The physical constraints of the passage from the Pacific, through San Francisco Bay to Concord NWS were considered as part of the port selection process. This passage meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS).

The volume or size of the local marine traffic (present or future) was not considered in the calculation of risk associated with the shipment of foreign research reactor spent nuclear fuel. In general, the number of ship mishaps is not proportional to the amount of ship traffic because port ship traffic is slow, and even when heavy, is normally a small number of ships per hour. Historically, increasing the volume does not significantly increase the probability of an accident. Rather, the number of ship mishaps is associated with navigational hazards and distances from the port to the open ocean or a large bay (port selection Criterion 2; Appendix D, Section D.1.9.2 of the EIS). Appendix D, Section D.5.3.1.3 of the EIS presents a discussion of the determination of the probability of ship accidents used in the EIS.

The worst plausible accident associated with the shipment of foreign research reactor spent nuclear fuel is considered to be the collision of the ship carrying the spent nuclear fuel with a petroleum tanker. In this accident, which is evaluated in the EIS, the transportation cask is assumed to be damaged in the collision, then subjected to a fire that resulted from the collision (Appendix D, Section D.5). Section 4.2.2.3 of the EIS discusses the assumptions that went into the port accident analyses and the results of those analyses. The addition of a mishap at a land-based facility, although it might in some way be the precursor for a severe accident involving a spent nuclear fuel-carrying ship, would not add to the severity of the worst plausible accident discussed above. As a result, the existence of land-based facilities such as refineries have no direct impact on the risk associated with spent nuclear fuel shipments, and are not included in the port selection criteria.

The distance from the port to the management site is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port population, route population, port experience with handling containers, and access to the ocean would also be considered in making the final selection of ports of entry. Appendix D, Section D.1.9 of the EIS presents details of the port selection process.

COMMENTOR NO. 504: DEWEY, DAVID D. (CONT'D.)

Please rethink Concord's status in relation to the port screening criteria and for the safety of the Bay Area, please take Concord off the list of ports.

Sincerely,

David D. Dewey

*** COMMENTS ***

I live in Clyde with my fiancé and his family. It would make us all feel very uncomfortably scared to know that toxic nuclear waste would be in our backyards. Preferrably it would best serve this nation well to close down the Naval Weapons Station, and to utilize energies within the nation toward peace + alternate forms of research for electricity etc. 515-1

COMMENTOR NO. 515: KOMAROMY, MARGI

Response to Comment No. 515-1

Concord NWS is a Department of Defense facility. Any decision to close it down would be undertaken as a separate action by the Department of Defense. In the foreseeable future, Concord NWS would be an operating facility.

COMMENTOR NO. 516: POE, W. LEE, JR.

June 19,1995

Foreign Research Reactor EIS
Office of Spent Nuclear Fuel Management (EM-37)
Office of Environmental Management
United States Department of Energy
1000 Independence Avenue, SW
Washington, D.C. 20585

Dear Sir:

Comments on Policy Concerning Foreign Research Reactor Spent Nuclear Fuel in DEIS

I would like to provide my comments on DOE/EIS-0218-D.

If, as the EIS says, there is a national benefit for the United States to receive foreign highly enriched fuel; then the U. S. should adopt a 10-year policy for receiving this fuel. The FRR SNF should be sent to either SRS or INEL for safe interim storage and/or processing. I feel strongly that DOE should not plan to store SNF indefinitely at SRS or INEL. As I state in the bulk of this letter, the scope of the management alternatives must be expanded to include all management activities for the SNF up to actual disposal.

Near-term plans should be made and demonstrated to be acceptable for disposal of these materials in a geologic repository out of the way of man. My present preference is reprocess the SNF, recover the HEU, dilute it to the 20% level that no longer presents a proliferation problem and reuse the enriched uranium. Both SRS and INEL have demonstrated that this can be accomplished in a safe, environmentally sound method using essentially available equipment and facilities. I strongly believe that this recovery and dilution should be DOE's selected alternative for HEU research reactor fuels. My major justification for this is that SRS has developed and is in the process of implementing means to dispose of low level waste, TRU waste and high level waste. Conditioning and disposal can be accomplished in an environmentally sound manner. Disposal requires DOE to complete and start-up the WIPP and high-level radioactive waste geologic repository. The suitability of these wastes for geologic disposal has been well demonstrated. I understand SRS is further along in demonstration of the high-level waste disposal than INEL; therefore, SRS is a better choice to receive this FRR SNF.

516-1

516-2

The DEIS seems to favor Alternative 1, safe interim storage of the FRR SNF, using for SRS, a two phased storage mode.

RESPONSE TO COMMENT
COMMENTOR NO. 516: POE, W. LEE, JR.

Response to Comment No. 516-1

The commentor's preference for domestic chemical separation is noted. This is Management Alternative 1, Implementation Alternative 6, which is discussed in Sections 2.2.2.6 and 4.3.6 of the EIS. The commentor's preference for blending the HEU down to LEU would also be DOE's stated preference. It is also part of Management Alternative 3, which is discussed in Section 2.4 and 5.5 of the EIS.

Response to Comment No. 516-2

The commentor's preference for chemical separation at the Savannah River Site over the Idaho National Engineering Laboratory is noted. In the near future the chemical separation facilities at the Savannah River Site might resume operations for the foreign research reactor spent nuclear fuel or for another purpose. These options are discussed in Section 2.2.2.6 of the EIS.

DOE announced a Record of Decision on May 30, 1995 for the Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs EIS. Chemical separation at Idaho National Engineering Laboratory was not included in this Record of Decision, so additional site-specific NEPA documentation would be required to restart the chemical separation facilities at this management site.

- Phase I would be to store the SNF in RBOF and L-Reactor Basin. RBOF has a demonstrated corrosion-free environment and could be used for long-term interim storage. L-Reactor Basin was designed for short-term wet storage and has had corrosion problems storing aluminum clad SNF for long periods. There is a corrective action (underway or planned) to improve this environment, but my judgment is that it can never be made corrosion free. In addition, the basin has no containment. I question long-term storage in that basin. I was not convinced that safe interim storage could be accommodated in L-Reactor by the information included in the DEIS. 516-3
- Phase II considers construction of improved dry storage capability. The DEIS states that these facilities cannot be available for 10 years. This alternative goes on to say the SNF would be transferred to the new dry storage facilities (Phase II storage facilities) and could be used for approximately 30 years until ultimate disposal. The DEIS does not address what would be required for this disposal. DOE should demonstrate that aluminum-clad HEU research reactor fuel can be disposed of in a geologic repository without extensive reprocessing before disposal to stabilize the components of the SNF for disposal. In addition, DOE should beef up the information on the technology and facility requirements for conditioning the aluminum clad SNF for safe interim (30-50 years) dry storage. 516-4

It is clear, from reading the DEIS that dry storage offers a safe, efficient storage mode, if the SNF has been properly conditioned. It is also important, in comparing this alternative to Alternative 6, that the final conditioning of the SNF be included in the evaluation.

I feel the DEIS shows that the 10-year envelope for acceptance of the fuel under this policy is adequate for this nation and foreign nations to develop alternative plans to safeguard the nuclear materials from these reactors. 516-5

I also feel that the DEIS shows in sufficient detail that modes of ocean and land transport, ports of entry do not offer significant risk. I recognize that "not in my neighborhood" comments will be heard from people not understanding the risk. I understand the risk and am willing to have the SNF in my neighborhood for my lifetime and the lifetime of my children as long as the U. S. Government has sound technical plans for geologic disposal at some reasonable future time and can show the SNF to be safe until that time. I am unwilling to say receive the FRR SNF with no closure of this concern even though interim storage is shown to be safe. I am unwilling to have wet or dry storage at SRS become the defacto disposal mode. 516-6

Very truly yours,

W. Lee Poe

W. Lee Poe, Jr.

Response to Comment No. 516-3

The commentor's concern about corrosion issues associated with the storage of foreign research reactor spent nuclear fuel at the L-Reactor Disassembly basin at the Savannah River Site is noted. Appendix F, Section F.1.3.1.1 has been revised to include the upgrades planned for the L-Reactor basin and the reasons why DOE considers the basin appropriate for safe interim storage of foreign research reactor spent nuclear fuel.

Response to Comment No. 516-4

Ultimate disposition of spent nuclear fuel from foreign research reactors is beyond the scope of this EIS (Section 1.3 of the EIS). Section 4.2.7 of the EIS contains a summary description of expected environmental effects of ultimate disposition. As stated in Sections 2.1 and 4.2.7 of the EIS, if a geologic repository is not prepared to accept the foreign research reactor spent nuclear fuel or its resultant stable waste forms (generated due to chemical separation or other processing technology) DOE would continue to manage the material in exisiting facilities at the DOE management site(s).

Section 2.6.5.1 and Appendix F, Section F.2.9 of the EIS indicate that, based on the existing experience of dry storage of aluminum-based spent nuclear fuel, no special conditioning of the fuel would be needed for safe 30- to 50-year dry storage.

Response to Comment No. 516-5

The commentor's suggestion that the proposed 10-year policy period would give research reactor operators sufficient time to develop other alternatives for safeguarding the foreign research reactor spent nuclear fuel, is noted.

Response to Comment No. 516-6

The commentor's support for the risk analyses provided in the EIS for marine, port and ground transportation is noted. If the spent nuclear fuel is accepted into the United States, it would be stored in either wet or dry storage at one of the five DOE management sites (including the Savannah River Site) identified in this EIS for an interim period not to exceed 40 years. Ultimate disposition in a geologic site, such as the one under consideration at Yucca Mountain, would occur after that time.

COMMENTOR NO. 519: GOLDEN, SUE

Please listen to us,
we do not want
nuclear waste
shipped through
Port of Tacoma or
any of our Ports.

Sue Golden

519-1

RESPONSE TO COMMENT
COMMENTOR NO. 519: GOLDEN, SUE

Response to Comment No. 519-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

REF./No. Pages:

MESSAGE:

We were unable to attend the Tacoma meeting with reference to the scheme to consider Tacoma as a port of entry for nuclear waste.

We object to the plan.

We feel the use of this city for a site of this kind would be a great mistake.

Geographically the area is in the middle of a growing and expanding urban area of several million persons. Economically, it would stifle the growth which is taking place here and which offers promise of even greater expansion. Environmentally, it would jeopardize and area which is of great concern to the government and to the private sector.

525-1

RESPONSE TO COMMENT
COMMENTOR NO. 525: DEVIK, BARBARA & RUDOLF

Response to Comment No. 525-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. The analyses provided in Sections 4.2.2 and 4.5 of the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port.

The population in the port, surrounding areas, and along the route to the management sites were considered during the analysis of potential ports of entry (Appendix D of the EIS). In the case of both incident-free transport of foreign research reactor spent nuclear fuel and accidents, impacts on these populations were shown by the analyses (Section 4 of the EIS) to be low.

DOE considers that the use of any of the ports indicated by the port selection process, including Tacoma, would not impact normal commercial operations, and therefore not endanger the ports' status with respect to their clients. This is based on the fact that the foreign research reactor spent nuclear fuel would be shipped to the United States in standard shipping containers that would require no special handling or precautions. As such, there should be no adverse commercial or economic reaction to the use of the port. Historically, there were no adverse commercial impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

COMMENTOR NO. 525: DEVIK, BARBARA & RUDOLF (CONT'D.)

COMMENTOR NO. 526: WRIGHT, DARLA J.

23 June 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, D.C. 20585

Dear Mr. Head,

I want to add my voice to those opposed to the transporting of any Nuclear waste through the Port of Tacoma. I am appalled to think of the catastrophic consequences this could create through any kind of accident that could possibly occur. 526-1

When Nuclear Reactor plants are built and used the disposal of the waste that is generated there should be part of the plan. Not an afterthought! And NOT transported anywhere. Disposal should be handled right on the site. 526-2

Our world is so fragile as it is. We have abused it far to long and it's time to stop and take care of it. This is not right and should not happen. Do not even think of this as a viable solution. It is not!

Sincerely,

Darla J. Wright

RESPONSE TO COMMENT
COMMENTOR NO. 526: WRIGHT, DARLA J.

Response to Comment No. 526-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 526-2

The commentor's opposition to the transportation of radioactive wastes is noted. The commentor's preference for disposal at the reactor site is likewise noted. This is Management Alternative 2, Subalternative 1a, which is described in Section 2.3 of the EIS.

As part of its nuclear weapons nonproliferation policy, the United States accepted spent nuclear fuel from foreign research reactors for over 30 years (Section 1.1 of the EIS). This policy of planned acceptance by the United States was intended to minimize risks that HEU would be diverted to the construction of nuclear weapons. As discussed in Section 1.2 of the EIS, many of the foreign research reactor operators cannot store their spent nuclear fuel at the reactor site due to a lack of facilities or regulatory constraints. Thus, the intent of the proposed policy is to remove as much U.S. -origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

June 22, 1995

Dear Mr. Head,

I cannot remember a time in my life when anything has concerned me as much as the proposal to ship high-level nuclear waste through the Port of Tacoma. My husband and I are the parents of two children. We were born and raised in Tacoma and have chosen to remain here because we are convinced that the Pacific Northwest offers unique beauty, opportunity, and a way of life that cannot be duplicated in other parts of the nation.

Until now, our children's futures appeared bright and promising. At 4 yrs. and 9 yrs. old, our daughter and son have had fears about natural disasters, most recently the threat of a large-scale earthquake. I've always told them not to worry, we have taken measures to be safe and are as prepared as we can be. Earthquakes are something we cannot control. Unfortunately, I cannot offer the same reassurances concerning this proposal. Should this become a reality for our city, there is no way to prepare, no way to feel safe. We become sitting ducks and pray that an accident never happens. But what if it does?

Unlike earthquakes, this doesn't have to be something that we live with. Our children have a right to grow up without this kind of threat hanging over their heads. You have the power to help restore our peace of mind. I implore you to please do everything possible to stop this from happening. You don't have to live here, Mr. Head. We do. Tacoma is our home, our life. Please, for our children, do not recommend the Port of Tacoma for this proposal.

531-1

Thank you for your consideration,

Sherrie Gibelyou

Response to Comment No. 532-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 532-2

DOE does not agree with the commentor's assertion of "federal arrogance" displayed at public meetings in Western Washington. DOE's responsiveness to the public is demonstrated by the seventeen public hearings which were held on the draft EIS in the locations determined to be most likely to be directly affected by the EIS alternatives, specifically in the ports of entry and at the potential management sites. In addition to accepting comments from the public during these hearings, written comments were also welcomed, and encouraged.

*** COMMENTS ***

I am writing to you to let you know I protest the use of the Concord Naval Weapon station as a port to receive weapons grade nuclear waste. You obviously have a current system you are using to transport the material to waste storage, and I don't see the advantage of changing the system. You are endangering people who live in the area, who did not buy their homes with the knowledge that was going to happen. You are lowering our property values on our homes and endangering all the people in the surrounding areas. 536-1

RESPONSE TO COMMENT
COMMENTOR NO. 536: LIU, DENISE

Response to Comment No. 536-1

The commentor's opposition to the use of the Concord NWS to receive foreign research reactor spent nuclear fuel is noted. The port selection criteria discussed in Appendix D, Section D.1.9 of the EIS identify ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Concord NWS, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2).

In regard to a possible reduction in property values as a result of the receipt of foreign research reactor spent nuclear fuel at Concord NWS, the analyses in Section 4.2.2.3 and Appendix D, Section D.5 of the EIS determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident. Historically, there were no adverse commercial impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

No "system" currently exists in the United States for transporting foreign research reactor spent nuclear fuel to waste storage. The goal of this EIS is to evaluate the environmental impacts of reasonable alternatives for disposition of this spent nuclear fuel, so that policy makers can factor this knowledge into the decisionmaking process.

COMMENTOR NO. 538: CONRY, MARGARET

Written Comments on the Draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

If you would like to give us written comments, please feel free to use this page and drop it off at the registration table when you leave. Alternatively, you may mail your comments to the Department of Energy at the address listed below. Also, please provide us with your name, address, and telephone number for any follow-up information or any questions concerning the intent of your comments. This will also allow us to properly indicate the source of the comments in the comment response document. Thank you.

*** COMMENTS ***

I feel that the proposed storage site for nuclear fuel rods in Concord would be a devastating and destructive situation: not only for the 300,000 citizens of the Concord area but the millions of people in any site on the planet. This planet is a gift of God which is on loan to us, and we have the responsibility of being good Stewards of the planet. We have the responsibility as co-creators to protect and save it and all its inhabitants

RESPONSE TO COMMENT
COMMENTOR NO. 538: CONRY, MARGARET

Response to Comment No. 538-1

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternative 1 or 3), there would be no storage of this material at the Concord NWS, or any other port. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

COMMENTOR NO. 538: CONRY, MARGARET (CONT'D.)

Putting a nuclear storage site in Concord is not a responsible action and will only bring further ruin and destruction to the planet.

538-1 (Cont'd.)

Margaret Conry

RESPONSE TO COMMENT
COMMENTOR NO. 540: MCTAGGART, FRANCIS & ROSALIE

Response to Comment No. 540-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through any ports in the Pacific Northwest is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 544: ADLE, DOROTHY R.

Dear Mr. Head

The proposal to transport and store temporarily spent nuclear fuel to and at the Concord Naval Weapons Station, Concord, California is a terrible idea! Approaching Concord via San Francisco Bay entails sailing under several highly travelled bridges. San Francisco Bay has

544-1

544-2

RESPONSE TO COMMENT
COMMENTOR NO. 544: ADLE, DOROTHY R.

Response to Comment No. 544-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternative 1 or 3) there would be no storage of this material at Concord NWS, any other port, or anyplace except for DOE management sites. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the spent nuclear fuel transportation cask.

Response to Comment No. 544-2

The physical constraints of the passage from San Francisco Bay to Concord NWS were considered as part of the port selection process and found to meet the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS).

On the issue of air and water quality as it pertains to the proposed policy of managing foreign research reactor spent nuclear fuel, DOE is convinced that there would be no significant adverse impacts to any of the ports that might be used to receive the material. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, no radioactive material has ever been released from a spent nuclear fuel transportation cask as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

already been heavily polluted, the worst offenders being various branches of the armed services. Now we should risk the most dangerous pollution of all?

544-2 (Cont'd.)

In addition, this is an earthquake-prone area. Not only the well-known San Andreas Fault, but much closer to Concord the Hayward and Concord Faults are a constant worry.

544-1 (Cont'd.)

Someone in your department should listen to a few traffic reports

544-3

Response to Comment No. 544-3

The frequency of accidents on highways has been taken into account in all the ground transport risk estimates in the EIS. As discussed in Section 4.2.3 and Appendix E of the EIS, spent nuclear fuel has been transported along highways, railways, and waterways for over four decades without release of the radioactive contents from the spent nuclear fuel transportation cask.

COMMENTOR NO. 544: ADLE, DOROTHY R. (CONT'D.)

in this immediate area. Overturned "Semis" are all-too-frequent and traffic is really heavy near Concord.

544-3 (Cont'd.)

I'm certainly in favor of "non-proliferation" but there must be a better way than this.

Very truly yours,

Dorothy R. Adle

RE: Potential Shipment of Highly Enriched Nuclear Fuel Though the Port of Tacoma
Puget Sound, and The Pacific Northwest

I am an activist in the Tacoma community,currently the elected chair of the Pierce County Democratic Party,a senior member of the United Way Board (second term),a member of the Citizen's Advisory Committee for the University of Washington branch campus in Tacoma,and also serve as an at-large member of the state-wide board of Washington Citizen Action--an affiliate of National Citizen Action.I am most concerned that the Department of Energy,an organization that I have respected for it's adroit decision -making ,would consider utilizing The Port of Tacoma for the trans-shipment of these highly unstable and toxic nuclear wastes.Apart from the negligent aspects of the draft environmental impact statement,I am most concerned that the Department has so little regard for the efforts and hard work of the Citizens of Tacoma as they labor to establish a City of which they can be proud.They have cleaned up a major environmental nightmare with the considerable effort expended in reclaiming the site of the Asarco copper smelter, absorbing job loss and facilitating major political co-operation in the process;They have worked to clean up Commencement Bay,and are laboring to convert a mill town economy to the 21st century,being at a very delicate stage of that evolution--This move to potentially make Tacoma a nuclear waste trans-shipment point will have a disastrous impact on the progress the City is about to make--several other proposed sites are much better established and are beyond the point where the impact will cripple their growth and potential.

It would be poor public policy if the Department decides to proceed with plans to designate Tacoma based on relative political clout--There are excellent objective reasons to choose another Port;there are compelling human reasons for allowing our community to proceed with its growth and development unfettered by the damaging stigma that would surely result from your designation of this City as the trans-shipment point.I trust that you will weigh your options carefully and make the right decision. 547-1

Thank you for your careful consideration of my concerns.I have fallen in love with this community and sincerely believe that its best interests are served as are those of this Nation by seeking another alternative for this purpose.

Sincerely Greg Mowat

RESPONSE TO COMMENT
COMMENTOR NO. 547: MOWAT, GREG

Response to Comment No. 547-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Under NEPA regulations, the socioeconomic effects evaluated for this EIS do not include those associated with psychological fear of receiving spent nuclear fuel. Based on past experience DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Tacoma would have no adverse economic impacts on business within the port or the surrounding communities.

COMMENTOR NO. 550: KNAGGS, CARRIE L.

June 22, 1995

Dear Mr. Tead,
I am against the movement of nuclear waste through the Port of Tacoma not only because it indangers me and my children but because it is wrong to allow the nuclear industry to bury their waste in somebody else's back yard. If they are not made to deal with their own crud they will not be made to take precautions and use common sense. They will not be encouraged to look for better ways of doing things. If they want to use nuclear energy they should have to deal with the consequences. Dealing with it should not include making it someone elses problem. The question I have for you is...How would you like it if your neighbor to your right took his wheelbarrow full of dog poo across your backyard every day to dump it in the yard of your neighbor on your left? How would you like to walk out in your yard and step in some of the gick that fell off that wheelbarrow. Or , God forbid, your child found some. Please listen to the people of Tacoma. Please make all industry take responsibility for their own actions and their own waste.

Sincerely,
Carrie L. Knaggs

RESPONSE TO COMMENT
COMMENTOR NO. 559: ZWICKEL, ABRAHAM

Response to Comment No. 559-1

The commentor's opposition to using Concord NWS is noted. However, DOE considers that the port selection criterion successfully identify ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in Sections 4.2.2 and 4.5 of the EIS indicate that the use of any of the ports indicated by the port selection process, including Concord NWS, would not pose any significant risk to either the port personnel or the population near the port. Foreign research reactor spent nuclear fuel would only pass through Concord NWS and the State of California on its way to a DOE management site, but would not be stored there.

COMMENTOR NO. 559: ZWICKEL, ABRAHAM (CONT'D.)

Open flues of drinking water flowing through CHWS at mercy of microscopic atomic waste fuel.

We three Zwickels, demand an end to all atomic POWER and atomic bombs. Leave uranium in the ground to avert itself over ages finally into lead according to DR. DAVID BRADLEY medical scientist of BRAIN TEST. REFERENCE. NO PLACE TO HIDE

COMMENTOR NO. 559: ZWICKEL, ABRAHAM (CONT'D.)

COMMENTOR NO. 560: LEWIS, CORA

June 20, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue SW
Washington DC, 20585

Dear Mr. Head,

I was delighted to see an over-capacity crowd to comment on the D.O.E.'s proposition to bring spent nuclear waste from other countries through the Port of Tacoma. Unfortunately, I was one of those concerned citizens that could not get into the auditorium to express my disapproval, however, I hope my letter will be taken with the seriousness intended.

As I follow this issue, I can't seem to get the picture out of my mind...a map of the United States with a big red circle with a line through it over the glowing state of Washington. I have difficulty enough with the United States deciding to be the world's nuclear garbage dump. Bringing it through an inland port, transporting it through waters whose shores are heavily populated, shipping it on our freeways and railways, over our rivers and through our rich farmlands seems to be a definate effort to ruin the reputation of a state rich in beauty and natural resources. Washington has its share of nuclear substances, Washington doesn't need this, Tacoma doesn't need this.

560-1

I can't imagine any commercial port wanting this kind of cargo. As I watched the televised meeting between the Port of Tacoma and the D.O.E. a few weeks ago, I became greatly offended that the D.O.E. has the attitude that Tacoma's citizens lives and health were less important than those who live in Seattle. As was put by the representatives from the D.O.E., Tacoma has fewer people so its best to let them take the risks. You want our longshoremen to handle the waste, you want our port to be responsible for protecting the waste and although you seem to have the attitude that this cargo comes to us with no dangers (therefore should be safe for any port), you still think it is best to bring it through an area of less population. In case you were unaware, Tacoma is the second largest city in our state, we have over 150,00 citizens; a sizable population, by all means.

560-2

If you feel the United States must take this waste under our care, then bring it to a ocean port...a military port that has experience handling this type of cargo and the military equipment to protect it. Ship it along railways and roadways that are isolated from as much population as possible. At the meeting between the Port of Tacoma and the D.O.E., the D.O.E. stated it would be expensive to update a military port. I don't think the government can put a price tag on safety for it's citizens when the world's nuclear waste is being pushed down the throats of Tacoma's citizens, our beautiful state of Washington, and our country.

560-3

My impression is that the D.O.E. feels that if we take this nuclear waste, it will stay out of the hands of those less desirable that may use it to build weapons to be used against us. As we look back over the past few years, it is apparent that there are terrorists within our borders too. Will the United States be responsible if the spent nuclear waste gets in the wrong hands and is used against on of the world's countries. I can't think of anything that would bring down a great nation faster!

Tacoma is working hard and succeeding in building a positive image. Our theaters are restored, our superfund sites are clean, Universities are coming in to support the educational needs of our area, our artists are coming home. Please leave us alone and let us finally become a desirable destination.

Sincerely,

Cora Lewis
3917 - 47 Avenue NE
Tacoma, WA 98422

cc: Representative Randy Tate

RESPONSE TO COMMENT
COMMENTOR NO. 560: LEWIS, CORA

Response to Comment No. 560-1

In evaluating and selecting acceptable ports of entry, DOE has developed evaluation criteria. DOE considers that the port selection criteria successfully identify ports that can safely handle foreign research reactor spent nuclear fuel. DOE further considers that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel or the population near the port. The EIS shows that the risks associated with an accident are low (Section 4.2.2.3 of the EIS) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2 of the EIS).

Response to Comment No. 560-2

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without the additional security that might be present at military bases. The security provided for the spent nuclear fuel shipments would be required to meet or exceed all of the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Nevertheless, the commentor's preference for the use of military ports is noted.

Neither acts of terrorism nor theft of materials by a determined group or individual can be completely precluded. However, proper security measures can greatly reduce the risk of such actions. Security would be provided for all shipments of foreign research reactor spent nuclear fuel, as required by the Code of Federal Regulations (10 CFR Part 73). The security provisions are summarized in the new Appendix H that has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that would be prepared for each foreign research reactor spent nuclear fuel shipment to specify the details of the transportation process, including security provisions in port and during transit.

Response to Comment No. 560-3

The broad purpose of the proposed action is to support the nonproliferation of nuclear weapons (Section 1.2 of the EIS). It is unlikely that internal terrorists could steal spent nuclear fuel from foreign research reactors and construct a nuclear weapon from it based on the fact that this spent nuclear fuel requires sophisticated processing techniques to extract the uranium for use in the construction of a nuclear weapon (Section 1.2 of the EIS). A greater risk is that HEU available through international commerce could be diverted to a nation capable of extracting the uranium and whose intent is to develop nuclear weapons capability.

Re: Nuclear Waste Shipment Through The Port of Tacoma, WA

Dear Mr. Head,

I definitely do not want shipments of high-level nuclear waste coming through the Port of Tacoma, Washington. No one can say that this would be 100% safe. There is always a chance for accident. Three Mile Island, the Exxon Valdez, Chernobyl, and the leaks at Hanford, Washington, were never supposed to happen--but they did. I do not want this nuclear waste coming through my community. I want my grandchildren to grow up safely in a healthy community and not have to worry about a nuclear waste accident. 561-1

Washington, D.C. 20585

Dear Mr. Head:

I'm writing to you in regards to the possible shipments of high-level nuclear waste through the Port of Tacoma.

As a mother of young children, here's a question for you: Do you have children or even grandchildren living in Washington state? Probably not. This is an area, I'm sure, which is far enough away for all families of the Department of Energy to not have to feel threatened in any way.

There is no way you (or anyone else, for that matter) can guarantee there would never be a leak, spill, or contamination of this waste. If paid well enough, some will believe many things. But this is human life we're talking. Many generations of it. 564-1

Speaking for my family, find another way of dealing with this nuclear waste. It is unnecessary to risk lives. Certainly there are many other options — find them. Leave our lives, and our waters, alone.

Sincerely,

Sherry Meyer

Washington DC 20505

Dear Mr Hand

I am writing to let you know how unhappy I am with the decision to bring spent nuclear fuel from foreign countries into the United States through the Port of Tacoma. **566-1**

I don't understand why the fuel can't remain where it is at now. Heaven knows that we have enough nuclear waste sites to clean up of our own, we don't need someone elses too, And IF its as safe as your department claims, why can't it be brought into the Port of Seattle? **566-2**

Here in Washington State, we were told by the U S Government how safe the activities going on at Hanford were. Now we are finding out about leaking tanks, releases of waste into the air and the rivers. Just today in the Seattle P I there is another article about how bodies were snatched and tested for effects of radiation. Those who were unfortunate enough to live downwind from the facilities have suffered miscarriages, cancers, & birth defects. All this from a "safe" facility. **566-3**

Mr Hand, find some other place to bring in the foreign waste. Find someplace who hasn't worked as hard as we have to clean up their environment. Someplace where there isn't appx 188,000 people living. Anyplace but The Port of Tacoma. Hey while your at it, maybe you could find someplace who would be willing to take our spent fuel?? **566-1 (Cont'd.)**

Sincerely yours
Nora Hiatt
Nora Hiatt

PS The next time you have a community meeting like the one here in Tacoma on June 19, please arrange for a larger facility. I was one of those that couldn't get in. **566-4**

RESPONSE TO COMMENT
COMMENTOR NO. 566: HIATT, NORA

Response to Comment No. 566-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 566-2

Many of the foreign research reactor operators cannot store their spent nuclear fuel at the reactor site due to a lack of facilities or regulatory constraints (See Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). The Port of Seattle was not selected among the proposed ports of entry based on the port selection process described in Appendix D of the EIS due to the application of the population criterion.

Response to Comment No. 566-3

DOE is committed to the Tri-party agreement for cleanup activities at the Hanford Site; however, the cleanup at the Hanford Site is beyond the scope of this EIS. Section 4.2.4 and Appendix F, Section F.4.3, discuss the impacts of foreign research reactor spent nuclear fuel management at the Hanford Site.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 566-4

DOE appreciates the commentor's frustration at not being able to personally attend the Tacoma meeting due to the overflow turnout. The facility for the June 19, 1995 meeting was selected by the City of Tacoma officials.

COMMENTOR NO. 567: RITZHAUPT, P.J.

Sir:

I protest the moving of nuclear waste thru the Port of Tacoma/Seattle area! We cannot deal with our own U.S. made radioactive waste properly (look at the Hanford mess) so why are we taking on waste from other countries! Are we going to keep our terrorist from making bombs by bringing it here ... Think not. Do not subject our area to possible danger from this deadly waste.

P.J. Ritzhaupt
Ret. Teacher

567-1

COMMENTOR NO. 567: RITZHAUPT, P.J.

Response to Comment No. 567-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 568: DAVIS, RANDAL L.

June 22, 1995

Charles Head
Office of Spent Nuclear Fuel (EM-37)
U.S. Department of Energy
1000 Independence Ave S.W.
Washington, D.C. 20585

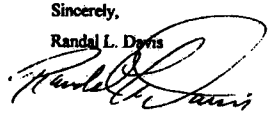
Dear Mr. Head:

As a citizen of the city of Tacoma I have followed with great concern the debate regarding the shipment of spent nuclear fuel through our city's port. I have listened as government officials and their paid representatives assure us that the risk of an accident is minimal and that the containers the fuels are stored in are extremely safe. I have listened as they tell us shipping spent fuel through our city will create jobs. To be frank with you, we don't believe the government has Tacoma's best interests at heart. Regardless of the amount of risk, the fact remains that accidents *do* happen. Chernobyl, Three Mile Island, leaks at Hanford, are all proof positive that the chance for disaster is quite possible. It may be true that the chance of an accident happening is quite minimal, but frankly Mr. Head, the citizens of Tacoma are not willing to take that risk. We are not willing to stake our children's future or the future of our city on government assurances. The government lies. The government covers up. The bottom line is, the government works *for the people*. The people of Tacoma shout a resounding NO!! to spent Nuclear fuel through our port. We will not allow this to happen. Our city's longshoremen have already said they would refuse to unload it. Other business' are concerned about the public perception of possible contamination to their own products. And what's more, we refuse to stake anyone's life on the government's assurances that the risk of an accident is minimal. We the citizens of Tacoma will fight this with all our will and might. We will do whatever is necessary to see that spent nuclear fuel does not pass through our port. The waters of Commencement Bay already sit high atop the list of superfund cleanup sites and we are *not* willing to jeopardize it further. The government will have to find some other port to ship the world's nuclear waste through because the citizens of Tacoma will not allow it to happen here.

568-1

Sincerely,

Randal L. Davis



RESPONSE TO COMMENT
COMMENTOR NO. 568: DAVIS, RANDAL L.

Response to Comment No. 568-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. DOE has added a sentence to (Appendix D, Section D.2.1.9 of the EIS) regarding Commencement Bay being a Superfund Site. The analysis of impacts in Section 4.2.2 of the EIS demonstrates that there would be no significant adverse impacts on the ports, people, or natural environment from shipments of foreign research reactor spent nuclear fuel and the overall impacts to Commencement Bay would be unchanged by the various management alternatives.

COMMENTOR NO. 570: TAYLOR, INEZ

June 22, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management
1000 Independent Ave. S.W
Washington D C 20585

Dear Mr. Head,

I, besides thousands of other Tacomans, do not want shipments of Nuclear waste going through the Port of Tacoma. 570-1

Accidents do happen and the thought of our beautiful Commencement Bay being contaminated is unacceptable.

Sincerely,

Inez Taylor

1000 Independence Ave. SW.
Washington, D.C. 20585

Dear Mr. Head,

I and my immediate family of 7, want to let you know we do NOT want our Port of Tacoma to become the unloading spot for all the worlds' nuclear waste.

We don't care how supposedly safe it it, accidents happen. Our water and port are too important to the livelihood of many hundreds of people, besides the possible contamination of all the local residents. 571-1

Our commuinity does NOT want to have all the health problems connected to over exposure to radiation. Look at what happened to all those people in Russia when the reactor metled down. That was quite a few years ago and they are still having health problems.

Find some other low populated area to bring it into the country. Not IN OUR BACKYARD!

We always thought our government was looking out for the best interest of its' citizens but this plan sure leaves us wondering!

Sincerely,

Donna Beach

Donna Beach

4908 No. 39th St.
Tacoma, WA. 98407
June 22, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management(EM-37)

U.S. Dept of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Sir:

I know that you are aware of the meeting in TAcoma, WA. June 20, 1995 concerning using our port for the receiving of spent nuclear fuel coming from countries other than our own.

Please be advised that we are emphatically opposed to having any of it proceed through our port. 573-1

We are jusr as emphatically opposed to having any of it coming into our country at all. 573-2

There is no way that the United States should be a dumping ground for any other countries spent fuel. Just because we let them have it is no good reason to store the left overs from it. Why would the United States let them have it in the first place if they are so unreliable that they cannot take care of their own.

Concerning the nations that are not reliable enough to be trusted to take care of their own, they will get it to use for whatever purpose they choose to use it for regardless of our efforts. There are many avenues open to them from even from those who are our supposed Allies. 573-3

Thank you for your consideration in this matter.

John Simac
Annice A. Simac

RESPONSE TO COMMENT
COMMENTOR NO. 573: SIMAC, JOHN & ANNICE A.

Response to Comment No. 573-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 573-2

The commentor's further opposition to management of spent nuclear fuel from foreign research reactors in the United States is also noted. Sections 2.3, 2.5, and 4.5 of the EIS describe other alternatives under consideration.

Response to Comment No. 573-3

Many of the foreign research reactor operators do not currently have means for storage or other disposition of their spent nuclear fuel (Section 1.2 of the EIS). This is a result of a longstanding policy of cooperation with the United States in the prevention of the proliferation of nuclear weaponry (Section 1.1 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

The United States provides LEU fuel to research reactor operators who agree to cooperate in the prevention of the spread of nuclear weaponry (Section 1.1 of the EIS). A willingness to assume responsibility for spent nuclear fuel containing uranium enriched in the United States does not imply that our allies are untrustworthy. Since a relatively small amount of HEU can be used to construct a nuclear weapon, it is prudent to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide.

Re:D.E.I.S. Nonproliferation Policy

Dear Sir:
Thank you for this opportunity of comment. They are as follows.

1- This program is to expensive. 575-1
2- I would believe that we could afford to provide maintenance and security with our own funding and troops much less expensively than the necessary process of returning and storing it here in the U.S.
3- Yesterday France, one of our allies, announced they were going to star nuclear testing again. Probably to scare the Bosnians or whoever they think they are threatened by, or to try to influence us in our policy towards the Bosnians. Who knows? Any responsible gov't is not going to use nuclear bombs. I don't know if it is the new millenium, and the number 2 instead of 1 in the date of the year that has people acting strangely, or what. But I feel we have a policy that protects the U.S., and the last time France went to war it was VietNam and she left(France's history is it never stays) and the U.S. rushed in. I frankly don't worry much about France. 575-2
4- I do not worry about Iraq, either, altho I feel we should have been more decisive in our action while engaged in Desert Storm. 575-3
5- After the bombing of Oklahoma City, That I worry about. I think if any truly freaked out militia were to be able to secure the nuclear material I would worry, alot.
6- In N.Y.C. last week the F.B.I. found a cannister of spent waste that had come into this country undetected.Until it's arrival.It had none of the proper casings prescribed in this draft, so I must think anyone on that flight, and any oythers that came in contact should be tested. That worries me. 575-4
7- Nuclear energy is too expensive. I would much prefer to see th money required for this proposal to be as stated in #2, and spend money saved on solar or wind energy, or maybe take a new look at water as a source. 575-5

RESPONSE TO COMMENT
COMMENTOR NO. 575: WILSON, EDIE

Response to Comment No. 575-1

Safely transporting, receiving, storing or chemically separating, and finally disposing of spent nuclear fuel rods is expensive. Depending on decisions made in other programs, particularly high-level waste disposal, the foreign research reactor spent nuclear fuel program, could be very expensive. Indefinitely storing and guarding spent nuclear fuel all over the world is more expensive than any program that consolidates the fuel for the same purpose. Furthermore, as explained in Section 4.4.1 of the EIS, overseas storage of the spent nuclear fuel would not be compatible with U.S. nuclear weapons nonproliferation policy objectives. Spent nuclear fuel management, whether in the form of storage, chemical separation (i.e., reprocessing), or geologic disposal, benefits from very large economies-of-scale. Consolidating the spent nuclear fuel costs less per fuel element than handling them separately in dozens of countries.

Response to Comment No. 575-2

France's announcement that it will begin nuclear testing again is outside the scope of this EIS.

Response to Comment No. 575-3

U.S. involvement in Desert Storm is outside the scope of this EIS.

Section D.5.9 has been added to Appendix D of the EIS to address terrorism and sabotage. This section concludes that, while certain terrorist and sabotage attempts cannot be precluded, theft would be. DOE is confident that the foreign research reactor spent nuclear fuel can safely be transported to the management site(s), if the foreign research reactor spent nuclear fuel is accepted into the United States. The security measures employed would meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). DOE supports these regulations as being adequate to protect the foreign research reactor spent nuclear fuel. If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security.

To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that provides details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site.

COMMENTOR NO. 575: WILSON, EDIE (CONT'D.)

-2-

8- If this policy does continue, the standards are all too low in all areas.

Thank you for this opportunity.

Very truly yours,

Edie Wilson

For any questions please call 908-246-2179, if I may be of assistance.

RESPONSE TO COMMENT
COMMENTOR NO. 575: WILSON, EDIE (CONT'D.)

Response to Comment No. 575-4

DOE intends to implement the proposed policy in a manner that is in accordance with all applicable laws and regulations. Therefore, the proposed action would be tightly regulated and the potential for diversion of foreign research reactor spent nuclear fuel by terrorists, or by nations seeking to develop nuclear weapons, would be minimized. DOE considers that proper implementation of the proposed action would prevent the type of occurrence the commentor has described.

Response to Comment No. 575-5

Consideration of alternative energy sources is outside the scope of this EIS. However, it is important to note that as part of its mission, DOE currently has ongoing programs that are seeking to develop and promote use of such alternatives, including solar, wind, and water resources.

COMMENTOR NO. 582: MAST, LAWRENCE

4413 N. 27th St
TACOMA, WA. 98407
JUNE 23, 1995

Mr. Charles Head;

Why should this country take nuclear waste from foreign countries when we have plenty of our own? Have you ever asked a foreign country to store our nuclear waste?

There is two much supposition about the shipping of our nuclear waste, we don't need more of that from other countries. Let them take care of their own.

One accident could ruin the welfare of whole cities and towns; killing or crippling hundreds of thousands innocent citizens, like those exposed to radiation years ago and are still suffering.

Even containers that are supposed to be unbreakable are like everything else, there are flaws.

582-1

Lawrence Mast
Alton G. Mast

RESPONSE TO COMMENT
COMMENTOR NO. 582: MAST, LAWRENCE

Response to Comment No. 582-1

Many of the foreign research reactor operators cannot store their spent nuclear fuel at the reactor site due to the lack of facilities or regulatory constraints (Section 1.2 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). Sections 2.3, 2.5, and 4.4 of the EIS describe other basic policy alternatives under consideration.

Radiological risks due to accidents at candidate ports, along transportation routes, and at interim management sites were analyzed in the EIS (Sections 4.2.2, 4.2.3, and 4.2.4, respectively, and Appendices B through F of the EIS). As demonstrated by the analysis, risks associated with implementation of the proposed action to human health or the environment would be low.

Transportation casks for spent nuclear fuel are built to withstand accidents (Section 2.6.2 and Appendix B of the EIS). During the past four decades spent nuclear fuel has been shipped along highway, rail, and barge routes in the United States. No transportation cask containing spent nuclear fuel has ever released its radioactive contents, nor has a transportation cask ever been punctured, including those involved in traffic accidents. (Section 4.2.3 of the EIS).

Response to Comment
Commentor No. 583: Eckard, Dorothy H.

Response to Comment No. 583-1

A national nuclear waste policy does not currently exist. Although such a policy would, no doubt, clarify and direct this country's efforts to address the nuclear waste issue, the question of managing foreign research reactor spent nuclear fuel that is addressed by this EIS cannot wait for a national nuclear waste policy to be developed. The main driver behind the proposed policy to manage foreign research reactor spent nuclear fuel is a concern to limit the possibilities of the proliferation of nuclear weapons. This issue cannot wait, especially since the amount of spent nuclear fuel involved here is so small compared to that elsewhere in the public and private sectors.

COMMENTOR NO. 584: WEISE, LESLIE

June 23, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. SW
Washington, D.C. 20585

Dear Mr. Head,

This letter is regarding the issue of whether the **Port of Tacoma (Washington State), will be the port of entry for shipments of high-level nuclear waste**. I speak on behalf of a large number of individuals in Western Washington state. We are extremely angry at the ignorance of you and your office to not listen to the concerns of the people of this state. This issue does not affect only the Port of Tacoma, but all of Western Washington State, which as you are forgetting has a very large population of people and natural wildlife. The chance of even a small leak or spill is not only *inevitable, but probable* and a number of disasters are proof of this, such as the leaks at Hanford and Three Mile Island. I implore you to make the right decision and choose another route for this very dangerous substance. The Northwest, especially western Washington state is so beautiful, please help to keep it and all its inhabitants safe and healthy.

584-1

Sincerely,

Leslie Weise
Concerned Resident of Seattle, WA

RESPONSE TO COMMENT
COMMENTOR NO. 584: WEISE, LESLIE

Response to Comment No. 584-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Regulations concerning "Type B" cask leakage during normal operation are specified in 10 CFR Part 71.51, and the allowed leak rate is essentially zero. The spent nuclear fuel elements contained in a transportation cask are mechanically sound. The cask would not contain water, thus there would be no leakage of radioactivity during transport. The only hazard is a very small, allowable level of radiation that emanates from the cask. The regulations governing the acceptable radiation level (10 CFR Part 71.47) are documented in Section 5.4, and Appendix B, Section B.2 of the EIS. The radiation level allowed by the regulations would not place undue harm on the individual member of the public, or the general population as a whole. Historically, the radiation level associated with the transport of foreign research reactor spent nuclear fuel was one to two orders of magnitude less than that allowed by 10 CFR Part 71.47. The EIS evaluated the risk of transporting foreign research reactor spent nuclear fuel using the allowed limits and concluded that the overall risk would be negligible (Section 4 and Appendix E of the EIS).

Accidents do occur. That is why the spent nuclear fuel transportation casks are designed, constructed and tested by simulation to withstand a series of impact and fire tests (Appendix B, Section B.2 of the EIS). Representative transportation casks have been crash tested to confirm compliance with regulatory standards. Two actual crash tests one involving a locomotive and the other a tractor trailer carrying a spent nuclear fuel transportation cask have been performed. Both tests showed no failure of the casks, but the locomotives were destroyed. These tests concluded that the transportation casks built to the federal standard would protect and retain their contents in the most severe accidents. With regards to fire duration, real life tests have been conducted to determine the accuracy of the techniques used to demonstrate compliance with this regulatory requirement. Further, examinations of real life fires on land and at sea, and fire tests have demonstrated that high intensity fires are unlikely to be sustained for lengthy periods, and even then not in a single location.

Nevertheless, in spite of the improbability of such fires, the EIS contains the results of an analysis of such a fire (Section 4.2.1.3). The results of the analyses are given in Appendix D of the EIS.

COMMENTOR NO. 587: KENNEDY, STEVE

6-17-95

To Mr. Charles Head,

Just a note to say, please don't let the U.S. become a dumping ground for nuclear waste. Do what ever you can to end this terrible problem, please fight all government waste, end all trade to countries that still trap & kill Tigers, there are only a few thousand beautiful Bengal Tigers left, we need to protect them better. And get rid of that expensive & un-necessary Helium complex in Amarillo, Texas, gross example of government waste. Lets have a strong, tough on crime, beautiful America,

587-1

587-2

Thank You
Steve Kennedy

RESPONSE TO COMMENT
COMMENTOR NO. 587: KENNEDY, STEVE

Response to Comment No. 587-1

The commentor's concern that the United States not become a dumping ground for nuclear waste is noted. If foreign research reactor spent nuclear fuel is accepted into the United States the policy would be of limited duration (Sections 2.2.1.1 and 2.2.2.2 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). Sections 2.3, 2.5, and 4.4 of the EIS describe other basic policy alternatives under consideration.

Response to Comment No. 587-2

The commentor's concern about the preservation of Bengal Tigers is noted. Although this matter falls outside the scope of this EIS (Section 1.3 of the EIS), policies of United States Government Agencies support efforts to preserve endangered species.

Facilities in Amarillo, Texas would not be used for management of spent nuclear fuel from foreign research reactors and are outside the scope of this EIS. Section 1.5 of the EIS describes environmental documentation related to this EIS.

COMMENTOR NO. 588: SNORTUM-PHELPS, TYLER

Written Comments on the Draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

If you would like to give us written comments, please feel free to use this page and drop it off at the registration table when you leave. Alternatively, you may mail your comments to the Department of Energy at the address listed below. Also, please provide us with your name, address, and telephone number for any follow-up information or any questions concerning the intent of your comments. This will also allow us to properly indicate the source of the comments in the comment response document. Thank you.

Address: 1211 Orange St.
City: Concord State CA Zip 94518

*** COMMENTS ***

The DraFT EIS Does NOT address the many safety issues specific to this area. The ships passing through the Delta will pass by many hazards + sensitive sites. The risk of accident is great enough that this is a totally unacceptable plan. The emergency response systems are not in place to deal with accidents, and there are far too many risks when transporting such hazardous material. Concord says NO!

588-1

RESPONSE TO COMMENT
COMMENTOR NO. 588: SNORTUM-PHELPS, TYLER

Response to Comment No. 588-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 588-2

DOE considers that there is adequate regulatory and emergency preparedness infrastructure to ensure the safe acceptance and transport to designated management sites if the foreign research reactor spent nuclear fuel is managed in the United States. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1. There are three national emergency response plans under which DOE provides radiological monitoring and assessment assistance. Under these plans, DOE provides technical advise and assistance to the State, Tribal and local agencies involved with a radiological incident. Emergency preparedness, security, and coordination of DOE with local emergency response authorities, and security are discussed in general in Sections 2.7 and 2.8 of the EIS. Details would be contained in the Transportation Plan, that would be prepared prior to any individual spent nuclear fuel shipment and coordinated with State and local officials. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments..

COMMENTOR NO. 590: DAUTEUR, ADELE

Tacoma, Washington
June 16, 1995

Dear Sirs
I believe that your choice of Tacoma as a Port for the disposal of spent fuel is one more example of picking a town with a smaller population and therefore less response from the citizens. 590-1

We object & we have roused the town before to action and will again. Do not use our port.

Sincerely,

Adele Dauteur

US Department of Energy
1000 Independence Avenue
Washington, DC 20585

Dear Sir:

This letter is in response to the potential shipment of highly enriched nuclear fuel through the Port of Tacoma, Puget Sound and the Northwest. We, along with our port and local government officials, oppose these shipments.

We have reason to believe that the Draft Environmental Impact Statement used outdated, incorrect or incomplete information in forming its conclusions and that a number of issues were not adequately addressed, namely:

- The DEIS does not consider the potential harm to the environment and people in the affected area, if a release of nuclear fuel or high levels of radiation were to occur; 591-1

- The DEIS does not address the potential loss of business to Tacoma and the surrounding area that could result from a release of nuclear fuel or high levels of radiation; and

- The DEIS does not adequately address the life cycle costs, risks and benefits, and alternatives to handling this cargo at the Port.

We oppose the shipment of highly enriched nuclear fuel through the Port of Tacoma, and respectfully request that you look further into the above stated objections. Thank you for your attention to this matter.

Sincerely,
Administrative Staff, Sisters of Saint Dominic

RESPONSE TO COMMENT
COMMENTOR NO. 591: SISTERS OF SAINT DOMINIC

Response to Comment No. 591-1

Updated information on the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. All of these errors have been corrected in the final EIS, so the final decision will be based on current information.

The commentor's opposition to the use of the Port of Tacoma to receive foreign research reactor spent nuclear fuel is noted. The port selection criteria discussed in Appendix D, Section D.1.9 of the EIS identify ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2).

Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, no radioactive material has ever been released from a spent nuclear fuel transportation cask as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments. The analysis of the consequences and risk associated with an accident in port involving foreign research reactor spent nuclear fuel determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS). Thus, businesses would not be adversely impacted by the presence of foreign research reactor spent nuclear fuel shipments.

Costs associated with this proposed action are discussed in Section 4.9 of the EIS. The benefit to the citizens of the United States from the proposed action, including those in potential ports of entry, along transportation routes, or near potential management sites, is less risk that weapons grade uranium from civil programs could be diverted into the production of nuclear weapons that might be used against us or our allies. Another benefit is the support for the U.S. position in regard to the Treaty on the Non-Proliferation of Nuclear Weapons. The analyses recorded in Section 4.2.2 of the EIS demonstrate that the risks from the proposed action are low. Various alternatives associated with the proposed policy are also discussed in Section 4 of the EIS.

ATTN: Charles Head
USDOE (EM-37)
1000 Independence Avenue
Washington, D.C. 20585

RE: Tacoma, Washington

Dear Mr. Head:

70% of the 20 metric tons of enriched nuclear fuel waste is generated by France, Britain, Germany, Japan, Sweden and Switzerland. A processing facility in Scotland has expressed a desire to upgrade its ability to handle all three types of nuclear waste. Your draft Environmental Impact Statement fails to adequately explore Alternative 2, which provides for the safe processing of this waste closer to where it is created. 593-1

Millions of dollars and years of civic effort have been successfully invested in cleaning the Puget Sound of pollution, as a Superfund Site, and improving the economic and social environment of the City of Tacoma. Shipping nuclear waste through the Port of Tacoma will result in narrow ship navigation and deep water safety problems for canisters, longshore union labor disruption and refusal to handle this dangerous cargo, congested freeway slowdowns and dense urban area population impact. 593-2

Do not underestimate the outrage in the entire Puget Sound area, from Seattle to Tacoma, that will result if you implement your plan. I assure you the attendance at your poorly publicized meeting in Tacoma on June 19, 1995 is only the beginning. I join the organized effort necessary to defeat the implementation of any plan to ship nuclear waste through Tacoma.

Sincerely,

JOE M. QUAINTANCE

RESPONSE TO COMMENT
COMMENTOR NO. 593: QUAINTANCE, JOE M.

Response to Comment No. 593-1

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS. Since the commentor identified no specific inadequacy in the analysis, DOE is unable to respond specifically.

Response to Comment No. 593-2

Shipment of foreign research reactor spent nuclear fuel would not jeopardize the significant cleanup effort undertaken in the area of Commencement Bay and the Port of Tacoma as noted by the commentor. The analysis in the EIS indicates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2 of the EIS). A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

DOE considers that the use of any of the ports indicated by the port selection process, including the Port of Tacoma, would not impact standard commercial operations, and therefore not endanger the ports' economic development, based on the fact that the foreign research reactor spent nuclear fuel would be accepted into the United States in standard shipping containers that would require no special handling or precautions. Historically, there were no adverse economic or cultural impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

The passage through Puget Sound meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS). The population and favorable transit from open ocean are not the only considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel, if it is accepted into the United States. Other items of importance include population along the route to the management site, port experience with handling containers, and port facilities. Appendix D, Section D.1.9 of the EIS presents details of the port selection process.

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of

COMMENTOR NO. 593: QUAINTANCE, JOE M. (CONT'D.)

RESPONSE TO COMMENT

COMMENTOR NO. 593: QUAINTANCE, JOE M. (CONT'D.)

a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

The possibility of a longshoremen strike was not considered in the port selection process since that factor does not impact on the capability to safely receive containers carrying foreign research reactor spent nuclear fuel.

COMMENTOR NO. 594: VAN DOORNINCK, KITTY-ANN

June 19, 1995

Charles Head
Office of Spent Nuclear Fuel Management
U.S. Department of Energy
1000 Independence Ave. SW
Washington DC, 20585

Dear Mr. Head,

I am writing to express my concern that Tacoma is being considered as a possible port of entry for nuclear fuel shipments. 594-1

I am adamantly opposed to any nuclear fuel shipments coming through the Port of Tacoma. The beauty and the depth of Puget Sound is unique, and the potential for terrible destruction is great.

As a citizen of Tacoma, I am concerned that this new "stigma" will only add to Tacoma and Pierce County's woes. You may not be aware that we are struggling with increasing violence in our community; having the problems of inability to pay for basic services: police, fire, jail, while struggling as a community to deal with the increasing number of poor, homeless, and mentally ill.

Please reconsider your proposal.

Sincerely,

Kitty-Ann van Doorninck

SUBJ: A Tacoma citizen against NIMBY

Mail from America Online user "PlasmaBob":

To: Charles Head
Office of Spent Nuclear Fuel Management (EM-37)

Dear Mr. Head-

I recently read a rather antagonistic article in my local Tacoma paper about a meeting on 17 June that you had with local citizens about the possibility of moving waste through the area. I do not think the local papers have been fair to you or the issue and have done a disservice to our community. I am an officer in the military, and I know how hard it can be to serve a nation that often does not want to be served. Keep up the hard work; I know that the issue of radioactive waste is a "hot potato" that no-one wants to handle but *must* be dealt with responsibly for our nation's sake. 596-1

I sent the following letter to the writer in the local paper (C. R. Rogers at the Tacoma News Tribune (crr@p.tribnet.com)). I don't expect him to respond or to print any of it, but I wanted to speak my views against the "NIMBY" knee-jerk reaction that you apparently observed from my community.

Dear Mr. Roberts-

I read your 22 June article in the Tacoma News-Trib, "Enough Voices May Awaken Those Who 'Don't Have Time To Listen'" with some concern. Tacoma citizens seem to have let "Not in My Backyard" (NIMBY) fears of radioactive waste sway common sense and the needs of the nation.

I am a Federal (military) employee. I can somewhat empathise with Mr. Head, the DOE representative, as he sat and was heckled by angry Tacoma citizens irate at the possibility of radioactive waste moving through the Port of Tacoma.

Your paper has reported quotes from the people who drove in from all over the state, environmentally-concerned citizens fearful of the possible consequences. But how big is the "silent majority" on this issue? I have chosen not to be silent: I think that our Federal Government has a serious problem in trying to deal with radioactive waste, which is complicated by communities putting their desires above the needs of the nation.

Most of us approve of the submarines in the Navy roving the seas; a mission that could not happen without nuclear power. We approve of medical research and the use of radioisotope tracers to locate illnesses. And yet, no-one is willing to allow the wastes that will come from even the most essential uses to move through their community. The Federal Government has spent billions designing a safe permanent waste disposal site in the Southwest US, only to be stymied by the local population changing its mind and voting against the site. As a result, hundreds of tons of nuclear waste remains in substandard "temporary" holding sites, causing significant risk of contamination. NIMBY sentiment has caused a serious problem that will harm the entire nation; we need to get a handle

RESPONSE TO COMMENT
COMMENTOR NO. 596: BRAUNGER, ROBERT M.

Response to Comment No. 596-1

The commentor's concerns and views on these matters are noted. Section 4 of the EIS presents radiological and nonradiological health effects calculated for the proposed action and management alternatives. No significant adverse health risks were found to result from implementation of the proposed action. Section 4.10 of the EIS provides a perspective of health risks and other common radiological and nonradiological risks.

COMMENTOR NO. 596: BRAUNGER, ROBERT M. (CONT'D.)

on the radioactive waste problem, but a community like ours refusing to let the nation use its port is adding to the problem, not solving it.

I understand that local citizens are concerned about the chances of an accident; they *should* be concerned. They should be presented clear data by the DOE and must be convinced that there are sufficient safeguards and procedures to protect against leaks. But in all of the articles that the News-Trib published on the radioactive waste issue, I never saw data. You only cited examples like Chernobyl, the Challenger disaster, and the Exxon Valdez. Your article went on to bash "bureaucrats" and the Federal Government. This is not responsible reporting. Sure, technology has had and will have disasters. But let us compare apples with apples. How about discussing some *real* data, like, say, what environmental impact there has been on other ports that had radioactive waste moving through them. I have no idea what data was presented at the meeting by Mr. Head, since your paper decided not to report it, merely to deride it.

I fear that the citizens of Tacoma are somewhat overreacting; yes, there is a finite probability of a serious accident. This probability needs to be lowered as much as possible, and safeguards and plans must be made to deal with the risk. But we are dealing with a min-max problem here: a very small probability of a very bad thing, much like the very small probability of an big asteroid slamming into the earth and causing mass extinctions. Low-probability disasters must have the probability weighted against the danger. I would contend that an earthquake or volcano eruption is a much larger *weighted* danger to the Puget Sound community than any nuclear waste moving through the port.

I apologize if this letter has become long-winded, but I feel that your column really did not present a balanced view of a complicated issue. If every community let NIMBY sentiments rule policy, then our nation would be unable to perform necessary, but unpleasant tasks, such as garbage disposal, waste disposal, or military weapon tests. Our community is binding the hands of the Federal Government as it attempts to cope with a nationwide problem. Tacoma needs to take a balanced view at the real risks of radioactive waste and make an informed decision.

Yours,

Robert M Braunger
Tacoma Resident

FAX (202) 586-5256

By this letter, I join hundreds of other Tacoma residents who object to the very idea of importing foreign nuclear waste to the U.S. via the Port of Tacoma. 598-1

Obviously, this idea was not very well thought out from the beginning – among other problems I see (in addition to the possibility of an 'accident' in this area) is the enormous handling/transportation expense of moving this material across the country to its ultimate destination. 598-2

Why not select a port nearer to the ultimate dump destination for this material and for once, save the taxpayers considerable money? Even though this is foreign generated material, there is no doubt that the U.S. Government will be picking up the tab on this one.

I will appreciate your consideration of the facts.

Sincerely,

RESPONSE TO COMMENT
COMMENTOR NO. 598: OWEN, DOUGLAS E.

Response to Comment No. 598-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, Section 4.2.2 demonstrates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 598-2

The concept that the United States has a responsibility to manage the foreign research reactor spent nuclear fuel has received a great deal of attention, as is partly exemplified by the preparation of this EIS. Handling and disposing of this nuclear material is a task that should be done to reduce the risk associated with the proliferation of nuclear weapons.

The accident risks, which were found to be low, are evaluated in Sections 4.2.2.3 and 4.5 of the EIS. The costs associated with the various alternatives are also evaluated (Section 4.9 of the EIS) as are the various financing arrangements (Section 2.2.1.2 of the EIS). The port selection process is discussed in detail in Appendix D, Section D.1.9 of the EIS. Distance from the management site(s) is only one of five port selection criteria.

COMMENTOR NO. 599: SMITH, HELEN

22 June 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue SW
Washington, DC 20585

Sir:

Please add my name to the already long list of Tacomans who are opposed to having spent nuclear fuel shipped through my port and town from other countries. I live here, my 81 year old father and 72 year old stepmother, my brother and sister-in-law, my grown son and my granddaughter, and my four cats live here and on behalf of all of them, I object most strenuously to this plan. 599-1

I thought the days of having to protest such things were in the past, but to paraphrase someone else's words, "The price of freedom is eternal vigilance!" I would like to continue the freedom of myself, my family, friends and neighbors from fear of some stupid accident making us all not only glow in the dark but just plain dead.

Since these other countries were "smart" enough to figure out how to make and use this material, let them figure out how to dispose of it in their own country instead of shipping it here to mine!

Sincerely,

Helen Smith

Response to Comment No. 605-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 605-2

DOE agrees that accidents do occur. That is why the spent nuclear fuel transportation casks are designed, constructed and tested by simulation to withstand a series of impact and fire tests (See EIS Appendix B, Section B.2). Representative transportation casks have been crash tested to confirm compliance with simulation process. Two actual crash tests involving a locomotive and a tractor trailer carrying a transportation cask have been performed. Both tests showed no failure of the casks but the locomotive and tractor trailer were destroyed. These tests demonstrated that a spent nuclear fuel transportation cask built to the federal standard would protect and retain its contents in all credible accidents. Nevertheless, the EIS evaluated the consequences of accidents involving a spent nuclear fuel transportation cask where the cask is considered failed with a certain probability. The accidents ranged from no cask failure to that of cask failure combined with a high intensity fire. Section 4 of the EIS provides a summary of impacts, both the risks and consequences, resulting from accidents involving a spent nuclear fuel transportation cask. The results indicate that the risk associated with the transport of the spent nuclear fuel is low.

Also, the spent nuclear fuel is solid metal and it is transported dry inside the transportation casks. As a result, the radioactivity within the spent nuclear fuel cannot "leak" from the transportation casks.

RESPONSE TO COMMENT
COMMENTOR NO. 607: LARSEN, CAROL

Response to Comment No. 607-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 607-2

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security such as might be present at military bases. The security provided for the spent nuclear fuel shipments would be required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Nevertheless, the commentor's preference for the use of military ports is noted.

Response to Comment No. 607-3

There are no countries that have disposal sites for spent nuclear fuel in operation today, so the option suggested by the commentor is not feasible. Nevertheless, options for management of the foreign research reactor spent nuclear fuel overseas are evaluated in the EIS, as Management Alternative 2, in Sections 2.3 and 4.4 of the EIS.

COMMENTOR NO. 608: JOWDERS, JULIA E.

COMMENTOR NO. 613: OSBORNE, JUDY C.

Dear Mr. Head,

My name is Judy Osborne. I was born and raised here in Tacoma, Washington. It is with great surprise and disappointment that I was informed (while presently on vacation) that the D.O.E. is considering using our dynamic area as a dumping ground for nuclear waste, some from other countries.

I implore you to select other ways to deal with this issue rather than endanger innocent people in a highly populated area.

Sincerely, Judy C. Osborne
4219 N. Alki St.
Tacoma, WA. 98407

613-1

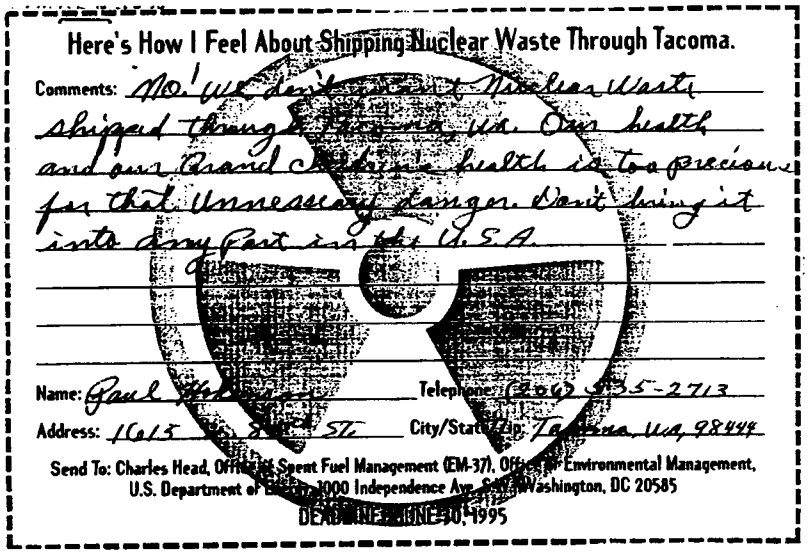
RESPONSE TO COMMENT
COMMENTOR NO. 613: OSBORNE, JUDY C.

Response to Comment No. 613-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States, there would be no storage of this material in the Port of Tacoma, or any other port. Under normal circumstances, it would remain at the port for a few hours. In the event of a major disruption of ground transportation systems, due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination.

Commentor No. 614: Hokenson, Paul



Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: NO! We don't want Nuclear Waste shipped through Tacoma via. Our health and our Grand Children's health is too precious for that Unnessary danger. Don't bring it into any Port in the U.S.A.

RESPONSE TO COMMENT
COMMENTOR NO. 615: EINERT, DAVID & SUSAN

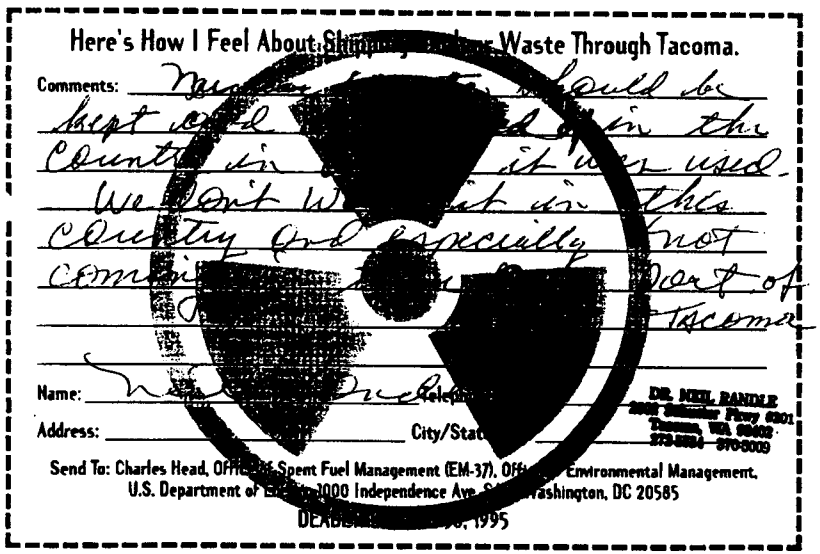
Response to Comment No. 615-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Section 2.8 of the EIS addresses the security measures that would be taken to ensure that there would be no unacceptable risks of terrorism or theft of materials. DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security such as might be present at military bases. The security measures employed at any port would meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). DOE supports these regulations as being adequate to protect the foreign research reactor spent nuclear fuel in any commercial port.

Appendix H has been added to the final EIS in response to public comments to better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



616-1

616-2

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by June 30, 1995. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

Co-sponsored by Port of Tacoma; Port of Seattle; Longshore Local #23; Puyallup Tribe; Citizens for a Healthy Bay; Cities of Tacoma, Fife, Milton, Boston, Federal Way; Tacoma–Pierce County Visitor & Convention Bureau, Tacoma–Pierce County Chamber of Commerce; Pierce County Central Labor Council and Pierce County.

Response to Comment No. 616-1

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

Response to Comment No. 616-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Washington, D.C. 20585

Dear Mr. Head,

I and my immediate family of 2 want to let you know we do NOT want our Port of Tacoma to become the unloading spot for all the worlds' nuclear waste.

We don't care how supposedly safe it it, accidents happen. Our water and port are too important to the livelihood of many hundreds of people, besides the possible contamination of all the local residents.

617-1

Our communinity does NOT want to have all the health problems connected to over exposure to radiation. Look at what happened to all those people in Russia when the reactor metled down. That was quite a few years ago and they are still having health problems.

Find some other low populated area to bring it into the country. Not IN OUR BACKYARD!

We always thought our government was looking out for the best interest of its' citizens but this plan sure leaves us wondering!

Sincerely,
Jenny Tharp

RESPONSE TO COMMENT
COMMENTOR NO. 617: THARP, JENNY

Response to Comment No. 617-1

The commentor's opposition to the use of the Port of Tacoma to receive foreign research reactor spent nuclear fuel is noted. The analyses provided in the EIS indicate that the use of any of the ports, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2).

Mr. Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Mr. Head:

Thank you for listening to Tacoma's concerns about becoming a receiving port for spent nuclear waste. As you have noted, "There's certainly a strong undercurrent of public opinion that is negative to this." You have also indicated that even before meeting with Tacoma's citizens, you had a fairly good idea what your recommendation would be in your report to the director of the Office of Spent Nuclear Fuel Management.

As you know, our public officials have strongly condemned this purposed shipment of nuclear waste into our town. As a concerned citizen who has lived in Tacoma most of my life, I also urge you not to allow our town to become a port of entry for nuclear waste.

No matter how many safety precautions are made, accidents happen. To think of the "what ifs" is beyond comprehension--Three Mile Island, the Exxon Valdez, Chernobyl, the leaks at Hanford. These were all accidents that shouldn't have happened. The potential for spent nuclear waste to contaminate our area is real. I agree with Harold Moss, Tacoma's Mayor, "This is a major threat."

Please recommend Tacoma not become a nuclear waste port. Thank you for listening. **618-1**

Sincerely,

Mrs. Vikki Cummings

COMMENTOR NO. 620: JEWART, JACK E.

24508-38th Ave Ct E
Spanaway, Washington, 98387
21 June 1995

Charles Head, Program Manager
Office Of Spent Nuclear Fuel Management (EM-37)
US Department Of Energy
1000 Independence Ave SW, Washington, DC 20585

Dear Sir:

I'm writing with regards to plans for movement of nuclear materials through Port of Tacoma, Washington. To begin with, I represent NO Agency, Group, or Affiliation but am speaking only as a citizen living in Pierce County, Washington. To demonstrate my knowledge of nuclear material, I'm including with this letter several diplomas and certificates I've been awarded. In particular, I would draw your attention to certificate awarding "The Meritorious Service Medal" by US Army which was given to me upon my retirement from US Army. It reads in part "Of particular importance was a completely rewritten Nuclear Accident/Incident Control Plan for Fort Lewis and the Northern United States Army SRX Sector" (Pacific Northwest). 620-1

Fully realizing this was some 28 years ago and procedures and equipment may have changed somewhat over these years, I will draw your attention to a couple problems that existed prior, without going into classified information. Army nuclear cargo in past was shipped by air. Aircraft routes included Pacific Northwest. Sixth US Army was responsible as long as planes were airborne. It suddenly became Fort Lewis's responsibility if a plane would crash into ground carrying nuclear cargo. Here are some limitations that I'm aware of.

One piece of safety monitoring equipment, used by emergency teams, was a gas proportional meter. Once calibrated, requiring various standards, this meter would NOT function when elevation varied by several thousand feet. Being calibrated at Fort Lewis location gave it a range of 0-3,000 feet. Unfortunately, many areas of Pacific Cascades, as well as Mount Rainier, exceed these elevations. In short, should accident occur by a plane hitting Mount Rainier at a high elevation, meter necessary for safety of emergency crews, would not function unless recalibrated (a lengthy procedure) at elevation in which accident occured. I realize that Tacoma Tideflats would not be a problem in this case.

Another piece of monitoring equipment used had a different specification. It's operational range was from 0-98% relative humidity. At humidity ABOVE 98%, meter did NOT function. Areas of Pacific Northwest DO, at sometimes, have a relative humidiy in excess of 98%. I again realize it would be a once in a blue moon shot that an accident would occur as safety is stressed in entire program. I also realize that should an accident occur, there might only be a slim possibility relative humidity would be in excess of 98% on that particular day.

Again, it's been some 28 years and I realize safety equipment necessary may be changed. I would ASSUME a complete review of environmental limitations of safety equipment will be checked prior to approval of Tacoma as a receiving site. Other areas, such as a location in California may NOT have climatic conditions of Seattle/Tacoma area and may not present problems.

In summary, and passing, I'll give you an actual account of an unloading situation of hazardous cargo I was given once. Necessary monitoring equipment for off loading a Merchant Marine ship was not available. Instructions given me were monitoring device was not needed as hazardous cargo would smell like fish if leaking. My reply to my superior was, "Do you realize that everything around docks in port town we're unloading in smells like fish!" Needless to say, correct monitoring equipment was positioned prior to unloading.

Yours Truly,

Jack E. Jewart (206) 847-1281

RESPONSE TO COMMENT
COMMENTOR NO. 622: RIDENOUR, MARGARET A.

Response to Comment No. 622-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 622-2

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted (Management Alternative 1 or 3, Sections 2.2 and 2.4 of the EIS). Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

Response to Comment No. 622-3

DOE agrees that accidents do occur. That is why the spent nuclear fuel transportation casks are designed, constructed and tested by simulation to withstand a series of impact and fire tests (Appendix B, Section B.2 of the EIS). Representative spent nuclear fuel transportation casks have been crash tested to confirm compliance with the simulation process. Two actual crash tests involving a locomotive and a tractor trailer carrying a transportation cask have been performed. Both tests showed no failure of the casks, but the locomotive and tractor trailer were destroyed. These tests demonstrated that a spent nuclear fuel transportation cask built to the federal standard would protect and retain its contents in all credible accidents. Nevertheless, the EIS evaluated the consequences of accidents involving a spent nuclear fuel transportation cask where the cask is considered failed with a certain probability. The accidents ranged from no cask failure to that of cask failure combined with a high intensity fire. Section 4.2.3 of the EIS provides a summary of impacts, both the risks and consequences, resulting from accidents involving a spent nuclear fuel transportation cask. The results indicate that the risk associated with the transport of the spent nuclear fuel is low.

Also, the spent nuclear fuel is solid metal and it is transported dry inside the transportation casks. As a result, the radioactivity within the spent nuclear fuel cannot "leak" from the transportation casks.

COMMENTOR NO. 623: DUNKIN, EVELYN

Response to Comment No. 625-1

The port selection process, described in Appendix D, Section D.1.9 of the EIS, identifies ports that are acceptable for the receipt and handling of foreign research reactor spent nuclear fuel; it does not determine which port is best. The decision as to which port or ports would be used in the case that foreign research reactor spent nuclear fuel is accepted into the United States, will be in the Record of Decision. The population in the port, surrounding areas, and along the transportation route to the management site are some of the many factors that must be considered in determining the best port. Section 4.2.2 of the EIS discusses the impacts on ports of the proposed action.

Send To: Charles Head, Office of Spent Fuel Management (EM-37), Office of Environmental Management, U.S. Department of Energy, 1000 Independence Ave., SW, Washington, DC 20585

DEADLINE: JUNE 30, 1995

RESPONSE TO COMMENT
COMMENTOR NO. 627: ZMUDA, MICHAEL

Response to Comment No. 627-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 628: BODENHUFER, PAUL J.

318 HARVARD AVE.
TACOMA WA. 98466-4305
20 JUNE 1995

CHARLES HEAD, PROGRAM MANAGER
OFFICE OF SPENT NUCLEAR FUEL MANAGEMENT (RW-37)
U.S. DEPT OF ENERGY
1000 INDEPENDENCE AVE SW
WASHINGTON D.C., 20585

DEAR MR. HEAD:
WE ARE OPPOSED TO NUCLEAR FUEL SHIPMENTS THROUGH THE PORT OF TACOMA.
THE MEETING ROOM LAST NIGHT HOLDING 300 PERSONS TO DISCUSS THIS ISSUE WITH DOE WAS NOT LARGE ENOUGH TO HOLD ALL THE PERSONS WHO WANTED TO ATTEND INCLUDING US. PROBABLY ABOUT 500 PEOPLE WANTED TO ATTEND TO VOICE THEIR OPINIONS.
THE DOE USED OUTDATED INFORMATION ON THE PORT OF TACOMA. THE DEIS LISTS ONLY ONE TERMINAL THROUGH WHERE THESE SHIPMENTS WOULD POTENTIALLY BE SHIPPED. THE PORT OF TACOMA HAS 6 CONTAINER TERMINALS. THE CONFIGURATION OF THESE TERMINALS IS SHOWN IN STATE IN EXISTENCE IN YEAR 1990 OR BEFORE. ON-DOCK RAIL YARD CONFIGURATIONS ARE NOT SHOWN AND WATERWAYS ARE SHOWN INCORRECTLY. GIVEN THESE ERRORS IN ANALYZING FACILITIES FOR HANDLING THESE SHIPMENTS THERE IS NO REMEDIATE THAT NEARBY POPULATIONAL CENTERS WERE SHOWN CORRECTLY AND EVALUATED CORRECTLY
THERE ARE SEVERAL AREAS IN THE PUGET SOUND REGION SHOWING WATER DEPTH OVER 200 METERS IN MAJOR SHIPPING LANES TO AND FROM THE PORT OF TACOMA. DOE DESCRIBED IN THE DEIS THAT IT WOULD BE VERY DIFFICULT OR IMPOSSIBLE TO RECOVER FUEL CASKS FROM DEPTHS GREATER THAN 800 METERS. DOE DID NOT CONSIDER THE DEEP WATER DEPTH IN PUGET SOUND

628-1

RESPONSE TO COMMENT
COMMENTOR NO. 628: BODENHUFER, PAUL J.

Response to Comment No. 628-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

In regard to the EIS being based on outdated and inaccurate information, updated information on the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. The errors identified by the commentator have been corrected in the final EIS, so the final decision will be based on current information. In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

COMMENTOR NO. 628: BODENHUFER, PAUL J. (CONT'D.)

2

318 HARVARD AVE
TACOMA, WA. 98466-7305
20 JUNE 1995

COMMENCEMENT BAY AND THE PORT OF TACOMA ARE LOCATED IN FEDERALLY DESIGNATED SUPERFUND SITE ("DIRTY PORT"). DOE DID NOT RECOGNIZE THAT SHIPMENT OF NUCLEAR MATERIALS WOULD CONTRIBUTE TO THIS "DIRTY PORT" STIGMA.

SEVERE FIRE OR EXPLOSION INVOLVING A SHIPPING CASK OF NUCLEAR SPENT FUEL WOULD CAUSE SEVERE DAMAGE AND HAVE LONG-TERM EFFECTS ON A LARGE AREA NEAR THE DISASTER SITE. IT WOULD HAVE CRIPPLING EFFECTS ON MANY BUSINESSES IN THE AREA.

628-1 (Cont'd.)

DOE DID NOT ADEQUATELY ADDRESS THE SECURITY REQUIREMENTS FOR THESE SHIPMENTS. THIS MATERIAL IS USEABLE IN NUCLEAR WEAPONS AND HIGHLY ATTRACTIVE TO TERRORISTS. PROPER SECURITY MEASURES TO COUNTER POSSIBLE ACTS BY TERRORISTS WERE NOT PROVIDED FOR IN DEIS.

THE BOUR ARE SOME OF THE REASONS WE ARE OPPOSED TO NUCLEAR FUEL SHIPMENTS THROUGH OUR PORT.

SINCERELY YOURS,
Paul J. Bodenhufer
PAUL J. BODENHUFER
MARGARET BODENHOFER

RESPONSE TO COMMENT
COMMENTOR NO. 632: REMILLARD, MICHELE

Response to Comment No. 632-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 632-2

The commentor's opposition to acceptance of foreign research reactor fuel into the United States (Management Alternatives 1 and 3, Sections 2.2 and 2.4 of the EIS) is noted. Under the basic implementation of Management Alternative 1, above ground dry cask storage would be used for the foreign research reactor spent nuclear fuel. Wet storage is also considered as an implementation alternative (Section 2.2.2.5 of the EIS). Underground burial would not be used, nor is it considered as an implementation alternative in the EIS.

COMMENTOR NO. 633: LAWRENCE, DOROTHY

Response to Comment No. 633-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 633-2

DOE did request that comments be submitted in writing, however, all oral comments presented at each hearing were summarized and have been addressed along with the written comments in Volume 3 of the EIS. All comments, written and oral, are part of the public record. The format adopted by DOE for the public hearings held on the draft EIS is fully in compliance with the requirements of NEPA regulations and DOE's requirements for conducting such hearings. In the large majority of cases, this public hearing format has been well received by the public. Nevertheless, in addition to the public hearings, several other avenues were also provided through which members of the public could make their comments on the draft EIS known.

COMMENTOR NO. 634: JENSEN, LAURA

Friday, June 23, 1995
Tacoma, Washington

Charles Head
Office of Spent Nuclear Fuel Management
(EM-37)
US Department of Energy
L000 Independence Avenue, S.W.
Washington, DC 20585

To Charles Head;

As a person who has always been a citizen of Tacoma but could only feel dumbfounded by the sound of the extraordinary plan to ship highly radioactive uranium through the Port of Tacoma, I could only feel so very sympathetic with the many comments I heard at the meeting Monday at the Untilities Building in Tacoma. I felt convinwed by the speaker who was a Renton resident who was concerned that the second alternative, to leave the uranium where it is, was not considered. He wondered if it could be fair to have the United States be the deposit of spent fuel for all these countries which have used the fuel themselves. He added that there was concern for wildlife in the event of a spill like an oilspill. I felt convinced by the speaker from the company that does deep water research that insisted that the described casks could not take the deep water pressure, that they were designed for shallower water. He insisted that the casks were not safe for shipping. I felt convinced by the speaker who believes the information from the report about the Port is out of date. This speaker argued that cask recovery would be difficult. He also argued that the Commencement Bay is a superfund site - much effort has gone toward clearing the contamination. He also urges that Tacoma not be used because operational plans are not adequate for safety.

634-1

634-2

634-3

634-4

634-3 (Cont'd)

Again, I felt shocked by the plan and felt sympathy for the imtelligent comments of the speaker.

Truly,

Laura Jensen
302 North Yakima C3
Tacoma, WA 98403-2213

RESPONSE TO COMMENT
COMMENTOR NO. 634: JENSEN, LAURA

Response to Comment No. 634-1

The commentor's preference for the overseas management alternative is noted. This is Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

Response to Comment No. 634-2

The intent of the proposed action is to support U.S nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide. The intent of the resultant proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

If foreign research reactor spent nuclear fuel were accepted into the United States, the policy would be of limited duration (Section 2.2.1.1 and 2.2.2.2 of the EIS).

Response to Comment No. 634-3

The EIS did not address marine spills in Puget Sound or elsewhere because the metal fuel is shipped dry inside a transportation cask, thus there is nothing to spill. In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, no radioactive contents have ever been released from a spent nuclear fuel transportation cask, nor has a spent nuclear fuel transportation cask ever been punctured, even as a result of an accident.

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS.

DOE has added a sentence to Appendix D, Section D.2.1.9 of the EIS regarding Commencement Bay being a Superfund Site. The analysis of impacts, as documented in Section 4 of the EIS, demonstrates that there would be no significant adverse impacts on the ports, people, or natural environment from shipments of foreign research reactor spent nuclear fuel and the overall impacts to Commencement Bay would be unchanged by the various management alternatives.

Foreign research reactor spent nuclear fuel has been accepted at ports in the United States without incident for over 30 years (Sections 1.1 and 1.2 of the EIS). If a policy to accept foreign research reactor spent nuclear fuel into the United States is adopted, this spent nuclear fuel would be shipped in standard transportation containers which are routinely handled at all of the candidate ports (Section 2.6.3.2 of the EIS).

Response to Comment No. 634-4

The commentor's reference to an individual who claimed that the spent nuclear fuel transportation casks are designed only for shallow water is noted. It is true that the regulations governing the design and construction of spent nuclear fuel transportation casks require a series of tests including immersion test to a depth of 50 meters, but this does not mean that the cask would buckle if it were to sink in deeper water. The pressure test resulting from the immersion test is a means to determine the tightness of cask seals, and it is not a structural integrity test. If a cask were to sink in a deep ocean, the cask seals would fail and the seawater would enter the cask. The seawater in-leakage would eventually equalize the pressure inside the cask to that of the outside. At that point, only the seawater corrosion would damage the cask structural integrity. If there is no seal failure the cask would not buckle at depths of less than 305 meters (1000 feet). The EIS evaluated scenarios involving sinking of a spent nuclear fuel transportation cask in the deep ocean and in the continental shelf (Section 4 and Appendix C of the EIS). If a cask were to sink in U.S. coastal waters it would be recovered.

COMMENTOR NO. 635: KAATTARI, OSCAR

June 23, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Mr. Head,

I have never written to protest anything but I am now in hopes that my small voice might add to those you have already heard from and will hear from. Mine is on two counts:

1. The entry of "nuclear scrap" into this country through the Port of Tacoma, Washington.

2. The fact of the entry of foreign nuclear scrap to add to our own that we have to contend with already.

635-1

In 1963 I became a journeyman machinist following a four year apprenticeship at Puget Sound Naval Shipyard. It was apparent to me at that time that to be involved in nuclear was to be "on the fast track" to advancement.

I chose not to because it looked to me that, in spite of all the "advantages" for it's use, it is too involved and makes too much too long term mess. You have a job now because of that mess, but I wouldn't want it.

I don't see that people living on Puget Sound, Washington, especially Tacoma, in this day should have to contend with scrap entering this country that belongs to someone else. More, I don't see that generations in the future should have to contend with the mess we have made in this country, and then to add to it bringing in foreign material.

We don't want Washington to be a dumping ground, either by accident (Tacoma), or by design (Hanford).

Oscar Kaattari

Oscar Kaattari

RESPONSE TO COMMENT
COMMENTOR NO. 635: KAATTARI, OSCAR

Response to Comment No. 635-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 636: OSTMANN, HEATHER

Heather Ostmann
906 Manor Dr.
Fircrest, WA 98466
June 22, 1995

Charles Head, Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington D.C. 20585

Dear Charles Head:

I am writing you this letter in regards to the plan to ship toxic nuclear waste through the Port of Tacoma. You must be well aware of the fact that the people of Western Washington strongly oppose this idea since your attendance at the meeting on June 19, 1995. I understand that this must be a difficult problem to solve (nobody wants boat loads of nuclear waste I am sure). Yet, I feel it is very unprofessional and disrespectful of not only you and your staff but also the entire Department of Energy to show so little concern for the people of Western Washington. It is us who will have to live with this stuff and the results of any accidents that may occur. Western Washington is a densely populated area and is continuing to grow at a rapid rate. I find it very callous on your part to disrespect our opinions on the matter and to not report our opinions to your bosses. I see no reason why your bosses should not listen to our opinions. As officials it is their job to represent the people of the United States. Yet, they do not have the time to listen to a large chunk of those people express their opinions on something as important as nuclear waste. With all due respect it is going to be shipped into our front yard. I think you and your bosses need to reevaluate not only your decision but, also your responsibilities to the American people. I think everyone in Washington D.C. who is a part of this decision should seriously consider every aspect of this situation (including the opinions of the public) before making a final decision. I feel that you at least owe us that. Thank you for your time.

636-1

Sincerely yours,

Heather Ostmann

Heather Ostmann
Tacoma Resident

RESPONSE TO COMMENT
COMMENTOR NO. 636: OSTMANN, HEATHER

Response to Comment No. 636-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. As a part of the overall evaluation of impacts, the EIS identifies ports of entry in the United States that are acceptable for the receipt and handling of foreign research reactor spent nuclear fuel. The Port of Tacoma is identified in the EIS as acceptable. The analysis in the EIS indicates that the use of any of the ports identified by the port selection process would not pose any significant risk to either the port personnel or the population near the port (Section 4.2.2.3 of the EIS).

Consistent with its responsibilities under NEPA, DOE has solicited comments and has encouraged public participation in preparing the final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. DOE has considered public comments in this process. The comment response document of the Final EIS (Volume 3) identifies public comments and the DOE responses. The decision on the implementation of the proposed action will be contained in the Record of Decision.

RESPONSE TO COMMENT
COMMENTOR NO. 638: PATRICK, JOHN (CONT'D.)

Response to Comment No. 638-2

The deadline for submission of comments in response to the draft EIS was extended from June 20 to July 20, 1995. DOE considers the comment period (90 days total) to be sufficient for public comment.

Response to Comment No. 638-3

An objective of the proposed policy is to safely manage the U.S.-origin HEU from foreign research reactors. Safe management of this material, which may include acceptance into the United States, is critical to the success of the U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapon-grade) uranium contained in spent nuclear fuel in civil programs worldwide. Both the management of the existing spent nuclear fuel and the reduction in the future use of HEU are aimed at reducing the risk of nuclear weapons proliferation. Nothing in the proposed action relates to military use of nuclear materials, weapons testing, or power reactor operation (e.g., Chernobyl, TMI-2). The proposed action is entirely related to civilian use of enriched uranium, particularly HEU.

Response to Comment No. 638-4

Regarding the commentor's general opposition to nuclear proliferation associated with nuclear activities of any type, it is essential to distinguish research reactors from other nuclear reactors and activities. Research reactors are used for many important commercial purposes, the most well-known of which is the production of medical radioisotopes and pharmaceuticals. They are not used to produce power or material for weapons. While some people might prefer to abandon the important commercial purposes of research reactors, the reality is that U.S. abandonment of the industry would only lead to the rest of the world continuing without the United States. Any safeguards against nuclear weapons proliferation the United States could hope to implement would be lost. Civilian research reactor operations would continue and weapons-grade uranium (fresh HEU) would be the fuel of choice in many cases.

TUESDAY 6/20/95

MR HEAD,

I'M A TRUCK DRIVER LIVING IN GIG HARBOR, WASHINGTON STATE WITH MY WIFE AND TWO CHILDREN, NOT FAR FROM TACOMA (JUST ACROSS THE NARROWS BRIDGE IN FACT.) BRING THE NUCLEAR WASTE TO TACOMA. 639-1

FOR MANY REASONS IT WOULD BE A GOOD THING.

1. IT WILL CREATE JOBS
2. IT WILL BE A WAY TO PROTECT THE NUCLEAR SECURITY OF THE UNITED STATES AND THE WORLD IN GENERAL.
3. IT WOULD SOLVE YOUR [redacted] PROBLEM OF WHERE TO RECIEVE THE SHIPMENTS.

THESE ARE JUST A FEW OF THE GOOD REASONS. THE ARGUMENTS AGAINST BRINGING IT HERE ARE NUMEROUS AND BASED ON FEAR AND MISINFORMATION, PERPETRATED BY PEOPLE CONDITIONED TO REACT NEGATIVELY TO ANYTHING ASSOCIATED WITH THE WORD NUCLEAR AND I WON'T DISCUSS THEM HERE.

THE CHANCES OF BEING EXPOSED TO DANGEROUS LEVELS OF RADIOACTIVITY FROM A [redacted] DAMAGED IN AN ACCIDENT CASK (BUILT AS GOOD AS THEY ARE) IS A FRACTION OF 1%.

RESPONSE TO COMMENT
COMMENTOR NO. 639: HALL, TIM

Response to Comment No. 639-1

The commentor's support of the U.S. nuclear weapons nonproliferation policy and Management Alternative 1 of the EIS and reasons for encouraging the DOE to bring foreign research reactor spent nuclear fuel through the Port of Tacoma are noted.

COMMENTOR NO. 639: HALL, TIM (CONT'D.)

I TAKE MORE CHANCES WITH MY LIFE AND THE LIFE OF MY FAMILY WHEN I GET OUT ON THE FREEWAY AND CROSS THE NARROWS [redacted] BRIDGE TO GO TO A MOVIE. SAME THING HAPPENS WHEN I GO TO WORK AND DRIVE MY TRUCK. LIFE IS A RISK AND IN THESE CYNICAL TIMES I STILL DON'T BELIEVE THAT MY GOVERNMENT OR A GOVERNMENT AGENCY WOULD GAMBLE WITH MY LIFE, THE LIVES OF MY [redacted] FAMILY, OR THEIR OWN LIVES WHEN IT COMES TO NUCLEAR ENERGY OR THE WASTE IT PRODUCES.

WELL THERE'S MY STATEMENT; I'M MORE AFRAID OF THE HAZMAT CONTAINERS BEING BROUGHT INTO AND OUT OF THE SEALAND TERMINAL THAN NUCLEAR WASTE CASKS.

KEEP UP THE GOOD WORK HOPE YOU PILE BALLOONS.

SINCERELY

T Hall

TIM HALL

Mr. Charles Head
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, D.C. 20585

Dear Mr. Head:

Please do all you can to prevent the shipment of nuclear waste through the Port of Tacoma. The people of this area are depending upon you as a representative of our Government to protect us from the possibility of a terrible accident. 641-1

Don't let us down.

Sincerely,

Irene Owens

Irene Owens

RESPONSE TO COMMENT
COMMENTOR NO. 641: OWENS, IRENE

Response to Comment No. 641-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 642: PUTZ, MARLENE M.

Marlene M. Putz
7605 S. C St. Apt. I
Tacoma, WA 98408

Dear Head,

I am against shipment of nuclear waste through the Port of Tacoma.

It is said that the containers are perfectly safe. I have a feeling that when Hanford was being built, the word SAFE was being used as well, & look at the mess now. Washington State has enough environmental problems!

Who made us nuclear waste policemen of the world? I believe all Governments should be held responsible for their own messes, cleanups & storage.

Sincerely,
Marlene M. Putz

642-2

RESPONSE TO COMMENT
COMMENTOR NO. 642: PUTZ, MARLENE M.

Response to Comment No. 642-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 642-2

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). Prior to 1989, it was United States policy to accept spent nuclear fuel containing uranium enriched in the United States (Section 1.1 of the EIS). Thus the intent of the resultant proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

RESPONSE TO COMMENT
COMMENTOR NO. 644: HOKENSON, PEGGY

Response to Comment No. 644-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 644-2

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

Enough voices may awaken those

C.R. Roberts

The News Tribune columnist

"They don't have time to listen."

Charles Head, federal project manager for the environmental impact statement concerning shipments of high-level nuclear waste through the Port of Tacoma, sat patiently through the meeting Monday night.

Head sat, his face parked in objectivity. People spoke -- more than 50 people -- all against the proposed shipments.

A tape recorder heard it all. A facilitator made notes with multi-colored pens upon sheets of paper large enough for everyone to see. Hundreds in the audience watched politely. Speakers spoke their hearts.

Head sat, and when the meeting was over he talked about what happens next. He will offer a report to the director of the Office of Spent Nuclear Fuel Management. But the director will not see the colorful notes, nor will he hear the five hours of testimony.

"They don't have time to listen," Head said.

In Washington, D.C., at the Department of Energy, the people who will decide whether Tacoma becomes the port of entry for one of this planet's most dangerous substances will hear only from Head. He says he honestly has a fairly good idea what he'll say, but he's not yet ready to announce his decision.

He said of what he heard in Tacoma, "There's certainly a strong undercurrent of public opinion that is negative to this."

Still it's too bad the public spreads back at headquarters don't have time to hear how strong that undercurrent really is.

Too bad they won't hear from the speaker who said, "We have the right to be free from fear."

Too bad they won't hear what Alice Ordwall, a Tacoma great-grandmother, had to say: "I want to leave a decent legacy for my kids. They have the right to have a decent children to life."

That decent would be less decent by far should some of the spent nuclear fuel somehow leak, or spill, or otherwise contaminate Commencement Bay, Tacoma, Pierce County and much of Western Washington.

People spoke of Three Mile Island, the Ravna Volden, Chernobyl, the leaks at Hanford, the O-rings on the Space Shuttle Challenger -- of many accidents that could never happen, but did.

They think we're not smart enough. They think they can put this over on us," said the gray-haired

who 'don't have time to listen'

talking about Charles Head. "We've given him enough watch to chew on. I hope he gets indigestion."

Legislators, part commissioners and members of the City Council spoke. Mothers and fathers -- some angry enough to swear -- spoke.

And it's too bad the bureaucrats have better ways to spend their time, rather than listening to what these people had to say. How easy it will be for them to ignore the comments -- the anger, the fear and the anguish -- of the people who were there on Monday night.

"When I was a kid, everybody told me Russia was going to drop the bomb. Now, it's the U.S. that's threatening me," said Melody Wilhite, who drove down from Everett.

"I see this as a major threat," Tacoma Mayor Harold Moss said.

A citizen asked, "Do we really trust the federal government to do the right thing? We'll fight you. We the people say no. We will not stop."

"I take with a grain of salt the statistics and information you gave us," Laureen Roth said.

"We will fight you. It won't happen," state Sen. Marilyn Rasmussen (D-Eatonville) said. "I think you have heard from the people."

Washington, D.C.

Hundreds of people came. People spoke. Charles Head sat through it all, and when it was over, when asked what he thought of what the people said, he replied with a weary sigh, "I was more impressed by the number of public officials."

But perhaps Head and his bosses would take time to listen if the rest of us spoke a bit louder.

If you don't like the idea of highly radioactive nuclear waste being shipped through the Port of Tacoma, write, before June 30, to Charles Head, Office of Spent Nuclear Fuel Management (EM-37), U.S. Department of Energy, 1000 Independence Ave. S.W., Washington, D.C. 20585. Or fax to (202) 586-8356.

If you don't care one way or the other, do nothing. If you haven't got the time to write a letter, then sit back and wait. Just you wait and see what happens next.

Your silence will be of great benefit to those who would rather not be bothered by whatever it is you have to say.

C.R. Roberts' column appears Sundays, Tuesdays and Thursdays. He can be reached at 597-8535, or by fax at 597-8274. Address TRIBnet e-mail to CR Roberts and Internet e-mail to cr@p.tribnet.com

Teresa M Gray
233 Sc 55th ST
Tacoma, WA. 98408 6402
6/23/95

Mr Head,

I am very much against the radioactive waste being shipped through the Port of Tacoma. 647-1

I am sure that every precaution would be taken against having an accident while handling this but needless to say accidents do happen sooner or later.

The Port of Tacoma has been working very hard to increase productivity and so far has done very well, not to mention all the improvements that are in process in the down town area.

I also feel very strongly that our children and grandchildren have the right to have a decent chance in life.

I see this as a major threat to our area.

And I say no.

Sincerely

Teresa M Gray

RESPONSE TO COMMENT
COMMENTOR NO. 647: GRAY, TERESA M.

Response to Comment No. 647-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS).

I am one of the many, together with my husband, who saw the hundreds of people who couldn't even get into the packed meeting in Tacoma — all violently opposed to shipping highly radioactive nuclear waste through the Port of Tacoma. Had there been enough space, I know thousands would have been inside that room!

The feeling that was predominant after the meeting was that you were not very moved by the flood of opposition.

I speak for everyone I know: do not allow this in Tacoma. People are opposed to it. Indeed, the majority. And if democracy means anything, it means the people's choice must be the deciding factor.

Re: Nuclear Waste being shipped through the Port of Tacoma in Washington State

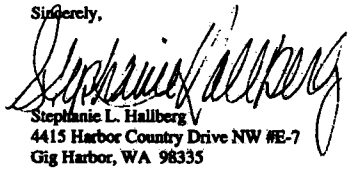
Dear Mr. Head:

I would like to express my concern on this issue as I am not prepared to risk my families health and safety to provide relief to foreign countries. I have heard that there has never been a shipping container leak in history, yet a leak is not impossible and I am absolutely *not* interested in having the first leak occur in my back yard. Please do *not* ship "spent" nuclear fuel through Washington State's Port of Tacoma. 651-1 651-2

I am a United States citizen and a registered voter in the State of Washington. I will be forwarding a copy of this letter to my Senatorial and Congressional representatives so that they too will hear the voice of the people.

Thank you for your attention to this matter. I hope that you will be compelled to make the right decision for the people of Washington State.

Sincerely,



Stephanie L. Hallberg

RESPONSE TO COMMENT
COMMENTOR NO. 651: HALLBERG, STEPHANIE L.

Response to Comment No. 651-1

DOE agrees that accidents do occur. That is why the spent nuclear fuel transportation casks are designed, constructed and tested by simulation to withstand a series of impact and fire tests (Appendix B, Section B.2 of the EIS). Representative transportation casks have been crash tested to confirm compliance with simulation process. Two actual crash tests, one involving a locomotive and the other a tractor trailer carrying a transportation cask, have been performed. Both tests showed no failure of the casks but the locomotive and tractor trailer were destroyed. These tests demonstrated that a spent nuclear fuel transportation cask built to the federal standard would protect and retain its contents in all credible accidents. Nevertheless, the EIS evaluated the consequences of accidents involving a spent nuclear fuel transportation cask where the cask is considered failed with a certain probability. The accidents ranged from no cask failure to that of cask failure combined with a high intensity fire. Section 4 of the EIS provides a summary of impacts, both the risks and consequences, resulting from accidents involving a spent nuclear fuel transportation cask. The results indicate that the risk associated with the transport of the spent nuclear fuel is low.

Also, the spent nuclear fuel is solid metal and it is transported dry inside the spent nuclear fuel transportation casks. As a result, the radioactivity within the spent nuclear fuel cannot "leak" from the transportation cask.

Response to Comment No. 651-2

To Mr. Head

I sincerely hope that you make it a priority to listen to what the people of the North West think of the proposal to make the Port of Tacoma the port for shipments of nuclear waste. Who but us can tell you of our areas quirks and nuances? It is so vitally important to take the time to listen to our objections. There is no way that we should be considered as "The Port" for such hazardous waste shipments. It it ludicrous to consider such an arrangement. We have spent lots of time and effort in cleaning up our waters and land and we still have not come anywhere near getting it as clean as it was 25 years ago. 652-1

There is no indication of where you stand or what you are thinking of, but i can not stress enough the fact that our environment is critical to the sanctity of marine life, both in the Puget Sound and for our Oceans that I just can not imagine that there can be any reasonable reason or justification that you can give to support using this area for these shipments. You must not allow the endangerment of these unique, life supporting waters. There must and have to be other options that are more viable and of a less global impact.

Thank you. Sincerely

LouVel McLeod

COMMENTOR NO. 659: ARNESTAD, CAROL

Response to Comment No. 659-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 659-2

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). Pursuit of this goal will help insure that citizens of the United States may all benefit from the security and peace of mind associated curbing the possible spread of nuclear weapons to terrorists and irresponsible nations.

Response to Comment No. 659-3

The EIS evaluates a wide range of reasonable alternatives, including overseas management (Management Alternative 2, Section 2.3). Sections 4.2 and 4.5 of the EIS demonstrate that the risks to workers and the public at and near the Port of Tacoma would be low if the foreign research reactor spent nuclear fuel were received there.

COMMENTOR NO. 659: ARNESTAD, CAROL (CONT'D.)

Goverment to step in and save the world so to speak at the expense of millions of Americans.
I Know I dont want my tax dollars supporting such a foolish Acqusition.
I strongly opposed this and want to go on record for it.

659-2 (Cont'd)

659-1 (Cont'd)

Sincerely
Carol Arnestad
PO Box 688
Eatonville WA 98328

P.S. I would have attended the meeting in TACOMA on June 19 1995 but I was serving on a Planning Commission meeting in my town that conflicted with it.

RESPONSE TO COMMENT
COMMENTOR NO. 659: ARNESTAD, CAROL (CONT'D.)

NEPA TEAM

DOE/EIS-0218F
February 1996

Volume 3

FINAL ENVIRONMENTAL IMPACT STATEMENT

on a

Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

Public Comments and Department of Energy Responses
Part 3b – Individuals (Pages 2.7-531 through 2.7-1080)

United States Department of Energy
Assistant Secretary for Environmental Management
Washington, DC 20585

Volume 3 is organized into three sections:

- Section 1 - Overview
- Section 2 - Written Comments and Responses
- Section 3 - Public Hearings

The Overview sets the tone for the document by summarizing the public comment process, by explaining how the receipt of written comments and the public hearing process were handled, and by summarizing the major issues raised by commentors and DOE's responses to these issues.

Section 2 of Volume 3, "Written Comments and Responses" contains all of the written comments received by DOE on the draft EIS. Upon receipt, these documents were assigned a sequential log number to be used in tracking during the comment response process. For presentation in Volume 3, these documents maintained their original log number, but were separated into the following seven distinct "affiliation" categories:

Section 2.1 - Federal Government
Section 2.2 - State Government
Section 2.3 - Local Government
Section 2.4 - Native American Groups
Section 2.5 - Non-Government Organizations
Section 2.6 - Foreign Entities
Section 2.7 - Individuals

Since these documents retained their original log number, the reader should note that while the documents in each respective section are in ascending order, their numbering therein is not sequential.

In order for a reader to find a specific document, a full "List of Commentors" has been included in each book (or part) of Volume 3, immediately following the "Table of Contents." This "List of Commentors" has been compiled alphabetically using either the commentors last name, the name of the submitting organization, or the name of a Federal, State, Tribal, or local government branch. City and State government bodies are listed under "City of" or "State of." Members of Congress are listed by the Senator's or Representative's name, with the government branch following.

To locate a document(s):

1. Find the "List of Commentors" and the name of the individual submitting the comment (or the name of the organization or agency if the comments were submitted on their behalf), and note the page number assigned to the first page of the comment document (i.e., a document from a Native American Group would be number 2.4-1, etc.).

2. Find the Volume 3 book (or part) that contains the section and page number for which you are looking and turn to the appropriate page to find a scanned copy of the document along with the responses to each of the comments delineated therein.

the written comments, the comments received during each of the 17 public hearings. Oral comments provided at these hearings have been summarized, rather than individually identified by each respective speaker. As such, there is not a list of speakers or identification of the commentors at the public hearings. A list of all registered attendees is provided immediately following the summary of each of the public hearings.

Public Comments and Department of Energy Responses

Section 1 Overview

Section 2 Written Comments and Responses

Section 2.1 Federal Government 2.1-1
Section 2.2 State Government 2.2-1
Section 2.3 Local Government 2.3-1
Section 2.4 Native American Groups 2.4-1
Section 2.5 Non-Government Organizations 2.5-1
Section 2.6 Foreign Entities 2.6-1
Section 2.7 Individuals 2.7-1

Section 3 Public Hearings

Section 3.1 Charleston Public Hearing 3.1-1
Section 3.2 Concord Public Hearing 3.2-1
Section 3.3 Galveston Public Hearing 3.3-1
Section 3.4 Hanford Public Hearing 3.4-1
Section 3.5 Idaho Public Hearing 3.5-1
Section 3.6 Jacksonville Public Hearing 3.6-1
Section 3.7 Las Vegas Public Hearing 3.7-1
Section 3.8 Norfolk Public Hearing 3.8-1
Section 3.9 Oak Ridge Public Hearing 3.9-1
Section 3.10 Portland Public Hearing 3.10-1
Section 3.11 Savannah Public Hearing 3.11-1
Section 3.12 Seattle/Tacoma Public Hearing 3.12-1
Section 3.13 Southport Public Hearing 3.13-1
Section 3.14 North Augusta Public Hearing 3.14-1
Section 3.15 Tacoma Public Hearing 3.15-1
Section 3.16 Washington, D.C. Public Hearing 3.16-1
Section 3.17 Wilmington Public Hearing 3.17-1

Attachment 1

Transcript of Public Hearing Held in Tacoma, Washington on June 19, 1995 on the Draft Environmental Impact Statement on the Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel A.1

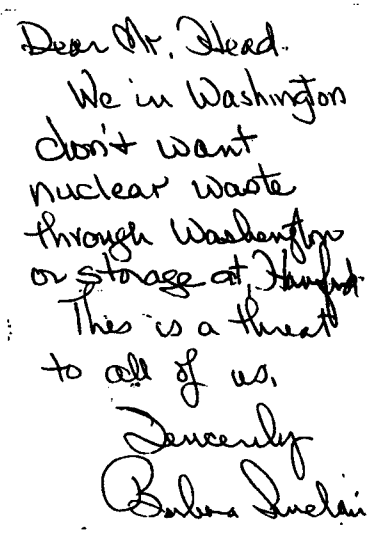
SECTION 2.7
INDIVIDUALS (CONT'D.)

COMMENTOR NO. 660: SINCLAIR, BARBARA



Dear Mr. Head.
We in Washington don't want nuclear waste through Washington or storage at Hanford. This is a threat to all of us.
Sincerely
Barbara Sinclair

660-1

RESPONSE TO COMMENT
COMMENTOR NO. 660: SINCLAIR, BARBARA

Response to Comment No. 660-1

The commentor's opposition to the transportation of foreign research reactor spent nuclear fuel through the State of Washington and its storage at Hanford Site is noted.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

COMMENTOR NO. 661: EBERT, MRS. L. A.

June 23, 1995
Dear Mr Had,

As you must be aware, Tacoma residents do not want nuclear residuals shipped through our Port of Tacoma. Our right to be heard are just as important as citizens of the larger cities.

Yours truly,
Mrs. L.A. Ebert

661-1

RESPONSE TO COMMENT
COMMENTOR NO. 661: EBERT, MRS. L. A.

Response to Comment No. 661-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 662: SLOAGHTER, EVERETT

To whom this MAY concern!

No body WAnts Nucleor Waste in our state so stop this right now!

No Nuc leor Waste in or threw WAshing ton State!

662-1

Everett Sloaghter

of TACOMA, WA.

RESPONSE TO COMMENT
COMMENTOR NO. 662: SLOAGHTER, EVERETT

Response to Comment No. 662-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 663: THORNDIKE, LOUISE W.

Louise Weeks Thorndike
74 East Road North
Tacoma, Washington 98406
(206) 752-0647

Mr. Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Mr. Head:

I work full time. My husband works full time. We have two teenagers. I only write political letters when issues threaten the welfare of my family and particularly my children.

The possibility of shipments of high-level nuclear waste through the Port of Tacoma threatens our lives. This is to tell you I oppose this. 663-1

We are not a high profile city such as Seattle or San Francisco or San Diego. But we have lives and precious loved ones who deserve our protection.

During the "cold war," I attended meetings on anti-nuclear weapons proliferation. I feared the Soviet Union then. Now it is individuals making decisions in my own country who threaten the welfare of my children.

Find another solution. Do not ship this deadly debris to our home town.

Sincerely,

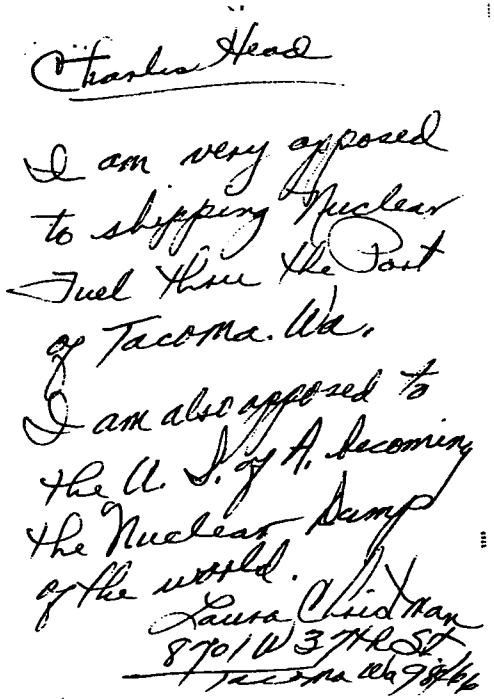
Louise Weeks Thorndike

RESPONSE TO COMMENT
COMMENTOR NO. 663: THORNDIKE, LOUISE W.

Response to Comment No. 663-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 664: CHRISTMAN, LAURA



Charles Head

I am very opposed
to shipping Nuclear
Fuel thru the Port
of Tacoma. Wa.
I am also opposed to
the U. S. of A. becoming
the Nuclear dump
of the world.
Laura Christman

664-2

RESPONSE TO COMMENT
COMMENTOR NO. 664: CHRISTMAN, LAURA

Response to Comment No. 664-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 664-2

The commentor's concern that the United States not become a dumping ground for nuclear wastes is noted. If foreign research reactor spent nuclear fuel is accepted into the United States it would be for a limited duration (Sections 2.2.1.1 and 2.2.2.2 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

Commentor No. 665: Whitney

COMMENTOR NO. 668: BRITTON, LUTHER & BARBARA

June 23, 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U. S. Department of Energy
1000 Independence Avenue S.W.
Washington, D.C. 20585

Mr. Head:

Back when the Atomic Energy Commission was first established we were told there would be practically no waste to speak of. What little there was would be easily taken care of with no danger of accidental contamination.

Now we are told that it is perfectly safe to ship tons and tons of nuclear waste from all around the world for "safe storage" in our country, and there would be no hazards.

We are not that unintelligent. We simply have no faith in much of anything concerned with the "safety" of nuclear energy any longer. There have been too many accidents!

The other countries should take care of their own nuclear waste. We sure do not need any more here! 668-1

Sincerely,

Luther C. Britton, Barbara A. Britton

Mr. and Mrs. L. C. Britton

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 670: RAY, ALICE V.

6/22/95

Mr. Hod

Please do not send spent nuclear fuel through the Port of Tacoma, Wa. There must be better ways to deal with this.

Accidents do happen, and this is a highly populated area. Our kids and grand children have a right to have a decent chance of life.

I'm getting pretty old, but I don't want to spend my life, or fear of nuclear energy happening to Tacoma.

Thank you for listening

Alice V Ray

670-1

RESPONSE TO COMMENT

Washington, D.C. 20585

Dear Mr. Head:

The Port of Tacoma is surrounded by millions of people, from Everett to Olympia, from the Pacific Coast to the Cascade Mountains. We live ten miles from the Port, in Puyallup. I am a citizen, a voter, a wife, a mother, a grandmother, a daughter, a sister, and an aunt. My husband is a citizen, a voter, a father, a grandfather, a son, a brother, and an uncle. We do not want any of our family or friends put at risk over something that doesn't have to happen.

Our state has had to worry over Hanford for years. In spite of all precaution, accidents do happen. We don't want to have to worry about this too. It is time to listen to the people.

No to nuclear waste being shipped through the Port of Tacoma. ‖ *671-1*

Sincerely,

Mary E. Richards

Response to Comment No. 671-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 672: OWENS, BARBARA

4303 224th St. East
98387
Spanaway, Washington
June 23, 1995

Dear Mr. Head,

Our family is adamantly opposed to shipping highly radioactive nuclear waste through the Port of Tacoma. This is due mainly to the fact of the population density of this area, and the potential for accidents, now and in the future. 672-1

Our lives and livelihood depend on the fact that we have relatively clean air to breathe, and the addition of the nuclear waste doesn't seem to be one that can be conducive to the health of anyone. Our families hope to remain in this area for years into the future, after our two U.S. Navy Sons return here to raise there families. Naturally, they will be expecting to return to a safe, clean, environment to raise families, work, play, and contribute to society.

Our four family members Larry, Barbara, Jeff, Matt Owens join in opposition to this proposal.

Thank you for your time and energies, both in trying to present the facts, as well as welcoming input from Americans as to their opinions.

Barbara Owens

Three of the above are Registered Pierce County voters. The 4th is currently serving in the Persian Gulf aboard the U.S.S. Abraham Lincoln CVN72

RESPONSE TO COMMENT
COMMENTOR NO. 672: OWENS, BARBARA

Response to Comment No. 672-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

1000 Independence Avenue S.W.
Washington, D.C. 20585

Re: Nuclear Waste through the Port of Tacoma

Dear Mr. Head:

I was recovering from the flu on Monday night and could not attend the meeting in Tacoma regarding the nuclear waste. I want to add my opinion.

NO!!! If the waste is too dangerous where it is, it is too dangerous to pass through our town of Tacoma or any other U.S. port. My husband and I have three grade-school age grandchildren and we want them to be able to live without that fear hanging over them. 673-1

An article in The News Tribune says that Great Britain and France operate plants capable of converting weapons-grade uranium into safe commercial-grade fuel. If they do not want it, the countries producing the waste could be encouraged to build a plant. We do not have to personally solve all the world's problems. 673-2

Sincerely,

Ann Hruza

Ann Hruza

*** COMMENTS ***

I am opposed to bringing nuclear waste to and through the Bay Area, and also to providing nuclear materials to anyone, at home or abroad. The Clinton Administration claims to favor non-proliferation, but continues to send nuclear materials to other countries, where they could be used to make weapons. This is hypocritical, as is the assumption that only the U.S. and a few other countries can be trusted with nuclear weapons. Indeed, we have shown that we cannot be trusted with them, and that the nuclear industry is inherently unsafe. If we are serious about stopping the threats of nuclear war and other nuclear power, we must be consistent, and simply stop the production and use of nuclear materials. The countries we are bringing the nuclear wastes from are, for the most part, as well or better equipped to deal with it as the U.S. is. So why move it and expose many more people to the dangers? I am opposed to poisoning the Ward Valley, Indian Reservations, parts

RESPONSE TO COMMENT
COMMENTOR NO. 676: REIMER, NANCY

Response to Comment No. 676-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is very low.

Response to Comment No. 676-2

The Energy Policy Act of 1992 prohibits the United States from selling HEU to foreign countries except under special conditions. Since enactment of this Act into law, no new export licenses for HEU have been issued by the United States. It is imperative for the United States to promote its nonproliferation policy by minimizing worldwide commerce in HEU, while concurrently continuing close cooperation with foreign research reactor operators. Failure to accept spent nuclear fuel from foreign research reactors would undermine confidence in the United States as a trustworthy partner in nuclear weapons nonproliferation efforts (Section 1 of the EIS).

Response to Comment No. 676-3

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

Response to Comment No. 676-4

The commentor's opposition to the management of foreign research reactor spent nuclear fuel in the United States, is noted. As discussed in Sections 4.2 and 4.5 of the EIS, the risk of adverse impacts to the environment associated with the management of the foreign research reactor spent nuclear fuel, in all management sites considered in the EIS, would be low.

COMMENTOR NO. 676: REIMER, NANCY (CONT'D.)

of Idaho or any where else with nuclear wastes. They exist; we must be dealt with – then, in the nearest, safest place to where they were used. And no more should be created, or this problem will continue to grow. The policy you propose perpetuates the problem and will make it worse by expanding the use of nuclear power while hiding the dangers of it. 676-4 (Cont'd) 676-5 676-6

Furthermore, now that the Ked seems about to resume nuclear testing, the nonproliferation policy (so-called) seems even more hollow. How can we ask other countries not to create nuclear weapons if we are, and not to test them if we do, and not to add to the problem if we continue to send them nuclear materials? 676-7

RESPONSE TO COMMENT
COMMENTOR NO. 676: REIMER, NANCY (CONT'D.)

Response to Comment No. 676-5

Spent nuclear fuel is created whenever research or other types of nuclear reactors are operated. The intent of the proposed action is to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium fuel in civil programs worldwide (Section 1.2 of the EIS). The proposed action supports continued operation of foreign research reactors, but with LEU fuel. Present and past nuclear weapons nonproliferation policies of the United States support nuclear technology for nations who agree not to construct nuclear weapons (Section 1.1 of the EIS). Because of the numerous applications of research reactors, nuclear research programs will continue with or without United States activities or completion of this program.

Response to Comment No. 676-6

The proposed action is to develop a policy to manage spent nuclear fuel from foreign research reactors (Section 2.1 of the EIS). The EIS evaluates environmental effects that would result from implementation of a variety of policy alternatives: management in the United States (Management Alternative 2; Section 2.2 of the EIS), overseas management (Management Alternative 2; Section 2.3), combined domestic and overseas management (Management Alternative 3; Section 2.4), and the No Action Alternative (Section 2.5). None of the alternatives address nuclear power reactors. As demonstrated by the analysis in Section 4 of the EIS, implementation of the proposed action poses no significant benefits or risks to human health or the environment.

Response to Comment No. 676-7

The topic of nuclear weapons testing is outside the scope of this EIS.

COMMENTOR NO. 677: BUTZ, ANDREW

Written Comments on the Draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

*** COMMENTS ***

As stated orally at the May 25 D.O.E. hearing in Portland, I am opposed to any process of shipping foreign spent nuclear fuel to the United States. First, such proposed shipments would not improve global security. Instead, they would send a strong message to those nations holding spent fuel, that we do not trust them or their intentions to comply with the provisions of the nuclear non-proliferation treaty. This undermining of international trust will have damaging effects even if the physical hazards of shipments are somehow ~~n~~ 677-1

Second, when the D.O.E. projects/estimates risk of human/environmental exposure to radiation, they use figures that are widely considered to be out-of-date by the medical community. In other words, the latest research indicates that smaller doses of radiation are more harmful than the D.O.E. officially acknowledges. 677-2

To Mail in Comments, Address Correspondence to:

Mr. Charles R. Head
Office of Spent Fuel Management, EM-37
U.S. Department of Energy
1000 Independence Avenue, SW
Washington, DC 20585-0001

P.S. I am appalled that the D.O.E. did not record (electronically) the proceedings of the May 25 Portland hearing. Is this the policy for all hearings? If so, it disy contempt for the process of substantive public participation. 677-3

RESPONSE TO COMMENT
COMMENTOR NO. 677: BUTZ, ANDREW

Response to Comment No. 677-1

The commentor's opposition to the management of foreign research reactor spent nuclear fuel in the United States, is noted. The suggestion that the nations considered under the policy may be offended by the proposed action is not realistic, as indicated in the discussion of Section 1.1 of the EIS.

Response to Comment No. 677-2

General radiological health effects are discussed in Section 4.1.3 and the specific impacts of each alternative are presented throughout Section 4 of the EIS. The radiation risk factors used in the analysis are endorsed and accepted by the NRC and the International Commission on Radiological Protection.

Response to Comment No. 677-3

DOE did request that comments be submitted in writing, however, all oral comments presented at each hearing were summarized and have been addressed along with the written comments in Volume 3 of the EIS. All comments, written and oral, are part of the public record. The format adopted by DOE for the public hearings held on the draft EIS is fully in compliance with the requirements of NEPA regulations and DOE's requirements for conducting such hearings.

COMMENTOR NO. 679: SKEA, JANE K.

Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

DEADLINE: [illegible], 1995

RESPONSE TO COMMENT
COMMENTOR NO. 679: SKEA, JANE K.

Response to Comment No. 679-1

The commentor's opposition to Management Alternative 1 to the proposed action is noted. If DOE decides to accept foreign research reactor spent nuclear fuel in the United States under the basic implementation of Management Alternative 1 (Section 2.2.1 of the EIS), DOE considers that the port selection criteria successfully identify those ports that possess the facilities for safe handling of foreign research reactor spent nuclear fuel (Appendix D, Section D.1.9 of the EIS). The analyses provided in the EIS indicate that the use of any of the facilities indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel or the population near the port (Section 4.2.2 of the EIS).

Response to Comment No. 679-2

DOE did request that comments be submitted in writing, however, all oral comments presented at each hearing were summarized and have been addressed along with the written comments in Volume 3 of the EIS. All comments, written and oral, are part of the public record.

DEADLINE: June 30, 1995 (OVER)

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by **June 30, 1995**. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

Co-sponsored by Port of Tacoma; Port of Seattle; Longshore Local #23; Puyallup Tribe; Citizens for a Healthy Bay; Cities of Tacoma, Fife, Milton, Ruston, Federal Way; Tacoma–Pierce County Visitor & Convention Bureau, Tacoma–Pierce County Chamber of Commerce; Pierce County Central Labor Council and Pierce County.

681-1

RESPONSE TO COMMENT
COMMENTOR NO. 681: SPRINKER, PATTY

Response to Comment No. 681-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

P.S. If the Gov't insists on accepting waste NUKE fuels then bring it and store it on military sites. They have the equipment + manpower to deal with it. The government + military has pushed Nuclear Energy so let them deal with it!!

Don't ruin our Puget Sound and our over-populated area.

Nukes are the gov't / military's baby. Let them babysit it! Don't push it on civilian Long Shoreman, fireman + rescue units to deal with it!!! Why Wash. State??? Ship it to Wash. D.C.!!!

681-2

Response to Comment No. 681-2

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security that might be present at military bases. The security provided for the spent nuclear fuel shipments would be required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Nevertheless, the commentor's preference for the use of military ports is noted. Sections 4.2.2.2 and 4.2.2.3 of the EIS provide the analysis on impacts of incident-free operation and consequences of port accidents, respectively.

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternative 1 or 3) there would be no storage of this material in the Port of Tacoma, any other port, or anyplace except for management sites. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

COMMENTOR NO. 682: MATTLEY, JULIA

JULIA MATTLEY
6411 S. G Street
Tacoma, WA 98408

June 20, 1995

Charles Head, Program Manager
U.S. Department of Energy EM37
1000 Independence Avenue
Washington, DC 20585

Sir:

Last night I listened and viewed the TV recording of the public meeting you held here in Tacoma regarding the transport of spent nuclear fuel through the Port of Tacoma. I agree with the general feelings expressed by the public at that meeting. I say "NO" we don't want to be the dumping ground of the world. We don't buy your political scheme. 682-1

It is not logical. How can any reasonable, thinking person even suggest such a thoughtless and impractical plan. It isn't a plan. It is not properly researched. Why should we be taxed with this burden when you can't even clean up the mess at Hanford? You say you are going to "dig a big hole and put it in it!" What will that do to our future generations' chances of having pure, clean water to drink? And you have not faced the problems of safety and emergency planning, financing, training, and transporting this lethal product to its destination. The damage you will do to our commercial business at the Port, as well as to our tourist trade, is irreplaceable. 682-2

We are a "small" community. Perhaps you feel that makes us vulnerable, but we will fight this to the end. If we go down as the spent fuel dump of the world, the whole world is going to know about it. So, Big Boy, put your thinking cap on and get real. We are reasonable people and will be glad to listen to, and yes, to cooperate in the finding of a practical, economical, logical and acceptable solution to this overwhelming world problem. But you must do your homework--use current statistics, maps, analyses, and research before you spring your plan on us. The proposal you presented last night is so flawed it is unthinkable that our government would allow such an ill-thought-out, poorly prepared scheme to be flaunted in the faces of Tacoma citizens.

Sincerely,

Julia Mattley

Julia Mattley

P.S. A logical plan for this venture would be to use our military bases already trained in nuclear handling -- or my suggestion -- Use Plan #2! 682-3

RESPONSE TO COMMENT
COMMENTOR NO. 682: MATTLEY, JULIA

Response to Comment No. 682-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 682-2

Foreign research reactor spent nuclear fuel shipments are subject to the same types of potential hazards as those of other ships carrying nonradiological hazardous materials.

DOE considers that there is adequate regulatory and emergency preparedness infrastructure to ensure the safe acceptance and transport to designated management sites if the foreign research reactor spent nuclear fuel is managed in the United States. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1. There are three national emergency response plans under which DOE provides radiological monitoring and assessment assistance. Under these plans, DOE provides technical advise and assistance to the State, Tribal and local agencies involved with a radiological incident. Emergency preparedness, security, and coordination of DOE with local emergency response authorities, and security are discussed in general in Sections 2.7 and 2.8 of the EIS. Details would be contained in the Transportation Plan, that would be prepared prior to any individual spent nuclear fuel shipments and coordinated with State and local officials. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments.

For each port considered, the impacts from activities related to the shipments of foreign research reactor spent nuclear fuel are evaluated in Section 4.2.2 of the EIS. The evaluation includes impacts from credible accidents, including shipboard fires. The risk to the environment that would result from these potential accidents is low.

Response to Comment No. 682-3

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security that might be present at military bases. The security provided for the spent nuclear fuel shipments would be required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Nevertheless, the commentor's preference for the use of military ports is noted.

The commentor's preference for Management Alternative 2, overseas management, as discussed in Section 2.3 of the EIS is noted.

*** COMMENTS ***

We wish to record our opposition to the proposal to use Concord Naval Weapons Station as a transfer point for nuclear waste. First of all, the area is geologically and environmentally unsuitable. There are major fault lines close by, and the delicate balance of the marshlands is already pushed to its limit by local industry hazards. Secondly, why choose an area already so densely populated by both commerce and residence. It is highly visible and easily accessed posing a security risk. Thirdly, and most personally, we chose to live in this area with a measured amount of risk; ie. the Base, refineries, fault lines, toxic waste. We accept all this in exchange for a wonderful home and neighbors. Adding the fear and hazard of nuclear waste destroys this balance and leaves absolutely no peace of mind. 686-1

RESPONSE TO COMMENT
COMMENTOR NO. 686: MAPASS, MR. & MRS. W., JR.

Response to Comment No. 686-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Concord NWS, or any of the ports analyzed in the EIS, is low.

The passage from San Francisco Bay to Concord meets the requirements of port selection Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2). Favorable transit from open ocean is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port population, population along the route to the management site, port experience with handling containers, and port facilities would be considered in making the final selection of ports of entry. Appendix D, Section D.1.9 of the EIS provides details of the port selection process.

The port selection criteria do not consider the existence of land-based facilities such as refineries because they have no direct impact on the risk associated with the shipment of foreign research reactor spent nuclear fuel.

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Spent nuclear fuel transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 demonstrate that the use of any of the selected ports will not pose any significant risk to the port personnel or the population near the ports.

RESPONSE TO COMMENT
COMMENTOR NO. 693: HALMISTION, JUNE

Response to Comment No. 693-1

The commentor's opposition to acceptance of foreign research reactor spent nuclear fuel into the United States is noted. DOE considers that the port selection criteria successfully identify those ports that possess the facilities for safe handling of foreign research reactor spent nuclear fuel (Appendix D, Section D.1.9 of the EIS). The analyses provided in the EIS indicate that the use of any of the facilities indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel or the population near the port (Section 4.2.2 of the EIS).

COMMENTOR NO. 695: ANONYMOUS

Energy officials should heed outrage

We don't want nuclear waste anywhere in the U.S.

695-1

Tacomans, blame their hearts, tend to be on the sleepy side when it comes to the Great Issues of the Day.

That's one of their endearing qualities. Unlike their latte-sipping brethren to the north, they're largely indifferent to the political fads that emerge in endless succession from such cultural centers as Manhattan, Boston and the Bay Area. The Tacoma City Council never came out against the Pershing missile or signed a sister city agreement with Managua. The city has its share of people who think the nation is going to hell in a handbasket, but stridency isn't their style. They don't riot in the streets, throw rocks at police officers, bomb federal buildings or torch abortion clinics.

Patrick O'Callahan

So when the citizenry does get genuinely hotlathered up, when ordinary folk start shouting and waving and waving protest signs the way they did at the Department of Energy's radioactive waste hearing on Tuesday, watch out. Energy officials in Washington, D.C., have no doubt encountered really protesters in other cities as they've slapped around their proposal to import spent reactor fuel through U.S. ports. But they should understand that in Tacoma, a large, angry demonstration is roughly equivalent to the storming of the Bastille or the shelling of Fort Sumter.

Not since Earl Kenneth Shriner sexually mutilated a schoolboy in 1989 have I seen so many Tacomans vent so much raw anger in a public forum. Roughly 200 people had to be barred from the Tacoma Public Utilities building, where the hearing was held, because the big auditorium was packed with a standing-room-only crowd. Outside, they chanted, circulated petitions and waved signs that read, "Hell no, we won't glow."

One brave and very lonely dissenter had the temerity to suggest that the area could use the jobs that would come from unloading nuclear fuel at the Port of Tacoma. He was instantly embroiled in a shouting match that could be heard for blocks.

Inside, the hearing felt like a fevered revival meeting crossed with a '60s-style antiwar rally. The locals who took their turn at the microphone were unanimously opposed to the idea of bringing radioactive waste through the port; what chiefly distinguished them was the hysteria content of their remarks. Some seemed to think the Pacific Northwest was on the brink of unspeakable nuclear horrors. Others thought the proposal was just rotten policy and a raw deal for Tacoma. Any convincing outburst at the Energy Department was met with cries of "Amen!" from the audience.

The place swarmed with local politicians trying to get in front of the issue and the television cameras. There was Mike Kreidler, a Democratic congressman lately turned out of office, reminding everyone that he'd sponsored legislation that would have helped prevent this very thing. There was mayoral candidate Brian Ebersole – normally the soul of reason – addressing the room in a near shout, whipping up the crowd with a "Hell no, we don't want nuclear waste coming here."

There were city council members and port commissioners. There was a collection of state legislators who – apparently worried they wouldn't get to deliver their sound bites in prime time – foolishly asked if they could cut ahead of the ordinary citizens who were lined up to speak. The request was unceremoniously shouted down.

Sure, there was a measure of orchestration behind all the anger. In advance of the hearing, Port Commission President Pat O'Malley and other opponents of the shipments had run heavy-handed newspaper advertisements showing a baby with a forehead festooned with the radioactive danger symbol. Fliers urged Tacomans to attend.

But while the publicity may have alerted people to the issue, it couldn't have produced the heat and

> A good many seemed motivated by a heartfelt concern for a city that is finally emerging from the shadow of industrial blight and Superfund pollution – a city that doesn't need a new stigma to live down.

passion that were in the air Tuesday night. O'Malley and company may have tapped a nerve, but the nerve was there to be tapped.

Some of those who showed up were no doubt driven by old-fashioned, ignoble nuclear-phobia, the irrational fear of any enterprise that involves the atom. But a good many of them seemed motivated by a heartfelt concern for a city that is finally emerging from the shadow of industrial blight and Superfund pollution – a city that doesn't need a new stigma to live down.

The Department of Energy should be forewarned: These people aren't going to roll over. Splitting the atom could prove an easier feat than bringing the pieces through Tacoma's back yard.

*** COMMENTS ***

I am very concerned about the possibility of nuclear waste being shipped to Washington state, and being transported through populated areas. I am surprised that the Department of Energy would encourage the public's agreement of this. From the information I have received it seems like an accident that is waiting to happen. I think that both the health of our environment and the health of the population should warrant further studies of any possible impact, no matter how slight. I am amazed that little or no information would be given to the towns and communities that would be effected. I don't think that it should be the responsibility of the state of Washington to become the nuclear waste garbage dump to the world! 703-1

RESPONSE TO COMMENT
COMMENTOR NO. 703: BECK, JOANNA

Response to Comment No. 703-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. All population within a 50-mile radius of Tacoma was considered when analyzing the impact of both incident-free transport and the range of hypothetical port accidents. The risks were found to be low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS).

Response to Comment No. 703-2

DOE's policy is to freely distribute information about the foreign research reactor spent nuclear fuel program to anyone who is interested. The distribution of this EIS is one example of this policy.

As discussed in Section 2.6.4.2 of the EIS, the NRC regulations concerning route notification are set forth in 10 CFR Part 73. This regulation requires shippers to submit proposed routes for spent nuclear fuel shipments to NRC for approval, and NRC publishes a public information circular that lists routes that have been evaluated and approved for specific spent nuclear fuel shipments.

The regulation also requires DOE to inform the Governor of each State and any Tribal chair, or their designee, along the route at least seven days prior to shipment of hazardous cargos, including radioactive materials. The towns and communities along the ground transport route could be notified individually in advance of each shipment by the Governor of each State.

Response to Comment No. 703-3

The commentor's opposition to the ports or facilities located in the State of Washington, is noted. As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

RESPONSE TO COMMENT
COMMENTOR NO. 704: SMYTH, ELIZABETH L.

Response to Comment No. 704-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

All shipments of radioactive material are tightly regulated. Internationally, the International Atomic Energy Agency (part of the United Nations) and the International Maritime Organization regulate such shipments. In the United States, the U.S. Department of Transportation, DOE, and the NRC all have regulations and rules that apply to these shipments. Section 5 of the EIS presents a detailed description of the applicable laws, regulations and other requirements.

Response to Comment No. 704-2

Foreign research reactor spent nuclear fuel shipments are subject to the same types of potential hazards as those of other ships carrying nonradiological hazardous materials.

The commentor wants assurance from DOE that DOE, and not local governments, would assume costs related to the transshipment of casks, including costs arising from accidents. Under the Price-Anderson Act, DOE would provide indemnification for public liability with respect to spent nuclear fuel if there is a "nuclear incident," as defined under law. In pertinent part, a "nuclear incident" is one that causes, for example, injury or sickness or property damage, resulting from radioactive, toxic, explosive, or other hazardous properties of the material. DOE does provide funding to States and Tribes, as described in Section 2.7.3.1 of the EIS, for transportation related issues. Such funding can enhance a jurisdiction's emergency management and planning capabilities.

Response to Comment No. 704-3

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

Response to Comment No. 704-4

Prior to 1989, it was U.S. policy to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). Ultimate disposition is a high-priority consideration which is discussed qualitatively in Section 4.2.7 of the EIS.

RESPONSE TO COMMENT
COMMENTOR NO. 710: HAMMER, BRUCE

Response to Comment No. 710-1

As discussed in Appendix D, Section D.1 of the EIS, both commercial and military ports were evaluated. Environmental effects of Management Alternative 1 or 3 at candidate commercial and military ports were evaluated and found to be low (Sections 4.2.2 and 4.5 of the EIS). There is no reason to prefer commercial or military ports based on environmental consequences. As discussed in Appendix D of the EIS, there is no environmental basis for preferring military vessels to commercial vessels.

As a part of the overall evaluation of environmental impacts associated with the shipment of foreign research reactor spent nuclear fuel, the EIS identifies ports of entry in the U.S. that are acceptable for the receipt and handling of foreign research reactor spent nuclear fuel. In evaluating and selecting acceptable ports of entry, evaluation criteria were developed to use in determining the final selection of ports of entry (Appendix D, Section D.1.9 of the EIS). The criteria include such factors as transit from open ocean, port population, population along the route to the management site, port experience with handling containers, and port facilities.

1000 Independence Ave. SW
Washington, D.C. 20585

June 20, 1995

Dear Mr. Head

I am writing with regard to the shipment of high level nuclear waste through the Port of Tacoma. As a professional engineer who has been involved in many environmental impact statements I fully understand the nature of EIS's and the often disregard for the public comments contained within. Since you stated that the director and his staff "do not have the time to listen to the statements made by those testifying in regard to this plan", it seems to me that the director and his staff will have no idea how vociferous is the opposition to this plan. This area, from its Congressmen to its Mayors to its average citizenry, will not allow these shipments to take place. The fight will be waged both politically and in the courts. I believe you are wasting your time and our money by trying to push this down our throats. If you want a battle, you have one. You are looking at a losing proposition. 715-1 715-2

Sincerely,

Steve Bennett

Response to Comment No. 723-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 723-2

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

Response to Comment No. 723-3

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). As demonstrated by the analyses in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment, including economic benefits, would be low.

COMMENTOR NO. 728: SUTHERLIN, CALVIN J. & JEAN

Copy to:

Charles Head, EM37
US Dept. of Energy
1000 Independence Ave.
Washington, D.C. 20585

Bishop Calvin D. McConnell
2112 Third Ave., Suite 301
Seattle, WA 98121-2333
Phone: 206-728-7674

Dear Sir:

I write you as a citizen of the United States and a property owner (near Port of Tacoma owned land). I also am an honorably discharged veteran (25th Engr. Combat Battalion) with support troop service in 4 European Campaigns, Normandy through Central Europe, supplying the entire First Army with Heavy Equipment. (I was in administration and personnel, with a "spec" number of Chaplain's assistant. We had no chaplain assigned.)

My wife and I were at the Tacoma meeting on nuclear waste through the Port of Tacoma. We listened to TV tapes also for a total of 6 hrs. of the meeting in Tacoma, June 19th. You must be quite a hardy soul to have endured the release of pent-up feelings of frustration of many! Thank you for your patience!

For many years I have studied the subject of war, including military law itself. I have studied the published reports of the Technological Steering Panel of Hanford and the reports of the current cancer studies of which the Hutchinson Cancer Center is a partner; the Thyroid Studies.

My understanding is that your Dept. of Energy report or the EIS report presented alternative courses of action. I appreciate the complicated world picture leading to the Dept.s choosing Alternative #1, rather than Alternative #2 which the overwhelming majority of the audience favors. I have studied the Nth power problem, or the dangers of nuclear proliferation, and this, indeed is a problem. (Beyond Hanford releases/in the soil, the air and river.) or leakage

728-1

On the choice we have, I like the idea of making the 6 or 7 nations friendly to U.S., take their responsibility for the spent rods (70% of the high grade uranium in the world). These rods are in their hands. They would, under that plan, arrange for the reprocessing of that 70% of the world's supply. These nations are our friends.

728-2

Forty other nations in the world control the 30% of the spent rods of high grade uranium. These nations have been considered somewhat less stable in this context of nuclear possession, or might become so.

All this I gather from inferences deduced from attendance. I would benefit from an actual copy of the Environmental Impact Study. Could you send one to me? Or tell me where to get one? I am relying now on newspaper coverage.

RESPONSE TO COMMENT COMMENTOR NO. 728: SUTHERLIN, CALVIN J. & JEAN

Response to Comment No. 728-1

Draft and final versions of this EIS describe four alternatives for implementation of the proposed action: management in the United States (Management Alternative 1; Section 2.2 of the EIS), overseas management (Management Alternative 2; Section 2.3 of the EIS), combined management in the United States and overseas (Management Alternative 3; Section 2.4 of the EIS), and No Action (Section 2.5 of the EIS). The draft EIS did not identify a preferred alternative for management of spent nuclear fuel from foreign research reactors; however, this final EIS does contain a preferred alternative in Sections 2.9 and 4.7.

Response to Comment No. 728-2

The commentor's suggestion to have nations friendly to the United States arrange for overseas management of spent nuclear fuel from their foreign research reactors, while the United States continues to develop an appropriate policy to manage spent nuclear fuel from research reactors in the remaining nations, is noted. Section 2.4 of the EIS describes combined domestic and overseas management (Management Alternative 3) of spent nuclear fuel from foreign research reactors. Advantages and disadvantages of overseas management are discussed in Section 2.3 of the EIS.

COMMENTOR NO. 728:
SUTHERLIN, CALVIN J. & JEAN (CONT'D)

Then, the 40 nations with the 30% of spent rods would be studied and an appropriate policy be made to ship such spent rods to the Swedish or Idaho Engineering agencies, as the case might be, or even Savannah, Georgia. The D.O.E. would supervise. 728-2

This alternative would be more flexible than Proposal #1 which would be dangerously using Puget Sound-Tacoma, taking the chances of unrecoverable casks or canisters going down to more than 500 ft. of depth. (We can only be sure of recovery down to 200 ft., we are reliably told). Also, land masses in Puget Sound are too close to be safe from horizontal dangerous radiation on both sides of the channels. (Leakage or accident) Perhaps, as Rep. Campbell suggested, that there are alternative delivery systems for the spent rods than dangerous shipping by vessel and surface systems, rail or truck transportation in an already bongested and dangerously laden Pacific N.W. inland and earthquake threatened transportation corridor. 728-3

Thank you, and be certain of my wife's and my prayers for your importance and your function in our democratic government.

RESPONSE TO COMMENT
COMMENTOR NO. 728:
SUTHERLIN, CALVIN J. & JEAN (CONT'D.)

Response to Comment No. 728-3

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Also, the environmental effects evaluated in the EIS determined that there would be no adverse ecological impacts to any of the ports that might be used to receive the material (Section 4.2.2). Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 40 years of spent nuclear fuel shipments, no radioactive materials have ever been released from a spent nuclear fuel transportation cask even as a result of an accident (Section 2.6.2 of the EIS).

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2). Therefore, a seismic event, even if it caused structures at the Port of Tacoma to fail, is not expected to compromise the transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 demonstrates that the use of any of the selected ports will not pose any significant risk to the port personnel or the population near the ports.

Hazel O'Leary
SECRETARY OF ENERGY
1000 Independence Avenue
Washington, D.C. 20585

RE: Tacoma, Washington
Shipping of DOE nuclear waste

Dear Secretary O'Leary:

It is a serious mistake to ship nuclear waste through the Puget Sound area. Mr. Charles Head conducted a public hearing in Tacoma, Washington on June 19, 1995. The meeting was poorly publicized. Still, a notice of only hours resulted in an overflow crowd of 500 persons. Public officials from the Port of Tacoma, City of Tacoma, City of Seattle, City of Puyallup, City of Renton, and others recited unanimous opposition to this plan. The President of the Longshore Union warned that his workers would not offload this cargo. 729-1

Mr. Head should explain to you the political danger demonstrated by the public outrage accompanying the presence of nuclear waste in Puget Sound. This area is well known for its liberal, environmental bias. You will be surprised by the organization of opposition to Tacoma harbor handling and trucking of nuclear waste over Seattle freeways.

Please do not damage President Clinton or the Democratic Party. 70% of the 20 metric tons of enriched nuclear fuel waste is generated each year by France, Britain, Germany, Japan, Sweden and Switzerland. A processing facility in Scotland has expressed a desire to upgrade its ability to handle all three types of nuclear waste. Please more carefully explore Alternative 2 in your Environmental Impact Statement, which provides for the safe processing of nuclear waste closer to where it is created. 729-2

Sincerely,

JOE M. QUAINTANCE

cc: Bill Clinton

RESPONSE TO COMMENT
COMMENTOR NO. 729: QUAINTANCE, JOE M.

Response to Comment No. 729-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 729-2

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Section 2.3 and 4.4.2 of the EIS.

COMMENTOR NO. 732: WADE, MARIANNE

Honorable Hazel O'Leary
Department of Energy
1000 Independence Ave SE
Washington D.C. 20583

Hello H. Hazel O'Leary:

I have spent most of the last thirteen years in Washington state. Raised in California through the sixties and seventies I witnessed unbearable insults to the environment. I spent most of my childhood rationing water that was already so treated there could very well have been more fluoride than hydrogen. I thought everybody flushed their toilets only twice a day. And despite the beauty of San Francisco and the love I have for it, let's face it the city has only two seasons.

Needless to say, I have marveled at the Northwest. It has a wonderful ecosystem. Diversity of nature ranging from rainforest to desert, ocean to mountain. Even though much of the land has been decimated by logging, challenged by Mt. St. Helens, and abused by the ignorant, nature prevails here. Despite a busy port, here in Tacoma I have witnessed days of such clarity I could see the rooftops of houses miles away across the sound. Most of the residents here focus on the beauty and try to support the environment. Perhaps you are familiar with the recycling statistics from the Puget Sound, specifically the efforts of Tacomans?

I don't mean to drip with civic pride because frankly most of the local policies and politicians make me cringe. But the Department of Energy's proposal to utilize Tacoma as a point of entry for spent nuclear waste sickens me more. Even though I drive by the Port of Tacoma with a slight shrug and a grimace, I understand it brings in much needed revenue. The billows above the port are a constant visual reminder of how greatly humans threaten the environment. Ship traffic is heavy enough here. I don't want to see any enter loaded down with spent fuel rods.

Please reconsider the proposal. I understand Mick Shultz of the Port of Tacoma has been organizing a fact-finding action the results of which should have been held at the last DEIS meeting. I also understand the Port of Tacoma Commission officially registered its opposition to this proposal May 12. Have they received a response? I have to agree with Port Commission president Patrick O'Malley, this state has had its share of waste issues. Perhaps you followed the closure and current destruction of the Asarco smelter in the tiny arsenic-laden town of Ruston, nestled in the north-end of Tacoma. I witnessed the explosion of the stack myself from a distance reported as "safe from the arsenic cloud". Tacoma has enough to deal with.

I respect your position as Secretary, but I don't envy it. I realize the disposal of nuclear waste is a real issue that needs to be addressed. I know there are no easy answers. I just don't believe there are "acceptable levels" of nuclear waste. I believe the Earth to be one entity and in that sense it doesn't matter where nuclear waste is stored, we all share it and we'll all be affected by it. True, Tacoma is a smaller urban district than Seattle but it is still heavily populated with residents very near the port. Please reconsider this proposal. Have Tacoma removed as a possible point of entry. I wish you much luck in this endeavor and hope a creative alternative can be found. 732-1

Thank you for your time and consideration.

Sincerely,

Marianne Wade
302 N. Yakima #B3

1000 Independence Ave. SW
Washington DC 20585

Dear Mr. Secretary,

RE: TACOMA Nuclear Waste Port Facility

Please enter our objections to the Nuclear Waste project which would involve Tacoma as a port of entry. We ask that the following points be considered:

The geographic location of Tacoma means that the greater Seattle Tacoma population is included in this zone.

The economic impact of such a facility would preclude industrial development in this same area.

The environmental concerns of the greater Tacoma area would be violated and much good that has been done in "cleaning up" the Sound and the wetlands of the Tacoma tide flats and the Nisqually delta would be jeopardized.

733-1

The Department of Energy and its predecessors do not have track records in this State which offer much reassurance.

Please enter our disapproval of the plan.

Sincerely yours,

Barbara and Rudolf Devik

Copies: Mr. Charles Head, USDOE
The Hon. Bob Evans, Deputy Mayor, City of Tacoma, WA

RESPONSE TO COMMENT
COMMENTOR NO. 733: DEVIK, RUDOLF

Response to Comment No. 733-1

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Tacoma is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternative 1 or 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3 of the EIS) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2 of the EIS).

DOE considers that the use of any of the ports indicated by the port selection process, including Tacoma, would not impact normal commercial operations, and therefore not endanger the ports' economic development. Nor should it contribute to any stigma based on the analysis in the EIS which demonstrates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and 4.8.4 and Appendix C, Section C.2 of the EIS). This is based on the fact that the foreign research reactor spent nuclear fuel would be accepted into the United States in standard shipping containers that would require no special handling or precautions. As such, there should be no adverse cultural or economic reaction to the use of the port. Historically, there were no adverse economic or cultural impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

Shipment of foreign research reactor spent nuclear fuel would not jeopardize the significant cleanup effort undertaken in the area of Commencement Bay and the Port of Tacoma as noted by the commentor. The analysis in the EIS indicates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2). Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. Based on over 30 years of spent nuclear fuel shipping, DOE considers that transportation casks passing through the Port of Tacoma, Commencement Bay, or any other port or waterway would not affect air or water quality. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

COMMENTOR NO. 739: LIVE, JULIE

6/22/95

Dear Charles Head,

I am sorry to have missed the meeting you were at in Tacoma tonight. I am very sick and not able to get out at nite. 739-1

I do not want the the highly radioactive Nuclear waste being shipped through the Tacoma port.

I believe we have enough nuclear waste deposits already on our own state at Hanford. I have just lost 2 friends in Vancouver Washington in the last year due to non treatable cancer. also both My folks have Cancer and I believe we have enough of our own Nations that we produced our selves. please keep out other Countries waste. we are not a dump for nuclear waste.

There must be $ involved that would be a great profit for some one, but I believe what ever the gain/profit is, it is not good enough to risk our lives and all the others in the process of shipping this nuclear waste 739-2

thank you

Julie Live
2415 S. Oakdale

Response to Comment No. 739-2

An objective of the proposed action is to reduce the risk of weapons-grade uranium falling into the hands of a nation attempting to develop a nuclear weapons capability (Section 1.2 of the EIS). As demonstrated by the analysis in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low. Costs and financing of the alternatives are described in Section 4.9 of the EIS.

COMMENTOR NO. 741: HAUSAUER, NANCY

June 22, 1995

Mr. Charles Head
Office of Spent Fuel Management (EM-37)
Office of Environmental Management
U.S. Department of Energy
100 Independence Avenue S.W.
Washington, D.C. 20585

Dear Mr. Head:

I am writing to express my strong resistance to the DOE sending nuclear waste through the Port of Tacoma. I live in Tacoma, near the port, and I have some strong concerns, both about the DOE's environmental impact statement regarding the proposed shipments, as well as the concept in general.

First, the general concept. Why ship this dangerous stuff all around? It seems more vulnerable to accident or terrorist attack in transit than if it is kept where it is. Or, if it must be processed, why not process it in England or Europe, where I understand there are perfectly fine processing plants already in place. I do not understand the reasoning. I do not understand why we must accept the rest of the world's nuclear waste. Don't we have enough of our own? 741-1

Second, the EIS. I understand that it is full of misinformation and inadequate assessments. It seems that the following things were not adequately addressed: adverse economic impact on Tacoma; water depth in Puget Sound making recovery of lost waste difficult/impossible; security risks; fire and explosion risks; and the effects and costs on Tacoma if an accident did occur. I also understand that the DOE used outdated, incorrect information about the Port of Tacoma--which to my mind invalidates the entire EIS, not to mention the fact that such a grievous error hardly inspires confidence in the DOE overall, not to mention that to make such a mistake is a terrible insult to the citizens of Tacoma. IN SHORT, THE EIS SOUNDS LIKE A FARCE! 741-2 741-3

Finally, the reasoning for selecting Tacoma as a port of entry for the nuclear waste is not clear to me. I believe it is unclear because it is not reasoning, but a political decision. I suspect that you believe that we are too small a city to mount a major protest, such as Seattle, San Francisco and Los Angeles have proven themselves capable of doing. (But you are wrong.) An editorial in the Tacoma News Tribune stated that you cited Seattle as a non-viable candidate because its population is too large. TOO LARGE FOR WHAT? Too large to be an acceptable risk in case of an accident? But you steadfastly tell us an accident will not happen. Guess what--we notice that these two statements do not add up. 741-4

Are you aware that out here in the rest of the country, among ordinary Americans, the DOE has a reputation for gross dishonesty? And well-deserved it is, to my mind. I will resist shipments of nuclear waste through my city by all legal means available to me. And I will organize others to join with me. Do not try to ram this down our throats.

Sincerely,

Nancy Hausauer

Nancy Hausauer
704 Sixth Avenue
Tacoma, WA 98405

RESPONSE TO COMMENT
COMMENTOR NO. 741: HAUSAUER, NANCY

Response to Comment No. 741-1

Spent nuclear fuel from foreign research reactors is not an attractive target for terrorists because it is not flammable or explosive (Section 1.1 of the EIS). As shown in Section 4 of the EIS, radiological health and other environmental risks resulting from the transportation of foreign research reactor spent nuclear fuel are low. Consequences of sabotage and terrorist activities are discussed in Appendix D, Section D.5.9 of the EIS.

Reprocessing in overseas facilities is one of the alternatives evaluated in the EIS (Management Alternative 2, Section 2.3, Subalternative 1b of the EIS).

Prior to 1989, it was United States policy to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). Ultimate disposition is a high-priority consideration which is discussed qualitatively in Section 4.2.7 of the EIS.

Response to Comment No. 741-2

DOE considers that the use of any of the ports indicated by the port selection process, including Tacoma, would not impact normal commercial operations, and therefore not endanger the ports' economic development. Nor should it contribute to any stigma based on the EIS analysis that indicates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2 of the EIS). This belief is based on the fact that the foreign research reactor spent nuclear fuel would be accepted into the United States in standard shipping containers that would require no special handling or precautions. As such, there should be no adverse cultural or economic reaction to the use of the port. Historically, there were no adverse economic or cultural impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

The security provided for the foreign research reactor spent nuclear fuel shipments would meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Appendix H has been added to the final EIS in response to public comments, to better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site(s).

A paragraph has been added to Section 2.6.3.1 of the EIS to discuss why security beyond that required by 10 CFR Part 73 is not needed for the receipt of foreign research reactor spent nuclear fuel at commercial ports.

Appendix D, Section D.5.3.1 of the EIS describes several accident scenarios that involve fire. The results of the analysis of these accidents can be found in Appendix D, Section D.5.4. The analysis shows that even in the event of a severe ship fire, neither the consequences nor risks are great (Appendix D, Section D.5.5). The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS).

Response to Comment No. 741-3

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. The evaluated data on populations is from the 1990 census. Although corrected information has been included in the port information for the Port of Tacoma, the analyses provided in Sections 4.2.2 and 4.5 of the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port.

Response to Comment No. 741-4

The process used to identify potential ports of entry for the foreign research reactor spent nuclear fuel is discussed in Appendix D, Section D.1.9 of the EIS. Please see the response to comment 439-5 for an explanation of the role played by population of prospective ports of entry in the port selection process.

COMMENTOR NO. 742: PRICCO, ARTHUR V.

50% unbleached pulp and 50% post-consumer fibre paper

June 17, 1995

Public Comments-Draft FRR SNF EIS
Charles Head, Program Manager
Office of Spent Nuclear Fuel Management
Department of Energy
1000 Independence Avenue, SW
Washington, DC 20585-0001

Dear Mr. Head,

I am opposed to the shipment of spent nuclear fuel rods through the San Francisco Bay area into Concord Naval Weapons Station for the following reasons.

-There is no data to show that a fuel cask can survive a prolonged fire such as in an oil fire.

742-1

-Nuclear laden vessels must pass under six bridges, past six refineries and several chemical plants to reach CNWS.

-There are numerous earthquake faults in and near Concord.

-Adjacent to CNWS is a school. In addition to these endangered students are approximately one million people who live along the Bay Area transport route.

-There is no permanent storage site in the US. The temporarily stored material will have to be moved again.

742-2

Require the countries that are producing this material to store it on-site under international safeguard. Most of the countries are Western Allies such as Sweden, Germany and Japan, and are fully capable of doing this. Take special measures with those countries with which there is concern of theft or diversion.

742-3

Sincerely,

Arthur V Pricco

RESPONSE TO COMMENT
COMMENTOR NO. 742: PRICCO, ARTHUR V.

Response to Comment No. 742-1

The passage from San Francisco Bay to Concord NWS meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS). Favorable transit from open ocean is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port population, population along the route to the management site, port experience with handling containers, and port facilities would be considered in making the final selection of ports of entry.

Regarding the commentor's concern about a prolonged fire, the duration of a ship fire is directly related to the amount of combustibles carried on board. In spite of this potential, the number of severe fires on ships is relatively small. Data available on the last 15 years from Lloyd's of London indicate that of 1,073 ship collisions in port worldwide, only eleven led to fires, and of those, only five caused extensive damage, with only one actually causing buckling of structures.

With respect to the impact a ship fire might have on a spent nuclear fuel transportation cask, there are three facts that would mitigate the potential damage. First, ship fires tend to move to different areas of the ship as the combustible material is consumed, so the transportation cask would not be exposed for the entire duration of the fire. Second, a ship fire's intensity is normally limited by the amount of oxygen that can reach the interior of a hold. Third, all ships that would be used to transport foreign research reactor spent nuclear fuel have built-in fire suppression equipment, which at a minimum would keep fires well below the extreme temperatures needed to damage the transportation cask. For these reasons, it would be almost impossible for spent nuclear fuel inside the transportation cask to reach 900 Kelvin (1,160 degrees Fahrenheit), the melting point of research reactor spent nuclear fuel. The probability of reaching such a temperature was calculated to be less than one in a billion (see Attachment D5 to Appendix D of the EIS). To put this temperature into perspective, steel used in a ships's structure buckles at around 700 Kelvin (800 degrees Fahrenheit).

The EIS contains the results of an analysis of the effects of an accident that involves a severe fire (severity category 6), which does not reach the temperature to melt foreign research reactor spent nuclear fuel. Appendix D, Section D.5.3 presents detailed discussion of accident probabilities and radioactive material source terms and Section D.5.4 presents the results of the analyses.

The port selection criteria do not consider the existence of land-based facilities such as

refineries because they have no direct impact on the risk associated with the shipment of foreign research reactor spent nuclear fuel. Section 4.2.2.3 of the EIS discusses the assumptions that went into the port accident analysis and the results of those analyses.

Regarding earthquake faults, the risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the transportation cask.

Response to Comment No. 742-2

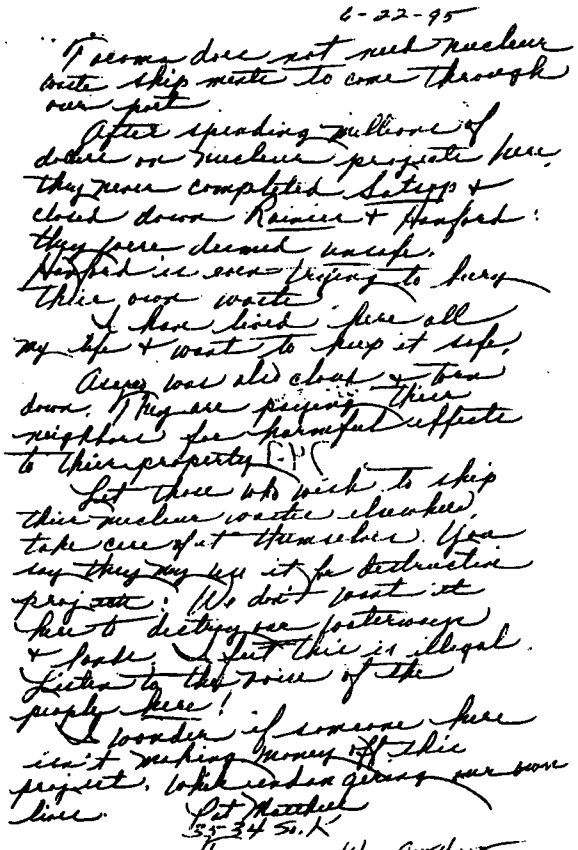
The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. A detailed, quantitative discussion of these impacts would have to be the subject of future NEPA documentation.

Appendix E and Section 4.2.3 of the EIS demonstrate that the risks associated with ground transport of the foreign research reactor spent nuclear fuel would be very low.

Response to Comment No. 742-3

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

COMMENTOR NO. 743: MATHEES, PAT



6-22-95

Tacoma does not need nuclear waste ship waste to come through our port.

After spending millions of dollars on nuclear projects here, they were completed, Satsop & closed down Rainier & Hanford: they were deemed unsafe. Hanford is even trying to bury their own waste.

I love birds, love all my life & want to keep it safe.

Please tear old cloak & burn down. They are prepared their neighbors for harmful effects to their property.

Let those who wish to ship their nuclear waste elsewhere, take care of it themselves. You say they may use it for destructive projects. We don't want it here to destroy our fisheries & lands. But this is illegal. Listen to the voice of the people here!

I wonder if someone here isn't making money off this project. Look under every rock.

Pat Mathees
35-34 So. K
Tacoma, Wa. 98418

743-2

RESPONSE TO COMMENT
COMMENTOR NO. 743: MATHEES, PAT

Response to Comment No. 743-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 743-2

The commentor's preference for Management Alternative 2 (overseas management, Section 2.3 of the EIS) or the No Action Alternative (Section 2.5 of the EIS) is noted.

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to health or the environment would be low.

6-22-95

Dear Charles Head:

We are property owners in nearby Tacoma and strongly, fiercely opposed to the shipment of spent nuclear fuel through the Port of Tacoma! Please don't do it!

744-1

Respectfully,

Rod & Margaret Cardwell
1319 - 11th Ave.
Fox Island, WA 98333

Response to Comment No. 744-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 745: SCALPH, ZONA

1903 E. 68th St.
Tacoma, WA 98404
June 21, 1995

Dear Mr. Head,

I am opposed to shipments of nuclear waste being sent not just through the Port of Tacoma from other countries, but being sent anywhere in the U.S. from abroad. 745-1

We as a country need to take care of our country. other countries need to take care of their own problems. 745-2

It's time we put America 1st. Isn't it correct that other countries can still build bombs even if the U.S. allows the nuclear waste storeage? 745-3

I worked with a girl for several weeks last fall who was sent here to try to clear her system from the effects of Chernobyl. Then she was

RESPONSE TO COMMENT
COMMENTOR NO. 745: SCALPH, ZONA

Response to Comment No. 745-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 745-2

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted (Management Alternative 1, Section 2.2 of the EIS). Section 2.3 of the EIS describes other alternatives under consideration.

Response to Comment No. 745-3

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). The proposed action will not eliminate all weapons-grade material from possible diversion to a nuclear weapons program. However, implementation of the proposed action would reduce this material by an amount sufficient to manufacture several hundred nuclear weapons.

sent back to Russia. People there have died because of the accidents. If accidents happen, & they will sometime, where would Tacoma children be sent?

I feel the "common" American citizen may not understand the entire picture, but does know it's not an ideal world & trying to take care of everything will leave us with nothing. Americans have always been willing to give but fear & distrust of the government that doesn't listen seems to be growing.

Sincerely,

Zona Scalph

COMMENTOR NO. 746: FAIRBANKS, JOYCE

JOYCE FAIRBANKS
1035 Regents Blvd, Ste 289
Tacoma, WA 98466-6030

June 23, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
U. S. Department of Energy
1000 Independence Avenue SW
Washington, DC 10585

Don't do it! You saw how angry the crowd in Seattle was. You heard us testify. Yet, we won't give up. We don't want your nuclear waste for Tacoma's port. Your proposal is insane & ill prepared & based on 1980 population figures. Joyce Fairbanks

I was one of numerous protestors at the June 19, 1995 public hearing on the U. S. Dept. of Energy's proposal to import high-level nuclear waste from other countries and ship it through the Port of Tacoma. I am strongly opposed to this proposal as well as importing nuclear waste for storage at Hanford, Washington. 746-1

There are many Port of Tacoma and City of Tacoma Risk Issues. The D.O.E. used outdated information. The state of Tacoma container terminals as well as the number is shown in a state of existence from the year 1980 or before. Given these errors in analyzing facilities for handling shipments it is very likely the population of Tacoma was shown as less than it is now. Tacoma is a major population center that merges with Seattle. Tacoma is the Number 2 size town in Washington.

Mt. St. Helens is about 100 miles from Tacoma. An active volcano, it erupted in 1980 and the tremors and ash spread throughout the state. Mt. Rainier and Mt. Baker are also active volcanoes that could erupt at any time.

This is earthquake country. Major fault lines run through the whole state. Scientists have been predicting some really big quakes. 746-2

Many anti-government neo-nazi para military groups call the Pacific Northwest home. Some of these groups are extremely volatile and could very easily sabotage nuclear waste shipments. Need I remind you of Oklahoma city? 746-3

Briefly, there are many issues not adequately considered in the draft environmental statement. The water depth in Puget Sound is over 200 meters deep in major shipping lanes to and from the Port of Tacoma. The D.O.E. did not recognize that Tacoma, specifically Commencement Bay and the Port of Tacoma are located in a federally designated Superfund site. This site is on the National Priority list for cleanup. D.O.E. did not recognize that the shipment of nuclear materials would contribute to the "dirty port" stigma. 746-4

The D.O.E. did not adequately consider severe fires/explosions. The D.O.E. did not adequately consider security issues. No provisions were made for upgrading and training local defense teams.

RESPONSE TO COMMENT
COMMENTOR NO. 746: FAIRBANKS, JOYCE

Response to Comment No. 746-1

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. The evaluated data on populations is from the 1990 census. Although corrected information has been included in the port information for the Port of Tacoma, the analyses provided in Sections 4.2.2 and 4.5 of the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port.

Earthquakes were not analyzed separately in the EIS because seismic activity would not result in greater damage to a transportation cask than that caused by a ship collision and subsequent fire. Rather, the consequences from the worst plausible accidents involving foreign research reactor spent nuclear fuel transportation casks were evaluated, regardless of what initiated them. An earthquake could be the initiator of either a ship or road accident, and thus affect the probability of such accidents; however, the number of earthquake-induced ship and road accidents is small compared to other causes.

Response to Comment No. 746-2

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security such as might be present at military bases. The security provided for the spent nuclear fuel shipments would be required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Security measures for the transportation of foreign research reactor spent nuclear fuel are discussed in Section 2.8 of the EIS.

Neither acts of terrorism nor theft of materials by a determined group or individual can be completely precluded. However, proper security measures greatly reduce the risk of such actions. Security would be provided for all shipments of foreign research reactor spent nuclear fuel, as required by the Code of Federal Regulations (10 CFR Part 73). The general security provisions are provided in the new Appendix H that has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that would be prepared for each foreign research reactor spent nuclear fuel shipment to specify details of the transportation process, including security provisions in port and during transit. The provisions include an interface between DOE and State, Tribal, and local authorities, prior to the implementation of the policy, for the identification and resolution of emergency management and security issues specific to the communities that would be affected. These issues include capabilities and training of first emergency responders.

COMMENTOR NO. 746: FAIRBANKS, JOYCE (CONT'D.)

Bringing nuclear waste through Tacoma poses an incalculable risk to the whole Pacific Northwest. We have the right to request our area be kept free from hazards of nuclear accidents, that our children and future generations remain healthy and free from fear. Keep nuclear waste out of the Puget Sound area. Our families and communities are too precious to be tampered with. NO NUCLEAR WASTE FOR THE PORT OF TACOMA!

Joyce Fairbanks

746-5

RESPONSE TO COMMENT
COMMENTOR NO. 746: FAIRBANKS, JOYCE (CONT'D.)

Response to Comment No. 746-3

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

A sentence has been added to Appendix D, Section D.2.1.9 of the EIS regarding Commencement Bay being a Superfund Site. The analysis of impacts associated with acceptance of the foreign research reactor spent nuclear fuel into the U.S. demonstrates that there would be no significant adverse impacts on the ports, people, or natural environment and the overall impacts to Commencement Bay would be unchanged by the various management alternatives.

Shipment of foreign research reactor spent nuclear fuel would not jeopardize the significant cleanup effort undertaken in the area of Commencement Bay and the Port of Tacoma. Nor should it contribute to any "dirty port" stigma based on the EIS analysis that indicates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2). Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive contents have ever been released from a transportation cask, nor has a cask ever been punctured, even as a result of an accident. Based on this experience, DOE does not expect the casks to leak or affect air or water quality. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

Response to Comment No. 746-4

The transportation casks that would be used for the foreign research reactor spent nuclear fuel are certified if their design meets certain tests, including a fire test, and if the individual casks pass periodic inspections (Section 2.6.2 of the EIS). These certification standards were developed for use of the casks on land, hence the 30 minute fire test, which is considered to be the extent of a high intensity fire resulting from a collision with a tanker truck. The duration of a ship fire is directly related to the amount of combustibles carried on board. In spite of this potential, the number of severe fires on ships is relatively small. Data available on the last 15 years from Lloyd's of London indicates that of 1,073 ship collisions in port worldwide, only eleven led to fires, and of those, only five caused extensive damage, with only one actually causing buckling of structures.

COMMENTOR NO. 746: FAIRBANKS, JOYCE (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 746: FAIRBANKS, JOYCE (CONT'D.)

In respect to the impact a ship fire might have on a spent nuclear fuel transportation cask, there are three facts that would mitigate the potential damage. First, ship fires tend to move to different areas of the ship as the combustible material is consumed, so the cask would not be exposed for the entire duration of the fire. Second, a ship fire's intensity is normally limited by the amount of oxygen that can reach the interior of a hold. Third, all ships that would be used to transport foreign research reactor spent nuclear fuel have built-in fire suppression equipment, which at a minimum would keep fires well below the extreme temperatures needed to damage the transportation cask. For these reasons, it would be almost impossible for nuclear fuel inside the transportation cask to reach 900 degrees Kelvin (1,160 degrees F), the melting point of foreign research reactor spent nuclear fuel. The probability of reaching such a temperature was calculated to be less than one in a billion (Attachment D5 to Appendix D of the EIS). To put this temperature into perspective, steel used in a ship's structure buckles at around 700 degrees Kelvin (800 degrees F).

The EIS contains the results of an analysis of the effects of an accident that involves a severe fire (severity category 6), which does not reach the temperature to melt research reactor nuclear fuel. Appendix D, Sections D.5.3 and D.5.4 present a detailed discussion of accident probabilities and radioactive material source terms and the results of the analyses, respectively. In conclusion, although long duration ship fires are possible, and have occurred, they are uncommon events. Analyses in the EIS indicate that even in the event of a severe ship fire involving a transportation cask, neither the consequences nor risks are great (Appendix D, Section D.5.5 of the EIS)

Response to Comment No. 746-5

Section 4.2.3 of the EIS presents a discussion of the risks and impacts on the Tacoma port area from receipt of the foreign research reactor spent nuclear fuel. The analyses demonstrate that such risks and impacts would be very low, both for the Tacoma area, as well as for other ports of entry and management sites.

COMMENTOR NO. 747: BEELER, JOHN J.

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Mr. Head:

I just wanted to voice my opinion and let you know that I do not like the idea of highly radioactive nuclear waste, being shipped through the Port of Tacoma. If you happen to remember the city you were in last week, it was TACOMA, WASHINGTON--as in Washington State. 747-1

Your comment that, your bosses in the --other Washington--do not have time to listen to the public was not taken very well in this part of the United States. 747-2

I suggest you listen to all the letters and faxes you will receive on this subject. Please mark me down, as being opposed to these shipments. I hope you "listen."

Thank you very much,

John J. Beeler

RESPONSE TO COMMENT
COMMENTOR NO. 747: BEELER, JOHN J.

Response to Comment No. 747-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 747-2

While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program manager and his staff. The Program Manager is responsible for relaying public views and concerns to the Secretary of Energy and her staff. The final EIS, including comments and responses, and Record of Decision are subject to approval by the Secretary of Energy. All comments received during the ninety day comment period are noted and answered in this document. Under NEPA and DOE's environmental regulations (Section 5 of the EIS), public participation and comments are an integral part of the environmental process.

Overall, DOE's public interaction related to this draft EIS has been well in excess of the requirements set forth in NEPA and the environmental regulations of DOE. Seventeen public hearings were held in the locations determined to be most likely to be directly affected by the EIS alternatives. In addition to accepting public comments during the hearings, written comments were also encouraged. All oral and written comments are addressed in Volume 3 of the EIS.

COMMENTOR NO. 758: CLEMENTS, FLORENCE

925 Ea. 63rd ST.
Tacoma, Wash - 98404
June 21, 1995

Mr. Charles Head:

We, in Tacoma do not want your spent Nuclear Fuel Coming Thru our ports -, and as Idaho is my birth State, I can't see putting it there to store. Look at the Hanford leaks, I feel terrible at the time Hanford was being built, and mentioned to my family of the underground streams that would be contaminated due to our government not caring.

Take the stuff to some desert Country where no one lives and no under ground streams - what's going to happen to our future generations here in our United States of America -

Please do not bring it into the Port of Tacoma.

Sincerely
Florence M. Clements

RESPONSE TO COMMENT
COMMENTOR NO. 758: CLEMENTS, FLORENCE

Response to Comment No. 758-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 758-2

The commentor's opposition to the use of Idaho National Engineering Laboratory as a management site for foreign research reactor spent nuclear fuel is noted.

Response to Comment No. 758-3

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 758-4

The commentor's preference for management of spent nuclear fuel from foreign research reactors in overseas, desert countries devoid of underground water is noted. Overseas management of foreign research reactor spent nuclear fuel is discussed in Sections 2.3 and 2.4 of the EIS.

As demonstrated by the analysis in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low.

COMMENTOR NO. 759: TATE, H.T.

DEAR MR. HEAD, June 21, 95

I'm not a citizen of TACOMA, I live in Puyallup, WA. but it has still come to my attention that somebody is pushing for Olympia's approval on shipping nucleor waste through the Port of Tacoma.

This must not happen.

It is an unsafe cargo and would devistate large surrounding areas if there were an accident.

Don't you people in our Government think things out before you begin bargaining?

Sincerly,

H. T. TATE
806 15th Ave S.E.

Dear Mr. Head,

I was a part of that large, animated gathering Mon. night (5/19/95) in Tacoma. However, I did not speak but was truly interested. Also want to commend you for your presentation and subsequent courtesy and attention.

It does not speak well for some of folks at the DOE that I saw at the gate — "They don't have time to listen". I hope you can carry the load!

A concerned Tacoman,
Marie A. Helmer

While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying public views and concerns to the Secretary of Energy and her staff. The final EIS, including comments and responses, and Record of Decision are subject to approval by the Secretary of Energy. All comments received during the ninety day comment period are noted and answered in this document. Under NEPA and the environmental regulations of DOE (Section 5 of the EIS), public participation and comments are an integral part.

Washington, D.C. 20585

To Charles Head:

As a person who has always been a citizen of Tacoma but could only feel dumbfounded by the sound of the extraordinary plan to ship highly radioactive uranium through the Port of Tacoma, I could only feel so very sympathetic with the many comments I heard at the meeting Monday at the Utilities Building in Tacoma. I felt convinced by the speaker who opposed the use of Tacoma because of the danger of shipboard fires and accidents in transport. I felt convinced by the speaker's questions about where information should be for all the citizens involved, their gratitude that at least a small flier had been issued from the NorthEnd Neighborhood Council, I felt sympathy. I felt more sympathy for the citizens from Federal Way who brought the resolution of their council that the environmental impact statement was not adequate in emergency planning and in consideration of the socio-economic base of the area.

The many speakers emphasized many more important reasons why this startling shipment of radioactive uranium should not go through the Port of Tacoma. I felt shocked by such news - and felt much sympathy with their intelligent comments. 762-1

764-2

RESPONSE TO COMMENT
COMMENTOR NO. 764: SCHUBLOM, CARL

Response to Comment No. 764-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Also, the environmental effects evaluated in the EIS determined that there would be no adverse ecological impacts to any of the ports that might be used to receive the material (Section 4.2.2). Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive materials have ever been released from a spent nuclear fuel transportation cask as a result of an accident (Section 2.6.2 of the EIS).

Response to Comment No. 764-2

Prior to 1989, it was United States policy to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). Ultimate disposition is discussed qualitatively in Section 4.2.7 of the EIS.

Dear Mr. Head:

My name is Nanette Ewing and I'm an 8th grade teacher at Lochburn Jr. High in Lakewood Washington. Lakewood is a suburb of Tacoma. Recently, Tacoma held a public hearing regarding the use of the port of Tacoma as a port of entry for the nuclear waste that is to possibly be shipped here. My 8th grade science classes became quite interested in the issue and some of them have written down their comments on how they feel about this happening in their area. I thought you might be interested in reading them.

Sincerely,

Nanette Ewing

RESPONSE TO COMMENT
COMMENTOR NO. 773: HILTON, JENNIFER

Response to Comment No. 773-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

The EIS did not address marine spills in Puget Sound or elsewhere because the spent nuclear fuel is solid metal that is shipped dry inside a transportation cask, thus there is nothing to spill. In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive contents have ever been released from a spent nuclear fuel transportation cask as a result of an accident.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.

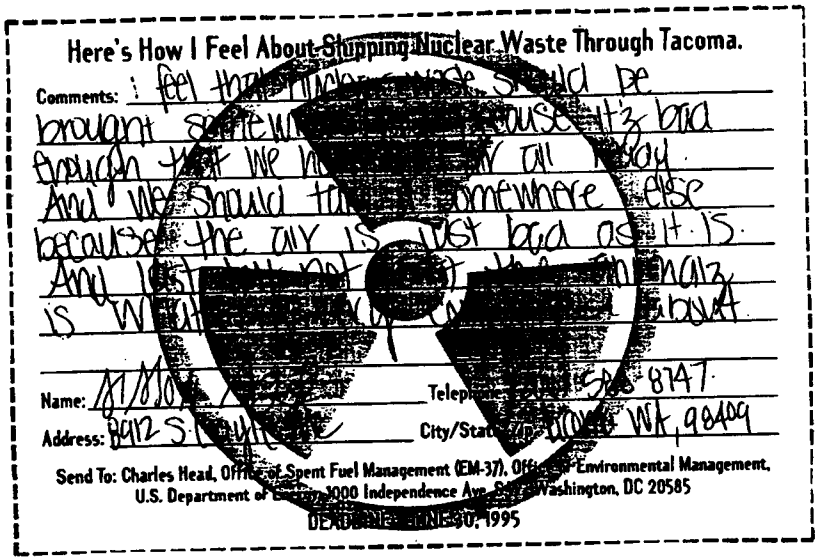
Response to Comment Commentor No. 775: Ogawa, Emily

Response to Comment No. 775-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 776: AGL, M.



Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: I feel that nuclear waste should be
brought somewhere because it's bad
enough that we have it all today.
And we should find somewhere else
because the city is just bad as it is.
And I just do not [illegible] is with [illegible]

COMMENTOR NO. 779: ANONYMOUS

The News Tribune, Tacoma, 24 June 1995

Enough voices may awaken those who 'don't have time to listen'

"They don't have time to listen."

Charles Head, federal project manager for the environmental impact statement concerning shipments of high-level nuclear waste through the Port of Tacoma, sat patiently through the meeting Monday night.

Head sat, his face parked in objectivity. People spoke – more than 50 people – all against the proposed shipments.

A tape recorder heard it all. A facilitator made notes with multi-colored pens upon sheets of paper large enough for everyone to see. Hundreds in the audience watched politely. Speakers spoke their hearts.

Head sat, and when the meeting was over he talked about what happens next. He will offer a report to the director of the Office of Spent Nuclear Fuel Management. But the director will not see the colorful notes, nor will he hear the five hours of tape.

"They don't have time to listen," Head said. In Washington, D.C., at the Department of Energy, the people who will decide whether Tacoma becomes the port of entry for one of this planet's most dangerous substances will hear only from Head. He said he already has a fairly good idea what he'll say, but he's not yet ready to announce his decision.

He said of what he heard in Tacoma, "There's certainly a strong undercurrent of public opinion that is negative to this."

And it's too bad the public servants back at headquarters don't have time to hear how strong that undercurrent really is.

Too bad they won't hear from the speaker who said, "We have the right to be free from fear."

Too bad they won't hear what Allen Orahall, a Tacoma great-grandmother, had to say: "I want to leave a decent legacy for my kids. They have the right to have a decent chance in life."

That chance would be less decent by far should some of the spent nuclear fuel somehow leak, or spill, or otherwise contaminate Commencement Bay, Tacoma, Pierce County and much of Western Washington.

People spoke of Three Mile Island, the Exxon Valdez, Chernobyl, the leaks at Hanford, the O-rings on the Space Shuttle Challenger – of many accidents that could never happen, but did.

"They think we're not smart enough. They think they can put this over on us," said the gray-haired woman the neighborhood kids call "Miss Alice." She's talking about Charles Head. "We've given him pretty much to chew on. I hope he gets indigestion."

Legislators, port commissioners and members of the City Council spoke. Mothers and fathers – some angry enough to swear – spoke.

And it's too bad the bureaucrats have better ways to spend their time, rather than listening to what those people had to say. How easy it will be for them to ignore the comments – the anger, the fear and the anguish – of the people who were there on Monday night.

"When I was a kid, everybody told me Russia was going to drop the bomb. Now, it's the U.S. that's threatening me," said Melody Willhite, who drove down from Everett.

"I see this as a major threat," Tacoma Mayor Harold Moss said.

A citizen asked, "Do we really trust the federal government to do the right thing? We'll fight you. We the people say no. We will not stop."

"I take with a grain of salt the statistics and information you give us," Laureen Roth said.

"We will fight you. It won't happen," state Sen. Marilyn Rasmussen (D-Estacville) said. "I think you have heard from the people."

Which is nice, but they don't have time to listen in Washington, D.C.

Hundreds of people came. People spoke. Charles Head sat through it all, and when it was over, when asked what he thought of what the people said, he replied with a weary sir, "I was more impressed by the number of public officials."

Too perhaps Head and his bosses would take time to listen if the rest of us spoke a bit louder.

If you don't like the idea of highly radioactive nuclear waste being shipped through the Port of Tacoma, write, before June 30, to Charles Head, Office of Spent Nuclear Fuel Management (EM-37), U.S. Department of Energy, 1000 Independence Ave. S.W., Washington, D.C. 20585. Or fax to (202) 586-5356.

If you don't care one way or the other, do nothing. If you haven't got the time to write a letter, then sit back and wait. Just you wait and see what happens next.

Your silence will be of great benefit to those who would rather not be bothered by whatever it is you have to say.

COMMENTOR NO. 780: TAYLOR, KATHLEEN M.

June 22, 1995

Dear Mr. Charles Head,

Please count my voice among those who were not able to attend the meeting on June 19, 1995. I understand from the attached article that you were impressed by the elected & appointed officials who made it to this meeting. I am glad they were there and that it was made plain that citizens of Tacoma and surrounding areas DO NOT DESIRE to have used foreign country nuclear waste shipped through our town. I also am of that same opinion. Count this as a No thank-you!

780-1

Sincerely,
Kathleen M. Taylor

COMMENTOR NO. 781: YALE, LISA LANDKAMER

25 June 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave S.W.
Washington, D.C. 20585

Dear Mr. Head,

I am strongly opposed to the proposal that high-level nuclear waste be shipped through the Port of Tacoma.

781-1

Nuclear waste is an extremely hazardous substance; even after taking safety precautions, accidents can and do occur. Leaks or spillage could contaminate Puget Sound and adversely affect a very scenic, and very populated, area for generations to come. Transporting nuclear waste through this region is not worth the risk.

As a Pacific Northwest native and local resident, I am extremely concerned that our voices be heard as you make this critical decision. According to Tacoma News Tribune columnist C.R. Roberts, hundreds attended the public meeting in Tacoma last month; all fifty speakers were opposed to the plan. Please heed our words and disapprove the proposed program to ship nuclear waste through Tacoma.

Thank you for your work in protecting our environment.

Sincerely,

Lisa Landkamer Yale

Lisa Landkamer Yale

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independent Avenue S.W.
Washington, D.C. 20585

Dear Mr. Head:

As a citizen of Tacoma, I am opposed to the idea of transporting nuclear waste through the Port of Tacoma. I have lived here all of my life and now work in the port area. I am very concerned about the safety of my family and the future of Tacoma. Don't we who live here have enough to worry about? Don't allow Tacoma to become a dumping ground through which deadly trash will be shipped. If you will refer to your geography, you will notice that Washington D.C. and Washington State are on opposite coastlines. No surprise that you would choose a location as far from yourselves as possible. Perhaps we should look at who we have working in this department, and get someone in there who care about all of us. Or maybe we could store some of it in your backyard so your children and grandchildren can enjoy it. Don't like that idea? Niether do we. 782-1

Have a nice day.

Debbie Triska

RESPONSE TO COMMENT
COMMENTOR NO. 782: TRISKA, DEBBIE

Response to Comment No. 782-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Spent nuclear fuel is a solid metallic fuel that is shipped dry, thus, it can not spill or leak.

COMMENTOR NO. 783: KOEHNKE, NAN

COMMENTOR NO. 783: KOEHNKE, NAN

Response to Comment No. 783-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 783-2

Environmental management, including safe waste disposal, is one of DOE's primary missions. The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1. of the EIS).

COMMENTOR NO. 785: PERRYMAN, EDWARD

Mr. Charles Head:

I do not like the idea of highly radioactive nuclear waste being shipped through the Port of Tacoma. I could go on and on, but my feelings are just the same — I do not like the idea of highly radioactive nuclear waste being shipped through the Port of Tacoma.

785-1

thank you

COMMENTOR NO. 787: POPPE, MARY ELLEN

June 26, 1995

Dear Mr. Head,

I could hardly believe what I was hearing on T.V. the night of June 19 about nuclear waste being shipped to Washington State. But I should know better by now what our Federal Gov't. will do to people if they are not paying attention. It should be no surprise to the people inside Washington D.C. why people throughout the rest of the U.S. are cynical.

As you no doubt have surmised, I am against nuclear waste being shipped to Washington State or to any part of the U.S., especially from other countries! 787-1

I am a teacher, I've never been in jail, I don't belong to a militia group, I pay taxes and I am a responsible citizen that makes my voice heard at the voting booth. No wonder politicians are a bit perplexed and nervous (hopefully unelected bureaucrats, too), about the feeling in this country to make changes. It's coming from many people that have been quiet for too long.

Sincerely,

Mary Ellen Poppe

COMMENTOR NO. 795: MULLINS, JULIE & STEVE

June 24, 1994

Dear Ms. Head,

I and my family are definately against the new proposal of Nuclear waste to be transported through our local ports and being stored here in any fashion. Why should we as local citizens risk our health and lives for the nuclear waste of other countries. I was truely disgusted by all the information else barned about the exposure my beautiful daughter and myself could have just sitting in traffic next to this poison. There's nothing we can do 10 years down the road when there's a high level of cancer through the community. Apologies don't save lives or change things: it is our right as Tacoma residents to make this decision — I'm sure it's very easy for the politicians in Washington D.C to decide. Let them this stuff should go — it won't kill them or their families, or children or grandchildren, they wouldn't be driving next to it, sleeping next to it, living with it.

Julie A. Mullins
Steve C. Mullins

over ↓

795-1

795-2

795-3

RESPONSE TO COMMENT
COMMENTOR NO. 795: MULLINS, JULIE & STEVE

Response to Comment No. 795-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 795-2

An objective of the proposed action is to reduce the risk of nuclear weapons-grade material falling into the hands of a nation with the technology and intent to develop a nuclear weapons capability (Section 1.2 of the EIS). As discussed in Section 4 of the EIS, risks associated with implementation of the proposed action to health and the environment would be low.

Response to Comment No. 795-3

DOE shares the commentor's concern about limiting radioactive exposures to the lowest levels achievable. Section 4.2.3 of the EIS discusses potential impacts to the general population from foreign research reactor spent nuclear fuel transport and demonstrates that the human health effects would be low. Please note that the analyses in the EIS used very conservative assumptions about radiation exposures and that the likely effects would be much lower.

COMMENTOR NO. 795: MULLINS, JULIE & STEVE (CONT'D.)

Other suggestions

1) Storing in remote areas that are densly populated. — 795-4

2) People handling or transporting the material are highly qualified in nuclear waste management and know the danger. — 795-5

3) When a place is found and decided upon, it is brought in by airplane so as not to accidentally pollute the waterways and create a catastrophe. That would also prevent unnecessary exposure to hundred of thousands of people in the process. From what I understand that's been an option, its just more expensive — I don't think nuclear waste is the area to cut corners! — 795-6

Julie & Steve L. Mullins
101 EAST 64th ST
TACOMA WA 98404
(206) 475-4144

RESPONSE TO COMMENT
COMMENTOR NO. 795: MULLINS, JULIE & STEVE (CONT'D.)

Response to Comment No. 795-4

The commentor's suggestion that foreign research reactor spent nuclear fuel should be stored in remote areas is noted. Spent nuclear fuel from foreign research reactors would not be stored at any of the candidate ports (Section 2.6.3.2 of the EIS). Candidate management sites are described in Section 3.3 of the EIS.

Response to Comment No. 795-5

Although the foreign research reactor spent nuclear fuel is radioactive material, the dose rates from the transportation casks would be low. Appendix D, Section D.4 of the EIS demonstrates that the radiation dose that anyone would receive while handling or being near a cask is less than the limit that is allowed to the public in an unrestricted area by NRC regulations (10 CFR Part 20). As discussed in Section 4.2.2.5 of the EIS, to avoid radiation doses which may exceed public dose limits, DOE would establish administrative procedures and maintain records to track individual exposures. Otherwise, no special handling or loading/unloading procedures would be required for the foreign research reactor spent nuclear fuel when it is contained in standard shipping containers.

Response to Comment No. 795-6

The commentor's preference for use of airplanes to transport the foreign research reactor spent nuclear fuel to DOE management sites is noted. The option of air transport was considered, but dismissed for the reasons given in Section 2.10 of the EIS.

COMMENTOR NO. 796: WEATHERFORD, JAMES A.

NUCLEAR WASTE SHIPMENT
PORTEST

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Sir,

I have been following the on-going controversy of the shipment of waste nuclear fuel through my home town, TACOMA WA, and I can say without hesitation I do not want it shipped through here. It has even been mentioned that Scotland wants the stuff to use in their power production system. If no american wants this waste in his/her backyard and you have a useful place for it to go that wants it, why is there any discussion? 796-1 796-2

DO NOT SHIP THIS WASTE THROUGH ANY U.S. PORT!!! LET SCOTLAND HAVE IT!!!

WE DON'T WANT IT IN TACOMA WASHINGTON!!!

James A. Weatherford 4/26/95

JAMES A. WEATHERFORD

RESPONSE TO COMMENT
COMMENTOR NO. 796: WEATHERFORD, JAMES A.

Response to Comment No. 796-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 796-2

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Section 2.3 and 4.4.2 of the EIS.

COMMENTOR NO. 797: BRYSON, ROBERT

Dear Mr. Head;

I am writing to you as a concerned and frightened citizen of the Tacoma area. I am sure that you are well aware that there are many people who live in this highly populated area of Washington state. Most of the people in this area are very much opposed to shipping nuclear waste through our city and our already ecologically strained Puget Sound waterways. I have heard about the fine job that the people in the Spent Nuclear Fuel Management Department do in making sure that this waste does not leak or contaminate during shipment. There hasn't been an incident in forty years of transporting this highly toxic and hazardous material. Quite frankly, it isn't the shipment of this material that concerns me as much as what we are doing to this our environment and ultimately to our future generations by accepting this material into our state. As you are well aware, there are two things of which we can be certain. One is that nothing manmade lasts forever except the radio active contaminates contained in the shipments of this material. The containers will deteriorate before the contained material loses the ability to contaminate the area in which it is stored. Two, accidents are human nature. There is no way that you or any other person or department can positively guarantee that an accident or act of terrorism will not happen in a populated area during the shipment of this material. People blow up Federal buildings,airplanes, and ships to make statements for their beliefs. What if some mentally unstable person wanted to make a statement of his own with a handy little nuclear device supplied by your department? It could happen!!! I don't know where you live sir, but I live here in the Tacoma area. It is my back yard that will be contaminated should any of this material leak into the air that I am breathing. It is my body and my friends and my family that is at risk. It is the water that we drink and the air that we breathe and the food that we eat that is at risk. It is our world that is at risk. This is the only world we have sir. If we keep filling it full of this kind of garbage we will leave a legacy to our future generations like no other plague or war or natural catastrophe has ever wrought upon this planet. If you just could take a quiet hour to contemplate and visualize even fifty years into the future, what this area would be like with the tremendous volume of radioactive waste that is being stockpiled,not only from our own reactors,but those of other countries as well. What kind of hell on Earth are you and your department creating for our children? There is absolutely no positive vision that can be derived other than the fact that it is out of sight out of mind "for now". Where is the vision of our leaders? Where is the concern for America? This is the most beautiful country in the world and Washington is the most beautiful state in this country. It is full of natural wonders and wildlife and wonderful people who appreciate this beauty for what it is. No one wants it to become a garbage dump for the worlds "spent nuclear fuel" except those who don't live here and don't want it in their back yard. It is time for you pro nuclear power people to wake up and smell the roses while there are still roses to smell. Sometimes we run into situations where the solutions (ie:nuclear power) are just too costly(ie:the environment) to pursue.

797-1

797-2

797-3

797-4

RESPONSE TO COMMENT
COMMENTOR NO. 797: BRYSON, ROBERT

Response to Comment No. 797-1

It is true that some of the nuclide in the spent nuclear fuel remains radioactive and toxic for a long time, but it is also true that this material can be stored safely. There is no intention to store the spent nuclear fuel in the transportation cask forever. The EIS proposes that the intact spent nuclear fuel be stored for a maximum of 40 years at a DOE management site. Experience at the Savannah River Site has shown an excellent storage capability concerning foreign research reactor spent nuclear fuel for lengths of more than 20 years. The research reactors, with the lifetime cores, keep the same fuel in the reactor pool for approximately 40 years. Others as indicated in Appendix F, Section F.2.9 of the EIS, have experience in safe storage of spent nuclear fuel in dry storage for more than 30 years. DOE proposes to store the foreign reactor spent nuclear fuel in dry storage after the receipt and characterization of the spent nuclear fuel. The EIS concluded that the risks of storing the foreign research reactor spent nuclear fuel in dry storage at any of the five potential management sites are low (Section 4.2.4, and Appendix F, Section F.4).

Response to Comment No. 797-2

Section D.5.9 has been added to Appendix D of the EIS to address the issue of attack by disgruntled persons or terrorists.

Response to Comment No. 797-3

Section 4.2.3 of the EIS presents a discussion of the human health risks and impacts on port areas, including Tacoma, from receipt of the foreign research reactor spent nuclear fuel. The analyses demonstrate that such risks and impacts would be low, both for ports of entry, as well as for the proposed management sites.

Response to Comment No. 797-4

As discussed in Sections 2.2 through 2.5 of the EIS, none of the policy alternatives would compel the United States to act as a permanent repository for spent nuclear fuel from foreign research reactors. If foreign research reactor spent nuclear fuel were accepted into the United States, it would be for a limited period of time. The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). Under Management Alternative 2 (Section 2.3 of the EIS), the United States would assist foreign research reactor operators in overseas management of their spent nuclear fuel. Management Alternative 3 (Section 2.4 of the EIS) would provide a combination of domestic and overseas management.

COMMENTOR NO. 797: BRYSON, ROBERT (CONT'D.)

I realize that this is a plea for curtailed nuclear power as well as a plea and a demand that you do not use Tacoma or the Puget Sound area for shipment of nuclear waste. It does not matter what you do or where you plan to put the waste. It will still contaminate the earth and the logical alternative is to curtail the production of this waste by curtailing the production of nuclear power. It is the only answer. I would rather live in darkness twelve hours a day and be secure that the earth was safe, than to live in the light of nuclear power and find that the future generations will be trying to live on a planet ravaged by radioactivity. Please think about cause and effect. We don't want it, we don't need it, and we won't accept it!!! 797-5 797-6

Sincerely,

Robert Bryson

RESPONSE TO COMMENT
COMMENTOR NO. 797: BRYSON, ROBERT (CONT'D.)

Response to Comment No. 797-5

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 797-6

As discussed in Sections 2 and 4 of the EIS, spent nuclear fuel from foreign research reactors can be safely stored with little risk of contamination at one or more of the five candidate management sites pending final disposition. Foreign research reactors are not used for production of commercial power. They do have applications in medicine, materials research, and agriculture which are described in Section 1.1 of the EIS.

COMMENTOR NO. 798: CATTON, WILLIAM R., JR.

22 June 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, DC 20585

Dear Sir:

This letter is meant to convey my very strong objection to using the port of Tacoma for shipping spent nuclear fuel.

I live near the city of Tacoma, and do not welcome the possibility of nuclear materials passing through this area. 798-1

Although I recognize that extreme measures would be taken to prevent accidents, no safeguard can be absolutely perfect. There will be some risk inherent in the very process of transferring shipments from ocean-going vessels to trains or trucks, and there is no way to reduce to zero the risk of railroad or highway accidents as the material moves on from the port.

Officials and the public in this area have expressed themselves as strongly opposed to incurring these risks. They should be listened to.

This country (and others) did an extremely unwise thing in plunging into an era of atomic power generation without having worked out in advance the requirements for safe disposition (I will not say disposal) of ensuing radioactive hazardous waste. I say this with benefit of hindsight, of course; as a young sailor aboard an aircraft carrier in the waters near Japan at the end of World War II, I was as cheered as were my shipmates by the imminence of the end of hostilities when we learned of the atomic bomb. But that was then, this is now. 798-2

I remember a time when the plumbing system on our ship was shut down for a prolonged time. We were, accordingly, not supposed to use the "heads." The physiology of sailors, like that of other organisms, goes on generating waste even when there is no means for disposing of it..... Imagine the situation and you have a small analogy for the predicament of a world that began half a century ago to accumulate radioactive materials for which it still lacks the equivalent of an effective "head."

A naval architect who consistently omitted that facility in every ship he designed would not be allowed to continue designing ships. But we entered the age of atomic power generation in a way as reckless as a navy committed to using designs with that glaring defect!

Please spare the port of Tacoma, and this still livable corner of the country.

Sincerely,

William R. Catton, Jr.

COMMENTOR NO. 798: CATTON, WILLIAM R., JR.

Response to Comment No. 798-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.3, and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 798-2

Environmental management, including safe waste disposal, is one of DOE's primary missions. The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1. of the EIS).

In re: Port of Tacoma, Washington

Hello Mr. Head:

I recently learned of the aforesaid port being considered as a possible port of entry for shipment of spent nuclear fuel.

As a citizen in good standing and property owner/tax payer in the county of said city, I direct you to cease considering the Port of Tacoma, Washington as a port of entry for the shipment of spent nuclear fuel as I fear for my family's safety and health. 799-1

In the alternative, I appeal to you to cease plans involving the aforesaid port for the shipment of spent nuclear fuel at least until the considerations in the enclosure attached are met with.

Good day.

L. Jeffrey Lickteig

Charles Head
Office of Spent Fuel Management(EM-37) 6/23/95
US Department of Energy
1000 Independence Ave., SW.
Washington, DC. 90585

Dear Mr. Head,

I didn't go to your meeting on Monday, June 19th. I baby-sat so my son and his wife could go. But I did read a piece in the Tacoma newspaper and I got the very definite impression that it doesn't really matter what we think about this 'spent fuel' issue. You're going to do it anyhow. 801-1

I realize the need for policing the nuclear 'spent fuel', but please police it where it originates! I understand the arguement, 'if we store it here, the crazies won't blow us up with it'. This is wrong! Where there's a will, there is a way...Oklahoma City! 801-2

We cannot deal properly with our own nuclear mess, (ie; Hanford) and we should import someone else's?

Please!!!!! Keep Washington State green.... not Washingtonians!!!

Thank you.

Sincerely,

Barbara J. Keller

RESPONSE TO COMMENT
COMMENTOR NO. 801: KELLER, BARBARA J.

Response to Comment No. 801-1

Under NEPA (Section 5.2.1 of the EIS) and applicable DOE environmental regulations (Section 5.2.3 of the EIS), public participation is an important component of the environmental process. All comments submitted during the comment period have been reviewed and responded to in Volume 3 of the EIS.

This EIS evaluates environmental effects of three alternatives for management of spent nuclear fuel from foreign research reactors: management in the United States (Management Alternative 1, Section 2.2 of the EIS), overseas management (Management Alternative 2, Section 2.3 of the EIS), and a combination of domestic and overseas management (Management Alternative 3, Section 2.4 of the EIS). A No Action Alternative, which means that the United States would not adopt a policy for managing spent nuclear fuel from foreign research reactors, was also evaluated (Section 2.5 of the EIS). None of the policy alternatives were found to result in significant benefits or risks to human health or the environment.

Response to Comment No. 801-2

As discussed in Sections 2.2 through 2.5 of the EIS, none of the policy alternatives would compel the United States to permanently act as a repository for spent nuclear fuel from foreign research reactors. If Management Alternative 1 (management in the United States, Section 2.2 of the EIS) is adopted, foreign research reactor spent nuclear fuel would be accepted for a limited period of time. This alternative would give foreign research reactor operators time to arrange for disposition of their spent nuclear fuel, while avoiding reactor shut downs and encouraging the use of LEU fuel in research reactors. Under Management Alternative 2 (Section 2.3 of the EIS) the United State would assist foreign research reactor operators in overseas management of their spent nuclear fuel. Management Alternative 3 (Section 2.4 of the EIS) would provide a combination of domestic and overseas management.

1000 INDEPENDENCE AVE. SW
WASHINGTON D.C. 20585

DEAR MR HEAD:

AS A PRIVATE CITIZEN, LIVING JUST EAST OF THE PORT OF TACOMA, I AM ALARMED AT THE THOUGHT OF HAVING NUCLEAR MATERIAL STORED & SHIPPED "JUST DOWN THE HILL FROM US"!

WE ARE NOT EQUIPPED IN THE TACOMA ETC AREA TO HANDLE THIS MATERIAL & THE POTENTIAL (GOD FORBID) EMERGENCY THAT COULD ARISE IF SOMETHING GOES WRONG!

IT WOULD SEEM TO ME THAT THE BEST & LOGICAL SOLUTION TO THE HANDLING, STORING ETC OF THE MATERIAL IS TO KEEP IT OVER SEAS WHERE IT CAN BE REPROCESSED - WE DON'T SEEM TO HAVE ADEQUATE REPROCESSING FACILITIES IN THE U.S.

ANYWAY, WE DON'T WANT IT IN OUR AREA!!

SINCERELY
W. S. LEAKE

802-1

802-2

802-3

RESPONSE TO COMMENT
COMMENTOR NO. 802: LEAKE, WILLIAM S.

Response to Comment No. 802-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States, there would be no storage of this material in the Port of Tacoma, or any other port. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

Response to Comment No. 802-2

Foreign research reactor spent nuclear fuel shipments are subject to the same types of potential hazards as those of other ships carrying nonradiological hazardous materials.

DOE considers that there is adequate regulatory and emergency preparedness infrastructure to ensure the safe acceptance and transport to designated management sites if the foreign research reactor spent nuclear fuel is managed in the United States. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1. There are three national emergency response plans under which DOE provides radiological monitoring and assessment assistance. Under these plans, DOE provides technical advise and assistance to the State, Tribal and local agencies involved with a radiological incident. Emergency preparedness, security, and coordination of DOE with local emergency response authorities, and security are discussed in general in Sections 2.7 and 2.8 of the EIS. Details would be contained in the Transportation Plan, that would be prepared prior to any individual spent nuclear fuel shipment and coordination with State and local officials. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments.

Response to Comment No. 802-3

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Section 2.3 and 4.4.2 of the EIS.

Washington, D.C. 20585

Dear Mr. Head:

We urge you to drop consideration of the Port of Tacoma as a place through which other nations' spent nuclear fuel is transported. We understand that another country (Scotland?) can safely convert this waste and get more use out of it, thereby reducing further the amount of nuclear waste in the world. Let's give priority to their request. Second priority should be given to the U.S. naval port that's being considered. 803-1 803-2 803-3

Sincerely,
Alicelia R. Warren
Robert Warren

RESPONSE TO COMMENT
COMMENTOR NO. 803: WARREN, ALICELIA & ROBERT

Response to Comment No. 803-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 803-2

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS.

Response to Comment No. 803-3

Ten ports that are considered to be able to safely receive foreign research reactor spent nuclear fuel were identified using the port selection criteria discussed in Appendix D, Section D.1.9 of the EIS. Either military or commercial ports, if they meet the selection criteria, are equally acceptable. Risks associated with accidents in both military and commercial ports are discussed in Appendix D, Section D.5.5 of the EIS.

COMMENTOR NO. 804: SWANSON, MARGARET

Margaret Swanson
11218 Butte Dr. SW
Tacoma, WA 98498

Mr. Charles Head
Office Of Spent Nuclear Fuel Mgmt(EM-37)
U.S. Department of Energy
1000 Independence Ave. SW
Washington, DC 20585

23 June 95

Dear Mr. Head,

My name is Margaret Swanson. I'm 27 years old, and I have lived in Tacoma all my life. I also have a daughter named Rhiannon, who will be two in a couple of weeks. She's also a Tacoma native.

I want to tell you about my new responsibities as a fairly new mom. It's my job to protect her from harm and watch out for her. When she's in the car, she's in a car seat; in the summer she has sunscreen to protect her skin from too much sun. Her food is cut into small pieces, my cabinets have child latches on them; I have a child harness on her out in public so she won't wander off. Being a good parent also means being a good role model. We wear seatbelts, we recycle, we drive the speed limit, we give to local and national charities to help our neighbors and fellow citizens. We try to do what's in the best interest of our children and our fellow Americans.

Having nuclear waste enter thru the Port of Tacoma IS NOT in our best interest. The financial gain to Tacoma by allowing this access will never be enough to compensate the loss of the Puget Sound and all it offers us- marine and wildlife, the livelihood of thousands of people, and just the serene beauty of it. All lost by one mishap by one human. The loss of two major military installations- Ft. Lewis and McChord AFB- due to radioactive contamination would be a devastating blow to the region, not to mention the Federal government. 804-1

The newly incorporated city of Lakewood where I live is the 6th largest in the state- where are you going to put us if we are displaced by an accident? 804-2

RESPONSE TO COMMENT
COMMENTOR NO. 804: SWANSON, MARGARET

Response to Comment No. 804-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS).

Response to Comment No. 804-2

The commentor's concern about a catastrophic accident associated with the ground transportation of foreign research reactor fuel, regardless of its probability of occurrence is noted. The risk to the environment and the health and safety of the public associated with the ground transportation of foreign research reactor spent nuclear fuel under Management Alternative 1 is discussed in Section 4.2.3 of the EIS.

COMMENTOR NO. 804: SWANSON, MARGARET (CONT'D.)

By now, I'm sure you must think I'm one of those NIMBY people- Not In My Back Yard. I'm not. I'm more concerned about those of you in Washington who think the chances are slim to none this plan of yours will be a problem. Let me tell you about chances.

When my daughter was born two years ago, she was diagnosed with achondroplasia; she's a dwarf. The chances of an average man and woman with no history to reproduce a dwarf is 1: 40,000. I am that one. It took higher odds than me for Chernobyl, for Three Mile Island, for Love Canal, for Phoupal, India, for Prince William Inlet to occur. I don't like your odds.

It just takes one.

We have more to lose- much, much, much more as a community than we do to gain in financial opportunity.

thank you.

A Concerned Registered Voter,

Margaret A. Swanson

COMMENTOR NO. 806: ERICKSON, BARBARA

Response to Comment No. 806-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 806-2

Based on the evaluation of impacts presented in Section 4.2.2 of the EIS, the risk that activities associated with the transportation of foreign research reactor spent nuclear fuel affecting current environmental conditions at any of the ports considered is low.

Response to Comment No. 806-3

The distance from the port to the management site(s) is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port population, route population, port experience with handling containers, and access to the ocean would be considered in making the final selection of ports of entry. Appendix D, Section D.1.9 of the EIS presents details of the port selection process.

Response to Comment No. 806-4

For the general public in a port area, there would be no measurable radiation exposure at all unless there was an accident that released some radiological material from the spent nuclear fuel transportation cask. The frequency of such an accident multiplied by the consequences of such an accident yields the risk of that accident. The risk of such an accident to the general public in the Tacoma area is given in Table 4-7 of the EIS, and it is shown to be far less than one LCF.

If an accident did occur, however, the consequences would not be horrendous, as suggested by the commentor. The estimated consequences of severe port accidents are presented in Table 4-6 of the EIS, and the worst consequence for the Port of Tacoma would be 0.8 latent cancer fatalities.

COMMENTOR NO. 809: ANONYMOUS

Response to Comment No. 809-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 809-2

The commentor's preference for the overseas management alternative is noted. This is Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 812: GOODMAN, L.

6/27/95

I am truly surprised to learn that you don't care what the people think about Nuclear waste being shipped through Tacoma. This is America and the people should not have to worry about having their city destroyed by an "accident". 812-1

Should you go ahead with the proposed plan, do you want to apologize in advance for any accident that may occur, since no one will be around to receive the apology later?

You will be surprised to learn that many, many people are scared of your plan. Please reconsider.

L. Goodman

RESPONSE TO COMMENT
COMMENTOR NO. 812: GOODMAN, L.

Response to Comment No. 812-1

DOE does care what the people of Tacoma think about the proposed action, as evidenced by the measures taken to obtain public comments. DOE's public interaction related to this draft EIS has been well in excess of the requirements set forth in NEPA and DOE's environmental regulations. Seventeen public hearings were held in the locations determined to be most likely to be directly affected by the EIS alternatives. In addition, the period of acceptance for written comments was extended from June 20 to July 20, 1995. However, the analyses presented in the EIS indicate that the risk of an accident resulting from the transport of the foreign research reactor spent nuclear fuel through Tacoma, or any of the other potential ports of entry, is low. Nevertheless, DOE notes the commentor's opposition to the use of Tacoma as a port of entry for foreign research reactor spent nuclear fuel.

COMMENTOR NO. 815: PUGH, PAMELA S.

Pamela S. Pugh
4137 "L" St
Bremerton, Wa. 98312.

June 20-95

Dear Sir;

I was not able to attend the meeting on 6/19/95 in regards to the deposit of nuclear waste into this country from Europe. I am really against this action even though the government tells us it would not be a problem - I believe it would be! Two or three years ago the U.S.A. wanted to dump their solid waste into the empty coal mines of Britain, or specifically England, + they understandably rebelled against it. Why does not each country take care of its own? Whether its people, garbage nuclear waste or whatever? Hopefully you had a good turnout at the meeting, I was encouraged to express my feelings on the matter in this manner. I would appreciate hearing the outcome of this situation.

Thank You - Sincerely
Pamela S. Pugh

815-1

815-2

RESPONSE TO COMMENT
COMMENTOR NO. 815: PUGH, PAMELA S.

Response to Comment No. 815-1

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted. Section 2.3 of the EIS describes other alternatives under consideration.

Response to Comment No. 815-2

The commentor's preference for the No Action Alternative is noted. The No Action Alternative is discussed in Sections 2.5 and 4.6 of the EIS.

Many foreign research reactor operators cannot store their spent nuclear fuel within their own country at this time due to existing regulatory or financial constraints. Management alternatives described in Sections 2.2 through 2.4 of the EIS are intended to provide foreign research reactor operators with time to arrange for disposition of their spent nuclear fuel. (Section 1.2 of the EIS).

Response to Comment No. 817-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 817-2

The commentor's opposition to acceptance of spent nuclear fuel from foreign research reactors into the United States is noted (Management Alternative 1, Section 2.2 of the EIS). Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

COMMENTOR NO. 819: MUNSON, LEONA S.

June 23, 1995

Mr. Charles Head
Dear Mr Head:

The elaborate public meeting held in Tacoma a few days ago was presented to the wrong audience. All those beautiful charts and recordings never will be seen or heard by the persons trusted with making the important decision of whether highly radioactive nuclear waste should be shipped through The Port of Tacoma. As you said your self "they dont have time to listen"

Would you want them deciding to move such hazardous material through your home area? And who has the right to cause The Tacoma area to live in constant fear of a Nuclear disaster?

Please give this problem some Seriors thought

Sincerely,
Leona S. Munson

819-1

819-2

RESPONSE TO COMMENT
COMMENTOR NO. 819: MUNSON, LEONA S.

Response to Comment No. 819-1

While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying public views and concerns to the Secretary of Energy and her staff. The final EIS, including comments and responses, and the Record of Decision are subject to approval by the Secretary of Energy. All comments received during the ninety day comment period are noted and answered in this document. Under NEPA and the environmental regulations of DOE (Section 5 of the EIS), public participation and comments are an integral part of the environmental process.

Response to Comment No. 819-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Washington, D. C. 20585

June 26, 1995

RE: Draft Environmental Impact Statement (EIS) on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

Dear Mr. Head:

The purpose of this letter is to express to you my unalterable opposition to the Department of Energy's proposal to make the Port of Tacoma, Washington a port of entry for spent foreign reactor fuel because I was unable to do so at the public hearing held on June 19, 1995. I very much wanted to add my voice to those opposing the proposal, but was unable to do so. In fact, I couldn't even get in the hearing room.

The proposal as outlined in the reference is not acceptable. I am employed by a small corporation engaged in the wholesale and retail seafood business, I am thoroughly familiar with and intimately dependant upon the seafood industry of Puget Sound and the coastal waters of Washington State.

Your proposal completely ignores the impact that an accidental discharge of radiation in the coastal waters, Straits of Juan De Fuca or Puget Sound proper would have on the seafood industry, let alone the lives of all of us who make the area our home. In so many other areas involved in the handling of radioactive materials, safeguards have not been effective. The "accident" that could not happen, has always managed to happen. I need only cite Chernobyl, Hanford and Three Mile Island to prove my point. 820-1

I strongly recommend that you do not select Tacoma as a Port of Entry for this program, in fact, I believe you need to drop the whole idea of importing other people's nuclear waste. I think you need to think this one through a little more. Your department is about to feel the bite of the budget axe, and I think you're trying to make one last attempt at justifying your department. You can't fool the American people for long Charlie. We're on to you.

Sincerely,

JAMES M. McCLINTIC
8017 65th St. Ct. W.
Tacoma, WA 98467-3944

RESPONSE TO COMMENT
COMMENTOR NO. 820: MCCLINTIC, JAMES M.

Response to Comment No. 820-1

The commentor's opposition to the use of the Port of Tacoma for the receipt of foreign research reactor spent nuclear fuel is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk of bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Based on over 30 years experience shipping spent nuclear fuel, DOE considers that spent nuclear fuel transportation casks passing through the Port of Tacoma, or any other port or waterway, would not release their radioactive contents, thus would not affect water quality. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

COMMENTOR NO. 821: LUNDSTROM, NORMAN & CYNTHIA

Mr. Charles Head
Office of Spent Nuclear Fuel
1000 Independence Ave. (EM-37)
Washington D.C. .20585

Mr. and Mrs. Norman H. Lundstrom
6711 Whitman St. N.E.
Tacoma, Washington 98422

June 27, 1995

Dear Mr. Head,

We strongly oppose the shipping of nuclear waste in the waters of Puget Sound or any other part of the Pacific Northwest. The Puget Sound basin and its surrounding land areas is comprised of high density population centers. Puget Sound and the Pacific Northwest is a fragile natural environment already struggling to survive the selfish impact of human kind. 821-1

We are extremely concerned about the potential catastrophic effect associated with shipping toxic/radioactive nuclear waste through our precious land and waterways. The reality of a natural disaster, an act of terrorism, or human ignorance does indeed exist! The Three Mile Island catastrophe, leakage at the Hanford storage site, and a number of published incidents at Rocky Flats support the above statement. Please carefully reconsider the shipping of deadly nuclear waste through Puget Sound and the Port of Tacoma, and for that matter anywhere else in the Pacific Northwest before it is too late. We very vividly recall Dixie Lee Ray spouting out all of the statistics which strongly suggested minimal concern for the potential of nuclear power plant disasters. Shortly afterward, this nation was faced with the Three Mile Island catastrophe. 821-2

In closing, please find the letter that our 8 year old nephew has written to you. This child does not stand alone. We are very concerned and you should be too.

If you would be kind enough to send us a copy of the environmental impact statement concerning this matter, we would appreciate it. Please keep us up to date on all aspects of this very critical matter.

Respectfully,

Mr. Norman H. Lundstrom
Mrs. Cynthia A.Lundstrom

encl.

RESPONSE TO COMMENT
COMMENTOR NO. 821: LUNDSTROM, NORMAN & CYNTHIA

Response to Comment No. 821-1

The commentor's opposition to the use of the Ports of Portland, Seattle, or Tacoma to receive foreign research reactor spent nuclear fuel is noted. The port selection criteria discussed in Appendix D, Section D.1.9 of the EIS identify ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma or Portland, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2).

It should also be noted that Section 3151 of Public Law 103-160 (the National Defense Authorization Act for the Fiscal Year 1994), requires that "the Secretary of Energy shall, if economically feasible and to the maximum extent practicable, provide for the receipt of spent nuclear fuel...at a port of entry in the United States which...had the lowest human population in the area surrounding the port of entry..." Public Law 103-160 was signed on November 30, 1993, which is after completion of the scoping process for this EIS. DOE included consideration of Section 3151 of Public Law 103-160 by including Criterion 5 in the port selection criteria for this EIS (Appendix D, Section D.1.9.5). Application of this criterion resulted in cities such as Seattle being dropped from the list of proposed ports of entry, while Tacoma stayed on the list.

Response to Comment No. 821-2

The human health risks due to accidents involving the transportation and management of the foreign research reactor spent nuclear fuel are discussed in Section 4 of the EIS. The results of the analyses of the credible accidents involving foreign research reactor spent nuclear fuel demonstrate that the risk of the proposed action would be low. Due to differences in the nature of the foreign research reactor spent nuclear fuel from the situation at Three Mile Island (e.g., Three Mile Island involved an operating power reactor versus the foreign research reactor spent nuclear fuel which is metallic and is shipped dry), there would be no accidents involving the foreign research reactor spent nuclear fuel that could approach the severity of the Three Mile Island accident.

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 826-2

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS.

COMMENTOR NO. 827: MARKIEWICZ, MICHELE C.

Tacoma Wa
June 1995

Charles Head,
DOE
Wash, D.C.

Dear sir

One of the attendees locked out of the recent public meeting for consideration of Tacoma as a port of entry for global nuclear waste, I would like to express my opposition to the proposal, and to urge you in your official capacity, in your social and personal consciences, in your ecological awareness, to work toward a cessation of the production of spent nuclear fuel.

Given the half-life of said material, you will not be able to work toward elimination of your own job, through lack of (eventual) necessity, but you might, as a PUBLIC official, 1) discourage proliferation of nuclear devices, 2) encourage research into and commitment to the safest, most isolated handling of such materials as already exist, handling to include transport mode, storage facilities, and security from theft.)

827-1

827-2

RESPONSE TO COMMENT
COMMENTOR NO. 827: MARKIEWICZ, MICHELE C.

Response to Comment No. 827-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 827-2

Implementation of the proposed action would support U.S. nuclear nonproliferation policy seeking to reduce and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment at candidate ports, along representative transportation routes, and at interim management sites would be low (Sections 4.2.2, 4.2.3, and 4.2.4 of the EIS respectively).

The DEIS from your office reflects neither of these approaches, and therefore, seeming lack of information and concern regarding the enormous responsibility which your title implies, carries. On behalf, not only, of the people of Tacoma, but of the present and future globe, please gather and use the most current and comprehensive knowledge available in your decision making, with one eye, daily, to rapid changes in the knowledge bank, and so to the need for quick adaptability. We, and posterity depend on it.

Sincerely and respectfully,

Ms. Michele C. Markiewicz

COMMENTOR NO. 828: HALE, STEVEN M.

Tacoma meeting 26 June 95

Mr Head

I watched you presentation and most of the speakers later on.

I believe the size of the group was about right for a town meeting. Perhaps what was needed was about 5 or 6 of these for a City our size.

What a miscalculation on your offices part to believe there would be so meager a response.

My wife was in the parking lot with many others trying to get into the small Place. In fact you could have filled a 3-5,000 place but then no more persons could have talked in just one mtg.

Here are my reasons your technically flawed plan as it is should

828-1

RESPONSE TO COMMENT
COMMENTOR NO. 828: HALE, STEVEN M.

Response to Comment No. 828-1

As evidenced by DOE's agreement to schedule a second meeting in the Tacoma area, DOE encouraged the input of the individuals, organizations, and State and local representatives who wished to voice their position on the proposed action. The facility used for this meeting was selected and provided by the City of Tacoma, not DOE.

Response to Comment No. 828-2

The passage from the Straight of Juan de Fuca to Tacoma, meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection. Appendix D, Section D.1.9.2 of the EIS presents details of the criterion and how it is applied. The favorable transit from open ocean is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port experience with handling containers, port facilities, access to land transportation, and population in the port and along the route to the management site(s), have also been considered in making the final selection of ports of entry. Appendix D, Section D.1.9 of the EIS presents details of the overall port selection process.

COMMENTOR NO. 828: HALE, STEVEN M. (CONT'D.)

Come here. I speak as a citizen a pwa police office and a medical army officer with years of intimate experience with nuclear weapons.

- Puget Sound is a narrow deep inherently busy transit pattern for big ship and small.

828-2

- There are a lot of radical self regulated self styled WacKo's in this area that could cause havoc easily. I mean easily, They aren't dumb.

828-3

- In looking at a map of the area it seems a route along the Columbia R.V.A. would be much easier to decontaminate if god forbid something should happen.

828-4

I believe we probably do need to recapture some of these materials but let us not alienate the intelligent citizenry.

Sincerely Steven M Hale

RESPONSE TO COMMENT
COMMENTOR NO. 828: HALE, STEVEN M. (CONT'D.)

The volume or size of the local marine traffic (present or future) was not considered in the calculation of risk associated with the shipment of foreign research reactor spent nuclear fuel. In general, the number of ship mishaps is not proportional to the amount of ship traffic because port ship traffic is slow, and even when heavy, is normally a small number of ships per hour. Historically, increasing the volume does not significantly increase the probability of an accident. Rather, the number of ship mishaps is associated with navigational hazards and distances from the port to the open ocean or a large bay (port selection Criterion 2; Appendix D, Section D.1.9.2 of the EIS). Appendix D, Section D.5.3.1.3 presents a discussion of the determination of the probability of ship accidents used in the EIS. In regard to the size of vessels, increased volumes of hazardous cargos, say gasoline, would not change the accident consequences because the most severe accidents analyzed already assumed a collision with a tanker and that the resulting fire was not limited by quantity of fuel available (Attachment D5 to Appendix D).

Response to Comment No. 828-3

The commentor's opinion about the presence of fringe groups in the Puget Sound area is noted. Section D.5.9 has been added to Appendix D of the EIS to address terrorism and sabotage. This section concludes that, while certain terrorist and sabotage attempts cannot be precluded, theft would be. DOE considers that the foreign research reactor spent nuclear fuel can safely be received at the ports and transported to the managements sites, if the foreign research reactor spent nuclear fuel is accepted into the United States. The security measures employed would meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. DOE supports these regulations as being adequate to protect the foreign research reactor spent nuclear fuel.

Appendix H has been added to the final EIS in response to public comments to better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site.

Response to Comment No. 828-4

The analyses provided in Sections 4.2.2 and 4.5 of the EIS indicate that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS). Use of the Columbia River would have no direct impact on the risk associated with the shipment of foreign research reactor spent nuclear fuel, if foreign research reactor spent nuclear fuel is accepted into the United States.

COMMENTOR NO. 829: PYFROM, LEON

Response to Comment No. 829-1

The commentor's preference for the alternative of overseas management is noted. This is Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

Response to Comment No. 829-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, or any U.S. port, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 830: GIANELI, GREG

June 27, 1995

Dear Sir:

I am writing this letter concerning the use of the Port of Tacoma as a destination for nuclear waste. I feel that you should look for a smaller port that would easier for security and one that needs the business. 830-1

I am not totally against the transport of the waste from other countries, as I worry about security in the other countries against terrorist. I feel we should help the other countries build their own depositories and supply them with some of our armed forces for security. 830-2

If it must come to the U.S. maybe you should build a handling facility on the Columbia near Hanford. That way the waste will be in shallow water on most of its transport and easier to retrieve in case of an accidental spill. 830-3

I feel the best thing to do is find a very remote place in the world and put it all there with a U.N. type of armed forces guarding it. 830-4

Thank you very much for listening to mine and other peoples ideas.

Sincerely,
Greg Gianeli

RESPONSE TO COMMENT
COMMENTOR NO. 830: GIANELI, GREG

Response to Comment No. 830-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 830-2

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a which is discussed in Sections 2.3 and 4.4.1 of the EIS.

Response to Comment No. 830-3

Commentor's recommendation to build new port facilities on the Columbia River for handling the foreign research reactor spent nuclear fuel was not considered by DOE. New port facility construction would be costly and time consuming, and would not accomplish the goal of timely return of the foreign research reactor spent nuclear fuel. DOE evaluated 161 ports (153 commercial and eight military ports) against selection criteria, resulting in 10 ports that met all of the criteria. Appendix D, Sections D.1.8 and D.1.9 of the EIS present a detailed discussion of the process and results.

Response to Comment No. 830-4

The commentor's preference for overseas storage in a remote location is noted. Under Management Alternative 2, Subalternative 1a (Sections 2.3 and 4.4.1 of the EIS), the United States would assist foreign research reactor operators in storing their spent nuclear fuel in their own country or some other location outside of the United States. The disadvantages of storage in remote locations include costs of constructing suitable storage facilities and the difficulty of providing security. This option would leave a concentrated quantity of highly enriched (weapons-grade) uranium outside of the United States. As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low.

COMMENTOR NO. 831: SAMUELSON, DOREEN

Dear Mr. Head-

I advertised the June 19th meeting in my church bulletin because it is so shocking that 41 counties want to use us as a nuclear dumping ground - and our government is open to it.

1. What politicians and their cronies are profiting from this? There can be no other reason than under the table payoffs & over the table profiteering. This adds to public cynicism which is widespread about political corruption. 831-1

2. We have enough debate in our own country as to where we can dispose of our own waste. 831-2

3. This is another example of no regard for the devastating effects nuclear waste will have on future generations. #now is their only concern. 831-3

4. Whoever promotes this will suffer at election time.

Sincerely,

[redacted]

Doreen Samuelson

Fox 13

RESPONSE TO COMMENT
COMMENTOR NO. 831: SAMUELSON, DOREEN

Response to Comment No. 831-1

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel. This EIS evaluates the environmental effects that would result from implementation of three alternatives for management of spent nuclear fuel from foreign research reactors: management in the United States (Management Alternative 1, Section 2.2 of the EIS), overseas management (Management Alternative 2, Section 2.3), and combined domestic and overseas management (Management Alternative 3, Section 2.4). The No Action Alternative (take no action regarding foreign research reactor spent nuclear fuel, Section 2.5) is also evaluated in the EIS. Implementation of any of these alternatives would pose no significant benefits or risks to human health or the environment. While implementation of the proposed action offers no financial gain for the United States Government or its officials, it would reduce the risks of diversion of weapons-grade materials to a nuclear weapons program.

Response to Comment No. 831-2

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. A detailed, quantitative discussion of these impacts would have to be the subject of future NEPA documentation. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of state to consider other means of dealing with the spent nuclear fuel (Section 1.1. of the EIS).

Response to Comment No. 831-3

Contrary to the commentor's assertion, the purpose of preparing this EIS is to evaluate and determine what significant impacts to the environment would occur if the proposed action were implemented. Sections 4.2.2., 4.2.4 and 4.5 of the EIS present a discussion of the risks and impacts on port areas and potential management sites, which demonstrates that such risks and impacts would be low. The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS), not to economically benefit anyone.

COMMENTOR NO. 832: BUTLER, DAVE

06-21-95

PORT OF TACOMA, WASHINGTON — shipments of spent nuclear fuel rods.

Good Morning,

Respectfully, you have no idea what you are dealing with on this issue.

Washington State residents will not permit transport of such materials through the heart of our Puget Sound, forests, mountains, cities and our homes.

You would have a greater chance of success receiving those shipments up the Potomac River, through WA D.C., through your neighborhood, past your home.

It will never happen here! If legal avenues to prevent this from happening are blocked:
- Private boats will blockade the Sound - logging trucks and autos will clog the highways - people will sit in front of these nuclear shipments...

... TACOMA/Washington State will be more trouble than its worth as a port of entry!

DCB

COMMENTOR NO. 832: BUTLER, DAVE

Response to Comment No. 832-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 833: BARRETT, HAROLD R.

13011 Meridian E.,D-202
Puyallup WA 98373-9460
June 26, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Mgt.(EM-37)
United States Department of Energy
1000 Indepence Avenue. S.W.
Washington DC 20585

Dear Sir:

I am unalterably opposed to using the Port of Tacoma for transhipping foreign nuclear wastes into this country. As a matter of interest, I am also opposed to the entire concept of foreign nuclear wastes being buried in the USA. Our experience at Hanford should convince us that we have quite enough difficulty with our own nuclear wastes. 833-1 833-2

Lest you write me off as just another anti-nuke environmental whacko, let me clarify. For 24 years, I was involved with nuclear weapons and nuclear reactors. I am thoroughly convinced of the validity of both programs. At the end of my nuclear "career"(1986-1990), I was employed shipping radioactive material in general and spent fuel in particular from Mare Island Naval Shipyard, Vallejo, California. I know what procedures and precautions must be taken. I was using CFR 49 on a daily basis as well as appropriate EPA and OSHA regulations along with the applicable Naval Reactors Directives and Manuals. I have zero confidence that our foreign counterparts will observe or even have the equivalent procedures. The State of Idaho has already indicated their unwillingness to act as a nuclear dump. Most of us have already figured out that,"I'm from the government, I'm here to help!", is not a particularly credible statement. Let us completely re-think this entire plan--remembering, always, that Murphy was an optimist. 833-3

Thank you for taking the time to read this.

Sincerely,

Harold R. Barrett

HAROLD R. BARRETT

RESPONSE TO COMMENT
COMMENTOR NO. 833: BARRETT, HAROLD R.

Response to Comment No. 833-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 833-2

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted (See Management Alternative 1, Section 2.2 of the EIS). Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

Response to Comment No.833-3

DOE understands this comment to refer to the regulations that would apply to the possible transportation of foreign research reactor spent nuclear fuel to the United States. All such shipments entering the United States would be required to comply with United States Department of Transportation and NRC regulations prior to entry into the United States. This process has been demonstrated to work well over the past 30 plus years of foreign research reactor spent nuclear fuel shipments to the United States.

COMMENTOR NO. 834: KENDALL, STEPHANIE A.

June 27,1995

To: Mr.Charles Head
Office of Spent Nuclear Fuel Management.

Dear Mr.Head.

I'm not a political activist,nor do I picket or protest for or against what happens to be the popular "crisis" of the moment.I've never felt compelled to vent my opinions in an angry letter to the editorial page of our local newspaper.Everyone has opinions and the right to express those opinions.But,as the enclosed article states,who takes the time to listen,or read,what someone feels very strongly about?

And that can be very sad,and in this instance,very dangerous. You represent a political group that cannot,or will not,consider the health and safety of the residents of this area.It's ludicrous to think that this group can say,without reservation,shipping spent nuclear fuel is safe and absolutely risk free.It's a crap shoot,and these idiots are holding the dice, ready to roll in our direction. 834-1

I don't like the idea of this group,or any other group,controlling my future,the future of my grandchildren,and the future of this area.I've lived in western Washington all of my life,and I wish to die peacefully in this great state.I do not want to see it become a nuclear wasteland,nor do I want to leave it before my time is up.Ship this waste to England or France where thier scientists can recycle into low grade fuel to power electricity. 834-2

Stop and think;would you want this kind of risk fall upon your home town and state?Would you be willing to to gamble with the lives of your family,and what has to be something you feel strongly about? Have you lost your human decency?I hope not,for all our sakes.

There's a new rallying phrase that says it all;NOT IN MY BACK* YARD!!

Sincerly,

Stephanie A.Kendall
A very concerned Tacoma resident.

Stephanie A. Kendall

RESPONSE TO COMMENT
COMMENTOR NO. 834: KENDALL, STEPHANIE A.

Response to Comment No. 834-1

This EIS does not state that transport of foreign research reactor spent nuclear fuel would be risk free, but rather that these risks would be low. Analysis in Sections 4.2.2, 4.2.3 and 4.5 of the EIS indicates that the risk associated with transporting the foreign research reactor spent nuclear fuel would be low for persons living near a port like Tacoma or along a transportation route.

Response to Comment No. 834-2

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS.

COMMENTOR NO. 837: COUTURE, GLORIA

JUNE 24, 1995

CHARLES HEAD
OFFICE OF SPENT NUCLEAR MANAGEMENT
(EM-37) U.S. DEPT. OF ENERGY,
1000 INDEPENDENCE AVE. S.W.
WASHINGTON, D.C. 20585

NO, NO, NO. I don't want to even think about the idea of a highly radioactive nuclear waste being shipped through the port of Tacoma. I can't image tolerating such an idea. I remember as a child being so scared in the 3rd. grade, living near McCord Air Force Base during the Korean War. I just knew one day those planes were not going to be ours. They would be Korean and they would bomb us and we would just be like every other country in the world. But my parents re-assured me this wouldn't happen. They had gone thru WW-11 and people we're patriotic, loved their land and country and fellow man, and yet they could take me out in public and I would be frightened again because people in conversation would say "mark my words, Russia will bomb us". 837-1

Well, now I've grown up and these things and these people don't scare me anymore. But have we learned anything, but greed, and power, and corruption, I think not.

My husband and I have twenty grandchildren, born and raised in the Puget Sound area, the majority of them are educated here, will marry here, work and live their lives here. I have never written to a public official in my life, but now is the time. I am damm angry. I will not sit by and watch my children suffer and die over a long period of time because you people are so efficient that accidents or things don't happen. I have lots of animosities about this country and its political activities, but I go with the flow. But when you put one of my children in jeopardy of their life, I get angry. What gives you this right, surley not our vote, I hope.

When you were in Tacoma, you were quoted as saying " I was more impressed with the number of officials at this meeting than the public". Well, we are the public. I still would like to think, I love my country, even tho we've been sold out by our government. I honor the history of my country, and truly feel in debt to the men & women who died to keep our land free. But now I am not ashamed to say I would not die for my country or expect my children or grandchildren to give their lives for this country, since Vietnam.

COMMENTOR NO. 839: SULLIVAN, MAURA E.

Maura E. Sullivan
4440 Memory Lane West
Tacoma, WA 98466

June 22, 1995

Mr. Charles R. Head, Program Manager
Office of Spent Fuel Management, EM-37
U.S. Department of Energy
1000 Independence Avenue, SW
Washington, DC 20585-0001

Dear Mr. Head:

I am writing to offer my comments on the Draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel (DEIS). First, I strongly believe that there should be no importation of Spent Nuclear Fuel from nations that do not pose a proliferation risk. This alone would greatly reduce the amount of waste that must be transported internationally and stored in the U.S. at our expense. There should also be no importation of Low Enriched Uranium wastes that can not be used in weapons production. Where the use of dry cask storage is feasible and would allow for international inspection, we should store the waste on site in the foreign nation. Other nations must pay their own financial, health and environmental costs for their nuclear programs. 839-1 839-2 839-3

Second, the use of commercial freighters or public ports in large cities puts longshore workers and the public, both on our roads and in the event of a shipboard fire, at risk. I urge you to use only military or dedicated ships and Department of Defense ports. That way, only employees who are highly skilled in hazardous waste transport will be in contact with the shipments. Also, the casks should be inspected before arriving at the port and the trucks and rail cars should be inspected before departure to the storage site. 839-4 839-5 839-6

Third, Hanford should not be chosen as a viable temporary storage site. Hanford's nuclear fuel cooling basins are already leaking and subject to massive failure in case of an earthquake. U.S. Department of Energy is presently having trouble funding safety upgrades and fuel removal from K-Basin. The problem should not be worsened by adding more waste to the site. 839-7

Fourth, safety and security issues were not adequately addressed in the DEIS. Shipboard fires pose a real threat because the casks have only been tested to 1475 degrees for 30 minutes while real fires may have a higher temperature for a longer duration. Also, the cask has been tested to a depth of 50 feet for 8 hours while depths in international waters and Puget Sound greatly exceed that amount. DOE wrote in the DEIS that it would be impossible to recover casks from a depth greater than 200 meters in case of an accident. 839-8

RESPONSE TO COMMENT
COMMENTOR NO. 839: SULLIVAN, MAURA E.

Response to Comment No. 839-1

The commentor's opposition to acceptance of foreign research reactor spent nuclear fuel from countries that do not pose a proliferation risk and the commentor's opposition to the acceptance of LEU from any country are noted.

As discussed in Section 2.10 of the EIS, publicly identifying a country as a proliferation risk would have adverse diplomatic and political consequences, and would severely diminish cooperation between the designated country and the United States. This option was considered, but was dismissed as unrealistic.

Response to Comment No. 839-2

The commentor's opposition to accepting foreign research reactor spent nuclear fuel from nations where dry storage is feasible is noted. As explained in Section 2.3 of the EIS, the opportunities for expanded spent nuclear fuel storage at foreign research reactor sites are limited or nonexistent.

Response to Comment No. 839-3

The EIS evaluates a number of financing arrangements for management of the foreign research reactor spent nuclear fuel in the United States. As discussed in Section 2.2.1.2 and 2.2.2.3 of the EIS, several financing options have been considered, ranging from collection of fees from the research reactor operators that would pay all of the costs of the program to full subsidization of the program by DOE. A compromise between these extremes would be for developed countries to be charged a competitive fee and the costs for developing countries would be subsidized by the United States for the acceptance and management of their spent nuclear fuel. Section 2.2.2.3 of the EIS discusses alternative financing arrangements, which include full subsidization for all countries, charging all countries the full cost of management, and subsidizing developing countries, but charging developed countries a full-cost recovery fee. The reasons the United States would pay some of the costs for other countries are: 1) some countries would be unable to afford the costs of the proposed action and would have no safe alternative means of managing their spent nuclear fuel (i.e., the developing countries); and 2) some countries would continue to use and trade weapons-grade nuclear material indefinitely unless the United States charges a competitive fee and absorbs any costs above that fee (i.e., most of the Western European countries).

Response to Comment No. 839-4

Based on the analyses of impacts associated with accidents and incident-free operations involving foreign research reactor spent nuclear fuel, DOE considers commercial ports,

COMMENTOR NO. 839: SULLIVAN, MAURA E. (CONT'D.)

Several areas in Puget Sound used as major shipping lanes exceed 200 meters. DOE has no provision for funding the training of local fire fighters or for law enforcement officers. 839-9

I urge you to enter into a more detailed analysis in the DEIS and a careful review of the program to import these High-Level Nuclear Waste materials from abroad. The DEIS insufficiently covers the above issues which may profoundly effect our lives here in the Pacific Northwest.

My phone number is 206-564-1653 in case you have any questions regarding my comments. I also request a copy of the Final EIS when it is available.

Sincerely,

Maura E. Sullivan

Maura E. Sullivan

Senator Slade Gorton

RESPONSE TO COMMENT
COMMENTOR NO. 839: SULLIVAN, MAURA E. (CONT'D.)

facilities, and freighters to represent acceptable options for the receipt and transportation of foreign research reactor spent nuclear fuel (Sections 4.2.2.3 and 4.5 of the EIS present the consequences of port accidents and Section 4.2.2.2 of the EIS presents impacts of incident-free operation).

Response to Comment No. 839-5

Commentor's recommendation to use only military ports and dedicated or military ships for the transport of foreign research reactor spent nuclear fuel is noted. However, Section 4.2 of the EIS demonstrates that commercial ports and facilities represent an acceptable option for the transportation of foreign research reactor spent nuclear fuel.

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security such as might be present at military bases. The security provided for the foreign research reactor spent nuclear fuel shipments would be required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security.

Whether the shipments come as cargo on a scheduled carrier or on a chartered ship, no special precautions are expected to be required by the Coast Guard or any other authority. As such, there need be no additional requirements to use dedicated or military ships, nor any adverse consequences to the use of the commercial ships or facilities.

Although the foreign research reactor spent nuclear fuel is radioactive material, the dose rates from the transportation casks used to transport it would be low. No special handling or loading/unloading procedures would be required for the foreign research reactor spent nuclear fuel when it is contained in approved shipping containers; experience with handling containers is sufficient. Therefore, no special training of longshoremen would be required.

Response to Comment No. 839-6

The foreign research reactor spent nuclear fuel containers would be inspected daily while onboard the ship (Appendix C, Section C.4.1 of the EIS), and trucks or railcars would be inspected under existing Federal, State and local transportation regulations prior to departing the port.

Response to Comment No. 839-7

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho

COMMENTOR NO. 839: SULLIVAN, MAURA E. (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 839: SULLIVAN, MAURA E. (CONT'D.)

National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 839-8

Section 2.8 of the EIS addresses the security measures that would be taken to ensure that there would be no unacceptable risks of terrorism or theft of materials. DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security such as might be present at military bases. The security provided for the spent nuclear fuel shipments is required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security.

Neither acts of terrorism nor theft of materials by a determined group or individual can be completely precluded. However, proper security measures greatly reduce the risk of such actions. Security would be provided for all shipments of foreign research reactor spent nuclear fuel, as required by the Code of Federal Regulations (10 CFR Part 73). The general security provisions are provided in the new Appendix H that has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that would be prepared for each foreign research reactor spent nuclear fuel shipment to specify details of the transportation process, including security provisions in port and during transit.

The transportation casks that would be used for the foreign research reactor spent nuclear fuel are certified if their design meets certain tests, including a fire test, and if the individual casks pass periodic inspections (Section 2.6.2 of the EIS). These certification standards were developed for use of the transportation casks on land, hence the 30 minute fire test, which is considered to be the extent of a high intensity fire resulting from a collision with a tanker truck. The duration of a ship fire is directly related to the amount of combustibles carried on board. In spite of this potential, the number of severe fires on ships is relatively small. Data available on the last 15 years from Lloyd's of London indicate that of 1,073 ship collisions in port worldwide, only eleven led to fires, and of those, only five caused extensive damage, with only one actually causing buckling of structures.

In respect to the impact a ship fire might have on a spent nuclear fuel transportation cask, there are three facts that would mitigate the potential damage. First, ship fires tend to move to different areas of the ship as the combustible material is consumed, so the cask would not be exposed for the entire duration of the fire. Second, a ship's fire intensity is normally limited by the amount of oxygen that can reach the interior of a hold. Third, all ships that would be used to transport foreign research reactor spent nuclear fuel have built-in fire suppression equipment, which at a minimum would keep fires well below the extreme temperatures needed to damage the transportation cask. For these reasons, it would be almost impossible for spent nuclear fuel inside the transportation cask to reach 900 degrees Kelvin (1,160 degrees F), the melting point of the foreign research reactor spent nuclear fuel. The probability of reaching such a temperature was calculated to be less than one in a billion (see Attachment D5 to Appendix D of the EIS). To put this temperature into perspective, steel used in a ship's structure buckles at around 700 degrees Kelvin (800 degrees F).

The EIS contains the results of an analysis of the effects of an accident that involves a severe fire (severity category 6), which does not reach the temperature to melt foreign research reactor spent nuclear fuel. Appendix D, Section D.5.3 of the EIS presents detailed discussion of accident probabilities and radioactive material source terms and Section D.5.4 presents the results of the analyses.

In conclusion, although long duration ship fires are possible, and have occurred, they are uncommon events. Analyses in the EIS indicate that even in the event of a severe ship fire involving a spent nuclear fuel transportation cask, neither the consequences nor risks are great (Appendix D, Section D.5.5 of the EIS). Although the nonradiological effects of such a catastrophic accident would obviously impact the local environment, no additional impacts are predicted due to the presence of foreign research reactor spent nuclear fuel.

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

Response to Comment No. 839-9

As discussed in Section 2.7.3.2 of the EIS, DOE provides funding to States and Tribes through the Office of Environmental Management and the Office of Civilian Radioactive Waste Management to assist with transportation related issues. This funding has been used in the past to enhance a jurisdiction's emergency management and response capabilities. Besides funding, much of DOE's assistance is provided in the form of technical assistance, for which DOE bears the cost. Assistance may be provided through

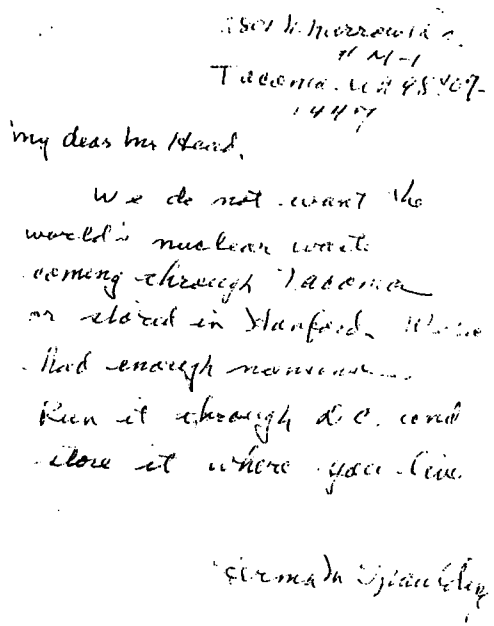
COMMENTOR NO. 839: SULLIVAN, MAURA E. (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 839: SULLIVAN, MAURA E. (CONT'D.)

DOE's Radiological Assistance Program and under the National Contingency Plan, as well as through training, DOE sponsored meetings, informal discussions, and informational materials.

Appendix H of the EIS contains the general provisions for emergency preparedness and security measures associated with the transportation of foreign research reactor spent nuclear fuel in the United States. The provisions include an interface between DOE and State, Tribal, and local authorities, prior to the implementation of the policy, for the identification and resolution of emergency management and security issues specific to the communities that would be affected. These issues include capabilities and training of first emergency responders. Funding for special needs, if necessary, would be addressed during this interface.

COMMENTOR NO. 840: SPAULDING, HERMA



1507 N. Narrows Dr.
#M-1
Tacoma, Wa 98407-
1447

My dear Mr Heard,

We do not want the
world's nuclear waste
coming through Tacoma
or stored in Hanford. We've
had enough nuclear...
Run it through D.C. and
store it where you live.

Sincerely, Herma Spaulding

840-1

RESPONSE TO COMMENT
COMMENTOR NO. 840: SPAULDING, HERMA

Response to Comment No. 840-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford site.

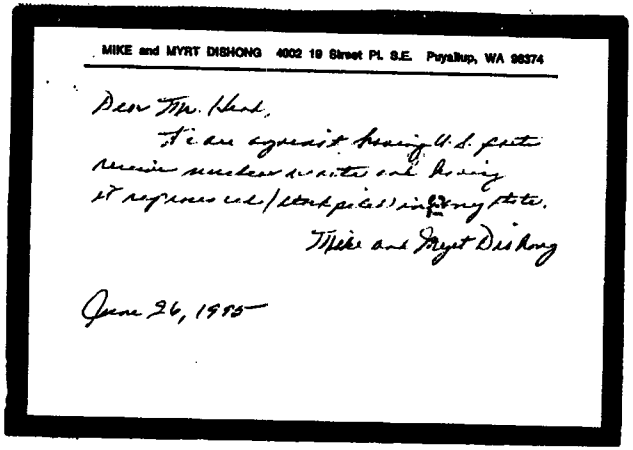
COMMENTOR NO. 841: DISHONG, MIKE & MYRT



MIKE and MYRT DISHONG 4002 19 Street Pl. S.E. Puyallup, WA 98374

Dear Mr. Hunt,

I am against having U.S. ports receive nuclear wastes and having it regenerated/distributed in my state.

Mike and Myrt Dishong

June 26, 1995

841-1

RESPONSE TO COMMENT
COMMENTOR NO. 841: DISHONG, MIKE & MYRT

Response to Comment No. 841-1

The commentor's opposition to accepting nuclear wastes into the United States is noted. Sections 2.3, 2.5, and 4.5 of the EIS describe other alternatives under consideration.

COMMENTOR NO. 842: HITSON, MARY JEAN

June 27, 1995

Charles Head, Office of Spent
Nuclear Fuel Management (EM-37)
U. S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Mr. Head:

In response to the proposed shipments of high-level nuclear waste through the Port of Tacoma, I am in agreement with the negative response you heard recently at the meeting in Tacoma, Washington. 842-1

Also, regarding "They don't have time to listen" statement made by you, they also probably won't take time to read this or any other letters. Hopefully, the amount of letters received will have an impact as to the will of the people... 842-2

My vote is a "No"!

Respectfully,

Mary Jean Hitson

Mary Jean Hitson

RESPONSE TO COMMENT
COMMENTOR NO. 842: HITSON, MARY JEAN

Response to Comment No. 842-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 842-2

While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program manager is responsible for relaying public concerns and issues to the Secretary of Energy and her staff. As indicated by this document, all comments received from the public were noted and taken seriously. Under NEPA and DOE's environmental regulations (Section 5 of the EIS), public participation and comments are an integral component of the environmental process.

COMMENTOR NO. 843: CITIZENS (TACOMA AREA)

May 27, 1995

Mr. Charles Head
Office of Spent Fuel Management, EM-37
US Department of Energy
1000 Independence Ave, SW
Washington DC 20585-0001

Mr. Head;
I attended the Public Review of the Draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel, held on May 26 at the Radisson Hotel, SeaTac, Washington. Although I made no critical statements concerning this document at the review, I was in deep empathy with those who did. This document is not only inadequate, it is flawed in its basic assumption. The assumption is that shuffling deadly waste from one location to another somehow deals with the real problem. Never mind spent fuel from foreign nuclear reactors. What are you going to do with the 30,000 tons of radioactive waste that is already bursting from storage space at American reactor sites and storage areas, and what will you do with the additional 55,000 tons of American waste that is expected to be generated in the next 15 years? Our esteemed federal senators tell us that existing contamination at the Hanford Site in Washington State cannot be cleaned up by any amount of funding on any conceivable time table. DOE's plans for long term storage at Yucca Mountain appears to be on the scrap heap. 843-1 843-2 843-3

If the Corporate Republic of America truly wanted nonproliferation, there would be no spent nuclear fuel to move. No one would be generating it; no one would be selling it. Sales of this material to hostile countries would be considered an act of treason. It is clear that the nuclear power industry wants limitless profit without accepting any responsibility. The real question with respect to the DEIS on spent nuclear fuel from foreign reactors, is, in my opinion, which states will stumble and fall in the stampede to escape the influence of the nuclear power industry; acting through the DOE, the courts, and the congress; which states will have ever more nuclear contamination shoved down their throats. The state perspective is gaining recognition at the nuclear administrative level. An article by Robert Loux, director of the Nevada Agency for Nuclear Projects, which oversees the DOE's high level waste program in Nevada, appeared in the June 1 Seattle Post-Intelligencer. Mr. Loux acknowledges the DOE's failure to deal with the fundamental problem, and calls for a national reassessment of the handling of nuclear waste. We keep hearing this call for reassessment every few years. 843-4 843-5

RESPONSE TO COMMENT
COMMENTOR NO. 843: CITIZENS (TACOMA AREA)

Response to Comment No. 843-1

Based on the amounts cited, the radioactive waste to which the commentor is referring appears to be spent nuclear fuel from commercial nuclear power plants. Spent nuclear fuel from power reactors is outside the scope of this EIS. Due to the significant difference in the size and weight of the commercial power reactor spent nuclear fuel and the foreign research reactor spent nuclear fuel (see Figure 2.5 in Section 2.6.1 of the EIS), the facilities used to handle and store the foreign research reactor spent nuclear fuel cannot be used for management of the power reactor spent nuclear fuel. Even if these two different spent nuclear fuel types could be managed in the same facilities, the maximum amount of foreign research reactor spent nuclear fuel covered by the proposed action is less than 20 MTHM (Sections 2.2.1.3 and 2.2.2.1 of the EIS), significantly less than the 30,000 MTHM cited by the commentor as already being in storage in the United States. This small amount of additional foreign research reactor spent nuclear fuel would be unlikely to affect the programs required to manage the 30,000 MTHM.

Response to Comment No. 843-2

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 843-3

Yucca Mountain, NV, is a candidate site for disposal, not long-term storage. As discussed in Section 4.2.7, Yucca Mountain is still the candidate site for a geologic repository for disposal.

Response to Comment No. 843-4

As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to the human health and environment, including economic benefits would be low. The management alternatives described in Sections 2.2, 2.3, and 2.4 of the EIS

I believe that once friendly foreign nations take possession of nuclear fuel, they should be required to retain it permanently. Spent fuel required to be returned to the United States for reasons of national security should not be imported on commercial freighters into public ports; nor transported on public highways by nonspecialists. I suggest that it be transported by military or technical specialists to those responsible for its manufacture, who then should be assigned the technical problem of finding a way to decontaminate it. 843-6 843-7 843-8 843-9

In case you have not yet gotten the picture, I remind you of the question asked by the young lady representing Mothers Against Nuclear Proliferation at the May 26 review: "What part of NO don't you understand?" I do not want this material in my back yard; or in my neighbors back yard. I do not want this material in my state, or in my country. City councils and longshoremen do not want it. The State of Washington doesn't want it. We do not want it. Do you understand? 843-10

encourage the use of LEU fuel in civilian programs, rather than highly enriched (weapons-grade) uranium fuel. Foreign research reactors are not used for the production of commercial power. Research, medical, industrial, and agricultural applications for research reactors are described in Section 1.1 of the EIS. Activities of the nuclear power industry are unrelated to the proposed action and management alternatives evaluated in this EIS.

Response to Comment No. 843-5

The commentor's concerns about nuclear waste and support for a national reassessment of the handling of nuclear waste are noted. However, these matters are outside of the scope of the EIS (Section 1.3 of the EIS). As discussed in Section 4 of the EIS, implementation of the proposed action, including interim management of spent nuclear fuel from foreign research reactors at one or more of the interim DOE management sites, would result in no significant benefits or risks to human health or the environment.

Response to Comment No. 843-6

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

Response to Comment No. 843-7

Based on the analyses of impacts associated with accidents and incident-free operations involving foreign research reactor spent nuclear fuel, DOE considers that commercial ports, facilities and commercial freighters represent an acceptable option for the transportation of foreign research reactor spent nuclear fuel (Section 4.2.2.3 of the EIS presents the consequences of port accidents and Section 4.2.2.2 presents impacts of incident-free operation). Ground transport of the foreign research reactor spent nuclear fuel would be accomplished by specialized trucking firms.

Response to Comment No. 843-8

Although the foreign research reactor spent nuclear fuel is radioactive material, the dose rates from the transportation casks would be low. No special handling or loading/unloading procedures would be required for the foreign research reactor spent nuclear fuel when it is contained in standard shipping containers; experience with handling containers is sufficient. Therefore, no special training of longshoremen or other transportation personnel would be required; however, truck transport of the foreign research reactor spent nuclear fuel would use specialized firms whose drivers have been specially trained.

COMMENTOR NO. 843: CITIZENS (TACOMA AREA) (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 843: CITIZENS (TACOMA AREA) (CONT'D.)

Response to Comment No. 843-9

Foreign research reactor spent nuclear fuel does not require transportation by specialists. The spent nuclear fuel would be returned to the United States in standard shipping containers that would require no special handling or precautions.

Returning foreign research reactor spent nuclear fuel to its manufacturers is not a practical solution because the manufacturers of fresh nuclear fuel do not have to deal with radiation at the level associated with spent nuclear fuel. Therefore, fresh fuel manufacturers do not have the facilities to handle spent nuclear fuel.

As explained in Section 2.6.5 of the EIS, only five sites were considered for management of the foreign research reactor spent nuclear fuel: the Savannah River Site, the Idaho National engineering Laboratory, the Hanford Site, the Nevada Test Site, and the Oak Ridge Reservation. The potential impacts of managing the spent nuclear fuel are discussed in Section 4.2.4 of the EIS. The main driver behind the proposed policy to manage foreign research reactor spent nuclear fuel is a concern to limit the possibilities of the proliferation of nuclear weapons. In the long term, the question of managing foreign research reactor spent nuclear fuel will be addressed as this country develops a policy regarding nuclear waste.

Response to Comment No. 843-10

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, Section 4.2.2 demonstrates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 844: LASCELLES, JEAN & FRED

RESPONSE TO COMMENT
COMMENTOR NO. 844: LASCELLES, JEAN & FRED

Response to Comment No. 844-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 846: CANFIELD, KERRY

610 — 2nd Ave. W. #110
Seattle, WA 98119-4419

June 28, 1995

Mr. Charles R. Head
Office of Spent Fuel Management, EM-37
U.S. Department of Energy
1000 Independence Avenue, SW
Washington, DC 20585-0001

Dear Mr. Head:

If one can believe the fact sheet distributed by Heart of America Northwest, I am still not convinced that USDOE has adequately prepared shipment handlers or potentially involved communities for the nuclear waste shipments it proposes. Moreover, in evaluating potential ports, the department seemingly ignored the obvious (given the nature of urban civilization): that a port with adequate facilities will have a high population density. This is not a minor matter, and deserves more serious consideration. 846-1

The USDOE simply asserts that nothing will go wrong and asks that we trust them. Yet in view of my earlier observation, and in view of current moves in Congress to curtail citizen oversight of official and commercial activities, I am not convinced that a climate of trust exists. Moreover, the need for these shipments cannot possibly be overwhelming, since the countries from whom it is proposed we should accept waste shipments are not true proliferation risks—and from the countries that actually are risks we probably can't expect to get the stuff back anyway! What's wrong with this picture? 846-2

The bottom line is that still the best means of dealing with nuclear waste seems to be canning it, shipping it somewhere, burying it, and managing the P.R. to keep the locals from protesting too much. This procedure has never been and is not now a solution to the nuclear waste problem. It is not improved by incorporating yet more bad ideas into it. 846-3

As for the most recent hearing about this matter in Seattle, I do not at all like the manner in which it was conducted. I don't like that potential protesters of USDOE policy were *a priori* cast in the roles of troublemakers, sufficient that security goons actually followed people around the meeting area. I do not like that public comment was not *recorded* and was instead only "summarized" on paper. Regardless of whether the public adequately understands the science, the policies, or the politics, we have a right to be taken seriously when we express concern about activities that can seriously impact our lives. The USDOE *still* needs to do a lot better! 846-4

Sincerely,

Kerry Canfield

Kerry Canfield

RESPONSE TO COMMENT
COMMENTOR NO. 846: CANFIELD, KERRY

Response to Comment No. 846-1

DOE considers that the port selection criteria successfully indicate those ports that can safely handle foreign research reactor spent nuclear fuel. DOE further considers that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel or the population near the port. The analysis in the EIS indicates that the risk associated with an accident would be low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks would also be low (Section 4.2.2.2).

As the port selection process section (Appendix D, Section D.1 of the EIS) explains in detail, Tacoma and the other nine ports all meet the criteria and hence are considered to be able to safely handle the foreign research reactor spent nuclear fuel. The experience criterion used in the port selection process (Appendix D, Section D.1.9.1) evaluates the port's experience in handling containerized cargo, not in dealing with radioactive material. Although the foreign research reactor spent nuclear fuel is radioactive material, the dose rates from the casks used to transport it would be low, so no special handling is required; experience with handling containers is sufficient. The Port of Tacoma has significant experience handling containers, so it met the experience selection criterion.

Response to Comment No. 846-2

Prior to 1989, it was a policy of the United States to accept spent nuclear fuel from foreign research reactors for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators, including those among our stable allies, have no immediate means for disposing of their spent nuclear fuel (Section 1.2 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). If the research reactors were forced to shut down, the United States would likely to be accused, rightly or wrongly, of failing to live up to its obligations under the Treaty on the Non-Proliferation of Nuclear Weapons to assist nonnuclear weapons states with peaceful applications of nuclear technology. If the reactors switch back to (or continue) the use of HEU as fuel, the move towards elimination of the civil use of HEU would be severely diminished.

As stated in the EIS, the U.S. has an obligation under the Treaty on the Non-Proliferation of Nuclear Weapons (NPT) to assist nonnuclear weapons states with peaceful applications of nuclear energy. Actions which compel a country to shut down a peaceful nuclear research program, or to seek reprocessing, could cast doubt on U.S. commitment to NPT principles. Any perception that the U.S. does not support the NPT, which is the foundation of the entire international nuclear nonproliferation regime, would make it that much harder to negotiate further nuclear nonproliferation agreements.

Response to Comment No. 846-3

The commentor's opposition to disposal in a geologic repository is noted. The Nuclear Waste Policy Act of 1982 (as amended, enacted as Public Law 97-425) specifies that spent nuclear fuel and high level radioactive waste shall be disposed of by emplacing it in a geologic repository.

Response to Comment No. 846-4

DOE does not consider that commentors at public hearings are "troublemakers." However, DOE must ensure that meetings are conducted in an orderly and safe manner and, therefore, sometimes security may be necessary due to numerous factors, such as the number of participants at a meeting or the controversial nature of a given proposed Federal action. There is no requirement under NEPA or the regulations that comments given orally at public hearings under NEPA be recorded electronically. NEPA does require that the public be afforded the opportunity to comment on draft EISs and that such comments be considered in the final EIS. Therefore, DOE summarized these comments so that such comments could be considered in the development of the final EIS.

COMMENTOR NO. 847: HENNUM, KARL I.

12419 16th Ave S
Seattle WA 98168-2249
June 28, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
Department of Energy
1000 Independence AVE S W
Washington DC 20585

Dear Mr. Head:

I vigorously oppose the proposal that the United States accepts any nuclear (or hazardous) waste from any foreign country. The very consideration of such a proposal is incomprehensible. 847-1

It is madness to import highly radioactive waste when we don't know what to do with what we have and are still generating. And it is irresponsible for any government to subject it's citizens to the health threat posed by trans-shipment of such waste, assuming it reaches port. 847-2 847-3

I hope reason and logic prevale and this proposal be rejected.

Yours in peace,

Karl I. Hennum

RESPONSE TO COMMENT
COMMENTOR NO. 847: HENNUM, KARL I.

Response to Comment No. 847-1

The commentor's opposition to management of nuclear wastes from foreign research reactors in the United States (Management Alternatives 1 or 3; Sections 2.2 and 2.4 of the EIS) is noted. Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

Response to Comment No. 847-2

Alternatives described in Sections 2.2 through 2.4 of the EIS support nuclear weapons nonproliferation policies of the United States. The intent of the proposed action and management alternatives is to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide. If a policy to accept spent nuclear fuel from foreign research reactors is adopted, the analyses in Section 4 of the EIS demonstrate that no significant human health or other environmental effects would result from implementation of the policy. As discussed in Section 2 and Appendix F of the EIS, foreign research reactor spent nuclear fuel can be safely stored at interim management sites pending final disposition (Section 4.2.7 of the EIS).

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1 of the EIS).

Response to Comment No. 847-3

Sections 4.2, 4.3, and 4.4 of the EIS presents the risks and consequences of accepting foreign research reactor spent nuclear fuel into the United States. The analyses demonstrate that there would not be any significant risks to human health, safety, or the environment from transport and management of the foreign research reactor spent nuclear fuel in the United States.

COMMENTOR NO. 848: PERRIN, BETTY J.

JUNE 28, 1995

Dear Sir:

I am against radioactive nuclear waste being shipped through the Port of Tacoma. 848-1

My late husband was a Longshoreman at the Port of Tacoma. He died in December 1983 from lung cancer.

Sincerely,

Betty J. Perrin

Betty J. Perrin

RESPONSE TO COMMENT
COMMENTOR NO. 848: PERRIN, BETTY J.

Response to Comment No. 848-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 850: SAWHILL, MRS. MERRY JERRY STEEL

14556 NE 31st #G-204
Bellevue, WA 98007
June 29, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management, EM-37
U. S. Department of Energy
1000 Independence Avenue S. W.
Washington D. C. 20585

Dear Mr. Head:

This letter is in response to an editorial which appeared in the Sunday, June 25, 1995 edition of the Tacoma News Tribune regarding the proposed nuclear fuel waste shipments destined for the Port of Tacoma located at Tacoma, Washington.

Although I am a native citizen of the City of Tacoma where I obtained my public education in Washington Elementary School, Mason Junior High School and Stadium High School, I was also married in Tacoma to Mr. Roy Bond Sawhill in St. Lukes's Memorial Church on December 19, 1943. Mr. Roy B. Sawhill and myself are both graduates of the University of Washington where he was a full professor of Civil Engineering for over two decades. We had three children and lived at 3808 42nd Avenue South in Seattle, Washington 98118 during his tenure with the University of Washington. Both of our families are from Tacoma where my mother, Mrs. Violet W. Steel was a public school teacher for 35 years and where my father, Mr. Horace Stanley Steel was a prominent Real Estate broker. We both have had profound friendships with our civic and personal relationships in Tacoma and feel that the nuclear fuel waste stock pile materials and their shipments should be accommodated and processed overseas where they originate. I am also a close friend of former Governor Dixie Lee Rae of Tacoma who was once employed by the U. S. Department of Energy and I am convinced she would most regrettably insist that the nuclear storage is a port environmental impact issue which would virtually undermine Tacoma's Stadium High School as a "French chateau" historical monument, the Washington State Historical Museum and it's Society and the pristine qualities for which Tacoma is famous. 850-1

Thank you for your opportunity to lobby for an alternative plan to keep the nuclear fuel wastes overseas where it is not an American responsibility to provide for it's keep. (Professor Roy B. Sawhill, myself and our three children spent an academic year abroad during 1996-1997 and feel that charity most assuredly begins at home!) 850-2

Sincerely yours,

(Mrs.) Merry Jerry Steel Sawhill

(Mrs.) Merry Jerry Steel Sawhill

RESPONSE TO COMMENT
COMMENTOR NO. 850: SAWHILL, MRS. MERRY JERRY STEEL

Response to Comment No. 850-1

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS.

Response to Comment No. 850-2

DOE considers that the use of any of the ports indicated by the port selection process, including Tacoma, would not impact any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2). Therefore, it should not impact economic or cultural development, or normal commercial operations. This belief is based on the fact that the foreign research reactor spent nuclear fuel would be accepted into the United States in standard shipping containers that would require no special handling or precautions. Historically, there were no adverse economic or cultural impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

Response to Comment No. 854-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 855: KITTLESON, ALBERTA H.

308 Ea. 123rd Street
Tacoma, WA 98445
June 29, 1995

Dear Mrs Charles Head,

The Port of Tacoma should definately not be considered for nuclear fuel shipments of waste. 855-1

The information the DOE has on the port is not up to date.

The depth of Puget Sound would make it a bad place to consider because if a cask fell over it would be impossible to retrieve it. 855-2

There could be serious fires and explosions.

Businesses would be ruined.

Our Port of Tacoma is on the Natl Priority list for cleanup under the Comprehensive Environmental Response, Compensation and Liability Act.

Sincerely,
Alberta Kittleson

I would have written sooner but I had an infection in my right hand.

I wrote to Sec. of Dept. of Energy some time ago.

RESPONSE TO COMMENT
COMMENTOR NO. 855: KITTLESON, ALBERTA H.

Response to Comment No. 855-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS.

Response to Comment No. 855-2

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

COMMENTOR NO. 855: KITTLESON, ALBERTA H. (CONT'D.)

Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: If yo[illegible] study the [illegible] Tacoma you will realize it should not be used for receiving any [illegible] of nuclear spent [illegible]

Name: Alberta [illegible]son Telephone: [illegible]-7797

DEADLINE: [illegible] 30, 1995

RESPONSE TO COMMENT

COMMENTOR NO. 855: KITTLESON, ALBERTA H. (CONT'D.)

COMMENTOR NO. 856: RHOADS, DEBORAH

June 26, 1995

Mr. Charles Head
Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave., S.W.
Washington, D.C. 20585

Dear Mr. Head,

I am writing to voice my opposition to DOE's proposal to ship spent nuclear reactor rods through the Port of Tacoma. I oppose the proposal for several reasons: 856-1

- Tacoma is at the heart of a rapidly increasing population base, which would be endangered by any release of radiation.
- Tacoma has been struggling to overcome a negative image and is on the verge of a long-awaited and much-needed economic renewal; this plan would seriously impede the City's efforts to attract clean industry and tourism.
- Too little effort has been made to identify alternatives that do not require shipping spent fuel rods to the United States. For example, has DOE seriously examined the feasibility and relative cost of constructing secured fuel reprocessing centers in carefully chosen locations overseas? 856-2
- If these rods must be stored in the United States, they should not enter through ports on the west coast, where prevailing winds would carry any contamination over heavily populated areas. Does anyone remember Mt. St. Helens? 856-3
- Outdated notions of international relations should not be used to justify endangering the lives of countless citizens of the United States. 856-4
- There is no acceptable plan for storing or reprocessing these fuel rods once they are in the United States. Will we find that the rods are being "stored" in perpetually moving railroad cars, forever seeking a place to unload their cargo? 856-5

I cannot believe that DOE has explored all the possible alternatives in this critically important decision.

Sincerely,

Deborah Rhoads

Deborah Rhoads, J.D., Ph.D.

Tacoma, Washington 98405

RESPONSE TO COMMENT
COMMENTOR NO. 856: RHOADS, DEBORAH

Response to Comment No. 856-1

DOE's analyses indicate that the risks associated with receipt of foreign research reactor spent nuclear fuel, even through the most heavily populated ports in the United States, would be minimal (Section 4.2.2.3 of the EIS). Nevertheless, in the National Defense Authorization Act for Fiscal Year 1994, Congress indicated that low port population should be a criteria for use in port selection, where economically feasible (Appendix D, Section D.1.6 of the EIS). It should be noted that even the National Defense Authorization Act for Fiscal Year 1994 did not make low port population an absolute requirement. Accordingly, the population of Tacoma was considered both during both the port selection process (Appendix D, Section D.1.9.5 of the EIS) and during the analyses of potential impacts from the proposed action (Section 4.2.2.3 of the EIS). The analyses demonstrate that the proposed action does not pose any significant risk to either port personnel, the local environment, or the population near the port.

Due to the absence of significant risks or impacts on the potential ports of entry, there should not be any impact on tourism or the business environment. In fact, historically there was no impact on these items for the ports that served as ports of entry for foreign research reactor spent nuclear fuel during the approximately 30 years when DOE previously accepted this spent nuclear fuel.

Response to Comment No. 856-2

The option of overseas management is Management Alternative 2 and is discussed in Sections 2.3 and 4.4 of the EIS. DOE could not construct reprocessing centers in other countries because each country has sovereignty over its own territory.

Response to Comment No. 856-3

The local meteorology and prevailing winds were taken into account when the impacts of accidents were calculated (Appendix D, Section D.5.3.3 of the EIS). The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3, "Consequences of Port Accidents"). The analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 856: RHOADS, DEBORAH (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 856: RHOADS, DEBORAH (CONT'D.)

Response to Comment No. 856-4

As discussed in Section 1.2 of the EIS, the proposed action is intended to reduce international commerce in weapons-grade materials, and hence support the nuclear weapons nonproliferation policies and goals of the United States. The proposed action supports the renewed Treaty on the Non-Proliferation of Nuclear Weapons, which was extended indefinitely under the auspices of the United Nations in May 1995, which encourages the use of LEU for civilian applications and reduces the potential spread of nuclear weapons to nonnuclear nations.

During preparation of this EIS, the analysis of impacts associated with the proposed action determined that the radiological or nonradiological risks to human health or the environment (Section 4 of the EIS) are low.

Response to Comment No. 856-5

The plan for the storage or chemical separation of foreign research reactor spent nuclear fuel if accepted in the United States is explained in Section 2.2 of the EIS. As discussed in Section 2.6.5.1 and 2.6.5.2, the technology for safely storing or processing spent nuclear fuel has been in use for over 40 years in the nuclear industry.

COMMENTOR NO. 858: YOMES, LORRAINE T.

To: Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

From: Lorraine T. Yomes
5402 N. 46th St.
Tacoma, Wa 98407

As a life long resident of Tacoma, I am greatly distressed by the thought of highly radioactive nuclear waste being shipped through the Port of Tacoma. I feel the time has come to make my feelings known.

I am appalled to know that the people who will ultimately make the decision about Tacoma's future are not even going to take the time to listen to the tapes or watch the video coverage. Yes you are going to make a report to the director of the Office of Spent Nuclear Fuel Management, but how can I be sure that the report will convey how deeply the citizens of Tacoma feel about not having nuclear waste shipped here. I think it is ludicrous for people who do not even live here to base their decision on your report alone. The least they could do is make the time to read the testimony or watch the tapes before they make a decision that has the potential to change the future destiny of Tacoma. I hope that in your report you truthfully express how strong the resistance to this proposed plan is. I urge you to convince these people that sending nuclear waste to Tacoma is not only a harmful idea but it is also the wrong decision. Is it not enough that the United States of America takes in thousands of foreigners every year, sends money and military troops when ever and where ever it is needed? Now we are expected to take on their nuclear waste also. You see accepting nuclear waste is not just a harmful idea for Tacoma; it is a harmful idea for our country. The time has come for the United States to stop bailing out the world. I as a citizen of this country and state have the right to be free from fear. Believe me the fear the wrong decision will be made is strong. The time has come for you the public servant to stand up and say the United States of America is not going to become the toxic waste dump for the world. Let the countries that produce the waste stand up and take responsibility for the proper disposal of their own nuclear waste. Tell them that the people of Tacoma have the right to live in a city where we do not have to fear what could happen if something went wrong. The chances of something going wrong are real. If you do not believe that just remember Three Mile Island, the Exxon Valdez, Chernobyl, the leaks at Hanford and the Challenger Space Shuttle. There is a place for nuclear waste but that place in not my hometown, in my backyard. Not Tacoma! So please for the sake of me, my family and the citizens of Tacoma, do the right thing. Make the only decision that can be made. Under no circumstance allow highly radioactive nuclear waste to be shipped through the Port of Tacoma. Make the bureaucrats listen, make them take the time. My future is riding on it!

858-1

858-2

858-3

Sincerely;

Lorraine T. Yomes

Lorraine T. Yomes

RESPONSE TO COMMENT
COMMENTOR NO. 858: YOMES, LORRAINE T.

Response to Comment No. 858-1

The commentor's opposition to the use of the Port of Tacoma is noted.

While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying the public views and concerns to the Secretary of Energy and her staff. The final EIS, including comments and responses, and Record of Decision are subject to approval by the Secretary of Energy. All comments received during the ninety day comment period are noted and answered in this document. Under NEPA and DOE environmental regulations (Section 5 of the EIS), public participation and comments are an integral part of the environmental process.

As discussed in Section 2.6.3 of the EIS, spent nuclear fuel from foreign research reactors would not be stored in the Port of Tacoma or any other candidate port. Each spent nuclear fuel shipment would be expected to remain in the port less than twenty-four hours. The analyses presented in Section 4 of the EIS indicate that the risk of acceptance of foreign spent fuel would result in no significant benefits or risks to human health or the environment (See especially Tables 4-6 and 4-7 of the EIS).

Response to Comment No. 858-2

If implemented, the proposed action would benefit the United States because it would reduce the risks of weapons-grade materials being diverted to a nuclear weapons program. This EIS describes four basic policy options for managing spent nuclear fuel from foreign research reactors: management in the United States (Management Alternative 1, Section 2.2 of the EIS), overseas management (Management Alternative 2, Section 2.3), combined domestic and overseas management (Management Alternative 3, Section 2.4), and the No Action Alternative (adopt no policy for management of foreign spent fuel, Section 2.5). The analysis of environmental effects which would result from implementation of these alternatives included evaluations of severe accidents at the candidate ports (Section 4.2.2). As shown in Tables 4-6 and 4-7 of the EIS, the risk associated with accepting foreign research reactor spent nuclear fuel at the candidate ports, due to severe accidents, would be low.

Response to Comment No. 858-3

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Dear Mr. Head,

I am a 42 year old woman residing in Tacoma, Washington. Since 1993 I have been diagnosed with breast cancer two different times. I do believe environmental pollution is partly responsible for the breast cancer epidemic that is killing 42,00 American women every year.
As a country we are in over our heads with environmental problems that will not be fully understood or corrected for many years to come. To suggest we accept foreign nuclear waste at the Port of Tacoma,or any other US port, is unthinkably reckless and void of both logic and compassion.
Remember: we are all downwinders.

859-1

Sincerely,

Bernadette Ronan

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 860: OTTO, MARY & EUGENE

6117 93rd St. S.W.
Tacoma, Wa. 98499
June 24, 1995.

To whom it may concern:

We are definitely opposed to Nuclear waste being shipped thru the Port of Tacoma — or any Port for that matter. The chances of accidents are far too high. We have already managed to contaminate quite a bit of our atmosphere and the dangers of compounding the situation are astronomical.

We all know they have a tiger by the tail (nuclear waste) and don't know how to let go (get rid of it) — but with all the resources our government has, there certainly has to be another alternative.

Sincerely
Mary & Eugene Otto

861-1

861-2

861-3

RESPONSE TO COMMENT
COMMENTOR NO. 861: DENZER, FREDERIC F.

Response to Comment No. 861-1

An objective of the proposed action is to reduce international commerce in highly enriched (weapons-grade) uranium (Section 1.2 of the EIS). Civilian uses of HEU are discouraged because HEU can be used to construct nuclear weapons which could fall into the hands of terrorists or irresponsible nations.

Response to Comment No. 861-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 861-3

The commentor's preference for acceptance of spent nuclear fuel from foreign research reactors at ports located on the east coast is noted. As discussed in Section 2.2.1.6 (See Figure 2-3) and Appendix D of the EIS, six ports on the east coast were selected as candidate ports of entry for acceptance of foreign research reactor spent nuclear fuel. Figure 2-3 of the EIS also shows the location of potential DOE management sites. No suitable management site exists in Arkansas, and it would not be cost-effective to construct one in that state.

COMMENTOR NO. 862: LOTH, PATRICIA K.

June 23, 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Ave. SW
Washington, DC 20585

Dear Mr. Head:

As long-time residents of the city of Tacoma, Washington, we are writing to oppose highly radioactive nuclear waste being shipped through the Port of Tacoma.

We have lived in Tacoma for over 40 years, have raised our children here, and now our grandchildren. We are very conscious of our environment and this beautiful country. However, we suffered through the ASARCO Smelter spewing sulphur, and now the aftermath of the arsenic, lead, and cadmium deposits in soil in most of the yards in North and West Tacoma. Chemists tested the soil and water constantly for contaminants, which was kept from the general public until the facts were brought out. The smelter is now gone, but the contamination is not and never will be.

We protest any more opportunities to possibly contaminate this area. Frankly, we do not trust the U.S. Government to be truthful or as careful as it proposes to be. **Accidents do happen, have happened, and are covered up.** We have seen unqualified people working in very dangerous, technical capacities, sometimes compounding potential problems by drug and alcohol use. It has been proven in some instances that the government covered up dangerous and/or lethal situations with no regard for citizens. 862-1

Again,we, and our co-workers and neighbors, plead **that you do not ship radioactive nuclear waste through the Port of Tacoma.** We urge you to keep the radioactive nuclear waste away from the United States in a safe place.

Sincerely,

Donald G. Loth
Patricia K. Loth

RESPONSE TO COMMENT
COMMENTOR NO. 863: REIMER, EVERETT

Response to Comment No. 863-1

As discussed in Section 1.1 of the EIS, shortly after the end of the Second World War, the United States Government realized that it must take action to prevent the spread of nuclear weapons. Thus, the United States adopted policies which would encourage peaceful applications of nuclear technology, while discouraging the spread of nuclear weaponry. Those same general goals remain in effect today. An objective of the proposed action is to reduce international commerce in weapon-grade materials, and to encourage the use of LEU fuel in foreign research reactors (Section 1.2 of the EIS).

aspects of our policies make things even worse, while the fact that this [redacted] effort to bamboozle the American public continues is the most frightening of all. Isn't it time to reverse course, fly right and tell people the truth? 863-1 (Cont'd.)

David Lilienthal, the first head of the Atomic Energy Commission and the former head of the Tennessee Valley Authority, was chosen by FDR and by Truman for his high ethics, good character and idealism The idea was that he would be the man to contain this dangerous substance. Now, the U.S. government's pretense of containment is a fraud. It is shipping and flying and otherwise transporting the stuff all over the world. Most of the spent fuel being returned to the U.S. is from countries like Canada and European ones that are as technologically advanced as we, as able to deal with it and less exposed to crime and terrorism. Furthermore, recent headlines indicate that the U.S. intends to resume the testing of nuclear weapons, which undermines and undoes much of the progress that has been made to [redacted] stop the arms race, which could kill us all. 863-1 (Cont'd.)

Please help resist this madness and [redacted] follow the right course. To the extent that you have, we thank you.

Dear Mr. Head:

I read an article in the Tacoma News Tribune that I could not believe. The article said that you and others like you in Washington 'Didn't have the time to listen' to those of us who live in and near Tacoma regarding the importing of nuclear waste. 864-1

I was stunned, and now that I've recovered, am furious that this "little" issue just isn't worth your time. A decision of this magnitude could detrimentaly effect millions of lives of U.S. citizens, and you don't have the time?????

The government's inability to clean up the already existing Superfund sites leaves me with no doubt that this action of importing yet another problem is completely beyond your ability to manage safely. 864-2

What I don't understand is why this is even an issue. Why are we considering importing this deadly material in the first place? Why is it our responsibility to clean up other's messes? Perhaps you can help clear this up for me. 864-3

Please listen now, and refuse this waste from ever entering our shores. Don't wait to listen to the screams and tears of those dying of radiation poisoning. If listening to us is not a valuable enough use of your time, perhaps spending a day in a children's leukemia ward would be a better alternative. It might give you a clue of the potential suffering you would be so casually endorsing lest you think I and others like me are exaggerating or being alarmist. 864-4

Thank you for your precious time.

Sincerely,

Valerie Mallinson

While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying public views and concerns to the Secretary of Energy and her staff. The EIS, including comments and responses, and Record of Decision are subject to approval by the Secretary of Energy. All comments received during the ninety day comment period are noted and answered in this document. Under NEPA and DOE's environmental regulations (Section 5 of the EIS), public participation and comments are an integral part of the environmental process.

Response to Comment No. 864-2

Spent nuclear fuel from foreign research reactors has been safely managed in the United States for nearly four decades (Section 1.1 of the EIS). However, the commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted. Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

Response to Comment No. 864-3

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). The objective is to make it less likely that a terrorist group or irresponsible nation could obtain a nuclear weapon.

Response to Comment No. 864-4

The estimated human health effects of the proposed action are presented throughout Section 4 of the EIS. In all cases the human health effects are shown to be low.

RE: PORT OF TACOMA

Dear Mr. Head;

We are writing to you to **protest** the shipping of highly radioactive nuclear waste through the Port of Tacoma. We do not think it wise to transport such toxic material in such a highly populated, earthquake-prone area. 866-1

Why should the United States bear the cost of disposing of these materials when their are plants in Europe which can make better use of them? 866-2

Have you considered the alternative of shipping this material to England, for example, where they have plants to convert it for electrical use.? They might even pay us for it! 866-3

Thank you for your consideration of our input.

Sincerely,

Walter & Virginia Goulette

Walter & Virginia Goulette
(25-year residents of Tacoma)

RESPONSE TO COMMENT
COMMENTOR NO. 866: GOULETTE, WALTER & VIRGINIA

Response to Comment No. 866-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Also, the environmental effects evaluated in the EIS determined that there would be no adverse ecological impacts to any of the ports that might be used to receive the material (Section 4.2.2 of the EIS).

Earthquakes were not analyzed separately in the EIS because seismic activity would not result in greater damage to a transportation cask than that caused by a ship collision and subsequent fire. Rather, the consequences from the worst plausible accidents involving foreign research reactor spent nuclear fuel transportation casks were evaluated, regardless of what initiated them. An earthquake could be the initiator of either a ship or road accident, and thus affect the probability of such accidents; however, the number of earthquake-induced ship and road accidents is small compared to other causes.

Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures in Tacoma to fail, is not expected to compromise the spent nuclear fuel transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 of the EIS demonstrate that the use of any of the selected ports would not pose any significant risk to the port personnel or the population near the ports. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive materials have ever been released from a spent nuclear fuel transportation cask as a result of an accident (Section 2.6.2).

Response to Comment No. 866-2

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons grade) uranium in civil programs worldwide. U.S. subsidization of the costs associated with shipping and managing this spent nuclear fuel in the U.S. is one of several options; other options include charging these nations either a competitive fee or the full cost for these activities. Reprocessing this spent nuclear fuel at existing European facilities is also an alternative under consideration in this EIS (Management Alternative 2; Sections 2.3 and 4.4.2 of the EIS).

Response to Comment No. 866-3

Yes. The overseas reprocessing option is Management Alternative 2, Subalternative 1b which is discussed in Section 2.3 and 4.4.2 of the EIS.

Washington D. C. 20585

I am appalled at the proposal to have nuclear waste shipped to the Port of Tacoma - or in fact any other port. 867-1

When there are alternatives such as its being reprocessed in friendly nations such as Scotland, Great Britain, etc. to a useable product, why in the world should it be stored anywhere in this country? 867-2

No matter how safe these containers are supposed to be, how many tragic accidents have there been in supposedly safe endeavors such as transporting noxious gasses by train - oil spills, etc. Not only that but it appears that we have more and more violent people in this country who could conceivably cause untold damage with this stuff being around - super safe as it might be. 867-3

It doesn't make sense to ship it across an ocean and/or continent when there are other options. Sadly, it seems like there is less and less common sense in evidence these days - in government - business - justice - it's heart-breaking. 867-2 (Cont'd.)

Please keep the stuff away from the Port of Tacoma and consider more viable options.

Thank you.

RESPONSE TO COMMENT
COMMENTOR NO. 867: RICHARDSON, MARGARET J.

Response to Comment No. 867-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma or any other port is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 867-2

The commentor's preference for the overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b which is discussed in Section 2.3 and 4.4.2 of the EIS.

Response to Comment No. 867-3

The spent nuclear fuel transportation casks are described in Appendix B, Section B.2 and Section 2.6.2 of the EIS. They are designed to survive severe accidents without releasing their radioactive contents.

Terrorists can commit violent acts in America. They could cause far greater damage if they were able to make a nuclear weapon. The whole purpose of this proposed action is to deny such people access to weapons-grade nuclear material and thus reduce the threat of a nuclear catastrophe.

COMMENTOR NO. 868: HOBBS, EMMETT & PATRICIA

June 24, 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Dept. of Energy
1000 Independence Avenue SW
Washington, D.C. 20585

Dear Mr. Head:

This letter is being written to inform you that we are opposed to having radioactive nuclear waste shipped through Tacoma. We were unable to attend the meeting here last week, but will do whatever is necessary to stop this proposal. 868-1

Sincerely,

Emmett W. Hobbs

Patricia A. Hobbs

Charles Head
Off. of Spent Nuc. Fuel Mngmt (EM-37)
US Dept. of Energy
1000 Independence Ave. S.W.
Washington D.C. 20585

Dear Sir:
I really do not believe that it is right to bring contaminants especially of nuclear nature thru the Port of Tacoma. 869-1

This waste stuff should be sealed as best as possible right where it sits & not dirty our shores at all. 869-2

Thanks for listening
Jean G. Redler

P.S. After working many years to develope the atom & fission etc., there must be somewhere if searched for long enough, a way to cleanse - partially at least, the waste products. 869-3

RESPONSE TO COMMENT
COMMENTOR NO. 869: REDLER, GERALD C.

Response to Comment No. 869-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma or any other port is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 869-2

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

Response to Comment No. 869-3

Unfortunately, due to the basic nature of the spent nuclear fuels and the fission products they contain, there is no "magic bullet" known today that will make them go away. The accepted disposal mechanism, as specified by United States Public Law 97-425, is to isolate the spent nuclear fuel in a geologic repository. The actions evaluated in this EIS are preparatory to such disposal (Section 4.2.7 of the EIS).

COMMENTOR NO. 870: PIDCOCK, MARVIN & ELNORA

June 25, 1995

Dear Mr. Mead,

I'm writing this to ask you to please refrain from bring Nuclear Waste thru' our port, just why is it actually needed?

Enough is being done to destroy our natural resources without adding more destructive problems to our area & future generations as is!

I'm sure you have good intentions of cargo being stored safely, as have oil & chemicals in the past but have destroyed lots of waters plus fish & wild fuel as well.

Accidents are bound to happen-----

Sincerely,
Marvin & Elnora Pidcock

Washington, DC 20585

Dear Mr. Head;

I am writing to express my disapproval of the plan to ship expended nuclear waste through the Port of Tacoma. I have three main reasons for objecting to this proposal:

1) the Port of Tacoma already suffers from massive environmental waste, including heavy metal residue, sunken junk, and industrial runoff.

2) the Puget Sound area is very heavily populated..

3) my own personal economic interest - I own a home in downtown Tacoma and fear real estate value could decline if there is even the smallest mishap. Not to mention potential damage to the ongoing plans to renovate/upgrade downtown Tacoma.

I cannot offer any suggestions of other ports to use, but would suggest you try to find a port in a less heavily populated region.

Sincerely,

Allison A. Odenthal

872-1

RESPONSE TO COMMENT
COMMENTOR NO. 872: ODENTHAL, ALLISON A.

Response to Comment No. 872-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS).

Shipment of foreign research reactor spent nuclear fuel would not jeopardize the significant cleanup effort undertaken in the area of Commencement Bay and the Port of Tacoma as noted by the commentor. Nor should it contribute to any "dirty port" stigma because the analysis in the EIS indicates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2 of the EIS). Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. Based on over 30 years experience shipping spent nuclear fuel, DOE considers that spent nuclear fuel transportation casks passing through the Port of Tacoma, Commencement Bay, or any other port or waterway would not affect air or water quality. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and emphasize the no-impact nature of these shipments on air and water quality.

COMMENTOR NO. 873: DOLSON, PATRICIA F.

June 25, 1995
Gig Harbor,WA

Dear Mr. Head;

As a U.S.citizen and resident of Washington State I strongly object to having nuclear waste shipped through the Port of Tacoma. This appears to be an irresponsible act on the part of our government and the people of Washington state are not going to sit back and take it. 873-1

The people of Russia did not have the freedom to speak. We do. Listen to us.

WASHINGTON DC. 20585

DEAR MR HEAD,

I WASN'T ABLE TO ATTEND THE HEARING ON THE NUCLEAR WASTE PROPOSAL OF THE PORT OF TACOMA. THE INFORMATION THAT I RECEIVED WAS ON THE LOCAL NEWS + THE TACOMA CITY COUNCIL. I WOULD LIKE TO GIVE YOU MY VOICE ON WHY I STRONGLY DISAGREE ON THE TRANSPORTATION + BURYING OF NUCLEAR WASTE IN WASHINGTON STATE.

I GREW UP 30 MILES FROM HANFORD NUCLEAR PLANT AND NOW I AM IN MY LATE TWENTIES. A COUPLE OF HANDFULS OF PEOPLE MY AGE HAVE DIED OR ARE DYING AS WE SPEAK OF CANCER. BIRTH DEFECTS (INCLUDING MY SISTER'S BABY) + PEOPLE MY PARENT'S AGE HAVE ALL SORTS OF TUMORS + CANCERS WHICH IS A LITTLE TOO COMMON WHEN I GO BACK HOME FOR A VISIT.

IF YOU PLAN TO USE THE PORT OF TACOMA TO BRING TONS OF NUCLEAR WASTE INTO OUR STATE BY BOAT FROM OTHER FOREIGN COUNTRIES THAN TRANSPORT IT VIA TRUCK AND/OR TRAIN TO BE BURIED SOMEWHERE. WHO'S TO SAY THERE WON'T BE AN ACCIDENT OR CONTAMINATION OF THE WATER, LAND, FISH, WILDLIFE + PEOPLE. THE GOVERNMENT CAN NOT GUARANTEE THE PEOPLE AN ACCIDENT WON'T EVER HAPPEN W/O ANY EFFECT. WHO IS TO SUFFER?

HANFORD NUCLEAR PLANT IS ONE OF THE SUPER FUND CLEAN UP PROJECT, WHICH IS PAID BY THE TAX PAYERS AT A PRICE OF $1 MILLION AN HOUR FOR THE NEXT 30 YEARS

- CONTINUE -

874-1

RESPONSE TO COMMENT
COMMENTOR NO. 874: CASTANHA, LESLIE

Response to Comment No. 874-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma or any other port is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Attn;
Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue, SW
Washington, DC 20585

June 27th, 1995

Dear Charles Head,

I received the 'DOE/EIS-0218D March 1995' about a month ago, I do have some questions concerning the DEIS.

In Volume 1, page 3-119, under **3.3.5.6 Land Use**, it says in the fourth paragraph, "There are no onsite areas subject to Native American Treaty rights or that contain any prime or unique farmland (PIC, 1992)." As for there being no Farmlands, I too would not start a Farm / Ranch in an area where Nuclear bombs are detonated not too far away. As for the 'Treaty' part, it is my understanding that these lands were never ceded to the U.S. In fact, while researching this matter, the Western Shoshone were able to provide me with a copy of the Treaty of Ruby Valley of 1863. This treaty was and still is of 'Peace and Friendship' between the two Nations (The Western Shoshone and The U.S. Government). The Treaty explains what rights the U.S. has on Western Shoshone Lands, the treaty does not say anything about 'Nuclear Testing or Storage of Nuclear Waste'. The Western Shoshone have also told me that there never was an agreement stating otherwise. 875-1

Could you please clarify for me who actually has rights to these lands that the U.S. Government plans to use as a Facility to store Spent Nuclear Fuel. Could you also send me a copy of any document stating the the Western Shoshone actually did sell or cede the land to the U.S. Government. Any land title exchange should have happened between the signing of the Treaty Of Ruby Valley of 1863 and the present date (1995).

2.)

DOE/EIS-0218D March 1995 Volume 1
Page 3-99 **3.3.4.3.2 Groundwater**

Groundwater Quality: The first paragraph, second sentence states that the ground water is already contaminated, what have the responsible people done to correct this disaster, be it ever so small or big. Are the people who live there still able to use their ground water to drink, irrigate with, water their animals, quench a child's thirst, how about future children? What will happen to the surrounding area in-case of an accident? Right now all this advertising is being done about how safe the 'Transportation Casks' are, I have seen footage of these tests, and the general public was not told that during these test the Casks did crack and leak water. What will happen when these casks crack and there is spent nuclear fuel in them instead of water. Is the area then going to be called "Chernobyl II"? 875-2 875-3

RESPONSE TO COMMENT
COMMENTOR NO. 875: LICHTBLAU, ANDREAS

Response to Comment No. 875-1

As stated in Section 3.3.5.6 of the EIS, it is DOE's contention that there are no onsite areas of the Nevada Test Site subject to Native American Treaty rights.

Response to Comment No. 875-2

The main portion of potable water supplies at the Oak Ridge Reservation is provided by surface rather than groundwater sources. Because of the abundance of surface water and its proximity to the points of use, almost no groundwater is used at the Oak Ridge Reservation. Although some groundwater contamination has been observed at the Oak Ridge Reservation, data indicate that most contamination remains relatively close to the source. In 1989, the Oak Ridge National Laboratory implemented an off-site residential drinking water quality monitoring program to document the groundwater quality near the Oak Ridge Reservation and to monitor the potential impact of operations on groundwater quality. Radionuclides and organics have been detected in some of the off-site monitoring wells, however, concentrations have been below drinking water standards. Section 3.3.4.3.2 of the EIS has been revised to include and document the response to the comment.

Response to Comment No. 875-3

Contrary to the commentor's statement, the prototype spent nuclear fuel transportation cask crash tests were conducted under conditions of complete openness. The public was invited, and attended each of the tests. The water leak after the crash test is a widely known subject, as documented in DOE/RW-0065, "Transporting Spent Nuclear Fuel: An Overview," March 1986. This report clearly indicates that there was some water leakage after a cask carried on a tractor-trailer crashed into a concrete block (10 feet thick) at 61 miles per hour. The crash did not damage the cask, and the same cask was later used for an 84 mile per hour crash test. The test was done with an old style spent nuclear fuel transportation cask which used liquid coolant. According to the report, the leakage, which was a very small amount (a total of about a cup of dyed water), started when the cask was hoisted free of the wreckage, and stopped when the cask was put on a different trailer for transport. The very small leak by the cask seal was due to strains placed on the cask subsequent to the crash test. The leakage was well within the NRC regulatory limit. The use of coolant in spent nuclear fuel transportation casks has been discontinued. In addition, the foreign research reactor spent nuclear fuels are intact solid fuel rods or plates, and if a cask were to break in an improbable accident, there is no radioactive liquid that could leak out and cause ground water contamination.

COMMENTOR NO. 875: LICHTBLAU, ANDREAS (CONT'D.)

3.)

Why is it the U.S.'s problem to store 'Foreign Spent Nuclear Waste'? I thought that the U.S has enough of it's own waste. It is also my understanding that if some of the U.S. reactors can't store the Spent Fuel Rods very soon, because their own storage places are almost full, that these Nuclear Reactors will have to close down, meaning that energy cannot be provided anymore. I know that a great percentage of the U.S. population would like to see these Nuclear Reactors close down and go to alternative power. Has the Government ever thought of doing what the public has asked? The U.S. Governments moto is " For the Public, of the Public", but I haven't really seen the Government actually consider doing what the Public asks them to do. Could you please explain to me why the DOE has not tried to use Wind and/or Solar energy to produce the energy that we need. Even a single Lightning Bolt would give us a substantial amount of electricity. In this day and age I would think it possible for the sceinentists to contain a single Bolt of Lightning. This would be very clean for Land-Water-Air. There would be no fear of contamination. Air quality would improve. *875-4* *875-5*

I have yet to finish reading the DEIS, but in the meantime if you would please answer my questions for me I would be thankful.

Sincerely

Andreas Lichtblau

RESPONSE TO COMMENT
COMMENTOR NO. 875: LICHTBLAU, ANDREAS (CONT'D.)

Response to Comment No. 875-4

An objective of the proposed policy is to reduce the amount of HEU available in international commerce and to encourage the use of LEU in research reactors (Section 1.2 of the EIS). The basic problem addressed in the EIS is the reduction of weapons-grade material which could be diverted for the manufacture of nuclear weapons. As discussed in Section 2.2.1.3 of the EIS, acceptance of foreign research reactor spent nuclear fuel would increase the DOE's current inventory of spent nuclear fuel approximately one percent by mass and ten percent by volume.

Due to the major differences in size (see Figure 2.5), the facilities that would be used to handle and store the foreign research reactor spent nuclear fuel cannot be used for management of power reactor spent nuclear fuel and thus would have no effect on the availability of storage space for this spent nuclear fuel.

Response to Comment No. 875-5

Consideration of alternative energy sources is outside the scope of this EIS. However, it is important to note that as part of its mission, DOE currently has ongoing programs that are seeking to develop and promote use of such alternatives, including solar and wind.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.

Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: I thi[illegible] stupid stupid" or I [illegible] heard. Are you paranoid? O[illegible] countries would use this for something instead of terror. We certainly don't need other countries so c[illegible]. If you [illegible] Washington D.C. where it [illegible] to y[illegible] then you can keep [illegible] st.

Response to Comment No. 876-1

The commentor's opposition to the acceptance of spent nuclear fuel from foreign research reactors is noted. Acceptance of foreign research reactor spent nuclear fuel for management in the United States, as described in Section 2.2 of the EIS, is one of the management alternatives evaluated in this EIS. Others include overseas management (Management Alternative 2; Section 2.3 of the EIS), combined domestic and overseas management (Management Alternative 3; Section 2.4 of the EIS), and the No Action Alternative (adopt no policy for management of spent nuclear fuel, Section 2.5 of the EIS). The proposed action supports nuclear weapons nonproliferation policies of the United States (Sections 1.1 and 1.2 of the EIS).

RESPONSE TO COMMENT
COMMENTOR NO. 879: PERRY, JOHN

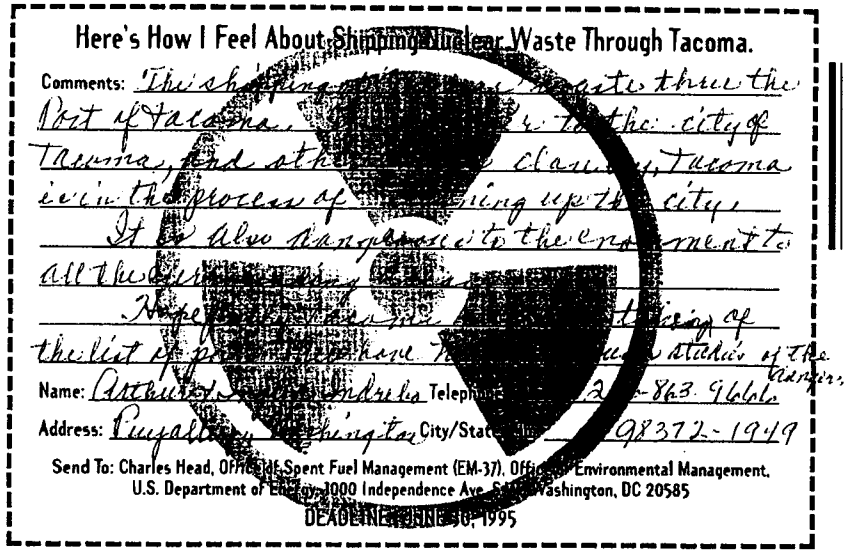
Response to Comment No. 879-1

The passage through Puget Sound to the Port of Tacoma does meet the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS). The favorable transit from open ocean is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port population, population along the route to the DOE management site, port experience with handling containers, and port facilities have also been considered in making the final selection of ports of entry. Appendix D, Section D.1.9 presents details of the port selection process.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: This shipping of waste thru the Port of Tacoma, ... to the city of Tacoma, and at the ... Tacoma is in the process of ... cleaning up the city. It is also dangerous to the environment to all the ... The ... of the list of ... have ... studies of the dangers.

DEADLINE: JUNE 30, 1995

880-1

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by **June 30, 1995**. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

Co-sponsored by Port of Tacoma; Port of Seattle; Longshore Local #23; Puyallup Tribe; Citizens for a Healthy Bay; Cities of Tacoma, Fife, Milton, Ruston, Federal Way; Tacoma–Pierce County Visitor & Convention Bureau, Tacoma–Pierce County Chamber of Commerce; Pierce County Central Labor Council and Pierce County.

Response to Comment No. 880-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Also, the environmental effects evaluated in the EIS determined that there would be no adverse ecological impacts to any of the ports that might be used to receive the material (Section 4.2.4.2.8 of the EIS).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures in Tacoma to fail, is not expected to compromise the transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 of the EIS demonstrate that the use of any of the selected ports would not pose any significant risk to the port personnel or the population near the ports. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive materials have ever been released from a spent nuclear fuel transportation cask as a result of an accident (Section 2.6.2 of the EIS).

881-1

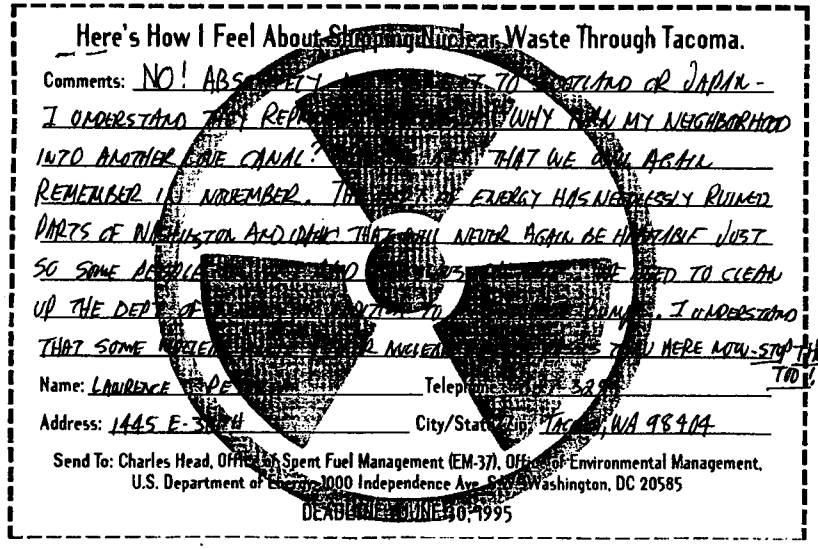
RESPONSE TO COMMENT
COMMENTOR NO. 881: LEWIS, BARRY & BETTY

Response to Comment No. 881-1

The commentor's opposition to Management Alternative 1 to the proposed action is noted. The analyses provided in the EIS indicate that the use of any of the facilities indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel or the population near the port (Sections 4.2.2 and 4.5 of the EIS).

Although response to emergencies is a local function, the Federal government, including DOE, would assist State and local governments in preparation for emergencies. Money for equipment, training programs and other assistance is supplied. In addition, DOE has emergency support teams that would be available to assist in an emergency that involved foreign research reactor spent nuclear fuel (Section 2.7 of the EIS).

COMMENTOR NO. 882: PETERSON, LAWRENCE C.



Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

RESPONSE TO COMMENT
COMMENTOR NO. 882: PETERSON, LAWRENCE C.

Response to Comment No. 882-1

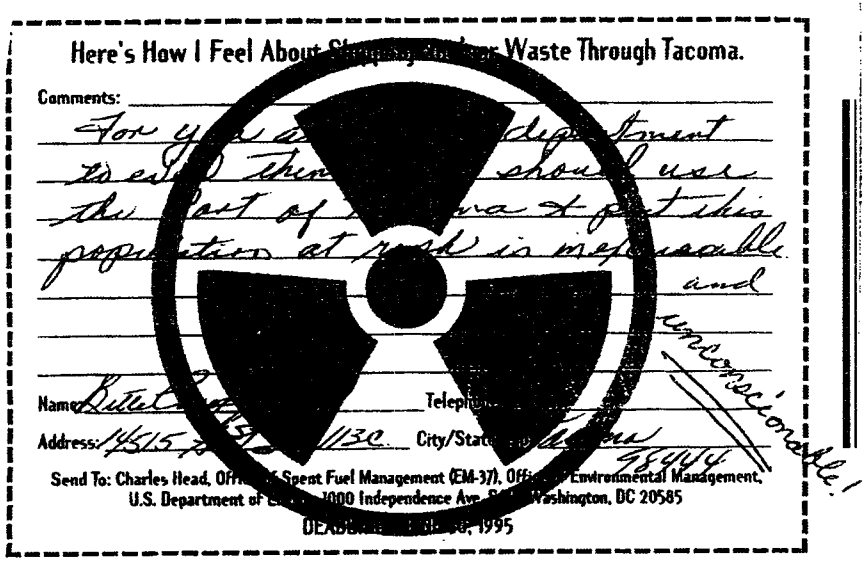
The commentor's preference for the overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b which is discussed in Section 2.3 and 4.4.2 of the EIS.

Response to Comment No. 882-2

The commentor's opposition to management of the foreign research reactor spent nuclear fuel in either the State of Washington or Idaho, is noted. As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

DOE is committed to the cleanup and restoration of several sites contaminated during the nuclear weapons development and production program. This has been the subject of other documents issued, or expected to be issued by DOE, in compliance with the requirements of NEPA. Spent nuclear fuel from foreign research reactors, which is the subject of this EIS, has been safely managed in the United States, including at the Idaho National Engineering Laboratory, for nearly four decades (Section 1.1 of the EIS). As discussed in Section 4.2 of the EIS, the risk to the environment and human health and safety of the public associated with the transportation and management of foreign research reactor spent nuclear fuel, would be low.

COMMENTOR NO. 883: CAUFFMAN, BETTE



Here's How I Feel About [illegible] Waste Through Tacoma.

RESPONSE TO COMMENT
COMMENTOR NO. 887: OLINE, LARRY

Response to Comment No. 887-1

The transportation casks that would be used for the foreign research reactor spent nuclear fuel are certified if their design meets certain tests, including a fire test, and if the individual casks pass periodic inspections (Section 2.6.2 of the EIS). These certification standards were developed for use of the casks on land, hence the 30 minute fire test, which is considered to be the extent of a high intensity fire resulting from a collision with a tanker truck. The duration of a ship fire is directly related to the amount of combustibles carried on board. In spite of this potential, the number of severe fires on ships is relatively small. Data available on the last 15 years from Lloyd's of London indicate that of 1,073 ship collisions in port worldwide, only eleven led to fires, and of those, only five caused extensive damage, with only one actually causing buckling of structures.

In respect to the impact a ship fire might have on a spent nuclear fuel transportation cask, there are three facts that would mitigate the potential damage. First, ship fires tend to move to different areas of the ship as the combustible material is consumed, so the cask would not be exposed for the entire duration of the fire. Second, a ship fire's intensity is normally limited by the amount of oxygen that can reach the interior of a hold. Third, all ships that would be used to transport foreign research reactor spent nuclear fuel have built-in fire suppression equipment, which at a minimum would keep fires well below the extreme temperatures needed to damage the transportation cask. For these reasons, it would be almost impossible for spent nuclear fuel inside the transportation cask to reach 900 degrees Kelvin (1,160 degrees F), the melting point of research reactor fuel. The probability of reaching such a temperature was calculated to be less than one in a billion (Attachment D5 to Appendix D of the EIS). To put this temperature into perspective, steel used in a ship's structure buckles at around 700 degrees Kelvin (800 degrees F).

The EIS contains the results of an analysis of the effects of an accident that involves a severe fire (severity category 6), which does not reach the temperature to melt research reactor nuclear fuel. Appendix D, Section D.5.3 and D.5.4 present a detailed discussion of accident probabilities and radioactive material source terms and the results of the analyses, respectively.

In conclusion, although long duration ship fires are possible, and have occurred, they are uncommon events. Analyses in the EIS indicate that even in the event of a severe ship fire involving a transportation cask, neither the consequences nor risks are great (Appendix D, Section D.5.5 of the EIS).

Response to Comment No. 887-2

The commentor's concern about using major interstate highways is noted. The U.S. Department of Transportation requires the use of major interstates because they are safer than smaller roads for trucks carrying heavy loads. DOE agrees with the Department of Transportation on this issue.

Response to Comment No. 890-1

As discussed in Section 2.7.3.2 of the EIS, DOE provides funding to States and Tribes through the Office of Environmental Management and the Office of Civilian Radioactive Waste Management to assist with transportation related issues. This funding has been used in the past to enhance a jurisdiction's emergency management and response capabilities. Besides funding, much of DOE's assistance is provided in the form of technical assistance, for which DOE bears the cost. Assistance may be provided through DOE's Radiological Assistance Program and under the National Contingency Plan, as well as through training, DOE-sponsored meetings, informal discussions, and informational materials.

Appendix H, which was added to the final EIS in response to public comments, contains the general provisions for emergency preparedness and security measures associated with the transportation of foreign research reactor spent nuclear fuel in the United States. The provisions include an interface between DOE and State, Tribal, and local authorities, prior to the implementation of the policy, for the identification and resolution of emergency management and security issues specific to the communities that would be affected. These issues include capabilities and training of first emergency responders. Funding for special needs, if necessary, would be addressed during this interface.

Commentor No. 891: Stoner, Mike

Response to Comment No. 891-1

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. The evaluated data on populations is from the 1990 census. Although corrected information has been included in the port information for the Port of Tacoma, the analyses provided in the EIS demonstrate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port.

The analysis in Sections 4.2.2 and 4.5 of the EIS indicate that the risk of bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis in the EIS indicates that there would be no significant adverse impacts to any of the ports, bays, or waterways that the material might pass through or near. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on water quality.

Response to Comment No. 891-2

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

Response to Comment No. 892-1

Spent nuclear fuel refers to enriched uranium fuel that has been used in a nuclear reactor. Because spent nuclear fuel is radioactive, it is transported in casks which shield the surroundings from radiation (Section 2.6.2 of the EIS). As noted in Section 4.2.3, spent nuclear fuel has been transported along highways and railways of the United States for over four decades without radiological incident. Analyses provided in Section 4 of the EIS indicate that no significant human health or other environmental effects are expected to result from implementation of the proposed action at the Port of Tacoma or other candidate ports.

RESPONSE TO COMMENT
COMMENTOR NO. 894: REED, JOE

Response to Comment No. 894-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma or any other port is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.

RESPONSE TO COMMENT
COMMENTOR NO. 896: DUNIGAN, STEVEN R.

Response to Comment No. 896-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted.

Based on the analyses of impacts associated with accidents and incident-free operations involving foreign research reactor spent nuclear fuel, DOE considers that commercial ports and facilities and commercial freighters represent an acceptable option for the transportation of foreign research reactor spent nuclear fuel (Section 4.2.2.3 of the EIS presents the consequences of port accidents and Section 4.2.2.2 presents impacts of incident-free operation).

To address several comments, DOE has added a paragraph to Section 2.6.3.2.1 of the EIS to discuss why special security is not needed for the receipt of foreign research reactor spent nuclear fuel at commercial ports.

COMMENTOR NO. 914: VILLA, DEXTER

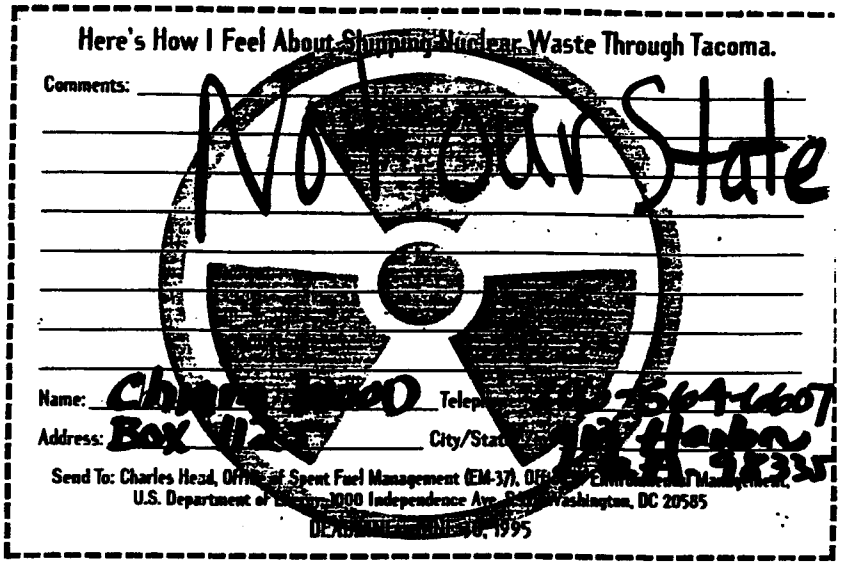
Response to Comment No. 914-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Commentor No. 915: Wood, Chiara

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



915-1

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by June 30, 1995. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

927-1

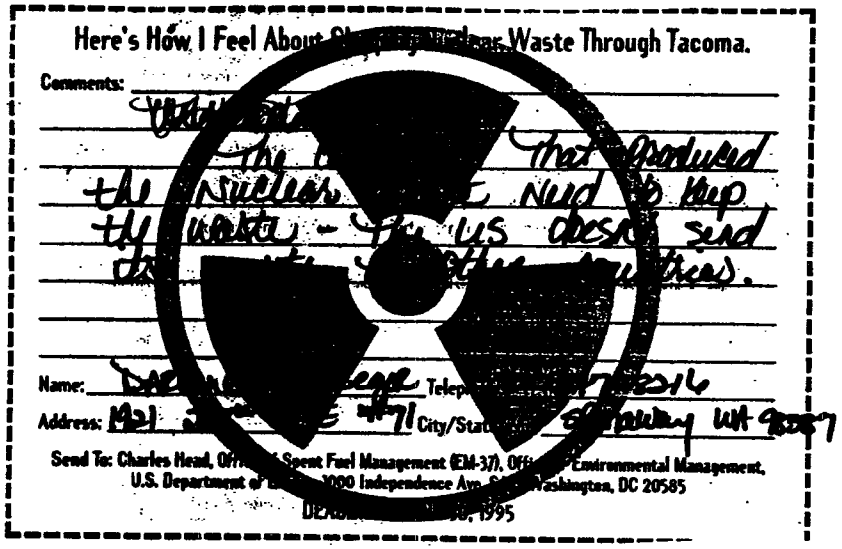
RESPONSE TO COMMENT
COMMENTOR NO. 927: DAVIS, JAN

Response to Comment No. 927-1

The commentor's opposition to acceptance of spent nuclear fuel from foreign research reactors in the United States is noted. As discussed in Section 1.1 of the EIS, foreign research reactor spent nuclear fuel has been accepted for disposition in the United States for over 30 years. During that time, no radiological release from a transportation cask containing foreign research reactor spent nuclear fuel has occurred (Section 4.2.3 of the EIS).

This EIS evaluates three alternatives for management of foreign research reactor spent nuclear fuel: management in the United States (Management Alternative 1, Section 2.2), overseas management (Management Alternative 2, Section 2.3), and a combination of domestic and overseas management (Management Alternative 3, Section 2.4). None of these management alternatives compel the United States to permanently serve as a repository for foreign research reactor spent nuclear fuel.

COMMENTOR NO. 928: MCGREGOR, DARLENE



928-1

RESPONSE TO COMMENT
COMMENTOR NO. 928: MCGREGOR, DARLENE

Response to Comment No. 928-1

The commentor's preference for overseas management of spent nuclear fuel from foreign research reactors is noted (Section 2.3 of the EIS). As discussed in Section 1.2 of the EIS, many of the foreign research reactor operators cannot store their spent nuclear fuel in their country due to existing regulatory or financial constraints. Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

933-1

RESPONSE TO COMMENT
COMMENTOR NO. 933: LOPEZ, G.A.

Response to Comment No. 933-1

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Tacoma is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternative 1 or 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Sections 4.2.2.3 and 4.5 of the EIS) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Sections 4.2.2.2 and 4.5 of the EIS).

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. The evaluated data on populations are from the 1990 census.

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). Section 4.2.1.3 of the EIS has been modified to include this assurance of recovery in coastal waters. See Appendix C, Section C.5.5 of the EIS for information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters were estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

The acceptance of foreign research reactor spent nuclear fuel through the Port of Tacoma would neither affect the activities being conducted in Commencement Bay as a result of being a "Superfund Site," nor would it add any additional burden to this designation. The transport of the spent nuclear fuel on the Bay would not add any hazardous material to the Bay or the environment. DOE has added a sentence to Appendix D, Section D.2.1.9 of the EIS recognizing the designation of the Commencement Bay as a Superfund Site. The notion that the spent nuclear fuel shipments, but not other more hazardous material shipments, passing through the Port of Tacoma would add to the designation "stigma" is an unjustified fear.

COMMENTOR NO. 933: LOPEZ, G.A. (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 933: LOPEZ, G.A. (CONT'D.)

Section 2.8 of the EIS addresses the security measures that would be taken to ensure that there would be no unacceptable risks of terrorism or theft of materials. DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security such as might be present at military bases. The security measures employed at any port would meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). If the port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide additional security. DOE supports these regulations as being adequate to protect the foreign research reactor spent nuclear fuel in any commercial port. To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site.

June 25, 1995

Charles Head
Office of Spent Nuclear Fuel Mgmt.
U.S. Department of Energy
Washington DC 20585

Dear Mr. Head:

I absolutely do not want radioactive nuclear waste shipped through the Port of Tacoma. 936-1

Thank you.

Kevin Gilmore

Kevin Gilmore
928 East 55th Street
Tacoma WA 98404-2621

Response to Comment No. 936-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 937: LEONARD, EILEEN M.

COMMENTOR NO. 938: BOWMAN, CHILTON A.

Jan 26-95

Charles Head
Project Manager
Spent Nuclear Fuel Managment

Dear Sir:

As a property owner living in the Tacoma area, we protest the shipping of nuclear waste through the Port of Tacoma or via Railroads in the City. We are opposed to it being sent to Hanford also.

Please find some other way and place to dispose of it.

Very truly,

Frances K. Bowman
Chilton A. Bowman

938-1

938-2

RESPONSE TO COMMENT
COMMENTOR NO. 938: BOWMAN, CHILTON A.

Response to Comment No. 938-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma or using rail transport within the City of Tacoma, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Also, Section 4.2.3 demonstrates that the risk associated with ground transport is also low.

Response to Comment No. 938-2

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

COMMENTOR NO. 939: DUDLEY, OLIVIA J.

To Whom It May Concern:

RE: Transportation of Nuclear Wastes Through Tacoma

Since 1975 I have been a resident and taxpayer in this city. I do not consider myself to be an 'activist' but I am very fond of my home, have raised my sons here and participated in community and school events in the process. I hope to see my grandchildren raise yet another generation. However, during the last two decades, I have witnessed the death of my mother and her sister, both as a result of diseases related to ecological toxicity.

At best, our region's environment has been tenuous for nearly half a century. Why else would we have been designated as a Super-Fund cleanup site?

To even consider transporting highly toxic chemical and/or waste materials across our county at this point, after all our efforts to maintain a better quality of air, water and life, goes beyond ambiguity -- it is sheer hypocrisy! The risks involved far outweigh any possible benefit to the citizens of our area. 939-1

Very truly yours,

Olivia J. Dudley

O. J. Dudley

June 1995

Mr. Charles Head;

My husband and I have four beautiful children. Our family is blessed to live in the lovely, clean Pacific Northwest. We have our choice of waterfront, coastline of the ocean or mountains to enjoy as a family. Right now all these areas are safe and free from radioactive nuclear waste. We want our environment to remain clean and free from any and all nuclear waste. We want to raise our children in a clean healthy environment - free to enjoy the "Great Outdoors!" Do not send nuclear waste through the Port of Tacoma! 943-1

Thank you,

Sincerely,

Tim and Debra Balding

Response to Comment No. 943-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 944: HARTOUGH, J.H.

To: Charles Head
Office of Spent Nuclear Fuel ~~Nuclear Fuel~~ Management June 22, 1995

If you were listening, you heard a resounding "No!" to the question of Nuclear Waste through Tacoma's Port.

In the preamble to the constitution it says "We the people..." in order ~~#~~ to ..."promote the general welfare"... establish government.

When government arrogantly disregards the will of the people, it serves no purpose. It is the case of the tail wagging the dog.

Future generations are now silent on this issue; but your right decision can protect them. We must learn how to re-process nuclear waste to make it harmless. Make that your focus.

Sincerely,
J. H. Hartough
Teacher of 23 years.

RESPONSE TO COMMENT
COMMENTOR NO. 945: HARTOUGH, MARY

Response to Comment No. 945-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 945-2

The commentor's preference for the alternative of overseas storage as described in Sections 2.3 and 4.4.1 of the EIS is noted. Foreign research reactors are not used for generation of commercial power or development of nuclear weapons. They do have research, medical, industrial, and agricultural applications (Section 1.1 of the EIS). Many of the foreign research reactor operators cannot store their spent nuclear fuel in their country due to regulatory or financial constraints (Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

COMMENTOR NO. 946: PETERSON, SHAWN

To: Charles Head,

As a child of the United States of America, I think that the children should also have a say in this since when we grow up, well be the ones dealing with nuclear waste in our lakes, rivers, and waterways. I am ~~very~~ much aginst mooring the waste into the Puget Sound. For one reason: I have an uncle that works at the port what happens if just one of those containers brakes open? my uncle, along with hundreds of others will probly die. For another reason what if one of them breaks open in the Sound? Every living creature that lives in or around the Sound will die. Plus there will be no more diving. And what about the fishermen? They'll be pretty mad. ~~Please~~ Think about it. Is this really worth it?

Sincerely,

Shawn ~~Peterson~~ Age: 10

Response to Comment No. 946-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 946-2

Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radiation has ever released from a spent nuclear fuel transportation cask, nor has a spent nuclear fuel transportation cask ever been punctured, even as a result of an accident. A paragraph has been added to the EIS (Section 4.2.2.2) to make this point and to emphasize the no-impact nature of these shipments on air and water quality. In the unlikely event of a severe accident, the analysis in Section 4.2.2.3 and Appendix D, Section D.5 of the EIS determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident.

948-1

948-2

948-3

RESPONSE TO COMMENT
COMMENTOR NO. 948: PETERSON, COURTNEY

Response to Comment No. 948-1

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS). Prior to 1989, it was United States policy to accept spent nuclear fuel containing uranium enriched in the United States (Section 1.1 of the EIS). Thus, the intent of the resultant proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

Response to Comment No. 948-2

If one of the spent nuclear fuel transportation casks released its radioactive contents, it would not kill everything in its path for 25 miles, as suggested by the commentor. The analysis in Section 4.2 of the EIS indicates that transporting the foreign research reactor spent nuclear fuel would cause very low impacts to persons living near a port of entry or along a transportation route.

Response to Comment No. 948-3

The possibility of longshoremen refusing to offload the foreign research reactor spent nuclear fuel was not considered in the port selection process (Appendix D, Section D.1.9 of the EIS) since that factor does not impact the capability to safely receive containers carrying foreign research reactor spent nuclear fuel. The decision as to which port or ports would be used, in the case that foreign research reactor spent nuclear fuel is accepted into the United States, will be made in the Record of Decision. In any case, the possibility described here is one of the many factors that would have to be considered in determining which ports to use.

U.S. Department of Energy
1000 Independence Ave. SW.
Washington, D.C. 20585

Dear Mr. Head:

I am writing in regards to the idea of highly radioactive nuclear waste being shipped through the Port of Tacoma, WA.

My family and I hope and pray that when you give your report to the director of the Office of Spent Nuclear Fuel Management, that it includes the true voice of the "City of Destiny", Tacoma, WA. Which we believe is that as a citizen of Tacoma we do not want radioactive nuclear waste being shipped here. We don't want low-level or middle-level or high-level radioactive waste in the Port Of Tacoma, Port of Seattle, Port Of Long Beach, CA or The Port of San Fransico. In fact if you can recommend the Port of Washington, D.C. for the Port of delivery I am sure you will see that our countries leaders don't want it near them or their families. 951-1

Thank you for listening and your time. We hope that you see that The City of Destiny and many more cities would like to be excluded from this plan.

Thank you,

Rachel R. Bennett

RESPONSE TO COMMENT
COMMENTOR NO. 951: BENNETT, RACHEL R.

Response to Comment No. 951-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Ports of Tacoma, Seattle, Long Beach, and San Francisco is noted. The ports of Seattle, Long Beach, and San Francisco do not meet all of the evaluation criteria used in the EIS to identify candidate ports for the potential receipt of foreign research reactor spent nuclear fuel. The analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 952: JENNINGS, MR. & MRS. ROBERT V.

1) 6/26/95

In regards to shiping Nuclear Waste materials through the Port of Tacoma Positively NO.

Why ship it through our town or any other, let them take care of their own Nuclear Waste.

People worry about our atmosphere already. They want us not to burn outside, We can't even burn in our fireplaces.

They want us to Recycle every thing, we Recycle garbage, we can't use certain hairspray + deodorants these things affect the Ozone layer.

Well, what do you think this radio active Nuclear Waste is going to do to the people of Tacoma.

What about the desisions you can get from Radio active materials?

Do we the people have

RESPONSE TO COMMENT
COMMENTOR NO. 952: JENNINGS, MR. & MRS. ROBERT V.

Response to Comment No. 952-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 952-2

The commentor's preference for the No Action Alternative which is described in Section 2.5 of the EIS is noted. As discussed in Section 4.6 of the EIS, implementation of the No Action Alternative would not support policies of the United States that are intended to prevent the spread of nuclear weapons. The intent of the proposed action is to support U.S. nuclear nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium fuels in civil programs worldwide (Sections 1.2 of the EIS).

Candidate ports for receipt of foreign research reactor spent nuclear fuel were chosen on the basis of selection criteria described in Appendix D of the EIS. Analyses presented in Section 4 (See especially Table 4-7) of the EIS indicate that risks associated with implementation of the proposed action to health or the environment at any of the candidate ports, including the Port of Tacoma, would be low.

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington D.C. 20585

June 25, 1995

Dear Mr. Head,

I am writing to let you know that I strongly oppose the proposal to make the Port of Tacoma a port of entry for nuclear waste from other countries. If you heard the voice of the people at the Tacoma Public Utilities meeting on June 19th, you must realize the widespread outrage over this idea. It's not just a handful of Greenpeacers and some idealistic student activists that are standing up against your department's plan. It is the entire city of Tacoma and the surrounding Puget Sound communities. We are not alarmists or panic mongers. We are average tax paying, law abiding citizens who believe we have a say in what happe ns in our state. 953-1

The Draft Environmental Impact Statement is based on outdated information, and fails to address important security and safety concerns. No amount of reassurrance as to the safety of shipping nuclear waste through our port and over our streets can over ride the fact that accidents happen. You, and the Department of Energy cannot guarantee that this proposal is risk free.

I do not want to allow a risk of this magnitude to be imposed upon myself, my children, my neighbors, or this beautiful part of our country. The Puget Sound area is a jewel. We will not permit it to be compromised.

The Department of Energy is a office of government that is supposed to SERVE THE PEOPLE. It seems as if this notion of "serving the people" has been lost in the shuffle. I urge you to listen to the voice of the people of Tacoma before you make a decision on this critical issue.

Sincerely,

Dayle Nelson

Mrs. Dayle Nelson

RESPONSE TO COMMENT
COMMENTOR NO. 953: NELSON, DAYLE

Response to Comment No. 953-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Some information on the Port of Tacoma (including the map) in the draft EIS was found to be outdated. This information and the map have been updated in Appendix D, Section D.2.1.9 of this final EIS.

The security provided for the spent nuclear fuel shipments is required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security.

Neither acts of terrorism nor theft of materials by a determined group or individual can be completely precluded. However, proper security measures greatly reduce the risk of such actions. Security would be provided for all shipments of foreign research reactor spent nuclear fuel, as required by the Code of Federal Regulations (10 CFR Part 73). The security provisions are summarized in the new Appendix H that has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that would be prepared for each foreign research reactor spent nuclear fuel shipment to specify details of the transportation process, including security provisions in port and during transit.

DOE considers that all safety concerns have been addressed in the EIS. More specific information is needed to address the commentor's concern for safety.

COMMENTOR NO. 954: HAUGE, HELENA

Mr Charles Head,

I strongly object to the idea of shipping highly radioactive (or any degree of radioactive) nuclear waste through the Port of Tacoma. Kindly find a less pristine area to transport this waste through. Washington State has enough to contend with, with its human growth problems & Hanford. Thank-you.

Helena Hauge

954-1

RESPONSE TO COMMENT
COMMENTOR NO. 954: HAUGE, HELENA

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 955: JENNINGS, SCOTT & RENEE M.

26 June, 1995

Charles Head
U.S. Dept. of Energy (EM-37)
1000 Independence Ave.
Wash. D.C. 20585

Subject: Shipping of Nuclear Waste to Tacoma Washington

Dear Sir,
I was unable to attend the meeting held Monday 6/19, but I am writing to express my deep concern and strong protest against such a plan.

My first objection is with your, and the administrations, desire to use the U.S. as a world dumping ground for nuclear waste. I do not understand why you would ever desire to accept this potentially grave burden. You stated at the meeting you desired to hear only technical reasons why waste should not be shipped, but never offered a sound technical reason why it should. It is my position that if a country cannot properly dispose of spent nuclear waste and adequately safeguard against terrorists acts, it is not worthy of producing nuclear based products in the first place. Shouldn't this safeguarding be subject to a global commission in charge of regulation in this area, keeping the nuclear waste in the country that produced it? In addition, certainly the shipping of these containers over vast distances increases the danger of not only accidents but also terrorist acts. 955-1

Secondly, I strongly submit that the Port of Tacoma should not be used for this potentially catastrophic endeavor. First of all, the data used in the initial analysis is unacceptably flawed. As stated at the meeting, the population data used is 15 years old! Few places have experienced the amount of population growth over the last 15 years as the Tacoma area and specifically the area surrounding the waterway leading to Commencement Bay. In order to arrive at the port, the route would take this nuclear waste through the Puget Sound area, a very populated and abundant in wildlife route. An accident in this area would be catastrophic to both humans and the wildlife ecosystem. In addition, the Port of Tacoma does not have adequate structure to handle such a task. No nuclear expertise exists in this area. 955-2

Last, I bring up a subject I did not her discussed at the meeting and that is, the extreme loss of land value that would result from this poor decision. Surrounding the Puget Sound waterway, and specifically Commencement Bay which houses the port, is a huge area of high value homes. These high value homes are burdened with a large amount of property taxes used to fuel the area's education system. This tax revenue would be lost as homes and land become worthless at the hand of such a hasty decision. The area's education system would be left in ruin as a result. As I stated earlier, this area has experienced huge growth over the last few years and I conservatively estimate over a million homes would be stripped of any significant value. A million homes at an average loss of $200, 000 each would result in a value loss of some $20 billion. Who will pay for this loss? Is the taxpayer willing to pick up the tab in light of the huge budget deficit challenges our country is faced with? I think not! Am I, as an individual, expected to shoulder the burden? I vehemently protest. I am not sure of what legal recourse I would have, but I would pursue a lawsuit with all my efforts. 955-3

In summary please, please reconsider this potentially devastating decision.

Concerned Citizens

Scott & Renee Jennings
4650 Lighthouse Dr. N.E.
Tacoma Wa. 98422 (206)952-7594

RESPONSE TO COMMENT
COMMENTOR NO. 955: JENNINGS, SCOTT & RENEE M.

Response to Comment No. 955-1

As discussed in Sections 1.1 and 1.2 of the EIS, the proposed action is intended to reduce the amount of weapons-grade enriched uranium available for potential diversion to the manufacture of nuclear weapons. Many of the foreign research reactor operators cannot store their spent nuclear fuel in their own country due to financial or regulatory constraints. Thus the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

Radiological health and other environmental risks were evaluated during preparation of this EIS. The analysis demonstrates that the risks associated with implementation of the proposed action to human health or the environment at candidate ports (Table 4-7 of the EIS), along transportation routes, or at interim management sites would be low (Sections 4.2.2, 4.2.3, and 4.2.4 of the EIS, respectively).

Response to Comment No. 955-2

DOE regrets any misunderstanding of the date and accuracy of the population data used for the Port of Tacoma analysis. The date of the population data used for the analysis was 1990, not 1980 as may have been indicated at the public hearing. Secondly, the population data centered on a 10-mile radius around the port, not around the city of Tacoma, which could account for a difference in the population data used for the port selection process. Appendix D, Section D.2.1.9 of the EIS presents a detailed discussion of Port of Tacoma population.

The Port of Tacoma has excellent facilities to handle containers. Appendix D, Section D.1.9.3 of the EIS presents a discussion of the "port facilities" selection criterion (Criterion 3).

As the port selection process section (Appendix D, Section D.1 of the EIS) explains in detail, Tacoma and the other nine ports all meet the criteria and hence are considered to be able to safely handle the foreign research reactor spent nuclear fuel. The experience criterion used in the port selection process (Appendix D, Section D.1.9.1 of the EIS) evaluates the port's experience in handling containerized cargo, such as would be the case for any spent nuclear fuel shipments. Although the foreign research reactor spent nuclear fuel is radioactive material, the dose rates from the casks used to transport it would be low, so no special handling is required.

COMMENTOR NO. 955: JENNINGS, SCOTT & RENEE M. (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 955: JENNINGS, SCOTT & RENEE M. (CONT'D.)

Response to Comment No. 955-3

The EIS evaluates the risk to the environment and the public health and safety associated with port activities in Section 4.2.2. The risk is evaluated for both incident-free operations and accident conditions. As discussed in Section 4.2.2, the risk from incident-free operations is low.

Several accident scenarios including a breach of the cask and fire sufficient to oxidize the contents were also analyzed. Results of the accident analysis at the ports are given in Section 4.2.2 of the EIS with supporting detail in Appendix D, Section D.5. No catastrophic effects were found to result from severe accidents involving foreign research reactor spent nuclear fuel.

DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. Under NEPA regulations, the socioeconomic effects evaluated for this EIS do not include those associated with psychological fear of receiving spent nuclear fuel, which would include the hypothetical loss of property values raised in the comment.

COMMENTOR NO. 956: OTIS, MR. & MRS. GLENN

6-27-95

We are appalled that you would even consider having Nuclear waste being shipped through Port of Tacoma and we are absolutely against it. Please, Please, do not let this happen. We love our Pacific Northwest and want to keep it free from such things.

Thank you for taking the time to read this.

Sincerely,

Mr. and Mrs. Glenn Otis
3921 Boise St. W.
Tacoma, Wa. 98466

956-1

RESPONSE TO COMMENT
COMMENTOR NO. 956: OTIS, MR. & MRS. GLENN

Response to Comment No. 956-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 957: SUNDE, JUDI

June 20, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management
US Department of Energy - MS EM-37
1000 Independence Avenue SW
Washington DC 20585

Dear Mr. Head:

This letter is being written to voice my concerns and objections to the proposal to move spent nuclear fuel shipments through the Port of Tacoma.

It is my understanding that the following facts regarding the Department of Energy's proposal are true:

- Outdated information regarding the impact on the Port of Tacoma resulting from fires/explosions occurring on a ship carrying spent nuclear fuel and whether the Port has the means to adequately contain/overcome such an incident was used. *957-1*
- Incorrect data regarding the depth of the major shipping lanes to and from the Port was used in determining whether it was possible to recover spent fuel casks in case of a ship breaking up and the casks sinking to the bottom of the Sound. *957-2*
- The Port area is located on a Superfund site. How can it be environmentally logical to contribute to a problem already recognized and designated for clean up? *957-1 (Cont'd.)*
- The DEIS does not address proper security measures to avoid theft of this material by "crazies."

RESPONSE TO COMMENT
COMMENTOR NO. 957: SUNDE, JUDI

Response to Comment No. 957-1

Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. In regard to fire, Appendix D, Section D.5.3.1 of the EIS describes several accident scenarios that involve fire. The results of the analysis of these accidents can be found in Appendix D, Section D.5.4 of the EIS. The analysis shows that even in the event of a severe ship fire, neither the consequences nor risks are great (Appendix D, Section D.5.5 of the EIS). Although the nonradiological effects of such a catastrophic accident would obviously impact the local environment, no additional impacts are predicted due to the presence of foreign research reactor spent nuclear fuel. The input to these analyses is all current data, including the population data, which was based on the 1990 census, so the DOE considers that the results are accurate.

DOE considers that there is adequate regulatory and emergency preparedness infrastructure to ensure the safe acceptance and transport to designated management sites if the foreign research reactor spent nuclear fuel is managed in the United States. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1. There are three national emergency response plans under which DOE provides radiological monitoring and assessment assistance. Under these plans, DOE provides technical advise and assistance to the State, Tribal and local agencies involved with a radiological incident. Emergency preparedness, security, and coordination of DOE with local emergency response authorities, and security are discussed in general in Sections 2.7 and 2.8 of the EIS. Details would be contained in the Transportation Plan, that would be prepared prior to any individual spent nuclear fuel shipment and coordinated with State and local officials. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments.

The acceptance of foreign research reactor spent nuclear fuel through the Port of Tacoma would neither affect the activities being conducted in Commencement Bay as a result of being a "Superfund Site," nor would it add any additional burden to this designation. The transport of the spent nuclear fuel on the Bay would not add any hazardous material to the Bay or the environment. DOE has added a sentence to Appendix D, Section D.2.1.9 of the EIS recognizing the designation of the Commencement Bay as a Superfund Site. The notion that the spent nuclear fuel shipments, but not other more hazardous material shipments, passing through the Port of Tacoma would create a "stigma" is an unjustified fear. The analysis of impacts, as documented in Section 4 of the EIS, shows that there would be no significant adverse impacts on the port, people, or natural environment from shipments of foreign research reactor spent nuclear fuel through any of the ports of entry. Historically, there were no adverse economic or cultural impacts to the ports that received foreign research reactor spent nuclear fuel for the 30 plus years it was received.

COMMENTOR NO. 957: SUNDE, JUDI (CONT'D.)

Charles Head
June 20, 1995
Page - 2 -

The Department doesn't say what would happen to the Port and surrounding areas -- both on land and water -- in case a serious incident were to happen. The major tax base for the Port and Tacoma is located in the very area that would be adversely affected should an incident happen. There are many communities that front the Sound, impacting a large population. Is the Department going to come in and make the Port and surrounding areas "whole" again in case of an incident? I think not! 957-3

The bottom line is the **Department of Energy used outdated and incorrect information to determine whether the Port of Tacoma would be a good candidate for the shipping of spent fuel casks through Commencement Bay to the Port.** The Port of Tacoma is not a sound/logical/feasible site for the shipping of this material and should be removed from the candidate list. 957-1 (Cont'd.)

Truly yours,

Judi Sunde

Judi Sunde

cc: Port of Tacoma

RESPONSE TO COMMENT
COMMENTOR NO. 957: SUNDE, JUDI (CONT'D.)

DOE considers that foreign research reactor spent nuclear fuel could safely be received at any of the candidate commercial ports, as it has in the past, without additional security such as might be present at military bases. The security measures employed at any port would be required to meet or exceed all of the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not meet the security requirements of 10 CFR Part 73, the shipper would be responsible for providing the required additional security. DOE supports these regulations as being adequate to protect the foreign research reactor spent nuclear fuel in any commercial port.

Response to Comment No. 957-2

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

Response to Comment No. 957-3

Several accident scenarios including a breach of the cask and fire sufficient to oxidize the contents were also analyzed for all ports considered. Results of the accident analysis at the ports are given in Section 4.2.2 of the EIS with supporting detail in Appendix D, Section D.5. No catastrophic effects were found to result from severe accidents involving foreign research reactor spent nuclear fuel.

Re: Draft Environmental Impact Statement - March 1995
Involving Shipping Nuclear Fuel via Port of Tacoma

Dear Mr. Head:

The D.E.I.S. referenced above is terribly inaccurate and vague. Tacoma is only 30 some miles from Seattle (the city you chose not to use because of its population). What the researchers of this document failed to notice is that there is one continuous mass of humanity stretching several hundred miles north and south of the Seattle-Tacoma area, and more than a hundred miles east and west of this megatropolis. Puget Sound is a very densely populated area now, and it is growing extremely rapidly. Seattle's city center falls well within the 50 mile "danger" range of the Port of Tacoma, which would indeed put its population in harms way in the insanely frightening event of a nuclear accident while transporting nuclear waste through Tacoma. Bear in mind that the highway system in this area is the fourth worse congested in the entire United States and expected to worsen. We have been warned that it is just a matter of time until we experience a 6.0 or better earthquake in this area because we sit over several major faults. Also, there's a 14,000 foot volcano sitting about 50 miles southeast of Tacoma which geologists tell us is due to "go off" at anytime. This doesn't sound like a very safe place to be transporting nuclear waste through, does it? Or does the Department of Energy even care? We've certainly been given that impression. As a matter of fact, there are more than a half million people in Tacoma and Pierce County, Seattle, Tacoma, Everett, Olympia, and the area directly around south Puget Sound (approximately 3 1/2 millions folks) is virtually exploding with growth. I get the distinct impression that whoever compiled the census data for your document wasn't using anything current. 958-1

As a Washingtonian, I emphatically do no want any additional nuclear garbage in this state or passing through this state. Personally, I don't see the reasoning for any more in the United States, period. We cannot be the world's garbage dump any more than we have been able to be the world's peace keeper. Both ideas are ludicrous! Washington is still trying to clean up the horror that Hanford has become. What a deadly and hideous can of worms Dr. Oppenheimer opened back in 1945. Unfortunately, for the world's population, it's a can that can't be resealed. However, just because the U.S. was the first to perfect and use nuclear energy, doesn't mean that the U.S. must or should be the collection point for all of the toxic waste that is used by and spread over the world. We have military personnel who can be stationed in the current storage locations for the express purpose of insuring its 958-2

RESPONSE TO COMMENT
COMMENTOR NO. 958: HARRIS, DIANE

Response to Comment No. 958-1

The Port of Tacoma was one of ten ports that was determined to be acceptable to receive the foreign research reactor spent nuclear fuel, if the material is to be accepted into the United States. Population of the port and surrounding areas to a radius of 10 miles (16 km) is one of the considerations of the port selection criteria, and one of the reasons the Port of Seattle was not included in the final list of ports. The population criterion for port selection (Criterion 5) is discussed in more detail in Appendix D, Section D.1.9.5 of the EIS. The date of the population data used for the analysis was 1990, not 1980 as may have been indicated at the public meeting.

All population within a 50-mile radius of the Port of Tacoma was considered when analyzing the impact of a range of hypothetical port accidents. The risks were found to be low (Section 4.2.2.3 of the EIS). Earthquakes were not analyzed separately in the EIS because seismic activity would not result in greater damage to a transportation cask than that caused by a ship collision and subsequent fire. Rather, the consequences from the worst plausible accidents involving foreign research reactor spent nuclear fuel transportation casks were evaluated, regardless of what initiated them. An earthquake could be the initiator of either a ship or road accident, and thus affect the probability of such accidents; however, the number of earthquake-induced ship and road accidents is small compared to other causes.

Response to Comment No. 958-2

Management alternatives described in the EIS include management of spent nuclear fuel from foreign research reactors in the United States (Management Alternative 1, Section 2.2), overseas management (Management Alternative 2, Section 2.3), and a combination of domestic and overseas management (Management Alternative 3, Section 2.4). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

As discussed in Section 1.1 of the EIS, spent nuclear fuel is not an attractive target for theft or sabotage. The greater risk is that, through international commerce, HEU might fall into the hands of a government with the means and intent to develop a nuclear weapons capability. Stationing military personnel at the reactor sites would have little practical effect on the potential for diversion of HEU to a weapons program.

The commentor's support for overseas reprocessing as described in (Section 2.3 of the EIS) is noted. From the viewpoint of nuclear weapons nonproliferation, overseas reprocessing does not result in a safer product (Section 2.3 of the EIS).

Charles Head
June 30, 1995
page two

need to bring it to the U.S. to "store." Instead of spending money to transport and store it here; build reprocessing plants, or assist the Scots in enlarging theirs. There surely must be a more reasonable and intelligent solution to this problem. Nuclear waste is no safer here than where it is now, providing we can supply personnel to watch over it until it can be reprocessed into a safer form. 958-3

We, the citizens of the world, have learned slowly and painfully not to believe all that we've been told by our governments about "safety" relative to using and storing radioactive materials. There are hordes of sick and dead in this state, in this country and worldwide who are the horrifying reality behind this "truth stretching" by our leaders and governmental agencies.

Undeniably, Washington State has already shouldered more than its fair share. I implore you to quit gambling with our lives. If you and the others at the Department of Energy don't think this garbage is dangerous, then I highly encourage each of you to take a cask home and bury it in your own backyard. Allow a cask or two tumble off of a train into your yard or pasture. Have your family sit in a parked car next to a truckload on a freeway during rush hour gridlock. We don't want it passing through here. Not now, not ever. Leave it where it is, and leave us alone.

Very truly yours,

Diane Harris

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma or any U.S. port is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 968-2

The commentor's preference for the No Action Alternative as described in Section 2.5 of the EIS is noted. As discussed in Section 4.6 of the EIS, the No Action Alternative does not support policies of the United States that are intended to prevent the spread of nuclear weapons. The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium fuels in civil programs worldwide (Sections 1.2 of the EIS). This objective is a substantive consideration in reducing the peril of nuclear weapons proliferation because a relatively small amount of HEU can be used to make a nuclear weapon. As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low.

COMMENTOR NO. 971: CANZLER, RON G.

Washington D.C. 20585

Dear Mr. Head:

I am writing this letter to let you know that I am against shipping Nuclear Waste through the Port of Tacoma. I think that Nuclear Waste is too hazardous to ship through a populated area like Tacoma. Citizens of the U.S.A. should not be exposed to this unseen hazard. 971-1

Mr. Head, I urge you to recommend an alternate plan that dose not require transporting hazardous waste through our town.

Thanks for your time and consideration.

Sincerely:

Ron D. Canzler
1006 E. 61st St.
Tacoma, Wa. 98404

RESPONSE TO COMMENT
COMMENTOR NO. 971: CANZLER, RON G.

Response to Comment No. 971-1

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Tacoma is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternative 1 or 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3 of the EIS) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2 of the EIS).

COMMENTOR NO. 972: TARANOVSKI, T.

The University of Puget Sound

Mr. Charles Head
Program Manager
Office of Spent Nuclear Fuel
Management (EM-37)
U.S. Department of Energy
1000 Independence Ave, SW
Washington, D.C. 20585

June 29, 1995

Dear Mr. Head:

I was unable to attend the recent hearing on shipment of nuclear waste via the port of Tacoma, but I would like to add my voice to those who are unalterably opposed to it. 972-1

I do not consider it sound national policy to receive and store spent nuclear waste from foreign reactors on U.S. soil. I am not impressed by the claim that national security requires this step since there are greater worries than that in regard to nuclear proliferation. I am, however, impressed by potential dangers to our community from possible spillage or nuclear accident, and, with all due respect, I am not convinced by reassurances provided by the Department of Energy. In short, the risks, to my mind, clearly outweigh potential benefits to the United States and to my community. 972-2

I hope that Tacoma will be taken off the list of ports for such shipment, and, in fact, I hope that all U.S. ports are taken of the list. This is a bad policy and I will work my with community leaders and congressional representatives to make sure that the citizens of Tacoma are not placed in danger from such acts.

Sincerely yours,

T. Taranovski
Prof. of History

P.S. The above views reflect my position as an individual, and I am not speaking as a representative of the University of Puget Sound (although I would not be surprised to find most of my colleagues sharing the above sentiments).

RESPONSE TO COMMENT
COMMENTOR NO. 972: TARANOVSKI, T.

Response to Comment No. 972-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 972-2

The proposed action is intended to reduce international commerce in highly enriched (weapons-grade) uranium (Section 1.2 of the EIS). Because relatively small amounts of HEU could be used to manufacture a nuclear weapon, it is prudent to remove as much of this weapons-grade material as possible from international commerce (Sections 1.1 and 1.2 of the EIS). As shown in Tables 4-6 and 4-7 of the EIS, the risks associated with implementation of the proposed action to human health or the environment at the Port of Tacoma or any other candidate port would be low.

COMMENTOR NO. 974: HUNT, BRIDGET & ROSS

Dear Charles Head,

My husband and I are definately opposed to any shipping of nuclear waste into this country, and especially in the Tacoma area. I'm quite surprised to hear that this idea is even a possibility. How can people of this country even conceive of shipping in nuclear waste from other countries? It's sad to even contemplate the possible outcomes here. All I can say is use your heart in this matter, please, as well as your head. Again absolutely no nuclear waste in Tacoma Washington, or in this country.

974-1

Respectfully Yours,
Bridget & Ross
Hunt

RESPONSE TO COMMENT
COMMENTOR NO. 974: HUNT, BRIDGET & ROSS

Response to Comment No. 974-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma and into the United States is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. Likewise, analysis in Sections 4.2.3 and 4.2.4 indicates that the risks associated with ground transportation and site management are low.

The benefit to the citizens of the United States from the proposed action, including those in potential ports of entry, along transportation routes, or near potential management sites, is less risk that weapons grade uranium from civil programs could be diverted into the production of nuclear weapons that might be used against us or our allies.

DOE would like to point out that shipments of foreign research reactor spent nuclear fuel have been received at ports in the United States for over 30 years, safely and without incident.

COMMENTOR NO. 975: KENNEDY, DENISE

June 21,1995

Dear Mr. Head,
I am writing in response to the proposal of transporting high level nuclear waste through Puget Sound. I am sure that you are not really all that interested in my reasons why, just that I am a taxpayer and a business owner in Tacoma. My business is not dependent on tourist is relies on the people of the community. I really don't think that when people are planning a move to this area they will consider Tacoma if the bay glows in the dark. I am sure you are aware that this community is plagued by violence. In a time when you can't even let your kids play in a neighborhood park by themselves do you really think I an comfortable with the largest body of water in this area becoming even more polluted. *PLEASE COUNT ME OPPOSED TO THIS IDEA!!* 975-1

Sincerely,
Denise Kennedy

Denise Kennedy

COMMENTOR NO. 975: KENNEDY, DENISE

Response to Comment No. 975-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 977: KELLER, BEVERLY E.

Office of Spent Nuclear Fuel Management(EM-37)
US Department of Energy
1000 Independence Ave. SW.
Washington, DC. 90585

6/23/95

To: Charles Head
cc: Mike Lowry(WA. ST. Governor)
cc: Slade Gordon(US Senator)
cc: Patty Murray(US Senator)

Dear Mr Head,

I am writing this letter because I feel that you need to hear as many voices as possible about the decision to send 'spent fuel' through the Port of Tacoma. I was at the meeting at the Public Utilities Building in Tacoma on Monday, June 19, 1995. I found out I was quite ignorant to what was being asked of the people of Tacoma and the state of Washington. But now I am clear of the issues and believe that you are about to do the citizens of the city and surrounding communities a great deal of harm. People are scared to death of this kind of poison. I know you understand that fact. I am tired of the government dictating what I have to live with. I believe I have the "God given right" to say NO to such a harmful substance going by my home. Do you have nuclear 'spent fuel' in your backyard? Probably not. So who are you to say I have to live with this kind of danger in mine. How do I protect my children and family from the kind of toxic exposure you are so willing to subject them to, in the event of an accident? Can you or anyone guarantee that there will never be an accident? You and I know that this cannot be done. With this letter, (and hopefully many like this one) WE WILL SPEAK LOUD ENOUGH FOR YOU TO HEAR! 977-1

All I am trying to do is protect my family and community from even the slightest possibility of ever becoming exposed to any type of nuclear waste.
I also think the United States does not need to take 'spent fuel' from any other countries! Why does it have to always be us? Are we the worlds watchdogs for everything? We have our own problems right here. We don't need to add to it the greatest threat of all. 977-2
I would rather pay for helping the homeless or stopping the violence in out streets, than to help some other country poison us. We are not cattle, to be led to our slaughter.
I am a mother of two small children(3 and 1). What will it take for you to realize that you or the ;government have NO RIGHT to make that decision for us.
I believe that it probably comes down to money. How much is the US. going to get paid to take the 'fuel'? I do not believe it will benefit anyone here. Just the countries that don't have to deal with it. 977-3
I have become very heavy-hearted about the way in which our country's government has of listening to it's people it has sworn to protect.
If you, Mr. Head, decide to go ahead with using the Port of Tacoma or any Puget Sound port and we have an accident, I hope you will be tried as a murderer!!!!! 977-4

Thank you and I hope to God "that you have time to listen!!"

Sincerely,
Beverly E Keller

Sumner, Wa. 98390

RESPONSE TO COMMENT
COMMENTOR NO. 977: KELLER, BEVERLY E.

Response to Comment No. 977-1

DOE shares the commentor's concern about limiting radioactive exposures to the lowest levels achievable. Sections 4.2, 4.3, and 4.5 of the EIS discuss potential impacts to workers and the general population from foreign research reactor spent nuclear fuel handling and transport. This analysis indicates that risks and impacts would be low. The analyses performed in the EIS used very conservative assumptions about radiation exposures and the actual effects would probably be much lower.

Response to Comment No. 977-2

The United States has played in the past, and continues to play a leadership role in the world community in matters of nuclear weapons nonproliferation. This leadership role ensures that our national interest is protected. The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

Response to Comment No. 977-3

As discussed in Section 2.2.1 of this EIS, the Port of Tacoma is one of ten candidate ports selected for receipt of spent nuclear fuel from foreign research reactors. The selection process is described in Appendix D of this EIS. Radiological consequences and risks were evaluated for severe accidents (See Tables 4-6 and 4-7 of the EIS). No significant radiological risks were found to result from implementation of the acceptance policy at any of the candidate ports, including the Port of Tacoma (Section 4 of the EIS).

Response to Comment No. 977-4

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Tacoma is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternative 1 or 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2).

COMMENTOR NO. 978: GRAMENZ, ROBERT

Mr. Charles Head
Office of Spent Nuclear Fuel Management, EM-37
US Department of Energy
1000 Independence Ave., SW
Washington, DC

June 28,1995

Dear Mr. Head,

I thank you for extending the period during which comments can be accepted regarding the plan to bring spent nuclear fuel into the US I had the opportunity to attend the public meeting in Tacoma on June 13. I have the following concerns:

1. Before any new policies are adopted that will result in more nuclear materials being brought into our facilities, the US must have a clearly stated non-proliferation policy, and the final disposition option for these materials must be implemented. Bringing these materials in and putting them into exdsting temporary storage sites means that further "carting around" will take place. The disposition question should be answered first. Transportation of SNF should be for the sole purpose of final storage, under international control. *978-1*
2. The US needs to take a clear position on the issue of reprocessing this fuel. Until we do so, using fears of reprocessing as a justification for importing the spent fuel into the US is questionable. *978-2*
3. DOE is still using High Enriched Uranium in its own reactors, while leaning on others to switch to LEU. We need to lead by example. *978-3*
4. We could adhere to our treaty obligations regarding FRR SNF by committing ourselves to finding the best long term and /or permanent solutions to the problem of SNF, while including other nations in the process. *978-4*

The risks of exposure to damaging radiation for Port workers and other citizens is low, but real. There is also the stigma that could be attached to a port that is handling nuclear wastes. Until the broad, long term commitments and clarifications that I enumerate above and that have been emphasized by Physicians for Social Responsibility after a review of the draft EIS, we oppose moving these materials through ports in the U. S. *978-5*

Sincerely,

Robert Gramenz, D.O
(Member of the Board, Physicians for Social Responsibility, Washington State Chapter)

RESPONSE TO COMMENT
COMMENTOR NO. 978: GRAMENZ, ROBERT

Response to Comment No. 978-1

The United States has a clearly stated policy on nuclear weapons nonproliferation which is summarized in Sections 1.1 and 1.2 of the EIS.

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1. of the EIS). As stated in Sections 2.1 and 4.2.7 of the EIS, if a geologic repository was not prepared to accept the foreign research reactor spent nuclear fuel or the high level radioactive waste form resulting from the chemical separation or other processing of such spent nuclear fuel, by the end of the 40 year program period, DOE would continue to manage the spent nuclear fuel, or the high level waste forms, until such a geologic repository were available.

Each foreign research reactor operator is responsible for transport of their spent nuclear fuel. The health and safety standards for the transport, however, are international in nature. As discussed in Appendix B, Section B.2.1.1 of the EIS, the international community has adopted regulations for the transport of radioactive materials and the authority for these regulations is the International Atomic Energy Agency.

Response to Comment No. 978-2

At this time, the U.S. is not chemically separating any spent nuclear fuel. The U.S. position on chemical separation of the foreign research reactor spent nuclear fuel is one of the implementation decisions that will be made based on the analysis in this EIS.

The justification for accepting the foreign research reactor spent nuclear fuel into the U.S. is to support U.S. nuclear weapons nonproliferation policy objectives. There is some fear of chemical separation only if the reprocessing is performed by a nation that intends to use the separated nuclear material in a nuclear weapon.

Response to Comment No. 978-3

The potential tritium production facility would be a part of the U.S. nuclear weapons production complex and would not be a "research reactor", such as those addressed by the Reduced Enrichment for Research and Test Reactors (RERTR) program. Thus, the use of HEU in a tritium production facility has no relationship to the proposed action. Rather, the intent of the proposed action is to support U.S. nuclear weapons nonproliferation

policy seeking to reduce, and ultimately eliminate, the use of highly enriched (weapons grade) uranium in civil programs worldwide (Section 1.2 of the EIS) in order to assist in precluding the spread of nuclear weapons to nonnuclear weapons states.

In any case, the draft EIS for tritium supply and recycling analyzed a number of different technologies for tritium production, including the Heavy Water, Modular High Temperature Gas-Cooled Reactor, Accelerator Production of tritium, and Advanced Light Water Reactor. Of these, only the Heavy Water Reactor and the Modular High Temperature Gas-Cooled Reactor would be fueled by highly enriched uranium. The preferred alternative for that final EIS is not to select a tritium supply source that is fueled by HEU.

Response to Comment No. 978-4

As discussed in Section 4.2.7, ultimate disposition of spent nuclear fuel from foreign research reactors is a priority consideration. Foreign research reactor spent nuclear fuel could be safely stored at one or more of the candidate management sites pending final disposition (Section 4.2.4 of the EIS).

Response to Comment No. 978-5

The potential impacts (including radiation exposure) to port workers are discussed in Section 4 of the EIS. Although the foreign research reactor spent nuclear fuel is radioactive material, the dose rates from the casks used to transport it would be low. Appendix D, Section D.4 of the EIS demonstrates that the radiation dose that anyone would receive handling or near a cask is less than the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20). As discussed in Section 4.2.2.5 of the EIS, to avoid radiation doses which may exceed public dose limits, DOE would establish administrative procedures and maintain records to track individual exposures. Otherwise, no special handling or loading/unloading procedures would be required for the foreign research reactor spent nuclear fuel when it is contained in approved shipping containers.

Shipment of foreign research reactor spent nuclear fuel would not contribute to any "stigma" because the analysis in the EIS indicates that there would be no significant adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2 of the EIS). Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. Based on over 30 years experience shipping spent nuclear fuel, DOE considers that spent nuclear fuel transportation casks passing through the Port of Tacoma, Commencement Bay, or any other port or waterway would not affect air or water quality. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

COMMENTOR NO. 979: TROCCOLI, VINCENT P. & ANNE MARIE

June 1995

Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, D.C. 20585

Dear Mr. Head,

Simply put, we don't like the idea of highly radioactive nuclear waste being shipped through the Port of Tacoma. 979-1

Thank you for your attention.

Sincerely,

V.P. and A.M. Troccoli

Vincent P. and Anne Marie Troccoli

RESPONSE TO COMMENT
COMMENTOR NO. 980: MAIURA, SHERRILL

Response to Comment No. 980-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. With respect to the comment from Congressman Norm Dicks on reprocessing foreign research reactor spent nuclear fuel overseas, please see the response to Comment 312.

COMMENTOR NO. 981: CUNNINGHAM, KATHRYN A.

30 June 1995

Mr. Charles Head
Office of Spend Fuel Management
EM-37 U.S. Department of Energy
1000 Independence Ave. SW
Washington, DC 20585-0001

Dear Mr. Head:

As a resident of Galveston Island and a faculty member at the University of Texas Medical Branch, I believe that it is a serious mistake to consider bringing spent nuclear fuel through our waters, particularly based upon the argument published in our newsprint: "The DOE plan would bring used nuclear fuel to the US for processing and storage to prevent the possibility of the materials being used in nuclear weapons." This is truly bizarre reasoning based upon archaic cold war ideals. Our community around the U.S. are struggling to surviv environmental destruction and we do not need foreign nuclear fuel to add to the already serious toxicity of the Texas Gulf Coast. 981-1 981-2

I believe that the entire philosophy and rationale behind this plan should be reexamined.

Cordially,

Kathryn A. Cunningham, Ph.D.
4520 Avenue R
Galveston, TX 77551

RESPONSE TO COMMENT
COMMENTOR NO. 981: CUNNINGHAM, KATHRYN A.

Response to Comment No. 981-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Galveston, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 981-2

As evidenced by the renewal of the Treaty on the Non-Proliferation of Nuclear Weapons, which was extended indefinitely under the auspices of the United Nations in May 1995, the proliferation of nuclear weaponry is a current and serious concern worldwide. During preparation of this EIS, environmental effects of the proposed action and management alternatives were evaluated in detail (Appendices A through F of the EIS). Based on the analyses in Section 4.2.2, the risks associated with implementation of the proposed action to human health and the environment at the candidate ports, including the Port of Galveston would be low.

COMMENTOR NO. 982: OATES, ROSE M.

June 28, 1995

DEAR SIR

I DONT WANT NUCLEAR WASTE PASSING THROUGH OUR AREA. ~~EVEN~~ EVEN if its SPENT WASTE IT SHOULD be KEPT OUT of THE ENTIRE U.S. 982-1

TACOMA should NOT EVEN BE A CONSIDERATION

THANK YOU for YOUR ATTENTION,

Rose M Oates #13-9
776 S. Commerce Street
Tacoma, Washington
98402

RESPONSE TO COMMENT
COMMENTOR NO. 982: OATES, ROSE M.

Response to Comment No. 982-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel to Tacoma or any part of the United States, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, would be low. Likewise, analysis in Sections 4.2.3 and 4.2.4 of the EIS indicates that the impacts of ground transportation and storage at DOE management sites would be low.

COMMENTOR NO. 983: ROMING, DONALD C.

Steilacoom, WA 98388
June 27, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-34)
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington DC. 20585

Dear Mr Head,

We do not believe that the United States should be importing spent nuclear fuel from other countries. 983-1

Other countries are recycling their nuclear fuel they also accept the responsibilities of the disposition as well.

Please keep this material out of our waters in the U.S. as a whole.

Thank you.

Sincerely,
Donald & Helen Roming

*

RESPONSE TO COMMENT
COMMENTOR NO. 983: ROMING, DONALD C.

Response to Comment No. 983-1

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted (Management Alternatives 1 or 3; Sections 2.2 and 2.4 of the EIS, respectively). Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

* This is the best available copy of this comment document.

COMMENTOR NO. 984: WACHLEURA, MILDRED

June 27. '95

Dear Mr. Hunt:

We are strongly opposed to the shipping of any nuclear material to the Port of Tacoma, Washington. We oppose also to transport through our state by any method to any U.S. destination. 984-1

Finally, nuclear materials are best dealt with where they are. We do not need to put populations at risk by moving them around the globe. 984-2

Find another way. 984-3

Yours truly,
Mildred Josephine Wachleura
2401 N. 26th St.
Tacoma, WA 98407

*

RESPONSE TO COMMENT
COMMENTOR NO. 984: WACHLEURA, MILDRED

Response to Comment No. 984-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 984-2

The commentor's opposition to transporting any nuclear material through the State of Washington by any method is noted. The analysis presented in Section 4.2.3, however, shows that the risks associated with this activity would be very low.

Response to Comment No. 984-3

The commentor's support for Management Alternative 2 (Section 2.3 of the EIS) or the No Action Alternative (Section 2.5 of the EIS) is noted. The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). As discussed in Section 4 of the EIS, the proposed action and management alternatives would result in no significant benefits or risks to human health and the environment.

Josh Vilderbrand
Kari Martin

RESPONSE TO COMMENT
COMMENTOR NO. 985: CITIZENS (TACOMA AREA)

Response to Comment No. 985-1

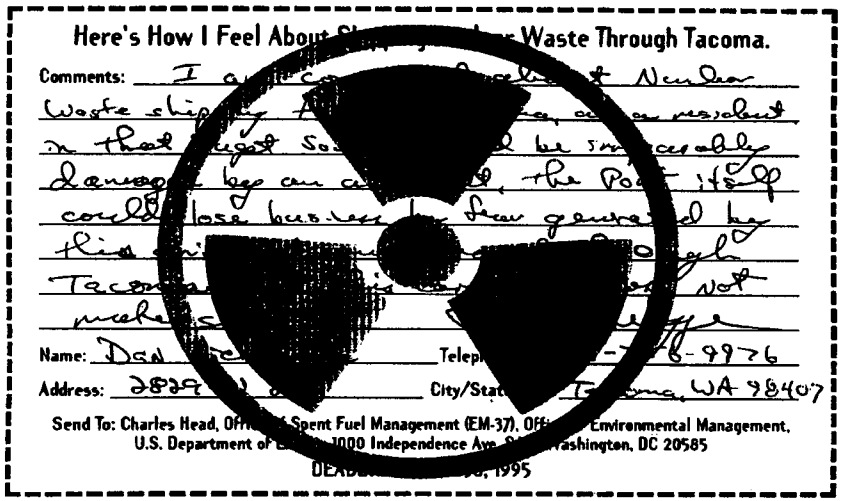
Management alternatives evaluated in the EIS for foreign spent nuclear fuel include management in the United States (Management Alternative 1, Section 2.2 of the EIS), overseas management (Management Alternative 2, Section 2.3), and a combination of domestic and overseas management (Management Alternative 3, Section 2.4). The EIS also provides an evaluation of a No Action Alternative (adopt no policy for management of foreign research reactor spent nuclear fuel). None of these alternatives would compel the United States to serve as a permanent repository for foreign research reactor spent nuclear fuel.

As discussed in Section 1.2 of the EIS, the management alternatives evaluated in this EIS are intended to support nuclear weapons nonproliferation policies of the United States.

Response to Comment No. 985-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 and Appendix D, Section D.5 of the EIS).

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



988-1

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by **June 30, 1995**. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

RESPONSE TO COMMENT
COMMENTOR NO. 991: POWELL, TONDIS

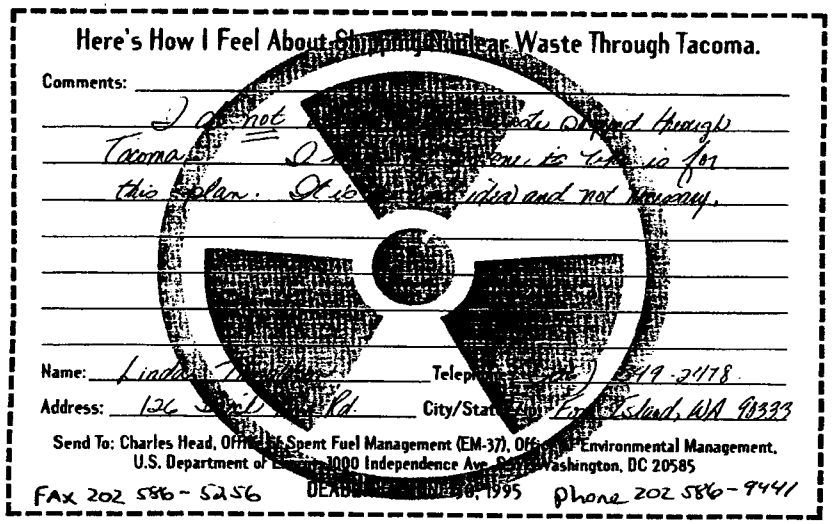
Response to Comment No. 991-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



992-1

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by **June 30, 1995**. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

RESPONSE TO COMMENT
COMMENTOR NO. 994: FRYE, CAROLYN

Response to Comment No. 994-1

DOE has added a sentence to Appendix D, Section D.2.1.9 of the EIS regarding Commencement Bay being a Superfund Site. The analysis of impacts for Management Alternatives 1 and 3 in Section 4 of the EIS indicates that there would be no significant adverse impacts on the ports, people, or natural environment from shipments of foreign research reactor spent nuclear fuel and the overall impacts to Commencement Bay would be unchanged by the various management alternatives.

Response to Comment No. 994-2

The commentor's preference for the use of military ships and military ports to transport foreign research reactor spent nuclear fuel is noted. The analyses of impacts associated with accidents and incident-free operations involving foreign research reactor spent nuclear fuel demonstrate that commercial ports and facilities represent an acceptable option for the transportation of foreign research reactor spent nuclear fuel (Section 4.2.2.3 of the EIS presents the consequences of port accidents and Section 4.2.2.2 presents impacts of incident-free operation).

Whether the shipments come as cargo on a scheduled carrier or on a chartered ship, no special precautions are expected to be required by the Coast Guard or any other authority. As such, there need be no additional requirements to use dedicated or military ships, nor any adverse consequences to the use of the commercial ships or facilities.

Response to Comment No. 994-3

As discussed in Section 2.2.1.2 and 2.2.2.3 of the EIS, several financing options have been considered, ranging from collection of fees from the research reactor operators that would pay all of the costs of the program to full subsidization of the program by DOE. A compromise between these extremes would be for developed countries to be charged a competitive fee, U.S. taxpayers would absorb the full costs of the program for developing countries and absorb the amount above a competitive fee for developed countries to accept and manage their spent nuclear fuel. The reasons the United States would pay some of the costs for other countries are: 1) some countries would be unable to afford the costs of the proposed action and would have no safe alternative means of managing their spent nuclear fuel (i.e., the developing countries); and 2) some countries would continue to use and trade weapons-grade nuclear material indefinitely unless the United States charges a competitive fee and absorbs any costs above that fee (i.e., most of the Western European countries). Costs borne by DOE for this program would ultimately be borne by the U.S. taxpayers.

COMMENTOR NO. 996: MCINTIRE, ROSE L.

847 E. 52nd

28 June 1995

Charles Head
Office of Spent Nuclear Fuel Mgmt (EM-33)
US Department of Energy
1000 Independence Ave. S.W.
Washington, DC 20585

Dear Mr. Head:

The plan to possibly use Tacoma as a port for entry for spent fuel rods is totally unacceptable. Especially, in light of the fact there are places that can use the material. We in Tacoma do not want that type of material coming through our area. 996-1

In addition, Hanford is hazardous enough without adding more to the pile. Funds for the clean up have been cut which leaves the Pacific Northwest more vulnerable to disaster than ever. 996-2

Do not bring that fuel here.

Sincerely,
Rose L. McIntire

RESPONSE TO COMMENT
COMMENTOR NO. 996: MCINTIRE, ROSE L.

Response to Comment No. 996-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 996-2

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

COMMENTOR NO. 997: PETERSON, MARVEN & LOIS

July 1, 1995

Mr. Charles Hendy

We learned with great interest to the final hearing on the shipping of high level nuclear waste thru the Port of Tacoma, and are very much opposed to the idea. We do not need our waters and air subjected to this. Keep it out of our Commencement Bay.

Sincerely

Marvin & Lois Peterson

COMMENTOR NO. 1000: PRIOR, RITA

June 27. 1995

Dear Mr. Head.

My husband & I settled in tacoma in 1952 - We purchased our present home in 1959, and raised our 2 daughters, and now are very active in helping them raise our 3 grandchildren. Their families live close to us in the North end of tacoma.

Since I retired from nursing several years ago, I walk 3-4 mi. every morning along a beautiful waterfront path, that our city built & maintains. I take my grand children with me whenever possible, and my husband often accompanies me, since he retired 3 yrs. ago.

I am writing on behalf of my husband, our daughters & son-in-laws, and grand children, when I plead with you to not to ship nuclear waste into Puget Sound. 1000-1

I don't feel our country is the only one with a conscience, or 1000-2

RESPONSE TO COMMENT
COMMENTOR NO. 1000: PRIOR, RITA

Response to Comment No. 1000-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through Puget Sound and the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1000-2

As evidenced by the indefinite extension of the Treaty on the Non-Proliferation of Nuclear Weapons in May 1995, there is a worldwide concern about the potential spread of nuclear weaponry. This EIS evaluates three management alternatives for spent nuclear fuel from foreign research reactors: management in the United States (Management Alternative 1, Section 2.2), overseas management (Management Alternative 2, Section 2.3), and combined domestic and overseas management (Management Alternative 3, Section 2.4). The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of HEU in civilian programs worldwide (Section 1.2 of the EIS).

This EIS does not state that if Management Alternative 1 is not adopted, then HEU would be sold to Iran or any other nation. Sections 1.1 and 1.2 of the EIS describe nuclear weapon nonproliferation efforts and concerns of the United States.

that we should have to store the worlds radio active wastes - Weive created enough monsters of our own that we have to be responsible for. It seems like a form of black mail to say if we don't take it and store it safely, they'll sell it To Iran! If any country considers this, it should be dealt with by all of the countries in the U.N. 1000-2 (Cont'd.)

It should be stored in a most isolated part of each country that created it - I think we all feel vulnerable enough to terrorists, without having Radio active waste being shipped through our port - 1000-3

Please don't ship it through the Port of Taroma 1000-1 (Cont'd.)

Thank you -
Rita Prior

Response to Comment No. 1000-3

The commentor's preference for overseas storage in isolated areas is noted. Overseas storage of foreign research reactor spent nuclear fuel is discussed in Sections 2.3 and 4.4.1 of the EIS.

COMMENTOR NO. 1001: PRITCHETT, BARBARA

Dear Sir: 6-25-95

I DO have a problem with any more nuclear waste coming in, through or around the Port of Tacoma or any other port in the State of Washington.

RESPONSE TO COMMENT
COMMENTOR NO. 1002: WATSON, MARIE

Response to Comment No. 1002-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 and Appendix D, Section D.5 of the EIS).

COMMENTOR NO. 1003: HALL, CAROL M.

Mr. Charles Head

PLEASE DO NOT

allow the world wide nuclear waste to enter our waterways & the Port of Tacoma. It is very upsetting to even think of this terrible & horrible thing happening here. Why pick on us? Direct this mess to the waterways into Washington D.C., after all that is where the whole darn mess started. You make us sound like a bunch of idiots on our West coast, espically in the Pacific N.W. Its like So what do we care here in Tacoma We do care!! And you make us sound unimportant to the rest of your Washington D.C. people.

Grow up & keep this whole mess out of our area.

Thank you for listening

Carol M. Hall 9883 E. "F" ST. Tacoma, WA 98445

1003-1

RESPONSE TO COMMENT
COMMENTOR NO. 1003: HALL, CAROL M.

Response to Comment No. 1003-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The Washington, DC area does not have the facilities required to safely manage the spent nuclear fuel.

The DOE representative's comment that their bosses in Washington "don't have time to listen" was taken in the wrong context. While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying public concerns and issues to the Secretary of Energy and her staff. As indicated by this document, all comments received from the public were noted and taken seriously. Under NEPA and DOE's environmental regulations (Section 5 of the EIS), public participation and comments are an integral component of the environmental process.

COMMENTOR NO. 1004: CONLEY, D. JEANNE

June 26, 1995

6-27-95

Dept of Energy
Gentlemen:
Just a line to inform you that my family and myself are very much opposed to your plan to ship nuclear waste through our harbor. We can't take the risk of doing this in our fine city. Ship it elsewhere where less populated.
Thank you.
Sincerely
Mrs. N. MYRVIK
4334-So-D
Tacoma, WA 98408.

1011-1

RESPONSE TO COMMENT
COMMENTOR NO. 1011: MYRVIK, MRS. NORMAN J.

Response to Comment No. 1011-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

The population in close proximity to the terminal, as well as those as far away as 50 miles, was considered when the effects of possible accidents were calculated (Appendix D, Section D.5 of the EIS). These calculations demonstrate that the risk from accidents to all individuals is low. Likewise, the incident-free radiation exposure to people nearer to the cask than those living outside the fence around the port was calculated and found to pose no significant risk (Section 4.2.3.2 of the EIS). The dose rate at 100 feet from a cask containing foreign research reactor spent nuclear fuel is essentially zero. For these reasons, the close-in population near the Port of Tacoma would not be subjected to any significant risk from the use of the terminal to receive foreign research reactor spent nuclear fuel.

COMMENTOR NO. 1013: TORGERSON, L.

June 27, '95

Dear Mr. Head-

I advertised the June 19th meeting in my church bulletin because it is too shocking that 41 countries want to use us as a nuclear dumping ground - and our government is open to it.

1. What politicians and their cronies are profiting from this? There can be no other reason than under the table payoffs & over the table profiteering. This adds to public cynicism which is widespread about political corruption. 1013-1

2. We have enough debate in our own country as to where we can dispose of our own waste. 1013-2

3. This is another example of no regard for the devastating effects nuclear waste will have on future generations. # now is their only concern. 1013-3

4. Whoever promotes this will suffer retribution time.

Sincerely,

Rev. L. Torgerson

Fox Island
U.C.C. Church.

RESPONSE TO COMMENT
COMMENTOR NO. 1013: TORGERSON, L.

Response to Comment No. 1013-1

The proposed action and management alternatives do not result from bribery or any other illegal activity. Rather, the proposed action supports the nuclear weapons nonproliferation objectives of the United States. Alternatives evaluated in this EIS include management of foreign research reactor spent nuclear fuel in the United States (Management Alternative 1, Section 2.2 of the EIS), overseas management (Management Alternative 2, Section 2.3), and combined domestic and overseas management (Management Alternative 3, Section 2.4). The No Action Alternative (adopt no policy for management of foreign research reactor spent nuclear fuel) is also evaluated (Section 2.5). As demonstrated by the analyses in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low.

Response to Comment No. 1013-2

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. A detailed, quantitative discussion of these impacts would have to be the subject of future NEPA documentation. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the spent nuclear fuel (Section 1.1. of the EIS).

Response to Comment No. 1013-3

Contrary to the commentor's assertion, the purpose of preparing this EIS is to evaluate and determine what significant impacts to the environment would occur if the proposed action were implemented. Sections 4.2, 4.3, and 4.5 of the EIS present discussions of the risks and impacts, which demonstrates that the risks and impacts would be low, for proposed ports of entry, along ground transportation routes, as well as for any potential management site. The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS), not to economically benefit anyone.

COMMENTOR NO. 1016: LEVINE, MAXINE

Maxine Levine

1721 Alhambra Avenue
Martinez, CA 94553
(510) 229-4320

BY FAX TO (202) 586-5256

July 7, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management (RF-7)
U.S. Department of Energy
1000 Independence Avenue SW
Washington, D.C.

Dear Mr. Head:

The purpose of this letter is to express the strong opposition of my husband and myself to the proposal to store nuclear waste, even temporarily, at the Concord Naval Weapons Station. 1016-1

We are also very opposed to even trans-shipping nuclear waste through the County of Contra Costa to the Concord Naval Weapons Station. From time to time the newspapers have reported accidents involving vehicles transporting weapons. The main highway routes into Contra Costa County are among the busiest, most heavily traveled and most congested in this state, if not the nation. The Delta and the Bay water ways are heavily used by ships transporting oil and chemicals to and from the numerous refineries and chemical plants in this county. The earthquake threats also make this a dangerous concept. 1016-2 1016-3

Contra Costa County is a highly industrialized urban area and a part of the San Francisco Bay area which is one of the largest population areas in California. There are more people in this county than there are in most of the other metropolitan areas in this nation. I am appalled that the Department, which is a part of my federal government, would even consider a scheme which clearly could endanger the citizens of this area.

The concept of purposefully bring nuclear waste from other nations into the United States is horrific. It is my urgent hope that my representatives will do their utmost to change this misguided federal policy. 1016-4

Very truly yours,

Maxine Levine

RESPONSE TO COMMENT
COMMENTOR NO. 1016: LEVINE, MAXINE

Response to Comment No. 1016-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternatives 1 or 3) there would be no storage of this material in the Port of Concord NWS, any other port, or anyplace except for DOE management sites. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

Response to Comment No. 1016-2

The commentor's opposition to transshipping foreign research reactor spent nuclear fuel through Contra Costa County is noted. During preparation of the EIS, environmental effects which could result from implementation of Management Alternative 1 or 3 (acceptance and management in the United States) were evaluated at candidate ports and along representative transportation routes. As discussed in Sections 4.2.2 and 4.2.3 of the EIS, the risks to human health or the environment at candidate ports or along transportation routes are low. Foreign and domestic spent nuclear fuel has been transported along truck and rail routes for over four decades. During that time, no transportation cask containing spent nuclear fuel has been breached, including those involved in traffic accidents (Section 4.2.3 of the EIS).

Response to Comment No. 1016-3

The physical constraints of the passage from San Francisco Bay to Concord NWS were considered as part of the port selection process. The passage meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS). The port selection process does not, however, consider the existence of land-based facilities such as refineries because the addition of some mishap at a land-based facility would not add to the severity of the worst plausible accident, which is considered to be the collision of the ship carrying the foreign research reactor spent nuclear fuel with a petroleum tanker.

The volume or size of the local marine traffic (present or future) was not considered in the calculation of risk associated with the shipment of foreign research reactor spent nuclear fuel. In general, the number of ship mishaps is not proportional to the amount of ship traffic because port ship traffic is slow, and even when heavy, is normally a small

number of ships per hour. Historically, increasing the volume does not significantly increase the probability of an accident. Rather, the number of ship mishaps is associated with navigational hazards and distances from the port to the open ocean or a large bay (port selection Criterion 2; Appendix D, Section D.1.9.2 of the EIS). Appendix D, Section D.5.3.1.3 of the EIS presents a discussion of the determination of the probability of ship accidents used in the EIS.

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the transportation cask.

Response to Comment No. 1016-4

The intent of the proposed policy is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly enriched (weapons-grade) uranium in civil programs worldwide (Section 1.2 of the EIS).

COMMENTOR NO. 1017: BOEKHOLT, CONRAD J. & BARBARA M.

1721 North Mildred Street
Tacoma, Wa 98406

June 27, 1995

Mr. Charles Head,
Program Manager
Office of Spent Nuclear Fuel Management (EM-37).
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington D.C. 20585

Re Nuclear Waste

Dear Mr. Head.

This letter is being written to express our deep concern that foreign nuclear waste may be shipped through the Port of Tacoma. 1017-1

We realize the importance of the waste not ending up in the hands of any nation who might use it to make nuclear weapons, but from what we understand, there are countries who have shown a great interest in accepting it and with no threat to the Free World.

Washington is a beautiful state. We are proud of our Puget Sound, our clean waters and beaches. Shipping waste through the Puget Sound is an "accident waiting to happen". Our concern is for our grandchildren. Who can guarantee that no accident will happen during their lifetime?. 1017-2

While our concern for Tacoma and Washington State is a personal one, we also feel that as long as there are willing receivers in other parts of the world, no American Port should be used. We ask that you consider all options before you allow this to happen.

Sincerely yours,

Conrad J. Boekholt.

Barbara M. Boekholt.

RESPONSE TO COMMENT
COMMENTOR NO. 1017: BOEKHOLT, CONRAD J. & BARBARA M.

Response to Comment No. 1017-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1017-2

The commentor's preference for overseas management of foreign research reactor spent nuclear fuel is noted. Section 2.3 of the EIS provides a discussion of the advantages and disadvantages of overseas management.

Although a no-accident guarantee is not feasible, Section 4.2 of the EIS determines that the risks associated with an accident in port are low, as are the consequences of such accidents.

COMMENTOR NO. 1018: WILSON, THERESA

Dear Charles 7-1-95

It has been brought to my knowlege that toxic waste is going to be brought into my state - Washington. I thought I'd write and let you know I don't want it brought here. Our environment needs to be preserved not destroyed.

1018-1

Thank You

Theresa Wilson

RESPONSE TO COMMENT
COMMENTOR NO. 1018: WILSON, THERESA

Response to Comment No. 1018-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1020: NOVOSAD, BETH

June 30, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management (EM-37)
US Department of Energy
1000 Independence Avenue SW
Washington DC 20585

Dear Mr. Head:

As a long-time resident of Pierce County, and soon-to-be-homeowner within Tacoma city limits, I must voice my protests to the proposal that the Department of Energy ship high-level nuclear waste through the Port of Tacoma. 1020-1

In my opinion, it makes much more sense to ship this waste to a location that has the facilities to reprocess the waste. There are facilities already in existence, close to ports, that could do this job. 1020-2

With Hanford already in Washington state, as well as mothballed nuclear power plants costing the taxpayers millions, hasn't Washington state already done our fair share and accepted enough responsibility for other nuclear projects?

Please do not saddle us with accepting high-level waste. We want our families to be able to grow and prosper without the threat of a nuclear mishap occurring in our backyard.

Thank you for listening. I sincerely hope that we will soon hear news that Tacoma has been removed from the list of sites being considered to accept this waste.

Sincerely,

Beth Novosad

Beth Novosad

RESPONSE TO COMMENT
COMMENTOR NO. 1020: NOVOSAD, BETH

Response to Comment No. 1020-1

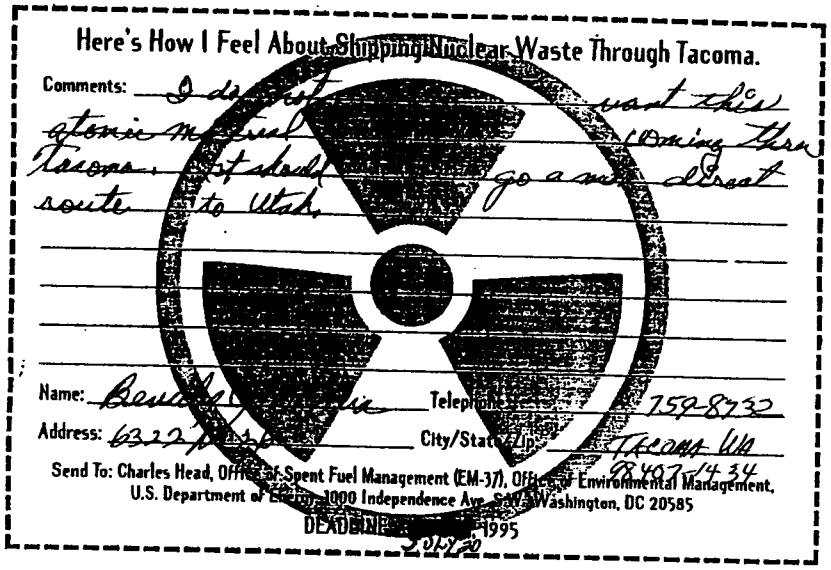
The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1020-2

The commentor's opinion that foreign research reactor spent nuclear fuel should be reprocessed at existing facilities, close to ports, is noted. Chemical separation is Implementation Alternative 6 to Management Alternative 1, and is discussed in Section 2.2.2.6 of the EIS. Facilities for chemical separation of spent nuclear fuel exist at the Savannah River Site and the Idaho National Engineering Laboratory. Port identification is based on criteria discussed in Section 2.6.3.1 of the EIS. Proximity to the management site(s) does not directly affect the identification of a port of entry.

COMMENTOR NO. 1023: WYDRA, BEVERLY J.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: I do not want this atomic material coming thru Tacoma. It should go a more direct route to Utah.

Name: [illegible] Telephone: 759-8732

Address: 6322 [illegible] City/State/Zip: Tacoma WA 98407-4434

Send To: Charles Head, Office of Spent Fuel Management (EM-37), Office of Environmental Management, U.S. Department of Energy, 1000 Independence Ave. S.W., Washington, DC 20585

DEADLINE: June 30, 1995 7-20-95

The strongest weapon against nuclear waste is right at your fingertips.
Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by ~~June 30~~ 7-20, 1995. And let them know that Tacoma is not a place for nuclear waste.
For more information call the Port of Tacoma Hot Line at 597-7575.

Dear Mr. Head;

Since the media is my only source for news about the plan to move nuclear fuel through our ports and stockpile it, I wonder if I've been misinformed about this strange idea to hoard the spent stuff in the states.

I understand that Scotland and Japan have facilities to reprocess this waste, and actually need to receive it in order to keep operating. Assuming that these countries are reliable, shouldn't we be sending it to those who are using it? 1037-1

I can find no justification for ignoring the obvious and jeopardizing our own spaces, when there is a solution so fitting to the need.

The Port of Tacoma is a lovely place, and should not be placed in such a hazardous situation when it is unnecessary. 1037-2

Please give more consideration to the Japanese and the Scotsmen who want this dangerous byproduct.

Sincerely,

G. J. Postlethwaite

RESPONSE TO COMMENT
COMMENTOR NO. 1042: MATTLEY, J.

Response to Comment No. 1042-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1042-2

DOE considers that foreign research reactor spent nuclear fuel could safely be received at commercial ports, as it has in the past, without additional security that might be present at military bases. The security provided for the spent nuclear fuel shipments would be required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Nevertheless, the commentor's preference for the use of military ports is noted. Sections 4.2.2.2 and 4.2.2.3 of the EIS provide the analysis on impacts of incident-free operation and consequences of port accidents, respectively.

Response to Comment No. 1042-3

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS.

COMMENTOR NO. 1043: BERRY, MARIAM M.

Please add my name to the list of those opposed to shipping nuclear waste through Tacoma. Isn't there a less populated, less environmentally fragile place? I don't like to see chances taken of a disaster to this beautiful place that is my home.
Marian Berry

1043-1

RESPONSE TO COMMENT
COMMENTOR NO. 1043: BERRY, MARIAM M.

Response to Comment No. 1043-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

The population in close proximity to the terminal, as well as those as far away as 50 miles, was considered when the effects of possible accidents were calculated (Appendix D, Section D.5 of the EIS). These calculations demonstrate that the risk from accidents to all individuals is low. Likewise, the incident-free radiation exposure to people nearer to the cask than those living outside the fence around the port was calculated and found to pose no significant risk (Section 4.2.3.2 of the EIS). The dose rate at 100 feet from a cask containing foreign research reactor spent nuclear fuel is essentially zero. For these reasons, the close-in population near the Port of Tacoma would not be subjected to any significant risk from the use of the terminal to receive foreign research reactor spent nuclear fuel.

COMMENTOR NO. 1044: DOUGHTRY, WALTER L.

Dear Mr Head
This card is small, however my concerns for Puget Sound is LARGE. I have lived in Tacoma since 1954, from the time I got back from KOREA where I swept mines in our Navy - my son serves now in the Nuclear sub fleet with 20 plus years as a leader. WE ARE BOTH KNOWLEDGEABLE ABOUT SHIPS AND NUCLEAR POWER. AN EXAMPLE OF WHAT CAN HAPPEN IS OUR FERRIES AND THE DAMAGE CAUSED BY THEM. PLEASE DO YOUR BEST TO STOP WASTE HERE. Walt Doughtry

1044-1

RESPONSE TO COMMENT
COMMENTOR NO. 1044: DOUGHTRY, WALTER L.

Response to Comment No. 1044-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 and Appendix D, Section D.5 of the EIS).

to keep nuclear
waste storage
out of
Oakland, Calif.

Thanks so much

Please get back to me
regarding what is being done.
Again Thank you
for your att:
to This matter. James McMills

1045-1

Response to Comment No. 1045-1

The commentor's opposition to the use of Oakland for nuclear waste storage is noted. None of the candidate management sites considered for interim management of the foreign research reactor spent nuclear fuel are located in the State of California. Also, DOE is not proposing to use the Port of Oakland for receipt of foreign research reactor spent nuclear fuel. For those ports proposed to be used for such shipments, the analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the ports is low.

RE: Draft Environmental Impact Statement (EIS) on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

Dear Mr. Head:

The purpose of this letter is to express to you my unalterable opposition to the Department of Energy's proposal to make the Port of Tacoma, Washington a port of entry for spent foreign reactor fuel because I was unable to do so at the public hearing held on June 19, 1995. I very much wanted to add my voice to those opposed to the proposal, but was unable to gain entry to the hearing chambers. 1046-1

The proposal is not acceptable. As President of a small corporation engaged in the wholesale and retail seafood business, I am throughly familiar with and intimately dependant upon the seafood industry of Puget Sound and the coastal waters of Washington State. My company has been in business in Tacoma for 40 years and I have been a part of the Company all of my life.

Your proposal ignores the impact that an accidental discharge of radiation in the coastal waters, Straits of Juan De Fuca or Puget Sound proper would have on the seafood industry. In so many other areas involved in the handling of radioactive materials, safeguards have not been effective. The "accident" that could not happen, has always managed to happen. I need only cite Chernobyl, Hanford and Three Mile Island to prove my point. I strongly recommend that you not select Tacoma as a port of entry for this program. 1046-2

Sincerely,

Gary Gerontis

GARY GERONTIS, President,

RESPONSE TO COMMENT
COMMENTOR NO. 1046: GERONTIS, GARY

Response to Comment No. 1046-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1046-2

DOE considers that there would be no significant adverse impacts on the natural resources or on the air and water quality at any of the ports that might be used to receive the foreign research reactor spent nuclear fuel, if accepted into the United States. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive material has ever been released from a spent nuclear fuel transportation cask, nor has a spent nuclear fuel transportation cask ever been punctured, even as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

In the unlikely event of a severe accident, the analysis performed for the EIS indicates that some radioactive material could be released from the cask and distributed into the environment. However, the analysis in Sections 4.2.2.3 and Appendix D, Section D.5, determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident. Close in to the accident, near the transportation cask would likely require some cleanup, but the overall impact on the water and air quality in the port would be low. Sections 4.2.2.3 and Appendix D, Section D.5 of the EIS detail the accident analysis and results.

COMMENTOR NO. 1047: FOGG, B.F.

Box 98505
Tacoma, WA 98498
June 22, 1995

Dear Mr. Head,

I enclose a present for you, to be shared with others as you wish.

Would you please ask the Federal powers-that-be to build their own port that would cater exclusively to the export of nuclear waste. The coast of Alaska's mainland comes to mind as a possible site. 1047-1

Thank you.

Sincerely,
Bo F. Fogg
(BO F. FOGG, M.A., M.A.)

RESPONSE TO COMMENT
COMMENTOR NO. 1047: FOGG, B.F.

Response to Comment No. 1047-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. The commentor's preference for construction of a government port that would cater exclusively to the export of nuclear waste is also noted. The analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. DOE has no intention of building a new port to receive or export spent nuclear fuel.

COMMENTOR NO. 1048: STANFORD, MATTHEW JR.

Charles Head
Office of Spent Fuel Management
EM-37 U.S. Department of Energy
1000 Independence Ave. SW.
Washington, D.C. 20585-0001

Dear Mister Head,

Given the nature of the economy of Galveston, Texas I am completely against using the Isle Port as a pass through point for spent weapons grade nuclear waste.

I am sure you would consider it redundant for me to address the many issues for and against this proposal as you are well aware of them. The point here is to express my sentiments against the project at this time.

If some of the final destination disposal problems could be solved along with the criteria for maintaining safety requirements, especially with the closed and relatively fragile eco-system surrounding the port, then future dialogue on the proposed plan may be warranted. But, since community objection will probably be the main judgement point, I cast my vote in the negative.

1048-1

Sincerely,

Matthew Stanford Jr.

Matthew Stanford JR.

RESPONSE TO COMMENT
COMMENTOR NO. 1048: STANFORD, MATTHEW JR.

Response to Comment No. 1048-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Galveston, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1049: BERGMAN, DARYL, RON & MAYA

July 5, 1995

Mr. Charlie Head
EM37
U.S. Dept. of Energy
1000 Independence Ave. So. West
Washington D.C. 20585

Dear Mr. Head:

I am writing to express my deep concern regarding the proposal to use Concord, CA as a transfer point for spent nuclear fuel rods. Obviously, there are many reasons why this plan is not acceptable, the proximity to our water supply, liquifaction concerns in the event of an earthquake, the population density in the Bay Area, proximity to oil refineries etc.. I would like to bring your attention to one other problem with this plan. It has come to my attention that after transfer this toxic material will be moved on our highways. I have enclosed a recent article in the Contra Costa Times that identifies the East Bay as having the worst gridlock in the Bay Area - which is the second most populated area in California. Just recently we had two incidents in which large trucks exploded on our freeways. Locating a transfer station in Concord, and using our roads to haul deadly materials makes no sense at all. We request that this plan be eliminated. 1049-1

It's appalling to think that the United States government is even considering to cheapen the value of the lives in this community. So much for our rights to life, liberty and the pursuit of happiness. This entire program should be rethought. California has already suffered dearly from massive base closures - and now we are being singled out to be the location for a nuclear transfer site. Please read the enclosed article and strike Concord from your list of possibile locations. 1049-2

Sincerely,
Daryl, Ron and Maya Bergman
510-687-7019

RESPONSE TO COMMENT
COMMENTOR NO. 1049: BERGMAN, DARYL, RON & MAYA

Response to Comment No. 1049-1

The commentor's opposition to the use of Concord NWS for the receipt of foreign research reactor spent nuclear fuel is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk of bringing foreign research reactor spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low. The EIS demonstrates that there would be no significant adverse impacts to any of the ports, bays, or waterways that the material might pass through or near. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. Based on over 30 years experience shipping spent nuclear fuel, DOE considers that spent nuclear fuel transportation casks passing through the Concord NWS would not release their contents, and would thereby not affect the quality of the water. As stated in Section 2.6.2 of the EIS, to date no spent nuclear fuel transportation cask has ever released any of its contents (radioactive material), even in actual highway accidents. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

The port selection process that determined that Concord NWS was an acceptable port considered the population of the port and surrounding areas (Appendix D, Section D.1.9.5 of the EIS). Additionally, all population within a 50-mile radius of the Concord NWS was considered when analyzing the potential impact of a range of hypothetical port accidents. The risks were found to be low (Appendix D, Section D.5 of the EIS).

The passage from San Francisco Bay to Concord meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2). The port selection criteria do not consider the existence of land-based facilities such as refineries because they have no direct impact on the risk associated with the shipment of foreign research reactor spent nuclear fuel. While local hazards, such as earthquakes, may slightly increase the probability of an accident, they would not increase the consequences of the accident, which were found to be very minor.

Response to Comment No. 1049-2

The commentor's opposition to truck transport from the Concord NWS is noted. The estimates of radiological health effects presented in Section 4.2.3 of the EIS are based on conservative assumptions using representative truck transportation routes from candidate ports to interim management sites, including consideration of traffic volumes and surrounding populations. Supporting detail for the calculations is given in Appendix E of the EIS. Radiological and nonradiological health effects of the alternatives were found to be low.

COMMENTOR NO. 1052: BUTKEY, TOM & GENNY

July 2, 1995

Office of Spent Nuclear Fuel Management
EM-37
U.S. Department of Energy
1000 Independence Ave. S.W.
Washington DC 20585

To: Charles Head, Program Manager

We totally reject the idea of nuclear waste of any sort being transported through or stored in the Puget Sound area -- Tacoma in particular.

There are too many possibilities for disaster. This kind of thing should definitely not be done in an area that is heavily populated with military bases, as our area is. It leaves military bases wide open to terrorist threats. It leaves us, the powerless inhabitants, as something that would just be considered an "unfortunate" bi-product should an accident occur. 1052-1

Push it through somewhere else. Park it somewhere else. Seattle had the right to say no and so does Tacoma.

Sincerely,

Tom and Genny Butkey
754 Polk Street South
Tacoma, WA 98444-5678

RESPONSE TO COMMENT
COMMENTOR NO. 1052: BUTKEY, TOM & GENNY

Response to Comment No. 1052-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternatives 1 or 3), there would be no storage of this material in the Port of Tacoma, or any other port. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

Neither acts of terrorism nor theft of materials by a determined group or individual can be completely precluded. However, proper security measures greatly reduce the risk of such actions. Security would be provided for all shipments of foreign research reactor spent nuclear fuel, as required by the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. The security provisions are summarized in the new Appendix H that has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that would be prepared for each foreign research reactor spent nuclear fuel shipment to specify details of the transportation process, including security provisions in port and during transit.

Response to Comment No. 1053: Hodgson, Stephen A.

Stephen A. Hodgson
1803 - 27th Street
Galveston, TX 77550

July 6, 1995

Charles Head
Office of Spent Fuel Management

SUBJ: Nuclear Waste Transport Facility
in Galveston, Texas

Dear Mr. Head:

I support the plan to permit the transport of radioactive waste through the Port of Galveston. *1053-1*

Legitimate opposition to the plan, I believe, should relate to safety issues such as to some accident theory which has perhaps been overlooked or omitted in the Environmental Impact Statement presented by the U.S. Department of Energy, (DOE).

The "Not in my backyard" type of opposition is emotional, not based on fact and should be discounted as such.

The "Not in my backyard crowd,"if taken seriously, would collectively shut down (or stop from happening) every power plant, chemical plant, land fill, prison, weapons facility, sewage treatment plant, etc., in the USA. The crowd would slowly but surely strangle the whole country. Hundreds of people in Galveston signed a petition to stop the permits and construction of the new WALMART store. But it finally got built. I would wager hard currency that many of the petition signers are now shopping at WALMART. The parking lot has cars at all hours and is very crowded at some hours.

The 40 people who braved the downpouring rain to appear at the hearing, according to the newspaper, were unanimous in their opposition to the DOE plans. But are those people representative of Galveston? I didn't show up because I hadn't yet read the Environmental Impact Statement and didn't believe myself informed enough to make a contribution.

What about the 70,000 people that didn't appear. Could we say that they were not overly concerned about the plans? Were they giving a tacit vote of approval by not appearing? Perhaps some were. Perhaps 40 or more persons were giving silent approval. Perhaps some who did not appear would have been opposed to the plan.

Response to Comment Commentor No. 1053: Hodgson, Stephen A.

Response to Comment No. 1053-1

The commentor's support for bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted.

The port selection process only indicates ports that are acceptable for the receipt and handling of foreign research reactor spent nuclear fuel. The decision as to which port or ports might be used if foreign research reactor spent nuclear fuel were accepted into the United States will be addressed in the Record of Decision, to be issued no sooner than 30 days after issuance of this final EIS.

Response to Comment No. 1053: Hodgson, Stephen A. (Cont'd.)

The sun is a giant reactor which is bombarding the earth with enormous quantities of radiation, ranging from large amounts of infrared, visible, and ultraviolet radiation to smaller amounts of X-rays and gamma rays. Sunbathers expose themselves to far more radiation than the public will ever see from the occasional ships, trucks and rail cars that would transport the waste. A percent of these sunbathers will develop skin cancer and many will be sunburned right then and there. But do we talk about closing down the beach? Do we notify our tourists and prospective tourists about the hazards of solar radiation? Hardly. But should we or could we? How could we possibly reach tourists who would be coming from every city in the country? *1053-2*

The paper quoted someone as saying, "If they (the tourists) found out we had nuclear waste here -- forget it." Now wait just a minute please. Do we advertise to our tourists that we transport and burn other forms of hazardous waste? Do we tell them not to wear blue or red tee shirts or risk getting shot? Do we tell them we're importing viruses for research? Hardly. Do we tell them about the pool table in Joe's bar. That stands for TROUBLE with a capital T, right here in Galveston City.

Even those who may choose to work in the docks handling the nuclear containers will wear film badges and dosimeters which measure the amount of radiation exposure. When a specified limit of dosage is reached (which is within conservative standards), the individual is not permitted any more exposure for that month. The work areas in which radiation exposure is possible would be secured and the public cannot enter except by authorization from safety officers, and with the use of film badges. They will also have a good reason to be there.

I did not see a single quote in the newspaper addressed at a specific safety issue. Were there any such? How many persons have reviewed the EIS, even perfunctorily?

Well then, how will this issue be decided? How should it be decided? By forty people who braved the rainstorm but evidently did not target specific safety issues? By vote of the Wharves Board? By the DOE or the Texas Health Department?

I believe that the hearing was not statistically significant enough to be representative of Galveston. I propose another route to decision making: An outreach program in the form of pro and con discussions by informed persons with various interested groups. Opinion surveys would then be conducted of these groups. Such groups would include the service clubs, the Fraternal clubs, the Chamber of Commerce, church and neighborhood groups, brown bag meetings at various work places and any other interested groups.

Another method would be a public hearing, similar to the last one conducted by the Wharves Board, but this time admitting only those who certify to having reviewed the Environmental Impact Statement or are otherwise knowledgeable about nuclear waste and nuclear waste handling.

Response to Comment Commentor No. 1053: Hodgson, Stephen A. (Cont'd.)

Response to Comment No. 1053-2

The commentor's observations regarding the danger of excessive exposure to the sun is noted. Sunbathers do expose themselves to increased risk of skin cancer, but this subject is outside the scope of this EIS.

The point of this would be to inform people and get informed input. And especially to minimize the impact of the "Not in my backyard" crowd.

If I may facilitate this by making contact with various groups and determining if there is interest in such meetings, would you please advise.

I present myself as a private citizen, but with some level of expertise in nuclear waste handling by employment experience at the Idaho National Engineering Lab and at the Nevada Test Site. I was a Project Mechanical Engineer for a waste handling and storage facility as a part of the Nuclear Fuel Reprocessing facility. Enclosed is a published article regarding the project, coauthored by myself.

Very truly yours,

Stephen A. Hodgson

Response to Comment No. 1054: Karilanovic, Dorothy L.

July 5, 1995

Mrs. Dorothy L. (McDonald) Karilanovic
4906 Crockett
Galveston Island, Tx 77551

Charles Head
Office of Spent Fuel Management
EM-37 U.S. Dept. of Energy
1000 Independence Ave., S.W.
Washington, D.C. 20585-0001

Dear Sir:

I am writing in reference to a proposal pending to transfer spent nuclear fuel through the port of Galveston, Texas. At a meeting held recently in Galveston, approximately 40 individuals attended a promotional program for the project, many voicing their opinions in opposition to the proposal.

For a number of years, the small city of Galveston (pop. approximately 61,000) located on an island only 3 miles wide has been struggling arduously to upgrade its tax base, to attract new business to the port and improve economic conditions for its citizens and small businesses. Thousands of dollars have been invested in improving the wharf sites for tourists located adjacent to Galveston's historical district - a main tourist attraction of the city - where many restaurants and shops are now located with the hope and intent of attracting thousands of visitors all year long. In spite of the money spent on the city by a few visionary wealthy philanthropists to try and build up a viable economy of tourism, middle income and lower income families are continuing to leave the island because of the paucity of well-paying jobs. In this regard, the city, therefore, does not need a deterrent to further discourage business interests from becoming established on the island, such as the Dept. of Energy's proposal to make Galveston a depot and transfer site for used nuclear waste.

1054-1

(Continued)

Response to Comment Commentor No. 1054: Karilanovic, Dorothy L.

Response to Comment No. 1054-1

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no adverse economic impacts on business or tourism within the port or the surrounding communities.

Letter to Charles Head, Dept. of Energy (Cont'd) 2

The cities and towns of this country should not have to help the Government and big industry sweep the results of risky poor policy planning under the rug. Why wasn't a way developed years ago when nuclear technology was originally developed to dispose of the potentially lethal waste products? 1054-2

Ten thousand years of deadly viability! Ten thousand years of fear and shame!

God, help us.

Sincerely,

Dorothy L. Karilanovic

(Mrs.) Dorothy L. Karilanovic

cc: John Unbehagen, Board Chairman, Galveston Wharves
Elbert Whorton, Board Member, Galveston Wharves

Response to Comment No. 1054-2

Environmental management, including safe waste disposal, is one of DOE's primary missions. The impacts of ultimate disposition of spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1 of the EIS).

RESPONSE TO COMMENT NO. 1055: DAWSON, JEAN F.

7616 131st St. Ct. E.
Puyallup, Wa. 98373
July 4, 1995

Mr. Charles Head
Office of Spent Nuclear Fuel Management
(EM-37)
U.S. DEpartment of Energy
1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Sir:

Accepting spent nuclear fuel shipped to the United States through the Port of Tacoma would be a serious error in my opinion.

Aside from the possible hazard to human health in this densely populated area, there is the additional risk of leakage in case of a severe earthquake. This could be a problem in any west coast port, but especially so in Tacoma.

An earthquake of greater than 7 magnitude may not occur for 50 or 100 years, but we are due for one according to seismologists.

The Port is built on an old mud flow from Mt. Ranier. This soil type could be expected to liquify in a strong quake, causing severe damage to any structure--building, dock crane, or railroad--that stands on it. The Pierce County Department of Emergency Management believes the Port will become a toxic nightmare in the event of a severe quake.Radiation leaking from nuclear fuel could make the area uninhabitable for a long time.

I am enclosing a brochure with some pertinent facts marked.

1055-1

Yours truly,

Jean F. Dawson

Jean F. Dawson

RESPONSE TO COMMENT
COMMENTOR NO. 1055: DAWSON, JEAN F.

Response to Comment No. 1055-1

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. The analysis in the EIS indicates that the risks associated with an accident are low (Sections 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Spent nuclear fuel transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). To date, after more than 30 years of spent nuclear fuel shipments, no radioactive material has ever been released from a spent nuclear fuel transportation cask as a result of an accident. Therefore, a seismic event, even if it caused structures at the Port of Tacoma to fail, is not expected to compromise the spent nuclear fuel transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 demonstrate that the use of any of the selected ports would not pose any significant risk to the port personnel or the population near the ports.

RESPONSE TO COMMENT
COMMENTOR NO. 1060: STALMAKER, ROGER

Response to Comment No. 1060-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1061: STALMAKER, MILDRED L.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.

Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: Something [illegible] to defuse our dear [illegible] waste so its no danger. Please do not bring it here. 1061-1 1061-2

RESPONSE TO COMMENT
COMMENTOR NO. 1061: STALMAKER, MILDRED L.

Response to Comment No. 1061-1

DOE is involved in various technology development programs to address and resolve nuclear waste management and disposal concerns. These programs cover a wide range of new and demonstrated technologies to advance beyond current waste management operations. The advances in high level nuclear waste separation, concentration and immobilization, and low level mixed waste characterization and disposal technologies would lead to an acceptable technique for stabilization and final disposition of spent nuclear fuel wastes.

Response to Comment No. 1061-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

*** COMMENTS ***

I write this as an individual, not on behalf of my church. I am deeply concerned about the environment. I am very deeply concerned about the continued production of nuclear waste, considering the current and undoubtedly permanent impossibility in Storing it. Shipping the rods through our county and state is very scary. An accident would be devastating to the population and the environment. Your environmental impact report is not clear or complete enough. Our objections are not satisfied that you plan to use in any particular. Save the rods where they are! 1062-1 1062-2 1062-3

RESPONSE TO COMMENT
COMMENTOR NO. 1062: NICKELL, JEAN

Response to Comment No. 1062-1

Spent nuclear fuel can be stored safety for long periods of time, as discussed in Appendix F, Section F.1 and Section 2.6.5.1 of the EIS.

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1. of the EIS).

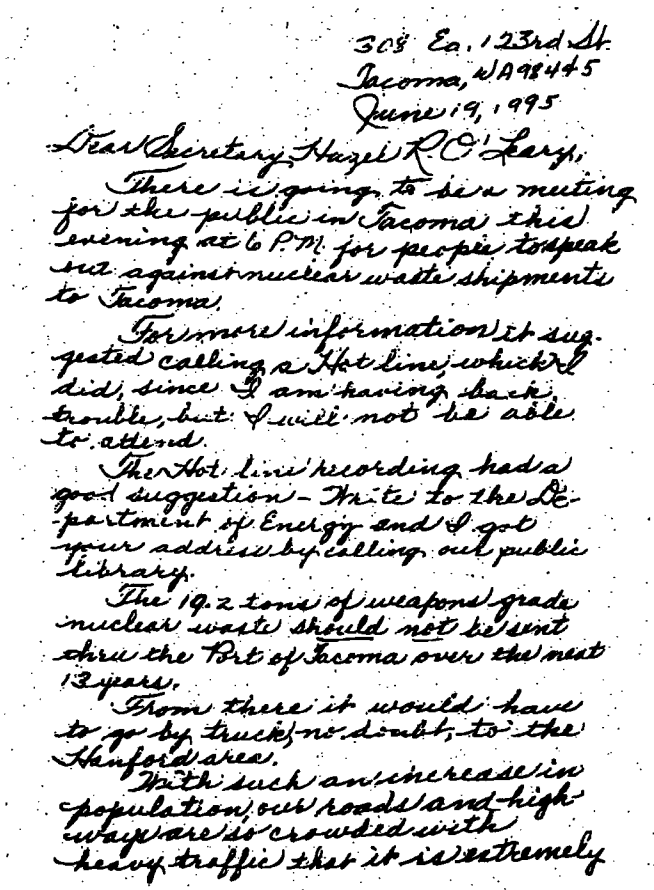
Response to Comment No. 1062-2

The commentor's opposition to the use of the Concord NWS for receipt of foreign research reactor spent nuclear fuel is noted. However, the analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2), and pose no significant risk to port personnel, the local population, or the environment.

Response to Comment No. 1062-3

The commentor's preference to keep the spent nuclear fuel rods where they are currently located is noted. This is Management Alternative 2 and is discussed in Sections 2.3 and 4.4 of the EIS. This preference, however, would not fulfill the U.S. nuclear weapons nonproliferation objective and would force many research reactors to shut down. This would limit their usefulness and contribution to research and medical advances. The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

COMMENTOR NO. 1067: KITTLESON, ALBERTA



308 Ea. 123rd St.
Tacoma, WA 98445
June 19, 1995

Dear Secretary Hazel R. O'Leary,

There is going to be a meeting for the public in Tacoma this evening at 6 P.M. for people to speak out against nuclear waste shipments to Tacoma.

For more information it suggested calling a Hot line, which I did, since I am having back trouble, but I will not be able to attend.

The Hot line recording had a good suggestion - Write to the Department of Energy and I got your address by calling our public library.

The 19.2 tons of weapons grade nuclear waste should not be sent thru the Port of Tacoma over the next 13 years.

From there it would have to go by truck, no doubt, to the Hanford area.

With such an increase in population our roads and highways are so crowded with heavy traffic that it is extremely

1067-1

1067-2

RESPONSE TO COMMENT
COMMENTOR NO. 1067: KITTLESON, ALBERTA

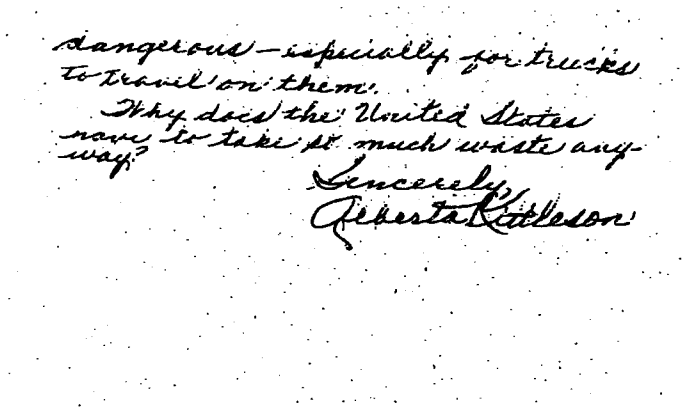
Response to Comment No. 1067-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1067-2

The ground transport route options and identification process are discussed in Section 2.6.4 of the EIS. Over a hundred representative ground transport route options were analyzed in Appendix E, including routes to all of the potential foreign research reactor spent nuclear fuel management sites. The results are presented in Section 4.2.3 of the EIS. In all cases the risks were found to be low.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.



dangerous – especially for trucks to travel on them.

Why does the United States have to take so much waste anyway?

Sincerely,
Roberta Kittleson

1067-2 (Cont'd.)

1067-3

Response to Comment No. 1067-3

Prior to 1989, it was a policy of the United States to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

COMMENTOR NO. 1069: CITIZENS (TACOMA AREA)

June 26, 1995

The Honorable Hazel O'Leary
The Secretary of Energy
Washington, DC 20585

*

Dear Ms. Secretary,

As residents of Tacoma, Washington, we declare strong objections to the proposal to receive nuclear waste at the Port of Tacoma from overseas, for transport to storage elsewhere. **1069-1**

We have the obvious safety concerns over receiving and transferring these materials to rail and carrying them through the fourth busiest corridor in the United States. **1069-2**

In addition, we feel (1) this waste program is not good environmental policy, economic policy, or energy policy, (2) the United States has failed to develop procedures for safe permanent disposal of nuclear waste, and (3) instead of utilizing our hi-tech industry to resolve nuclear waste disposal problems, we are adding nuclear waste from other countries to our existing storage and disposal problems and creating a permanent blight on the region's natural and economic landscape. This is no legacy to leave the next generation. **1069-3**

John and Dianne Hansen 2101 Hillside Dr. NE. Tacoma WA 98422

RESPONSE TO COMMENT
COMMENTOR NO. 1069: CITIZENS (TACOMA AREA)

Response to Comment No. 1069-1

The commentors' opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1069-2

The commentor's concerns about safety are noted. The risks of receiving, transferring, and transporting the foreign research reactor spent nuclear fuel are discussed in Sections 4.2.2 and 4.2.3 of the EIS. In all cases, the risks were found to be low.

Response to Comment No. 1069-3

The commentor's opinion that the proposed action represents poor environmental policy, economic policy, and energy policy is noted.

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1 of the EIS).

DOE is using high technology to resolve nuclear waste disposal problems. Vitrification is the preferred technology for high-level waste and geologic disposal is the preferred disposal technique. Many other countries, especially developing countries, do not have these technological capabilities.

DOE agrees that the next generation should not have to clean up the existing nuclear waste inventories. That is one of the reasons that DOE issued the draft Waste Management Programmatic EIS in August, 1995, as discussed in Section 1.5 of the EIS.

* This is the best available copy of this comment document.

COMMENTOR NO. 1070: MCCLINTIC, JAMES M.

The Honorable Hazel O'Leary, Secretary,
U. S. Department of Energy
1000 Independance Avenue S.W., Rm. 7A257
Washington, D. C. 20585

June 26, 1995

Dear Secretary O'Leary:

This letter is to advise you that I am adamantly opposed to a proposal made by your staff to use the Port of Tacoma, Washington as a port of entry for spent radioactive nuclear fuel materials from foreign reactors. 1070-1

Members of your staff have prepared a draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. This proposal envisions using the Port of Tacoma as a transshipment point for radioactive nuclear waste materials. These materials would be offloaded from seagoing cargo vessels and loaded aboard other forms of transportation and thence shipped on to storage sites here in the U. S..

Your staffer, Mr. Charles Head, who attended a public hearing on June 19th, here in Tacoma, is quoted in a local newspaper article. His words give me grave cause for concern. During the meeting, overwelming disapproval of the proposal was voiced by people from all over Western Washington. Your staffer told the Tacoma News Tribune reporter that "They don't have time to listen." I believe that he meant that you and your department don't have time to listen to the concerns of the citizens most likely to be affected by this proposal. Perhaps Mr. Head has forgotten that he and the entire department serve by the grace of the Congress and the President, and thereby, the citizens of the country. I strongly recommend that you counsel Mr. Head on his responsibilities, lest he begin to personify the National Rifle Association's recent reference to "jackbooted government thugs." I truly hope that Mr. Head was misquoted or misunderstood by the reporter. 1070-2

I also have grave concerns for the safety of the citizens of Washington and the fishery which is such a large part of the local economy should the unthinkable happen, a nuclear accident. I urge you in the strongest possible terms to ask your staff to select an alternative to Tacoma, Washington as the port of entry if this program must be adopted. Your staff has not done its homework properly. There are serious concerns not addressed by your proposed EIS. These include, but are not limited to the following: The long term effects of unrecoverable containers in Puget Sound; the security of containers during transshipment; the 1070-3

RESPONSE TO COMMENT
COMMENTOR NO. 1070: MCCLINTIC, JAMES M.

Response to Comment No. 1070-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1070-2

The DOE representative's comment that their bosses in Washington "don't have time to listen" was taken in the wrong context. While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying public concerns and issues to the Secretary of Energy and her staff. As indicated by this document, all comments received from the public were noted and taken seriously. Under NEPA and DOE's environmental regulations (Section 5 of the EIS), public participation and comments are an integral component of the environmental process.

Overall, DOE's public interaction related to this draft EIS has exceeded requirements set forth in NEPA and the environmental regulations of DOE. Seventeen public hearings were held in the locations determined to be most likely to be directly affected by the EIS alternatives. In addition, the period of acceptance for written comments was extended from June 20 to July 20, 1995. DOE considers that these actions have provided sufficient opportunity for the public to comment on the draft EIS.

Response to Comment No. 1070-3

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

The security provided for the spent nuclear fuel shipments would be required to meet or exceed all of the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all

COMMENTOR NO. 1070: MCCLINTIC, JAMES M. (CONT'D.)

effects of a nuclear accident at the port. Please do not dismiss my concerns and those of my fellow citizens. We have been told too many times that the horrible "accident" can't happen, but Chernobyl, Hanford and Thee Mile Island tell us otherwise. There are other sites for the port of entry which do not pose the security or accident risks that exist in Tacoma. Please do not risk making the beautiful Puget Sound Region a nuclear wasteland.

Sincerely,

JAMES M. McCLINTIC
6017 65th St. Ct. W.
Tacoma, WA 98467-3944

RESPONSE TO COMMENT
COMMENTOR NO. 1070: MCCLINTIC, JAMES M. (CONT'D.)

of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site(s).

The EIS includes analyses that were performed to evaluate the impact of various accidents. The consequences of port accidents, including category six accidents (the worst plausible accident), are discussed in Appendix D, Section D.5.4.2.2. In all cases the risks were found to be low.

COMMENTOR NO. 1071: CASEY, DIANA L.

Charles Head
Office of Spent Nuclear Fuel Mamagement
(EM - 37)
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, D>C> 20585

Dear Sir:

It was with great dismay that I heard about the Federal Government's consideration of Tacoma, Wa., as a possible port of entry for the transportation of nuclear waste. This is an inhabited area and for the past several years Tacoma has made a very serious effort to clean up and contain its toxic pollutants. The city has gotten better and better in its compliance with federal law and the Environmental Protection Agency. Is this now to be its reward? Our families live here, and if man's ignorance in his careless usage of nuclear facilities is ever enlightened, perhaps our great grandchildren will be able to also. Have we learned nothing from the disasters of Three Mile Island and Chernobyl? 1071-1

Tacoma, since it is the best deepwater port on the West Coast, should not even be considered for this nuclear transportation. If an accident were to foul the waters here , the entire Puget Sound fishing industry would die, and all of the large cities in the area would be in very serious danger of irreversible poisoning. Seattle, our San Francisco of the North, our capitol city,Olypmia, and many other metropolitan areas would be in jeopardy for the health and safety of its citizenry for years to come.

The Environmental Protection Act has protected the spotted owl to the detriment of the forestry industry, but the humans in this area cannot even be assured pure water, air, or soil for their offspring. I know...I know,,,EVERY precaution will be taken to preclude an accident, but nothing is fail safe. So, you ask, where should we go instead of Hanford, Washington, for storage of spent fuel?
My suggestion would be to go back to the virtually uninhabited places that the Federal Government has used in the past to detonate nuclear warheads, like those areas in New Mexico that had the cancer rates tripled for only a few locals and their families and had the surrounding areas poisoned with a radioactive half-life of only a few thousand years. Is it not enough to poison just a part of the planet and make it unliveable? Do we really have to threaten the entire blessed globe? 1071-2

RESPONSE TO COMMENT
COMMENTOR NO. 1071: CASEY, DIANA L.

Response to Comment No. 1071-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

DOE considers that there would be no significant adverse impacts on the natural resources and on the air and water quality at any of the ports that might be used to receive the material under the proposed policy of managing foreign research reactor spent nuclear fuel. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive material has ever been released from a spent nuclear fuel transportation cask, nor has a spent nuclear fuel transportation cask ever been punctured, even as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

Response to Comment No. 1071-2

Candidate management sites are described in Section 3.3 of the EIS. These sites were selected for management of spent nuclear fuel from foreign research reactors because they have appropriate handling facilities and personnel as well as established security measures. The management sites are remote from populated areas. As discussed in Section 4 of the EIS, foreign research reactor spent nuclear fuel can be safely stored at one or more of these sites. Selection of new remote sites would not be cost effective.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

COMMENTOR NO. 1071: CASEY, DIANA L. (CONT'D.)

The Puget Sound region boasts the last natural (undeveloped) estuary in the United States; this is the Nisqually Basin area, and to put this in harm's way along with this most beautiful of living areas is unconscionable. There is enough desert the world over for the storage of nuclear waste; there is absolutely no reason at all to use a wonderfully liveable area, one of the last outside Alaska in the U.S. that still has some old growth forest and wilderness area. The idea that the Feds can foist this upon us without our even voting upon it sounds a tad like a Tea Tax to me. Is it any wonder the militia is arming itself? How about shipping the waste up the Potomac River and storing it in a nice lead- lined building on Pennsylvania Avenue instead? Or, just maybe we need to look at alternatives to nuclear energy since we seem to have created a Frankenstein that noone, not even the physicists, seem to know how to control. Will it come far too late, that knowledge that dividing the smallest thing known to man may unleash a plague of sickness and death the likes of which the world has never seen? Cannot our leaders see beyond the ends of their noses at the likely result of using so much nuclear fuel? Will we eventually have to launch the waste into space ? We in Tacoma cherish our unpolluted natural areas, our lives and our living space, and we will fight to keep it unfouled.

Sincerely,

Diana L. Casey

Diana L. Casey

RESPONSE TO COMMENT
COMMENTOR NO. 1071: CASEY, DIANA L. (CONT'D.)

Nuclear warheads are not detonated in the State of New Mexico. The first atomic bomb was detonated in July 1945 southeast of Socorro, New Mexico in a portion of what is now the Trinity Site within White Sands Missile Range, New Mexico. Since that time, no nuclear detonations have been conducted in New Mexico. The Trinity Site is now a tourist attraction. Tourism and hunting on White Sands Missile Range are controlled to minimize interference with range operations and the abundant desert wildlife now residing in the area. Cancer rates in that area are not known to significantly exceed the national average.

COMMENTOR NO. 1072: JENSEN, ROBERT J. & BEVERLY A.

Tacoma Wa
June 27, 1995

Dear Sir
Just a few lines to let you know how terrible the majority of us Puget Sounders feel about our country even considering accepting other countries nuclear garbage — We cannot emphasize strongly enough how disasterous one small accident would be — Not only are we ill-equipped to handle such volumes of foreign nuclear waste products, but we can't even take care of our own properly. (ie: Hanford and Yucca.)
An alternative would be to keep the nuclear waste overseas, where it would be reprocessed in Scotland, Japan or France. All three of these countries have indicated they want it —
Please don't make our

*** COMMENTS ***

I am opposed to the routing of nuclear waste thru the Port of Tacoma for a number of reasons including: possibility of shipboard fires for which temperature the nuclear containers are not designed to withstand; ill-trained/ equipped city, county, state emergency workers for nuclear accidents; getting stuck in traffic in my regular trips through the Port of Tacoma next to a truck containing nuclear waste; and being downwind in a residential area a couple of miles from the Port of Tacoma. I am very concerned about the possibility of terrorist hijacking or attack on the nuclear shipments. The shipping route thru the Straits of Juan de Fuca & Puget Sound provide ample cover for small terrorist boats or even on-shore missles & weapons to be used against the ship carrying the nuclear waste. There is a lot of coast line in the many miles of inland waterways in the Port of Tacoma shipping route conducive to this activity. This should be a criteria in the selection process of a port! The shipping route also goes through some heavily populated areas. The Port of Tacoma itself is not designed to be secure against terrorist activities. In my opinion military harbor facilities should be given much greater weight than commercial ports due to security issues as well as experience in handling nuclear wastes & emergencies.

RESPONSE TO COMMENT
COMMENTOR NO. 1073: AMDAHL, DREW

Response to Comment No. 1073-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, the analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2), and pose no significant risk to port personnel, the local population, or the environment.

Appendix D, Section D.5.3.1 of the EIS describes several accident scenarios that involve fire. The results of the analysis of these accidents can be found in Appendix D, Section D.5.4. The analysis indicates that even in the event of a severe ship fire, neither the consequences nor risks are great (Appendix D, Section D.5.5). Although the nonradiological effects of such a catastrophic accident would obviously impact the local environment, no additional impacts are predicted due to the presence of foreign research reactor spent nuclear fuel.

DOE considers that there is adequate regulatory and emergency preparedness infrastructure to ensure the safe acceptance and transport to designated management sites if the foreign research reactor spent nuclear fuel is managed in the United States. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1 of the EIS. There are three national emergency response plans under which DOE provides radiological monitoring and assessment assistance. Under these plans, DOE provides technical advise and assistance to the State, Tribal and local agencies involved with a radiological incident. Emergency preparedness, security, and coordination of DOE with local emergency response authorities, and security are discussed in general in Sections 2.7 and 2.8 of the EIS. Details would be contained in the Transportation Plan, that would be prepared prior to any individual spent nuclear fuel shipment and coordinated with State and local officials. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments.

The radiation dose that anyone would receive handling, working or traveling near a cask is below the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20). As such, no special precaution would be required from anyone in the area of a cask carrying foreign research reactor spent nuclear fuel.

Neither acts of terrorism nor theft of materials by a determined group of individuals can be completely precluded. However, proper security measures can greatly reduce the risk of such actions. The security provided for the spent nuclear fuel shipments is required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional

COMMENTOR NO. 1073: AMDAHL, DREW (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 1073: AMDAHL, DREW (CONT'D.)

Section 3.2 of the EIS presents the population within 10 miles (16 km) of each port, and the accident impact analysis takes into account population within 50 miles (80 km) of the port. Port selection Criterion 5 (Appendix D, Section D.1.9.5 of the EIS) considers population in the port and along the route to the management site.

Response to Comment No. 1073-2

The EIS evaluates the use of both military and commercial ports in Section 4.2.2 and Appendix D. The information presented demonstrates that the risks associated with using any of the ports identified by the port selection process is low.

COMMENTOR NO. 1074: JOHNSON, MARJORIE

July 9, 1995

Charles Head
Office of Spent Nuclear Fuel Management
US Department of Energy
1000 Independence Avenue SW
Washington D.C. 20585

Dear Mr. Head:

I hope that by now, from everything I have read and heard, you have removed Tacoma Washington from all consideration concerning shipments of high-level nuclear waste through our port. 1074-1

I don't believe that any port in this country should have to dea with it.

If our country has that much money to spend on this kind of project, then use that money to send equipment and professional to the country where it is now stored for appropriate containmen 1074-2

The U.S. does not have to take on all the worlds problems.

Sincerely,

M Johnson

Marjorie Johnson

RESPONSE TO COMMENT
COMMENTOR NO. 1074: JOHNSON, MARJORIE

Response to Comment No. 1074-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, or any U.S. port, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1074-2

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

COMMENTOR NO. 1077: BUNNELL, DIANNE

July 7, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Mr. Head:

I read with great satisfaction that the June public hearings on the issue of bringing spent foreign research fuel elements through the Port of Tacoma resulted in a strong show of support by Washingtonians *AGAINST* such a possibility. — *1077-1*

I know Ports are the issue, but I wish you could explain to me, Mr. Head, how American depositories are better suited than any that could be constructed by American know-how, with personnel trained by American methods (or perhaps administered by Americans) *in the country that creates the waste???* — *1077-2*

Our personal experience is this: my husband's first wife died at age 39 from a cancer that normally is easily treatable. We have no proof that the unusually aggressive, fast growing cancer was affected by the fact that Susan grew up near Hanford nuclear facility; but, if there's nothing to worry about at Hanford, why the massive clean up efforts underway today? Nuclear storage is *not* the end of the story. — *1077-3*

During the time my husband was a boy growing up in Tacoma in the 50's, there was total disregard to environmentally sound practices — now, Tacoma has made monumental leaps in terms of clean up, fine cultural offerings and civic pride. Finally, Tacoma's getting to be beautiful! This plan would certainly affect this great city. What business seeks out a city in which massive amounts nuclear business is conducted? Other issues include transportation routes, handling facilities and the configurations of the on-dock rail yard were incorrectly drawn up on out-of-date maps; the depth of water in the Tacoma area would present a disasterous problem, if an accident were to ever happen; the population in this area has skyrocketed, and will continue to grow -- has a full disaster contingency been addressed in terms of redressing the citizenry and funding needed to rebuild? These issues and others addressed at the hearing make it clear that the Port of Tacoma is not an optimum location for this program.. — *1077-1 (Cont'd.)*

Is this program of nuclear dumping grounds really in the best interest of the next generation? Or is it simply expedient? As Steven Seagal said at a rally against building a nuclear storage dump on reservation land: "I see death. How's one word? Death," he said. "I could add a couple of others: sickness, suffering." As far as I'm concerned, we've already experienced the results of nuclear waste. — *1077-4*

Sincerely,

Dianne Bunnell

RESPONSE TO COMMENT
COMMENTOR NO. 1077: BUNNELL, DIANNE

Response to Comment No. 1077-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, such adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Tacoma would have no adverse economic impacts on business or tourism within the port or the surrounding communities.

In regard to the EIS being based on outdated and inaccurate information, updated information on the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. All of the errors identified by the commentor, have been corrected in the final EIS, and the conclusion that the risks associated with accepting foreign research reactor spent nuclear fuel into the United States through Tacoma, or any of the other candidate ports, are low and would result in low impacts is still valid. The population data used in the analyses, which was verified as being correct, were based on the 1990 census.

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis shows that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

The population in close proximity to the terminal, as well as those as far away as 50 miles, was considered when the effects of possible accidents were calculated (Appendix D, Section D.5 of the EIS). These calculations demonstrate that the risk from accidents to all individuals is low. Likewise, the incident-free radiation exposure to people nearer to the cask than those living outside the fence around the port was calculated and found to

pose no significant risk (Section 4.2.3.2 of the EIS). The dose rate at 100 feet from a cask containing foreign research reactor spent nuclear fuel is essentially zero. For these reasons, the close-in population near the Port of Tacoma would not be subjected to any significant risk from the use of the terminal to receive foreign research reactor spent nuclear fuel.

Response to Comment No. 1077-2

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

Response to Comment No. 1077-3

DOE agrees that radiological contamination presents a risk to the health and safety of workers and nearby public. DOE is committed to the Tri-party agreement for the cleanup of contaminated areas at the Hanford Site; however, the cleanup at the Hanford Site is beyond the scope of this EIS. Section 4.2.4 and Appendix F, Section F.4.3 of the EIS discuss the impacts of foreign research reactor spent nuclear fuel storage at the Hanford Site.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 1077-4

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly-enriched (weapons-grade) uranium in civil programs worldwide.

Response to Comment No. 1084-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1085: SCHERER, ELLEN

June 23, 1995

Mr. Charles Head
Department of Energy
1000 Independance Avenue
Washington, D.C. 20585

Dear Mr. Head;

After recently watching the hearings on the Nuclear Waste issue in Washington State, I have become very alarmed. I am the mother of 3 small children. We are in the process of buying a home in the Federal Way area which is a short distance from the Port of Tacoma.

And the federal government wants to bring nuclear waste from Japan to the area for storage. Why? I'm sure you are aware that this is a highly populated area. The nuclear industry has a far from good safety record. Any sort of accident or mishap would start a chain reaction of catastrophic events. Nuclear is an unstoppable force and it would be unwise to expose innocent people to a potential volative situation. 1085-1

Please don't let this happen. Other options should be taken.

Thank you for listening.

Please respond when a decision has been reached.

Ellen Scherer
1900 S.W. Campus Dr.
Bldg. 42 - Apt. 101
Federal Way, Washington 98023

RESPONSE TO COMMENT
COMMENTOR NO. 1085: SCHERER, ELLEN

Response to Comment No. 1085-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternatives 1 or 3), there would be no storage of this material in the Port of Tacoma, or any other port. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

COMMENTOR NO. 1086: CHUTE, MARGARET C.

Dear Mr. Charles Head,

I am writing to protest shipping nuclear waste through the U.S. via port in Tacoma. 1086-1

Why make a "nuclear garbage dump" of the United States. A probable accident would ruin this area. 1086-2

Also we have no commercial reprocessing facilities in the United States, France and Japan. These countries have the waste with to do with and would use the nuclear waste. 1086-3

Sincerely,
Margaret C. Chute
2501 So 35th St #10
Tacoma, Wa. 98409

RESPONSE TO COMMENT
COMMENTOR NO. 1086: CHUTE, MARGARET C.

Response to Comment No. 1086-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1086-2

Prior to 1989, it was a policy of the United States to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). As discussed in Section 4 of the EIS, each of the management alternatives could be implemented without significant effects on human health or the environment.

Response to Comment No. 1086-3

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS. As discussed in Section 2.6.5.2, the United States has chemical separation facilities at two of the potential management sites.

In the near future, the chemical separation facilities at the Savannah River Site might resume operations for the foreign research reactor spent nuclear fuel or for another purpose. These options are discussed in Section 2.2.2.6 of the EIS.

DOE announced a Record of Decision on May 30, 1995 for the Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory (INEL) Environmental Restoration and Waste Management Programs EIS. Chemical separation at the Idaho National Engineering Laboratory was not included in this Record of Decision, so additional site-specific NEPA documentation would be required to restart the chemical separation facilities at this site.

COMMENTOR NO. 1091: CHAPEL, MARGARET C.

July 4, '95

Dear Mr. Head,

Please don't put your toxic garbage in Concord Naval Weapons Station, or anywhere in the San Francisco Bay area.

1091-1

Thankyou,
Margaret C. Chapel

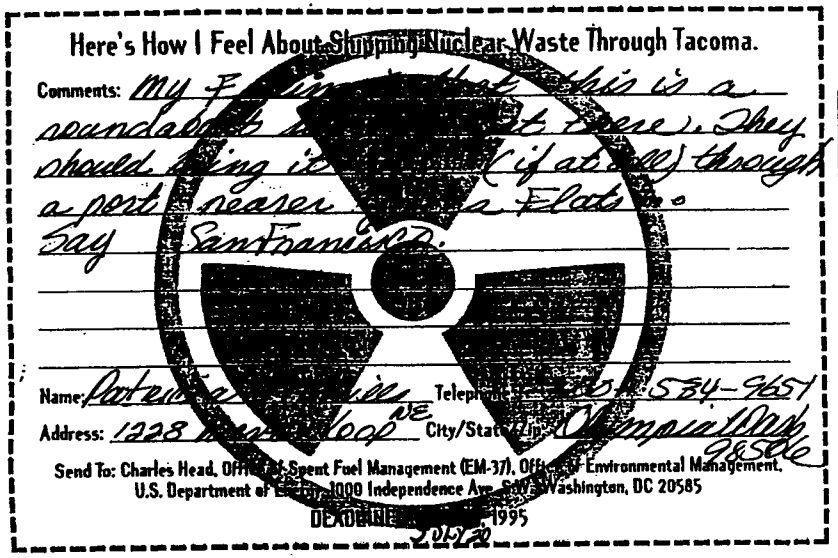
RESPONSE TO COMMENT
COMMENTOR NO. 1091: CHAPEL, MARGARET C.

Response to Comment No. 1091-1

The commentor's opposition to the use of Concord NWS for the shipment of foreign research reactor spent nuclear fuel is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

Commentor No. 1092: Mills, Patricia J.

AMAZINGLY, YOU CAN STOP NUCLEAR WASTE FROM COMING HERE WITH JUST ONE HAND.



Here's How I Feel About Shipping Nuclear Waste Through Tacoma.

Comments: My F[illegible] that this is a scandal to ship it here. They should bring it [illegible] (if at all) through a port nearer [illegible] Flats. Say SanFrancisco.

Name: Patricia J. Mills Telephone: (206) 584-9651

Address: 1228 [illegible] Loop SE City/State/Zip: Olympia WA 98506

DEADLINE: June 30, 1995

The strongest weapon against nuclear waste is right at your fingertips. Here's your chance to let the Department of Energy know how you feel about their possible plan to ship 19.2 tons of weapons-grade nuclear waste through the Port of Tacoma over the next 13 years. So, pick up a pen, fill out this form and send it to the address above by June 30, 1995. And let them know that Tacoma is not a place for nuclear waste. For more information call the Port of Tacoma Hot Line at 597-7575.

Co-sponsored by Port of Tacoma; Port of Seattle; Longshore Local #23; Puyallup Tribe; Citizens for a Healthy Bay; Cities of Tacoma, Fife, Milton, Renton, Federal Way; Tacoma-Pierce County Visitor & Convention Bureau, Tacoma-Pierce County Chamber of Commerce; Pierce County Central Labor Council and Pierce County.

1092-1

Response to Comment Commentor No. 1092: Mills, Patricia J.

Response to Comment No. 1092-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

June 1995

Dear Secretary of Energy Hazel O'Leary,
I live in Contra Costa county where the Concord Naval
Weapons Station and port are. I am opposed to the plan
to bring spent fuel and high level nuclear waste
through the Bay Area, with its large population. We
are also politically aware here, and environmentally 1093-1
sensitive. We have earthquakes and flooding, and
plenty of traffic accidents. It seems foolish to transport
this very hazardous material so far when there are
closer alternatives.
Furthermore, I think that the countries that use nu-
clear power should get used to disposing of its waste
nearby, or give it up. We cannot keep taking all the waste 1093-2
and the U.S. should not be distributing this stuff in the
first place. We should not be making or using it ourselves
until we know how to safely dispose of it. We are far
from that point! Nuclear power is not necessary, and
nuclear weapons are an abomination. Not only the wastes
but the weapons can fall into the wrong hands at any
time, and be abused. The U.S. has abused them and so
have the other nations that have them. Nuclear power 1093-3
plants and weapons have already done a great deal of
harm. We should not be encouraging and making it
easier for the rest of the world to go nuclear, but
shutting down the present production and use of radio-
active materials. We don't know what to do with the
contamination we have already. Each new step is 1093-4
fraught with danger and controversy, as you know.
If only President Clinton had the guts to tell the world!
Trying to play it safe, he probably won't be re-elected,
but if he found his own backbone or could borrow one,
he might be. Which reminds me of a joke I'll enclose
from the book from the Fellowship of Reconciliation - "How
To Keep Laughing Even Though You've Considered All the
Facts" by Richard Beato.

Response to Comment No. 1093-1

The commentor's opposition to the use of Concord NWS to receive foreign research reactor spent nuclear fuel is noted. The port selection criteria discussed in Appendix D, Section D.1.9 of the EIS identify those ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Concord NWS, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2).

All population within a 50-mile radius of the Concord NWS was considered when analyzing the impact of both incident-free transport and the range of hypothetical port accidents. The risks were found to be low. (Appendix D, Section D.5 provides details on accident analysis).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the transportation cask.

Response to Comment No. 1093-2

The commentor's opposition to acceptance of foreign research reactor spent nuclear fuel is noted. Other alternatives under consideration are discussed in Sections 2.3 and 2.5 of the EIS.

The United States encourages the use of LEU fuel in research reactors because it cannot be used to manufacture nuclear weapons. As discussed in Sections 2.2.1.9 and 2.6.5, foreign research reactor spent nuclear fuel could be safely stored at any of the five candidate management sites until final disposition. Final disposition is a high priority consideration and is discussed qualitatively in Section 4.2.7 of the EIS.

As shown in Tables 2-1 and 2-2 of the EIS, Iraq is not a candidate for participation in the proposed action. Thus, spent nuclear fuel from Iraq would not be managed under the proposed policy.

COMMENTOR NO. 1093: REIMER, NANCY (CONT'D.)

2/ most of the spent fuel from other countries that the U.S. would be bringing back could be disposed of just as safely, or more so, in those countries, such as Canada and Europe. As for the unstable parts of the world, what are we giving them nuclear material for? We see what has happened in Iraq, and to Iraq, which the U.S. flooded with weapons in the 1980's! The greatest abuses have been committed there, including by Bush in the Gulf War, which he could have easily prevented by sending clear signals to Saddam Hussein that he wanted that war, although in the end it didn't help him, and the terrible consequences continue. Saddam Hussein said well, however, that now is allied with the Russians for humanitarian reasons! From bad to worse with power, politics and nuclear energy.

Back at home, too much of the radioactive materials are also starting or ending up on Indian land. So is other hazardous waste. The health of Native Americans has suffered. Nuclear weapons have been exploded on Shoshone land in the 1950's. The people of Big Mountain have been driven off their land and are still fighting relocation because Peabody Coal, Santa Fe Pacific and others, including some tribal leaders, want to exploit the area. Our local utility (Pacific Gas and Electric) is trying to send nuclear wastes to the Apache Mescalero Reservation and to Ward Valley, west of Needles, Calif. and 18 miles from the Colorado River. No wonder

1093-5

1093-2 (Cont'd.)

1093-6

RESPONSE TO COMMENT
COMMENTOR NO. 1093: REIMER, NANCY (CONT'D.)

Response to Comment No. 1093-3

Foreign research reactors are not used for generation of commercial power or the development of nuclear weapons. Section 1.1 of the EIS describes the research, medical, agricultural, and industrial applications of research reactors. Because it is unrealistic to expect foreign nations to forego the benefits of nuclear technology, the United States supports the use of LEU fuel in civilian applications and discourages actions which might lead to the spread of nuclear weaponry (See Sections 1.1 and 1.2 of the EIS). In addition, the U.S. accrues significant benefits from the operation of foreign research reactors - including Moly-99 and other medical isotopes.

Response to Comment No. 1093-4

See response to comment number 1093-2 above.

Response to Comment No. 1093-5

The commentor's preference for the overseas management alternative is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

Response to Comment No. 1093-6

If Management Alternative 1 is adopted, no foreign research reactor spent nuclear fuel would be managed on Indian lands. Sections 2.6.5 and 3.3 of the EIS describe candidate management sites for spent nuclear fuel from foreign research reactors. Section 3 and Appendix A provide characterizations of the racial and ethnic composition of populations residing in potentially affected areas.

3/

people are nervous! The Oklahoma City disaster made us all more aware of the problem of home-grown terrorism, too. The downsizing and moving away of companies is causing unemployment and the attendant economic and psychological problems, which can lead to such crazy acts. The government should lead the way in finding sensible solutions. The obvious one in the case of nuclear power is to phase it out, but the present policy seems to be to perpetuate it, and kind of hook the central purpose, which is military, with so-called benign uses: nuclear energy, radioisotopes in medicine, agriculture, industry, etc., only if the overall price is not higher than the benefits, but it is.

Please do not visit this menace on the S.F. Bay area any more than it already is. We are struck with the Livermore lab, the Concord Naval Weapons Station, and other nuclear hazards already. One building at Lawrence Livermore National Laboratory stores 8.80 pounds of plutonium according to a May 14, 1995 newspaper article about earthquake preparation.

I appreciate your coverage in helping more of the truth about our nuclear past emerge. As long as it is hidden, there is little chance of preventing future disasters. We have a world to save, and informed people know that it is in great danger. A half a century ago, a few years after my birth, the U.S. bombed Japan. That was a terrible mistake. Now I have Japanese in-laws -and a nephew who did not survive racism and others.

Sincerely, Nancy Reimer

1093-2 (Cont'd.)

1093-7

Response to Comment No. 1093-7

The commentor's opposition to bringing foreign research reactor spent nuclear fuel into the San Francisco Bay Area and, more specifically, into Concord NWS is noted. As indicated by the analysis in Section 4 of the EIS, the risk associated with implementation of the proposed action to human health and the environment would be low. Environmental effects of normal operations and accidents were included in the environmental action.

Response to Comment No. 1093-7

The commentor's opposition to bringing foreign research reactor spent nuclear fuel into the San Francisco Bay Area and, more specifically, into the Concord NWS is noted. As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low. Environmental effects of normal operations and accidents were included in the environmental evaluation.

COMMENTOR NO. 1093: REIMER, NANCY (CONT'D.)

P. S. Since writing this I was very sorry to read that the U.S. government is planning to resume nuclear testing. This places the whole world in jeopardy as it undermines the difficult and necessary process of stopping the arms race, and undoes the progress already made through much hard work and sacrifice. Please do what you can to stop it. We appreciate the efforts you are making, but they are not enough. Too much is at stake here.

This is a love letter, if you really mean what comes with it - love for the world, and for you and your efforts to save it, We really must put our shoulder to the wheel now, and keep at, and be honest, too.

Attention: Mr. Charles Head
1000 Independence Ave. S.W.
Washington, DC, 20585-0001

Dear Mr. Head:

Twenty tons of weapons-grade U-235 waste to be transported from foreign countries to be stored at Hanford? Right next to the Columbia River? Hanford, with its perennial problems of leaking containers, and its incredible and unaccountable losses of plutonium? I guess the Columbia River and the cities along its banks are expendable. 1095-1

With decisions like that coming from our own government, who needs enemies?

Sincerely,

Arden R. Benson

RESPONSE TO COMMENT
COMMENTOR NO. 1095: BENSON, ARDEN R.

Response to Comment No. 1095-1

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Charles Head
Program Manager
Spent Nuclear Fuel Management

Dear Mr. Head:

I urge you not to ship nuclear waste through the Port of Tacoma.

I can see no economic benefit, yet it is likely that there exists liabilities in one form or another. Specifically increased taxes and devalued property. 1097-1

Being a close neighbor to the Port, I stand to lose significantly should you decide to ship this waste through the Port of Tacoma.

Sincerely,

Paul C. Schroeder

Paul C. Schroeder

RESPONSE TO COMMENT
COMMENTOR NO. 1097: SCHROEDER, PAUL C.

Response to Comment No. 1097-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 and Appendix D, Section D.5 of the EIS).

Although not a direct economic benefit, the management alternatives described in the EIS would reduce the threat of nuclear proliferation, which has both national and global value.

COMMENTOR NO. 1102: ROCHE, ANITA F.

4848 Venner Rd
Martinez CA 94553
July 5, 1995

Dear Mr. Head,

The DOE plan to ship nuclear waste through the Concord Naval Weapons Station should be "dumped." To put the shipments through a densely populated area such as the San Francisco Bay could be another Chernobyl.

I don't like pushing the plan onto another area either; but, isn't there somewhere less populated that could be used?

Please reconsider.

Sincerely,
Anita Roche

1102-1

RESPONSE TO COMMENT
COMMENTOR NO. 1102: ROCHE, ANITA F.

Response to Comment No. 1102-1

The commentor's opposition to the use of Concord NWS for the shipment of foreign research reactor spent nuclear fuel is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

The port selection process that determined that Concord NWS was an acceptable port considered the population of the port and surrounding areas (Appendix D, Section D.1.9.5 of the EIS). Additionally, all population within a 50-mile radius of the Concord NWS was considered when analyzing the potential impact of a range of hypothetical port accidents. The risks were found to be low (Section D.5).

The passage from San Francisco Bay to Concord meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for the port selection (Appendix D, Section D.1.9.2).

COMMENTOR NO. 1104: HAGBERG, JOHN

COMMENTOR NO. 1105: TRETTIN, LILLIAN D.

712 Wakendaw Blvd.
Mount Pleasant, SC 29464

May 9 1995

Mr Charles Head
Office of Environmental Management (EM-37)
U.S Department of Energy
1000 Independence Ave S.W
Washington D.C. 20585

Dear Sir

I want to state emphatically for the record that I oppose the shipment of nuclear fuel rods through Wando Welch Terminal a property that borders the town of Mount Pleasant SC. The terminal is located near some of the town s most rapidly expanding suburbs and busiest thoroughfares. The proposed action is clearly inappropriate for a community expanding at Mount Pleasant's current high rate of growth. I am writing, not in response to a paid public notice in one of the local newspapers (which I--like a lot of other people in Mount Pleasant--missed), but in response to the headline of a more prominent news article that appeared the day after the meeting: "Few turn out to protest nuclear fuel rod shipments." As the article notes, attendance at the meeting on May 8 was low compared to attendance at a meeting held a year earlier, at which time residents voiced strong disapproval. It is unfortunate that the May 8 meeting received so little attention, since a well-managed scoping process is one of the keys to a successful (and acceptable) EIS.

1105-1

Please add my name and address to your mailing list. I would like to receive the draft EIS and any other public material related to this process (the DOE implementation plan, if there is one), and I would like to be notified of any other public meetings. Before I moved to Mount Pleasant last year, I worked at Oak Ridge National Laboratory in Oak Ridge TN, where I prepared social and cultural impact sections of large-scale environmental impact statements for the Dept of Energy. I thus have first hand experience with the opportunities and the drawbacks that characterize the scoping process. This first scoping meeting failed because it was inadequately advertised and attended; it could not have possibly addressed the concerns and arguments that residents in this region share. I hope many of them will call the mayor's office, as I did, or read the editorials that are sure to appear, and send you a flood of letters.

Sincerely,

Lillian D. Tretlin

Lillian D. Tretlin, Ph.D.

cc: Mayor Cheryll Woods-Flowers
Town of Mount Plesant

RESPONSE TO COMMENT
COMMENTOR NO. 1105: TRETTIN, LILLIAN D.

Response to Comment No. 1105-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Wando Welch Terminal is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Charleston, Wando Terminal, or to any of the ports analyzed in the EIS, is low.

The commentor states that the population of Mount Pleasant and surrounding communities is large and growing rapidly, hence it is not an appropriate port to use to bring in the foreign research reactor spent nuclear fuel. However, Section 4.2.2 of the EIS, which evaluates the impacts on ports of Management Alternative 1 to the proposed policy, and which takes into account population, indicates that the risk associated with this activity at any of the assessed ports, including those ports in the Charleston/Mount Pleasant area, is low.

*** COMMENTS ***

I write this as an individual, not on behalf of my church. I am deeply concerned about the environment. I am also deeply concerned about the continued production of nuclear waste, considering the current and undoubtedly permanent impossibility of storing it. Shipping the rods through our county and state is too scary. An accident would be devastating to the population and the environment. Your environmental impact report is not clear or complete enough. Our citizens are not satisfied that you plan is wise in any particular. Leave the rods where they are! 1062-1 1062-2 1062-3

RESPONSE TO COMMENT
COMMENTOR NO. 1062: NICKELL, JEAN

Response to Comment No. 1062-1

Spent nuclear fuel can be stored safety for long periods of time, as discussed in Appendix F, Section F.1 and Section 2.6.5.1 of the EIS.

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1. of the EIS).

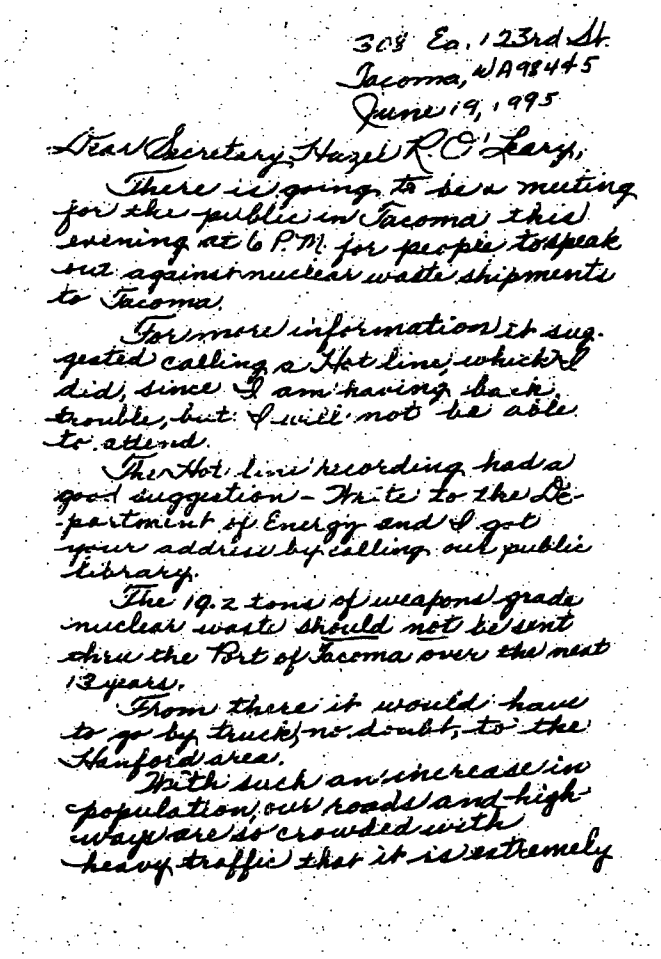
Response to Comment No. 1062-2

The commentor's opposition to the use of the Concord NWS for receipt of foreign research reactor spent nuclear fuel is noted. However, the analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2), and pose no significant risk to port personnel, the local population, or the environment.

Response to Comment No. 1062-3

The commentor's preference to keep the spent nuclear fuel rods where they are currently located is noted. This is Management Alternative 2 and is discussed in Sections 2.3 and 4.4 of the EIS. This preference, however, would not fulfill the U.S. nuclear weapons nonproliferation objective and would force many research reactors to shut down. This would limit their usefulness and contribution to research and medical advances. The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

COMMENTOR NO. 1067: KITTLESON, ALBERTA



308 Ea. 123rd St.
Tacoma, WA 98445
June 19, 1995

Dear Secretary Hazel R. O'Leary,

There is going to be a meeting for the public in Tacoma this evening at 6 P.M. for people to speak out against nuclear waste shipments to Tacoma.

For more information it suggested calling a Hot line, which I did, since I am having back trouble, but I will not be able to attend.

The Hot line recording had a good suggestion - Write to the Department of Energy and I got your address by calling our public library.

1067-1 The 19.2 tons of weapons grade nuclear waste should not be sent thru the Port of Tacoma over the next 13 years.

From there it would have to go by truck, no doubt, to the Hanford area.

1067-2 With such an increase in population our roads and highways are so crowded with heavy traffic that it is extremely

RESPONSE TO COMMENT
COMMENTOR NO. 1067: KITTLESON, ALBERTA

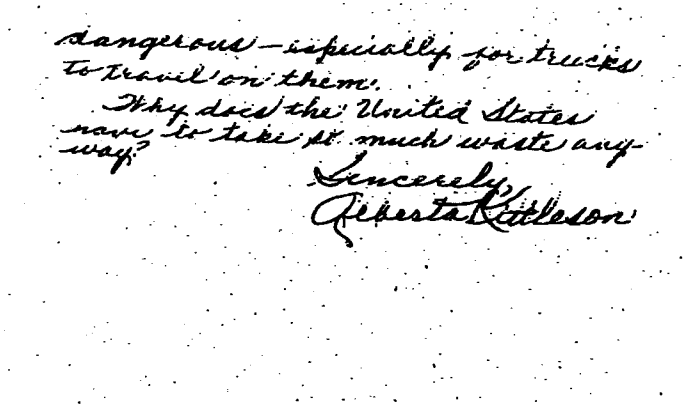
Response to Comment No. 1067-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1067-2

The ground transport route options and identification process are discussed in Section 2.6.4 of the EIS. Over a hundred representative ground transport route options were analyzed in Appendix E, including routes to all of the potential foreign research reactor spent nuclear fuel management sites. The results are presented in Section 4.2.3 of the EIS. In all cases the risks were found to be low.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.



dangerous – especially for trucks to travel on them.
Why does the United States have to take so much waste anyway?
Sincerely,
Roberta Kittleson

1067-2 (Cont'd.)

1067-3

Response to Comment No. 1067-3

Prior to 1989, it was a policy of the United States to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). Thus, the intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS).

COMMENTOR NO. 1069: CITIZENS (TACOMA AREA)

June 26, 1995

The Honorable Hazel O'Leary
The Secretary of Energy
Washington, DC 20585

Dear Ms. Secretary, *

As residents of Tacoma, Washington, we declare strong objections to the proposal to receive nuclear waste at the Port of Tacoma from overseas, for transport to storage elsewhere. **1069-1**

We have the obvious safety concerns over receiving and transferring these materials to rail and carrying them through the fourth busiest corridor in the United States. **1069-2**

In addition, we feel (1) this waste program is not good environmental policy, economic policy, or energy policy, (2) the United States has failed to develop procedures for safe permanent disposal of nuclear waste, and (3) instead of utilizing our hi-tech industry to resolve nuclear waste disposal problems, we are adding nuclear waste from other countries to our existing storage and disposal problems and creating a permanent blight on the region's natural and economic landscape. This is no legacy to leave the next generation. **1069-3**

John and Diane Hansen 2101 Hillside Dr. NE Tacoma WA 98422

RESPONSE TO COMMENT
COMMENTOR NO. 1069: CITIZENS (TACOMA AREA)

Response to Comment No. 1069-1

The commentors' opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1069-2

The commentor's concerns about safety are noted. The risks of receiving, transferring, and transporting the foreign research reactor spent nuclear fuel are discussed in Sections 4.2.2 and 4.2.3 of the EIS. In all cases, the risks were found to be low.

Response to Comment No. 1069-3

The commentor's opinion that the proposed action represents poor environmental policy, economic policy, and energy policy is noted.

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1 of the EIS).

DOE is using high technology to resolve nuclear waste disposal problems. Vitrification is the preferred technology for high-level waste and geologic disposal is the preferred disposal technique. Many other countries, especially developing countries, do not have these technological capabilities.

DOE agrees that the next generation should not have to clean up the existing nuclear waste inventories. That is one of the reasons that DOE issued the draft Waste Management Programmatic EIS in August, 1995, as discussed in Section 1.5 of the EIS.

* This is the best available copy of this comment document.

COMMENTOR NO. 1070: MCCLINTIC, JAMES M.

The Honorable Hazel O'Leary, Secretary,
U. S. Department of Energy
1000 Independance Avenue S.W., Rm. 7A257
Washington, D. C. 20585

June 26, 1995

Dear Secretary O'Leary:

This letter is to advise you that I am adamantly opposed to a proposal made by your staff to use the Port of Tacoma, Washington as a port of entry for spent radioactive nuclear fuel materials from foreign reactors. 1070-1

Members of your staff have prepared a draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. This proposal envisions using the Port of Tacoma as a transshipment point for radioactive nuclear waste materials. These materials would be offloaded from seagoing cargo vessels and loaded aboard other forms of transportation and thence shipped on to storage sites here in the U. S..

Your staffer, Mr. Charles Head, who attended a public hearing on June 19th, here in Tacoma, is quoted in a local newspaper article. His words give me grave cause for concern. During the meeting, overwelming disapproval of the proposal was voiced by people from all over Western Washington. Your staffer told the Tacoma News Tribune reporter that "They don't have time to listen." I believe that he meant that you and your department don't have time to listen to the concerns of the citizens most likely to be affected by this proposal. Perhaps Mr. Head has forgotten that he and the entire department serve by the grace of the Congress and the President, and thereby, the citizens of the country. I strongly recommend that you counsel Mr. Head on his responsibilities, lest he begin to personify the National Rifle Association's recent reference to "jackbooted government thugs." I truly hope that Mr. Head was misquoted or misunderstood by the reporter. 1070-2

I also have grave concerns for the safety of the citizens of Washington and the fishery which is such a large part of the local economy should the unthinkable happen, a nuclear accident. I urge you in the strongest possible terms to ask your staff to select an alternative to Tacoma, Washington as the port of entry if this program must be adopted. Your staff has not done its homework properly. There are serious concerns not addressed by your proposed EIS. These include, but are not limited to the following: The long term effects of unrecoverable containers in Puget Sound; the security of containers during transshipment; the 1070-3

RESPONSE TO COMMENT
COMMENTOR NO. 1070: MCCLINTIC, JAMES M.

Response to Comment No. 1070-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1070-2

The DOE representative's comment that their bosses in Washington "don't have time to listen" was taken in the wrong context. While it would be impractical for the Secretary of Energy to personally review and respond to all of the written and oral comments concerning this EIS, this information was reviewed by the Program Manager and his staff. The Program Manager is responsible for relaying public concerns and issues to the Secretary of Energy and her staff. As indicated by this document, all comments received from the public were noted and taken seriously. Under NEPA and DOE's environmental regulations (Section 5 of the EIS), public participation and comments are an integral component of the environmental process.

Overall, DOE's public interaction related to this draft EIS has exceeded requirements set forth in NEPA and the environmental regulations of DOE. Seventeen public hearings were held in the locations determined to be most likely to be directly affected by the EIS alternatives. In addition, the period of acceptance for written comments was extended from June 20 to July 20, 1995. DOE considers that these actions have provided sufficient opportunity for the public to comment on the draft EIS.

Response to Comment No. 1070-3

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters.

The security provided for the spent nuclear fuel shipments would be required to meet or exceed all of the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the final EIS in response to public comments. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all

COMMENTOR NO. 1070: MCCLINTIC, JAMES M. (CONT'D.)

effects of a nuclear accident at the port. Please do not dismiss my concerns and those of my fellow citizens. We have been told too many times that the horrible "accident" can't happen, but Chernobyl, Hanford and Thee Mile Island tell us otherwise. There are other sites for the port of entry which do not pose the security or accident risks that exist in Tacoma. Please do not risk making the beautiful Puget Sound Region a nuclear wasteland.

Sincerely,

JAMES M. McCLINTIC
8017 65th St. Ct. W.
Tacoma, WA 98467-3944

RESPONSE TO COMMENT
COMMENTOR NO. 1070: MCCLINTIC, JAMES M. (CONT'D.)

of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site(s).

The EIS includes analyses that were performed to evaluate the impact of various accidents. The consequences of port accidents, including category six accidents (the worst plausible accident), are discussed in Appendix D, Section D.5.4.2.2. In all cases the risks were found to be low.

COMMENTOR NO. 1071: CASEY, DIANA L.

Charles Head
Office of Spent Nuclear Fuel Mamagement
(EM - 37)
U.S. Department of Energy
1000 Independence Avenue S.W.
Washington, D>C> 20585

Dear Sir:

It was with great dismay that I heard about the Federal Government's consideration of Tacoma, Wa., as a possible port of entry for the transportation of nuclear waste. This is an inhabited area and for the past several years Tacoma has made a very serious effort to clean up and contain its toxic pollutants. The city has gotten better and better in its compliance with federal law and the Environmental Protection Agency. Is this now to be its reward? Our families live here, and if man's ignorance in his careless usage of nuclear facilities is ever enlightened, perhaps our great grandchildren will be able to also. Have we learned nothing from the disasters of Three Mile Island and Chernobyl? 1071-1

Tacoma, since it is the best deepwater port on the West Coast, should not even be considered for this nuclear transportation. If an accident were to foul the waters here , the entire Puget Sound fishing industry would die, and all of the large cities in the area would be in very serious danger of irreversible poisoning. Seattle, our San Francisco of the North, our capitol city,Olypmia, and many other metropolitan areas would be in jeopardy for the health and safety of its citizenry for years to come.

The Environmental Protection Act has protected the spotted owl to the detriment of the forestry industry, but the humans in this area cannot even be assured pure water, air, or soil for their offspring. I know...I know,,,EVERY precaution will be taken to preclude an accident, but nothing is fail safe. So, you ask, where should we go instead of Hanford, Washington, for storage of spent fuel? 1071-2
My suggestion would be to go back to the virtually uninhabited places that the Federal Government has used in the past to detonate nuclear warheads, like those areas in New Mexico that had the cancer rates tripled for only a few locals and their families and had the surrounding areas poisoned with a radioactive half-life of only a few thousand years. Is it not enough to poison just a part of the planet and make it unliveable? Do we really have to threaten the entire blessed globe?

RESPONSE TO COMMENT
COMMENTOR NO. 1071: CASEY, DIANA L.

Response to Comment No. 1071-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

DOE considers that there would be no significant adverse impacts on the natural resources and on the air and water quality at any of the ports that might be used to receive the material under the proposed policy of managing foreign research reactor spent nuclear fuel. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of spent nuclear fuel shipments, no radioactive material has ever been released from a spent nuclear fuel transportation cask, nor has a spent nuclear fuel transportation cask ever been punctured, even as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on air and water quality.

Response to Comment No. 1071-2

Candidate management sites are described in Section 3.3 of the EIS. These sites were selected for management of spent nuclear fuel from foreign research reactors because they have appropriate handling facilities and personnel as well as established security measures. The management sites are remote from populated areas. As discussed in Section 4 of the EIS, foreign research reactor spent nuclear fuel can be safely stored at one or more of these sites. Selection of new remote sites would not be cost effective.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

*** COMMENTS ***

I am opposed to the routing of nuclear waste thru the Port of Tacoma for a number of reasons including: possibility of shipboard fires for which temperature the nuclear containers are not designed to withstand; ill-trained/ equipped city, county, state emergency workers for nuclear accidents; getting stuck in traffic in my regular trips through the Port of Tacoma next to a truck containing nuclear waste; and being downwind in a residential area a couple of miles from the Port of Tacoma. I am very concerned about the possibility of terrorist hijacking or attack on the nuclear shipments. The shipping route thru the Straits of Juan de Fuca & Puget Sound provide ample cover for small terrorist boats or even on-shore missles & weapons to be used against the ship carrying the nuclear waste. There is a lot of coast line in the many miles of inland waterways in the Port of Tacoma shipping route conducive to this activity. This should be a criteria in the selection process of a port! The shipping route also goes through some heavily populated areas. The Port of Tacoma itself is not designed to be secure against terrorist activities. In my opinion military harbor facilities should be given much greater weight than commercial ports due to security issues as well as experience in handling nuclear wastes & emergencies.

RESPONSE TO COMMENT
COMMENTOR NO. 1073: AMDAHL, DREW

Response to Comment No. 1073-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, the analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2), and pose no significant risk to port personnel, the local population, or the environment.

Appendix D, Section D.5.3.1 of the EIS describes several accident scenarios that involve fire. The results of the analysis of these accidents can be found in Appendix D, Section D.5.4. The analysis indicates that even in the event of a severe ship fire, neither the consequences nor risks are great (Appendix D, Section D.5.5). Although the nonradiological effects of such a catastrophic accident would obviously impact the local environment, no additional impacts are predicted due to the presence of foreign research reactor spent nuclear fuel.

DOE considers that there is adequate regulatory and emergency preparedness infrastructure to ensure the safe acceptance and transport to designated management sites if the foreign research reactor spent nuclear fuel is managed in the United States. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1 of the EIS. There are three national emergency response plans under which DOE provides radiological monitoring and assessment assistance. Under these plans, DOE provides technical advise and assistance to the State, Tribal and local agencies involved with a radiological incident. Emergency preparedness, security, and coordination of DOE with local emergency response authorities, and security are discussed in general in Sections 2.7 and 2.8 of the EIS. Details would be contained in the Transportation Plan, that would be prepared prior to any individual spent nuclear fuel shipment and coordinated with State and local officials. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments.

The radiation dose that anyone would receive handling, working or traveling near a cask is below the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20). As such, no special precaution would be required from anyone in the area of a cask carrying foreign research reactor spent nuclear fuel.

Neither acts of terrorism nor theft of materials by a determined group of individuals can be completely precluded. However, proper security measures can greatly reduce the risk of such actions. The security provided for the spent nuclear fuel shipments is required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional

COMMENTOR NO. 1073: AMDAHL, DREW (CONT'D.)

RESPONSE TO COMMENT
COMMENTOR NO. 1073: AMDAHL, DREW (CONT'D.)

Section 3.2 of the EIS presents the population within 10 miles (16 km) of each port, and the accident impact analysis takes into account population within 50 miles (80 km) of the port. Port selection Criterion 5 (Appendix D, Section D.1.9.5 of the EIS) considers population in the port and along the route to the management site.

Response to Comment No. 1073-2

The EIS evaluates the use of both military and commercial ports in Section 4.2.2 and Appendix D. The information presented demonstrates that the risks associated with using any of the ports identified by the port selection process is low.

COMMENTOR NO. 1074: JOHNSON, MARJORIE

July 9, 1995

Charles Head
Office of Spent Nuclear Fuel Management
US Department of Energy
1000 Independence Avenue SW
Washington D.C. 20585

Dear Mr. Head:

I hope that by now, from everything I have read and heard, you have removed Tacoma Washington from all consideration concerning shipments of high-level nuclear waste through our port. 1074-1

I don't believe that any port in this country should have to dea with it.

If our country has that much money to spend on this kind of project, then use that money to send equipment and professional to the country where it is now stored for appropriate containmen 1074-2

The U.S. does not have to take on all the worlds problems.

Sincerely,

M Johnson

Marjorie Johnson
8801 27th Street West 16B
Tacoma, WA 98466

RESPONSE TO COMMENT
COMMENTOR NO. 1074: JOHNSON, MARJORIE

Response to Comment No. 1074-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, or any U.S. port, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1074-2

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

COMMENTOR NO. 1077: BUNNELL, DIANNE

July 7, 1995

Charles Head, Program Manager
Office of Spent Nuclear Fuel Management (EM-37)
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Mr. Head:

I read with great satisfaction that the June public hearings on the issue of bringing spent foreign research fuel elements through the Port of Tacoma resulted in a strong show of support by Washingtonians *AGAINST* such a possibility. 1077-1

I know Ports are the issue, but I wish you could explain to me, Mr. Head, how American depositories are better suited than any that could be constructed by American know-how, with personnel trained by American methods (or perhaps administered by Americans) *in the country that creates the waste???* 1077-2

Our personal experience is this: my husband's first wife died at age 39 from a cancer that normally is easily treatable. We have no proof that the unusually aggressive, fast growing cancer was affected by the fact that Susan grew up near Hanford nuclear facility; but, if there's nothing to worry about at Hanford, why the massive clean up efforts underway today? Nuclear storage is *not* the end of the story. 1077-3

During the time my husband was a boy growing up in Tacoma in the 50's, there was total disregard to environmentally sound practices — now, Tacoma has made monumental leaps in terms of clean up, fine cultural offerings and civic pride. Finally, Tacoma's getting to be beautiful! This plan would certainly affect this great city. What business seeks out a city in which massive amounts nuclear business is conducted? Other issues include transportation routes, handling facilities and the configurations of the on-dock rail yard were incorrectly drawn up on out-of-date maps; the depth of water in the Tacoma area would present a disasterous problem, if an accident were to ever happen; the population in this area has skyrocketed, and will continue to grow — has a full disaster contingency been addressed in terms of redressing the citizenry and funding needed to rebuild? These issues and others addressed at the hearing make it clear that the Port of Tacoma is not an optimum location for this program. 1077-1 (Cont'd.)

Is this program of nuclear dumping grounds really in the best interest of the next generation? Or is it simply expedient? As Steven Seagal said at a rally against building a nuclear storage dump on reservation land: "I see death. How's one word? Death," he said. "I could add a couple of others: sickness, suffering." As far as I'm concerned, we've already experienced the results of nuclear waste. 1077-4

Sincerely,

Dianne Bunnell

RESPONSE TO COMMENT
COMMENTOR NO. 1077: BUNNELL, DIANNE

Response to Comment No. 1077-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, such adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Tacoma would have no adverse economic impacts on business or tourism within the port or the surrounding communities.

In regard to the EIS being based on outdated and inaccurate information, updated information on the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. All of the errors identified by the commentor, have been corrected in the final EIS, and the conclusion that the risks associated with accepting foreign research reactor spent nuclear fuel into the United States through Tacoma, or any of the other candidate ports, are low and would result in low impacts is still valid. The population data used in the analyses, which was verified as being correct, were based on the 1990 census.

In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel were to sink in any U.S. coastal waters, it would be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1000 feet). Appendix C, Section C.5.5 of the EIS presents information on the probability of a cask sinking in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask sinking in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis shows that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).

The population in close proximity to the terminal, as well as those as far away as 50 miles, was considered when the effects of possible accidents were calculated (Appendix D, Section D.5 of the EIS). These calculations demonstrate that the risk from accidents to all individuals is low. Likewise, the incident-free radiation exposure to people nearer to the cask than those living outside the fence around the port was calculated and found to

pose no significant risk (Section 4.2.3.2 of the EIS). The dose rate at 100 feet from a cask containing foreign research reactor spent nuclear fuel is essentially zero. For these reasons, the close-in population near the Port of Tacoma would not be subjected to any significant risk from the use of the terminal to receive foreign research reactor spent nuclear fuel.

Response to Comment No. 1077-2

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

Response to Comment No. 1077-3

DOE agrees that radiological contamination presents a risk to the health and safety of workers and nearby public. DOE is committed to the Tri-party agreement for the cleanup of contaminated areas at the Hanford Site; however, the cleanup at the Hanford Site is beyond the scope of this EIS. Section 4.2.4 and Appendix F, Section F.4.3 of the EIS discuss the impacts of foreign research reactor spent nuclear fuel storage at the Hanford Site.

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 1077-4

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and eventually eliminate, the use of highly-enriched (weapons-grade) uranium in civil programs worldwide.

RE: Spent Nuclear Fuel Through
Port of Tacoma

Dear Mr. Head:

I wish to be counted among the multitudes of people AGAINST shipping spent nuclear fuel through the Port of Tacoma, Tacoma, Washington. *1078-1*

Since there is a need and request for nuclear fuel in Japan and Scotland it should be sent there. *1078-2*

Stock-piling this fuel in the United States and shipping through the Port of Tacoma or any other ports should NOT even be considered.

I am against it.

Sincerely,

Mabel Nesbit

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1085: SCHERER, ELLEN

June 23, 1995

Mr. Charles Head
Department of Energy
1000 Independence Avenue
Washington, D.C. 20585

Dear Mr. Head;

After recently watching the hearings on the Nuclear Waste issue in Washington State, I have become very alarmed. I am the mother of 3 small children. We are in the process of buying a home in the Federal Way area which is a short distance from the Port of Tacoma.

And the federal government wants to bring nuclear waste from Japan to the area for storage. Why? I'm sure you are aware that this is a highly populated area. The nuclear industry has a far from good safety record. Any sort of accident or mishap would start a chain reaction of catastrophic events. Nuclear is an unstoppable force and it would be unwise to expose innocent people to a potential volative situation. 1085-1

Please don't let this happen. Other options should be taken.

Thank you for listening.

Please respond when a decision has been reached.

Ellen Scherer
1900 S.W. Campus Dr.
Bldg. 42 - Apt. 101
Federal Way, Washington 98023

206-661-1842

RESPONSE TO COMMENT
COMMENTOR NO. 1085: SCHERER, ELLEN

Response to Comment No. 1085-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternatives 1 or 3), there would be no storage of this material in the Port of Tacoma, or any other port. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

COMMENTOR NO. 1086: CHUTE, MARGARET C.

Dear Mr. Charles Head,
I am writing to protest shipping nuclear waste through the U.S. via port in Tacoma. 1086-1

Why make a "nuclear garbage dump" of the United States. A probable accident would ruin this area. 1086-2

Also we have no commercial reprocessing facilities in the U.S. Scotland, France and Japan. These countries have the wherewithal to do with and would use the nuclear waste. 1086-3

Sincerely,
Margaret C. Chute
2501 So 35th St #10
Tacoma, Wa. 98405

RESPONSE TO COMMENT
COMMENTOR NO. 1086: CHUTE, MARGARET C.

Response to Comment No. 1086-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1086-2

Prior to 1989, it was a policy of the United States to accept foreign research reactor spent nuclear fuel for disposition in the United States (Section 1.1 of the EIS). Many foreign research reactor operators have no immediate means of disposing of their spent nuclear fuel (Section 1.2 of the EIS). The intent of the proposed policy is to remove as much U.S.-origin HEU as possible from civil programs worldwide and give foreign research reactor operators time to convert their reactors to the use of LEU fuels and to make arrangements for disposition of their LEU spent nuclear fuel (Section 1.2 of the EIS). As discussed in Section 4 of the EIS, each of the management alternatives could be implemented without significant effects on human health or the environment.

Response to Comment No. 1086-3

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS. As discussed in Section 2.6.5.2, the United States has chemical separation facilities at two of the potential management sites.

In the near future, the chemical separation facilities at the Savannah River Site might resume operations for the foreign research reactor spent nuclear fuel or for another purpose. These options are discussed in Section 2.2.2.6 of the EIS.

DOE announced a Record of Decision on May 30, 1995 for the Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory (INEL) Environmental Restoration and Waste Management Programs EIS. Chemical separation at the Idaho National Engineering Laboratory was not included in this Record of Decision, so additional site-specific NEPA documentation would be required to restart the chemical separation facilities at this site.

COMMENTOR NO. 1091: CHAPEL, MARGARET C.

April 4, '95

Dear Mr. Head,

Please limit* put your topic garbage in Concord Naval Weapons Station, or anywhere in the San Francisco Bay area. 1091-1

Thankyou,
Margaret C. Chapel

1092-1

RESPONSE TO COMMENT
COMMENTOR NO. 1092: MILLS, PATRICIA J.

Response to Comment No. 1092-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

June 1995

Dear Secretary of Energy Hazel O'Leary,

I live in Contra Costa county where the Concord Naval Weapons Station and port are. I am opposed to the plan to bring spent fuel and high level nuclear waste through the Bay Area, with its large population. We are also politically aware here, and environmentally sensitive. We have earthquakes and flooding, and plenty of traffic accidents. We are not fooled to transport this very hazardous material so far when there are closer alternatives. 1093-1

Furthermore, I think that the countries that use nuclear power should get used to disposing of its waste nearby, or give it up. We cannot keep taking all the waste and the U.S. should not be distributing this stuff in the first place. We should not be making it or using it ourselves until we know how to safely dispose of it. We are far from that point! Nuclear power is not necessary, and nuclear weapons are an abomination. Not only the waste but the weapons can fall into the wrong hands at any time, and be abused. The U.S. has abused them and the have the other nations that have them. Nuclear power plants and weapons have already done a great deal of harm. We should not be encouraging and making it easier for the rest of the world to go nuclear, but shutting down the present production and use of radioactive materials. We don't know what to do with the contamination we have already. Each nuclear step is fraught with danger and controversy, as you know. If only President Clinton had the guts to do what he ordered! Trying to play it safe, he probably won't be re-elected, but if he found his own backbone for real he could become one he might be. Which reminds me of a joke I received in connection with the book from the Fellowship of Reconciliation - How To Keep Laughing Even Though You're Scared to Death by Richard Beard. 1093-2

1093-3

1093-4

RESPONSE TO COMMENT
COMMENTOR NO. 1093: REIMER, NANCY

Response to Comment No. 1093-1

The commentor's opposition to the use of Concord NWS to receive foreign research reactor spent nuclear fuel is noted. The port selection criteria discussed in Appendix D, Section D.1.9 of the EIS identify those ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Concord NWS, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2).

All population within a 50-mile radius of the Concord NWS was considered when analyzing the impact of both incident-free transport and the range of hypothetical port accidents. The risks were found to be low. (Appendix D, Section D.5 provides details on accident analysis).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the transportation cask.

Response to Comment No. 1093-2

The commentor's opposition to acceptance of foreign research reactor spent nuclear fuel is noted. Other alternatives under consideration are discussed in Sections 2.3 and 2.5 of the EIS.

The United States encourages the use of LEU fuel in research reactors because it cannot be used to manufacture nuclear weapons. As discussed in Sections 2.2.1.9 and 2.6.5, foreign research reactor spent nuclear fuel could be safely stored at any of the five candidate management sites until final disposition. Final disposition is a high priority consideration and is discussed qualitatively in Section 4.2.7 of the EIS.

As shown in Tables 2-1 and 2-2 of the EIS, Iraq is not a candidate for participation in the proposed action. Thus, spent nuclear fuel from Iraq would not be managed under the proposed policy.

COMMENTOR NO. 1093: REIMER, NANCY (CONT'D.)

2/ Most of the spent fuel from other countries that the U.S. would be bringing back could be disposed of just as safely, or more so, in those countries, such as Canada and Europe. As for the unstable parts of the world, what are we giving them nuclear materials for? We see what has happened in Iraq, and to Iraq, which the U.S. flooded with weapons in the 1980's. The greatest abuses have been committed there, including by Bush in the Gulf War, which he could have easily prevented by sending clear signals to Saddam Hussein. One feels that he wanted that war, although in the end it didn't help him, and the terrible consequences continue. Saddam Hussein eats well, however, and now is allied with the Russians for Star Wars technology! From bad to worse with power politics and nuclear energy.

Back at home, too much of the radioactive materials are starting or ending up on Indian land. So is other hazardous waste. The health of Native Americans has suffered. Nuclear weapons have been exploded on Shoshone land in the 1990's. The people of Big Mountain have been driven off their land and are still fighting relocation because Peabody Coal, Arizona Pacific and others, including some tribal leaders, want to exploit the area. Our local utility (Pacific Gas and Electric) is hoping to send nuclear wastes to the Apache Nation reservation and to Ward Valley, west of Needles, Calif. and 15 miles from the Colorado River. No wonder

1093-5

1093-2 (Cont'd.)

1093-6

RESPONSE TO COMMENT
COMMENTOR NO. 1093: REIMER, NANCY (CONT'D.)

Response to Comment No. 1093-3

Foreign research reactors are not used for generation of commercial power or the development of nuclear weapons. Section 1.1 of the EIS describes the research, medical, agricultural, and industrial applications of research reactors. Because it is unrealistic to expect foreign nations to forego the benefits of nuclear technology, the United States supports the use of LEU fuel in civilian applications and discourages actions which might lead to the spread of nuclear weaponry (See Sections 1.1 and 1.2 of the EIS). In addition, the U.S. accrues significant benefits from the operation of foreign research reactors - including Moly-99 and other medical isotopes.

Response to Comment No. 1093-4

See response to comment number 1093-2 above.

Response to Comment No. 1093-5

The commentor's preference for the overseas management alternative is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS.

Response to Comment No. 1093-6

If Management Alternative 1 is adopted, no foreign research reactor spent nuclear fuel would be managed on Indian lands. Sections 2.6.5 and 3.3 of the EIS describe candidate management sites for spent nuclear fuel from foreign research reactors. Section 3 and Appendix A provide characterizations of the racial and ethnic composition of populations residing in potentially affected areas.

3/

people are nervous! The Oklahoma City disaster made us all more aware of the problem of home-grown terrorism, too. The downsizing and moving away of companies is causing unemployment and the attendant economic and psychological problems, which can lead to such crazy acts. The government should lead the way in finding sensible solutions. The obvious one in the case of nuclear power is to phase it out, but the present policy seems to be to perpetuate it, and kind of mask the central purpose, which is military, with so-called benign uses: nuclear energy makes sense in medicine, agriculture, industry, etc., only if the overall price is not higher than the benefits, but it is.

1093-2 (Cont'd.)

Please do not visit this menace on the S.F. Bay area any more than it already is. It is armed with the Livermore lab, the Concord Naval Weapons Station, and other nuclear hazards already. One building at Lawrence Livermore National Laboratory stores 8.80 pounds of plutonium according to a May 14, 1995 newspaper article about earth quake preparation.

1093-7

I appreciate your coverage in helping raise awareness about our nuclear past & menace. As long as it is hidden, there is little chance of preventing future disasters. We have a world to save, and informed people know that it is in great danger. A half a century ago, a few years after my birth, the U.S. bombed Japan. That was a terrible mistake. Now I have Japanese in-laws - and a nephew who did not survive racism and chemicals.

Sincerely, Nancy Reimer

Response to Comment No. 1093-7

The commentor's opposition to bringing foreign research reactor spent nuclear fuel into the San Francisco Bay Area and, more specifically, into Concord NWS is noted. As indicated by the analysis in Section 4 of the EIS, the risk associated with implementation of the proposed action to human health and the environment would be low. Environmental effects of normal operations and accidents were included in the environmental action.

Response to Comment No. 1093-7

The commentor's opposition to bringing foreign research reactor spent nuclear fuel into the San Francisco Bay Area and, more specifically, into the Concord NWS is noted. As discussed in Section 4 of the EIS, the risks associated with implementation of the proposed action to human health or the environment would be low. Environmental effects of normal operations and accidents were included in the environmental evaluation.

COMMENTOR NO. 1093: REIMER, NANCY (CONT'D.)

P. S. Since writing this I was very sorry to read that the U.S. government is planning to resume nuclear testing. This places the whole world in jeopardy as it undermines the difficult and necessary process of stopping the arms race, and undoes the progress already made through much hard work and sacrifice. Please do what you can to stop it. We appreciate the efforts you are making, but they are not enough. Too much is at stake here.

This is a love letter, if you really read what comes with it - love for the world, and for you and your efforts to save it. We really must put our shoulders to the wheel now, and keep on, and be honest, too.

COMMENTOR NO. 1095: BENSON, ARDEN R.

720 N.W. Front Ave., D-12
Portland, OR 97209
July 12, 1995

U.S. Department of Energy
Office of Environmental Management (EM-37)
Attention: Mr. Charles Head
1000 Independence Ave. S.W.
Washington, DC, 20585-0001

Dear Mr. Head:

Twenty tons of weapons-grade U-235 waste to be transported from foreign countries to be stored at Hanford? Right next to the Columbia River? Hanford, with its perennial problems of leaking containers, and its incredible and unaccountable losses of plutonium? I guess the Columbia River and the cities along its banks are expendable. 1095-1

With decisions like that coming from our own government, who needs enemies?

Sincerely,

Arden R. Benson
(503) 295-4076

RESPONSE TO COMMENT
COMMENTOR NO. 1095: BENSON, ARDEN R.

Response to Comment No. 1095-1

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

COMMENTOR NO. 1096: BENSON, TERESA

June 26, 1995

Mr. Charles Head, Program Manager
Office of Spent Nuclear Field Management
US Department of Energy
1000 Independence Avenue, SW
Washington, D.C. 20585

Dear Mr. Head;

I, oppose bringing nuclear waste from foreign countries to be brought into the United States. 1096-1

Valdosta, Ga. [illegible]

RESPONSE TO COMMENT
COMMENTOR NO. 1096: BENSON, TERESA

Response to Comment No. 1096-1

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted (Management Alternatives 1 or 3, Sections 2.2 and 2.4 of the EIS, respectively). Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

COMMENTOR NO. 1097: SCHROEDER, PAUL C.

July 12, 1995

Paul C. Schroeder
4725 41st St. N.E.
Tacoma, WA 98422

Charles Head
Program Manager
Spent Nuclear Fuel Management

Dear Mr. Head:

I urge you not to ship nuclear waste through the Port of Tacoma.

I can see no economic benefit, yet it is likely that there exists liabilities in one form or another. Specifically increased taxes and devalued property. 1097-1

Being a close neighbor to the Port, I stand to lose significantly should you decide to ship this waste through the Port of Tacoma.

Sincerely,

Paul C. Schroeder

Paul C. Schroeder

RESPONSE TO COMMENT
COMMENTOR NO. 1097: SCHROEDER, PAUL C.

Response to Comment No. 1097-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 and Appendix D, Section D.5 of the EIS).

Although not a direct economic benefit, the management alternatives described in the EIS would reduce the threat of nuclear proliferation, which has both national and global value.

COMMENTOR NO. 1102: ROCHE, ANITA F.

4848 Kenner Rd
Martinez CA 94553
July 5, 1995

Dear Mr. Head,

The DOE plan to ship nuclear waste through the Concord Naval Weapons Station should be "dumped." To put the shipments through a densely populated area such as the San Francisco Bay could be another Chernobyl.

I don't like pushing the plan onto another area either; but, isn't there somewhere less populated that could be used?

Please reconsider.

Sincerely,
Anita Roche

1102-1

RESPONSE TO COMMENT
COMMENTOR NO. 1102: ROCHE, ANITA F.

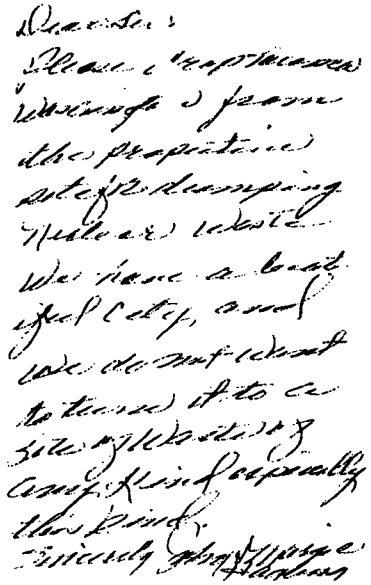
Response to Comment No. 1102-1

The commentor's opposition to the use of Concord NWS for the shipment of foreign research reactor spent nuclear fuel is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

The port selection process that determined that Concord NWS was an acceptable port considered the population of the port and surrounding areas (Appendix D, Section D.1.9.5 of the EIS). Additionally, all population within a 50-mile radius of the Concord NWS was considered when analyzing the potential impact of a range of hypothetical port accidents. The risks were found to be low (Section D.5).

The passage from San Francisco Bay to Concord meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for the port selection (Appendix D, Section D.1.9.2).

COMMENTOR NO. 1104: HAGBERG, JOHN



1104-1

RESPONSE TO COMMENT
COMMENTOR NO. 1104: HAGBERG, JOHN

Response to Comment No. 1104-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1105: TRETTIN, LILLIAN D.

712 Wakendaw Blvd.
Mount Pleasant, SC 29464

May 9 1995

Mr Charles Head
Office of Environmental Management (EM-37)
U.S Department of Energy
1000 Independence Ave S.W
Washington D.C. 20585

Dear Sir

I want to state emphatically for the record that I oppose the shipment of nuclear fuel rods through Wando Welch Terminal a property that borders the town of Mount Pleasant SC. The terminal is located near some of the town s most rapidly expanding suburbs and busiest thoroughfares. The proposed action is clearly inappropriate for a community expanding at Mount Pleasant's current high rate of growth. I am writing, not in response to a paid public notice in one of the local newspapers (which I--like a lot of other people in Mount Pleasant--missed), but in response to the headline of a more prominent news article that appeared the day after the meeting: "Few turn out to protest nuclear fuel rod shipments." As the article notes, attendance at the meeting on May 8 was low compared to attendance at a meeting held a year earlier, at which time residents voiced strong disapproval. It is unfortunate that the May 8 meeting received so little attention, since a well-managed scoping process is one of the keys to a successful (and acceptable) EIS.

1105-1

Please add my name and address to your mailing list. I would like to receive the draft EIS and any other public material related to this process (the DOE implementation plan, if there is one), and I would like to be notified of any other public meetings. Before I moved to Mount Pleasant last year, I worked at Oak Ridge National Laboratory in Oak Ridge TN, where I prepared social and cultural impact sections of large-scale environmental impact statements for the Dept of Energy. I thus have first hand experience with the opportunities and the drawbacks that characterize the scoping process. This first scoping meeting failed because it was inadequately advertised and attended; it could not have possibly addressed the concerns and arguments that residents in this region share. I hope many of them will call the mayor's office, as I did, or read the editorials that are sure to appear, and send you a flood of letters.

Sincerely,

Lillian D. Trettin

Lillian D. Trettin, Ph.D.

cc: Mayor Cheryll Woods-Flowers
Town of Mount Pleasant

RESPONSE TO COMMENT
COMMENTOR NO. 1105: TRETTIN, LILLIAN D.

Response to Comment No. 1105-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Wando Welch Terminal is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Port of Charleston, Wando Terminal, or to any of the ports analyzed in the EIS, is low.

The commentor states that the population of Mount Pleasant and surrounding communities is large and growing rapidly, hence it is not an appropriate port to use to bring in the foreign research reactor spent nuclear fuel. However, Section 4.2.2 of the EIS, which evaluates the impacts on ports of Management Alternative 1 to the proposed policy, and which takes into account population, indicates that the risk associated with this activity at any of the assessed ports, including those ports in the Charleston/Mount Pleasant area, is low.

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1158-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse economic and cultural impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Under NEPA regulations, the socioeconomic effects evaluated for this EIS do not include those associated with psychological fear of receiving spent nuclear fuel. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourist industry at the port.

Response to Comment No. 1158-3

Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, after more than 30 years of nuclear fuel shipments, no radioactive material has ever been released from a spent nuclear fuel transportation cask as a result of an accident.

Response to Comment No. 1159-2

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE agrees that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be higher than the actual risk, or the risk from other even more hazardous activities. However, such adverse impacts have not been observed during the 30 plus years in which foreign research reactor spent nuclear fuel was accepted into the United States in the past. Under NEPA regulations, the socioeconomic effects evaluated for this EIS do not include those associated with the psychological fears of receiving spent nuclear fuel. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism or the future business development of the port.

Response to Comment No. 1159-3

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternatives 1 or 3), there would be no storage of this material in the Port of Galveston, or any other port. Under normal circumstances, it would remain at the port for a few hours. In the event of a major disruption of ground transportation systems, due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination.

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Galveston, or to any other port evaluated, is low.

Response to Comment No. 1161-2

Several accident scenarios including a breach of the cask and fire sufficient to oxidize the contents were analyzed during preparation of the EIS. Results of the accident analysis at the ports are given in Section 4.2.2 of the EIS with supporting detail in Appendix D, Section D.5. No catastrophic effects were found to result from severe accidents involving foreign research reactor spent nuclear fuel. In addition, no catastrophic events were identified that would require the evacuation of the island of Galveston. Emergency response and management for the ports identified in the EIS are discussed in Section 2.7.

RESPONSE TO COMMENT
COMMENTOR NO. 1165: BARRETT, CHARLENE

Response to Comment No. 1165-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1165-2

Sections 4.2.2 and 4.2.3 of the EIS present a discussion of the health risks and impacts on the Galveston port area from receipt of the foreign research reactor spent nuclear fuel. The analyses in Section 4 of the EIS demonstrate that such risks and impacts would be low, both for port areas as well as for the proposed management sites.

Response to Comment No. 1165-3

On the issue of air and water quality as it pertains to the proposed action for managing foreign research reactor spent nuclear fuel, DOE considers that there would be no significant adverse impacts to any of the ports that might be used to accept the material. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, no radioactive contents have ever been released from a spent nuclear fuel transportation cask, nor has a spent nuclear fuel transportation cask ever been punctured, even as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point and to emphasize the no-impact nature of these shipments on environmental quality, including marine resources.

Response to Comment No. 1165-4

The use of a remote port might slightly reduce the already low consequences of an accident, however there are other considerations that also must be made when making port selection. Appendix D, Section D.1.9 of the EIS presents a complete discussion of the port selection process.

RESPONSE TO COMMENT
COMMENTOR NO. 1166: ALFINIECE, DONA

Response to Comment No. 1166-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risks associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated in the EIS, are low.

The intent of the proposed action is to support U.S. nuclear weapons nonproliferation policy seeking to reduce, and ultimately eliminate, the use of highly-enriched (weapons-grade) uranium in civil programs worldwide. There are very few, if any, economic benefits that would result from the proposed action.

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1175-2

Management of foreign research reactor spent nuclear fuel in the United States is only one of the alternatives evaluated in this EIS (Sections 2.2 through 2.4). The intent of all three management alternatives is to support the nuclear weapons nonproliferation objectives of the United States by seeking reduction, and eventual elimination, of highly enriched (weapons-grade) uranium in civilian commerce. Under Management Alternative 1 (management in the United States), foreign research reactor spent nuclear fuel would be accepted for a limited period of time during which foreign research reactor operators could make arrangements for disposition of their spent nuclear fuel.

RESPONSE TO COMMENT
COMMENTOR NO. 1180: LITTON, L.

Response to Comment No. 1180-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1180-2

The volume or size of the local marine traffic (present or future) was not considered in the calculation of risk associated with the shipment of foreign research reactor spent nuclear fuel. In general, the number of ship mishaps is not proportional to the amount of ship traffic because port ship traffic is slow, and even when heavy, is normally a small number of ships per hour. Historically, increasing the volume does not significantly increase the probability of an accident. Rather, the number of ship mishaps is associated with navigational hazards and distances from the port to the open ocean or a large bay (port selection Criterion 2; Appendix D, Section D.1.9.2 of the EIS). Appendix D, Section D.5.3.1.3 of the EIS presents a discussion of the determination of the probability of ship accidents used in the EIS. Section 4.2.2.3 of the EIS demonstrates that the risks associated with an accident in a port are low, and there would be little adverse impact upon the environment.

Comments: I realize it has to go somewhere but NOT a resort town. I am opposed to nuclear energy to begin with. For safety reasons — but think about the bad press. What tourist would pick nuclear waste waters? An accident would mean economic as well as a health disaster

1185-1

1185-2

1185-3

Response to Comment No. 1185-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1185-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that of shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism at the port.

Response to Comment No. 1185-3

Sections 4.2.2 and 4.2.3 of the EIS present a discussion of the health risks and impacts on the Galveston port area from receipt of the foreign research reactor spent nuclear fuel. The analyses in Section 4 of the EIS demonstrate that such risks and impacts would be low, both for port areas as well as for the proposed management sites.

However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Galveston, or to any other port evaluated, is low.

Although hurricanes or fogs could lead to a minor delay for an individual foreign research reactor spent nuclear fuel shipment, such events would not significantly affect the transport of the spent nuclear fuel, because ships carrying the fuel could be rerouted, or wait for passage of a hurricane. Appendix D, Section D.2.1.2 of the EIS discusses the environmental conditions in the area of the Port of Galveston, including potential for hurricanes.

RESPONSE TO COMMENT
COMMENTOR NO. 1193: NEAL, JACK

Response to Comment No. 1193-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. DOE considers that the port selection criteria successfully identify ports that can safely handle foreign research reactor spent nuclear fuel. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Galveston, would not pose any significant risk to either the port personnel or the population near the port. Spent nuclear fuel from foreign research reactors is shipped in standard containers, and does not require special handling techniques (Section 2.6.3.2.2 of the EIS).

Response to Comment No. 1193-2

The commentor's opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted (Management Alternatives 1 or 3, Sections 2.2 and 2.4 of the EIS, respectively). Sections 2.3 and 2.5 of the EIS describes other alternatives under consideration.

Comments: Concern about the effect on tourism - Evacuation routes in case of emergency

Name: Mary W Carter

Address: 115 Lichelius Houston, TX 77079

1199-1

1199-2

1199-3

RESPONSE TO COMMENT
COMMENTOR NO. 1199: CARTER, MARY W.

Response to Comment No. 1199-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1199-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism at the port.

Response to Comment No. 1199-3

Several accident scenarios including a breach of the cask and fire sufficient to oxidize the contents were analyzed during preparation of the EIS. Results of the accident analysis at the ports are given in Section 4.2.2 of the EIS with supporting detail in Appendix D, Section D.5 . No catastrophic effects were found to result from severe accidents involving foreign research reactor spent nuclear fuel. In addition, no catastrophic events were identified that would require the evacuation of the island of Galveston. Emergency response and management for the ports identified in the EIS are discussed in Section 2.7.

COMMENTOR NO. 1200: HOLMES, TERRY R.

RESPONSE TO COMMENT
COMMENTOR NO. 1203: ANONYMOUS

Response to Comment No. 1203-1

Any ship that would be used to transport foreign research reactor spent nuclear fuel will be equipped with long range communication equipment and remain in contact with weather advisory services. Therefore, the ship would be aware of the existence of a hurricane or other dangerous storm with sufficient advance notice in order to avoid being in the Port of Galveston specifically, or any port or other restricted waterway when such a storm hit. Since docking the ship and unloading of the foreign research reactor spent nuclear fuel would be accomplished quickly, typically well within a day, the foreign research reactor spent nuclear fuel would not be caught in restricted spaces due to an extended port stay. Even if the ship were to experience a collision or sink as the result of a severe storm or other cause, the analysis in the EIS indicates that the risk to people nearby is low. Appendix D, Section D.5 presents details on the calculation of consequences and risk associated with accidents in port and their approaches. Appendix D, Section D.2.1.2 of the EIS discusses the environmental conditions in the area of the Port of Galveston, including fog and potential for hurricanes.

otal number of pages, including cover: 1

- Message:

To the U. S. Department of Energy:

I would like to express my adamant opposition to the transport of spent nuclear fuels through the Port of Galveston. The potential perils and downside to this plan are many, while I can see absolutely no advantages to the Port of Galveston or to the citizens of our community. 1205-1

Galveston is a community rich in history and architecture. Coupled with our beaches and recreational activities such as fishing, surfing, and boating, Galveston is a destination for some 6 million visitors annually. I feel this plan imperils our burgeoning visitor industry just at a time when we are beginning to make a resurgence as a visitor destination. 1205-2

Because Galveston is an island, these fuels would have to be further transported along heavily congested local roads before crossing a bridge to the mainland which is our only link to a north/south interstate highway. 1205-3

I would respectfully urge you to consider the alternative plan for disposal of these spent nuclear fuels which is to keep them in the country of origin. According to published reports, there is a tremendous economic advantage to this alternative. 1205-4

The proposed plan for sending these fuels through the Port of Galveston has been strongly opposed by many in our community. It has been officially opposed by The Galveston City Council, The Galveston County Commissioners Court and several civic organizations. The Port of Galveston is in the process of filing a written response which will request your consideration of the alternative plan. Again, I urge you to abandon any efforts to ship these spent nuclear wastes through our home town.

Armin Cantini

RESPONSE TO COMMENT
COMMENTOR NO. 1205: CANTINI, ARMIN

Response to Comment No. 1205-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

Response to Comment No. 1205-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism or future business development at the port.

Response to Comment No. 1205-3

The risks of ground transport are discussed in Section 4.2.3 and Appendix E of the EIS. In all cases, the risks are shown to be low.

Response to Comment No. 1205-4

The commentor's preference for the option of each country managing its own spent nuclear fuel is noted. This could be either Management Alternative 2 or the No Action Alternative, which are described in Sections 2.3 and 2.5 of the EIS, respectively. The policy considerations and environmental impacts of these two alternatives are discussed in Sections 4.4 and 4.6 of the EIS.

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel through the Port of Galveston, or any other port evaluated, is low.

COMMENTOR NO. 1215: PECK, ROBERT & DIANE

July 20, 1995

Robert & Diane Peck
3121 Avenue P
Galveston, Texas 77550

Attn: Mr. Charles Head

We are opposed to the transportation of foreign spent nuclear fuel via the Port of Galve
ton. Galveston is an
island with only one Interstate highway connected to the mainland by a bridge. The tran
ortation of this nuclear
waste must also go through a major city , Houston. 1215-1

Galveston, Texas as an entry port would be a bad choice by our government. This move
uld hurt the tourist
industry and wipe out what is left of the port business. 1215-2

Galveston, Texas is a bad choice!

Thank you.

RESPONSE TO COMMENT
COMMENTOR NO. 1215: PECK, ROBERT & DIANE

Response to Comment No. 1215-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Galveston, or to any of the ports analyzed in the EIS, is low.

In port selection, one of the criteria (Criterion 5, Appendix D, Section D.1.9.5 of the EIS) considers population in port and along the route to the management site. Galveston is considered a low-population density port and the population along the route (including Houston) to the management sites is among the lowest of the candidate ports (Appendix D, Section D.1.9.5 of the EIS). DOE acknowledges that there is only one major road to the mainland, however, this is not a reason to eliminate Galveston from consideration, considering the low risk of the proposed action (Section 4.2.2.3 of the EIS).

Response to Comment No. 1215-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism or future business development at the port.

Charles Head
Office of Spent Fuel Management (EM-37)
Office of Environmental Management
US Department of Energy
1000 Independence Ave. SW
Washington, DC 20585

Dear Mr. Head,

We oppose the importation of spent nuclear fuel into the United States — but especially the Pacific Northwest, Hanford + Idaho. Using commercial freighters and public facilities is risking public safety — no matter how many precautions are taken. No one can promise or guarantee that a disaster will never happen and we citizens who were at the mercy of our government from Hanford's 30+ years radiation leaking problems deserve to have peace of mind. We've paid our nuclear dues.

1219-1
1219-2
1219-3
1219-4
1219-2 (Cont'd.)

RESPONSE TO COMMENT
COMMENTOR NO. 1219: LINVILLE, SUSAN J. & OTHEL L.

Response to Comment No. 1219-1

The commentor's opposition to acceptance of foreign research reactor spent nuclear fuel in the United States is noted. Sections 2.3, 2.5, and 4.4 of the EIS describe other alternatives under consideration.

Response to Comment No. 1219-2

As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford Site.

Response to Comment No. 1219-3

According to the Record of Decision for the Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement, discussed above, some foreign research reactor spent nuclear fuel could be managed at the Idaho National Engineering Laboratory. Based on the environmental impact analysis, presented in Section 4.2.4 and Appendix F, Section F.4 of this EIS, the Idaho National Engineering Laboratory would be an acceptable site for foreign research reactor spent nuclear fuel management.

Response to Comment No. 1219-4

Based on the analyses of impacts associated with accidents and incident-free operations involving foreign research reactor spent nuclear fuel, DOE considers that commercial ports, facilities and freighters represent acceptable options for the receipt and transportation of foreign research reactor spent nuclear fuel (Section 4.2.2.3 of the EIS on consequences of port accidents and Section 4.2.2.2 for impacts of incident-free operation).

FROM: Sallie Shawl
Concerned Citizen

DATE: July 20, 1995

SUBJECT: Nuclear Waste Shipments through Tacoma

I am another person against the shipment of nuclear waste through Tacoma. 1222-1

As a matter of fact, I'm against the waste being shipped anywhere, not because I don't want it in my backyard but because I believe that if people have to deal with the waste, they'll be less likely to want to create the waste in the first place. My hope is that someday in the not-too-distant future we, as a species, will stop the madness of doing anything which creates such waste.

Yes, we have much waste to deal with now. And I hope to God that we can figure out a long-term way to store it. But in the meanwhile, it should be stored where it is, alleviating the dangers involved in transporting it. In terms of the security issues, it would be alot cheaper for us to store it there and have our personnel there to guard it there. Has that ever been considered? 1222-2 1222-3

That's all.

For a nuclear-free world,

Sallie E. Shawl

RESPONSE TO COMMENT
COMMENTOR NO. 1222: SHAWL, SALLIE E.

Response to Comment No. 1222-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

The commentor's preference for the overseas management alternative is also noted. This is Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

Response to Comment No. 1222-2

The impacts of ultimate disposition of the foreign research reactor spent nuclear fuel are discussed qualitatively in Section 4.2.7 of the EIS. DOE is currently evaluating the feasibility of construction of a disposal site at Yucca Mountain, NV. In the meantime, support for U.S. nuclear weapons nonproliferation policy requires DOE and the Department of State to consider other means of dealing with the foreign research reactor spent nuclear fuel (Section 1.1. of the EIS).

Response to Comment No. 1222-3

The commentor's preference for the alternative of overseas storage is noted. This is Management Alternative 2, Subalternative 1a, which is discussed in Sections 2.3 and 4.4.1 of the EIS. The cost of secure long term storage in multiple nations overseas would be greater than the cost of secure storage in existing U.S. facilities.

Charles Head
Office of Spent Fuel Management, EM-37
U. S. Department of Energy
1000 Independence Ave, SW
Washington, DC 20585-0001

Dear Mr. Head,

I am writing to you concerning the idea of shipping spent nuclear fuel through Galveston. I am a life long resident of Galveston and I for one do not want spent nuclear fuel to be passed though where I live. I have read an article on this idea and I have found that the state for it's destination, is fighting this in court and that it will not be except any fuel to be stored. This in turn means that it will be stored on the island until they settle in court. What person would want to come to this island with the knowledge that there is nuclear waste here? This island has been made into a tourist town. The tourist and the beaches are our livelihood. My concerns are as follows:

What will happen if there is a spill (you have seen what happens when we spill oil)?

What will happen if there is a hurricane while the fuel is being stored on the island? You cannot tell me that you will have a safe storage facilities. No one can control or predict what mother nature will do.

I hope that many other locals wil get involed and inform you that this is not what this island wants or need.

1233-1

Sincerly,

Debra A. Conway

RESPONSE TO COMMENT
COMMENTOR NO. 1233: CONWAY, DEBRA A.

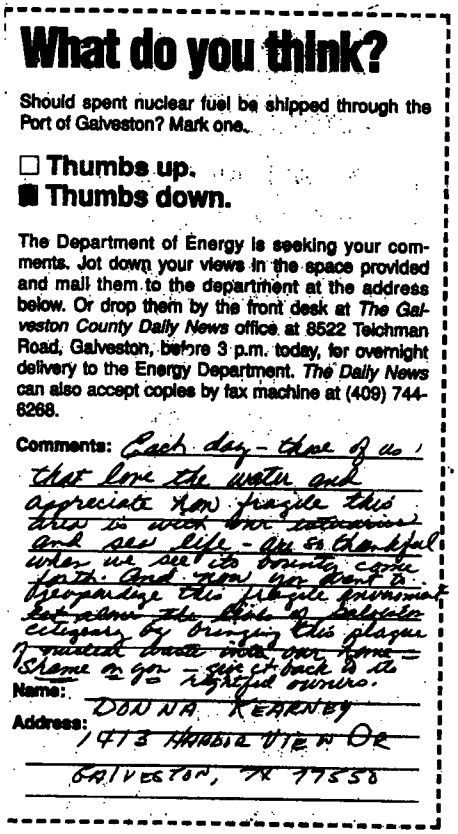
Response to Comment No. 1233-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism or future business development at the port.

If the foreign research reactor spent nuclear fuel is accepted into the United States, there would be no storage of this material in the Port of Galveston, or any other port. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

Foreign research reactor spent nuclear fuel in a transportation cask cannot "spill" because it is solid metallic fuel and is shipped dry. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. To date, with over 30 years of experience, no radioactive contents have ever been released from a spent nuclear fuel transportation cask as a result of an accident. A paragraph has been added to Section 4.2.2.2 of the EIS to make this point.

Although hurricanes or fogs could lead to a minor delay for an individual foreign research reactor spent nuclear fuel shipment, such events would not significantly affect the transport of the spent nuclear fuel, because ships carrying the fuel could be rerouted, or wait for passage of a hurricane. Appendix D, Section D.2.1.2 of the EIS discusses the environmental conditions in the area of the Port of Galveston, including potential for hurricanes.



What do you think?

Should spent nuclear fuel be shipped through the Port of Galveston? Mark one.

RESPONSE TO COMMENT
COMMENTOR NO. 1240: BARNETT, GINGER

Response to Comment No. 1240-1

The commentor's favorable statement on the use of the Port of Galveston as the port of entry for foreign research reactor spent nuclear fuel is noted. The Port of Galveston is one of ten candidate ports of entry which are determined to be acceptable in the case that foreign research reactor spent nuclear fuel is accepted into the United States. If any foreign research reactor spent nuclear fuel were to be accepted into the United States, the selection of the actual port(s) of entry to be used would be made in the Record of Decision, subsequent to completion of this final EIS.

COMMENTOR NO. 1246: BROWN, MR. MICHAEL C., SR.

1000 INDEPENDENCE AVE SW
WASHINGTON, DC 20585- 0001

Dear Mr. Head:

I disagree with the use of Galveston Bay being used to transport radioactive waste. I do not care if you go around the island, along side, or in the middle. Thousands of people will get injured, if an accidental occurs. This island is not set up for radioactive accidents. This is not a way of life for people living in Galveston. 1246-1

Once the word gets out, you will not be able to sell any houses in Galveston, or get anybody to come to Galveston Island. NO RADIOACTIVE WASTE !!!!!!! 1246-2

mr. Michael C. Brown Sr.

RESPONSE TO COMMENT
COMMENTOR NO. 1246: BROWN, MR. MICHAEL C., SR.

Response to Comment No. 1246-1

The commentor's opposition to the use of the Port of Galveston for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Galveston is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternative 1 or 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Galveston, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2).

Response to Comment No. 1246-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipments of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. However, adverse impacts have not been observed during the 30 plus years foreign research reactor spent nuclear fuel was accepted into the United States in the past. Based on this past experience, DOE considers that shipping foreign research reactor spent nuclear fuel through the Port of Galveston would have no detrimental effect on tourism, property values, or future business development at the port.

Dear Mr. Head:

I write this letter as a concerned citizen of the Gulf Coast area. I do not want to see nuclear waste travel through the Port of Galveston. I own property in both Galveston and Houston. My family has enjoyed the quality of recreation the area affords for many years and we hope to continue to do so.

Hopefully, you realize Galveston is an island. One of the major sources of income for island residents is tourism. There are many weekend visitors as well as property owners from Houston with second homes that frequent the islands beaches, historic sites and fishing facilities.

1250-1

1250-2

RESPONSE TO COMMENT
COMMENTOR NO. 1250: KIMBALL, LINDA

Response to Comment No. 1250-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Galveston is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Galveston, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1250-2

Based on the evaluation of impacts presented in Section 4 of the EIS, the risk associated with the shipment of foreign research reactor spent nuclear fuel through any of the ports identified is not greater than the risk associated with the handling of other hazardous cargos. DOE acknowledges that, in many instances, the perception by the public of the risks associated with spent nuclear fuel may be greater than the actual risk, or the risk from other even more hazardous activities. COMMENTOR NO. 1250: KIMBALL, LINDA (CONT'D.)

To travel from Houston, Bay from Galveston one must go across the Galveston Causeway. This the one access on and off the island should a severe disaster occur if the island needed to be evacuated. I experienced an evacuation years ago because of a hurricane warning. The causeway was "bottle necked" for hours.

I say no to nuclear waste travelling via the Port of Galveston!

Sincerely
Linda Kimball

RESPONSE TO COMMENT
COMMENTOR NO. 1250: KIMBALL, LINDA (CONT'D.)

Response to Comment No. 1250-3

As discussed in Sections 4.2.2.3 and 4.5 of the EIS, very low consequences for, or risks to, the population of Galveston would be expected from a severe accident involving spent nuclear fuel from foreign research reactors. Spent nuclear fuel is neither flammable or explosive. No evacuation of the city would be required due to an accident involving foreign research reactor spent nuclear fuel.

July 18, 1995

Charles Head, Program Manager
Office of Spent Nuclear fuel Management
(EM-37) U.S. Department of Energy
1000 Independence Ave. S.W.
Washington DC 20585

Mr. Head:

I am writing in regards to the issue of shipping spent nuclear waste through the Port of Tacoma. I strongly believe that this should not be done. In the City of Tacoma alone there are over 176,000 people (as per the 1990 census). In Pierce County, excluding Tacoma there are 214,795 households. All these people would be affected if there were to be an accident with the waste that your agency plans on bringing through our port, as well as those residents in South King County. 1254-1

The Port of Tacoma is with a few miles at most of Interstate 5, which is the main highway from Seattle to Portland. Any mishap could shut down I-5 causing disruption of transportation of goods and services throughout the Puget Sound. This area is also prone to occasional earthquakes, which increases the risk of mishap.

I read that Japan and Scotland have facilities that could use this material. I believe if there are other counties that are reliable, they should be given this waste. These two counties would be such places. Insisting that this waste be kept within the United States is an unwise policy in this day. 1254-2

If this spent nuclear waste is shipped through the Port of Tacoma, I will be forced to considered moving from Tacoma and I know of others that feel the same way. This would be

COMMENTOR NO. 1254: DANIEL, CORNELIUS W., IV

Response to Comment No. 1254-1

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Tacoma is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternatives 1 and 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Sections 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel casks are also low (Section 4.2.2.2).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is very small. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at the Port of Tacoma to fail, is not expected to compromise the spent nuclear fuel transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 of the EIS demonstrate that the use of any of the selected ports would not pose any significant risk to the port personnel or the population near the ports.

Response to Comment No. 1254-2

The commentor's preference for overseas reprocessing is noted. This is Management Alternative 2, Subalternative 1b, which is discussed in Sections 2.3 and 4.4.2 of the EIS.

COMMENTOR NO. 1254: DANIEL, CORNELIUS W., IV (CONT'D.)

sad to see because Tacoma is beginning a revival. Additional, I have heard absolutely no word that there is any benefit to having this waste shipped through the Port of Tacoma, or for that matter any other city that is being forced upon. I feel that not having any real say or compensation in this matter is the greatest injustice of all.

Sincerely,

Cornelius W. Daniel IV "Cort"

1259-1

RESPONSE TO COMMENT
COMMENTOR NO. 1259: ROBERTS, ELIZABETH

Response to Comment No. 1259-1

The commentor's opposition to the use of the Port of Tacoma for receipt of foreign research reactor spent nuclear fuel is noted. Based on the port selection process described in Appendix D of the EIS, the Port of Tacoma is among the ten candidate ports listed in Section 2.2.1.6 of the EIS which could receive foreign research reactor spent nuclear fuel under Management Alternative 1 or 3. The analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port. The analysis in the EIS indicates that the risks associated with an accident are low (Section 4.2.2.3) and that the risks associated with incident-free handling of the foreign research reactor spent nuclear fuel are also low (Section 4.2.2.2).

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at the Port of Tacoma to fail, is not expected to compromise the spent nuclear fuel transportation cask.

All of the population within a 50-mile radius of the Port of Tacoma was considered when analyzing the impact of a range of hypothetical port accidents. The risks were found to be low (Section 4.2.2.3 of the EIS). The evaluation of accident probabilities, both marine and land, were based on national accident rates, which include locale-specific conditions only as they impact the national statistics. As local hazards, such as earthquakes, volcanos, and mud slides, could be accident initiators, they may slightly increase the probability of an accident. However, they would not increase the consequences of the accident, which were found to be minor for marine (Appendix C, Section C.5.4 of the EIS), port (Appendix D, Section D.5.4.2.2), and land transportation accidents (Appendix E, Section E.7.4).

COMMENTOR NO. 1260: MCLEOD, DEAN L.

17 July 1995

Public Comments on the Draft FFR SNF EIS
Attention: Charles R. Head
Office of Spent Fuel Management (EM-37)
United States Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585-0001

Dear Sir:

I write this as a resident of Bay Point, recently moved to Concord, California. I come from a conservative background and have never carried a placard or participated in an organized protest in my life. I'm 51 years old and a grandfather. Today also happens to be the anniversary of the greatest homefront disaster of World War II, when the docks at Concord Naval Weapons Station exploded.

The following is written, acknowledging the responsibility that you are faced with, and the need to focus on the larger, more general issues.

It is clear to me, that until a couple of months ago, Concord, California was just the name of a place to you; one to which you had given little or no thought. Further, based on the subject EIS, I conclude that you have never even heard of Bay Point, California. I hope that my questions and comments will help to change that. 1260-1

The geographic, demographic and industrial particularities of this place cry out against the plan to increase the already intense risks that exist here.

Here are my comments and questions on the Draft EIS:
My review of the "Summary" revealed several general areas that need consideration. There is very little hard data in the "Summary", but it raises numerous questions in my mind. I quote from the EIS, then respond:

1. p. 4: "On October 21, 1993, DOE published a Notice of Intent to prepare an EIS on a proposed action for the acceptance of foreign research reactor spent nuclear fuel containing uranium enriched in the United States (58 FR 54336)." "DOE received public comments, through writing and testimony at nine public hearings held at candidate port and site locations, through January 1994." "DOE received over 2,000 comments from about 500 individuals on a variety of issues..." 1260-2

Since legal notice, comment period and public hearings were based on the assumption that the port of entry would be Oakland, the last minute change to Concord Naval Weapons Station has effectively deprived the affected

RESPONSE TO COMMENT
COMMENTOR NO. 1260: MCLEOD, DEAN L.

Response to Comment No. 1260-1

The commentor's opposition to the use of Concord NWS for receipt of foreign research reactor spent nuclear fuel is noted.

Concord was one of 161 ports (153 commercial and eight military ports) considered. These ports were evaluated against selection criteria, resulting in 10 ports that met all of the criteria. See EIS Appendix D, Sections D.1.8 and D.1.9 for a detailed discussion of the process and results. The analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1260-2

The fact that a scoping meeting was not held in the Concord vicinity is due to the fact that one of the purposes of the scoping meeting, in accordance with NEPA and DOE's applicable regulations, is to identify the scope of the EIS through public input. Therefore, based on information and comments provided by participants at the scoping meeting, and based on other considerations, DOE acted within its rights to expand the scope of the EIS to include additional ports as possible candidates for receipt of foreign research reactor spent nuclear fuel. Once such additional port is Concord NWS. The public and other interested parties (government officials, industry, etc.) were afforded opportunity to comment on the draft EIS, both at the public hearing and in writing after the public hearing. The 90 day public comment period ended on July 20, 1995. In addition, DOE considers the analyses conducted in Section 3.2.1.6 and Appendix D, Section D.2.1.6 are adequate regarding Concord NWS.

COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

communities of their rights as citizens. No one in Contra Costa was aware of the decision to utilize Concord until April, 1995. This is outrageous. Are you prepared for the legal consequences of this?

More importantly, whatever studies were undertaken as to suitability of the various ports, Concord had to have been given short shrift, since it was not even considered until the past few months. Why was inadequate study made of CNWS?

2. p. 13: "Screening criteria [for choosing potential ports of entry] were based on input from the public (during the EIS scoping process), a U.S. Merchant Marine Academy panel of maritime safety experts and factors identified in Section 3151of the National Defense Authorization Act of FY 1994.

Why was the affected public for Concord excluded from input until the last moment?.

Of the three recommendations of the Maritime Acadamy panel "necessary for safe shipment", Concord fails two. One of these is "short distance from the open ocean". Page D-11 of Selection and Evaluation of Potential Ports of Entry says:

> Ports that can only be reached by transporting spent nuclear fuel through long, narrow, winding, or crowded ship channels present additional risks that can be avoided by using ports that are easier to reach.
>
> Less desirable are potential ports...which present [a narrow strait such as Carquinez] crowded by oil tankers in the channel and numerous petroleum and petrochemical plants along the channel that could impact on ship safety in the event of a plant or pipeline accident.

The second "necessary" criteria is "adequate port cargo facilities" (D-3). The U.S. Merchant Marine Academy Workshop recommended "onsite purpose-built cranes with trained operators". Concord has neither. Construction of crane facilities would not lead to "trained operators". Why has the DOE ignored these factors?

Under "important but not necessary" recommendations, Concord fails for numerous reasons:

1.There are "significant environmental considerations for the port D-15)" The landward portion of the station is home to several endangered species. The port areas straddle a sensitive and delicate wetlands area. Why has this been ignored?

1260-2 (Cont'd.)

1260-3

1260-4

RESPONSE TO COMMENT
COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

Response to Comment No. 1260-3

Concord NWS was one of 161 ports (153 commercial and eight military ports) considered. These ports were evaluated against selection criteria, resulting in 10 ports that met all of the criteria. See Appendix D, Sections D.1.8 and D.1.9 of the EIS for a detailed discussion of the process and results.

DOE's public interaction related to this draft EIS exceed the requirements set forth in NEPA and DOE's environmental regulations. Seventeen public hearings were held in locations determined most likely to be directly affected by the EIS alternatives. In addition, the period of acceptance for written comments was extended from June 20 to July 20, 1995. DOE considers that these actions have provided sufficient opportunity for the public to comment on the draft EIS.

If any foreign research reactor spent nuclear fuel is to be accepted into the United States, the selection of the actual port(s) of entry to be used would be made in the Record of Decision, subsequent to completion of this final EIS.

The physical constraints of the passage from San Francisco Bay to Concord NWS were considered as part of the port selection process. The passage was found to meet the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2 of the EIS).

As shown by the port selection process described in Appendix D, Section D.1 of the EIS, Concord NWS and the other nine ports all meet the port selection criteria and hence are considered to be able to safely handle the foreign research reactor spent nuclear fuel. Criterion 3 regarding appropriate port facilities (Appendix D, Section D.1.9.1) was established to evaluate each port for "adequate port cargo facilities" as recommended by the U.S. Merchant Marine Academy. Under Criterion 3, each port was to have at least one adequate crane for offloading containerized spent nuclear fuel onto ground transport. Currently, the Concord NWS has a floating crane that routinely handles containers. Also, the NWS is scheduled to add two container cranes to increase the container handling capacity of the facility.

Response to Comment No. 1260-4

As a part of the port selection process, the EIS examines desirable port attributes as one of the criteria used in selecting ports acceptable for the receipt and handling of foreign research reactor spent nuclear fuel. The port selection process is described in detail in Appendix D, Section D.1.9 of the EIS with desirable port attributes discussed in Section D.1.9.6. Included among the desirable port attributes, DOE examined the environmental concerns near the ports and the environmental concerns from severe natural phenomena, such as earthquakes.

COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

2. There is a substantial presence of "conflicting uses: explosives, petroleum..." Concord is the main west coast transhipment center for weapons and explosives. Bringing in waste nuclear material to the same facility, even if to a separate area, contradicts the panel's recommendation. The station is surrounded by petroleum and chemical plants. Why has this been ignored?

Likelihood of severe natural phenomena impacting port activities (such as high winds ...earthquakes". The port at CNWS was built adjacent to the town of Bay Point, which was renamed Port Chicago in 1931 because, like the more famous place, there are constant high winds. The port straddles the Concord Earthqake Fault, and is built on swamp land subject to instant liquifaction in a severe earthquake. Why has this been ignored?

Why would the DOE ignore the requirements of the National Defence Authorization Act and the recommendations of the U.S. Merchant Marine Academy panel?

I believe it is significant that the safety statistics quoted in the study separate the risks of marine transportation, port handling and rail/truck transportation, ignoring the fact that Contra Costa, particularly Bay Point, would be subject to all three hazards, thus tripling the risks. Why have not the impacted communities been advised of these risks?

1260-4 (Cont'd.)

4. p. 21: "In more than three decades of shipping spent nuclear fuel into and within the United States, no accident has ever occurred in which a "Type B" cask was punctured or spent nuclear fuel contents released, even in actual highway accidents.

Try this logic: In the 27 years that Southwest Airlines has flown there has been no crash, accident or death. Therefore, is there no such risk? Statistically, taking only Southwest Airlines, the risk of accident is one in billions, considering all the passenger miles the airline has flown. But what is the reality? Every few months airlines crash somewhere in the world. What are the statistics for airline safety over-all? Although quite safe, entirely different than that for Southwest Airlines alone. What is pertinent to this issue are the odds of road accidents, shipping accidents and train accidents in general. More fundamental, though, is the consequence of an accident. In an auto or train accident, one or two persons might get killed. When an airline crashes, a couple of hundred people can die. If there is a serious accident, where the spent nuclear fuel rods burn, many thousands of persons could ultimately die from radiation sickness or cancer. Why does the EIS downplay the real dangers?

1260-5

5. p. 26: "An emergency management and response infrastructure exists to support the implementation of those Management Alternatives that have an effect in the United States. This encompasses ports of entry, ground

1260-6

RESPONSE TO COMMENT
COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

Although ports are not generally environmentally sensitive areas within the context of NEPA, the EIS identifies the presence of wetlands and Tule Elk near the Concord NWS as an environmental concern. If foreign research reactor spent nuclear fuel is accepted by the United States, environmental concerns may be considered in the decision as to which port to use for each shipment of foreign research reactor spent nuclear fuel. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk to humans as well as wildlife associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

DOE understands that Concord NWS's primary mission is to support the military through handling munitions and that no handling of the foreign research reactor spent nuclear fuel could occur concurrently with handling explosives. Administrative controls would be in place to preclude the handling of high explosives while the foreign research reactor spent nuclear fuel was on Concord NWS or in a ship near Concord NWS. While there would be high explosives in Concord NWS's bunkers while the foreign research reactor spent nuclear fuel was being handled, as long as the high explosives were not handled, there would be little danger of explosion. The port selection criteria do not consider the existence of other land-based facilities, such as refineries or inventories of hazardous materials, because they have no direct impact on the risk associated with the shipment of foreign research reactor spent nuclear fuel.

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. While local hazards, such as earthquakes, could slightly increase the probability of an accident, they would not increase the consequences of the accident, which were found to be very minor for both marine and land transportation accidents. Appendix D, Section D.5.3.1.3 of the EIS discusses the port accident probabilities developed from marine accident data. Hence the overall low risk is essentially unchanged in seismic areas.

In preparing the EIS, DOE has considered accepting the foreign research reactor spent nuclear fuel at any of 10 ports selected on the basis of specific criteria described in Section 2.6.3.1 of the EIS. As stated in the EIS, the criteria were based on several sources, including the recommendations made at a U.S. Merchant Marine Academy workshop, public input received during the scoping process, and the factors identified in Section 3151 of Public Law 103-160 (the National Defense Authorization Act for the fiscal year 1994). For each port selected, the impacts from activities related to the shipments of foreign research reactor spent nuclear fuel were evaluated in Section 4.2.2. The evaluation includes impacts from incident-free activities, credible accidents (including shipboard fires), emergency management and response, cumulative impacts, mitigation measures, and environmental justice concerns. The risk to the environment and the health and safety of workers and public resulting from the proposed action for all candidate ports was determined to be low.

COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

transportation routes, and management sites." "In the United States, state and local governments are required to have emergency management and response programs." "Thses programs must be capable of managing all hazards, ranging from natural disasters to hazardous materials incidents on a day-to-day basis."

This totally begs the question.

The emergency management and response infrastructure in Contra Costa and Solano Counties would be powerless to "manage" in the face of a nuclear materials leak on the river, at Concord Naval Weapons Station or on highway 4. Contra Costa County failed to adequately manage a simple chemical spill at the General Chemical Plant in Richmond two years ago. Why does the EIS provide no indication of how Contra Costa County would cope? 1260-6 (Cont'd.)

6. p. 36: "The most severe ground transport accidents would be truck or train crashes, followed by a large fire."

Highway 4, the main route between Concord and the storage sites is one of the most dangerous highways in Northern California. Were it to be used east of Concord or west of Martinez the odds of a truck accident rise astronomically. The road beds of the railroads leading to and from Concord Naval Weapons Station are under-maintained and their general safety is questionable. 1260-7

Review of Appendix A: Environmental Justice Analysis

8. p. A-1: "Executive Order 12898 *Federal Actions to Address Environmental Justice in Minority Populations and Low Income Populations*, directs Federal agencies to identify and address...disproportionately high and adverse human health or environmental effects of their programs, policies and activities on minority and low income populations."

The fundamental assumptions of the analysis in Appendix A are faulty. A circle with a ten mile radius (the assumption chosen) could be drawn around any metropolitan area and produce the finding that no environmental injustice exists. By including the racial and economic demographics of the mored distant affluent and well educated areas in the statistics, the real impact on those most at risk is obscured. The study admits that the closer a community is to the accident, the greater the risk. The greatest risk is at the port of entry. A circle drawn 3 miles around the loading docks of Concord Naval Weapons station would primarily include the communities of Clyde and Bay Point. An examination of the racial and demographic make-up of these communities will persuade the objective observer that using Concord Naval Weapons Station violates Executive Order 12898. 1260-8

9. p. A-1: "In the case of spent nuclear fuel from foreign research reactors, no fatalities are expected due to radiological exposure or traffic accidents." 1260-9

RESPONSE TO COMMENT
COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

No significant health, safety, or environmental risks were found to exist at any of the candidate commercial or military ports selected (Sections 4.2.2 and 4.5 of the EIS) which would warrant a cumulative impact analysis in the final EIS addressing the effect of receiving spent nuclear fuel on existing commercial and military environments at the various ports, including the Concord NWS. Spent nuclear fuel from foreign research reactors is shipped in standard containers, and does not require special handling techniques (Section 2.6.3.2.2 of the EIS) or additional security beyond that required by NRC regulation (which can readily be provided in any of the commercial or military ports). No special precautions are required by the U.S. Coast Guard (Section 2.6.3.2.2 of the EIS).

Response to Comment No. 1260-5

While it is a fact, that there have not been any accidents in the United States in which a "Type B" spent nuclear fuel transportation cask was punctured, the EIS evaluated the consequences of accidents involving a cask where the cask is considered failed with a certain probability. The accidents ranged from no cask failure to that of cask failure combined with a high intensity fire. The approach and the results of the transportation analysis are documented in Appendix E and summarized in Section 4 of the EIS. For the analysis of accidents at sea and at ports, Appendices C and D of the EIS provide the approach and the calculational results. The results are not downplayed.

Response to Comment No. 1260-6

DOE considers that if foreign research reactor spent nuclear fuel is managed in the United States, there is adequate regulatory and emergency preparedness infrastructure to ensure its safe acceptance and transportation to the designated management site. Emergency preparedness, security, and coordination of DOE with local emergency response authorities that would be involved with the acceptance and transportation of foreign research reactor spent nuclear fuel will be discussed in detail in the Transportation Plan, to be prepared prior to the implementation of the policy. The general provisions of the Transportation Plan are included in Appendix H, which was added to the final EIS in response to public comments.

As discussed in Section 2.7.3.2 of the EIS, DOE provides funding to States and Tribes through the Office of Environmental Management and the Office of Civilian Radioactive Waste Management to assist with transportation related issues. This funding has been used in the past to enhance a jurisdiction's emergency management and response capabilities. Besides funding, much of DOE's assistance is provided in the form of technical assistance, for which DOE bears the cost. Assistance may be provided through DOE's Radiological Assistance Program and under the National Contingency Plan, as well as through training, DOE sponsored meetings, informal discussions, and informational materials.

COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

This totally begs the question. The statistical analysis used to dismiss potential risks is completely bogus. The analysts who scratched out the piffle in this study should be forced to give their names to the public for ridicule, and be reported to any professional organizations to which they belong.

1260-9 (Cont'd.)

10. p. A-2: "Potential radiological impacts to people residing near the port are associated with low probability (less than one in a million) accidents that are so severe that the spent nuclear fuel casks rupture and a fire would burn long enough around the cask that some of the radiological material would be released." "Most of this vaporized spent nuclear fuel would be expected to be deposited in the first few miles downwind of the fire but small amounts could be carried out for several tens of miles."!!

Yes, death for several tens of miles. This is the crux of the issue. There can be almost no imaginable scenario in which anyone would willingly submit to any level of risk. The residents of Bay Point have born excessive risks for 53 years. Concord is 6-7 miles south and west of the docks. Bay Point is 1 1/2 miles southeast and directly downwind. Fifty-one years ago today over 300 persons were killed and the town of Bay Point/Port Chicago was devastated WITH WORLD WAR II VINTAGE BOMBS.

1260-10

11. p. A-3: "The port at Concord Naval Weapons Station is the exception [among proposed ports in that it has] larger percentages of minority populations *in the surrounding county.*"

The assertion here is that within a 10 mile radius of the base (the presumed danger zone) the percentage of minority and poor people is lower than the surrounding counties. This conclusion is so fallacious and deceptive that it boggles the mind. Within the 10 mile radius (see map on A10) are included Pittsburg, Bay Point, Concord, Pleasant Hill, Martinez, Benicia, Vallejo and Crockett. If you average in Benicia, Concord, Pleasant Hill and Martinez, the impact on poor and minorities is less than average. Why has the DOE ignored the fact that the greatest risk is in Bay Point, with its large minority and poor population.

1260-8 (Cont'd.)

Review of Appendix C:
Marine Transport and Associated Environmental Impacts:

The major flaw in the analysis is that no consideration was given to the special risks associated with ship transport 35 miles up river from the Golden Gate. The Carquinez Straits are particularly narrow, with treacherous currents. Furthermore, populations all along the route are put at risk. This cannot be compared to open sea shipping, nor highway or rail transportation. Why has the DOE failed to study this special risk?

1260-11

RESPONSE TO COMMENT
COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

Response to Comment No. 1260-7

DOE has not yet selected ground transportation or transport modes for the foreign research reactor spent nuclear fuel. If Concord NWS is selected, then DOE would choose the best route to I-680 in accordance with Department of Transportation regulations (49 CFR Part 397.101 (a)(2)). That route could use Route 4, Route 24, and/or Waterfront Road. These are the local Concord streets that the trucks would probably use. The State of California routing agency can designate a preferred route, which the shipments would be required to follow, in accordance with 49 CFR Part 397.103.

The commentor's view that the railroad roadbeds leading to and from Concord NWS are under-maintained and their general safety is questionable is noted. Section 4.2.3 of the EIS, however, demonstrates that the risks of transporting the foreign research reactor spent nuclear fuel by rail would be low.

Response to Comment No. 1260-8

As discussed in Appendix D, Section D.1.9.5 of the EIS, a circle with a 10-mile (16-km) radius centered at each candidate port was selected for the analysis because it is the area most likely affected in the event of an accident involving spent nuclear fuel from foreign research reactors. Table A-1 of Appendix A, shows an enumeration of minority populations residing within ten miles of candidate ports and in counties having boundaries within ten miles of the candidate ports. For eight of the twelve terminals listed in Table A-1, the percentage of minority population residing within ten miles of the candidate port exceeded the percentage of minority population residing in surrounding counties. The opposite was found for four of the twelve terminals, including Concord NWS. Due to the different racial and ethnic compositions and geographical dispersions of populations residing near candidate ports (Table A-2 of Appendix A), it is not feasible to identify a typical demographic condition. The analysis in the EIS provides an equal treatment for all the candidate ports consistent with the physical nature of radiological risks in the event of an accident. As discussed in Section 4 of the EIS, implementation of the proposed action would result in no significant benefits or risks to workers or the general population, including minority and low-income populations.

Response to Comment No. 1260-9

DOE disagrees with the commentor's assertion that the statistical analysis is bogus. The statistical nature of radiological health effects is explained in Section 4.1.3 of the EIS. Other analytical procedures are discussed throughout Section 4 and Appendices B, C, D, E, and F. Since the commentor does not offer any specific criticisms of the analysis, DOE is unable to respond in specific terms. Nevertheless, the commentor's disagreement with the results is noted. The names of the analysts are listed in Section 6 of the EIS.

COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

Review of Appendix D: Selection and Evaluation of Potential Ports of Entry

The section for Concord Naval Weapons Station (D-60 through D-63) was put together very hastily, so much so that place names are not even spelled correctly (San Suisun Bay, Clydes, Brizzly Bay). More significant, though is the complete failure to mention the community of Bay Point, with its population of 20,000 adjacent to the weapons station fence. How can the DOE ignore out of existence a community of 20,000 people?

1260-11 (Cont'd.)

13. p. D-62: The likelihood of severe natural phenomena, such as high winds and earthquakes is reflected in the structural requirements...in the Uniform Building Code." "For the Port of Concord NWS, the code provides a basic wind speed of about 70 miles per hour. The port is located on the edge of a very high seismic zone with an acceleration of 0.45 g."

Yes, any reasonable person can see that this is no place for hazardous materials of the nature proposed. On this basis alone, the Concord Naval Weapons Station should be dropped from consideration. Were an accident to occur, the prevailing winds would spread the radioactive material very far, very fast. Furthermore, the docks are on the edge of the Concord Fault Zone. Dramatically significant, though is the fact that the whole dock area is filled wetlands subject to immediate liquifaction in the case of an earthquake. The USGS regularly warns us that it is not a question of whether we will have a severe earthquake, but simply a question of when. Further, the study makes no mention of the 25 inch natural gas main that runs parallel to the railroad tracks through the weapons station and through the community of Bay Point. Nor does it mention the gasoline and jet fuel pipes that abound along the tracks near the docks. This is a major disaster waiting to happen. Why does the EIS ignore these explosive safety factors?

1260-12

Mr. Head, please give careful consideration to your place in history. Surely you don't want to risk being in the position of the Navy Port Director, 12th Naval District, who recommended in 1941 that Port Chicago was an ideal location for weapons storage, particularly because of "its complete isolation from habitation and industrial activity". Two years later, on July 17, 1944,the adjacent town of Port Chicago was extensively damaged and hundreds were killed. The risks to your place in history and to Contra Costa are exponentially greater this July 17, 1995.

Sincerely yours,

Dean L. McLeod
1830 Polk Street
Concord, California 94521

RESPONSE TO COMMENT
COMMENTOR NO. 1260: MCLEOD, DEAN L. (CONT'D.)

Response to Comment No. 1260-10

The commentor's quote from Appendix A is accurate, but DOE disagrees with the commentor's conclusion about impacts from an accident, "death for several tens of miles." Exposure to small amounts of radioactive material increases the risk of cancer whether the radioactive material comes from natural sources or man-made sources, but this exposure does not cause death to everyone who is exposed. The amount of risk depends on the amount of exposure (Sections 4.1.3 and 4.1.4 of the EIS).

Response to Comment No. 1260-11

The port selection process that determined that Concord NWS was an acceptable port considered the population of the port and surrounding areas. Appendix D, Section D.1.9.5 of the EIS provides an explanation of the "population" criterion. In regard to the amount of marine traffic and the number of refineries and bridges along the route to Concord NWS, the passage from San Francisco Bay to Concord NWS was evaluated and found to meet the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection (Appendix D, Section D.1.9.2). The population and favorable transit from open ocean are not the only considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel, if it is accepted into the United States. Other items of importance include population along the route to the management site, port experience with handling containers, and port facilities. Appendix D, Section D.1.9 of the EIS presents details of the port selection process.

The corrections identified by the commentor have been incorporated into the EIS.

None of the port descriptions, either in Section 3.2 or Appendix D, Section D.2 of the EIS, list or discuss all of the communities in the area of the port. There was no attempt to ignore Bay Point out of existence. When the population of the area was calculated for the port selection evaluation and for accident analyses, Bay Point was included.

Response to Comment No. 1260-12

Appendix D, Section D.5.3.1 of the EIS describes several accident scenarios that involve fire. When the impacts of accidents were calculated (Appendix D, Section D.5.3.3), a 50-mile radius around the port, as well as the local meteorology and prevailing winds, were taken into account. The results of the analysis of these accidents can be found in Appendix D, Section D.5.4. The analysis shows that even in the event of a severe ship fire, neither the consequences nor risks are great (Appendix D, Section D.5.5). Although such a catastrophic accident would obviously impact the local environment, no significant impacts are predicted due to the presence of foreign research reactor spent nuclear fuel. In fact, the analysis of impacts associated with an accident involving foreign research

reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS). The analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing foreign research reactor spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low, even for the most-affected individuals.

The effects of a severe explosion on a foreign research reactor spent nuclear fuel transportation cask was not evaluated because the radiological impacts of the fire discussed above would be worse, or "bound" the results of an explosion. The energy content of a severe fire greatly exceeds that of a severe explosion. With a severe fire not only is the cask violated, as it might be by a large explosion, but the heat of the fire would lift what is released from the cask, spreading the radioactive material farther, affecting more people. The impacts of an explosion followed by a severe fire are equivalent to the category 6 accident which results in a violated cask being engulfed by a severe fire (Appendix D, Section D.5.3.1.1 of the EIS), which is discussed above.

Earthquakes were not analyzed separately in the EIS because seismic activity would not result in greater damage to a transportation cask than that caused by a ship collision and subsequent fire. Rather, the consequences from the worst plausible accidents involving foreign research reactor spent nuclear fuel transportation casks were evaluated, regardless of what initiated them. An earthquake could be the initiator of either a ship or road accident, and thus affect the probability of such accidents; however, the number of earthquake-induced ship and road accidents is small compared to other causes.

DOE would like to point out that the foreign research reactor spent nuclear fuel is neither volatile nor unstable. The fuel that the proposed policy deals with is a metal which contains enriched uranium matrixed in, all clad with either aluminum or stainless steel. This type of fuel is very stable. See Section 2.6.1 of the EIS for a detailed description of the foreign research reactor spent nuclear fuel.

*** COMMENTS ***

I am writing on behalf of all my family. We oppose the plan for nuclear waste coming to our nearby Naval Weapons Station in Concord. 1261-1

It is our choice that foreign waste be kept abroad, hopefully under international management. We feel the U.S. has more than enough to handle with the storage of our own nuclear waste.

The Concord area is part of the East Bay Area, a densely populated part of northern California. We are setting on an active quake fault-line. I'm sure by now many area citizens & the contacted you with the terse, negative opinions regarding this matter. 1261-2

Sincerely,
Gayle Cord Salter

P.S. I'd love to have part of the monies spent to produce all your read-out materials!!

RESPONSE TO COMMENT
COMMENTOR NO. 1261: SALTER, GAYLE CORD

Response to Comment No. 1261-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1261-2

The commentor's preference for overseas management is noted. This is Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

All of the population within a 50-mile radius of the Concord NWS were considered when analyzing the impact of both incident-free transport and the range of hypothetical port accidents. The risks were found to be low. (Appendix D, Section D.5 of the EIS provides details of the accident analysis). Earthquakes were not analyzed separately in the EIS because seismic activity would not result in greater damage to a transportation cask than that caused by a ship collision and subsequent fire. Rather, the consequences from the worst plausible accidents involving foreign research reactor spent nuclear fuel transportation casks were evaluated, regardless of what initiated them. An earthquake could be the initiator of either a ship or road accident, and thus affect the probability of such accidents; however, the number of earthquake-induced ship and road accidents is small compared to other causes. Therefore, the probability of accidents, and hence overall low risk (consequences multiplied by probability) is essentially unchanged in seismic areas.

COMMENTOR NO. 1262: CONCERNED CITIZENS

We, the undersigned, object to the Department of Energy's plan for the transportation of nuclear waste, such as spent nuclear fuel rods, through the waterways, and on the railways, highways and roads of the San Francisco Bay Area. We also object to the unloading and storage, no matter how temporary, of nuclear waste in the Bay Area, including the Concord Naval Weapons Station in Concord, CA., as is currently proposed.

RESPONSE TO COMMENT
COMMENTOR NO. 1262: CONCERNED CITIZENS

Response to Comment No. 1262-1

The commentors' opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS and on the waterways, railroads, highways, and roads in the San Francisco Bay Area is noted. Sections 4.2.2 and 4.2.3 of the EIS, however, demonstrate that the risk associated with bringing spent nuclear fuel to the Concord NWS and through the Bay Area, or to any of the ports or routes analyzed in the EIS, is low.

Response to Comment No. 1262-2

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternative 1 or 3) there would be no storage of this material in the Concord NWS, any other port, or anyplace except for DOE management sites. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

COMMENTOR NO. 1263: HOLLANDER, TARA

~~Charles Head~~
Program Manager

\Office of S pent Nuclear Fuel Management (EM-37)
U.S. Dept. of Energy
1000 Independence Ave., S.W.
Washington, D.C. 20585

Dear Mr. Head;

I wish to strongly state my objections to the plan that would make Tacoma the port that would receive nuclear waste currently being shipped from overseas. My understanding is that arrangements could be made to keep the waste in Scotland, Japan, or France. All of these other options have not yet been thoroughly explored. I would also strenuously object to shipping the waste through Tacoma, as there are better ports to do so in Portland and California. 1263-1 1263-2 1263-1 (Cont'd.)

Thank you for your consideration.

Sincerely,

Tara Hollander

RESPONSE TO COMMENT
COMMENTOR NO. 1263: HOLLANDER, TARA

Response to Comment No. 1263-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1263-2

The commentor's preference for shipping the material to Scotland, Japan, or France is noted. This is covered under Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

COMMENTOR NO. 1266: PEDERSEN, DOUGLAS

July 20, 1995

Department of Energy
Forrestal Building, Room GB-205
1000 Independence Avenue Southwest
Washington, DC 20585

Attention: Charles Head, Project Manager

Subject: Shipment of High Level Nuclear Waste through the Port of Tacoma

Dear Mr. Head:

I was unable to attend the public hearings held recently by the Department of Energy (DOE) in Tacoma, Washington. The newspaper reports indicated that the DOE is seeking "technical reasons" for disqualifying the Port of Tacoma from receiving radioactive spent fuel rods from foreign reactors.

The first technical reason involves a train wreck that never should have happened. On November 11, 1993, two fully loaded freight trains collided head-on at high speed, shredding eight locomotives and launching freight cars hundreds of feet through the air (see attached). Had one of your "unbreakable" nuclear shipping casks been involved, I shudder to think of how the local volunteer fire department would deal with the pieces, especially since the wreckage smoldered for over 14 hours. 1266-1

The second objection comes from DOE Secretary Hazel O'Leary -- your boss. She says that in eight years, we will run out of storage space for domestically-produced, high-level radioactive waste (see attached). Why then are we bringing in materials from overseas when there is no place to put it? 1266-2

Thanks for your time.

Douglas Pedersen

RESPONSE TO COMMENT
COMMENTOR NO. 1266: PEDERSEN, DOUGLAS

Response to Comment No. 1266-1

Accidents do occur. That is why the spent nuclear fuel transportation casks are designed, constructed and tested by simulation to withstand a series of impact and fire tests (Appendix B, Section B.2 of the EIS). Representative transportation casks have been crash tested to confirm compliance with regulatory standards. Two actual crash tests involving locomotive and tractor trailer carrying a spent nuclear fuel transportation cask have been performed. Both tests showed no failure of the casks, but the locomotive was destroyed. These tests demonstrated that the spent nuclear fuel transportation casks built to the federal standard would protect and retain their contents in all credible accidents. With regards to fire duration, real life tests have been conducted to determine the accuracy of the techniques used to demonstrate compliance with this regulatory requirement. Further, examinations of real life fires on land and at seas, and fire tests have demonstrated that high intensity fires are unlikely to be sustained for lengthy periods, and even then not in a single location.

Nevertheless, in spite of the improbability of such fires, the EIS contains the results of an analysis of such a fire (Section 4.2.1.3). The results of the analyses are given in Appendix D of the EIS.

Response to Comment No. 1266-2

Storage technologies which could be used for safe storage of spent nuclear fuel from foreign research reactors are discussed in Section 2.6.5 of the EIS. Candidate management sites for foreign research reactor spent nuclear fuel are described in Section 3.3 of the EIS. As discussed in Section 2.6.5.3 of the EIS, management of foreign research reactor spent nuclear fuel could be accomplished with modifications to existing facilities and construction of new interim storage facilities. Activities of the domestic commercial nuclear power industry are unrelated to the management alternatives evaluated in this EIS.

COMMENTOR NO. 1270: KARAIM, DENNIS A.

Mr. Charles R. Head
Office of Spent Fuel Management (EM-37)
United States Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585-0001

Re: Public Comments on the Draft FRR SNF EIS

Dear Sir,

I am a five-year resident of Bay Point, a town bordering the Concord Naval Weapons Station. More accurately, my property is directly adjacent to the Weapons Station. Therefore, I was very interested to hear of the Department of Energy's proposed plans for the Weapons Station.

I attended the Public Hearing held by the Department of Energy in Concord, California on May 22, 1995. A proposal for using the Concord Naval Weapons Station as a spent nuclear fuel transfer station was discussed.

I presented information about the Concord fault which runs through the proposed site. The Concord fault is only one of many faults in the San Francisco Bay Area. Not only will the spent nuclear fuel be transferred from ship to land on this fault, but than by ground over many other Bay Area faults to one of the proposed temporary storage facilities.

Having an active fault line under a proposed transfer station, as well as many other faults in the area which would affect ground transportation, will greatly increase the possibility of an accident and increase fatality risks.

The information I presented came from the Association of Bay Area Governments. The following is the agency's name, address, phone and fax number:

Association of Bay Area Governments (ABAG)
P.O. Box 2050
Oakland, CA 94604-2050
Phone: 510-464-7900
Fax: 510-464-7970

A document was written about the San Francisco Bay Area fault locations, their activity, and impact. The document's name is "San Francisco Bay Area On Shaky Ground" and the authors are Jean B. Perkins and Jack Boatwright. The source for the fault locations and activity was the California Division of Mines and Geology. Please contact Jean for further information regarding this document.

This week I also contacted the U.S. Geological Survey in Menlo Park, CA. An earthquake with a magnitude of 1.9 was measured on the Concord Fault on July 10, 1995, at 6:52 a.m.

I am confident that the three resources I have mentioned could, upon request, provide more information related to the location, activity, and impact of all the San Francisco Bay Area fault lines.

Finally, I am oppose to the Concord Naval Weapons Station being used for the transfer or storage of spent nuclear fuel or any other nuclear material.

Sincerely,

D. A. Karaim

Dennis A. Karaim

1270-1

1270-2

RESPONSE TO COMMENT
COMMENTOR NO. 1270: KARAIM, DENNIS A.

Response to Comment No. 1270-1

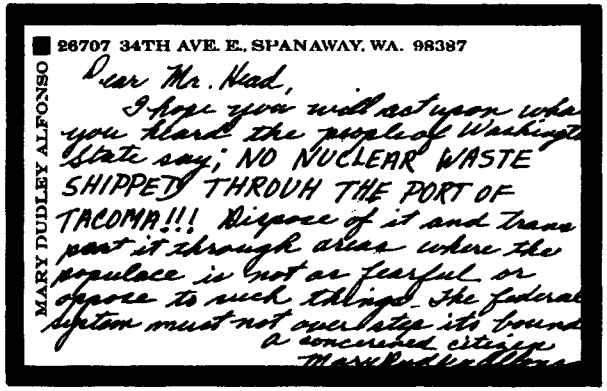
The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Concord NWS is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the ports analyzed in the EIS, is low.

The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event is low. Transportation casks are designed and built to withstand significant punishment without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the transportation cask. Further, the analyses of impacts associated with accidents involving foreign research reactor spent nuclear fuel presented in Section 4.2.2.3 of the EIS demonstrates that the use of any of the selected ports would not pose any significant risk to the port personnel or the population near the ports.

Response to Comment No. 1270-2

If the foreign research reactor spent nuclear fuel is accepted into the United States (Management Alternative 1 or 3), there would be no storage of this material in the Concord NWS, any other port, or anyplace except for DOE management sites. Under normal circumstances, it would remain at a port for only a few hours. In the event of a major disruption of ground transportation systems due to adverse weather, seismic activity, or other situation, DOE's goal is to minimize holding times at the ports and to provide safe transport of the spent nuclear fuel to its destination as quickly as possible.

COMMENTOR NO. 1277: ALFONSO, MARY DUDLEY



MARY DUDLEY ALFONSO
26707 34TH AVE. E., SPANAWAY, WA. 98387

Dear Mr. Head,
I hope you will act upon what you hear the people of Washington State say; NO NUCLEAR WASTE SHIPPED THROUH THE PORT OF TACOMA!!! Dispose of it and transport it through areas where the populace is not as fearful or opposed to such things. The federal system must not overstep its bounds.
a concerned citizen
Mary Dudley Alfonso

1277-1

RESPONSE TO COMMENT
COMMENTOR NO. 1277: ALFONSO, MARY DUDLEY

Response to Comment No. 1277-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

COMMENTOR NO. 1278: VIKON, SHIRLEY J.

July 29, 1995

Charles Head, Office of Spent
Nuclear Fuel Management
(EM-37) U.S. Dept of Energy
1000 Independence Ave. S.W.
Washington D.C., 20585

Dear Mr. Head:
I live in the city of Tacoma
WA. I strongly disapprove of
sending spent nuclear fuel
through our port. I understand
there are two places - neither
in the U.S.A. who would like
to receive it - ~~Scotland~~ + Israel.
Please do not route the waste
fuel through our port.

Thank you,
Shirley J. Vikon
1524 S. 58th St.
Tacoma WA 98408

1278-1

1278-2

RESPONSE TO COMMENT
COMMENTOR NO. 1278: VIKON, SHIRLEY J.

Response to Comment No. 1278-1

The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. However, analysis in Sections 4.2.2 and 4.5 of the EIS indicates that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low.

Response to Comment No. 1278-2

The commentor's preference for shipping the foreign research reactor spent nuclear fuel to Scotland and/or Israel is noted. Shipment to Israel would not be possible, but shipment to Scotland is covered under Management Alternative 2, which is discussed in Sections 2.3 and 4.4 of the EIS.

Volume 3

FINAL ENVIRONMENTAL IMPACT STATEMENT

on a

Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel

Public Comments and Department of Energy Responses
Part 4 – Public Hearings

United States Department of Energy
Assistant Secretary for Environmental Management
Washington, DC 20585

Volume 3 is organized into three sections:

- Section 1 - Overview
- Section 2 - Written Comments and Responses
- Section 3 - Public Hearings

The Overview sets the tone for the document by summarizing the public comment process, by explaining how the receipt of written comments and the public hearing process were handled, and by summarizing the major issues raised by commentors and DOE's responses to these issues.

Section 2 of Volume 3, "Written Comments and Responses" contains all of the written comments received by DOE on the draft EIS. Upon receipt, these documents were assigned a sequential log number to be used in tracking during the comment response process. For presentation in Volume 3, these documents maintained their original log number, but were separated into the following seven distinct "affiliation" categories:

Section 2.1 - Federal Government
Section 2.2 - State Government
Section 2.3 - Local Government
Section 2.4 - Native American Groups
Section 2.5 - Non-Government Organizations
Section 2.6 - Foreign Entities
Section 2.7 - Individuals

Since these documents retained their original log number, the reader should note that while the documents in each respective section are in ascending order, their numbering therein is not sequential.

In order for a reader to find a specific document, a full "List of Commentors" has been included in each book (or part) of Volume 3, immediately following the "Table of Contents." This "List of Commentors" has been compiled alphabetically using either the commentors last name, the name of the submitting organization, or the name of a Federal, State, Tribal, or local government branch. City and State government bodies are listed under "City of" or "State of." Members of Congress are listed by the Senator's or Representative's name, with the government branch following.

To locate a document(s):

1. Find the "List of Commentors" and the name of the individual submitting the comment (or the name of the organization or agency if the comments were submitted on their behalf), and note the page number assigned to the first page of the comment document (i.e., a document from a Native American Group would be number 2.4-1, etc.).

2. Find the Volume 3 book (or part) that contains the section and page number for which you are looking and turn to the appropriate page to find a scanned copy of the document along with the responses to each of the comments delineated therein.

the written comments, the comments received during each of the 17 public hearings. Oral comments provided at these hearings have been summarized, rather than individually identified by each respective speaker. As such, there is not a list of speakers or identification of the commentors at the public hearings. A list of all registered attendees is provided immediately following the summary of each of the public hearings.

Public Comments and Department of Energy Responses

Section 1 Overview

Section 2 Written Comments and Responses

Section 2.1 Federal Government 2.1-1
Section 2.2 State Government 2.2-1
Section 2.3 Local Government 2.3-1
Section 2.4 Native American Groups 2.4-1
Section 2.5 Non-Government Organizations 2.5-1
Section 2.6 Foreign Entities 2.6-1
Section 2.7 Individuals 2.7-1

Section 3 Public Hearings

Section 3.1 Charleston Public Hearing 3.1-1
Section 3.2 Concord Public Hearing 3.2-1
Section 3.3 Galveston Public Hearing 3.3-1
Section 3.4 Hanford Public Hearing 3.4-1
Section 3.5 Idaho Public Hearing 3.5-1
Section 3.6 Jacksonville Public Hearing 3.6-1
Section 3.7 Las Vegas Public Hearing 3.7-1
Section 3.8 Norfolk Public Hearing 3.8-1
Section 3.9 Oak Ridge Public Hearing 3.9-1
Section 3.10 Portland Public Hearing 3.10-1
Section 3.11 Savannah Public Hearing 3.11-1
Section 3.12 Seattle/Tacoma Public Hearing 3.12-1
Section 3.13 Southport Public Hearing 3.13-1
Section 3.14 North Augusta Public Hearing 3.14-1
Section 3.15 Tacoma Public Hearing 3.15-1
Section 3.16 Washington, D.C. Public Hearing 3.16-1
Section 3.17 Wilmington Public Hearing 3.17-1

Attachment 1

Transcript of Public Hearing Held in Tacoma, Washington on June 19, 1995 on the Draft Environmental Impact Statement on the Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel A.1

Attachment 2

Port and Transportation Accident Analyses of Additional Military Ports A.2

SECTION 3.0 PUBLIC HEARINGS

The public hearing at Charleston, South Carolina, a candidate port of entry, was held in the Mt. Pleasant Complex, on May 8, 1995. Twenty-eight people attended the hearing. The hearing was interactive in nature and the following is a summary of the comments and issues that were raised. The following is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided during the hearing.

ISSUES RAISED	DOE RESPONSES
A comment was made that, as is evident by the small turnout at the hearing, not many people have heard about it and the hearing was not well-advertised.	The draft EIS was mailed to more than 1500 people and an official DOE announcement of the hearing location and purpose was advertised in local newspapers. [Public service announcements were also provided to local radio stations and to cable-access television. The hearing was announced in the Federal Register concerning the EIS. In addition, 1-800 numbers were provided for pre-registration and for requesting copies of the draft EIS.]
A question was asked as to why DOE stopped accepting foreign research reactor spent nuclear fuel in 1988.	When the program of accepting foreign research reactor spent fuel expired (in 1988 for Highly Enriched Uranium (HEU) fuels and 1992 for Low Enriched Uranium (LEU) fuels), an environmental review was required prior to renewal of the policy.
Clarification was requested on the time periods covered by the EIS (e.g., 40 years, 10-15 years).	The [proposed] policy has a 10-year duration and a potential 13-year period to complete the actual shipments. The evaluation of impacts [in the EIS] cover a 40-year [interim storage] period.
A comment was made that DOE keeps referring to the port as "Charleston," but the Wando Terminal is actually in Mount Pleasant.	[Even though the Wando Terminal is in the town of Mt. Pleasant, it is considered to be part of the Greater Charleston Area and is operated as part of the "Port of Charleston."]
A comment was made that DOE has not yet perfected vitrification of high-level waste resulting from chemical separation. Commentor questioned how vitrification can be considered for the spent nuclear fuel sent to the Savannah River Site?	Chemical separation and vitrification of the high level waste are evaluated as alternatives in the draft EIS. The Defense Waste Processing Facility at Savannah River Site, which would be used for vitrifying the high-level wastes, is scheduled to start operations this year.
A question was asked as to why barge transport was not analyzed. Commentor requested that barge transport be considered for the Savannah River Site transportation because it provides for a shorter route.	Barge transportation was considered in the draft EIS but was dismissed due to added risk of additional intermodal transport activity. [In response to public comments, barge transportation was reconsidered in the final EIS and is discussed in Sections 4.2.3.6 and Appendices A and E of the EIS.]
A question was asked as to what medical group or doctor reviewed or conducted the analyses on health effects. The draft EIS Appendices do not indicate medical involvement.	REACTS (the nation's premier radiation health facilities/personnel) reviewed risk codes and analyses.
A question was asked about the effect of public comment and whether the size of the group affects the weight given the comment.	The public's input is considered in preparing the final EIS and addressing identified errors. The size of the group does not affect consideration of comments.

ISSUES RAISED	DOE RESPONSES
A question was asked as to where the vitrified waste would be stored.	Current plans are for disposal of the vitrified waste in a deep geologic repository. DOE is currently studying a potential repository site at Yucca Mountain in Nevada. [Interim storage of vitrified waste from the chemical separation of the foreign research reactor spent nuclear fuel could be at the Savannah River Site (see Sections 2.2.2.6 and 4.3.6 of the EIS.]
Comments were made strongly opposing shipments of spent nuclear fuel through Mount Pleasant. Reasons provided included the following: Mt. Pleasant does not meet criteria for receiving shipments; no railroad; poor evacuation routes; insufficient emergency response capabilities; truck shipments would pass close to schools; wind and fog conditions; and rapid growth in community, subdivisions, and businesses.	[The commentor's opposition to the use of Charleston/Mt. Pleasant is noted. As to Charleston/Mt. Pleasant not meeting the criteria for receiving shipments of foreign research reactor spent nuclear fuel, the port does meet the criteria, as discussed in Appendix D, Section D.1.9. of the EIS.] [Although Wando Terminal does not have a railroad connection, this does not remove it from consideration, as discussed in Appendix D, Section D.1.9.4.] [Section 4.2.2.3 of the EIS shows that risks resulting from a severe accident in the Charleston area would be so low that evacuation routes were not a consideration in the port selection process.] [Charleston weather, with the exception of hurricanes, is not considered extreme. Appendix D, Section D.1.9.6 of the EIS discusses severe natural phenomena.] [The population along the route from Wando to various management sites was considered in the port selection process (Appendix D, Section D.1.9.5). Although this analysis considered residential population, it does not consider day-time population concentrations such as schools. Nevertheless, the overall risk calculated is accurate, in part because overall some schools might bring children closer to the route used while others would move them further away. The risk associated with all ground transportation was found to be low.] [In regard to emergency response capabilities, DOE will ensure that those capabilities are sufficient for the ports selected for use, if foreign research reactor spent nuclear fuel is accepted by the United States.]
Two letters were read and submitted for the record by the Mayor from (1) State Port Authority and (2) Town of Mt. Pleasant.	[These are addressed in the written comments in Chapter 2 of this Volume 3.]

ISSUES RAISED	DOE RESPONSES
Recommendations were made that DOE use military ports instead of commercial ports because shipments are of national interest and the military ports have experience in handling similar cargo. Commentors specifically suggested that DOE should consider the facilities in North Charleston, in place of those at the Wando Terminal.	The EIS analyses show a safe record of shipping through commercial ports and these risks are not at a level that would preclude commercial ports. [Of the 161 ports considered by the draft EIS, eight were military ports. As the result of public comment, an additional nine military ports, five on the West Coast and four on the East Coast, were considered after the draft EIS was released. No significant reduction in risk was found by using any of the additional military ports. However, the Naval Weapons station in the Charleston, South Carolina area was found to be an excellent facility because of its low population, hazardous cargo handling experience, nuclear experience, and proximity to Interstate highways and rail lines.]
A question was asked if the selection of storage sites and ports of entry are related.	The draft EIS proposes use of any of the 10 candidate ports identified in the draft EIS. Specific ports for a given shipment will depend on shipping arrangements existing at the time. [The distance from all ports to the management site is considered in Appendix D, Section D.2 as part of the port selection process. The storage site selection was not based on proximity to ports.]
A question was asked if "No Action" is a reasonable alternative given the United States commitment to nonproliferation.	DOE and the Department of State have indicated that they do not consider No Action to be a responsible alternative, but the NEPA process requires that this alternative be addressed in an EIS. [Section 4.6 of the EIS]
A comment was made that the analysis in Appendix D is not clear as to why the Wando Terminal was chosen over the North Charleston Terminal.	[This is discussed in Appendix D, Section D.2.1.1. Wando Terminal was selected over North Charleston because of superior services and greater distance from populated areas.]
A question was asked if United States flag vessels and sailors will be used. Commentor suggested that they should be used to keep business in the United States and not disrupt port growth.	DOE has not required the use of United States vessels. Analyses in the draft EIS assume commercial vessels will be used, because experience indicates that container vessels and crew are highly qualified.
Explanation was requested as to why DOE has not provided funds to Mount Pleasant for training and response equipment.	No decision has been made on whether foreign research reactor spent nuclear fuel would come into the United States. When a decision is made, DOE will work with the States to develop a transportation plan addressing these needs.

ISSUES RAISED	DOE RESPONSES
A request was made to clarify the relationship of the DOE Programmatic Spent Nuclear Fuel and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Program EIS to this proposed Nuclear Weapons Nonproliferation Policy concerning Foreign Research Reactor Spent Nuclear Fuel EIS.	The EIS includes the five [management] sites under consideration for spent fuel management in the draft DOE Programmatic Spent Nuclear Fuel and Idaho National Engineering Laboratory (SNF & INEL) EIS [Section 1.5 of the EIS]. Decisions made under the Programmatic SNF & INEL EIS will determine the management sites for foreign research reactor spent nuclear fuel. The preferred alternative in the Programmatic SNF & INEL EIS is to store aluminum-clad spent nuclear fuel at the Savannah River Site and non-aluminum-clad spent fuel (TRIGA) at the Idaho National Engineering Laboratory. [Since the public hearing, the Programmatic EIS Record of Decision (ROD) was issued on May 30, 1995. It establishes that the Savannah River Site would receive aluminum-clad fuel and the Idaho National Engineering Laboratory would receive non-aluminum clad fuel, in the event that foreign research reactor spent nuclear fuel is accepted by the United States.]
A question was asked as to why DOE uses "approximately" in giving projected shipments, elements, volumes, etc.	It is difficult to provide precise figures for shipments and volumes projected over a ten year period into the future.
A question was asked as to the exact number of foreign research reactor spent nuclear fuel elements that could be shipped to the United States.	The current [total] estimates are up to 22,700 fuel elements or 19.2 metric tons of heavy metal (MTHM).
A question was asked as to which countries have the capability to convert reactors to LEU fuels but refuse to do so.	Three countries out of 41 have not converted to LEU, although they are physically able to do so. Countries include the Netherlands and France. [No countries have formally refused to convert their research reactors to LEU. There are three reactors in two countries (France and Belgium) that cannot be converted to use the LEU fuel available today. In addition, the operators of low-power research reactors (less than 100kw) that do not need fresh fuel for the remainder of the service life [lifetime core], do not intend to convert to LEU fuel.]
An estimate was requested of the number of weapons that could be developed if 10 percent of the HEU under the proposed policy was diverted for nuclear weapons.	It is estimated that about 18 [meant 8] nuclear weapons could be produced from 10 percent of the metric tonnage of HEU spent nuclear fuel in the proposed action. [Eighteen nuclear weapons could be made from 10 percent of the unirradiated research reactor nuclear fuel, eight from spent nuclear fuel.]
A comment was made that DOE should evaluate the impacts of shipments into Wando Terminal on the 1978 Court Order that established environmental protection conditions for developing the Wando Terminal. Commentor stated that spent nuclear fuel shipments would violate the Court Order.	[The Department of Energy was not a party to the Federal Court Order which the commentor referenced. However, a review of the court order, signed in March, 1979, indicates that none of the provisions would be violated by shipping foreign research reactor spent nuclear fuel into the Wando Terminal.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to what DOE will do permanently with the spent nuclear fuel given that facilities at the Savannah River Site are temporary and staff is decreasing.	DOE does not intend to store spent nuclear fuel permanently at the Savannah River Site. Storage is intended for an interim period pending ultimate disposal in a geologic repository. The Savannah River Site is fully capable of storing over that time period [in existing or future facilities].
A question was asked as to how personnel downsizing at the Savannah River Site will affect the ability to safely store aluminum-clad spent nuclear fuel.	Personnel reductions are not planned for spent nuclear fuel management. The Receiving Basin for Offsite Fuels (RBOF) can safely store aluminum-clad fuel. In addition to RBOF, the EIS discusses the use of one or more of the reactor disassembly basins for storing additional spent nuclear fuel elements. [The L-Reactor Disassembly Basin is considered for this purpose.]
A question was asked about the status of financial assistance DOE promised to the State of South Carolina for emergency response.	Financial assistance was part of an agreement between the State and DOE for the transport of the "urgent relief" shipment to the Savannah River Site from Sunny Point, North Carolina. Payment was stopped when the Governor of South Carolina filed suit against DOE. [Federal funding to state and local governments for maintaining emergency response programs has been provided historically by DOE, as discussed in Section 2.7.1. There are three national emergency response plans under which DOE provides radiological monitoring and assessments assistance. Under these plans, DOE provides technical advice and assistance to the State, Tribal, and local agencies involved with a radiological incident. Emergency response authorities are discussed in Section 2.7 and Appendix H of the EIS.]
Concern was expressed about the deteriorating nature of aluminum-clad fuel in pool storage and about possible deterioration in the fuel in the Receiving Basin for Offsite Fuels.	Spent [nuclear] fuel stored in the older reactor disassembly basins has degraded, because the basins were not designed for long-term storage. RBOF, which is a newer facility, has been designed for longer life and the integrity of the fuel has been maintained.
A comment was made that when DOE spent nuclear fuel deteriorated and created additional high-level waste, DOE did not do another environmental review. Commentor stated that deteriorating waste presents a "clear and present danger" and should be subject to environmental review.	[The subject of the EIS is foreign research reactor spent nuclear fuel, all of which is currently not in DOE's possession.] [All foreign research reactor spent nuclear fuel accepted under the proposed policy would either be sound fuel or failed fuel in sealed cans. Any spent nuclear fuel that arrives in failed condition will be canned prior to storage. If the fuel were to be stored wet, the condition of the spent nuclear fuel will be monitored to detect any failing fuel. In this way, no high level waste will be generated.]

ISSUES RAISED	DOE RESPONSES
Questions were asked as to why the United States should accept spent nuclear fuel from developed countries or NATO countries when they are not the threat to proliferation.	DOE wants to remove HEU from worldwide commerce. Developed countries need to set the example for less developed countries. Developed countries sell research reactors and they set the standard for the fuel cycle.
A question was asked as to why foreign research reactor spent nuclear fuel is not stored abroad until a geologic repository is available; spent nuclear fuel would then be transported only once.	DOE is concerned about continued use of HEU if the United States does not take action now. [One of the options presented in the EIS is for the United States to assist other nations to store the spent nuclear fuel overseas (Management Alternative 2, subalternative 1a, Section 4.4.1 of the EIS).]
A question was asked as to how difficult it is, and what time-frame is needed, for research reactors to convert from HEU to LEU.	The necessary tasks, such as new designs, design verification, and establishment of control systems are difficult and can take several years.
A question was asked about the impacts to public health if a cask is damaged and dropped into the river. Activities such as eating fish and swimming in the river were cited as examples of concerns.	Casks are designed against a set of criteria to withstand severe accidents. Casks are subjected to a drop test in which the cask is dropped onto an unyielding surface; they are submerged in water; they are subjected to high temperatures; and they are dropped onto a steel post. [In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel is sunk in any U.S. coastal waters, it will be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). See Appendix C, Section C.5.5 of the EIS for information on the probability of a cask sinking in coastal and deep ocean waters. Swimming or other uses of the water would not be impacted.]
A concern was expressed about the impact that a terrorist attack involving explosives would have in dispersing radioactive material.	The casks are robust and designed to withstand severe accidents. An explosion could damage everything near the cask but the contents of the cask probably would remain intact. In addition, spent nuclear fuel is a metal which is not readily dispersible. [Appendix D, Section D.5.9 discusses the consequences of a terrorist attack on a cask.]
A question was asked as to how certain DOE is that the cladding will be intact for all of the spent nuclear fuel.	It is possible that not all spent nuclear fuel has been stored the way DOE would have preferred. However, before spent nuclear fuel leaves a foreign country, it will be examined by a United States inspector [a DOE representative]. If there is a breach in the fuel, it must be canned in a sealed container, which then is placed into the cask.
A question was asked as to who owns the fuel and what is its documentation.	The foreign research reactor operators own the fuel until it is received into United States territory. All fuel that is accepted is accompanied by information as to its history, characteristics, etc. [The actual location of taking title to the foreign research reactor spent nuclear fuel is discussed in Section 2.2.1.4.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to whether the amount of plutonium in foreign research reactor spent nuclear fuel poses a nuclear proliferation or health risk.	Foreign research reactor spent nuclear fuel contains little plutonium, and there is not enough to present a proliferation risk. It is the highly enriched uranium that is the major proliferation risk.
Explanation was requested as to why the spent nuclear fuel was not sent to a country who wants it (e.g., France).	Overseas reprocessing by the French or the British is considered as an alternative [Management Alternative 2] in the EIS [Section 2.3].
A comment was made that spent nuclear fuel has been safely transported in the past.	[Foreign research reactor spent nuclear fuel has been transported safely over long distances without incident for over thirty years.]

Williams, Blake R.

Woods-Flowers, Mayor Cheryl

The public hearing for the Concord Naval Weapons Station, a candidate port of entry, was held at the Centre Concord, Concord, California on May 22, 1995. There were 177 registrants for the hearing, and approximately 240 people attended. The hearing attendees requested a format in which they presented public statements with little or no dialogue between attendees and DOE. Consequently, DOE responded to some comments in writing after the hearing. Those responses are presented in brackets [ ]. The following is a summary of the comments and issues that were raised.

ISSUES RAISED	DOE RESPONSES
A request was made to extend the comment period to 90 days. A question was asked as to who had authority to extend the public comment period. A comment was made that if citizens do not have enough time to provide comments, an injunction will be pursued.	The Secretary of Energy has authority to extend the public comment period. [Comment period was extended from June 20 to July 20, 1995, for a total of 90 days.]
A request was made for additional public hearings/information hearings. A comment was made that Oakland had an opportunity to speak in November 1993; yet Concord/Contra Costa residents did not have opportunity to attend hearings or provide comments during the scoping process.	The request for a second hearing is noted. In addition to attending public hearings, hearing attendees and the public are encouraged to provide written comments which can be addressed in detail. [Public hearings were held near the candidate ports of entry and the potential management sites. DOE considers that these actions have provided ample opportunity for the public to comment on the draft EIS.]
An announcement was made that the Concord City Council will consider this issue on June 6. The Martinez City Supervisor announced a public hearing to address issue on June 5.	[These announcements are noted.]
A comment was made that advertising for the public hearing was inadequate, did not provide enough advance notice, and that local communities were not notified by DOE of the hearing.	[An announcement of the hearing time, date, location and purpose was included in a Federal Register Notice. Notices of the hearings were disseminated through the news media, including radio, television, and newspapers. DOE requested that the hearing notice be placed within the first 10 pages of the newspaper and that the notice be published both one week and one day before the hearing. This schedule was modified to fit some local newspaper publication schedules. In addition, an 1-800 number was provided for hearing pre-registration and for requesting responses to questions about the hearing.]
A question was asked as to why Tacoma, only 250 miles from the Idaho National Engineering Laboratory site, is not selected as the port. Other ports are closer to the DOE sites than Concord.	[Tacoma is one of ten candidate ports selected by the process described in Appendix D, Section D.1.9, of the EIS. The distance from the port to the management site is only one of the considerations in selecting ports of entry for the foreign research reactor spent nuclear fuel. Other considerations such as port population, route population, port experience with handling containers, and access to the ocean will be considered in making the final selection of a port(s) of entry.]

ISSUES RAISED	DOE RESPONSES
A question was asked that if the potential for accidents is minimal, why are port population levels of concern.	The 1994 National Defense Authorization Act [which was written specifically to regulate the receipt and storage of foreign research reactor spent nuclear fuel at the Savannah River Site] states [that where economically feasible and to the maximum extent practicable], the government should use low population ports in receiving foreign research reactor spent nuclear fuel. DOE elected to apply this criterion in identifying ports of entry for all five potential [management] sites, to the extent practicable. [See Appendix D, Section D.1.9 of the EIS for the port selection criteria.]
A question was asked as to how many shipments could come into Concord.	There would be [a maximum of approximately] 180 casks shipped over 13 years, and these shipments could be divided among the three proposed ports on the West Coast.
A question was asked as to whether military ports are required for the spent [nuclear] fuel shipments.	Military ports are not required. Their handling activities are largely the same as commercial ports. However, during the public scoping process for the EIS, public comments requested that military ports be included in the analysis.
Commentors questioned why DOE would off-load at a military port. Objections to the military port included: - the ease with which military ports provide cover-up of DOE activities; - lack of security and ease of entry at the Concord NWS; - a 1942 explosion at the Concord NWS and the court-martial of 250 sailors who refused to unload nuclear cargo; - question as to whether there is missing nuclear material at Concord NWS and whether DOE can confirm or deny that there are nuclear weapons at the Concord NWS; and - desire to close the military base.	[Concord NWS was selected as one of 10 candidate ports of entry that could safely and effectively receive spent nuclear fuel from foreign research reactors. Candidate ports meet selection criteria described in Appendix D, Section D.1.9 of the EIS. Eight of the 10 ports are commercial ports. Concord NWS's security is equal to or better than that at commercial ports, but security at candidate ports is acceptable. DOE will neither confirm nor deny the presence of nuclear weapons at Concord NWS. The presence or absence of nuclear weapons at Concord NWS is not relevant to the evaluation of environmental effects conducted during the preparation of the EIS. If Concord NWS were not available, alternate ports would be used from those selected in the Record of Decision.]
Concern was expressed about the Concord NWS's capacity to off-load spent nuclear fuel shipments.	Spent nuclear fuel shipments will be in International Standards Organization (ISO) containers and Concord NWS has the experience and facilities necessary to handle these containers. [Concord NWS experience dealing with hazardous materials is further detailed in Appendix D, Section D.2.1.6 of the EIS.]

ISSUES RAISED	DOE RESPONSES
A comment was made about a Channel 2, KTVU, November 1993 study that recalled munitions incidents at the Concord NWS. These included: inadequate worker training, dropping of containers into Sacramento River, derailments, collisions, crane accidents, and inappropriately packed weapons.	[As a result of the television report the commentor cites, the Contra Costa County Board of Supervisors initiated an investigation of the allegations. Their report on the subject, "Safety at the Concord Naval Weapons Station" dated November 2, 1993, concluded in part, "There were no incidents involving explosions or radiation exposure....Many of the reported incidents were not accidents caused by Weapons Station employees but, rather, were discoveries by employees that materials being received had been damaged during loading or transit. In some cases the shipments had not been properly blocked, braced or banded."] [Concord NWS has not dropped ordnance into the water. If ordnance were dropped into the water, Concord NWS policy is to recover it without exception. Periodic dredging of the dock area has never detected or recovered ordnance.] [The safety record at Concord NWS is significantly better than that of ports in the private sector with similar activities. According to the Department of Labor statistics, for the category of marine cargo handling, the number of lost workday cases per 100 full-time workers for 1993 was 7.1 nationwide, which is typical (1994 data is not available). The number of lost workday cases per 100 workers at Concord NWS for the first three quarters of fiscal year 1995 was 5.3, which is also typical for Concord.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the Concord NWS has been a good neighbor for 50 years. The City of Concord has no official position [on the proposed action] but wants all potential environmental, safety, and health issues explored. Commentor expressed concern about public safety, transportation routes, long-term impacts, and terrorism. The City of Concord will also submit written comments.	[Health and safety were primary considerations during the evaluation of environmental effects for the proposed action. Sections 4.2.2 and 4.5 of the EIS demonstrate that risk associated with bringing spent nuclear fuel to any port analyzed in the EIS is low.] [Transportation routes are not yet selected because ports, sites, and transport modes have not yet been determined. Transportation routes would be chosen in accordance with applicable routing regulations and guidelines. Risks to the general population and workers during transportation of spent nuclear fuel from foreign research reactors were found to be low for normal operation and for severe accidents. Estimates of radiological and non-radiological risks during shipment of spent nuclear fuel over land and sea are given in Section 4 of the EIS.] [Acts of terrorism by a determined group or individual cannot be completely precluded. However, security measures at any port would meet or exceed Federal requirements (10 CFR Part 73). A discussion of terrorist attacks has been added to Section 2.8 and Appendix D, Section D.5.9 of the EIS.] [Appendix H of the EIS discusses general provisions of the Transportation Plan which is a document that provides the details associated with the transportation of spent nuclear fuel from foreign research reactors.]
A question was asked as to why DOE would choose Concord, with shipments passing under the Golden Gate Bridge and a population of 6 million people.	[Marine passage from San Francisco Bay to Concord NWS meets the requirements of Criterion 2 (Favorable Transit From Open Ocean) for port selection in the EIS. The port selection process also considered the population of the port and surrounding areas in determining that Concord NWS was an acceptable port. Other considerations, such as population along the route to the management site, port experience with handling containers, and adequate port facilities were also considered in selecting ports of entry. See Appendix D, Section D.1.9 of the EIS for details of the port selection process.]
A question was asked as to whether DOE has considered the ports of Vallejo or Mare Island.	Both these ports were reviewed but rejected because they had almost no container handling experience.

ISSUES RAISED	DOE RESPONSES
A comment was made that the draft EIS does not identify or address the issue of a high minority population in Bay Point.	[As shown in Table A-1, Appendix A of the EIS, about 26 percent of the population residing near the port was comprised of minority persons in 1990, while approximately 33% of the populations in surrounding counties were comprised of minority persons. Population criteria for port selection are discussed in Appendix D, Section D.1.9.5 of the EIS. Section 3.2.1 identifies low-income households and describes racial and ethnic composition of minority populations around each candidate port. Environmental effects were evaluated and found to have no significant beneficial or adverse effects on the general population, including minority and low-income populations (Chapter 4 of the EIS).]
A question was asked as to why Oakland was taken off the port list.	The Defense Authorization Act states "to the extent possible the government should use low population ports." Population of the port and surrounding areas to a radius of 10 miles is one of the port selection criteria [that determined that] the Port of Oakland would not be included [among the ports in the draft EIS]. [The population criterion for port selection (Criterion 5) are discussed in more detail in Appendix D, Section D.1.9.5 of the EIS.]
Comment was made that DOE needs to address economic assistance to localities. Questions asked were: Who pays for additional security, such as local law enforcement, for large demonstrations? Is there an accident fund? Who pays for social services associated with proposed action?	[Nuclear Regulatory Commission and DOE regulations require escort of shipments of spent nuclear fuel on public highways. Normally the escort is supplied by State and/or local police, but arrangements and payment are the responsibility of the shipper. No additional personnel would be required to secure the port area or temporary storage area. Historically, shipments of foreign research reactor spent nuclear fuel have been treated the same as any other hazardous material shipment. Some State and local governments, however, may impose additional requirements on shipments of foreign research reactor spent nuclear fuel. These requirements such as additional security and other services may impact State and local agencies.] [There is no "accident fund". However in the event of a nuclear accident or incident, liability coverage would be provided under the provisions of the Price-Anderson Act.] [Dealing with demonstrations is the responsibility of local and State governments, as well as the military if such demonstrations occur on military bases. However, if the demonstration were the result of the receipt of foreign research reactor spent nuclear fuel, DOE would support local or State governments or the military organization in dealing with the demonstrations.]

ISSUES RAISED	DOE RESPONSES
Comment was made that the draft EIS included inadequate analysis of economic issues for long-range land use planning.	[Concord NWS would only be used as a trans-shipping point, so no long-range land use planning is required.]
Comment was made that DOE needs to address social impacts, such as the reduction in housing value close to the Concord NWS.	[No significant negative social impacts would result from the proposed action (Chapter 4 of the EIS).]
A question was raised as to what will happen to the proposed action if there are reductions in the DOE budget and changes in areas of DOE responsibility. A comment was made that the DOE Baseline Management Environmental Report (BMER) reports excessive cleanup costs, and yet the DOE budget is being cut. What happens if responsibilities for this action are transferred to another government department?	[The management of foreign research reactor spent nuclear fuel containing United States-enriched uranium will be an issue for the United States government regardless which Federal agency has responsibility for it. The potential lack of DOE program funding is outside the scope of this EIS.]
A comment was made that costs of managing [spent nuclear] fuel should be borne by the foreign research reactor operators who benefitted from the fuel.	[Alternative financing arrangements, including full cost recovery, are discussed in Sections 2.2.1.2 and 2.2.2.3 of the EIS.]
A question was asked as to how much of the project costs will be recovered through "competitive fees."	[The range of cost recovery alternatives considered run from full cost recovery to full subsidization. The decision on the financing arrangements will be presented in the Record of Decision.]
Comments were made opposing United States' use of nuclear energy in general. Specific comments included the following: - DOE appears to be trying to subsidize nuclear programs. - The nuclear power industry covers for the nuclear weapons industry. - DOE should stop producing nuclear fuel. - Energy must be cheap and a nuclear reactor does not produce more energy than it consumes. - There should be a Manhattan Project to develop safe and renewable energy. - The United States should stop promoting nuclear power.	[Long-standing policies of the United States support peaceful applications of nuclear technology for foreign nations who agree not to develop or proliferate nuclear weaponry (Section 1.1 of the EIS). The proposed action is intended to advance U.S. nuclear weapons nonproliferation goals and encourage foreign research reactor operators to convert from HEU to LEU fuel. Foreign research reactors are not used to provide commercial power or to develop nuclear weapons. Applications for these reactors are summarized in Section 1.1 of the EIS. Regarding the development of alternative energy sources, DOE has on-going programs, beyond the scope of this EIS, to develop and promote use of alternative energy sources such as solar and wind. The production of nuclear fuel and the promotion of nuclear power are beyond the scope of this EIS.]
A question was asked as to whether DOE is planning to ship more spent nuclear fuel (other than covered under the policy), e.g., commercial fuel.	No. The proposed action of this policy does not include shipment of commercial fuel. The receipt of spent nuclear fuel from power reactors is outside the scope of this EIS.

ISSUES RAISED	DOE RESPONSES
Comments were made that the city and county should be made Nuclear-Free Zones. A commentor said that nuclear technology is not safe and peaceful.	[The establishment of Nuclear-Free Zones has been found to violate the Interstate Commerce Clause of the U.S. Constitution. Research reactors can be operated safely and they serve peaceful purposes, including medical, commercial, and educational applications. Section 1.1 of the EIS describes these applications.]
The question was asked as to why the United States should be responsible for this foreign research reactor spent nuclear fuel.	The spent nuclear fuel contains U.S.-origin enriched uranium, which is the focus of this EIS. [The intent of the proposed action is to support United States nuclear weapons nonproliferation policy seeking to reduce and eventually eliminate the use of highly enriched (weapons grade) uranium in civil programs worldwide.]
A question was asked as to why the United States is supplying nuclear material, such as low enriched uranium, to other countries.	[The United States has encouraged the use of low enriched uranium in research reactors because it cannot be used to make nuclear weapons. Converting foreign research reactors from highly enriched (weapons-grade) uranium fuel to the low enriched uranium supports the United States nuclear weapons nonproliferation policy.]
Comment was made that the draft EIS does not look holistically at nonproliferation policy.	[The EIS evaluates effects that would result from implementation of policies which support overall nuclear weapons nonproliferation objectives of the United States.]
A question was asked as to whether highly enriched uranium is the only nonproliferation problem. Comment was made that low enriched uranium reactor fuel generated plutonium.	Both highly enriched uranium and plutonium are potential nuclear weapons proliferation problems, but plutonium is a smaller risk than highly enriched uranium with respect to foreign research reactor spent nuclear fuel [because very little plutonium is produced from highly enriched uranium fuel]. When low enriched uranium is used as research reactor fuel, uranium^{238} amounts increase and plutonium production increases. However, because research reactor fuel is enriched to contain less than 20% uranium^{235} the plutonium poses less risk than the highly enriched uranium. The amount of plutonium in shipping casks would be 7 ounces. [On the average, a loaded foreign research reactor LEU spent nuclear fuel transportation cask would contain less than 13 ounces of plutonium.]
A comment was made that the seven ounces of plutonium in each cask would total 315 pounds for all the expected casks. Commentor stated that this amount is sufficient for 63 nuclear bombs and asked how this fact fit into United States nuclear weapons nonproliferation policy.	[Although the focus of this proposed policy is to return HEU, any plutonium that would be controlled by this policy is a positive aspect. Language has been added to Section 1.2 of the EIS to explain the relationship between HEU and plutonium in spent nuclear fuel from foreign research reactors.]

ISSUES RAISED	DOE RESPONSES
A comment was made that commentor did not object to receipt of spent nuclear fuel at the Concord NWS and would prefer managing spent nuclear fuel in the United States rather than having it in the hands of the Chinese, Iranian, and South African governments. Commentor requested that there be additional emergency measures in the case of an accident in the United States.	[Emergency measures are part of the port's and DOE's planning and procedures. Each port considered in the EIS has developed an Area Contingency Plan. This plan outlines response capabilities, procedures, and authorities for responding to, and recovering from, hazardous material incidents. Additionally, DOE would provide assistance to local authorities to ensure that appropriate measures were taken in the event of an accident. As part of this assistance, DOE's Radiological Assistance Program teams from the eight offices, strategically located throughout the country, would be used to coordinate and to provide remediation assistance. Details of emergency response requirements would be included in the Transportation Plan prepared prior to actual shipments. General provisions of the Transportation Plan are included in Appendix H of the EIS.]
A comment was made that most people agree that it is better to bring spent nuclear fuel to the United States safely than leave the material in other countries. Commentor stated that the real problem is the [spent nuclear] fuel storage.	[The technology for safely storing spent nuclear fuel has been in use, in one form or another, for over 40 years in the nuclear industry. Storage technologies and site management options are discussed in Sections 2.6.5.1 and 2.6.5.3 of the EIS.]
A question was asked as to the United States policy on eliminating our nuclear weapons production.	[This topic is outside the scope of this EIS.]
Comment was made that nuclear weapons production continues 15 miles away in Livermore. Livermore has 880 pounds of plutonium on an earthquake fault.	[Activities at Livermore National Laboratories and the amount of plutonium at that location are not the subjects of this EIS, nor do they have any bearing on the issues raised here.]
Comment was made opposing indefinite extension of the Non-Proliferation Treaty and opposing the pressure applied [regarding this Treaty] by the United States to other countries. Commentor stated that these countries have a right to nuclear technology.	[While the Treaty on the Non-Proliferation of Nuclear Weapons establishes the "inalienable right" to peaceful nuclear technology, it also stipulates that this provision be in conformity with the Treaty's fundamental prohibitions against providing or seeking any assistance in the manufacture of nuclear weapons or other nuclear explosive devices. While non-nuclear weapons states agree not to pursue development or acquisition of nuclear weapons or other nuclear explosive devices, the nuclear weapons states commit themselves to assist non-nuclear weapons states with peaceful applications of nuclear energy. The Reduced Enrichment for Research and Test Reactors (RERTR) program is an example of how the United States helps nations with peaceful application of nuclear energy. The Non-Proliferation Treaty was extended indefinitely by the Review and Extension Conference of the Parties to the Treaty on the Nonproliferation of Nuclear Weapons at the United Nations in New York on May 11, 1995.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to how the United States can expect China to cooperate on nuclear technology when China will not even agree to United States' patent and copyright issues.	[The non-proliferation of nuclear weapons is in China's best interest as well as the best interest of the United States and the world as a whole. China's perception of the patent and copyright issue is a separate issue.]
Commentors oppose United States acceptance of foreign research reactor spent nuclear fuel and oppose storage and transshipment in the United States.	[The commentors' opposition to management of spent nuclear fuel from foreign research reactors in the United States is noted.]
A comment was made that in this public hearing, DOE appears to be trying to "sell" the policy.	[Public hearings on the draft EIS allow the public to express opinions, voice concerns, and ask questions. In addition, the intent is to provide responses whenever possible and appropriate and to offer additional information to increase public understanding of the issues involved in the proposed action.]
A comment was made that spent nuclear fuel should remain at reactor sites until permanent disposal is developed.	[Due to financial or regulatory constraints, some research reactor operators may not be able to store spent nuclear fuel in their own country. This alternative would not fulfill the nonproliferation policy pursued by the United States to reduce and eventually eliminate highly enriched (weapons grade) uranium from civilian programs worldwide.]
A question was asked as to what percentage of incoming shipments to the United States would be from developed/developing countries.	[Approximately] 78% of the shipments would be from developed countries and 22% from developing countries.
A comment was made that if most of the shipments are from developed countries, the United States should negotiate for overseas management of their spent nuclear fuel.	[The EIS has evaluated the potential for implementing the proposed action overseas (Management Alternative 2; Section 2.3 of the EIS). However, many reactor operators cannot, at this time, manage their spent nuclear fuel in their own country (See Sections 1.1 and 1.2 of the EIS). An objective of the proposed action is to provide foreign research reactor operators with a limited period of time to develop arrangements for disposition of their spent nuclear fuel outside the United States, while avoiding reactor shut downs, and discouraging conversions from low enriched uranium fuel to highly enriched uranium fuel.]
A comment was made that foreign research reactor operators should handle their own problems.	[Due to financial or regulatory constraints, some research reactor operators may not be able to store spent nuclear fuel in their own country. This alternative would not fulfill the nonproliferation policy pursued by the United States to reduce and eventually eliminate highly enriched (weapons grade) uranium from civilian programs worldwide.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the EIS policy makes no sense until there is a final disposal policy.	[Although ultimate disposition of spent nuclear fuel from foreign research reactors is outside the scope of this EIS, the impacts of ultimate disposition are discussed in Section 4.2.7 of the EIS. DOE's position is that the foreign research reactor spent nuclear fuel would be disposed of in a geologic repository. A detailed qualitative discussion of ultimate disposition of spent nuclear fuel will be the subject of future NEPA documentation.]
A comment was made in support of international monitored retrievable storage.	[Monitored retrievable storage at a single location for all of the foreign research reactors spent nuclear fuel is not an option considered in this EIS as it is not a plausible near- or mid-term option.]
Comment was made that "Temporary Storage" is a misnomer for 40-year storage.	A 40-year management period is assumed between receipt of spent nuclear fuel and final disposal in a geologic repository [It is unclear how long it would take to ready the ultimate disposition site. The option of disposal at the Yucca Mountain site is still under consideration.]
A comment was made that if the United States begins reprocessing, it must consider that other countries may restart reprocessing and may have faulty facilities (commentor referred to the explosion at Krasnoyarsk).	[Chemical separation of spent nuclear fuel in existing facilities is not a preferred technology. Nonetheless, chemical separation remains an alternative, especially in light of DOE's substantial technical expertise in these operations and the availability of existing facilities.]
A 1970 Oak Ridge Study detailed how much it would cost to develop a reprocessing facility -- six months and $25 million.	[This comment is noted. However, as stated in the EIS, if chemical separation was used, it would be done in existing facilities.]
Several requests were made for more specific information as to which local transportation routes would be used. A question was asked as to whether DOE could do a "transportation menu" and plug in data as shipments proceed.	The Department of Transportation and the Nuclear Regulatory Commission regulations require selection of the shortest route to the nearest interstate. Final routes are not selected until implementation of a decision to use a particular port and site. [In addition to the applicable routing regulations and guidelines, the selection of the actual route would be responsive to environmental and other conditions that were in effect or could reasonably be predicted at the time of shipment. Such conditions could include adverse weather conditions, truck or road conditions, and bridge closures. In effect, the collection, analysis, and selection of these factors could be viewed as a "transportation menu."]

ISSUES RAISED	DOE RESPONSES
Comments were made, and questions asked, about transportation routes. These included the following: - routes in EIS are incomplete and there are route uncertainties; - concern about local road conditions and local traffic patterns; - use of 580, danger of Highway 4; - inadequate rail routes in Bay Point; - Benicia Bridge is the only way to Tahoe; - and Amtrak runs along transportation corridor.	[Ports, sites, routes, and transport modes have not been selected for managing foreign research reactor spent nuclear fuel in the United States since no policy of acceptance has been adopted. If Concord NWS is selected as a port of entry, then routes would be chosen in compliance with the Department of Transportation Code of Federal Regulations (49 CFR Part 397.101 (a)(2)). Routes selected could include Route 4, Route 24, and/or Waterfront Road. The State of California routing agency can designate a preferred route, which the shipments would be required to follow, in accordance with 49 CFR Part 397.103. Routes take into consideration accident rates, transit time, and population density.] [The trucks would carry ISO containers of standard size, so they would have no trouble with overpasses or bridge crossings. Existing railroad structures are strong enough to carry a fully loaded marine transport shipping cask. Results presented in Appendix E and Section 4.2.3 of the EIS show that the ground transport risks would be low along the representative routes. Other routes would also be expected to have similarly low risks including those along the Amtrak route.]
A question was asked about the number of transshipment sites and whether DOE will authorize other ports to accept the spent nuclear fuel.	The EIS identifies three ports on the West Coast, six on the East Coast, and one on the Gulf Coast that could accept the spent nuclear fuel.
A question was asked as to whether Oak Ridge or Savannah River Site shipments would be transshipped from Asia through California or through the Panama Canal.	They could travel through the West Coast ports. [However, there is no legal restriction to shipping the spent nuclear fuel through the Panama Canal.]
Questions were asked as to the type of advance notifications for truck and rail shipments and whether there will be advance notice to the California Highway Patrol.	[Shippers are required to submit proposed routes for spent nuclear fuel shipment to NRC for approval, and NRC publishes a public information circular that lists routes that have been evaluated and approved for specific spent nuclear fuel shipments. DOE is also required to notify State officials in advance of the shipment of hazardous cargoes and to notify the Governors of each State along the route at least seven days prior to each shipment. No further notifications are made by DOE.]
A request was made for exact shipment dates for every shipment and the day of the first shipments.	Shipments could begin in 1996. Exact dates are not available.

ISSUES RAISED	DOE RESPONSES
Comments were made that the draft EIS does not contain sufficient specifics on transportation safety and emergency response. Questions and comments included: - What is DOE's contribution to additional emergency response services? - Who would assist the Concord NWS emergency responders--who is responsible for emergency response and who issues special instructions to responders once the spent nuclear fuel is on the highway? - Will the Nuclear Regulatory Commission (NRC) or DOE monitor for radiation? - Will there be military security? - Accident analyses should be broken down to the local level. - It is safer if NRC is involved in the spent nuclear fuel shipments.	[Primary responsibility for emergency response to an incident would reside with State, Tribal, and local authorities. DOE would provide coordination, financial and technical assistance, and training to the State, Tribal, and local emergency response personnel. In addition, DOE has Radiological Assistance Program teams that operate from eight strategically located DOE offices around the country. Upon State, Tribal, or local request, these teams can provide technical expertise and assistance to monitor and assess radiological hazards. The teams are activated on an "as-needed" basis and generally can be ready to deploy from their home station within four hours of notification.] [Nuclear Regulatory Commission regulations relevant to shipment of radioactive material include a requirement of security escort of the shipment during land transport.] [DOE will provide radiation monitoring as needed to meet DOE and NRC regulations.] [Additional military security is unnecessary. See Appendix H of the EIS for basic security requirements. Ground transportation accident analyses are provided in Section 4.2.3 of the EIS.]
Concerns were expressed regarding construction and safety of the transportation casks. Reference was made to deteriorating casks at the Lawrence Livermore Laboratory, death resulting from exposure to the casks, and inability of the casks to exist for 24,000 years. Questions were asked about the construction of spent nuclear fuel transportation casks and whether they are lead-lined.	[Spent nuclear fuel transportation casks are designed to safely transport and shield spent nuclear fuel, not to provide long-term storage. They are also designed to preclude release of radioactive material. To date, after more than 40 years of spent nuclear fuel shipments, no radioactive contents have ever been released from a transportation cask containing spent nuclear fuel, nor has a spent nuclear fuel transportation cask ever been punctured, even as the result of an accident.] The casks are made with steel inner and outer shells. Casks are designed with different materials for different types of radiation. Lead is used to attenuate gamma radiation.
A question was asked as to whether the container ships have cranes, and, if crane availability is limited at the Concord NWS, would the Navy or contractors handle off-loading of casks.	Ships can have their own cranes, in which case the ship's crew could unload. If floating cranes are used, however, the Concord NWS would off-load. Currently the Concord NWS has a floating crane that routinely handles containers.
A comment was made that ship barge cranes are not safe.	[Standard containers are routinely unloaded at Concord NWS. Concord is scheduled to add container cranes by 1999.]

ISSUES RAISED	DOE RESPONSES
A comment was made that ISO containers are unreliable.	[ISO containers are widely used to transport various kinds of cargo, including spent nuclear fuel casks. Undamaged and well-maintained ISO containers are strong and reliable. ISO containers that would be used to transport spent research reactors fuel would be inspected for integrity prior to use. ISO containers used to carry spent nuclear fuel transportation casks have additional reinforcement.]
A question was asked as to whether ships for spent [nuclear] fuel transportation will be self-contained.	[If "self-contained" is taken to mean that the ship would be designed exclusively for this purpose, there is no need to restrict the types of vessels that might be used for transport of the spent nuclear fuel. The EIS evaluates the use of four types of ships, including purpose-built ships, for use in transporting foreign research reactor spent nuclear fuel (Section 2.6.3.2.1). No significant difference in the incident-free or accident risk were found between any of the types of ships (Sections 4.2.1 and 4.2.2). The responsibility for shipping would be with the foreign research reactor operators. However, DOE will require that only reputable shipping firms, United States or foreign flag, be used for the transport.]
A comment was made that all shipments of spent nuclear fuel should be escorted so that truckers do not make unnecessary stops within the community.	[Transport of spent nuclear fuel would be conducted in compliance with NRC regulations for physical security, including requirements for armed escorts and two-way communications with a communications center during the journey (Section 2.8, Section 5.4.2, and Appendix H of the EIS). This requirement would make the chance of unnecessary stops in a community by trucks transporting foreign research reactor spent nuclear fuel highly unlikely.]
Concern was expressed for the cancers that may be caused by this DOE action and the action of DOE to respond to health risks.	[Radiological and non-radiological environmental risks resulting from the proposed action were evaluated under conservative assumptions and found to be low (Section 4 of the EIS). The methods used in this EIS to estimate risks of cancer due to radiation exposure are accepted by the U.S. Nuclear Regulatory Commission and the International Commission on Radiological Protection.]
A comment was made questioning the accuracy of the risk estimate of one in a million chance of an accident.	[Section 4 of the EIS describes the calculational techniques, assumptions, and results of the evaluation of radiological and non-radiological health effects. More detailed discussions of the calculations and results are given in Appendices C through F.]

ISSUES RAISED	DOE RESPONSES
A comment was made that exposure to workers is inadequately explained in the draft EIS.	[Appendix D, Section D.4.3.2.1 of the EIS provides a time/distance analysis of spent nuclear fuel transportation cask handling; Section D.4.5 provides the resulting doses and risks; Appendix F, Section F.5 presents and evaluation of other dose rates from a transportation cask containing research reactor spent nuclear fuel. Marine transport workers, port workers, and ground transport workers are subject to the same limits as members of the general public: 100 mrem per year. DOE and the Department of State would also monitor the radiation doses to the workers during inspection and handling. If a worker dose approaches 100 REM in any year, other workers would be used.]
An explanation was requested about the level of exposure to school children. Commentor stated that adult exposure rates should be correctly converted for child exposure rates.	[NRC regulations limit the exposure of children, as members of the general public, to 100 mrem/year, as explained in Section 4.1.3 of the EIS. There are no separate dose rate limits set for children in unrestricted areas.]
A comment was made that, in determining impacts, DOE "levels the spike" by averaging the risk numbers of a catastrophic accident.	[The use of risk (consequence multiplied by probability of occurrence) is the appropriate technique to evaluate the negative impacts. High consequence events, such as a meteor striking Earth, must be considered with the probability of occurrence. Section 4 of the EIS describes the calculational techniques, assumptions, and results of the evaluation of radiological and non-radiological health effects. More detailed discussion of the calculations and results are given in Appendices C through F.]
An objection was made to the graph in the draft EIS comparing management of spent [nuclear] fuel radiation risks to diet soda and peanut butter consumption.	[Table 4-60 provides a comparison with risks presented in the basic implementation of the proposed action, acceptance and management of the foreign research reactor spent nuclear fuel in the United States. The table lists risks estimated to increase an individual's chance of death in any year by one in one million.]
A comment was made that the DOE risk assessment on the Livermore incinerator was off by a factor of seven.	[This comment is outside the scope of this EIS and has no bearing on the analysis of alternatives for this proposed action.]
A comment was made questioning the extent of the "affected area." Commentor suggested that everyone is affected and emphasis should be on "thinking globally and acting locally."	[The EIS evaluates accident impacts in a 50-mile radius around each candidate port. Sections 4.2.2 and 4.5 demonstrate that the risk associated with bringing spent nuclear fuel to the Concord NWS, or to any of the candidate ports analyzed in the EIS, is low, even for the most-affected individual. The proposed action is, in fact, based on "thinking globally" by implementing appropriate local activities that reduce the use of highly enriched nuclear weapons grade uranium in civilian programs worldwide.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the Figures on pages 29 and 30 of the draft EIS Summary dealing with latent cancer fatalities are misleading. Commentor stated that DOE flip-flops between probabilistic and simple numbers and advocated use of latent cancer fatalities instead of simple numbers.	[Probabilities are used to compute the expected number of latent cancer fatalities under each alternative. In the calculations for this EIS, the number of latent cancer fatalities was often less than one, which can cause confusion. The results would be easier to interpret if the number of fatalities were whole numbers. When the number of fatalities is so low that it is a fraction, then it can only be interpreted as a chance of incurring cancer. Section 4.1.3 of the EIS provides more information.]
A comment was made that the accuracy of software used in the evaluation of radiological risks is debatable. Commentor suggested that RADTRAN/RISKIND variances should be stated; there should be a sensitivity analysis; sampling methods should be addressed; and underlying assumptions should be stated.	[Software used in the evaluation of radiological risks is accepted in the nuclear safety community, including the U.S. Nuclear Regulatory Commission. For more information on these computer codes, see "Validation of the Transportation Computer Codes HIGHWAY, INTERLINE, RADTRAN 4, AND RISKIND," report number DOE/ID-10511, dated May 1995.] [The RADTRAN and RISKIND codes are discussed in Appendix E, Section E.5.1 of the EIS. The variances and sensitivity analysis are incorporated in the lower bound and upper bound risk factors in many of the tables in Appendix E. There are no sampling methods involved in performing these calculations. Underlying assumptions for this analysis are stated throughout Appendix E and Section 4 of the EIS.]
A comment was made that DOE's use of theoretical projections does not match real world scenarios.	[The EIS evaluates the risk associated with plausible incident-free and accident conditions (Section 4.2 of the EIS). The evaluation includes impacts from routine activities and credible accidents, including shipboard fires and truck accidents. The probability of a truck accident involving foreign research reactor spent nuclear fuel is estimated from historical records of similar actual truck shipments (Section 4.2.3.3). The EIS also evaluates a worst-plausible-accident in which a ship carrying spent nuclear fuel collides with a petroleum tanker, and the maximum risk is presented (Section 4.2.2.3).]
A comment was made that latent cancer fatalities in the draft EIS only address the back-end of the nuclear fuel cycle. Commentor stated that DOE must also address health risks from minimization, processing, and other fuel cycle activities and look at the long-term health risks from spent nuclear fuel.	[Section 4.3.6 of the EIS evaluates the potential impacts due to chemical separation and associated onsite activities at the Savannah River Site and Idaho National Engineering Laboratory. Other nuclear fuel cycle activities are beyond the scope of this EIS.]

ISSUES RAISED	DOE RESPONSES
A request was made that DOE examine the cumulative impacts of congested freeway travel in which individual drivers/passengers are in close contact with spent nuclear fuel truck shipments.	[The maximum radiation dose rate near a spent nuclear fuel transportation cask would be 10 mrem per hour at 2 meters from the truck. The maximum radiation dose that an individual member of the public could legally receive is 100 REM per year. Thus, for an individual driver or passenger to receive a radiation dose equal to the annual limit on a congested freeway, he or she would have to be stuck in traffic right next to the same truck for 10 hours. This possibility is implausible, so no mitigation measures are planned.]
A comment was made that DOE is dividing the environmental impacts of actions between the foreign research reactor spent nuclear fuel and military spent nuclear fuel.	[Although this EIS does deal with spent nuclear fuel, the thrust of the proposed action and the source of the fuel are different than military spent nuclear fuel. The spent nuclear fuel of interest is already overseas and the thrust is to properly manage it so that U.S. nuclear weapons nonproliferation goals are served. The two subjects, military spent nuclear fuel and foreign research reactor spent nuclear fuel, are so different as to require a separate EISs.]
Concern was expressed about terrorism (i.e., Oklahoma City type incident).	[Neither acts of terrorism nor theft of materials by a determined group or individual can be completely precluded. However, proper security measures greatly reduce the risk. Shipments of foreign research reactor spent nuclear fuel would be conducted to meet or exceed security requirements in the Code of Federal Regulations (10 CFR Part 73). Nuclear Regulatory Commission regulations for physical security include requirements for armed escorts and two-way communications with a communications center during the journey (Sections 2.8 and 5.4.2, and Appendix H of the EIS). The risk that the spent nuclear fuel could be diverted or sabotaged is also reduced because of the size and weight of the casks. Section 2.8 and Appendix D, Section D.5.9 of the EIS discuss terrorist activities that might be associated with the transportation of spent nuclear fuel from foreign research reactors. To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. Appendix H presents the general provisions of the Transportation Plan which is a document that provides the details associated with the transportation of the foreign research reactor spent nuclear fuel.]
A request was made that the EIS include information about the effects of fire and earthquakes on gas and oil pipelines that run through the Concord NWS.	[No information was put in the EIS on the subject of pipelines that pass through the candidate ports. While it is true that pipelines may rupture during an earthquake and that there may be a significant fire as the result, this type of accident was not individually analyzed because the worst plausible accident, the collision between a tanker and the ship carrying the foreign research reactor spent nuclear fuel with a resultant severe fire engulfing the damaged cask, is worse than an undamaged cask being subjected to a severe fire. See Appendix D, Section D.5.4 for a discussion of the accident analyses and their results.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE should factor into its calculations the level of petroleum shipping that goes through San Francisco Bay. It is plus or minus 47 million tons -- more than Los Angeles or Long Beach. A calamity could destroy bridges and transportation routes. The ships have to cross under 6 bridges and openings are 300 feet wide. Thirteen ships have hit the Benicia Bridge (rail) since 1975.	[The port selection criteria do not specifically consider the amount of marine traffic. In general, the number of ship mishaps is not proportional to the amount of ship traffic, because port ship traffic is slow and, even when heavy, is normally a small number of ships per hour. Hence, increasing this volume does not significantly increase the probability of an accident.]
A concern was expressed about spent nuclear fuel casks falling off trucks.	[In the unlikely event that a spent nuclear fuel transportation cask fell from a truck, the potential risks would be low. As Section 2.6.2 of the EIS states, these casks are designed and constructed to withstand significant stress without releasing their contents. The dose rate at 100 feet from a transportation cask containing foreign research reactor spent nuclear fuel is essentially zero. Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material In more than 40 years of spent nuclear fuel shipments, no spent nuclear fuel transportation cask has ever been breached or released its radioactive contents as the result of an accident.]
Concern was expressed about shipboard fires and a request was made that DOE review a 1991 Greenpeace study on ship fires.	[The memo written by Dr. Resnikoff of Greenpeace was reviewed. However, Dr. Resnikoff (Greenpeace) does not provide adequate information on the cask inventories, release fractions, and meteorological assumptions that he used in his analyses, nor does he explain any changes he may have made to the code used to predict consequences. Without full disclosure, it is impossible to determine exactly why his estimates are orders of magnitude greater than DOE's well-documented and publicly available estimates. His statements that large economic impacts would be incurred and are ignored in the DOE analyses are untrue. In fact, DOE's economic analyses are presented in the EIS (Section 4.2.2.3) and show that economic impacts would be low.] [Severe accidents involving a breach of the cask and fire sufficient to oxidize the contents were analyzed during preparation of this EIS. Information on accident analysis, including fire scenarios, is in Appendix D, Section D.5.3.1. No significantly increased impacts are predicted due to the presence of foreign research reactor spent nuclear fuel.]
A question was asked as to how it is possible to contain nuclear material for 240,000 years without a human accident.	[Intact or processed foreign research reactor spent nuclear fuel would be transported to a geologic repository for final disposition when a repository is available. This EIS does not analyze environmental impacts of disposal at a geological repository. However, Federal policy is to provide deep geologic permanent disposal that would contain nuclear material for thousands of years without human accident. See Section 4.2.7 on ultimate disposition of the spent nuclear fuel.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the draft EIS should include more disaster scenarios, and commentor asked if these were required in the EIS.	Analyses of reasonably foreseeable events is required. A broad range of accident scenarios, including severe accidents, is evaluated in Section 4.2 of the EIS.
A question was asked as to whether DOE explored Concord's local hazards, such as earthquakes, the Concord Fault, and weather (snow in the mountain pass). Commentor noted that the Association of Bay Area Governments has put together information based on a 7.1 earthquake.	[The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of seismic event is low. These casks are designed and built to withstand significant stress without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at Concord NWS to fail, is not expected to compromise the spent nuclear fuel transportation cask. While local hazards such as earthquakes, may slightly increase the probability of an accident, they would not increase the consequences of the accident, which were found to be minor for both marine and land transportation accidents (Section 4.2.2.3). Therefore, the overall low risk is essentially unchanged in seismic areas.] [Appendix E, Section E.5.2 discusses the accident assessment methodology for overland transportation. As in the case of earthquakes, the local weather hazard of snow may slightly increase the probability of an accident, but would not increase the consequences of the accident.]
A comment was made that the Western States Legal Foundation was involved in a successful campaign to keep spent nuclear fuel out of Oakland.	[Comment is noted.]
A comment was made objecting to the DOE process. Commentor stated that people in government are too far removed from the people and the people do not trust the "nuclear giants."	[The DOE public hearings and public comment response process surpasses requirements of the National Environmental Policy Act, which emphasized public participation and disclosure during evaluations of the environmental effects of Federal actions (Section 5.2.1 of the EIS). The public comment process provides a forum in which individuals and organizations may voice their concerns and state positions on the proposed action. DOE has worked towards greater involvement of the public in its present and future activities. Numerous public hearings that DOE conducted for the draft EIS reflect DOE's understanding of the importance of meaningful participation of the public in its planning process.]
Comments were made indicating lack of trust in the government and DOE. Commentors mentioned the DOE tests near Los Angeles and the town of St. George, cover-ups of testing on military personnel, Hanford activities and lack of tank monitoring, radiological tests on children, and the bombing of the Shoshone in Idaho. A comment was made that DOE cannot be trusted to tell the community if something happens during a shipment.	[DOE Secretary O'Leary has made a concerted effort to encourage public trust by providing information on past DOE actions. The public hearing format provides opportunity for an increased interaction between DOE and the public, thus serving to facilitate communication and build a sense of trust. DOE provided fact sheets, videos, and exhibits at the hearings to assist the public in gathering factual knowledge about the proposed policy alternatives and their environmental impacts.]

ISSUES RAISED	DOE RESPONSES
A comment was made about the Concord NWS's "export of death and poison."	[The commentor's opposition to the use of Concord NWS is noted.]
A comment was made opposing exploitation of women in DOE public relations videos.	[DOE policy is not to allow exploitation of any group or individual in its information products.]
A comment was made that "Grizzly Bay" and "Suisun Bay" are misspelled in the draft EIS.	[The corrections have been made in the final EIS.]

The public hearing at Galveston, Texas, a candidate port of entry, was held at the Tremont House on May 17, 1995. Forty-eight people attended the hearing. The hearing discussion was interactive in nature and the following is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided during the hearing.

ISSUES RAISED	DOE RESPONSES
A comment was made that the United States should assist foreign countries in reprocessing their spent nuclear fuel.	[The Commentor's support for implementation of Management Alternative 2 is noted (Section 2.3 of the EIS).]
A comment was made that recent Waste Isolation Pilot Plant studies indicate that it is better not to move spent nuclear fuel.	[Moving any hazardous material is not without risk and should be avoided when not necessary. In this case, however, the United States Government considers that foreign research reactor spent fuel should be removed from international commerce. As discussed in Section 4 of the EIS, implementation of the proposed policy would pose no significant risks to health or the environment.]
A question was asked as to whether DOE could account for every gram of HEU and, if not, how could this policy be effective?	DOE cannot guarantee that every gram of HEU could be recovered. However, DOE considers that gaining control of 80% of the HEU is safer than retrieving none. [DOE has a record of all HEU, leased or sold, to foreign research reactors.]
A question was asked as to the chance of extending the policy beyond 13 years.	DOE has stated in the EIS that it will not extend the policy.
A question was asked as to whether this policy applies only to foreign research reactor spent nuclear fuel.	Yes. The proposed policy in this EIS applies only to foreign research reactor spent nuclear fuel [containing uranium enriched in the United States]. A separate programmatic EIS addresses all of the DOE-owned spent nuclear fuel at United States facilities.
A question was asked as to DOE's position on nuclear-free zones.	Nuclear-free zones have not been upheld by the courts because they violate the Interstate Commerce Clause of the U.S. Constitution.
A question was asked as to whether the Port of Galveston would be required to accept these shipments if they are not wanted.	The Interstate Commerce Clause prevents Galveston from rejecting these shipments. However, DOE would work with State and local officials to determine transport routes, emergency preparedness training, etc. [Appendix H has been added to the EIS to address some of the emergency response issues.]
A question was asked as to why, since Galveston is far away from storage sites, it was selected as a candidate port.	The process through which Galveston was chosen is recorded in Appendix D. DOE notes that Galveston is closer than East Coast ports to the Idaho National Engineering Laboratory, the Nevada Test Site, and the Hanford site.
A comment was made that DOE should consider the ports of Beaumont, Corpus Christi, and/or Texas City.	[All three ports were included in the 153 commercial ports originally considered. All three were eliminated on the basis of applicable experience (Appendix D of the EIS).]

ISSUES RAISED	DOE RESPONSES
A question was asked as to what the actual point of entry would be at the Port of Galveston and whether or not any container terminal could be used.	No. Only certain terminals would be used.
A question was asked as to whether the recent announcement of the West Texas Low Level Waste Site played a role in DOE's selection of the Port of Galveston as a candidate port.	No. The West Texas Low Level Waste Site was not involved in the selection of the Port of Galveston as a candidate port.
A question was asked as to the rationale for transporting spent nuclear fuel across land and why the Port of Savannah could not be used instead.	Galveston is closer to the Idaho National Engineering Laboratory, the Nevada Test Site, and the Hanford site than any of the East Coast ports. The Savannah port is also under consideration.
A question was asked as to what the EPA requirements are and whether Tier II State requirements are being followed.	[A preliminary review of Texas Tier II requirements indicates that no report would need to be filed because foreign research reactor spent nuclear fuel is not a hazardous chemical. If the decision is to accept foreign research reactor spent nuclear fuel into the United States and if Galveston is to be one of the ports of entry, the requirements of Texas Title II would be more thoroughly reviewed. All local, State, and Federal requirements would be met.]
A question was asked as to whether the City of Galveston could establish its own safety requirements for transport within the city.	Yes. DOE would work with the State and local officials to satisfy local communities' safety requirements, if a decision is made to accept any of the foreign research reactor spent nuclear fuel into the United States.
A question was asked as to the cost of the EIS.	This EIS cost about $7 million.
A question was asked as to the estimated cost of the entire project.	The estimated cost of the entire project will be about $1 billion, but that figure is not based on any specific alternative.
A question was asked as to how much all the transportation will cost.	DOE is unsure about the cost for transportation, because DOE has not adopted a policy nor selected a preferred alternative.
A question was asked as to whether there is the possibility of a "Chernobyl effect" in a worst case scenario.	A "Chernobyl effect" is not possible because its physical characteristics are not conducive to a Chernobyl-type explosion. It is a much more stable fuel form.

ISSUES RAISED	DOE RESPONSES
A question was asked as to what would happen if a ship containing spent nuclear fuel blows up in the Houston Ship Channel and sinks.	[In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel is sunk in any United States coastal waters, it will be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). See Appendix C, Section C.5.5 of the EIS for information on the probability of a cask being sunk in coastal and deep ocean waters. The impacts of a foreign research reactor spent nuclear fuel transportation cask being sunk in coastal and deep waters are estimated in the EIS (Appendix C, Section C.5). The results of this analysis show that both the consequences and the risk of these accidents are low (Appendix C, Sections C.5.4 and C.5.5).]
A question was asked as to what would happen if a cask breaks up in the water during transport.	That is unlikely. [Spent nuclear fuel transportation casks are designed and constructed to retain their radioactive material contents, even in severe accidents. Were a cask to sink in water, it would not break up, even in the deepest waters. If the water were deep enough, the cask seal would fail due to water pressure, which would allow water to enter the cask and equalize the pressure within the cask.]
A question was asked as to how many accidents DOE has had.	DOE has had seven traffic accidents [involving spent nuclear fuel] with no radioactive releases in 40 years.
Questions were asked as to what a lethal dose of radiation would be if the cask breaks open; and what would be the impacts of an explosion that results in pieces of the cask "lying around."	This is very unlikely to happen. However, if a cask was breached, a person would receive a lethal dose of radiation if that person was within 1 to 7 meters of the cask unprotected [in the worst case]. If pieces of the casks were scattered around, the surrounding soil would have to be removed and treated. [These unlikely scenarios are discussed in Appendix D to the EIS, section D.5.9.]
A request was made for information on how many deep water ship accidents have occurred and what would be the health effects (actual numbers) of a deep water accident.	[According to data from Lloyd's of London, between 1978 and 1993, there have been 414 collisions between ships that occurred at least 10 miles offshore. See Appendix C, Section C.5.4 of the EIS for the results of sunken casks in deep water. Health effects in actual numbers are included.]
A question was asked about the impact of an accident on cities "downwind," such as Texas City.	The radiological impact would be localized. Spent nuclear fuel is a solid and its radiation will not be picked up by wind and transported "downwind." [In the unlikely event of a severe accident including partial vaporization of the solid metal fuel, the analysis performed for the EIS shows that some radioactive material could be released from the cask and distributed into the environment. However, the analysis also shows that the resultant contamination is so small that no cleanup would be required in any of the ports or surrounding areas. See Section 4.2.2.3 of the EIS for port accident impacts.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to what would happen if a petrochemical truck hits a truck with a cask.	This scenario is accounted for in the traffic risk calculations presented in Section 4 and Appendix E of the EIS.
A question was asked as to whether a history of all accidents can be included in the final EIS.	Yes. A history of all accidents can be included in the final EIS. [A history of spent nuclear fuel shipments, including accidents is presented in Appendix E, Section E.9 of the EIS.]
A question was asked as to what would happen if terrorists destroy the casement on the piers, and whether there could be an "Oklahoma City-type" explosion.	The shipments are guarded. If an Oklahoma City-type explosion occurred, the truck and surrounding area would be destroyed. However, the integrity of the cask would be maintained. The cask would be examined, monitored for radiation, and reloaded onto a truck to continue its trip. [See EIS Section 2.8 and Appendix D, Section D.5.9 of the EIS for further discussion.]
A question was asked as to what proximity [to the spent nuclear fuel would cause] prompt death would take place versus a latent cancer fatality.	It is difficult to answer this question without a specific accident scenario. [The EIS discusses health risks in Section 4.1.3, "General Radiological Health Effects." A large dose of radiation can cause prompt death, but such a dose is not possible in any reasonable accident scenario involving the transport of foreign research reactor spent nuclear fuel.]
A comment was made noting a September 1980 toxic release in Galveston and the resulting health effect on the community.	[The comment is noted.]
A question was asked as to what sensitivity analyses of the environment around each port was considered since the Galveston area is a central flyway for migratory birds.	Appendix D of the draft EIS provides details on the environmental analyses. [Sensitivity analyses of the environment were not performed for individual ports, because there were judged to be no significant environmental impacts.]
Comments were made concerning the negative economic impacts, depreciation of property values, and decreased tourism in Galveston if spent nuclear fuel was shipped through the port. Commentors suggested that these perceptions may be greater than the actual risk but nevertheless requested that DOE consider "offsets" to economic impacts upon the community.	There are no [significant adverse or beneficial] economic impacts noted in the draft EIS. [The use of any of the ports indicated by the port selection process would not impact normal commercial operations, and therefore, there should be no adverse commercial impacts or economic reaction to the use of the port. Historically, there were no adverse economic impacts on the ports that received foreign research reactor spent fuel for the thirty plus years it has been received.]
A question was asked as to who would pay port fees.	Reactor operators in developing countries will be assisted by DOE in covering the port fees. Reactor operators in developed countries are responsible for paying the port fees.
A question was asked as to who will pay for extra security.	Extra security and radiation monitoring will be borne by either DOE or the reactor operators.

ISSUES RAISED	DOE RESPONSES
A question was asked as to whether Galveston would receive compensation for the use of its port.	[The Port of] Galveston will be compensated the same as for accepting other hazardous cargo.
A question was asked as to whether DOE will supply the list of all the hearing attendees.	Yes. DOE will supply the list of all [registered] hearing attendees. [The list is included in Volume III of the EIS.]
A question was asked as to who does the emergency planning and what is considered a timely response to an accident.	There are Transportation Plans developed for each shipment. These plans are developed by DOE along with State and local officials. DOE has rapid response teams around the United States; the closest one to Galveston is in Amarillo. DOE works with local responders to provide emergency response and other assistance training. [The general provisions of the Transportation Plan are provided in Appendix H.]
Concern was expressed about the ability to evacuate Galveston in the event of an accident since Galveston cannot adequately evacuate people in the event of a hurricane. Commentor pointed out that Galveston is an island, and the only exit is by the causeway on I-45. Commentor suggested that DOE consider transportation routes.	[Each port considered in the EIS has been required to develop an Area Contingency Plan outlining the response capabilities, procedures, and authorities for responding to, and recovering from, hazardous material incidents.]
A question was asked as to what land transportation routes would be used.	DOE cannot give specifics because the routes are designated by the Nuclear Regulatory Commission. [Representative routes were evaluated for the purpose of risk analysis, but these exact routes may not be the ones selected. All routes must be approved by the Nuclear Regulatory Commission. DOE would notify the Governor of each State at least seven days in advance of each shipment.]
A comment was made that DOE should address what happens if the causeway is closed along a planned route.	[As discussed in Section 2.6.4.2 of the EIS, NRC regulations concerning route notification are set forth in 10 CFR 73. This regulation requires DOE to notify the Governor of each State along the route at least seven days prior to the shipment. Any impediments along the route would be addressed at that time.]
Questions were raised as to the type of vessels used for marine transport and requirements of these vessels. These included: Can "special purpose" ships be used, or will the "low-bid" approach be used? Can foreign flag vessels be used? Are there provisions to protect United States transportation jobs? Are there stipulations on the age and condition of the equipment?	DOE can use "special purpose" ships. Some carriers might be foreign flag. There will be equipment inspections and certifications by international authorities such as IAEA, International Maritime Organization (IMO), etc. There will not be enough shipments to impact United States transportation jobs.
A question was asked as to how many shipments will go through Galveston by month and year and how many shipments over 30 years.	If all of the fuel came through Galveston, 3 to 4 casks per month would travel through Galveston. Shipments could be made for up to 13 years. There would be about 720 marine shipments during that time.

ISSUES RAISED	DOE RESPONSES
A comment was made stressing the importance of advance planning with State and local officials prior to each shipment.	[As discussed in Section 2.6.4.2 of the EIS, NRC regulations concerning route notification are set forth in 10 CFR Part 73. This regulation requires DOE to notify the Governor of each State along the route at least seven days prior to the shipment.]
A question was asked as to whether the casks are vented.	No. The casks are not vented.
A question was asked as to who owns the shipping casks.	In some cases the shipper or the transportation company owns the shipping casks. [Some research reactors also own casks.]
A question was asked as to whether there is a chance of a back-up of shipments at the port of entry.	Spent nuclear fuel would probably leave a port within four to six hours after receipt of shipment. If there is inclement weather, the shipment would be brought onto land and kept guarded until it could be safely transported. [The spent nuclear fuel transportation cask, in most cases, would be at the port no longer than 24 hours.]
A point was made that this is the first hearing in Galveston; Galveston was not included in the scoping process. Commentor asked who made the decision to add Galveston to the list of candidate ports, and what recourse does Galveston have.	The scoping process took place in late 1993. DOE accepted comments from the public at that time. [The scoping process was open to anyone, regardless of the locations of the public hearings]. These comments were factored into the port selection process and, as a result, DOE's criteria were revised. Galveston was then included in the list of acceptable ports.
A question was asked as to how the final decision on the policy will be reached. Commentor asked if it will be a unilateral decision, and how and when will the public know where they are in this process.	The final policy will be decided upon by the Secretary of Energy and announced in the Record of Decision. The final EIS will include all public comments.
A question was asked about the impact of the public's letters and statements on DOE's decision.	Public comments do impact the development of EIS's. For example, public comments did result in changes between the scoping process and the draft EIS for this proposed policy. [Public comments are also considered in DOE's decision as to the preferred alternative in the EIS.]
A question was asked as to whether an administrative appeal process exists at DOE.	DOE does not have an administrative appeal process.
A comment was made concerning inadequate public notification, i.e., newspaper ads were too small to be noticed and not enough advance notification.	[DOE advertises public hearings in local newspapers and in radio and cable-access television announcements, as well as announcing them in the Federal Register notice. The comment on the need for better media advertising is noted.]

ISSUES RAISED	DOE RESPONSES
A comment was made referencing the lack of instruction given to public reading room officials on what to do with the EIS. At the Rosenberg Library, commentor had to get argumentative before they would look for the document. DOE should have enclosed an instruction letter.	[Comment is noted.]
A request was made for Galveston to receive a copy of all issues raised by Dr. Whorton.	[No written comments were received from any Dr. Whorton.]
A comment was made that DOE should provide videos to the public reading room and to the port authorities.	[The commentor's request for additional availability is noted. Videos were available for viewing in the exhibit area before the public hearings and were provided to attendees who requested copies.]

The public hearing at Richland, Washington, for the candidate Hanford Site, was held on June 14, 1995 at the Columbia Basin College. Two people perused exhibits and obtained materials, but no one attended the discussion portion of the hearing.

ISSUES RAISED

DOE RESPONSES

List of Attendees at Hanford, WA Public Hearing

Bradford, Eric

Clayton, Danetu

The public hearing at Idaho Falls, Idaho, for the candidate DOE management site at Idaho National Engineering Laboratory, was held at the Weston Quality Inn on May 18, 1995. Eight people attended the hearing. The hearing was interactive and the following is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided during the hearing.

ISSUES RAISED	DOE RESPONSES
Questions were raised as to whether DOE has the current capacity to reprocess non-aluminum-clad fuel, and whether the Savannah River Site canyons could process aluminum-clad fuel.	DOE currently does not process non-aluminum-clad fuel (although the Idaho National Engineering Laboratory could be upgraded to process non-aluminum-clad fuel). The Savannah River Site currently has chemical separation facilities and the capability to process the aluminum-clad fuel.
A question was asked as to whether DOE has considered French reprocessing facilities.	DOE has considered reprocessing at French facilities but currently France only reprocesses its own spent nuclear fuel and does not accept foreign [spent nuclear] fuel. However, the United Kingdom is actively soliciting reprocessing business.
A question was asked as to what agreements and obligations the Dounreay facility in the United Kingdom would be subject to under the Treaty for Non-Proliferation if it reprocesses spent nuclear fuel.	[The Dounreay Site in the United Kingdom is open to international inspection by the IAEA under the terms of the Treaty for Non-Proliferation.]
A question was asked as to the amount of money that DOE is providing for research and development on chemical separation.	DOE is providing $5 to $7 million over the next 2-3 years for pyroprocess research and development.
A question was asked as to whether a small group of people is driving the DOE policy of this EIS, and if this affects the chances of reprocessing fuel in the United States.	Reprocessing [chemical separation] is a sensitive question and it is difficult to predict its use. DOE sites may have different opinions, and these may differ from the opinion of the candidate ports and from various [members of the] public.
A question was asked about other processing techniques for spent nuclear fuel and the amount of research and development done in the United States on this issue.	Most of the proposals for new reprocessing techniques exist [only] on paper and are 10-15 years away from being usable techniques.
A comment was made that reprocessing foreign research reactor spent nuclear fuel would address the United States "balance of payment" issue.	[Under full cost recovery, a positive balance of payments would be realized for the effort.]
A question was raised as to the major obstacle to reprocessing.	The obstacles associated with reprocessing [chemical separation] include other waste streams that are produced as a result of reprocessing, and the policy of the United States not to encourage this technology. For example, the United States is encouraging the Russians to stop reprocessing spent nuclear fuel.
A question was asked whether the Japanese are building a reprocessing facility.	[The Japanese are planning to start their first industrial-scale reprocessing plant at Rokkashomura sometime after the year 2000.]

ISSUES RAISED	DOE RESPONSES
Clarification was requested of the burn-up rate of HEU.	In 1994 the burn-up rate was 60%. This information can be found in Appendix B of the EIS.
A question was raised as to the size of one metric ton of heavy metal.	One metric ton of heavy metal [MTHM] is about 200 cubic feet, including structural materials. [One MTHM of pure uranium in metallic form occupies about 1.9 cubic feet.]
A comment was made that about 19 metric tons of heavy metal spent nuclear fuel could come into the United States in Management Alternative 1, with about one metric ton going to the Idaho National Engineering Laboratory and 18 metric tons going to the Savannah River Site. The question was how much of the 18 metric tons would enter northwest ports and travel across Idaho highways.	Generally, the fuel [that would be accepted through West Coast ports] would be from southeast Asia. The specific numbers are not available, but of the total 19.2 metric tons of heavy metal, about 4.8 metric tons could come to West Coast ports and 14.4 metric tons to East Coast ports.
A comment was made that processing spent nuclear fuel into a form for dry storage is preferred.	[The commentor's preference for processing the foreign research reactor spent nuclear fuel into a suitable form for dry storage is noted.]
A question was asked as to whether the calculated risk in the EIS included chemical separation risk.	DOE has included chemical separation risks [under Management Alternative 1, Implementation Alternative 6].
Explanation was requested as to the method of calculating latent cancer fatalities and whether Environmental Protection Agency (EPA) methods were used.	DOE did not use the EPA methodology for calculating risk and latent cancer fatalities.
A comparison of the risk as presented in the EIS with other industrial occupational hazards and risks was requested.	DOE did not compare these calculations [with industrial hazards. However, a comparison with a range of common hazards in provided in Section 4.9 of the EIS.]
A comment was made that the methodology used in the EPA regulations on natural background radiation data were incorrect and should not be used in the EIS.	[DOE did not use the referenced methodologies for radiation exposure calculations.]
A question was asked whether this was the only hearing in Idaho. It was noted that the Snake River Alliance, along with Representative Crapo, asked for hearings in Twin Falls, Pocatello, and Boise.	[Although the applicable regulations require a single public hearing, DOE held 17 public hearings nationwide. The Idaho Falls hearing, in combination with the 90 day period for submitting written comments, was considered by DOE as adequate for Idaho citizens to comment.]

List of Attendees at Idaho National Engineering Laboratory Public Hearing

Braitsford, Beatrice

Downs, Terry L.

Hansen, Dick

Heiselmann, Harry W.

Jobe, Lowell A.

Pole, Joyce

Wadkins, R.P.

Whitaker, Kathleen B.

The public hearing at Jacksonville, Florida, a candidate port of entry, was held in the Prime F. Osborn III Convention Center on May 12, 1996. Five people attended the hearing. The hearing discussion was interactive in nature and the following is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided during the hearing.

ISSUES RAISED	DOE RESPONSES
A question was asked as to the location of reactors that still use HEU.	Of the countries that have research reactors, about 30 have converted to LEU and the others are in the process. Only a few of those that could convert have not yet done so. These include reactors in France and the Netherlands.
An explanation was requested as to why a country such as France would not convert to LEU.	Not all countries share the United States goal of eliminating commerce in HEU. In addition, HEU fuel for reactor operations provides more efficiency (than LEU) with an increase in operating performance at lower costs.
A question was asked as to how the decision is made on where to store the foreign research reactor spent nuclear fuel, if the fuel is to be managed in the United States.	The DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs EIS [SNF & INEL EIS] identifies the Savannah River Site as the preferred storage site for all DOE-owned aluminum-clad spent nuclear fuel, and the Idaho National Engineering Laboratory for TRIGA and other non-aluminum-clad spent nuclear fuel. [The Record of Decision for the SNF & INEL EIS was issued May 30, 1995 and includes the explanation for DOE's decision to manage types of spent nuclear fuel in this manner.]

ISSUES RAISED	DOE RESPONSES
Clarification was requested on how Price-Anderson liability coverage applies to transportation carriers in the event of an accident. Questions asked included the following: Does Price-Anderson coverage apply to incidents causing closure of a rail route or highway? Who determines if and when Price-Anderson goes into effect? Is a cask that falls off a rail car considered an accident covered under Price Anderson? Commentor noted that CSX (a transport company) supports the government in the proposed action but needs more information on how Price-Anderson would be applied. These questions will also be submitted in writing.	[The Price-Anderson system provides very broad financial protection to compensate victims for damage or injury in the event of a nuclear incident or precautionary evacuation within the United States, including accidents that might occur during the transport of spent nuclear fuel to a DOE facility.] [In addition, the Price-Anderson system provides indemnification to parties such as railroads or trucking companies who might otherwise be found liable for injury or damage to third parties, including loss of profits or damage due to the closure of a rail route or highway, if such injury or damage were caused by a nuclear incident or precautionary evacuation ordered by an authorized State or local official. However, in the absence of a particular set of facts, it is difficult to determine whether or not Price-Anderson would apply to a particular situation.] [DOE would normally determine, in the event of a nuclear incident, whether or not the provisions of Price-Anderson would be available under a particular DOE contract or as a result of a particular DOE program. Ultimately, Price-Anderson applicability could be decided by a court of law.] [If a cask were to fall off of a rail car, and this event subsequently leads to either (1) a nuclear incident (damage or injury caused by the nuclear material), or (2) a precautionary evacuation (no actual damage or injury caused by nuclear material but imminent danger of such damage or injury) that has been ordered by an authorized State or local official, Price-Anderson is likely to apply. In the absence of a nuclear incident or precautionary evacuation, liability questions would be settled through normal legal processes.]
A question was asked as to whether the final EIS will delineate the preferred type of transportation.	Yes. See Section 2.9.]
A question was asked as to whether workers unloading the casks will be aware of their contents.	Workers handling spent nuclear fuel [transportation] casks will be aware of the cask contents.
A question was asked as to how long it will take to unload spent nuclear fuel casks at the Jacksonville port and how long will it be before the casks are transported on to the Savannah River Site.	The EIS assumes 24 hours for unloading at the ports. A more realistic estimate of the duration is about 4 hours.

ISSUES RAISED	DOE RESPONSES
Clarification was requested of the volumes of spent nuclear fuel involved if foreign research reactor spent nuclear fuel is accepted into the United States.	22,700 spent nuclear fuel elements, or 19.2 metric tons of heavy metal, would be shipped to the United States [if such a decision is made] over a 13 year period. If all of the spent nuclear fuel were to be accepted through the Port of Jacksonville, the volume would be equivalent to about 3 International Shipping Organization (ISO) containers per month.
Clarification was requested of the percentage of [spent nuclear] fuel in each category of fuel type (e.g., aluminum-clad and TRIGA).	About 75% of the foreign research reactor spent nuclear fuel covered under the proposed policy is aluminum-clad fuel; the remaining 25% is TRIGA fuel.
An Edlow Group representative read a statement presenting the position of about 14 foreign research reactor operators. (A written statement was also submitted.) Statement is summarized as follows. (1) Foreign research reactors provide benefits; (2) Foreign research reactor operators always relied on United States assurances to take back U.S.-origin fuel; (3) United States acceptance of foreign research reactor's spent nuclear fuel supports nonproliferation goals; (4) With United States acceptance of foreign research reactors' spent nuclear fuel, reactor operators willingly cooperated in the RERTR program and converted to LEU; (5) Foreign research reactor operators are making long-term plans to deal with their own fuel overseas; (6) In the short-term, foreign research reactors do not have safe storage capacity; (7) Foreign research reactors' spent nuclear fuel makes up only 1% of heavy metal content of entire DOE-owned spent nuclear fuel inventory; (8) United States acceptance can be done without significant impacts; (9) While United States acceptance adds a small amount of spent nuclear fuel to DOE inventory, the trade-off is taking HEU out of world commerce; and (10) DOE should move forward with United States acceptance of foreign research reactor spent nuclear fuel.	[For DOE's response to comments in the statement, see comment document number 7 and 1130 in this Volume 3 of the EIS.]
A question was asked as to whether there are other alternatives besides reprocessing and storage.	DOE is evaluating newer technologies, but those technologies are about 10-15 years away from being ready for use. Currently, storage and reprocessing are the options.
A question was asked as to whether storage at the Idaho National Engineering Laboratory (INEL) is wet or dry.	Both Idaho National Engineering Laboratory (INEL) and the Savannah River Site use wet storage methods (spent nuclear fuel pools). INEL also currently uses dry storage methods, and the Savannah River Site could potentially use dry storage methods in the future.
A question was asked as to how DOE will deal with short- and long-term management.	DOE will use spent [nuclear] fuel storage facilities in the short-term until long-term management facilities are available.

ISSUES RAISED	DOE RESPONSES
A question was asked as to what the policy is regarding conversion of research reactors in the United States to the use of LEU.	The United States has encouraged domestic research reactors to convert to the use of LEU fuels. Most domestic research reactors have either converted, or are in the process of converting, to the use of LEU fuels.
A question was asked as to whether the proposed policy is for a finite action.	The proposed policy covers a finite amount of spent nuclear fuel to be accepted over a finite period.
A question was asked as to whether the proposed policy will be subject to renewal after the 10-year duration.	No. The 10-year duration of the policy is finite. There are no plans for extension of the policy. The intent is that foreign research reactors will have developed their own means of managing future spent nuclear fuel by the time the 10-year policy expires. [The policy would allow shipment of foreign research reactor spent nuclear fuel for a 13 year period; the additional three years is to account for the cooling of fuel discharged from the reactors during the last year of the policy.]
A question was asked as to the timeframe for final disposal of spent nuclear fuel.	The EIS assumes 40 years before a permanent disposal facility is expected to be available.

List of Attendees at Jacksonville, FL Public Hearing

Buehler, Robert

Joy, Ted

Julian, M.

Kyte, John

Stowell, Charles

The public hearing at Cashman Field, Las Vegas, Nevada, for the candidate DOE Management site at the Nevada Test Site, was held on June 12, 1995. The hearing, which was attended by fourteen people, was interactive in nature. Below is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided during the hearing.

ISSUES RAISED	DOE RESPONSES
Comments were made that low-turn-out of public citizens at the hearing is indicative of insufficient advertising for, or general apathy-among members of the public. DOE should focus on ways to reach the public, including better advertising of draft EIS availability at time of issuance. The Federal Register Notice is not sufficient advertising; and DOE should do more to get the media involved in communicating DOE programs, activities, and risk information.	[DOE complied with NEPA and other applicable laws and regulations in advertising for the public hearings. Specifically, advertising included sending public service announcements to local radio stations and to local cable access television, and placing advertisements in major newspapers in each of the hearing locations. Newspaper advertisements were published one week before each hearing and again one day before each hearing. Also, in accordance with NEPA, announcements of the hearings were published in the Federal Register.]
A comment was made stating that Nye County was not aware of the draft EIS and may not have received a copy when it was mailed to those on DOE's distribution list. Commentor stated that Nye County officials should not be overlooked.	A copy of the Draft EIS was mailed to Mr. William Offutt, Nye County Manager, Tonopah, NV; The Honorable Cameron McRea, Chairman, Nye County Commissioners, Pahrump, NV; Mr. Les Bradshaw, Manager, Nye County Nuclear Waste Repository Project Office, Tonopah, NV; and the Amargosa Valley Community Library, Amargosa Valley, NV. Copies of the Final EIS will be forwarded to the same individuals and organizations.
A comment was made that the public's perception of risk is often the result of the perpetuation of myths. Although there has been some improvement by DOE, more focus is needed on how to better communicate "the basics", i.e., rationale behind proposed action, the nature of radiation, comparison of radiation risks with other risks (e.g., hazardous chemicals), etc.	[The comment on the need for improved communication is noted. A series of fact sheets, displays, exhibits, and a video were prepared in an effort to communicate the issues addressed by the EIS.]
A comment was made that options for dealing with nuclear materials should be debated at the national level through a public consensus process.	[Under the NEPA (Section 5.2.1 of the EIS) and environmental regulations of the DOE (Section 5.2.3 of the EIS), public participation and comments are an important component of the environmental process. Although the final decision concerning management of spent nuclear fuel from foreign research reactors will be made by the Secretary of Energy, public comments on the draft EIS will be considered in reaching the final decision.]
Concern was expressed that U.S. acceptance of foreign research reactor spent nuclear fuel could be just "the foot in the door" and that DOE might eventually bring spent nuclear fuel to Nevada from all over the world--given that Yucca Mountain is the only repository site under study.	[This EIS and proposed policy apply only to foreign research reactors spent nuclear fuel containing uranium enriched in the United States. Another EIS would be required to store other nuclear material in Nevada or at any other DOE management site.]
A comment was made that the draft EIS discusses the possibility of using the Engine Maintenance and Disassembly (EMAD) facility for Phase 2 storage, but EMAD is not suitable without major modifications for spent nuclear fuel storage.	The draft EIS makes it clear that EMAD would not be used in the near-term for spent nuclear fuel storage. It is considered for Phase 2 (longer-range) storage if EMAD upgrades are made.

ISSUES RAISED	DOE RESPONSES
Concern was expressed about the cumulative risks of storing the foreign research reactor spent nuclear fuel in the United States. Commentor stated that even one additional latent cancer fatality is not acceptable and asked how many people in the room would volunteer to be that "one" latent cancer fatality.	[Cumulative impacts at the DOE management sites were found to be low and are discussed in Section 4.2.4.3 of the EIS.]
A comment was made that the United States should not store foreign research reactor spent nuclear fuel in this country or perpetuate its continued existence. Options recommended include: reprocessing, high burn-up of fuel in a reactor, transmutation and reduction of the spent nuclear fuel to its least obtainable quantity, launching of the spent nuclear fuel into the extra-terrestrial environment, and leaving the spent nuclear fuel where it is overseas.	Launching material into space has been discussed in the past but was eliminated from consideration due to consequences from a Challenger-type accident. [All realistic options are addressed in Section 2 of the EIS.]
A comment was made that commentor was not convinced of the rationale for U.S. acceptance as it relates to furthering nuclear weapons nonproliferation objectives. Commentor stated that the potential for proliferation of nuclear materials is uniform across the world and that it is not a question of "who owns it" but of "who does it best." Commentor stated that plutonium or HEU are no more secure here in the United States than overseas.	[It is in the interest of the United States to maintain leadership within the world community in the reduction of global nuclear weapons non-proliferation risk. In this leadership role, the United States has initiated the RERTR program and encouraged other nations to support it. It is important that the United States consistently support a program that has thus far proven successful in helping to prevent the spread of nuclear weapons.]
A comment was made that the draft EIS states that its main objective is to get HEU out of civilian hands; yet in certain countries, such material is already in non-government or para-military hands. Commentor suggested that the United States needs to focus on finding out "who has what," especially in light of government changes in Russia and other countries.	[The United States Government is very interested in "who has what" in regard to HEU and to remove as much of the HEU from international commerce as possible. The main objective of this proposed action is to remove foreign research reactor spent nuclear fuel containing HEU enriched in the United States from international commerce.]
A comment was made that no one has enough information on when the next earthquake, typhoon, ship sinking, or terrorist attack will occur to be able to make a decision on where to store or dispose of nuclear waste. For example, if a ship sinks or an accident happens, who gets sued? Commentor stated that there are a lot of open questions. Commentor stated that DOE needs a comprehensive, decisive approach to consider these things every step of the way and what DOE needs is "ensured utmost quality effectiveness."	[This EIS takes a comprehensive approach to considering the risks associated with the proposed action. Each alternative is analyzed and resultant risks are estimated in order to compare the various proposed alternatives and the No Action alternative. Natural events such as earthquakes and hurricanes were considered (EIS Appendix D, Section D.1.9.6), as were terrorist actions (EIS Appendix D, Section D.5.9), sinking ships (EIS Section 4.2.1). All of these evaluations concluded that the risks would be low.]
A question was asked as to who owns the foreign research reactor spent nuclear fuel.	The spent nuclear fuel contains uranium that was enriched in the United States. When the United States leased the fuel, the United Stated maintained title [ownership]. As the United States built relationships with foreign research reactor countries, it began to sell the fuel [and these] countries then assumed title. If the foreign research reactor spent nuclear fuel is accepted by the United States, the United States would then accept title.

ISSUES RAISED	DOE RESPONSES
A question was asked as to the average life of research reactors and the length of time the fuel rods are in the reactor.	The useful life of a reactor [extends from] 20 to 40 years, depending on the type of reactor and its purpose. The length of time that fuel stays in the reactor depends on the reactor type. It varies from 45 days to 40 years.
A question was asked as to when the proposed policy would start.	If DOE decides to adopt a policy, the policy would begin following issuance of the Record of Decision.
A question was asked on plans for ultimate disposition of the foreign research reactor spent nuclear fuel if it comes into the United States.	The EIS evaluates management of the spent nuclear fuel for up to 40 years, by which time it is expected that a decision would be made to dispose of the fuel in a geologic repository. [Disposal of the foreign research reactor spent nuclear fuel in a geologic repository is discussed in the EIS, Section 4.2.7.]
A question was asked if the United States is still sending HEU fuel to foreign research reactors.	As directed under the Energy Policy Act [of 1992], the United States can no longer send HEU to any research reactor except under special circumstances (i.e., reactor unable to convert). There are three reactors in Europe which would still be eligible to receive HEU under the special conditions, but the United States has not sent HEU overseas since the passage of the Energy Policy Act.
A question was asked as to the duration of the proposed policy.	The duration of the proposed policy is specified in Sections 2.2.1.1 and 2.2.2.2 of the EIS.
A question was asked as to whether U.S. storage sites are adequately secured against theft or terrorism, given the recent bombing incident [at Oklahoma].	All DOE management sites have security measures to prevent unlawful entry and sabotage. The nature of spent nuclear fuel and [the weight of transportation] casks preclude ease of theft. The bigger concern is diversion of spent nuclear fuel material in other countries.
A question was asked as to the cost for implementing the proposed policy.	Cost information for the range of alternatives is contained in the draft EIS [Section 4.8].
A question was asked as to whether international organizations have positions on this proposed policy.	The IAEA [International Atomic Energy Agency] wrote to DOE asking for renewal of the Off-Site Fuels Policy.
A question was asked as to whether private entities in Europe expressed interest in taking the spent nuclear fuel.	The (United Kingdom) Atomic Energy Authority [UKAEA] and Cogema (France) have indicated [that they have the] capabilities to reprocess the [spent nuclear] fuel at their facilities in Dounreay [United Kingdom] and Marcoule [France], respectively. [The UKAEA has expressed an interest in reprocessing some of the spent nuclear fuel. No entity has expressed interest in taking the foreign research reactor spent nuclear fuel for storage.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to who will make the final decision on the proposed policy and its alternatives.	The decision, which will be documented in a Record of Decision, will be made by the Secretary of Energy.
A question was asked as to whether overseas reprocessing would decrease the amount of spent nuclear fuel coming to the United States.	Yes, although some countries do not have the capability to store the high-level waste products resulting from reprocessing. [Under Management Alternative 2, high level waste from overseas reprocessing might be accepted in the United States.]
A question was asked as to how many fuel elements would come from Europe if the fuel is brought to the United States.	[The total amount of spent nuclear fuel from 16 countries in Europe would be 12,291 elements (9.4 MTHM [metric tons of heavy metal]) under the basic implementation.]
A question was asked as to which country has the largest amount of foreign research reactor spent nuclear fuel.	Canada has the largest amount of foreign research reactor spent nuclear fuel.
A question was asked as to who is the carrier for ocean transport.	[There has been no decision that any of the foreign research reactor spent nuclear fuel will be moved. Hence, no ocean carriers have been selected.]

Standish, Paul

The public hearing in the Hampton Roads area, a candidate port of entry, was held at Old Dominion University, located in Norfolk, Virginia, on May 15, 1995. The hearing was attended by 14 people. The hearing was interactive in nature and the following is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided at the hearing.

ISSUES RAISED	DOE RESPONSES
Clarification of the choices for spent nuclear fuel separation technology was requested.	There are two choices in separation technology. One is chemical separation in existing facilities at either the Savannah River Site or the Idaho National Engineering Laboratory. The Savannah River Site is currently operating on a limited basis. The other choice is to develop processing technologies that are an improvement over the current methods and use these to process the foreign research reactor spent nuclear fuel. One new process under development is about a year from test runs.
Clarification was requested on whether isotope separation technology was available in the United States.	Isotope separation technology already exists and is the technology by which the DOE enriches uranium for fuel. The United States began this process in 1942 for use in bombs.
Information about the costs and sources of money for the foreign research reactor spent nuclear fuel program was requested.	The assumptions for the cost analyses are described in the EIS [Section 4.8]. The options range from the United States paying all costs to the [research reactor] operators paying to return this material. The nominal approach is for the United States to pay the full costs of transporting and managing the spent nuclear fuel from developing countries and to charge developed countries a competitive fee. Numerous cost scenarios range from one billion dollars if the United States pays all costs, to nothing if the foreign research reactor operators pay these costs.
Clarification was requested about storage requirements and how the United States will pay the program costs in these times of budget/deficit reduction.	Regarding storage, DOE estimates that if all the foreign research reactor spent nuclear fuel were brought back to the United States under this program, adequate storage space would occupy about four acres of land. The question of who will pay is a valid one and has not yet been decided by DOE.
A question was asked as to whether any foreign research reactor spent nuclear fuel comes from countries that have not signed the Treaty on Non-Proliferation, such as Israel.	Yes. Israel is on the list of countries from which foreign research reactor spent nuclear fuel will be accepted. It is advantageous to include Israel [in the proposed policy] because of the United States' intent to recover nuclear weapons grade materials, such as HEU. DOE is working with the Department of State's Non-Proliferation Office on this EIS and this issue. [The only other nation involved in this proposed action that has not signed the Treaty is Pakistan.]
A question was asked if any foreign research reactor spent nuclear fuel destined for West Coast ports will go through the Panama Canal.	[Possible] transport through the Panama Canal will depend on arrangements made for each shipment. Most shipments are expected to come on regularly scheduled container ships which usually do not go through the Panama Canal. [There are no known regulatory prohibitions to using the Panama Canal for shipping spent nuclear fuel from foreign research reactors.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to which method of ground transportation has the highest risks--train or truck.	Risk in either mode is so low that, from a risk standpoint, there is no practical reason to distinguish between the two. Rail transport to a site generally takes place at a further distance from the public than trucks, which travel on the public highways and make stops at truck stops where people are located. [Impacts of ground transportation are presented in Section 4.2.3 and Appendix E of the EIS.]
A question was asked as to the criteria for port selection.	Appendix D, Section D.1.9 of the EIS provides detail on the criteria for port selection. DOE began with 153 potential commercial ports and considered routine handling experience, equipment availability, ready ocean access, transportation from port, population at the ports, and populations along transportation routes from the port to the [management] site.
A question was asked as to whether uranium is enriched in other countries.	Yes. Both Russia and China enrich uranium for their own use and for sale to client states. These countries are not included in this EIS because the scope is limited to United States-enriched HEU. The United States is trying to convince both Russia and China to establish programs like the Reduced Enrichment for Research and Test Reactors (RERTR), which is a program aimed at promoting the conversion of foreign research reactors from HEU fuel to LEU fuel and thereby further eliminate HEU from civilian commerce. [Eleven countries are known to have at least some enrichment capabilities.]
Justification was requested as to why it matters who enriched the uranium if the program goal is to reduce proliferation.	[It doesn't. However, it would be impractical to try to address all non-proliferation issues in one EIS. The established scope of this EIS is focused on U.S. origin enriched uranium.]
A request was made for information on the amount of uranium enriched in other countries in comparison with the United States.	[The United States provides approximately 40% of worldwide enrichment demand.]
A question was asked as to how many spent nuclear fuel rods are in a cask.	There could be 30 to 33 elements [in an average cask].
A question was asked if generally there is one spent nuclear fuel cask per International Standards Organization (ISO) container.	Yes. There would generally only be one cask per ISO container.
A question was asked as to how many casks are on one shipping vessel.	The number of casks could range from one to eight.
Clarification was requested on how many casks would stay at the port if eight casks were to come into Norfolk.	The intent is that [all] the [spent nuclear] fuel would be removed as soon as feasible, and 24 hours is the limit used in the EIS analysis. DOE's experience is that the shipment could be quickly moved out from the ports.

ISSUES RAISED	DOE RESPONSES
A question was asked as to whether eight casks could be in a port at one time.	DOE would restrict loads to [no more than] eight casks per shipment. In addition, there are a limited number of casks available for [research reactor spent fuel] shipments, and that will also control the number of casks per shipment.
A question was raised as to whether empty casks pose hazards.	Empty casks do not pose hazards. They are checked for radiation and purged at the DOE management site.
Clarification was requested as to whether there were other program goals, such as the United States purchasing wastes from Russia.	Purchasing waste is not part of the program. There is a DOE program, however, that involves the purchase of HEU from dismantled Russian warheads because of concern about Russia's ability to safely store HEU.
A question was raised as to whether Greenpeace might resist the foreign research reactor spent nuclear fuel activities.	Although in the past Greenpeace has strenuously resisted nuclear transport and activities, DOE believes that Greenpeace understands the importance of nuclear weapons nonproliferation and promotes actions that reduce proliferation risks. [See the written comment from Greenpeace for information on the Greenpeace position (comment number 1137, Section 2 of this volume).]
A question was asked about what sites and options are available if the program is "enacted offshore."	Most countries are as sensitive as the United States to storing spent nuclear fuel from other countries. A single storage site does not exist to handle this material from many countries. If DOE decides to store the spent nuclear fuel overseas, it would probably do so at the reactor site where it is produced. This would be expensive due to the number of sites involved. The EIS evaluates this option and explains that it is unmanageable. [See Management Alternative 2, subalternative 1a, Section 4.4.1 of the EIS.] There are two possible sites in Western Europe that could reprocess [this type of spent nuclear fuel]--[Dounreay] in the United Kingdom and Marcoule in France. France's facility in Marcoule currently does not accept spent nuclear fuel from other nations for reprocessing. The United Kingdom is willing to accept spent nuclear fuel from other countries, but is limited, as is Marcoule, to accepting HEU fuels for reprocessing. They also require the reactor operator to take back the wastes from reprocessing and permit the separated uranium to be HEU or LEU--whichever the customer requests.
Questions were asked about France's position on the DOE options, France's promotion of breeder reactors to other countries, and whether the United States could obtain the spent nuclear fuel from other breeder reactors in other countries.	This issue is out of the scope of the EIS. However, while France has sent research reactors to other countries, it has not promoted breeder reactors in other countries.

ISSUES RAISED	DOE RESPONSES
A comment was made pointing out risks from terrorist activities. Commentor observed that, in 1968, DuPont developed "red mercury," and current literature suggests that this could be used in the ultimate bomb by terrorists. Commentor asked what contingencies exist to protect against terrorists and, if red mercury is like a tiny neutron bomb, what will happen if it is used by terrorists.	The [foreign research reactor spent nuclear fuel] shipments will be guarded. However, the real protection is in the nature of the material itself and the container in which it is housed. [Transportation casks used for international shipment of foreign research reactor spent nuclear fuel weigh between 10 and 25.5 tons] A typical cask [used for inter-DOE site rail shipments] weighs between 100 and 120 tons; both are very robust. An explosion near the [smaller] container would probably knock it over and destroy everything around it, but the spent nuclear fuel elements would be expected to remain intact. [Section 2.8 and Appendix D, Section D.5.9 of the EIS discuss terrorism and sabotage.] ["Red mercury" is outside the scope of this EIS.]
A question was asked as to what might be the main problem for this spent nuclear fuel program.	There are two major problem areas: costs and convincing the public that managing the spent nuclear fuel is an appropriate option.
A question was asked as to whether or not DOE expected public resistance to the program.	[If you mean physical resistance, the answer is "No."] There were no major road blocks to the Urgent-Relief shipment of spent fuel from four countries which took place in late 1994. Although there were high public tensions in some communities, it should be noted that nothing adverse happened during the shipment.
A request was made for DOE to review an article that proposed use of an incinerator to dispose of radioactive waste.	Incineration, a treatment technology using combustion at high temperatures to burn materials to destroy hazardous waste, is a chemical reaction. The character of atoms in the nucleus of radioactive material remains unchanged by fire [or high temperatures. Therefore, incineration is not an option for disposing of radioactive waste, although it is used to reduce the volume of certain radioactive wastes.]
A comment was made that the United States is looking at future problems if it does not encourage further nuclear technology development. Commentor stated hope that fission technology will break through political powers and provide links to countries like North Korea and Iran.	[The commentor's concerns and aspirations are noted.]

The public hearing was held on June 16, 1995 at Pollard Auditorium in Oak Ridge, Tennessee, for the candidate DOE Management site at Oak Ridge. Fifteen people attended the hearing. The format of the hearing was interactive in nature. Below is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided at the hearing.

ISSUES RAISED	DOE RESPONSES
A comment was made that there appear to be two separate issues DOE is addressing: (1) What to do with spent nuclear fuel whether it is highly enriched or not; and (2) whether the United States will allow the continued use of HEU in research reactors. Commentor requested elaboration.	The proposed policy addresses two primary goals of the United States. One is to obtain control of all U.S.-origin HEU. The other is to create an environment whereby foreign research reactors will continue with an LEU fuel cycle. This latter goal is why the proposed policy includes U.S. management of LEU. Without creating an incentive for conversion to an LEU fuel cycle (i.e., U.S. acceptance of their spent nuclear fuel, whether HEU or LEU), foreign research reactors are likely to send their fuel to reprocessing facilities in the United Kingdom or France and receive back HEU for their fuel. [Regarding the issue of what to do with spent nuclear fuel, the proposed management alternatives include options for managing materials containing both LEU and HEU, as discussed in Sections 2.2 through 2.4 of the EIS. As to whether the United States will allow continued use of HEU in research reactors: the United States has not sold HEU for 3 years and is only allowed by U.S. law to provide HEU to reactors that are unable to convert to LEU at present. The proposed policy is intended to encourage conversion to LEU and ultimately eliminate the use of HEU in worldwide commerce.]

ISSUES RAISED	DOE RESPONSES
A question was asked concerning the relationship of this draft EIS to the "Urgent-Relief" Environmental Assessment, against which the State of South Carolina filed suit. Commentor asked about the status of that lawsuit.	As DOE started planning for the EIS, some foreign research reactor operators indicated critical situations in which their reactors would have to be shut down in the very near-term unless they received "urgent relief." The "Urgent-Relief" Environmental Assessment was prepared to address the need for urgent-relief shipments to the United States of [up to] 409 fuel elements [to ensure that the reactor operator continue to cooperate with U.S. nuclear weapons non-proliferation programs until the EIS could be completed and a Record of Decision issued]. A Finding of No Significant Impact was issued on the Environmental Assessment in April 1994, and the first shipment took place in August 1994 (144 elements from 4 countries). While the first shipment was at sea, the State of South Carolina filed suit. The primary concern was the separation of the urgent-relief shipments from the EIS. The Court allowed DOE to accept the first shipment into the Savannah River Site, but the second shipment was halted, and no shipments into the United States from foreign research reactors have occurred since. The lawsuit is still pending. DOE recently argued its case before the Court, stating its position that the Environmental Assessment was sufficient for the urgent-relief shipments, and that DOE wants the remaining elements to be shipped to Savannah River Site. [On August 23, a Federal appeals court overruled the District Court's order blocking the shipment of fuel. This opens the way for shipment of the remaining Urgent-Relief fuel.]
Elaboration was requested on the attitudes of foreign research reactors and their governments with respect to the proposed policy.	As expressed in comments at other public hearings by the Edlow Group, which represents 14 foreign research reactor operators, they believe that the United States is legally obligated, from past agreements and commitments, to accept the spent fuel containing U.S. origin enriched uranium. DOE disagrees that is it legally obligated and considers it has the right to choose the "No-Action" Alternative in the EIS. Foreign research reactor representatives have stated that if the United States takes no action to relieve them of their spent nuclear fuel, many of them would likely send their spent nuclear fuel to reprocessing facilities and convert back to HEU, [which is] more efficient and less costly. The State Department and DOE consider it important to get our allies on an LEU fuel cycle to help in our negotiations with Russia and China (the other major providers of enriched uranium) to do the same.
A question was asked as to whether the United States owns the foreign research reactor fuel and whether that is why some believe the United States has a legal responsibility to take it back.	Early on, the United States leased fuel to foreign research reactors and thus maintained title. As operation of the foreign research reactors matured, the United States began selling the enriched uranium fuel and, thus, gave up ownership. The proposed policy applies to enriched uranium of U.S. origin--whether or not the fuel is owned by the United States. If the spent nuclear fuel is accepted into the United States, the United States would assume ownership.

ISSUES RAISED	DOE RESPONSES
A question was asked concerning the basis for giving foreign research reactor spent nuclear fuel priority over U.S. commercial fuel--given that commercial U.S. utilities have paid over $6 billion into the Nuclear Waste Fund and that the Nuclear Waste Policy Amendments Act of 1987 calls for DOE acceptance of commercial spent nuclear fuel by 1998 (for interim storage in a Monitored Retrievable Storage Facility). Commentor stated that DOE appears to be sending a message that commercial spent nuclear fuel is low on the priority list and that this is not a good message to send.	[The foreign research reactor spent nuclear fuel that might be accepted by DOE under the proposed action would comprise only about 1% of the spent nuclear fuel (measured in MTHM - metric tons of heavy metal) that is already being managed by DOE. It would be less than about 0.05% of the commercial spent fuel currently being stored in the United States. Thus, there is a vast difference in the resources that would be needed to manage the two spent nuclear fuel types. Furthermore, due to the significant differences in the size and characteristics of the two different types of spent nuclear fuel (EIS Section 2.6.1), the facilities that would be used for management of the foreign research reactor spent nuclear fuel could not be used for commercial power reactor spent nuclear fuel. At the same time, due to the weapons-grade uranium content of much of the foreign research reactor spent nuclear fuel, there is a pressing need for action by DOE to manage it (EIS Sections 1.1 and 1.2). The proposed action by DOE to manage the foreign research reactor spent nuclear fuel now is not a case of giving this spent nuclear fuel priority over the commercial power reactor spent nuclear fuel. DOE is simply proposing to deal with this separate issue now because it is feasible to do so, and necessary to do so. DOE will separately continue to work toward a solution to the commercial power reactor spent nuclear fuel disposal issue as rapidly as possible.]
A comment was made that in the past, the United States adopted a policy to bring back U.S.-origin HEU foreign research reactor spent nuclear fuel for reprocessing. U.S. reprocessing has since ceased. Now the United States appears to be trying to convince people that it is better to bring in the foreign research reactor spent nuclear fuel and sequester it for storage. Commentor asked whether U.S. storage is the preferred option by the State Department and DOE.	[There was no preferred alternative in the draft EIS. Section 2.9 of the final EIS for the preferred alternative.]
A comment was made that, in the past, it was hard to convince environmental groups that United States acceptance of foreign research reactor spent nuclear fuel was a preferable option. Commentor asked what was their position now?	Environmental groups such as Greenpeace and NRDC [National Resources Defense Council] have consistently opposed reprocessing, whether overseas or in the United States. NRDC has indicated its general support for United States acceptance of U.S.-origin HEU foreign research reactor spent fuel as long as it is not going to be reprocessed.
A question was asked as to the time-frame covered in the EIS.	The EIS covers a policy duration of 10 years for acceptance in the United States or management overseas of the foreign research reactor spent nuclear fuel, with an additional 3-year window to allow for completion of shipments. The EIS assumes interim management of the [spent nuclear] fuel, if brought into the United States, for a 40-year period, at which time it is assumed that a geologic repository will be available.

ISSUES RAISED	DOE RESPONSES
A comment was made that the EIS should address the implications of not having a permanent repository available for disposal of foreign research reactor spent nuclear fuel within 40 years, which is likely to happen if Yucca Mountain is found to be unsuitable. Commentor stated that communities around interim storage sites should be informed of the potential for longer-term storage beyond 40 years.	[Due to the speculative nature of spent nuclear fuel ultimate disposition, this subject is out of the scope of this EIS.]
A comment was made that the draft EIS shows higher risks (primarily to workers) from reprocessing than for storage of spent nuclear fuel. However, the risk analysis does not show the true risks of not reprocessing. Those risks could be higher because some highly enriched uranium fuel may not be suitable for geologic disposal without further action on the waste form due to criticality concerns. Commentor further stated that performance assessments by Sandia National Laboratories indicate that some fuel would not be acceptable for geologic disposal without some form of reprocessing.	Waste acceptance criteria are not yet available for the [geologic] repository. Some intact HEU may not be acceptable in a repository without some change in the nature of the spent nuclear fuel. However, this does not necessarily mean reprocessing is the only option. Because waste acceptance criteria are not currently available, ultimate disposal of the foreign research reactor spent nuclear fuel in a geologic repository is only qualitatively addressed in the draft EIS (Chapter 4). With regard to reprocessing, the draft EIS states that reprocessing is not a preferred technology. In the Interim Management of Nuclear Materials draft EIS, issued in March 1995, DOE addresses the alternative of reprocessing for only DOE-owned fuel that may present a health and safety concern.
A comment was made that the draft EIS risk estimates (exposures to radiation) are based on the maximum possible activity (conservative estimates) rather than what is more likely to occur. Commentor requested that the EIS include more discussion emphasizing the conservatism of the analyses or use more realistic assumptions. Commentor stated that this is important to public understanding, particularly with respect to risks of spent nuclear fuel transportation, which is of most concern to the public. Commentor suggested that DOE could use the next best approximation of dose estimates, showing a range of estimates to account for burnup of the fuel.	[The evaluation of incident-free doses for marine and port activities were calculated using both the regulatory limit and the "historic" dose rates. See Appendices C and D of the EIS for the results. Ground transportation doses were calculated only at the regulatory limits, but the "historic" doses would be approximately 10% of the regulatory limit doses. The risks can be scaled the same way. As discussed in Section 4 and Appendices B through E of the EIS, risks associated with handling and transporting spent nuclear fuel from foreign research reactors would be low. Foreign research reactor spent nuclear fuel has been transported to management sites in the United States for over three decades without radiological incident]
A comment was made that the Nuclear Waste Policy Amendments Act (NWPAA) of 1987 prohibits development of a Monitored Retrievable Storage (MRS) Facility in Nevada. If foreign research reactor spent nuclear fuel were stored at the Nevada Test Site, couldn't that be considered an MRS and contrary to NWPAA?	The NWPAA [prohibition in Nevada] applies only to [development of an MRS for U.S.] commercial spent nuclear fuel.
A comment was made that DOE may not have as many interim storage alternatives as it thinks if the States choose to fight alternative selection in the courts (i.e., Idaho).	[The comment is noted.]

ISSUES RAISED	DOE RESPONSES
Elaboration was requested on spent nuclear fuel storage facilities at the Savannah River Site.	The Savannah River Site would accept aluminum-clad fuel, consistent with the May 30, 1995 Record of Decision on the Programmic EIS [Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement]. In the near-term, spent nuclear fuel would be received for wet storage at the Receiving Basin for Off-Site Fuels (RBOF), which currently stores foreign research reactor spent nuclear fuel. When RBOF reaches capacity, foreign research reactor spent nuclear fuel would be received at the L-Reactor Disassembly Basin. During the 13-year period of shipments, it is anticipated that L-Reactor Disassembly Basin will also reach capacity, and new storage capacity will be needed at Savannah River Site. The draft EIS assumes under the basic implementation of [Management] Alternative 1 that new facilities will be for dry storage. Wet storage of aluminum-clad spent nuclear fuel is a disadvantage because of the corrosion potential. RBOF and L-Reactor Disassembly Basin are sufficient for near-term storage, but dry storage is assumed for longer-term storage.
A comment was made that DOE should consider financial benefits for localities for accepting foreign research reactor spent nuclear fuel under this policy. Such benefits have been considered for other DOE programs. Commentor suggested that the cost analyses in the EIS should address such payments.	[No "payments" are planned to localities for accepting foreign research reactor spent nuclear fuel, due to the minimal impacts such an action would entail and the subsequential nuclear weapons nonproliferation benefits that would result.]
A comment was made that Appendix F, concerning potential impacts to Oak Ridge, states that the use of Bear Creek for wet storage of the foreign research reactor spent nuclear fuel is consistent with land use plans. Commentor pointed out that it is unclear whose land use plans are being addressed and asked for further elaboration.	[DOE's plans are referenced in Appendix F of the EIS (MMES, 1994).]
A question was asked as to what is going to happen with the current spent nuclear fuel stored at the Savannah River Site.	The Interim Management of Nuclear Materials EIS [issued in March 1995] addresses the alternatives for managing the Savannah River Site spent nuclear fuel.
A comment was made urging DOE to extend the comment period to demonstrate a genuine interest in receiving public comments in a meaningful way. Commentor stated that the sincerity of DOE is tied to how long it gives the public time to comment.	[The public comment period was extended from 60 days to 90 days, ending on July 20, 1995.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE would get more people at its hearings if the hearings were not held on Friday nights.	[Comment is noted.]
An interest was expressed concerning attendance at hearings at other sites.	DOE identified the number of attendees at the various public hearings. [The number of attendees at all public hearings is included in Volume III of the Final EIS.]
A question was asked as to the means of advertising the public hearings other than newspaper advertisements.	Advertisements in the form of announcements on the radio and on cable-access channels were used in addition to the Federal Register announcements.
A comment was made that if DOE is genuinely interested in receiving participation in hearings and obtaining comments from local governments, these entities should have received formal requests, with sufficient advance notice, so that they have time to respond. The Mayor of Oak Ridge did not receive advance notice, according to commentor.	[Comment is noted, and the Mayor of Oak Ridge has been added to DOE's mailing list for future notifications. DOE complied with NEPA and other applicable laws and regulations in advertising for the public hearings. Specifically, advertising included sending public service announcements to local radio stations and to local cable access television, and placing advertisements in major newspapers in each of the hearing locations. Newspaper advertisements were published one week before each hearing and again one day before each hearing. Also, in accordance with NEPA, announcements of the hearings were published in the Federal Register.]

The public hearing at Portland, Oregon, a candidate port of entry, was held at the Portland Marriott on May 25, 1995. About 85 people, 61 of whom registered, attended the hearing. The hearing attendees requested a format in which they presented public statements with little or no dialogue between attendees and the DOE. Therefore, most DOE responses were not given at the hearing, but are provided in brackets [ ]. The following is a summary of the comments and issues that were raised.

ISSUES RAISED	DOE RESPONSES
Objections were made to the question and answer hearing format and to the lack of a recording system. Commentors objected to notetakers summarizing key issues as opposed to recording the hearing verbatim. Specific comments supporting the objection included: - DOE failed to meet DOE regulations and the National Environmental Policy Act (NEPA) regulations. - It is not clear that NEPA would permit this format. DOE may be asking us to take part in an illegal hearing. - Without a recorded hearing, people cannot have a statement considered for the record or monitor the administrative record for accuracy in reflecting issues and responses. - Commentors wish to read their name and comments in the final EIS. - DOE cannot be trusted to correctly report the testimony. - Notetakers and the hearing facilitator are DOE contractors and may not be objective. - Page 49 of the draft EIS Summary refers to the hearings as hearings. - Recorded public testimony protects DOE and the public in case of an adjudicatory process. - The onus should not be on the people attending the hearing to write down their comments and use their stamps. - DOE was un-democratic in not including the public in the decision not to record the hearing.	This hearing format is acceptable according to the National Environmental Policy Act (NEPA), and DOE plans to use the format for all 17 public hearings. [At the majority of hearings the format was well received. The method of recording comments was determined by DOE General Counsel to be in compliance with DOE requirements and the Council on Environmental Quality (CEQ) regulations implementing NEPA. During the hearings, an independent, professional facilitator recorded the major comment themes on flip charts that the audience could see. Notetakers in the audience provided additional information to supplement the points captured by the facilitator. DOE also encouraged the submittal of written comments on forms available during the public hearings or in any other written form.] [The names of those individuals who registered for the hearing are listed in Volume 3. DOE's responses to the issues raised at the hearing are included in Chapter 3 of Volume 3.] [DOE responded to the issues presented in general. Notetakers often used specific phrases of the commentors, but an individuals comments may be included in several of the issues raised.]
A question was asked as to the position within the DOE of Mr. Charles Head, the DOE hearing official.	Mr. Head is the Project Manager for the EIS.
A question was asked as to whether the law requires maintenance of an audio record of the hearing and whether DOE was obligated to have another hearing if the hearing format is illegal.	[An audio record of the public hearing is not required. The format adopted by DOE for the public hearings complies fully with the requirements of NEPA implementing regulations and DOE requirements.]

ISSUES RAISED	DOE RESPONSES
Comments were made about errors in comment response documents. A commentor stated that he was misquoted in DOE's Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement (SNF & INEL EIS) comment/response system and wants to see a correction. A question was asked as to the process of correcting mistakes made in the comment response document. The commentor stated that a written statement of the correction should be mailed to the commentor.	[The DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement has been completed and was issued in final form in April 1995. DOE regrets if the commentor's position was misinterpreted.]
A question was asked as to what can be done about errors in the draft EIS.	DOE addresses errors in the final EIS.
Comments were made that DOE had done a poor job notifying the public of the hearing. Specific comments include the following: - The ad was not placed in a prominent position in the newspaper. - The ads were designed not to get public involvement. - There was insufficient local media coverage. The public in Spokane and Vancouver may not have seen or heard notice of the hearings. - In order to have a reasonable understanding of the concerns of the people of Portland, 75% of them need to be aware of the hearing. - If it were not for Heart of America, citizens would not have known about this hearing. - Individuals on DOE mailing lists did not receive any of the documents.	DOE used standard processes for disseminating the information including radio announcements and newspaper notices. DOE also requested that the ad be placed within the first 10 pages. [Newspaper notice was requested to be published both one week and one day before each hearing. This schedule was modified to fit some local newspaper publication schedules. The hearing was also announced in a Federal Register Notice and public service announcements were sent to local cable access television stations.]
A comment was made that information on the hearing was available through local radio and the newspaper. The commentor noted that KINK radio did a good job in advertising this hearing and the *Oregonian* placed the hearing notice on the 3rd page.	[The comment is noted.]
A comment was made that neither the Tacoma library nor the appropriate Portland officials received a copy of the EIS.	[Copies of the draft EIS were sent May 30, 1995 to the Tacoma Public Library, Tacoma Avenue South and the Tacoma Public Library-McCormick Branch, in Tacoma WA. The EIS was also distributed to local planning officials and civic institutions in potentially affected areas, as well as to DOE reading rooms, libraries, and federal, state, Tribal and local governments.]
An objection was raised to holding the hearing for the Port of Tacoma, WA in a location that was 30 miles from either Seattle or Tacoma.	[In order to provide a hearing opportunity within the city of Tacoma, DOE held a public hearing at the Tacoma Public Utilities Building in Tacoma on June 19, 1995 in addition to the May 24, 1995 public hearing near the Seattle/Tacoma International Airport.]
A comment was made in support of a workshop with off-the-record dialogue prior to a public hearing.	[The commentor's suggestion is noted.]
A question was asked as to why the people in Portland could not vote on the issue of accepting spent nuclear fuel in Portland.	This action is conducted under NEPA and not by a referendum process. The public, however, has an opportunity to comment during the comment period.

ISSUES RAISED	DOE RESPONSES
A question was asked as to the names of those in DOE responsible for the policy action. Commentor also asked who suggested bringing the spent nuclear fuel to Portland.	DOE and the Department of State are the responsible agencies. The heads of these agencies are Secretary O'Leary and Secretary Christopher, respectively. The draft EIS analyzed environmental effects of management alternatives and their implementation. The port selection process is outlined in Appendix D of the EIS. Portland was one of 153 potential ports (plus 8 military ports) considered. These ports were evaluated against selection criteria, resulting in 10 ports that met all the criteria.
A comment was made that if DOE does not respond to each question asked, DOE will be responding in the Federal District Court.	[DOE has responded to all issues raised at public hearings.]
A comment was made that the issue of hearing process needs to go to the Governor and City Council. Commentor stated that the City of Seattle will take DOE to court for indefensible process.	[DOE adopted a format that provided opportunity for increased interaction between DOE and the public. This hearing format is acceptable according to NEPA. The method of recording comments was determined by DOE General Counsel to be in compliance with DOE requirements and the Council on Environmental Quality (CEQ) regulations.]
A comment was made that Oregon Congressional Representatives Furse and Wyden submitted their statements for the record through Heart of America Northwest. Commentor said that Oregon Representative Bunn and Senator Packwood also signed a letter opposing this program.	[The commentors' opposition to bringing foreign research reactor spent nuclear fuel into the United States is noted. Sections 4.2.2 and 4.5 of the EIS demonstrate that the risk associated with bringing spent nuclear fuel to the Port of Portland, or to any of the ports analyzed in the EIS, is low.]
Concern was expressed that, according to the draft EIS, developed countries would pay only the shipment costs, not the long-term storage costs. Commentor noted that a disposal site is 20 years behind schedule--"a site that will never open." Commentor noted that DOE charges hundreds of thousands of dollars to deal with waste at Hanford; yet, our allies are not being asked to pay this cost.	[Several financing arrangements are discussed in Sections 2.2.1.2 and 2.2.2.3 of the EIS ranging from charging all countries full cost recovery fee to manage their spent nuclear fuel to full subsidization of all countries by the United States.]
A question was asked whether once HEU is blended to LEU, it could still be used in nuclear weapons and could the uranium be re-enriched.	[LEU is not suitable for use in nuclear weapons. However,] the uranium could be re-enriched, [but it would require high technology equipment.]
A comment was made stating that this policy incorporates less than 4 percent of the highly enriched uranium in the world. Commentor said that this amount of highly enriched uranium could be taken back in less than 10 shipments rather than the 780 proposed in the EIS.	[It is logistically, and technically impossible to bring back approximately 11,250 HEU research reactor spent nuclear fuel elements (which is half of all foreign research reactor spent nuclear fuel considered under Management Alternative 1) in ten shipments of the largest available power reactor spent fuel transportation cask. Examples of limitations include, but not limited to: research reactor facility capability to handel a heavy (125 or more ton) transportation cask, research reactor facility capability to prepare and package the research reactor spent nuclear fuel to emplace it in a larger power reactor spent nuclear fuel transportation cask, cask, and research reactor facility access to rail lines for transporting the transportation cask. Even if all these limitations were somehow resolved, then the HEU spent nuclear fuel elements require between 40 to 100 power reactor transportation cask shipments.]

ISSUES RAISED	DOE RESPONSES
Commentor suggests that the policy is a trade policy related to reactor and uranium sites. Commentor also stated a company in Washington has developed a dry cask storage technology; United States needs to export technology rather than import waste.	[The proposed policy is not a trade policy. The Energy Policy Act of 1992 prohibits the United States from selling HEU to foreign countries, with certain stringent exceptions. However, U.S. nuclear weapons nonproliferation policy is to reduce and ultimately eliminate worldwide commerce in HEU. Failure to accept the foreign research reactor spent nuclear fuel would undermine U.S. credibility needed for successful efforts to convert foreign research reactors to LEU, as discussed in Section 1.2 of the EIS. In regard to the purchase of LEU by foreign research reactor operations, several sources of supply are available worldwide.] [The EIS provides a discussion of applicable storage technologies, including dry cask storage (Section 2.6.5). If Management Alternative 2 is selected, there may be overseas opportunities for commercially-developed storage technologies.]
Comments were made questioning why the United States needs to accept spent nuclear fuel from countries that are not a proliferation risk. Commentor stated that only 3 casks--2 from Pakistan, and 1 from Iran--are from proliferating risk countries.	[Of the 41 countries that would be covered under the proposed policy, the majority do not pose a direct proliferation risk. However, many of these countries that have converted to LEU may switch back to HEU to fuel their research reactors if the United States does not accept their spent nuclear fuel. These countries could indeed buy HEU -- Russia and China have both supplied HEU in the past. The suggestion that spent nuclear fuel should be accepted only from nations that are proliferation risks also leads to the problem of identifying these countries. As discussed in Section 2.8 of the EIS, public identification of a nation as a proliferation risk would have adverse diplomatic and political consequences, and would likely insure that nations so labeled would refuse to cooperate further with the United States.]
Comments were made in support of Management Alternative 2, to provide assistance to those countries that can store this material. Commentors suggested that waste stay at generating sites.	[The commentors' preference for overseas management of the foreign research reactor spent nuclear fuel is noted. The EIS has evaluated Management Alternative 2, overseas management, in Section 4.4 of the EIS. However, many reactors in nations which are closely allied with the United States cannot, at this time, dispose of their spent nuclear fuel in their own country (Sections 1.1 and 1.2 of the EIS). The outcome of such an approach would be a concentration of weapons-grade material stockpiled in locations not directly subject to control by the United States. The intent of the proposed policy is to provide foreign research reactor operators with a limited period of time to develop arrangements for disposition of their spent nuclear fuel, and to convert to LEU fuel (Section 1.2 of the EIS).]

ISSUES RAISED

A comment was made stating that Greenpeace and the Nuclear Free Port Zone support the "No Action" alternative. Specific comments were as follows:

- Greenpeace will not engage in any dialogue with DOE until transportation and production ceases.
- DOE has yet to decide on final disposition, and the United States will be trying to manage spent nuclear fuel rods over 40 years.
- Facilities must be responsible for their own wastes.
- Greenpeace finds reprocessing is unacceptable and the Tomsk 7 accident in 1992 is an example of reprocessing plant problems.
- The byproduct of transuranic waste must be vitrified but the vitrification facility is not functioning as designed.

Additional comments opposing the proposed action included the following:

- People moved to Oregon for the pristine environment.
- Oregon Peaceworkers do not want any waste passing through the State from any West Coast port.
- The EIS proposal was "concocted fully" by the Defense Department.
- Humans should not be expendable in favor of economic benefit.
- The DOE lied about the Three Mile Island Accident. There is contamination from Hanford and Chernobyl.
- DOE is trying to put a happy face on the issue of radioactive material storage.
- There are no "Atoms for Peace."
- We do not trust the action of DOE.
- The Mescalero Apache were bribed to accept a MRS site.
- The spent nuclear fuel should be left where it is. (Commentor referred to disturbing facts stated in Marvin Resnikoff's "Next Nuclear Gamble.")
- If DOE wants the spent nuclear fuel, they can have it in their back yard.

DOE RESPONSES

[The commentors' preference for the No Action Alternative, which is described in Section 2.5 of the EIS, is noted. DOE addresses the potential detrimental impacts of No Action in Sections 1 and 4.6 of the EIS.]

[Although ultimate disposition of foreign research reactor spent nuclear fuel is outside the scope of this EIS, it is discussed qualitatively in Section 4.2.7 of the EIS.]

[Due to financial or regulatory constraints, not all foreign research reactor operators may be able to store spent nuclear fuel at their facilities. The intent of the proposed policy is to provide foreign research reactor operators with a limited period of time to develop arrangements for disposition of their spent nuclear fuel and to convert to use of LEU fuel (Section 1.2 of the EIS).]

[The advantages and disadvantages of domestic chemical separation are discussed in Sections 2.2.2.6 and 4.3.6 of the EIS. It is included in the EIS as a reasonable alternative.]

[Disposal of transuranic waste is not related to this proposed action.]

[The commentors' opposition to the proposed action is noted. Based on the evaluation of impacts presented in Section 4 of the EIS, however, the risk to the Portland environment associated with the shipments of foreign research reactor spent nuclear fuel is low. No significant impact to land, water, or air quality is anticipated in any of the ports or any of the waterways used in the transport of foreign research reactor spent nuclear fuel.]

[The intended purpose of the proposed action is to aid in safeguarding the citizens of the United States against the threats of proliferation of nuclear weapons (Section 1.1 and 1.2 of the EIS). The Department of Defense has not been and will not be involved in this proposed action, other than through voicing its support for the necessity of action by the United States, and possibly through use of one or more of its ports as ports of entry for the spent nuclear fuel, if any is accepted into the United States. The financial implications of the proposed action are discussed in Section 4.8 of the EIS. The human health and safety considerations associated with the proposed action are also fully addressed in the EIS (Section 4).

[The statements comparing spent nuclear fuel shipments to Chernobyl are inappropriate. The Chernobyl reactor accident was far worse than any possible accident involving a shipment of spent nuclear fuel. The health risks due to accidents are discussed in Section 4.2 of the EIS.]

ISSUES RAISED	DOE RESPONSES
A comment was made that we need to find a way to store the spent nuclear fuel even if nuclear technology is not supported. Commentor did not support shipping from country to country but supported educating countries to take responsibility for their own waste and nonproliferation. These countries benefitted from the spent nuclear fuel.	[Many foreign research reactor operators located in nations which are closely allied with the United States cannot, at this time, dispose of their spent nuclear fuel in their own country (Sections 1.1 and 1.2 of the EIS). The intent of the proposed policy is to provide foreign research reactor operators with a limited period of time to develop arrangements for disposition of their spent nuclear fuel and to encourage conversion to LEU fuel (Section 1.2 of the EIS).]
A question was asked as to whether the United States would now agree to also accept other countries' commercial fuel.	[No. The proposed policy does not include U.S. acceptance of commercial fuel. The receipt of spent nuclear fuel from nuclear power reactors is outside the scope of the EIS.]
A comment was made that action on the spent nuclear fuel issue should be held under local control.	[Consistent with its responsibilities under the National Environmental Policy Act, DOE has solicited comments and has encouraged public participation in preparing a final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. DOE has considered public comments in this process. The selection of the actual port(s) of entry, if foreign research reactor spent nuclear fuel is accepted into the United States, would be made after consultation with the public, State, Tribal and local governments. This decision will be made in the Record of Decision subsequent to completion of the final EIS.]
A comment was made that spent nuclear fuel is not a commercial commodity and should be shipped in "purpose built" ships with lead-lining and lead lids.	[The commentor's preference for "purpose built" ships is noted. The EIS evaluated the use of four types of ships, including purpose-built ships, for use in transporting foreign research reactor spent nuclear fuel (Section 2.6.3.2.1). No significant difference in the incident-free or accident risk were found between any of the types of ships (Sections 4.2.1 and 4.2.2).]
A question was asked as to how long the shipment would be at sea.	It takes 10 to 20 days depending on the ship [where it is coming from, the route, and the port of entry].

ISSUES RAISED	DOE RESPONSES
Several questions were asked about the choice of ports. Specific questions included the following: - Is Portland considered a low-population density port? - Why is the Bremerton port not suitable? - With two military sites available, why are you considering a public dock. - Why not off-load spent nuclear fuel in Port Astoria, transport to barges down Columbia River and off-load to rail or truck?	[Portland is considered a medium-population density port and is therefore acceptable as a port of entry for foreign research reactor spent nuclear fuel. The fact that it is not a low-population density port is balanced by its experience in handling containers and the low population on the route to Idaho National Engineering Laboratory.] [As recommended by the Military Traffic Management Command, a total of eight military ports were evaluated as candidates given their experience with dry containerized cargoes. The facility at Bremerton was not among those evaluated.] [The port selection criteria show that there is no stated preference for military ports. Either military or commercial ports, if they meet the port selection criteria, are equally acceptable.] [There are two instances in which barge transport would be feasible as a substitute for truck or rail transport of foreign research reactor spent nuclear fuel: (1) up the Columbia River to the Hanford Site and (2) up the Savannah River to the Savannah River Site. New analysis on these two possible barge transport routes has been inserted into Appendix E, Section E.8.15 of the EIS. The net result of this analysis is that barge transport would present approximately the same level of risk to workers and the public as would truck or rail transport. This level of risk is very low and the most likely outcome would be zero latent cancer fatalities.]
Concern was expressed about the problems of International Shipping Organization (ISO) containers. Specific comments and questions were: corrosion of container by sea water; opening in the top of each container; possible inadequate repair, improper welding, and metal fatigue of old casks; inadequate testing of casks; does the testing of used casks include X-ray; accidents happening that result in release of radiation; inadequate and infrequent ISO inspection and maintenance; containers falling onto 15-ton hatch covers; and lower ratings against fire on DOE casks than on safes one can purchase at Sears.	Spent nuclear fuel is shipped in [transportation] casks that meet Nuclear Regulatory Commission (NRC) and International Atomic Energy Agency (IAEA) regulations. Casks are required to meet design conditions before certification and are tested according to NRC regulations intended to establish stresses on a cask more severe than is expected to be encountered. An example is the 30-foot drop onto an unyielding surface. Transportation casks shield the surroundings from harmful levels of radioactivity. Casks are leak-tested, visually inspected, and radiologically surveyed prior to use. This process complies with IAEA standards and is observed internationally. [Transportation Casks are radiographed (X-rayed) at the time of manufacture.] Spent nuclear fuel has been transported over United States highway and rail systems for more than 40 years without a release from a cask. [ISO shipping containers are used nationally and internationally to carry a variety of cargos by sea and land. Special reinforced ISO containers are used for spent nuclear fuel transportation casks. If well-maintained, these containers would safely carry a foreign research reactor spent nuclear fuel transportation cask. ISO containers would be inspected for integrity prior to being used to carry a foreign research reactor spent nuclear fuel transportation cask and containers that were damaged in a manner that would prevent them from safely performing their intended function would be replaced.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to whether casks have been tested in earthquake conditions.	[No. Spent nuclear fuel transportation casks are designed and built to withstand significant stress without releasing their contents (Section 2.6.2 of the EIS). While local hazards, such as earthquakes, may be the cause of an accident such as those analyzed in the EIS, they would not increase the consequences of the accident, which were found to be minor for both marine and land transportation accidents (Section 4.2.2.3).]
An explanation was requested as to why a cask is tested on 30-foot drops and whether a cask has been tested with a 100-foot drop onto a dock. A commentor states that "normal package tests last until a package breaks."	Drop tests are made with the use of an "unyielding" or engineered surface. This surface test is more stringent than dropping onto a surface such as docks, roads, and soil that yield to the pressure.
A comment was made that the weight of spent nuclear fuel shipment containers is reaching the capacity for the off-load cranes.	[Criterion 3 of the port selection process evaluates the physical attributes of port facilities to determine whether they are appropriate for the safe handling of foreign research reactor spent nuclear fuel (Appendix D, Section D.1.9.3 of the EIS). To be suitable, port facilities were to possess at least one 30 metric ton capacity crane for off-loading spent nuclear fuel containers onto ground transport. Since a fully loaded standard shipping container would not exceed 30 metric tons, the minimum rated crane capacity evaluated in the EIS is considered suitable for the safe handling of spent nuclear fuel.]
Concern was expressed about the ramifications of shipboard fires on the casks, and commentors stated that shipboard fire conditions exceeded the parameters of the draft EIS analysis. A comment was made that estimates of 1475° F for one-half hour are misleading; it is not uncommon for house fires to reach 2000° F. A ship fire burned in 1988 for 36 hours; and hull temperature can reach more than 2000° F for 24 hours. A comment was also made that ship crews are not trained to handle such accidents, and the fire department is not capable of handling this type of fire.	Cask tests must be repeatable and generate clear results. The NRC temperature tests generate situations greater than expected as the test temperature of 1475°F is maintained for 30 minutes through the whole cask. During the tests, testing equipment holds the cask in the hottest part of the fire and the heat is raised to 2100°F to bring the cask temperature to 1475°F. In an accident, which is not a controlled environment, the ship is in a heat sink (the water) which would lower the temperature of the fire. It is unlikely that the temperature of 1475°F degrees would be exceeded. [In respect to the impact a ship fire might have on a spent nuclear fuel transportation cask, there are three factors that mitigate the potential damage. First, ship fires move to different areas of the ship as the combustible material is consumed, so the cask would not be exposed for the entire duration of the fire. Second, a ship fire's intensity is limited by the amount of oxygen that can reach the interior of a hold. Third, ships that would be used to transport foreign research reactor spent nuclear fuel have built-in fire suppression equipment, which, as a minimum, would keep fires below the temperatures needed to damage the transportation cask. For these reasons, it is unlikely the spent nuclear fuel inside the transportation cask to reach 900 degrees Kelvin (1,160°F), the melting point of research reactor fuel. The probability of reaching such a temperature was calculated to be less than one in a billion (see Attachment D5 to Appendix D of the EIS). To put this temperature into perspective, steel used in a ship's structure buckles at around 700 degrees Kelvin (800 degrees F).]

ISSUES RAISED	DOE RESPONSES
	(response continued from previous page) [The EIS contains the results of an analysis of the effects of an accident that involves a severe fire (severity category 6), which does not reach the temperature to melt research reactor nuclear fuel. Appendix D, Section D.5.3 presents a detailed discussion of accident probabilities and radioactive material source terms and Section D.5.4 presents the results of the analyses.] [Ship crews are trained to combat fires, because fire at sea on a ship is a dangerous situation. Most large ports either have, or have access to, the equipment and people to combat a severe ship fire. As discussed above, the probability of a severe ship fire reaching temperatures high enough to melt fuel, is low.]
A comment was made that, unless technical experts explain otherwise, excess fire conditions cause the internal contents of the cask to expand under the heat until the cask bursts.	DOE will provide you with the specific answers in the EIS. [Spent nuclear fuel transportation casks are sealed with "O"-ring seals on the cask head. If the cask is heated, the air inside of the cask would cause an increase in internal pressure until the "O"-ring seal fails and the pressure is relieved. This would occur before the structure of the cask is threatened.]
A question was asked as to whether, in a shipboard fire, radioisotopes would remain contained in the cask when subjected to gas expansion and/or moisture. Commentor noted that NRC estimates that 2.7 percent of the cesium inventory could be released involving a commercial fuel element. An aluminum clad element is less stable under similar condition. A comment was given that a plume from the cask, containing cesium, could travel 60 miles downwind with a release up to 900 square miles. Commentor asked for the curie count in cesium casks.	There are about 28,000 cesium curies in a cask. Page B-24 of Appendix B in the EIS indicates the radionuclide inventories per cask, including cesium. [Appendix D, Section D.5.3.1 describes accident scenarios that involve fire. The most severe accidents analyzed assume cask damage and the release of radioactive material. The maximum plausible accident analyzed assumed that 0.1% of the cesium is released, however, sensitivity analyses included releases of up to 30% (see Attachment D5 to Appendix D).] [When the impacts of accidents were calculated (Appendix D, Section D.5.3.3 of the EIS), a 50 mile radius around the port, as well as the local meteorology and prevailing winds, were taken into account. The results of the analysis of these accidents can be found in Section D.5.4. The analysis shows that even in the event of a severe ship fire, both the consequences and risks would be low (Appendix D, Section D.5.5). Although such a catastrophic accident would obviously impact the local environment, no significant impacts are predicted due to the presence of foreign research reactor spent nuclear fuel. No decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS).]
A comment was made that railroad delays make it difficult to guarantee that the spent nuclear fuel casks would remain in port only 4 hours.	[The spent nuclear fuel would be expected to remain in the port less than 24 hours.]
A comment was made that if DOE ships spent nuclear fuel on highways or by rail, the commentor, and others, will protest by sitting on the rail tracks and highways. Commentors noted that at the last public resistance, 400 people, from 12 - 80 years of age, sat on the tracks.	[The comment is noted.]

ISSUES RAISED	DOE RESPONSES
A comment was made that potential radioactive contamination from nuclear technology is a worldwide problem. Commentor said that we cannot lie on railroad tracks and wish problems away; those who are unhappy should put their information on the record rather than present "negative, nonconstructive remarks."	[The comment is noted.]
Several comments were made that accidents happen despite planning. Comment was made that probable transportation accidents are a collision between railcars and a barge hitting a bridge.	[Chapter 4 of the EIS describes risks estimated for hypothetical accidents at candidate ports, along transportation routes, and at interim storage sites in which some radioactive material is released. However, because the amount of radioactive material released would be small, the amount of contamination is small and no cleanup would be required, except possibly in the immediate vicinity of the cask.]
Comments were made about the need for additional security to protect spent nuclear fuel shipments in the ports and along transportation routes. Specific comments and questions included the following: - Are we going to have the National Guard? - Who will pay for the National Guard to secure each shipment? - How do we separate security of nuclear spent fuel from other cargo? - Navy shipments have been accompanied by a gunboats. - There should be 24-hour guards.	[Shipments of foreign research reactor spent nuclear fuel would be conducted to meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). Nuclear Regulatory Commission regulations for physical security include requirements for armed escorts and two-way communications with a communications center during the journey (Sections 2.8 and 5.4.2 of the EIS and Appendix H of the EIS). The National Guard does not escort spent nuclear fuel shipments.] [To better describe the security and emergency preparedness associated with transport of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. Appendix H presents the general provisions of the Transportation Plan which is a document that provides the details associated with the transportation of the foreign research reactor spent nuclear fuel.]
A concern was expressed about acts of terrorism and sabotage. Commentor noted that the spent nuclear fuel is probably safer from terrorism in the United States than abroad. The commentor stated the need for city evacuation plans, guarded ports, and specially-built ships to guard against terrorist acts.	[Section 2.8 and Appendix D, Section D.5.9 have been added in the EIS to discuss the consequences of terrorism and sabotage. Security measures employed would meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73).] [Security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel are described in Appendix H of the EIS. This appendix presents the general provisions of the Transportation Plan, which is a document that provides the details that would be associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site.]

ISSUES RAISED	DOE RESPONSES
Comments were made that DOE must address vulnerabilities at each of the spent nuclear fuel sites. Specific vulnerabilities identified include the following: - The Hanford site does not have a fire suppression system or leakproof tanks and is in a seismic activity area. - Management of spent fuel at Hanford will delay cleaning the K-Basin; drainage of K-Basin for additional storage will contribute to a high radiation dose on the Columbia River. - Why we are taking this stuff to a facility with over 1600 spill sites, terrible contamination and with funding consistently being reduced. - Idaho National Engineering Laboratory and Savannah River Site have not been upgraded with appropriate fire suppression systems. - Some DOE sites have become Superfund sites. How many are Superfund sites?	[No spent nuclear fuel from foreign research reactors would be shipped to the Hanford site. As specified in the Record of Decision for the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement, issued on May 30, 1995, the Savannah River Site and the Idaho National Engineering Laboratory have been identified as the two sites selected for management of foreign research reactor spent nuclear fuel. Both of these sites have existing facilities capable of accepting the fuel on the effective starting date of the policy. Of the five DOE sites considered for temporary storage, all are Superfund sites, except the Nevada Test Site.]
NEPA requires consideration of impacts on site resources. The lack of funding to upgrade site safety standards and facilities was also identified as a concern.	[As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel would be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for that EIS, issued on May 30, 1995, specifies that the Savannah River Site and the Idaho National Engineering Laboratory as the two sites selected for management of foreign research reactor spent nuclear fuel. Both of these sites have existing facilities capable of accepting the fuel on the effective starting date of the policy. The EIS discusses the impacts on site resources and required new facilities in Sections 3.3 and 2.6.5, respectively.]
Comments were made about the safety of trucks used for shipments of spent fuel. Specific comments included the following: - DOE has contracted with unsafe trucking firms. In 1991, DOE wanted to employ a trucking firm whose trucks were in violation of the State's safety standards. The Washington Highway Patrol stopped and arrested at least 50 percent of the drivers at the border. Is DOE choosing the low bidder? - A truck with contaminated exterior crisscrossed the country before contamination was detected at Hanford. - DOE says States cannot stop trucks from moving into the Columbia Gorge. There may be dangerous snow conditions in this area.	[Transportation of hazardous and radioactive materials, substances, and wastes are governed by the Department of Transportation, NRC and Environmental Protection Agency regulations, as discussed in Section 5.4 of the EIS. Trucking firms under contract with DOE would be required to comply with applicable regulations.] [To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. This appendix presents the general provisions of the Transportation Plan, which is a document that provides the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port, transit to the management site, and plans in the case of severe weather or adverse road conditions.] [DOE checked the 50% citation statistic with the Washington Highway Patrol and found that no such statistic exists.]

ISSUES RAISED	DOE RESPONSES
A comment was made that Department of Transportation regulations state that each shipment must be transported through the lowest populated areas. Commentor asked why transport would be through downtown Portland. Commentor noted that highway route control studies state that interstates and by-passes or alternates would be selected by the State; adding that the Navy solved this transport problem by barging up the Columbia.	[The population residing near candidate ports and along transportation routes was an important factor that was considered in port selection and in the evaluation of environmental effects of the proposed action and management alternatives (See Section 4, Appendix D, and Appendix E of the EIS).] [Overland shipment by rail or by truck is regulated by Department of Transportation and NRC regulations dealing with packaging, notification, escorts and communication. Under Department of Transportation regulations, those specific routes designated by appropriate State agencies are enforceable if the Department of Transportation determines that such routes are likely to result in further reduction of radiological risk. Also, shippers are required to submit proposed routes for spent nuclear fuel shipments to the Nuclear Regulatory Commission for approval. NRC then publishes a public information circular that lists routes that have been evaluated and approved for specific spent nuclear fuel shipments. All the routes take into consideration accident rates, transit time, and population density.]
A concern was expressed that transport of spent nuclear fuel would reduce the bulk grain commodity shipping business because no other vessels would call at the Port. Commentor said the Port exports seven million metric tons of grain per year.	[The commentors' concerns about possible economic impacts to the grain commodity shipping at the Port of Portland as a result of foreign research reactor spent nuclear fuel shipments are noted. The use of any of the ports indicated by the port selection process, including Portland, would not impact normal commercial operations, and therefore not endanger the ports' status with respect to their clients. Foreign research reactor spent nuclear fuel would be shipped to the United States in standard shipping containers that would require no special handling. There would be no adverse commercial or economic reaction to the use of the port. Historically, there were no adverse commercial impacts to the ports that received foreign research reactor spent nuclear fuel during the 30 plus years that it has been received.]

ISSUES RAISED	DOE RESPONSES
Comments were made about the safety of dock workers and the possibility of work stoppage. Specific comments included the following: Cumulative impacts on longshoremen, up to 200 mrem/yr, are not acceptable; the Port can and will be relentless in establishing standards for worker safety and health if these shipments are forced on Portland; unions will engage in a work action that will cripple Terminal 6; the longshoremen have adopted a resolution not to handle spent fuel on the West Coast; and the Environmental Impact Statement does not address a work stoppage.	[The maximum allowable exposure for port workers would be 100 mrem per year, the same radiation dose limit established by the Nuclear Regulatory Commission to protect individual members of the public (Section 4.2.2.2 of the EIS). As the EIS demonstrates, both the dose and dose rate for the port workers are low. To avoid radiation doses which may exceed public dose limits, DOE would maintain records to track individual exposures so that worker rotation can take place if an individual worker approaches the 100 mrem/year exposure. Appendix D, Section D.4.3.2.1 sets forth the time/distance analysis of cask handling. Section D.4.5 provides the resulting doses and risks, and Appendix F, Section F.5 presents an evaluation of the dose rates from a transportation cask containing research reactor spent nuclear fuel.]
	[The two regulatory limits (200 mrem/h at the cask surface and 10 mrem/h at two meters away from the vehicle) would both apply simultaneously. For shipments of certain radioactive materials (e.g., small, intense cobalt-60 sources), the 200 mrem/h-at-the-cask-surface limit is the more stringent limit. For shipments of spent nuclear fuel, however, the 10 mrem/h-at-two-meters regulatory limit turns out to be more stringent because the source of radiation is large and distributed throughout the internal volume of the cask. Casks loaded with spent nuclear fuel up to the 10 mrem/h-at-two-meters limit radiate at a level well below the 200 mrem/h level at the cask surface (Section 4.1.5 and Appendix F, Section F.5 of the EIS). Longshoremen would be exposed to radiation from the cask for a relatively short time and would not come into contact with the cask due to the presence of the shipping container.]
	[Provision of time to resolve a work stoppage was one of the factors that led DOE to provide an extra three years for shipment of the foreign research reactor spent nuclear fuel under Management Alternative 1.]
	[The possibility of a work stoppage was not considered in the port selection process because this possibility has no impact on the actual capability of the port to safely receive containers carrying foreign research reactor spent nuclear fuel.]
A comment was made that there should be city evacuation plans.	[Section 4.2.2.3 shows that risks resulting from a severe accident would be so low that evacuation routes would not be necessary.]
	[To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. This appendix presents the general provisions of the Transportation Plan, which is a document that provides the details which would be associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the DOE management site.]
A comment was made that DOE's claim of "no significant impact" in the EIS does not take into account cumulative impacts from the actions in all the other EISs that DOE is completing.	[The EIS does, in fact, address the cumulative impacts of handling all of DOE's spent nuclear fuel.]

ISSUES RAISED	DOE RESPONSES
A question was asked as to the basis for the claim that an individual is exposed to less radiation living within 50 miles of a DOE site than flying in an airplane. A question was asked if the radiation was alpha or gamma.	The expected dose to an individual from 25 hours of flying at 35,000-40,000 feet is 13 mrem from cosmic radiation which [is neither gamma or alpha radiation, but] has the same biological effect as gamma radiations. [No member of the public would be expected to actually receive as much as 13 mrem per year under the proposed policy.]
A comment was made that DOE should stop using "harmless" comparisons such as riding in an airplane, eating peanut butter, and drinking diet soda. Commentor said that in one case the risks are ones for which there is a choice; in the case of spent nuclear fuel shipment risks, there is no choice.	[Table 4-60 is presented to provide a point of comparison with risks presented in the basic implementation of Management Alternative 1, acceptance and management of the foreign research reactor spent nuclear fuel in the United States. The table presents risks estimated to increase an individual's chance of death in any year by one in one million. Individual choice would not affect the actual risk associated with the activities.]
A comment was made that a report to the Senate Energy Committee indicated that radiation exposure levels to the public on the Columbia River are up to 200 mrem per year above the background level. Commentor indicated that this is the potential exposure rate for a Yakima Indian fishing on the Columbia River on State property.	[Since none of the foreign research reactor spent nuclear fuel would be shipped to Hanford, there is no connection between the comment and this EIS.]
A comment was made that, due to uranium mining, the rate of mental retardation on the Pine Ridge Reservation is 15 times the national average.	[The comment is noted. Appendix D, Section D.4 of the EIS demonstrates that the radiation dose that anyone would receive handling or near a transportation cask containing foreign research reactor spent nuclear fuel is less than the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20).]
A comment was made that DOE and NRC regulatory standards are antiquated. Acceptable radiation levels are lower than previously thought.	[The regulatory standards for radiation exposure limits are beyond the scope of this EIS. The established regulatory limit for radiation exposure is 10 mrem per hour at 2 meters distance from the vehicle, the ISO container in this case. Most spent nuclear fuel shipments are much lower than that. The radiation dose that anyone would receive handling, working or traveling near a spent nuclear fuel transportation cask is below the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20). The current annual limit is 100 mrem in an unrestricted area.]

ISSUES RAISED	DOE RESPONSES
Concerns were expressed about the possibility of radioactive releases. Specific comments included the following: radiation fallout patterns should be described in the EIS; at 20 rem there is immediate acute radiation sickness for fire fighters, and we do not want our fire fighters to be doomed; downwind of Terminal 6 is a major intersection of two rivers--Willamette and Columbia Rivers; in an accident, there could be a lethal dose for one year over 900 square miles.	[Appendix D, Section D.5.3.1 of the EIS describes accident scenarios that involve fire. When the impacts of accidents were calculated (Section D.5.3.3), a 50 mile radius around the port, as well as the local meteorology and prevailing winds, were taken into account. The results of the analysis of these accidents can be found in Section D.5.4. The analysis shows that even in the event of a severe ship fire, neither the consequences nor risks are great (Section D.5.5). Although a catastrophic accident would impact the local environment, low impacts are predicted to result from the presence of foreign research reactor spent nuclear fuel. In fact, the analysis of impacts associated with an accident involving foreign research reactor spent nuclear fuel also determined that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3 of the EIS). Section 4.2.2 demonstrates that the risk associated with bringing spent nuclear fuel to the ports analyzed in the EIS, is low.] [The threshold for immediate acute radiation sickness is considered to be 200 rem, not 20 rem.]
A question was asked as to when the United States began this program.	The precursors leading to this program started in the 1950s. [Since the 1950's, as part of the Atoms for Peace program, the United States has provided peaceful nuclear technology to foreign nations in exchange for their promise to forego development of nuclear weapons. A major element of this program was provision of research reactor technology and fuel.]
A comment was made in opposition to the manufacture of new reactors and the supply of fuel.	[The commentor's objections to the manufacture of new reactors and provision of reactor fuel are noted, but are outside the scope of the EIS. Any new reactor starting up would not be covered by the program.]
A question was asked as to whether there is an international public forum on this issue. Commentor asked if there should be more United Nations involvement.	There is no official international public forum at present. However, the International Atomic Energy Agency (IAEA) requested that DOE take action to accept foreign research reactor spent nuclear fuel in support of the nonproliferation of nuclear weapons.
A question was asked as to what would happen to the program if DOE is abolished. Concerns were expressed about how the program would be funded.	Spent nuclear fuel will be there whether DOE is or not. There have been various proposals for transferring responsibility to another agency.
A commentor expressed concern about the amount that citizens of Oregon will be taxed for the program.	[Costs of the proposed management alternatives are in Section 4.8 of the EIS, including uncertainties and financing options. Tax revenue implications, if any, are beyond the scope of the EIS.]
Questions were asked about the cost of the implementation of the total program.	The cost would be approximately $1 billion over 40 years depending on which alternative is chosen. Much of this cost would probably be paid by the research reactor operators.

ISSUES RAISED	DOE RESPONSES
A comment was made that the Tribal community was not included in the discussion with DOE. Commentor stated that these people still have inherent rights, they should be consulted first, and DOE ignored the beliefs of the Tribal community. Commentor stated that Tribal members had told DOE to keep the uranium in the ground and to work together for balance and harmony and unification of all people. Commentor stated that DOE should listen to those of us who are advocating "No Action."	[The commentor's preference for the No Action Alternative is noted. Consistent with its responsibilities under the National Environmental Policy Act, the Department of Energy has solicited comments and has encouraged public participation in preparing a final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. The draft EIS was distributed to Tribal governments as well as Federal, State, and local entities. DOE has considered all public comments in this process and regrets that the commentor believes the Tribal community was not fully included in the process.]
A commentor questioned how profitable nuclear power really is after all the money DOE has spent on nuclear power, cleanup, and public relations. [Commentor referenced a Greenpeace report called "Fiscal Vision."]	That information is beyond the scope of the EIS. [Research reactors are not used for power production.]
A commentor made the following specific comments on sections of the draft EIS: - Page 3-29: The statement "some recreational fishing and boating..." should be "significant recreational fishing and boating...." - Page 4-11: The reference to cask damage and the statement that no human population on the ocean could be affected is not relative to an accident situation on the Columbia River navigational channel. This is not addressed. - Page 4-23: The port accident risk analysis does not include the navigational channel.	[The analysis of accidents in port (Appendix D, Section D.5 of the EIS) were also performed at the worst location in the approach to the port (Section D.5.3.2); these are called "channel" locations in the analyses. In the case of Portland, this analysis was assumed to occur at the St. Johns Bridge. The results of these channel calculations, like the port or "dock" locations, all showed low risk (Section 4.2.2.3).]

List of Attendees at Portland, OR Public Hearing

Ackerson, Amber
Anderson, Carola
Baker, Carol
Benner, David
Boyett, Keven
Brawner, Allan
Brenner, David
Butz, Andrew
Cali, Jeff
Carrigan, Michael
Cropper, Tom
Doying, David
Dreizen, Diane
Fantz, Ronald B.
Ferguson, Ken
Fisk, Rod
Ford, Mr. Lynn

The public hearing at Savannah, Georgia, a candidate port of entry, was held in the Coastal Georgia Center on May 11, 1995. Eight people attended the hearing. The hearing was interactive in nature and the following is a summary of the comments and issues that were raised. The information in brackets [ ] was not provided at the hearing.

ISSUES RAISED	DOE RESPONSES
Clarification was requested as to how decisions will be made on transportation modes.	The final EIS will identify the preferred transportation modes if a policy decision is made for United States acceptance of foreign research reactor spent nuclear fuel. The Record of Decision will document the policy decision. Specific modes, such as truck versus rail, will be decided on a case-by-case basis.
Clarification was requested as to how decisions will be made on ports of entry.	The final EIS will identify ports that could be used. It is anticipated that the final EIS will maintain the ten ports identified as candidates in the draft EIS. The use of a specific port [of the ten candidates] would be decided on a case-by-case basis and would depend on country of origin, sea route, and availability of the port at the time of shipment.
Clarification was requested as to the role of the Record of Decision with respect to selection of management alternative.	The final EIS identifies the preferred management and implementation alternatives. The Record of Decision, the key decision document, identifies decisions made with regard to which policy will be adopted if any and which alternatives will be used.
Clarification was requested as to the Department of State's posture with regard to overseas management of the foreign research reactor spent nuclear fuel.	Although the EIS includes overseas management as a management alternative, the Department of State does not consider it to be a wise option. A key driver for the United States management of the foreign research reactor spent nuclear fuel is the September 27, 1993, Presidential Policy Statement on [nuclear weapons] nonproliferation and export controls, which states the United States goal to eliminate overseas HEU stockpiles.

List of Attendees at Savannah, GA Public Hearing

Cajigal, George L.

Slocumb, Bill

Wells, Nellie

Wells, Christopher

The public hearing at the Seattle/Tacoma airport area, for the Tacoma candidate port of entry, was held on May 24, 1995. Approximately 45 people attended the hearing. The hearing attendees requested a format in which they presented public statements with little or no dialogue between attendees and DOE. Therefore, DOE responses were not given at the hearing, but are provided in brackets [ ]. The following is a summary of the comments and issues that were raised.

ISSUES RAISED

Objections were raised about DOE's proposed interactive format for the hearing and DOE's decision to use note takers to summarize key issues as opposed to a court reporter to record the hearing verbatim. Specific comments supporting the objections included the following:

- DOE has an obligation under CEQ regulations to record comments; oral comments should be given the same weight as written comments.
- DOE will be subject to litigation if public testimony at this hearing is not recorded.
- There is lack in trust of DOE contractors to take hearing notes; contractors are not neutral -- they are paid by DOE; flipchart notes taken by facilitator do not correctly summarize comment.
- The purpose of a recorder is that if the EIS is legally challenged, there is an administrative record. Otherwise, there is human frailty and subjectiveness in the record.
- Given budget cuts at Hanford, why pay two notetakers instead of buying a tape recorder.
- Without a recorded hearing, the public has no effective mechanism to ensure that the record is complete and to see that the EIS reflects the issues that have been raised and has been responsive.
- Commentors wanted to read statements into the record, but that is not possible because there is no record.
- Since the question at hand is whether the proposed policy is an appropriate public policy, DOE's response to each public comment is necessary to ensure an appropriate public policy; otherwise this public hearing had no purpose.
- DOE is inhibiting public participation by asking people to come to a hearing and then provide written comments.
- Have never been to a public hearing that was a discussion and not recorded.
- DOE is presenting and defending.
- In the Summary, page 49, these hearings were described as public hearings. DOE did not disclose the proposed hearing format to the public ahead of time, and the public was "manipulated to preregister for nothing."

DOE RESPONSES

DOE adopted a new, more interactive format for these public hearings to more constructively address the issues raised by the public. Public comments during the hearings were summarized and it was requested that specific comments for the record be submitted in writing. This method of recording comments was determined by DOE General Counsel to be in compliance with DOE requirements and Council of Environmental Quality (CEQ) regulations, [and fully in compliance with NEPA requirements for conducting such hearings. This public hearing format provided opportunity for increased interaction between DOE and the public. In the majority of cases, this format has been well received by the public. Moreover, the public was afforded other opportunities to comment on the draft EIS, including a 90-day period in which to submit written comments. All such comments are presented in the final EIS along with DOE responses.]

ISSUES RAISED	DOE RESPONSES
A commentor stated that DOE did, in fact, indicate in the newspaper advertisement that the hearing would be an informal discussion. Commentor said that under the Washington Public Hearings Act there is no requirement of an official recorder for a public hearing.	[This comment is noted.]
Comments were made that DOE's provision of security at the public hearing was insulting to the hearing attendees and gave the impression that DOE believed the hearing attendees were violent.	Standard DOE policy is that security be provided at public hearings for the protection of the public and DOE in the unlikely event that someone would pose a physical threat.
Several commentors argued that foreign research reactor spent nuclear fuel should be managed overseas and not be accepted into the United States. Variations to this overall comment included support for the "No Action" alternative; support for Management Alternative 2 (overseas management with U.S. assistance); and increased verification of the spent nuclear fuel "where it is."	[Commentor's support for Management Alternative 2 or "No Action," is noted.]
Comments were made that: (1) the United States has no obligation to take the spent nuclear fuel; (2) allies pose no threat to the United States; (3) taxpayers should not have to pay for managing foreign spent nuclear fuel; (4) the International Atomic Energy Agency can easily monitor dry cask storage at reactor sites overseas; (5) the United States needs to take care of its own waste before it accepts others' wastes.	[The United States has no legal obligation to take the spent nuclear fuel; however, implementation of the proposed action would provide U.S. citizens and taxpayers increased security and the assurance that action has been taken to limit nuclear weapons proliferation, thus reducing the likelihood of a nuclear incident. While Management Alternative 1 or 3 to the proposed action would include the acceptance and management of foreign research reactor spent nuclear fuel from U.S. allies who do not pose a current proliferation threat, governments and alliances may change. The International Atomic Energy Agency could provide monitoring at overseas reactor sites; such monitoring would be considered if DOE adopts a policy using Management Alternative 2. Although the ultimate management and disposal of U.S. and foreign nuclear waste are beyond the scope of this EIS, the impacts of ultimate disposition are discussed in Section 4.2.7 of the EIS. DOE is currently working under NEPA and the Nuclear Waste Policy Act of 1982 to provide for ultimate disposition of the nuclear waste.]

ISSUES RAISED	DOE RESPONSES
Comments were made questioning the need to accept spent nuclear fuel from countries that do not pose a proliferation risk and the need to accept LEU fuel, which does not pose a proliferation risk. Sweden was cited as an example of a country that is not building bombs and should not be of concern. A commentor suggested that 98% of the risk could be eliminated by telling the other countries that they must take responsibility for their fuel. It was suggested that DOE should keep in mind that in order to divert the HEU contained in the spent nuclear fuel an agent would have to move the cask to a reprocessing facility. It was also questioned whether the United States could actually expect Iran, one of the countries involved, to turn over its spent nuclear fuel.	Of the 41 countries that would be covered under the proposed policy, the majority do not in and of themselves pose a [nuclear weapon] proliferation risk. However, many of these countries that have converted to LEU would be expected to switch back to HEU to fuel their research reactors if the United States does not accept their spent nuclear fuel containing the enriched uranium DOE originally supplied. These countries could indeed buy HEU -- Russia and China have both supplied HEU in the past. The United States is presently working with Russia and China to get them to adopt programs similar to the U.S. RERTR program. The suggestion that DOE should accept spent nuclear fuel only from nations that are proliferation risks leads to the problem of identifying these countries. [It is long-standing policy that the United States provide certain nuclear technology and services (including the acceptance of foreign research reactor spent nuclear fuel) to nations who cooperate in preventing the spread of nuclear weapons. As a result of this policy, few nations have acquired nuclear weapons over the past 50 years.]
A comment was made that if the United States wants to promote nuclear nonproliferation, it should start working toward disarmament. A related comment was made that other countries will have no incentive to diminish or stop using nuclear materials if the United States takes their spent nuclear fuel.	[Disarmament is not an issue in the proposed action and is not evaluated in the EIS. Regarding incentives to stop using nuclear materials, the United States is encouraging countries through the RERTR program to convert to LEU, and thereby to curtail the use of weapons-grade material such as HEU in international commerce.]
Concerns were expressed that the United States does not have a national policy on nuclear waste; there are no plans for disposal of DOE's waste streams; there is no safe method of disposal; and the United States was becoming the world's garbage dump.	[Although specific issues related to ultimate disposal are beyond the scope of this EIS, the impacts of ultimate disposition are discussed in Section 4.2.7 of the EIS. A detailed discussion will be the subject of future NEPA documentation. The Nuclear Waste Policy Act of 1982 specifies that U.S. policy is to dispose of high level radioactive wastes and spent nuclear fuel in geologic repositories.]
A question was asked whether the United Kingdom is one of the countries under consideration in the proposed policy.	Yes.
A comment was made questioning why the United States would take spent nuclear fuel from the United Kingdom when it has sent nitric acid shipments from Hanford to British Nuclear Fuels.	[The nitric acid that was purchased by British Nuclear Fuels Limited from Hanford is to be used in BNFL's [commercial nuclear power] reprocessing facilities in England. These shipments are outside the scope of this EIS.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE's rationale that the United States must honor its commitments is weak. Commentor stated that the United States has long signed agreements and broken them, the commentor noted the breaking of Indian treaties as an example.	[It is important to show responsibility and reliability in our dealings with other nations to help maintain the U.S. leadership role in the prevention of nuclear weapons proliferation and in encouraging other nations to support U.S. efforts.]
A comment was made that the United States has a hypocritical attitude concerning nuclear nonproliferation. Supporting comments were that the United States has used the Treaty on Non-Proliferation to proliferate in that the Treaty allows those countries that have nuclear weapons to continue to have them; the United States is responsible for more than half of the weapons shipped all over the world, and $300 billion dollars a year is spent by the United States on military weapons; the United States is helping North Korea build reactors but North Korea will be keeping their spent nuclear fuel from the United States; the EIS fails to say the United States will no longer sell material to other countries so that it would not have to take back fuel in the future; the nuclear weapons industry is irresponsible and dishonest.	[The United States has never sold or exported nuclear weapons to other nations. Highly enriched uranium has been sold to other nations for use in research reactors in exchange for a pledge from those nations not to develop nuclear weapons. In fact, many nations that are non-nuclear weapons states did not develop weapons because of this arrangement.] [The sale of highly enriched uranium is no longer allowed by the Energy Policy Act of 1992, except in certain limited situations. Therefore, the management of the highly enriched uranium currently overseas is of importance. Once the highly enriched uranium used in foreign research reactors is recovered, this effort need not be repeated.] [Power reactor fuel, which contains low enriched uranium, is of much less concern for nuclear weapons proliferation. Therefore the proposal currently under discussion with North Korea has no bearing on this EIS or the proposed policy. Nor does the level of export of conventional weapons.]
A comment was made that the international activist position, based on commentor's experience on panels with activists from Japan, Russia, and other countries, is to keep nuclear waste where it is.	[Many foreign research reactor operators have no immediate means for dispositioning their spent nuclear fuel outside of the United States. An objective of the proposed action is to provide them with a limited time to arrange for disposition of their spent nuclear fuel outside of the United States.]
A comment was made that DOE is in the business of segmenting its EISs. The following examples were provided: The Savannah River Site, Hanford Site, and Idaho National Engineering Laboratory are being proposed to manage foreign research reactor spent nuclear fuel; the same sites are being proposed under a separate EIS to manage Navy fuel; and the same sites are being proposed under yet another EIS for commercial spent nuclear fuel.	Commercial spent nuclear fuel is not covered by any of the EISs mentioned by the commentor related to the three DOE sites. [Section 1.5 of the EIS explains the relationship of this EIS to other NEPA documents relating to spent nuclear fuel management. The DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Restoration and Waste Management Program Environmental Impact Statement included consideration of the foreign research reactor spent nuclear fuel in its cumulative impacts.]
A comment was made that dry cask storage technology is available and is appropriate for use overseas.	[Dry cask storage technology is a proven storage technology. Section 2.6.5.1 of the EIS provides a summary of available storage technologies.]

ISSUES RAISED	DOE RESPONSES
A question was raised as to why DOE wants to prevent other countries from using the Sellafield reprocessing facility in the United Kingdom when DOE has issued a formal finding that reprocessing in the United Kingdom posed no proliferation risks, based on numerous international safeguards and monitoring to back up its assertion.	The Sellafield facility can only reprocess commercial spent nuclear fuel. DOE is considering, as an alternative, the use of Dounreay in Scotland [the United Kingdom] for reprocessing foreign research reactor spent nuclear fuel. Reprocessing by our allies is a difficult question. Whereas the United States does not reprocess, it nevertheless recognizes that its allies can safely reprocess. The United States recognizes that if it tried to prevent the United Kingdom from reprocessing, we would jeopardize their help in other areas.
A question was asked as to whether the Dounreay facility is subject to the same requirements as the Sellafield facility. Commentor asked whether DOE's finding that an inspection system ensures no diversion would apply if spent nuclear fuel was sent to Dounreay for reprocessing. Commentor stated that reprocessing at Dounreay appears to be a reasonable alternative and that British Nuclear Fuels Limited (BNFL) is more than willing to enter into an agreement with the United States.	Dounreay is subject to the same requirements as Sellafield. Dounreay has reprocessed spent nuclear fuel, extracted the HEU, and returned the HEU back to the country of origin. The concern of the United States is not with the Dounreay facility itself, but any diversion of HEU into international commerce after the HEU leaves Dounreay. However, reprocessing at Dounreay, with certain restrictions applied to ensure no diversion of HEU into international commerce, is an alternative being considered.
A comment was made that the best means of dealing with nuclear waste is to can it, transport it, and bury it.	[The commentor's position is noted. Underground dry storage is not one of the alternatives selected for interim management of spent nuclear fuel from foreign research reactors (Section 2.6.5.1 of the EIS).]
A question was asked about the difference between Navy and DOE spent nuclear fuel.	The characteristics of naval fuel are classified information.
Concerns were expressed about the threat of terrorist attacks or sabotage against the spent nuclear fuel casks, including the blowing up of a cask.	It would be difficult for a terrorist to divert a spent [nuclear] fuel [transportation] cask since a cask typically weighs at least 25 tons [10 to 25 tons] -- casks are extremely difficult to move. The explosion potential of a cask is very low. In the event of an explosion, the truck would likely be turned over and everything surrounding it may be gone, but the cask would remain intact. [Section 2.8 and Appendix D, Section D.5.9 have been added in the EIS to address terrorism and sabotage.]
Comments were made strongly opposing shipments of spent nuclear fuel through the Ports of Tacoma or Seattle.	[The commentor's opposition to the use of the Port of Tacoma or Seattle is noted. However, Sections 4.2.2 and 4.5 demonstrate that the risk to any port analyzed in this EIS would be low.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE should use military ports because they are far superior to commercial ports when it comes to security.	[DOE considers that the foreign research reactor spent nuclear fuel could safely be received at commercial ports without additional security such as might be present at military bases. The security provided for the spent fuel shipments is required to meet or exceed all the applicable security requirements in the Code of Federal Regulations (10 CFR Part 73). If any port did not already provide security sufficient to satisfy these requirements, it would be the responsibility of the shipper to provide the required additional security. Nevertheless, the commentor's preference for the use of military ports is noted. Security measures are addressed in Section 2.8 of the EIS.]
A comment was made that the amount of ship traffic should be considered in the port selection process.	[In general, the number of ship mishaps is not proportional to the amount of ship traffic because port ship traffic is slow; and even when heavy, traffic is normally a small number of ships per hour. Hence, increasing this volume does not significantly increase the probability of an accident. Rather, the number of ship mishaps is associated with navigational hazards and distances from the port to the open ocean or a large bay. Therefore, the port selection process focused on favorable transit from the open water. See Appendix D, Section D.1.9.2 for a discussion of this criterion.]
A comment was made that it has taken years of hard work to achieve a worldwide port status, the receipt of spent nuclear fuel would stigmatize the port, and companies would not do business with the port.	[Historically, there have been no adverse commercial impacts or stigma attached to the ports that received foreign research reactor spent nuclear fuel over thirty years it has been received. Foreign research reactor spent nuclear fuel would be accepted into the United States in standard shipping containers that require no special handling.]
A question was asked as to whether Seattle could be considered -- based on commentor's understanding that ports may be added or dropped as a result of public input or changed criteria.	The selection and evaluation of the ten candidate ports, as detailed in Appendix D of the EIS, was based on specific selection criteria. It is possible that some comments may result in a change in the criteria, in which case other ports could be considered.
A comment was made that the spent nuclear fuel shipments under this EIS should come into the same ports that were used to ship HEU out of the country. Commentor stated that if Tacoma did not export nuclear fuel through the Puget Sound, then Tacoma should not have to receive the spent nuclear fuel.	[Accepting the foreign research reactor spent nuclear fuel through the same port from which the enriched uranium departed is not practical or necessary. Much of the enriched uranium was shipped overseas by airplane, an option not available for the foreign research reactor spent nuclear fuel. Tacoma was one of 161 ports (153 commercial and eight military ports) considered. These ports were evaluated against selection criteria, resulting in 10 ports that met all of the criteria and are currently considered capable of safely handling foreign research reactor spent nuclear fuel (Appendix D, Section D.1.9.2 of the EIS).]

ISSUES RAISED	DOE RESPONSES
A question was asked as to what ports were used when the United States originally shipped the HEU to the foreign countries. Commentor suggested that it would be helpful to know the history.	Some HEU was shipped by vessel; some was flown by plane. DOE will provide the information on ports. [All exported TRIGA fuel was flown out of Los Angeles, except for that going to Japan, which was shipped out of the Port of Oakland. The remainder of the HEU that was used for foreign research reactor nuclear fuel was all exported by air from Albuquerque, except for one shipment that was flown out of Memphis.]
A question was asked as to whether DOE would commit that, if another port was added to the list of candidate ports, DOE would hold a public hearing at that location.	A commitment to hold additional hearings would be the decision of the Secretary [of Energy].
A question was asked as to whether DOE is proposing to ship spent nuclear fuel through the West coast and then transport the fuel to East coast sites.	That is a possibility. [Analyses in the EIS demonstrate that the risk associated with using the West Coast ports, to receive foreign research reactor spent nuclear fuel bound for the Savannah River Site, would be low. If foreign research reactor spent nuclear fuel is accepted by the United States, the decision as to which port to use for each shipment would include consideration of the population along the land route to the designated management site.]
A comment was made that two of the port selection criteria -- adequate facilities and low population -- are contradictory. Commentor stated that a port with adequate facilities will have a lot of people.	[The commentor's observation on the correlation between particular port and population size is noted.]
A question was asked as to whether it was true that only one cask per ship would be shipped into the Port of Portland.	There would be one cask per International Standards Organization (ISO) container. The EIS calculates impacts from one-to-eight casks per ship. In September 1994, four casks came into the Military Ocean Terminal at Sunny Point, North Carolina on two ships.
A question was asked as to whether container ships are double-hulled.	No.
A question was asked as to what the regulatory requirements are concerning how far apart casks are stored on a vessel. Commentor noted that containers on vessels coming into Portland were stacked according to manifests.	DOE is not aware of regulations regarding spacing for radioactive shipments. [The transportation of hazardous material is governed by the International Movement of Dangerous Goods (IMDG) Code, which is associated with the International Maritime Organization. This code establishes the international rules for shipping hazardous cargos, which includes foreign research reactor spent nuclear fuel.]

ISSUES RAISED	DOE RESPONSES
A comment was made that there are commercial ships that could be carrying food. Commentor asked what DOE is doing to guarantee that loading in foreign ports is in compliance with U.S. regulations.	There would be [cognizant] people at the loading site to ensure that casks are loaded properly at foreign ports. In terms of what would be done if there are other materials on board, DOE does not believe there would be a problem since the casks provide shielding, but DOE will provide more information on this. [As to isolating the casks from other freight, this would not be necessary for radiation or any other reasons. The small amount of radiation coming from the spent nuclear fuel transportation cask would be gamma radiation which does not activate or contaminate other materials, so there would be no need to isolate it. Also, see the response immediately above.]
A comment was made that ships carrying spent nuclear fuel should be loaded entirely with the spent nuclear fuel and nothing else.	[See second paragraph of the response above.]
Concerns were expressed about the possibility of transportation accidents. A commentor noted that if fuel is moved enough times, "you will guarantee an accident."	[The EIS shows that the risks associated with an accident are low (Section 4.2.2.3).]
A question was asked as to whether DOE will notify communities of an accident if one were to occur.	Spent nuclear fuel shipments from foreign research reactors would not be classified. Under regulations of the Nuclear Regulatory Commission, the Governor's designee would be notified of shipments. Satellite-based tracking systems are capable of pinpointing within 15 minutes where any particular shipment is -- each State has access to this type of monitoring. [Notification of communities about accidents would be the responsibility of the State and local emergency management organizations. DOE would have a supporting role. State Troopers would be among the first to know about an accident, if one were to occur. See Section 2.8 of the EIS for details.]
A comment was made that each community should be publicly notified well in advance of each shipment.	Advance public notification of shipments to communities cannot be given because it would violate regulations of the Nuclear Regulatory Commission. [Notification would be provided to the Governor of each state along a transportation route at least seven days prior to its scheduled occurrence.
A question was asked as to whether a member of the public could ask the Governor's office to be notified in advance of spent nuclear fuel shipments.	Only Governors and emergency responders would be notified [by DOE. Further notification by State Governors is a state function.].
A comment was made that the State of Oregon requested the ability to inspect and monitor Navy spent nuclear fuel shipments going to Idaho National Engineering Laboratory but was denied. Commentor asked what process has changed that would allow this activity by Oregon.	Navy spent nuclear fuel shipments are classified. States do not inspect classified shipments. [Any foreign research reactor spent nuclear fuel shipments would not be classified.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the State of Oregon's emergency responders are not funded for training to handle these shipments.	[Detailed information regarding emergency response requirements and capabilities are found in Section 2.7.4, Appendix D, Sections D.2.1.1, and D.4.3 of the EIS. The EIS also provides information on the availability of well-trained and equipped national emergency response teams, including DOE's Radiological Assistance Program teams that are available for prompt, reliable assistance to first responders for long-term response and mitigation.]
A comment was made that half of the trucks carrying spent nuclear fuel that enter the State of Washington at the border have been arrested by State Patrol inspectors for safety deficiencies, and these same companies will be used for these shipments. Commentor also noted that Canadian shipments will enter the State of Washington at its borders by truck.	DOE contacted the Commercial Vehicle Division of the Washington State Highway Patrol in response to this comment, but was not able to ascertain the source of the commentor's statistic about 50 percent of the trucking firms having serious safety defects for low-level waste shipments to the Hanford Site. From January 1 through August 15, 1995, however, out of 301 radioactive shipment inspections performed by the Highway Patrol at Plymouth, WA, only ten vehicles were issued citations. This is a citation rate of only three percent, n by the Highway Patrol at Plymouth, WA, only ten vehicles were issued citations. This is a citation rate of only three percent, not fifty percent. Furthermore, none of the ten citations were for serious safety defects. DOE is committed to ensure safe transportation through the implementation of the MCEP.] [DOE would contractually require that only reputable shipping firms are used to ship the foreign research reactor spent nuclear fuel covered by this proposed policy. Trucking firms with poor safety records would be excluded from transporting the foreign research reactor spent nuclear fuel under the mandatory MCEP, which is described above.] [DOE recognizes its responsibility to assure that its hazardous materials are transported safely. DOE developed and implemented in 1992 a mandatory Motor Carrier Evaluation Program (MCEP). The MCEP is revised every year to keep it up to date with changing regulations. The criteria for evaluating motor carriers in the MCEP are: – Hazardous Material Transport Experience, – Equipment Profile, – Insurance Requirements, – Financial Stability, – Carrier Safety Programs,

ISSUES RAISED	DOE RESPONSES
	(continued from the previous page) – Drivers (including: Training Program, Selection Criteria, Turnover Rate, and Incentive Program), – Carrier Management, – Equipment Maintenance Program, – Hazardous Material Routing Policy, – Security, – U.S. DOT OMC Safety Rating, and – Carrier Interviews.]
A comment was made that each transport vehicle should be well and visibly marked.	[Every vehicle transporting foreign research reactor spent nuclear fuel would be clearly marked in accordance with Department of Transportation regulations. See Section 5.4 of the EIS for details.]
A comment was made that every ship or truck should be escorted by a team of people who are fully and effectively trained.	[To better describe the security and emergency preparedness that would be associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. This appendix presents the general provisions of the Transportation Plan, which is a document that provides the details that would be associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the management site.]
A comment was made that clean-up money has been misappropriated and diverted to other programs. Commentor cited earmarked funding that was eliminated to protect the Columbia River and clean up contaminated soils, groundwater, and tanks. Commentor also stated that Strontium-90 levels were 1500 times the drinking water standard. Commentor asked when the government was going to wake up and take care of these problems.	[The comment is outside the scope of the EIS.]

ISSUES RAISED	DOE RESPONSES
A comment was made that Hanford, Idaho National Engineering Laboratory and Savannah River Site all have problems with storage facilities and that there is no basis yet to safely store our own spent nuclear fuel. A commentor elaborated on problems at Hanford and why it is not an acceptable site for storing spent nuclear fuel, citing the K-Basins as an example of a leaking storage facility and having seismic vulnerabilities. Commentor stated distrust in what DOE Richland officials tell the public.	[The potential impacts of storing the spent nuclear fuel are discussed in Section 4.2.4 of the EIS. The data presented demonstrate that the risks resulting from the spent nuclear fuel storage are low.]
A comment was made that the Savannah River Site only has storage capacity for 844 spent nuclear fuel rods and that the site is the only place that the spent nuclear fuel could be received.	The Savannah River Site currently has storage capacity for 1400 spent nuclear fuel rods. [If the Record of Decision indicates that the spent nuclear fuel will be accepted by the United States, additional storage capacity will have to be constructed. See Section 2.2.1.9 of the EIS.]
A concern was expressed about cuts in the DOE budget and DOE's ability to properly manage wastes and clean-up activities.	[DOE will continue to fund vital functions, such as spent nuclear fuel management.]
A question was asked as to whether a fiscal study was done on the costs associated with building facilities, transporting nuclear fuel, storing the waste, and disposing of the waste.	[Section 4.8 of the EIS addresses costs of the proposed action.]
A comment was made that, of the three locations where DOE intends to store the spent nuclear fuel, not one has sufficient funding to expand the storage capacity so it can store the fuel. Commentor asked if DOE would address the cumulative impacts of additional spent nuclear fuel, including resource impacts (marginal and capital costs) and long-term costs of storage, and address the inadequate funding according to Activity Data Sheets for the sites.	The EIS does address cumulative impacts [Section 4.2], and costs [Section 4.8], associated with the management of foreign research reactor spent nuclear fuel. Other DOE-owned spent nuclear fuel is addressed in the DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Restoration and Waste Management Program Environmental Impact Statement (SNF & INEL EIS) [Section 1.5 of the EIS].
A comment was made that the law requires DOE to consider cumulative impacts in this EIS, not in the Programmatic EIS. Commentor asked whether DOE was going to consider cumulative impacts in this EIS.	Both the DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Restoration and Waste Management Program Environmental Impact Statement and this EIS address cumulative impacts that would result from management of the DOE-owned spent nuclear fuel and foreign research reactor spent nuclear fuel.
A comment was made noting that the EIS stated that there were no significant impacts associated with the proposed policy and that there must have been a lot of assumptions associated with this statement. Commentor asked what those assumptions were and whether DOE considered the possibility of accidents in its assumptions.	The EIS used conservative assumptions in the analyses of impacts and did consider accidents. Assumptions for each of the alternatives analyzed are presented in the EIS. [The EIS shows that the risks associated with an accident are low (See Sections 4.2.1.3, 4.2.2.3, 4.2.3.3, and 4.2.4.1 of the EIS) and that the risks associated with incident-free handling of and potential accidents associated with the foreign research reactor spent nuclear fuel casks are also low (See Sections 4.2.1.2, 4.2.2.2, 4.2.3.2, and 4.2.4.1 of the EIS).]

ISSUES RAISED	DOE RESPONSES
A question was asked as to how DOE reconciles low significant environmental impacts with anecdotal information, such as families dying of cancer. A related question was whether there is a correspondence between the results of the DOE analyses and "actual numbers."	Considerable [scientific] work was done to correlate radiation doses with cancer incidents. The data analyzed were from real-life incidents. For example, people who were exposed to radiation as a result of Hiroshima and Nagasaki were tracked to monitor ill-health effects. [The internationally accepted results on which the EIS analyses are based are presented in Section 4.1.3 of the EIS.]
A question was asked as to the regulatory limit for radiation exposure.	The regulatory limit for radiation exposure is 10 mrem [per hour] at 2 meters away [from the vehicle]. Most spent nuclear fuel shipments are much less than that. [The radiation dose that anyone would receive handling, working or traveling near a cask is below the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20).]
A comment was made expressing concern about the health effects of spent nuclear fuel on people. Commentor stated that there is no consensus among scientists regarding the impacts of low-dose, long-term exposures. Commentor asked if DOE had any additional data on this and whether DOE considered other views besides the viewpoint that no danger exists.	There are varying views. DOE has not conducted scientific research on this subject on its own. Rather, DOE has used parameters recognized by the scientific community [the United State Nuclear Regulatory Commission and the International Council on Radiation Protection].
A comment was made that the distance from Tacoma, Portland, or Seattle to Hanford is about 700 miles, which is a long trip, and a lot of things could happen. Commentor stated that, although DOE says there is no danger, there are incidents of cancer and deformed children at Hanford and that "it isn't that simple and clean and free from danger."	[The commentor's opposition to use of the Hanford site is noted. In the Record of Decision for the Programmatic Spent Nuclear Fuel Program, the Savannah River Site, and the Idaho National Engineering Laboratory were designated as interim management sites for spent nuclear fuel from foreign research reactors. The Hanford site was not so designated.]
A comment was made that the radiation levels and latent cancer fatalities discussed in the EIS apply to adults and do not address exposures to children. Commentor stated that it is important to answer what radiation levels cause what impact. Under United States regulations, casks are allowed to emit 200 mrem per hour of radiation at the surface, which is equivalent to about 10 full-body x-rays per hour. Commentor stated that this translates to 8 fatal cancers per 10,000 people exposed and that the number is 2-to-8 times greater for children.	[The relationship between radiation exposure and latent cancer fatalities (LCF) used in the EIS was for the general population, which includes children, pregnant females and other higher risk individuals. The exception is where only workers are present, such as at DOE facilities. In these instances, a worker dose-LCF relationship was used.] [While the limit at the surface of a cask is 200 mrem/hr, the limit 2 meters from the surface of the container (an ISO container in this case) is only 10 mrem. See Section 4.1.3 of the EIS for a discussion of the general radiological health effects.]
A comment was made that no safe level of radiation exposure has been determined.	[While regulatory limits have been established, the comment is noted. Section 4.9 of the EIS describes risks associated with U.S. acceptance of the spent nuclear fuel (Management Alternative 1 or 3) and compares these risks with those due to the natural background radiation and other common risks.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the cause of the air's movement is not fully understood and that we are not positive about what causes the movement of air -- perhaps air is an intelligent form of life. Commentor suggested that this be taken into consideration.	[The comment is outside the scope of the EIS.]
A question was asked as follows: Given DOE's statement that a cask would emit 10 mrem per hour if a person was standing at a distance of 2 meters away from the cask -- what if a person was sitting on Interstate 5 during rush hour 2 meters away from the cask on a truck receiving a dose equivalent to a full-body x-ray per hour -- what is the number of latent cancer fatalities?	[As explained in Section 4.1.3, the relation between dose and LCF for the general public is 0.0005 LCF per person-rem. If a person were to sit next to the cask for one hour, he or she could receive 10 mrem or 0.01 person-rem. Therefore, the probability of the person dying from cancer as a result of this exposure is 0.000005, or one in 200,000.]
Comments were made on behalf of the Longshoremen Local in Tacoma expressing concern about possible exposures to workers and the community at large in the event of an accident.	[In the improbable event that an accident should occur, the impact analysis results demonstrate that, although there is a linear relationship between the population around the port and the accident consequences expressed in population dose (Section 4.2.2.3 and Figure 4-1 of the EIS), the highest risk of a latent cancer fatality is 0.000029 for the full range of ports considered. The risk number assumes the acceptance of all of the foreign research reactor spent nuclear fuel into the United States and the use of very high population-density ports such as Elizabeth, New Jersey which is just across the Hudson River from New York City.]
A question was asked as to whether there is special handling training for drivers and dock workers.	If a decision is made to ship spent [nuclear] fuel through a particular port, a Transportation Plan will be developed that would identify any special or additional training that may be required for workers. Truck drivers are required to have additional training to be licensed to handle spent nuclear fuel.
A comment was made that every worker should be given fully informed consent of the hazards involved, including worst-case scenario accidents.	[The radiation dose that anyone would receive handling or working near a spent nuclear fuel transportation cask is below the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20). As such, no signed consent form would be required from anyone associated with the cask carrying foreign research reactor spent nuclear fuel.]
A comment was made that in the event of an accident, the DOE-trained people at Hanford that deal with radioactive accidents "do not do us any good" if there is an accident in Tacoma.	[The DOE Radiological Assistance Program team that operates from Hanford can be deployed upon State, Tribal, or local request. These teams can provide technical expertise and assistance to monitor and assess radiological hazards. The team generally is ready to deploy from their home station within four hours of notification.]

ISSUES RAISED

Comments were made expressing concerns about the potential impacts of, and EIS analyses on, ship-board fires. Specific comments included the following:

- In 1986 a Court barred DOE from importing fuel through ports since there was no adequate analysis of a shipboard fire. The EIS is invalid because spent nuclear fuel has already been received into South Carolina.
- In the event of a shipboard fire, there would be a release of radioactive gas.
- The fire test of 1475 degrees Fahrenheit for 30 minutes is not sufficient. Tacoma has experience with shipboard fires that reached 2000 degrees Fahrenheit for 24 hours (September 1991). Had other hazardous cargoes been onboard, the fire would have burned hotter and may have been uncontrollable.
- If one cask of spent nuclear fuel was onboard during a ship fire inland, results show that plumes would extend 60 miles downwind from a ship accident for up to an area of 900 square miles. Contamination levels would be high enough to require evacuation and decontamination. The gamma radiation dose would be lethal to any person within one mile downwind for a period of one year.

DOE RESPONSES

With regard to the incident that was mentioned involving a 2000 degree Fahrenheit shipboard fire, only a small portion of the flame reaches peak temperature during an actual incident such as the one described. When DOE conducted the heat tests on the type of casks that will be used for these shipments, the casks were subjected to sustained temperatures. Casks onboard the ship will not get to peak temperature. Even if they did, the outcome would be that some of the lead shielding would melt and redistribute. The spent nuclear fuel would still be contained inside the cask. Some of the shielding, however, would not completely encompass the cask. After the fire was extinguished, new external shielding would be used to continue the transportation process. [Cask certification standards were developed for use of the casks on land, hence the 30 minute fire test, which is considered to be the extent of a high intensity fire resulting from a collision with a tanker truck. A ship fire has the potential for a longer duration fire due to the amounts of combustibles carried by some ships. In spite of this potential, the number of severe fires on ships is relatively small. Data available on the last 15 years from Lloyd's of London indicates that of 1,073 ship collisions in port worldwide, only eleven led to fires, and of those, only five caused extensive damage, with only one actually causing buckling of structures.]

[In respect to the impact a ship fire might have on a spent nuclear fuel transportation cask, there are three facts that mitigate the potential damage to the spent nuclear fuel. First, ship fires tend to move to different areas of the ship as the combustible material is consumed, so the cask would not be exposed for the entire duration of the fire. Second, a ship fire's intensity is normally limited by the amount of oxygen that can reach the interior of a hold. Third, all ships that would be used to transport foreign research reactor spent nuclear fuel have built-in fire suppression equipment, which as a minimum would keep fires well below the extreme temperatures necessary to damage the transportation cask. For these reasons, it is almost impossible for nuclear fuel inside the transportation cask to reach 900 degrees Kelvin (1,160°F), the melting point of foreign research reactor spent nuclear fuel. The probability of reaching such a temperature was calculated to be less than one in a billion (see Attachment D5 to Appendix D of the EIS). To put this temperature into perspective, steel used in a ship's structure buckles at around 700 degrees Kelvin (800 degrees F).]

[The EIS contains the results of an analysis of the effects of an accident that involves a severe fire (severity category 6), which does not reach the temperature to melt research reactor nuclear fuel. See Appendix D, Section D.5.3 of the EIS for detailed discussion of accident probabilities and radioactive material source terms and Section D.5.4 for the results of the analyses.]

ISSUES RAISED	DOE RESPONSES
	(continued from the previous page) [In conclusion, although long duration ship fires are possible, and have occurred, they are uncommon events. Analyses in the EIS show that even in the event of a severe ship fire involving a transportation cask, neither the consequences nor risks are great (Appendix D, Section D.5.5 of the EIS).] [The massive accident contamination projections that are cited by the commentor appear to come from a report by Dr. Resnikoff (Greenpeace). Unfortunately Dr. Resnikoff does not provide adequate information on the cask inventories, release fractions, and meteorological assumptions that he used in his analyses, nor does he explain any changes he may have made to the code used to predict consequences. Without full disclosure, it is impossible to determine exactly why his estimates are orders of magnitude greater than DOE's well-documented and publicly available estimates. DOE's analyses are presented in Section 4.2.2.3 of the EIS and show that contamination from a severe ship accident and fire are small.]
With regard to the 30-foot drop test for Type B containers, a comment was made that the distance from the cranes to the dock is much more than 30 feet.	DOE's 30-foot drop test was on to an unyielding surface. Even if the actual distance from the crane to the dock is greater than 30 feet, there would not be the same type of stresses at a port dock that would result from an unyielding surface. [An unyielding surface is a theoretical, perfectly flat surface that cannot be moved, dented, or cracked in any way. An acceptable "unyielding surface" for the Nuclear Regulatory Commission consists of a monolithic concrete base, reinforced by rebar and covered with a plate of battleship armor (Section 5.4.1).] [In one experiment, a real cask was dropped from much higher than 30 feet from a helicopter onto ordinary soil with no damage to the cask.]
With regard to the crash test for Type B containers, a comment was made that crashing a truck into a wall at 84 miles per hour is not the same as trains crashing into trucks. This type of an incident has happened.	[In another experiment, a real cask sitting on a truck trailer was struck by a locomotive traveling at 80 miles per hour. The locomotive was destroyed, the transportation cask was dented, but cask containment remained intact.]

The public hearing at Southport, North Carolina, for the candidate port of entry at the Military Ocean Terminal at Sunny Point, was held at the Southport City Hall, on May 23, 1995. Twenty-one people attended the hearing. The hearing was interactive in nature and the following is a summary of the comments and issues that were raised. Information in brackets [ ] was not provided at the hearing.

ISSUES RAISED	DOE RESPONSES
Clarification was requested as to which countries are involved in the proposed policy and the size of their research reactors?	As identified in the EIS, 41 countries are covered under the proposed policy. These countries have spent nuclear fuel containing uranium that was enriched in the United States. [Section B.1.1.3 of the EIS provides information on foreign research reactors that are eligible for inclusion under the proposed action.]
Comment was made that each nation should take care of its own wastes and should have the option to reprocess its wastes at overseas facilities. A doubt was raised about arguments in the draft EIS that foreign countries would continue using HEU since their security would also be at risk.	[Management Alternative 2 considered in the EIS includes the option of overseas reprocessing. However, as discussed in Section 2.3 of the EIS, certain arrangements in support of U.S. nuclear weapon nonproliferation policy would have to be established, including blending the HEU down to LEU, developing the capability to reprocess high density LEU, and converting reactors to LEU. Some foreign research reactor operators would have no option except to continue using, or convert to, HEU fuel.]
Comment was made that other countries should bear financial responsibility for management of their spent nuclear fuel -- even if the fuel is accepted into the United States for management.	[As discussed in Section 2.2.1.2 and 2.2.2.3 of the EIS, several financing options have been considered, ranging from collection of fees from the research reactor operators that would pay all of the costs of the program, to full subsidization of the program by DOE. A compromise between these extremes would be for developed countries to be charged a competitive fee to accept and manage their spent nuclear fuel. U.S. taxpayers would absorb the full costs of the program for developing countries and absorb the amount above a competitive fee for developed countries. The reasons the United States would pay some of the costs for other countries are: 1) some countries would be unable to afford the cost of the proposed action and would have no safe alternative means of managing their spent nuclear fuel (i.e., the developing countries); and 2) some countries would continue to use and trade weapons-grade nuclear material indefinitely unless the U.S. charges a competitive fee and absorbs any costs above that fee.]
A question was asked as to whether the sea shipments would be on dedicated ships (i.e., exclusively carry spent nuclear fuel).	The EIS analyzed shipments via commercial vessels, chartered vessels, and specially-built vessels. DOE is maintaining the options for decisions to be made by the foreign research reactor operators and their shippers at the time of shipment, depending on specific circumstances. [Whether the shipments come as cargo on a scheduled carrier or on a chartered ship, no special precautions are expected to be required by the Coast Guard or any other authority. Therefore, DOE sees no need to use dedicated ships.] An Edlow Group representative reiterated the long-standing experience in shipping spent [nuclear] fuel on both commercial and dedicated shipments, as well as special-built ships. Decisions depend on the amount and nature of the spent nuclear fuel.

ISSUES RAISED	DOE RESPONSES
A question was asked as to how many ships would come into the United States with spent nuclear fuel.	The number of ships depends on how many casks are loaded onto a ship. About 720 casks are estimated to be shipped by sea over a 13-year period.
A question was asked as to how many ship-loads of spent nuclear fuel could come up the river to the Savannah River Site.	With a total amount of 720 casks that could be shipped over a 13-year period, the total number of ships would be about 500. The number of ships coming up river to the Savannah River Site would depend on how many casks are on a ship and what other ports are selected for entry.
Clarification was requested on how DOE estimates the number of sea shipments.	If one cask is shipped per ship, the maximum number of shipments would be 720. However, it would not be economical to ship only one cask per ship.
Concern was expressed about the vulnerability of North Carolina and South Carolina to hurricanes and earthquakes.	[The EIS considered severe natural phenomena as part of the port selection process (Appendix D, Section D.1.9.6 of the EIS). The probability of each phenomenon impacting foreign research reactor spent nuclear fuel is low.]
Several commentors stated their opposition to spent nuclear fuel entering the State of North Carolina.	[The commentor's opposition to receipt of the foreign research reactor spent nuclear fuel at MOTSU and to transport across the state is noted.]
A comment was made that the draft EIS did not accurately portray the population estimates in the Wilmington and Southport areas, particularly the summer and autumn populations, which were stated as being larger than the average population.	[Accident analysis populations were based on the 1990 census (Appendices A, D, and E of the EIS). Transient populations cannot be accurately estimated, therefore only permanent resident populations were considered.]
A question was raised as to whether DOE would designate specific ports of entry in advance, or simply state which ports are acceptable and allow the shippers latitude to select the port of entry.	The approach to be used in port selection will be determined when the Secretary of Energy issues the Record of Decision. However, the most likely approach to be taken is for the shippers to have maximum flexibility to designate the port of entry based upon DOE's determination of acceptable ports.
Concern was expressed about the potential for sinkholes underneath the rail lines in the Southport area and the ability to safely retrieve a cask that falls into a sinkhole.	[Spent nuclear fuel transportation] casks have been designed to be robust and withstand severe accident conditions. These casks have been subjected to simulated severe accident tests, such as a crash, fire, and the dropping of a cask onto an unyielding surface. If a cask were to fall into a sinkhole, DOE would immediately retrieve the cask. [The transportation cask would not be ruptured by virtue of falling into a sinkhole.]
A suggestion was made that DOE should take into account the Consent Agreement between Martin Marietta and the Army Corps of Engineers that allows lime mining to continue in spite of documented sinkholes in the Southport area.	[Additional language has been added to Section 3.2.1.5 of the EIS to address this issue.]

ISSUES RAISED	DOE RESPONSES
A comment was made that road conditions in the Southport area were inadequate for spent nuclear fuel transportation. It was noted that, according to State documents, there are no plans in place to correct poor road conditions.	[The North Carolina Department of Transportation was contacted regarding this issue. Although the roads servicing MOTSU are primarily small, two-lane roads, they would be adequate to transport foreign research reactor spent nuclear fuel as long as State regulations for normal traffic are met. Appendix D, Section D.2.1.5 of the EIS has been changed to better describe the road access to MOTSU.]
A suggestion was made that the public in Brunswick County should be notified if and when spent nuclear fuel shipments will be transported through their communities.	[DOE is required to inform State officials in advance of the shipment of hazardous cargos. DOE would also work with State and local officials to ensure that channels of communication remain open and that emergency response preparedness is coordinated.]
A question was asked whether the shipment schedule will be deemed safeguarded information, thus precluding public notification.	Under Nuclear Regulatory Commission regulations, [information on the] spent [nuclear] fuel shipments is considered safeguarded information. This is not meant to be secretive but to balance against a security threat. However, DOE will work with States to assure that proper authorities know the specifics about a shipment and will be prepared to respond to any emergency.
A question was asked as to whether local emergency and highway patrols will be trained to respond to accidents involving spent nuclear fuel.	When it is known that a shipment would take place, DOE would work with the State to assure that local communities were trained and equipped to respond to any emergency involving spent nuclear fuel.
A suggestion was made that DOE should provide its own security teams and not drain the State and local response capabilities.	Most shipments are escorted by the shipper's security. Trucks are also continually tracked by a DOE satellite tracking system.
A suggestion was made that DOE should take total responsibility for emergency response and security.	[As discussed in Section 2.7 of the EIS, responsibility for emergency response would reside with State, Tribal, and local authorities. DOE would provide coordination, financial and technical assistance and training to the State, Tribal, and local emergency response personnel. In addition, DOE has Radiological Assistance Program teams that operate from eight strategically located DOE offices around the country. Upon request, these teams can provide technical expertise and assistance to monitor and assess radiological hazards. The teams are activated on an "as-needed" basis and generally can be ready to deploy from their home station within four hours of notification.]
	[Nuclear Regulatory Commission and DOE regulations require escort of shipments of spent nuclear fuel on public highways. Normally the escort is supplied by State and/or local police, but arrangements and payment are the responsibility of the shipper. Section 2.8 and Appendix H have been added to the EIS to address security measures.]

ISSUES RAISED	DOE RESPONSES
A request was made for DOE to consider extending the public comment period.	[The deadline for submission of comments in response to the draft EIS was extended thirty days from June 20 to July 20, 1995, a total of 90 days.]
A comment was made that there should be total nuclear disarmament and that the Treaty on Non-Proliferation does not provide an incentive for nuclear disarmament. Commentor expressed disagreement with extension of the Treaty on Non-Proliferation.	Comment noted but is beyond the scope of the EIS. [The United States supported the indefinite extension of the Treaty on the Nonproliferation of Nuclear Weapons, which is the foundation for the international nuclear weapons nonproliferation regime.]
A comment was made that taxpayers should be alerted that "94 more nuclear reactor plants will be operating around the world in the next 15 years and that they should be aware of the huge costs for nuclear waste cleanup associated with these plants." Commentor asked how many of these plants "have deals" with the United States to "dump their waste" in our country.	The proposed policy in this EIS deals only with spent nuclear fuel at foreign research reactors that contains uranium enriched in the United States.
A question was raised as to whether, in light of the United States encouragement of foreign research reactors to downgrade their use of reactor fuel to LEU, the United States was requiring the same of its own research reactors.	The United States is encouraging its own research reactors to convert to the use of LEU instead of HEU. Most United States research reactors have either converted to the use of LEU or are in the process of converting to the use of LEU.
A question was asked as to whether the United States is purchasing the spent nuclear fuel.	No. The United States sold the fuel to the foreign research reactors. The uranium was enriched in the United States. Under the policy, the United States would merely be accepting the spent [nuclear] fuel containing U.S.-enriched uranium if a decision is made for the United States to manage the spent [nuclear] fuel.
A question was asked as to whether the United States is still supplying the enriched uranium to other countries.	The United States has not exported HEU for 3 years [since enactment of the Energy Policy Act of 1992 prohibited the export of HEU, except under special circumstances].
A question was asked as to whether the United States will continue to produce nuclear weapons from the spent nuclear fuel at the Savannah River Site.	No. Production of nuclear weapons from spent nuclear fuel is against current United States policy.
A question was asked as to how many spent nuclear fuel casks were currently available.	According to an Edlow Group representative, there are about 8-10 [spent nuclear fuel transportation] casks available.
A question was asked regarding what casks would be used and whether they would be standard spent nuclear fuel casks or new casks.	The cask type depends on the characteristics of the spent nuclear fuel to be shipped and the arrangements made by the shippers. Cask descriptions are contained in Chapter 2 of the EIS and Appendix B.

ISSUES RAISED	DOE RESPONSES
A question was asked as to how the casks were tested.	In order to be certified, casks undergo simulated [severe] accident tests, including a crash test, a drop onto an unyielding surface, and a fire test. [Engineering analysis may be used to demonstrate an ability to pass these tests, rather than performing physical tests.]
A suggestion was made that casks should be full-scale tested, with spent nuclear fuel in them.	[Full-scale demonstration testing of casks were conducted in the United States in the 1970s to confirm that Type B casks built to Federal standards (10 CFR Part 71) could protect and retain their contents in the most severe accidents. Similar tests have conducted in the United Kingdom, Germany and Japan. In each of these tests, the cask prototype was deformed as predicted by analysis, but no simulated radioactive material was released.]
A question was asked as to how casks are approved.	Before entering the United States, the cask [design] goes through an evaluation process by the Nuclear Regulatory Commission (NRC) and certification by the Department of Transportation (DOT). If the NRC evaluation concludes that the cask is certifiable to NRC standards, DOT issues a certification for the United States acceptance of the cask.
Clarification was requested as to the meaning of the statement that spent nuclear fuel under this policy represents about one percent of the DOE inventory.	The one percent of DOE inventory refers to one percent of the metric tons of heavy metal (MTHM) of spent nuclear fuel in the DOE inventory. MTHM is a standard measurement used for the content [the quantity of the mass of heavy metal] of uranium and other heavy metals.
A comparison of foreign research reactor spent nuclear fuel with commercial spent nuclear fuel was requested.	The EIS Summary and Chapter 1 contain illustrations that show the differences between the two types of fuel. DOE's current inventory of spent nuclear fuel is about 10 percent of the commercial industry's inventory. The DOE inventory is about 2,500 metric tons of heavy metal. [Currently about 2,700 MTHM of DOE spent nuclear material is being stored at various DOE facilities.]
A question was asked as to whether uranium is enriched in nuclear power plants.	No. Nuclear power plants produce energy; they do not enrich uranium. Uranium enrichment requires complex processing plants.
A question was asked regarding the United States plan for ultimate disposition of spent nuclear fuel.	The current plan is disposal of spent nuclear fuel in a geologic repository.

ISSUES RAISED	DOE RESPONSES
An Edlow Group representative read a statement presenting the position of about 14 foreign research reactor operators. (A written statement is included in Volume 3 of the EIS.) Statement is summarized as follows: (1) Foreign research reactors provide benefits; (2) Foreign research reactor operators always relied on United States assurances to take back U.S.-origin fuel; (3) United States acceptance of foreign research reactor's spent nuclear fuel supports nonproliferation goals; (4) With United States acceptance of foreign research reactors' spent nuclear fuel, reactor operators willingly cooperated in the RERTR program and converted to LEU fuel; (5) Foreign research reactor operators are making long-term plans to deal with their own fuel overseas; (6) In the short-term, foreign research reactors do not have safe storage capacity; (7) Foreign research reactor spent nuclear fuel makes up only 1% of heavy metal content of entire DOE-owned spent nuclear fuel inventory; (8) United States acceptance can be done without significant impacts; (9) While United States acceptance adds a small amount of spent nuclear fuel to DOE inventory, the trade-off is taking HEU out of world commerce; and (10) DOE should move forward with United States acceptance of foreign research reactor spent nuclear fuel.	[Comments are noted. Statement was also submitted as a written comment. DOE response is included in Volume 3 of the EIS, written comments section, document number 7.]

The public hearing at North Augusta, South Carolina, hearing site for the candidate DOE Management Site at the Savannah River Site, was held in the North Augusta Community Center on May 9, 1995. Twenty-one people attended the hearing. Below is a summary of the comments and issues that were raised at the hearing, which was interactive in nature. Information in brackets [ ] was not provided in the hearing.

ISSUES RAISED	DOE RESPONSES
A question was asked regarding the foreign research reactor operators' position on whether the United States should store or reprocess their spent nuclear fuel if it is accepted into the United States.	According to an Edlow Group representative, the foreign research reactor operators do not want to interfere with United States domestic policy and have taken no position on what DOE should do with the spent nuclear fuel upon United States acceptance. [The Edlow group is a group of 14, mostly European, foreign research reactor operators represented by Edlow International Company, an international traffic management firm.]
A question was asked as to whether foreign countries have experience in reprocessing.	France and the United Kingdom both have experience in reprocessing. [Germany and Japan also have experience in reprocessing.]
A question was asked as to what foreign research reactor operators would prefer if the spent nuclear fuel were to be managed overseas.	According to an Edlow Group representative, most foreign research reactor countries have circumstances that preclude near-term storage (laws, time-consuming licensing process, lack of capacity). Therefore, storage is not a viable option. Most foreign research reactors would likely revert to, or continue using, highly enriched uranium. [Management Alternative 2, the overseas management option, could be implemented by U.S. assistance in reprocessing as well as storage.]
A question was asked as to whether there are any demonstrated storage sites for dry storage of aluminum-clad fuel overseas.	Australia, Japan, and Canada have dry storage facilities for aluminum-clad fuel. [Denmark also has dry storage facilities for aluminum clad fuel.]
A question was asked as to what type of wet storage these countries require prior to dry storage.	[They use pool storage similar to that use in the United States.]
A question was asked as to whether foreign research reactor operators would consider paying to help the United States manage their spent nuclear fuel.	According to an Edlow Group representative, the official position of the foreign research reactor operators (that belong to the Edlow Group) is that they do not want the United States to subsidize their shipping of spent nuclear fuel to the United States for management. They are willing to pay actual costs as long as they are real costs (cost-based pricing as opposed to market-based pricing). The Edlow Group representative noted that the September 1994 cost of the urgent-relief shipment into the Savannah River Site was more than twice what DOE had charged prior to termination of the program in 1987.

ISSUES RAISED	DOE RESPONSES
An Edlow Group representative read a statement presenting the position of about 14 foreign research reactor operators. (A written statement was also submitted.) Statement is summarized as follows. (1) Foreign research reactors provide benefits; (2) Foreign research reactor operators always relied on United States assurances to take back U.S.-origin fuel; (3) United States acceptance of foreign research reactor's spent nuclear fuel supports nonproliferation goals; (4) With United States acceptance of foreign research reactors' spent nuclear fuel, reactor operators willingly cooperated in the RERTR program and converted to LEU; (5) Foreign research reactor operators are making long-term plans to deal with their own fuel overseas; (6) In the short-term, foreign research reactors do not have storage capacity; (7) Foreign research reactors' spent nuclear fuel would make up only 1% of heavy metal content of entire DOE-owned spent nuclear fuel inventory; (8) United States acceptance could be done without significant impacts; (9) While United States acceptance would add a small amount of spent nuclear fuel to DOE inventory, the trade-off would be taking HEU out of world commerce; and (10) DOE should move forward with United States acceptance of foreign research reactor spent nuclear fuel.	[Comment is noted. DOE's response to the written submittal is included in this Volume 3 of the Final EIS, document number 7.]
A comment was made that, from the perspective of a group of foreign research reactor operators, the United States is legally committed through contractual obligations and other expressed and implied means to accept foreign research reactor spent nuclear fuel.	DOE's position is that the United States is not legally obligated to accept foreign research reactor spent nuclear fuel. [With the exception of cases in which DOE has executed contracts for acceptance of spent nuclear fuel from specific foreign research reactors, DOE considers that neither the DOE nor the United States Government has any legal obligation to receive spent nuclear fuel from foreign research reactors. Even in cases where there may be signed contracts for shipment of spent unclear fuel to the United States, there are two cases, as follows, in which DOE considers that neither DOE nor the United States Government have any legal obligation to accept the spent nuclear fuel. 1. In the absence of a completed Appendix A for each shipment, mutually agreed to by DOE and the research reactor operator, DOE considers that the contracts have not been completed and are not binding. 2. In the absence of a completed review under the National Environmental policy Act (up to and including issuance of a Record of Decision or Finding of No Significant Impact specifically covering the proposed shipment), DOE considers that any contract would be subject to successful legal challenge and would not be enforceable.]

ISSUES RAISED	DOE RESPONSES
A comment was made that, although the commentor supports the nonproliferation policy and supports the Savannah River Site, in light of the budget situation, DOE should look carefully at the cost of bringing foreign research reactor spent nuclear fuel into the United States and that foreign research reactor operations should consider sharing the cost. The commentor asked if a cost analysis would be done.	A cost analysis is included in the EIS [Volume 1, Section 4.8]. According to an Edlow Group representative, the foreign research reactor operators are willing to pay all costs associated with shipment of their spent nuclear fuel to the United States, provided the charges are cost-based.
A question was asked about the status of technologies for blending HEU down to LEU.	The physics for blending HEU to LEU is basic and the [technology and] capability to do so exists [in the United States, United Kingdom, France, and other countries].
A question was asked as to whether there is a Federal policy for weapons-grade uranium in power reactors.	[Presidential Decision Directive 13 specifies that it is U.S. policy to minimize and eventually eliminate the use of highly enriched uranium in civil programs worldwide. This policy would include the use of weapons-grade uranium in power reactors. As a practical matter, weapons-grade uranium is not used in power reactors.]
A question was asked as to whether a NEPA action relative to United States policy to no longer reprocess was completed.	No. NEPA actions usually apply to [and are required for proposed] actions to do something; not to cease something, [unless the cessation would have potentially significant environmental impacts.]
A question was asked as to whether the United States is paying countries to send the HEU to the United States.	[The United States has not proposed paying countries to send HEU to the United States under the proposed action. However, certain costs could be subsidized.] In a separate program [the U.S.-Russian HEU Purchase Agreement], the United States is paying Russia for its HEU [blended down to LEU] because of concerns about Russia's ability to store HEU safely [and to further U.S. nuclear weapons nonproliferation objectives].
A question was asked as to when the technology became available for reactors to run on LEU fuel.	The Reduced Enrichment for Research and Test Reactors program began in 1978 when the United States started encouraging foreign research reactors to convert operations to LEU fuel. [The technology has been available since the 1960s.]
A comment was made that the United States should focus its proposed policy on only "rogue" nations instead of worrying about NATO countries.	This was considered in preparation of the EIS. DOE does not consider that this alternative is appropriate because: (1) the status of governments can change; (2) the United States is looking to NATO countries to set an example for other countries; and (3) not all NATO countries agree with the U.S. goal of eliminating worldwide use of HEU.

ISSUES RAISED	DOE RESPONSES
A question was asked as to why the proposed policy is limited to only U.S.-origin enriched uranium and why there is a time limit.	The EIS addresses a finite action, which applies only to foreign research reactor spent nuclear fuel with U.S.-origin enriched uranium. The 10-year policy duration would accept from foreign research reactors all of the U.S.-origin spent [nuclear] fuel [containing HEU]. [The United States is encouraging Russia and China to retrieve the HEU that they supplied. The time limit is to encourage foreign nations to arrange for their own nuclear waste disposal outside of the United States.]
Clarification was requested of the NEPA actions that followed expiration of the HEU Off-Site Fuels Policy in 1988 for HEU and 1992 for LEU fuels.	As described in more detail in Chapter 1 of the EIS, an Environmental Assessment [and draft "Finding of No Significant Impacts" (FONSI)] were prepared following expiration of the Off-Site Fuels Policy to evaluate possible implementation of a new policy for United States acceptance of foreign research reactor spent nuclear fuel. Because of the strong negative comments received on the Environmental Assessment [and draft FONSI, this NEPA review] was never completed. Key concerns during public comment on the Environmental Assessment involved opposition to a United States acceptance policy in general and the need for a more comprehensive NEPA review, resulting in preparation of this EIS.
A question was asked about the relationship between the Environmental Assessment prepared in 1994 for the U.S. acceptance of Urgent-Relief shipments of foreign research reactor spent nuclear fuel and the South Carolina lawsuit.	The State of South Carolina filed a lawsuit in September 1994 while the first of two shipments under the 1994 Environmental Assessment was in progress. The second shipment has not taken place and the lawsuit is still pending. [On August 23, 1995, a Federal appeals court overruled a District court order that had blocked shipment of the spent nuclear fuel. This ruling clears the way for the remaining Urgent Relief shipment.]
A comment was made that the burn-up of plutonium and tritium in a reactor goes hand-in-hand with nonproliferation. Commentor asked if DOE is looking at multi-purpose reactors that would burn up plutonium and tritium.	DOE is studying burn-up reactors as part of a separate NEPA review.
A question was asked as to how DOE, in its public outreach, responds to the legal issues and States' opposition to storing spent nuclear fuel in their States. Was it a matter of "sharing the larger world issues"?	DOE's preferred approach is to conduct outreach activities that explain the reasons why an action is being proposed and how the action or lack of action may affect [the public].
Clarification was requested as to what fraction of worldwide HEU is represented in the proposed policy.	It is difficult at this time to estimate the amount of worldwide HEU. Currently, there is a major undertaking between DOE and Russian laboratories to identify the HEU in Russia. Efforts are also underway with China. Russia and China are also pursuing programs similar to the United States to retrieve the HEU that they have provided to others.

ISSUES RAISED	DOE RESPONSES
A question was asked as to whether more plutonium is generated as reactors convert to LEU.	Only a small increase in plutonium is generated [when the fuel is converted] from [HEU to] LEU. In comparison with HEU, there is a net decrease in weapons grade material [when reactors convert to LEU].
A comment was made that there does not appear to be a concern by DOE or the Department of State that any of the spent nuclear fuel could be stolen or hijacked. The commentor questioned the use of commercial shipping because of a terrorist threat and suggested that military shipping should be used.	The weapons-grade material is an integral part of the solid metal fuel elements. Before the weapons grade material can be usable, it must be separated from the fuel element. This can only be done by a reprocessing plant. A terrorist could not "run up and grab" a [spent nuclear fuel transportation] cask. [Casks used for marine and ground transport weigh about 10-25 metric tons. EIS Section 2.8 and Appendix H have been added to the Final EIS. They describe, among other items, the security that will be in place for shipments.]
A question was asked as to how dry storage of all aluminum-clad nuclear fuel at the Savannah River Site compares in scale to the aluminum-clad nuclear fuel in storage at commercial power plants.	About 4 acres would be required for the dry storage of all DOE-owned aluminum-clad fuel. This is comparable to the storage of spent nuclear fuel at just one commercial nuclear power plant. [Commercial power reactors do not use aluminum-clad fuel.]
A comment was made that aluminum-clad nuclear fuel should be chemically separated at the Savannah River Site. Reasons cited were the massive costs and increased exposures associated with the canning of failed aluminum-clad elements for storage and the availability of the chemical separation technology. Comment applies to the foreign research reactor spent nuclear fuel and existing DOE-owned spent nuclear fuel.	[The DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement Record of Decision issued May 30, 1995 identifies the Savannah River Site for consolidation of aluminum-clad spent nuclear fuel. This EIS includes an evaluation of alternatives under which the aluminum based spent nuclear fuel could be reprocessed there.]
A comment was made that it seems incomprehensible for DOE to consider chemically separating some of its own fuel and not foreign research reactor spent nuclear fuel.	Under a separate NEPA action, DOE is evaluating the chemical separation of certain DOE-owned spent nuclear fuel at the Savannah River Site. The analysis contained in this EIS [Sections 2.2.2.6 and 4.3.6] include alternatives under which foreign research reactor spent nuclear fuel could be chemically separated, if other DOE-owned fuel is to be chemically separated.
A question was asked if, in order to store or dispose of aluminum-clad fuel, each element would have to be individually canned.	Only those elements found to be defective would require separate canning.
Clarification was requested of the amount of aluminum-clad foreign research reactor spent nuclear fuel.	The total amount of foreign research reactor spent nuclear fuel covered under the proposed policy is about 19.2 metric tons of heavy metal from about 22,700 individual spent fuel elements. Aluminum-clad fuel represents about 75% of this amount.

ISSUES RAISED	DOE RESPONSES
A comment was made that page 15 of the draft EIS Summary states that shippers would generally select the most direct route. Commentor noted that this was not the case with the August 1994 urgent-relief shipment into the Military Ocean Terminal at Sunny Point, where the shipment went from Sunny Point by rail to the Savannah River Site on a route that was not the most direct route.	[Once the port of entry is selected, the most direct route to the DOE management site will normally be selected. Sometimes, for reasons beyond the control of the shipper, alternate routes are used. In any case, the risk of ground transportation of the foreign research reactor spent nuclear fuel is low. NRC approval of the route taken is always required. Port selection will be part of the Record of Decision.]

McFarland, Scott

McGehee, Berny

Pajeglio, John W.

Pittman, Randall

Rozelle, Martin

Sieg, Paul

Taylor, Linda

Tjersland, Gary T.

Walters, Vanessa

Wells, Christopher

The public hearing at Tacoma, Washington, a candidate port of entry, was held at the Tacoma Public Utilities Building on June 19, 1995. There were 123 persons who registered to attend the hearing, and about 220 persons did attend the hearing. A verbatim transcript of this hearing was made at the request of hearing participants; the transcript is included as Attachment 1 to this volume of the EIS. The hearing attendees requested a format in which they presented public statements with little or no dialogue between attendees and the DOE. Therefore, most DOE responses were not given at the hearing, but are provided in brackets [ ]. The following is a summary of the comments and issues that were raised.

ISSUES RAISED	DOE RESPONSES
Questions were asked as to how much the public's opinion mattered and whether the public opinion affected the final decision.	DOE is requesting public comments. All public comments are heard and considered by DOE as well as by local legislators and Congress. Public comments that directly affect the EIS and final decisions are those that show technical reasons that a certain action will result in unreasonable risk. It should be noted, however, that DOE does not hear unanimous opposition to the proposed action everywhere it goes.
Commentors stated appreciation that DOE was tape-recording the hearing and has extended the public comment period. One commentor stated that DOE would not have taped this hearing had the local public not made a fuss about it.	[DOE adopted a public hearing format that provided opportunity for increased interaction between DOE and the public in order to facilitate communication. In the large majority of cases, this public hearing format was well received by the public. During the hearings, the facilitator recorded the major comment themes on flip charts, and notetakers recorded additional information to supplement the points captured by the facilitator. DOE also encouraged the submittal of written comments, on forms distributed during the public hearings or in any other written form during the 90-day public comment period. Considering all the mechanisms that were provided to submit public comment, DOE considered that tape recording the hearing was not necessary. However, at the request of several groups, DOE tape recorded the Tacoma hearing. A transcript is included in Volume 3 of the EIS.]
Comments were made that there was insufficient notice and insufficient advertising for the public hearings and that, if it was not for action by local officials and grass roots organizations to get the word out, they would not have known about the hearings. Some commentors asked for more hearings. A comment was made that the public does not find out about DOE actions until after the fact. Commentor stated that these types of things are deliberately kept from them.	[DOE placed advertisements for the June 19, 1995 hearing in the Tacoma Tribune on June 12 and 18, 1995. In addition, interest groups placed advertisements in the same paper (one at least a quarter page in size). In all, seventeen public hearings were held on this EIS in the locations determined to be most directly impacted by the proposed action, specifically in the ports of entry and at the potential management sites. This is well in excess of the single public hearing the applicable regulations require DOE to conduct. In addition to accepting comments from the public during these hearings, written comments were also welcomed, and encouraged. DOE considers that these actions have provided ample opportunity for the public to comment on the draft EIS.]

ISSUES RAISED	DOE RESPONSES
A comment was made urging members of the audience to continue the fight against the proposed action. Specific comments included the following: - DOE has not met the burden of the last injunction, and the Heart of America Northwest is committed to a state-wide initiative to stop DOE. - We must keep the emotions boiling and not let up in our fight against this proposed action. This first came to our attention in 1988 and it was ignored -- now it has become a possibility. We must stick together. - When DOE decides what port to use it will be a political decision. That is where we come in. The campaign starts tonight. - The public must send the message repeatedly to DOE and must write and send letters to Congress, Mr. Head, and the President. - Skagit County was able to keep a nuclear power plant out if its county and the public here can do the same. - The City of Tacoma is united against spent nuclear fuel shipments through the Port of Tacoma. - We will take DOE to court if it attempts to bring in spent nuclear fuel through the Port of Tacoma.	[The commentor's opposition to bringing foreign research reactor spent nuclear fuel through the Port of Tacoma is noted. In evaluating and selecting acceptable candidate ports of entry for receipt of foreign research reactor spent nuclear fuel, the EIS developed and applied evaluation criteria which are described in Appendix D, Section D.1.9 of the EIS. The Port of Tacoma is included in this evaluation. DOE considers that the port selection criteria successfully identify ports than can safely handle the spent nuclear fuel. The decision as to which port(s) would be used if foreign research reactor spent nuclear fuel is accepted by the United States, will be made in the Record of Decision.]
A question was asked as to why Secretary O'Leary has not visited the Tacoma area or appeared at this hearing.	[Although Secretary O'Leary cannot be personally involved in every DOE action or hearing, she will be involved in reaching the final decision on this issue.]
A comment was made indicating that the public distrusts the Department of Energy.	[Secretary O'Leary has made a concerted effort to provide the public with information on past DOE actions to increase public trust. Public hearings provide opportunity for increased interaction between DOE and the public, thus serving to facilitate communication and build a sense of trust. DOE has provided fact sheets, videos, and exhibits at the hearings to assist the public in gathering factual knowledge about the proposed policy alternatives and their environmental impacts.]
A question was asked as to whether this EIS is conceptual in nature.	An EIS is not necessarily conceptual. Programmatic EISs are broad, but project-specific EISs such as this one [on foreign research reactor spent fuel] are not.
A question was asked as to whether Mr. Head (DOE) has a personal bond in case the EIS analyses were wrong. Commentor stated that since Mr. Head is promoting this action, he should be held liable if there was an accident and people were killed.	Mr. Head does not have a personal bond [to cover performance of his DOE functions. Mr. Head is not personally liable for DOE information or actions.] The United States has a law, known as the Price-Anderson Act [that would cover costs associated with a nuclear incident. Mr. Head is not personally liable for DOE information or actions. However, DOE considers that the EIS analyses are correct.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the proposed action was short-sighted and that the United States would be taking on the liability as world police for the foreign countries for thousands of years.	[The proposed action has both short and long-term goals. The objective of the proposed action is to support United States nuclear weapons nonproliferation policy by seeking to reduce and ultimately eliminate the use of highly enriched (weapons grade) uranium in civil programs worldwide.] [The proposed action is not a "world police" activity, nor would the management of spent research reactor fuel from foreign research reactors continue beyond the limited proposed policy duration.]
Comments were made questioning why the United States needs to accept spent fuel from countries that are not a proliferation risk. Specific comments included the following: More than 75% of the countries covered in the proposed action are allies; only 1.4% of the proposed shipments come from countries that are nuclear proliferation risks; any nation can develop nuclear weapons; the nonproliferation argument is not strong; the EIS leaves the impression that some of the countries cannot be trusted, such as Japan, Sweden, Canada, France and Switzerland -- this is insulting to these countries; eliminate allied countries from the list and focus on the remaining countries, which would eliminate about 90% of the problem.	Unless the United States provides an incentive for foreign research reactor operators to switch to the use of low enriched fuels, these reactor operators may return to the use of highly enriched uranium fuel. In addition to operating research reactors, some of our allies are manufacturing and exporting research reactors. Countries also may continue exporting research reactors that run on highly enriched uranium fuel, and the market for highly enriched uranium will continue. The proposed policy seeks to provide an incentive for countries to convert to low enriched uranium. The United States is also working with Russia and China to do the same with their client states. [DOE believes it is not prudent to publicly label selected nations as allies or to label those seen as threatening to the United States (Section 2.8 of the EIS). Negative political and diplomatic reactions from nations designated as threats would likely preclude their cooperation in efforts to reduce international commerce in highly enriched uranium.]
A question was asked as to why the spent nuclear fuel is not contained and left in countries where it is generated.	An option, in addition to United States acceptance of the foreign research reactor spent nuclear fuel [Management Alternatives 1 or 3], is for the United States to assist in [overseas reprocessing or] developing secure storage facilities at more than 100 foreign research reactors worldwide [Management Alternative 2]. However, some governments are not stable, and there would be no assurances that the spent nuclear fuel would stay in those storage facilities. The spent fuel could be diverted to nuclear weapons production.
Comments were made that the United States should not bear the responsibility for other countries' spent nuclear fuel. Specific comments included the following: The United States should encourage responsibility and accountability on the part of the countries who have benefitted from the U.S.-origin highly enriched uranium; why should the United States be responsible for the whole world; first they take our jobs -- now they are shipping us their waste.	[The intent of the proposed action is to support United States nuclear weapons nonproliferation policy by seeking to reduce and eventually eliminate the use of highly enriched (weapons grade) uranium in civil programs worldwide. As discussed in Chapter 4 of the EIS, implementation of the proposed action would have no significant environmental effects, including economic or employment effects.]

ISSUES RAISED	DOE RESPONSES
A comment was made questioning why the United States provided highly enriched uranium to other countries in the first place. One commentor argued that there is no evidence that these countries will convert to low enriched uranium. Another commentor questioned DOE's statement that Japan would build reactors using highly enriched uranium.	[As a major component of the "Atoms for Peace" program, particularly in the early years, the United States provided research reactor technology, and the highly enriched uranium necessary to fuel the research reactors, to foreign nations in exchange for their promise to forego development of nuclear weapons. (Section 1.1 of the EIS.)] [In 1978, in response to concern about the potential diversion of highly enriched (weapons grade) uranium for use in nuclear weapons, the DOE initiated the Reduced Enrichment for Research and Test Reactors (RERTR) program. This program was aimed at reducing the use of highly enriched uranium (HEU) in civilian programs by promoting the conversion of foreign research reactors from HEU to LEU. Research reactors are of interest because the major civilian use of HEU is as nuclear research reactor fuel. The RERTR program has been successful and many foreign research reactors have been modified to operate with high-density low enriched fuel instead of HEU fuel. Appendix B, Table B-3 provides information on the status of operating reactors that have, or can be, converted to low enriched fuel.] [DOE knows of no intention by the Japanese to build an HEU reactor. Any such statement made by a DOE official would have been made in error.]
Comments were provided strongly opposing Alternative 1 and supporting either Alternative 2 or the No Action Alternative.	[Commentors' opposition to Management Alternative 1 and support for Management Alternative 2 or the No Action Alternative are noted.]
A comment was made noting that the EIS states that construction of storage facilities at reactors is not practical due to small quantities of spent nuclear fuel in each country. Commentor noted that seven countries comprise 70% of the inventory and suggested that those countries with small inventories should not be included in the proposed policy.	[An objective of the proposed action is to reduce and eventually eliminate all HEU from international commerce. Even relatively small amounts of HEU could be used to produce nuclear weapons.]
Comments were made that the United States does not have adequate facilities to reprocess the spent nuclear fuel. Commentors suggested that the United States consider reprocessing overseas. One commentor stated that nothing was mentioned in the EIS about allowing for overseas reprocessors to recycle diluted highly enriched uranium back to countries from which it came. Commentor noted that the facility at Dounreay has the capability to reprocess about 50% of material that is aluminum-clad but cannot reprocess the TRIGA material, which comprises about 10%, or the low enriched uranium fuel.	[The United States does have the capability to chemically separate spent nuclear fuel. However, the EIS also considers possible overseas reprocessing in Management Alternative 2 in Sections 2.3 and 4.4.2. The EIS also addresses the possibility that overseas reprocessors could return waste to countries from which it came.] [Subalternative 1b to Management Alternative 2 (Section 2.3 of the EIS) discusses overseas blending of HEU down to LEU. Once LEU, the disposition of the material would be unimportant from a nonproliferation point of view. It could be returned to the origin country. However, whether HEU or LEU, most countries do not have the capability or facilities to store this spent nuclear fuel.]

ISSUES RAISED	DOE RESPONSES
Comments were made that the United States does not have adequate storage facilities for the foreign research reactor spent nuclear fuel and suggested overseas storage. Hanford was a specific example of an inadequate storage site due to leaks. A comment was made that the EIS should contain equal discussion of placing secure facilities within the other countries. Commentors noted that the EIS paid inadequate attention to this alternative and was overly biased toward bringing the spent nuclear fuel into the United States.	[As explained in Section 1.5 of the EIS, the selection of the site or sites at which the foreign research reactor spent nuclear fuel could be managed is based on the analysis in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. The Record of Decision for this EIS was released on May 30, 1995. In accordance with this Record of Decision, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford site.] [If the Record of Decision indicates that the spent nuclear fuel will be accepted by the United States, additional storage capacity may have to be constructed after the first few years (Section 2.2.1.9 of the EIS).] [The United States has no authority for "placing facilities within other countries." Actions within other countries are subject to the laws and regulations of those countries. However, Management Alternative 2 does include possible assistance to other countries to manage their spent nuclear fuel as discussed in Section 2.3 of the EIS.]
Comments were made that the proposed action amounts to an "unfunded mandate" and that the government is "blackmailing its own people in order to control other countries."	[The Government of the United States encourages, but cannot force, foreign nations to support the nonproliferation of nuclear weapons. Costs of the proposed action, which are discussed in Section 4.8 of the EIS, would be borne by the federal government or foreign governments rather than by the States. Financial options are described in Section 2.2.1.2 of the EIS. No attempt has been or will be made to blackmail citizens of the United States or other countries to support the nonproliferation of nuclear weapons or the policy options described in the EIS.]
A comment was made that the United States should not accept any foreign research reactor spent nuclear fuel until ultimate disposal of spent nuclear fuel in this country is determined. Commentor stated that having no long-term disposal site sends the wrong message to other countries. A comment was also made that a 10-to-13-year solution is a band-aid fix and that a permanent solution should be part of the EIS.	The proposed policy is based on current plans that a geologic repository will be available [for permanent disposal]. The proposed action to [develop a policy to] manage foreign research reactor spent nuclear fuel has been supported by Administrations from both parties since President Carter. [Due to limitations in available overseas storage, many foreign research reactors face shutdown or conversion back to HEU fuel, unless some immediate action is taken.]

ISSUES RAISED	DOE RESPONSES
Concerns were expressed about the costs of managing foreign research reactor spent nuclear fuel in the United States. A question was asked as to whether a full and fair cost-benefit analysis was performed. One commentor compared the costs as being greater than $2 billion for implementing Alternative 1 and less than $1 billion for Alternatives 2 and 3.	[Costs of the proposed management alternatives are discussed in Section 4.8 of the EIS, including uncertainties and financing options.]
A question was asked as to when the decision will be made on which port to use.	There are ten candidate ports. Any one of these ports might be used. Under the proposed action, it would be up to the shipper to determine which port works best for particular shipments based on the availability of vessels. [If foreign research reactor spent nuclear fuel is accepted by the United States, the Record of Decision will indicate which ports may be used. Selection of the port of entry for a given shipment will be a joint decision of the shipper and DOE.]
A question was asked as to how DOE came to the conclusion that spent nuclear fuel would be shipped through the Port of Tacoma.	[The Port of Tacoma is one of 10 candidate ports.] The port selection process included 153 commercial and 8 military ports. DOE worked with the Merchant Marine Academy to develop criteria for the use of ports and applied these criteria to all potential ports. The list was then winnowed down. Appendix D of the EIS gives the details of the port selection process. [As discussed in Section 4.2.2 of the EIS, implementation of the proposed action would pose no significant benefits or risks to health or the environment at any of the candidate ports.]
A question was asked as to why the Port of Seattle was eliminated from the list. Commentor asked what the difference is between the populations of Seattle and Tacoma.	There are fine line differences. The Defense Authorization Act for Fiscal Year 1994 requires low population as a criterion for port selection. However, the Act is not explicit on how to apply this requirement. DOE analyzed the populations of port cities and transportation routes. There was a slight difference between port populations, and the Port of Tacoma was the more desirable of the two ports. [While the National Defense Authorization Act was written specifically to regulate the receipt and storage of foreign research reactor spent nuclear fuel at DOE's Savannah River Site, DOE elected to apply this criterion in identifying ports of entry for all five potential sites, to the maximum extent practicable.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE has not explained how other ports were eliminated and why Tacoma remains on the list. Commentor noted that Seattle was eliminated due to population and asked why, if there is no risk, population was a criterion. A comment was made that DOE ignored fairness and equity issues by selecting a small port such as Tacoma.	[The port selection process is documented in Appendix D of the EIS. DOE initially considered 161 ports of entry for foreign research reactor spent nuclear fuel. These ports were evaluated against the five evaluation criteria described in Appendix D, Section D.1.9, resulting in ten candidate ports, including Tacoma, that met all of the criteria as being acceptable for the receipt and handling of the spent nuclear fuel. Criterion 5 of the port selection criteria indicates ports that can safely handle foreign research reactor spent nuclear fuel with the least risk to populations near the port. Although the Defense Authorization Act for Fiscal Year 1994 specifies that only low population ports should be used for receipt of foreign research reactor spent nuclear fuel, the Act is not explicit on how to apply this requirement. DOE analyzed the populations of port cities and transportation routes. By seeking to minimize the risk to populations surrounding the ports of entry, the EIS further diminishes the low risks associated with an accident (Section 4.2.2.3). DOE believes that the use of any of the ports indicated by the port selection process, including Tacoma, would not pose any significant risk to either the port personnel, local environment, or the population near the port.]
Concern was expressed that the Port of Tacoma is in close proximity to residential areas.	[The population residing near candidate ports and along transportation routes was an important factor that was considered in port selection and in the evaluation of environmental effects of the proposed action and management alternatives (See Section 4, Appendix D, and Appendix E of the EIS).]
Commentors expressed strong opposition to using Tacoma as a port of entry of spent fuel. Commentors cited resolutions passed by the Port of Seattle, the City of Federal Way, and the City of Fife. Also cited was a vote by the Board of Tacoma/Pierce County Chamber of Commerce opposing importation of spent nuclear fuel through Tacoma. Comments were also made that the longshoremen will not handle spent nuclear fuel at the ports.	[The commentor's opposition to use of the Port of Tacoma is noted. DOE has also noted the resolutions passed by local governments and local authorities. However, Sections 4.2.2 and 4.5 demonstrate that the risk associated with bringing spent nuclear fuel to the Port of Tacoma, or to any of the ports analyzed in the EIS, is low. The potential environmental impacts (including radiation exposure) to port workers is discussed in Section 4.2.2 of the EIS.]
A comment was made that the purpose of the hearing was to be talking about Tacoma -- "not wet and dry facilities or high-octane or low-octane fuel." Commentor did not believe it was necessary to explain technical reasons for not bring the fuel into Tacoma -- commentor had "people reasons."	[The National Environmental Policy Act requires federal agencies to evaluate the environmental effects of proposed actions. The environmental evaluation is required to assess environmental impacts as accurately as possible. The purpose of the public hearing is to inform the public and to obtain comments from the public concerning the proposed action and its environmental effects.]

ISSUES RAISED	DOE RESPONSES
Comments were made suggesting that DOE consider using military ports instead of commercial ports. Reasons cited were that military ports are better trained and equipped to handle these kinds of shipments and they have better security. One commentor expressed concern that DOE stated at another hearing that military ports were not considered due to costs.	[Both commercial and military ports were considered in selecting the 10 candidate ports in the EIS. Military ports are not better equipped than commercial ports. No special training or experience is required to handle spent nuclear fuel. Foreign research reactor spent nuclear fuel could safely be received at commercial ports without additional security such as might be present at military bases. To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS.]
A comment was made that information in the draft EIS on the Port of Tacoma is outdated and contains errors. Examples cited were as follows: one terminal is listed instead of 6 terminals; the map depicting the Port of Tacoma is 15 years old. Commentor stated that these errors lead Tacoma residents to believe that the same errors carried forward to the population analysis done for the Port.	[Updated information on the terminals at the Port of Tacoma has been incorporated into Appendix D, Section D.2.1.9 of the EIS. Population data used in the analysis was obtained from the U.S. Bureau of the Census based on census data for 1990. Although corrected information has been included in the port information for the Port of Tacoma, the analyses provided in the EIS indicate that the use of any of the ports indicated by the port selection process, including Tacoma, would pose low risk to the port personnel, local environment, and the population near the port.]
Comments were made that the depth of Puget Sound would make it difficult to recover sunken casks. Specific comments included the following: Puget Sound is deeper than 50 feet; the casks could not withstand the deep water pressure in the Puget Sound and would buckle if they sank; the EIS states that casks can be recovered in water up to 200 meters deep -- however, there are numerous sites in the shipping channels that exceed the 200 meter depth; there is doubt that DOE would go after a sunken cask.	[In the unlikely event that a transportation cask loaded with foreign research reactor spent nuclear fuel is sunk in any U.S. coastal waters, it will be recovered, even from the deepest portions of Puget Sound, which reaches depths of 305 meters (1,000 feet). See Appendix C, Section C.5.5 of the EIS for information on the probability of a cask sinking in coastal and deep ocean waters.
A comment was made that the Puget Sound area has on average 20 minor earthquakes every month; it has shallow faults; and seismic activity is abundant.	[The risk of releasing radioactive material from a foreign research reactor spent nuclear fuel transportation cask as the result of a seismic event would be low. Transportation casks are designed and built to withstand significant stress without releasing their contents (Section 2.6.2 of the EIS). Therefore, a seismic event, even if it caused structures at the Port of Tacoma to fail, would not be expected to compromise the cask. While local hazards, such as earthquakes, may be the cause of an accident such as those analyzed in the EIS, they would not increase the consequences of the accident, which were found to be minor for both marine and land transportation accidents (Section 4.2.2.3). Therefore, the overall low risk is essentially unchanged in seismic areas.]

ISSUES RAISED	DOE RESPONSES
A comment was made that Commencement Bay is a Federal Superfund site, which makes it unsuitable.	[Shipment of foreign research reactor spent nuclear fuel would not jeopardize the Superfund cleanup effort undertaken in the area of Commencement Bay and the Port of Tacoma. The EIS indicates that there would be no adverse impacts to any of the ports or bays, or the quality of water or air (Sections 4.2.1.1 and Appendix C, Section C.2). DOE has added a sentence to the EIS (Appendix D, Section D.2.1.9) regarding Commencement Bay being a Superfund site, and a paragraph has been added to Section 4.2.2.2 of the EIS to emphasize the low impact these shipments would have on air and water quality.]
A comment was made that operational procedures are inadequate at the Port of Tacoma for handling spent nuclear fuel shipments.	[Spent nuclear fuel from foreign research reactors would be shipped in standard containers, and would not require special handling techniques (Section 2.6.3.2.2 of the EIS) or additional security beyond that required by NRC regulation, which can readily be provided in any of the commercial or military ports.]
A comment was made that the Port of Tacoma has regular commercial traffic and that highly enriched uranium has no place in commercial channels. Commentor suggested that ship traffic be considered when selecting ports.	[The commentor's concern about the amount of ship traffic in the Port of Tacoma is noted. In general, the number of ship mishaps is not proportional to the amount of ship traffic because the port traffic is slow and, even at its heaviest, only a few ships per hour. Hence, at this traffic level, an increase in volume does not significantly increase the probability of an accident. Rather, the number of ship mishaps is associated with navigational hazards and distances from the port to the open ocean or a large bay. As a result, the port selection process focused on the availability of a favorable passage to the open water. If the foreign research reactor spent nuclear fuel is accepted by the United States, sea shipments would arrive either in commercial or chartered ships. If commercial ships are used, the ship traffic into Tacoma would be unchanged because commercial ships would call at the Port of Tacoma whether or not they were carrying foreign research reactor spent nuclear fuel. If chartered ships were utilized, and all the West Coast-bound ships came to Tacoma, Tacoma's ship traffic would increase by no more than about one a month (186 shipments spread over 13 years under Management Alternative 1), fewer under Management Alternative 3.]
A concern was expressed about the fact that the Office of Marine Safety in the State of Washington was recently dissolved.	[DOE does not expect the loss of this State office to impact safety if spent nuclear fuel is accepted into the United States. Spent nuclear fuel from foreign research reactors would be shipped in standard containers, and does not require special handling techniques (Section 2.6.3.2.2 of the EIS) or additional security beyond that required by NRC regulation (which can readily be provided in any of the commercial or military ports). No special precautions would be required by the U.S. Coast Guard (Section 2.6.3.2.2 of the EIS).]

ISSUES RAISED	DOE RESPONSES
A comment was made that if the storage facility is in South Carolina, shipments should go through a port close to that facility.	A large portion of the spent nuclear fuel -- the aluminum-clad fuel -- would be shipped directly to the Savannah River Site. Other types would be shipped [to a West Coast port and then transported] to the Idaho National Engineering Laboratory. Spent [nuclear] fuel from Europe, West Africa, and Eastern South America would be shipped through an East Coast port, while non-aluminum-clad fuel from Europe would be shipped through a West Coast port and then shipped to the Idaho National Engineering Laboratory. [Although ports close to the DOE management site would require less ground transport to reach the management site, port selection considers a number of other factors -- port population, experience, safe transit from the open ocean, and port facilities (See Appendix D of the EIS).]
A question was asked as to whether the spent nuclear fuel transportation would be overseen by DOE or by private contractors. Commentor expressed concern that transportation would be overseen by "the lowest bidder."	[DOE would oversee the overall operation if foreign research reactor spent nuclear fuel is accepted by the United States. The responsibility for arranging the shipping and selecting the carrier would be in the hands of the owners of the material, the operators of the foreign research reactors. DOE would require, in the contract with the foreign research reactor operators, that only well-equipped, well-maintained ships and vehicles be used to ensure safety. Ships entering U.S. territorial waters and trucks, barges, and trains operating in the United States must meet U.S. safety regulations.]
A comment was made that if the spent nuclear fuel is shipped to the United States, it should be shipped in military vessels to military ports.	[Military vessels were not considered because transporting this material is not part of their mission. In addition, the risks associated with using either commercial or charter vessels would be low. As discussed in Appendix D, Section D.1 of the EIS, both commercial and military ports were evaluated. No significant environmental efforts would result from implementation of the proposed action at any of the candidate commercial and military ports (Section 4.2.2 and 4.5 of the EIS).]
A comment was made that DOE should consider flying the spent nuclear fuel on military aircraft.	[The option of air transport was considered, but dismissed for the reasons given in Section 2.10 of the EIS. These reasons include prohibitive costs, lack of standard operating procedures for air transport, lack of experience with this type of transportation, and lack of suitable casks for air transport.]

ISSUES RAISED

A comment was made that DOE cannot account for all nuclear properties transported in the United States and that some materials are lost, damaged, or stolen. A comment was made that there should be a complete team of experts accompanying the shipments.

DOE RESPONSES

[DOE can account for nuclear inventories. As a part of the Secretary of Energy's Openness Initiative, information has been declassified regarding inventory differences showing a net total decrease from book inventories for plutonium and highly enriched uranium. The inventory differences are a result of physical inventories after adjustments for transactions, removals, decays, corrections, transmutation, and production. Stringent safeguards and security measures have made theft or diversion highly improbable, and if these acts were attempted or had occurred, they would have been detected.]

[Theft of materials by a determined group or individual cannot be completely precluded. However, proper security measures greatly reduce the risk. All shipments of foreign research reactor spent nuclear fuel would be conducted hearing or exceeding all the security requirements in the Code of Federal Regulations (10 CFR Part 73). For the reasons discussed in Section 1.2 of the EIS, spent nuclear fuel from foreign research reactors cannot be easily stolen. Section 2.8 and Appendix D, Section D.5.9 discuss security measures against sabotage and terrorist attack activities.]

[To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. This appendix presents the general provisions of the Transportation Plan, a document that provides the details of activities that would be associated with the transportation of the spent nuclear fuel, including the security arrangements in port and in transit to the DOE management site.]

ISSUES RAISED	DOE RESPONSES
A commentor (former Congressman) referenced his introduction in 1994 of the Safe Handling and Shipping Act whereby a port could deny acceptance of nuclear waste unless there was a comprehensive emergency response plan in place, notification was made to communities, radiation exposures would not exceed regulatory limits, and the Federal government would bear the costs. Commentor stated that policies need to be re-evaluated.	[As discussed in Section 2.7 of the EIS, the primary responsibility for emergency response to an incident would reside with State, Tribal, and local authorities. DOE would provide coordination, financial and technical assistance and training to the State, Tribal, and local emergency response personnel. In addition, DOE has Radiological Assistance Program teams that operate from eight strategically located DOE offices around the country. Upon State, Tribal, or local request, these teams can provide technical expertise and assistance to monitor and assess radiological hazards. The teams are activated on an "as-needed" basis and generally are ready to deploy from their home station within four hours of notification.] [To better describe the security and emergency preparedness associated with transportation of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. This appendix presents the general provisions of the Transportation Plan, which is a document that provides the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the DOE management site.] [DOE is required to inform the Governor of each State seven days in advance of the shipment of hazardous cargos (10 CFR Part 73.37). Further advance public notification of shipments to communities cannot be given by DOE because it would violate NRC regulations. Additional notification to communities would be the responsibility of the Governor's office.]
Concerns were expressed about the adequacy of the Port of Tacoma's emergency response capability to handle spent nuclear fuel accidents. Specific comments included the following: The EIS does not adequately address training and first response issues; the Port of Tacoma would be financially responsible for emergency response, which is an undue burden to be placed on the community by a Federal mandate; Tacoma should not have to pay for training and equipment for emergency responders, truck drivers, and port authorities -- this should be provided by the United States government; the City of Tacoma does not have the equipment and training to handle radioactive waste accidents; the EIS is misleading when it relies on local governments' emergency response capabilities; the EIS fails to address clean-up from accidents; and what will DOE do to improve the Fire Department's capability in Tacoma.	[Each port considered in the draft EIS has developed an Area Contingency Plan. This plan outlines response capabilities, procedures, and authorities for responding to and recovering from hazardous materials incidents, including cleanup. Federal funding to State, Tribal, and local governments for maintaining emergency response programs is discussed in Section 2.7.1 of the EIS. This funding can provide opportunities for training such as those necessary for emergency fire response. In addition, DOE would provide assistance to local authorities to ensure that appropriate measures were taken in the event of an accident. DOE provides radiological monitoring and assessment assistance to State, Tribal, and local agencies involved with a radiological incident. As part of this assistance, DOE's Radiological Assistance Program teams from the eight offices located throughout the country could be used to coordinate and to provide remediation assistance.]

ISSUES RAISED	DOE RESPONSES
Comments were made regarding the integrity of spent nuclear fuel casks. Specific comments were: spent nuclear fuel that is not well-characterized should be double-packaged; all packages should meet 10 CFR Part 71 regulatory limits; the containers are too large and there are critical mass concerns -- DOE should not put "a lot of stuff together;" and there are no guarantees against construction flaws in the casks as there were flaws with the Challenger.	[If a policy to accept and manage foreign research reactor spent nuclear fuel is adopted, the spent nuclear fuel would be shipped in Type B casks (Section 2.6.2 and Appendix B, Section B.2 of the EIS). The shipper of record must comply with the Department of Transportation and Nuclear Regulatory Commission requirements for shipment by vessel and overland (10 CFR Parts 71 and 73 and 49 CFR Parts 171, 173 and 176). Spent nuclear fuel has been transported in Type B casks on highways and rail lines in the United States for over four decades without release of contents.]
Comments were made citing specific routing problems, such as the following: adding truck traffic to the I-5 corridor is putting an additional load on the fourth most congested highway system in the United States; and the M Street curve has a lot of accidents when icy.	[The commentors' transportation concerns are noted. Final routes would not be selected until implementation of a decision to use a particular port and site. If the Port of Tacoma was selected as a port of entry for a foreign research reactor spent nuclear fuel shipment, DOE would choose the best route to a DOE management site in accordance with Department of Transportation Code of Federal Regulations (49 CFR Part 397.010 (a)(2) and applicable Nuclear Regulatory Commission regulations). In addition to the applicable routing regulations and guidelines, the selection of the actual route would be responsive to environmental and other conditions that were in effect, or could reasonably be predicted, at the time of shipment. Such conditions could include adverse weather conditions and road conditions due to traffic, weather, and closures. Appendix E and Section 4.2.3 of the EIS show that all the ground transport risks would be low along all the representative routes. Other routes would also be expected to have similarly low risks.]
A comment was made that Tacoma is struggling with commuter rail and freight rail on the Burlington Northern tracks and that Tacoma has no more resources for transportation improvements.	[Appendix D, Section D.1.9.4 of the EIS specifically addresses the consideration of ready access to intermodal transportation in the port selection process. In applying this criterion, DOE found the Port of Tacoma to be acceptable . Other considerations such as port population, route population, port experience with handling containers, and access to the ocean have also been considered in selecting ports of entry. Appendix D, Section D.1.9 presents the details of the port selection process.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the EIS fails to adequately address security issues. A comment was made that the farther these materials are shipped, the greater prospect of the materials falling into the wrong hands. A question was asked about the risk of "some lunatic that has a missile or something to blow this stuff up."	[Acts of terrorism and theft of materials by a determined group or individual cannot be completely precluded. However, proper security measures greatly reduce the risk. All shipments of foreign research reactor spent nuclear fuel would be conducted to meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). Nuclear Regulatory Commission regulations for physical security include requirements for armed escorts and two-way communications at two hour intervals with a communications center during the journey (Section 5.4.2 of the EIS). Section 2.8 and Appendix D, Section D.5.9 discuss security measures against sabotage and terrorist attack activities. To better describe the security and emergency preparedness that would be associated with transport of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. Appendix H presents the general provisions of the Transportation Plan which is a document that provides the details that would be associated with the transportation of the foreign research reactor spent nuclear fuel.]
A comment was made that, due to the history of safely transporting spent nuclear fuel in this country, commentor saw no physical risk in transporting the spent nuclear fuel, assuming that casks are sealed properly. Commentor stated that the chance of physical injury is "basically zero." Commentor elaborated on his experience working at the Three Mile Island nuclear power reactor from 1980 to 1990, during which time there were 49 shipments over 116,467 miles, and there were no mishaps. Another comment was made that shipments, if small enough, could be done safely and create jobs in the area. Commentor noted that Fort Lewis, McCord, Bremerton, and Everton have nuclear fuel and asked, for the audience's sake: "How did it get there? Have we been damaged?"	[The comments regarding the safe transport of radioactive material are noted. The EIS demonstrates that the risk associated with transport of the foreign research reactor spent nuclear fuel is low.]
Concerns were expressed about the potential for shipboard fires near and within the port. Commentors stated that the extent and impacts of shipboard fires were inadequately addressed in the EIS.	[Appendix D, Section D.5.3.1 describes several accident scenarios that involve fire. The results of the analysis of these accidents can be found in Section D.5.4. The analysis shows that even in the event of a severe ship fire, neither the consequences nor risks are great (Section D.5.5). Although the non-radiological effects of such a catastrophic accident would obviously impact the local environment, no additional impacts are predicted due to the presence of foreign research reactor spent nuclear fuel.]

ISSUES RAISED	DOE RESPONSES
Concerns were expressed about the risk to children who could be stuck in traffic next to a truck carrying spent nuclear fuel. Some argued that the equivalencies provided in the EIS to full-body x-rays did not take into account the health impact to children.	[The relationship between radiation exposure and latent cancer fatalities (LCF) used in the EIS was for the general population, which includes children, pregnant females and other higher risk individuals. The exception is where only workers are present. In these instances, a worker dose-LCF relationship was used.] [As explained in Section 4.1.3 of the EIS, the relation between dose and LCF for the general public is 0.0005 LCF per person-rem. If a person were to sit next to the cask for one hour, he or she would receive 10 mrem or 0.01 person-rem. Therefore, the probability of the person dying from cancer as a result of this exposure is 0.000005, or one in 200,000.]
Comments were made that the EIS underestimated the health and environmental impacts associated with spent nuclear fuel and underestimated the potential for accidents. Commentors argued that the estimates provided for latent cancer fatalities were either too low, were averaged so as to be misleading, or were still unacceptable. Other comments were that accidents will happen; there are still unanswered questions concerning the effects of the proposal; exposure to the contents of a spent nuclear fuel cask in the event of an accident would cause certain death; and DOE officials should put the spent nuclear fuel in their own backyards if they think the risk is so low.	[These same analyses calculate the maximum expected population dose for the worst plausible accident if it were to occur at any of the 10 candidate ports. The resulting population dose, multiplied by the industry accepted conversion to latent cancer fatalities, are the results presented in the EIS. Appendix D, Section D.5.9 has been added to the EIS to discuss the results of terrorism. In this section, the radiation dose rates from a fully exposed transportation cask load of research reactor spent nuclear fuel is presented. In the unlikely event of a severe accident, the analysis performed for the EIS shows that some radioactive material could be released from the cask and distributed into the environment. However, the analysis also shows (Section 4.2.2.3) that the resultant contamination would be so small that no cleanup would be required in any of the ports or surrounding areas.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE uses its own self-regulating standard for how much radiation people can be exposed to and that this is not the same standard that NRC uses for exposure limits in one year. Commentor stated that the DOE standard is 4 times higher than the NRC and EPA standards, which are 25 mrem per year for radiation exposure. Commentor noted that DOE says it is conceivable that one could get up to 50 mrem if a person was stuck in traffic next to a nuclear waste cask.	[Appendix D, Section D.4 demonstrates that the radiation dose that anyone would receive handling or near a spent nuclear fuel transportation cask is less than the limit that is allowed to the public in an unrestricted area by NRC regulations (Title 10 CFR Part 20). See Section D.4.3.2.1 for the time/distance analysis of cask handling, Section D.4.5 for the resulting doses and risks, and Appendix F, Section F.5 for an evaluation of the dose rates from a transportation cask containing research reactor spent nuclear fuel. The maximum allowable exposure for port workers would be 100 mrem per year, the same radiation dose limit established by the NRC to protect individual members of the public (Section 4.2.2.2 of the EIS).] [DOE's public radiation protection standard (10 CFR Part 835.208) is identical to those of the NRC and all other Federal agencies as required by Executive Order, and is consistent with recommendations of all national and international radiation protection organizations. The limited dose is 100 mrem/year to members of the public (2% of that allowed for radiation workers), which is within the range of variation of natural background radiation levels in populated areas of the United States.] [As explained in Section 4.1.3 of the EIS, the relation between dose and LCF for the general public is 0.0005 LCF per person-rem. If a person were to sit next to the cask for one hour, he or she would receive no more than 10 mrem or 0.01 person-rem.]
Comments were made that DOE underestimated the exposures to longshoremen during unloading activities. Specific comments included the following: - The EIS underestimates radiation dose from unloading casks by 23% and to ships' crews by 27%. Ships' crews can get up to 760 mrem, which is 3,040% of the allowable dose to the general public. - DOE used 9 mrem per hour for radiation exposure during unloading activities, while it should have used 11 mrem per hour. If a person was standing for 20 minutes 2 meters away from the cask, the radiation exposure would go up by 33% in one hour.	[The two regulatory limits (200 mrem/h at the cask surface and 10 mrem/h at two meters away from the vehicle) would both apply simultaneously. For shipments of certain radioactive materials (e.g., small, intense cobalt-60 sources), the 200 mrem/h-at-the-cask-surface limit is the more stringent limit. For shipments of spent nuclear fuel, however, the 10 mrem/h-at-two-meters regulatory limit turns out to be more stringent because the source of radiation is large and distributed throughout the internal volume of the cask. Casks loaded with spent nuclear fuel up to the 10 mrem/h-at-two-meters limit radiate at a level well below the 200 mrem/h level at the cask surface. (See Section 4.1.5 and Appendix F, Section F.5 of the EIS.) See Appendix D, Section D.4.3.2.1 for the time/distance analysis of cask handling, Section D.4.5 for the resulting doses and risks, and Appendix F, Section F.5 for an evaluation of the dose rates from a transportation cask containing research reactor spent nuclear fuel. The maximum allowable exposure for port workers would be 100 mrem per year, the same radiation dose limit established by the NRC to protect individual members of the public (Section 4.2.2.2). As the EIS demonstrates, both the dose and dose rate for the port workers are low.]

ISSUES RAISED	DOE RESPONSES
A comment was made disagreeing with DOE that there are no technical problems. A commentor stated that she lived 100 kilometers from Hanford and was exposed to deliberate radiation releases from the Hanford site, having been exposed to 650 mrem. For this reason, commentor stated, she will not have any children.	[Sections 4.2.2 and 4.5 of the EIS demonstrate that the risks associated with bringing foreign research reactor spent nuclear fuel through the Port of Tacoma, or any other of the ports analyzed in the EIS, is low.] [No foreign research reactor spent nuclear fuel would be managed at the Hanford site. In accordance with the Record of Decision for the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement, all of the aluminum-based foreign research reactor spent nuclear fuel managed by DOE will be managed at the Savannah River Site in South Carolina. Any other foreign research reactor spent nuclear fuel to be managed by DOE will be managed at the Idaho National Engineering Laboratory. Accordingly, no foreign research reactor spent nuclear fuel would be shipped to the Hanford site.]
A comment was made that DOE refers to "unrealistic scenarios," but a worst-case "credible" accident is not the same as a worst-case accident. Commentor stated that the Navy trained for worst-case scenarios and accepted their possibility. Commentor stated that DOE has not acknowledged the possibility of worst-case accidents and, thus, is doomed to failure. Another commentor stated that DOE did not provide adequate technical responses to questions about the consequences of "abnormal radioactive releases" in worst-case accidents.	[There is no such thing as a "worst case scenario". For any "worst case" that is postulated, a still more severe accident can be postulated by adding one more drum of gasoline, one more wrecked rail car, one more terrorist, etc. In addition, for each assumption that is made to make a postulated accident more severe, the probability of the accident becomes more remote. Nevertheless, DOE did analyze the severe accident in which a ship carrying a spent nuclear fuel transportation cask is involved in a collision with another ship, severe enough to breach the shipping cask and then subject the cask to a fire resulting from the collision (Section 4.2.2.3 of the EIS).] [In the unlikely event of a severe accident, the analysis performed for the EIS shows that some radioactive material could be released from the cask and distributed into the environment. However, the analysis also shows that the resultant contamination would be so small that no cleanup would be required in any of the ports or surrounding areas. Close in to the accident, near the cask would likely require some cleanup, but would result in no significant effects on air and water quality at the port. Section 4.2.2.3 and Appendix D, Section D.5 detail the accident analysis and results.]

ISSUES RAISED	DOE RESPONSES
Concerns were expressed about the role of human error in accidents and accident response. The following examples were provided: The Three Mile Island was not an accident -- it was the result of consistent breaking of the rules, policies, and procedures. The Exxon Valdez may have been an accident, but the response after the accident took a very long time because people were not trained and equipment was not available.	[The probability of an accident at sea is discussed in Appendix C, Section C.5.5 of the EIS, while the port accident probabilities are found in Appendix D, Section D.5.3.1.3. The EIS shows that the risks associated with an accident are low (Section 4.2.2.3). The evaluation of accident probabilities, both marine and land, were based on national accident rates, which include human error factors as they impact the national statistics. However, while human errors might cause an accident such as those analyzed in the EIS, they would not increase the consequences of the accident, which were found to be minor for both marine and land transportation accidents. The likelihood of human error is further reduced since spent nuclear fuel from foreign research reactors would be shipped in standard containers and would not require special handling techniques (Section 2.6.3.2.2 of the EIS) or additional security beyond that required by NRC regulation which can be provided at the Port of Tacoma. Additionally, no special precautions are required by the U.S. Coast Guard (Section 2.6.3.2.2 of the EIS).]
	[Although response to emergencies is a local function, the Federal government, including DOE, would assist State and local governments in preparation for emergencies. Emergency response preparedness details would be part of DOE's Transportation Plan that would be prepared prior to any actual shipments. The general provisions of such a plan are identified in Appendix H of the EIS.]
A comment was made that the nuclear industry does not have a good safety record and what happens in Puget Sound affects the world.	[The safety record of the "nuclear industry" is beyond the scope of this EIS. Health and safety were primary considerations during the evaluation of environmental effects for the proposed action and its management alternatives. Conservative estimates of radiological and non-radiological impacts show that risks to the population and workers are low (Section 4.2.2 of the EIS). Section 4.9 describes risks associated with U.S. acceptance of the spent nuclear fuel and compares these risks with those due to the natural background radiation and other common risks.]
A concern was expressed about impacts to the fishing industry. Commentor noted that the Tacoma area is struggling in the fishing industry, and every year there are less and less fish.	[Spent nuclear fuel transportation casks are designed and built to preclude release of radioactive material. The EIS indicates no adverse impact to the quality of water in incident-free transport (Appendix C, Section C.4). If a cask was sunk in Puget Sound or any other U.S. coastal waters, it would be recovered, with no significant impact on the environment, including the fishing industry.]

ISSUES RAISED	DOE RESPONSES
Comments were made about the economic impacts to the Port and City of Tacoma as a result of spent nuclear fuel shipments. Specific comments included the following: - The Port of Tacoma is in competition with other West coast ports for shipping business and could lose business from other countries because of the nuclear stigma. - Spent nuclear fuel shipments will hurt the image of Tacoma as a safe, friendly and attractive place to visit. Tacoma enjoys a $365 million industry from visitors and does not want that destroyed. - Companies will not relocate businesses to the Port of Tacoma if nuclear waste is brought in -- they will go to the Port of Vancouver. Jobs are needed in Tacoma. - Tacoma exports 70% of all agriculture produced in the State of Washington. "We don't want our apples next to your waste."	[The use of any of the ports indicated by the port selection process, including the Port of Tacoma, would not impact normal commercial operations, and therefore not endanger the ports' economic development. Nor should it contribute to any stigma associated with the spent nuclear fuel because the EIS indicates that there would be no adverse impacts to any of the ports or bays, or the quality of water or air (Section 4.2.1.1 and Appendix C, Section C.2). This belief is based on the fact that the foreign research reactor spent nuclear fuel would be shipped to the United States in standard shipping containers that would require no special handling or precautions. Historically, there were no adverse economic or cultural impacts to the ports that received foreign research reactor spent nuclear fuel for the more than 30 years it has been received.]

The public hearing in Washington, DC, was held at the Omni Shoreham Hotel, on May 31, 1995. Fifty-nine people attended the hearing, including representatives from the foreign research reactor countries. The hearing was interactive in nature. Below is a summary of the issues that were raised. Information in brackets [ ] was not provided at the hearing.

ISSUES RAISED	DOE RESPONSES
A question was asked as to which countries are "inviting" United States participation to "control" their fuel.	The DOE is not aware of specific requests to "control" a country's fuel. The United States, however, has a sense of responsibility to control the use of the spent nuclear fuel because the enriched uranium in foreign research reactors originated in the United States. The United States' intention is to establish an environment that is in the best interests of the [United States and] countries who have received United States-enriched uranium.
Concern was expressed that EURATOM countries can ship to Dounreay, Scotland, for reprocessing without United States consent but others have to ask for United States consent.	Requiring non-EURATOM countries to obtain United States consent for reprocessing allows the United States to ensure that non-EURATOM countries arrange for blending down the HEU, separated during reprocessing, to LEU.
A request was made that DOE not base the selection of a management alternative on special interest group sensitivities.	[Concerns of all parties that submit comments (orally or in writing) have been considered in preparing a preferred alternative on the proposed action.]
A question was asked as to why the United States does not choose to have Europeans manage their own spent nuclear fuel since they have existing capabilities for reprocessing.	This option is considered under Management Alternatives 2 and 3, provided arrangements could be made so that reprocessing would be conducted in a manner consistent with United States [nuclear weapons] nonproliferation goals. This would include blending down the HEU to LEU.
A comment was made that the DOE spent nuclear fuel program is vital for many reactor operators, and consideration should be given to those sites that have storage problems. As a result of the expiration of the Off-Site Fuels Policy, it has been difficult for foreign research reactor operators to store their spent nuclear fuel longer than anticipated. It is unreasonable to expect those countries to develop facilities for the minute quantity of spent nuclear fuel that they generate.	[DOE is aware of this concern, and acted to relieve some of the most critical storage problems with the Urgent-Relief Acceptance of Foreign Research Reactor Spent Nuclear Fuel. An objective of the proposed action is to provide reactor operators with a limited period of time to develop disposition arrangements not dependent on the United States.]

ISSUES RAISED	DOE RESPONSES
A request was made to clarify the relationship of the proposed policy to the International Atomic Energy Agency (IAEA).	The following response was provided at the hearing by an IAEA representative: The IAEA supports the Reduced Enrichment for Research and Test Reactors (RERTR) program and urged reinstatement of the Off-Site Fuels Policy. To support IAEA nonproliferation goals, IAEA recommends an EIS decision of shipping foreign research reactor spent nuclear fuel (containing United States-enriched uranium) back to the United States. This includes (1) return of fresh HEU, (2) return of HEU that has lost its "self-protection", (3) return of spent nuclear fuel from low-security facilities, and (4) return of spent nuclear fuel that is in poor condition. The IAEA has also sent a letter to the Minister of Atomic Energy of the Russian Federation suggesting that Russia consider the take-back of spent [nuclear] fuel of Russian origin.
A question was asked as to why the United States is assuming responsibility for foreign research reactor spent nuclear fuel.	In order to comply with its [nuclear weapons] nonproliferation goals, the United States accepted spent nuclear fuel enriched in the United States for over thirty years. This action created an expectation that spent nuclear fuel acceptance would continue. If the United States does not adopt a policy, many research reactor operations could be shut down as the countries did not plan for, or have, long term storage facilities. In addition, the Dounreay reprocessing facilities can only handle HEU [at this time], and reactor operators would be likely to return to HEU use from LEU use if a policy is not adopted. The United States is seeking to eliminate world-wide commerce in HEU and needs a policy to manage United States-origin enriched uranium.

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE has a legal obligation to accept foreign research reactor spent nuclear fuel. Commentor (on behalf of the Edlow Group, which represents 14 foreign research reactor operators) commented as follows: Many foreign research reactor operators have contracts, or other documents, evidencing written commitments that DOE will receive fuel. DOE has stated a moral and political obligation in affidavits, in Federal Register notices, in the Contract for Urgent Relief, and in contracts with Argonne National Laboratory. It is understood that DOE has been advised by its attorneys not to address legal obligation in the EIS. The legal obligation is a relevant consideration under NEPA and should be addressed in the EIS.	[With the exception of cases in which DOE has executed contracts for acceptance of spent nuclear fuel from specific foreign research reactors, DOE considers that neither the DOE nor the United States Government has any legal obligation to receive spent nuclear fuel from foreign research reactors. Even in cases where there may be signed contracts for shipment of spent unclear fuel to the United States, there are two cases, as follows, in which DOE considers that neither DOE nor the United States Government have any legal obligation to accept the spent nuclear fuel. 1. In the absence of a completed Appendix A for each shipment, mutually agreed to by DOE and the research reactor operator, DOE considers that the contracts have not been completed and are not binding. 2. In the absence of a completed review under the National Environmental policy Act (up to and including issuance of a Record of Decision or Finding of No Significant Impact specifically covering the proposed shipment), DOE considers that any contract would be subject to successful legal challenge and would not be enforceable.]
A comment was made that the United States appears to be trying to monopolize trade in nuclear development and technology and exclude countries from developing reactor technology.	There are no attempts by this proposed policy to influence such policy decisions. This policy deals only with [foreign research reactor] spent nuclear fuel. By alleviating critical storage situations until countries develop their own storage capabilities, the proposed action will allow for continued operation of foreign research reactors. If the United States does not take action, then countries would be responsible for waste treatment, storage, and disposal even though many do not have that capability.
A comment was made that new processing technologies would need to be developed if foreign research reactor spent nuclear fuel is chemically separated in the United States.	The United States does not need to develop a new process for chemical separation of spent nuclear fuel. The facilities at the Savannah River Site are technically capable of chemically separating the aluminum-based foreign research reactor spent nuclear fuel, and the facilities at the Idaho National Engineering Laboratory are technically capable of chemically separating all the foreign research reactor spent nuclear fuel.
A comment was made that if reprocessing is chosen as an alternative, HEU should not be stored. Potential proliferation use of HEU should be monitored throughout the process of blending down HEU to LEU.	[The commentors' position on storage of HEU and monitoring during blending down is noted. DOE states in the EIS its preference for blending sown any separated HEU.]

ISSUES RAISED	DOE RESPONSES
A comment was made that overseas reprocessing may have grave consequences to nonproliferation goals. The Reduced Enrichment for Research and Test Reactors (RERTR) Program and Off-Site Fuels Policy contributed to cutting off supply and demand for HEU. Overseas reprocessing would undermine this progress. The spent nuclear fuel should be managed with wet or dry interim storage in the United States and then placed in geologic disposal, setting a model for other countries.	[The commentor's opposition to Management Alternative 2 is noted and a preference for wet or dry interim storage in the United States prior to geologic disposal.]
A comment was made that there is little difference in reprocessing at Dounreay or in the United States. Dounreay reprocessing meets nonproliferation goals and the fuel can be conditioned.	[The current practice of the Dounreay, Scotland facility is to allow the customer (reactor operator) to specify the form of the separated uranium and its disposition (Section 2.3 of the EIS). This could mean that separated HEU could be returned as HEU, contrary to United States nuclear weapons nonproliferation objectives. Further, Dounreay does not currently have the capability to reprocess the new high density LEU fuel the United States is encouraging operators to use.]
A question was asked as to why Dounreay should listen to United States' wishes regarding spent nuclear fuel from countries other than the United States. If Germany, Belgium, the Netherlands, and France want to send spent nuclear fuel to Dounreay and receive fuel back, why would Dounreay listen to the United States and refuse to return HEU to the customer?	The United States is not telling the British (Dounreay) what to do. Both countries are discussing options that are mutually beneficial, including the business interests of Dounreay. The United States and Dounreay are in discussion regarding Dounreay's willingness to reprocess in ways consistent with the United States nuclear weapons nonproliferation goals. Also, as some of these countries support the United States' policy, it is not clear that the countries in question will ask Dounreay to send HEU back or that Dounreay would comply.
A comment was made that reprocessing at Dounreay is not an option for many countries because they cannot accept back the reprocessed waste.	[Under Management Alternative 2 (Section 2.3 of the EIS), the United States might accept reprocessing waste from countries that cannot take back their waste.]
A comment was made that if the United States can accept spent nuclear fuel from foreign countries, it should be able to take back Dounreay reprocessing waste for the countries who cannot take back this waste.	[Under Management Alternative 2 (Section 2.3 of the EIS), the United States might accept reprocessing waste from countries that cannot take back their waste.]
A comment was made that the foreign research reactor community expressed concern over the practicality and pricing implications, if DOE combines forces with Dounreay under Management Alternative 2 or 3 (i.e., resulting essentially in one option and one price for reprocessing). Commentor stated that this is a monopoly issue that would place foreign research reactor operators in an untenable position.	[The intent of the proposed action is to support United States nuclear weapons nonproliferation objectives, not to address the practicality and pricing of the disposal of foreign research reactor spent nuclear fuel. However, DOE is aware that the implementation of this policy, in compliance with the Record of Decision, would impact the disposal of foreign research reactor spent nuclear fuel and the price of that service. These considerations will enter into the development of the Record of Decision.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the Reduced Enrichment for Research and Test Reactors (RERTR) Program will work only if all participate. It was suggested that DOE choose Management Alternative 1 and bring back all the United States-origin fuel. Commentor stated that reactor operators are in a competitive business, and some operators believe that conversion to LEU provides no benefits in cost or performance. There is unfair competition if some reactors can use HEU while others must use LEU. If there is overseas reprocessing, research reactors will take HEU back.	[The commentor's support for Management Alternative 1 is noted. The United States has offered the possibility of LEU acceptance as an enticement for reactor operators to convert from HEU to LEU use.]
A comment was made that only one alternative discussed in the draft EIS is consistent with President Clinton's Nonproliferation Policy Directive PDD-13, and reflects a preferred alternative jointly developed by DOE and the Department of State, which is subject to NEPA review requirements. That preferred alternative, which is to return the spent nuclear fuel to the United States over a ten-year period and place it in dry storage until it can be put into a repository, was specified in a July 1993 submittal by Secretary O'Leary to Secretary of State Warren Christopher.	[The draft EIS did not include a preferred alternative. However, Management Alternative 1 would support United States nuclear weapons nonproliferation policy objectives. A preferred alternative is selected in the Final EIS.]
A suggestion was made to bring all the spent nuclear fuel into the United States and maximize the nonproliferation benefit, because the environmental impact would be the same whether partial or total amounts of spent nuclear fuel were returned.	Environmental impacts would be nearly the same for partial or total spent nuclear fuel amounts. However, much of the United States public wishes to minimize the amount of radioactive material coming into the United States. South Carolina officials have indicated they might consider managing the minimum amount of foreign research reactor spent nuclear fuel but do not wish to manage all of it.
A question was asked whether South Carolina would be willing to accept spent nuclear fuel if its management included reprocessing, which provides jobs for the State.	Reprocessing [chemical separation] at the Savannah River Site is considered an option.
A comment was made noting the billions of dollars DOE has spent in cleanup and in managing its existing radioactive waste. Commentor questioned whether, given its track record, DOE should manage more spent nuclear fuel.	Even though there have been problems in DOE spent nuclear fuel management, it is of value to note that the best [managed] United States spent nuclear fuel [program] is the foreign research reactor fuel in the Receiving Basin for Off-Site Fuels at the Savannah River Site. [Foreign research reactor spent nuclear fuel has been safely managed in the United States for nearly four decades (Section 1.1 of the EIS).]
A commentor expressed disappointment that the draft EIS proposed only to "manage" foreign research reactor spent nuclear fuel and not "accept" spent nuclear fuel into the United States, as previously planned during the draft EIS scoping stage. Commentor felt this was inconsistent with the objective of "accelerated" return. The policy implications of reprocessing would result in delays; although the option of reprocessing should be kept open. The only option for this EIS should be to return the fuel to the United States.	[The commentor's support for United States acceptance of the foreign research reactor spent nuclear fuel is noted.]

ISSUES RAISED	DOE RESPONSES
A comment was made that Canada supports the incorporation of target materials, which are weapons-grade, into the management alternatives. Commentor noted that much of Canada's target material is used in medical isotope manufacture for medical diagnoses done in the United States.	[The acceptance of target material is subalternative 1c of Implementation Alternative 1 for Management Alternative 1, which is discussed in Section 2.2.2.1 of the EIS.]
A question was asked about the advantages of the Hybrid Alternative. Commentor stated that if some spent nuclear fuel can be received at Dounreay, why not all of the fuel.	Under the Hybrid Alternative (Management Alternative 3) DOE and the Department of State may consider adopting components of Management Alternatives 1 and 2, such as some reprocessing overseas and some storage in the United States. As not all countries can accept their reprocessed waste from a reprocessing facility, under the Hybrid Alternative the United States could accept and manage this remaining waste.
A comment was made that some research reactors must use HEU and, thus, will take HEU back from reprocessing because they cannot use LEU. It was suggested that a higher grade of research reactor fuel using LEU be developed for use in the reactors.	[Development of high-density LEU for use in these reactors is a high priority for DOE.]
A statement was made that Edlow International is prepared to ship by rail, truck, or barge through any port to designated sites under the terms and conditions decided by the research reactor operators, DOE, and the transporter and according to Department of Transportation and Nuclear Regulatory Commission rules.	[The comment is noted.]
A question was asked as to whether wording in the draft EIS precludes shipping on I-90 through Buffalo, New York.	The wording in the draft EIS does not preclude shipping on I-90 through Buffalo. The routes in the draft EIS are representative. Actual routing is selected at the time of shipping.
A comment was made that opinions from the Department of Defense (DOD) should have been included in the draft EIS, as DOD has urged that, for national security reasons, the spent nuclear fuel acceptance program be expedited.	[DOD opinions will be considered in developing the decision that goes into the Record of Decision.]
A comment was made that when the Off-Site Fuels Policy expired in 1988, the original Federal Register Notice should have been followed by a new Federal Register Notice.	[The comment is noted.]
A question was asked about the Record of Decision for the DOE Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement (SNF & INEL EIS).	At the time of this public hearing (May 31, 1995), DOE is in the process of preparing to release a Record of Decision on or about June 1, 1995. [The SNF & INEL EIS Record of Decision was released on May 30, 1995.]

ISSUES RAISED	DOE RESPONSES
Comments were made about the importance of keeping this EIS on schedule. Delay could cause several operational emergencies, and undue hardship already has been experienced by the foreign research reactor community. DOE should accept late comments rather than extend the formal comment process.	[Despite extending the comment period by 30 days, the need to avoid delay is understood. Every effort will be made to adhere to the schedule for release of the Record of Decision by the end of the calendar year.]
A request was made that DOE, given its responsibility under the RERTR program, reopen spent nuclear fuel return agreements at prices available when the 1988 spent nuclear fuel return agreement expired. It was suggested that DOE keep the prices reasonable, not competitive.	[Financial arrangements will be made after the Record of Decision, if spent nuclear fuel from foreign research reactors is to be managed by the United States.]
A comment was made that the draft EIS does not clearly discuss the risk of spent nuclear fuel sabotage. Commentor noted that the initial high radioactivity of spent nuclear fuel makes the material "self-protecting," because it has to be handled by remote tools. But, as it ages, the radioactivity decreases, thus increasing the risk of sabotage.	DOE will address this issue more clearly in the EIS. [Appendix D of the EIS, Section D.5.9 has been added to the EIS to discuss terrorism and sabotage, and new Appendix H has been added to discuss security. This appendix presents the general provisions of the Transportation Plan, which is a document that provides all of the details associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the DOE management site.]
A comment was made that the draft EIS does not adequately address the impacts of diversion of HEU resulting from overseas reprocessing and the ramifications of a resulting nuclear weapons explosion. Commentor stated that if a nuclear bomb explodes, the result will be greater than a latent cancer.	DOE will consider overseas reprocessing only if it complies with United States nuclear weapons nonproliferation goals. DOE is considering the vulnerability implied by the commentor.
Representatives from the following groups said they were submitting written comments: Nuclear Control Institute, Edlow Group, Egan and Associates, McMaster University, and Atomic Energy Canada Ltd.	DOE acknowledges the submission of written comments from the listed groups. [See Chapter 2 of this Volume 3 of the EIS for the public written comments and the DOE response.]

List of Attendees at Washington, DC Public Hearing

Ahern, Richard
Bartlett, John W
Busick, Eleanor
Casta, Jorog
Chronodovlos, Dimitris
Conde, Marilena
DeBlock, Marie-Jo
Dejohrte, Paul
Drake, Carolyn C
Dullahan, J
Edlow, Jack
Egan, Joseph
Ernst, Peter C.
Fulmer, Beth
Futo, John S.
Giognard, Peter A.
Gronberg, Lisbeth
Gruber, Gerhard
Heycu, Hajo
Hopkins, L.J.
Jager, Wolfgang
Katz, Jon
Keeling, F.
Krull, Dr. Wilfred
Kuperman, Alan
Kwapik, Michael
Lash, Fred C.
Laursen, Marianne
Linhart, Jim
Lipin, Heather
Lopez-Ofin, M.
Lpreciardo, R.A.
Matos, James E.
McDonough, Michael D.
Meigs, Marilyn F.
Mota, Jose
Murray, Allan
Raisonnier, Daniele
Ritchie, Iain G.
Saint-Jacques, Guy
Schmidt, T.
Shapar, Howard
Silverman, Jennifer
Stenberg, Bo
Sundman, Bo
Svenson, Erik A.
Temple, Jonathan

Walter, Hajek
Wenzel-Constabel, Peter
Wiley, Patricia
Wolf, Walt H.
Yourish, Karen
Ziegler, Leopold A.
Zmora, Hagai

The public hearing at Wilmington, North Carolina, a candidate port of entry, was held in Cape Fear Community College Auditorium on May 22, 1995. Seventeen people attended the hearing. The hearing was interactive in nature and the following is a summary of the comments and issues that were raised. Information in brackets [ ] was not presented at the hearing.

ISSUES RAISED	DOE RESPONSES
Several commentors expressed support for overseas management of foreign research reactor spent nuclear fuel, provided there are appropriate storage technologies and security.	[The commentor's preference for Management Alternative 2 is noted. This alternative is discussed in Sections 2.3 and 4.4 of the EIS.]
Comment was made that American taxpayers should not have to bear the costs of managing spent nuclear fuel from other countries. Options suggested by commentors included the following: (1) foreign countries should pay for the management of their spent fuel; (2) foreign countries should contribute to the costs of storing their spent nuclear fuel in the United States for the 40 years assumed in the EIS; and (3) the fuel manufacturers who prospered from making the fuel should bear some financial burden.	According to an Edlow Group representative, foreign research reactor operators are willing to pay the full costs of shipping their spent nuclear fuel to the United States provided that the costs are reasonable. [As discussed in Section 2.2.1.2 and 2.2.2.3 of the EIS, several financing options have been considered, ranging from collection of fees from the research reactor operators that would pay all of the costs of the program, to full subsidization of the program by DOE. A compromise between these extremes would be for developed countries to be charged a competitive fee to accept and manage their spent nuclear fuel. U.S. taxpayers would absorb the full costs of the program for developing countries and absorb the amount above a competitive fee for developed countries. The reasons the U.S. would pay some of the costs for other countries are: 1) some countries would be unable to afford the cost of the proposed action and would have no safe alternative means of managing their spent nuclear fuel (i.e., the developing countries); and 2) some countries would continue to use and trade weapons-grade nuclear material indefinitely unless the U.S. charges a competitive fee and absorbs any costs above that fee (i.e., most Western European countries).] It should be noted that the United States government manufactured the enriched uranium.
A question also was asked as to how potential budget cuts would affect the proposed action.	The EIS evaluates a number of financing options for the proposed action, including one in which developed countries pay costs of shipping the fuel to the United States. [As noted above], foreign research reactor operators are willing to pay the costs of shipping their spent fuel to the United States (provided the costs are reasonable). [DOE does not anticipate budget cuts affecting essential activities such as the safe management of spent fuel. If DOE were abolished in response to action by Congress, the current DOE programs for management of spent nuclear fuel would have to be transferred to some other Federal government agency to protect the health safety of the public. Since the spent nuclear fuel will not simply go away, these programs cannot simply be abolished.]

ISSUES RAISED	DOE RESPONSES
Concern was expressed about the spent fuel's vulnerability to terrorist attacks. Comment was made that the Oklahoma City bombing changed the nature of what countries are at risk; domestic terrorism is on the rise; and terrorist opportunities are greatest as shipments cross over sea and land. Comment was made that the foreign research reactor spent nuclear fuel is safer in countries such as Sweden, Denmark, or Germany.	[Acts of terrorism and theft of materials by a determined group or individuals cannot be completely precluded. However, proper security measures greatly reduce the risk. All shipments of foreign research reactor spent nuclear fuel would be conducted to meet or exceed all the security requirements in the Code of Federal Regulations (10 CFR Part 73). DOE supports these regulations as being adequate to protect the foreign research reactor spent nuclear fuel. Nuclear Regulatory Commission regulations for physical security include requirements for armed escorts and two-way communications with a communications center during the journey (Section 5.4.2 of the EIS). Section 2.8 and Appendix D, Section D.5.9 discuss the issues of sabotage and terrorist activities. To more fully describe the security and emergency preparedness associated with transport of the foreign research reactor spent nuclear fuel, Appendix H has been added to the final EIS.]
Opposition was expressed to allowing the shippers to choose the shipment routes on a shipment-specific basis -- commentor expressed lack of trust in the shippers' judgment.	[Overland shipment by rail or by truck is regulated by Department of Transportation and NRC regulations dealing with packaging, notification, escorts and communication. Under Department of Transportation regulations, those specific routes designated by appropriate State agencies are enforceable if the Department of Transportation determines that such routes are likely to result in further reduction of radiological risk. Also, shippers are required to submit proposed routes for spent nuclear fuel shipments to the Nuclear Regulatory Commission for approval. NRC then publishes a public information circular that lists routes that have been evaluated and approved for specific spent nuclear fuel shipments. All the routes take into consideration accident rates, transit time, and population density. Hundreds of shipments of spent nuclear fuel have been transported for nearly four decades over highway and rail routes in the United States. No radiological incident involving spent nuclear fuel has occurred during that time (Section 4.2.3 of the EIS).]
A comment was made that if spent nuclear fuel is accepted into the United States, shipments should be on larger, more robust ships than were used for the August 1994 Urgent-Relief shipment into the Military Ocean Terminal at Sunny Point.	According to an Edlow Group representative, spent nuclear fuel shipments have been made in similar ocean-going vessels for the past 30 years, with a safe shipping history. [The EIS evaluated the use of four types of ships for transporting the spent nuclear fuel should it be accepted into the United States: container vessels, roll-on/roll-off ships, general /cargo ships, and purpose-built ships. No significant difference in the incident-free or accident risk were found between any of the types of ships (Sections 4.2.1 and 4.2.2 of the EIS).]

ISSUES RAISED	DOE RESPONSES
A comment was made that spent nuclear fuel shipments in the United States should be accompanied by security. A commentor noted that the 1994 Urgent-Relief shipment into the Military Ocean Terminal at Sunny Point would not have had transportation security if it were not for public demand.	[All shipments of foreign research reactor spent nuclear fuel would be conducted to meet or exceed security requirements in the Code of Federal Regulations (10 CFR Part 73). Nuclear Regulatory Commission regulations for physical security include requirements for armed escorts and two-way communications with a communications center (Section 5.4.2 of the EIS). To better describe the security and emergency preparedness associated with transport of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. Appendix H presents the general provisions of the Transportation Plan which is a document that provides the details that would be associated with the transportation of the foreign research reactor spent nuclear fuel, including security.]
Concern was expressed about the fact that the Urgent-Relief shipment that came into the Military Ocean Terminal at Sunny Point entered into the port during hurricane season and while the port was preparing for military combat readiness.	[While local hazards such as hurricanes might slightly increase the probability of an accident, they would not increase the consequences of the accident, which were found to be low for both marine and transportation accidents (Section 4.2.2.3 of the EIS).]
	[Activities at the port would be taken into consideration when scheduling shipments of foreign research reactor spent nuclear fuel. Receipt of spent nuclear fuel from research reactors would not be scheduled at the same time as other port activities that would increase a risk of accident.]
A comment was made that the draft EIS gives a false sense of security in terms of health risks to those who live along rail routes.	[The potential adverse environmental and health effects were found to be low along potential transportation routes (road or rail). Radiological health effects are quantified in Section 4.1.3 of the EIS.]
A comment was made that casks of spent nuclear fuel moving down the highway are like "eggs moving down the highway." Commentor stated that the material inside the casks is porous; the amount of radiation released in an atomic explosion is equivalent to the amount of radiation contained in some commercial spent fuel; and that spent nuclear fuel from overseas can be devastating if an accident happens.	As noted in the [EIS] analyses, the casks are robust and have passed severe accident testing. The foreign research reactor spent nuclear fuel is more benign than commercial spent nuclear fuel. [Section 2.6.2 and Appendix B, Section B.2 of the EIS describe the severe accident tests that the casks undergo in order to be certified and approved for use. Commentor's statements regarding the nature of the spent nuclear fuel inside the transportation casks and the amount of radiation are incorrect. Sections 2.6, 4.1, and 4.2 of the EIS describe the nature of the spent nuclear fuel and radiological doses that would be associated with a spent nuclear fuel transportation cask during normal and accident conditions.]

ISSUES RAISED	DOE RESPONSES
A comment was made that the draft EIS failed to consider data in numerous agency studies documenting the evidence of active and probable sinkholes in the Southport area and along nearby rail lines. Commentor stated that sinkholes were man-induced as a result of lime mining that disturbed an underground aquifer. Commentor cited a Consent Agreement with the Army Corps of Engineers concerning continued mining. Commentor provided supporting documentation on sinkholes and requested that DOE consider the data in the EIS analyses.	[Sinkhole data provided in written comment document 18 was considered. Local hazards, such as sinkholes, can serve as accident initiators and may therefore slightly increase the probability of an accident. However, they would not increase the consequences (results) of the accident, which were found to be low (Section 4.2.2.3 of the EIS).]
A comment was made that shipments are easily tracked by terrorists and that it does not take a genius to track them.	Although it may sometimes be possible to track shipments in the United States, it would be safer having the spent nuclear fuel in the United States, particularly that spent nuclear fuel which has cooled and is, therefore, more easily handled. [All shipments of foreign research reactor spent nuclear fuel would be conducted meeting or exceeding all the security requirements in the Code of Federal Regulations (10 CFR Part 73). Section 2.8 and Appendix D, Section D.5.9 discuss the issue of sabotage and terrorist activities. To better describe the security and emergency preparedness associated with transportation of the spent nuclear fuel, Appendix H has been added to the EIS. This appendix includes the general provisions of the Transportation Plan, which provides the details that would be associated with the transportation of the foreign research reactor spent nuclear fuel, including the security arrangements in port and in transit to the DOE management site.]
Concern was expressed about the potential for terrorists to shoot charges into casks, creating an explosion in route.	[Section 2.8 and Appendix D, Section D.5.9 have been added to the EIS to address terrorism and sabotage. These sections discuss the consequences of just such a terrorist act. In addition, the EIS analyzes several types of ship fires, the impacts of which would be worse, or "bound" by the results of an explosion involving a spent nuclear fuel transportation cask. The energy content of a severe fire greatly exceeds that of a severe explosion. With a severe fire not only would the transportation cask be violated, as it might be by a large explosion, but the heat of the fire would lift what would be released from the transportation cask, spreading the radioactive material farther, potentially affecting more people. The impacts of an explosion followed by a severe fire would be equivalent to the Category 6 accident analysis which would result in a violated cask being engulfed by a severe fire (Appendix D, Section D.5). The analysis in the EIS shows that neither the consequences nor risks are great and that no decontamination, interdiction, or condemnation of property would result from the worst plausible accident (Section 4.2.2.3).]
A comment was made that people along transportation routes have the right to know ahead of time when spent nuclear fuel shipments are coming through their communities. Nuclear Regulatory Commission regulations and DOE Orders require that Governors be notified in writing 7 days in advance of shipments.	During the Urgent-Relief shipment planning, DOE worked with North Carolina and South Carolina six months in advance to prepare for the shipment, including designations of routes. Several local and regional emergency responders were involved. It would be the State's responsibility to make sure proper local notifications are made.

ISSUES RAISED	DOE RESPONSES
A comment was made that people along transportation routes need to be better informed of the precautions being made by DOE to assure safety (e.g., emergency response assistance.)	[As discussed in Section 2.7 of the EIS, primary responsibility for emergency response to an incident would reside with the State, Tribal, and local authorities. DOE would provide coordination, financial and technical assistance, and training to the State, Tribal, and local emergency response personnel. In addition DOE has Radiological Assistance Program teams that operate from eight strategically located DOE offices around the country. These teams can provide technical expertise and assistance to monitor and assess radiological hazards. To better describe the security and emergency preparedness associated with transport of the foreign research reactor spent nuclear fuel, Appendix H has been added to the EIS. Appendix H presents the general provisions of the Transportation Plan which is a document that provides the details which would be associated with the transportation of the foreign research reactor spent nuclear fuel.]
A question was asked as to whether there is any storage capacity remaining at the Savannah River Site and how long it will be before the fuel would have to be moved again. A question was asked as to the lifetime of the Receiving Basin for Offsite Fuels.	There is currently enough capacity at the Receiving Basin for Offsite Fuels (RBOF) to accept spent nuclear fuel through 1996. DOE is in the process of upgrading L-[Reactor Disassembly] Basin for receipt of spent nuclear fuel after 1996. Alternatives are also being considered for new [dry] storage facilities at the Savannah River Site. To receive all foreign research reactor spent nuclear fuel, new storage facilities would be needed. DOE does not expect to have to move spent nuclear fuel out of RBOF, L-[Reactor Disassembly] Basin, or any new facilities until a repository is available.
A question was asked as to whether reprocessing is a viable option.	The draft EIS includes reprocessing (chemical separation) as a viable option [(See Sections 2.2.2 and 4.3 of the EIS). Reprocessing would not violate current United States policy as long as the separated uranium is not used in nuclear weapons.]
Concern was expressed that very few local emergency response personnel are adequately trained and equipped.	There is ongoing dialogue among DOE, the Federal Emergency Management Agency (FEMA), States, and emergency response associations as to the proper equipment for each layer of response. Once agreements are reached with the State, DOE will provide financial assistance for emergency equipment for local jurisdictions. For the Urgent-Relief shipment, DOE provided specialized emergency response training at State and some local levels [four courses in North Carolina and South Carolina and specialized training at MOTSU]. The Savannah River Site Radiological Assistance Team shadowed the train throughout the shipment to assist local responders in the event of an accident.
A comment was made that there are many small communities on the shipment route which were not involved in decisions on the AWE shipment (e.g., Awe, Monroe, Hamlet, Laurinberg). Commentor suggested that DOE should have more hearings along the transportation corridors in North Carolina and noted that citizens' fears need to be considered.	DOE went through a deliberative process in preparation of the Urgent-Relief shipment, coordinating with the State on route selection and emergency response. DOE looks to the State to assure that local communities are adequately represented in determining routes and emergency preparedness needs.

ISSUES RAISED	DOE RESPONSES
Concern was expressed that the impacts of bringing foreign research reactor spent nuclear fuel to the Savannah River Site would result in disproportionate impacts to minority and low-income communities. Reasons cited were: (1) storage at Savannah River Site would be temporary and DOE would need to move fuel many times, impacting minorities; (2) adding more "white people" into the mix and reducing the percentage of minority and low-income communities masks the true picture; and (3) the Urgent-Relief shipment through Sunny Point "zig-zagged" through communities that would also be affected if the shipments come through Charleston. (Commentor submitted written comments.)	[Appendix A of the EIS responds to Executive Order 12898 which directs Federal agencies to identify and address disproportionately high and adverse environmental effects of their policies and activities on minority populations and low-income populations. Environmental effects of Management Alternatives 1 and 3 (management in the United States) were evaluated and found to have no significant beneficial or adverse effects on the general population, including minority populations and low-income populations surrounding Wilmington, the Savannah River Site, Charleston, or any other port or site in the EIS. Section 3.2.1 of the EIS identifies low-income households and describes the racial and ethnic composition of resident minority populations surrounding each of the candidate ports. Environmental justice at candidate ports, along ground routes, and at interim management sites is discussed in Sections 4.2.2.6, 4.2.3.7 and 4.2.4.5 respectively, of the EIS.]
A comment was made that many people along the shipment routes are illiterate and cannot write, yet should be allowed a chance to participate in decisions that affect them. It was suggested that DOE establish a 1-800 line so they can call in their comments.	[Commentor was provided the 1-800 telephone number for Charles Head, Project Manager of the EIS.]
A comment was made that the proposed policy is mistakenly referred to as a nonproliferation policy and that providing LEU to questionable nations is only furthering the spread of nuclear weapons. Commentor cited the following examples: Iran has questionable intentions; the United States does not officially recognize Taiwan; it is widely known that Pakistan has the bomb; and Slovenia is unstable.	The countries cited by the commentor are on the list because they have spent nuclear fuel containing uranium enriched in the United States, which the United States wants back under its control. LEU will not be provided to countries, such as Iran and Pakistan, that are not committed to nonproliferation.
A comment was made that the Treaty on Nonproliferation of Nuclear Weapons is a failure and that, under this policy, we have managed to spread nuclear materials and technology over the world.	It is not in DOE's scope [of the EIS] to argue the merits of the Treaty on Non-Proliferation [of Nuclear Weapons] and whether or not it supports nonproliferation. However, it has been successful to date in minimizing the spread of bomb-grade material available world-wide [as well as the spread of nuclear weapons].
A comment was made that the nuclear weapon proliferation risk of countries included in the proposed action is not readily discernible.	[Of the 41 countries that would be covered under the proposed policy, the majority do not pose a proliferation risk. However, many of these countries that have converted to LEU may switch back to HEU to fuel their research reactors if the United States does not accept their spent nuclear fuel containing the HEU originally supplied by the United States. These countries could buy HEU -- Russia and China have both supplied HEU in the past. The suggestion to accept spent nuclear fuel only from nations that are proliferation risks also leads to the problem of identifying these countries. As discussed in Section 2.8 of the EIS, nations that were publicly labeled as proliferation risks would very likely withdraw from further cooperation in nuclear weapon nonproliferation efforts.]

ISSUES RAISED	DOE RESPONSES
A comment was made that there are a lot of exaggerations in the draft EIS, particularly the importance of shipments into the United States to the nonproliferation policy. Commentor stated that prior to the Urgent-Relief shipment, citizens were told that if the shipment was not allowed to come through Sunny Point, the entire nuclear nonproliferation program would "fall through."	[DOE and the Department of State consider it imperative that the United States maintain its leadership role in reducing the amount of HEU in global commerce. An objective of the proposed action is to reduce, and eventually eliminate, civilian use of HEU fuel in foreign research reactors (Section 1.2 of the EIS). This objective is a primary goal of DOE's nuclear weapons nonproliferation policy.]
A question was asked as to what degree the citizens in the foreign research reactor host countries are involved in these decisions.	[The foreign research reactor host countries are supporting this policy. Many of their citizens submitted comments on the draft EIS.]
A comment was made that the proposed policy is inconsistent with the United States government accepting Japan's use of plutonium-fueled reactors and reprocessing of its spent nuclear fuel in France.	Under the Treaty on Non-Proliferation of Nuclear Weapons, Japan has the right to choose its own energy options. The United States does not have the authority to stop Japan from using plutonium. The proposed policy deals with only U.S.-origin enriched uranium contained in spent nuclear fuel from foreign research reactors.
A comment was made that the United States appears to be seeking to monopolize world trade in nuclear materials and monopolize the current status of non-nuclear weapons states.	The United States is seeking to create a norm against use of highly enriched uranium in research reactors, thus seeking to eliminate world-wide commerce in highly enriched uranium.
A comment was made that the proposed policy represents a "no-end game."	The EIS includes a finite scope and time frame of policy [10-year policy, which should allow for management of all U.S.-origin highly enriched uranium].
Concern was expressed that the United States may never have a geologic repository and that decisions are being made when we do not know what to do with our own waste.	The EIS assessed impacts of 40-year storage, at which time a permanent solution is expected. Current plans are for operation of a geologic repository within 40 years.

ISSUES RAISED	DOE RESPONSES
An Edlow Group representative read a statement presenting the position of about 14 foreign research reactor operators. (A written statement is included in Volume 3 of the EIS.) Statement is summarized as follows: (1) Foreign research reactors provide benefits; (2) Foreign research reactor operators always relied on United States assurances to take back U.S.-origin fuel; (3) United States acceptance of foreign research reactor's spent nuclear fuel supports nonproliferation goals; (4) With United States acceptance of foreign research reactors' spent nuclear fuel, reactor operators willingly cooperated in the RERTR program and converted to LEU fuel; (5) Foreign research reactor operators are making long-term plans to deal with their own fuel overseas; (6) In the short-term, foreign research reactors do not have safe storage capacity; (7) Foreign research reactor spent nuclear fuel makes up only 1% of heavy metal content of entire DOE-owned spent nuclear fuel inventory; (8) United States acceptance can be done without significant impacts; (9) While United States acceptance adds a small amount of spent nuclear fuel to DOE inventory, the trade-off is taking HEU out of world commerce; and (10) DOE should move forward with United States acceptance of foreign research reactor spent nuclear fuel.	[The commentors' support for U.S. acceptance of foreign research reactor spent nuclear fuel (Management Alternative 1 or 3) is noted. The Edlow group written comments are responded to in Section 3 of this Volume, documents 7 and 1130.]
A comment was made that the draft EIS states that conservative assumptions were used to estimate impacts; yet, under the maximum estimated impacts of incident-free and accident conditions of transport and storage, the draft EIS continues to state that impacts are "zero" or there are "no" latent cancer fatalities. Commentor expressed view that zero impacts or no latent cancer fatalities, is unrealistic.	The EIS statement that there are no latent cancer fatalities expected from the EIS alternatives for ground transport and storage is based on over 40 years of experience in transporting and managing spent nuclear fuel. To date, there have been no accidents in which a transportation cask has ruptured or otherwise released its contents. Casks have been proven to withstand severe accidents through a series of tests and analyses in which the casks were crashed, dropped, and burned.
A comment was made that the draft EIS failed to assess non-cancer health risks, such as immune deficiencies and birth defects. (Written comments provided.)	Non-fatal cancers and other health effects were not calculated in the EIS because they are lower probability and because the higher probability fatal cancer rate was so low for all of the analyzed cases (Section 4.1.3 of the EIS).]
A comment was made that the draft EIS does not address new research on radiological health risks. Cited was a recent study of the North Carolina Public Health Department that assessed exposures of Oak Ridge workers. Commentor stated that the study showed that exposure of 140 mrems resulted in a significant increase in cancer. Also cited were studies by Resnikoff. (Written comments provided.)	[The effects of low level radiation is a topic currently being discussed among experts, with no resolution currently available. The dose of latent cancer fatality conversion used in the EIS is the current industry-accepted value (Section 4.1.3 of the EIS). These dose conversion factors are also accepted by the International Commission on Radiological Protection and the U.S. Nuclear Regulatory Commission.]

ISSUES RAISED	DOE RESPONSES
A comment was made that DOE is lying when it says LEU, which is enriched at below 20%, cannot be used in making a bomb. Commentor stated that if a country can turn 20% or greater enriched uranium into a bomb, it can also turn 5% enriched uranium into a bomb.	The average terrorist and country could not convert LEU to a bomb. The only way for it to become bomb-grade is for the enrichment to be increased to greater than 20%, which can only be done in a huge, complex facility. Only five countries currently have the capability to enrich uranium. [Eleven nations have some enrichment capability.] Most countries are faced with three choices: (1) shut down their reactors; (2) go to other enriched uranium suppliers, including countries that are not as careful with respect to nonproliferation (China or Russia--two of the five); or (3) develop their own enrichment capability.
A comment was made that DOE's use of "spent" in spent nuclear fuel is a miscommunication. Commentor stated that the term sounds like something is depleted when in fact it is more dangerous than before.	"Spent" fuel means that there is less Uranium-235 in the fuel than when the fuel originally started in the reactor.

Transcript of Public Hearing Held in Tacoma, Washington on June 19, 1995 on the Draft Environmental Impact Statement on the Proposed Nuclear Weapons Nonproliferation Policy Concering Foreign Research Reactor Spent Nuclear Fuel

Facilitator - Leslie Wilderson (LW): Welcome to the Department of Energy meeting on the nuclear weapons nonproliferation policy concerning spent nuclear fuel from foreign research reactors. This is a meeting to discuss the Draft Environmental Impact Statement (DEIS) that the Department of Energy (DOE) has developed in deciding their proposals.

My name is Leslie Wilderson. I am here as a neutral facilitator. I do not work for DOE, I work for a small company in Denver, Colorado. My job is to make sure that all of you who want to be heard tonight get an opportunity to be heard and that no one gets an opportunity to be heard more than their share. So, we have a lot of people here tonight. I am very pleased to see this many people turning out to participate in public policy determination for our country.

We have a deceptively simple agenda for this evening. There will be a presentation by Mr. Charles Head, who is the Program Manager for the foreign research reactors, and who is the Project Manager for the DOE's Environmental Impact Statement (EIS) on this project. He will give a brief overview of the DEIS for those of you who haven't had a chance to plough through all of the pages of that document, and so that everyone will have an opportunity to have a level playing field in terms of the knowledge of the project. After that, we'll have some questions and answers and discussions. This room, as some of you, I know, up front have heard us talking over the last few minutes, about how this room is not really conducive to discussion, which is really the purpose of this meeting -- is to talk and answer questions, and receive input from the Department, and to discuss things about this project. This room doesn't lend itself to that, very much.

We have, in order to make sure that the Department gets your input, we have a couple of note takers up at the front table. I'll be jotting some things on flip charts. There will also be a tape recorder that is plugged into the sound system. Now, the sound system isn't quite what anyone of us would like to have either and so Larry Burke (where are you?), Larry (in the back) is going to be a sort of an auxiliary sound system and he will be carrying a little lavaliere mike (like this) so (for whoever is speaking) he will have a mike for you so that you will be plugged into the sound system and all of your friends and neighbors can hear you and the Department officials can hear you, and the note takers and the tape recorder can hear you. So, that's what will be happening there.

We have a lot of people who have signed up to speak, 49 people so far. And, if we hold to about a 3-hour discussion (you can divide that up for yourselves) that is about 2.5 minutes a person, and that is just for speaking, that's not for discussion. So try to be respectful of your counterparts and your colleagues who will need some of their own time to make their presentations and to make their views known. ...[inaudible question from audience]... What we will have is Larry with the microphone -- no podium. Could you have a podium? I don't know, I suppose we could. [Podium was brought out so that speakers from the audience could use it.]

Okay, let me say one other thing, there are note pads (out in the ante room out there) and also some exhibits that I think most of you were able to take a look at (this is really loud is there something we

could do?) Anyway, there are exhibits and some printed materials out there, if you didn't get a chance before the meeting to avail yourself of those resources, by all means do so after the meeting. There are also note pads so that you can prepare written comments, if you would prefer doing it that way, and of course the Department is, I guess, still receiving written comments through normal channels (i.e., to say writing a letter to the address in Washington, DC). All of the comments are given the same weight. There is no particular advantage to giving a written presentation versus an oral presentation. As soon as Mr. Head finishes the overview, we will be taking people who signed up to speak in the order in which you signed up.

I see a question in the back row - Yes:

[someone from the audience, mostly inaudible, asked about taking a vote to see how many people were for and how many were against it].

Apparently that was a good suggestion, that's good. [Vote took place later -- after DOE presentation and Q/A session, but before formal audience presentation.] Would you like me to introduce you now? Okay, without further ado and especially because we are...excuse me? I don't know, those are not part of the Department's, it's the yellow...who is passing them out and who is collecting those? Okay, the gentleman in the red shirt, there.
Okay, without further ado, I'd like to introduce Mr. Charles Head, who is the Program Manager for this project.

Charles Head: Thank you very much, Leslie. Does this thing work better if I hold it a little further from my mouth? [audience: "NO"] Alright....okay, you think it works better further away, alright, I think you're right. Okay, this is an overview of the Environmental Impact Statement on a Proposed Nuclear Nonproliferation Policy concerning the Spent Fuel from Foreign Research Reactors. I'll tell you very briefly, at first, what might happen if we were to decide to accept any of this spent fuel and if it were to come into Tacoma. It would probably come in on a normal commercial container liner, the same as you see coming up the Sound all the time. We are estimating that there might be as many as one cask shipment a month, so in all likelihood, there would be no change in the number of ships coming up the channel, at all. The spent fuel would be loaded inside shipping casks, and the shipping casks would be loaded inside standard ISO containers. The ISO containers would be handled using the same equipment, the same mechanisms, and procedures as are used for any other commodity. There would be radiation surveys conducted on the containers to ensure that the shipping cask is performing as it's supposed to. But, in most aspects, the shipment would be done just as for any other commodity. On receipt in the port, the casks would be off-loaded onto either railcars or onto truck. These particular photographs that I'm showing you were taken during past transportation. Those onto railcars were taken in September of 1994 in a shipment that came into North Carolina. Once the spent fuel was loaded onto the railcars or onto the trucks, they would be taken either to the Idaho National Engineering Laboratory (INEL) or to the Savannah River Site (SRS) in South Carolina. Once they get to those two sites, the spent fuel would either go into wet or dry storage and, possibly, some of it, might be reprocessed. That which was put into wet storage would go into a facility that looks somewhat like this one: This picture was taken at the SRS in South Carolina. This is the Receiving Basin for Off-site Fuels. What you see here, is mostly spent fuel from foreign research reactors that has been accepted by the United States in the past. If it was to be stored dry, it would probably go into a...it could go into a facility that looks like this one: This particular photograph shows dry storage of commercial power reactor spent fuel. The spent fuel is loaded inside a hermetically sealed cylinder and it is then moved into this big concrete blockhouse. This thing is, basically, a concrete garage that you park the cylinder (that contains the spent

fuel) in. That, in a nutshell, is what would be likely to happen if we decide to accept any spent fuel and if it was to come in through Tacoma.

Now, let me explain, very briefly, why we are considering this. This goes back to the days, right after World War II, when everybody thought that nuclear power was going to be the great panacea that was going to help everyone. We were going to be driving around in atomic powered automobiles, flying in atomic powered airplanes, we were each going to have a nuclear power plant in our basement, and electricity was going to be too cheap to meter any more. Most of the countries around the world wanted to get into this act before they were left behind. They didn't want to have to buy their nuclear technology from the United States or from one of the developed countries, they wanted to be able to do it on their own. What we were concerned about was that, if other countries started developing their stand-alone nuclear technology, they would inevitably also develop the capability of making nuclear weapons. So we developed a nonproliferation concept which called for other countries to promise not to develop nuclear weapons if we would promise to help them with peaceful applications of nuclear energy. And the way we helped them with peaceful applications of nuclear energy, one of the major ways, was to help them obtain research reactors and operate those research reactors in their countries. Now, the type of research reactors that we provided them used highly enriched uranium (HEU) for fuel. HEU is weapons-grade material. It could be made into a nuclear weapon if you could take it out of the spent fuel. From the beginning, the way we kept that from happening, was to accept the return of the spent fuel after it was used. In fact, in the early days, we leased the fuel to the other countries and the provisions of the lease required that it be returned to the United States after they were through with it. As time went on and people got more comfortable with the program, those leases were eventually changed into sales, and the provisions that required that the material be returned to the United States were dropped. Nevertheless, the process of having the spent fuel shipped back to the United States continued and went on for about 30 years. Now, as time went on, the United States got more concerned about the proliferation of nuclear weapons, in general, and specifically about this weapons-grade material that was used in research reactors. In 1978, we started a program called the Reduced Enrichment for Research Test Reactors program that was aimed at developing a new type of fuel for the research reactors. By the time we got to 1978, the state-of-the-art was advanced to the point where we could make the fuel for these research reactors out of low-enriched uranium (LEU); that is, uranium that cannot be used directly in nuclear weapons. The United States developed this fuel and then started trying to convince the people (whom we had been supplying with fuel in the past) to stop using HEU and switch over to LEU. That is an expensive process, to convert the reactor. The reactors didn't operate as well on LEU as they did on HEU. Nevertheless, we were able to convince them to start switching over to this less troublesome fuel, but one of the major incentives that we used to get them to switch was that we continued to accept their spent fuel including the LEU spent fuel. This went on until 1987. The policy under which we were accepting this spent fuel was announced in the Federal Register every five years, basically the terms and conditions under which we would accept the spent fuel, and we renewed it routinely on about a 5-year cycle. In 1987, however, the Department decided, that before we renewed it again, we had better do a full environmental review of the actions to make sure that we were in full compliance with environmental laws. We extended the policy for one year to give us time to do the environmental review. However, that review ran into problems and was never completed. As a result, in 1988, the policy for accepting HEU spent fuel from foreign research reactors expired. Now, what we are doing, right now, is finally finishing that environmental review.

The DEIS has several alternatives in it for dealing with this problem, and one of the alternatives that is suggested is to do nothing whatsoever. Leave the spent fuel where it is, tell the research reactor operators that they are on their own, and walk away from the problem. The Department doesn't

recommend that approach. We are very concerned that, if we did, we would rapidly wind up with the situation where the availability of weapons-grade material would escalate around the world. Instead, we are proposing to take action to manage the spent fuel from these foreign research reactors. Now, the type of action that we might take, could vary. One alternative, is to accept and manage the spent fuel in the United States. Another alternative (that a number of people have asked me about tonight) is to deal with it overseas. And the third alternative, the hybrid, is basically a mixture of elements from one or more of these two alternatives. There are a number of lower-level alternatives, as well, that have to be dealt with. We have to determine how much of the spent fuel we are going to look at. The EIS addresses a nominal amount of 22,700 elements of spent fuel, but it also looks at other alternatives. We look at two alternatives that involve less spent fuel and we look at another one that involves all of the spent fuel plus target material. This is another material that is very, very similar to the spent fuel, so we bracket it. We have a nominal approach that we are considering and we bracket it on the high and the low side. Similarly, on the duration of the policy, we are looking at a policy duration that would nominally last for 10 years, but we look at an option on the low side and another option on the high side. We are looking at several options for how you would finance this proposed action. Options for where we would take title to the fuel, options for how we would transport it over the ocean. For ports of entry, we have started with a list of ports that are basically every commercial port in the United States, applied a series of criteria that are specified in the DEIS, and winnowed down that list of 153 ports to a list of 10. What we hope to be able to demonstrate is that acceptance through any one (or all of those 10 ports) is acceptable. We want to keep as many ports available as possible because over the 13 years that the shipments might occur there could be changes in the transportation industry that would cause one port to become much more effective than another one. We basically want to give latitude so that we can get this job done as effectively as possible. We looked at the use of rail and highway for ground transportation. We discussed barge transport, briefly, as well, but basically we expect most of it would go by rail or highway. For storage sites in the DEIS we considered the Savannah River Site, the INEL, Hanford, the Oak Ridge Reservation in Tennessee, and the Nevada Test Site.

Now, since we developed the DEIS, another major document was completed by DOE. It was called the Programmatic SNF&INEL EIS. It addressed the question of how DOE could manage all of the spent fuel that it is responsible for. This includes spent fuel from nuclear submarines, spent fuel from test reactors in the United States, spent fuel from R&D activities that are conducted in the United States, but (to ensure that we have covered the cumulative impacts of all these activities) it also considered what we should do with the foreign research reactor spent fuel, if it was accepted. The conclusion of that EIS was that, if we accepted foreign research reactor spent fuel, it should only go to only two places: All of the aluminum-clad spent fuel should only go to SRS and all of the rest of the foreign research reactor spent nuclear fuel should go to the INEL. So these last three sites are no longer being actively considered as sites to which we might ship foreign research reactor spent nuclear fuel.

We are looking at different storage technologies, basically dry storage technology, but we are considering wet storage, as well. As an alternative to storage, we are considering near-term chemical separation of the spent fuel in the United States and we are considering another alternative that could involve development of a new processing technology: One that would presumably have better environmental characteristics, and better nonproliferation characteristics, than any of the processes used in the United States at this time. This viewgraph shows, quickly, the distribution of ports that we are considering. Six ports on the East Coast and one Gulf Coast and three West Coast. As I said, all of the spent fuel would go to either the Idaho site or to the Savannah River Site. Now, the DEIS does have a number of preliminary conclusions in it. It indicates that (based on our analysis) the environmental consequences of all of the alternatives that I've just discussed a few minutes ago, are small. This is an activity that,

as I said before, we have been doing for over 30 years with no problems of any sort. We didn't run into problems in the past and we don't anticipate any in the future. The highest estimated risk to any member of the general public (living within fifty miles of any of the DOE management sites) from any of the alternatives would be less than 1/2 of an additional latent cancer fatality. This translates to less than one-in-one million chance of developing a latent cancer fatality. Basically, that same risk level applies to workers, as well, and none of the alternatives would significantly contribute to cumulative impacts.

As we finish this EIS, there are a number of decisions that have to be made. Most fundamentally, we have to decide if we are going to do anything at all. Are we going to adopt a policy to manage the foreign research reactor spent nuclear fuel or to take no action? If we decide to take an action, which one of the management alternatives would we take? Would we bring it into the United States? If we do that, what will we do with it? Do we store it, reprocess it? If we manage it overseas, what would we do there? These are all questions that we have to answer as we finish this EIS. Now, in closing, I want to emphasize that this is a DRAFT EIS. There have been no decisions made, at this time, that the United States is going to do anything. Before we would make any decisions, we have to finish the public comment period, consider the public comments and finish the final EIS, which is scheduled for October of this year. Then, we are required to wait for 30 days before we make any decision on the action to be taken. We basically expect that the decision (on what action would come out of this process) will happen shortly before the end of this calendar year. Let's see, these, this schedule, in fact, is old. We have slipped the schedule for about a month since it was made. In fact, the reason we slipped the schedule is that the public comment period was originally planned to run through the month of June. However, in response to a request that came out of Patty Murray's office, the Secretary of Energy is expected to, very shortly, sign an authorization to extend the public comment period through the 20th of July, adding another month to the comment period. Now, that finishes my overview.

At this point, I'd be happy to answer any questions that anybody has or to hear comments. We do have a makeshift portable mike that Larry, who is standing right back there, can walk around to you folks if you'd like to comment from where you are sitting, or if you'd like to come up to either the podium or one of these microphones, you're certainly welcome to do so as well. Larry, could you come down here to this gentleman?

LW: There is going to be some movement here with the podium.

Q: What port is this going to be shipped through, and when will that port be decided?

LW: We are waiting for the sound system to get reinstalled and please bear with us for a few moments.

CRH: Now, we are back on-line. You asked "which port, and when would we know?"

A: There are 10 ports listed in the Draft EIS. What we hope to do is show that any one of these 10 ports could be used. Then it will be up to the shipper who is making all of the arrangements for the transportation to determine which port works best based on the availability of the ships to bring it overseas and truck or rail to carry it over land when the shipment is made.

Q: So, in other words, we have no choice in this matter?

A: That's why we are going through this review process and asking for comments from the public.

Q: How does one affect or influence the decision?

A: If, and there are, 2 levels to answer that question. If some member of the public shows us a technical reason why it shouldn't be done here or why it would cause an unreasonable level of risk. Then that could make us to rule that port out.

Q: Will this be handled with the same level of expertise as at Hanford? If you want technical reasons you have to give us more information than the approximate minute and a half you spent on shipments.

A: Well, this was only intended to be an overview. If you want more detail, there is lots of it in the EIS itself. I don't claim that the way spent fuel has been managed at Hanford is a sterling example of how that process is supposed to be done. The fact is that we don't plan to take any of the spent fuel to Hanford. Where we do anticipate on taking it is to either Idaho or South Carolina where they have been accepting it for several decades. Those facilities happen to be the best that DOE has. The spent fuel that is in storage there is in excellent condition and we expect it to continue those operations at least as well as we have been doing so far.

Q: There are a lot of unanswered questions. The public comment period time...really Senator Patty Murray is to be commended for what she did... How did we come to the conclusion that we were to take the spent fuel from all over the world into Tacoma?.

A: Okay, the process of selecting Tacoma -- we started with a list of every commercial port in the United States. We didn't go to every marina and fishing port, but we did go to all of the big ports that we could identify. We did work with a panel of marine experts from the U.S. Maritime Academy in New York and came up with a series of criteria that would enable us to winnow down the list to a shorter list of ports that would have the types of characteristics that we would like for this type of job. That whole winnowing process is explained in Appendix D of the DEIS.

LW: Can I interject here? I know that there are a lot of you with your hands up, there are also over 50 people that have signed up to give presentations. Let's, if we could, agree on about ten more minutes for specific questions about the presentations or about the EIS. Then, we could move into specific discussions. And, there is some concern about the sound system and I apologize. For those of you who have questions, if you could shout, that would be good. For those of you who have presentations, and who want to, there will be a microphone down here or Larry with the portable mike. There are some hands in the back, I believe, that were some of the first ones, that gentleman, there.

Q: The majority of nuclear waste coming through here are from our allies and there is not much of an amount here. My concern is that you got Germany, and you got France in here and they reap the benefits of this. I don't see why you don't just leave it in place where they're at. I am concerned about places like Romania and places like that. Sure, I can see us getting that out. But, the rest of this...Japan and everything else...that's quite a bit that they want to bring in. They get the benefits of what we gave them for technology. We got our own problems, too. So I don't have any problems with leaving it where it's at.

A: Okay, there are a couple of reasons that we are considering accepting spent fuel from our wealthy allies. One of them is that those countries, several of them, manufacture and export research reactors and (if we don't accept spent fuel from them) they are probably going to switch their domestic reactors back to the use of HEU and then when they go about selling research reactors to other countries in the world, largely third world countries, they will be very likely to end up selling research reactors that operate on HEU which would wind up with having a demand for HEU in exactly the kind of countries that you are concerned about. Another problem is, we are not the only country in the world who started a process like this. The Soviet Union (back when there was a Soviet Union) did the same thing and so did the Chinese, in both cases, with their client states. The United States, right now, is in the middle of trying to convince both the Russians and the Chinese that they need to work with their client states to get them to stop using nuclear weapons material as fuel in their research reactors. If we take steps that cause our allies, no matter how rich they are, no matter how stable they are, to switch back to the HEU, we are not going to have a ghost of a chance of getting the Russians or Chinese to twist their allies arms to stop using weapons-grade material.

Q: Whatever happened to world-wide citizens' responsibility? These people are responsible for what they do in their countries. Why should we be the only ones responsible for the whole world? We're not. We have some responsibility for our own country.

A: That's a valid point of view. I would hope that we could get them to.

LW: Lady in the pink.

Q: I'd like to know the technicality of why Seattle was not selected and what the difference was between the population of Seattle and Tacoma and the impacts if there was an accident on the Columbia River.

A: It is, in fact, a very, very, fine line between the use of Seattle and Tacoma. In the Defense Authorization Act, for fiscal year 1994, Congress inserted a rider that told us to use to the greatest extent practicable ports that would expose this action to the lowest number of population. That particular phrase was not very explicit and we had to do some figuring to try to find out how to apply it. What we wound up doing, was to do an analysis of the populations of both the potential port cities, and the populations along the transportation routes, for both the rail lines and the truck lines. What we found was that there was a very slight difference between the potential population exposed between Tacoma and Seattle, but made Tacoma a more desirable port.

Q: You are worried about accidents, right? You have to come up with the least number, so you are worried about accidents, right?

A: We were concerned with complying with Congress' direction.

LW: Let's do it in order. There is a white sleeve that I see in the back there, a red short sleeve after that.

Q: If one of the storage facilities in South Carolina, why not send it directly there using a more direct route (east coast)?

A: Okay, a large portion of the spent fuel if we decide to accept it at all, we'd probably do exactly what you are suggesting. Remember, that the decision has been to put the aluminum-clad spent fuel at the SRS and the other types of spent fuel that are just physically different, out in Idaho. The aluminum-clad spent fuel from Europe and Western Africa and the Eastern part of South America probably would go in through the East Coast. The non-aluminum-clad spent fuel from Europe would probably go into the East Coast and be trucked across the United States to Idaho. The spent fuel from the Pacific Rim countries, if it was going on its way to Idaho, would probably come in through West Coast ports. If it was on its way to the SRS, it might well go through the Panama Canal and in through an East Coast Port.

Q: If we're concerned about not letting unfriendly people get a hold of this fuel, why don't we ship it through military ports, where they already have security trained in this. Why are we shipping it through a public port?

A: Okay, fair question! What you've got to recognize is that there is a world of difference between HEU that's trapped inside a spent fuel element and that which has been somehow extracted. If we leave the spent fuel overseas, in other countries where the governments in fact want to develop nuclear weapons or are willing to look the other way as a terrorist organization does it, if we leave it in a situation where organizations have the financial backing of a country and time to do it, you can extract HEU from spent fuel and manufacture it into a weapon. But, you have to have a lot of time and a lot of money and a very sophisticated chemical processing capability to do that. Now, when you are shipping the spent fuel....on the other hand, this weapons material is an integral part of the spent fuel element along with the highly radioactive fission products that are still in there as well. The net result of all this is that it is not a very attractive thing for somebody to try to steal during transportation. It also is inside of a shipping cask that probably weighs a minimum of 25 tons, probably more. If you're trying to make a quick get-away, its not very conducive to being able to move quickly.

Q: If it's not desirable to take it when it is contained while being shipped, why can't we contain it and leave it where it is? If it would be a costly, expensive quick get-away thing, why move it? Why can't we just spend our resources containing it there instead of shipping it? We just had 2 derailments of trains this last weekend. What's going to happen when they go?

A: Well, we could try to build much, much better, more secure, storage facilities at around the 100 reactors around the world. The problem with doing that is that all it takes is a change in government, like we had in Iran for example, and all of the sudden that spent fuel, even though its in the most secure storage facilities that we could possibly provide them, the government can decide to take it out of that storage facility and give it to their weapons production program. You have no assurance that it will stay in that storage facility.

Q: So, then I'm sorry to keep asking the same question, but are you saying that we don't have to have any special training or security to have this stuff come into our ports? The military would not be better equipped for doing this? We're already paying them.

A: The military would not be any better equipped to do this shipment than a standard commercial port.

Q: Then what is going to happen when the U.S. Government decides to phase-out DOE, where will we be then?

A: You'd be in somewhat the same situation as you were with those programs that were in the Atomic Energy Commission before ERDA [the Energy Research and Development Administration] was developed and with those programs that were under ERDA before DOE was developed. The spent fuel is still going to be there, and if Congress decides to do away with DOE, it will have to establish some other agency to pick up the program.

LW: Excuse me, but there are some hands up on the other side, and unless you decide that you don't want the presentations from the 50-some people coming up, we only have a few minutes left for questions. So those who have already signed up can ask your questions. The gentleman in the blue shirt.

Q: If the U.S. accepts the fuel, will the transportation be overseen by DOE or will it be done by private contractors?

A: The transportation will be subject to regulation by the Department of Transportation, by the Nuclear Regulatory Commission and, for those parts of it that are overseas or in international waters, by the International Atomic Energy Agency. The transportation would actually be done by private contractors, the same way almost all DOE activities are done here in the United States. There are not enough DOE Federal employees to actually do it. But, it would be subject to Federal oversight.

Q: Do these people still have oversight of spent fuel?

A: They've been overseeing spent fuel transportation for a number of years, both DOE spent fuel transportation and some done in the commercial sector.

Q: Overseas shipments?

A: In the overseas shipments...there have been overseas shipments, yes, it goes on.

LW: Gentleman in the green hat.

Q: No matter where you go, you're going to have people speaking against nuclear waste. How much does public opinion really mean if you decide that you are going to put nuclear waste here? I mean how much does it really mean? No matter where you go, you will find people speaking out against it. There are just as many people here speaking out against it in Seattle as there are in Savannah, Georgia or anywhere. How much assurance do we have that there won't be any leakage or damage?

A: Okay. You might be interested to know that, everywhere we go, we don't hear this. Interestingly enough, there have been...[audience: "go THERE, go THERE"] but then, what is the impact of meeting like this? As I've pointed out a minute ago, if someone points out to us a technical error that's been made or a technical point that has been overlooked, we absolutely have to address it. But, when it comes to the policy questions of whether we should be doing

this program or not, the Department is doing this because we've have been told to by the Administration.

LW: The gentleman in the white sleeve, in the back row.

Q: I'd like to point out a technical error. First of all, would you agree with me that an EIS is more or less conceptual in nature?

A: Not necessarily. Programmatic Environmental Impact Statements are very broad, but project-specific Environmental Impact Statements are much more specific.

Q: Do you have a personal bond since you've been working at this just in case you are wrong?

A: Well, I don't have a personal bond, but the U.S. government does have one. It's called the Price Anderson Act.

Q: You're talking about our taxes. But, I believe that when you're talking about something of this magnitude, I'd like to point out that you're putting us in jeopardy and I believe that whatever responsibility or claim you have or whoever is responsible for doing this should have liability. I don't know if you would be able to continue doing what you're doing if you had to sign a piece of paper waiving all your rights under legislative statutes and be subject to liability. I feel that any corporation or company or individual or department or anybody who would bring all the problems without being personally responsible...because you are the ones who would have to pick up the liability. I'd like to say yes, go right ahead with this, but I don't want you to go ahead with it when you're going to have people...unprotected and I think that unless you're willing to waive all your rights, along with your kids' inheritance and your grandkids' inheritance, have a nice day.

LW: Let's take a couple more. There is a gentleman in the back.

Q: My question to you, sir, is let's assume that there is an accident, and people are killed, who is going to apologize for it - YOU?

A: You would be getting apologies from DOE and the research reactor operators as well, I'm sure.

Audience Comment: "A lot of help that's going to do when there are people that are going to die because of that."

LW: Gentleman in the front row, with your hand up.

Q: I see no physical risk in the transportation of this material assuming these casks are sealed properly. Your chance of physical injury liability are approximately zero. However, what I see (and what has been my complaint about all along) is that the Port of Tacoma is in competition with every other major port on the West Coast. We have a number of Asiatic states including Japan, who are highly sensitive about the word "nuclear" even though they are (themselves) in the nuclear trade. We have a lot of companies in this country that we are trying to promote to use the Port of Tacoma. They hear the word 'nuclear' and they are out of here. This is an

economic issue. It's not a technical issue. And just as a point on the basis, I don't think that a nonproliferation treaty will stop any sovereign state that decides it must (for its own national reasons) need nuclear weapons. It won't slow them down more than a year anyway. No terrorist group is going to use spent nuclear fuel for a nuclear bomb. Any nation's state (if it decides that it must have one) if they have to go back to ground zero (like we did in the 1940's) they will.

LW: According to my watch, it is 7:30 or thereabouts. What I'd like to do is move into the presentations now and the comments that people have signed-up to make. We have a couple of ways to do that. There is a microphone at the podium which is not particularly convenient to anyone. We also have microphones up here and we have Larry with the portable mike. I apologize to you TV people, but this is the sound system that we have to work with. The first person who signed up is Sharon Metcalf, is she here? I have something like 55 people altogether.

If we could do one thing before that, because I feel that it is appropriate to do it now, there was a request earlier for a vote. Could the gentleman who requested it tell us what it is all about? [a member of the audience responded, but it is inaudible on tape.] Facilitator rephrased as follows: the gentleman asked that the audience vote on 1) how many people are in favor of spent nuclear fuel coming in through Tacoma and 2) how many are against spent nuclear fuel coming in through Tacoma. He would like to have a 2-part question: First, should we bring it into this country at all (Yes or No)? and, second, if it is 'Yes' should it come through Tacoma?

All those in favor of bringing it into the U.S. at all, please signify by raising your hand.

Those opposed to bringing it into the U.S. at all...[audience raised hands]...should we count?.

CH: I think we could say that the overwhelming majority said "no".

LW: So then, do we need to do the 2nd part?

Those in favor of bringing it through the port of Tacoma signify by raising your hands. [Audience raised hands.]

Those opposed to bringing it through the port of Tacoma? [Audience raised hands.] Unanimous. Thank You.

PRESENTATIONS:

Sharon Metcalf: I'm only first because I'm the only person who called the "800" number. If you want to sign up in the future, you should remember that little secret.

My name is Sharon Metcalf, I'm an Assistant City Attorney for the City of Seattle and representing Seattle this evening. I was asked by the City Council to come and convey to DOE the strong opposition of the City to the proposed action in so far as it would affect the people and resources in the entire Puget Sound Area. Of course, on behalf of the narrower interest of the citizens of the City limits of Seattle, we are gratified that the Port of Seattle is no longer on the proposed list of ports. But, our concerns apply equally to the City of Tacoma and the inappropriateness of using that port for receipt of these materials. We understand that it is still contemplated, also, that after the materials are brought in and unloaded in Tacoma, that they would be shipped through Seattle by truck or rail and this is certainly

unacceptable. As you know, the Seattle City Council has passed a series of resolutions stating its clear and unequivocal opposition to DOE's proposals to transport such intrinsically dangerous material through heavily populated areas of the country, including any Puget Sound Port. The City's concerns, expressed previously, have focused on the risks of shipboard fires, which we do not feel have been adequately analyzed in the EISs, and on transportation related accidents. We have a very highly congested transportation corridor. We know that we do not in any of our communities have adequate emergency response capability to deal with the problems that might arise from the type of accidents that would be associated with transport of radioactive materials. Seattle appreciates the opportunity to express its views. We earnestly ask that you reconsider this proposal. The statistical probabilities of the various eventualities discussed in the EIS may seem very low, but the consequences could be catastrophic. We do not believe that it is necessary, or appropriate, to expose the citizens of Puget Sound to those risks.

LW: The next speaker is Shirley Lantz. [the audience asks that the speakers be lined up behind the podium]. Shirley Lantz, Philip Keightley, Larry Brosman, Doug Wood, and Dr. Rens Verberg. So, I guess that you all are going to use the podium, that makes the TV people happy.

Comment: Something to hide behind.

Shirley Lantz: I want you to see what I think about this plan.

LW: Let the record show that it is a Mickey Mouse Tee-Shirt!

Shirley Lantz: This isn't going to be long. I just want to express that I am a citizen of Tacoma. I have neighbors here that I have told this waste problem to and I had not heard about it until about a month ago. Then I became frantic. By Thursday, I had received nothing in the mail pertaining to this. As a voter, I'm just wondering how many of you voters received information without having to look at the paper or watch TV? May I have a show of hands? ...Nothing, right? A flyer showing you as a taxpayer what was taking place? What form was it? [audience member: the Neighborhood Council] That's what I received -- one of these yellow forms, right? And, Pat O'Malley of the Port Commission said that he'd sent these out to as many people as possible. Only 3 here, counting me, have received it. Addressed to myself, not my husband and myself, or my neighbors, or anybody, just us. So why are they keeping it so secret? What is the problem? I understand that there were 30 at the first meeting, and 30 represented at the second meeting. These were all at the Sea/Tac airport. I'm proposing that you have more meetings if you want, that this has been illegal, that there has been very little representation to us from our politicians. I want to know what our Governor thinks about it. I want to know what Norm Dicks thinks about it. I haven't a word, and I want to know what Slade Gorton is doing about it. I end my case. I went to the grocery store and, for 72 cents, I got a bag of chopped liver. This is what I feel like right now. I end my case. Thank you.

Philip Keightley: I am Philip Keightley, Assistant City Manager, with the City of Federal Way. Mayor Gates apologizes for not being able to make this presentation, herself. She has asked me to put into the public record a unanimously passed motion by the City Council on June 6th on behalf of the citizens of Federal Way.

The resolution, and I'll just do excerpts out of it for interests of time: Resolution 95205, a resolution of the City Council of the citizens of the City of Federal Way, WA, opposing the shipment of spent nuclear materials through the Port of Tacoma. Whereas, the DEIS is inadequate in several respects, including that it fails to adequately address security issues at the port and in transit. It fails to adequately

identify emergency response in the event of a catastrophic mishap, and it fails to adequately address the socioeconomic impacts associated with the stigma of being within the proximity of a port of entry of spent nuclear waste. Whereas, the City of Federal Way is a major municipality of 73,500 persons located only one mile from the Port of Tacoma. Now, therefore, the City Council of the City of Federal Way hereby resolves as follows: Statement in opposition. The City of Federal Way City Council strongly opposes the shipment of spent nuclear materials through the Port of Tacoma and encourages the Department of Energy to choose a more suitable site to receive these materials. This is resolved by the City Council on June 6th. The City has also sent to DOE a letter that summarizes the EIS items that do not meet the environmental impact adequately.

I will give a copy of this resolution to you and the letters. Thank you very much.

Larry Brosman: My name is Larry Brosman and I am a resident of the city of Renton. It is pleasing to know that not just Tacoma residents feel the impacts of this possible action. We in Renton...the Seattle Attorney was here -- we're very concerned about this throughout the Puget Sound area. And that's as it should be because we're a community here. We're just not one city or two cities; we're a whole community. One thing, that I would like to address, is that DOE's recommendations don't really talk about Management Alternative 2 which says: "Do it abroad". Forty-one countries produce this nuclear waste, and one country is being seen as the depository of the nuclear waste. It just does not seem fair to me. Also, the belief that the U.S. managing nuclear waste will prevent nuclear proliferation, I think, is a vain belief. Nuclear proliferation will happen anyway. We have tried in the past to be the world's policeman with guns, and bombs, and things like that, and that hasn't worked too well. And now, we are trying to prevent nuclear proliferation by storing all the decaying nuclear fuel here. I don't think that will work either. There are three negative impacts, I think, that say: "Don't do this at all". First of all, the possibility of an accident. I'm not in shipping, but I respect shippers. Nonetheless, there have been accidents in Puget Sound with oil and that sort of thing. Well, an oil spill is hard to clean up. It has a negative impact on life, and on birds, and things like that, but the half-life of uranium is strongly greater and much longer than it would take to clean up than an oil spill. Secondly, the economic burden of transport and storage seems to be placed primarily on the United States in the DOE's alternative. That's not fair, either. Our nation's pockets only go so deep and those pockets shouldn't pay this bill. Thirdly, the perception of how Tacoma is seen is important to me. Mt. Rainier is a beautiful national and natural historic site. People come here to vacation because they love to see Mt. Rainier, they love to be around Tacoma. Well, let's go to Tacoma, let's go watch some nuclear waste being stored. Can you imagine? I mean, Tacoma is a nice town, now. But, if we allow nuclear waste to go in and out all the time, how will its value be affected? Well, thank you for your time.

LW: Excuse me, I need to be doing a mike check. Am I on? Am I not on? Let me alert a few more speakers: Monte Keller, Paul Miller, Maggie Kelly, Nadori Okazaki, and Michael Isensee.

Doug Wood: My name is Doug Wood, I'm the president of a company that does deep water research on pressure. I'm here because I had a nuclear nightmare last night and I came down here to find out what's going on. DOE is lying to Tacoma. They have a flaw in their casks. Those casks can't take deep water pressure. If a ship sinks, those casks will buckle. They are designed for 50 feet of water. Puget Sound has 500-700 feet of water, it is much deeper in the ocean. These casks are not safe for ships. I want that in the record.

Rens Verburg: Good Evening, My name is Rens Verburg. I'm the co-chair of the Environmental Commission of the City of Tacoma and we have prepared a statement. In light of the time constraints, I'll just read the most salient paragraphs of that:

The Tacoma Environmental Commission has reviewed the U.S. DOE's proposed policy to manage spent fuel from foreign research reactors and the accompanying environmental analysis. The Commission raises the following environmental concerns which have not been adequately addressed: Number 1, information about the Port of Tacoma -- it's terminals, it's operations, and the surrounding area contained in the environmental analysis -- is outdated and does not accurately reflect current conditions. The deep water depth of Puget Sound, as mentioned by the previous speaker, would cause substantial problems in the recovery of nuclear fuel shipping containers in the case of an accident. An explosion or fire on board a vessel navigating Puget Sound would pose considerable harm to the surrounding populations and environment. Commencement Bay is currently designated a Federal Superfund site. Considerable cleanup has already been undertaken by the Port of Tacoma, the City, and the industries of Commencement Bay to address contamination issues. The Port of Tacoma is in close proximity to residential neighborhoods despite what DOE may think in that regard. Operational procedures regarding handling of the shipments are inadequate. Permanent disposal of the spent nuclear fuel has not been determined and the security aspects of the shipments have not been addressed. The citizens of Tacoma have determined to live in a clean environment and have undertaken to restore to the City the highest standards of clean air, clean water, and clean land. High-level radioactive waste presents a threat of the most catastrophic injury to Tacoma residents. The potential release of radiation from high-level radioactive waste presents an unacceptable risk. Therefore, the Tacoma Environmental Commission strongly opposes the introduction, storage, or shipment of high-level radioactive waste through Tacoma's port, rail lines, or highways. And we further urge DOE to remove Tacoma as a possible United States entry site for these shipments.

Thank you. [applause]

Monty Keller: My name is Monty Keller, and I must admit that I came here tonight and found that I was very ignorant to the issues of nuclear waste. However, I came here tonight to represent my children. I don't want my child to become a statistic, or to be the one, or the first man to die. I believe our kids are very good technical reasons not to have nuclear waste come through the Port of Tacoma.

Paul Miller: Thank you. Paul Miller, Tacoma City Council. The Tacoma City Council has recently adopted a Resolution standing in opposition to the selection of the Port of Tacoma as a transhipment site. Many of my Council colleges are here tonight and I will allow them to speak to that issue. I want to speak, first of all, to the short-sighted attitude that DOE seems to be expressing. You talked about the naivete with which we approached nuclear waste and nuclear reactors in 1958. Yet, I believe that we are taking that same short-sighted approach to waste shipments, and the acceptance of waste shipments, in this proposal. We are taking on the liability under the guise of being the policemen for the world. We are taking on the liability, not for the next 10 or 20 years for these countries, but for the next 1,000 or 10,0000 years. Not only affecting my children or grandchildren, but generations beyond generations. I think that the DEIS has skirted the issue of Alternative Number 2. I encourage you to go back and in greater depth analyze the opportunity for equal investment in placement of secure facilities within the country of origin for the nuclear waste. I don't buy that France, or England, or Japan are in any greater risk of economic, or social, or governmental overturn than the United States is.

Speaking specifically to the DEIS and the shortcomings, there is a written document that has been forwarded on to DOE from the City of Tacoma. Specifically, the DEIS contains many errors with regard to the Port of Tacoma. In particular, it lists a single terminal in the Port versus the six container terminals that currently exist. The map displayed within the Port of Tacoma is incorrect and shows a configuration that is over fifteen years old. It does not show the on-dock rail configurations that exist

within the Port and leads the City of Tacoma to believe that the same errors and the same lack of thoroughness with which DOE has investigated and identified, the configuration and layout of the Port of Tacoma, has to carry forward to the configuration of the population centers and the impacts in the surrounding area. Secondly, as stated previously, DOE has, in its own document, indicated the difficulty or near impossibility of recovering fuel casks from depths greater than 200 meters and indicates that those depths only exist in the ocean. Whereas, simple investigation of the Puget Sound would identify numerous sites within the Puget Sound area, in the shipping channels leading to the Port of Tacoma, that exceed the stated 200 meter depth. Commencement Bay and the Port of Tacoma are located in a Federally designated Superfund site. Over 200 million dollars have been spent, or will be spent, in the cleanup of past contamination within the Port of Tacoma and Commencement Bay. We are endeavoring to remove the stigma, the economic stigma, that has existed on Tacoma because of past excesses, of not only industry, but Government, in the waste handling within this nation. We do not need to carry that process forward. DOE did not properly evaluate or determine the impact of a severe fire or explosion of a shipping cask which would cause severe damage and have long-term effects on a large area near the disaster site. Both within the Port of Tacoma and the economic impacts that would occur based on that damage, but also within the Puget Sound area, is an enclosed ecosystem which has very little flushing action within it to resolve any long-term impacts.

I would add that, onto your presentation tonight, your presentation in the back room, you talk in terms of the percentage of this shipment in comparison to all radioactive materials. I think that it is an oversimplification and an attempt to cloud the issue to include medical waste within your presentations. Clearly, we are talking something absolutely different than the material waste left over from an x-ray at a hospital than what we are talking about in these type of shipments. Secondarily, you talk, in terms of the DEIS, the potential risk of death or fatality when, in reality, the dangers go far beyond mere fatalities to health problems, and property damage, and economic loss; and those issues need to be addressed in DEIS.

The DEIS does not adequately address security requirements nor the training for port facilities and the basis of security around these shipments. I have to believe that if our concern is the potential for these materials to fall into the hands of individuals, or countries that can make use of them and pose a security risk to the United States, that the farther we ship these, the greater opportunity we provide for those materials to fall into the wrong hands, and that the closer we can contain them, and store them, and secure them to their original site, the less risk we have of that opportunity. Clearly, DOE did not properly address first response capability. It is put on the onus of the fire departments, the State, and the localities within the shipment area to have first response. There is no provision made in the DEIS for upgrading or training of the local first response team. Secondarily, it is on the onus of the City of Tacoma, the Port of Tacoma, Pierce County, and the State of Washington to have financial responsibility for that first response. And your own documents only say that, if and when it is determined by DOE that it is necessary to respond, you will respond. DOE did not analyze the effects of an accident classified as a disaster on the local area or the population. DOE did not address effects and cost incurred in a local area should a local accident occur. And, DOE fully ignored fairness and equity issues by selecting smaller ports. Lastly, I would like to indicate that I think that DOE, if you get beyond the first issue, of which I believe Alternative 2 is a more appropriate issue to be studied, and that is leaving the materials where they are generated. But, if you get beyond that to selecting an entry port, I believe that it's absolutely wrong for DOE to take the approach of isolating down to only commercial ports for entry. Clearly, we have military bases that are structured and set up, not for just security purposes, but already handle radioactive materials; Trident being one of those, where materials can come in through a port where radioactive material is handled on a regular basis, where security measures are in place, and where

the personnel are already trained in not only the handling, but in the safe and secure methodology of transportation of highly radioactive material. I resent, I resent, the U.S. government presuming that a population base of Tacoma is small enough to impose such a high risk on, and to pass on, the cost liabilities. [applause]

Maggie Kelly: A few years ago, a thief broke into my house. An alert neighbor called the police and, fortunately, he was unable to get away with anything. But in the meantime, he had gone through my personal possessions and he had strewn my lingerie and private items all over the house. As you can well imagine, I felt violated.

Mr. Head, local dignitaries, fellow citizens of Tacoma, my name is Maggie Kelly, and I'm here as a private citizen, to tell you that my sense of privacy and citizenry in this great city have been violated in the same way that a thief violated my home. I'm here to say also, that I am insulted. Now, I'm sorry that may sound like strong language for someone to come this distance and give us a presentation, but I am insulted because this presentation was supposed to be about Tacoma being the port of entry. Not about the wet and dry storage facilities, not about the differences between high octane and low octane fuel. No, we were to be talking, strictly, about the Port of Tacoma as the port of entry. And, the fact that it was assumed, I don't know, is it because we don't have enough people in Tacoma? Is that why we're supposed to sit and listen to this and take this as some real information? I'm not sure. I am insulted. I am insulted when someone comes to me and says, and I quote: "You have to demonstrate to us a technical reason". Ladies and gentlemen, Mr. Head, Department of Energy, I don't need one of your goddamn technical reasons. We've got PEOPLE reasons! [applause] Ladies and gentlemen, there is something very skewed about a government's reasoning that blackmails its own people in order to control other countries. [applause] There is something wrong with that kind of thinking. Tacoma does not need to be a port of entry to prove that Tacoma is already a global community. Let's look with pride at what Tacoma already does as a global community. Let's look at pride to the people. Let us be the port of entry for people, not for nuclear waste. Let us look with pride to the amount of medical aid, to the assistance that we have sent to peoples of other countries. We do not need to demonstrate any part of a global community by being a port of entry for somebody else's nuclear waste.

Finally, I have one invitation to any person who suggests that the risk is so small we don't have to worry about it. And, here is my suggestion: We don't need the wet and dry storage places. Just everyone of you people who think that it is so safe, you just take a vat of this and put it in your back yard! [applause]

LW: While our next speaker is coming, and for the "on deck" circle: Gerald Pollet, Linda Cunio, Alice Orchal, Kelly Golden, and Martin Sutherland.

Midori Okazaki: Hi, my name is Midori Okazaki and I'm from Senator Patty Murray's office. I'll just be very brief tonight since I know that a lot of you want to talk. I don't know if applause is for being brief, but anyway.

First of all, I want to thank DOE for responding to the Senator's earlier concerns that she had raised about lack of opportunity for input and access to information, and they responded by having this hearing here tonight, so I want thank you for that. Then, I want to thank everybody for coming here tonight and showing that this hearing was necessary and that there is a lot of concern in this community.

Despite your earlier actions in responding to our first concern, we still remain concerned over the possibility of the importation of spent nuclear fuel through Tacoma. There are numerous public health

and safety concerns that we think present a compelling case for DOE to preclude any further consideration of any commercial port, including Tacoma, as a port of entry. And, these concerns were addressed more fully in a letter that was sent to the Secretary of DOE by Senator Murray, Representative Dicks, and Representative McDermott. The Senator hopes that DOE would limit its focus to military ports, either those currently ID'd in the DEIS or any other appropriate military port. Thank you for coming again, tonight, and we hope that you will consider these and other comments. I'm sure you will hear a lot tonight. Thank you. [applause]

Mike Isensee: Hello, I'm Mike Isensee and I'm here tonight representing Citizens for a Healthy Bay. We're a Tacoma-based environmental non-profit organization that works the clean-up, restoration, and stewardship of Commencement Bay and its surrounding watersheds. I'm here tonight, speaking on behalf of my Board of Directors who voted unanimously to oppose the shipment of spent nuclear fuel through the Port of Tacoma. We do so knowing full well, at its face, that it is sort of a "not in my back yard" attitude and we don't believe that is an appropriate response to these issues. So we did look at what we thought were the appropriate alternatives to this issue, and I want to speak briefly to those tonight.

We believe that DOE and the State Department gave inadequate attention to Alternative No. 2 that is in their DEIS. In the EIS, only two pages, actually less than two pages, of space were given to this alternative. The Alternative No. 2 actually is two alternatives that could be looked at. First, is the storage of spent nuclear fuel at the nuclear facility where it has been used. We believe that this alternative should be looked at and that there are quite likely means of ensuring through international compliance and other means that it would be as safely stored at such a location as by shipping it through the Port of Tacoma or other U.S. ports for storage here. Secondly, is the potential to reprocess the HEU to become LEU at processors internationally. Unfortunately, the United States doesn't have any such facility. We don't reprocess this fuel, we just store it permanently. But, there are facilities, at least three of them internationally, that can reprocess this fuel to become LEU and, as Mr. Head spoke to earlier, as LEU, this material could not be utilized as nuclear weapons-grade material, thus satisfying the nonproliferation goals.

However, realizing that DOE might not listen to Citizens for a Healthy Bay and those of us in Tacoma, we also want to speak to some of the issues regarding if this material is shipped to the United States. We believe that it should be shipped on military vessels and only to military ports of entry where people are trained at handling these materials -- to such ports that were included in the EIS as such ports that were capable of handling these materials. And at an earlier public hearing last month, it was stated that the only reason that these ports weren't chosen was that it would increase the cost of the shipments. In addition to being secure port locations, these are typically located at much greater distances from population centers. This is borne out in the DEIS. They do not face the stigma, that we here in Tacoma do, of having a Superfund site -- being our bay. In addition, they don't face the possible interference of regular, commercial traffic and, thus, would limit the economic problems facing those areas that the shipments may come through. Whatever port this material comes through, Citizens for a Healthy Bay believe that the U.S. government must, at a minimum, provide several things: First, initial and ongoing training and education to port employees or military personnel and to local emergency response personnel. In the DEIS, there is no mention of providing this. It would be left up to the local governments to pay for this, for us locally to pay for this, when it is actually a national issue and all taxpayers, through the Federal government, should pay. The U.S. government should provide any response materials necessary in the case of an accident. Radiation monitoring should occur for dockside workers and for the environment. And, funds to carry out public education, training, and all emergency response capabilities to the port or ports of entry and surrounding communities, need to be provided.

In addition, at this time, we think that the DEIS is inadequate in responding to the potential of a catastrophic fire or explosion that involves one of the ships or trucks involved in the transport of this material and what the risks of such an event would be.

I appreciate those people, especially at the port and the city of Tacoma, that worked for this final public hearing. This was not a DOE scheduled public hearing. It was only because members of the local community stood up and said: "We need to have adequate public notice and a public meeting where you, the residents of Tacoma, can come and hear about this and speak about it". I want to thank you all for coming tonight. [applause]

Gerald Pollet: My name is Gerald Pollet and I am representing the citizens group, Heart of America Northwest, here tonight which, on behalf of our 16,000 members, we've have been fighting this fight against DOE's stupidity for about a decade and it seems to keep coming back.

There is one thing all of us in this room need to think about tonight about this proposal. Someone's already talked about it. It's our children, it's our children. Do you want your child to be stuck in traffic next to a high-level nuclear waste cask? A gentleman earlier said: "Well, there's no technical problems with this," and it's the only time that Mr. Head didn't respond. You can lie by failing to respond as well as by offering responses. If our children are stuck in traffic next to one of these high level nuclear waste casks, the EIS admits that our child, my daughter, your sons, your daughters, can get up to five full body x-rays from these shipments and not one iota of medical benefit. DOE uses its own self-regulatory standard for how much radiation you and I and our children can be exposed to in this process. It is not the same standard that the U.S. Nuclear Regulatory Commission (NRC) and the U.S. Environmental Protection Agency (EPA) have for exposure of the public in a year. I have to get technical for a minute because Mr. Head said that: "I'm not going to listen to your complaints as citizens petitioning your government. I'll only listen to a technical rationale". Okay. DOE uses a standard that is four times the EPA and NRC standard for exposure to radiation in a year. That's why they can release so much radiation from their sites like Hanford. It's their history of self-regulation. The NRC and EPA have a standard that allows you to receive 25 millirem of radiation in a year. Maybe, write that down -- '25', okay? Now that level of radiation will cause, and here's why it is set, what the government says is an acceptable fatal cancer risk of one additional fatal cancer per 10,000 adults exposed to 25 millirems. Yes, I said adults, not our children. That's one fatal cancer for every 10,000 people exposed to 25 millirem. The EIS admits, that it is, quote, conceivable that you could get up to 50 millirem stuck in traffic next to this. That's twice an allowable rate. But, it gets worse for other members of our community. Far, far, worse and more frightening. And, I quote Mr. Head. Mr. Head says: "The environmental consequences of all the alternatives are small." I'll tell you what is small. My child is small. Our children need to be protected from someone who would play games with numbers. The way this EIS is written is the people who are going to be exposed to the doses of radiation that are conceivable are never addressed. Instead, they average the dose over the entire population and say "less than one in-a-million chance". Well, maybe if it is the average person in Tacoma and you play spent nuclear fuel roulette it is less than one in a million chance. But, if you're the parent of a child stuck in traffic next to one of these shipments, it is not less than one-in-a-million. In fact, it is a couple of times in 10,000 all of a sudden, which becomes fairly frightening in a year. There is an even more frightening point to this. Our neighbors, our brothers and sisters who work in the ports, are going to be exposed to levels of radiation that reach, basically, the equivalent of 10 millirems per hour, six feet away from the cask. Now, there is no mention of the radiation exposure to the longshore workers in this EIS. The EIS has a tremendous, and I would guess deliberate, mathematical error - set of mathematical errors - and it underestimates the radiation dose from unloading the cask by over 23 percent, and it underestimates the

radiation dose to the ship's crews, who are members of the public, by 27 percent. DOE, basically, will expose, potentially, the ships crew -- remember I said that 25 millirems is the allowable exposure. Recalculating using their own methodology, correcting their math errors, the ships crew can get up to 760 millirem which is 3,040 percent of the allowable annual radiation dose for the general public. That is a lot of radiation dose! How do we get that figure? Well, number one, without going through the math here, DOE says that, unloading a cask, the maximum exposed individual gets 9 millirem of radiation. They assume an average of 5.5 meters away from the cask. Any high school student, though, can calculate that at 5.5 meters for an hour, the average radiation dose should be over 11 millirems, not 9. That seemingly small error adds up and adds up, and it's important because the DOE has its own self-regulatory standard and says in the EIS: "Hey, someone unloading a ship once will not be in danger of exceeding our own self-regulatory standard for radiation exposure." They will be at 66 percent of our own self-regulatory standard, they say. Ah, but they will be at 2.5 times of what the public is supposed receive in a year. And, they'll be at far more multiples of that if they unload shipments more than once in a year. Now, there is no rational basis for assuming that someone is going to be 5.5 meters away from the cask, actually. It's an irrational assumption used to lower the figures. In fact, if you play with the figure and someone happens to walk a little closer to the cask for a little while -- let's say 40 minutes at 10 meters away, giving you the benefit of the doubt that they are further away for two-thirds of the time -- but, if they spent 20 minutes 2 meters away, 6 feet away from the cask, all of the sudden their radiation exposure goes up in an hour by 33 percent. This is how you can use statistics to try to say "there is no significant environmental impact, and ignore our children."

There are other errors throughout this EIS that impact our health and safety. First off, the risk of a fire on inland waters is not adequately considered, whatsoever. Puget Sound is inland waters. The calculations in the materials that we've handed out to people, and which we've submitted before, show that the radiation exposure risk from a potential shipboard fire, using DOE's and the NRC's own analysis of how much radiation can be released in a shipboard fire exceeding 1,475 degrees for 30 minutes -- it's all they are required to meet for their cask. We have shipboard fires that exceed 2,000 degrees -- heating up the hull to 2,000 degrees for 24 hours in Puget Sound, and I read from a consultant's report: "The results show serious contamination plumes extending over 60 miles downwind from a ship accident encompassing an area up to 900 square miles. The contamination levels are high enough to require evacuation and decontamination for areas of up to one mile downwind from a ship accident. The gamma radiation dose would be lethal to any person who remained in the contaminated area for one year." Yes, we all have something to worry about.

We have some choices. First off, we need to thank the Port of Tacoma, the City of Tacoma, Senator Murray for fighting to get us this hearing. But, we can't stop. We've got to go and ask the local governments to tell DOE, in no uncertain terms, we will take you to court for these violations. Let them know it, now, by Resolution. We have alternatives. People have talked about dry cask storage abroad. Why the heck should we be importing nuclear waste instead of exporting the technology we use in this country for safe storage? Only 1.4 percent of this waste comes from the countries that Mr. Head acknowledges the U.S. government says are proliferation risks, 1.4 percent only. Finally, if litigation threats won't work, and litigation is needed, we will litigate. Yes, we will sue you again. You haven't met the burden we put on you by the last injunction, Mr. Head. And, if that doesn't work, we must ask everyone in the State Congressional delegation to go back and fight for the legislation that former Congressman Mike Hydler introduced two years ago that would have given us the ability to say: "We can't expose our neighbors and children to more radiation than would otherwise be allowed just because the DOE self-regulates." And, if we can't get it through Congress, Heart of America Northwest is committed to do a State-wide initiative. We hope you will all be there with us. Thank you. [applause]

LW: Is there a portable mike available? Yes, it's alive.

Linda Cunio: My name is Linda Cunio, and I am here on behalf of myself and the next seven generations, the grandchildren that you will have, but I will never have, because a long time ago I had to make a very difficult choice. Back about the time that Captain Kirk was first hearing Scottie tell him that the anti-matter mixture was off and about to explode, I learned that since I had grown up in eastern Washington and lived approximately 100 kilometers from Hanford, that I had been the subject of deliberate radiation release experiments by our Government along with everyone else who lived in eastern Washington. But, I didn't find this out until I was in my twenties. Gerald cited statistics of acceptable levels of around 28/25. At times, when the Greenrun was being released from Hanford, which was what it was called, we were subjected to upwards of 650 millirems. I don't know what this is going to do to my body. But, I know that, for me, this was not an acceptable risk to have the choice or the chance of passing the problems on to my children. So, I won't have any. So, when I hear that our government assures me that this shipment is safe, that there are no technical problems, from personal experience, I can't put a lot of stock by that. Gerald very rightly pointed out that he's asking for technical reasons. We're not technicians, we're people. Our children, the next seven generations, the next ten generations, the next hundred generations are our technical reasons. I work in the transportation industry here in Tacoma. I work with truck shipments, and rail shipments, and water shipments. And I know the kind of things that can go wrong, even with the best of preparation, the best trained people. I don't want to be involved in one of these. I don't want to be in the same county, I don't want to be in the same hemisphere, if something goes wrong. Technical reasons. Mt. Rainier is beautiful, but it is not dead. Mt. Tahoma is very much alive. It's been placed at the top of the list of most dangerous volcanos in the world for 1995. Due to its proximity to population centers, due to its increasing seismic activity, volcanic activity, due to the history of seismic activity in our area, the Puget Sound area, as far away as Portland, Oregon, has, on average, 20 minor earthquakes every month. The experts tell us that we are due for a big one and that our chances of having more devastation far exceeds that of Los Angeles. They have newly discovered, or newly advised us, of faults, very shallow faults that run along the Bainbridge Island to Seattle corridor and others which in the past have caused as much as 200 feet instantaneous drop in the level of the areas around it, like Washington. There are cedar trees in the bottom of Lake Washington, 200 feet under water. Technical problems. I don't need any other technical problems. The grandchildren that I will never have on my knee are enough technical problems. I vote No. [applause]

Alice Orchal: My name is Alice Orchal. I'm in awe of these statements that have proceeded me. I am an individual, but I am a mother, a grandmother, a great-grandmother, a neighbor that is called Grandma Alice or Aunt Alice, a caring citizen that feels that each and every one of us need to stand up and be counted. I live in the area by Tacoma landfill. I fought pollution for many years. Now, I am asked to allow nuclear shipments to come through our city. I believe that we have been subject to enough pollution. I believe that the risk is far too great, not to us, but to the children and the generations to come. I believe that it is inconceivable, that we, as a city, should be deliberately placed at risk from a nuclear shipment. We deserve the right to be free from fear. He talked about how his child, coming next to one of these nuclear shipments, could be effected. Quite frankly, if I drove past one, it would scare the living daylights out of me. I think we have a right to be free from this kind of persecution. If these shipments come through our highly populated area, it would be like sitting on an unexploded, live, ticking time bomb. It must not be permitted to happen. We need to protect our environment. It is a God-given opportunity and obligation, not only for this generation, but the generations to come. I stand up to be counted. I say "NO" to nuclear shipments, not only in Tacoma, but in the Pacific Northwest. We have a right to live. [applause]

Mike Kreidler: My name is Mike Kreidler..

LW: I'm stunned, but I don't see you on the list.

Mike Kreidler: I was just about to say, that I was generously afforded the opportunity to take Kelly McGoldrich's place.

LW: Okay, great. And, let me read the on-deck list: Anita Johnson, Bob Evans, Bill Baarsma, Grace Georges, and Pat O'Mally.

Mike Kreidler: I don't believe that DOE has come into the changes that have taken place in the world today. There is a whole new world out there. The threat of the Soviet Union, the changes that are taking place across this planet of ours, really forced them to re-evaluate the policies and the commitments they made many years ago, and are attempting to fulfill here today, through the Port of Tacoma. I was born and raised here. My parents were born and raised here. I know the Puget Sound. I value the Puget Sound. I value this community. This is a community that has always been willing to step up and do its fair share. But, it's not a community that is willing to take responsibility for problems that should be resolved elsewhere. And, that means that we should not even be in the process, right now, of accepting shipments into this country until the thoughtful re-evaluation that should be taking place has been undertaken; the potential for reprocessing in other countries, the threats that realistically exist in this day and age, have been taken into consideration. That doesn't exist today in DOE. As a part of their thinking, it needs to be, before you come to this step. But, as I said before, Tacoma has always been willing to step up to its responsibilities. But, the way this whole issue has been approached, is one that comes at a time when it gives people reason to think that maybe there are conspiracies. Maybe there are reasons why things happen the way they do. Tacoma is a responsible community that has a history of doing the right thing. We are on the verge of seeing some major growth in our community by virtue of the kind of commitment we've made -- environmentalists, and business and industry groups together -- to see that that happens. But, now, you would subject us to the threat of what could happen with nuclear waste. That's why, in 1994, along with Congressman Norm Dicks, I introduced the Safe Handling and Shipment Act of 1994. That Act would have given the Port of Tacoma the authority to establish reasonable guidelines, and failure to meet those reasonable guidelines would have been cause for them to deny the acceptance of nuclear waste through the Port. It doesn't take an Act of Congress. This is something that DOE could enact itself. But, it would have called for the training of workers for the handling of these materials, a comprehensive response plan in case there was a fire, spill, or other type of contingency. Local communities would have been informed about the shipments and about the potential risks that existed. Radiation exposure levels for workers may not exceed standards for public exposure already set in regulation. And on top of that, for DOE and the Federal government to accept the costs that go along, and commensurate, with those activities. That's a bare minimum. But, as I said before, as we urge Congress, as we urge our leaders, to take responsible positions to make sure that happens. The bottom line is that DOE has not gone through the thought process to bring us into the changes that exist in 1995. We can do better. We will do better. I urge you to go back to the drawing board and re-evaluate your policies, take into account the types of programs and policies that should be granted to the Port of Tacoma, or any port in this country of ours, before shipment would be considered for them. This is the bare minimum for any community. Tacoma will do its part, but don't shove this at us and let us have these kind of risks. Thank you. [applause]

Martin Sutherland: Good afternoon, my name is Martin Sutherland and, first of all, I would like to say that it is a pleasure to see quite a bit of people to show up for this. I was kind of getting worried when I got here pretty early.

I would just like to mention some names here. I will refer to my notes the best I can, here: John Langdon, Rufus King, William Patterson, Robert Morris, James Wilson, George Read, Roger Sherman, John Blair, William Few, and these are just a few names of a group of men who brought forth one of the most important documents ever written in the United States and that was called the Constitution of the United States of America. The first three words are: "We The People". [applause] Thanks. These are the three most precious words I consider in the Constitution. And these words set forth that the people have a voice of what our government does and we as a people must be heard and that we are also heard in the process. The people in this city stand united against an unreasonable government entity that is supposed to hear our voice and has overlooked that very important element. The people of this great city of Tacoma have stated on numerous occasions the concern of unanswered questions and the effects of such nuclear waste entering these ports and, not just our ports, but our waters too. The City of Tacoma is going through an evolution in which our ports are being transformed into a cleaner and healthier environment. But, for the use of all nations, for commercial use. The thought of allowing nuclear waste, as proposed by DOE, to enter our ports is not just a concern at home to Tacomans, but also abroad. So the people of Tacoma have spoken loud and clear and we are not wanting these products entering our ports, and in the interest of all parties, that these countries that have benefitted from these technologies should convey the detriment. It must never be forgotten that the voice of the people are to be heard at all times. This is what our forefathers believed in, fought for, and died for through our brief history. And Tacomans stand united with other cities to keep nuclear waste out of our city and out of our ports. Thank you very much. [applause]

Anita Johnson: My name is Anita Johnson and I live on 36th and East K Street. And, I started out at a quarter to three yesterday, and someone conveniently handed me three of these, and I thought that I'd just go around and chat to my neighbors, and it turned out that I had more friends in my neighborhood than I thought. I only went two blocks and I filled up three. These are my friends and my neighbors, and this is my son, Matthew, and that is the reason that I don't want any nuclear waste coming through Tacoma. Because life is too precious. Thank you.

Bob Evans: Good evening, I'm Bob Evans, the Deputy Mayor of Tacoma, and I have some canned remarks which I'm trying to shorten, or get rid of, because I think what I'm seeing here and listening to tonight is really a voice of people. It's more than that. It's the emotions of people, as well as either your intuition or informed opinions, or your scattershot opinions -- it is all valid. Those kind of things are more effective than any DEIS statistic. I think you must keep those emotions boiling as long as this issue is before us. This came to the city several years ago, in 1988. It was ignored. It came again, and was regarded then as a kind of, perhaps, late hippie bloom of some sort which is really out of town and nobody's business, and we couldn't pass a Resolution. Now that it's an actual possibility, it is a Resolution which this city, and Seattle, and Fife, and Milton, and Federal Way; all of the entities around here, the county, the longshoremen -- what did I forget? -- the Port -- a major player -- the Port. In any event, finally, something draws us all together. And, it has to keep us together, as long as this is an issue. It's remarkable to me that all of the entities of government, which rarely really talk to each other on a genuine basis, have gotten together so uniformly, unanimously, to support resistance to this proposal. We value it greatly. And, it goes higher than that: Randy Tate and Norm Dicks are of one mind, if you can believe it, on this issue. And I'm hoping, I know that Senator Murray is, and I'm hoping that Senator Gorton is, equally, of one mind. We have our State Legislatures: Ruth Fisher,

Rosa Franklin, probably Steve Conway somewhere, also of like mind. We must, again, draw together, keep this package boiling hot while it lasts. I must say that I've heard some specifics about the DEIS, and it is in my view, in some measure at least, a fictional document. It goes for what it wants, ignores the problems which are not otherwise addressed, masks those things which are critical, exposes those things which are frequently scare-heads. And, one of them which has just come up today really offends me. We are given the impression, in some areas, that those other nations are not really to be trusted -- the ones which have those fuels now. And I might list those other nations for you. There are forty-one nations, some of which cannot be trusted, it's true. But the ones which we may trust, which also have 70 percent of the total material of what we are talking about are: The United Kingdom, France, Germany, Switzerland, Sweden, Japan, and Canada. I think those nations can be trusted, and if they have the material, and since they have not only the material, but the reprocessing and storage facilities, the trained personnel, and equipment, let it stay there, which is Alternative No. 2, which we heard about earlier. [applause] It seems to me entirely insane to drag that material halfway around the world and then pump it back into the middle of our nation, and it will only be there for ten years, or thirteen if we are lucky, and, at the end of that time there will still be no solution. This country has no reprocessing, no storage plume that I know, no storage facility that is adequate, and no means really of delivering it back where it came from. We have, at our Hanford, as you may know, a plume of radioactive water creeping out into the Columbia River and materials like this, low grade it's true, stored on the ground. We don't need to do this, we are spending 274,000 billion dollars to cleanup the Superfund site, which is Tacoma. Do we need to bring this in and pollute us back to where we used to be? No more. I think you must keep the emotion you've got, and keep it red-hot as long as you can until this issue is resolved. Thank you. [applause]

Bill Baarsma: My name is Bill Baarsma. I'm a member of the Tacoma City Council, and thank you, Deputy Mayor Bob, you did a terrific job. I would like to introduce very briefly, if I may, the Mayor of Fife, who will have to leave us. Mayor Stegham will you stand so the people can see you? The Mayor has given me a resolution that was passed by the City Council. I'll read the last line and just a few sentences from the letter of transmittal to DOE:

> "Be it resolved that the City Council of the City of Fife, strongly opposes the shipment of spent nuclear materials from foreign research reactors through the Port of Tacoma and the City of Fife. Passed on the 13th day of June." The cover letter -- I'm just summarizing some of the highlights -- "our city, our businesses and our surrounding population and businesses feel strongly that the risks involved in shipment through our area, or anywhere in the United States, represent an unacceptable burden and risk upon our citizens. Therefore, we strongly oppose option or Alternative No. 1 and support Alternative No. 2." I share those sentiments. Thank you, Mayor, for being with us today. [applause] I might note that Alternative 1 does make eminent sense to me. The logic for Alternative 2 escapes me. But we have to make comment on the EIS and have those references to deal with. Excuse me, I'm sorry! Excuse me, Mr. Head, for the record: Whoa, I almost made a BIG mistake. I DO support Alternative 2, the logic for Alternative 1 escapes me. Oh, my moment! I'd like to comment, if I may, on page 26 of the Summary of the EIS in reference to Alternative 1. In there, I would like to quote very briefly: "In the United States, local governments are required to have emergency management and response programs. These programs must be capable of managing all hazards ranging from natural disasters to hazardous materials incidents on a day-to-day basis. These programs include support from special emergency response teams and emergency operation centers." That observation is an appropriate one, but a bit

misleading one as far as our community is concerned. Yes, the Tacoma Fire Department has a hazardous materials unit. There is a four member team that provides coverage, seven days a week, around the clock. It involves 20 highly trained fire fighters. The unit is located in the tide flats area. Its charge is to handle and control the spillage of oil and other toxic materials. However, this unit has no equipment nor does it have the training or capability to handle accidents involving radioactive materials. Again, our fire fighters are highly motivated and skilled -- among the best anywhere. But, they do not have the resources to handle a catastrophe or an accident involving radioactive waste. And, I must say, that we as a city would not put that burden on them. Our emergency management division of the county government does have a hazardous materials management team. But, for radioactive spillage or accidents, its capability is limited to monitoring and detection of materials after the fact, using, I might note, 1950's and 1960's technology. It can, in concert with the Tacoma Fire Department, set up perimeters around an affected site. It has no resource capability or training to cleanup or control the extent of an accident. And finally, I would like to say that we've had a number of shipboard fires in this area and fairly recently. Two in Commencement Bay alone. In one case, the fire department had to tow the vessel to the center of Commencement Bay where it burned to the water line. Smoke congregated in the basin area of Commencement Bay, and then drifted north with the prevailing winds. The other fire of furnace intensity involved a container ship. We had to call in support services from Seattle to help control that disaster. So, the DEIS places the burden for response to any incidents on the local jurisdictions. This is viewed by us as yet another unfunded Federal mandate that must tax our citizenry -- that taxes our citizens. Bringing this high-level nuclear waste through the Port of Tacoma poses a financial risk, a security risk, an environmental risk, and a health risk; in sum, an unacceptable risk. We are philosophically opposed to buying a problem that has great cost and does not benefit this community. Thank you, Mr. Head. [applause]

Grace Georges: My name is Grace Georges, I live in Puyallup. Mr. Head, I'm going to give you an opportunity to say something. I will be very brief. I have three very short questions. The first one is that I'm curious as to why the United States has chosen to be the world's garbage dump and I want to know what is going to happen when the dumps become full? Number two, one small construction flaw in the space shuttle Challenger caused a major disaster. Do we have any guarantees that there will be no construction flaws in the capsules (what do you call them?), the waste casks as they're shipped? And, number three is a question that a young man in the audience posed earlier, and I didn't hear the answer to. Is this meeting really going to change anything or has the government made a decision and we truly have no voice? Thank you. [applause]

Charles Head: Okay. Could you go over the first question, again, so I make sure I remember it?

Grace Georges: Well, my first question was regarding the United States being the world's garbage dump -- that's what it sounds like to me -- and what happens when we run out of space to store this garbage?

Charles Head: Okay. This proposed action has been supported by every Administration on both sides of the political spectrum for the last several administrations. It's one that was supported by the Republican Administration, and one that was supported by the current Administration, and it's supported as being in the best interests of the United States to reduce the vulnerability of the United States and other countries to nuclear terrorism.

Grace Georges: Okay.

Charles Head: So, we are doing it for our own interests.

Grace Georges: What happens when our areas get full. Do we just keep getting more and more?

Charles Head: We're still anticipating that a geologic repository will be opened in which we can ultimately dispose of spent fuel.

Grace Georges: I'm sorry, but I don't know what that means.

Charles Head: That means that we plan to essentially dig a very deep mine and put the spent fuel back in the earth from whence it came.

Audience Member: Is there ever enough room for all of the United States' waste, that DOE's Yucca Mountain would...

Grace Georges: Excuse me (to audience), but these are my questions right now, you've had your turn. Okay. My second question is: Can we guarantee that there will be no construction flaws in the waste casks?

Charles Head: The casks are very carefully inspected as they're built. And, one of the interesting aspects of storing or transporting radioactive materials in them is that if they are not shielding it right you will know about it as soon as you load it and do your radiation surveys.

Grace Georges: Okay. And if that happens and there is a leak, what do they do then? Does somebody endanger themselves and weld a patch over it, or what?

Charles Head: No, if that sort of thing was identified, you would have to unload the cask and go get another cask.

Grace Georges: Okay. What do you do with the stuff that is in the cask that's leaking?

Charles Head: Well, you would put it..I mean you would discover this at the reactor as you were loading the shipping cask. You would unload it and put it right back into the reactor until you got another shipping cask.

Grace Georges: Okay, my third question that I heard the young man address, and I didn't hear an answer, but perhaps you did and I just missed it. Does a meeting like this really make a difference? Could it make a change or has the government already decided what they are going to do and we might as well have stayed at home and I missed out on the strawberry shortcake feed in my Mobile home tonight to come here.

Charles Head: The government has definitely not made any decisions on what will be done at the end of this environmental review. And yes, meetings like this do have an effect. They are listened to, not only by DOE, but also by your elected officials all the way up to Congress.

Grace Georges: I appreciate that. Thank you very much. [applause]

LW: Let me interject something here, get some more on-deck speakers, and say a couple of things. First of all, it's almost nine o'clock, and after I read the list of the next five speakers, what I'm wondering is: Would you like to take a very -- I'm not going to say a break -- but would you like to stand up and just kind of stretch...those chairs look comfy, but they're not very comfy for very long. So let me read the next list and, as the speakers are coming up, stand up and sort of stretch and then sit back down and we'll carry on. We've got, now, close to sixty people on the list and we've gone through twenty.

Audience Member: Excuse me; before you do that, we have state legislators here who have statements to be made. I'd like to have them come up at this point, if that is agreeable to the audience. [audience shouting no.]

LW: The State can be on record. The question is, wait, wait, wait, the question is, and this is for us all, I guess, to think about. We have a list of people who signed up in order and the question is: Would it be acceptable to this group to have some of your state legislators read a statement or present a written statement? Hand something in [audience saying no.] Okay, okay. I think the elected representatives have their answer. Let me read the next few names, there is: Ray Robinson, Jack Fabulich, Steve Anderson, Mike Fletcher, and Melody Wilhite. Okay, now as they are coming forward just take a real quick stretch in place and sit back down.

LW: Well, we've done...give you another minute or two. We are at number twenty, we just finished our twentieth speaker, if I could have your attention please! We've just finished our twentieth speaker, and we have forty more to go. So, in the interest of everybody's life, and I know this is very important to you, and what I'd like to encourage you to do is, as you give your written presentations, if you have some written remarks to hand those in and do a brief summary. Many of you who have previously spoken have been very successful with that. So I would encourage the rest of you to do that as well.

Pat O'Malley: Hello, I'm Pat O'Malley, President of the Port Commission. Along with my fellow port commissioners, Mr. Fabulich, Mike Fletcher, and Jerry Thorpe, we appreciate the opportunity to be here tonight, and we thank you all for coming.

The Port of Tacoma believes that HEU has no place in commercial channels. That's why we support the goals of nuclear non-proliferation. However, adopting Alternative 1, which calls for all HEU to be returned to the United States, is bad management. We believe it's bad policy, and it's bad finance. It's bad management because we believe Alternative 1 makes the United States -- makes us all custodians of a warehouse of nuclear waste that we are unable to reprocess, recycle, or store. Look at Hanford. We can't manage our own nuclear waste why are we taking on more? It's bad policy because storing nuclear waste, with no long-term operational storage site, sends the wrong message to other countries with research and commercial reactors. It encourages risk and irresponsibility. It's bad finance. Returning this fuel, and using Alternative 2, is at least one billion dollars less expensive that Alternative 1. There are no benefits to Tacoma, or to our region. There are no benefits to the port, there is no job that is created. Our longshoremen's union will be exposed to radiation. They've taken the position that they are unanimously opposing this. They've also said that they won't handle it under any circumstances. [applause] Some of the other speakers have noticed that this amounts to an ongoing unfunded mandate. And, why is that? Because we are, we, the City of Tacoma, going to be charged with the primary response in case there is a spill. That's going to require more training, more expertise; it is going to require equipment. I would suggest to you, that there isn't a fire department on the West Coast that could respond to a nuclear accident. This material is dangerous. In the DEIS, actually in a letter that

I received recently, the DOE admits that open contact with the contents inside one of these casks will cause certain death within two days. We believe the case is compelling for Alternative 2. It's a simple question and I want to phrase it properly. Since over 70 percent of the spent fuel under the proposed policy resides in seven countries having major commercial nuclear reactor programs, all having major spent fuel storage capability, three having spent nuclear fuel reprocessing capability, and all participating in the IAEA nuclear safeguards program, why not eliminate Germany, Sweden, Switzerland, France, Canada, Japan, and the United Kingdom from consideration and select Alternative 2 and focus on the remaining 30 percent of the problem? Alternative 2, we believe, focuses, as I said, on the short- and long-term disposal issues. It permits fuel to be recycled. France, United Kingdom, and Japan currently have the capability and are reprocessing and recycling this fuel right now. They have capability for long-term storage. In fact, the U.K. has a reprocessing facility in Scotland that they are considering shutting down because they don't have enough HEU to supply their reprocessing reactor. In short, the DOE should select Alternative 2. Returning this weapons-grade material to the U.S. risks our quality of life and those of future generations. There is a wonderful statement in management theory: That, if you make the wrong decision, that you will execute it poorly. It is clear to us, the Port, that bringing this material back to the United States when we have the inability to store it, to reprocess it, is a terrible decision. We thank also the Port of Seattle that is here, Henry Yates, and the other communities that have supported us in this venture, and we thank you, again, for coming out tonight. Thanks, Mr. Head. Oh, and I yield the rest of my time to Mr. Ebersol. [applause]

Brian Ebersol: Anita Preston yielded her time also, so you're going to get two for the price of one, here. I'm Brian Ebersol, the State Representative representing this area, and I appreciate the opportunity to very briefly comment on this issue that is very important, not only to the future for the Port of Tacoma, but also the future of Tacoma and the entire Puget Sound region. President Clinton has said, repeatedly, that his Administration would pay attention to ordinary citizens on issues such as this. Well, this is that kind of chance and I hope he'll will pay attention on this issue because both public officials and ordinary citizens in Tacoma want no part of this nuclear waste shipment scheme. Our port officials are unanimously against it, our port workers are unanimously against it, our city officials are against it, and common sense is very much against it. Puget Sound is one of the top five or six most heavily traveled transportation corridors in the entire country. How anyone would think that this is a good place to transport nuclear waste is beyond me. There is no way to tap dance around the issue that nuclear waste is one of the most deadly and persistent poisons known to mankind. The best engineers in the world have worked for decades to try to find ways to store it safely and without good result. It still poses a tremendous threat to people and material. This deadly material simply has no place in a commercial port, or near waters, or on our highways, or in a densely populated urban area. The DOE has not explained to anyone's satisfaction how other ports were eliminated from consideration while our commercial port remained high on the list of possible nuclear waste transport sites. Why was Seattle eliminated? Well, because there's a lot of people that live there. Well, if there is no threat, why do you care how many people live there? The answer to all these questions is "No", and that should be the answer we should give loud and clear tonight. We've worked very hard to have the Port of Tacoma be a world-class port that has global commerce of all kinds and we don't want Federal nuclear waste mandates threatening the progress that we've made. Let me close by saying that this issue is vital to Tacoma, but it is not just a Tacoma issue, it is a Puget Sound issue, it's a State issue because no one wants waste on State highways. That is why it is up to us to take the lead. We should take the lead on this issue by saying: "No, Hell no, we don't want the nuclear waste coming here." There has got to be a better way to solve the problem. Let's find it. Thank you very much. [applause]

Ray Robinson: My name is Ray Robinson. I've been retained by the Port of Tacoma to help them with the assessment with these three alternatives and I'd like to address one of those better ways, Brian. Before I do so, at the risk of correcting one of my five bosses, the five port commissioners, I believe Mr. O'Malley said something about a one-million dollar cost differential. As I read the EIS, the draft, I believe the high side cost estimate for Alternative 1 is close to 2 billion dollars, and I believe the high side cost estimate for Alternative 2 and 3 are like something slightly under 1 billion. So I believe that there is, roughly, a 1 billion dollar difference between Alternative No. 1 and the other two alternatives. Is that correct, Mr. Head?

CH: I would have to go back and check those numbers.

Ray Robinson: I believe that is correct, and if it is not correct, I would appreciate it if you would correct me, that would be useful. I would like to just briefly comment. A couple of things about my experience -- I have over twenty years of nuclear fuel experience in a wide variety of settings, mostly in the commercial nuclear fuel sector. I'm also a 25-year plus resident of this state, my family, my kids, my two kids, were born and raised on the east side of the state and also we lived on the west side on the Puget Sound, and they went to school on both sides of the state. We currently are residing in the state of Washington and we have a personal interest in this as well as a professional interest. I would like to say that Alternative 2 provides a significant advantage, in my opinion, to all the other Alternatives. And, I'd like to comment about a few objections I've found in the Summary on page 5. One of those is, and I believe that the DOE states: "Currently overseas reprocessing results in separated HEU that is placed back into commerce for use as new reactor fuel." Nothing is mentioned in the EIS, as far as I can tell, about the possibility of taking that HEU that can be reprocessed today at the Dounreay reactor in Scotland, and it can be diluted down to lower than bomb grade material, and it can be, yes, it can be recycled, but as a bomb-proofed and non-proliferation proofed material. Having high value, it can be recycled back to the countries from whence it came. You also state that the overseas reprocessing facilities, for example, Dounreay in Scotland, currently do not have the capability to reprocess the high density low-enriched fuels that the United States is encouraging the foreign research reactors to use to replace the HEU fuels. In talking to some of the top technical people at the Dounreay reactor in Scotland, I find that they do have the capability to reprocess, fairly immediately, approximately half of the materials identified in the DEIS. That material, specifically, is the HEU coming from the aluminum-based or metal-based type of fuel elements. They do not currently have the capability of reprocessing the TRIGA reactor, the fairly unique specialized fuel which comprises approximately 10 percent of the total 20 metric tons that are in question here. And, they currently do not have the capability to process the low enriched high-density uranium fuel. In speaking with these people, they are seeking business in this area. They have published a price for what they would charge for the HEU and, in informal conversations, they have an interest in pursuing alternatives that would allow them to take care of all three types of fuels at the Dounreay reactor reprocessing facilities in Scotland. So I believe that you are partially correct in the Summary -- they currently do not have the capability to do all three. They have the capability to do about half of it now and appear to be willing to work toward a solution for the other half that they don't have the capability to deal with at the present time. A final statement is, that is that's in page 5 of the Summary: "For most foreign research reactor operators, construction of a new storage facility would not be practical due to the very high cost of storing small amounts of spent nuclear fuel and the long time required to design, license, and construct facilities." Well, it is a problem for any country, anywhere, including the United States, to add new capacity to store and deal with the spent nuclear fuel. There are at least seven countries that I am aware of, and they were mentioned earlier, that have major commercial power operations that are trying to deal with the long-term geologic repository storage of their own fuel coming out of their commercial power reactors. Those

seven countries are on this list and, as mentioned by Mr. O'Malley, comprise roughly 70 percent of the total inventory that we are talking about in those 20 metric tons of foreign reactor fuel. In my opinion, and I think in the opinion of a lot of people, there are many issues that need to be addressed in resolving what is the best means -- issues of risk, cost, permanence of the solution, and let us underscore that the 10-13 year solution that is mentioned in this DEIS is really, on the scheme of things, a very short-term, band-aid fix to a long-term problem. So a permanent solution ought to be part of the consideration of this DEIS. Timing of the solution, and very importantly, establishing some responsibility and accountability in those countries pursuing the peaceful uses of the atom. We started it, but we need to also encourage some major responsibility and accountability for those receiving the benefit. That has been brought up earlier in one of the questions here tonight. And very importantly, the U.S. can act as a real role model for both the nuclear weapon countries, the countries that have nuclear weapons, and for the countries that have major commercial nuclear power capabilities. We can act as a role model on how to responsibly and, in a financially sound way, go about dealing with this problem. As one speaking to...that knows quite a bit about this whole problem, and one who very definitely supports the nuclear nonproliferation objectives that this policy is seeking to resolve, I really encourage you, on behalf of the port, we encourage you to look very, very hard at all the aspects of Alternative No. 2. Talk to the foreign countries that have the capability. Let's get into the bilateral and trilateral discussions that need to be held, and let's get on with resolving this problem overseas and keeping it out of this country entirely. Thank you. [applause]

Ruth Fisher: Thank you. First of all, I'm not Jack Fabulich. Commissioner Fabulich yielded his time to me. He asked me to inform you that he prefers Alternative No. 2. My name is Ruth Fisher. I represent the 27th District in the State Legislature. The Port of Tacoma is in the 27th district. I was the Chair of the House Transportation Committee and became the Ranking Member after the last general election. I wish to speak to the issue of transportation tonight. Adding truck traffic to the I-5 Corridor North is putting an additional load on the 4th most congested highway system in the United States. Not in Western Washington, not in the State of Washington, not even on the West Coast, the 4th most congested corridor in the United States! If we are addressing rail traffic, you will be adding to another crowded corridor. The State of Washington has invested a good chunk of money in the tracks going north and south. We have been designated a priority corridor by the United States Department of Transportation (DOT). We are struggling with commuter rail, inner city rail, and freight rail on the Burlington Northern tracks in this State. We are also struggling with a political climate that has said: "No more money for transportation improvement." If you're considering air traffic, we're in the middle of controversy surrounding the third runway at Sea/Tac Airport, and that may not be resolved for ten or twenty years. You cannot add to the transportation system without severe consequences. And, I'm not talking only about collisions. I'm talking about the additional traffic on an overloaded system. We, in this State, must continue planning for the growth which will occur in the next decade. And, the transportation system is not adequate, now. As a public official who is concerned, I object. As a resident who must use this system, I object! As a long-time Representative focused on transportation problems and solutions, I object. [applause]

Jack Fabulich: I think you did a better job than I would have done! [applause]

Lorraine Wojahn: Port Commissioner Anderson has yielded his time to me. My name is Lorraine Wojahn, I represent the 27th District as State Senator and also as President pro temp of the Washington State Senate. I'm also here on behalf of Senator Marcus Gaspard who is our Majority Leader with whom we have written a letter. I'm not going to read the letter to you because it's not that long, but it said everything that has been said before; and it was said best, I think, by Mrs. Kelly who

put herself in the place of you as a citizen in the State of Washington. She was outstanding in her projections. The one thing I do want to suggest to you, though, after we've talked about the dangers of shipping nuclear waste, which we stated in the letter, through the corridors of Washington, I think there is an additional problem here. We think that the DEIS, prepared by the Federal government, is incomplete and inaccurate. Now, this has been stated more clearly and at length by others, but I wanted to re-emphasize this so that the State of Washington recognizes this, also. We believe that it is based on outmoded information about port terminals, and the information is outmoded, and it fails to adequately address critical security and cleanup concepts. So that we not only have the problem, we have also the additional problem of a group from DOE that refuse to listen or prepare a statement that was accurate. And all I want to say, other than that, is that someone sitting next to me as I came in at six o'clock tonight, someone said: "First they take our jobs, now they are shipping us their waste." Thank you very much. [applause]

Mike Fletcher: I've got to put my glasses on to see what I've written here. My name is Mike Fletcher. I'm one of the unanimous voices from the Port of Tacoma Commission that is opposing the shipment of nuclear waste coming through the Port of Tacoma. I want to take you back, Mr. Head, to May 22nd. One of the questions that the Commission posed to your representatives was that of: "What if we had a catastrophic accident?" Your DEIS goes through and basically says it can't happen and it won't happen. The response was promised in writing within three days. I have in front of me, here, your letter of June 16th, which is more than three days by quite a bit. And, one of the other things, just to bring it back to perspective and timing, is that you promised that DOE would respond in case there is an accident in Hanford. And, if it takes the same amount of time to get here, we have a serious problem on our hands. Okay? Just wanted to add a little levity in there, but seriously, you get the point. What I'm saying is, a non-responsiveness, an attitude of -- "Okay, we're doing this and we are not really going to listen to what you have to say." I read through this and the scenarios that you answered didn't really answer the questions that we wanted, that were really posed. Maybe we need to re-do that in writing, again, for you so that we can get the proper response, and it will be: "I'll get to what we really want to get to in a minute." But in your Item 3, you keep using the word "unrealistic case scenario". And, you're right. What I see there, in Item 3, is really a very unrealistic scenario and it's not the most probable scenario at all. I agree with you, it is indeed unrealistic. A worst case credible accident is not the same as a worst case accident. You refer to credible accidents, quite frequently, in your responses and in your DEIS. To give you a little background: I am a graduate of the Navy's nuclear power program. I operated a nuclear power plant. I've lived with this. I've dealt with it for a good part of my life. One of the things that we did in the Navy was we trained for worst case scenarios. We acknowledged that they can happen. You are not acknowledging that it can happen. We didn't sweep them under the rug. We faced them. We learned how to deal with them. We accepted the possibility that it can and could happen. If you are not prepared for it, if you are not willing to accept that they can happen, you can't prepare for it. And if you can't prepare for it, you are doomed for failure. So, I submit to you, that you're doomed for failure! [applause]

The question I would like to re-propose to you is, and let me read what I've written down here. The Port of Tacoma Commissioners and others are interested in knowing what the consequences are of abnormal radioactive releases. One of the things you've brought to us was you've analyzed release fractions for worst-case credible accidents. I am not interested in credible accidents. I'm interested in worst-case possibilities. Even if you only gave us 50 percent, I think you would be shocked at the figures you would get for us -- what we would be exposed to. You asked for technical responses. You have not been willing to give us technical responses to our questions. I want technical responses. The Commission and the people of Tacoma deserve your technical responses. The people of Pierce County,

the people of Washington State deserve your technical responses. Please give them to us. You've been presented with technical reasons why Alternative No. 2 is a very acceptable alternative. I suggest, as the other Commissioners have, as Dr. Robinson and many other speakers have, that you look hard at Alternative No. 2. I think you'll find that it is a very acceptable means of solving your problem. Thank you. [applause]

Melody Wilhite: My name is Melody Wilhite, and I'm down here from Everett tonight. I'm a private citizen and this whole thing, to me, is ludicrous. I was born and raised in Seattle. I grew up in the fifties, you know. During school, one of the things we did was to practice getting under our desks because Russia might drop the bomb. I never thought that it was going to be the U.S. that was going to be threatening me. You know, I mean, it terrifies me. You know, the fires and the sinking, that has been covered, but an accident by nature is something unforeseen. You talk about not needing security because: "Gee, we can't reprocess" and you can't do anything with this unless you reprocess it. You know, there are lunatics out there that have access to armor piercing shells who wouldn't have a qualm in Hell of shooting something and releasing this stuff. You know, it doesn't have anything to do with sanity. It shouldn't be here. It shouldn't be happening. We don't need to have this conversation because we had a vote. You know, everybody here is against this. You know, I don't understand. The only alternative is number 2. Help the people that are producing the waste find a way to solve the problem. Leave it there! [applause]

LW: We have five more speakers on deck: Jerry Thorpe, Doris Christiansen, Robert Hawes, Darlene Woolery, and Vernon Louie. That will take our next five.

Jerry Thorpe: Good evening, I'm Jerry Thorpe, and I'm one of the Port Commissioners, and I also teach school here in Tacoma, and I teach American Government. And I want you to know that this very type of activity is what I talk with my students about. About people becoming concerned, and coming out and expressing their views for their government officials to hear. I only wish that I could have my students here, right now, to see real government in action. This is the very heart of the democratic process. I get my kids out to some meetings, and this is a great meeting, and I really appreciate what's going on. We've heard some very eloquent comments. I think the comments that have been made are just absolutely outstanding. There are three points that I'd like to make. And I only want to focus on some areas that have not been touched on because I don't want to go over what has already been touched on. Number one is that, and it has been touched on a little bit, but my first comment is that we've been given some figures about what causes cancer or what could cause cancer and, I would submit to our learned gentlemen from DOE, that our doctors are still very unsure of exactly what causes cancer, and how much is too much radiation, and they're constantly mystified by this disease. It's a terrible disease and I think that there's hardly a person in this audience whose family has not been touched by this particular disease. And, why would we want to do anything that would even possibly cause increased dangers of cancer in our community? I can't imagine why we would. Number two, Mr. Head kind of made a mistake that a lot of people make when they are debating an issue. And he made the statement about Japan and he said the comment was made, well, "Why are we taking the nuclear waste from Japan?", and he said: "You know, if we don't take their nuclear waste then they're going to build reactors, and they'll build reactors that will use more of this high-energy nuclear waste." And, given the very background of Japan and what they have gone through, I can't even imagine Japan doing anything to perpetuate use of high nuclear energy or nuclear material after what they have been through. I can't even, it doesn't even, it's beyond the pale and I think you made a big mistake. As a debater, you suffered a lot of minus points on that. And then a third comment is that we are going to be taking this nuclear energy from these countries that have this high nuclear waste material, and of the 50 percent of

these that have these reactors, we can see no evidence that any of these nations are about to move from the use of high energy materials to low energy materials. And, if they are not going to move to the low energy materials, that means that they are going to continue shipping out this high energy material forever, and I see no end to it. In fact, Mr. Head said in answer to a very nice question from a lady, "Well, we are planning on building this huge, deep mining shaft to even put more nuclear waste into." So, I think he kind of betrays himself by saying: "There is no end in sight." Now, we are looking to where we can put the rest of this, and even more of this, and he is still looking for the best spot for this, and so I find... I think...these are three things that I would like to point out that have not been touched on so far.

And one last point, and that is just for the record: The Puyallup Tribe of Indians has gone on record opposing the shipment of this nuclear fuel into the Port of Tacoma. And, they have quite a statement here and I will give you this statement because they, as we know, the Indians are very much concerned about their environment and the effect of this danger to their environment, and they go on record unanimously to register their opposition to receiving these shipments based on the information available. That was signed by their Director, William C. Sullivan, Director of Environmental Programs, Puyallup Tribe of Indians. Thank you very much. [applause]

Doris Christiansen: Good evening. My name is Doris Christiansen and I'm a Tacoma resident. During the accident in Chernobyl, I was still living in Germany. And in Germany we have a big radioactive cloud coming from Chernobyl. And for years, we couldn't eat vegetables and fruit from our own yard; we couldn't go and pick berries in the woods or mushrooms. Our kids couldn't play in sand boxes and on the ground because the ground was highly contaminated. And nuclear waste is highly dangerous and accidents happen all the time. And I'm worried, and so are my family, and neighbors, and friends. Thank you. [applause]

Robert Hawes: I'll try and get this right. My name is Robert Hawes. I'm just here as a private citizen. But, I have to tell you my background. I spent over ten years in the Air Force and most of that was in the area of munitions and special weapons. I was trained in the handling of radioactive material and to decontaminate radioactive warfare or accidents. So I think I have a little bit more than a fair knowledge of what's involved when you're handling these things and the possibility of some type of accident or contamination. First off, I would like to state that Three Mile Island was not an accident. It was the result of consistent breaking of rules of policies and procedures, decisions by several individuals that were based on personal gain or fear for their jobs, or money, or something else. But they were not based on safety. That has cost us billions of dollars, already, and nobody knows what the final cost will be. The Exxon Valdez may have been an accident or something that could have been avoided; it was just one of those things. But the response after the accident left no doubt. There wasn't any for a very long time. Now, there was supposed to be, because one of the things that the State of Alaska, and Unions, and everybody said about this was: "In case there is a spill, we want to be able to clean it up quickly. Well, because of budgetary crunches and things over the years, and they hadn't really had any problem with oil spills, people were no longer trained, crews were no longer available, equipment was no longer available, so when the accident did happen there wasn't any response. And the results, of course, were far more catastrophic then they needed to be. Now, I spent quite a few years in the military. I worked for some government contractors, General Dynamics by name, one of the biggest, and I wouldn't say one of the best, but certainly no worse than a lot of the rest of them. So I'm very much familiar with governmental operations, and contractor operations, and things of this type. Now, I'm not necessarily opposed to the United States bringing into this country, for safekeeping, some of this nuclear waste from countries that they feel it may be a hazard, you know, or take it from the international community. But,

as it was pointed out tonight, most of this being proposed doesn't fall into this category. Absolutely not! The other part of the thing is that we've had atomic bombs and things flying around for years up in the air, handled on the road, on railroads, and things like that, but usually by very competent people that were very, very, you know, conscious of what they were dealing with. The problem is, from what I'm reading in here, of what is proposed for the way that this thing is to be handled, by ships, by containers and the rest of that, it scares me a great deal. These people are not prepared for this. To them, it's just some other type of cargo. When, in actuality, it is far from that. You haven't done your homework or if you've done your homework, you have blatantly ignored the safety of a lot of people. And I think it boils down to economic expediency because the proper handling of this, and it can be done reasonably safely and properly, costs a lot of money. But they don't want to spend the money like having a complete team travel with every shipment. These containers, that you take and have this stuff being traveled in, are way too large. There should be very, very small quantities, so if there is a rupture in one of them, the actual contamination is very, very small. The other thing, that anybody who knows anything about critical mass knows, is that you don't put a lot of that stuff together in that kind of quantity. No, you just haven't done the job right, plain and simple. Why not fly it in? Why not take it and have military aircraft or contractor aircraft that can handle this stuff for AEC and the rest of it, fly it in to a close place or where you have good road transportation to it. Why bring the thing all the way across the water in ships, in container ships, along with just everything else? Money! The way to handle the thing, to handle safely, takes a crew of trained people; it takes the right equipment, and the right process, none of which I see in anything that has been presented here tonight. Now, you know the feelings. I think I've taken...I didn't come here particularly worked up about it. But, after hearing some the information from other people about some of the things and getting a few of the statistics that probably mean a little more to me than most I feel that you really need to go to work. And, if it is a matter of money, then say so! Thank you. [applause]

Darlene Woolery: I'm Darlene Woolery and I'm a citizen of Tacoma. I have been all of my life. And, I'd like to speak to DOE. I'm disappointed in you people. First of all, this part of the country is extremely spoiled. We are used to having a tape recorder being made of every conversation that we have at a hearing. And, upon having that tape recording, we are able to go back to our people and we are able to get exact copies of the minutes. I pick up a letter about this thing and I get: "Oh by the way, they are not taping this thing;" and I say: "What do you mean, they are not taping this thing?" So, now we got somebody from CNN, and I said: "He was here tonight?" And, they got a cable channel from our own city here that is having to record this because DOE doesn't have the ability to take this stuff and feed it to us? It is recorded tonight only because we made a fuss before. It wasn't recorded before then! Only because there was a fuss made before and not because you were planning on it.

Now, let's get into something else, you guys. All the magic stuff about this nuclear energy. You keep bringing up this word cancer. I hope to God, you never have to deal with a friend or a loved one that is dying of cancer. That person represents an awful lot of people. It's not an easy disease to die of. I've watched people -- I have a neighbor who is dying of it, and I've watched my whole neighborhood go into tears at night because we cannot help her.

Now, my fire department. We are having some meetings here in Tacoma, right now, because we are having some reorganization in our fire department. We have a four-minute response time. I haven't seen anything from you people as to what you are going to do to improve the fire department in the corridor. What are you going to do? Are you going to give us some money, supposedly, to improve this? Or, is it going to come out of my pocket again? No, wrong, you come up with it! Are you going to train our port people? This means an ongoing training program. It's not just one shot. It means over, and

over, and over, and over, and over again training. The drivers, are they going to be especially trained to handle this cargo? Right now, they're not! They have to take a DOT test and if they pass the test they get the thing slapped on their wallet and they can drive it. That means they can get out here on the freeway, and most of you that live in this part of the country know what happens on the M Street curve in the winter when it gets to be a little bit icy. We spent four hours waiting to go someplace and we don't get to go, right?

I just want to know, do you really care what we think? I don't think you do! I don't. All I see is a: "Oh, boy, will these people ever stop talking and leave me alone so I can home?" look on your face. Well I'm sorry, we care an awful lot because when this meeting was called very shortly -- this is a meeting where people you see here tonight were called with less than 24 hours of notification that this meeting was going to go on). In the meantime, before these people were notified there was going to be like 20-30 people, mostly our elected officials. It doesn't work that way. I think you recall -- you are on the public payroll -- you are not a private entity. As a public payroll person, you owe more to us than just getting up there and saying: "This is what we are going to do." Thank you. [applause]

Vernon Louie: My name is Vernon Louie. I'm Chairman of the Puyallup Tribe Fish Commission. And, when I first heard about this stuff coming into the waters, you know, I was astonished. I mean how could we let this happen? How could we, as Indians, let this stuff come into our waters? We've had to fight all of our lives just for the right to put a net into the water to catch fish. And every year, fewer and fewer of our fish come back. When they do come back, they're smaller, they're diseased. And these are things we have to contend with every year. Here now, they are talking about bringing this stuff in that is going to do more to our fish, there, in the water. I shouldn't say "our fish." The fish belong to everybody. It's part of our mother, Mother Earth, and the stuff that you take out of our Mother Earth should have never been taken out in the first place. It has caused nothing, but misery to Mankind and to our Mother that it was taken. From the first day, it was taken from the Earth. And now that it is out, and these people from other countries want to send it over here back to us. I have no answers to why they want to do this. The only answer I have is a question: "Why was it taken out in the first place?" Leave it there. Our people, Indian people, for years since the white man first came here have fought, and fought, and fought -- we're still fighting just for the simple thing: So that we can watch our children eat a piece of fish just as our forefathers ate a thousand years ago. And day-by-day, second-by-second, this right has been taken away from us and it has been taken away from you. So now I say, it is time we put a stop to this and don't let this stuff come in here. Because I know the Puyallup Tribe fishermen do not want it here, or the Puyallup Tribe people. One more thing, too. There are laws against playing Russian roulette. If you take a pistol and put one bullet in that pistol and spin the cylinder and put it against your head, that's against the law. But here, this nuclear stuff that they're bringing in here, they're playing Russian roulette with all of our lives and our Mother -- our Mother Earth. If it comes in here and something happens, it is going to destroy everything. And when the salmon is gone, mankind will be gone. Thank you. [applause]

LW: Okay, thank you. Our next five speakers are: Deanne Hazleton, Roxi Giddings, Robert Trotter, Gary Clark, and Dick Marzono.

Deanne Hazlelton: My name is Deanne Hazlelton and I don't have any specific qualifications to speak here. My family is five generations in this State. And I am a mother, and a grandmother, and I am a person who has followed the nuclear industry and technology story for the past twenty years. Twenty years ago, my nine year old twins called me up on the telephone and asked if they could testify at the NRC hearings in Seattle, WA, against the construction of a nuclear power plant on the Skagit

River. And I would like to tell you folks here tonight that the people of Skagit County kept the nuclear power plant out of their county and we can do the same here. I would like to bring up one point that I have not heard mentioned tonight. As I've said, I've been following the nuclear industry and one of the things that I have read over the years is that the DOE and the DOT cannot account 100 percent for all nuclear properties that are transported in the United States by either highway, air, or rail. This may not seem very significant. It's my understanding, that some of these nuclear materials are lost due to theft; they're just lost and sometimes from damage. If that figure were even one-tenth of one percent, when we're talking about 20 million metric tons, that is an incredible amount of material. And, this could be lost, damaged here. When we talk about anything that happens in the Port of Tacoma as a result of a nuclear accident, we are not just talking about our children in our community. We are talking about the world's children and the community of the world. When that material gets into our Puget Sound waters, it is carried all over the globe. The nuclear industry does not have a good safety record. We heard tonight how what happened in Chernobyl affected people in Germany. We heard from a lady who lived in Hanford. What happens here affects the rest of the world. Not only do I not want, nor does my family want, nuclear waste shipped into the Port of Tacoma, we do not want it shipped into the United States. We believe that the United States policy on nuclear energy is ill advised. Rather than supporting and facilitating foreign nations' continued and increasing reliance upon nuclear energy so that their level of consumption can reach our own level of consumption, we should be encouraging the people of our nation to reduce our reliance on nuclear energy. We need to stop it. Forty years from now, if I'm fortunate enough to be alive, I do not want to read how what happens tomorrow in Tacoma is now just coming to light. This has been the history of the nuclear industry. We don't find out about it until after the fact. These things are kept from us, and I believe deliberately are kept from us. We are not children. We do not need to have the facts hidden from us. I do not want this in my community or any community. Thank you. [applause]

Roxie Giddings: It's Roxie Giddings. It's okay. It's a nickname anyhow. I go back a long, long, time. I live out in Pierce County, in Parkland, and I've been around here for a long time. I was born over on Woodby Island and it's an island in the Puget Sound. We have a rotten record of taking care of this stuff. We don't want it here. We can't handle it. We're not willing to handle it. The DOE is us. The port is us. The Tribes are a different nation, but they are also us. The City and the County governments are us and, for once, we are finally trying to tell ourselves that we need to deal with this. I carried around an initiative once, in 1976, trying to get nuclear safeguards, and those of you with grey hair -- you'll remember that one. That was the first initiative I ever carried. I just, I don't think as a people we are willing to pay to clean up this mess. We are talking now about getting rid of DOE. They're the only people working to clean up the mess as far as I can tell. And now, we've got people back in the government that we've elected and put in there that are not willing to clean up Hanford. I'm also a downwinder. I lived in Pasco for eight years. My sister has had a mastectomy now and my brother has a little heart trouble, and we just, I mean you don't put tracers on this stuff, you can't prove anything. I don't really believe, that we would, as DOE, have the will to remove a cask if it did go in the water! And especially if it was imploded, we wouldn't do it. We've got casks all over California, off the coast, which we put out there because we buried them out there. And they imploded when they went underneath the water and we haven't taken care of those. We're not willing to a ..actually we were not willing to have the Atomic Energy Commission, and we changed it to DOE, if you remember that. And, now we are not willing to have the DOE because we can't take care of this stuff. And we tried to tell people, when they put the WPPSS in here and they wined and dined us, we wined and dined ourselves, through, what-is-it, Westinghouse or something, trying to tell ourselves that we could put this stuff into some kind of ceramic cask and it would be okay and, maybe, we would put it on the surface of the ground over at Hanford, and then we would do what with it? Blow air through it at 600 degrees F for

every cask that they had? And then, and then -- they told us they were putting waste in these things and they hadn't even started ..they were just working on the glass, at that time, they hadn't even started putting radioactive materials with it when they took our people from our utilities to Richland, and wined and dined them, and showed them how great it would be to do five nuclear power plants at once in this State, which we couldn't. You can tell I'm a little angry about this. I don't think we are willing to pay to have these ships come in here safely. We're not willing to pay. We just dissolved the Office of Marine Safety in the State of Washington, and their job -- which they never really did -- to start to accomplish their job -- was to prevent oil spills in the Puget Sound area, and that was their total and complete job. It was not connected with any cleanup of this sort of thing. Which brings us to cleanup. We are not willing to clean up a mess. And so for my final statement, I want to say that the people in the United States are not willing to pay for nuclear messes and I don't want to be the next nuclear mess that is sacrificed. [applause]

Linda Smith: Hi, my name is Linda Smith and I'm here tonight on behalf of Bob Trotter who was speaker number 35 and I lucked out because I was supposed to be here for my boss on number 50, so I'll go in and take number 35 instead. Once again, Good Evening, my name is Linda Smith, and I'm here on behalf of Tacoma County Visitor and Convention Bureau. We're an organization that represents Pierce Counties tourism and its interests. We're in the image building business. And the Visitor and Convention Bureau promotes our community to tourists, tour operators, meeting planners, convention delegates, and travel writers. We not only promote our area's attractions, facilities, and visitors services, we promote Pierce County as a safe, friendly, and an attractive to visit. Transporting spent nuclear waste through the Port of Tacoma will harm Pierce County's public image. It will destroy the visitor's image of a safe destination. And it will destroy the recognition that Pierce County has won from travel writers and their readers in the past years. If spent nuclear fuel is transported through the Port of Tacoma, travel writers will have another story, a new story. Instead of writing about Tacoma's new history museum, the future development of glass, and maritime museums, this story will be about a warning to visitors. Instead of praising our waterfront development efforts, our customers will read about the dangers of radiation Tacoma residents must prepare for in the event of a nuclear accident on our waterfront. The visitor industry is a 365 million dollar industry in Pierce County. It directly employees about 5,500 people here. The Pierce County visitor industry has a bright future and we don't want to destroy it with a negative image such as this. The DOE should drop the Port of Tacoma from its list of public ports considered as entry points considered for the world's spent nuclear fuel. If it is unsafe to transport this spent nuclear fuel through larger population centers, such as Seattle, then it is obviously unsafe for Tacoma and its neighboring communities. We are no more willing to cope with the devastation of a nuclear accident than any other community. I urge DOE to rethink its use of the Port of Tacoma and all other public port facilities, and encourage the Department to use a military port or to work with other nations to safely store their own nuclear waste within their own countries. Thank you. [applause]

Gary Clark: My name is Gary Clark, I'm here as a private citizen, but I'm also familiar with transportation packages used for the transport of radioactive materials. I've been in this business for ten years designing and licensing these packages, so I know what it takes to do it and do it right. For example, DOE has a bad track record when it comes to Hanford. But, when it comes to transportation of nuclear materials, I want to give you an example of how to do it right. And that was to remove the damaged fuel elements from Three Mile Island Unit 2 to Idaho National Engineering Laboratory (INEL). That occurred over forty-nine shipments. It occurred from July 1986 to April of 1990. A one-way trip totalled 2,383 miles for a total of 116,767 miles of shipping nuclear waste in a transportation package. There were no mishaps whatsoever in that package. I've also been studying - done studies - for DOE looking at the spent nuclear fuel of all DOE fuels. So I'm familiar with that phase of it and I would

submit that this fuel that is off-shore that is highly enriched -- I know the enrichment level is very hazardous -- can be easily turned into nuclear materials if it is diverted, or nuclear bomb-grade material. It needs to be put into a safe area. After hearing testimony today, I would say that we should only be looking at the 30 percent, not the 100 percent of the 20 or 21 metric tons to bring back into a safe area. Whether that's in the U.S. or somewhere else to reprocess it, it is, I think, up for negotiations with the U.S. government and the potential hosting States. In regard to utilizing packages for this work, I would submit to the DOE that they only utilize NRC certified packages that have been reviewed, and they do not use Certificates of Competent Authority through DOT for foreign packages, and they do not use DOE-certified packages. In addition to that, if the fuel is not well characterized, and I believe over two-thirds of the DOE fuel is not well characterized, then they should overpack this in another sealed containment structure that goes inside the transportation packages, which is also leak-tight. And, for example, that I can name off my head that affects the people in the State of Washington, K-basin fuel is in that classification. There are over 2100 metric tons of that fuel sitting over there, so that gives you an idea of the magnitude that we are talking about. One of my last points that I would like to make is that if DOE is going to utilize any ports, whether it is Tacoma, or Portland, or anybody else on the West Coast, they need to provide the funding levels to train the workers that are going to handle these shipments at each port of entry. For people's information, all transportation packages have radiation limits set by Title 10 of CFR 71 and I believe that all DOE packages that they would use for this potential action would fall into that category and meet those limits. Thank you. [applause]

LW: Our next speakers are: Rick Ryan, Roger Allen, Anita Preston, Andrew Munro, and Phil Watkins.

Dick Marzano: My name is Dick Marzano and I am President of the Longshoremen Local of Tacoma. I have a statement I would like to read, but before I do, I would just like to comment on a couple of things. First of all, a lot of gifted and talented speakers that have spoken before me have done an eloquent job and I agree with everything that they have been saying. It says here in the EIS on proposed nuclear weapons about how you can make a difference. And in it, I'll read one little, small, thing: "Your input on the DEIS will play a key role in DOE's and the Department of State's decision-making process." Then it states: "Does your input matter?" and on the very end -- I won't read the whole thing -- it says: "Yes, your input does matter." Then we've heard from the Port of Tacoma; we'll hear from the Longshoremen, the Puyallup Tribe, Citizens for a Healthy Bay, City Councils of Tacoma, Fife, Milton, Ruston, Federal Way, Pierce County Visitor and Convention Bureau, the Pierce County Chamber of Commerce and the Pierce County Central Labor Council. Every one of those agencies and Commissions have adopted resolutions or drafted policies that are saying simply: "No". They, gave you all...the Port of Tacoma, came and gave you time and effort and gave you Alternative 2 and what could be done. So, what I am saying, Mr. Head, is that, yes, there has been input and the State of Washington and the citizens feel they have paid their dues and we're saying "no". When our union was informed that we may be chosen as a port of entry for the spent nuclear waste, many questions immediately came to mind. The natural fear of what would happen if there was an accident and what precautions would be taken in order to prevent this from occurring. The Longshormen's Union of Tacoma is not only concerned with possible exposure to themselves if an accident would occur; we are also concerned with what devastation could happen to our community. Also, if any, what local agencies are trained to handle such an accident? Security is another concern. The Port of Tacoma has relatively easy access. Whereas the security in the two government ports under consideration, Military Ocean Terminal at Sunny Point, NC, and the Naval Weapons Station in Concord, CA, have a far superior degree of security already in place. This must be considered with today's social climate. The Puget Sound has two of the busiest ports in the nation, Tacoma and Seattle both being in the top ten in activity. Therefore, the amount of ship traffic should have been considered when choosing possible sites and we feel that this was not done.

Tacoma is proud of its port and the Longshore Union is equally proud of its accomplishments. It has taken years of dedication, cooperation, and hard work from city officials to laborers, from port officials to shipping companies. The entire community has contributed to making the Port of Tacoma achieve its major port status world-wide. We believe that to choose the Port of Tacoma as a port of entry for spent nuclear waste would turn that completely around, and that this could make companies take a second look at having their business in the Port of Tacoma. We have mentioned cost as being a factor and we wonder if you have given any consideration to what price we, in Tacoma, may have to pay? We loudly say: "The price is too high!". Thank you [applause]

LW: As our next speakers are coming up, let me say that I've just been told that we have to vacate this room at eleven. So according to my watch, it's a little after ten and we still have lots of people on the list although several people have traded their time . With your permission, I would like to suggest that those of you who have something that has not yet been said be thinking about how you would say things; and for those of you who have things to say that repeat or amplify something that has already been said, you might think about putting it in writing and submitting it rather than taking some of your neighbors' time here. That's just a suggestion, but keep in mind, we do have to get out of here in a little less than an hour and we've got a lot of speakers to go. So be generous to each other on your time.

Andrew Munro: Thank you. I think we've skipped a couple of people. I'm Andrew Munro with Congressman Norm Dicks' office. I'm pleased to be here. I want to read a statement, briefly, from Congressman Dicks, and I know that Congressman Dicks is following up with Secretary Grumbly regarding this issue and will be interested in hearing Mr. Head's report about this public hearing. I know what my report is going to be to him: It's very clear what the sentiment is. Without further ado, I'll read this statement from Congressman Dicks:

> "As a United States Congressman representing portions of the Tacoma/Pierce County area, I've received numerous communications from constituents and from public officials from this area strongly protesting the use of the Port of Tacoma as one of the points of entry for spent fuel shipments from foreign reactors. Let me take this opportunity to join them in their opposition and to urge DOE to look elsewhere for a more appropriate candidate site. My objections to the use of the Port of Tacoma as a port of entry are related to the nature of the port and to the selection process which I believe was overly biased in favor of bringing these materials into the United States. To begin with, the Port of Tacoma is the fastest growing container port on the West Coast and, as such, is a primary economic force in Pierce County and the entire Pacific Northwest region. In addition, it is a major transshipment port for military cargo during a mobilization, acting synergistically with Fort Lewis and McCord Airforce Base. Over the past several years, I have been supportive of actions which enhance the port's commercial intermodal capability and competitiveness, as well as the military capability that remains in reserve. Likewise, I have attempted to discourage the port from pursuing opportunities unrelated to those missions. In this regard, I believe that the spent fuel mission would detract from this direction in that it would require the unnecessary expenditure of scarce resources for the enhanced safety and security requirements of the fuel shipments. Moreover, I am not convinced that the DOE's EIS process resulted in a thorough enough evaluation of alternatives that are readily available outside the United States. After review of the DEIS document, I believe that closer examination of Alternative 2 should have been conducted, which appears to offer the clear advantage of encouraging a longer term solution to the issues of storage and reprocessing. With at least eight nations, other than the United

States, interested in a similar objective and willing to participate in this program, I believe greater priority should have been given to this international option in the EIS process. I will be discussing this and other related matters with Assistant Secretary Grumbly in the near future. But, I want to express my strong opposition at this time to proceeding with the evaluation of the Port of Tacoma option based upon what I consider to be faulty assumptions in the EIS process. Sincerely, Norm Dicks." [applause]

Phil Watkins: Mr. Head, ladies and gentlemen, my name is Phil Watkins. I am here on behalf of Congressman Randy Tate who represents the Port of Tacoma, the Cities of Fife, Federal Way, and some of the other communities that have been represented here tonight. The Congressman wanted me to be here on his behalf -- he's in Washington, DC -- and to make some brief remarks. Admittedly, briefer than they were going to be at 6:00 pm tonight. First of all, the Congressman wants to thank DOE for holding this hearing tonight. As you'll remember, the original plan was to only have one hearing on this issue in Sea/Tac. And the Congressman thought that it would be better if we had a hearing in Tacoma where the people who are most directly affected could be heard. He would also like to thank DOE for responding to several of his requests with reference to this issue, including his request that this evening's hearing be recorded and that the public comment period, be extended. These events are significant because they are all based on one fundamental principle: That government must be responsive to the people in our community. As we all know, the Port of Tacoma is one of the ten ports of entry under consideration for receiving these hazardous waste shipments. Shipping spent nuclear fuel through the Port of Tacoma, the sixth largest container port in the country and the Tacoma community is not a prudent approach. Hundreds of thousands of our families could be hurt in the event that a tragedy occurs. Our community is not prepared to handle some of the circumstances that could potentially occur. What would happen if the shipping cask or the nuclear waste was breached? What are the possible effects on humans and the environment? What agencies are responsible for putting out the fire, an explosion, or an act of terrorism? What are the plans if a catastrophe takes place? There are also other issues that need to be addressed, such as: Was a full and fair cost-benefit analysis performed? What does the risk assessment study say? Are our allies being asked to share the burden of storing and disposing of this spent nuclear fuel? The second critical issue in this debate is the final destination of any nuclear hazardous waste delivered through the Port of Tacoma. Hanford is struggling with the financial burdens of its cleanup. The Idaho National Engineering Laboratory has also expressed concerns with receiving shipments of the radioactive waste. Congressman Tate looks forward to working with the City of Tacoma, the Port of Tacoma, the surrounding community, Congressman Dicks, and other members of this delegation on this very important issue. Again, thank you for giving us a chance to make our remarks tonight. I have extended written remarks for the written record. [applause]

LW: Would the omission of three speakers mean that those speakers elected not to speak or are they going in a different order? Rick Ryan, Roger Allen, and Anita Preston.

Anita Preston: Thank you. I'm Anita Preston, Anita W. Preston, and I am a lifetime native of Tacoma, and I live in old Tacoma near the Commencement Bay. In fact, it's in about my backyard. So speaking of having something in your back yard, believe me, this is a big thing in my back yard. Especially with the shipping lanes if these ships come in with the nuclear waste. But, the effect of any nuclear accident would be much more extensive than in just my backyard. As we heard tonight, it may cover an area of 900 square miles. That's a pretty big one. Referring to the comments in the EIS, and I refer to Page 9, the 'No Action' selection is my preferred choice. I haven't heard that much tonight. 'No action', someday I'm going to see that somebody's going to pass that alternative "no action". So I keep trying. The second choice is Management Alternative No. 2, and that's to keep the nuclear fuel overseas and

have it monitored there. Primarily for public health, I strongly oppose the nuclear fuels from being transported through the Port of Tacoma. In addition, I oppose the storage of the fuels at Hanford, Washington. The State of Washington has done more than its share in dealing with nuclear waste. You've heard tonight, many comments, and I'm not going to go into any detail anymore because you've heard so much already. It concerns me also that the DOE has not provided funding for the local implementation of safety training, and monitoring, and providing necessary equipment for emergency personnel - completely omitted. There is also concern of tarnishing the image of Tacoma, and we have been improving this steadily in Tacoma. We've had problems in the past, and we've tackled them, and we've done pretty well with doing things like the odor of Tacoma, etc., and this has changed a lot and we don't want to have anymore problems. So I urge the DOE to not appoint Tacoma for their nuclear port of entry. Thank you. [applause]

LW: Are there other -- Rick Ryan or Roger Allen. Okay, we have five more speakers on the list: Jerry Farm, John Avery, Lynn Healey, Harold Moss, and Whitney DalBalcon.

John Avery: I'm John Avery, I assume that the gentleman before me is not here, so I'll go ahead. I'm with the North-end Neighborhood Council and we're the folks who passed around of these petitions and got the information out. We wanted to make sure that the citizens of Tacoma came to this and I'm just delighted. We've had so many people here tonight. Not only the two hundred and some that this auditorium holds, but I want you to also know that there were 75 to 100 waiting outside that couldn't get in. I want to present Mr. Head and the DOE 858 signatures on a petition against having the waste shipped through Tacoma, and over 130 comment cards that people have taken the time to write -- all of them expressing opposition to having this waste coming through our town. I'm not going to take a lot more time. I think though, to summarize, there are questions of safety, and the handling of this waste, and those answers have not been adequate. I think there are questions of equity, of our allies dealing with this in an equitable way, and those questions have not been answered. And may I say, that as a person who has spent a lot of time in countries in the world, I think that we can trust that we have environmental allies in countries like the United Kingdom, France, Sweden, Japan, Denmark -- I know we do -- and those are good people, and they will help us to come up with solutions. I think if we stigmatize them as using negative ways of dealing with this waste, we do them a disservice. I think there are questions of believability. We've had debacles in this state with the WPPSS scandal, the whole Hanford situation. We've had eloquent people expressing themselves from eastern Washington tonight, obviously having suffered from that. And I think they are right in questioning the believability. Those answers have not been adequate. We have questions of security. How are we going to deal with this? How are people going to be trained? What about cleanup? Those answers have not been adequate. So I urge DOE and, basically, as a citizen talking to his government, to our government, I urge you all to listen to the citizens, reconsider the alternatives, and not bring this waste through Tacoma. Thank you. [applause]

LW: Okay, let's see, where are we..Lynn Healey...is Lynn Healey here? Okay, Harold Moss, you're on.

Harold Moss: It's been a long evening, but a good one. I come just to remind you of what really is important. Technically, we can talk about your engineer being smarter than my engineer. My engineer has a better idea than yours. You can talk about all the technical, split-hair issues that you want to. And you can talk about public safety, and you can parade everything you want to in front of this body. There are two issues: One is the technical issue of how can we retrieve spent fuel from overseas. How can we make those countries who exhibit capability for handling it themselves handle it themselves? And,

how can we safely retrieve what's left from those countries who cannot? The second half of that thing is: 'Us'. That is the political decision that will be made. Remember, when the decision of what port is going to be used it will be a political decision. Political! That is where we come in. The lady who got up and said they wanted to put a nuclear plant in Scagit country and defeated it spoke to the issue that is before all of us. This campaign starts tonight -- doesn't end. I think it was wonderful that we filled the house and that we, in our way, directed our responses and our concerns to Mr. Head, but he alone will not make this decision. This is a political decision. That means that we not only send the message tonight, we must be prepared to send that message repeatedly. You are going to have to write. You're going to have to stay on our political, our legislative bodies. You're going to have to continuously send in those letters to your Congress-people, to your Senators, to the President, and to Mr. Head. If you fail to do that, we all may be looking at the loss of our own identity. We may face the loss of the identity that we have worked so hard to put in place. And that is a decent community, a safe community, one that takes its responsibilities very seriously. We have not come through this far to now turn it over to become somebody's dump. But, the only way we are going to do that is to get the attention, and keep the attention of those who are actually going to do the voting as to where this nuclear dump is located. As a Mayor of the City of Tacoma, it's been such a pleasure to work towards the improvement to our city. I see this as a major threat. Just a major threat. Not so much from the security, not so much from the safety. I see it as a major threat to every effort that we make, to every effort that we make to make this a livable community. I urge you to take it someplace else. I'd like to... well I can't do this... okay. Thank you very much. [applause]

LW: Whitney DalBalcon? Okay. We're getting down to it. The next five are: Nancy Watkins, Rosa Franklin, Claire Petrich, Tom Martee, from the Peninsula Neighborhood Association, and Mike Kriedler, who has already spoken.

Henry Yates: Hello, my name is Henry Yates. I am taking the place of Rosa Franklin. She graciously gave me her time. I'll be brief. I am representing the port to the north, the Port of Seattle. I'm the Director of Public Relations for that port. In 1986, the Port of Seattle passed a Resolution that strongly objected to the presence of high-level nuclear fuel waste within waters of the State of Washington. We stand by that resolution. We support, very strongly, the position that has been taken by the Port of Tacoma in regard to the waste coming to this particular port. There's currently, now well defined and widely understood, a comprehensive, coordinated policy -- a plan -- among Federal, State, local, and other government agencies that will assure the safe shipment of this material. Not only are we concerned about the safe handling of it, but we're also concerned about the commercial impact of bringing this particular waste into the waters of Puget Sound. The Ports of Seattle and Tacoma, as you know, are linked by Puget Sound. They are only 30 minutes away from each other. We have been very successful at building a strong and vibrant business, mostly containers and other types of cargo. We can compete and do compete with other West Coast ports very successfully. As most of you know, our cargo, the cargo that comes through the Ports of Seattle and Tacoma, doesn't really have to come here. Most of it can come to just about any West Coast port. We have worked hard to get the cargo that we get through our docks into our ports. An accident with this sort of material or simply a work stoppage that's related to this sort of material could damage the reputation that we have around the world for being premier container ports. And that cargo that I just mentioned, that could go to other West Coast ports, just might do that. The Port of Vancouver, BC, in spring of 1996, will be doubling its capacity to handle container cargo and other kinds of cargo. Again, this sort of material -- a problem with this sort of material -- would make the Port of Vancouver a pretty attractive place for the other kinds of cargo, the container cargo that we get, to go through. We don't want to create a situation like that. What ends up happening is: Not only does the cargo go through ports like Vancouver, the container cargo, the big

container cargo, go through ports like Vancouver, but the jobs that are so much needed in our community do, as well. We urge you to evaluate other ways of handling this material and we strongly oppose its coming through the Puget Sound Area, the Port of Seattle, the Port of Tacoma. Thank you. [applause]

Claire Petrich: Thank you. I'm Claire Petrich and I'm here tonight as Chair of the Port Industrial Committee which is a Committee of the Tacoma Pierce County Chamber of Commerce. The Chamber of Commerce represents business owners -- small business owners and large business owners, hundreds of them -- and also all of the employees of those businesses within Tacoma and Pierce County. The Chamber of Commerce promotes an environment that's good for business. We promote an environment that is good for manufacturing, for jobs, for development, for services. And with that as our purpose, the Board of the Chamber of Commerce has voted to oppose the importation of spent nuclear fuel through the Port of Tacoma as not in the best interest of the region or of this community. We are opposed to it for a number of reasons many of which have been mentioned tonight. But, I will repeat a couple of them. First, we are opposed because of the health and safety issues that have been mentioned innumerable times this evening. We are also concerned because of the commerce that goes through the Port of Tacoma. It has been mentioned what the impact of the radiation in the spent nuclear fuel rods can be on individuals. What has not been questioned is the impact or the effect, in fact, of those shipments on other cargo that is placed aboard the commercial vessels that will be shipping them into this port. We don't know the answer to that. Our longshoremen have refused to handle the containers, the casks, that will be brought through with spent nuclear fuel. Does that mean, also, that other cargoes aboard other commercial vessels might be impacted? We do not want to see businesses impacted in a negative way in our community. We are concerned also because by identifying such trans-shipment points such as the Port of Tacoma, and also then stating that we have security concerns, we feel that security has been compromised in that way. We are concerned because no provisions have been made to fund or to train nuclear HAZMAT teams locally. We are concerned because transportation routes that travel through high population areas and both road and rail in our Puget Sound area are nearing capacity. Our community, the businesses in our community, our city government, and environmental groups have worked hard to cleanup environmental toxic wastes. We've worked hard to cleanup arsenic, PCPs, lead, and other items that are in our soils and in our waters. We believe that these are nothing, absolutely nothing, compared to the devastation that could occur should there be a nuclear accident in this community. To conclude, the Chamber of Commerce stands for the exchange of goods and services that are promoted throughout our community, throughout our country, and throughout our world. We categorically reject commerce in this particular instance that threatens our future and that we see to be of no benefit to our community. Thank you. [applause]

LW: I feel like a football umpire, flipping the thing on --now I do the hand signals here. Alright, Tom ...the State Representative from the 2nd District - Tom Campbell, Marilyn Rasmussen -- let me just read all the rest of the names and we'll see who is here. Tom Campbell, Marilyn Rasmussen, Laureen Roth, Leonard Holden, David Price, Henry Yates has already spoken, and Stephanie Smith - that's it!

Tom Campbell: My name is Tom Campbell. I'm a member of the House of Representatives of the State of Washington, and I'm here tonight to categorically say that, Mr. Head, we would appreciate it if you would take your fuel dump or toxic waste dump and take it somewhere else. Without a doubt, we have faced many problems in this State. And this is one, that I think you've heard from many of us: That we simply do not, and wish not, to try to find a way to solve it -- it's not our problem! We do have enough nuclear waste in our State. It really comes down to a matter of trust and a matter of confidence. Being an Army veteran, I often think about those members of the 82nd airborne who were asked to walk over the ground zero back at the Nevada Test Site and they were told that it was a minimal risk. It

wasn't a problem. Most of them aren't with us today; most of them are dead from cancer and related diseases. The downwinders have been here and they've told us a little bit about their story. They continue to suffer and die as a result of an unknown risk. In my private life, I'm a Doctor of Chiropractic and every year I'm updated about exposure to x-ray because that's part of my job, and we're told every year that maybe last year's was a little too high. So what we know today certainly is outdated by tomorrow. And I don't think we can have any confidence, Mr. Head, of being told that these exposures are, in fact, acceptable. I contend that any exposure is an unacceptable amount. This policy, frankly, is ridiculous -- that we have to, once again, be the policemen of the world. Have we learned nothing from the Vietnam experience? Have we got to the point where we have to go out and make moral judgments for everyone else to decide what is best for them? I think from what we heard tonight, that we've got enough problems here. We certainly haven't done a very good job with our own nuclear waste. I would certainly like to see that industry start winding down at the very least. And, I would like to see us take care of what we have, not bring in millions and millions of metric tons of more waste that could definitely cause death and destruction in our country. Again, being a Washington resident and thinking about that nuclear waste flowing into the Columbia River, at the very least causes a great level of discomfort, as well as the unknown of what's going to happen with that. I guess, to really sum this thing up, is do we really trust the Federal Government do the right thing, to tell us what we need to know, and that our community will be safe? I contend, Mr. Head, that we do not trust the Federal Government even close to that. We're tired of being pushed around and being told, frankly, after the fact that we are a site for this ridiculous policy and that we, the people of the State of Washington will have to find a way to deal with it and pay for it. Although, frankly, that is a secondary issue to me, payment of it. I want to let you know that the State of Washington, and I'm speaking now as a State Representative, we'll fight you. We will go forward within the State Legislature, if necessary, as well as the Governor's office -- I will go to the Governor's office, and I'm not alone, there are many of us in the Senate and the House that feel exactly the same way. We feel you are way beyond your authority in doing this, frankly, and I am going to talk about policy and not technical details because it was said so well by our Mayor. It's not a technical matter, it's a people matter. And, we the people say: "No!". We'd ask you to take your nuclear waste and leave. And please, don't take it into the borders of this state. We will not stop. And, if you think that the people in the state of California put up a fight -- look out! We are a nice, easy-going people, but when we're riled, we're right there until the finish line and we won't quit. Thank you. [applause]

Marilyn Rasmussen: Thank you. For the record, I'm Marilyn Rasmussen and I'm a State Senator from the 2nd District which is just south of here, and it does have our beautiful Mt. Rainier. But, I chair the Agriculture Committee; I serve on the Transportation Committee; I also serve on Freight and Rail, and I had the major bill this year to help freight rail, and all their infrastructure across the State. And what I submit to you, is that you're going to leave a paper trail. Not just in Tacoma, but across the State. A paper trail that will go on for generations and generations. I come from rural, rural Pierce County, and we're farmers. We protect our environment, we care about out environment. I'm really embarrassed and ashamed that the bureaucracy hasn't listened from the last meeting they had in our city. I'm really embarrassed and ashamed, as a taxpayer, that the bureaucracy is so far behind that they send out inadequate, not accurate descriptions of what our port is all about. And, I guess I am ashamed and I'm embarrassed, as a legislator that helps fund, helps do the policies that come through to us that this is something we have to deal with. I sent you a letter, I submitted a letter tonight, and I am also part of the letter from the other senators from this area. I think you have heard from the people, and our Mayor Moss said it very well when he said that it is people and it is political. We don't want the paper trail. We don't want this here. Last week we had Secretary Pena come to the Port of Seattle and I sat and listened to him talk about transportation issues. That was on Thursday. On Friday, Secretary Glickman

was here. He is head of the Department of Agriculture. He came to talk about agriculture in this State. Where is our Secretary of Energy? Is he going to listen? If he doesn't, I'm embarrassed and ashamed. But yes, as Representative Campbell said: "We will fight you." It will not happen, and I guarantee it, it won't happen. But, take these words back. Of all the people that came here to speak, take them back, and if they're recorded, as you say they are, have him listen to it. This is a beautiful state and this is a beautiful country. Let's not let the bureaucracy ruin it. Let's let the people say what is best for this country because they do know best. I have to tell you that, as far as being a farmer, I'm very, very, proud of what the Port of Tacoma and the Port of Seattle does for our industry. We export 70 percent of all the agriculture that is produced in this State. We export it, mostly through our ports. And, we don't want our apples alongside of your nuclear waste. It just doesn't sound good. I can't go home to my kids and my grandkids and say: "You didn't listen and you don't care." So please, I implore you, take the message back and let's not waste people's time with more meetings like this because I think that this meeting was very well attended tonight. I think everyone here spoke from their heart and they told you how it's going to affect our beautiful city, our countryside, the paper trail across our State. We have worked hard. We have worked hard to make the best use of our tax dollars in this State, for our wonderful quality of life. A third of the people that live in this state didn't live here 10 years ago, so we're fighting with a lot of growth and we acknowledge that, and we work to make this a better State. So, I implore you. Just say: "No"- okay? It won't work. Thank you. [applause]

Stephanie Smith: Wow, I wasn't expecting to be last! My name is Stephanie Smith. I'm a 21 year old college student; I'm a mother, and a wife, and a voter. I'm a representative of my generation and we're sick and tired of environmental accidents. These accidents have been caused by overworked and untrained handlers of toxins. It's ridiculous! Coincidentally, I just finished an environmental science class at my college. So all the statistics are pretty fresh in my mind, still. The pollution of Puget Sound is inexcusable and possibly irreversible. Don't you think we've abused Puget Sound enough? It's getting pretty bad out there. I'm begging you to reconsider Tacoma as a possible route and to think about the health of the public instead of the amount of money that you can save on safely transporting this waste. In the past, we've trusted you guys to come up with reliable ways to store high-level nuclear waste. Most of them are leaking now. As a citizen of this planet, not just Tacoma, I don't trust you. Please reconsider, and if you do import, no matter what port you use, keep the people and the wildlife safe. Thank you. [applause]

Laureen Roth: I'm Laureen Roth and I have been a political activist since the 1950's. I oppose this, the transportation of this waste through our city, and I agree with most of the people who are opposed to it that have spoken before. And I question our ability to store this stuff safely because you haven't been able to do that at Hanford. It's a mess over there. They're still trying to clean it up. It's leaking into the Columbia River. I've followed that since the 1940's. I've heard nothing, but no information or misinformation. You have not been forthright with the American people. You have not been forthright with the citizens and I take with a grain of salt the information and the statistics that you give to us now. The people that were put in danger over in the Hanford area and lied to over the years about the effects, and not given the information to take their families away from the danger over there, and not been informed by our Federal government makes me ashamed, ashamed of our government. And, I am a very patriotic and staunch supporter of our form of government. I am the State Committeewoman for Pierce County from the Democratic Party. I'm active at the National, State, and Federal levels of the Democratic Women -- Federation of Democratic Women -- and have held offices in those areas. And I'll tell you now, if this comes through the Port of Tacoma, we will fight this to the last ditch! And I will be there at the forefront to fight it. [applause]

David Price: Howdy, I'm David Price. I was born here, raised in the area, and been a resident most of the time since 1971. I am a downwinder. I worked at Puget Sound Naval Shipyard for a number of years around radiation, and I do distrust the DOE. That being said, I would like to ask the audience -- think about this: Ft. Louis, McCord, Bremerton, and Bangor have radioactive elements and weapons and fuel there. How did it get there? Okay. How did it get there? Have we been damaged by that? I think that I've heard in the testimony here that there is probably better alternatives. But, if those alternatives are not viable, shipments, if small enough, could be done safely and it could create a lot of good paying jobs in the area. Thank you.

LW: That completes the list of people who had signed up to speak. Is there anyone who didn't have an opportunity to sign up who has a brief comment?

Audience Member: [barely audible -- away from microphone] I'd like to put in my two bits. I've taught school here in Tacoma for 21 years. To augment my teaching in the classroom, I prevailed upon my wife to part from some of our hard-earned cash and I bought that little [sailboat?] you saw coast through the marine parade a few years ago. I find that teaching youngsters in the out-of-doors with sailboats is the easiest way to give grades. You send them out sailing and you come back (?). This is no place for those nuclear aberrations that will reduce the quality of the students who we have to teach. Heaven knows they're bad enough as it is.

Jack Fabulich: I'm one of the Port Commissioners also. I'm just real pleased that you all showed up. I think that we had to send Mr. Head a message, and I think he got it very well. I do appreciate -- he took a lot of gruff tonight -- that's what he gets paid for. You've got to have a message, and I think the message is clearly loud and clear. Believe me, I was very impressed with some of the comments that I hadn't even thought about, and we studied the issues with Mr. Robinson, who is very knowledgeable, so I just say, I think your letter that I received back from you, the one that we asked about -- you know the night that we had the first meeting. That you had some people here that were representing DOE that couldn't answer the simple question that we asked -- that if there was a cask that did have a leak what would happen to the people who would be exposed to it? And they said: "Well, you know, it has not happened", but the event in Oklahoma did not happened before either. I guess our message is, and my message is, just tell me, if I'm standing 2 feet and that cask happens to get blown up or there is a crack in it, what is my danger? And, they said we'll get you an answer to that in three days. That is when I thought we had a bit of a problem. So, with that, I hope you take that message back to the people, and we are very willing to work with that Alternative 2. I think there are some other things we can add to that -- shipping knowledge. Shipping to these countries that are available to take the fuel and reprocess it. That's our opinion. Thank you.

LW: And thank you all for participating, for coming out. It's been a long evening. You've been very patient. They've got your comments. Thank you so much.

ATTACHMENT 2

ATTACHMENT 2
Port and Transportation Accident Analyses of Additional Military Ports

In response to public comments and concerns that the EIS did not adequately consider the use of military ports, eight additional military ports were considered. The selected additional military ports are: the ports of Bremerton, Everett, and Port Hadlock, WA; Port Hueneme, CA; Kings Bay, GA; Mayport and Pensacola, FL; and Yorktown, VA. Additional evaluations addressing the incident-free and accident impacts associated with the transport of foreign research reactor spent nuclear fuel through these eight military ports to the management sites were performed.

Port Activities Impacts

The incident-free risks associated with both at-sea transport and in-port handling of foreign research reactor spent nuclear fuel, as documented in Appendices C and D of the EIS, are applicable to the eight military ports. If military ports were used, there would be no intermediate stops at other U.S. ports. The at-sea accident analysis and results presented in Appendix C of the EIS are applicable to any ports selected.

Port accident impacts were estimated using the MACCS computer program with site-specific population and meteorology as were done for the 13 port cities modeled in Appendix D of the EIS. A summary of mean consequences and risks for port accident analysis is presented in Tables 1, 2, and 3. These results indicate that the consequences of an accident at any of the eight ports is comparable to the range of consequences for the same accident at the similar (intermediate to low) population density ports analyzed in the EIS. For example, among the eight military ports analyzed, for the accident severity category 6, the consequences ranged from a high of 2,600 person-rem (for Port Hueneme, CA), to a low of 55 person-rem (for Pensacola, FL). This compares to a range of consequences from 27 person-rem (for MOTSU, NC), to 6,510 person-rem (for Port Elizabeth, NJ) for the same accident, (see Table 4-6 of Volume 1, or Table D-46 of Appendix D, of the EIS).

Figure 4-1in Section 4 of the EIS presents a consequence versus population curve for population dose within a 16 km (10 mile) radius of the ports. The correlation identified for the 13 port cities analyzed in the EIS holds for these additional eight military ports. When plotted on this figure, the consequence data (population dose) for these ports fall on, or near, the curve generated in the EIS.

Consistent with the approach presented in Appendix D, Section D.5.4.3.2 and Attachment D5 of the EIS, additional analyses were performed to estimate the range of consequences associated with even more improbable accident scenarios, i.e., high temperature fire involving a spent nuclear fuel transportation cask (accident severity categories 5B and 6B). The results for a high temperature accident for the Port of Elizabeth, NJ, is given in Appendix D, Section D.5.4.3.2. The mean consequences of a similar accident at the eight military ports, as presented in Table 4, range from about half, to slightly less than ten percent, of the consequences estimated for the Port of Elizabeth, NJ. These consequences are within the range of those evaluated in the EIS.

Ground Transportation Impacts

The transportation routes, including accident and incident free risks, were analyzed as described in Appendix E. Truck and rail routes were analyzed, using the HIGHWAY and INTERLINE codes, from the node nearest the port to the DOE management sites. No new rail analysis was done for Mayport, FL because the port facilities are not served by rail. The spent nuclear fuel would have to be transported to the same rail node used for the Port of Jacksonville. Table 5 shows the route distances, and is directly comparable to Table E-3. Table 6 summarizes the population along these routes, and is directly comparable to Table E-4.

As described in Appendix E, the RADTRAN 4 computer code was used to analyze the radiological risks associated with overland transportation. Table 7 lists, on a per shipment basis, the incident free risks associated with transporting spent nuclear fuel from the ports to DOE management sites. Table 7 is directly comparable to Table E-8. The accident risks, also determined using the RADTRAN 4 code, are listed in Table 8, which corresponds to Table E-9.

Table 8 lists the non-radiological risks associated with incident-free emissions and vehicle accidents. The analytical results shown in Table 8 can be compared with Table E-10. A comparison of the risk factors from the eight military ports to the risk factors from the ports considered in Appendix E shows that the risk associated with using any of these eight ports falls within the bounds calculated in Appendix E. The public risk associated with the use of any or all of the eight military ports does not differ significantly from the risk associated with using any or all of the previously identified ports.

Yorktown	6700	2500	2500	3.1	1.1	0.46	6.4E4	2.4E4	2.7E4	29	11	12

a 1.3E4 means 1.3×10^4 or 13,000.

Table 5 Summary of Route Distances for Truck and Rail Modes

Shipments to Kings Bay					
Route	Distance km (mi)		Percentage in Zone		
			Rural	Suburban	Urban
From Eastern Ports					
Truck:					
Mayport, FL	4,745	(2,964)	84.3	14.4	1.3
Kings Bay NSB, GA	4,685	(2,926)	85.9	12.8	1.2
Pensacola, FL	4,430	(2,767)	85.1	13.5	1.4
Yorktown, VA	4,665	(2,914)	85.6	13.2	1.3
Rail:					
Kings Bay NSB, GA	4,942	(3,087)	82.6	15.3	2.1
Pensacola, FL	4,430	(2,767)	90.8	8.2	1
Yorktown, VA	4,717	(2,946)	83.1	14.2	2.7
From Western Ports					
Truck:					
Bremerton, WA	451	(282)	68.2	27.2	4.6
Everett, WA	397	(248)	69.5	26	4.5
Port Hueneme, CA	1,952	(1,219)	82.2	14.8	3
Port Townsend, WA	536	(335)	67.8	28.2	3.9
Rail:					
Bremerton, WA	669	(418)	82.3	15.4	2.3
Everett, WA	717	(448)	67.9	23.2	8.8
Port Hueneme, CA	2,030	(1,268)	75.1	17.3	7.7
Port Townsend, WA	666	(416)	72.4	20.4	7.3

Shipments to Idaho National Engineering Laboratory					
Route	Distance km (mi)		Percentage in Zone		
			Rural	Suburban	Urban
From Eastern Ports					
Truck:					
Mayport, FL	4,076	(2,546)	83	15.5	1.4
Kings Bay NSB, GA	4,017	(2,509)	84.9	13.8	1.3
Pensacola, FL	3,762	(2,350)	83.9	14.7	1.5
Yorktown, VA	3,998	(2,497)	84.5	14.1	1.4
Rail:					
Kings Bay NSB, GA	4,063	(2,538)	84.3	14.7	1.1
Pensacola, FL	3,503	(2,188)	90.6	8.4	1
