

Overview of the ENERGY STAR® TV Specification Revision

Katharine Kaplan Osdoba
US EPA
ENERGY STAR Program

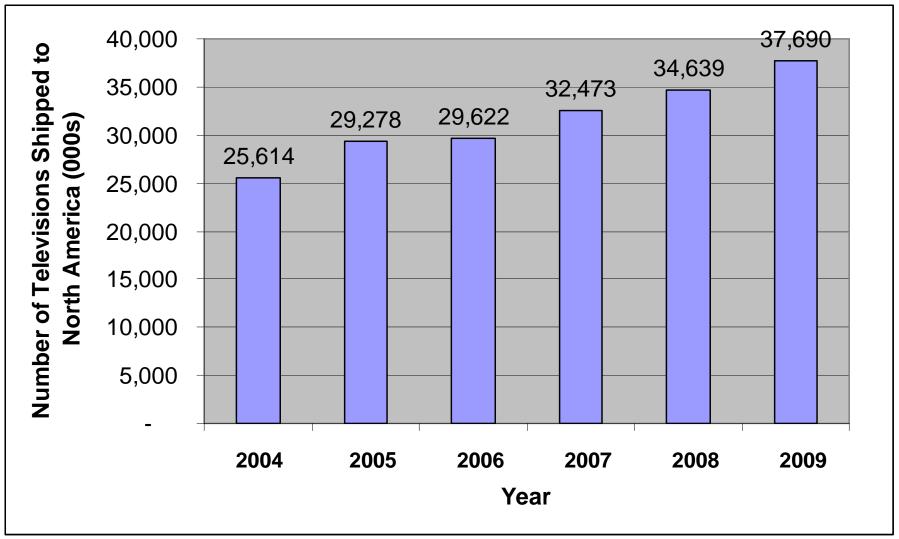

Why Revise the ENERGY STAR TV Specification?

- High market penetration of ENERGY STAR TVs
- Changing landscape of TV market leading to increased energy consumption of TVs:
 - More TVs per U.S. household (~2.8)
 - Larger TVs
 - By 2009, iSuppli estimates 71.5% of North American market will be comprised of flat panel televisions with screen sizes 30 inches and above
 - More feature-rich models
 - TVs in 'on mode' more hours per day
 - Per Nielsen Media Research, for September 2004 September 2005 viewing season, average US household was tuned into television an average of 8 hours and 11 minutes per day
 - More peripherals that contribute to additional hours in 'on mode' (game consoles, DVRs, increased cable/satellite programming)

Growth in TV Shipments to North America (2006 Onwards Projected)

Source: iSuppli's TV Systems Market Tracker – Q1 2006

Why Are TV Shipments Growing?

- Consumers showing higher preference for larger screen sizes
- Value brands entering the market
- Consumers investing in new units in preparation for the move from analog to digital over-the-air (OTA) signal transmission
- Increased adoption of flat panels
- Decline in average selling price of televisions

Result: Increase in the number of TVs per household – now 2.8 (up from 2.3 in 2000)

Increased Energy Consumption of TVs

- EPA estimates that currently, all US televisions consume 69 TWh/year
 - Costs consumers \$5 billion annually to power their sets
- In 2010, projected that this number will rise by approximately 75% and US televisions will consume 121 TWh/year
 - Will cost consumers over \$8 billion annually to power their sets

Television Display Type	All Modes - Average Power Consumption per Unit (kWh/yr)	Active Mode Only - Average Power Consumption per Unit (kWh/yr)	
CRT	244	216	
LCD	256	192	
Plasma	679	532	
DLP	444	311	

Source: Prepared by LBNL. Data derived from testing conducted by Ecos Consulting and CNET in 2004 - 2005. Recognize manufacturers are making technology improvements, leading to lower power consumption, which may not be reflected in above data.

CNET TV Power Consumption Estimates

- Good opportunity for ENERGY STAR to act as a point of differentiation in the market
 - Potential for significant energy savings exists
- Per independent testing by CNET of 20 TVs (varying screen sizes and technologies):
 - Two 50" plasma TVs had on mode power consumption which varied by 178 watts
 - Two 32" LCD TVs had on mode power consumption which varied by 38 watts and standby mode power consumption which varied by 7 watts
 - Opportunity to address power consumption within technologies; not only between technologies
 - View testing at: http://reviews.cnet.com/4520-6475_7-6400401-3.html?tag=nav

Current ENERGY STAR TV Specification

Table 1: Energy-Efficiency Criteria for ENERGY STAR Qualified TVs, VCRs, DCR TVs with POD Slots, TV/VCRs, TV/DVDs, VCR/DVDs, TV/VCR/DVDs, Television Monitors, and Component Television Units.

Product Category	Phase I Standby Mode (effective 7/1/02)	Phase II Standby Mode (effective 7/1/04)	Phase III Standby Mode (effective 7/1/05)
TV	≤ 3 Watts	Analog: ≤ 1 Watt *Digital: ≤ 3 Watts	≤ 1 Watt
VCR	≤ 4 Watts	≤ 1 Watt	≤ 1 Watt
Television Monitor	Analog: ≤ 1 Watt Digital: ≤ 3 Watts		—→ <u><</u> 1 Watt
Component Television Unit	≤ 3 Watts		—→ <u><</u> 1 Watt
TV/VCR Combination Unit	≤ 6 Watts		—→ <u><</u> 1 Watt
TV/DVD, VCR/DVD, and TV/VCR/DVD Combinations	≤ 4 Watts		≤ 1 Watt
DCR TVs with POD Slots	No POD Installed: ≤ 3 Watts POD Installed: ≤ 15 Watts		•

Why Important to Address Standby Mode for TVs?

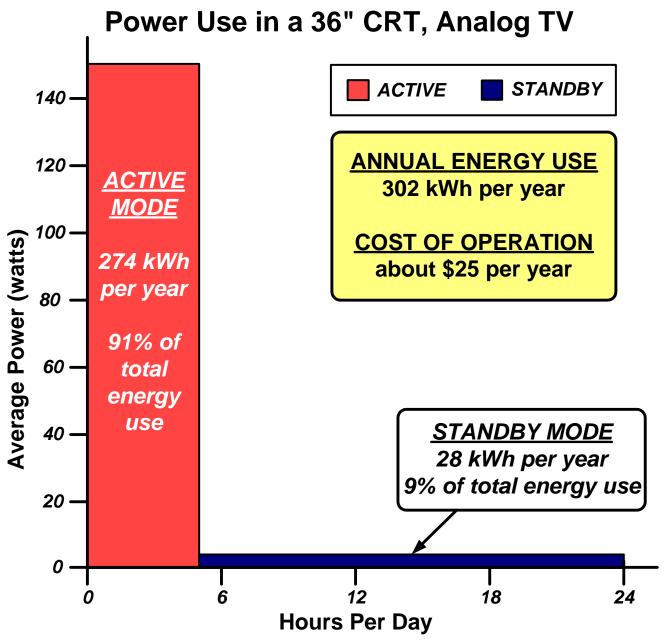

- Allowed EPA to set a specification to capture low hanging fruit
 - To date, approximately 2.6 MtC of carbon saved since the launch of the TV specification
 - Equivalent to removing over 1.8 million cars from the road
- TVs spent vast majority of time (over 80%) in Standby Mode
 - Significant savings to be earned by moving to one watt
- One watt consistent with FEMP levels and international goals
- Regardless of technology or screen size, manufacturers able to meet one watt for TVs
 - EPA now considers this market transformed

On Mode Provides Next Opportunity

- ENERGY STAR moving towards on mode specifications for electronics products:
 - Monitors (effective 1/1/2005)
 - External power supplies (effective 1/1/2005)
 - Imaging equipment (effective 4/1/2007)
 - Computers (effective 7/1/2007)
 - DTAs (effective approx late 2007)
 - TVs (effective approx early 2008)
- Significant opportunity for additional savings

Source: Testing conducted by Ecos Consulting for NRDC.

Key Elements of New Specification

- Will address both active/standby mode power consumption of TVs
- Built-in TV peripherals, such as a DVD player, to be turned off during testing
- Will be based on performance (e.g., screen size); not technology
 - Screen size will be considered
- Test data provided by stakeholders will inform specification levels

Anticipated Timeline for TV Specification Revision

July 2006

Participate in IEC TV Working Group meeting in Washington

August 2006

IEC members prepare moving test clips to allow for decision-making at Berlin meeting re: approach

September/October 2006

Stakeholders conduct testing of latest TVs; share results with EPA

December 2006

Draft 2 specification released for review/comment

February 2007

Finalize specification

July 2006

EPA hosts TV test procedure workshop in Washington, following IEC meeting

September 2006

Draft presented for IEC consideration in Berlin; approach finalized for informal use

November 2006

Draft 1 TV specification released for review/comment. Stakeholder meeting to discuss Draft 1

January 2007

Discuss Draft 2 with stakeholders.

January 2008

New specification takes effect
