Pierarchical Regression Models

3 Missing Data

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

Hierarchical models Example - BrCa in NC

## What makes a model hierarchical?

#### Definition

The joint distribution, (such as  $f(y, \beta, \mu, \tau^2)$ ) can be written as a series of conditional distributions

**Basic Bayesian regression** 

 $f(\boldsymbol{y},\boldsymbol{\beta},\boldsymbol{\mu},\tau^2) = f(\boldsymbol{y} \,|\, \boldsymbol{\beta}) f(\boldsymbol{\beta} \,|\, \boldsymbol{\mu},\tau^2)$ 

イロト イポト イヨト イヨト 二日

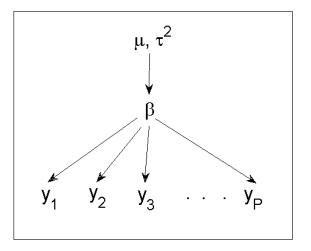

Hierarchical models Example - BrCa in NC

## What makes a model hierarchical?

- The parameters of the model are arranged in levels
- Parameters at one level are dependent on parameters of higher levels
- In the basic Bayes logistic regression example
  - $y_i$  depends on  $\beta$
  - $\beta$  depends on  $\mu$ ,  $\tau^2$

### Breast Cancer in North Carolina

Hierarchical models are a natural way to formulate many applied problems

(日)

Hierarchical models Example - BrCa in NC

## Breast Cancer in North Carolina

Hierarchical models are a natural way to formulate many applied problems

- Want to estimate county-specific breast cancer rates in North Carolina in 2004
- y<sub>i</sub> is the number of cancer cases in the *i*<sup>th</sup> county
- N<sub>i</sub> is the population of each county in 2004

(日)

Hierarchical models Example - BrCa in NC

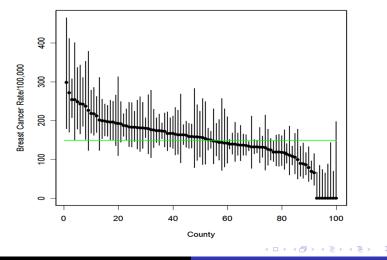

# Breast Cancer in North Carolina

Hierarchical models are a natural way to formulate many applied problems

- Want to estimate county-specific breast cancer rates in North Carolina in 2004
- y<sub>i</sub> is the number of cancer cases in the *i*<sup>th</sup> county
- N<sub>i</sub> is the population of each county in 2004
- Standard maximum likelihood techniques provide a simple answer θ̂<sub>i</sub> = y<sub>i</sub>/N<sub>i</sub>

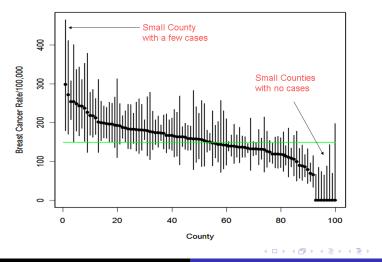

But is it a reasonable answer?

Hierarchical models Example - BrCa in NC

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

Hierarchical models Example - BrCa in NC

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

Hierarchical models Example - BrCa in NC

- Some of the point estimates are absurdly high or low
- Some of the confidence intervals are huge

#### How can we improve on this?

- We have some prior knowledge about BrCa rates
- Lets incorporate it through a hierarchical model

Hierarchical models Example - BrCa in NC

### **Hierarchical Modeling of Cancer Rates**

#### Model

 $egin{aligned} & y_i \sim \mathsf{Poisson}(N_i \mathsf{exp}( heta_i)) \ & heta_i \sim \mathsf{Normal}(\mu, au^2) \end{aligned}$ 

- Poisson model with different intercepts for each county
- $\exp(\theta_i)$  is the county-specific rate
- N<sub>i</sub> is commonly called the offset term

counties.txt contains the data for this example and counties.R has the code

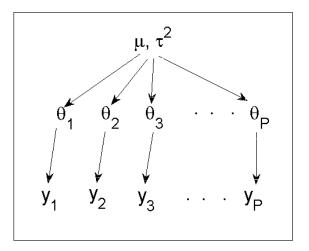

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ト

# A quick change in software package

- SAS has really nice Bayes capabilities and will probably get even better shortly
- But it's new, and you can reach its limitations quickly
- The BUGS family winBUGS, openBUGS, etc are very adaptable to most epidemiology applications (and its free)
- Using BUGS directly is a pain, but you can call it through R easily
- I won't bore you with an introduction to this software
  - I've posted a brief tutorial online, with code and data for all the examples
  - http://dir.niehs.nih.gov/dirbb/serbayes/

Hierarchical models Example - BrCa in NC

# Key Properties of Hierarchical Models

### Shrinkage

- Estimates are pulled away from their unbiased MLE and toward the prior mean
  - Bayesian: natural consequence of combining prior with data
  - Frequentist: introduce bias to reduce MSE (biased but more precise)

(日)

Hierarchical models Example - BrCa in NC

Rich MacLehose

Bayesian Methods for Epidemiologic Data Analysis

Hierarchical models Example - BrCa in NC

# Pro's and Con's

### Pro's

- Works really well bias/variance trade off
- Incorporates prior knowledge
- Certain problems that are very difficult for frequentist inference are easily solved in Bayesian hierarchical models
  - Non-parametrics, change point problems, spatial data

### Con's

- More difficult to program
- SAS doesn't have a proc hierarchical (yet)

### 3 Missing Data

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

ъ

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# **Hierarchical Regression**

- Incorporating prior knowledge and shrinking estimates is very appealing
- Want to incorporate variable effects in hierarchical regression models
  - Logistic regression, though linear or poisson are easy extensions
- Motivating example of DBP's and SAB
  - Simulated data set and code provided

(日)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Spontaneous Abortion (SAB)

- Pregnancy loss prior to 20 weeks gestation
- Very common (> 30% of all pregnancies)
- Relatively little known about its causes
  - maternal age, smoking, prior pregnancy loss, occupational exposures, caffeine

(日)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Spontaneous Abortion (SAB)

- Pregnancy loss prior to 20 weeks gestation
- Very common (> 30% of all pregnancies)
- Relatively little known about its causes
  - maternal age, smoking, prior pregnancy loss, occupational exposures, caffeine
  - disinfection by-products (DBPs)?

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# **Disinfection By-Products**

- A vast array of DBPs are formed in the disinfection process
- We focus on 2 main types:

#### Trihalomethanes (THMs)

CHCl<sub>3</sub>, CHBr<sub>3</sub>, CHCl<sub>2</sub>Br, CHClBr<sub>2</sub>

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# **DBPs** and SABs

### Early Studies

 Noted an increased risk of SAB with increased tap-water consumption

#### More Recent Studies

- Increased risk of SAB with exposure to THMs
- Notably, CHBrCl<sub>2</sub> in Waller et al (1998)
   OR=2.0 (1.2, 3.5)

<ロ> <同> <同> <同> < 同> < 同>

Introduction Right Fr Hierarchical Regression Models Frequen Missing Data Hierarch

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

### Specific Aim

To estimate the effect of each of the 13 constituent DBPs (4 THMs and 9 HAAs) on SAB

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

- 2507 enrolled in three metropolitan areas in U.S.
- Years: 2001-2004
- Recruitment
  - Prenatal care practices (52%)
  - Health departments (32%)
  - Promotional mailings (3%)
  - Drug stores, referrals, etc. (13%)

(I)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Data Collection

### **Baseline Interview**

demographic information, medical history, other confounders

### Pregnancy loss

self report or chart abstraction

### DBP concentration

- Disinfecting utilities
- Weekly samples at two sites with high DBPs
- Every other week at third site with low DBPs

(日) (四) (三) (三)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Logistic Model

- Standard logistic analysis
- Categorize DBP variables (quartiles,tertiles)

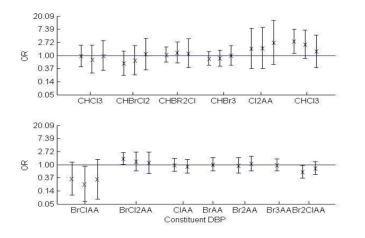

$$logit{Pr(y_i = 1 | \cdot)} = \alpha + \gamma_1 z_{1i} + \dots + \gamma_p z_{pi} + \beta_1 x_{1i} + \dots + \beta_{32} x_{32i}$$

### Where,

- $\alpha$  is the intercept
- *z*<sub>1i</sub>...*z*<sub>pi</sub> are confounders: smoking, alcohol use, ethnicity, maternal age
- $x_{ki}$  is the concentration of the k<sup>th</sup> category of DBP for the *i*<sup>th</sup> individual for the time interval around conception

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Results of frequentist analysis

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Results of frequentist analysis

- Several large but imprecise effects are seen
- 4 of 32 coefficients are statistically significant
- Imprecision makes us question results

Is there a better analytic approach?

Image: A marked and A marked

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

### Other common options

- Try all exposure in one model
  - Problem: unreliable estimates

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Other common options

- Try all exposure in one model
  - Problem: unreliable estimates
- Combine variables in aggregate scores
  - Problem: difficult to interpret, can mask effects

(I)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Other common options

- Try all exposure in one model
  - Problem: unreliable estimates
- Combine variables in aggregate scores
  - Problem: difficult to interpret, can mask effects
- Analyze one variable at a time
  - Problem: uncontrolled confounding

(I)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Why choose a Bayes hierarchical model here?

- High correlation in the data
- There is some previous knowledge to be brought in
- Interpretability

(日)

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

- A simple two-level hierarchical model popularized by Greenland
- Have seen use in nutritional, genetic, occupational, and cancer epidemiology
- Despite the name, they are Bayesian models.
  - name may refer to asymptotic methods commonly used in fitting semi-Bayes models

(日)

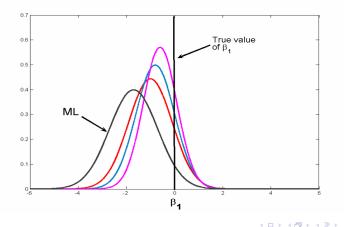

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Shrinkage of Regression Coefficients

- Regression coefficients are shrunk toward prior distribution as in BrCa example
- Amount of shrinkage depends on prior variance
  - Large variance  $\rightarrow$  little shrinkage
  - Small variance  $\rightarrow$  lots of shrinkage

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Shrinkage in model 1

|                                | Motivating Example: DBPs and SAB  |
|--------------------------------|-----------------------------------|
| Introduction                   | Right From the Start              |
| Hierarchical Regression Models | Frequentist Analysis              |
| Missing Data                   | Hierarchical Model 1 (semi-Bayes) |
|                                | Model 2 (fully Bayes)             |
|                                |                                   |

#### Model

$$logit\{Pr(y_i = j | \cdot)\} = \alpha + \beta_1 x_{1i} + \dots + \beta_k x_{ki} + \gamma_1 z_{1i} \dots \gamma_p z_{pi}$$
  
$$\beta_j \sim N(\mu, \phi^2)$$

- $\alpha$  = intercept
- $\gamma$ 's = confounder effects
- $\beta$ 's= exposure effects

▲ 御 ▶ ▲ 臣 ▶ ▲

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

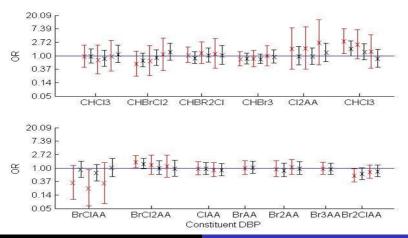

# **Prior specification**

- Little prior evidence of effect: specify  $\mu = 0$
- Calculate  $\phi^2$  from existing literature
  - Largest observed effect: OR=3.0

• 
$$\phi^2 = (\ln(3) - \ln(1/3))/(2 \times 1.96) = 0.3142$$

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Model 1 - Results

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

### Can we improve on the semi-Bayes model?

- Assumes the prior variance,  $\phi^2$ , is known with certainty
  - constant shrinkage of all coefficients
- Sensitivity analyses address changes to results with different prior variances
- Data contain information on prior variance

(日)

|                                | Motivating Example: DBPs and SAB  |
|--------------------------------|-----------------------------------|
| Introduction                   | Right From the Start              |
| Hierarchical Regression Models | Frequentist Analysis              |
| Missing Data                   | Hierarchical Model 1 (semi-Bayes) |
| Ţ.                             | Model 2 (fully Bayes)             |

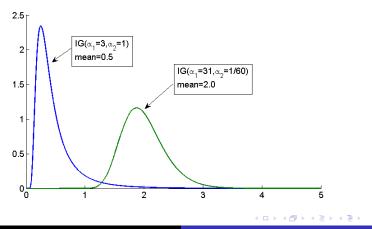

Places prior distribution on \$\phi^2\$
 reduces dependence on prior variance

$$logit\{Pr(t_i = j | \cdot)\} = \alpha + \beta_1 x_{1i} + \dots + \beta_k x_{ki} + \gamma_{1i} z_{1i} + \dots + \gamma_{pi} z_{pi}$$
  
$$\beta_j \sim N(\mu, \phi^2)$$
  
$$\phi^2 \sim IG(\alpha_1, \alpha_2)$$

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

### What's an inverse-Gamma distribution?

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

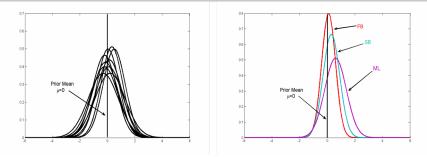

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# Properties of model 2

- Prior distribution on  $\phi^2$  allows it to be updated by the data
- As variability of estimates from prior mean increases, so does  $\phi^2$
- As variability of estimates from prior mean decreases, so does  $\phi^2$
- Adaptive shrinkage of all coefficients

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

### Adaptive Shrinkage of model 2

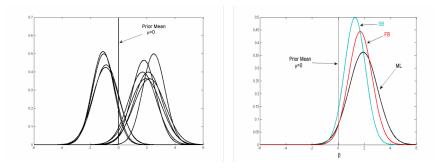

| Model | Prior variance | $\phi^2$ , Data | Shrinkage |
|-------|----------------|-----------------|-----------|
| SB    | Fixed          | Constant        | Constant  |
| FB    | Random         | $\downarrow$    | ↑         |

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Adaptive Shrinkage of model 2

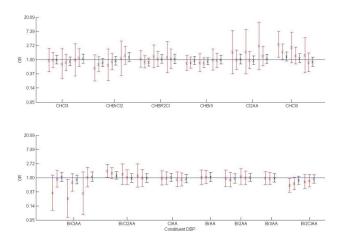

| Model | Prior variance | $\phi^2$ , Data | Shrinkage    |
|-------|----------------|-----------------|--------------|
| SB    | Fixed          | Constant        | Constant     |
| FB    | Random         | 1               | $\downarrow$ |

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

Image: A matrix

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

## Model 2 - Results

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

≣⇒

Motivating Example: DBPs and SAB Right From the Start Frequentist Analysis Hierarchical Model 1 (semi-Bayes) Model 2 (fully Bayes)

# The Problem with Model 2

- How sure are we of our parametric specification of the prior?
- Can we do better by grouping coefficients into clustering and then shrinking the cluster specific coefficients separately?
  - Amount of shrinkage varies by coefficient
- see MacLehose et al. 2007

(日)

Introduction and Terminology Simulated Data

2 Hierarchical Regression Models

3 Missing Data

Rich MacLehose Bayesian Methods for Epidemiologic Data Analysis

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

Introduction and Terminology Simulated Data

- Missing data are omnipresent
- The best solution to missing data is to avoid it by good study design
- When that's not possible, you can begin to address missing data through proper analysis

Introduction and Terminology Simulated Data

## Various Missing Data Techniques

#### The Good

Bayesian modeling, E-M algorithm, Multiple Imputation, Weighted Estimating Equations

#### The So-So

Hot deck imputation, Improper imputation

#### The Ugly

Replacing missing values with sample mean

・ロ ・ ・ 一 ・ ・ 日 ・ ・ 日 ・ ・

Introduction and Terminology Simulated Data

# Missing Data Terminology

#### Missing Completely At Random

- Data is missing based on a coin flip
- Lightning struck your sample
- Complete case analysis is unbiased here

#### Example

$$Logit{Pr(y_i = 1)} = \alpha + \beta_1 x_{i1} + \beta_2 x_{i2}$$
  
Logit{Pr(r\_i = 1)} =  $\lambda_0$ 

where  $r_i$  is an indicator for whether the  $x_{i1}$  is missing

Introduction and Terminology Simulated Data

# Missing Data Terminology

#### Missing At Random

- The data DO contain information about why some values are missing
  - e.g., Diabetic men don't report dietary variables as often

#### Complete case analysis?

- If the missingness depends on the outcome, complete case analysis may be biased
- If the missingness depends only on other covariates, complete case analysis is not biased
  - However, you want to include covariates that cause missingness in the regression

Image: A math a math

Introduction and Terminology Simulated Data

# Missing Data Terminology

#### Missing At Random

- The data DO contain information about why some values are missing
  - e.g., Diabetic men don't report dietary variables as often

#### Example

$$Logit{Pr(y_i = 1)} = \alpha + \beta_1 x_{i1} + \beta_2 x_{i2}$$
$$Logit{Pr(r_i = 1)} = \lambda_0 + \lambda_1 y_i + \lambda_2 x_{i2}$$

Where  $r_i$  is an indicator for whether the  $x_{i1}$  is missing

・ロト ・ 四 ト ・ 回 ト ・

э

Introduction and Terminology Simulated Data

# Missing Data Terminology

#### Not Missing at Random

- The missing data itself contains information about why some values are missing
  - e.g., Men with certain dietary habits don't report those dietary variables as often
- Complete case analysis is not OK here

#### Example

$$Logit\{Pr(y_i = 1)\} = \alpha + \beta_1 x_{i1} + \beta_2 x_{i2}$$
$$Logit\{Pr(r_i = 1)\} = \lambda_0 + \lambda_1 x_{i1} + \lambda_2 y_i$$

where  $r_i$  is an indicator for whether the  $x_{i1}$  is missing

Introduction and Terminology Simulated Data

# Missing Outcome Data

- If the outcome is MCAR, you get unbiased estimates
- If the outcome is MAR and you're doing likelihood inference, you get unbiased estimates
  - Beware GEE in this case
- The data won't provide any information outside of what they're already telling you in the regression model
- it its not missing at random, you still need to worry

Introduction and Terminology Simulated Data

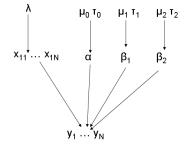

## Hierarchical Analysis of Missing Data

#### Bayesian analysis of missing data

- Place a prior distribution on the missing covariates and proceed as usual
  - This makes Bayesian approaches to missing data relatively easy, comparatively
  - $x_{i1} \sim N(\lambda_0 + \lambda_1 y_i + \lambda_2 x_{i2}, \tau^2)$  if  $x_{i1}$  continuous
  - x<sub>i1</sub> ~ Bernoulli(p<sub>i</sub>) with p<sub>i</sub> a logistic model if x<sub>i1</sub> discrete
- All we're doing is adding a few lines to our Gibbs sampling algorithm, drawing values for the missing covariates

(日)

Introduction and Terminology Simulated Data

Introduction and Terminology Simulated Data

## Simulated Data

- We'll simulate some data so we know what the answer should be when we analyze it
- 200 observations from a linear regression

• 
$$y_i = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + \beta_3 x_{i3} + \epsilon_i$$

missingdata.R contains the code for this example

(日)

Introduction and Terminology Simulated Data

# Bayesian Analysis of Full Data

#### Model

$$y_i = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + \beta_3 x_{i3} + \epsilon_i$$
  

$$\epsilon_i \sim N(0, \sigma_y^2)$$
  

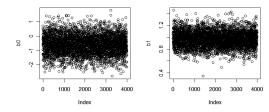

$$\beta_j \sim N(0, 100)$$
  

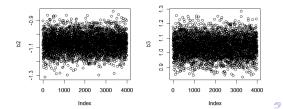

$$\sigma_y^2 \sim Uniform(0.00001, 100)$$

- Non-informative priors on all parameters
- Don't do this if you have prior information!
- Caution is required for the prior on  $\sigma^2$

Introduction and Terminology Simulated Data

### Convergence

Rich MacLehose

Bayesian Methods for Epidemiologic Data Analysis

Introduction and Terminology Simulated Data

### Full Data results

| Coefficient | Coeff | 95% CI       |
|-------------|-------|--------------|
| $\beta_0$   | -0.6  | (-1.9, 0.7)  |
| $\beta_1$   | 1.0   | (0.7, 1.2)   |
| $\beta_2$   | -1.1  | (-1.2, -0.9) |
| $\beta_3$   | 1.0   | (0.9, 1.2)   |

- $\beta_1, \beta_2, \beta_3$  almost identical to truth
- β<sub>0</sub> is off a bit, but the credible intervals are quite wide, and include the truth

(日)

Introduction and Terminology Simulated Data

# Missing Data type 1: MCAR

#### MCAR Data

$$Pr(r_{i1} = 1) = 0.2$$
  

$$Pr(r_{i2} = 1) = 0.25$$
  

$$Pr(r_{i3} = 1) = 0.3$$

- The r<sub>i</sub>'s are probabilities of each variable being missing
- The probabilities are constant: MCAR
- 56.4% of the data are missing

Introduction and Terminology Simulated Data

## Some intuition on the model

- We want to estimate  $\beta$  in the same way as before
  - Combining prior with data
- Also want to estimate  $\mu$ , the mean of the missing data
  - Under MCAR, the data provide lots of information about μ
  - For instance, the means of observed variables
  - The µ's are used to impute missing values of x's

Introduction and Terminology Simulated Data

# MCAR Data results

|             | Complete Case |              | Account for MCAR |              |
|-------------|---------------|--------------|------------------|--------------|
| Coefficient | Coeff         | 95% CI       | OR               | 95% CI       |
| $\beta_0$   | -1.6          | (-3.4, 0.3)  | -1.1             | (-2.4, -0.6) |
| $\beta_1$   | 1.1           | (0.7, 1.5)   | 1.0              | (0.7, 1.3)   |
| $\beta_2$   | -1.2          | (-1.3, -1.0) | -1.1             | (-1.2, -0.9) |
| $\beta_3$   | 1.0           | (0.8, 1.1)   | 1.0              | (0.9, 1.2)   |

- CC and adjusted are quite similar Not surprisingly
- Accounting for the MCAR mechanism improves precision slightly
- This is why people usually don't bother with missing data techniques when MCAR

Introduction and Terminology Simulated Data

# Missing Data type 2: MAR

#### MAR Data

Logit{
$$Pr(r_{i1} = 1)$$
} = 15 + 2 $y_i - x_{2i}$   
Logit{ $Pr(r_{i2} = 1)$ } = 3 + 0.5 $y_i$   
Logit{ $Pr(r_{i3} = 1)$ } = -13 -  $y_i - x_{1i}$ 

- The missingness mechanism is different for each variable
- Depends on the rest of the observed data, so MAR
- 17% of *x*<sub>1</sub>, 3% of *x*<sub>2</sub>, and 37.6% of *x*<sub>3</sub> missing

- Complete Case analysis would yield incorrect answer
- Complete Case intervals don't include true effect, even!
- Bayes model accounting for MAR recovers true effects, almost exactly

(日) (圖) (E) (E) (E)

Introduction and Terminology Simulated Data

- Bayesian methods for missing data can be very useful
- Generally easier to implement than other (proper) methods
- The results depend on your model for x
- Can't test between MCAR, MAR, NMAR
- Extensions to non-ignorable data are straightforeward (see Kmetic et al, Hernan et al)
