Crop Production

Released October 10, 2014, by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, United States Department of Agriculture (USDA).

## Corn Production Up Less Than 1 Percent from September Forecast Soybean Production Up Slightly Cotton Production Down 2 Percent Orange Production Up 3 Percent from Last Season

Corn production is forecast at 14.5 billion bushels, up less than 1 percent from the previous forecast and up 4 percent from 2013. Based on conditions as of October 1, yields are expected to average 174.2 bushels per acre, up 2.5 bushels from the September forecast and 15.4 bushels above the 2013 average. If realized, this will be the highest yield and production on record for the United States. Area harvested for grain is forecast at 83.1 million acres, down 1 percent from the September forecast and down 5 percent from 2013. Acreage updates were made in several States following a thorough review of all available data.

Soybean production is forecast at a record 3.93 billion bushels, up slightly from September and up 17 percent from last year. Based on October 1 conditions, yields are expected to average a record high 47.1 bushels per acre, up 0.5 bushel from last month and up 3.1 bushels from last year. Area for harvest in the United States is forecast at a record 83.4 million acres, down less than 1 percent from September but up 9 percent from last year. Acreage updates were made in several States based on a thorough review of all available data.

All cotton production is forecast at 16.3 million 480-pound bales, down 2 percent from last month but up 26 percent from last year. Yield is expected to average 790 pounds per harvested acre, down 31 pounds from last year. Upland cotton production is forecast at 15.7 million 480-pound bales, up 28 percent from 2013. Pima cotton production, forecast at 578,000 bales, was carried forward from last month.

The United States all orange forecast for the 2014-2015 season is 6.96 million tons, up 3 percent from the 2013-2014 final utilization. The Florida all orange forecast, at 108 million boxes ( 4.86 million tons), is up 3 percent from last season's final utilization. Early, midseason, and Navel varieties in Florida are forecast at 52.0 million boxes ( 2.34 million tons), down 2 percent from last season's final utilization. The Florida Valencia orange forecast, at 56.0 million boxes ( 2.52 million tons), is up 9 percent from last season's final utilization. In Florida, citrus growing conditions were ideal from the beginning of the citrus bloom to the start of the 2014-2015 season harvest. The California Navel orange harvest is getting underway.

Florida frozen concentrated orange juice (FCOJ) yield forecast for the 2014-2015 season is 1.60 gallons per box at 42.0 degrees Brix, up 2 percent from last season's final yield of 1.57 gallons per box. Projected yield from the 2014-2015 Early-Midseason and Valencia varieties will be published in the January Crop Production report. All projections of yield assume the processing relationships this season will be similar to those of the past several seasons.

This report was approved on October 10, 2014.

## Corn for Grain Objective Yield Data

The National Agricultural Statistics Service is conducting objective yield surveys in 10 corn-producing States during 2014. Randomly selected plots in corn for grain fields are visited monthly from August through harvest to obtain specific counts and measurements. Data in these tables are rounded actual field counts from this survey.

(Z) Less than half of the unit shown.
${ }^{1}$ Includes corn in the dent stage of development. Ears are firm and solid. Kernels fully dented with no milk present in most kernels.
${ }^{2}$ Includes that portion of the crop that is mature and ready for harvest. No green foliage is present.

## Soybean Objective Yield Data

The National Agricultural Statistics Service is conducting objective yield surveys in 11 soybean-producing States during 2014. Randomly selected plots in soybean fields are visited monthly from August through harvest to obtain specific counts and measurements. Data in these tables are actual field counts from this survey.

## September Weather Summary

September featured highly variable precipitation and rapidly fluctuating temperatures. In the Corn Belt alone, a cold snap led to widespread frost across the upper Midwest from September 11-13, but largely spared late-developing corn and soybeans. Following the cool spell, an extended period of late-season Midwestern warmth promoted summer crop maturation. Most of the upper Midwest experienced beneficial dryness, but heavy rain in the southern Corn Belt slowed early-season harvest efforts. Regardless of the weather extremes, Midwestern crop conditions remained near historic highs, with nearly three-quarters of the corn ( 74 percent) and soybeans ( 73 percent) rated in good to excellent condition by October 5. Those numbers represented the highest United States corn and soybean ratings in October since 2004 and 1994, respectively.

Meanwhile, a band of September dryness stretched from the southeastern Plains and Mid-South into the Northeast. The mostly dry weather favored summer crop maturation and harvesting, but increased stress on pastures and reduced topsoil moisture for the establishment of newly planted winter grains. Across the Deep South, however, heavy rain hampered fieldwork in several areas, including southern Texas and the southern Atlantic coastal plain.

Heavy September rain also soaked portions of the southern High Plains and the Southwest, in part due to moisture associated with the remnants of eastern Pacific Hurricanes Norbert and Odile. Substantial precipitation fell in other parts of the West, including the Great Basin and Intermountain region, providing some drought relief. However, warm, mostly dry weather persisted in central and southern California and portions of the interior Northwest. By October 5, at least one-third of the rangeland and pastures were rated in very poor to poor condition in California ( 70 percent), Oregon (48 percent), Nevada (40 percent), and Washington (34 percent).

## September Agricultural Summary

Most of the Nation saw above-average temperatures for the month of September, with scattered locations across the West recording temperatures more than $4^{\circ} \mathrm{F}$ above normal for the month. However, locations across the Corn Belt generally recorded below-average temperatures for the month, slowing down the maturity of row crops before harvest began. The eastern United States saw generally below-normal precipitation for the month with the exception of a band stretching from Iowa to Indiana and another along the Atlantic coast from North Carolina to Florida. Rainfall levels varied across the western United States from no precipitation in central and southern California to over 10 inches in southeast New Mexico.

Ninety percent of this year's corn crop was at or beyond the dough stage by August 31, eight percentage points ahead of last year and slightly ahead of the 5-year average. By August 31, eight percent of the corn crop was mature, 4 percentage points ahead of last year but 8 percentage points behind the 5 -year average. At the beginning of the month, the percentage of corn mature was behind the 5 -year averages in all of the estimating States except Nebraska and Texas. Below-average temperatures throughout the Corn Belt continued to slow down progress in major corn producing regions. Nationwide, 82 percent of the corn crop was at or beyond the dent stage by September 14, three percentage points ahead of last year but 3 percentage points behind the 5 -year average. The corn harvest began in most southern Corn Belt locations by the middle of the month with 4 percent of the Nation's corn harvested by September 14, equal to the same time last year but 5 percentage points behind the 5 -year average. Ninety-six percent of the corn crop was at or beyond the dent stage by September 28, slightly ahead of last year but slightly behind the 5 -year average. By September 28, sixty percent of the corn crop was mature, equal to last year but 10 percentage points behind the 5 -year average. Nationally, 12 percent of the corn crop was harvested by September 28, slightly ahead of last year but 11 percentage points behind the 5 -year average. Overall, 74 percent of the corn crop was reported in good to excellent condition on September 28, unchanged from the beginning of the month but 19 percentage points better than the same time last year. Corn condition ratings in the good and excellent categories are as high as they have been this late in the season since 2004.

Sixty-one percent of the sorghum crop was coloring by August 31, nine percentage points ahead of last year and 7 percentage points ahead of the 5 -year average. With progress limited to Arkansas, Louisiana, and Texas, 25 percent of the Nation's sorghum crop was harvested by August 31, two percentage points behind last year but slightly ahead of the 5 -year average. By September 14, forty-five percent of the crop had reached maturity, 9 percentage points ahead of last year and 8 percentage points ahead of the 5 -year average. Nationally, 28 percent of the sorghum crop had been harvested by September 14, four percentage points behind last year but slightly ahead of the 5 -year average. Ninety-three percent of
the sorghum crop was coloring by September 28, equal to last year but 4 percentage points ahead of the 5 -year average. By September 28, fifty-nine percent of the crop had reached maturity, 7 percentage points ahead of last year and 5 percentage points ahead of the 5 -year average. Nationally, 32 percent of the sorghum crop had been harvested by week's end, 4 percentage points behind last year and slightly behind the 5 -year average. Overall, 57 percent of the sorghum crop was reported in good to excellent condition, unchanged from August 31 but 3 percentage points better than the same time last year.

By August 31, fifty-eight percent of the barley crop was harvested, 15 percentage points behind last year and 10 percentage points behind the 5 -year average. Eighty-one percent of the barley crop was harvested by September 7, six percentage points behind last year and slightly behind the 5 -year average. Crop damage was reported in Idaho with sprouting and sooty mold due to increased precipitation during August. By September 21, ninety-five percent of this year's barley crop was harvested, 4 percentage points behind last year but equal to the 5 -year average.

The seeding of the 2015 winter wheat crop was underway by the beginning of September with 3 percent planted by September 7, two percentage points behind last year and slightly behind the 5 -year average. By September 21, producers had sown 25 percent of the winter wheat acreage, 4 percentage points ahead of last year's pace and 3 percentage points ahead of the 5 -year average. Producers had sown 43 percent of the Nation's winter wheat acreage by September 28, six percentage points ahead of last year's pace and 7 percentage points ahead of the 5-year average. Dry conditions near the end of the month allowed for rapid planting progress in Oklahoma, with 57 percent complete by September 28, twenty-six percentage points ahead of the 5 -year average. Nationally, 14 percent of the winter wheat had emerged on September 28, three percentage points ahead of the same time last year and 2 percentage points ahead of the 5-year average.

Thirty-eight percent of the spring wheat crop was harvested by August 31, twenty-three percentage points behind last year and 27 percentage points behind the 5 -year average. Due to delayed spring planting the spring wheat harvest in Minnesota was nearly 3 weeks behind the 5 -year average at the beginning of the month. Seventy-four percent of the spring wheat crop was harvested by September 14, fifteen percentage points behind last year and 12 percentage behind the 5 -year average. Ninety-four percent of the spring wheat crop was harvested by September 28, slightly behind last year and 2 percentage points behind the 5 -year average. By the end of the month, harvest was complete or nearly complete in Idaho, Minnesota, South Dakota, and Washington. On September 7, sixty percent of the spring wheat crop was reported in good to excellent condition, compared with 63 percent on August 31 and 70 percent at the end of August 2013.

By August 31, ninety-seven percent of the rice crop was at or beyond the heading stage, 3 percentage points ahead of both last year and the 5 -year average. Producers had harvested 17 percent of the Nation's rice crop by August 31, equal to last year but 9 percentage points behind the 5 -year average. Forty-six percent of the Nation's rice crop was harvested by September 21, two percentage points ahead of last year but 7 percentage points behind the 5 -year average. Fifty-nine percent of the Nation's rice crop was harvested by September 28, three percentage points ahead of last year but 3 percentage points behind the 5 -year average. The rice harvest was nearly complete in Louisiana and Texas by the end of the month, and over a majority of the crop had been harvested in Arkansas and Mississippi. Overall, 74 percent of the rice crop was reported in good to excellent condition on September 21, unchanged from August 31 but 3 percentage points better than the same time last year.

Five percent of the Nation's soybean crop was dropping leaves by August 31, two percentage points ahead of last year but 2 percentage points behind the 5 -year average. Nationwide, 12 percent of the soybean crop was at or beyond the leafdropping stage by September 7 , two percentage points ahead of last year but 5 percentage points behind the 5 -year average. A few cases of Sudden Death Syndrome in soybeans were reported throughout the month in some parts of Illinois. Forty-five percent of the crop was at or beyond the leaf-dropping stage by September 21, slightly ahead of last year but 8 percentage points behind the 5 -year average. Significant harvest progress was limited to the Mississippi Delta and soybean harvest had just begun in several States in the Midwest. Nationally, 3 percent of the soybean crop was harvested by September 21, equal to last year but 5 percentage points behind the 5 -year average. Nationally, 10 percent of the soybean crop was harvested by September 28, equal to last year but 7 percentage points behind the 5 -year average. Overall, 72 percent of the soybean crop was reported in good to excellent condition on September 28, equal to the beginning of the month but 19 percentage points better than the same time last year. Soybean condition ratings in the good to excellent categories are as high as they have been this late in the season since 1994.

Producers had begun to harvest early peanut varieties in Florida and Georgia at the beginning of the month. Producers had harvested 3 percent of the Nation's peanut crop by September 14, slightly behind last year but equal to the 5 -year average. Producers had harvested 12 percent of the Nation's peanut crop by September 28, slightly ahead of last year but 3 percentage points behind the 5 -year average. Overall, 56 percent of the peanut crop was reported in good to excellent condition, down 4 percentage points from August 31 but 3 percentage points below the same time last year.

Nationally, 31 percent of the cotton crop had open bolls by August 31, sixteen percentage points ahead of last year and 4 percentage points ahead of the 5 -year average. Fifty-one percent of the cotton crop had open bolls by September 14, seventeen percentage points ahead of last year and 2 percentage points ahead of the 5 -year average. By September 14, six percent of the United States cotton crop was harvested, 2 percentage points ahead of last year but slightly behind the 5 -year average. Nationwide, 64 percent of the cotton crop had open bolls by September 28, seven percentage points ahead of last year but 6 percentage points behind the 5 -year average. By September 28, ten percent of the cotton crop was harvested, 3 percentage points ahead of last year but 3 percentage points behind the 5 -year average. Overall, 49 percent of the cotton crop was reported in good to excellent condition on September 28, down slightly from the beginning of the month but 7 percentage points better than the same time last year.

By September 21, ten percent of the Nation's sugarbeet acreage had been harvested, 5 percentage points ahead of the same time last year and 2 percentage points better than the 5 -year average. Thirteen percent of the Nation's sugarbeet acreage had been harvested by September 28, four percentage points ahead of last year but equal to the 5 -year average. Idaho sugarbeets were 23 percent harvested by the end of the month, approximately 10 days ahead of the 5 -year average pace.

## Crop Comments

Corn: Acreage updates were made in several States following a thorough review of all available data. Total planted area at 90.9 million acres is down 1 percent from the previous estimate. Acreage harvested for grain is forecast at 83.1 million acres, down 1 percent from the September forecast and down 5 percent from 2013.

The September 1 corn objective yield data indicate the highest number of ears on record for the combined 10 objective yield States (Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Nebraska, Ohio, South Dakota, and Wisconsin).

At 14.5 billion bushels, 2014 corn production is forecast to be the highest production on record for the United States. The forecasted yield, at 174.2 bushels per acre, is also expected to be a new record high. Twenty-two States expect a record high corn yield for 2014.

No major weather events were reported in the Corn Belt during September. However this year's late maturing crop delayed harvest in the top 18 corn producing States. By September 7, sixty-nine percent of the corn crop was at or beyond the dent stage, 8 percentage points ahead of last year but 5 percentage points behind the 5 -year average. Seventy-four percent of the corn was reported in good to excellent condition, 20 percentage points better than the same time last year.

By September 14, twenty-seven percent of the corn crop was mature, 7 percentage points ahead of last year but 12 percentage points behind the 5 -year average. Corn was 19 percent mature in Iowa, 25 percentage points behind the 5 -year average. Nationally, 90 percent of the corn crop was at or beyond the dent stage by September 21, two percentage points behind the 5 -year average. At the same time, 7 percent of the corn was harvested, 8 percentage points behind the 5 -year average. Corn harvest progress was behind the state 5 -year averages in all estimating states except Texas.

The corn crop ended the month with 60 percent of the crop mature, equal to the same time last year but 10 percentage points behind the 5 -year average. Twelve percent of the corn crop was harvested by week's end, slightly ahead of last year but 11 percentage points behind the 5 -year average. Overall, 74 percent of the crop was reported to be in good to excellent condition, 19 percentage points better than the same time last year.

Sorghum: Production is forecast at 404 million bushels, down 6 percent from last month but up 4 percent from last year. Acreage updates were made in several States following a thorough review of all available data. Planted area, at
7.21 million acres, is down 3 percent from the previous estimate and down 11 percent from last year. Area harvested for grain is forecast at 6.17 million acres, down 4 percent from September 1 and down 5 percent from 2013. Based on October 1 conditions, yield is forecast at 65.4 bushels per acre, down 1.8 bushels from last month but up 5.8 bushels from last year.

As of September 28, fifty-nine percent of the sorghum crop was mature, 7 percentage points ahead of last year and 5 percentage points ahead of the five-year average. Harvest progress had reached 32 percent at this time, 4 percentage points behind last year and slightly behind the 5-year average. Fifty-seven percent of the crop was rated in good to excellent condition, compared with 54 percent last year at this time.

Rice: Production is forecast at 221 million cwt, up 1 percent from September and up 16 percent from last year. Area for harvest is expected to total 2.91 million acres, unchanged from September but up 18 percent from last year. Based on conditions as of October 1, the average United States yield is forecast at 7,584 pounds per acre, up 83 pounds from the September forecast but 110 pounds below the 2013 average yield of 7,694 pounds per acre. A record high yield is expected in Texas.

By September 28, fifty-nine percent of the United States acreage was harvested, 3 percentage points ahead of the same time last year but 3 percentage points behind the five-year average.

Soybeans: Acreage updates were made in several States based on a thorough review of all available data. Planted area, at 84.1 million acres, is down less than 1 percent from the previous estimate. Area for harvest is forecast at a record 83.4 million acres, down less than 1 percent from September but up 9 percent from 2013.

The October objective yield data for the combined 11 major soybean-producing States (Arkansas, Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, Ohio, and South Dakota) indicate a higher pod count compared with last year as conditions have generally been more favorable across the Midwest. Compared with final counts for 2013, pod counts are up in seven of the eleven published States. The largest increase from 2013's final pod count is expected in Missouri, up 469 pods per 18 square feet. An increase of more than 200 pods per 18 square feet is expected in Arkansas and Illinois.

As of September 28, sixty-nine percent of the soybean crop was dropping leaves or beyond, 5 percentage points ahead of last year but 2 percentage points behind the 5 -year average. At that time, progress was behind normal in 12 of the 18 major States, with Kentucky and Minnesota more than 10 percentage points behind normal. Harvest progress, at 10 percent complete, was equal to last year's pace but 7 percentage points behind normal. Harvest progress was more than 10 percentage points behind normal in Iowa, Minnesota, Nebraska, North Dakota, and South Dakota.

As of September 28, seventy -two percent of the United States soybean crop was rated in good to excellent condition, 19 percentage points better than the same week in 2013.

If realized, the forecasted yield will be a record high in Arkansas, Delaware, Georgia, Illinois, Indiana, Louisiana, Mississippi, Missouri, Ohio, Pennsylvania, South Dakota, and Tennessee.

Sunflower: The first production forecast for 2014 is 2.45 billion pounds, up 21 percent from 2013. Area planted, at 1.57 million acres, is down 8 percent from the June estimate and is down fractionally from last year. Sunflower growers expect to harvest 1.51 million acres, down 7 percent from June but up 2 percent from the 2013 acreage. Despite the increase from last year, harvested area for the Nation is expected to be the third lowest since 1976. The October yield forecast, at 1,626 pounds per acre, is 248 pounds higher than last year's yield.

As of October 1, higher yields are expected in 7 of the 9 published States compared with last year, with only California and Minnesota expecting a decline in average yields. The forecasted production in North Dakota, the leading sunflower-producing State, is 1.10 billion pounds, up 81 percent from 2013 due to a combination of improved yields and increased acreage this year compared with last year when poor conditions hampered planting.

Peanuts: Production is forecast at 4.98 billion pounds, up slightly from the September forecast and up 19 percent from last year's revised production of 4.17 billion pounds. Area for harvest is expected to total 1.31 million acres, unchanged from September but 25 percent higher than 2013. Based on conditions as of October 1, the average yield for the United States is forecast at 3,812 pounds per acre, up 12 pounds from the September forecast but 189 pounds below the revised 2013 average yield of 4,001 pounds per acre.

As of September 28, 12 percent of the 2014 peanut crop had been harvested, slightly ahead of the same time last year but 3 percentage points behind the five-year average. Fifty-six percent of the crop was rated in good to excellent condition on September 28, compared with 59 percent at the same time last year.

Canola: The first production forecast for 2014 is 2.52 billion pounds, up 14 percent from 2013 and will be the largest production on record, if realized. Area planted, at 1.71 million acres, is down 2 percent from the June estimate but up 27 percent from last year. Canola farmers expect to harvest 1.55 million acres, down 7 percent from June but up 23 percent from 2013. Harvested area for the Nation will be the second largest on record, if realized. The October yield forecast, at 1,622 pounds per acre, is 126 pounds below last year's yield but will be the fourth highest on record, if realized.

The yield in North Dakota, the largest canola-producing State, is forecast at 1,800 pounds per acre, down 20 pounds from last year's yield. Planted area in North Dakota is estimated at 1.18 million acres, an increase of 29 percent from 2013. Generally beneficial spring weather allowed planting of the crop to progress well ahead of last year and slightly ahead of normal. Maturation of the crop was near normal through the growing season but harvest began slightly behind normal in mid-August.

Cotton: Upland cotton harvested area is expected to total 9.7 million acres, unchanged from last month but up 32 percent from 2013. Pima harvested area, at 189,400 acres, was carried forward from last month.

As of September 28, forty-nine percent of the cotton acreage was rated in good to excellent condition, compared with 42 percent at this time last year. Sixty-four percent of the crop had open bolls by September 28, seven percentage points ahead of last year but 6 percentage points behind the 5 -year average. Ten percent of the crop had been harvested by September 28, three percentage points ahead of last year but 3 percentage points behind the 5 -year average.

Scattered showers persisted throughout much of September; however dry weather by the end of the month allowed producers to begin harvest in many areas. Record high yields are forecast in Arizona and Kansas.

Ginnings totaled $1,154,450$ running bales prior to October 1, compared with 486,400 running bales ginned prior to the same date last year.

Alfalfa and alfalfa mixtures: Production of alfalfa and alfalfa mixture dry hay for 2014 is forecast at 64.5 million tons, up 1 percent from the August forecast and up 12 percent from 2013. Based on October 1 conditions, yield is expected to average 3.55 tons per acre, up 0.05 ton from August and up 0.31 ton from last year. If realized, yield would be the highest on record. Harvested area is forecast at 18.2 million acres, unchanged from August, but up 2 percent from 2013. Arizona, Nebraska and Utah are expecting record high yields in 2014.

With the exception of the continuing drought in the far western United States, much of the growing season has been characterized by good moisture and cooler than average temperatures. This resulted in favorable conditions for most of the Nation's alfalfa hay crop.

Other hay: Production of other hay is forecast at 84.1 million tons, up 9 percent from the August forecast and up 7 percent from 2013. Based on October 1 conditions, yields are expected to average 2.13 tons per acre, up 0.17 ton from August and up 0.19 ton from last year. If realized, yield would be a record high. Harvested area is forecast at 39.5 million acres, unchanged from August but down 3 percent from 2013.

Good August moisture, excluding the far western States, has many producers expecting improved yield and production over last year. Producers in Alabama, Colorado, Louisiana, North Dakota, and Wyoming are expecting record high yields in 2014.

Dry beans: United States dry edible bean production is forecast at 29.0 million cwt for 2014, up 19 percent from last year. Planted area is estimated at 1.69 million acres, up 25 percent from 2013. Harvested area is forecast at 1.63 million acres, 24 percent above the previous year. The average United States yield is forecast at 1,787 pounds per acre, a decrease of 80 pounds from 2013. If realized, this yield will be the third highest on record, behind only the previous two seasons.

In North Dakota, planting was virtually complete by June 22, well ahead of last year but equal to the 5 -year average. By October 5, dry bean harvest was 62 percent complete, behind the 5 -year average at 71 percent. Crop condition was rated mostly fair to good. In Michigan, September weather was favorable for dry bean harvest, which reached 61 percent complete by October 5, slightly behind the 5 -year average of 65 percent. Nebraska's harvest was 77 percent complete by October 5 with the crop mostly rated good to excellent. Harvest was wrapping up in Washington and Idaho by October 5 with 96 percent and 84 percent harvested, respectively.

Tobacco: United States all tobacco production for 2014 is forecast at 849 million pounds, up 17 percent from 2013. Area harvested is forecast at 358,880 acres, 1 percent above last year. Average yield for 2014 is forecast at 2,365 pounds per acre, 331 pounds above 2013.

Flue-cured tobacco production is expected to total 557 million pounds, up 23 percent from the 2013 crop. North Carolina growers reported excellent growing conditions for this crop year despite having an initial delay in transplanting due to sporadic periods of rain.

Burley production is expected to total 211 million pounds, up 10 percent from last year. Kentucky and Tennessee growers reported that crop conditions improved and fieldwork activities resumed following variable weather conditions with random periods of rain earlier in the season.

Sugarbeets: Production of sugarbeets for the 2014 crop year is forecast at 32.1 million tons, down 2 percent from last year. Producers expect to harvest 1.15 million acres, down slightly from the previous forecast and down 1 percent from 2013. Expected yield is forecast at 28.0 tons per acre, a decrease of 0.4 ton from last year.

Sugarcane: Production of sugarcane for sugar and seed in 2014 is forecast at 29.3 million tons, down 5 percent from last year. Producers intend to harvest 882,500 acres for sugar and seed during the 2014 crop year, down 28,300 acres from last year. Expected yield for sugar and seed is forecast at 33.2 tons per acre, down 0.6 ton from 2013.

Grapefruit: The 2014-2015 United States grapefruit crop is forecast at 1.03 million tons, down 2 percent from last season's final utilization. In Florida, fruit per tree is forecast to be down from the previous season. Projected droppage is expected to be above average.

Lemons: The forecast for the 2014-2015 United States lemon crop is 840,000 tons, up 1 percent from last season's final utilization. Demand remains strong in both Arizona and California.

Tangelos: Florida's tangelo forecast is 900,000 boxes ( 41,000 tons), up 2 percent from last season's final utilization. Projected fruit size is below average and projected droppage is above average.

Tangerines and mandarins: The United States tangerine and mandarin crop is forecast at 782,000 tons, up 8 percent from last season's final utilization.

Florida citrus: In the citrus producing areas, high temperatures for the month ranged from the mid to upper 90s. Despite generally heavy and widespread rainfall, abnormally dry conditions covered the western and a portion of the central citrus producing regions during most of September. Growers and caretakers were spraying, performing irrigation repair, and pushing trees.

California citrus: The harvest of Valencia oranges continued. Citrus groves were skirted and pruned for insect control. Tangelo and grapefruit harvests remained active. Lemon harvest continued, but slowed toward the end of September.

California noncitrus fruits and nuts: In Sutter County, prune harvest continued. Stone fruit was exported. Olives were maturing normally. Pomegranates and persimmons were nearing harvest at the end of the first week of September. The Clingstone peach harvest was completed at the end of the first week of September in Yuba County. Prune orchard cleanup continued, with some prune and peach orchards removed. Golden kiwi harvest continued. Late varieties of nectarines and peaches were harvested. Table and wine grape harvests were active. Some growers were still laying raisins while some were picked up during the second and third weeks of September. Almond and walnut orchards were harvested. Husk fly treatments were applied to walnut orchards. The pistachio harvest started and continued throughout the month with good quality reported.

Pecans: Production is forecast at 276 million pounds (utilized, in-shell basis), up 3 percent from 2013. Improved varieties are expected to produce 233 million pounds or 85 percent of the total. The native and seedling varieties are expected to produce 42.6 million pounds, making up the remaining 15 percent of production.

## Statistical Methodology

Field crop survey procedures: Objective yield and farm operator surveys were conducted between September 24 and October 6 to gather information on expected yield as of October 1. The objective yield surveys for corn, cotton, and soybeans were conducted in the major producing States that usually account for about 75 percent of the United States production. Randomly selected plots were revisited to make current counts. The counts made within each sample plot depend on the crop and the maturity of that crop. In all cases, plant counts are recorded along with other measurements that provide information to forecast the number of ears, bolls, or pods and their weight. The counts are used with similar data from previous years to develop a projected biological yield. The average harvesting loss is subtracted to obtain a net yield. The plots are revisited each month until crop maturity when the fruit is harvested and weighed. After the farm operator has harvested the sample field, another plot is sampled to obtain current year harvesting loss.

The farm operator survey was conducted primarily by telephone with some use of mail, internet, and personal interviewers. Approximately 13,300 producers were interviewed during the survey period and asked questions about probable yield. These growers will continue to be surveyed throughout the growing season to provide indications of average yields.

Orange survey procedures: The orange objective yield survey for the October 1 forecast was conducted in Florida, which produced about 69 percent of the United States production last season. In August and September 2014, the number of bearing trees and the number of fruit per tree were determined. In August and subsequent months, fruit size measurement and fruit droppage surveys are conducted to develop the current forecast of production. California and Texas conduct grower and packer surveys on a quarterly basis in October, January, April, and July. California conducts an objective measurement survey in September for Navel oranges and in March for Valencia oranges.

Field crop estimating procedures: National and State level objective yield and grower reported data were reviewed for reasonableness and consistency with historical estimates. The survey data were also reviewed considering weather patterns and crop progress compared to previous months and previous years. Each State Field Office submits their analysis of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the survey data and the State analyses to prepare the published October 1 forecasts.

Orange estimating procedures: State level objective yield estimates for Florida oranges were reviewed for errors, reasonableness, and consistency with historical estimates. Reports from growers and packers in California and Texas were also used for setting estimates. These three States submit their analyses of the current situation to the Agricultural Statistics Board (ASB). The ASB uses the survey data and the State analyses to prepare the published October 1 forecast.

Revision policy: The October 1 production forecast will not be revised; instead, a new forecast will be made each month throughout the growing season. End-of-season estimates are made after harvest. At the end of the marketing season, a balance sheet is calculated using carryover stocks, production, exports, millings, feeding, and ending stocks. Revisions are then made if the balance sheet relationships or other administrative data warrant changes. Estimates of planted acres for spring planted crops are subject to revision in the August Crop Production report if conditions altered the planting intentions since the mid-year survey. Planted acres may also be revised for cotton, peanuts, and rice in the September Crop Production report each year; spring wheat, Durum wheat, barley, and oats only in the Small Grains Annual report at the end of September; and all other spring planted crops in the October Crop Production report. Revisions to planted acres will only be made when special survey data, administrative data, such as Farm Service Agency program "sign up" data, or remote sensing data are available. Harvested acres may be revised any time a production forecast is made if there is strong evidence that the intended harvested area has changed since the last forecast. End-of-season orange estimates will be published in September's Citrus Fruits Summary. The orange production estimates are based on all data available at the end of the marketing season, including information from marketing orders, shipments, and processor records. Allowances are made for recorded local utilization and home use.

Reliability: To assist users in evaluating the reliability of the October 1 production forecast, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviation between the October 1 production forecast and the final estimate is expressed as a percentage of the final estimate. The average of the squared percentage deviations for the latest 20-year period is computed. The square root of the average becomes statistically the "Root Mean

Square Error." Probability statements can be made concerning expected differences in the current forecast relative to the final end-of-season estimate, assuming that factors affecting this year's forecast are not different from those influencing recent years. For example, the "Root Mean Square Error" for the October 1 corn for grain production forecast is 1.9 percent. This means that chances are 2 out of 3 that the current production forecast will not be above or below the final estimate by more than 1.9 percent. Chances are 9 out of 10 ( 90 percent confidence level) that the difference will not exceed 3.3 percent.

Also, shown in the following table is a 20 -year record for selected crops of the differences between the October 1 forecast and the final estimate. Using corn again as an example, changes between the October 1 forecast and the final estimate during the last 20 years have averaged 160 million bushels, ranging from 3 million bushels to 448 million bushels. The October 1 forecast has been below the final estimate 9 times and above 10 times. This does not imply that the October 1 corn forecast this year is likely to understate or overstate final production.

Reliability of October 1 Crop Production Forecasts
[Based on data for the past twenty years]

| Crop | Root mean square error | 90 percent confidence interval | Difference between forecast and final estimate |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Production |  |  | Years |  |
|  |  |  | Average | Smallest | Largest | Below final | Above final |
|  | (percent) | (percent) | (millions) | (millions) | (millions) | (number) | (number) |
| Corn for grain ................................. bushels | 1.9 | 3.3 | 160 | 3 | 448 | 9 | 10 |
| Dry edible beans .................................. cwt | 3.3 | 5.7 | 1 | (Z) | 3 | 15 | 4 |
| Oranges ${ }^{1}$.........................................tons | 7.2 | 12.5 | 525 | 2 | 1,676 | 5 | 14 |
| Oranges ${ }^{12}$.....................................tons | 4.8 | 8.4 | 379 | 2 | 1,101 | 5 | 11 |
| Rice .................................................. cwt | 1.8 | 3.1 | 3 | (Z) | 7 | 10 | 9 |
| Sorghum for grain ........................... bushels | 5.1 | 8.8 | 14 | (Z) | 33 | 8 | 11 |

## Access to NASS Reports

For your convenience, you may access NASS reports and products the following ways:
> All reports are available electronically, at no cost, on the NASS web site: http://www.nass.usda.gov
> Both national and state specific reports are available via a free e-mail subscription. To set-up this free subscription, visit http://www.nass.usda.gov and in the "Follow NASS" box under "Receive reports by Email," click on "National" or "State" to select the reports you would like to receive.

For more information on NASS surveys and reports, call the NASS Agricultural Statistics Hotline at (800) 727-9540, 7:30 a.m. to 4:00 p.m. ET, or e-mail: nass @ nass.usda.gov.

The U.S. Department of Agriculture (USDA) prohibits discrimination against its customers, employees, and applicants for employment on the basis of race, color, national origin, age, disability, sex, gender identity, religion, reprisal, and where applicable, political beliefs, marital status, familial or parental status, sexual orientation, or all or part of an individual's income is derived from any public assistance program, or protected genetic information in employment or in any program or activity conducted or funded by the Department. (Not all prohibited bases will apply to all programs and/or employment activities.)

If you wish to file a Civil Rights program complaint of discrimination, complete the USDA Program Discrimination Complaint Form (PDF), found online at http://www.ascr.usda.gov/complaint filing cust.html, or at any USDA office, or call (866) 632-9992 to request the form. You may also write a letter containing all of the information requested in the form. Send your completed complaint form or letter to us by mail at U.S. Department of Agriculture, Director, Office of Adjudication, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, by fax (202) 690-7442 or email at program.intake@usda.gov.

# USDA Data Users' Meeting 

Monday, October 20, 2014

Crowne Plaza Chicago-Metro<br>Chicago, Illinois 60661<br>312-829-5000

The USDA's National Agricultural Statistics Service will be organizing an open forum for data users. The purpose will be to provide updates on pending changes in the various statistical and information programs and seek comments and input from data users. Other USDA agencies to be represented will include the Agricultural Marketing Service, the Economic Research Service, the Foreign Agricultural Service, and the World Agricultural Outlook Board. The Foreign Trade Division from the Census Bureau will also be included in the meeting.

For registration details or additional information for the Data Users' Meeting, see the NASS homepage at http://www.nass.usda.gov/meeting/ or contact Rose Armstrong (NASS) at (202) 720-3896 or at rose.armstrong@ nass.usda.gov.

This Data Users' Meeting precedes the Industry Outlook Conference that will be held at the same location on Tuesday, October 21, 2014. The outlook meeting brings together analysts from various commodity sectors to discuss the outlook situation. For registration details or additional information for the Industry Outlook Conference, see the conference webpage on the LMIC website: http://www.lmic.info/IOC/. Or call the Livestock Marketing Information Center (LMIC) at (303) 236-0460.

[^0]:    ${ }^{1}$ Other States include Arizona and Georgia. Individual State level estimates will be published in the Crop Production 2014 Summary.

[^1]:    ${ }^{1}$ Production ginned and to be ginned.
    ${ }^{2} 480$-pound net weight bale.
    ${ }^{3}$ Estimates for current year carried forward from an earlier forecast.

[^2]:    ${ }^{1}$ Net tons.

[^3]:    ${ }^{7}$ Estimates for current year carried forward from an earlier forecast

[^4]:    ${ }^{1}$ Net pounds per box: oranges in California-80, Florida-90, Texas-85; grapefruit in California-80, Florida-85, Texas-80; tangerines and mandarins in Arizona and California-80, Florida-95; lemons-80; tangelos-90.
    ${ }^{2}$ Navel and miscellaneous varieties in California. Early (including Navel) and midseason varieties in Florida and Texas. Small quantities of tangerines in Texas and Temples in Florida.
    ${ }^{3}$ Includes tangelos and tangors.

[^5]:    Represents zero.
