

Table of Nuclear Magnetic Dipole and Electric Quadrupole Moments

N.J.Stone,

Oxford Physics,
Clarendon Laboratory
Parks Road,

OXFORD OX1 3PU
U.K.

This Table is a compilation of experimental measurements of static magnetic dipole and electric quadrupole moments of ground states and excited states of atomic nuclei throughout the periodic table. To aid identification of the states, their excitation energy, half-life, spin and parity are given, along with a brief indication of the method and any reference standard used in the particular measurement. The literature search upon which the Table is based is complete to early 1998. Many of the entries prior to 1988 follow those in Raghavan, Atomic and Nuclear Data Tables 42, 189 (1989), with amendment as required.

General Introduction

This Table comprises a listing of measured magnetic dipole and electric quadrupole moments of ground states and excited states of atomic nuclei. Results obtained by all experimental methods are included and the literature search covers the period approximately up to the end of 1998. The Table includes many listings from the most recent previous compilation [1], mainly without changes, but amended where appropriate. To assist in definitive identification of the nuclear state involved, the table includes the energy (in keV), half-life, and spin/parity of the state, taken either from the authors or from recent compilations. The Table follows its predecessors in listing also any reference isotope and state used to deduce the quoted moment from experiment. The method used in the experiment is given, although for all details of the method reference should be made to the original publication. References are given both in the ENSDF format [for use with the NNDC Nuclear Data compilation] and to the journal. Listings of abbreviations used to identify methods and journals are given later in this introduction. Some common comments on the results are made by abbreviations given next to the Table entry. The abbreviations used for these comments are also listed in this introduction.

POLICIES

Signs Signs are given when the sign can be determined from experimental data. Where the sign is not given by the measurement, no sign is given in the Table, although it can often be inferred either from systematics or from the magnitude of the result.

Results and Uncertainties Experimental values and their associated errors are as given by the authors subject to a policy of limiting significant figures. Numerical errors with digits above 15 have been rounded to 2 and results have been rounded to give no more significant figures than the rounded error would allow. Thus a published value 0.953(65) has been rounded to 0.95(7) and 0.25(16) rounded to 0.3(2).

Magnetic Dipole Moments (μ) The fundamental reference is to the adopted proton moment +2.79284734(3) nuclear magnetons (nm), after diamagnetic correction, based on the most recent recommended values for physical constants [2]. This has been revised downward since the last compilation [1] by 0.018 ppm. Other subsidiary dipole moment standards are set using high precision experimental ratios of nuclear magnetic resonance frequencies for heavier stable nuclei

^{11}B , ^{14}N , ^{35}Cl , ^{45}Sc , ^{111}Cd , and from optical pumping frequency for ^{199}Hg , compared to that of the proton or deuteron. References to these are given where they appear in the Table.

Corrections for diamagnetism, Knight shift, paramagnetism and hyperfine anomaly are noted by annotations d, K, p, or ha respectively after the entry when they have been taken into consideration by authors, either by explicit corrections or by allowance in quoted uncertainties.

The diamagnetic correction merits further comment. This correction is applicable under any circumstance that a magnetic field is applied to the nucleus under study and the nucleus is situated in a medium subject to diamagnetism - that is all media other than vacuum. Diamagnetism describes the polarisation of the medium whereby the field as experienced by the nucleus is reduced. This effect leads to a reduction in the magnetic dipole interaction energy and an apparent reduction in the nuclear magnetic dipole moment if the full applied magnetic field strength is used.

Many experimental methods use 'internal' or 'transient' fields produced by electrons in the vicinity of the nucleus. Such internal fields are determined through their measured interaction energy with nuclei having known magnetic dipole moments. They are not subject to diamagnetic correction, although they do require correction for any hyperfine anomaly between the isotope used for calibrating the field and the isotope under study [4]. Of course, if there is any additional external applied field used then this component of the total field at the nucleus is subject to the diamagnetic correction.

Several previous tabulation compilers have apparently applied diamagnetic corrections and have included listings of diamagnetic correction factors due to Johnson and co-workers [3]. It should be stressed that the tabulated corrections apply only to neutral atoms, assumed spherical, and are not generally applicable e.g. to nuclei implanted into planar non-magnetic foils and subject to applied magnetic fields. All recent [post 1989] entries in the Table are unmodified published values.

Electric Quadrupole Moments (Q). These are listed in units of barns ($1 \text{ b} = 10^{-28} \text{ m}^2$). Corrections relating to electric field gradient shielding caused by polarisation of atomic electrons, normally known as Sternheimer Corrections, are indicated by the annotation st after the entry. The Sternheimer correction, which can be positive (shielding) or negative (anti-shielding) and can be large, is difficult to calculate with high accuracy, even for different states of the same atom or ion. It is the cause of several apparently large discrepancies between reported, uncorrected, electric quadrupole moments listed in the Table.

Where two values of Q are given based on CER experiments, the first represents the value assuming constructive interference between the matrix elements and the second assumes destructive interference.

Arrangement of the Table

The table is set up with ten columns giving information as follows:

Column 1. Identifies the nucleus by atomic number Z and neutron number N , with its chemical symbol. This is given once for each nucleus. Nuclei are grouped by element in increasing sequence of atomic number and by increasing neutron number for each element.

Column 2. Gives the energy of the state on which the measurement is made, rounded to the nearest keV, 0 being the ground state.

Column 3. Gives the half-life of the state: abbreviations used y = years, d = days, h = hours, m = minutes, s = seconds, ms = milliseconds (10^{-3} s), μs = microseconds (10^{-6} s), ns = nanoseconds (10^{-9} s), ps = picoseconds (10^{-12} s) and fs = femtoseconds (10^{-15} s).

Column 4. Gives the spin (I) and parity of the state. Uncertain values are given in brackets.

Column 5*. Gives the measured nuclear magnetic dipole moment μ in units of the nuclear magneton μ_N (nm). No sign is given if it was not determined by the experiment. The uncertainty in the result is given in brackets, subject to the policy declared in the introduction. Thus 1.432(8) means a value of 1.432 nm with uncertainty 0.008 nm and of unknown sign. In some cases, where the spin of the level is unknown, the nuclear g -factor, $g = m/I$ is given. Where several states were unresolved, the average g -factor is given as g_{av} .

Column 6*. Gives the measured nuclear electric quadrupole moment in units of the barn (1 barn = 10^{-28} m²). No sign is given if it was not determined by the experiment. The uncertainty in the result is given in brackets, subject to the policy declared in the introduction. Thus +1.27(10) means a value of +1.27 barns with uncertainty 0.10 barns.

Column 7. In this column any reference standard upon which the listed result depends is given. Often the reference state has been used to obtain the value of a static magnetic hyperfine field, a transient field or an electric field gradient which is then used to determine the quoted result. Any subsequent change in the value of the standard will affect the listed result.

Column 8. The method used in the measurement is briefly identified here. A list of abbreviations used follows this description of the Table. In view of the great proliferation of specialised methods, this simple description is very limited and for detailed information reference should be made to the original publication. Where there has been re-evaluation by the tabulator of the original result, usually associated with change to the reference standard, this is denoted by R.

Column 9. Here is given the NSR reference where known.

Column 10. Here the Journal reference to the original work is given, generally in the form journal (abbreviated), volume, page and year (last two digits, in brackets). A list of journal abbreviations and other abbreviations used is given below.

* Certain entries have additional annotations relating to whether or not specific corrections have been made. These annotations are discussed under the magnetic dipole moment and electric quadrupole moment sections of the policies given above.

List of Annotations and Abbreviations in the Table

a	Requires no Sternheimer correction.
d	Corrected for diamagnetism.
g.s.	Ground State.
h	This result uses an uncertain hyperfine field. Given error is experimental only.
K	Corrected for Knight shift.
#	This result uses an estimated hyperfine field with no error given.

Experimental Reference Abbreviations

AB	Atomic Beam Magnetic Resonance - Thermal Beam
AB/D	Atomic Beam Magnetic Resonance (direct moment measurement)
ABLDF	Atomic Beam with Laser Double Resonance Detection
ABLFS	Atomic Beam with Laser Fluorescence Spectroscopy
ABLS	Atomic Beam Laser Spectroscopy
β -NMR	NMR of in-beam polarised nuclei with beta asymmetry detection
β -NMR/OP	NMR of nuclei polarised by optical pumping with beta asymmetry detection
β -NNQR	Nuclear Quadrupole Resonance with beta detection
B(E2)	Value based on measured E2 transition probability
BFNO	Brute Force Nuclear Orientation
BFNMR/ON	Nuclear Magnetic Resonance on Brute Force Oriented Nuclei
CDPAC	Constant-Delay Perturbed Angular Correlation
CEAD	Integral Perturbed Angular Distribution after Coulomb Excitation
CER	Coulomb Excitation Reorientation
CERP	Precession of Coulomb Excitation Reorientation
CETD	TDPAD following Coulomb Excitation
CFBLS	Collinear Fast Beam Laser Spectroscopy - Accelerated Beam
CFBLS/ β -NMR	Collinear Fast Beam Laser Spectroscopy: NMR with beta detection
CIAN	Coulomb Interaction of Aligned Nuclei
ENDOR	Electron-nuclear Double Resonance
EPR	Electron Paramagnetic Resonance
ES	Electron Scattering
FDPAC	Time Differential Perturbed Angular Correlation of Fission Fragments
FortP	Fortschrift Physik
IAPAD	Integral Attenuation of Perturbed Angular Distribution
IBSQB	Quantum Beats after Surface Interaction at Grazing Incidence
IPAC	Integral Perturbed Angular Correlation
IPAD	Integral Perturbed Angular Distribution
IMPAC	Perturbed Angular Correlation after Ion Implantation
IMPAD	Perturbed Angular Distribution after Ion Implantation
Ka-X	Kaonic X-ray Hyperfine Structure
LEMS	Level Mixing Spectroscopy

LMR	Level Mixing Resonance on Oriented Nuclei
LRDRS	Laser RF Double Resonance Spectroscopy
LRFS	Laser Resonance Fluorescence Spectroscopy
LRIMS	Laser Resonance Ionisation Mass Spectroscopy
LRIS	Laser Resonance Ionisatio
LRS	Laser Resonance Spectroscopy
LRSRD	Laser Resonance Spectroscopy with Radioactive Detection
MA	Microwave Absorption in gases
MAPON	Multiple Adiabatic Passage NMR on Oriented Nuclei
MB	Molecular Beam Magnetic Resonance
MCHF	Multiconfigurational Hartree Foch calculated efg's used to extract Q
ME	Mossbauer Effect
M/N	Maser/Nuclear Magnetic Resonance frequency comparison
MS	Molecular Spectroscopy
Mu-X	Muonic X-ray Hyperfine Structure
N	Nuclear Magnetic Resonance
NMR	Nuclear Magnetic Resonance
NMR/ME	Nuclear Magnetic Resonance detected using the Mossbauer Effect
NMR/ON	Nuclear Magnetic Resonance on Oriented Nuclei
NMR/ON(β)	Nuclear Magnetic Resonance on Oriented Nuclei with beta detection
NMR/ON(X)	Nuclear Magnetic Resonance on Oriented Nuclei with X-ray detection
NMR/AC	Nuclear Magnetic Resonance detected using Angular Correlation
NO/CP	Gamma Circular Polarisation measured from Oriented Nuclei
NO/ME	Mossbauer Effect on Oriented Nuclei
NMR/OP	NMR detected using Optically Pumped Ions
NO/S	Static Nuclear Orientation with gamma detection
NO/ β S	Static Nuclear Orientation with beta detection
NO/D	Dynamic Nuclear Orientation
O	Optical Spectroscopy
OD	Optical Double Resonance
OGLS	Optogalvanic Laser Spectroscopy
OL	Optical Level Crossing
OP/ β -NMR	Optical Pumping with NMR using beta detection
OP/RD	Optical Pumping with Radiative Detection
PhPi	Pion Photoproduction near threshold
Pi-X	Pionic X-ray Hyperfine Structure
PMR	Paramagnetic Resonance
PPDAC	Perturbed Polarisation-Directional Angular Correlations
PPR	Proton Pick-up Reaction: Spectroscopic Factors
Q	Quadrupole Resonance
QIR	Quadrupole Interaction deduced from Relaxation Time
R	Re-evaluated by tabulator, usually because of change in reference standard
RENO	Reorientation Nuclear Orientation
RIGV	Recoil into gas or vacuum
RIV/D	Recoil into Vacuum, Differential method
SOPAD	Stroboscopic Observation of Perturbed Angular Distribution
TDPAC	Time Dependent Perturbed Angular Correlation
TDPAD	Time Dependent Perturbed Angular Distribution
TF	Transient Field integral perturbed angular correlation
TFL	Tilted Foil hyperfine field integral perturbed angular correlation

TFLD Tilted Foil Time Differential Perturbed Gamma Angular Distribution
TIS Trapped Ion Spectroscopy
TR/OLNO Time Resolved On-Line Nuclear Orientation
