

## Compound Annual Returns

The Board provides compound annual returns when showing investment performance for 10 years. The compound annual return represents the geometric average annual return for the period. An example of the 4 -step calculation using the S\&P 500 index returns from 1995 through 2004 is provided on the back of this page.

Step 1: Convert percentages to decimals (move the decimal point two places to the left) and add 1 (You must add 1 to the returns and multiply the resulting factors together (see Step 2) to include the effect of compounding. Calculating the simple average (adding the returns and dividing by 10) ignores the effect of compounding.):

| 1995 | $37.58 \%$ | $=.3758+1=1.3758$ |
| :--- | :--- | :--- |
| 1996 | $22.96 \%$ | $=.2296+1=1.2296$ |
| 1997 | $33.36 \%$ | $=.3336+1=1.3336$ |
| 1998 | $28.58 \%$ | $=.2858+1=1.2858$ |
| 1999 | $21.04 \%$ | $=.2104+1=1.2104$ |
| 2000 | $(9.10 \%)$ | $=-.0910+1=$ |
| 2001 | $(11.89 \%)$ | $=-.1189+1=$ |
| 2002 | $(22.10 \%)$ | $=-.2210+1=$ |
| 2003 | $28.69 \%$ | $=.2811$ |
| 2004 | $10.88 \%$ | $=.2869+1=1.2869$ |
|  |  |  |

Step 2: Multiply the factors you calculated in Step 1 together:

$$
\begin{aligned}
& 1.3758 \times 1.2296 \times 1.3336 \times 1.2858 \times 1.2104 \times \\
& .9090 \times .8811 \times .7790 \times 1.2869 \times 1.1088=3.1259
\end{aligned}
$$

Note: If you subtract 1 from the result of this step ( $3.1259-1=2.1259$ ), and multiply by $100(2.1259 \times 100=212.59 \%)$, you get the cumulative return for the period.

Step 3: Take the nth root (where $n$ equals the number of years in the period) of the result of Step 2:

$$
\sqrt[10]{3.1259}=1.1207
$$

Step 4: Subtract 1 from the result of Step 3 and multiply by 100:

$$
(1.1207-1) \times 100=.1207 \times 100=12.07 \%
$$

$12.07 \%$ equals the compound annual return for the S\&P 500 index for 1995-2004. You may get slightly different results because of rounding.
