of Agriculture

Natural Resources  
Conservation Service

### Where to Go for Help

Contact your local  
Natural Resources  
Conservation Service office.

It is listed in the telephone  
directory under Government  
offices—

U.S. Department of  
Agriculture, Natural  
Resources Conservation  
Service (formerly known as  
Soil Conservation Service).

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, and marital or familial status. (Not all prohibited bases apply to all programs). Persons with disabilities who require alternative means for communication of program information (Braille, large print, audio tape, etc.) should contact the USDA Office of Communications at (202) 720-5881 (voice) or (202) 720-7808 (TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, D.C. 20250, or call (202) 720-7327 (voice) or (202) 720-1127 (TDD). USDA is an equal employment opportunity employer.

# Rock Reed Filter

*What is it?*

UNITED STATES DEPARTMENT OF AGRICULTURE  
Natural Resources Conservation Service  
Plant Materials Center  
14119 Broad Street  
Brooksville, FL 34601

## What is a Rock Reed Filter?

The Rock Reed Filter is a sewage treatment system that uses rocks and aquatic plants to filter septic wastes. The United States Department of Agriculture, Natural Resources Conservation Service (NRCS), in cooperation with the United States Environmental Protection Agency, has constructed a demonstration Rock Reed Filter at the NRCS plant materials center in Brooksville, Florida. NRCS technicians are evaluating the effectiveness of the Rock Reed Filter when used in conjunction with a conventional sewage treatment system.

*The aquatic plants filter the suspended solids, use the nutrients for plant growth, and accumulate the pollutants found in the effluent.*

## How Does it Work?

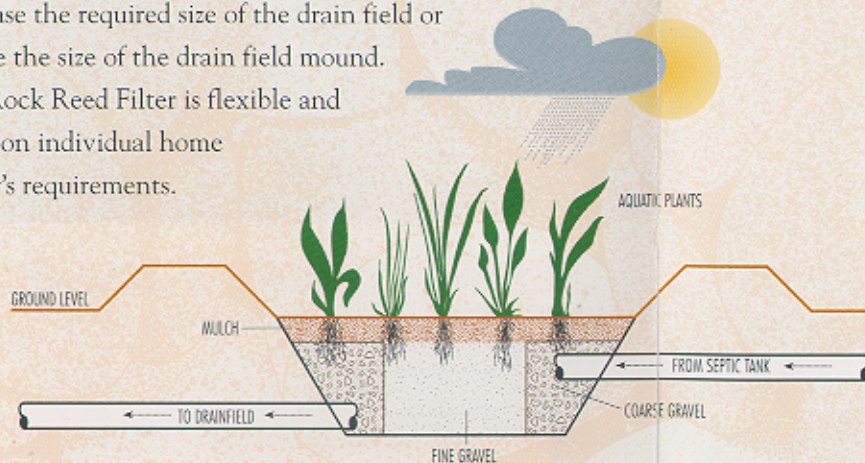

The Rock Reed Filter works by using aquatic plants grown hydroponically in a layer of rock. After the plants are established, their roots extend to the bottom of the rock layer where the effluent provides the nutrients needed for plant growth. A symbiotic relationship exists between the plants and several types of microorganisms. In a healthy aquatic plant, these microorganisms absorb minerals, heavy metals, and organic chemicals in the waste water

while producing simple sugars and amino acids available for plant uptake. In return, the plant provides the oxygen needed to maintain the beneficial microbial population. Due to an impervious liner that surrounds the entire structure, the Rock Reed Filter works independently of the ground water level. This allows successful treatment of effluent in areas where the water table is shallow or where water levels continually fluctuate.

*Monitoring wells are used to sample the waste water. Initial testing has shown a reduction of suspended solids, nitrogen, phosphorus, and coliform bacteria.*

When compared to the cost of building conventional systems, the construction of the Rock Reed Filter is relatively inexpensive. It is designed to decrease the required size of the drain field or reduce the size of the drain field mound. The Rock Reed Filter is flexible and based on individual home owner's requirements.

## Benefits to Using Rock Reed Filters

- Practically odorless
- Aesthetically pleasing
- Easily maintained
- Individually designed
- Relatively inexpensive
- Environmentally beneficial

*A variety of aquatic plants can be used in the Rock Reed Filter making it an aesthetically pleasing alternative to waste water treatment.*
