

## Short-Term Energy and Winter Fuels Outlook (STEO)

### Highlights

- EIA projects average U.S. household expenditures for natural gas, heating oil, electricity, and propane will decrease this winter heating season (October 1 through March 31) compared with last winter, which was 11% colder than the previous 10-year average nationally. Projected average household expenditures for propane and heating oil are 27% and 15% lower, respectively, because of lower heating demand and prices. Lower heating demand and higher prices contribute to natural gas and electricity expenditures that are 5% and 2% lower than last winter (see EIA [Short-Term Energy Outlook and Winter Fuels Outlook slideshow](#)).
- Driven in large part by falling crude oil prices, U.S. regular gasoline retail prices fell to an average of \$3.41/gallon (gal) in September, 29 cents below the June average. U.S. regular gasoline retail prices are projected to continue to decline to an average of \$3.14/gal in December. EIA expects U.S. regular gasoline retail prices, which averaged \$3.51/gal in 2013, to average \$3.45/gal in 2014 and \$3.38/gal in 2015.
- Weakening global demand helped North Sea Brent crude oil spot prices fall to an average of \$97 per barrel (bbl) in September, the first month Brent prices have averaged below \$100/bbl in more than two years. EIA projects that Brent crude oil prices will average \$98/bbl in fourth-quarter 2014 and \$102/bbl in 2015. The WTI discount to Brent, which averaged \$11/bbl in 2013, is expected to average \$7/bbl in both 2014 and 2015.
- Total U.S. crude oil production averaged an estimated 8.7 million barrels per day (bbl/d) in September, the highest monthly production since July 1986. Total crude oil production, which averaged 7.4 million bbl/d in 2013, is expected to average 9.5 million bbl/d in 2015. If realized, the 2015 forecast would be the highest annual average crude oil production since 1970. Natural gas plant liquids production is expected to increase from an average of 2.6 million bbl/d in 2013 to 3.2 million bbl/d in 2015.
- Natural gas working inventories on September 26 totaled 3.10 trillion cubic feet (Tcf), 0.37 Tcf (11%) below the level at the same time a year ago and 0.40 Tcf (11%) below the previous five-year average (2009-13). Projected natural gas working inventories reach 3.53 Tcf at the end of October, 0.28 Tcf below the level at the same time last year. Despite the lower stocks at the start of this winter's heating season, EIA expects the Henry Hub natural gas

spot price to \$4.00/million British thermal units (MMBtu) this winter compared with \$4.53/MMBtu last winter. This price forecast reflects both lower expected heating demand and significantly higher natural gas production this winter.

## Projected Winter Fuel Expenditures by Fuel and Region

The average household winter heating fuel expenditures discussed in this STEO provide a broad guide to changes compared with last winter. However, fuel expenditures for individual households are highly dependent on local weather conditions, market size, the size and energy efficiency of individual homes and their heating equipment, and thermostat settings (see [Winter Fuels Outlook table](#)). Forecast temperatures based on the latest forecasts from the National Oceanic and Atmospheric Administration (NOAA) are much warmer than last winter east of the Rocky Mountains, with the Midwest 16% warmer, the South 12% warmer, the Northeast 11% warmer. However, last winter provides a reminder that weather can be unpredictable, and the Winter Fuels Outlook includes forecasts for scenarios where heating degree days (HDD) in all regions may be 10% higher (colder) or 10% lower (warmer) than forecast.

**Natural Gas.** About half of all U.S. households heat with natural gas, and the average household may expect a 5% decrease in winter natural gas expenditures. EIA projects a 10% decline in residential natural gas consumption this year as temperatures are expected to return to closer-to-normal levels. The savings from lower consumption are partially offset by higher residential prices. Although EIA forecasts lower Henry Hub prices this winter, current spot prices do not directly translate into lower delivered residential prices. Utilities began buying gas in April for the upcoming heating season, and prices in 2014 have averaged higher than last year. Plus, the rates that utilities charge can be set by state utility commissions a year or more in advance.

Under a 10%-colder scenario, EIA projects consumption will be 3% less than last year and expenditures will be 6% greater than last year. Under a 10%-warmer scenario, EIA expects a decline of 17% in consumption and 12% in expenditures compared with last year.

Last winter, [gas-fired power plants in the Northeast](#) had to compete for an increasingly limited amount of available natural gas pipeline capacity from a system that was already constrained, particularly in New England and New York. This caused natural gas spot prices and consequently day-ahead power prices to spike. Pipeline constraints still exist in the area, and day-to-day price volatility is likely. The region has two important marginal sources of supply for times of very high demand: liquefied natural gas (LNG) imports and pipeline imports from Canada. Although LNG imports have declined dramatically in the past several years, GDF Suez still receives cargoes from Trinidad under long-term contracts at its LNG terminal near Boston. One of the terminal's customers is the adjacent Mystic Power Plant. LNG received at the Canaport LNG terminal in New Brunswick, Nova Scotia, also comes to the United States via the Brunswick Pipeline.

Strong production growth this year contributed to a record inventory build. EIA projects working natural gas inventories of 3,532 billion cubic feet (Bcf) at the end of October. EIA

expects working gas inventories to be drawn down to 1,534 Bcf at the end of March 2015. Even in the event of another cold winter, EIA does not expect stocks to fall below 1,000 Bcf by the end of this heating season.

**Heating Oil.** EIA expects households heating primarily with heating oil to spend an average of \$362 (15%) less this winter than last winter, reflecting prices that are \$0.25/gal (6%) lower and consumption that is 10% lower. Heating oil prices are expected to be lower in large part because of lower crude oil prices, with Brent crude oil prices forecast to average \$9/bbl (\$0.22/gal) lower this winter than last. In the 10%-colder-weather scenario, projected expenditures are \$124 lower than last winter, with prices that are \$0.16/gal lower than last winter.

A number of factors contribute to uncertainty in this winter's heating oil market, including weather and oil price volatility, the adequacy of inventories, and changes in fuel specifications. Distillate stocks in the Northeast totaled 29.3 million barrels on September 26, 0.2 million barrels below the same time last year and the lowest level for this time of year since 2000. However, unless severe weather in the Northeast coincides with severe weather in Europe, demand should be readily met via supplies from the Atlantic Basin market.

Reliance on heating oil is highest in the Northeast, where about 23% of households depend on heating oil for space heating. Nationwide, only 5% of households use heating oil. The state of New York, which accounts for about one-third of the region's heating oil market, has required the use of ultra-low sulfur heating oil since July 2012. Five states (Connecticut, Massachusetts, New Jersey, Rhode Island, and Vermont) lowered their heating oil maximum sulfur specification on July 1 from 2,000 parts per million (ppm) (and higher) to 500 ppm. No major impact is expected as suppliers will either blend high-sulfur distillate with ultra-low sulfur diesel (ULSD) or deliver ULSD, which is a readily available fuel.

In January 2015, new regulations will limit marine vessel fuel sulfur levels in certain coastal waters to 1,000 ppm. Some vessels are expected to switch from using residual fuel oil to distillate because of its lower sulfur content. However, the effect on the Northeast heating oil market should be limited because marine fuel demand in this region is relatively small.

**Propane.** About 5% of all U.S. households heat with propane. EIA expects households heating primarily with propane to spend less this winter, but the projected decrease varies across regions. EIA expects that households heating with propane in the Midwest will spend an average of \$767 (34%) less this winter than last winter, reflecting prices that are about 24% lower and consumption that is 13% lower than last winter. Households in the Northeast are expected to spend an average of \$340 (13%) less this winter, with average prices that are about 5% lower and consumption that is 9% lower than last winter.

Heading into the winter months, primary propane stocks in the Gulf Coast (PADD 3) and the Midwest (PADD 2) at the end of September were 6.6 million barrels (18%) and 3.7 million

barrels (15%) higher, respectively, than at the same time last year. Propane spot prices at the Mont Belvieu, Texas and Conway, Kansas delivery points in early October were close to prices at the same time last year. The outlook for propane demand is uncertain given volatility in winter temperatures and another [expected record corn crop](#), which could draw down propane stocks for crop drying. The Cochin Pipeline, which previously delivered propane from Canada to the Midwest, was reversed in early 2014. While this reversal will limit the ability to deliver propane into the region, higher propane production from gas plants in the Midwest and new and expanded rail terminals should help to supply propane to the region this winter.

**Electricity.** Households heating primarily with electricity can expect to spend an average of \$17 (2%) less this winter, with 3% higher prices but 5% less consumption than last winter. About 39% of all U.S. households rely on electricity as their primary heating source, ranging regionally from 15% in the Northeast to 63% in the South.

Under a 10% colder scenario, EIA estimates that U.S. residential electricity consumption this winter would be 1.8% higher than during the winter of 2013-14. Residential electricity prices would not rise immediately, but the effect of colder temperatures would pass through to retail electricity rates over the succeeding months of 2015. For a 10% colder scenario, the average U.S. residential price would rise by 2.7% in 2015 in contrast to the baseline forecast of 1.7% growth. The effect would be greatest in New England where residential prices would rise by 6.0% next year if there's a cold winter, in contrast to the baseline forecast of a 3.6% increase.

[Wholesale electricity prices in the Northeast region spiked last winter](#) because of a winter freeze and constraints on supplying natural gas to power generators. As a result, [retail electricity customers in that area have experienced increases](#) averaging up to 12% so far this year. The natural gas pipeline constraints in New England still exist and deliveries into the region are near capacity. If colder-than-expected temperatures occur this winter, there is the possibility that wholesale electricity prices could rise again. Electricity traders are already factoring in this uncertainty through higher forward market prices for wholesale electricity in the Northeast Independent System Operators.

**Wood.** The use of cord wood and wood pellets as the primary residential space heating fuel has increased by 38% since 2004, to about 2.5 million households in 2013. About 8% of households use wood as a secondary source of heat, making wood second only to electricity as a supplemental heating fuel. About 20% of New England homes (1.1 million) used wood for space heating, water heating, or cooking in 2009 (EIA, [Residential Energy Consumption Survey, 2009](#)), which is nearly twice the national rate. Almost half of all rural households in New England used wood, compared with only 12% of the area's urban households.

## Global Petroleum and Other Liquids

EIA projects world petroleum and other liquids supply to increase by 1.6 million bbl/d in 2014 and by 0.9 million bbl/d in 2015, with most of the growth coming from countries outside of the

Organization of the Petroleum Exporting Countries (OPEC). Forecast non-OPEC supply grows by 1.9 million bbl/d in 2014 and 1.2 million bbl/d in 2015. The United States and Canada account for much of this growth. Projected world liquid fuels consumption grows by an annual average of 1.0 million bbl/d in 2014 and 1.2 million bbl/d in 2015.

Global disruptions to near-term supply have abated since June, when Libya's production and exports were at a minimal level, and violence in northern Iraq escalated, causing northern production (outside of Iraqi Kurdistan) to come nearly to halt. Iraq's southern crude oil exports still remain unaffected by the unrest in northern Iraq. In Libya, production averaged 0.8 million bbl/d in September, its highest level in more than 1 year. However, the security situation in Libya is still precarious, with a significant possibility of intermittent disruptions.

**Global Petroleum and Other Liquids Consumption.** EIA estimates that global consumption grew by 1.3 million bbl/d (1.5%) in 2013, averaging 90.4 million bbl/d for the year. EIA expects global consumption to grow by 1.0 million bbl/d in 2014 and 1.2 million bbl/d in 2015. Projected global oil-consumption-weighted real GDP, which increased by an estimated 2.7% in 2013, grows by 2.7% and 3.3% in 2014 and 2015, respectively.

Consumption outside of the Organization for Economic Cooperation and Development (OECD) is projected to grow by 1.2 million bbl/d in 2014 and 1.1 million bbl/d in 2015, accounting for nearly all forecast global consumption growth during that period. China is the leading contributor to projected global consumption growth, with consumption increasing by 0.37 million bbl/d in both 2014 and 2015.

EIA expects a 0.20-million-bbl/d decline in OECD consumption in 2014. Japan and Europe are expected to account for much of the projected OECD consumption declines. EIA expects Japan's consumption, which fell by 0.16 million bbl/d in 2013, to continue to decline by an annual average of 0.13 million bbl/d in 2014 and 0.14 million bbl/d in 2015. Japan's oil consumption is expected to fall as the country continues to reduce its share of oil used in the electricity sector, replacing it with natural gas, coal, and nuclear power as the country returns some nuclear power plants to service in 2015. EIA projects that OECD Europe's consumption, which fell by 0.15 million bbl/d in 2013, will decline by 0.13 million bbl/d in 2014 and by a further 0.02 million bbl/d in 2015. U.S. consumption, which increased by 0.47 million bbl/d in 2013, is expected to decline by 0.04 million bbl/d in 2014 and then increase by 0.17 million bbl/d in 2015.

**Non-OPEC Petroleum and Other Liquids Supply.** EIA estimates that non-OPEC production grew by 1.4 million bbl/d in 2013, averaging 54.1 million bbl/d for the year. EIA expects non-OPEC production to grow by 1.9 million bbl/d in 2014 and 1.2 million bbl/d in 2015. The United States is the leading contributor to forecast non-OPEC supply growth, increasing by 1.48 million bbl/d in 2014 and 1.23 million bbl/d in 2015. EIA estimates that Eurasia's production will rise by an annual average of 0.08 million bbl/d in 2014 and 0.02 million bbl/d in 2015. This forecast assumes the current economic sanctions on Russia do not affect Russian oil production in the short term.

Unplanned supply disruptions among non-OPEC producers averaged nearly 0.6 million bbl/d in September, down slightly from the previous month. South Sudan, Syria, and Yemen accounted for more than 90% of total non-OPEC supply disruptions. EIA does not assume a disruption to oil supply or demand as a result of ongoing events in Ukraine.

**OPEC Petroleum and Other Liquids Supply.** EIA estimates that OPEC crude oil production averaged 29.9 million bbl/d in 2013, a decline of 0.99 million bbl/d from the previous year, primarily reflecting increased outages in Libya, Nigeria, and Iraq, along with strong non-OPEC supply growth. EIA expects OPEC crude oil production to fall by 0.2 million bbl/d in 2014 and by more than 0.4 million bbl/d in 2015 to accommodate growing production in non-OPEC countries.

Unplanned crude oil supply disruptions among OPEC producers averaged 2.2 million bbl/d in September 2014, 0.2 million bbl/d lower than the previous month because of decreased outages in Libya. Libya's production increased to 0.8 million bbl/d in September, 0.3 million bbl/d higher than the previous month, but still well below the 1.4 million bbl/d the country produced before the major blockades started in mid-2013. Libya still faces a considerable challenge in ramping up production to its full capacity or even sustaining it at the current level. Despite the recent production increase, the security situation has deteriorated in parts of the country, and the evacuation of foreign workers is inhibiting production levels from reaching capacity at some fields. As a result, EIA does not expect Libya's oil production to recover to its pre-blockade level over the forecast period.

EIA expects OPEC surplus crude oil production capacity, which is concentrated in Saudi Arabia, to average 2.2 million bbl/d in 2014 and 3.0 million bbl/d in 2015. These estimates do not include additional capacity that may be available in Iran but is offline because of the effects of U.S. and European Union sanctions on Iran's ability to sell its oil.

**OECD Petroleum Inventories.** EIA estimates that OECD commercial oil inventories totaled 2.55 billion barrels at the end of 2013, equivalent to roughly 55 days of consumption. Projected OECD oil inventories rise to 2.62 billion barrels at the end of 2014.

**Crude Oil Prices.** North Sea Brent crude oil spot prices averaged \$97/bbl in September, a decrease of \$5/bbl from August and the first month Brent crude oil prices have averaged below \$100/bbl since June 2012. Brent crude oil prices were driven downward in large part because of weakening global oil demand and higher Libyan oil exports (EIA, [This Week in Petroleum](#), September 24, 2014). The forecast Brent crude oil price averages \$104/bbl in 2014 and \$102/bbl in 2015, \$2/bbl lower and \$1/bbl lower than projected in last month's STEO, respectively.

The monthly average WTI crude oil spot price fell from an average of \$97/bbl in August to \$93/bbl in September. High refinery runs contributed to the discount of WTI crude oil to Brent

crude oil falling from an average of \$8/bbl during the first half of this year to an average of \$4/bbl in the third quarter. EIA now expects WTI crude oil prices to average \$91/bbl in the fourth quarter of 2014 and \$95/bbl in 2015. The discount of WTI to Brent crude oil is forecast to widen from current levels, averaging \$7/bbl in the fourth quarter of 2014 and in 2015.

Energy price forecasts are highly uncertain, and the current values of futures and options contracts suggest that prices could differ significantly from the forecast levels ([Market Prices and Uncertainty Report](#)). WTI futures contracts for January 2015 delivery, traded during the five-day period ending October 2, averaged \$91/bbl. Implied volatility averaged 19%, establishing the lower and upper limits of the 95% confidence interval for the market's expectations of monthly average WTI prices in January 2015 at \$76/bbl and \$107/bbl, respectively. Last year at this time, WTI for January 2014 delivery averaged \$102/bbl and implied volatility averaged 20%. The corresponding lower and upper limits of the 95% confidence interval were \$85/bbl and \$121/bbl.

## U.S. Petroleum and Other Liquids

**Liquid Fuels Consumption.** Total U.S. liquid fuels consumption rose by 470,000 bbl/d (2.5%) in 2013, the largest increase since 2004. Consumption of all the major liquid fuels rose, except residual fuel oil. Consumption of hydrocarbon gas liquids (HGL) registered the largest gain, increasing by 190,000 bbl/d (8.5%). In 2014, total liquid fuels consumption is expected to fall by 40,000 bbl/d (0.2%), with declines in the consumption of motor gasoline, HGL, residual fuel oil, and other oils offsetting increases in distillate fuel and unfinished oils consumption. Total consumption grows by 170,000 bbl/d in 2015, with HGL consumption accounting for three-fourths of the increase.

Motor gasoline consumption grew by 160,000 bbl/d (1.9%) in 2013, the largest increase since 2004. But consumption of that fuel falls by 20,000 bbl/d (0.2%) in 2014 and by a further 20,000 bbl/d in 2015 as improving fuel economy in new vehicles offsets highway travel growth. Distillate fuel consumption increases by 150,000 bbl/d (3.9%) in 2014, reflecting colder-than-average first-quarter weather and economic growth. Consumption of that fuel rises by a more moderate 70,000 bbl/d (1.9%) in 2015 under assumptions of normal winter weather.

**Liquid Fuels Supply.** The forecast for total U.S. crude oil production increases from 7.4 million bbl/d in 2013 to 8.5 million bbl/d in 2014 and 9.5 million bbl/d in 2015. The highest previous annual average U.S. production level was 9.6 million bbl/d in 1970. Oil production from the Gulf of Mexico is expected to increase from 1.3 million bbl/d in 2013 to 1.6 million bbl/d in 2015, with 11 projects starting this year. Six projects began production in the first half of 2014: Na Kika Phase 3, Mars B, Dalmatian, Entrada, Atlantis Phase 2, and Tubular Bells. Additional wells are expected to come online in the fourth quarter of 2014 from the Cardamom Deep, South Deimos/West Boreas, Hadrian South, Jack/St. Malo, and Lucius projects.

HGL production at natural gas liquids plants is projected to increase from 2.6 million bbl/d in 2013 to 3.2 million bbl/d in 2015. Most of this growth is expected to come from additional ethane and propane production that will meet growing demand associated with expanding domestic ethylene and propylene production and export capacity.

The growth in domestic production has contributed to a significant decline in petroleum imports. The share of total U.S. liquid fuels consumption met by net imports fell from 60% in 2005 to an average of 33% in 2013. EIA expects the net import share to decline to 20% in 2015, which would be the lowest level since 1968.

**Petroleum Product Prices.** Monthly average regular gasoline retail prices fell from \$3.69/gal in June to \$3.41/gal in September. EIA expects average regular gasoline retail prices to continue falling to \$3.14/gal in December. The U.S. annual average regular gasoline retail price, which averaged \$3.51/gal in 2013, is projected to average \$3.45/gal in 2014 and \$3.38/gal in 2015. Diesel fuel prices, which averaged \$3.92/gal in 2013, are projected to fall to an average of \$3.85/gal in 2014 and \$3.80/gal in 2015. Daily and weekly national average prices can differ significantly from monthly and seasonal averages, and there are also significant differences across regions, with monthly average prices in some areas falling above or below the national average price by \$0.30/gal or more.

## Natural Gas

**Natural Gas Consumption.** EIA expects that total natural gas consumption to average 72.5 Bcf/d in 2014, an increase of 1.6% from 2013, with the industrial sector leading the growth. In 2015, total natural gas consumption will increase 0.3%, as continued industrial sector growth and higher electric power sector consumption offset lower residential and commercial consumption. Higher natural gas prices this year contribute to a 2.3% decline in natural gas consumption in the power sector to 21.8 Bcf/d in 2014. EIA expects natural gas consumption in the power sector to increase to 22.6 Bcf/d in 2015.

**Natural Gas Production and Trade.** EIA expects natural gas marketed production to grow by an annual rate of 5.4% in 2014 and 2.0% in 2015. STEO projects that the strong increases already seen in the Lower 48 states this year will continue, offsetting declines in the Gulf of Mexico. As of July, the most recent month for which EIA data are available, marketed production was 4.2 Bcf/d greater than it was in July 2013.

Growing domestic production is expected to continue to put downward pressure on natural gas imports from Canada and spur exports to Mexico. Exports to Mexico, particularly from the Eagle Ford Shale in South Texas, are expected to increase because of growing demand from Mexico's electric power sector and flat Mexican production.

LNG imports have fallen over the past four years because higher prices in Europe and Asia are more attractive to sellers than the relatively low prices in the United States. LNG exports are

still a very small part of the total picture, however, and overall the United States will remain a net importer of natural gas because of pipeline imports from Canada.

**Natural Gas Inventories.** Natural gas working inventories totaled 3,100 Bcf as of September 26, which was 373 Bcf lower than at the same time last year and 399 Bcf lower than the previous five-year (2009-13) average. The injection season began somewhat slowly in April, but has continued at a strong pace, with injections above the five-year (2009-13) average throughout most of the injection season. EIA expects working gas stocks will reach 3,532 Bcf at the end of October, 283 Bcf lower than at the same time last year. Heading into next summer, EIA projects end-of-March 2015 inventories will be 122 Bcf below the five-year (2010-14) average.

**Natural Gas Prices.** The Henry Hub natural gas spot price averaged \$3.92/MMBtu in September, a slight increase from August. EIA expects spot prices to remain below \$4.00/MMBtu through November, before rising with winter heating demand. Projected Henry Hub natural gas prices average \$4.45/MMBtu in 2014 and \$3.84/MMBtu in 2015.

Natural gas futures prices for January 2015 delivery (for the five-day period ending October 2) averaged \$4.19/MMBtu. Current options and futures prices imply that market participants place the lower and upper bounds for the 95% confidence interval for December 2014 contracts at \$2.96/MMBtu and \$5.94/MMBtu, respectively. At this time last year, the natural gas futures contract for January 2014 averaged \$3.83/MMBtu and the corresponding lower and upper limits of the 95% confidence interval were \$2.91/MMBtu and \$5.04/MMBtu.

## Coal

According to data compiled by [the Association of American Railroads \(AAR\)](#), [year-to-date rail coal shipments](#) were down by 0.1% as of September 27. AAR data show that total U.S. rail traffic is up 4.4% year-to-date and shipments of petroleum and grain are up by 12.5% and 17.7%, respectively.

Two railways that serve Powder River Basin (PRB) producers, Union Pacific and BNSF, provided the [U.S. Surface Transportation Board \(STB\)](#) with their assessments of their ability to provide rail service for the remainder of the year (fall peak period) and the upcoming winter season. The STB annually requests the assessments from all [Class I railroads](#). Union Pacific stated that it has responded by activating surge resources, which included acquiring more locomotives, hiring more employees, and increasing coal train sizes where possible. [BNSF](#) also plans to expand its locomotive fleet and increase coal train sizes, but they emphasized that their priority will be to transport coal that is currently contracted.

**Coal Supply.** EIA estimates that coal production for the first three quarters of this year, 742 million short tons (MMst), was slightly lower (3 MMst, or 0.4%) than production over the same period last year. Year-to-date production in the West, which includes the PRB, is down by nearly

2 MMst, and has been hindered by rail transportation problems. EIA expects that U.S. coal production will accelerate in the fourth quarter and annual production will grow 1.4% to 998 MMst in 2014. In 2015, forecast U.S. coal production increases by 0.4% to 1,002 MMst.

Electric power sector coal inventories fell to 125 MMst at the end of July, 7 MMst lower than the previous month. This stock drawdown was 4 MMst less than the same time last year. Coal inventory reductions in the Midwest and South, two regions that rely heavily on coal-fired generation, were down 1 MMst and 2 MMst, respectively, when compared with last year.

**Coal Consumption.** Higher electricity demand and higher power sector natural gas prices that are more than 21% above their 2013 level contributed to a 3.0% increase in electric power sector coal consumption for the first seven months of this year from the same period last year. EIA projects total coal consumption of 941 MMst in 2014, an increase of 1.7% from last year. Total coal consumption is projected to fall by 2.0% in 2015, as retirements of coal power plants rise in response to the implementation of the [Mercury and Air Toxics Standards](#), electricity sales growth slows to 0.6%, and natural gas prices fall relative to coal prices.

**Coal Trade.** EIA estimates that coal exports for the first seven months of this year were 15.5% (10.9 MMst) lower compared with last year, with tonnage declines for steam coal exports more than 4 times those for metallurgical coal. Exports of coal are projected to decline to 96 MMst in 2014 from 118 MMst in 2013, primarily because of slowing world coal demand growth, lower international coal prices, and increasing coal output in other coal-exporting countries. EIA projects coal exports to remain nearly flat in 2015.

Coal imports for the first seven months of this year increased by 36.5% (1.8 MMst) compared with last year. EIA expects coal imports, which account for about 1% of U.S. coal consumption, to total 11.4 MMst in 2014 and fall slightly to 10.7 MMst in 2015.

**Coal Prices.** Annual average coal prices to the electric power industry fell from \$2.39/MMBtu in 2011 to \$2.35/MMBtu in 2013. EIA expects the average delivered coal prices to be \$2.36/MMBtu in 2014 and remain at that level in 2015.

## Electricity

**Electricity Consumption.** Forecast U.S. sales of electricity to the residential sector are 1.7% higher in 2014 compared with last year, driven in large part by the cold weather experienced early in the year. Residential electricity sales fall by 0.3% in 2015. U.S. commercial sector electricity sales are expected to average 0.9% higher in 2014 than sales last year and then grow by 0.4% in 2015. EIA expects U.S. industrial sector electricity sales to remain flat during 2014 and grow by 2.1% in 2015.

**Electricity Generation.** EIA projects that average daily U.S. electricity generation in 2014 will grow by 105 gigawatthours per day (0.9%) from last year. Relative fuel costs have favored coal-

fired generation over natural gas this year, leading to an expected increase in coal's share of total generation from 39.1% in 2013 to 39.8% this year, while the share supplied by natural gas falls from 27.4% to 26.8%. In 2015, EIA expects that natural gas' fuel share will rise to 27.6% and coal's fuel share will decline to 38.7%.

**Electricity Retail Prices.** EIA expects the U.S. residential price to average 12.5 cents per kilowatthour in 2014, which is 3.0% higher than the average last year. Prices increase in all regions of the country except along the Pacific Coast. Average U.S. residential electricity prices grow at a slower rate of 1.7% in 2015.

## Renewables and Carbon Dioxide Emissions

**Electricity and Heat Generation from Renewables.** EIA projects that total renewables used for electricity and heat generation will grow by 2.2% in 2014. Conventional hydropower generation is projected to fall by 4.2%, while nonhydropower renewables rise by 5.6%. [Nonhydropower renewables generation surpasses hydropower](#) on an annual basis for the first time in 2014. In 2015, total renewables consumption for electric power and heat generation increases by 4.6%, as a result of a 4.3% increase in hydropower and a 4.7% increase in nonhydropower renewables.

EIA projects that wind power capacity will increase by 8.8% in 2014 and 16.2% in 2015. Electricity generation from wind is projected to contribute 4.7% of total electricity generation in 2015.

EIA expects continued robust growth in solar electricity generation, although the amount of utility-scale generation remains a small share of total U.S. generation at about 0.6% in 2015. While solar growth has historically been concentrated in customer-sited distributed generation installations, utility-scale solar capacity slightly more than doubled in 2013. EIA expects that utility-scale solar capacity will about double again between the end of 2013 and the end of 2015; about two-thirds of this new capacity is being built in California. However, customer-sited photovoltaic capacity growth, which the STEO does not forecast, is expected to exceed utility-scale solar growth between 2013 and 2015, according to [EIA's Annual Energy Outlook 2014](#).

**Liquid Biofuels.** Ethanol production in June matched the monthly average production record of 959,000 bbl/d set in December 2011, and then fell back to an average of 909,000 bbl/d in September. EIA expects ethanol production to average 927,000 bbl/d in 2014 and 933,000 bbl/d in 2015. Biodiesel production averaged 89,000 bbl/d in 2013 and is forecast to average 81,000 bbl/d in 2014 and 84,000 bbl/d in 2015.

**Energy-Related Carbon Dioxide Emissions.** EIA estimates that carbon dioxide emissions from fossil fuels increased by 2.5% in 2013 from the previous year. Emissions are forecast to rise by 1.1% in 2014, and then to decline by 0.4% in 2015. The increase in total emissions in 2013 and 2014 reflects increases in emissions from coal of 4.2% and 1.8%, respectively. The price of natural gas to electric power generators was \$0.91/MMBtu above its 2012 level in 2013 and is

expected to rise by \$0.91/MMBtu in 2014, contributing to an increase in coal use. Coal emissions are projected to decline by 1.9% in 2015.

## U.S. Economic Assumptions

**Recent Economic Indicators.** Economic growth improved substantially in the second quarter of 2014. The U.S. Bureau of Economic Analysis (BEA) reported that second quarter [real gross domestic product \(GDP\)](#) grew at an annualized rate of 4.6% from the first quarter of 2014, which reflects an upward revision of 0.4% from its previous estimate. Recent housing data have been mixed. The Census Bureau reported that [new home sales](#) in August rose 18% over July levels, and 33% over levels in August 2013. [Existing home sales](#) in August, however, fell by 1.8% from July according to the National Association of Realtors. Census also reported that [new orders for durable goods](#) fell 18.2% from July to August, but rose 0.7% excluding transportation.

EIA used the September 2014 version of the IHS macroeconomic model with EIA's energy price forecasts as model inputs to develop the economic projections in the STEO.

**Production and Income.** Real GDP growth reaches 2.2% in 2014 and accelerates to 2.9% in 2015, similar to the forecast last month. Exports are expected to pick up in the latter half of 2014 relative to imports, but a strong dollar will slow these gains in 2015. Housing starts more than make up for this in 2015. Real disposable income grows by 2.5% in 2014, the same as last month, and total industrial production grows by 4.1% in 2014, up from 3.9% forecast last month. In 2015, these variables grow at 2.5% and 3.7%, respectively.

**Expenditures.** Private real fixed investment growth averages 5.5% and 7.4% in 2014 and 2015, respectively, led by industrial and transportation equipment in 2014 and a broad array of equipment categories in 2015. Real consumption expenditures grow at the same rate as real GDP in 2014 at 2.2%, but fall below the real GDP growth rate in 2015 at 2.6%. Durable goods expenditures drive consumption spending in both years. Export growth is 2.8% and 4.9% over the same two years, while import growth is 3.2% in 2014 and 4.2% in 2015. Total government expenditures fall by 0.4% in 2014, but increase by 0.5% in 2015.

**U.S. Employment, Housing, and Prices.** Projected growth in nonfarm employment averages 1.8% in 2014 and 2015. This is accompanied by a gradually declining unemployment rate that reaches 5.7% at the end of 2015. The employment growth in 2015 is slower than projected last month and the declines in the unemployment rate are the same. Housing starts grow an average of 8.9% and 25.4% in 2014 and 2015, respectively. Both consumer and producer price indexes increase at a moderate pace, and wages continue to show modest gains.

This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

Note: Winter covers the period October 1 through March 31. Fuel prices are nominal prices. Fuel consumption per household is based only on households that use that fuel as the primary space-heating fuel. Included in fuel consumption is consumption for water heating, appliances, and lighting (electricity). Per-household consumption based on an average of EIA 2005 and 2009 Residential Energy Consumption Surveys corrected for actual and projected heating degree days. Number of households using heating oil includes kerosene.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review. Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly*, DOE/EIA-0109;*Petroleum Supply Annual*, DOE/EIA-0340/2; *Weekly Petroleum Status Report*, DOE/EIA-0208; *Petroleum Marketing Monthly*, DOE/EIA-0380; *Natural Gas Monthly*, DOE/EIA-0130;*Electric Power Monthly*, DOE/EIA-0226; *Quarterly Coal Report*, DOE/EIA-0121; and *International Petroleum Monthly*, DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model. Macroeconomic projections are based on Global Insight Model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States.

OPEC = Organization of Petroleum Exporting Countries: Algeria, Angola, Ecuador, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes offshore supply from Denmark, Germany, the Netherlands, Norway, and the United Kingdom.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly*, DOE/EIA-0109.

Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

Sudan production represents total production from both north and south.

OPEC = Organization of Petroleum Exporting Countries: Algeria, Angola, Ecuador, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, Venezuela.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

**Historical data:** Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

**Table 3c. OPEC Crude Oil (excluding condensates) Supply (million barrels per day)**

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Liquefied Petroleum Gas" includes ethane, propane, butanes and refinery olefins.

(h) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly*, DOE/EIA-0109; *Petroleum Supply Annual*, DOE/EIA-0340/2; and *Weekly Petroleum Status Report*, DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

**Table 4b. U.S. Hydrocarbon Gas Liquids (HGL) and Petroleum Refinery Balances (million barrels per day, except inventories and utilization factor)**

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

 (d) For a list of States in each inventory region refer to *Methodology for EIA Weekly Underground Natural Gas Storage Estimates* (<http://tonto.eia.doe.gov/oog/info/ngs/methodology.html>).

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly*, DOE/EIA-0130; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and coal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available. kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by electricity-only and combined-heat-and-power (CHP) plants operated by electric utilities and independent power producers.

(b) Generation supplied by CHP and electricity-only plants operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

 (d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or collocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

(a) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(b) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(c) Conventional hydroelectric and pumped storage generation.

(d) Wind, biomass, geothermal, and solar generation.

**Notes:** Data reflect generation supplied by electricity-only and combined-heat-and-power (CHP) plants operated by electric utilities, independent power producers, and the commercial and industrial sectors. The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from U.S. Energy Information Administration *Electric Power Monthly* and *Electric Power Annual*.

**Projections:** EIA Regional Short-Term Energy Model.

**Table 7e. U.S. Regional Fuel Consumption for Electricity Generation, All Sectors**

(a) Petroleum coke consumption converted from short tons to barrels by multiplying by five.

(b) Other petroleum liquids include jet fuel, kerosene, and waste oil.

**Notes:** Data reflect generation supplied by electricity-only and combined-heat-and-power (CHP) plants operated by electric utilities, independent power producers, and the commercial and industrial sectors. Data include fuel consumed only for generation of electricity. Values do not include consumption by CHP plants for useful thermal output.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Physical Units: st/d = short tons per day; b/d = barrels per day; cf/d = cubic feet per day; mmb = million barrels.

**Historical data:** Latest data available from U.S. Energy Information Administration *Electric Power Monthly* and *Electric Power Annual*.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Wood and wood-derived fuels.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Includes small-scale solar thermal and photovoltaic energy used in the commercial, industrial, and electric power sectors.

(e) Fuel ethanol and biodiesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biodiesel may be consumed in the residential sector in heating oil.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from EIA databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226 and *Renewable Energy Annual*, DOE/EIA-0603; *Petroleum Supply Monthly*, DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

 (a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey*.

(b) Total highway travel includes gasoline and diesel fuel vehicles.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model. Macroeconomic projections are based on Global Insight Model of the U.S. Economy.

- = no data available

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

 See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

**Historical data:** Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** Macroeconomic projections are based on the Global Insight Model of the U.S. Economy.

**Table 9c. U.S. Regional Weather Data**

- = no data available

**Notes:** Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* ([http://www.eia.gov/forecasts/steo/special/pdf/2012\\_sp\\_04.pdf](http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf)) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (<http://www.eia.gov/tools/glossary/>) for a list of states in each region.

**Historical data:** Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

**Projections:** Based on forecasts by the NOAA Climate Prediction Center (<http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml>).
