All Experimenters' Meeting

November 28, 2005

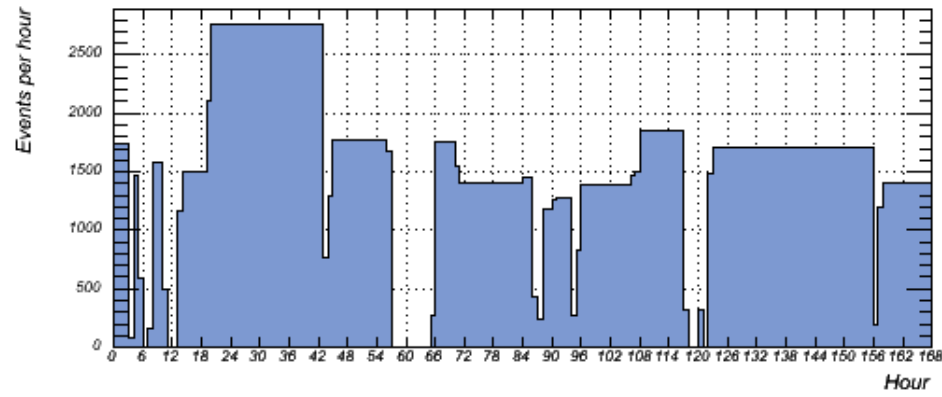

News & Status

- Last week we ran -20 GeV/c beam.
- All data on the Liquid Hydrogen target with 20% empty target runs:
Last week we had 255500 events in 4130spills.
- Beam quality stable, at a rate of one spill every 2 minutes, and sometimes at 1 spill every minute.
- Some major down times in the last week due to Accelerator enclosure accesses.
- Detectors problems in the last week, lost HV control due to communication failure to 1440 mainframe in MC7.
- No Data Acquisition problems in the last week

2005-11-21

2005-11-21

2005-11-21

Future plans for this week and are:

- Take -20 GeV/c beam on LH2 target until we get 500,000 triggers, around Tuesday.
- Take two special runs:
 - Muon calibration run
 - Beam Ckov calibration run
- Plan to then switch to 85 GeV/c beam on LH2 target.
