

APPENDIX B
EMISSIONS INVENTORY

Emissions Inventory

The data in the inventories presented in these appendices represent the most accurate information available to the District on emissions of Toxic Air Contaminants (TAC) from stationary sources during a twelve-month period which coincides approximately with the calendar year 2001.

As part of the annual permit renewal process, facilities supply annual information to the District on material throughput and/or usage for permitted sources at their sites. This information is entered into the District data base where it is used in the estimates of emissions. The emissions values that are published in the inventory are calculated values; they are generally the product of annual throughputs and emission factors that have been developed for individual sources or types of equipment. These emission factors are one element in the District data bank; some emission factors have been developed through source testing, either by the District or by a facility, some are derived from the pertinent literature, and some are obtained from EPA documents. The published emissions also include any reductions due to abatement devices/equipment

Facilities whose emissions are below the thresholds established for each TAC are not listed in the inventory. The emissions from these facilities are however included in the pollutant totals presented in Appendix B-2. The TAC thresholds are based on relative toxicity. These thresholds reflect the emission level that is estimated to result in a de minimus level of health risk based on a set of very conservative risk assessment assumptions. For carcinogens, the threshold reporting levels have been set at the emission level that corresponds to a cancer risk of 1 in-one-million; non-carcinogen trigger levels represent the amount estimated to result in a hazard index of one.
