Savannah River	SR
Oak Ridge	OR
Portsmouth*	Ports
Idaho	ID
Richland	RL

How this book is organized:

The first sheet behind each tab presents the site footprint reduction scenario and comparison with the base case. The second sheet(s) shows the analysis of the footprint reduction scenario using HQ subproject level data. Original information provided by the site is shown behind the "Site Submittal" coversheet. Footprint reduction scenarios were developed at Headquarters for sites marked with an asterisk above in the table of contents.

EM Footprint Reduction Scenarios

[redacted]

Small Sites							
Brookhaven	Completion of EM work	$20	107	$54	266%	$31	• Accelerates decommissioning of the High Flux Beam Reactor (HFBR) by 9 years (from 2020 to 2011) • Savings from reduced surveillance and maintenance (S&M) for High Flux Beam Reactor (HFBR) and Brookhaven Graphic Research Reactor (BGRR) (EM is not required to pay for BGRR S&M as long as HFBR is not decontaminated and decommissioned) • Also reduces costs from base operations and grants
West Valley*	Completion of cleanup	$138	922	$49	35%	$15	• Accelerates completion of cleanup by 2 years (from 2018 to 2016) and eliminates three years of surveillance and maintenance costs • Only remaining activities at site are storage, and ultimately shipment, of high level waste canisters
Moab	Acceleration of site work	$218	785	$172	79%	$32	• Site closure accelerated by 9 years • Associated surveillance and maintenance costs are reduced
NTS	Completion of site cleanup	$107	507	$72	68%	$19	• Soil remediation accelerated by 4 years • Groundwater remediation accelerated by 1 year • Program management costs reduced
Large Sites							
Savannah River	Footprint reduction/D&D (Avoids cost to fully D&D five reactors)	$1,926	10,727	$3,150 -($1,720 w/o D&D efficiency)	164%	$965 ($113 w/o D&D efficiency)	• Accelerates decontamination, decommissioning and remediation of the C, D, M, P and R Areas (and reactors) by 7 years • This case also reflected in-situ decontamination and decommissioning (ISD) of five reactors • Includes efficiencies similar to recent experience at INL on similar nuclear facility and reactor decommissioning projects • Reduces site footprint 90% from 263 square miles to 31 square miles • Avoids the cost of full decontamination and decommissioning of five reactors
Oak Ridge (Total)	ORNL, Y-12 and ETTP Footprint Reductions	$934	6,225	$722	77%	$302	• Accelerates decontamination and decommissioning for the Oak Ridge National Laboratory Central Campus, the former uranium processing facility known as Y-12, and the East Tennessee Technology Park (ETTP)
Oak Ridge (ORNL)	ORNL Central Campus Footprint Reduction	$371	2,473	$375 ($322 w/o D&D efficiency)	101%	$164 ($120 w/o D&D efficiency)	• Brings 95 Office of Science Integrated Facility Disposition Project (IFDP) facilities into EM scope earlier and accelerates demolition of Central Campus facilities by 7 years • Includes a 10% workforce efficiency improvement on additional scope • Reduces infrastructure, liquid waste processing, and surveillance and maintenance costs
Oak Ridge (Y-12)	Y-12 Footprint Reduction	$316	2,105	$229 ($183 w/o D&D efficiency)	73%	$64 ($46 w/o D&D efficiency)	• Two of the highest risk Integrated Facility Disposition Project (IFDP) buildings at Y-12 (Alpha 5 and 9206) are added earlier to existing EM scope (Alpha 4) and demolition is accelerated by 7 years • Includes a 10% workforce efficiency improvement on additional scope • Reduces infrastructure and surveillance and maintenance costs
Oak Ridge (ETTP)	ETTP Footprint Reduction	$247	1,647	$118	48%	$54	• Accelerates demolition of the K-25 and K-27 gaseous diffusion process buildings and remaining support facilities by 2 years • Reduces base operations, safeguards and security, and surveillance and maintenance
Portsmouth	Site Acceleration	$274	733	$1,596	583%	$483	• Accelerates start of Process Building decontamination and decommissioning from 2012 to 2010 and reduces duration from 22 years to 10 years • Reduces associated surveillance and maintenance costs

EM Footprint Reduction Scenarios

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Idaho	Site-wide Footprint Reduction	$221	1,473	$287	130%	$76	• Accelerates deactivation and decommissioning • Assumes a continued attainment of cost performance indicator of 1.5 ($1.5 worth of work completed for $1) • Reduces footprint by 68% from 775 acres to 247 acres by 2017 • Supports achieving all transuranic waste Settlement Agreement requirements by 2018
Richland (Total)	River Corridor and PFP Footprint Reductions	$338	2,256	$1,054	311%	$688	• Richland business case consists of two distinct cases, one for the River Corridor and one for the Plutonium Finishing Plant (PFP)
Richland (River Corridor)	River Corridor	$131	876	$822	626%	$559	• Accelerates completion of the River Corridor Project by 4 years from FY19 to FY15 • River Corridor decontamination and decommissioning excludes 300 Area facilities (Office of Science is taking responsibility for them) • Reduces site footprint 67% from 586 square miles to 75 square miles
Richland (PFP)	PFP Footprint Reductions	$207	1,381	$232	112%	$129	• Accelerates demolition of the Plutonium Finishing Plant (PFP) and remaining support facilities by 4 years from FY19 to FY15 • Capitalizes on efficiencies of currently trained plutonium-qualified and cleared workforce
Total		**$4,176**	**$23,736**	**$7,156**	**171%**	**$2,611**	

* Worker-year calculations are half of other sites due to high non-labor costs (e.g. equipment or waste shipments)

Brookhaven Site
BRNL-0041 "HFBR" Acceleration Business Case

Summary
Proposal to move HFBR D&D workscope forward from 2018 – 2020 to 2009 – 2011. Accelerating this work scope and performing it concurrently with BGRR D&D work will result in $9.3 million in cost savings in the form of increased efficiencies (lower demobilization/remobilization costs) and ecomonies of scale.

Baseline; Current Site Position: (FY 2008 thru FY 2025; $158,500K Life Cycle Cost)

- Continue O&M for BRNL-0030 (from $7M - $3M per annum)
- Continue BRNL-0100 for NY State Grant for regulatory support ($150K per annum)
- Complete BRNL-0040 Reactor D&D in FY 2010 ($43.8M)
- Complete Near Term scope of BRNL-0041 CCB removal & WLA remediation in FY 2009 ($9.9M)
- Complete Out Year Baseline scope for BRNL-0041 D&D in FY 2020 ($21M - $47.5M)
- Transfer all projects (BRNL-0030, -0040, -0041, -0100) to SC in FY 2021
- Assume EM Program Funding through FY 2025 (not in Brookhaven's Baseline)
    a. Includes 5 years of Site Min-Safe funding after all EM scope has completed per agreement with SC.

Acceleration Scenario: (FY 2008 thru FY 2012; $86,100K Life Cycle Cost)

- Maintain overall Baseline funding requirement in FY 2009 in support of current Site position
- Apply an additional $21.4M of Near Term funds and complete BRNL-0041 in FY 2011
    - FY 2009 $5M
    - FY 2010 $10.7M
    - FY 2011 $5.7M
- Establish a HFBR acceleration savings of $9.3M (Out year cost $30.7M vs accelerated cost of $21.4M)
- Complete full D&D of BRNL-0040 in FY 2010 as planned, and BRNL-0041 in FY 2011
- Transfer all current EM scope to SC in FY 2012. (13 years sooner)
- Total EM Site cost avoidance of $72M, including avoided site min-safe costs. (see backup for details)

Calculations for Investment, Savings, and ROI %

December 2008

Brookhaven Near-Term Completion:
- Accelerates demolition of the High Flux Beam Reactor (HFBR) by 9 years (from 2020 to 2011).
- Reduces base operations, surveillance and maintenance, and grants.

PBS Cost Avoidance; FY2025 vs FY2012	
-30	52401
-40	4943
-41	13094
-100	1950
	72388

Analysis Summary	
HFBR cost to end in FY2025	38403
HFBR cost to end in FY2012	[redacted]
HFBR Funding Cost Avoidance	13094
Sitewide (all PBSs) cost to finish HFBR in FY2025	158497
Sitewide (all PBSs) cost to finish HFBR in FY2012	86109
Sitewide (all PBSs) Cost Avoidance	72388

Data Facts:

1 Figures do not include SC overhead dollars (SC is not a contributor to the above funding requirements)
2 BRNL-0030, 0040, 0041 EACs provided by BSA
3 BRNL-0030 currently in O&M (Min Safe)
4 BRNL-0040 & 0041 Baselines validated (ICE and IPR)
5 BRNL-0040 & 0041 at CD-3
6 BRNL-0030 scope (FY08 thru FY25) includes: 200K hours of BSA labor, $4.5M for space, fuel, elect, services, etc. Plus subcontractor expenses.

Project Mgmt
O&M, and monitoring of up to 16 GW treatment systems and approx 725 GW monitoring wells
Maintenance & monitoring of 3 capped landfills
Post cleanup monitoring of the Peconic River
Implement/monitor of institutional controls & surveillance of S&GW cleanup areas
Records management, regulator/stakeholder participation & communication

7 BRNL-0040 & 0041 out year S&M (Min Safe) tasks include facility environmental monitoring, structure integrity and safety, active systems and controls surveillance and maintenance.

Acceleration Assumptions: (Finish all Projects by FY 2011 and transfer to SC in FY 2012)

Scenario A: HFBR Completion in FY 2020

1 BRNL-0040 will complete D&D in FY 2010 as planned
2 BRNL-0041 will complete D&D in FY 2020 as planned
3 Xfer all EM scope to SC in FY 2021
4 EM liability ends in FY 2025

Scenario B: HFBR Completion in 2011

1 BRNL-0040 will complete D&D in FY 2020 as planned
2 BRNL-0041 D&D will start in FY 2009 & complete in FY 2011 (vs. FY 2020)
3 BRNL-0041 D&D will see a ROI of approx. $9.3M for the DOE ($30.7M - $21.4M)
4 Target Xfer of all current Brookhaven EM projects to SC in FY 2012 vs. FY 1021
5 Target EM liability ending in FY 2012 vs. FY 2025
6 Total cost avoidance for EM approx. $72M.

WV

West Valley Demonstration Project

Calculations for Investment, Savings, and ROI %

December 2008

West Valley Near-Term Completion:
- Accelerates completion of cleanup by 2 years (from 2018 to 2016) and eliminates three years of surveillance & maintenance costs
- Only remaining activities at site are storage,

Savannah River Footprint Reduction:

- Accelerates completion of C, D, M, P and R areas (and reactors) by 7 years
- Reduces site footprint 90% from 263 square miles to 31 square miles
- Avoids the cost of fully D&D of five reactors ($100M per reactor)
- Includes savings from D&D efficiencies (CPI of 1.5), reducing required investment and increasing savings

Business Case

Implementing the Area Completion Strategy to Facilitate Risk and Cost Reductions at SRS

Department of Energy

June 2008

EXECUTIVE SUMMARY

A Savannah River (SR) Operations Office Business Case regarding environmental cleanup is discussed. Included is a discussion of the highly effective Area Completion (Scenario 1) Strategy that is being implemented to significantly reduce risk to human health and the environment and project cost. Also discussed is Scenario 2, an opportunity to expedite reduction of the SRS footprint between FY09 and FY15 by accelerating Scenario 1 (Area Completion) which will result in significant project cost avoidance and accelerated risk reduction.

Challenge

The SR validated baseline does not support the soil and groundwater cleanup schedule contained in the Federal Facility Agreement (FFA) and will significantly decelerate the cleanup progress and momentum achieved to date (358 of 515 waste units have been completed). Further:

- Ongoing site missions prevents environmental cleanup project from addressing the highest risk areas (e.g., F/H Tank Farms) until the outyears
- Environmental cleanup project needs to demonstrate near term results to ensure that resources and funding remain available
- Greatest opportunity to show near term progress is through Area Completion Strategy implementation
- Validated baseline constrains Area Completion funding which places active projects on standby, prevents the initiation of new work until FY2015, and prevents Federal Facility Agreement Area Completion enforceable milestones from being met

Background

Implementation of the Area Completion Strategy has enhanced the SR ability to meet regulatory commitments and achieve risk reduction.

- Met over 2,025 FFA milestones in a row since 1993
- Eliminated risk closest to the Savannah River at T-Area – the first Area Completion
- Achieved final cleanup at the Old Radioactive Waste Burial Ground – the highest priority SRS waste unit
- Implemented early actions to accelerate M-Area Completion (Second Area Completion)

However, baseline target funding stops all environmental cleanup progress.

Action/Result

This Business Case presents two scenarios to maintain, at a minimum (Scenario 1), and accelerate environmental cleanup progress (Scenario 2).

	Scenario 1 – Compliant Area Completion	Scenario 2 – Accelerated Area Completion for Footprint Reduction
Foot Print Reduction achieved by 2015	65%	90%
Area Completions achieved by 2015	4	6
Cost avoidance in lifecycle as compared to SR validated baseline ($8,180M for PBS 30)	$1,500M	$1,800M
Accelerates program completion as compared to SR validated baseline (2038)	7 years	7 years

Discussion

DOE-SR, EPA-Region 4 and SCDHEC entered into a Memorandum of Agreement (MOA) in July 2003 to support accelerated cleanup of the SRS. The primary goal of the MOA was to use an "Area Completion" approach to streamline the soil and groundwater cleanup approach (integrating facility decommissioning) and re-sequence the cleanup work that was yet to be undertaken. The Area Completion Strategy addresses entire industrial areas of the SRS – soils from contaminated waste units along with facilities that may have contaminated the surrounding soils – as a consolidated area and completion of each area will be documented in a Record of Decision that is issued for each industrial area. Implementation of the Area Completion Strategy was initiated in FY2003 with T-Area, and there are currently 4 (M, P, R, and D) additional areas underway.

Implementing the Area Completion Strategy resulted in significant project cost avoidance in FY07. Facility decommissioning and environmental cleanup work were sequenced and conducted in such a manner to maximize resource utilization and realize cost efficiencies. Integrated regulatory documentation was developed to expedite regulatory reviews and negotiations and eliminate rework and redundancy. Addressing an entire industrial area at a single time allows remedial decisions to be made earlier, with less conservatism and on a larger scale than when small parcels of contamination are addressed individually and other contamination areas remain to be addressed at some time in the future. In FY07, through Area Completion, nearly half of the annual regulatory milestones and regulatory documents were eliminated. Additionally, schedules were accelerated by 50%.

To further support the Area Completion Strategy, in FY08, DOE aligned D&D (associated with Area Completion) and soil and groundwater activities into a single project, PBS-0030. This consolidation allows DOE increased flexibility in baseline and funds management throughout the cycle, from budget and planning activities to execution of the scope.

Baseline

The current validated baseline, 2008 PEP, supports Area Completion Project (ACP) (PBS-30 [Soil and Water Remediation] and PBS-40 [Nuclear Facilities D&D]) completion by FY2038. The total cost of the 2008 PEP baseline is $8,180M. However, only severely limited funding is provided in the near term (FY2009 through FY2014) for ACP S&M activities. Execution of the 2008 PEP places active projects on standby, prevents the initiation of new work until FY2015, and prevents FFA enforceable milestones and RCRA Permit commitments from being met.

Two scenarios for implementation of the Area Completion Strategy are evaluated in this Business Case. The first scenario (Compliant Area Completion) supports attainment of enforceable regulatory milestones and commitments. The second scenario (Accelerated Area Completion for Footprint Reduction) examines the use of the Area Completion Strategy to achieve accelerated footprint reduction at SRS.

Scenario 1 - Compliant Area Completion

Scenario 1 is a proposal that meets all of the FFA and RCRA permit conditions. The starting point for the development of the cost estimate for this scenario was the 2008 PEP. The schedule for Areas C, D, M, P, and R were then adjusted to meet the required regulatory dates. The cost profile for this scenario is provided in Table A1. The total to-go lifecycle cost for PBS-30 in Scenario 1 is $7,534M.

Advantages:

- **Implementing the Area Completion Strategy enables the Department to meet regulatory milestones and commitments and avoids a likely dispute with the regulators (and possible fines and penalties for missed milestones and commitments) and avoids negatively impacting efforts with the regulators on tank closures, high level waste processing, and consolidation of special nuclear materials.** The State of South Carolina has a high value for the risk reduction efforts at SRS related to removing or rendering immobile the various waste streams (e.g. HLW, SNF, MOX) at SRS because they view these waste streams as having the potential to negatively impact the environment and surrounding communities. They place an equally high value on the Area Completion Strategy because it focuses on contaminants that either have a high potential for release or have been released to the environment. They view these potential and real releases as a high priority because they represent a current threat to the groundwater and surface water. Therefore, they have the highest probability to impact communities off-site in the near-term.

- **Implementation reduces the site footprint by an additional 50% over the baseline by FY2015.** In this scenario, significant progress is made in completing areas and the active portion of the site is reduced from the current 85% to 35%. This is accomplished by completing the remediation work in M, P, R, and D Areas.

- **Implementation of the Area Completion Strategy has demonstrated significant economic advantages.** Prior to FY2005, the remediation of areas at SRS was implemented on a waste unit by waste unit basis. This process of evaluating and remediating small waste sites within an area did not allow for economies of scale for characterization or cleanup. Also some practical remedial alternatives are precluded due to the limited nature of the evaluation. For example, at T-Area several waste units containing uranium contamination were grouped together and the remedial solution was consolidation of the waste from these units under an on-site cap. Implementation of the Area Completion Strategy at T-Area resulted in a cost avoidance of approximately $37M over the traditional approach. Similarly, $645M in cost avoidance could be realized through the remainder of the project.

- **Implementation reduces the risks to the remediation project by $400M to $800M**. The Area Completion Strategy allows for an integrated review of all potential sources in an area. This comprehensive look at an area enables a different suite of remedies to be evaluated in contrast to individual remedies for individual waste units. One of the larger risks within the project is the risk of not being able to close the hardened facilities in-situ. Continued work on the Area Completion Strategy reduces the probability of these types of risks as has been initially supported by the CAB and regulators.

The following assumptions were used in developing Scenario 1:

- D&D and soil and groundwater remediation scope will be sequenced in order to support the Area Completion Strategy as defined and agreed to by EPA and SCDHEC, through the 2003 Memorandum of Agreement and FFA Appendix E, "Long-Term Projections," for FY 2008.
- New groundwater remediation activities will be deferred until contaminant source control is achieved, consistent with the 2003 MOA and FY 2008 Appendix E.
- Hardened facilities (such as reactor buildings and separations facilities) will undergo in-situ decommissioning.
- The budget provided for FY2009 through FY2014 has been increased to perform Area Completion scope required to support regulatory requirements.
- Waste from D&D and cleanup activities within an industrial area may be left within the area if hardened facilities exist to protectively manage the waste.
- Operational activities will be completed or modified to allow Area Completion activities to proceed.
- Historical considerations will not impact Area Completion activities and schedules.
- C-Area Administrative facilities (705-C, 705-1C, 705-3C, 707-C) will not be required to be decommissioned for Area Completion.
- This plan does not include the costs to construct new facilities or perform major renovations to relocate people or services and assumes that facilities can be excessed to support the schedule.
- With the exception of SREL and SRNL designated facilities which have already been removed from the EM D&D scope, all other structures are decommissioned.
- No contractor management reserve (funded contingency) is included.

Benefits:

The benefits from Scenario 1 can be divided into 4 categories.

(1) Benefits gained from implementation of the Area Completion Strategy that could be lost if there is an extended suspension of work
(2) Cost avoidance associated with accelerating the Area Completion work
(3) Footprint reduction
(4) Minimizing overall project risks by continued implementation of the Area Completion Strategy

Category 1. Benefits Gained from Implementation of the Area Completion Strategy:
The Area Completion Strategy produced efficiencies when a change was made from addressing one small geographic area at a time to a large industrial area.

Comparison:

- Milestone Reductions – Reduced from 127 in FY04 to 63 in FY07
- Documents Reductions – Reduced from 1,449 in FY04 to 684 in FY07
- Staffing Reductions – Reduced from 745 in FY04 to 226 in FY07

Category 2. Cost Avoidance Associated with Accelerating the Area Completion Work
A comparison of FY08 PEP costs (2038 completion) vs. the Scenario 1 cost profile (2032 completion) indicate that the overall base line costs will be reduced by an estimated $645M. This cost avoidance is primarily due to reductions in fixed project costs due to the overall acceleration of the schedule for the remediation effort. Additionally, this effort will reduce the overall site lifecycle costs by an estimated $900 when the cost avoidance for S&M is included.

Table 1. Scenario 1 Cost

	Scenario 1 (Total $K)	Cumulative (Total $K)
FY09	89,210	
FY10	177,861	
FY11	156,444	
FY12	155,326	
FY13	157,746	
FY14	219,169	
FY15	265,602	1,221,358
FY16+	6,313,563	7,534,921
Total	7,534,921	

Category 3. Footprint Reduction for 2015
Scenario 1 provides sufficient funding to achieve a 65% footprint reduction by the year 2015.

Category 4. Minimizing Project Risks
The following project risks directly related to an extended remediation schedule were identified in PBS-SR-0030 Soils and Groundwater Project Risk Management Plan with respect to the baseline.

Risk	Description	Min Impact ($K)	Most Likely Impact ($K)	Max Impact ($K)
1	Minimal assessment and remedial actions of the Integrator Operable Units consistent with baseline	26,000	80,000	170,000
2	No additional waste units or groundwater plumes outside those previously identified	2,800	9,800	14,000
3	Regulators continue to allow Monitored Natural Attenuation and passive technologies as assumed in the baseline	2,000	60,000	160,000
4	Remedial action durations consistent with baseline assumptions	5,750	11,500	26,500
5	There are no delays in D&D project execution	25,000	30,000	60,000
6	In-situ decommissioning is acceptable as final End-Point for hardened facilities	400,000	500,000	800,000
7	D&D costs, including waste disposal, are consistent with baseline estimates	44,000	88,000	175,000
8	D&D Funding delays	50,000	100,000	200,000
	Totals	555,550	879,300	1,605,500

The above data indicates that the minimum impact that these risk pose is $555,550K, the most likely impact is $879,300K, and the maximum impact is $1,605,500K. The single largest risk in this list is related to an in-situ decommissioning end-point for the hardened facilities. The regulators are supporting the in-situ decommissioning end-point. However, delaying remediation due to insufficient funding jeopardizes the momentum attained for support of in-situ decommissioning due to:

- Strained regulatory relationships
- The possibility of regressing to the one waste unit at a time approach instead of a continuation of the Area Completion Strategy
- Loss of continuity with the current regulator and CAB decision makers

Overall, funding Scenario 1 is estimated to mitigate at least $400,000K to $800,000K in project risk.

Scenario 2 - Accelerated Area Completion for Footprint Reduction

Scenario 2 represents an effort to expedite the SRS footprint between FY2009 and FY2015 by accelerating Area Completion which will result in significant cost avoidance and accelerated risk reduction. An additional investment would be needed above the cost of Scenario 1 which would result in a significant dividend.

Advantages:

- **Implementing the Area Completion Strategy to accelerate footprint reduction achieves all of the benefits in Scenario 1.**

- **There are additional financial benefits from accelerated footprint reduction.** The additional financial benefits are due to three factors. First, acceleration of the projects capitalizes on the current relationship with the regulators to achieve in-situ remedies on the hardened facilities. Current estimates indicated that up to $200M per hardened facility can be saved by an in-situ remedy or $600M for three facilities in the 6-year window. Second, acceleration of the work reduces projects inflation cost. Third, the accelerated footprint reduction will reduce future S&M costs (estimated savings of $1.88B).

- **The Area Completion Strategy facilitates other uses of SRS.** For example, the Army expressed interest in using reactors and the D-Area Powerhouse for training. Accelerating reactor D&D will enable the expedient use of these facilities to support the Army's national security mission. This potential future use highlights the fact that the remediation of areas can turn SRS into a national resource for future missions.

- **Implementation reduces the site footprint by an additional 75% over the baseline by 2015.** In this scenario, significant progress is made in completing areas and the active portion of the site footprint is reduced from the current 85% to 10%. This is accomplished by accelerating the completion of the remediation work in C, D, M, P and R Areas.

The following assumptions were used in developing Scenario 2:

- Unconstrained funding will be available to execute all footprint reduction workscope [D&D (approximately 200 facilities)] and remedial activities (100 waste units).
- SRS Mission Needs (ongoing operation) constrains the availability of all facilities to be decommissioned.

- Soil and groundwater remediation and D&D activities will be integrated and performed concurrently within an area.
- Early (Final) Actions will be performed to facilitate simultaneous completion of D&D and SGCP activities in an area.
- Footprint reduction is based on surface/subsurface operable unit completions and excludes ongoing groundwater and IOU activities.
- Waste units and facilities associated with SRNL will be excluded from the FFA due to ongoing operation and will not preclude A-Area Completion.
- Groundwater OUs can be remediated prior to Area Completions.
- Waste units (i.e., discharge canals) within the IOU will be remediated to facilitate risk reduction, but will not contribute to footprint reduction.
- Regulatory support is available to support Footprint Reduction.
- Area Completion activities were scheduled to support an accelerated Area Completion objective without regard to funding constraints.

Benefits:

The benefits from Scenario 2 can be divided into 2 categories.
(1) Project cost avoidance associated with accelerating the Area Completion work
(2) Footprint reduction.

Category 1. Cost Avoidance Associated with Accelerating the Area Completion Work
A comparison of FY08 PEP costs (2038 completion) vs. the Scenario 2 cost profile (2032 completion) indicate that the overall base line costs will be reduced by an estimated $921M. This cost avoidance is primarily due to reductions in fixed project costs due to the overall acceleration of the schedule for the remediation effort. Additionally, this effort will reduce the overall site lifecycle costs by an estimated $900 when the cost avoidance for S&M is included.

Category 2. Footprint Reduction for 2015
Scenario 2 provides sufficient funding to achieve a 90% footprint reduction by the year 2015.

Table B1. Scenario 2 Cost

	Scenario 2 (Total $K)	Cumulative (Total $K)
FY09	120,360	
FY10	205,267	
FY11	261,083	
FY12	303,943	
FY13	311,658	
FY14	351,796	
FY15	358,876	1,912,984
FY16+	5,346,357	7,259,341
Total	7,259,341	

Summary

The validated baseline does not provide sufficient funding to meet enforceable FFA milestones and RCRA Permit commitments.

Scenario 1 could achieve a $645M cost savings and complete the project 7 years earlier as compared to the SR validated baseline. Scenario 1 also supports meeting all FFA milestones and RCRA commitments. In addition, Scenario 1 could also achieve a $900M cost avoidance by eliminating other S&M savings across the site.

Scenario 2 could achieve a $921M cost savings and complete the project 7 years earlier as compared to the SR validated baseline. Scenario 2 also supports meeting all FFA milestones and RCRA commitments. In addition, Scenario 2 could also achieve a $900M cost avoidance by eliminating other S&M savings across the site.

SRS PBS 30 Savings Summary from FY08 PEP Baseline

EXECUTIVE SUMMARY

A Savannah River (SR) Operations Office Business Case regarding environmental cleanup is discussed. Included is a discussion of the highly effective Area Completion (Scenario 1) Strategy that is being implemented to significantly reduce risk to human health and the environment and project cost. Also discussed is Scenario 2, an opportunity to expedite reduction of the SRS footprint between FY09 and FY15 by accelerating Scenario 1 (Area Completion) which will result in significant project cost avoidance and accelerated risk reduction.

Challenge

The SR validated baseline does not support the soil and groundwater cleanup schedule contained in the Federal Facility Agreement (FFA) and will significantly decelerate the cleanup progress and momentum achieved to date (358 of 515 waste units have been completed). Further:

- Ongoing site missions prevents environmental cleanup project from addressing the highest risk areas (e.g., F/H Tank Farms) until the outyears
- Environmental cleanup project needs to demonstrate near term results to ensure that resources and funding remain available
- Greatest opportunity to show near term progress is through Area Completion Strategy implementation
- Validated baseline constrains Area Completion funding which places active projects on standby, prevents the initiation of new work until FY2015, and prevents Federal Facility Agreement Area Completion enforceable milestones from being met

Background

Implementation of the Area Completion Strategy has enhanced the SR ability to meet regulatory commitments and achieve risk reduction.

- Met over 2,025 FFA milestones in a row since 1993
- Eliminated risk closest to the Savannah River at T-Area – the first Area Completion
- Achieved final cleanup at the Old Radioactive Waste Burial Ground – the highest priority SRS waste unit
- Implemented early actions to accelerate M-Area Completion (Second Area Completion)

However, baseline target funding stops all environmental cleanup progress.

Action/Result

This Business Case presents two scenarios to maintain, at a minimum (Scenario 1), and accelerate environmental cleanup progress (Scenario 2).

	Scenario 1 – Compliant Area Completion	Scenario 2 – Accelerated Area Completion for Footprint Reduction
Foot Print Reduction achieved by 2015	65%	90%
Area Completions achieved by 2015	4	6
Cost avoidance in lifecycle as compared to SR validated baseline ($8,180M for PBS 30)	$1,500M	$1,800M
Accelerates program completion as compared to SR validated baseline (2038)	7 years	7 years

Discussion

DOE-SR, EPA-Region 4 and SCDHEC entered into a Memorandum of Agreement (MOA) in July 2003 to support accelerated cleanup of the SRS. The primary goal of the MOA was to use an "Area Completion" approach to streamline the soil and groundwater cleanup approach (integrating facility decommissioning) and re-sequence the cleanup work that was yet to be undertaken. The Area Completion Strategy addresses entire industrial areas of the SRS – soils from contaminated waste units along with facilities that may have contaminated the surrounding soils – as a consolidated area and completion of each area will be documented in a Record of Decision that is issued for each industrial area. Implementation of the Area Completion Strategy was initiated in FY2003 with T-Area, and there are currently 4 (M, P, R, and D) additional areas underway.

Implementing the Area Completion Strategy resulted in significant project cost avoidance in FY07. Facility decommissioning and environmental cleanup work were sequenced and conducted in such a manner to maximize resource utilization and realize cost efficiencies. Integrated regulatory documentation was developed to expedite regulatory reviews and negotiations and eliminate rework and redundancy. Addressing an entire industrial area at a single time allows remedial decisions to be made earlier, with less conservatism and on a larger scale than when small parcels of contamination are addressed individually and other contamination areas remain to be addressed at some time in the future. In FY07, through Area Completion, nearly half of the annual regulatory milestones and regulatory documents were eliminated. Additionally, schedules were accelerated by 50%.

To further support the Area Completion Strategy, in FY08, DOE aligned D&D (associated with Area Completion) and soil and groundwater activities into a single project, PBS-0030. This consolidation allows DOE increased flexibility in baseline and funds management throughout the cycle, from budget and planning activities to execution of the scope.

Baseline

The current validated baseline, 2008 PEP, supports Area Completion Project (ACP) (PBS-30 [Soil and Water Remediation] and PBS-40 [Nuclear Facilities D&D]) completion by FY2038. The total cost of the 2008 PEP baseline is $8,180M. However, only severely limited funding is provided in the near term (FY2009 through FY2014) for ACP S&M activities. Execution of the 2008 PEP places active projects on standby, prevents the initiation of new work until FY2015, and prevents FFA enforceable milestones and RCRA Permit commitments from being met.

Two scenarios for implementation of the Area Completion Strategy are evaluated in this Business Case. The first scenario (Compliant Area Completion) supports attainment of enforceable regulatory milestones and commitments. The second scenario (Accelerated Area Completion for Footprint Reduction) examines the use of the Area Completion Strategy to achieve accelerated footprint reduction at SRS.

Scenario 1 - Compliant Area Completion

Scenario 1 is a proposal that meets all of the FFA and RCRA permit conditions. The starting point for the development of the cost estimate for this scenario was the 2008 PEP. The schedule for Areas C, D, M, P, and R were then adjusted to meet the required regulatory dates. The cost profile for this scenario is provided in Table A1. The total to-go lifecycle cost for PBS-30 in Scenario 1 is $7,534M.

Advantages:

- **Implementing the Area Completion Strategy enables the Department to meet regulatory milestones and commitments and avoids a likely dispute with the regulators (and possible fines and penalties for missed milestones and commitments) and avoids negatively impacting efforts with the regulators on tank closures, high level waste processing, and consolidation of special nuclear materials.** The State of South Carolina has a high value for the risk reduction efforts at SRS related to removing or rendering immobile the various waste streams (e.g. HLW, SNF, MOX) at SRS because they view these waste streams as having the potential to negatively impact the environment and surrounding communities. They place an equally high value on the Area Completion Strategy because it focuses on contaminants that either have a high potential for release or have been released to the environment. They view these potential and real releases as a high priority because they represent a current threat to the groundwater and surface water. Therefore, they have the highest probability to impact communities off-site in the near-term.

- **Implementation reduces the site footprint by an additional 50% over the baseline by FY2015.** In this scenario, significant progress is made in completing areas and the active portion of the site is reduced from the current 85% to 35%. This is accomplished by completing the remediation work in M, P, R, and D Areas.

- **Implementation of the Area Completion Strategy has demonstrated significant economic advantages.** Prior to FY2005, the remediation of areas at SRS was implemented on a waste unit by waste unit basis. This process of evaluating and remediating small waste sites within an area did not allow for economies of scale for characterization or cleanup. Also some practical remedial alternatives are precluded due to the limited nature of the evaluation. For example, at T-Area several waste units containing uranium contamination were grouped together and the remedial solution was consolidation of the waste from these units under an on-site cap. Implementation of the Area Completion Strategy at T-Area resulted in a cost avoidance of approximately $37M over the traditional approach. Similarly, $645M in cost avoidance could be realized through the remainder of the project.

- **Implementation reduces the risks to the remediation project by $400M to $800M.** The Area Completion Strategy allows for an integrated review of all potential sources in an area. This comprehensive look at an area enables a different suite of remedies to be evaluated in contrast to individual remedies for individual waste units. One of the larger risks within the project is the risk of not being able to close the hardened facilities in-situ. Continued work on the Area Completion Strategy reduces the probability of these types of risks as has been initially supported by the CAB and regulators.

The following assumptions were used in developing Scenario 1:

- D&D and soil and groundwater remediation scope will be sequenced in order to support the Area Completion Strategy as defined and agreed to by EPA and SCDHEC, through the 2003 Memorandum of Agreement and FFA Appendix E, "Long-Term Projections," for FY 2008.
- New groundwater remediation activities will be deferred until contaminant source control is achieved, consistent with the 2003 MOA and FY 2008 Appendix E.
- Hardened facilities (such as reactor buildings and separations facilities) will undergo in-situ decommissioning.
- The budget provided for FY2009 through FY2014 has been increased to perform Area Completion scope required to support regulatory requirements.
- Waste from D&D and cleanup activities within an industrial area may be left within the area if hardened facilities exist to protectively manage the waste.
- Operational activities will be completed or modified to allow Area Completion activities to proceed.
- Historical considerations will not impact Area Completion activities and schedules.
- C-Area Administrative facilities (705-C, 705-1C, 705-3C, 707-C) will not be required to be decommissioned for Area Completion.
- This plan does not include the costs to construct new facilities or perform major renovations to relocate people or services and assumes that facilities can be excessed to support the schedule.
- With the exception of SREL and SRNL designated facilities which have already been removed from the EM D&D scope, all other structures are decommissioned.
- No contractor management reserve (funded contingency) is included.

Benefits:

The benefits from Scenario 1 can be divided into 4 categories.

(1) Benefits gained from implementation of the Area Completion Strategy that could be lost if there is an extended suspension of work
(2) Cost avoidance associated with accelerating the Area Completion work
(3) Footprint reduction
(4) Minimizing overall project risks by continued implementation of the Area Completion Strategy

Category 1. Benefits Gained from Implementation of the Area Completion Strategy:
The Area Completion Strategy produced efficiencies when a change was made from addressing one small geographic area at a time to a large industrial area.

Comparison:

- Milestone Reductions – Reduced from 127 in FY04 to 63 in FY07
- Documents Reductions – Reduced from 1,449 in FY04 to 684 in FY07
- Staffing Reductions – Reduced from 745 in FY04 to 226 in FY07

Category 2. Cost Avoidance Associated with Accelerating the Area Completion Work
A comparison of FY08 PEP costs (2038 completion) vs. the Scenario 1 cost profile (2032 completion) indicate that the overall base line costs will be reduced by an estimated $645M. This cost avoidance is primarily due to reductions in fixed project costs due to the overall acceleration of the schedule for the remediation effort. Additionally, this effort will reduce the overall site lifecycle costs by an estimated $900 when the cost avoidance for S&M is included.

Table 1. Scenario 1 Cost

	Scenario 1 (Total $K)	Cumulative (Total $K)
FY09	89,210	
FY10	177,861	
FY11	156,444	
FY12	155,326	
FY13	157,746	
FY14	219,169	
FY15	265,602	1,221,358
FY16+	6,313,563	7,534,921
Total	7,534,921	

Category 3. Footprint Reduction for 2015
Scenario 1 provides sufficient funding to achieve a 65% footprint reduction by the year 2015.

Category 4. Minimizing Project Risks
The following project risks directly related to an extended remediation schedule were identified in PBS-SR-0030 Soils and Groundwater Project Risk Management Plan with respect to the baseline.

Risk	Description	Min Impact ($K)	Most Likely Impact ($K)	Max Impact ($K)
1	Minimal assessment and remedial actions of the Integrator Operable Units consistent with baseline	26,000	80,000	170,000
2	No additional waste units or groundwater plumes outside those previously identified	2,800	9,800	14,000
3	Regulators continue to allow Monitored Natural Attenuation and passive technologies as assumed in the baseline	2,000	60,000	160,000
4	Remedial action durations consistent with baseline assumptions	5,750	11,500	26,500
5	There are no delays in D&D project execution	25,000	30,000	60,000
6	In-situ decommissioning is acceptable as final End-Point for hardened facilities	400,000	500,000	800,000
7	D&D costs, including waste disposal, are consistent with baseline estimates	44,000	88,000	175,000
8	D&D Funding delays	50,000	100,000	200,000
	Totals	555,550	879,300	1,605,500

The above data indicates that the minimum impact that these risk pose is $555,550K, the most likely impact is $879,300K, and the maximum impact is $1,605,500K. The single largest risk in this list is related to an in-situ decommissioning end-point for the hardened facilities. The regulators are supporting the in-situ decommissioning end-point. However, delaying remediation due to insufficient funding jeopardizes the momentum attained for support of in-situ decommissioning due to:

- Strained regulatory relationships
- The possibility of regressing to the one waste unit at a time approach instead of a continuation of the Area Completion Strategy
- Loss of continuity with the current regulator and CAB decision makers

Overall, funding Scenario 1 is estimated to mitigate at least $400,000K to $800,000K in project risk.

Scenario 2 - Accelerated Area Completion for Footprint Reduction

Scenario 2 represents an effort to expedite the SRS footprint between FY2009 and FY2015 by accelerating Area Completion which will result in significant cost avoidance and accelerated risk reduction. An additional investment would be needed above the cost of Scenario 1 which would result in a significant dividend.

Advantages:

- **Implementing the Area Completion Strategy to accelerate footprint reduction achieves all of the benefits in Scenario 1.**

- **There are additional financial benefits from accelerated footprint reduction.** The additional financial benefits are due to three factors. First, acceleration of the projects capitalizes on the current relationship with the regulators to achieve in-situ remedies on the hardened facilities. Current estimates indicated that up to $200M per hardened facility can be saved by an in-situ remedy or $600M for three facilities in the 6-year window. Second, acceleration of the work reduces projects inflation cost. Third, the accelerated footprint reduction will reduce future S&M costs (estimated savings of $1.88B).

- **The Area Completion Strategy facilitates other uses of SRS.** For example, the Army expressed interest in using reactors and the D-Area Powerhouse for training. Accelerating reactor D&D will enable the expedient use of these facilities to support the Army's national security mission. This potential future use highlights the fact that the remediation of areas can turn SRS into a national resource for future missions.

- **Implementation reduces the site footprint by an additional 75% over the baseline by 2015.** In this scenario, significant progress is made in completing areas and the active portion of the site footprint is reduced from the current 85% to 10%. This is accomplished by accelerating the completion of the remediation work in C, D, M, P and R Areas.

The following assumptions were used in developing Scenario 2:

- Unconstrained funding will be available to execute all footprint reduction workscope [D&D (approximately 200 facilities)] and remedial activities (100 waste units).
- SRS Mission Needs (ongoing operation) constrains the availability of all facilities to be decommissioned.

- Soil and groundwater remediation and D&D activities will be integrated and performed concurrently within an area.
- Early (Final) Actions will be performed to facilitate simultaneous completion of D&D and SGCP activities in an area.
- Footprint reduction is based on surface/subsurface operable unit completions and excludes ongoing groundwater and IOU activities.
- Waste units and facilities associated with SRNL will be excluded from the FFA due to ongoing operation and will not preclude A-Area Completion.
- Groundwater OUs can be remediated prior to Area Completions.
- Waste units (i.e., discharge canals) within the IOU will be remediated to facilitate risk reduction, but will not contribute to footprint reduction.
- Regulatory support is available to support Footprint Reduction.
- Area Completion activities were scheduled to support an accelerated Area Completion objective without regard to funding constraints.

Benefits:

The benefits from Scenario 2 can be divided into 2 categories.

(1) Project cost avoidance associated with accelerating the Area Completion work
(2) Footprint reduction.

Category 1. Cost Avoidance Associated with Accelerating the Area Completion Work
A comparison of FY08 PEP costs (2038 completion) vs. the Scenario 2 cost profile (2032 completion) indicate that the overall base line costs will be reduced by an estimated $921M. This cost avoidance is primarily due to reductions in fixed project costs due to the overall acceleration of the schedule for the remediation effort. Additionally, this effort will reduce the overall site lifecycle costs by an estimated $900 when the cost avoidance for S&M is included.

Category 2. Footprint Reduction for 2015
Scenario 2 provides sufficient funding to achieve a 90% footprint reduction by the year 2015.

Table B1. Scenario 2 Cost

	Scenario 2 (Total $K)	Cumulative (Total $K)
FY09	120,360	
FY10	205,267	
FY11	261,083	
FY12	303,943	
FY13	311,658	
FY14	351,796	
FY15	358,876	1,912,984
FY16+	5,346,357	7,259,341
Total	7,259,341	

Summary

The validated baseline does not provide sufficient funding to meet enforceable FFA milestones and RCRA Permit commitments.

Scenario 1 could achieve a $645M cost savings and complete the project 7 years earlier as compared to the SR validated baseline. Scenario 1 also supports meeting all FFA milestones and RCRA commitments. In addition, Scenario 1 could also achieve a $900M cost avoidance by eliminating other S&M savings across the site.

Scenario 2 could achieve a $921M cost savings and complete the project 7 years earlier as compared to the SR validated baseline. Scenario 2 also supports meeting all FFA milestones and RCRA commitments. In addition, Scenario 2 could also achieve a $900M cost avoidance by eliminating other S&M savings across the site.

SRS PBS 30 Savings Summary from FY08 PEP Baseline

OR

ETTP Complete - 2015

Oak Ridge Footprint Reduction Proposal

Site: Y-12

Current Footprint and Schedule

This footprint reduction proposal addresses the highest risk buildings (Alpha 4, Alpha 5 and 9206) at Y-12. These buildings were built in the 1940's as part of the Manhattan project. They are located in the heart of the Y-12 plant. They pose the greatest risk to the work force and the environment at Y-12 and are a primary contributor to offsite releases of mercury. The deteriorating condition of the Alpha 5 building and the standing water that is accumulating in its basement is a major concern and must be addressed.

Alpha 4 contains 510K square feet and is currently owned by EM. It has been deactivated and is ready for demolition. Demolition is scheduled to run from FY12 through FY16 in the certified baseline which was constrained to current funding targets.

Alpha 5 contains 614K square feet and is not currently owned by EM. Significant effort will be required to stabilize this building, including removal of all material and equipment currently in the building, as well as, the contaminated water that has accumulated in the basement, before demolition can begin.

Building 9206 contains 58K square feet and is not currently owned by EM. It can be demolished by FY15.

Issue:

The certified baseline only addresses the facilities at Y-12 that are currently owned by EM. In order to address the highest risk facilities at Y-12, two major facilities not currently owned by EM need to be demolished. These facilities would not be demolished until FY22 given the current funding profiles.

Therefore, additional funding is needed to address the highest risk facilities first at Y-12.

Proposed Footprint and Schedule:

Two major, high risk facilities at Y-12 can be demolished and the facility with the greatest risk can be stabilized by FY15 with an additional investment of $362 million over the next six years.

A picture of the current main plant area of Y-12 is attached, as well as, a picture of what the area will look like after this footprint reduction initiative.

Funding Requirements:

Y-12 (PBS 41)	Dollars in millions FY10	FY11	FY12	FY13	FY14	FY15
Current FY10 budget request			14	18	22	27
Footprint Reduction request	50	54	68	72	77	122
Overbaseline request	50	54	54	54	55	95

Benefits:

Mortgage Reduction: This footprint reduction proposal will accelerate the demolition of facilities by seven years achieving savings of $183 million by reducing infrastructure and surveillance and maintenance costs at the site and cost escalation.

Risk Reduction: Reduces the footprint of contaminated facilities that are rapidly deteriorating, thereby, reducing the increasing risk of release and damage to the environment and ongoing Y12 mission operations. More than 4,000 workers carry out their daily activities within three thousand feet of the buildings addressed in this proposal.

Return on Investment:

Investment: $362 million
Net savings: $183 million
Return on Investment: 38% (on net present value of investment and savings)
Annual return on investment: 6%

Oak Ridge Footprint Reduction Proposal

Site: ORNL Central Campus Area

Current Footprint and Schedule

This footprint reduction proposal addresses a 4 block area covering 100 acres in the heart of the main campus area of ORNL. This area was initially constructed in the 1940's as part of the Manhattan project. The recent modernization activities at ORNL border both sides of this area. Many of the facilities in this area contain reactors, hot cells and laboratories that have radiological contamination.

This area currently has 177 facilities containing 634K square feet that require decontamination and decommissioning. Approximately 240K cubic yards of soil and sediments contain contamination (primary contaminant is Cs and Sr) that will need to be addressed under CERCLA. In addition, 50K linear feet of inactive underground pipelines need to be grouted.

Limited progress has been made to-date on the cleanup of the central campus area of ORNL because of higher priority work. Only 28 facilities (easy, less contaminated) containing 65K square feet have been demolished. Approximately 40 underground storage tanks and 4 surface impoundments have been grouted in place and over 900 cubic yards of contaminated soils have been removed from the Tank W-1a area.

Therefore, most of the cleanup that is required by the interim Record of Decision in the ORNL Central Campus area remains. It has become a high priority because of the deteriorating condition of the buildings which affect worker safety, the risk of damage posed to the environment and the ongoing ORNL modernization.

Issue:

EM is responsible for all the soil and groundwater remediation in the Central Campus area of ORNL. The cleanup of the Central Campus area is complete by FY16 in the current certified baseline, which was constrained to current funding targets. However, the certified baseline only addresses the facilities in the Central Campus area that are currently owned by EM, which are 45% of the all the facilities in this area. In order to complete the soil and groundwater remediation the remaining 55% of the facilities not currently owned by EM need to be demolished. These facilities would not be demolished until FY22 given the current funding profiles.

Therefore, additional funding is needed to demolish all the facilities in the Central Campus area that will not have an ongoing mission by FY15 to facilitate the soil and groundwater remediation.

Proposed Footprint and Schedule:

Over 80% of the cleanup of the Central Campus area of ORNL can be completed by FY15 for an additional investment of $411 million over the next six years. A few essential buildings with ongoing operations will remain that will eventually require decontamination and decommissioning, along with the remediation of the underlying soils.

A picture of the current Central Campus area is attached, as well as, a picture of what the Central Campus area will look like after this footprint reduction initiative.

Funding Requirements:

	Dollars in millions					
ORNL Central Campus (PBS 42)	FY10	FY11	FY12	FY13	FY14	FY15
Current FY10 budget request	13	21	79	75	53	35
Footprint Reduction request	63	91	144	146	136	107
Overbaseline request	50	70	65	71	83	72

Benefits:

Mortgage Reduction: This footprint reduction proposal will accelerate the demolition of facilities by seven years achieving savings of $318 million by reducing infrastructure and surveillance and maintenance costs at the site and cost escalation.

Risk Reduction: Reduces the footprint of contaminated facilities that are rapidly deteriorating, thereby, reducing the increasing risk of release and damage to the environment and ongoing ONRL mission operations. More than 2500 workers carry out their daily activities within three thousand feet of the Central Campus area.

Return on Investment:

Investment: $411 million
Net savings: $318 million
Return on Investment: 65% (on net present value of investment and savings)
Annual return on investment: 11%

SITE SUBMITTAL

Oak Ridge Footprint Reduction Proposal

Site: ETTP

Current Footprint and Schedule

ETTP was built to enrich uranium for defense programs. Production operations ceased at ETTP in the mid-eighties. Approximately 2200 acres (1400 within the fenced main plant area and 800 outside the fence) contain potential contamination that will be addressed under CERCLA. The site contains 160 release sites that require remediation and 500 facilities, including 125 major facilities, that require decontamination and decommissioning.

A little over half of the facilities have been decommissioned and half of the release sites have been remediated. In addition, about half of the $3 billion of the estimated life cycle costs for this site have been expended.

While significant progress has been made on the cleanup of ETTP, a lot of work remains ($1.5 billion worth) to meet CERCLA requirements and honor our regulatory commitments.

The highest priority at the site is the decommissioning and decontamination of the K-25 and K-27 gaseous diffusion process buildings due to the deteriorating condition of the buildings which affect worker safety and pose a risk of damage to the environment. A lot of work remains to finish the D&D of the remaining facilities and to remediate all the burial grounds and contaminated soils to mitigate the contamination from plumes migrating off-site. A final Site-Wide Record of Decision will be required to address all groundwater, surface water, sediments, ecological and long-term stewardship concerns at the site.

The current certified baseline which was constrained to current funding targets has the final Site-Wide ROD completed in FY17. K-25 is demolished and K-27 is ready for demolition by FY12. K-27 and all remaining facilities are demolished by FY16 and all soil and groundwater remediation is completed by FY16.

Issue:

The current funding targets do not provide adequate funding to address the cleanup at ORNL and Y12 and complete ETTP any earlier than FY17. Once the K-25 building is demolished the highest worker and environmental risks reside at ORNL and Y12. The certified baseline reflects an increase in funding at ORNL and Y12 over the next five years to reflect this shift in risks. Therefore, additional funding is needed to accelerate the footprint reduction at ETTP and reduce the mortgage at ETTP.

Proposed Footprint and Schedule:

ETTP can be completed by FY15, two years earlier than the certified baseline, for an additional investment of $202 million over the next five years.

A map depicting the work remaining at ETTP in FY15 under the current baseline is attached. A map showing the completion of ETTP in FY15 is also attached. The difference in these two maps represents the footprint reduction that will be accelerated by two years.

Funding Requirements:

	Dollars in millions				
ETTP (PBS 40)	FY10	FY11	FY12	FY13	FY14
Current FY10 budget request	168	167	77	74	108
Footprint Reduction request	221	201	132	123	119
Overbaseline request	53	34	55	49	11

Benefits:

Mortgage Reduction: Two year acceleration of schedule achieves savings of $118 million by reducing the base operations, infrastructure, safeguard and security, and surveillance and maintenance costs at the site.

Risk Reduction: Completes CERCLA required cleanup, reduces DOE's footprint and achieves desired end-state as commercial industrial part two years ahead of schedule.

Return on Investment:

Investment: $202 million
Net savings: $118 million
Return on Investment: 54% (on net present value of investment and savings)
Annual return on investment: 11%

Eliminated costs in 2032 to 2044 to reflect earlier D&D completion

Eliminated 2031 to 2045 costs to reflect accelerated D&D completion

D&D costs in 2032 to 2034 accelerated to the earlier period of 2017 to 2031, consistent with USEC exercise of lease option thru 2016 due to earlier D&D completion

Accelerated and compressed some costs in 2025 to 2034 to 2022 to 2034 and eliminated remaining costs in 2025 to 2034, due to earlier D&D completion

D&D costs in 2020 in 2033 accelerated and compressed to 2010 to 2018, also progress start date moved from 2014 to 2025

Adjusted near-term maintenance costs to reflect accelerated and compressed D&D schedule and eliminated costs in 2027 to 2042

Idaho Acceleration of Work Scope Through 2015

The Idaho Cleanup Project (ICP) could accelerate FY 2011 and FY 2012 Deactivation & Decommissioning (D&D) work scope to FY 2009 and FY 2010. This would allow additional facilities in the INTEC area to be D&D'd during the FY 2011 – FY 2012 time frame and continue thru to FY 2015. TAN, PBF, and ETR D&D will be completed by FY 2008-2009 allowing closure of the areas.

These D&D accelerations from the above action would result in the closure of the following areas:

1. Materials Test Reactor Complex D&D (86,241 sq. ft.)
2. CPP-601/640 Demolition (101,279 sq. ft.)
3. Other INTEC Facilities currently in ICP contract
4. RWMC facilities D&D (over 81,825 sq. ft.)
5. New INTEC facilities D&D (over 700,000 sq. ft.)

The ICP has already accelerated some D&D activities within the current contract suggesting the above plan is realistic and achievable. For example, the Power Burst Reactor Facility should have all D&D activities (18,679 square feet – 150 acres) completed in FY 2008. The Test Area North Complex will have all D&D activities completed FY 2008 (261,040 square feet – 250+ acres). Both were to be completed in FY 2012. The acceleration of these D&D projects will save the surveillance and maintenance costs and escalation for these projects.

The successful acceleration of the D&D is contributed to several key factors, namely:

1. The establishment of a solid rapport with the regulators and the public through upfront communications and a team approach in developing and processing the critical documentation necessary in establishing the final end-sate for each high-risk facility (defines expectations).

2. The agreement by both regulators to use the CERCLA Non-time Critical Removal Action process as the process for defining and executing the D&D work.

3. The most important factor is the dedicated staff and crews. These individuals work together, train together and develop confidence and trust with each other. This approach minimizes worker accidents and results in an outstanding safety performance record.

The ICP could also accelerate the exhumation of buried waste. This scenario assumes 5.6 acres are exhumed by FY 2015, the majority of the grouting is completed, compaction of required waste zone materials is completed, the first year (of three) required to process materials for the layers of the cap is complete, and the initial soil layer installation on the cap is completed. This would clearly enable Idaho to address all TRU waste Settlement Agreement requirements by 2018. However, if this scenario was accepted, further

analysis and evaluation would need to occur related to the human resource and equipment constraints.

By accelerating the buried waste exhumation, the entire RWMC area will be ready for D&D around the 2017-2018 time frame as the AMWTP is scheduled for a 2015 completion. This will close the Radioactive Waste Management Complex 3- 4 years earlier than currently planned.

Chart 1b shows the baseline funding scenario to accomplish the above accelerations. However, a smoother funding scenario could allow for nearly the same result at a $600 - $610M level.

It should also be noted that the D&D work has not only been able to be accelerated, but it is under-running the current estimates. Therefore, even thought the charts show the baseline funding required, it is likely the D&D could be accomplished for less.

Assumptions:

- The baseline currently provides for the SRS SNF swap beginning in FY 2013. This could be accelerated, but it would compete resources completing the Navy SNF return and other accelerated work scope.

- All other work (SNF, calcine, remediation work etc.) continues at the current baseline projections.

Idaho Operations Office
FY 2010 - FY 2014 Field Request

Objective:

- Footprint Reduction (Requires over baseline funding)
  - 2010 activities will reduce the EM presence at the INL by 225,000 square feet
  - 2011 activities will reduce the EM presence at the INL by 235,000 square feet
  - 2012 activities will reduce the EM presence at the INL by 1,000 square feet
  - 2013 activities will reduce the EM presence at the INL by 260,000 square feet
  - 2014 activities will reduce the EM presence at the INL by 160,000 square feet
  - 2015 activities will reduce the EM presence at the INL by 550,000 square feet
- Total reduction is 1,431,000 square feet.
  - This equates to 41% reduction of total square feet remaining at Idaho under EM purview.
- Total investment is $398M returning $834M of completed D&D facilities equating to a savings of $436M over the identified time frame.
- Near-term completions
  - The D&D of the Materials Test Reactor complex will be completed in FY 2010 removing an EM presence from the Reactor Technology Complex.
