CMP CP-121 NORTH HOSTEEN ROAD

1.0 LOCATION AND FUNCTION

CMP CP-121 will be installed on North Hosteen Road to discharge surface runoff (from the watershed area located due east) into Hosteen Pit. Facilitating the culvert, will be a down drain pipe and rip-rap drop structure placed along the road. Placement of these structures will provide erosion control on the cut slopes and ultimately to protect the underlying water pipe.

2.0 BACKGROUND AND CONCERN

Currently, North Hosteen Road has improper drainage with erosional problems in certain areas. Specifically, the drainage problem is characterized by excessive ponding in the eastern side ditch. In addition, routing of the surface runoff from the undisturbed land to the side ditch causes erosion of the cut slope. For proper drainage and control of erosion, placement of a culvert, downdrain pipe, and rip-rap drop structure are proposed.

3.0 DESIGN

3.1 Culvert Design

The watershed area for CP-121 is measured to be 40.52 acres, yielding a calculated peak flow of 7.49 CFS. The soil type is predominately Avalon (AZ) soil with properties of hydrologic group B and a curve number of 78. For this undisturbed landtype, the SEDCAD program computed a culvert sizing of 18 inches. Installation of the culvert will include a minimum cover of 2 ft. and a slope of 1%.

3.2 Drop Structure Design

The watershed area for DD-26 is measured to be 20.65 acres, giving a peak flow of 4.25 CFS. Similar to the culvert, the curve number utilized in this calculation was 78. The down drain is modeled to be an 18 in. corrugated metal pipe with a 28° elbow and measuring a total length of 30 feet. This structure will have a 6 in. concrete head wall projecting 2 ft. above and below the diameter of the pipe.

The designed rip-rap channel has a watershed area of 31.81 acres with a peak flow of 6.09 CFS. Again, the curve number 78 was used for the hydrology calculation. The channel geometry will include a trapezoidal shape with side slopes of 3:1 and a bottom width of 3 ft. The channel will be sloped at 14 % from the catchment area to the side ditch of the road.

The drainage control structures shall be maintained as outlined in CHAPTER 11, Section 11.5.6.1.6. For hydrology and design information on the culvert, down drain pipe, and rip-rap drop structure, refer to Appendix 11-Z in the approved PAP.

5.0 REMOVAL AND RECLAMATION

Refer to the CHAPTER 12, Section 12.3.2 of the Navajo Mine PAP for culvert/drop structure removal and reclamation of Primary Roads.

Structure #2 (Pond)

1000 ac. used to simulate 200 cfs NAPI discharge

Pond Inputs:

Initial Pool Elev:	0.01 ft
Initial Pool:	0.00 ac-ft

Pond Results:

Peak Elevation:	5.07 ft
Dewater Time:	0.00 days

Dewatering time is calculated from peak stage to lowest spillway
