14. SUPPLEMENTARY NOTES This work was performed for the National Science Foundation Department of Polar Programs.			
15. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.) This report presents the results of two weeks of bi-directional high-frequency radio path soundings in a trans-auroral environment between Christchurch, New Zealand, and the U.S. station, McMurdo (Black Island), Antarctica, during mid-January, 1992. The work was commissioned by the Naval Undersea Warfare Center, New London, CT, for the National Science Foundation. This investigation demonstrated the value of ALE adaptive radio systems as a real-time frequency management tool. Based on the results observed, the authors recommended that NSF consider the acquisition of a 1-kW ALE radio system to be used, primarily as an oblique ionospheric channel sounder, with their existing communications system. This addition would provide significant improvement to the NSF frequency management capability.			
16. Key Words (Alphabetical order, separated by semicolons) adaptive radio; ALE; Antarctica; automatic link establishment; communications; frequency management; high frequency; high latitude; radio
