ONCE AGAIN, THANK YOU FOR THE OPPORTUNITY TO COMMENT ON THE D.O.E.'S PLAN FOR THE FUTURE OF PANTEX. PANTEX HAS BEEN AN IMPORTANT PART OF OUR REGIONAL ECONOMY FOR MANY YEARS, AND WE SUPPORT THE CONTINUATION OF ENVIRONMENTALLY SOUND OPERATIONS AT THE PLANT. I WOULD ALSO LIKE TO THANK ALL THE CONCERNED CITIZENS OF OUR COMMUNITY WHO HAVE MAKE THE EFFORT TO ATTEND THIS MEETING TONIGHT.

1/34.01 I strongly support the continuation of the high explosive function at the Pantex facility. I oppose any effort to move these functions to the national labs. Pantex is the most cost effective DOE facility and has an excellent track record in doing the high explosive functions.

2/40.20 • I believe that Pantex should be chosen as the location for fissile materials storage and disposition functions. Pantex already stores surplus plutonium and has a safety and security record that is unmatched in the DOE complex. When given fair budget consideration, strong local support and national security interest, Pantex is the ideal choice for this function of fissile materials storage and disposition.

When given fair budget consideration, strong local support and national security interest, Pantex is the ideal choice for this function of fissile materials storage and disposition.

QUESTIONS:

3/34.10
- Please explain how DOE can justify the cost of 432 people at the weapons lab to manufacture explosive components when Pantex has identified about 50 people to perform that same operation.

4/34.07
- Is it reasonable to assume that the HE facilities to be used at the weapons lab for manufacturing explosive components are as new and as technologically advanced as those at Pantex?

1/34.01 continued
- Since the American taxpayer has already suffered the cost and burden of the new High "E" explosive facility at Pantex, wouldn't it be most reasonable to apply them to this mission?

"Just an Little Peace and Quiet" for Mac Stuart, All-American Physicist

by Rita Calvert, Director, Dallas Peace Center

Mac was a quiet, sensitive older brother, with a wacky sense of humor He was four when I was born, and was so excited that early morning that he ran from door to door on our street, knocking and announcing "Our little 'tiny' is here!" (I was stuck with that nickname for a long time!) He was a whiz at math and science (helped me with my story problems) but couldn't spell worth a darn! Each year when we would ask him what he wanted for Christmas, he would reply with a wry smile, "Just a little peace and quiet..."

He was not an egghead, though. He ran track (in spite of his asthma), and played terrific boogie-woogie and jazz piano. He could also knock out a powerful Chopin's Polonaise. He was voted the "Best Looking" in his Senior Class, and closely resembled a brown-eyed Robert Redford. But with all that, there was always an underlying seriousness, and a willingness to listen to his little sister's problems. His children told me that he was the same with them He would put aside a speech he was preparing, to talk or go pick them up when they needed a ride, and then go back to his work until well into the morning hours.

Mac Stuart (5 years) with Rita Calvert (1 year)

Mac was greatly touched by cruelty and hated violence, but he did love his Pittsburgh Pirates! I always dreaded when Dallas played Pittsburgh, because I knew one of us would lose. He had married a Chi Omega sister of mine, Sharon Meier, and they had a family of three girls and one boy.

He received his Doctorate in Nuclear Physics in 1955 from the University of Iowa, and went to work for Westinghouse right away. We never really knew what he was working on, since it was all classified. We eventually found out he had been one of the Senior Scientists on the first nuclear submarine, the U.S.S. Nautilus, working under Admiral Rickover for two years. He was responsible for the heat shield which protected the crew. The money from the new industry was good for a growing family, and they built a beautiful home in the suburbs of Pittsburgh.

As the Vietnam was was ending in 1973, he decided he did not want to work any longer in military projects, and went to work at Combustion Engineering in Granbery, Connecticut. This company designs nuclear power plants. Mac was in charge of the containment, or safety of the operation. After about five years, he became increasingly concerned about the possibility of a nuclear accident, (i.e. Three Mile Island) and asked to be loaned for research into alternate energy sources. His ultimate goal was to ret... to Evansville, Indiana, (our home) to teach.

After reaching Palo Alto, California and trying out his first swimming pool, he contracted a cough, which led to the discovery of carcinoma of the lung. He had surgery and chemotherapy, yet went to the office every day he possibly could (working as a consultant to the Electrical Power Research Institute.) While he was there, the real Three Mile Island incident occurred, justifying his fear.

By January, he began to have severe headaches, and tests found the cancer had metastasized to his brain. He continued to work through the radiation treatments.

By April, he called me and said he was "home free," and not to worry, he wasn't "going anywhere." He offered to send me a book he had been reading on the power of the mind over our circumstances, in response to my confiding problems with my new profession. We were planning to go to California after his hair grew back, for the wedding of his daughter, Holly.

On May 13 we called to wish him "The Big Five-O, and got no answer. The next day his minister called me to say he had entered the hospital that weekend, and exploratory surgery for fluid build-up had discovered the cancer had spread throughout his body, and he had maybe 10 days to live.

He died on June 2, after telling us to go to our hotel to rest, that we looked tired. At his memorial service his work associates told me that he had turned in his last project, as complete and concise as ever, and checked into the hospital for his final stay. His minister who went to comfort him, found himself comforted by the patient, who kept his sense of humor and had accepted his upcoming death with grace. At the memorial service when they played "Let There Be Peace on Earth, and Let it Begin With Me," I knew that Mac had found his "Peace and quiet" at last.

Stuart Family, 1962—Front: Sharon, Holly, Mac; Middle: Rob, Teresa; Back: Elaine

Postscript

Since the time of writing of the article above, I have been asked by people in the anti-nuclear movement if my brother could have been exposed to excessive radiation. Now that I know more about this issue, I am sure of it. He worked with atomic energy from 1951 to 1979, not exactly a time in history when we were aware of the scope of its dangers.

Three years after his death, his first wife Sharon developed leukemia, and died within 6 months. His youngest daughter, Holly gave birth to a 2 1/2 pound baby boy, who was hospitalized for three months. His second daughter, Teresa, developed a fibroid tumor when pregnant with her third child; and his oldest daughter, Elaine, was childless for almost 20 years, and only recently became pregnant after extensive fertility treatments. These events began to fit a pattern.

Mac was a heavy smoker. He suffered from asthma as a young boy, and was probably very susceptible to lung irritation. But he was also exposed to who-knows-how-much radiation for 20 years. He made many trips to White Sands, NM, and doubtless many other nuclear installations. He suffered episodes of thyroid and testicular inflammation in the 1960's which destroyed the function of those organs. I have every reason to believe that he, and probably his family, have been victims of radiation exposure, as well as tobacco smoke.

This knowledge adds greatly to the pain of losing these two young vibrant human beings, who left four children alone to fend for themselves these last 16 years. I have tried to be Mom and Grandma to his Grandchildren, but they have missed their own parents greatly. Who knows what they could have contributed to the world at large, not to mention their family?

When Fumiko Amano, a survivor of Hiroshima and a peace educator, came to my office at the Dallas Peace Center to speak, we embraced and grieved for the loss of our two brothers to the nuclear bomb. When will the Nuclear Holocaust end? When will we listen to the scientists and other victims who cry out from their graves and warn us every day of the dual danger of smoking and exposure to nuclear by-products? When will we destroy these weapons of destruction and learn to rely on nonviolent means to solve conflict?

President Eisenhower was prophetic when he said "The world in arms is not spending money alone. It is spending the sweat of its laborers, the genius of its scientists, the hopes of its children." The price is too high.

Call your Congressperson and both Senators today to ask that they oppose the trucking of nuclear waste from Maine and Vermont to dump on Sierra Blanca, Texas, upstream from Big Bend, 16 miles from the Rio Grande (or Bravo, as the Mexicans call it). Tell them to vote "No "on HR 558 and S. 419, the Texas Compact Bill, which we defeated in September, but which saw flurries of activity from proponents (including Texas Governor George Bush) in December and again in March. Also tell them to vote against the transfer of land in Ward Valley to California to build a nuclear dump near indigenous land, endangering non-human and human species (H.R. 2334 and S. 1596) See back cover and inside back cover for more information.

COMMENT LETTER

PAGE 1 OF 2

It is my intent this evening to speak briefly to each of the Programmatic Environmental Impact Statements, and reserve comments on the Pantex Site-Wide EIS until the June public meeting.

These documents are being addressed in this community as an economic and jobs issue. While the local economy is undeniably important, both of these PEIS drafts deal with issues that have national and international implications, ~~and they deserve to be considered in that light~~. Those implications involve national and international security; they involve decisions about nuclear waste that we have been unable to make decisions about for more than 50 years; and they involve introducing new technologies with a wide range of health, ~~and~~ safety and environmental risks. They deserve to be considered in that light, read thoughtfully and carefully, and addressed with more than pep rallies about jobs.

1/40.36 The Stockpile Stewardship and Management PEIS, does not ~~make~~ adequately make a case for development of of more than $2.6 billion in new capital cost and $2 billion in development of a ~~new~~ new super computer. The reliability of US nuclear weapons has been tested over and over again. The French just recently completed a series of tests designed to allow them to continue nuclear weapons development by simulated tests and computer models. No reasonable person can look at

SSM-H-PTX-015
COMMENT LETTER

PAGE 2 OF 2

2/40.07 the proposed new facilities and and believe they have any purpose other than continued weapons development.

The storage and disposition options provide us no good choices; reasonably so, because there are none. The emphasis on the spent fuel standard may leave us with a false sense of security – virtually every country which has developed nuclear weapons has done so from spent nuclear fuel. It may ~~prevent~~ provide some level of security from theft by terrorists, but the nuclear nations of the world themselves hold hostage each other and the non-nuclear nations.

We have for more than 50 years been unable to resolve the issue of what is to be done with spent nuclear fuel – producing more of it, or other materials equally as toxic, is more problem, not solution –

PANTEX WORKSHOPS April 22, 1996
Statement by William H. Seewald

Given the time allotted and the amount of information to be covered in these "workshops," remarks will have to be brief and abridged. However, notwithstanding the voluminous issues of great concern, some reference must be made to the process. Combining these three documents into a single opportunity for public input together with the very short amount of time much of the material has been available does justice

1/41.10

neither to the NEPA process itself, nor to the people and agencies that wish to make reasoned responses to these documents. At least in the case of the Stockpile Stewardship as well as the Storage and Disposition, the documents are substantive enough to require careful analysis. It is also an unavoidable conclusion that the hearing process envisioned by NEPA has been transformed by DOE into a format they feel they can more effectively control — that being the workshops. There is nothing wrong with workshops per se, but they do not meet the government's full responsibility to the public. That any of us at all are standing here to give testimony is only the result of citizen lobbying and the willingness of individuals to face down any obstacles to get their concerns into the public record.

2/41.05

One overriding point must be made regarding the Stockpile Stewardship and Management document even though one also must look at the cumulative impact of all three. It is clear that one of the significant premises compelling much of the decision-making process is the extraordinary attempt by the government to justify the continued operation of all three of the major DOE weapons laboratories, Los Alamos, Sandia, and Lawrence Livermore. The redundant laboratory capacity built during the cold war to spur competition can now only be characterized as an obscene abuse of the tax-payers pocketbook. That such a political decision gets made in Washington is certainly no surprise, but it is incumbent on all of us to demand accountability in these decisions, to refuse to acquiesce in expedient political decisions as well as those that are based on bad science or a disregard for the natural resources of the Panhandle.

3/40.27

The Storage and Disposition document with its potentially momentous effect on our area is tragically flawed in three important areas. Number one, it doesn't really live up to the second part of its title. If long-term storage decisions are to be made, it seems absolutely essential that they be informed by a least a fairly concrete sense of the method of disposal as well as where that will happen, the time frame, and a reasonable consideration of the processes themselves. Secondly, this EIS, as with the others under consideration today, does not make a realistic distinction between strategic and surplus plutonium. The effort to maintain two thirds of all the plutonium ever produced in the U.S. as "strategic" evidences a less than serious commitment to disarmament as well as giving rise to the suspicion that some effort to generate commerce in plutonium is superseding the security need to immobilize this dangerous substance. Thirdly, this

document sets out options that would obligate plutonium processing, generating all kinds of new nuclear waste streams that have never existed at Pantex before. The document gives little or no consideration to the effects on Panhandle agriculture. Just the threat of contamination from these activities could devastate the marketability of our products. It furthermore remains unconscionable that apparently considerations other than the water needs of domestic and agricultural usage seem to preclude the realistic designation of the Ogallala as an aquifer eligible for the fullest protection of federal law and policy.

The Site-Wide EIS, an effort brought about by citizen lobbying of the Department of Energy, has not really been in the public domain long enough for a detailed consideration. Unfortunately, the substance of the document itself may require much less time than the gravity of the issues warrants. There is again no consideration of the most basic industry of the Panhandle, agriculture. The agreement to evaluate alternative storage sites for pits, specifically Department of Defense sites seems to have been an insubstantial one since that site is not included in the actual storage EIS. If, as implied in the analysis, Manzano mountain becomes ineligible because of the the threat such a facility represents to Albuquerque, what are we to make of the government's concern for the residents of the Panhandle?

Sad to say we hear more about jobs than grave issues relative to safety and the protection of natural resources. But the best way absolutely to protect jobs in the Panhandle, whether in agriculture or at the Pantex Plant itself, is to keep the plant from becoming the next Rocky Flats. When that happens the only jobs will be for nuclear waste handlers and the state regulators who can only step in after the damage is actually done but who have no federally mandated authority over many of the processing functions being proposed. On top of the Ogallala Aquifer is the wrong place for long-term storage of plutonium, nuclear waste facilities, or any kind of plutonium processing.

Comments for PEIS Public Hearing on
Storage and Disposition of Weapons-Usable Fissile Materials
and
Stockpile Stewardship and Management
Amarillo, TX April 22, 1996
Doris Berg Smith

In a Democracy the voice of the people is important in any decision-making policies regarding how our government will manage surplus nuclear materials and what forms of disposition are being considered. At this time it is vital that all the right questions are asked to protect the natural resources of this area for the future generations of not only the Texas Panhandle and the State of Texas, but of the world.

Many issues come into play in this very over-arching discussion. Not the least among them the cost to us the taxpayer to produce these documents and to find them flawed in many ways. These Documents are lacking important information in many areas that make it virtually impossible to even begin the discussion.

The over-all cost to you and me, neighbor, for implementing the expensive options characterized in these documents are not prudent or wise. 1/40.07 Why is the Department of Energy so intent on building new Research, Development and Testing facilities when the entire world is looking to the U.S. for leadership in an extension of the Non-Proliferation Treaty, and a zero threshold for a Comprehensive Test Ban. Instead the intent seems to be continue to build and test!

2/40.12 In the SSM-PEIS the scenario for these options, in a downsizing of the nuclear weapons complex, alone is expected to exceed $30 Billion within a decade. These proposed new facilities are expensive! In this time of tight budget constraints, we the grassroots people should be imploring our Congressional leaders to stop all this massive spending on projects which lead to a build up in nuclear weapons. How many weapons do we need before we say, "That's enough?" How many nuclear warheads have we used?

It is time now, with the downsizing, to really actively pursue **REAL DOWNSIZING.** Do we want to continue to drag our country into further indebtedness by continuing nuclear weapons production? What is the real reason behind pouring dollars into Defense - are we trying to keep war and war games going in the pretense that this is the way to build peace and to achieve economic development in rural communities across America? This is a 'sunset industry', my friends and neighbors, and needs to be managed as such.

3/10.13 What will the DOE and "We" do with all the waste that will be generated for at least the next 20 years? There are no licensed facilities to accept the wastes that are piled up on facilities throughout the DOE Complex at this time - why generate more than needs to be generated.

We are now faced with storage and disposition of surplus fissile materials, every option considered has tremendous waste streams attached to any option. Where will this waste go? It seems quite evident that the site that creates the waste, keeps the waste. Will that saddle communities across this country with the economic and environmental problems of hosting waste treatment, storage and processing facilities?

1

4/43.09 In the PEIS's where were the impacts to the present agricultural economy which has built and sustained this area? Why were the risks to this economic stronghold not assessed? What will happen when we no longer produce food for people, where is our priority? Are bombs more important than food? We in agriculture strive to produce quality, wholesome food for the world population -one farmer feeds in excess of 131 people, yet the industry across the road from us builds bombs to annihilate people. Where is our sense of morality and respect for life?

5/04.05 The documents fail to address the issue of the location of Pantex over the Ogallala Aquifer. 4/43.09 continued Water and agriculture are the real wealth of the Texas Panhandle, without them there would be no "Texas Panhandle". Food is the most important commodity we produce - it must be protected.

Not all alternatives for siting the processes for storage and disposition were analyzed - If Manzano Weapons Storage Site at Kirtland Air Force Base has facility that could store 30,00 pits, why was it not further characterized in the other documents?

We say to you DOE, we want no storage of surplus plutonium at Pantex because it is dangerous and will lead to plutonium processing which results in additional waste generation and storage.

No processing of plutonium at Pantex since every plutonium processing facility has created large amounts of contamination which has adversely affected the workers and the public.

No waste disposal facilities at Pantex because we must preserve and protect the Ogallala aquifer.

Historically the plutonium at Pantex has been in pit form, now with these documents all of a the nation's weapons-usable plutonium not in active warheads will be stored at Pantex - plutonium will come to Pantex from Rocky Flats, Colorado; Hanford, Washington; Los Alamos, New Mexico; Savannah River, South Carolina; Nevada Test Site; and the Idaho National Engineering Lab. We find this unacceptable to an agricultural productive area.

No nuclear power reactors at Pantex - there is no need to construct them and the use of MOX fuel in them will not destroy the plutonium - it only creates more plutonium.

Please do not turn the Texas Panhandle, known for its beef and cereal grain production, into a plutonium waste site. You have created enough of these tragic land problems across the United States - the is no need to create another one here. It is very much like putting poison in your cereal bowl! When this area becomes contaminated - what have we gained?

SS & M PEIS Testimony - April 25, 1996

Christina Brown
Rt. 3, Box 173R
Espanola, NM 87532

My name is Christina Brown, I have lived in Northern New Mexico for the last twenty years.

1/40.36 The current plans the Department of Energy has regarding stockpile stewardship of nuclear weapons and increased plutonium production at Los Alamos Lab are unacceptable. It is just plain crazy to be spending billions of dollars on new, experimental, expensive facilities to test weapons reliability when we can already accomplish this with existing technologies and facilities. Meanwhile the many social, economic and environmental problems in this state are being ignored and underfunded by the government. New Mexico has been the national nuclear sacrifice zone for far too long. Enough is enough!

If the nuclear industry and politicians really cared about peoples' health and safety, or about the future of this planet, they would make cleaning up the radioactive waste that is already here their number one priority. What needs to happen is for the money and the politics to truly get behind the will of the people in this matter.

2/40.15 If we as a nation put the same kind of energy and purpose into permanently and ethically solving the nuclear waste problem as we did with the Manhattan Project in World War Two, we are capable of finding an answer. That is what the Lab should be doing first and foremost, using the great scientific minds at their disposal to deal with the radioactive mess that has already been made.

3/40.27 Current environmental restoration activities at Los Alamos seem to be the equivalent of putting a band-aid on a severed limb. And carting radioactive waste around the country to store in someone else's backyard - usually states with an under-represented, indiginous or poor population base -- is not only wrong, it's stupid, as it greatly increases the likelihood of a radioactive accident.

Another priority for the lab should be research and development of alternative, NON-POLLUTING sources of energy - solar energy being the most obvious choice for this state. After that, the lab should get serious about benign technology transfer, economic parity and environmental justice for surrounding communities that have been affected by radioactivity for the last fifty years.

SSM-H-SF-002
COMMENT LETTER **PAGE 2 OF 2**

4/40.69 Although the Department of Energy and LANL have become much more open about their activities in recent years, which is commendable, the fact is that people have been lied to about the risks of radioactive exposure and the true activities at the lab for so long, that it is really difficult for myself and many others to trust these institutions. I'm not here to shut down LANL completely or to take jobs away from people. I have close friends who live and work in Los Alamos; it used to be a truly beautiful, natural place. But every time I go up the hill, I can feel the fear and denial, and I wonder how many more "safe" levels of exposure my body can receive before I become affected by the poison that I know is there.

Our current ability to destroy ourselves and every living creature on the planet through nuclear weapons and waste is the ultimate result of losing touch with the natural world and disrespecting the Earth. Unless we halt this madness NOW, we can forget about any future whatsoever for human beings or the generations to come. To support a sustainable world, the lab MUST change its direction - there should be plenty of employment in the fields of environmentally sound waste disposal, alternative energy research and also in the medical field to find ways of healing people from this horrible legacy of death we have created.

3/40.27 continued

5/41.03 Finally, I strongly urge the Department of Energy and our representatives in Washington -- do not underestimate the urgency behind the comments given today at this public hearing. Because the people who believe that nuclear weapons production and nuclear waste exposure is morally, ethically and environmentally wrong are not going to go away. Don't assume that it is "just those radicals in Santa Fe" who feel this way - there are many, many more of us out their who either couldn't leave their jobs or families to attend these hearings, or who have already given up on having "the system" acknowledge and do something about their views. So please, please take this testimony very seriously. Thank you for the opportunity to express my views.

SSM-H-SF-003
COMMENT LETTER **PAGE 1 OF 4**

Submitted to the April 25th 1996
Hearing on the Future of LANL,
Doubletree Hotel,
Santa Fe, NM

LOOK AT THE DAY AND AGE WE LIVE IN.

RADIATION FROM CHERNOBYL IS NOT ONLY SMOULDERING, SOME OF IT RECENTLY CAUGHT FIRE – THE JURY'S STILL OUT ON THAT ONE. WHAT A STRANGE TIME TO BE CONSIDERING GREATER NUCLEAR OUTPUT FOR LANL

1/10.11 THE IRONY CONTINUES: NO ONE HAS YET PRESENTED A REASONABLE PLAN TO DISPOSE OF THE NUCLEAR WASTES GENERATED ON OUR SIDE, IN THE RACE WITH THE RUSSIANS. RUSSIA, ITSELF IN A STATE OF RELATIVE POLITICAL AND ECONOMIC TURMOIL, CANNOT ACCOUNT FOR MASSIVE AMOUNTS OF FISSILE MATERIAL. OUR OWN SENATE IN THE PAST MONTH HAS BEEN DISCUSSING WHAT TO DO ABOUT THE TONS OF PLUTONIUM AND ENRICHED URANIUM THROUGHOUT THE WORLD AND THE FACT THE A NUMBER OF *ILL*-PAID RUSSIAN EXPERTS COULD BE PREY TO *WELL*-PAYING, INTERNATIONAL TERRORISTS.

2/40.06 ARE *WE* THEN TO BE PREY TO A MONEYED MILITARY ESTABLISHMENT, EVEN NOW THAT

2/40.06 continued

THE COLD WAR IS SUPPOSEDLY OVER? ARE *WE* TO GIVE UP THE ONE MOVE THAT COULD HELP ELIMINATE THESE WEAPONS OF ARMAGEDDON – THE MOVE OF RELINQUISHING THEM OURSELVES?

WE HAVE OUR OWN, HOME-GROWN CATASTROPHES, EVEN IF THEY HAVE SO FAR BEEN ON A SMALLER SCALE THAN CHERNOBYL: OUR DOWNWINDERS, OUR VICTIMS OF SADISTIC RADIATION EXPERIMENTS, OUR TOWNS LIKE ROCKY FLATS.

3/43.06

AND NOW THE D.O.E. IS SUGGESTING THAT LOS ALAMOS TAKE ON ROCKY FLATS' – THIS HUMAN FAILURE'S – RESPONSIBILITY FOR THE PRODUCTION OF PLUTONIUM?

I WAS A JOURNALIST IN JAPAN FOR SIX YEARS. NATURALLY, MY READERS WERE VERY INTERESTED IN WHAT DROVE THE JAPANESE ECONOMIC MIRACLE. NATURALLY, THERE WAS NO SIMPLE ANSWER. MY RESPONSES INCLUDED THINGS MOST OF US BELIEVE IMPORTANT: HARD WORK, RESEARCH, TECHNOLOGICAL PROWESS, A DEVOTION TO EDUCATION. THERE WAS ANOTHER FACTOR THAT WAS RARELY REPORTED: THE PEACEFUL CONSTITUTION IMPOSED BY THE MACCARTHUR GOVERNMENT AFTER THE WAR. NOT ONLY IS

JAPAN LEGALLY A COUNTRY *FREE* OF NUCLEAR ARMS, BUT THE VERY SPIRIT OF JAPAN'S CONSTITUTION DISCOURAGES WARLIKE ACTIVITIES; RATHER, IT *ENCOURAGES* THE PRACTICES OF PEACE. NOW, ANYBODY WHO THINKS SUCH PRACTICE IS SIMPLY A PASSIVE ATTITUDE OUGHT GO TALK TO SOMEONE WHO HAS BEEN IN THE AUTOMOBILE BUSINESS FOR A LONG TIME, OR IN THE ELECTRONICS INDUSTRY. THE POINT IS THAT, YES, WE DO NEED TO REMAIN COMPETITIVE.

4/40.27

YES, WE NEED A LOS ALAMOS. WE NEED SCIENTISTS, EVEN TECHNOCRATS; BUT WE DO *NOT* NEED THEM SPENDING .THEIR PRECIOUS EFFORTS AND OUR TAX DOLLARS ON MECHANISMS OF DESTRUCTION THAT *NO ONE* SHOULD EVER USE.

WE NEED OUR SCIENTIFIC MINDS WORKING ON SERIOUS PROBLEMS: WAYS TO MITIGATE POLLUTION, TO SAVE ENERGY, TO FIGHT DISEASE, TO FEED THE HUNGRY, TO CONSERVE WATER. THE CREATORS OF LANL MUST HAVE BELIEVED THEIR EFFORTS WOULD BRING ABOUT PEACE. IF THAT IS THE CASE, LET'S MAKE LANL REALIZE ITS

ORIGINAL MISSION, OF BRINGING PEACE, AND NOT ANNIHILATION, TO THE WORLD.

THANK YOU.

Comments:

I was living in the southeastern part of W. Germany in April 1986 with my one yr. old daughter, when the Chernobyl accident happened. The first few days everything was hushed up. Then we were asked to stay inside as much as possible, not to eat our home-grown vegetables, wild mushrooms or wild herbs and not to drink the milk of our cows, sheep or goats. The contaminated milk was eventually shipped to the East Block & Third World countries in the form of powdered milk, the highly contaminated hazelnuts found their way into our chocolates years later. These are just a few examples of the unscrupulousness of many business people.
We were advised not to let our children play in the fields, in the sandboxes, on the earth for one whole year. The forests along the Western Czechoslova-

sian border is dead.
For months people were shopping vegetables with geiger counters to purchase the least radioactive vegetables.
My pregnant girlfriend, who was part of a self-sufficient country commune kept on living off her vegetables and goat's milk products and gave birth to a dead baby.
For 6 years we were advised not to eat wild mushrooms, as they soaked up the caesium from the earth. And this happened 1,000's of km away from Chernobyl.
I was considering moving to Asia to bring up my child in a healthy environment, but when I found out, that the Himalayas were also heavily contaminated, as that huge cloud of fall-out was moving all around the planet and the higher the elevation the more radioactive it is. I realized that there is no where to go. We are all more or less affected by radiological accidents. We live in New Mexico will be the biggest losers, but everybody on the planet loses.

1/10.30

I cannot understand the short-sightedness of the people behind nuclear energy as well as a source of energy as for the manufacturing of weapons.
We have had innumerable radiological incidents to proove that humans err. I don't believe we have the wisdom to handle this energy.

2/40.07

I also can't understand the hypocrisy of the U.S. Government concerning the Nuclear Non-proliferation Treaty on the one hand & designing new so-called "mini"-nuclear bombs. The U.S. Government is provoking the countries who don't have nuclear weapons to produce them, instead of discouraging them.

PHYSICIANS FOR SOCIAL RESPONSIBILITY/NEW MEXICO
The United States Affiliate of International Physicians for the Prevention of Nuclear War
Recipient of the 1985 NOBEL PEACE PRIZE

Comments of Janna Rolland, Executive Director of
New Mexico Physicians for Social Responsibility
on the Draft Programmatic Environmental Impact Statement for Stockpile
Stewardship and Management
Santa Fe, April 25, 1996

Good Afternoon. My name is Janna Rolland and I am the Director of New Mexico Physicians for Social Responsibility.

1/40.07 With the end of the Cold War, the DOE has the opportunity to shift away from weapons production to weapons dismantlement and maintenance of existing weapons. Instead of downsizing an consolidating, the DOE is proposing an unnecessary and expensive new program of Stockpile Stewardship and Management. PSR believes that this program is unnecessary, too costly, and harmful to non-proliferation and international security goals.

The DOE's plans to invest billions of dollars in large-scale experimental facilities to overcome limitations on nuclear weapons research and development programs imposed by the current moratorium on underground nuclear testing. Not surprisingly, the international community perceives these programs as attempts by the U.S. to get around a Comprehensive Test Ban Treaty. The development of advanced nuclear experimental capabilities creates the potential for a new breed of competition among nuclear weapons states. In this way, the proposed SS&M program violates the spirit of the Nuclear Non-Proliferation Treaty, which could lead other countries to abandon their treaty responsibilities, increasing the likelihood of proliferation and decreasing hope for Russian ratification of START II and future arm reduction treaties.

2/40.02 The "sub-critical" tests planned for the Nevada Test Site this summer, can only be seen by other nations as a mockery of the negotiations for the Comprehensive Test Ban Treaty currently taking place in Geneva. These experiments are not needed to maintain existing weapons and seriously call into question our government's commitment to arms control.

1/40.07 continued This PEIS must include analysis of alternatives that are consistent with U.S. treaty obligations, including the NPT's requirement to eliminate nuclear weapons. This includes analyzing arsenals of less than 1000 weapons.

3/41.18 Even as the SS&M PEIS considers three dangerous, costly and unnecessary facilities,

SSM-H-SF-007
COMMENT LETTER
PAGE 2 OF 2

3/41.18 continued — It fails to include in its scope the DARHT facility. We are told that the DARHT facility at LANL is an integral and essential component to the SS&M program, as are the Low Yield Nuclear Experiment Facility (LYNER) and Big Explosive Experimental Facility (BEEF) and the at the Nevada Test Site. The DOE should justify each new and existing facility in light of the end of the Cold War and true national security needs.

4/21.04 — The National Ignition Facility is estimated to cost $4.5 billion. This will only create 230 long term jobs at Livermore. Think how many teachers could be employed. Think how much health care can be provided to rural or inner city communities. Think how much low income housing could be created.

Rather than passively monitoring the nuclear arsenal while it awaits dismantlement, the DOE is proposing to spend billions of taxpayer's hard earned dollars in the name of national security. $40 billion over 10 years! A better

5/40.36 — approach is to maintain a minimal curatorship program that complies with arms control treaty obligations and nonproliferation goals. Such a program would be limited to passive maintenance of the arsenal as it awaits dismantlement.

In closing, I would like to remind you that a healthy, well-educated, well-housed citizenry living in a clean and beautiful environment is true national security.

Thank you.

Comments:
1/40.34 Please consider using a word other than "stewardship" when talking about nuclear weapons (and other weapons of mass destruction) and the stockpiling thereof. "Stewardship" implies caretaking of a valued resource. When we talk about waste we use the word "management." Why not use this one for the stockpile as well?

Comments:

1/10.29 LANL has not shown good faith in developing & maintaining safety standards while involved in nuclear weapons research & application: I don't want my child or any children in NM exposed to radioactive waste produced in the name of "safety & reliability" of nuclear stockpiles.

2/40.27 It's time for LANL to change its orientation, to catch up with the rest of the world and use technology in a way that promotes renewable, clean resources (ie- solar energy, geothermal, wind energy). This is the only alternative that seems viable, during such volatile times, when even LANL seems quite inept in controlling its emissions (via air & water).

1/10.30 I am opposed to increasing activities at los alamos that would increase the production of radioactive waste. Current practice (for the past 50 years) is to pile up the waste at the site where it is produced. Thus, by implementing this project, you are creating a nuclear waste dump upwind of most of northern new mexico. This is apparent each night, for example, when the (incandescent) lights of los alamos are visible from Santa Fe.

2/40.15 Don't produce more radioactive waste until you have a safe long term disposal for it. Don't create a defacto waste dump in a place as unsafe (environmentally and in terms of security) as los alamos

I live in Tesuque, NM just south of Los Alamos. I have moved to New Mexico because of its natural beauty and healing atmosphere. I am not in favor of any further expansion of any kind regarding any kind of nuclear production or testing in New Mexico, specifically at LANL.

I am not very educated in this matter at present, but I need to communicate that should expansion happen, I would not feel safe... and would need to move out of the area. This would be a real shame: I love this area very much.

So if I have any voice that can be heard, I would appreciate this being passed on to authorities as a "no" vote.

Comments:
Please recognize nuclear energy as hazardous and deadly to life forms on this planet! It kills! In regards to the half life of radioactive waste — it will "affect" many generations of plants, animals and humans. We can no longer afford to escalate and stockpile creating more nuclear waste. Nuclear ions in our water tables and in the atmosphere and in the food chains is anti-life. No one will live if we continue to "test" and [illegible] radioactive materials. The planet, our earth, the land which we inhabit needs to be held in sacred respect and not raped by a phallic, power-mongering enterprise.
Please care! Act!

Comments:

1/10.30

1) It is unfair and immoral to consider New Mexico as an empty state into which nuclear garbage can be piled with no opposition. Out of this does not ensue that this waste should be shipped to some poor ignorant third world country but that nuclear waste if produced at all should be treated properly on-site. If that cannot be done, and I am sure it can't, nuclear waste should not be produced.

2/09.11

2) Transporting nuclear waste thru New Mexican cities and countryside is dangerous, irresponsible and the chance of accidents too big to be taken.

Please continue on the other side if you wish to use additional space. THANK YOU—your comments are important to us.

Comments:

1/40.72 I am present at these hearings today to register my strong opposition to any continued weapons design and/or manufacture at the labs in Los Alamos. It is universally understood that this is a both dangerous and immoral endeavor. If the DOE is here today to factor community feelings on the subject, the results are clear. Every speaker I have heard is strongly against LANL's continued involvement in weapons design and production. If our voice is a factor in decisions for LANL then your choice on how to proceed is clear. Stop now. You (yes, even you who is transcribing this) are responsible.

Please continue on the other side if you wish to use additional space. THANK YOU—your comments are important to us.

Comments:

Meeting was run very smoothly & w/ a general feeling of goodwill.

1/41.05
The only concern of a member of the public is that this event may be no more than a quality P.R. strategy.

Will the comments made here — largely against further arms testing — have any influence upon the D.O.E.'s decisions?

Regards

Gentlemen:

Subject: 96030010 - U.S. Department of Energy Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management

The Missouri Federal Assistance Clearinghouse, in cooperation with state and local agencies interested or possibly affected, has completed the review on the above project application.

None of the agencies involved in the review had comments or recommendations to offer at this time. This concludes the Clearinghouse's review.

A copy of this letter is to be attached to the application as evidence of compliance with the State Clearinghouse requirements.

Sincerely,

Lois Pohl, Coordinator
Missouri Clearinghouse

Greetings,

My name is Jerry Arnold and I am an a TDCJ-ID inmate affected by all actions concerning the Pantex ~~facility~~ facility. I use the DOE's own definition, "... impacts are evaluated ... for the general population residing in...[a]... 50 mile radius..." (~~see~~ DPEIS, Vol. 1, Feb 1996, sec3.1.1.1, pg 3-4). I feel it is a honor for me to be given this opportunity to present my comments for your review.

I believe the world would be a much better place if no
1/40.06 government felt the need to maintain a nuclear weapon intimidation stance. No country dares to take the lead in removing this danger from the planet. We,
2/40.07 the United States, need to actively pursue the intent of START I, II, CTBT, NPT, and all future nuclear deterrance treaties. The United States should
3/40.15 also lead the world in doing research into methods and processes

(2)

3/40.15 continued

of neutralizing radioactivity. Further, we should enlist the help of other governments and the international scientific community.

I believe that new facilities (such as the proposed Atlas Facility, and others) are not required and even counter to nuclear deterrance. The monies for their construction would be better spent doing research into neutralizing radioactivity and disarming the nuclear threat.

4/34.02

the A/D operations and HE operations currently at Pantex should be consolidated at NTS. I make ~~this~~ the recommendation to also transfer the HE operations at Site 300, LLNL to NTS. I make these recommendations based on information obtained from the DPEIS, Vol. II, sec. A.3.5., ppg A-135 to A-139. I use

5/33.03

this information to also recommend the transfer of A/D activities at ORR/Y-12 to SRS Since there is more acreage to provide an enviromental ~~imp~~ impact buffer zone.

(3)

1/40.06 continued

To close, I will summarize my thoughts. First, I believe a "zero level" stockpile is the only vaible option. Since that option is not

3/40.15 continued

being considered I strongly recommend that the United States pursue research and development of radioactivity neutralizing methods and processes.

4/34.02 continued

Finally, based on my understanding of HE and the A/D process these operations should be consolidated at NTS and SRS.

Thank you for your time and review. I appreiate the opportunity to present my comments and views.

Sincerely,

Jerry Arnold

Comments:

1/32.03 I have many concerns about moving the Plutonium Pit Production to LANL. These concerns center around the lack of a sound ES&H culture at LANL, and their failure to implement "Conduct of Ops" successfully.

2/40.30 At the center of the LANL ES&H failures is the profound destruction of Employee Rights at LANL. LANL management, in outright defiance of their contractual commitments, destroyed the University of California Employee Rights of their staff in 1983. In 1993 they attacked the remaining employee rights at LANL. This wholesale destruction of employee rights has lead to a high level of fear and intimidation among LANL employees. This fact is borne out in Employee

Dear Sir:

The phrase "stockpile stewardship" simply means that the U.S. is continuing to spend billions of dollars to support nuclear weapons development—and the laboratories that are thereby kept in business.

1/40.07
At the same time, the nations of the world are trying to reach agreement on the Comprehensive Test Ban which would ban all nuclear tests worldwide.

The Lawrence and Los Alamos laboratories are not playing the role of caretakers; they are designing facilities which will continue the development of nuclear weapons.

2/40.12
The Peacemakers of the First Congregational church of Palo Alto join me in protesting this costly and unnecessary proposal.

I want this statement to go into the

SSM PEIS

Yours very truly,

Dolly DuPrau

Re: Public Comment on the Department of Energy's Stockpile Stewardship and Management (SSM), Storage and Disposition (S&D) of Weapons-Usable Fissile Materials, and the Pantex Site-Wide Draft Programmatic Environmental Impact Statements (PEISs)

Dear Sirs:

Thank you for the opportunity to comment on the U.S. Department of Energy's (DOE) Draft Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials, as well as the Pantex SWEIS. Also, please consider this our comments on the Pantex Site-Wide Environmental Impact Statement (SWEIS)

As we explained in our communication on these subjects during the past few years, we were appointed by the City Commission of the City of Amarillo, Texas, on February 8, 1991 to co-chair Panhandle 2000, a group of Amarillo-area citizens interested in the environmentally sound retention and expansion of Pantex. We were also requested to organize community support for Pantex. Ours is a broadly representative organization of individuals and entities who reflect the strong support of the vast majority of area residents for DOE's work in the Texas Panhandle at Pantex.

1/08.15 The issues addressed in the three Drafts are of paramount concern to the people sharing the Texas Panhandle with the Pantex Plant and the DOE. The dramatic employment reductions forecasted in the Draft SSM PEIS will severely impact the Panhandle economy. While Pantex is willing to participate, if necessary, in efficient downsizing of the nuclear weapons complex, any reductions at Pantex should come only after intensive cost and technical analyses to assure that national security needs are still being met in a cost-effective manner

Ensuring confidence in the United States' nuclear stockpile and the safety and reliability of the nation's nuclear deterrent are vital issues that have been addressed by activities at the Pantex Plant for over forty years. As neighbors to the plant, we are very aware, and proud, of the critical role that Pantex plays in fulfilling our nation's goals for defense and energy needs. We look forward to maintaining a vital role in meeting our present and future national security needs.

2/40.23 The Administration's proposals to disseminate current Pantex functions to other sites seems certain to adversely affect the nation's ability to produce nuclear weapons in the future, and to dangerously weaken national security. This is reflected in the SSM PEIS's workload assumptions of 1,000 warheads in the future stockpile, a number far lower than even the 3,500 set in still-unratified START 2 treaty. We urge you to recognize the importance of DOE's production complex, and avoid surrendering the victory we gained in the Cold War through the planned obsolescence of our production capability, which can only be rebuilt at great cost in later years.

As DOE presses toward its Record of Decision regarding SSM and S&D functions, we find it necessary to begin with a summary of the existing facilities Pantex possesses which would require minimal upgrading to meet many of the needs presented in the Drafts. The following table presents the list of existing facilities that are available for particular stockpile management and plutonium storage missions:

Capability	Facilities
1. Weapons assembly/disassembly	Existing facilities in Pantex Zone 12
2. Nonnuclear components	Existing facilities with modifications
3. Nuclear components:	
a. Pit storage	Existing facilities with modifications
b. Pit reuse (minor)	Existing facilities in Pantex Zone 12
c. Replacement pit fabrication and reuse (major)	Existing facilities with modifications
d. Secondaries and cases	Existing facilities in Pantex Zone 12 with modifications
4. High explosives components	Existing facilities in Pantex Zones 11 and 12

Keeping this in mind, please consider the following comments on plans for the Complex as DOE prepares its final drafts on upgrading and/or downsizing facilities at the sites where Stockpile Management capabilities are located, and where Stockpile Storage and Disposition missions are contemplated.

I. SSM PEIS.

A. Assembly/Disassembly Functions at Pantex, and Strategic Reserve Storage.

3/30.01 We are pleased DOE selected Pantex as the preferred alternative for assembly/disassembly (A/D) functions, abandoning earlier, cost-prohibitive plans to

3/30.01 continued transfer these functions from Pantex to the Nevada Test Site (NTS). Pantex's demonstrated experience and strong safety record, as well as the monumental costs associated with recreating A/D facilities elsewhere, make Pantex the ideal site in maintaining these functions.

4/42.09 Further, DOE mentions that strategic storage should be co-located with disassembly, but does not emphasize the protection of those reserves to meet future national security needs.. Pantex should be the preferred site for such a mission in coordination with its stewardship functions. Parenthetically, Pantex should be selected for all S&D storage functions. It makes no sense from any perspective, budget or otherwise, to site strategic storage at one site and surplus at another.

3/30.01 continued Just as maintaining core scientific competencies in the three national laboratories will help ensure the safety and reliability of a smaller stockpile, *maintaining the core production competencies of Pantex* (the sole authorized site for weapons assembly) will ensure our ability to meet future national security needs for stockpile assembly and disassembly. Pursuing complete unilateral disarmament would run contrary to stated national security objectives. Absent total disarmament, we must maintain an assembly infrastructure capable retrofitting aged weapons and assembling new weapons as needed in the future. While DOE plans no new construction at the existing plant, Pantex should be considered for upgrading and/or new construction to prepare for these nuclear weapons production needs.

5/40.13 Finally, in its deliberations, *DOE should insist that budgetary comparisons between Pantex and other sites are accurate, and include capital, transportation, training, remediation, security, and other costs.*

B. High Explosives Fabrication at Pantex.

While we are pleased with Pantex maintaining A/D functions, we are very concerned that DOE did not name Pantex as the preferred site for continuing high explosives fabrication. In conjunction with the A/D functions, it is necessary to maintain HE fabrication at the corresponding site; thus, these functions should remain at Pantex.

6/34.01 The Draft SSM PEIS implies that Pantex would keep HE functions should it retain A/D functions. Since DOE intends to keep A/D at Pantex, Pantex should also retain HE fabrication. In any event, because of ongoing disassembly work at Pantex, DOE admits the plant "would have to retain disposition and disposal capability for the HE inventories currently on site and those expected from near-term weapon dismantlement regardless." In addition, should future needs arise for weapons production, it will be critical to have the HE facilities at the weapons production/assembly site.

If establishing core competencies at the labs are so important for high explosives, why is it not so for uranium functions? DOE has made it clear that in the instance of HEU, maintaining core competencies at the production site is a priority. Why not so for HE?

6/34.01 continued

We adamantly disagree with the statement in the draft PEIS that there is no significant cost benefit to siting HE at Pantex as opposed to the national labs. Earl Whiteman of DOE's Albuquerque Field Office admitted in the April 23 PEIS hearing that it would be more expensive to relocate HE to LANL and LLNL, but he attempted to justify this saying it was "only for a one-time cost." This analysis raises serious questions as to the criteria used to determine the cost considerations for this and other transfers. The capital outlay alone necessary for transfer is admittedly cost-prohibitive; and while transferring HE functions may be less expensive than transferring other functions, the least expensive alternative is to maintain those functions at Pantex. DOE appears to be overlooking or ignoring other glaring considerations like the upgraded facilities and trained personnel at Pantex versus those present (or, more accurately, absent) at the labs. The assertion in the Draft SSM PEIS that it might be cheaper to transfer HE to the labs than it would be to downsize at Pantex is fantastic and defies logic since transfer would still ultimately require some duplication of facilities. In order to reach such a conclusion, one must assume that capital, training, and other costs are not taken into account. Incredibly, the Draft SSM PEIS assumes that the labs, which have failed in every instance to successfully implement *any* production on the magnitude necessary to meet national security needs, could for the first time accomplish this with high explosives. At the public hearings, Mr. Whiteman admitted that Pantex has both capabilities necessary for high explosives work (the quality assurance component), while he labs only have one (the ability to "press" explosives, but at a level which does not match Pantex). Finally, DOE

7/09.09

must account for the costs and safety risks associated with transportation of high explosives components between the labs and Pantex. There is no justifiable reason for initiating the unnecessary costs and increased risks associated with transferring HE functions to the labs.

C. New construction/stewardship activities at Pantex.

Until recently, DOE concentrated research and development functions at the labs and production functions at the industrial sites. It appears DOE is headed in a new direction. While the drafts propose to continue concentrating all stewardship functions

8/40.52

and to transfer particular industrial functions to the labs, the DOE overlooks the potential for Pantex to perform new stewardship functions complimentary to its current management functions. The scientific, technical, and managerial competence presently at Pantex, combined with additional technical resources from Mason & Hanger, Battelle, and the Higher Education Consortium, offer the human and material resources necessary for the future needs of the SSM Program.

Pantex has the necessary resources, with the required safeguards and security, to meet the goal to downsize and/or consolidate facilities while providing an effective and efficient production capability for a smaller stockpile. Facilities are currently in place to perform almost all the necessary mission elements of the stockpile management program, a fact that should not be overlooked as the DOE seeks to preserve the integrity of the nuclear stockpile under increasing budgetary constraints.

8/40.52 continued

The obvious advantage of Pantex is, by utilizing the facilities already in place, DOE could eliminate the capital cost for establishing the same capabilities elsewhere. The cost of unnecessarily duplicating facilities (*currently in place at Pantex*) at another site would cost the DOE tens of millions of dollars in infrastructure alone, notwithstanding the additional expense of related transportation, environmental remediation, start-up and training costs required at a redundant site which would cost taxpayers additional millions of dollars.

Another fact that should not be overlooked is that Pantex is the candidate site located nearest to the LANL, the preferred site for the Atlas facility, and the planned site for plutonium pit fabrication. This facility is key to DOE's ability to address stockpile reliability and safety issues by means other than nuclear testing due to the indefinite extension of the nuclear testing moratorium in July 1993. The conclusion to be drawn is that the location of SSM Program functions at Pantex would not only take advantage of current storage and dismantlement capabilities, but would also capitalize on the geographical proximity of Pantex and LANL that would be conducive to the exchange of technological information necessary for effective management of a smaller nuclear weapons complex.

In addition to Pantex, the Texas Panhandle also boasts of the Amarillo National Resource Center for Plutonium (ANRCP) which is taking a lead role in environmental and nuclear research. The ANRCP is operated by the Higher Education Consortium, comprised of three of the nation's preeminent university systems (The Texas A&M University System, Texas Tech University System, and The University of Texas System). Consistent with the SSM Program non-proliferation objectives, the Consortium is coordinating the U.S.-Russian Summit Working Group on the Disposition and Accumulation of Fissile Materials in order to ensure that the nation's arms-control objectives are met. The involvement of the Consortium adds an academic dimension of research excellence and third party monitoring that ensures continued competency of the people who must make the scientific and technical judgments related to the safety and reliability of nuclear weapons. We want to stress that we view the role of the ANRCP as complimentary to the labs, and supplementing, not supplanting, their functions.

The Consortium and the development of the ANRCP are logical extensions of the current allocation of functions within the U.S. nuclear weapons complex. In light of continuing changes in the national security picture for the U.S , and given the importance of resolving dismantling issues and issues related to the future stewardship of the nuclear stockpile, the *siting of research and technical functions at Pantex for the SSM Program is highly appropriate*.

The significant nuclear stockpile still present in the former Soviet Union under sometimes suspect surveillance makes our continued cooperation with Russia regarding management of the nuclear stockpile critical to international security. The key role the

Amarillo National Resource Center for Plutonium is playing for DOE in SSM and fissile materials activities with Russia argue for an expanded role for Pantex.

Accordingly, it is appropriate to consider Pantex as an alternative site for future defense missions. The location of new activities at Pantex would ensure that core technical capabilities are preserved at a location that can secure them at the most efficient cost to the American taxpayers.

II. S&D PEIS.

A. Fissile Materials/Plutonium Storage and Disposition at Pantex.

In addition to DOE's hesitation to name a preferred site for HE, we are also concerned that the Draft S&D PEIS did not list a preferred site for plutonium storage and disposition. Whether the decision reached is for "No Action" or "Consolidate," plutonium will continue to be present at Pantex through assembly/disassembly operations. President Clinton last year announced that he was declassifying 38.2 metric tons of weapon-grade plutonium as excess to national security needs. Of that amount, 21.3 metric tons are located at Pantex. For this reason alone, Pantex should be the preferred site for storage, disposition, and utilization. Doing so would avoid the economic and other attendant costs of transporting plutonium to a new site as well as the massive infrastructure costs of unnecessarily recreating a Pantex-like facility at another site.

1. Storage.

4/42.09 continued

As aforementioned, Pantex is already safely storing most of the weapons-usable surplus plutonium from the dismantled stockpile. Pantex presently has more than 8,500 plutonium pits stored on site and can easily be expanded to hold more than 20,000. We fully support the proposed action in the SWEIS to expand Pantex's storage capabilities to 20,000 pits. The plant is also scheduled to be upgraded to prepare the storage bunkers for receipt of plutonium pits relocated from Rocky Flats. This will increase further the plutonium stockpile present at Pantex.

One major concern is, as it is currently drafted, the S&D PEIS does not emphasize a continuation of the Strategic Plutonium Reserve necessary to meet continued national security needs. Once again, storage of the strategic reserve is a logical mission at Pantex as an extension of its assembly/disassembly functions and long-term plutonium storage consideration. Neither the SSM PEIS nor the S&D PEIS takes the logical next step by naming Pantex as the site for storage of strategic and surplus plutonium. At the hearing, Earl Whiteman of DOE said at the hearing "it made sense" to collocate strategic storage and assembly/ disassembly to minimize transportation, and to collocate strategic storage with surplus storage, since the strategic stockpile may be declared surplus at some point. Mr Whiteman said that Pantex has a facility which is "exactly the right size" for strategic storage, and that there was sufficient space at Pantex for all functions. DOE should not

only recognize that storage should follow disassembly, but also that certain disposition options should follow storage to minimize transportation and other costs. It is important that a stockpile of strategic reserve remain a stated objective of S&D functions included in either plutonium storage or pit fabrication duties. Since Pantex also is in close proximity to LANL, the preferred site for pit fabrication, designating Pantex as the alternative site for a strategic reserve would be the most cost-effective choice.

With regard to storage, the focus should be squarely on the issue of storing the pits safely, and we fully support storage of plutonium and other fissile materials at Pantex under both the "no action" and "long-term" alternatives, given adequate assurances that such storage is safe and environmentally sound. In addition to extensive environmental safety protections already in place, Pantex has built an elaborate security system to protect stored plutonium from potential theft. Safe storage is critical for maintaining the integrity of the stockpile and our commitment to international safety. Pantex is the only site currently capable of this level of protection to prevent possible proliferation of stolen weapons-grade plutonium.

Ensuring safety and accountability of our surplus plutonium stockpile can best be accomplished through the construction of a new consolidated storage and staging facility at Pantex. Such a facility would:

4/42.09 continued

- Strengthen national and international arms control efforts by fostering continued and enhanced cooperation with Russia on transparency issues, and bilateral agreements to monitor dismantlement and maximize options for the disposition of surplus weapons-usable fissile materials;
- Ensure that storage and disposition of weapons-usable fissile materials is carried out in compliance with environment, safety, and health (ES&H) standards,
- Consolidate all nuclear materials which would provide significant cost savings for surveillance, storage, and disposition.

Siting a new consolidated storage facility at Pantex also would further the "stored weapons standard" which envisions the same high standards of security and accounting applied to storage of nuclear weapons being maintained for weapons-usable fissile materials throughout the process of dismantlement, storage and disposition. Pantex has put in place, and is accustomed to maintaining, the high security and accounting standards for nuclear weapons storage for decades as the Complex' sole site of disassembly.

Siting long-term storage at Pantex also will help us achieve the Administration's nonproliferation goals. No current treaty requires us to disassemble nuclear warheads, but only to disable the delivery vehicle; the warheads can remain intact under treaty, and the U.S. is disassembling voluntarily and unilaterally. If the U.S. is to strive for reciprocity, and encourage Russia and other countries to "go the extra mile" and disassemble nuclear arms as opposed to merely "dismantling" them, Pantex, being the sole U.S. site for disassembly, would be the consummate site for storage of fissile materials.

4/42.09 continued

We disagree with DOE's findings that under either the "No Action Alternative," or the "Long-Term Storage and Disposition Alternatives," that Pantex has the greatest potential to experience adverse cumulative impacts. This conclusion is almost wholly based on what DOE terms as the "small, compact area" in which Pantex is sited. This conclusion fails to take into consideration the fact that DOE already owns the 10,000 acres on which Pantex is located, and that more land is available for any new or upgraded facilities, at no cost to the federal government. Further, Pantex is located 14 miles from a central city; the finding that cultural, socioeconomic (such as level of road service in the event of construction), and public and occupational health and safety impacts would be greater at Pantex is incorrect. For example, to imply that intersite transportation impacts would be greater at Pantex is absurd, since (1) Pantex currently houses the vast majority of plutonium pits, thus avoiding the lion's share of any transport (and the appurtenant budgetary, environmental, and political costs related thereto) if it was selected as the preferred alternative for S&D; and (2) is the site closest to LANL, the proposed site for pit fabrication. Even if one were to accept such a finding regarding Pantex, the differences between candidate sites would be so small to demand that they not be seriously considered as an accurate or meaningful criterion on which to base selection.

If DOE chose not to construct a new consolidated storage facility, we would support the upgrade of Pantex storage capability necessary to comply with current design and environment, safety, and health requirements.

2. Disposition Alternatives.

DOE has not yet decided on the preferred alternative for disposition or the sight for disposition, but whatever decision is reached, Pantex should be the preferred site since it is already the current storage site for plutonium removed from dismantled weapons and the site of strategic plutonium reserve.

While the *implementation* of any disposition option must be environmentally sound, the *ultimate decision* of which options will be chosen will be *based largely on national security considerations*, especially the success or failure to reach accord with Russia on these issues.

While the U.S. should take any unilateral actions it deems appropriate if its national security interests are maintained, the volatility of the former Soviet republics and the changing world scene dictate that *reciprocity* guide our actions. The Draft S&D PEIS identifies three major alternatives as reasonable for plutonium disposition: immobilization in glass or ceramic form; burning in reactors as MOX fuel; or deep burial in boreholes either directly or in immobilized form.

How do these options fit into reciprocity? The White House Fact Sheet on Nonproliferation contains the policy statement that the U.S. should "seek to eliminate...the accumulation of stockpiles of ...uranium and plutonium," including those from civil nuclear

4/42.09 continued

programs. It is unrealistic to believe that any disposition decision by the U.S. which does not contemplate the use of plutonium as fuel will cause other countries - either with or without nuclear weapons - to abandon the use of plutonium in reactors. For example, Russia, with its large investment in its nuclear infrastructure, and its lack of financial means to convert to other forms of energy, is highly unlikely to forego the use of nuclear power, including the use of plutonium. Also, European nations like France, which lack the vast natural resources of oil, gas, and coal which the U.S. enjoys, have little incentive to give up their reliance on nuclear power. If that is the case, and in full recognition that reactor-grade plutonium can easily be used in weapons, the U.S. will be compelled for "reciprocity" and national security reasons to maintain plutonium in pits for some period of time and plan to utilize it through the mixed oxide fuel option. The U.S. cannot lead by positing unacceptable or unfeasible options; it must recognize the circumstances which it and other nations face, and pursue a course which will benefit its national security goals, and possibly other goals as well.

We are not convinced that plutonium is more of a liability than an asset. Why can't we make swords into plowshares, and utilize these resources - which took so much time, effort, and money to develop - and examine the peaceful uses of these materials? Examination of possible beneficial uses is one of the primary purposes of the research being conducted at DOE research facilities across the country. We strongly support, as part of this research, the review of long-term options for plutonium disposition, including environmental considerations. This review can involve research and policy study on the best forms of plutonium for storage, disposition, and utilization, storage options, security and safeguards and other issues.

Further, we believe that this option, with its emphasis on education and research, will help reverse the "brain drain" which could adversely affect the Nuclear Weapons Complex as its primary function changes. The Defense Nuclear Facility Safety Board has said that the government is losing most of its veteran experts. While DOE has attempted to address this problem through instituting a program to attract new young scientists to the Complex, we believe that more young scientists will have the incentive to develop and maintain expertise in these disciplines if the types of serious research which the "beneficial use" option offers is available through DOE.

The questionable efficacy of the "irreversibility" of vitrification or boreholes argues for use in reactors, at least for pits and other "MOX-able" plutonium. While we recognize that some plutonium "scrap" can only be disposed through avenues other than MOX, the extraordinary advances in science, especially in this important area, render naive the notion that sometime in the near future the technology to "reverse" vitrification, boreholes, or any other such "waste generating" process will be readily available to those who desire it.

Accordingly, we support a course which will provide a tangible demonstration to the affected citizens that there exist long-term disposition options which both fit our national security interests as well as a common sense desire to reap a beneficial use from these materials. The Administration should consider a joint program between Russia and

4/42.09 continued

the U.S. (and perhaps other countries) which actually would take a plutonium pit apart, make plutonium oxide, fabricate mixed oxide fuel, and burn the fuel in a commercial light water reactor

Such a policy would meet the "spent fuel standard" by making the plutonium as inaccessible for weapons use as the plutonium in spent nuclear fuel from commercial power reactors. It also recognizes the fact that the only course to safe disposition is to separate the atom through fission. It also looks beyond the spent fuel standard by maximizing the options available to DOE and the Administration with regard to disposition.

3. Environmental Safety and Health Criteria.

a. Airplane Crash Risk Analysis:
The 1994 "Finding of No Significant Impact" arising from the Environmental Assessment found an airplane crash/accident occurring at Pantex to be an "incredible event" not justifying the preclusion of additional storage at Pantex. Even so, the plant subsequently worked with the Department of Defense and the FAA to reduce flights paths over Pantex, and took other steps to ameliorate the situation. However, the Draft SWEIS does not account for the reduced flights thereby exaggerating the probability for airplane accidents at Pantex and their resulting impacts, and, incredibly, *increases* the probability of a crash from the 1994 "FONSI." In the recent hearings, Nan Founds responded to this concern by saying that DOE is formulating its own analysis not dependent on FAA data, but also stated there were serious problems with DOE's analysis, which would be addressed. In its initial analysis, DOE is ignoring not only credible work already completed, but also the obvious reduction in accident potential for use in determining the ES&H of siting new functions at Pantex. This undermines the perceptions for fair and equal criteria for use in accurately comparing the various sites under consideration. We urge DOE to correct the analysis and avoid the wrongful preclusion of Pantex for consideration of additional functions.

b. Environmental Impacts of Potential Increased S&D Functions:
In the Draft S&D PEIS, DOE characterizes Pantex as having the "greatest potential" to experience adverse cumulative impacts from an increased role in plutonium storage and disposition. However, this characterization is way beyond the means of DOE's cursory analysis. NEPA regulations require that environmental impact statements discuss "significant" impacts and support these with evidence. DOE has taken license to ignore these regulations by discussing potentiality and susceptibility without basing these in fact. We object to this type of characterization which unfairly and inaccurately misrepresents Pantex's ability to handle an increased role in S&D. These conclusions also totally contradict those contained in the SWEIS which characterize the impacts as "minimal" and "negligible." It is imperative that DOE correct the inaccurate mischaracterizations before making its final decisions for plutonium storage and disposition missions.

4/42.09 continued

4. Cost savings due to avoidance of transport of special nuclear materials.

Regardless of the final decision for storage and disposition, DOE must make accurate budgetary comparisons a primary consideration in its analysis of where to site these functions. *DOE should insist that budgetary comparisons between Pantex and other sites are accurate, and include capital and transportation costs, and also take into consideration the political consequences of transfers from Pantex.* We also urge DOE to compare on a "side-by-side" basis all six candidate sites for: (1) Conduct of operations; (2) Implementation thereof; (3) Security; (4) Relationship between management, unions, community; (5) Quality system programs; (6) OSHA/ ES&H envelope; (7) Engineering systems; (8) Radiation safety; (9) Applied technology; (10) Training programs; (11) Explosive and nuclear safety programs; and (12) Employee involvement in daily operations.

Accurate comparisons between all sites under consideration should once again make Pantex the preferred site. Maintaining and expanding the interim storage facilities at Pantex would all but eliminate the significant transport costs, and the attendant environmental and political risks involved with moving these functions to another site. Eliminating the unnecessary transportation of radioactive materials, will translate into less cost and greater public safety and protection. Ignoring or miscalculating the risks and costs associated with weapons materials would be a serious omission.

We are confident that any fair comparison of economic and political costs will favor Pantex over the other sites included in consideration, since recreating this infrastructure at another site would be cost-prohibitive.

5. Economic factors.

Pantex is perhaps the most cost-effective alternative for any new construction of SSM and S&D facilities if DOE pursues that course. First, labor costs are low. The existing work force in the Amarillo area has the skills necessary to meet the construction and operation requirements for any new functions and to do so at highly competitive wage rates. With a civilian labor force of 110,200, the Amarillo Metro Area can provide the project with a large, well-educated, and comparatively inexpensive labor pool. Average wage costs for manufacturing employment in Amarillo are 18% below the national average. Second, utility costs are highly competitive. According to the Utility Data Institute, the SPS industrial rate currently ranks in the lowest 11 percent among U.S. investor-owned utilities. SPS has a long history of low rates and presently offers the lowest rates among investor-owned utilities in Texas. If new facilities were operational now, SPS's standard rate for this class of firm service at 80 percent load factor would average 3.2 cents per kWh. Also, land to house new construction is readily available. The Department of Energy presently owns the 10,000 acres on which the Pantex plant is located. More land is available for any new facility, at no cost to the federal government.

4/42.09 continued

Finally, the City of Amarillo has excess water capacity to an extent enjoyed by no other candidate site, without depleting the Ogallala Aquifer.

6. Public and political support.

In addition to the economic factors listed above, local support for the Pantex Plant, and its expansion, is extraordinarily strong. A Shipley and Associates poll of the four county area surrounding the plant (Armstrong, Carson, Potter, and Randall) found that 99% of the respondents believe that Pantex is important to the local economy, 88% said that Pantex is a facility that they can be proud of, 79% favored Pantex expansion, and 88% agreed that Pantex is safe. In May 1991, a Lance Tarrance poll showed that 85% of area residents supported an expanded Pantex. Also, a July 1991, poll conducted by the Amarillo Globe-News showed that almost 75% of the respondents favored expansion of Pantex. Consideration of the results of the 1991 Tarrance poll (Republican) and the Shipley poll (Democratic) reveals that regardless of party affiliation of the pollster or time the poll is conducted, Pantex enjoys the overwhelming support of Panhandle residents, at a level perhaps unsurpassed by any other Complex site.

8/40.52 continued

Area and state elected public officials are virtually unanimous in support of current and expanded plant operations. Essentially the entire 32-member Texas Congressional Delegation has pledged support for expansion and will be active in the effort in the future, as well as the Governor, Lieutenant Governor, area legislators, and other public officials. Thus, the message is clear from the nation's elected representatives that the role that Pantex plays in the future of the weapons complex is vital to the nation's nuclear deterrent and the safety and reliability of nuclear weapons.

III. Conclusion.

On all accounts, Pantex clearly is the best and most cost-effective alternative to DOE for stewardship and management, storage and disposition, and other defense-related missions. We respectfully urge DOE to designate Pantex as the preferred alternative site for all existing and new functions in DOE's Final PEISs and Records of Decision. Thank you for the opportunity to share our thoughts and concerns with you.

Yours truly,

Jerry Johnson

Peace Action TEXAS

Jay Rose
Office of Reconfiguration, U.S. Dept. of Energy
1000 Independence Ave., S.W.
Washington, D.C. 20585

April 24, 1996

Dear Mr. Rose,

Please find here comments on the PEIS's that have recently been issued related to the reconfiguration of the Nuclear Weapons Complex. It is with great seriousness and concern that I am writing.

The comments are limited and incomplete due to the complexity of the subject, the voluminous nature of your "dictionary-size" reports, and the shortness of the time to comment.

I represent, in principle, the positions taken by the statewide group of which I am chair, Peace Action Texas, and of the national organization, with which we are affiliated with the same name. Together we are the largest grass roots peace organization in the country, we are an NGO to the United Nations and cooperate and support similar peace organizations in others countries.

As a peace activist who has been for years an advocate of nuclear disarmament, a Comprehensive Test Ban and a world treaty for Non Proliferation, I am celebrating the fact that we are finally on the path. Indeed, we are now living through a time of historic opportunity. Our actions, our policies will effect generations throughout the world for thousands of years to come. I hope and pray that we have the will and the moral courage to grasp this opportunity.

The United States can and must lead the world on a path to peace—peace with one another and peace with our fragile planet. Our decisions and actions related to our Nuclear Weapons Complex will be a major part of that journey for mankind.

Sincerely,

Jan Sanders
Chair, Peace Action Texas

Peace Action Texas is a grassroots based organization whose mission & purpose is to educate the public in order to recruit members and organize them into a nonviolent citizens' movement with the sustained political power to reverse the world arms race, abolish nuclear weapons, teach and practice non-violent resolution of conflict and construct a world of peace & justice.

Jan Sanders, Chair 7326 Malabar Lane Dallas, TX 75230 (214)369-9388

Comments
by Jan Sanders
re the Draft Programmatic Environmental Impact Statement for the Stockpile Stewardship and
Management of Nuclear Weapons and
the Storage and Disposition of Nuclear Materials

Process for public comment: I called the DOE one week prior to the Amarillo meetings to get the schedule and format so that I could meet the deadline for air fares to travel from Dallas. The schedule, as told to me, changed in that week. Indeed local members said that had been a problem throughout the lead time for this meeting.

I am concerned about all three of the PEIS's, but I needed to be four places at once Monday evening, which was impossible. Because I was told that everything would be over by noon on Tuesday I was not able avail myself of the additional sessions on Tuesday afternoon.

1/41.01 I would encourage the Dept. in planning future meetings, hearings or workshops to automatically notify those who have participated in the past and to notify national offices of groups that would be interested in providing public input on the topics at stake.

The message? Public input, questions, and comments are not really being sought in this round of reviews.

Questions and Requests:

2/40.05 1) I would like to have sent to me the documents, memorandum or legislation from the President and the Congress that directs the DOE "to maintain the safety and reliability of the enduring nuclear weapons stockpile." p S-1 What is the number of warheads that the Dept. is being asked to maintain in the ready arsenal? How was this number determined? Was there public debate on this?

I was surprised to be told in Amarillo that the number (NWSP) was classified as a matter of national security. Is the number so small that the touted "nuclear deterrence" would be questioned? In light of the collapse of the Soviet Union, the signing of the NPT treaty extension and the discussions of a CTB, and the fact that we do indeed live in free and open society--I plan to request a Freedom of Information request for this information. It is impossible to respond to the issues of safety and environmental impact when the numbers range in the thousands.

2/40.05 continued "Stockpile stewardship and management capabilities are independent of foreseeable future stockpile sizes." S-3 It is hypocritical to say that we will lead the world toward nuclear disarmament, our NPT position, but we want to keep on the ready the capability of putting a bomb together tomorrow.

3/40.14 2) In light of the negotiations for a CTB and the Testing Moratorium that has been in effect under both a Republican and Democratic President, why is the Nevada Test Site being maintained and funded?

4/40.22 3) Why must an alternative to underground nuclear testing be developed to verify the "safety and reliability of weapons"? S-1 Our arsenal has been tested, repaired, & maintained for years. We have accumulated a huge stockpile and an incredible amount of knowledge. Didn't we learn how to do it? How can the additional expense be defended?

4) In light of the knowledge (an lack of it) that we have acquired in the 50 years of the atomic era, why would we even consider the continuation or the new construction that would result in the

5/40.07 creation of more low and high level waste? We are struggling with the waste we already have! To construct new facilities that would provide the plutonium processing that formerly was at Rocky Flats in this era of nuclear disarmament seems to make a mockery of our treaties, it insults the intelligence of the American taxpayer and is an incredible threat to the environment.

6/04.05 5) In the alternative to consolidate the "capability", translate that the ability to build new nuclear bombs, that moves the Rocky Flats plutonium processing to Pantex, I would like to ask if any or all of the other DOE facilities are located over an aquifer?

7/08.20 6) Clarify for me the level of importance placed on the impact of jobs lost or jobs gained in any particular area in making your recommendations.

I hope to receive answers to the above questions. In light of these questions, I would like to take some clear positions on the issues.

Positions and urgings:

8/40.27 1) Develop a program that would continue the orderly disassembly of our nuclear arsenal. Use this disassembly action to lead and provide an incentive to the other nuclear powers to do the same. Concentrate our research and considerable technical expertise on the safe disposal of the lethal material.

Use the nuclear labs and our trained and dedicated workers throughout the complex in a collaborative way to assist other nuclear powers in safely disposing of the nuclear arsenals over a period of time, with open inspections and exchange of expertise.

9/41.03 2) Provide American citizens with information that will enable them to participate in the development of a sound and safe nuclear public policy. The removal of the "classified for national security" blanket will set the stage for transparency in dealing with our international global neighbors.

6/04.05 continued 3) If other DOE sites are not over aquifers of the size and importance as the Ogalalla, I would urge the storage of plutonium or the vitrified or ceramic treatments of the waste at any of these other sites. There is no good location, but we do know that if radio-active material from plutonium enters the water supply it will be there for what number of years?--25,000? or just a few hundred?

10/40.50 4) I strongly oppose the use of surplus plutonium by the nuclear energy companies here or abroad. It continues the waste stream, threatens the environment at every movement and handling of the material, and it leaves plutonium in the spent fuel that could be diverted to nuclear weapons. I know it is hot, difficult, etc., but the plutonium is still there and plutonium is a crucial component of the bomb.

11/42.13 5) Shut down the Nevada Test Site. Convert it to a solar energy testing site or is the area to hot?

12/40.15 6) Shut down one of the labs. Does the myth of the "competition" still rein? When I learned that Nagasaki bomb was from the 2nd lab it made me grieve with shame that we might have used Nagasaki as a test. Convert the remaining lab into an all out effort to do the research on waste disposal or neutralization of radio-active materials.

SSM-M-009
Comment Letter
Page 4 of 4

2/40.05 continued — 7) Stop the connection between technological research and development and war and killing. If our scientists would benefit from the development of a super computer, fine. Place it in one of our great universities or hospitals or at the Peace Institute not for new bomb making.

13/40.12 — 8) Peace Action has as one of its four program areas its support for economic conversion from a war-defense contracted economy to a peace economy. It includes job conversion and/or re training of workers loyal to and dependent as their localities have also been on the large government defense contracts. We would not turn our backs on their needs, nor would we ever support the continuation of bomb making as a jobs program. The DOE should not allow the boosterism of the Chamber of Commerce of one area (Panhandle 2000) dictate these decisions of national and international import. And finally,

14/40.06 — 9) Peace Action has taken a position in support of Abolition 2000, a worldwide movement to abolish nuclear weapons by the year 2000. Therefore, I urge that you consider the Start II treaty as just that, a start toward the very attainable goal of Abolition 2000. To allow the Start II treaty to limit in anyway our leadership in the Non Proliferation work (p S-7) would be wrong

Some further observations, questions and comments:

15/40.60 — With a stockpile numbering in the thousands, which was built over a period of years, I would make the logical assumption that it will age over a period of time as well. What if we cannibalized parts from one to another to make repairs and to maintain as many as possible, how long would it take for us to drop to zero? If, during this wear down period, we took a leadership role in the Non-Proliferation movement, we could produce a much safer and secure world, than we would have it were bristling with new weapons "capability".

16/43.12 — In recent years the military genius of this country has produced modern, non nuclear weapons that approach the destructive power of a nuclear warhead. As a peace advocate, I'm not particularly proud of that, but I would point out that the environmental risks from the raw materials, the transport, the manufacturing, the assembling and the deployment of those weapons are not as great or as long lasting as those associated with nuclear bombs. How can we put our own people and our own environment at this level of health and safety risk when we have in hand safer alternatives? Have we, in the build-up and now in the prospects of the "stewardship" of an arsenal capable of blowing up the world, deterred the bomb from being dropped on us by others, but instead have we not dropped it on our selves?

10/40.50 continued — The power, the near worship of the power of the nuclear bomb is evil. It undermines the moral character of this country that we are willing to continue to possess weapons of mass destruction of this magnitude and by the possession threaten the peoples of the world with their use.

During the height of the arms race during the Cold War the Bishops of the Catholic church challenged the bomb making and then the Bishops of the Methodist church in their "In Defense of Creation" pastoral letter challenged even the possession.

I intend to [illegible] these comments to the President, the Secretaries of Defense and [illegible] and to my elected representatives to Congress -

Thank you - Jan Sanders

SSM-M-010
Comment Letter
Page 1 of 1

U.S. Dept. of Energy

1/40.12 — I am concerned about the use of $4.5 billion of taxpayers money for the building of the National Ignition Facility. It seems that the money would be much more wisely spent for the many needs facing this Country - specifically in the areas of education, where 30% of our students are dropping out of school before graduating from high school. Efforts should be made to train and hire teachers who spend the time to educate our students in todays world

2/40.07 — At the same time, with the reduction of nuclear arms as national and worldwide policy - this procedure seems to be contrary to this policy - as it appears to enhance production of nuclear weapons.

Seems to me if we are intent in deficit reduction, then there would be a place to [illegible] use 20% in education and cut $2 billion from the national debt.

Sincerely,

Duncan [illegible]

CPE STUDENT CONFERENCE
96

CONTROL & MANAGEMENT OF NUCLEAR WEAPONS:

The Imperative for Nuclear Testing!

Lorin D. Higley
391 Stillman, Apt. B
Upland, CA 91786-7081

A nuclear test ban does not equate with arms control, management of arsenals, safety and reliability of stockpiles; nor can it result in either peace or national security.

The current comprehensive test ban poses a threat to the security of the free world as also the United States. This paper proposes a need for weapon and weapon-delivery systems testing; as also stockpile reliability, modernization and safety tests for the sake of national security policy of the West led by the United States. First, why nuclear weapons.

1/40.04

Nuclear deterrence provides common security the world over. Nuclear war-fighting capacity leads to deterrent capacity. Now the technology or the know how, the knowledge, and the materials are out there. Were utopian peace dreams realized by the destruction of all nuclear arsenals, how does one keep pariah development in check? If the West does not have the capability, any revisionist country may hold the west hostage to its demands simply by covert development. In short, once Pandora's box has been opened, allowing its evil essences to escape, there can be no trapping of those evil essences once they are loose upon the world. Nuclear weapons are force multipliers par excellence; therefore unauthorized maverick development will always loom over the horizon for just such an asset

I submit that any test ban has the consequence of keeping the United States and the West from nuclear war fighting capacity. Without such, there goes hegemony, deterrence, and force multipliers along with any hope to control nuclear development elsewhere.

The International Atomic Energy Agency (IAEA) is tasked with measures of verification to assure that nuclear materials are-not subverted to terrorist or "have not" developments. It assures compliance to treaties and for prevention of proliferation. With no nuclear weapons in the West to back up it program with force, the guts will be torn out of any IAEA capabilities.

Nuclear technology along with the physics pertaining to it so commonly pervades science, engineering, and medicine that even if the Pugwash Conference were able to eliminate all such weapons, they can readily spring to life again, much as a hardy garden weed. In short, there is no hope of containing the knowledge and means to build the nefarious things, even if none presently existed. Forfeiting United States nuclear capability via test bans will do nothing to control weapons proliferation elsewhere!

Last, any megalomaniac who opportunistically gains an atomic bomb will find the use of it irresistible in order to demonstrate just what kind of power the maniac has in hand

WHY TEST?

This paper postulates controlled underground, fully contained, environmentally safe and secure testing modules for the purpose of maintenance or status quo, without

1/40.04 continued

build up of nuclear stockpiles. Linear updating and maintenance pertains only to management of existing stockpiles without increasing arsenals.

1 Reliability Tests: To ensure that calculations and laboratory premises have reliability —will work as designed. Applied research cannot be separated from experimental validation. There are two general types.

(a) Performance Tests, to validate basic weapon physics and technological applications, both for design and system components. Systems pertains to command and control, management, support, delivery components resources and/or technological components.

(b) Effects Tests, to evaluate the impact of electromagnetic pulse radiation upon critical components of military, security, space, or missile assets. How well can components function in a nuclear environment; or can critical space assets function given exposure to nuclear detonations? How well will satellites and communications work after exposure to Gamma or hard X-ray radiation? Can scientists evaluate the impact of electromagnetic pulse radiation in both waves and particles upon critical components of military, security, space, or missile assets without testing? How do critical space assets act given exposure to nuclear weapons detonations? Can communications, command, and control plus intelligence (C^3+I) links maintain integrity given a nuclear battle field? Because computers cannot model such, newly developed national security, and military systems need to be exposed to effects of nuclear detonations. What about nuclear-boosted lasers or particle beam weapons? These are pumped with the effect of small controlled nuclear detonations in a vacuum pipe, insulated from blast, heat, or debris. The major thrust of tunnel horizontal tests work strictly from effects from a detonation.

1 Modernization: Pertains to linear development of new designs in old systems, or new systems altogether. Replacing old stock with the more efficient and reliable, derives less radioactive fallout. Modernization requires development, thus needing testing. Low yield, point-target warheads especially require validation, given current technological sophistication. The country requires test-proof data. Otherwise, larger, dirty, area warheads result given a lack of ability to test. In short, testing results in smaller and better managed weapons.

2 Proof Test Stockpile: Nuclear weapons have limited shelf life. Neutron enhancement detests plutonium. So, for how long past predicted shelf life can one expect to operate from old stockpiles? Can aged warheads be repaired, or reconfigured? How to build a confidence curve without testing? When the moratorium began, the United States commonly featured a ten-year lag in modernization. Some weapons were then approaching 40 years, even though meant for 20-25 years (Kulchuck) How soon before attrition from age renders the American capability negligible? How can a state build a confidence curve without testing? What About component oxidization in such a highly corrosive environment? Are old weapons even safe for the user?

3. Safety & Safeguards Tests: More reliable and secure safety features are improved constantly, including tamperproof mechanisms that can prevent unauthorized use. Redundant safety features cause the arming and firing trains to be more complex. Will a new design work? Will slow high explosives (HE) work rather than sensitive? A nuclear warhead crashed and burned in an aircraft will not

1/40.04 continued

detonate with slow HE. Slow HE is desirable if it can be engineered to work given a warhead configuration How does one validate without test data?

4. New technology: Why should the USA test? Other than for reasons enumerated, add the need to guard against the United States being technologically surprised by new weapon concepts. Any nation that tests can readily develop new horizons from older research in laser, particle beam, and/or plasma physics weapons.

5 Pariah Development: Testing allows design of cleaner, safer, smaller, more reliable, and predictable weapons within an arsenal, especially given new development. Any state just beginning nuclear weapons has a need to test in the best interest of the world. As one said, "Man if they got 'em, let 'em clean 'em up and size 'em down with some safety and reliability! That, or else take 'em away from 'em!" Further, testing means that it is known who has developed and at what stage.

6. Verification: Testing allows perfection in the means of mutual joint verification of all nuclear powers. A centralized nuclear test site equates with measures of control and management of weapons development for compliance world wide. To ignore the fact of nuclear weapons does not make them go away. Worse, denial in the form of "Nucs equal nuclear winter"—so out of the public domain, out of mind, by just forgetting them, will eventually accumulate latent problems. Joint or mutual verification places pressure on maverick states that would try to test, for it could be monitored and verified from a number of sites around the world

7 Without Testing: Russia falls back on previously tested heavy warheads with higher radioactive yields with simpler area-targeted warhead designs (counter value). China, India, Pakistan, Israel, along with any emerging nuclear powers have no opportunity to size down, clean up, or rise up the technological curve toward reliability and safety. The USA relies on technology-optimized warheads, but remains stuck with a ten-year lag in applications of design, effects and reliability Add to that ten years another five years since moratorium.

8. Spin offs: Aside from stockpile reliability, managed testing yields spin offs. Field tests allow scientist to investigate basic physics, with every package fully subscribed with experiments. This becomes impossible without small device nuclear pumping; i.e., lasers, particle beams, plasma physics, and electromagnetic spectrum physics as revealed in a controlled nuclear detonation. This is the physics of which the stars or astronomy are made.

Therefore, I contend that the comprehensive test ban currently being touted is born of deficient and counter productive assumptions or irrational fear. This ill-advised political move plays on an uninformed public opinion without relevance to military doctrine or military strategies, defense policy, or national security policy. A nuclear test ban does not equate with arms control, cannot be equivalent to peace or security, and neither does it enhance the safety or the reliability of existing nuclear weapon stockpiles. A test ban simply denies a nuclear power the ability to maintain and modernize its nuclear assets while building down, if in that mode as is the United States. If in a build up mode, testing becomes a more urgent imperative in the general interest of the earth's commons. What then, might this paper suggest as a resolution to the nuclear conundrum?

4 CALL FOR AN INTS

2/40.46

If nuclear weapons, exist; then equations cannot not balance without the imperative to engage in nuclear testing. I propose an International Nuclear Test Site (INTS) for the collective security and good of the world at large, in spite of deniers. Control and management may be achieved with an INTS.

This paper recommends a world-wide multinational testing program at a single given site, at which all nuclear nations may test their own nuclear devices under close supervision and control of the IAEA Each state could provide its own security, diagnostics, and evaluation for its own purposes as desired The sanctity of classified nuclear technology given national sovereignty would not be jeopardized at an INTS. Testing would be in accordance with treaty provisions of the NPT—a collective security program

Professor Kugler, The Claremont Graduate School, states that if one has nuclear weapons, one should test, especially if down the technological curve. He states that the USA does not need testing because the country has climbed so far up the curve. I submit, the United States has an equal imperative, for different reasons, for testing, even beyond stockpile reliability. By enumerating the ten reasons for nuclear testing one may derive basic suppositions concerning maintenance of nuclear assets in a safe and reliable mode. In the Appendix, information concerning international treaties to which the United States subscribes is also pertinent. I direct attention in particular to the "Proposed Comprehensive Test Ban Treaty" sponsored by the USA.

Opponents to nuclear testing confuse means with policy ends. Weapons of themselves do not make war (Gray). People make war, whether the instruments may be a club, bow/arrow, flintlock, artillery, or the superbomb. Atomic weapons are, however, different in kind rather than just be degree. A whole new sphere of strategy instrumental to policy should adhere to atomic technology, as argued by Gray Nuclear weapons are different by their sheer destructive capacity, in small increments of time, over large areas if desired and if the weapon may be so designed. Pugwash and deniers turn away from what empirically exists; that which requires management, supervision, policy, and effective storage. Without testing, the world has neither management, system, nor policy—just utopian oblivion heedless of national security interests.

In so arguing, the author flies in the face of pervasive popular aversions to force of which atomic weapons are a totem. Unfortunately, as Osgood notes, aversion nullifies the calculated management of force as an instrument of policy (100). This is why my plea sounds anachronistic. Peaceniks presume that without nuclear testing the issues goes away simple because it no longer impinges on the consciousness—for now.

THEORY: I assume universalism or common international systems structural controls, under the IAEA and NPT supervision as a public good. This proposal applies to a balance of interest on behalf of every nuclear power, given centralized IAEC monitoring at a common test site. For the United States, its policy interests and national objectives as the nuclear hegemon demands preponderance in means of nuclear force projections in reserve against the time it may be required. This further requires a nuclear weapons strategy offensively and deterrence defensively. The American objective should pertain to both a war fighting contingency along with defense and/or deterrence.

2/40.46 continued

Empirically nuclear weapons exists. More nations will acquire them. China and France currently test. Great Britain already tests on the American's Nevada Test Site, and desires further testing, particular for SLBM applications. Israel, India, Pakistan and China are under tested. Their warheads are probably large, dirty radioactively, and laced with low-technological applications that can only be cleared up with controlled tests. In fact, they may not even be safe from unauthorized use. As Gray states, "Nuclear weapons can be deterred only by nuclear weapons" (160), so why wait until things get out of hand and have to catch up? The USA needs the best inventory, because nucs are there, and nucs deter nucs. In addition, if the Americans are to keep their lead as the premier nuclear power, they need to get on with modernization and upgrading

AN INTS PROPOSED

I propose for an International Nuclear Testing Site, the existing one on the Nevada Test Site (NTS) where the reservation has been withdrawn from public domain as a result of contamination, with all necessary support services in situ. The NTS features all required services, support, maintenance, and insularity in place for such an international venture. For small yields, Yucca Flats. For yields of 100-150 kilotons, Pahute Mesa. Tunnels for horizontal effects tests as also for physics packages are in place Their tunneling moles can cut an 18 foot face. The NTS features large-hole drilling/tunneling, along with proven containment/ stemming procedures for a shot, supported by super-heavy life equipment, all of which is mobile

A SINGLE WORLD TESTING SITE HAS MANY ADVANTAGES. It standardizes international testing while lowering the cost per user (the British already use this site). More important, it allows the definition of a legitimate nuclear club. The regime could corral mavericks engaged in opaque development; that is, unannounced and covert buildup of unproved assets The IAEA's jurisdiction over an INTS allows a measure of control over users; i.e., states owning nuclear weapons. It could help pinch off a black market, for there exists a regularized channel for development of warheads with secure facilities for weapons-grade special nuclear materials. The IAEA on an INTS would share certain vital technology with users so as to insure higher standards of safety or reliability of weapons, such as PALS for example. PALS are passive action links in the arming and firing train of a nuclear weapon requiring two knowledge persons in order to activate along with access to computer codes so as to unlock classified codes. This preserves a weapons from unauthorized access or use. Further the INTS increases confidence in treaty compliance. But what about the United States specifically?

The Las Vegas Sun, 4 May 93, "The Pentagon affirms that the NTS is necessary for the United States. John Deutsch, the Undersecretary of Defense for Acquisitions and Chairman of the Nuclear Weapons Council told a House panel, 'Underground nuclear testing at the NTS is necessary to ensure the safety of the nuclear stock pile'." If this is true, it holds more urgently for other nations farther down the technology curve. "An option proposed is that five powers, USA, Russia, France, China, and GB allow tests...."(p.5). The Article stops short of proposing a common joint site option

Obvious, the nuclear hegemon needs to guard against being technologically surprised by new weapons concepts that can be uncovered by the nations that continue to test. Modernization is linear. "We have stopped mid-stride," states Kuckuck. "The LLL lab continually disassembles and examines nuclear weapons and conducts non-nuclear tests on components. But LLL requires detonation tests.

WHO IS WHO?

Who supports and who stands against nuclear testing? Those opposed to testing currently have their way, and it affects the laws of war, for opposition prevails. The Pugwash oppose, as also the UN General Assembly Let us consider the UN. In Henkin, under the use of force, any use of nuclear weapons is considered contrary to customary International law (1022). In 1961 the General Assembly passed a resolution declaring the use of nuclear weapons a violation of the United Nations charter and of international law. Henkin, allows big powers the deterrent value of such, conceding that it is not illegal or immoral to own such arsenals (ibid.). The use draws the line. Later in Henkin, Cot & Boniface, on Disarmaments and Arms Control, International Law, Achievements and Prospects Opinion, 811-12 (Bedjaoui, ed.1991) has a section stating that the goal of arms control is thus to safeguard peace, which is not automatically endangered by the existence of arsenals (1040). This legal opinion allows managing and making predictable as also controlling weapons—precisely the arguments in support of testing. The opinion makes a distinction between laws of war pertaining to outlawing a weapon and arms control referring to regulating a weapon (1040). The point here, deniers and opponents are on the side of outlawing nuclear weapons long after they are securely in the arsenals of many powers and slowly proliferating. This paper opts for Cot & Boniface's prospects of regulating and limiting a weapon and its application. It is revealing to see who else currently opposes. Obviously environmentalists, and their extremist greens and Green Peace, along with peace activists. The Roman Catholic Church remains actively hostile to testing without questioning how one can rule something illegal that will not go away. Politicians who note public averseness fall into line, along with the uninformed. There exists no public relations for or on behalf of regulations and controls over nuclear weapons or the technology. Without an advocate, the public remains ignorantly averse. Then follows Hollywood types and other weirdoes. Liberal students generally hop onto the deniers bandwagon. There a certain learned Professor, Moffitt states that nuclear weapons equal nuclear winter–end of story and out of the public domain—as if that completely finishes this issue (167-170). Do you suppose that if I ignore my mother-in-law, she too might simply disappear?

So, who supports nuclear testing, thereby opting for arms control rather than outlawing such weapons? Obviously the Departments of Defense and of Energy. The UN Security Council if forced to a vote. Laboratories and agencies such as LLL, LNL, Sandia, EG&G, Bechtel for example. The United States' Army, Navy, and Air force. Craft unions, for their livelihood is soundly bound up in the continual operation of defense and D.O.E. sites. Country wise, we know France, and China currently test. Great Britain would like to. India has only one known test. Pakistan none. In addition, Japan and Germany would, inasmuch as they will have to go nuclear if ever the United States pulls out of NATO and the Pacific, leaving each up to own resources for defense capability. Authors, if pinned down, such as Gray, the Tofflers, and Zacheim and Ranney would certainly see the logic of testing in the national security interests. Zacheim & Ranney's "constant force modernization" splits between operations & support costs and operations & maintenance. Both of these are missing in the present nuclear program of the USA. These authors note the current defense deficiencies in nuclear and delivery programs.

CONSEQUENCES OF MORATORIUM

3/40.01 The United States as the leader of the Western world in military and nuclear capability, faces attrition and diminishing assets as a consequence of the lack of testing The moratorium in 1992 saw the country with a ten-year lag time in modernization.

3/40.01 continued

Every five years the natural attrition of the stockpile diminishes our assets in a sharply downward curve. Therefore in some 20 years time the viable capability of warheads will diminish so drastically that some other nation will become the premier nuclear power. The American prevailing nuclear capability will see either parity or becomes second best with an increasing attrition curve. Any state that test will easily over take the USA. Currently that will be either France or China. The critical point of power transition will be very dangerous. Why?

The "Power Transition Theory of Organskl and Kugler (The War Ledger) on that attrition curve of diminishing assets, somewhere between 20-25 years, will find another nation prepared to challenge American hegemony. The power transition theory addresses great power, systemic wars. When this comes, the United States will have a very questionable and weak nuclear means at hand. What country will test and challenge? Try France allied with Russia! Or consider China. The consequence of the current moratorium becomes the outlawing of nuclear weapons for the United States by default. It means the demise of American hegemony. Of course with the continuing weakness of the United States, both Germany and Japan will have to go nuclear in their national security interests because the Americans have the folly to fall into a decrepit condition. Worse, our delivery systems at all ranges may be in no better shape than our warheads. Only the SLBMs remain truly viable at this time. We no longer have short or intermediate (theater) range assets. Our ICMB strategic assets lack policy, strategy, and constant force modernization. All in all, a bleak picture resonates with proponents of moratorium—aimed at the heart of American capability. Can you believe it? We participate gullibly in our own demise? For the sake of some utopian idealism Americans gut their strength for some amorphous universal goods packaged as "peace".

CONCLUSIONS

I TAKE THIS STAND BECAUSE I AM A PATRIOT. For the love the United States of America, its flag, and principles, it requires my attention to our own national security policy. Given the moratorium, the USA has no modernization of systems, delivery, or war needs. Neither have we maintenance of deterrence. Defensively we have no options. Why not opt for some defense if we allow our offense to deteriorate? Without strength through arms, a new ABM treaty seems advisable. Any sort of space anti-satellite and anti-missile system seems as important to me as was the Patriot to Israel and the Gulf War forces facing scuds. If we allow our offensive to go down the drain, then had we not best pull in some defense? It takes very little defense to give pause to an aggressor as to whether a "go-for-broke-attack" may succeed or not. Defense helps some, but creates a lot of doubt in an enemy unless he has overwhelming superiority. Vulnerability is last thing I personally want. If you personally face a double barreled .12 gage shotgun, you will opt for cover and concealment first, and offense last.

Those who mindlessly support a comprehensive nuclear testing moratorium certainly do not rationally know the disservice they do to the national security interests of the West and the United States. In a "Security Studies" journal, World Politics, David A. Baldwin warns that "American security is now threatened more by domestic problems than by external military threats (131). This applies to domestic affairs and the trade off between security and other vital national interests. But it also applies to attitudes towards and denial of nuclear testing as a means of national security policy. Certainly neither nuclear weapons nor the military, ought to be ends in themselves. Rather they serve the overall interests of policy. Without testing, nuclear deterrence or defense capacity will not be there to serve at all unless the issue can be rationally re-thought. Hence the lack of balanced strategic thinking The "no nuc testing" club believes in no use, no first use, prohibition of using or owning viable nuclear weapons, and by eliminating testing, can have the results of prohibition, for nucs cannot then be maintained. Right now, is their field day. Personally I prefer to stand foursquare, true and blue for arms control, management, regulated arsenals, predictability with increased safety and reliability. Thus I stand for nuclear testing and NPT. I am not talking about some normative peace utopia or politics. I speak for national survival by considered management!

APPENDIX I

TREATIES

The United States adheres to, and when it conducts underground nuclear tests, it does so in compliance with existing international agreements. Major agreements to which the United States subscribes follow.

The Limited Test Ban Treaty, signed in Moscow, 5 August 1963, which prohibits testing in outer space, underwater, or in the atmosphere. This ended the era of atmospheric testing.

The Threshold Test Ban Treaty of 1974, which limits underground nuclear weapon explosions to a maximum yield of 150 kilotons (one kiloton=1000 tons conventional explosives).

The Peaceful Nuclear Explosives Treaty of 1976, which places a 150 kiloton limit on nuclear detonations with peaceful applications.

NPT, or Nuclear Non-Proliferation Treaty, extended in April 1995 in conjunction with a proposed Comprehensive Test Ban Treaty.

IAEA (International Atomic Energy Agency): The IAEA "International Safeguards" refer to verification measures to assure that nuclear material is not subverted for weapons development by the "have not" nations, for compliance to treaties, or for prevention of proliferation.

Proposed Comprehensive Test Ban Treaty: According to this paper, an ill-advised political move playing on public opinion without relevance to security policy or strategic relevance.

I submit this constitutes an erroneous policy born of deficient and counter productive assumptions. A nuclear test ban does not equate with arms control, cannot be equivalent to peace or security, and neither does it enhance the safety or the reliability of existing nuclear weapon stockpiles. A test ban simply denies a nuclear power the ability to maintain and modernize its nuclear forces while building down--if a state runs on a build-down track. If in a build up mode, testing becomes a more urgent imperative in the general interests of the earth's commons.

Joint Verification Agreement: The USSR and the USA, worked out effective verifiable arms control agreements. This issue centers on "verifiable" along with common safety, reliability, and controllability over international nuclear testing. In the early 1990's, the USA and the USSR were present at one another's underground nuclear tests, each verifying and validating an independent system that allows both dependable and reliable means to detect, evaluate, measure, and locate any underground nuclear tests in the world. Verification measures magnitude as also a typology of weapon designs. Verification pertains to compliance of treaty provisions for those who join this exclusive club of nuclear power holders.

Incidently, the two superpowers were able to finally see how the other side did it. That is, drill, design LOS pipe, rack a device and subscribed experiments, implant, contain, and shoot a device. This, along with the vast support services the enterprise requires, found both doing the same thing, but in different ways.

East Lansing, Michigan: Michigan State University Press. His Ch 8, "The military Dimension of Strategic Power" completely ignores the nuclear arsenal and delivery systems of the United States, an attitude labeled herein as "denial."

Organski, A. F. K. & Jacek Kugler, 1980. The War Ledger. Chicago: University of Chicago Press.

Pugwash Conferences on Science and World Affair: Refers to information taken from network media broadcasts concerning the 50th anniversary of the founding of Pugwash. The British physicist, Joseph Rotblat, heads an anti-nuclear weapons group he helped found in 1957. Rotblat was originally part of the Manhattan Project, developing the first atomic bomb during WWII. He resigned when it became clear Germany was not developing nuclear weapons. Pugwash recommends doing away with nuclear weapons per se. If so, then testing becomes a moot point. Such utopian hopes subvert rational or strategic thinking, as if Pandora can close her box after allowing its essences to spill out. However, Rotblat has reportedly asserted the need for nuclear testing so long as weapons do exist. I note that if the nuclear moratorium extends beyond 25 years, those countries that do test (France or China) will become the nuclear hegemons of the 21st century. Why? Simply because America forfeits its assets through a lack of proper management; e.g., nuclear testing.

Osgood, Robert E., 1967. "The Expansion of Force," in Robert S. Art & Kenneth N. Waltz, eds, The Use of Force: International and Foreign Policy, 2nd ed., New York University Press of America.

Watkins, Admiral. 3 June 92. A letter to House Speak Thomas S. Foley, published in the NTS News & Views, Vol 3, No. 7, of July 1992, for federal and contractor employees of the DOE, pp2&8. Admiral Watkins, at the time, fully sustains the reasons for testing as enumerated within this study. His letter was sent over the issue of nuclear moratorium.

Comments:

1/40.06 If the US is serious about stemming the spread of nuclear weapons, it must take leadership in ending the international nuclear double standards & make disarmament, dismantlement & international expectations for a Comprehensive Test Ban Treaty a reality.

Nonproliferation requires unconditional, irreversible disarmament. The SS&M Program is antithetical to this approach.

2/40.12 Many organizations in another communication since are citing the likely effect the economic, environmental & national security costs of the SS&M Program described in the draft PEIS.

I do not believe in the name of the nation & all life that we cannot continue nuclear weapons research, testing & production. Life systems need the funds!

Please continue on the other side if you wish to use additional space. THANK YOU—your comments are important to us.

April 8, 1996

Office of Reconfiguration
US Department of Energy
PO box 3417
Alexandria, VA 22302

Dear Sirs:

I request that the following two questions with comments be included in the Stockpile Stewardship and Management PEIS review and to have specific answers to them.

Question 1

How does the current plan ensure the timely up-sizing of the nuclear weapons system should it become necessary?

1/40.40 One of the stated objectives has been to retain the ability to up-size the nuclear weapons in the event that the international situation worsens making the down-sized level too small. It is stated that this objective is to be reached by increasing production from a one-shift basis to a full-time basis using the same production equipment. This proposed action seems to ignore the fact that the additional training needed by capable machinists to properly and safely engage in the highly demanding efforts of weapons production is about five years. This seems to be an unreasonable delay in response to an urgent threat.

Given the above it would seem that the only way to accomplish a rapid scale-up of nuclear weapons production is to establish a sufficient level of comparable machine work at the production site to employ a staff adequate to go to full-scale production. The technical staff including machinists could then be rotated between the weapons work and the equivalent work to maintain their skills at the proper level.

In the past the Y-12 machine shop capabilities were always in demand for prototype work although this activity was never seriously pursued as a strategic course of action. If this tactic were deliberately pursued it should be possible to employ a staff adequate to ensure a rapid scale-up should it become necessary.

Question 2

2/40.53 How does the current plan minimize the impacts on weapons performance due to inadvertent or unavoidable changes in production methods?

Given that the new nuclear weapons program will not permit weapons testing the problem becomes how to maintain a weapons stockpile without testing. In addition, one of the givens is that there is to be no new weapons design. It is stated that surrogate testing will be used to keep the weapons data base current but I believe that this statement is a bit misleading in the following manner. The weapons data base comprises two parts: 1) the weapons test data and 2) the supporting physical properties and design data. The weapons test data will not change and while surrogate testing may be successful in improving the physical properties data and the computational models there will always be the question: As the production methodology slowly changes do these improvements in data and computations truly reflect the performance of the untested weapons in the stockpile? One method to ensure a positive answer is to devote a new effort to document the details of the current production methods and to establish procedures which will minimize the changes in weapons performance resulting from inadvertent or unavoidable incremental changes in the weapons stockpile.

I do not see in the planning where such an effort exists. On the contrary, the plans seem to stress the down-sizing of the production facility and a considerable upgrade in the surrogate testing methods. In fact, if there were a method of ensuring a completely stable weapons stockpile then no surrogate testing

2/40.53 continued would be needed. On the other hand, if the weapons, for any reason, start to undergo significant changes then surrogate testing, while useful, does not ensure unpredicted changes in performance will not take place. I believe that a better balance between surrogate testing and weapons stabilization would be desirable.

It may be that any definitive actions in these matters lie beyond the time frame of the plans but I would point out that if they are now ignored the current skills and knowledge required will be lost.

Thank you for your attention to this matter.

Sincerely,

Alfred A. Brooks

Testimony Given At The April 1,1996 Hearing On The Draft PEIS For The SSMP ,In Oak Ridge, TN

I am Frank Bruce, a retired Associate Director of the Oak Ridge National Laboratory. I reside at 116 Euclid Circle, Oak Ridge, Tennessee 37830.

The purpose of the Draft PEIS should be to present to the public a plan that assures, beyond any doubt, the safety and reliability of the nuclear stockpile. Since the size of the stockpile is being reduced, the public also

1/40.05 has a right to expect a"peace bonus". In this Draft PEIS there is little assurance of the continuing safety and reliability of the stockpile. Neither is there any saving offered by the so-called science based stockpile surveillance plan.

2/40.13 I request answers to two questions. First, what is the annual cost [capital and operating,but without underground testing] for the next decade, for the SSMP.How does that cost compare with that of a conventional surveillance program [rigid inspection and recertification but no underground testing], such as been used successfully for the last 50 years.

3/40.06 Secondly, in the May 1995 SSMP the DOE itself said: "Science based stewardship and management of the stockpile has never been done before. Meeting this challenge will be neither inexpensive nor without risk." Please explain how we, the public, should feel comfortable with a plan that is very, very costly and gives us less,not more, nuclear deterrent?

Comments
Stockpile Stewardship and Management
Draft Programmatic Environmental Impact Statement
John K. S. Walter, Jr
April 17, 1996

Although I am presently a private citizen, nearly all of my engineering career was in various organizations involved in national security. Just over a year ago, I retired from Sandia National Laboratories. From 1960 through 1994, I worked for an AEC Weapons Production Agency, the Los Alamos Scientific Laboratory, and Sandia National Laboratories in widely varying engineering assignments and at various levels. The laboratories particularly had (and have) many brilliant, dedicated, and patriotic scientists and engineers, and I have been a strong advocate for the weapons programs, the labs, and DOE plants. In the early 1990s, I was assigned for a year to DOE Headquarters in Washington, D.C., to assist in planning the reconfiguration of the DOE Weapons Complex, under a program that has been redirected.

My comments are based on my personal experiences, my personal contacts with many others in the same general business, and a few notes that I have kept during my career. My comments follow the following general outline:

1) Positive reaction to public hearing and summary document.
2) Expression of negative opinion concerning the overall policy direction.
3) Discussion of planned major facility installations at laboratories.
4) Comments on nuclear testing.
5) Sampling of unmet needs in national security.
6) Summary of recommendations.

1/41.05 It is appropriate to comment positively on the outstanding briefing at the public hearing on March 28, 1996, in Albuquerque, New Mexico, and the documentation available to the interested public. The *Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management-Summary* is well written and understandable. The briefing by Steve Guidice was well prepared, and his responses to many varied questions and comments (some hostile) were professional, polite, and respectful.

2/40.54 However, I believe that the overall policy direction is fatally flawed and leading completely in the wrong direction. In fact, the overall policy direction leads the environmental study to worry about such minutiae as "...Statistically, this equates to one fatal cancer every 5 million years at Pantex from operation of the A/D Facility." Since we are concerned with the nuclear safety and security of the world involving real weapons of mass destruction, literally tons of plutonium, and an environmental mess, the overall policy directions for the program are extremely important.

The summary document mentions several major facility installations either previously authorized or in the advanced planning stages. It is at least implied that these facilities are

3/41.18 justified for "science based stockpile stewardship". The DARHT facility, for example, is an advanced, very capable flash X-ray machine that will allow dynamic evaluation of the high explosive implosion process of a simulated nuclear explosive primary. It is, of course, not possible to take a real primary and test it in the DAHRT facility, so it would appear to be a design tool. It is undoubtedly already established by nuclear testing at NTS that the primaries in the enduring stockpile, as built to specifications, will operate as desired. To the citizenry and to potential adversaries, the DARHT facility appears to be a design and development tool, hardly to be justified by stockpile stewardship. So is it also for the National Ignition Test Facility to be installed somewhere-perhaps at Livermore.

4/21.15 The NIF will use high power lasers to generate conditions for thermonuclear reactions, that is, similar to the reactions that take place in the secondary of a nuclear explosive. However, it is already known and certified through nuclear tests that the secondaries will operate as designed, if driven by the test certified primary. It is certainly not obvious why the NIF is required for stockpile stewardship. If the facility is required for the design of new weapons, then it would appear the US is still involved in the design and development of new weapons-which seems to counter stated policy. If the facility is required for basic fusion research, then it has no business in the weapons program.

With respect to nuclear testing, several years ago Robert N. Thorn gave testimony to the House Committee in Armed Services. At the time, Thorn was a Deputy Director at the Los Alamos National Laboratory. Previously, he had been the head of a group that was responsible for the thermonuclear design of Los Alamos nuclear explosives for weapons applications. Although Robert Thorn is no longer living, his concern over the importance of nuclear testing to provide confidence in the nuclear deterrent are pertinent to today's issues. During Thorn's career, he exerted a major influence on what has become the enduring stockpile. In his testimony he described in unclassified terms incidents where temporary test moratoriums resulted in weapon certification without the benefit of nuclear tests and basically resulted in temporary situations where portions of the stockpile were inoperable. In the event that new weapons are required through unanticipated international developments, it is unrealistic and perhaps foolhardy to assume that we as a country would commit military forces with untested weapons, particularly when we have a stockpile that is certified through nuclear tests.

5/40.01 Still on the subject of nuclear testing, in my direct experience at Los Alamos, I participated in the mechanical design of three different test devices for nuclear tests. Although the nuclear designs were exhaustively analyzed, not one of the devices worked as intended. Although the current design tools are more capable than those available in the late 1960s, it is unduly arrogant to believe that future designs can be attained without nuclear testing. In a crunch, we would depend on existing tested designs, make a mad scramble to drill holes in Nevada, or commit forces to military action with weapons which may or may not operate.

In these considerations, it is significant to consider the relationship between the DoD and DOE. Although I am now a private citizen without current access and my knowledge is limited, I did attend a Stockpile Improvement Conference in early 1993. The participants

primarily included operational planning officers at the colonel level, DOE representatives, and DOE Laboratory personnel. The general attitude was hostile, or at least a negative, toward any stockpile improvements suggested by the DOE laboratories, unless the DOE representatives had direct evidence that existing weapons were unsafe or inoperable. Suggested DOE improvements to the stockpile not only impacted the DOE financially but also required significant resources on the part of the DoD. This DoD budget impact seemed to be a significant deterrent for taking any action with the stockpile unless weapons were known to be unsafe or inoperable. In fact, there were facetious remarks about the lack of any market pull whatsoever! The DoD representatives cited decreasing budgets and DoD base closings as significant restraints to budget commitments for improving the nuclear weapons in the stockpile. There are some that believe that the myriad of complex nonnuclear subsystems and components require continual evaluation, updating, and refurbishment, since their effective lifetimes are essentially unknown. At least the process should not be restrained by multi-agency budget overlap. In addition, the non-nuclear subsystems were optimized for their military effectiveness and not necessarily for extended lifetimes.

Some of my contacts at Sandia Laboratories have indicated that there are very few stockpile improvement projects underway and have facetiously indicated that the current mission statement at Sandia Laboratories is 1.2 billion dollars and 8000 people. This state of affairs must be doubly true for the nuclear laboratories.

6/42.08 There are many expensive programs facing the DOE, or the country, that need funding before undertaking unneeded installations that have a strong appearance of tools for the design and development of new weapons. Examples include the cleanup of the weapon sites, the storage of low level waste, the long term storage and safe keeping of plutonium, the development of theater ABMs, and the storage and reprocessing of spent reactor fuel. It would even make more sense to drill contingency holes in Nevada in case an unexpected international situation demanded a special nuclear weapon response for which a test would be required.

Although congressional delegations from affected states have done an excellent job of protecting budget levels for the local DOE facilities, I believe that the nuclear deterrent issues are important enough to transcend institutional protection. The Galvin Commission essentially recommended that the nuclear national labs should tend to their knitting and only work in other arenas when the basic national security mission is supported.

7/40.27 However, the lab leaders ended up meeting and "splitting up the pie", and the institutions remain essentially unchanged. If the federal government and/or private industry do not have real and important work for the labs, they need to be consolidated, downsized, or "right-sized".

8/40.26 In summary, the issues are important enough to justify another review, prior to building a widely scattered, expensive set of facilities designed to understand the basics physics of nuclear explosives. The concept of science based stewardship looks like, feels like, and quacks like a set of facilities for proceeding with the development of new weapons while

SSM-M-015
COMMENT LETTER

PAGE 5 OF 5

8/40.26 continued | there are so many other unmet needs. The stockpile needs continual refurbishment, modernization, and remanufacture in order to survive long term dormant storage. The relationship between DOE and DoD must be modified in order to assure cooperation and the availability of resources to carry out a long term program. The country needs a facility to build replacement pits, when pits go bad or are consumed in surveillance.

I am sending these comments under a cover letters to appropriate members of congress.

4/2/96 As of 4/4/96, I will have been a pipefitter at Y-12 for 17 years.

My question is on the Draft PEIS Stockpile Stewardship and Management and I request that the question be answered in writing in the final PEIS.

1/08.18 The Draft PEIS states in the Summary on page S-35 that the proposed plan is to cut Y-12's manufacturing capability from the current 2350 Defense Program workers to 870. The kind of employees making up this 870 total are reported in the Appendix, Volume 2, on Page A97.

Please identify the skill mix that makes up the proposed 131 craft workers

CHATTANOOGA, TENNESSEE

April 5, 1996

The Honorable Hazel O'Leary
Secretary of Energy
Forrestal Building
1000 Independence Avenue S.W.
Washington, D.C. 20585

Dear Ms. O'Leary,

I am the Democratic candidate for Congress from the 3rd District of Tennessee. On April 1st of this year I attended the DOE public hearing on the Programmatic Environmental Impact Statement for Stockpile Stewardship and Management as both a concerned citizen and a candidate for Congress. After participating in that public hearing I wish to advise you personally of my deep concern that this administrative proceeding is seriously flawed.

At the risk of stating the obvious, this entire proceeding is about downsizing of DOE's mission in an entirely new geopolitical context. It is obvious that there are several sites, notably including both Los Alamos and Oak Ridge, competing for the stockpiling and stewardship functions which will remain once downsizing is completed.

1/41.03

It is also apparent that a downsizing which simply involved a reduction of existing stockpiling and stewardship activities at existing sites would require no new environmental impact statement. That a PEIS has been prepared at all speaks eloquently to the fact that the DOE plan from the outset has been to perform stockpile and stewardship activities either at new locations and/or to a much greater extent than previously.

2/41.10

The documents ostensibly comprising the underlying administrative record in the PEIS amount to more than five inches of reading material of a highly complex and technical nature. Participants at the public hearing, and especially public

The Honorable Hazel O'Leary
April 5, 1996
Page 2

2/41.10 continued officials were highly critical of DOE's procedure of making these background documents available only a matter of days before the hearing seriously impairing the public's ability to familiarize themselves with the data and assumptions which underlie the PEIS.

3/41.05 The proceedings were compromised further by the combination of the hearings on stockpile and stewardship PEIS with the hearings on the Storage and Disposition of Weapons PEIS with all of its attendant administrative record. And, although the underlying documents were only available at the last minute there was an abundance of visual aids and even subject specific video which obviously had been prepared well in advance of the Oak Ridge hearing.

4/41.06 The net impression was that DOE was not proceeding even-handedly to obtain informed input on a question still undecided. Rather the impression was that DOE was attempting to overwhelm Oak Ridge with paper and slick presentations in an attempt to sell a preordained conclusion which favored Los Alamos without regard for critical facts and factors which favor Oak Ridge.

In this context it should hardly be surprising that the PEIS hearings have been viewed with public skepticism and not inconsiderable resentment. DOE has further compounded an already acute credibility problem by assigning major responsibility for development of the PEIS administrative record to Los Alamos personnel when it is obvious on its face that Los Alamos is one of the sites competing for future stewardship activities. This action destroys any illusion of fairness or objectivity, and instead conjures up visions of foxes designing henhouses.

It is my feeling that the administrative record of this proceeding so abundantly demonstrates a lack of even-handedness that a defensible conclusion to this proceeding is impossible. I urge you to put an immediate end to the travelling road show presenting the Stockpile and Stewardship PEIS and the Storage and Disposition of Weapons PEIS and instead develop a process whereby each of the competing locations can be objectively evaluated in a fair and objective process.

Based on my own participation and first hand observation, I would find it impossible to defend DOE's decision making process in this proceeding as it has unfolded.

The Honorable Hazel O'Leary
April 5, 1996
Page 3

I would appreciate your personal response to this letter at your earliest opportunity and would further request that a copy of these remarks be placed in the administrative record of both the Stockpile and Stewardship PEIS and the Storage and Disposition of Weapons-Usable Fisible Materials Draft PEIS.

Very truly yours,

Charles N. Jolly

Over one hundred years ago, my great-grandparents came to Amarillo. My grandfather was the first president of the Amarillo Board of Trade (predecessor of the Amarillo Chamber of Commerce) in 1906, my father was on the board of the Chamber in the 1936, and I served as president of the organization in 1961. With deep roots and a large investment in Amarillo, involvement and a strong interest in community affairs has always been a commitment.

1/40.52 I respectfully urge DOE to designate Pantex as the preferred alternative for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition and any related functions.

Sincerely yours,

B. R. Barfield

To Whom It May Concern:

I may be unable to attend the Department of Energy's public hearings in Amarillo on April 22 and 23, but wanted to comment on the Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (SDD) of Weapons-Usable Fissile Materials.

1/40.52 The Pantex Plant has always received strong support from Amarillo and the region, and we strongly urge the DOE to designate Pantex as the best site for any new construction/stewardship activities.

By building and expanding on facilities that are already here, DOE could eliminate the costs of duplicating facilities elsewhere.

2/34.01 Pantex would also seem to be the best site to continue High Explosives fabrication. The cost to transfer these functions to another site would be prohibitive and should the emphasis in our country shift from deterrence to production of nuclear weapons, the Pantex Plant is already in position to quickly and cost-efficiently begin production.

1/40.52 continued Because of our strong community support and the cost-effectiveness of utilizing and expanding already existing facilities, I urge the DOE to designate Pantex as the preferred alternative site for all existing and new stockpile management functions as well as consolidation of all plutonium storage and disposition functions.

Sincerely,

Garet von Netzer

Testimony Given At The April 2, 1996 Hearing, In Oak Ridge, TN On The Draft PEIS For The SSMP

I am Frank Bruce, a retired Associate Director of the Oak Ridge National Laboratory. I reside at 116 Euclid Circle, Oak Ridge, Tennessee 37830.

On June 14,1995 the DOE published a Notice of Intent in the Federal Register announcing its intent to prepare a SSM PEIS.The PEIS contained brief descriptions of the eight major facilities in the nuclear weapons complex. On page 8 of the document, descriptions of the programs at Lawrence Livermore National Laboratory [LLNL] and Los Alamos National Laboratory [LANL] appear. They are identical to the letter.

1/40.27

The DOE appointed Galvin Committee reviewed the effectiveness of the DOE's National Laboratories. It recommended that LLNL be phased out of the weapons business.

Please explain how the DOE justifies the continued operation of LLNL as a weapons laboratory in light of the fact that it duplicates LANL, and in light of the Galvin Committee's recommendation.

RE: Pantex

To Whom It May Concern:

1/30.01
2/34.01
3/40.52

Greg Lair, Inc., of Canyon, Texas, supports the selection of Pantex for weapons assembly and disassembly activities. We strongly endorse the continuation of high explosives (HE) functions at Pantex, and oppose any plan to move these functions to the national laboratories. Since Pantex is the most cost-effective Department of Energy (DOE) facility and enjoys the strongest local support, we endorse the addition of other environmentally sound stewardship and management functions at Pantex. Furthermore, we believe that Pantex should be chosen as the location for fissile materials storage and disposition functions.

2/34.01 continued

Pantex must retain HE capabilities to process the inventories already onsite from dismantling. Millions of tax payers dollars have been spent recently at the site to ensure that all the functions are safe and efficient. It is the only cost-effective choice available. Moreover, it would be highly advantageous to have all HE functions situated on the site to upgrape existing weapons systems; In the event of weapons production, onsite HE functions will be a necessity. High Explosives functions must remain at Pantex.

3/40.52 continued

Since Pantex is the most cost-effective DOE facility and enjoys the strongest locall support, it is appropriate to consider Pantex as an alternative site for all future defense-related facilities to complement activities at the national laboratories. The location of additional defense-related activities at Pantex would ensure that core technical capabilities are preserved at a location that can secure them at the most efficient cost to the tax payer. The Department of Energy must view accurate budgetary comparisons between Pantex and other sites. Life-Cycle analysis would assist in these comparisons to ensure the inclusion of all capital, transportaion, training, remediation, and all costs.

April 22, 1996

Greg Lair, Inc.
P.O. BOx 510
Canyon, TX 79015

Page -2-

We believe that Pantex should be chosen as the location for plutonium storage. It seems that Pantex is the only facility that has handled assembly and disassembly operations in a safe and efficient manner. If cost savings are considered, Pantex is the only choice for plutonium storage. The facility is already storing plutonium on-site, and has strived significantly to ensure not only safety but environmentally sound practices as well. Not only has the facility made recent upgrades to storage facilities, storage container usage and reconfigurement, and security enhancement, Pantex could also upgrade facilities for any and all storage options being considered by the DOE using processes already in place with minimal cost and difficulty. It makes little sense to re-create storage facilities at another site and then unnecessarily transport large amounts of plutonium across the country from Pantex. The cost and possible consequences of this decision would be enormous. Pantex also should be designated the preferred site for any disposition options and related function. It makes sense to site deposition where storage already exists. Furthermore, it is not feasible, from any perspective, to site strategic storage at one site and surplus at another. Pantex has the necessary safety, security, and surveillance capabilities to accommodate an expanded role with minimal costs, and it is the production site closest to Los Alamos, the planned fabrication site.

3/40.52 continued

Based upon the above reasons and for the continued benefit of the entire community, Greg Lair, Inc. urges the Department of Energy to designate Pantex as the preferred alternative site for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition and any related functions.

Sincerely yours,

Greg Lair

PAGE 1 OF 2

For: Hearing Record,
DRAFT PROGRAMMATIC ENVIRONMENTAL
IMPACT STATEMENT (SSM PEIS)

We fear for the future of the children of the earth in a world of increasing nuclear weapons.

Our own children were born & brought up during the days of atmospheric testing. At the time our family was living on the East Coast where the wind and rain were the delivery systems for fallout from bombs tested thousands of miles away in the Nevada desert.

It took us some time to realize that parents could actually bring about policy changes, but such a change did take place in 1963 after thousands of mothers, fathers and others wrote and marched for an end to nuclear testing--a campaign that resulted in the Partial Test Ban Treaty under President John F. Kennedy.

However, in order to conclude that treaty, an agreement was struck with the national nuclear labratories and their advocates in Congress and the administration, that testing would continue underground.

Indeed, testing continued for thirty years and today the nuclear arsenal stands at a far more sophisticated level than it did in 1963.

1/40.07

In 1993, to his credit, President Clinton put a stop to underground testing and began to press for a Comprehensive Test Ban Treaty. But history tends to repeat itself and is doing so today when once again the pressure from the national labs--Sandia, Los Alamos and Lawrence Livermore Labratory, is being felt in Washington. As a result, the Comprehensive Test Ban Treaty sought by the administration will be undermined by continued testing of bombs both in-lab and at the Nevada Test Site, so that new, miniaturized, ever-more powerful and woefully expensive models will become possible.

In other words, the Comprehensive Test Ban will be far from comprehensive and Stockpile Stewardship will hardly be the benign effort it purports to be.

Once again a multi-billion dollar sop is being thrown to the national nuclear labratories that will surely trigger another nuclear arms race worldwide.

What sort of message are we sending to the nuclear have and have-not nations now negotiating in Geneva?

It is high time the United States stood firm on the force of international law, especially on Article VI of the Non-Proliferation Treaty renewed just last summer which states, "Each of the Parties to the Treaty undertakes to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament..."

SSM-M-026
COMMENT LETTER

PAGE 2 OF 2

2/40.06

The date is certainly not early, but there is still time to negotiate an end to the nuclear arms race in good faith, not the beginning of a new and more dangerous race. The United States spearheaded the nuclear race originally. It is high time we took the initiative in ending that race, and in leading the world out of the nuclear morass, rather than more deeply into it!

It is also high time that the mothers and fathers of this planet no longer have need to fear for their children's future on account of more prevalent, more powerful, more deliverable nuclear weapons.

Alice Cox

Dr. William P. Cox

Statement to the Department of Energy
April 11, 1996
Stockpile Stewardship and Management PEIS Hearings
by Patrice Sutton, MPH
311 Douglass Street, San Francisco, CA 94114

I am a member of the Board of Western States Legal Foundation. I am also a Research Scientist working in public health and an active member of the American Public Health Association Peace Caucus. The Department of Energy's (DOE's) Stockpile Stewardship and Management (SSM) Programmatic Environmental Impact Statement (PEIS) is an outrage and affront to my responsibilities in both of these integrally related roles of public health and peace.

1/40.12

Amidst public squalor, DOE is proposing spending billions of dollars to perpetuate nuclear weapons research, testing and development well into the 21st century. In the minutes that I have to comment on DOE's plans for a nuclear future, 600 children will die or be permanently and severely disabled by preventable illness. Yet DOE proposes the plunder of vast resources that could improve living conditions and lessen real social, economic and environmental risk. To our national disgrace, a much higher proportion of the US population lives in poverty than in other wealthy industrialized nations -- one in 5 children in America live in families with incomes below the poverty line. Federal funds for housing, corrected for inflation, were reduced by 75% during the period 1981-1992, and we now accept the unacceptable — the sight of homeless families sleeping on the street. I am here to say to the DOE that we need a program to re-build a public health infrastructure that has been devastated, not a program to reconfigure the nuclear weapons complex.

2/40.06

Yet the choice between continuing the production of nuclear weapons and a world free of nuclear weapons has been disallowed by DOE — dismissed in less than 100 words on page S-23. How can the DOE seriously suggest that the environmental impact of maintaining research, design, testing and production capabilities of nuclear weapons can be fairly assessed if the most basic and crucial issues to the discussion, namely, do we need nuclear weapons and what is the impact of their use are not permitted?

DOE's PEIS statement regarding "denuclearization" is that, "under this approach, nuclear weapons would be eliminated worldwide." *This is exactly why this alternative should be considered.* The US' newly affirmed Non-Proliferation Treaty (NPT) obligations require that the US pursue an end of the nuclear arms race at an early date and a treaty on general and complete nuclear disarmament. Indeed, the intended meaning of a zero-yield Comprehensive Test Ban Treaty (CTBT) is to stop the production of nuclear weapons — to herald the beginning of the end of nuclear weapons. In stark contrast to the US' treaty commitments, the PEIS is a harbinger of a nuclear weapons filled future.

Replacing underground nuclear testing with an expanded laboratory infrastructure exemplifies a continued commitment to nuclear weapons as core instruments of national policy. That commitment legitimizes nuclear weapons which in turn affects other countries assessment of their desirability. Aggressively maintaining and developing nuclear weapons design and production capabilities allows the nuclear weapons States to rekindle the arms race at any time, a message that endangers the long term viability of the non-proliferation regime. If the US is serious about stemming the spread of nuclear weapons, it must take leadership in ending the international double standard and make disarmament and eventual abolition of nuclear weapons a top priority. The SSM plan are antithetical to this approach.

SSM-M-027
COMMENT LETTER **PAGE 2 OF 2**

2/40.06 continued

Despite the apparent appeal for public input at this time, DOE has constrained that input to issues of *how* we will maintain nuclear weapons capabilities, not the consequences of their maintenance. The logic of nuclear weapons is that if they are built it is possible for them to be used. Nuclear weapons are a cardinal feature of US military strategy, which embraces a comprehensive integration of conventional and nuclear weapons. US military strategy is based on the principle of escalation dominance, which briefly summed up, directs the US maintain military superiority at every progressive level of violence. As the PEIS states, "a safe and reliable US nuclear weapons stockpile has been the cornerstone of maintaining a credible nuclear deterrent." Nuclear weapons must be credible, you do not make them if you are not willing to use them. I would invite the authors of the PEIS to view the pictures of Nagasaki and Hiroshima, visions that have clearly depicted that we cannot *ever* be willing to use nuclear weapons again. So when we are talking about "reliability", the critically important questions, *"how reliable"*, and *"why"*, remain unanswered, particularly in regard to what purposes a "robust" arsenal serves for projecting US power globally.

1/40.12 continued

Over the last 50 years, the US has squandered over $4 trillion dollars on nuclear weapons. More difficult to assess are the costs to the environment and public health: Some 235,000 atomic veterans, nearly 4,000 human radiation experiments involving tens of thousands of individuals, at least $230 billion to clean up the nuclear weapons complex, national sacrifice zones and the possibility of total annihilation. The continued production of nuclear weapons, as part of a renewed commitment to militarism, steals resources that could be used to protect the lives of the 40,000 children who die each and every day for lack of food, clean water and immunizations. It steals resources that could provide education for the one billion people who will mark the turn of the century without being able to sign their name or read a road sign. An honest PEIS would show an alternative, that rather than embarking on building US nuclear weapons capabilities, would turn our attention to reweaving the social fabric of our communities, and to promoting our stated goals of nuclear non-proliferation. Contrary to the PEIS, the only "rightsizing" consistent with the NPT and CTBT is a one size fits all — no nuclear weapons for anyone future.

Re: Comment on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile materials Draft Programmatic Environmental Impact Statements (PEISs).

Thank you for the opportunity to comment on the U. S. Departments of Energy's (DOE) Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials. Please also consider this my comment on the Pantex Site-Wide Draft Environmental Impact Statement, since most of the issues addressed in these documents are identical.

1/40.52

First and foremost, I maintain that any current and future functions at Pantex must be conducted in a safe and environmentally sound manner. Any expansion at Pantex must be implemented in a way that does not impair the health or safety of area residents or have an adverse affect on the environment.

Second, I maintain that the history of Pantex and the Texas Panhandle communities have been one of lower cost than other facilities, a safer and more environmentally sound operation and of overall strong community support for the operation.

SSM-M-033
COMMENT LETTER

PAGE 2 OF 2

1/40.52 continued

Third, I further maintain that the movement of any existing functions from Pantex to other locations are not cost effective uses of our (yours and mine) tax dollars. The high cost of new facilities would far outweigh any other theorized savings that come from a facility with historically higher costs.

Finally, I maintain that if any movements of operations are to be considered, the operations that have provided safe, cost effective and productive performance over the years should receive additional work rather than having any work removed. Therefore, Pantex should be the natural location for expanded functions. Because of its performance record and its available facilities, Pantex should be the preferred location for any weapons work.

Sincerely,

Bill K. Wolfe

RE: Comment on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable

Sirs:

Thank you for the opportunity to comment on the U. S. Department of Energy's (DOE) Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials. Please also consider this response as my comment on the Pantex Site-Wide Draft Environmental Impact Statement.

1/40.52

As a public official, and more importantly, as an employee at the Pantex Plant for more than twenty years, I am confident that all current and any future functions at the Pantex Plant will be conducted in a safe and environmentally sound manner. Best industry practices are routinely exercised at Pantex. Speaking as an elected official, an employee of Mason & Hanger, and as a citizen of the of the Amarillo community, our first priority is to ensure that any operations, including expansions, at Pantex will be implemented in a way that does not impair the health or safety of area residents or that have an adverse affect on the environment.

2/30.01

It is gratifying to know that the DOE has selected Pantex as the preferred alternative for assembly/disassembly activities, which appeared to many persons in our community, to be the only legitimate choice. However, the failure to ascertain Pantex as the preferred candidate site for new and/or consolidated stockpile management facilities, leaves one wondering if the DOE hasn't overlooked the obvious; that the Pantex Plant provides the best solution as a site which affords the DOE the capability to maintain the integrity of the U. S. nuclear stockpile in a most cost-effective manner.

Much of the assets at Pantex represent a major investment of tax dollars that have already been expended or that is being expended to modernize and update facilities and equipment. In a day when downsizing and cost-cutting is a common cry of the federal government, is seems the only logical course of action is to utilize as much readily-available resources without having to reinvent the wheel; Pantex offers that kind of realization.

2/30.01 continued

To enumerate why I believe Pantex is the obvious preferred choice in the SSM and PEIS consideration. First, because of labor costs, utility rates, and water and land availability, Pantex is perhaps the most cost-effective alternative for any new construction of 'SSM facilities. These tangibles in this area are more amenable to doing business here than those at any other Complex site. It is appropriate to consider Pantex as an alternative site for all future defense-related facilities to complement activities at the national labs, such as the planned Atlas Facility and plutonium pit fabrication site at Los Alamos National Laboratory. In view of the past and present primary mission at the Pantex Plant, that of assembly/disassembly of the nuclear weapons and high explosive functions, is logical, as pointed out in the PEIS, that an ample plutonium reserve be also located at Pantex. If, in its deliberations, DOE insists that budgetary comparisons between Pantex and the other sites are accurate, and include capital, transportation, training, remediation, and other costs, the choice of Pantex will be evident.

3/34.01

Secondly, as previously noted, high explosives (HE) functions are a well-established facet of the work done at Pantex. Because the production assembly/disassembly functions remain at Pantex, the HE functions should also remain at Pantex. After all, the SSM Draft admits that Pantex must retain HE capabilities to process the inventories already on site from dismantling. Therefore, the least expensive alternative is to maintain HE functions at Pantex. When all costs, including capital outlay, are considered, the transfer of HE functions from Pantex would cost taxpayers from $40 million to $50 million.

As the sole DOE-authorized facility for assembly and disassembly of nuclear weapons, Pantex has handled these functions in a safe and efficient manner for more than 40 years. One of the challenges faced after dismantling a significant portion of the nuclear stockpile is processing or disposal of the by-products of the dismantlement efforts. While the DOE considers it's options, from a cost savings standpoint, a viable option would be to continue storing plutonium at the Pantex Plant at present while planning for the future. When additional needs arise, upgrades of existing facilities for any and all storage options being considered by DOE at a minimal cost and with minimal difficulty, could be accomplished with the least overall impact of any other facility, not the least of which is community support. It makes little sense to re-create storage facilities at another site and then unnecessarily transport large amounts of plutonium across the country from Pantex. The budgetary and political costs for such a decision would be enormous. Because of these costs, Pantex also should be designated the preferred site for any disposition options and related functions.

1/40.52 continued | Based upon these reasons, I respectfully urge DOE to designate Pantex as the preferred alternative site for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition and any related functions. Thank you for the opportunity to comment on these documents.

Sincerely,

Manny Perez Villasenor
Potter County Commissioner

4/30/96

Dear Mr. Rose,

1/40.50 | In the real world, not the human contrived egocentric one; but the real one of natural law. When a part of the system gets interrupted & displays abberant behavior, the other systems have to work overtime to compensate for the errant dangerous system run amuk. It is difficult to get ones voice heard when it is being drained by those who are so far removed and the energy just seems to be being sucked off at an alarming rate & the source can become so diseased that it can not produce.

Question?

Who derives the most benefit (i.e. dollars in pocket.)?

Those who derive the benefit are responsible to clean up the mess. Those who receive the most, owe the most.

Question?

Who would be most a risk in case of a catastrophe at the site & there would be no fast fix?

(over)

1/40.50 continued

Question?

How much of Mason Hangers profit is devoted to clean up?

I do hope some reason pervails in the money mongering manipulative maneuvering. It is not only the lives of the living organisms in the Texas panhandle; but everyone that has breakfast & lunch & dinner, or that depends on oxygen to survive.

Please remember economy & safety first.

Sincerely,
Kila Mills-Rekdal

Very good job of handling an improbable range of interests. The presentations were very well done — you got two of your very best presenters to do it. This is a fulluva way to make policy sometimes, but I think it's working. Slowly, all this forced transparency is re-establishing some DOE credibility that was at rock bottom.

COMMENT LETTER

PAGE 1 OF 1

4/2/96

Dear DOE folks,

Regarding the PEIS for the nuclear weapons Stockpile Stewardship and Management program: I object to any EIS that dismisses out of hand any consideration of alternatives based on a
1/40.60 stockpile of less than 1000 weapons, let alone the alternative of planning for zero nuclear weapons. NEPA requires inclusion of all reasonable alternatives. In fact, on political, social, economic,
2/40.26 ethical and environmental grounds, denuclearization is the only reasonable alternative. A National Ig-
3/21.17 nition Facility or other lab upgrade is not acceptable.

Sincerely, Larry Turk, RN

Future Mission of Los Alamos National Lab. (LANL)

The forest fire that is burning near the lab (as I write this) dramatically demonstrates how important it is not to have any materials in Los Alamos that, if released into the air by an out-of-control fire, would threaten the health of residents in Los Alamos, Espanola, or Santa Fe.

1/43.18 The environmental impact of forest fires that occur in the area have the potential to be tragic and to destroy the reputation of the United States in the eyes of the world. No decent government takes the kinds of risks involved in making LANL the premier nuclear weapons facility for the country. Since our government is decent, and since forest fire is an environmental hazard to LANL, you need to redesign the Lab's mission radically to eliminate all inflammable materials that would get into the air and water here in a fire.

Ellen Roddick

Comments:
I attended a recent LANL Stockpile Stewardship and Management EIS "able presentation by Barry Lawson and Steve Guidice, the latter from DOE's Albuquerque Office. Unlike many of the "antis" in attendance, I, as a retired naval officer understand the needs for nuclear deterrent and maintaining a reliable inventory. I do, however, question the selection of LANL as a site for additional "pit" production and for DARHT's "non-destructive testing."

1/40.32

I have read earlier reports of security deficiencies at LANL indicating a general laxness in readiness to accept a five-fold increase in pit production. Similar media articles reveal an adversarial relationship between the DOE and LANL (micromanagement indicated) which may only lead to disharmony and loss of efficiency. Added to these are allegations of sexual harassment at Albuquerque DOE from years past and more recently, pornographic Internet "play" at Sandia, a sister facility to LANL: a lack of professionalism within the DOE complex indicated.

2/32.03

3/40.72

Plutonium "leaks" pursuant to pit production and DARHT activities

megastar the environment. It is my understanding that traces of plutonium have been found in the Rio Grande and hazardous wastes including cadmium, stored in several LANL sites, including approaching the aquifer (tritium) — more (plutonium) is not better.

• Population centers around and downwind of LANL are affected by inadvertent releases — these include Los Alamos, the Española Valley, and Santa Fe. It is coincidental, yet timely, that smoke from a fire at Bandelier, adjacent to LANL, is drifting over Santa Fe at this writing (4/27); plutonium releases could be expected to follow a similar course — and produce equal more profound effects.

3/40.72 continued

• Concluding, I question (doubt is a better term) the prudence of siting further plutonium activities at LANL; I concur with many that other, more remote sites merit more realistic considerations.

Cordially,

ABOLITION IS THE *ONLY REASONABLE* ALTERNATIVE;
PLAN FOR ZERO!

Comment on the Department of Energy (DOE) Draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement (SSAM PEIS)

Contrary to global expectations that a Comprehensive Test Ban Treaty (CTBT) will halt nuclear weapons development and lead inexorably to disarmament, as we await the signing of the treaty this year it appears that nuclear weapons research, development and testing by the United States will continue unabated. The National Ignition Facility (NIF), planned for the Lawrence Livermore National Laboratory, is intended to produce miniature thermonuclear explosions to provide data for the "advance" of nuclear weapons science. Slated to go on line in 2002, *ten years after the end of the Cold War*, the NIF represents the single largest military program ever planned for the Livermore Lab. The NIF, which will cost more than $1 billion to build, with a projected lifetime cost of over $4.5 billion, is the most expensive element of a vast laboratory-based infrastructure to preserve the capacity to maintain, test, modify, design and produce nuclear weapons well into the 21st century — *with or without underground testing*. The Department of Energy's (DOE) multi-billion dollar "Stockpile Stewardship and Management" (SS&M) Program includes an elaborate system of high-tech laboratory facilities consisting of explosives testing installations as large as sports stadiums, extensive new manufacturing capabilities, and the world's fastest supercomputers.

When President Clinton announced his support for a "zero-yield" CTBT last August, he strongly endorsed the SS&M Program as a necessary means of maintaining the U.S. "nuclear deterrent" without underground testing. This coupling is strikingly reminiscent of the deal struck during negotiation of the 1963 Partial Test Ban Treaty (PTBT) which banned nuclear tests in the atmosphere, in space, and under water. At that time, the nuclear weapons establishment and its allies in Congress and the Administration insisted as a condition for ratification that the U.S. pursue an extensive underground nuclear weapons testing program while maintaining the nuclear weapons laboratories and the capacity to speedily resume atmospheric testing. In the years immediately following conclusion of the PTBT U.S. nuclear testing increased and the weapons labs grew stronger. Thirty-three years later, the U.S. nuclear arsenal far exceeds that of 1963 in sophistication. *The SS&M Program anticipates maintenance of thousands of these weapons of unspeakable mass destruction for the foreseeable future.* (DOE's "base case" planning scenario assumes maintenance of at least 3,500 "strategic" nuclear weapons plus an estimated 5,000 non-strategic and reserve weapons.)

By allowing for the preservation, indeed, expansion of U.S. nuclear weapons capabilities through underground testing, the 1963 PTBT represented a lost opportunity to pursue nuclear disarmament. This suggests that the substitution of a laboratory-based infrastructure for underground testing proposed by the SS&M Program will recapitulate the profound failure of the PTBT to end the nuclear arms race. Replacing underground nuclear

1/40.07

testing with an expanded laboratory infrastructure exemplifies a continued U.S. commitment to nuclear weapons as core instruments of national policy. The Nuclear Non-Proliferation Treaty (NPT) -- signed in 1970 and reaffirmed by the U.S. and 177 other countries in 1995 -- forbids non-weapons states from acquiring nuclear weapons, in exchange for which nuclear

1/40.07 continued

powers pledge eventually to disarm. Article VI of the NPT states: *"Each of the Parties to the Treaty undertakes to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament . . ."* The S&M Program poses a threat to international security by perpetuating the legitimacy of nuclear weapons. This, in turn, may encourage other countries to abandon their NPT obligations.

2/10.11

The U.S. has squandered more than $4 trillion on nuclear weapons over the last 50 years, *an amount roughly equivalent to the national debt.* Including new or upgraded tritium facilities and production, SS&M Program operating costs are likely to exceed $40 billion within a decade. Moreover, the fifty year U.S. embrace of the atom as an instrument of military technology and an energy panacea has created an enormous environmental burden in the form of contaminated air, land, and water, and vast quantities of radioactive wastes. As a byproduct of the SS&M Program, DOE projects staggering rates of more nuclear waste generation for at least the next two decades.

1/40.07 continued

If the U.S. is serious about stemming the spread of nuclear weapons, it must take leadership in ending the international nuclear double standard and make disablement, dismantlement, and eventual abolition of nuclear weapons a top priority. *Nonproliferation requires unconditional, irreversible disarmament.* The SS&M Program is antithetical to this approach.

3/40.60

The National Environmental Policy Act, the statute under which the SS&M Programmatic Environmental Impact Statement (PEIS) is being prepared, requires a comparative analysis of *all* reasonable alternatives. Yet, despite the NPT obligation to disarmament and international expectations for a CTBT, the draft PEIS rejects consideration of *any* alternative based on indefinite maintenance of a hypothetical stockpile of less than 1000 nuclear weapons, or *any* alternative scenario based on "passive" maintenance of the existing stockpile through inspection and identical remanufacture of parts (as opposed to building and operating a massive array of sophisticated experimental facilities that can be used for continuing nuclear weapons design). It also dismisses any "denuclearization" option out of hand, despite an avalanche of public comments, since 1991, demanding inclusion of a "plan for zero" stockpile option. *In fact, denuclearization is the only reasonable alternative.*

4/40.12

The undersigned organizations agree that as a nation we cannot afford the economic, environmental and national security costs of the SS&M Program described in the draft PEIS. Continued nuclear weapons research, testing and production cannot be justified. The SS&M Program is a budgetary black hole; it endangers public health and the environment and drains resources badly needed for more constructive purposes such as environmental restoration, education, health care and affordable housing. By providing a means for nuclear weapons designers to continue their deadly pursuits and supporting the maintenance of a huge nuclear

1/40.07 continued

arsenal well into the 21st century, the SS&M Program undermines the stated U.S. goal of encouraging nonproliferation by sending a hypocritical message to other nations: "Do as we say, not as we do." We call on the DOE to listen to what thousands of U.S. citizens have been telling them for years: nuclear weapons make us *less* secure -- let's get rid of them! The draft SS&M PEIS is wholly inadequate. DOE, go back to the drawing board and plan for the elimination of nuclear weapons. It's the *only reasonable alternative.*

Re: DPEIS for Stockpile Stewardship and Management

Dear DOE:

As I read the DPEIS for Stockpile Stewardship and Management I realized that you and I live in two completely different paradigms. The DPEIS explains the new mission that DOE sees for itself in the post Cold War 21st century. As I understand it, you intend to keep us safe from the threat of nuclear attack by assuring that our existing stockpile of nuclear weapons will work and by staying ready to build new weapons if needed. Since you can't test the weapons anymore, you plan to build new facilities where you can assess and certify their performance through computer simulation and experiments under conditions similar to those in a thermonuclear reaction. According to the DPEIS, your plans will have virtually no environmental or health impacts, so the only decision to make is which parts of the country to favor with the jobs that you will create.

1/40.06 In my paradigm, the production of nuclear weapons and nuclear waste is an extreme threat to the future of life on earth and must cease immediately. I feel no benefit from the nuclear deterrence. I believe the U.S. greatly jeopardized our security by amassing a bloated stockpile of weapons, while indicating every readiness to use them. That forced other countries to create their own stockpiles, and bankrupted the Soviet Union when they tried to keep up with us. Had we instead been friendly neighbors, we would not be faced with the specter of several countries in the former Soviet Union where organized crime now controls hundreds of nuclear weapons.

But it is looking ahead at the future millennia that causes me to seek the abolition of all nuclear production. This genie should not have been let out of the box. Every DOE site is grossly contaminated. You haven't solved the waste problem because it is unsolvable. Your projects have already created enough highly toxic materials to kill everything on earth for the next several thousand years. That is not a legacy to be proud of.

No caring human being would knowingly perpetrate such horrors onto their children, so I can only conclude that you choose not to see my paradigm. Unfortunately I don't have the same choice. Because you carry such a big stick you get funding to perpetuate your vision, and the voices of people like me are dismissed as fringe. Time will tell whether your paradigm will sustain itself or whether your disastrously expensive projects will bankrupt this country too.

Based on that introduction, I'm sure you have already filed my letter in your "beyond the bounds of reason" category. I hope that is not the case, for I represent a large and growing number of people who justifiably fear all things nuclear and who (justifiably) do not trust DOE. It would be inadvisable to ignore us.

I will now comment on specific parts of the DPEIS because I feel morally bound to do so, not because I think my comments will have any effect. I know from past experience that you probably won't change your plans based on my feedback.

Livermore Lab

2/40.27 It looks like the labs lobbied so successfully that they might survive even if the rest of the Complex goes belly up. It isn't intuitively obvious why we need not one, not two, but three R&D labs when we aren't building any new weapons. In fact, you considered phasing out LLNL based on the Galvin report. That must have motivated their staff of 35 taxpayer-paid Public Relations personnel! Now they'll not only be around to do peer reviews of LANL, they may also get NIF plus fabrication of secondaries, cases, high explosives, and non-nuclear parts.

Well, the people in the Bay Area don't want any of those dangerous, polluting industries. We want LLNL converted to peaceful, non-nuclear research such as solar energy. We don't want extremely hazardous HEU here, or the very toxic chemicals that are used in high explosives. We don't want Livermore or Site 300 to become any more contaminated than they already are. The local citizens group Tri-Valley CAREs, the internationally-known law institute Western States Legal Foundation, and the well-researched Livermore Conversion Project have already indicated these concerns to DOE. It is very disrespectful of you to ignore their vision for the future in your DPEIS.

Environmental Justice at the Nevada Test Site

3/07.02 Your plans for the Nevada Test Site are truly onerous. That land belongs to the Western Shoshone Nation, who are adamantly opposed to the nuclear testing and waste disposal that have already decimated their beautiful desert. To relocate weapons assembly/disassembly there or build NIF there would add insult to injury. This is an environmental justice matter of the highest priority. The Western Shoshone people have already suffered

SSM-M-048
COMMENT LETTER
PAGE 3 OF 3

3/07.02 continued | enough living downwind from your testing activities. DOE should contain the waste it has already brought onto the site, stop bringing in more, and clear out - immediately.

Environmental and health impacts

4/40.21 | Your statistics on health risks to the public are truly laughable. Assembly/disassembly at NTS would result in only one fatal cancer every 645 million years? In 645 million years there could be hundreds of earthquakes, volcanoes, ice ages and perhaps even an inland sea at the Nevada Test Site. Please give us some believable figures. We know radiation causes a much higher incidence of cancer than that. We know DOE covers up its data on the health effects of its projects. But we would like you to treat the readers of the DPEIS as intelligent, thinking human beings, and sincerely try to assess the risk to workers and people living near your facilities.

It is also very hard to swallow the DPEIS's repetitive mantra "No significant impacts are expected." Couldn't you at least find one or two token significant impacts so we could believe you actually considered something real? Given the environmental catastrophes at Hanford, Rocky Flats, Fernald, and Mound, why should we trust any DOE project to be environmentally benign? The mess at Rocky Flats must be understood and contained before plutonium fabrication is re-established, so that a similar disaster can be averted in the new location.

5/42.12 | The Environmental Restoration and Waste Management PEIS is entirely relevant to the Stockpile Stewardship and Management PEIS, and the findings of the former should be discussed in the latter.

6/10.15 | Your statements that LANL and SRS have adequate existing waste management facilities worries me a lot. Both of those sites are still practicing shallow land burial of radioactive wastes, including many very dangerous, long-lived elements. This practice must be stopped, not continued and increased as contemplated in this DPEIS.

If you read this whole letter, I appreciate your attention and I hope you consider my comments seriously.

Sincerely,

Victoria Woodard

Friends of Oak Ridge National Laboratory
P.O. Box 6641
Oak Ridge, Tennessee 37831-6641

April 29, 1996

US Department of Energy
Office of Reconfiguration
PO Box 3417
Alexandria, VA 22302

Sirs:

The Friends of Oak Ridge National Laboratory, and organization comprised of former and current staff members of ORNL and of other citizens of the area who are interested in the future welfare of the Laboratory and the community, wishes to comment on the Draft Programmatic Environmental Impact Statement on Stockpile Stewardship and Management.

1/33.01 | An aspect that did not seem to receive attention in the Draft nor the public meeting is the strengthening of other local organizations by the existence of the superb capabilities of the Y-12 Plant shops. Many people at ORNL can attest to occasions when construction of special equipment was feasible only because of our neighbors in Bear Creek Valley. Many important national programs were made possible by the geographic juxtaposition of the two organizations.

We feel that the increase in capabilities arising from the synergism of ORNL and Y-12 is an important national asset. It should be weighted in future decisions about assignments of weapons and non-weapon work to Y-12 to maintain its unique capabilities.

Sincerely,

William Fulkerson
President

RE: DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT FOR STOCKPILE STEWARDSHIP AND MANAGEMENT (DOE/EIS-0236, FEBRUARY 1996)

The Oak Ridge Reservation Local Oversight Committee, Inc. (LOC) has reviewed the Stockpile Stewardship and Management Draft Programmatic Environmental Impact Statement (SS&M PEIS) and submits the following comments and recommendations:

Comments

1/41.10
1. Local governments and citizens have been overwhelmed by DOE's timing in releasing major National Environmental Policy Act documents. While the agency may save money by holding multiple hearings in two days, cost savings do not outweigh the negative aspects of a concurrent process.

2/40.53
2. The statement of the problem in the PEIS does not adequately focus on two fundamental aspects of stockpile stewardship and management: (a) resources need to be devoted not only on surrogate testing, but also on the stabilization and preservation of manufacturing capabilities; and (b) the programmatic decision must be based on the inclusion of weapons production experts in the process.

3. The current plan does not consider the need to minimize impacts on weapons performance due to inadvertent or unavoidable changes in production methods. The PEIS states that surrogate testing will be used to keep the weapons data base current; however, this is somewhat misleading. The weapons data base consists of two parts: (a) the weapons test data; and (b) the supporting physical properties and design data. The weapons test data will not change, and while surrogate testing may be successful in improving the physical properties data and the computational models, there will always be the question: As the production methodology slowly changes, do these improvements in data and computations truly reflect the performance of the untested weapons in the stockpile?

4. The PEIS does not evaluate the impacts associated with the loss of specialists currently employed at the Y-12 facility. Even though employees are highly skilled craftsmen when hired, they undergo a long period of specialized training to perform HEU tasks. This invaluable expertise will be lost if work is transferred elsewhere, and workers will have to be trained. This investment in human capital needs to be included in the cost of alternatives.

Anderson • Meigs • Rhea • Roane • City of Oak Ridge • Knox • Loudon

136 S. Illinois Avenue, Suite 208 • Oak Ridge, Tennessee 37830 • Phone (615) 483-1333 • Fax (615) 482 6572

3/40.40
5. The PEIS does not demonstrate an ability to implement the timely up-sizing of the nuclear weapons system should it become necessary. The PEIS states that the objective can be reached by increasing production from a one-shift basis to a full-time basis using the same production equipment. Again, this proposed action seems to ignore the fact that the additional training needed by capable machinists to properly and safely engage in the highly demanding efforts of weapons production is about five years. This is an unacceptable delay in response to an urgent threat.

6. The DOE has not provided cost estimates for the proposed alternatives. It is not likely to be economically feasible to replicate Y-12 facilities at the western labs, especially when it may be necessary to enlarge the facility at a future date.

7. The PEIS does not explain how some of its proposed consolidated configurations would affect national security in the event of a terrorist act.

4/40.13
8. The DOE needs to factor the costs of decontamination and decommissioning facilities into the PEIS alternatives, as well as state the source of funding for these and other environmental management activities. Funds to transfer ownership, maintenance, and D & D of facilities are not included in the DOE's proposed budget for FY 97.

9. The scope of the PEIS is too broad, by its inclusion of NEPA analyses for three of the six proposed new facilities.

Recommendations

1/41.10 continued
1. The DOE should work with host communities to provide assistance for an independent evaluation of cumulative socioeconomic and environmental impacts of this and other major DOE actions. Each of the three host governments at the ORR site (City of Oak Ridge, Anderson and Roane counties) have requested and been denied assistance.

2/40.53 continued
2. The DOE should devote a new effort to document details of the current production methods, and to establish procedures which will minimize the changes in weapons performance resulting from inadvertent or unavoidable incremental changes in the weapons stockpile.

1/41.10 continued
3. The DOE should avoid issuing major documents within days of one another and expecting stakeholders to comment within a short time frame. Likewise, concurrent meetings should not be held on such important topics as these.

5/40.27
4. The DOE should reexamine the Galvin Committee report, especially the recommendation to consolidate potentially duplicative design lab activities as a cost saving measure.

6/40.23
5. For national security purposes, the bulk of weapons design and production capabilities should not be co-located.

7/08.21
6. The DOE must more fully analyze the socioeconomic impacts associated with each of the proposed alternatives, including impacts associated with loss of employment and population, as well as other financial impacts on the region's economy. Local government representatives should be included in this more detailed analysis.

SSM-M-050
COMMENT LETTER **PAGE 3 OF 3**

The LOC appreciates the opportunity to comment on the PEIS, and looks forward to a timely response to these issues.

Sincerely,

Amy S. Fitzgerald, Ph.D.

SSM-M-052
COMMENT LETTER **PAGE 1 OF 1**

My name is John M. Napier

I live at 113 Dartmouth Circle, Oak Ridge, TN 37830.

My question relates to the Draft Program Environmental Statement for Stockpile Stewardship and Management.

1/04.02 Section 4.6.2.4 states that the LANL water resources will be used up by about 2000. If water from the San-Chama supply is added, the supply will last until about 2020. If the water requirements are larger than have been estimated, (Tables 3.4.3.3-2 and 3.4.4.2-2 shows that Y-12 uses 96% more water than estimated to be used at LANL for the same amounts of work load), how will LANL be able to produce the required number of weapons with this very limited water supply?

Please include the answer to this question in the final Stockpile Stewardship and Management Environmental Impact Statement.

RESOLUTION NUMBER 96-2

WHEREAS, the Oak Ridge Reservation Local Oversight Committee (LOC), being comprised of elected officials and citizen representatives of Anderson, Knox, Loudon, Meigs, Rhea, and Roane Counties and the City of Oak Ridge, was created to provide local input into decisions affecting the continued operation of the U.S. Department of Energy's (DOE) Oak Ridge Reservation; and

WHEREAS, the DOE has issued the Draft Programmatic Environmental Impact Statement (PEIS) for Stockpile Stewardship and Management which recommends a technical program for maintaining the safety and reliability of the nuclear stockpile; and

WHEREAS, the DOE has simultaneously issued the Storage and Disposition of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statement; and

1/41.10 **WHEREAS**, the DOE unduly restricted local government and public involvement on these important topics by issuing the documents at the same time and by holding concurrent public hearings in Oak Ridge; and

WHEREAS, decisions based on the Stockpile Stewardship and Management PEIS may result in numerous, adverse impacts on Oak Ridge and the surrounding communities; and

WHEREAS, the PEIS does not focus sufficiently on the stabilization and preservation of manufacturing capabilities, nor has it adequately involved weapons production experts in program development; and

WHEREAS, this document cannot support a Record of Decision based on the DOE's analysis of socioeconomic impacts, environmental consequences, schedule, and technology;

WHEREAS, the citizens of LOC jurisdictions are entitled to assurances that the impacts associated with the DOE's preferred alternatives are thoroughly analyzed; therefore, be it

2/40.87 **RESOLVED** that the Board of Directors of this Committee request that DOE implement the No Action alternative until further analyses are performed and until additional public hearings are held; and be it further

3/40.13 **RESOLVED** that the DOE make available detailed cost information which compares the costs associated with the implementation of alternatives; and be it further

4/13.01 **RESOLVED** that the DOE engage in a collaborative process with host states, local governments, and communities to improve understanding of interrelationships between, and cumulative impacts of potential DOE actions; and be it further

RESOLVED that this resolution and attached comments shall be submitted to the U.S. Department of Energy for consideration in its preparation of the Programmatic Environmental Impact Statement for Stockpile Stewardship and Management, and that the Executive Director send a copy of this resolution to the Tennessee Congressional delegation and other relevant federal and state officials.

This, the 2nd day of May 1996.

Edmund A. Nephew

DRAFT PROGRAMMATIC ENVIRONMENTAL
IMPACT STATEMENT FOR
STOCKPILE STEWARDSHIP AND MANAGEMENT

COMMENTS 4/16/96

Sometimes I picture in my mind a meeting at the Department of Energy at which staffers are preparing the revision of the 1991 Programmatic Environmental Impact statement titled "Reconfiguration of the Nuclear Weapons Complex."

"Let's change the title," says one staffer. "Nuclear weapons are very unpopular. Let's give this PEIS a title that sounds smart and safe and doesn't mention nuclear weapons."

"I like the sound of the two S's," says a second staffer. And then he has an inspiration. "How about Stockpile Stewardship?" "I like that," says a third staffer. "We could call it Scientific Stockpile Stewardship and then we would have three S's."

Another staffer says, "I think the title should cover weapons research and development. I suggest the word, management."

Voila! The title for the revised PEIS is born -- Stockpile Stewardship and Management.

There are brilliant scientists and publicists at the Department of Energy, but I sometimes wonder if they are really idiot savants. They all know that a nuclear war could mean the end of the world or at least the end of human beings. But they fail to see the connection between their work and the continuation of nuclear arsenals in this country and in other countries.

1/41.08

They insist that our nuclear weapons must be "Reliable," but they don't face the fact that a reliable nuclear missile could destroy a city, kill thousands of civilians, and wreak untold, lasting damage on the environment. Are they really willing to use genocidal weapons?

The irony of a nuclear attack is that the attacking nation would also be a victim since the fallout cloud could circle the earth.

Each of the nations with a nuclear arsenal claims that its arsenal is needed as a deterrent. But it is also a temptation for those in power.

SSM-M-054
COMMENT LETTER

Women for Peace
4/16/96
Page 2

1/41.08 continued

I fear what other nations might do, but I also worry about our own military establishment. Just about two weeks ago Secretary of Defense William Perry said that if any country would use chemical weapons against the U.S., our response could include nuclear attack.

The nations of the world are giving awesome power to their military leaders.

Occasionally nuclear weapons scientists do think through to the results of their work. For example, the noted physicist, Theodore B. Taylor, who was a leading designer of nuclear weapons, now speaks out against both nuclear weapons and nuclear power.

Women for Peace urge others to take up the vital, life-preserving challenges of our time.

2/40.12

Instead of lobbying Congress and the Administration to spend billions on esoteric laboratory equipment, they could lobby for negotiations for an international treaty to ban all nuclear weapons.

They could apply their brilliant minds to the challenge of developing non-polluting, cheap sources of energy. Finally, what may be the most difficult task of all, they could devise means for dealing with the vast amount of radioactive and hazardous waste now accumulating all over the world as a result of nuclear programs.

Women for Peace urge the Department of Energy to tear up their PEIS and plan a different and truly beneficial role for the Department.

WOMEN FOR PEACE, EAST BAY

To Whom it May Concern:

1/40.07

It is my understanding that the Department of Enery has plans to design and build new nuclear weapons into the next century under the guise of "Stockpile Stweardship". If this is true, I believe that these plans threaten international efforts for a Comprehensive Test Ban Treaty and call into question the United States' committment to the Non-Proliferation Treaty.

I am unable to attend the Draft Stockpile Stewardship and Management Hearings and I am writing to voice my protest to plans for "Stockpile Stewardship". I believe our country needs to be leaders in showing support for the Comprehensive Test Ban.

Thank you for your consideration of this matter.

Sincerely yours,

Peg Marland and Bob Marland

My name is John M. Napier

I live at 113 Dartmouth Circle, Oak Ridge, TN 37830.

My question relates to the Draft Program Environmental Statement for Stockpile Stewardship and Management.

1/04.13

Relative to section 4.2.3.4, is the statement correct that says the phaseout of work at Y-12 would reduce the flow in the East Fork of Poplar Creek to zero and would have no impact on the water quality in the creek? Are there no natural springs beneath some buildings in the plant that run continously into the East Fork of Poplar Creek (very low flow rates)?

Is it not correct that the City of Oak Ridge must have a flow in the East Fork of Poplar Creek in order to discharge the treated severage water from the City and if the flow from Y-12 is zero, would the City of Oak Ridge be allowed to continue to discharge the treated water into the creek?

Please include the answer to this question in the final Stockpile Stewardship and Management Environmental Impact Statement.

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTION:

A stated objective of the DOE in reconfiguring the complex was to "achieve significant cost reductions to make the cost of operations consistent with a smaller stockpile." (Preferred Alternative Report, Feb.1996, page 2, line 1).

1/40.24

The PEIS considers at length and in depth a wide range of alternatives for downsizing the production complex. For instance, the discussion of "Stockpile Management Alternatives" in Chapter 3 of Volume I requires 81 pages (pp.3-23 to 3-104) to present all the cases considered for downsizing the production complex. All of the projected budget reductions result from chopping the production complex.

The discussion of the stockpile Stewardship alternatives does not mention a single alternative for trimming Lab budgets in accordance with DOE's stated objective, only the needs to build up and add to the experimental capabilities of the Labs! And the Stewardship part of the SSMP is treated in just 7 pages (3-15 to 3-22) of the PEIS, yet this is the area where all future DP budget increases are required.

Question: Why was "downsizing/rightsizing" of the Weapons Labs not also included by DOE as a perfectly logical "Stockpile Stewardship Alternative" that should have been looked at in drafting this PEIS; belt-tightening should apply to all parts of DOE accountability in times of budget pressures such as DOE will be under in the years ahead. The SSMP at its root is lop-sided, deeply chopping the production side, building up the research side under the plea of needing even more science after 50 years of aggressive programs. The U.S. knowledge pool is arguably broader and deeper than that any of our potential enemies and yet the DOE(Labs) contends we need still more, is not willing - apparently - to even include as a PEIS alternative one of looking at the possibilities of trimming of any weapons programs of the three weapons Labs.

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTIONS:

Major emphases appear in the SSMP of May 1995, in this draft PEIS, and in Dr. Hecker's testimony before the Senate Armed Services subcommittee meeting in March 1996 on the vital importance for the Labs to be able to attract new and top quality scientists to assure the Labs future viability.

No mention is made in the PEIS as to the importance of Y-12 Plant maintaining their cutting edge by hiring the kind of top flight production and development specialists that have solved so many of the NWComplex technology problems in the past. The Preferred Alternatives Report, Feb. 1996, now even refers to Y-12 as "The Secondary Factory", and says nothing about the importance of the technical support specialists who are critical members of the production team.

1/33.10 First Question: Does DOE plan to operate Y-12 over the longer term future at the $100 million level shown for 2008 in the Preferred Alternatives report, page 41 ?

2/40.24 Second Question: How does DOE expect Y-12 to maintain the ability to attract and retain the kind of top quality talent that DOE seems to want so badly for their Labs ? Making weapon parts is just as important as designing them (ask our potential international antagonists), sometimes as difficult and more time consuming.

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTIONS:

In DOE's Preferred Alternatives report of Feb. '96, in the chart at bottom of page 39, the schedule for downsizing Y-12 is shown with workforce reductions completed by the end of 2002 and steady state operations commencing at the beginning of 2004 and continuing (to the end of that graph) in 2011.

In the PEIS Manning Levels Graph on page 4-51 of Vol.I, however, the employment levels for Y-12 is first shown for the year 2000 and rather than ceasing to fall in 2008, it shows a Y-12 employment level which continually drops beyond 2003 each third year for which the data are plotted out to the last year on the graph which is 2030 !

1/08.13 Question: Are the PEIS financial and socioeconomic impacts reported in DOE's Draft PEIS based on:

[a] these PEIS data given on page 4-51 of Volume I, or

[b] on the data shown on the page opposite, i.e. page 4-50 of PEIS Volume I, or

[c] are they based on the still different data presented by Mr. Whiteman in his Introduction to the Hearing Apr 1 in Oak Ridge which are still a different set of numbers for the downsized Y-12 ?

The choice may not be critical in impacting the ORR ROI, but surely will matter for the impacts on the City of Oak Ridge.

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT & QUESTIONS:

The Science-Based Stockpile Stewardship and Management Program marginalizes the role of the Production Plants, proposing trading the expertise and facilities proven to be a vital part of the Nation's nuclear weapons system over four and a half decades for a science-based approach which has DOE with admirable candor themselves admit is risky in the final summarizing paragraph of the SSMPlan (May 1995, page 13):

"Science-based stewardship and management of the U.S. stockpile has never been done before. Meeting this challenge will neither be inexpensive nor without risk."

1/40.33 Where is the Draft PEIS is such an admission of these shortcomings and their potential environmental impacts?

Why was the surer and less expensive approach of manufacturing enough weapons every year (say 10%) to keep the average stockpile age within limits accepted in the past as reasonable not given full consideration as a very credible alternative rather than accepting an SBSS&MP which "has never been done before" which is "neither inexpensive nor without risk"?

COMMENTS & QUESTION:

Why has DOE chosen to take unnecessary risks and forgo the more direct, less risky, and less expensive way to give the DOD the confidence it needs by remanufacturing the downsized number of weapons required to proven, tested specifications using the historic partnership between the Labs and Y-12? Is attracting brilliant scientists to duplicate weapon labs worth that added risk and cost to the public? In the DOE SSMP of May 1995, the pre-eminence of that motivation is revealed when DOE says (page 8, column 1, line 27):

"Perhaps most important, remanufacturing would not retain the required breadth and depth of nuclear weapon expertise and judgment that will be needed to address future concerns about the safety and reliability of an aging stockpile."

1/40.24 The Public notices that this DOE SSMP concern is for maintaining general nuclear weapon "expertise" at the Labs and is quite willing to do so at the expense of expertise in manufacturing technology at the production sites. A vigorous remanufacturing emphasis would require a vigorous Y-12, hardly provided by the Preferred Alternative (given to us in charts at the PEIS Hearing Apr.1&2, but not in the Draft PEIS) which cuts Y-12's Defense Programs supported employment from 3,126 in 1996 to 1,080 in 2003, a cut of 70%, while building up the Labs stockpile management program by a combined 30% (Pref. Alt. Report, Feb. 1996, pp.26&30).

The persistent argument raised by the Labs and some DOE staff that remanufacturing to old specifications will not be possible for the longer term future is not a sound one for secondaries and case parts. Y-12 has been doing remanufacturing for years, working with the Labs to solve the substitution problems that have arisen, solving them successfully and meeting all the specifications.

Furthermore the "remanufacturing" option is miscast perjoratively in this SSMP and PEIS which uses it in the narrow sense of rebuilding "to original specs when defects arose" (see PEIS Volume I, page 3-6, column 2, pp.2), whereas the best use of remanufacturing would be to keep the average age of the stockpile at a reasonable minimum.

2/40.33 Question: Why was remanufacturing not been given a fairer, more widespread debate in the development of the SSMP (not the PEIS) including inputs of outside production and DOD experts rather than adopting the SBSSMP (incl.NIF) approach which clearly and admittedly is driven by goals of protecting the Labs and attracting and holding top rank scientists to LANL and LLNL?

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTIONS:

A cadre of process development, technical support specialists at Y-12 over the past 40 years has been a vital part of the production team, available immediately to help solve problems and answering questions arising in HEU and Li processing, machining, and in secondaries surveillance. The SMPref.Alt.Report, (Feb.96 page 5&6), details the DOE decision to give "explicit responsibility for oversight of surveillance" and "for assurance of continued competence in weapons technology" to the weapons laboratories". This has never called for or been needed in the past. It will result in duplication of staffs and facilities and divided accountability.

1/33.01 Question: What is the intention of DOE for downsizing of the process development/technical support function at Y-12 which is a vital part of the production team? The PEIS does not address this crucial issue of Process Development/technical support except for announcing DOE's intention to try to overcome LLNL's obvious lack of competence in the areas DOE has already paid Y-12 to become competent in by doubling the expenditures on process development at LLNL (Pref. Alt. Rept.page 30 !

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTIONS:

In DOE's Preferred Alternatives report of Feb. '96, in the chart at bottom of page 39, the schedule for downsizing Y-12 is shown with workforce reductions completed by the end of 2002 and steady state operations commencing at the beginning of 2004 and continuing (to the end of that graph) in 2011.

In the PEIS Manning Levels Graph on page 4-51 of Vol.I, however, the employment levels for Y-12 is first shown for the year 2000 and rather than ceasing to fall in 2008, it shows a Y-12 employment level which continually drops beyond 2003 each third year for which the data are plotted out to the last year on the graph which is 2030 !

1/08.13 Question 1: Where are these PEIS Volume I, page 4-51 chart data discussed ??

Question 2: What is the source of the numbers plotted and what is the significance of the trends shown for the ORR Downsize, given in the lower half of Figure 4.2.3.8-1 on page 4-51 of PEIS Volume I ? This is the only place in the PEIS which shows data for Y-12 out to the year 2030, and this shows a continuously decreasing employment level and level of EM support discussed nowhere else. These PEIS data are directly contradicted by the cost table for downsizing shown in the Analysis of Pref.Alt. report, Feb. '96, page 9-22 which shows no decline in funding after 2008. Which is right ?

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTIONS:

The Draft PEIS says that three alternative plans for secondaries and case manufacturing were considered along with that of "no action".

1/33.05 The Y-12 proposal as stated in the PEIS is to downsize Y-12's manufacturing capability from the current
2350 direct DP workers to 870 workers. (See Summary, page S-35). Los Alamos's proposal (Ibid) is that
they could do the job with 321 directs, a seventh as many. Livermore's proposal (Ibid) was that they
could do the job with 290 directs, an eighth as many. But Livermore's proposal is on a very different
basis as stated in the Appendix on page A-82, 2nd column, line 4; namely the weapon parts production
capacity of the LLNL proposal is only one third of that of the for the Y-12 and LANL proposals.

Please explain how and why DOE considers these very different proposals to be *credible* alternatives for the nation's crucial secondaries and case manufacturing mission in evaluating and comparing the environmental impacts in the PEIS.

COMMENT LETTER

PAGE 1 OF 1

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENTS, REQUEST & QUESTIONS:

1/08.17 The Draft PEIS states in the Summary on page S-35, 1st column bottom, that the proposed plan is to cut
Y-12's manufacturing capability from the current 2350 current Defense Program workers to 870. The
kinds of employees making up this 870 total are reported in the Appendix, Volume 2, on page A-92.

But the data presented by Mr. Whiteman in his Introductory remarks to the Hearings April 1 & 2 in Oak
Ridge, were not these numbers, but 3126 current DP workers at Y-12 to be cut to a downsized level of
1080 in the year 2003, a cut of 2046 employees. The numbers given by DOE in their PEIS, on the other
hand, show a reduction in DP supported workers at Y-12 for the same years and for the same Case from
2350 to 870, a cut of only 1480 employees.

Question: The financial and socioeconomic analyses that constitute the heart of this PEIS were presumably
based on the downsizing data given in the PEIS, a decrease of 1480 DP workers. What then are the
financial and socioeconomic impacts of the new data presented in the Introductory Charts which call for a
cut of 2046 workers, 38% higher than those described in the PEIS on page S-35, and in Volume I on page
4-50 ?

2/08.18 Question 2: Please identify the skill mix that makes up the proposed 131 craftworkers. Without the breakdown of direct labor skills the Public cannot evaluate the feasibility of this level for meeting the proposed manufacturing requirements nor the reasonableness of the cross-over flexibility assumption.

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENT AND QUESTION:

1/40.23

Our Nation's defense posture recognizes the need to preserve nuclear weapons expertise. Just as important as preserving the capability of designing weapons is the importance of preserving the expertise of manufacturing them. The SBSSMP plan is built around a *science-based* future for maintaining our Nation's nuclear weapons capability rather than being the balanced plan the Nation needs which also is *manufacturing-based*. It has taken years to develop the capability to produce the kind of quality weapons we have in our stockpile in addition to developing the science.

How can the public and Congress have credibility in DOE's *science-based* plan which strips Y-12 (with decades of experience in manufacturing secondaries and cases) by 70% of present levels (see Pref. Alt. Report, Feb. 1996, page 39), but which surprisingly then provides for increases in the staffs of the 2 Weapon Labs by 30% in this same area of stockpile management (see ibid. page 26 & 30); areas in which neither Lab has any historic production capability. The public understands that knowing the *science* of building an airplane or a weapon is one thing, knowing how to *manufacture* them to demanding specs is something quite different

STOCKPILE STEWARDSHIP AND MANAGEMENT DRAFT PEIS COMMENT

NAME: William J. Wilcox, Jr.
ADDRESS: 412 New York Avenue, Oak Ridge, TN 37830
PHONE: (423) 483-4990

COMMENTS AND QUESTIONS:

1/40.23

When the experts at the Labs think about taking over and doing the Y-12 manufacturing function they focus on the science and know-how involved in producing secondaries and case parts. However, they may have an inadequate appreciation for what is involved in manufacturing spec-meeting weapons parts in the regulatory world DOE must operate in today. Certification of weapons parts for DOD in a Defense Nuclear Safety Board and regulation dominated world requires a world of discipline far different than one of just cutting metal parts on a fancy milling machine in the back of someone's laboratory to small tolerances. Understanding the science or technology (some which the Labs know or can learn from Y-12) is only one part of doing DOE's job.

2/33.05

The statements reflected by the Los Alamos and Livermore proposals on page S-35 of the PEIS Summary suggest some lack of appreciation for what is involved. They say they can do the downsized production job with only 321 people at LANL and only 290 at LLNL. Y-12, which has been doing that work for decades says it will require 870 people and that PEIS number is wrong - the correct number, given by Mr. Whiteman at the start of the April 1 hearing is that Y-12 will require 1,080 people, 3 to 4 times as many as the Lab proposals contend.

1/40.23 continued

Not only has Y-12 over the years had to master the science, technology, and art of making parts to weapons quality specs, but it has had to meet and conform to many other demands in so doing, demands which the Labs may be hard pressed to deliver in the context of their new, untried "science-based stockpile management" paradigmatic approach; requirements such as Conduct of Operations, OPSEC, DNSB, NIOSH, NEPA and other environmental requirements, waste management, etc. the rigid nuclear materials accountability system, nuclear criticality system, etc.etc. These are real requirements and real costs of manufacturing in today's world. DOE has chosen the Y-12 proposal as the Preferred Alternative over the two Lab proposals, but the public will puzzle over this unexplained preference - over and beyond the obvious stretch capacity advantage that Y-12 offers.

2/33.05 continued

Question: does DOE really believe that the Labs proposals spelled out in the PEIS (e.g. Summary page S-35) are credible alternative proposals? A real concern is that some future DOE management team or other oversight group on the look-out for even more cost savings, seeing these "alternatives" and assuming they are comparable, may be misled (by the apparently large savings to be made) into assuming the Labs can do the job as well as Y-12 with the result that DOE closes down Y-12 and moves secondaries/case production to the Labs. This would be a major loss to the Nation, not just in abandoned stretch capacity, but very likely in overall eventual cost, safety and quality.

Comments:

1/40.19 I am opposed to the manufacture of plutonium pits at Los Alamos National Laboratories. I lived downwind from the Rocky Flats Plant in Denver, Colorado for over 20 years. As you well know, Rocky Flats was raided by the FBI and shutdown, leaving behind a highly contaminated "superfund" site. The communities immediately surrounding Rocky Flats were left with polluted water supplies, diminished property values and unexplained illnesses.

Since then, I have had grave doubts about the ability of the Nuclear Weapons Complex to conduct its business with integrity and responsibility to the citizens of this country. And I question the DOE's ability to "oversee" such an industry.

2/40.78 As I write this, I believe there is still no site-wide EIS available for LANL. I believe that we, the citizens,

Comments:

1/40.07 We are writing to express our opposition to the Stockpile Stewardship and Management Program Draft EIS. The new and upgraded facilities called for in the draft are a threat to the Non-Proliferation Treaty, which we support in its attempts to eventually disarm nuclear powers. The rationale purported in the Draft — that these upgrades are necessary to safeguard the nuclear stockpile — is without merit. It is the informed opinion of experts that aging only affects reliability, not safety.

2/40.15 The additional funding called for in the Draft should be earmarked for clean-up and environmental programs.

3/10.10 Our coalition is primarily concerned with the health and vitality of our Penasco Valley watershed and communities, and feel an increased stockpile, and resulting waste disposal problems at LANL are a direct

Comments on the DOE hearing on April 11, Livermore, CA:

1/40.44 In the absence of underground tests the SS&M program is absolutely vital for maintaining the basics of nuclear weapons physics and keeping track on the condition of the weapon stockpile. In my view, a superpower like the United States must have the leading edge of nuclear weapons know-how, irrespective of the winds of day-to-day politics. This is not "nuclear madness". Who should have it? Perhaps Mr. Sadam or the Peoples' Republic of China?

During the years of the Cold War design projects always had to be done in an atmosphere of hurry and many aspects of weapons physics were left so to speak "unresearched". Precisely, because the Cold War is over, the conditions are suitable to conduct weapons research in a relaxed atmosphere with no pressing time limits. The proposed NIF superlaser seems to be an excellent tool to create conditions reminiscent to that of nuclear explosives in a microscopic scale.

2/21.07 In addition, the NIF superlaser will be an excellent research tool for the study of controlled themonuclear fusion, which is vital if civilization is to survive the energy crunch of the 21-st century. It is my understanding that the NIF superlaser will create high temperature conditions only in a microscopic scale and intends to study fusion not fission, therefore no nuclear waste is involved.

The dual purpose NIF facility is perhaps the best investment of taxpayers money. I want to register my full support.

Balazs Rozsnyai
Livermore.

Comments:

1/40.06 DOE's proposed Stockpile Stewardship and Management Program at LANL is totally injustified and dangerous to the health and well being of the people of NM and the world. Experts agree that the safety and reliability of the U.S. nuclear weapons stockpile can be maintained by existing surveillance programs and replication of parts as needed. The Stockpile Stewardship and Management Program simply provides LANL with the continuing capacity to design, produce, and test new nuclear weapons at a time when the rest of the world is grasping at worldwide nuclear disarmament on the eve of the signing of two significant global treaties—the Nonproliferation Treaty and the Comprehensive Test Ban Treaty. The Stockpile Stewardship Program will undermine the full acceptance of both these critical treaties, thus undermining the global security of us all.

2/40.15 Nuclear weapons have already cost us close to $4 trillion about equal to the national deficit—this is obscene—and now billions more will be wasted, on unnecessary facilities, while new nuclear waste will be generated.

1/40.06 continued And yet funding for cleanup, environmental restoration, and technology transfer is being cut. Even funding for the NM Environment Department LANL Monitoring Bureau is in danger of being axed as it becomes more effective. I would call this downright irresponsible. It seems to me the only safety DOE and LANL are concerned about is the safety of the weapons, not the safety of the people (Turn to back of page.)

Please continue on the other side if you wish to use additional space. THANK YOU—your comments are important to us.

1/40.06 continued | who live in this beautiful state. And don't count on WIPP—the people of NM are determined to keep WIPP closed for the safe, long term future of the ground water and of our beloved state. New Mexicans deserve good, safe jobs, not jobs at any cost. The SSAM Program must never be implemented. We must not continue to legitimize nuclear weapons. It's not OK. Thank you.

Comments:

1/40.07 | The Draft SS&M PEIS is totally unacceptable. It contradicts everything that the NonProliferation Treaty stands for and undermines the Comprehensive Test Ban Treaty. For years we have been told that LANL would not take over the work of Rocky Flats and that no new nuclear weapons would be designed + produced. We wanted to believe it because it is the sane thing. Who would continue this nuclear madness? at this point in history. Apparently the DOE has lost all reason.

2/40.12 | The cost of nuclear weapons in dollars is the cost of our national defict. In human health the cost has been beyond counting – nuclear weapons and their toxic waste is the biggest threat we have. If we have enemies still, post cold war, it is due to the nuclear proliferation

3/40.36 | that we are still spreading. Responsibile Stewardship demands that the DOE consider a passive, caretakers role in which weapon reliability be maintained through identical

4/40.33 Replication of parts, or to consider eliminating nuclear weapons altogether (which is preferable) The proposed upgrade of facilities & production plans are totally unacceptable. The recent Dome fire which threatened Los Alamos, released some radioactivity (according to monitors in Santa Fe) from old dumpsites?) Even though the fire

5/43.18 did not reach LANL itself, it is a warning to the Lab. We cannot afford to risk a Chernobyl incident here, especially when it has never been proved that nuclear weapons are necessary. We need to keep all scientists working into the next century cleaning up waste that we already have, not making more.

LANL needs to come into compliance with environmental law, stop all plans + projects, hold a site-wide EIS on the whole picture, and start working on the real problems that we have created — ozone depletion and the rest. It is insane that we have to worry for our lives + our health from our own Government. We are losing all faith in our leaders and many of the ills of our society are direct results of this. Show our

6/40.50 kids some hope and reverse this trend. Rewrite the SSM PEIS to include the caretaker option + the elimination of nuclear weapons altogether.

Attention: SSM PEIS

Dear Mr. Rose:

The Natural Resources Defense Council, Inc. ("NRDC") submits the following comments on the Department of Energy ("DOE" or the "Department") Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management (the "Draft PEIS").

1/40.85

I. THE DRAFT PEIS FAILS TO CONSIDER ADEQUATELY THE ENTIRE RANGE OF CURRENT AND PROPOSED ACTIONS CONNECTED WITH THE WEAPON STOCKPILE STEWARDSHIP AND MANAGEMENT ("WSSM" or "SS&M") PROGRAM AND REASONABLE ALTERNATIVES TO SUCH ACTIONS.

A. Because of the Substantial Changes in the Nature and Purpose of DOE's Atomic Energy Defense Activities, as Reflected in the Design and Implementation of a Long-Term Weapon Stockpile Stewardship and Management Program, the PEIS Must Consider in a Comprehensive Manner All Related, Connected, Cumulative and Similar Actions Designed to Achieve the Goals of Stockpile Stewardship and Management, Including Activities Asserted to be Ongoing.

1. The National Environmental Protection Act ("NEPA") requires preparation of an environmental impact statement ("EIS") on every proposal for major federal action significantly affecting the quality of the human environment. 42 U.S.C. § 4332. The Council on Environmental Quality ("CEQ") and DOE NEPA regulations provide guidance on when and how EISs should be prepared at the program level.

2. The CEQ Regulations state that a "proposal" exists at that stage in the development of an action when an agency "has a goal and is actively preparing to make a decision on one or more alternative means of accomplishing that goal and the effects can be meaningfully evaluated." 40 C.F.R. § 1508.23. In this case, DOE's stated stockpile stewardship and management goal is to "maintain the core

intellectual and technical competencies of the U.S. in nuclear weapons including research, design, development, testing, reliability assessment, certification, manufacturing and surveillance; to maintain all three nuclear weapons labs and the capability to resume nuclear testing if needed, and to maintain a safe and reliable U.S. nuclear weapons stockpile." Draft PEIS, p. 2-7. DOE is actively evaluating alternative means of accomplishing these goals.

3. The CEQ Regulations define "major federal action" to include the "adoption of programs, such as a group of concerted actions to implement a policy or plan; systematic and connected agency decisions allocating agency resources to implement a specific statutory program or executive directive." 40 C.F.R. § 1508.18(b)(3). DOE's NEPA regulations require preparation of a programmatic EIS to support a DOE programmatic decision in these circumstances. 10 C.F.R. § 1021.330. In this case, DOE is expressly considering a group of concerted actions to implement current national security policies for nuclear deterrence, arms control and nuclear proliferation, and determining how to allocate scarce agency resources to implement these policies. See Draft PEIS Chapter 2. Thus, this group of concerted actions together constitute a major DOE program for which a PEIS is clearly required.

In preparing an environmental impact statement, agencies shall make sure that the proposal which is the subject of the EIS is properly defined. Agencies shall use the criteria for scope (40 C.F.R. § 1508.25) to determine which proposal(s) shall be the subject of a particular statement. (See comment 13 below.) **Proposals or parts of proposals which are related to each other closely enough to be, in effect, a single course of action must be evaluated in a single impact statement.** 40 C.F.R. § 1502.4.

4. In evaluating the overall impacts of its Stockpile Stewardship and Management Program, DOE cannot ignore the effects of a large number of activities and projects that are integral parts of this program simply by claiming that they are "ongoing." It is well settled that NEPA applies to ongoing as well as new activities. 40 C.F.R. § 1508.18(a); see Andrus v. Sierra Club, 442 U.S. 347 n. 21 (1979)("'[M]ajor Federal actions' include the 'expansion or revision of ongoing programs.'"). Programmatic impact statements are "particularly appropriate" when an agency has an ongoing program that continues to have a significant effect on the human environment. NRDC v. Energy Research and Development Administration, 451 F.Supp. 1245 (D.D.C. 1978) (referring to programmatic EISs prepared by DOE's predecessor agency on ongoing waste management practices at the Hanford and Savannah River sites).

1/40.85 continued

5. The operative test is whether there is a "change in the status quo." Committee for Auto Responsibility v. Solomon, 603 F.2d 992, 1003 (D.C. Cir. 1979), cert. denied, 445 U.S. 915 (1980). In other words, significant changes in programs rising to the level of major federal actions which have or will change the status quo must be studied under the procedures outlined in NEPA. Public Service Co. of Colorado v. Andrus, 825 F.Supp. 1483, 1500 (D. Idaho 1993). A determination under this test is based to some extent on whether the proposed agency action and its environmental effects were within the contemplation of the original project when adopted or approved. Westlands Water Dist. v. U.S. Department of Interior, 850 F. Supp. 1388 (E.D. Cal. 1994); see Upper Snake River v. Hodel, 921 F.2d 232, 235 (9th Cir. 1990). As shown below, the changes to DOE's nuclear energy defense program lie far beyond the contemplation of the original program, and thus require a comprehensive PEIS in order to reexamine the entire program as a whole, not just individual parts.

6. In the recent case of Public Service Co. of Colorado v. Andrus, supra, the court found a number of changes in the status quo with respect to the management of nuclear waste at the Idaho National Engineering Laboratory ("INEL"). First, the court found that the volume of nuclear waste being brought to INEL and the frequency of shipments is increasing dramatically under the existing or "ongoing" programs at INEL. Id. Second, the court found a "significant change in the status quo" in the fact that the waste is no longer being reprocessed for further use, but simply being brought to INEL to be stored indefinitely. Id. The court said that this change "signaled a potentially significant change in the entire purpose of INEL, which for most of its history has served as an advanced research facility." Id. at 1501.

Third, the court noted that existing facilities at INEL are nearly filled to capacity and/or are nearing the end of their useful lives. These facilities are experiencing problems with corrosion, environmental contamination and other problems which call their continued use into serious question. Id. at 1500. Fourth, the court found that DOE is proposing to expand and reconfigure certain facilities, and will most likely have to build additional facilities, in order to accommodate all of the waste the agency wishes to bring to INEL. Id. at 1501. Finally, DOE announced its intention to develop and apply new technologies at INEL to reprocess the spent fuel into forms suitable for permanent storage in a geologic repository. Id.

7. In light of all these changes and new proposals, the court held that DOE must prepare a comprehensive, site-wide EIS addressing all nuclear waste activities at INEL. The court specifically stated that this EIS must review not just the "more recent proposals" but also "what DOE characterizes as 'ongoing'

1/40.85 continued

activities." Id. at 1502. The court characterized DOE as "seeking to evade NEPA review" by "characterizing all of its activities as ongoing" and "fractionalizing and segmenting its proposals." Id. at 1501. The court also required the EIS to include an analysis of all previous and proposed shipments of waste to INEL and all related activities, including the expansion and revision of storage facilities, as well as DOE's proposals to develop new processing technologies.

8. The purpose of a programmatic EIS is to trigger a comprehensive consideration of an entire program and a broader look at alternatives. Jones v. Lynn, 477 F.2d 885, 890-91 (1st Cir. 1973). A programmatic statement permits a "questioning or restatement of basic objectives and value judgements, assessments of progress and projections of future program directions, and a taking stock of what all this activity and expenditure has meant." W. Rogers, Environmental Law 937. In NRDC v. Administrator, Energy Research and Development Administration, 451 F. Supp. 1245, 1257 (1978), for example, the court cited an unpublished decision by the Eastern District of Washington that approved the Hanford programmatic waste management EIS:

> The [PEIS] reassessed and reevaluated the current waste management program at Hanford, including current storage and disposal practices. That [PEIS] provided [ERDA] with an environmental disclosure sufficiently detailed to aid in the decision as to whether and how to proceed with the current Hanford radioactive waste management program, and made available information to the public information concerning the environmental impacts of the current program and encouraged public participation in the development of that information.

In contrast, by fragmenting and segmenting its WSSM program, as it did in the INEL case, DOE cannot possibly analyze the overall program and consider relevant alternatives to the program as a whole.

9. In light of the NEPA requirements described above, DOE is not justified in its apparent belief that by merely designating large portions of the WSSM program as "continuing activities," it has been relieved of its responsibility under NEPA for making a thorough and comprehensive assessment of the broad impacts of the SS&M program as a whole, including an assessment of reasonable alternatives for accomplishing the program's substantially revised mission objectives. Nor can this requirement for comprehensive programmatic review be satisfied by sweeping virtually the entire existing base program into a supposed "No Action" alternative,

1/40.85 continued

or by relegating detailed consideration of ongoing activities to occasional review in a site-specific EIS. On the contrary, as explained above, the Courts have recognized that changed circumstances, particularly on the dramatic scale of those leading to the creation of the WSSM program, can make the major restructuring of a longstanding federal activity, such as nuclear weapons research, development, testing and production, a proposal for major federal action significant enough to trigger the preparation of a comprehensive PEIS.

10. Ironically, the existence of such dramatically changed circumstances has been repeatedly cited by DOE itself as the principal justification for the creation of the WSSM Program. In its FY 1997 Atomic Energy Defense Activities congressional budget request, submitted March 1, 1996, DOE explicitly links the emergence of the WSSM program to specific changes in the policy environment that took place between July 1992 and January 1996:

> Over the past several years, the United States policy governing the nuclear weapons stockpile *has undergone profound change* to reflect the new and evolving geopolitical and military structures of the post Cold War world. In 1992, the United States announced a halt in the production and design of new nuclear weapons and a moratorium on underground nuclear testing. In 1993 and 1994, the President and Congress directed the Secretary of Energy to establish a stockpile stewardship program to ensure the preservation of the core intellectual and technical competencies of the United States in nuclear weapons.
>
> In February, 1995, the Secretary of Defense submitted to the president and the Congress the Nuclear Posture Review, which established requirements for the Department of Energy related to maintaining nuclear weapons infrastructure and capabilities....In August, 1995, the President announced that the United States would pursue a true zero yield Comprehensive Test ban Treaty (CTBT) as a means of reducing the danger posed by nuclear weapons proliferation. The President outlined a series of safeguards that define the terms under which the U.S. would enter a CTBT. Safeguard A directs the conduct of the Stockpile Stewardship program to ensure the safety and reliability of the stockpile.
>
> In January, 1996, the Senate gave overwhelming approval to the START II Treaty. The treaty ratification text highlighted the nation's commitment to proceed with a robust stockpile stewardship

1/40.85 continued

> program,...*The Defense Programs Stockpile Stewardship and Management Program* is a single highly integrated technical program for maintaining the safety and reliability of the U.S. nuclear stockpile that *has evolved in response to these many new policies* (emphasis added). DOE Budget Request, Vol. 1 at 21-22.

11. In a similar vein, the Draft PEIS states:

> In response to the end of the Cold War and changes in the world's political regimes, the emphasis of the U.S. nuclear weapons program *has shifted dramatically over the past few years* from developing and producing new weapons to dismantlement and maintenance of a smaller enduring stockpile. Accordingly, the nuclear weapons stockpile is being significantly reduced, the United States is no longer manufacturing new nuclear weapons, and DOE has closed or consolidated some of its former weapons industrial facilities. Additionally, in 1992 the United States declared a moratorium[1] on underground nuclear testing, and in 1995 President Clinton extended the moratorium and decided to pursue a "zero yield" Comprehensive Test Ban Treaty (emphasis added)" PEIS at 1-1.

12. A recent DOE Final EIS, issued in August 1995, explicitly links the above developments to the creation of the WSSM program:

> For almost 50 years, nuclear tests were key to gathering data used for developing nuclear weapons and certifying their safety, reliability, and performance. Nuclear tests were also used to evaluate the effectiveness and certify performance of weapons that were redesigned. Since the 1992 moratorium on nuclear tests, *DOE has recognized that a new approach, based on scientific understanding and expert judgement, is needed* to ensure confidence in a nuclear deterrent and the U.S. stockpile....*DOE now intends to accomplish this [Atomic Energy Act] mission through the SS&M program....This new approach must rely on scientific understanding and judgement, not on nuclear testing and the development of new weapons, to predict, identify, and correct problems affecting the*

[1] Actually, in 1992 the United States Congress enacted a nine month moratorium and other restrictions on U.S. underground nuclear tests which President Bush very reluctantly signed into law.

1/40.85
continued

safety and reliability of the stockpile (emphasis added)." DARHT Final EIS at 2-5,6.

In all our years of reviewing EISs and litigating NEPA claims, we cannot recall a stronger case for comprehensive programmatic review of an ongoing federal activity based on radically changed circumstances. Because the WSSM program is an acknowledged, deliberate, and carefully planned response to these dramatically changed circumstances, all federal and federally-sponsored activities proposed for continuation pursuant to this program, as well as reasonable alternatives to these activities, must be considered fully in the PEIS.

13. In preparing EISs, including programmatic EISs, agencies must include all connected, cumulative and similar actions, 40 C.F.R. § 1508.25, whether they be new or continuing. 40 C.F.R. § 1508.18(a). Connected actions are defined as actions which are "closely related" and therefore should be discussed in the same impact statement. 40 C.F.R. § 1508.25. Actions are connected, among other things, if they "are interdependent parts of a larger action and depend on the larger action for their justification." 40 C.F.R. § 1508.25(a)(1)(iii). Actions are also connected if they "cannot or will not proceed unless other actions are taken previously or simultaneously." 40 C.F.R. § 1508.25(a)(1)(ii).

Agencies must also include in the EIS all cumulative actions, which are actions which, when viewed with other proposed actions, have cumulatively significant impacts. 40 C.F.R. § 1508.25(a)(2). Agencies should also include in a single EIS all "similar actions" when the best way to assess adequately the combined impacts of similar actions or reasonable alternatives to such actions is to treat them in a single impact statement. 40 C.F.R. § 1508.25(a)(3). "Similar actions" are defined as actions which, when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together. Id.

In evaluating the intensity of a proposed action to determine its significance, the CEQ regulations at § 1508.27(7) require agencies to consider whether "the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts." The regulations further define "cumulative impact" as "the impact on the environment which results from the incremental impact of the action when added to other past, present and reasonably foreseeable future actions regardless of what agency (federal or non-Federal)or person undertakes such other

1/40.85
continued

Mr. Jay Rose
May 7, 1996
Page 8

actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. Id. See NRDC v Hodel. 865 F.2d 288 (D.C.Cir. 1988).

There can be no doubt about the highly interdependent, similar, connected and cumulative quality of the actions now underway and proposed to be undertaken pursuant to the Stockpile Stewardship and Management Program. The FY 1997 DOE Budget request refers to "intensive Stockpile Stewardship and Management planning processes [that] we have had underway for the past two years. Budget Request at 22. As described by DOE:

> the SS&M Program *is a single, highly integrated technical program* for maintaining the safety and reliability of the U.S. nuclear stockpile in an era without nuclear testing and without new weapons development and production (emphasis added). DARHT Final EIS at 2-5.
>
> The Defense Programs Stockpile Stewardship and Management Program *is a single, highly integrated technical program for maintaining the safety and reliability of the U.S. nuclear stockpile....all stockpile stewardship and management activities have achieved a new, closer linkage to each other* as evidenced in the *draft Stockpile Stewardship and Management Plan* and the ongoing Programmatic Environmental Impact Statement process. DOE FY 1997 Budget Request, Vol. 1, at 22.
>
> FY 1997 will be year in which we begin to look forward to what needs to be done, as opposed to the last four to five years during which the focus has been on responding to major policy shifts such as the implementation of the moratorium on underground nuclear testing and cessation of design and production. *The primary focus of activity will be on implementation of the Stockpile Stewardship and Management Plan, currently being drafted, which provides a highly integrated program plan consistent with current policy guidance.* Id. at 44.
>
> In the *new paradigm of closer integration between Stockpile Stewardship and Management activities*, there are also issues that will be addressed jointly. The Stewardship program will play a major role in reducing the vulnerability of the smaller stockpile to single-point and common-mode failures, principally through research

1/40.85 continued

> *base support of the new Enhanced Surveillance Initiative* funded in the Stockpile Management decision unit. The Stewardship and Management programs *also have shared responsibilities in advanced manufacturing and systems engineering studies to integrate technological drivers such as advanced computing into an efficient and effective production complex of the future*. The Dual Revalidation program, managed by Stockpile Management, *will encompass both laboratories and plants in a new joint process for validating the safety, reliability, and performance of the stockpile over time*. Finally, the Radiological/Nuclear Accident Response program, funded by Stockpile Management, *utilizes capabilities throughout the weapons complex, including weapons expertise at the laboratories and specialized capabilities resident at the DOE facilities in Nevada*. Id. at 22.

Clearly, a NEPA-compliant programmatic analysis of such a "highly integrated" and "intensively planned" program would not seek to unbundle it, and thereby attempt to disguise the vast majority its proposed actions either as "continuing activities" in a falsely labeled "No Action" alternative, or as prospective future actions that "cannot be defined to the degree necessary" to be fully considered as part of the proposed action. Draft PEIS at 3-21.

B. The Draft PEIS Has Not Considered The Full Range of Proposed and Potential Stockpile Stewardship Activities That Is Required by NEPA.

DOE has characterized a number of potential stockpile stewardship facilities as not "ripe" for NEPA review because "they have not reached the stage of development and definition that is necessary for evaluation and decision making." Draft PEIS at 1-5. This claim has no basis in law and is not supported by the facts.

2/41.17

1. (a) "Agencies shall prepare statements on broad actions so that they are relevant to policy and are timed to coincide with meaningful points in agency planning and decisionmaking." 40 C.F.R. § 1502.4(b).

   (b) "Environmental impact statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." 40 C.F.R. § 1502.2(g).

   (c) "Agencies shall integrate the NEPA process with other planning <u>at the earliest possible time</u> to insure that planning and decisions reflect environmental values, to

avoid delays later in the process, and to head off potential conflicts. 40 C.F.R. § 1501.2.

2/41.17 continued

2. The PEIS contains brief one-paragraph descriptions, and cursory generic environmental impact analyses, of the following so-called "Next Generation Stockpile Stewardship Facilities:" the Advanced Hydrotest Facility, the High Explosives Pulsed Power Facility, and the Advanced Radiation Source (X-1) and Jupiter Facility. PEIS at 3-20,21,22, and 4-517,518,520,521.

3/40.56

3. On the one hand, DOE appears to be laboring under the misapprehension that because the above projects have not yet entered the stage at which they receive congressional "line item" funding for construction, that they may be excluded from a programmatic impact analysis. On the other hand, DOE also excludes from programmatic consideration a large number of other WSSM projects and facilities on the basis that, "as a general rule," they had "broken ground" prior to September 1995. The systematic application of these two artificial constructs reduces what is supposed to be a "programmatic" analysis into a brochure for three site-specific projects for which no reasonable alternatives to DOE's preferred alternative have been identified, much less honestly and competently analyzed and compared.

2/41.17 continued

4. According to DOE, "the next generation of potential stockpile stewardship facilities cannot be developed and described to the degree necessary to perform detailed environmental impact analysis in this PEIS." Draft PEIS at 4-517. Whether or not this statement is true -- and in some cases we doubt that it is -- it is irrelevant. The ability to perform detailed (i.e. site-specific) environmental impact analysis is <u>not</u> the relevant standard for inclusion of project in a PEIS. Site-specific analysis can come later. 40 C.F.R. § 1508.28. <u>See</u> <u>NRDC v. ERDA</u>, 451 F.Supp. 1245 (D.D.C. 1978):

> As a general rule, the preparation of a PEIS does not obviate the necessity of preparing a particularized impact statement for individual major federal actions that are components of a subject program. Because programmatic statements are primarily concerned with analyzing the cumulative or synergistic environmental impacts of a program as a whole, they generally are unable to reflect a considered analysis of the particularized actions of individual federal actions. Yet such analysis of particularized aspects of individual federal actions must be performed under the mandate of section 102(2)(C). Thus,

2/41.17
continued

> "site-specific" EISs will usually be necessary to supplement the environmental analysis of a programmatic impact statement.

451 F. Supp. at 1258 (emphasis added). The Ninth Circuit also required a programmatic EIS to consider reasonably foreseeable similar projects that are part of the overall development plan:

> Where there are large scale plans for regional development, NEPA requires both a programmatic and site-specific EIS....This court has held that where several foreseeable similar projects in a geographic region have a cumulative impact, they should be evaluated in a single EIS....There, emphasizing the likelihood of future development, the court remanded to the agency for further consideration of cumulative impact because the agency had examined single projects in isolation without considering the net impact that all the projects in the area might have on the environment.

City of Tenakee Springs v. Clough, 915 F.2d 1308 (9th Cir. 1990).

The relevant standard is whether these facilities are under active investigation as part of the WSSM program, such that their inclusion in a broad programmatic analysis of environmental impacts and reasonable alternatives would assist in ensuring that these statements are "relevant to policy," "timed to coincide with meaningful points in agency planning and decisionmaking," and "serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made."

5. As exemplified by the current draft PEIS, DOE's current approach virtually ensures that the primary function of the PEIS will be to justify decisions already made, thereby placing the Department in violation of NEPA. In its FY 1997 Budget Request, the Department itself admits:

> The impact of the announcement of the preferred alternative [construction and operation of the National Ignition Facility and Contained Firing Facility at LLNL and the ATLAS Facility at LANL] on the FY 1996 and FY 1997 budgets is minimal. Funding for the three Stockpile Stewardship facilities highlighted above *has been programmed into the FY 1997 and outyear budget*

2/41.17
continued

> *requests* (emphasis added)." FY 1997 Budget Request, Vol 1. at 28.

In NEPA terms, this candid admission of the irrelevance of the SS&M PEIS and ROD for the Department's own planning and budgeting is the proverbial "smoking gun." Unfortunately, this gun isn't merely a smoking pistol. In preparing this draft PEIS, the Department has trained an M-16 on the National Environmental Policy Act, and set the trigger on automatic fire.

6. DOE claims that it is in a position to provide only "a broad description of what these three facilities might look like." PEIS at 3-21. This is a transparent falsehood. There is considerable documentary evidence that the design and engineering of these "next generation" facilities are under active exploration by DOE and its national laboratory contractors (see below), and no one disputes that these facilities are components of a highly integrated long-term plan for Stockpile Stewardship and Management. Indeed, some of these "next generation" facilities may actually be available sooner, at considerably less expense, and with lesser aggregate environmental impact, than the National Ignition Facility (NIF) which is treated in the PEIS as a preferred alternative for proposed action at a preferred site.

7. Also, DOE should reacquaint itself with the EIS requirement for federal and federally-assisted research, development, and demonstration programs involving new technologies that, if applied, could significantly affect the quality of the human environment:

> Statements shall be prepared on such programs and shall be available *before the program has reached a stage of investment or commitment to implementation likely to determine subsequent development or restrict later alternatives* (emphasis added)." 40 C.F.R. § 1502.4(e)(3).

8. The Advanced Hydrotest Facility (AHF) - Conceptual designs of this facility were circulating in the DOE weapons community more than three years ago, and NRDC is persuaded that considerable additional design work on the facility has been accomplished in the interim. Under the heading "Core Stockpile Stewardship-Core Research and Advanced Technology, and under the "Programmatic Category" entitled "Design Assessment and Advanced Technology, the FY 1997 DOE budget request contains the following information regarding development of the Advanced Hydrotest Facility:

2/41.17
continued

MEASURABLE PERFORMANCE ACTIVITIES:
FY 1995: ....
- Tested technology for an Advanced Hydrotest Facility, including a full inductive adder power modulator.
FY 1997: ....
- Continue Advanced Hydrotest Facility development activities including development of physics design requirements and research of potential pulse power machine technologies. FY 1997 DOE Budget Request, Vol.1 at 77.

Under a more detailed "Programmatic Subcategory" entitled "Design Assessment and Advanced Technology/Physics Detail" the following descriptions of work are provided:

MEASURABLE PERFORMANCE ACTIVITIES:
FY 1995: ....
- Tested technology necessary for an Advanced Hydrotest Facility, including the development of a full inductive adder power modulator, and development of an electromagnetic code for simulating electron beam propagation in non-linear lines.
FY 1996: ....
- Continue Advanced Hydrotest Facility development activities.
FY 1997: ....
- Continue Advanced Hydrotest Facility development activities including:
-- Development of initial physics design requirements for the potential facility.
-- Preliminary design activities for advanced research pulse power machines required to evaluate competing technologies for inclusion in facility design. Id. at 79.

The FY 1997 DOE Budget Request also notes that while the "Stockpile Stewardship and Management Plan, currently in draft, will provide *the primary programmatic guidance for FY 1997*", other important planning documents "include ... *the developing advanced hydrodynamics program plan* (emphasis added)." Id. at 57.

Under the heading "SIGNIFICANT CHANGES FROM FY 1996," the budget request lists the following: "Enhance the support of activities to investigate the

2/41.17
continued

potential of advanced facilities to replace underground nuclear testing: + $9.5 million." Id. at 57.

Under the Heading "Highlights of the FY 1997 Budget Request - Program Increases," there is the following explanation: "Increases for advanced hydrodynamic research and development contained in the Physics subprogram (net + $9.5 million) is *for technology development needed for the next generation advanced hydrodynamics facility* (emphasis added)." Id. at 25.

In sum, the Department has both broad programmatic and more specialized plans for the design and development of the Advanced Hydrotest Facility, and is devoting increasing budgetary resources to these tasks. The exclusion of the AHF from the analysis of proposed actions in the PEIS is not supported by the facts, and is a violation of NEPA.

9. The High Explosives Pulsed Power Facility (HEPPF) - This "next generation" facility is misleadingly presented in the PEIS as though it were *sui generis*, when in fact it is the direct outgrowth of the longstanding Athena program at the Los Alamos National Laboratory that uses pulsed-power technology "to explore high-energy density physics in support of the nuclear weapons program." Los Alamos Science, No.21, 1993, p. 64.

The Athena program uses two methods to generate intense electrical pulses: a large capacitor bank called Pegasus II and a high-explosive pulsed power generator called Procyon. Just as the Atlas facility at Los Alamos (one of three new facilities that make up the DOE's "preferred alternative" in the draft PEIS) is the prospective follow-on facility to Pegasus II, the HEPPF is the prospective follow-on to Procyon. As noted by a former director of High Energy Density Physics at Los Alamos three years ago,

> Each of our capabilities can be extended to higher energies for even more interesting applications. The next advance in Laboratory capacitor banks is Atlas, a 25-megajoule machine that will permit us to study high energy densities over tens of cubic centimeters. The Procyon high-explosive pulsed-power generator will be followed by a more advanced system that will deliver in excess of 200 million amperes. Id. at 69.

High-explosive pulsed power is also currently the subject of an unprecedented program of scientific cooperation involving the Los Alamos National Laboratory and the Russian Institute of Experimental Physics, better known by its former

2/41.17
continued

Soviet code name, Arzamas-16, the former Soviet Union's first nuclear weapon design laboratory, which has done extensive work on the development of high-explosive pulsed power machines. The draft PEIS provides none of this essential background, and provides absolutely no factual or analytical basis for its grossly uneven treatment of what are in effect *parallel projects within the same program at the same national laboratory*! Far from justifying the exclusion of HEPPF from the proposed action, what scanty data there is the draft PEIS strongly suggests that HEPPF could well be made available sooner and far more cheaply than, for example, the NIF.

> HEPPF would probably be sited at NTS because of the amount of high explosives and an existing infrastructure is already available. A likely candidate site would be the Big Explosives Experimental Facility (BEEF) at NTS....The facility has the capability to support many of the sophisticated diagnostic techniques needed for the evaluation of hydrodynamic and pulsed power experiments containing large amounts of HE. Existing facilities at NTS would be used, to the extent practical, to develop HEPPF. Draft PEIS at 4-520, 521.

The exclusion of high-explosive pulsed power generally, and the HEPPF in particular, from the programmatic analysis of proposed SS&M actions in the PEIS is not supported by the facts, and is a violation of NEPA.

10. <u>The Advanced Radiation Source (ARS [X-1]) and Jupiter Facility</u> - Aside from a passing reference in a one-paragraph summary of the No Action alternative for Stockpile Stewardship, the Sandia National Laboratory's longstanding and extensive program to develop ever more powerful advanced pulsed-power x-ray sources is omitted from the descriptions of the SS&M program contained in the PEIS. Similarly, the prospective role of this program in science-based stockpile stewardship is relegated to a one paragraph discussion of the ARS(X-1) as a "next generation" stockpile stewardship facility. Draft PEIS at 3-22.

However, publicly available documentation suggests that this characterization of the ARS(X-1) project is misleading and unsupported by the facts. According to news reports, recent breakthroughs in controlling the symmetry of implosion in Sandia's Saturn pulsed power accelerator have more than quadrupled Saturn's x-ray output, to about 85 trillion watts (terawatts). According to Don Cook, Director of Sandia's Pulsed Power Sciences Center, this success means that it now appear possible to reach 150 terawatts on Particle Beam Fusion Accelerator II

2/41.17
continued

(PBFA II), rather than the 50-100 terawatts that it was originally designed to produce.

> In the coming months, as Labs researchers achieve those output levels on PBFA II, Sandia will begin preparations to build its next generation X-ray source, the X-1 Advanced Radiation Source. The X-1 ARS would provide four times the peak X-ray output of PBFA II, quadrupling the Labs' X-ray generation capabilities from 2 million joules per shot (PBFA's peak output) to 8 million joules (megajoules). "Until recently, our objective with the X-1 was to produce up to 200 trillion watts in a lab here at Sandia," Don says. "But the recent breakthrough on Saturn suggests that the X-1 might go even higher, possibly to 400 trillion watts."
>
> By continuing to scale up Sandia's accelerator capabilities, he says researchers in the "laboratory" can continue to close in on approximating the extreme conditions found inside a weapon as it detonates. Future accelerators also will help validate three-dimensional computational models that simulate nuclear detonations. *Construction of the X-1 ARS, to be located in Area 4, would begin in 2000 and be completed by 2003.* The pulsed power team hopes to reach the accelerators maximum output levels by about 2005. Then, if results on the X-1 warrant scaling up further, construction of a new super accelerator currently known as Jupiter would produce as much as 32 megajoules of energy by around 2015. Because of the amount of X-ray energy it would produce, 16 times that of the building-booming PBFA II, Jupiter would likely be located at the Nevada Test Site ....to explore the possibility of "high gain" with Inertial Confinement Fusion (ICF) at the level of 100 to 1000 megajoules of fusion energy, the output level needed to make fusion energy sources practical in a power plant....
>
> He [Sandia scientist Juan Ramirez] adds that *one of Sandia's goals in planning the X-1 is to keep the costs of the facility manageable* (less than $100 million to build) "so that the decision to construct it remains a technical and programmatic decision rather than a political one," he says. No formal decision has been made to build the X-1, he says. *Sandia has begun setting technical specifications and performing feasibility studies and cost determinations.* "Turn-of-the-

2/41.17 continued

century X-1 Advanced Radiation Source to succeed PBFA II." *Sandia Lab News*, March 29, 1996, at 4.

Another recent article emphasized the important connections between Sandia's pulsed power accelerators and the broader objectives of the SS&M program:

> Data generated inside Labs accelerators are being used to test three-dimensional computer codes being developed within the nuclear weapons complex that simulate what happens inside a nuclear weapon when it detonates, such as the radiation flow and radiation coupling between the primary and secondary portions of a nuclear weapon, explains Don [Cook]. Such simulations are becoming increasingly important as the US seeks a worldwide ban on nuclear testing. "Nuclear weapons are huge sources of X-rays," he says. *"Part of Sandia's science-based stockpile stewardship mission requires us to scale up both our laboratory x-ray sources and our computational capabilities so that we can do the job we used to do in Nevada, but must now learn to do without ever actually detonating a weapon.* That will require simulations on very good computer codes, tested against data produced in part inside Sandia accelerators....*The increased radiation outputs will also help Labs weapons researchers study radiation hardness issues and ensure that electronics and other components in nuclear weapon arming, fusing, and firing systems will continue to work as expected in hostile environments*..."Labs' pulsed power team achieves record breaking x-ray outputs on its Saturn accelerator." Id. at 1, 5.

In sum, the X-1 ARS is being developed to support stockpile stewardship objectives on a schedule that parallels that of the NIF (i.e. startup by 2003), and yet neither the X-1 nor Sandia's already extensive current accelerator pulse power program are included in the programmatic analysis and discussion of proposed SS&M actions and reasonable alternatives.

4/41.18

C. As a Result of Its Fragmented and Segmented Approach, The Discussion of the Entire Stockpile Stewardship Program Has Been Unreasonably Narrowed Down to a Discussion of Three Specific Projects.

1. The three specific projects that comprise the Department's preferred alternative in the draft PEIS represent only a small fraction of the total facilities, activities, and environmental impacts involved in the SS&M program. As shown in the

4/41.18 continued

preceding pages of these comments, DOE has achieved such an anomalous result in the draft PEIS by violating some of CEQ's best known regulations governing the preparation of such statements. Another, and simpler, way of demonstrating the overwhelming inadequacy of what has been produced is simply to list the publicly acknowledged major components of the SS&M program that are not adequately discussed, or in many cases, even mentioned, in the current draft PEIS:

--Dual-Axis Radiographic Hydrotest Facility (DARHT). According to a recent Memorandum Opinion and Order in the United States District Court for the District of New Mexico, the parties to the DARHT NEPA suit (which delayed DARHT construction for over a year pending completion of an adequate EIS) "agree that DARHT will have significant environmental effects and will be covered by the SS&M PEIS and the [site-wide] EIS." Civil Action No. 94-1306-M at 9 (D.N.M. 1996). However, this "coverage" in the draft PEIS consists of the following: "for the purposes of this PEIS, DOE includes DARHT as an existing facility at LANL because DOE has reached an independent decision to construct and operate the facility." Despite DARHT's construction being only 30% complete at the time the draft PEIS was issued, and despite the fact that a Federal Court found that DOE had acted illegally in beginning construction of DARHT without first preparing an EIS, the draft PEIS mistakenly treats DARHT as a facility that had legally broken ground prior to September 1995, and therefore includes it as part of the "No Action" alternative without further consideration of programmatic impacts and reasonable alternatives. DARHT's status as an independently justified interim action supported by its own site specific EIS does not relieve DOE of the obligation to include DARHT in a broad programmatic assessment of the SS&M program.

--Processing and Environmental Technology Laboratory (PETL) This $49 million dollar facility, scheduled to begin construction in the first quarter of FY 1997, and to be completed by the first quarter of FY 2001, will be used "for the development of advanced stockpile surveillance technologies, the assessment of age-related defects identified during routine surveillance, and the development of cost-effective manufacturing technologies for retrofit and replacement [nuclear weapon] components." The Stockpile Stewardship and Management Program, DOE Office of Defense Programs, May 1995, at 15. *"The PETL will replace a number of existing facilities distributed throughout Sandia, some of which would require modification to meet current safety standards in order to used for planned stockpile stewardship activities* (emphasis added)." Id. at 15. Despite its obvious programmatic and site-specific environmental impacts, the PETL is not discussed in the SS&M PEIS.

4/41.18
continued

–<u>The Chemistry and Metallurgy Research (CMR) Building Upgrades Project</u> - Despite being the largest structure at the Los Alamos National Laboratory (LANL), this $204 million, 10 year project to upgrade the main building used for analytical work with toxic plutonium, uranium, and their alloys, is not mentioned in the PEIS and also lacks its own independent EIS. The project began during the third quarter of FY 1993 and is scheduled for completion at the end of 2002. Given the critical importance of this project to the ability of LANL to safely perform its SS&M program missions, its exclusion from the PEIS is untenable and a violation of NEPA.

–<u>The Accelerated Strategic Computing Initiative</u> - Considered by many experts to be the technical core of the science-based stockpile stewardship program, this large (approximately $120 million annually) 15-year program (FY1996-2010) is not even mentioned, much less meaningfully discussed in the PEIS, but it is intended to "create 3-D, full systems virtual testing and [nuclear weapon and weapon component] prototyping ability based on advanced weapon codes and high performance computing." DOE FY 1997 Budget Request at 68. "*With the President's decision to pursue a Zero-Yield Comprehensive Test Ban Treaty, computational simulation of nuclear events has become the critical core element of weapon predictive capability and Science-Based Stockpile Stewardship.*" Id. at 81. The global security and nonproliferation impacts on the human environment of any nation, agency, or subnational group achieving the capability confidently to conduct full system tests of nuclear weapon prototypes in "virtual reality" are both varied and profound, and yet remain unanalyzed in the draft PEIS.

– <u>The Los Alamos Neutron Science Center (LANSCE)</u> - In FY 1996, a major change in the purpose and need for this facility occurred when DOE Defense Programs assumed management of LANSCE from Energy Research. According to DOE, "the LANSCE facility provides *a new source of critical data in the detection of small-scale material defects which might serve as indicators of weapon component aging (deterioration/damage) and in the prediction of material performance* (emphasis added)." DOE offers no basis for excluding the continued operation and proposed upgrading of this facility from the PEIS discussion of SS&M alternatives. The LANSCE upgrade is expected to cost $172 million through FY 2000. LANL Institutional Plan, 1996-2001, p. 20.

– <u>The Weapons Experimental Tritium Facility</u> (WETF) - Located at LANL, this facility received Sandia's Tritium Research Lab inventory in FY 1995, and is scheduled in FY 1997 to "perform experiments...to meet Stockpile Stewardship programmatic needs." Despite its obvious environmental impacts and

4/41.18
continued

programmatic role, DOE offers no justification for excluding continued operation of this facility from consideration in the PEIS.

– <u>The Los Alamos Critical Experiments Facility</u> - these experiments are highly proliferation sensitive, and potentially dangerous, even lethal, to accidentally exposed personnel. Consideration in the PEIS of the continued operation of this facility in support of the SS&M program is highly appropriate, indeed, mandatory, given its obvious environmental and programmatic impacts.

– <u>The Low-Yield Nuclear Explosives Research</u> (LYNER) Facility - completed only in FY 1995, LYNER is a tunnel complex at the Nevada Test Site that is scheduled to be the site of a continuing program of "subcritical" nuclear experiments beginning in FY 1996. Neither the LYNER facility nor the program of subcritical experiments slated to be conducted there under the aegis of the SS&M program are considered in the draft PEIS. As shown below, the conduct of these tests underground at the LYNER facility, and the programmatic purpose and need for subcritical experiments of any kind, wherever conducted, are both controversial issues that must receive full and fair analysis in the PEIS, including consideration of reasonable alternatives to the proposed action.

5/40.02

II. THE DRAFT PEIS FAILS TO CONSIDER THE PROGRAMMATIC DECISION ON WHETHER TO PROCEED WITH PROPOSED SUBCRITICAL HYDRONUCLEAR EXPERIMENTS AS PART OF THE STOCKPILE STEWARDSHIP AND MANAGEMENT PROGRAM, AND IF SO, WHERE TO CONDUCT SUCH EXPERIMENTS

A. The Proposed Subcritical Tests are Clearly Part of DOE's Stockpile Stewardship and Management Program

1. DOE's planned subcritical tests clearly fall within the scope of DOE's proposed stockpile stewardship and management program. DOE considers these proposed tests one means of achieving its stockpile stewardship goals. They are part of the agency's group of concerted actions to achieve US national security policies. DOE plans to allocate scarce agency resources to these tests rather than to alternative actions. These tests are clearly connected to the Stockpile Stewardship and Management Program, since they are interdependent parts of the overall program and depend upon that program for their justification.

2. There seems to be no dispute that the proposed subcritical tests are part of DOE's Stockpile Stewardship and Management Program. To the contrary, the agency has

5/40.02 continued

expressly characterized these tests as "an important element of Science Based Stockpile Stewardship." Memorandum for the Secretary from Victor H. Reis, Asst. Secretary for Defense Programs 1 (Oct. 17, 1995). The Draft PEIS also notes: "Other aspects of stockpile stewardship activities at NTS include ...subcritical dynamic experiments". Draft PEIS at A-43. Yet except for this passing reference, there is no reference at all in the entire draft PEIS to these proposed tests.

B. There Is No Justification for Failing to Analyze the Proposed Subcritical Tests in the Draft PEIS

1. These proposed tests cannot be considered part of DOE's self-styled "next generation" of facilities that are not discussed in the Draft PEIS because, according to the agency, "they have not reached the stage of development and definition that is necessary for evaluation and decision making." Draft PEIS at S-5. We have challenged above the application of this standard to a number of proposed facilities that are the subjects of DOE-sponsored research and development activities leading to deployment within roughly the same time period as the National Ignition Facility, the principle component of DOE preferred PEIS alternative. Similarly, with respect to subcritical tests, DOE has already approved such tests in principle and carried out preparatory activities, including mining of the test site. In fact, DOE had originally scheduled these tests to begin next month.

2. Nor is DOE is justified in characterizing the proposed tests as continuing activities that need not be discussed in the PEIS. As explained in NRDC's comments on the draft EIS for the Nevada Test Site (which are incorporated herein by reference), ongoing non-nuclear hydrodynamic testing and dynamic experiments are a completely different type of activity than the subcritical nuclear tests now proposed. Similarly, previous underground nuclear weapons testing was qualitatively and quantitatively different from the proposed subcritical testing, was carried out in support of vastly different national security policies, and was halted by a moratorium in 1992. DOE did not even begin mining activities for the LYNER test site until March 1993, well after the passage of the Hatfield-Exon-Mitchell Amendment instituting a nine-month moratorium on U.S. underground nuclear tests, which President Clinton subsequently extended indefinitely. Moreover, DOE did not announce the approval in principal of such tests until October 1995, after DOE was in receipt of the President's announced zero-yield test ban policy and had largely formulated the main elements of its SS&M program in response to specific Congressional and Presidential Directives received

5/40.02 continued

prior to that date. For these reasons, the subcritical tests must be viewed as integral part of DOE's proposed SS&M program, rather than a "business as usual" continuation of previous testing activities.

3. Courts have considered restart of a DOE production reactor to be a proposal for major Federal action significant enough to trigger preparation of an EIS. NRDC v. Vaughan, 566 F. Supp. 1472 (D.D.C. 1983). In Vaughan, the court required DOE to prepare a comprehensive EIS addressing all potential environmental impacts from restart of the L-Reactor, not just, as DOE argued, the incremental impacts of restart as compared to previous operation. Id. at 1475-76. The resumption of underground nuclear tests, while in theory not nuclear test "explosions," should nevertheless be considered a proposal for major Federal action requiring a comprehensive analysis in the PEIS(especially in a case such as this where the circumstances have changed so dramatically), because they pose a risk of violating the President's "zero yield" policy, they are highly controversial, and their compliance with the impending Comprehensive Test Ban Treaty may not be susceptible to confident determination by other treaty parties, weakening support for the treaty and potentially obstructing its ratification by certain countries.

4. Even if the testing were appropriately characterized as an ongoing activity, as explained above, courts have required agencies to prepare EISs where an ongoing project or program undergoes changes which themselves amount to major Federal actions. Public Service Co. of Colorado v. Andrus, 825 F. Supp. 1483, 1500 (D. Idaho 1993); see also 40 C.F.R. § 1508.18(a) (major Federal action can include new and continuing activity)). In Public Service Co., the court characterized DOE as "seeking to evade NEPA review" at the INEL facility by "characterizing all its activities as 'ongoing,' by fractionalizing and segmenting its proposals, and by its strenuous opposition to the NEPA positions advanced by the State of Idaho." Id. at 1501-02.

In the present case, DOE must admit that the proposed subcritical tests represent a major change in the status quo from previous testing, since prompt critical or supercritical tests involving fissile materials and high explosives are still prohibited by the moratorium.

5. The proposed subcritical tests pose potentially significant effects that require discussion in the PEIS. The CEQ NEPA regulations define the term "significantly" to include, among other things, consideration of the following:

a. The degree to which a proposed action affects public health or safety;

5/40.02 continued

b. The degree to which the effects on the quality of the human environment are likely to be highly controversial;

c. The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks;

d. The degree to which the action may establish a precedent for future actions with significant effects or represent a decision in principle about a future consideration;

e. Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.

40 C.F.R. § 1508.27(b). In addition to potential environmental impacts from the proposed subcritical tests, any discussion of which seems to be completely absent from the PEIS (EIS), the proposed tests would be highly controversial and involve unique and unknown risks from a nonproliferation standpoint. Because of the ongoing CTB treaty negotiations, they could also establish a precedent for future testing activity by other nations with significant and potentially unwelcome effects. The first round of tests could also represent a decision in principle about the long-term prospects for such tests. The subcritical tests, therefore, represent a proposal for major Federal action with significant environmental effects that should be discussed in the PEIS.

6. Unlike the decision on tritium supply (see Draft PEIS at 1-9), DOE has not determined that a decision on whether to conduct subcritical nuclear tests is an interim action that may proceed in advance of the Stockpile Stewardship and Management PEIS. The CEQ Regulations state that:

While work on a required program environmental impact statement is in progress and the action is not covered by an existing program statement, agencies shall not undertake in the interim any major Federal action covered by the program which may significantly affect the quality of the human environment unless such action (1) is justified independently of the program; (2) is itself accompanied by an adequate environmental impact statement; and (3) will not prejudice the ultimate decision on the program. Interim action prejudices the ultimate decision on a program when it tends to determine subsequent development or limit alternatives.

5/40.02 continued

40 C.F.R. § 1506.1(c). DOE has made no representations that the subcritical tests comply with these requirements. As explained above, these tests, which by themselves constitute major Federal action with significant environmental effects, are an integral part of the stockpile stewardship program, for which a PEIS is required, and have no independent justification. The planned tests are not covered by any existing programmatic or site-specific EIS statement and NRDC has raised serious questions about the adequacy of the draft NTS EIS.[3] In addition, any decision on the tests in advance of a final PEIS will tend to determine subsequent development and limit other alternatives, thus prejudicing the ultimate decision on the program.

C. **The PEIS Should Analyze the Programmatic Decision on Whether to Proceed with the Subcritical Tests and If So, Where to Conduct Such Tests**

1. "Agencies shall prepare statements on broad actions so that they are relevant to policy and are timed to coincide with meaningful points in agency planning and decisionmaking." 40 C.F.R. § 1502.4(b).

2. "For projects directly undertaken by Federal agencies the environmental impact statement shall be prepared at the feasibility analysis (go-no go) stage and may be supplemented at a later stage if necessary." 40 C.F.R. § 1502.5.

3. "Agencies are encouraged to tier their environmental impact statements to eliminate repetitive discussion of the same issues and to focus on the actual issues ripe for discussion at each level of environmental review." 40 C.F.R. § 1502.20.

In the PEIS, DOE admits that the PEIS strategy is to "identify the effects of U.S. national security policy changes on Stockpile Stewardship and Management program missions and determine the configuration (facility locations) necessary to accomplish the Program missions. Draft PEIS at S-5. It further specifies that, for the few projects it has chosen to analyze in the PEIS, the programmatic statement will support the programmatic decision on whether to proceed with the facility and if so, where to site the facility. Id. The "go-no go" decision on whether and where to proceed with a stockpile stewardship project is certainly an "actual issue ripe for discussion" at this programmatic stage. The same decisions should be analyzed at this stage for the proposed subcritical tests -- whether to proceed with the tests or to choose some other alternative, including the no-action alternative, and if so, where to site those facilities. The PEIS should give serious consideration to the alternative of conducting such tests at the weapons

[3] NRDC hereby incorporates by reference its May 3, 1996 comments on the Draft EIS on the NTS.

5/40.02 continued

laboratories instead of the NTS. Only by considering such programmatic decisions at this stage can the PEIS be timed to provide meaningful input into agency planning and decisionmaking, as required by NEPA.

4. The possibility exists that the site-specific EIS on the NTS facility does discuss the proposed subcritical tests at the LYNER facility in a classified appendix. The one-sentence description of this classified appendix provides virtually no information as to its purpose and scope. As we discussed in our comments on the NTS Draft EIS, there is a wealth of publicly available information on the proposed tests that should be made available in the unclassified portion of the EIS. Even if such information were made available, however, the discussion of alternatives to the proposed tests, and a decision on whether and where to proceed, should first be made at the programmatic level in the PEIS and associated ROD. If in fact, the agency then decides to proceed with the tests at another location, a project-specific EIS should then be prepared in connection with that location.

6/21.05
7/40.87

III. THE PROJECT SPECIFIC ANALYSIS OF THE NIF IS CONSISTENT WITH THE MAIN BODY OF THE PEIS – BOTH MAKE A MOCKERY OF THE NEPA PROCESS. THE DISCUSSION OF NIF IS SO WOEFULLY INADEQUATE BOTH IN SCOPE AND CONTENT THAT IN ORDER TO COMPLY WITH THE LEGAL OBLIGATIONS OF NEPA, DOE HAS NO ALTERNATIVE BUT TO REVISE AND RECIRCULATE THE DRAFT PEIS, RATHER THAN GOING DIRECTLY TO A FINAL PEIS.

Deficiencies in the NIF Project Specific Analysis (hereafter referred to as "DRAFT PEIS") are as follows:

A. The discussion of alternatives is inadequate.

8/21.01

Other than location the only alternatives examined in the Draft are the Conceptual Design, the Enhanced Design, and the No Action Alternative. The Conceptual Design and the Enhanced Design differ only in the flexibility of NIF, that is whether it will be designed to accommodate direct drive targets as well as indirect drive ("hohlraum") targets. Aside from site selection DOE in effect has limited discussion to two alternatives: build NIF or nothing. The Enhanced Design option, now the preferred option, has been included recently in recognition that the indirect drive alternative is in deep trouble because achieving ignition using hohlraum targets at NIF can no longer be assured. Even the Enhanced Design does not include a reasonable design alternative proposed by a JASON review panel, namely the construction of separate target chambers for classified and unclassified research.

8/21.01 continued

The DRAFT PEIS contains no discussion of alternative means of obtaining each of the categories of data that the NIF is intended to provide for stockpile stewardship. For example, in *Energy Daily*, May 6, 1996, pp. 1-2, there is reference to a Sandia Laboratories breakthrough in target technology for generating intense X-rays with a pulsed power accelerator. The article states,

> ...Tight congressional budgets could mean NIF will not get the $191 million the Department of energy wants for construction of the facility in FY 1997. Should Congress fail to provide the $130 million increase in the NIF budget, support for building the machine could crumble in the nuclear weapons research community and in Congress, ...
> But Sandia's advances in pulse-power accelerator target performance now hold the promise of developing an alternative way to tackle at least some of the weapons physics issues that NIF would address, according to Sandia officials.

In addition, the DRAFT PEIS should include a thorough discussion of the following alternatives:

1. Defer NIF and place a greater emphasis upon meeting the short-term objective of transferring the manufacturing facilities and skills from nuclear weapon production complex plants that have been or are being shut down to the weapon laboratories, and establishing surveillance and maintenance procedures for the enduring stockpile weapons. In NRDC's view the enduring stockpile can be maintained through surveillance, maintenance, and refabrication of warheads to design specifications that are within well established parameters for predictable nuclear performance, without any reliance on NIF. The notion advanced by the PEIS that weapon remanufacture is a viable option only if permits manufacture of exact replicas is nonsense. Obviously, a number of subsystems in a warhead can be replaced with new subsystems without significantly affecting nuclear performance. The test record shows that U.S. nuclear weapon designs have not displayed any great sensitivity to small changes in materials and manufacturing tolerances that typically exist between R&D and production versions of a weapon, indicating that not all warhead production parameters are sensitive, and that DOE's caricature of precise replica remanufacture is not required to maintain a reliable nuclear weapon stockpile in the future, with or without NIF, which is basically irrelevant to the practical dimensions of the stockpile stewardship problem.

   The DRAFT PEIS contains no discussion of the balance in funding between program elements designed to meet the short-term objectives and program elements designed to improve understanding of the science of nuclear weapon performance.

SSM-M-089
COMMENT LETTER

PAGE 27 OF 34

9/21.07

2. Build an ICF machine that has a higher likelihood of achieving the goal of generating economically competitive fusion energy. Everyone agrees that NIF cannot serve as the basis for commercial ICF reactor because of its high cost, low driver efficiency, and the fact that the needed repetition rate of target implosions cannot be obtained with the Nd:glass lasers employed in NIF due to the time needed to cool the lasers between shots. The NIF shot rate is expected to be average only one or two shots a day when it is up and running. A commercial machine will require a shot rate of a five per second, or on the order of 200,000 times greater.

The four ICF driver concepts that have received significant attention in the U.S. are solid-state lasers, of which the Nd:glass lasers used in NIF are but one type, KrF lasers, light-ion accelerators and heavy ion accelerators. There are some in the technical community that believe that the KrF and the heavy ion programs are the two most promising ICF drivers for a reactor because they have a potential for a high repetition rate, a relatively high efficiency, and lower cost. Both drivers are under development by DOE, but at low budget levels. The DRAFT PEIS should discuss: i) enhancing the KrF program; ii) enhancing the heavy ion beam program; and iii) enhancing the light ion beam program as alternatives to NIF. The scientific uncertainties associated with each of these concepts should be thoroughly discussed. When comparing an enhanced KrF program alternative to the NIF basic and enhanced alternatives, DOE should discuss the implications of the fact that the needed laser beam uniformity requirements for direct drive implosions have already been met for the KrF laser and are not even close for NIF's glass laser. Similarly, when weighing an enhanced heavy ion beam alternative against the NIF alternatives, DOE should provide a detailed technical analysis of the current status of heavy ion target design, and how DOE proposes to develop the heavy ion target with NIF. In each case DOE should provide detailed time and cost schedules for the program alternatives.

3. Select an alternative driver that has a higher probability of achieving ignition, even if it meant stretching out the ICF program schedule.

4. Modify the NIF design to increase the driver energy to a higher level to give greater confidence that ignition can be achieved.

5. Delay construction of NIF until there is high confidence that the primary goal of NIF, achieving ignition, can be achieved using NIF. The DRAFT PEIS fails to discuss the controversy over whether ignition can be achieved (see discussion below). In light of the fact that DOE cannot demonstrate at this time with high confidence that ignition can be achieved with NIF, the DRAFT PEIS should

SSM-M-089
COMMENT LETTER

PAGE 28 OF 34

9/21.07 continued

consider as an alternative, delaying the construction of NIF until additional experiments can be performed on the NOVA and OMEGA ICF machines, and until the results of this additional research has been understood, peer reviewed and published.

The CEQ Regulations refer to the discussion of alternatives as "the heart of the environmental impact statement." 40 C.F.R. 1502.14 § 1502.14. Agencies must "rigorously explore and objectively evaluate all reasonable alternatives," (§ 1502.14(a)) including reasonable alternatives not within the jurisdiction of the lead agency. § 1502.14(c). They must devote substantial treatment to each alternative considered in detail so that reviewers may evaluate their comparative merits. § 1502.14(b). They should present the environmental impacts of the proposal and alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. § 1502.14.

6/21.05 continued

When a very large number of alternatives are potentially available, the agency need only consider a reasonable number of alternatives, but they must cover the full spectrum of alternatives. CEQ, "Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations," Question 1, 46 Fed. Reg. 18026, 18027 (1981) (emphasis added). The existence of a viable but unexamined alternative renders the EIS inadequate. Idaho Conservation League v. Mumma, 956 F.2d 1508 (9th Cir. 1992).

Each of the proposed alternatives described above is reasonable and feasible and represents an alternative means for achieving the objectives of DOE's NIF proposal. They must be included in the PEIS in order for it to include the full spectrum of possible alternatives. As a result, DOE must prepare and circulate a revised DRAFT EIS that rigorously analyzes these alternatives in detail. To proceed directly to a Final EIS would deprive government reviewers and members of the public the opportunity to comment meaningfully on the analysis of these reasonable alternatives and would be in violation of the requirements of NEPA.

9/21.07 continued

B. The DRAFT PEIS fails to acknowledge that DOE cannot demonstrate with high confidence that ignition, the primary goal of NIF, can be achieved with NIF as it is currently designed.

Whether NIF as currently envisioned can achieve ignition is controversial, and there is a wide range of expert opinion on the subject. The final report of the DOE's Inertial Confinement Fusion Advisory Committee (ICFAC) – dated February 21, 1996 – DOE has since abolished the committee, states that "the probability of ignition has increased above 50%, and some believe that it is well above this level." When asked whether he was among

9/21.07 continued

those who now believe the probability is greater than 50 percent, one of the ICFAC members has stated privately to NRDC staff that on the basis of recent experimental results his estimate has moved from below 50 percent to "about 50 percent." We might add that some ICF experts apparently believe the probability of NIF achieving ignition is well below this level.

For example, Dr. Stephen P. Bodner gives a series of arguments why NIF is unlikely to achieve ignition. While there has been some progress on beam smoothing most of the issues raised by Dr. Bodner have not been resolved. "Time-Dependent Asymmetries in Laser Fusion Hohlraums," *Comments on Plasma Physics and Controlled Fusion*, 16, at 351-374. Moreover, there is no peer reviewed technical report that sets forth the theoretical and experimental basis that supports a conclusion that there is high confidence that NIF will achieve its primary goal.

In its final report before being abolished, the ICFAC committee was unable to conclude that the NIF should be constructed, and instead limited its recommendation to completing the NIF design phase, stating, "The committee recommends that as far as ignition is concerned there is sufficient confidence that the program is ready to proceed to the next step in the NIF project, that is to go to the final design phase in FY 1997."

ICFAC gives NIF only about a 50-50 chance of achieving ignition, and it endorsed only proceeding to the design phase. DOE then abolished ICFAC and no new review body has been announced either by DOE or the National Academy of Sciences. DOE calls for a backup direct drive option. This is no ringing endorsement for the construction of NIF. Rather it is a clarion call to go slow and not to commit to construction until there is high confidence that ignition can be achieved. The DOE claims that it is important to complete the construction of NIF by the year 2002 and ignition by 2005, because by then the stockpiled warheads will have "aged beyond their design lifetime." DRAFT PEIS, at I-8. To suggest that the needs of the weapons program places a time constraint on the completion of NIF is nonsense, when some in the ICF program are questioning whether NIF should be built at all. There are a number of bona-fide nuclear weapon experts who doubt that NIF will make any significant contribution to the resolution of real world nuclear stockpile problems.

The CEQ NEPA regulations state that "NEPA procedures must ensure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis... [is] essential to implementing NEPA. 40 C.F.R. § 1500.1. Specifically, the regulations require agencies to "insure the professional integrity, including scientific integrity, of the discussions and analyses in environmental impact statements." 40 C.F.R. § 1502.24.

9/21.07 continued

As CEQ stated, "Ultimately, of course, it is not better documents but better decisions that count. NEPA's purpose is not to generate paperwork -- even excellent paperwork -- but to foster excellent action. 40 C.F.R. § 1500.1(c). To ensure that DOE makes a fully informed decision on NIF, particularly a decision based on whether NIF can achieve its primary objective of ignition, the unresolved technical issues that are still a matter of considerable controversy need to be set out and addressed, via a thorough technical exposition in a revised DRAFT PEIS.

C. The discussion of the non-proliferation risks associated with proceeding with NIF is inadequate.

In NRDC's view the non-proliferation risks associated with proceeding with NIF are by themselves, justification for selection of the No Action Alternative. This has been made abundantly clear to DOE in past interactions we have had with DOE and LLNL staff. It has also been a major issue raised by the Congress. The DRAFT PEIS makes passing reference to the recent study--*The National Ignition Facility and the Issue of Non-Proliferation*--prepared by the DOE Office of Arms Control and Non-Proliferation and has quoted its two conclusions that (1) the technical proliferation concerns at NIF are manageable and therefore can be made acceptable, and (2) NIF can contribute positively to U.S. arms control and nonproliferation goals. [DRAFT PEIS, pp. I-5,6] These self-serving conclusions by DOE are unsupported by the detailed analysis in the body of the DOE report.

10/21.17

With regard to the first conclusion, we would like to know why DOE believes that "transparency measures and access screening procedures" can serve to "manage" the proliferation risks associated with other weapon states and non-weapon states in cases where these states point to the DOE program as justification for beefing up their own ICF programs. And if a non-weapon state shares DOE's objectives of obtaining weapons physic data and maintaining a cadre of scientists experts with the skills needed to design and understand the performance of nuclear weapons, how will DOE "manage" this latent proliferation risk through "transparency and screening," if the non-weapon state objective is long-term and undeclared?

It is noteworthy that the European Science and Technology Assembly (ESTA) Working Party, in its report, "Inertial Confinement Options to Control Nuclear Fusion," March 27, 1996, has recommended that the European Union beef up its ICF research, taking advantage of DOE's rapidly evolving process of declassification of weapon related ICF research. The ESTA recommended, "Advantage should be taken where possible of active collaboration with the extensive declassified US programmes;" and "Special action should be taken to ensure *crucial access* for European researchers to a small-scale programme on the French and US laser-driven ignition facilities." (Emphasis supplied)

9/21.07 continued

The second conclusion of DOE's Office of Arms Control and Nonproliferation, that "NIF contributes positively to U.S. arms control and nonproliferation policy," simply reflects DOE's belief that the Administration's support of NIF was part of the price that it had to pay to entice DOD and the weapon labs to go along with CTBT. This is nothing more than evidence of the political weakness of DOE and the White House in gaining political support for a CTBT, for there is not a scintilla of evidence that anything positive will flow directly from the NIF program in terms of achieving U.S. arms control and nonproliferation policy objectives.

D. "Where is the beef?"

The discussion in the DRAFT PEIS of the need for NIF and alternatives to it is contained in a patently inadequate section that is devoid of any technical analysis addressing whether NIF can achieve its primary objective of ignition, and devoid of any detailed cost and schedule data. The discussion of the benefits and risks of proceeding with NIF is filled with unsubstantiated DOE and LLNL dogma and ex cathedra pronouncements and void of facts.

11/21.12

Take, for example, the issue of mixing of the plutonium and DT in the primary. How important is improving one's understanding of the mixing in primaries to stockpile stewardship? What scenarios related to warhead degradation will require an improved understanding of mixing? With respect to each scenario, will the lack of understanding translate into concern over whether any of the warheads that are to remain in the stockpile will work at all, or will the uncertainty only be reflected in a small change in the range in the predicted yield? Which of these scenarios can be addressed with NIF? Can the issue of significant yield uncertainties due to mixing be more directly addressed through more frequent tritium reservoir replenishment? Precisely how will NIF be used to resolve this subset of issues?

What will the experimental protocol look like? What alternative means does DOE have, or could DOE develop, for improving ones understanding of mixing in general, and the subset of issues in particular? Can these issues be resolved if NIF cannot achieve ignition? How can a useful set of mixing experiments be constructed if ignition is barely achieved, or rarely achieved, or if the gain is very low so that a any mixing leads to ignition failure? How important would the issue of improved understanding of mixing be to the development of new nuclear weapon types in the absence of testing, if U.S. policy toward development of new warhead types were modified to permit such development?

9/21.07 continued

There is a similar set of questions with respect to each of the other technical issues the NIF purports to address. These also should be developed and answered in the DRAFT PEIS.

E. There is no programmatic discussion of the ICF program or the possible follow-on facilities to NIF.

NIF is just one more step in DOE's ICF program. Both for weapon research and civil energy applications, higher yield ICF facilities are desired by the ICF community. The DRAFT PEIS contains no discussion of the follow-on facilities to NIF or the other ICF programs now in operation. In this regard, the DRAFT PEIS utterly fails to lay out the full ICF program applicable to stockpile stewardship, including the elements at the University of Rochester, the Naval Research Laboratory, Sandia National Laboratories, Los Alamos National Laboratory and General Atomics, much less reasonable alternatives to it. The DRAFT PEIS will have to be revised and reissued if it is to serve as a *programmatic* EIS covering stockpile stewardship issues.

7/40.87 continued

IV. DOE SHOULD NOT PROCEED WITH THE STOCKPILE STEWARDSHIP PROGRAM UNTIL IT HAS PREPARED AND CIRCULATED A NEW DRAFT PEIS, CONSIDERED AND RESPONDED TO ALL COMMENTS, AND ISSUED A FINAL PEIS AND RECORD OF DECISION

A. The CEQ Regulations

1. "Agencies shall not commit resources prejudicing selection of alternatives before making a final decision." 40 C.F.R. § 1502.2

2. "Environmental impact statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." 40 C.F.R. § 1502.2(g).

3. "If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion." 40 C.F.R. § 1502.9(a).

B. Summary of Draft PEIS Deficiencies

1. The Draft PEIS for DOE's SS&M Program suffers from the following major deficiencies:

1/40.85 continued

a. It relies on an arbitrary and capricious criterion ("ground-breaking before September 1995")to exclude important ongoing SS&M projects from consideration as part of the Proposed Action;

b. It arbitrarily omits discussion of a wide range of continuing and highly interconnected SS&M activities, amounting to the bulk of the SS&M program, from consideration as part of the Proposed Action, despite the fact that significant changes are occurring in these SS&M program activities, and in the program as a whole, in direct response to radically changed circumstances in the global and national security environment.

2/41.17 continued

c. It arbitrarily excludes programmatic consideration of certain facilities on the strength of an unsupported contention that such facilities belong to an undefined "next generation" of stewardship facilities that cannot be characterized sufficiently for programmatic environmental impact analysis;

4/41.18 continued

d. The combination of a, b, and c above effectively reduces the Stockpile Stewardship portion of the PEIS process to one designed merely to ratify three site-specific project decisions already made, without any consideration of the broad impacts arising from the extensive, highly integrated DOE SS&M program (of which the proposed action is but one component) and without exploration of reasonable programmatic alternatives to the proposed action. Indeed, the scope of the programmatic review has been so narrowed as to thoroughly disqualify the present draft as the basis for an adequate final PEIS.

6/21.05 continued

e. Even when the PEIS did consider a specific project in detail -- the NIF -- it did so in a woefully inadequate manner.

V. CONCLUSION

As we noted above, in all our years of reviewing EISs and litigating NEPA claims we cannot recall a stronger case for comprehensive programmatic review of an ongoing Federal activity based on radically changed circumstances. We were, frankly, shocked and dismayed by the extent of the evasions and inconsistencies in the present draft PEIS. Beyond its

numerous technical inadequacies, it appears to have been assembled with a raw contempt for the spirit of NEPA and the philosophy of meaningful public involvement and agency decisionmaking which imbues this landmark statute of environmental protection.

7/40.87 continued

It is our considered view that the current draft PEIS cannot serve as the basis for an adequate final PEIS and subsequent record of decision. It must be withdrawn and a new draft prepared and circulated that fully complies with both the letter and the spirit of NEPA's requirements for programmatic analysis of major Federal actions affecting the quality of the human environment. The new draft must reflect a good faith effort to include in the analysis all ongoing SS&M activities as well as projects in research and development that are included in long-range program plans but not yet formally approved for site-specific construction activity. The definition of proposed action must faithfully reflect the broad range and highly integrated character of SS&M program activities, and the draft PEIS must seriously consider all reasonable alternatives to the proposed action for accomplishing the program's essential missions.

Sincerely,

Christopher E. Paine

E-mail: WSLF@igc.apc.org

INTRODUCTION

Western States Legal Foundation (WSLF) is a non-profit, public interest, environmental and peace organization which, since 1982, has participated in administrative proceedings, litigation, and grassroots activities to further the end of the nuclear arms race and related technologies and promote nuclear disarmament and the cleanup of federal facilities engaged in nuclear weapons research, testing, and production. WSLF is a member of the nation-wide Military Production Network (MPN) and a founding member of Abolition 2000, a Global Network to Eliminate Nuclear Weapons (originally known as the NGO Abolition Caucus).

In 1994 and 1995 WSLF participated as an observer in its capacity as a registered Non-Governmental Organization (NGO) in four sessions of international negotiations in Geneva and New York on the Comprehensive Test Ban Treaty (CTBT) and the Nuclear Non-Proliferation Treaty (NPT). Last spring WSLF executive director, Jacqueline Cabasso and WSLF attorney John Burroughs spent a month at the United Nations in New York monitoring the NPT Review and Extension Conference. In November 1995 they observed the hearings before the International Court of Justice in the Hague on the (il)legality of the threat or use of nuclear weapons.

WSLF has participated in numerous administrative proceedings under both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA) concerning proposed defense programs, energy related activities, and environmental restoration and waste management projects at the Lawrence Livermore National Laboratory (LLNL) and the Los Alamos National Laboratory (LANL). For purposes of this comment, the most relevant proceedings include:

The 1986 LLNL Environmental Impact Report (EIR) prepared by the University of California pursuant to CEQA. WSLF filed suit to set aside the EIR and successfully obtained a settlement which compelled preparation of the 1992 LLNL site-wide EIS;

The 1991 Programmatic EIS on Reconfiguration of the Nuclear Weapons Complex (scoping);

The 1991 Programmatic EIS on the Environmental Restoration and Waste Management Program (scoping);

The 1992 LLNL site-wide EIS;

The 1993 rescoping of the PEIS on Reconfiguration of the Nuclear Weapons Complex;

The 1995 EIS on the Dual Axis Radiographic Hydrodynamic Test (DARHT) Facility;

The 1995 study on the National Ignition Facility and the issue of Nonproliferation;

The 1995 Programmatic Environmental Impact Statement of Stockpile Stewardship and Management (scoping);

The 1996 Draft Waste Management Programmatic EIS (WM DPEIS)

1/40.60

In our estimation, the Department of Energy's (DOE's) Draft Programmatic Environmental Impact Statement (PEIS) for Stockpile Stewardship and Management (SS&M) is fatally flawed. Despite the NPT obligation to pursue nuclear disarmament and international expectations that a CTBT will preclude the modernization or improvement of nuclear weapons, the DPEIS fails to analyze any programmatic alternative based on maintenance of a hypothetical stockpile of less that 1000 nuclear weapons, any alternative based on "passive" maintenance of the existing stockpile through inspection and identical remanufacture of parts (as opposed to building and operating a massive array of sophisticated experimental facilities that can be utilized to continue nuclear weapons design activities) or any "denuclearization"/"zero" option. Instead, the analysis in this DPEIS begins, in essence, with the conclusion that the policy debate over Stockpile Stewardship and Management is over, and that the program alternative has already been determined. In effect, the DPEIS merely considers siting options for pre- selected activities and the legally mandated "no action" alternative.

The DPEIS fails on at least three counts: its lack of analysis of a range of reasonable programmatic alternatives to meet the goal of maintaining the U.S. nuclear stockpile safely as the nation fulfills its treaty obligations; its failure to describe the "no action" alternative in a comprehensible manner; and its failure to describe the only programmatic alternatives actually considered, namely SS&M and "no action", in a way that allows useful comparison. These are not merely technical flaws, but fundamental structural problems of sufficient magnitude to prevent meaningful participation by the public and other agencies and obfuscate informed analysis by decisionmakers.

For the foregoing reasons the DOE should withdraw this draft PEIS and prepare a revised draft PEIS, while all programmatic decisions and activities are put on hold. The revised draft should analyze the programmatic alternatives demanded by the public but excluded from the present draft, namely: "maintenance"; "remanufacturing"; and "denuclearization". The PEIS should also analyze a "zero" stockpile case -- both with and without the capability to reconstitute the arsenal -- which is based upon a scenario of global reduction and elimination of nuclear weapons in compliance with NPT Article VI over time periods ranging from 15 years to the projected lifetime of the proposed facilities (on the order of 40 years).

1/40.60 continued

THE PEIS SHOULD INCLUDE ALTERNATIVES EXAMINING THE IMPACTS OF A POLICY COURSE OF REDUCTION OF NUCLEAR WEAPONS, ULTIMATELY RESULTING IN THEIR ELIMINATION PURSUANT TO U.S. OBLIGATIONS UNDER ARTICLE VI OF THE NON-PROLIFERATION TREATY

The DPEIS purports to examine three possible stockpile sizes: 1) indefinite maintenance of an arsenal of 3500 warheads deployed in long-range systems (plus nonstrategic nuclear forces, DOD operational spares, spares to replace weapons eliminated by DOE surveillance testing, and weapons to reconstitute to the START I level; the post-START II arsenal); 2) an arsenal of larger size (START I plus; the "hedge" option); and 3) a smaller arsenal reflecting post-START II reductions of about 1000 warheads (While the DPEIS states that "the size of the nation's nuclear stockpile is being considerably reduced" and refers to the "remaining weapons" in the U.S. stockpile as if it is rapidly dwindling to almost nothing, a nuclear arsenal of 1000 weapons represents an unspeakably destructive force, 100 times the size of an arsenal of 1 to 10 weapons that Herbert York has said would provide deterrence.[1] However, the three cases have minimal effect on the facilities and configurations proposed by DOE, so that there is no true programmatic review. This is demonstrated by DOE's rejection of real programmatic alternatives, strongly supported by public commenters: 1) denuclearization; 2) remanufacturing; and 3) maintenance. DOE's analysis in support of refusing to examine a zero option and true programmatic alternatives is fundamentally flawed, as shown below. To comply with NEPA, DOE must examine a zero case and the true programmatic alternatives

<u>NPT Article VI and the zero option</u>: As we have consistently maintained, a zero option is based upon U.S. fulfillment of its obligation under Article VI of the NPT to negotiate the reduction and elimination of nuclear weapons. That option is well within the universe of reasonable alternatives the PEIS should examine to inform decisionmaking by DOE itself, other agencies, the President, Congress, and the public. Further, it will broaden and enrich the comparative examination of environmental and proliferation impacts. The differing impacts of possible futures are themselves one relevant factor in planning the complex, yet if DOE does not study a zero option the range of comparison will be narrow

The zero option is official, recently reaffirmed U.S. policy. The NPT entered into force in 1970. Its article VI requires declared nuclear weapons states including the United States "to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament". In a resolution at the Conference on Disarmament at Geneva on April 6, 1995, anticipating the NPT extension conference, the United States, the United Kingdom, France, and Russia declared that "we welcome the fact that the nuclear arms race has ceased". CD/1308, 7 April 1995. At the

[1] Although there is no precise, objective number that can be cited, Herbert York has argued that the number of warheads needed to maintain a credible minimum deterrent is "somewhere in the range of 1, 10, or 100" survivable, deliverable warheads, "closer to 1 than it is to 100." Herbert York, <u>Remarks about Minimum Deterrence</u>, Lawrence Livermore National Laboratory, CTW-12-90, January 25, 1991

1/40.60 continued

NPT Conference, these states took the position that they have now fulfilled one prong of Article VI, "cessation of the nuclear arms race" That leaves the second prong, "nuclear disarmament", i.e reduction and elimination of nuclear arsenals. At the conference, the nuclear states reaffirmed their commitment to pursue nuclear disarmament. In connection with the decision extending the NPT indefinitely, the parties, including the United States, adopted a set of "Principles and Objectives for Nuclear Non-Proliferation and Disarmament" which included a "programme of action" calling for " systematic and progressive efforts to reduce nuclear weapons globally, with the ultimate goal of eliminating those weapons". NPT/CONF.1995/L.5, 9 May 1995. This program is intended to implement Article VI and indeed constitutes an authoritative interpretation by the NPT parties of what Article VI requires U.S. representatives at the Conference independently affirmed that the ultimate goal of the United States is the elimination of nuclear weapons. Also, in a post-Conference interview, Ralph Earle, Deputy Director of the Arms Control and Disarmament Agency and one of the U.S. representatives to the Conference, stated regarding the Principles that "we are prepared now to begin their implementation as if they had the same standing as the Treaty itself". BASIC Reports, June 1, 1995, p. 3

The nuclear weapons states' fulfillment of Article VI obligations will continue to come under close scrutiny by NPT parties. For example, at the NPT conference itself the claim by the nuclear weapon states that the arms race has ended was disputed. Nonnuclear states including Indonesia asserted that while the quantitative arms race may have ended, the qualitative arms race is continuing through laboratory-based simulated testing programs. Fundamental disagreement on this point prevented completion by the conference on a final document reviewing operation of the Treaty over the past 25 years with regard to Article VI. Another element of the extension decision was to agree "to strengthen the review process for the operation of the Treaty with a view to ensuring that the purposes of the preamble and the provisions of the Treaty are being realized" NPT/CONF.1995/L.4, 10 May 1995.[2] Review Conferences will be held at five year intervals, with the next conference set for the year 2000. In addition, Preparatory Committee meetings will be held, at a minimum, in each of the three years prior to the Review Conference. The purpose of the Preparatory Committee meetings is to "consider principles, objectives and ways in order to promote full implementation of the Treaty, as well as its universality, and to make recommendations thereon to the Review Conference. <u>These include those identified in the Decision on Principles and Objectives for Nuclear Non-Proliferation and Disarmament</u>". Id. (emphasis added).

The provision for a strengthened review process recognizes that NPT parties - in particular, the nuclear weapons states - must be dynamic in meeting their obligations if the regime is to be viable in the long run. As the President of the Conference, Ambassador Jayantha Dhanapala of Sri Lanka, observed in a post- Conference interview: "Unless there is

[2] WSLF provided copies of the NPT documents referenced here as attachments to our scoping comments We will provide additional copies on request

1/40.60 continued

substantial progress evidenced in the nuclear disarmament field, we are going to have very serious erosion of the confidence of states parties to the Treaty This could be quite dangerous for the future . . ." BASIC Reports, June 1, 1995, p 2.

DOE rejects the zero option based upon the NPT obligation for several alleged reasons One is that expanded laboratory testing "will enable the United States to enter into [a CTBT, a central element of the NPT obligation] while maintaining a safe and reliable nuclear weapons stockpile consistent with U.S. national security policies". (S-19). This is assertion, no more. There is informed opinion that a "safe" and "reliable" arsenal can be maintained using the existing, very extensive, laboratory infrastructure, without additional facilities. But, DOE has foreclosed analysis of this debate, so essential to policy choices, by refusing to consider programmatic alternatives of "denuclearization", "remanufacturing", and "maintenance". In effect, DOE has analyzed its preferred alternative, SS&M, as the only reasonable alternative to no action, rather than analyzing several reasonable alternatives. In other words, SS&M is not an alternative at all; the choice is presented simply as "go" or "no go". This approach is not acceptable under NEPA, certainly not where there are in fact alternative courses of action which many in the public and government regard as eminently reasonable. DOE has also failed to analyze separately "safety" and "reliability", which is

2/40.34

essential to reasoned appraisal of the proposed facilities See generally our scoping comment on this PEIS.[3] For example, if "safety" is given a higher priority than "reliability", a different mix of facilities might result To the extent, as was blatant in the NIF non-proliferation review, that DOE is referring to a political deal struck within the United States government, this is simply a bootstrap, circular argument, whose very premises were created by DOE's promotion of laboratory testing. To understate the matter, such self-serving analysis is not appropriate to such important issues

3/40.07

DOE then asserts that "[o]ne benefit of science-based stockpile stewardship is to demonstrate the U.S. commitment to NPT goals". (S-19) Just the reverse is true: the effect of SBSS is to undermine confidence in the U S. commitment to NPT goals. To take one important example, India is now reluctant to enter into a CTBT that does not prohibit laboratory development of nuclear weapons because of the announced aim of the U.S. and other nuclear weapons states to maintain and improve their arsenals without test explosions, and to preserve the ability to design nuclear weapons. In its argument to the International Court of Justice, October 30, 1995, concerning the question referred to the court by the General Assembly of the legality of the threat or use of nuclear weapons, Australia, a close U.S. ally, squarely rejected the premise of SS&M, namely the ability indefinitely to maintain the nuclear arsenal.

The argument of the Australian Minister of Foreign Affairs, Gareth Evans, began with the point that "nuclear weapons are by their nature illegal under customary international law,

[3] "Comment of the Western States Legal Foundation on the Scope of the Stockpile Stewardship and Management Programmatic Environmental Impact Statement," August 11, 1995, Attachment A

3/40.07 continued

by virtue of fundamental general principles of humanity. It is illegal not only to use or threaten use of nuclear weapons, but to acquire, develop, test, or possess them. The right of states to self- defense cannot be invoked to justify such actions." Evans continued, "Second, it follows that all States are under an obligation to take positive action to eliminate completely nuclear weapons from the world. To implement this obligation, States which do not possess such weapons cannot lawfully acquire them, and States which do possess nuclear weapons cannot add to, improve, or test them. States which possess nuclear weapons must, within a reasonable time-frame, take systematic action to eliminate completely all nuclear weapons in a manner which is safe and does not damage the environment." (pp. 41-42) (emphasis added)

Evans' remarks directly pertinent to the NPT and SS&M were as follows:

Article VI of the Nuclear Non-Proliferation Treaty imposes an obligation the nuclear weapon States, and on all other parties to the Treaty, to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control. At this year's Non-Proliferation Treaty Review and Extension Conference, the nuclear weapon States reaffirmed "their commitment, as stated in Article VI, to pursue in good faith negotiations on effective measures relating to nuclear disarmament", and the ultimate goal of eliminating those weapons was also reaffirmed.

Mr President, Members of the Court, during this transitional phase, all States, including the nuclear weapon States are prohibited by customary international law from engaging in any action inconsistent with this commitment. They cannot introduce new nuclear weapons. They cannot refine their existing stockpiles. They cannot engage in action intended to ensure maintenance of their nuclear arsenals indefinitely into the future.

In particular, the testing of nuclear weapons under any circumstances must now be prohibited. Not only is testing a "use" of nuclear weapons, and therefore subject to the primary obligation I have identified, but tests for the purpose of developing new nuclearweapons or for refining existing weapons would clearly be illegal, as they are directed to enhancing nuclear armaments, rather than eliminating them. However, even testing for the purpose of maintaining existing stockpiles would be inconsistent with the obligation, since such conduct is aimed at extending the period in which the status quo can be maintained. (pp. 66-67) (emphasis added) [4]

[4] See Verbatim Record (excerpt), Monday 30 October 1995, International Court of Justice in the case in Legality of the Use by a State of Nuclear Weapons in Armed Conflict and in Legality of the Threat or Use of Nuclear Weapons, Attachment B.

3/40.07 continued

As Evans made clear, "action intended to ensure maintenance of their nuclear arsenals indefinitely into the future" is contrary to the NPT Article VI obligation, as well as the general illegitimacy and illegality of nuclear weapons. Yet this is exactly what DOE is describing in its PEIS! DOE must analyze programmatic alternatives and a zero option which do not assume, in DOE's phrase, U.S. maintenance of a nuclear arsenal for the "foreseeable future".

22 states participated in the oral hearings before the World Court, and another 23 states made written submissions only. More than two-thirds of the states that participated in the written and oral proceedings argued for the illegality of the threat or use of nuclear weapons. (Release of an advisory opinion from the court is probable, though not assured, by June 1996. For background on the case, see John Burroughs and Jacqueline Cabasso, "Nukes on Trial", March/April 1996 Bulletin of the Atomic Scientists, pps. 41-45, Attachment C). Most states arguing for illegality, like Australia, emphasized the NPT Article VI obligation. For example, New Zealand's Attorney General, Paul East, stated, "The agreed premise of [the NPT] is that a world free of nuclear weapons would be a better place. The treaty held out the promise of that goal being reached without undue delay." The United States and other nuclear weapons states, while contending that threat or use of nuclear weapons may be legal depending upon the circumstances, acknowledged the NPT obligation. For example, State Department legal advisor Conrad Harper stated: "It is true that the Non-Proliferation Treaty affirms the commitment of nuclear-weapon States toward reducing the number of nuclear weapons and toward achieving the goal of disarmament."

Against this background, DOE's assertion that SS&M demonstrates the U.S. commitment to NPT goals is wholly implausible. DOE attempts to save this point by arguing that loss of confidence in the U.S. stockpile "could provide an incentive to other nations [which rely on the U.S. deterrent] to develop their own nuclear weapons programs". Again, this is an assertion based upon a dubious premise, namely that expanded laboratory testing is necessary to maintain the "safety" and "reliability" of the arsenal, which DOE has chosen not to subject to comparative analysis in the PEIS. Further, it avoids examination of an alternative path to global security, global elimination of nuclear weapons, which the NPT Extension and Review Conference and the World Court hearings demonstrated that many states - including many U.S. allies - regard as preferable to the current global regime. It also assumes what is increasingly in doubt, that the threat of mass destruction by use of technically reliable nuclear weapons is and will remain credible. NEPA does not require DOE to commit solely to fulfillment of the Article VI obligation within a reasonable time period. This depends on many factors outside of DOE's control. But NEPA does require DOE to consider that path as one reasonable and possible future.

DOE's next argument is that SS&M will not lead to direct proliferation, as by transfer of data or copying of technology (S-19). This argument is subject to many objections - what technology has not spread? - yet it is offered as if self- evident. In contrast, DOE's non-proliferation review of NIF non- proliferation impacts was clear that NIF's direct

3/40.07 continued

proliferation risks require careful management.[9] DOE must consider paths, i.e. not constructing new facilities, which pose less risk of direct proliferation. For extended discussion of this point, see, e.g., See generally "Comment of the Western States Legal Foundation on the National Ignition Facility (NIF) and the Issue of Nonproliferation, Draft Study," October 10, 1995, attachment E

DOE then argues that "proliferation drivers for other states, such as international competition or the desire to deter conventional armed forces, would remain unchanged regardless of whether DOE implemented the proposed action". (S-19) For reasons stated above, this is simply untrue U.S enhancement of its maintenance and design capability clearly will enter into other states' calculations regarding their actual or potential nuclear weapons programs, as is illustrated by India's attitude towards the CTBT.

In general, DOE's discussion of potential proliferation impacts fails to meet any reasonable standard for balanced, impartial analysis. Despite the continuing presence of a vigorous debate, both domestically and internationally, concerning the potential proliferation effects of continuing nuclear weapons research, testing, and production, the DPEIS does not, in actuality, include an analysis of potential proliferation impacts. Instead, the DPEIS stresses the benefits of its proposed actions for U.S. arms control and nonproliferation goals in its "Purpose and Need" section, dismissing any possible adverse proliferation consequences in conclusory statements bereft of analysis It is important to realize that nuclear weapons proliferation, in the long run, is likely to result in extensive, adverse environmental impacts on a global scale, even if the weapons never are used The disastrous legacy of Cold War nuclear weapons research, testing, and production in the current nuclear weapons states is far more than enough to demonstrate the environmental dangers of the proliferation of weapons testing and production, with aspiring nuclear states most likely conducting clandestine programs where public scrutiny and environmental controls are unlikely A Programmatic

---

[9] Even the authors of the JASON Inertial Confinement Fusion (ICF) Review, who generally favor NIF, warned that its advisory committee should "be alert to activities by foreign users that might serve clandestine nuclear weapon development activities," and that "the difficulty of managing the tension between openness and credibility on the one hand, and assuring the utility of the ICF program to SBSS, on the other hand, is a serious issue and will require considerable attention by DOE/DP." JASON, the MITRE Corporation, "Inertial Confinement Fusion (ICF) Review," February 23, 1996, at 11-12. This demonstrates that within the mainstream scientific community, there is serious concern over potential negative direct proliferation impacts of Stockpile Stewardship. Over the relevant, decades-long time-scale for this Programmatic review, NIF may also pose other proliferation risks-- for example, the potential development of pure fusion weapons which eventually could allow states to produce nuclear weapons without needing to produce or otherwise obtain plutonium or HEU. See Theodore B Taylor, "Comment on the August 23, 1995 DOE Draft Study of the National Ignition Facility and the Issue of Nonproliferation" Attachment D DOE also states categorically in the DPEIS that "NIF is not a weapon and the ICF approach cannot be directly extended to become a weapon," (v.III, p.I-2). This assertion also is challenged by Dr. Taylor, a widely respected former nuclear weapons designer, who states that "possible directed energy weapons that use NIF-like technology to energize extremely high power narrow beams of microwaves...might be used for disabling or destroying electronic or other sensitive electronic components of military or civilian systems, in space or the atmosphere, at considerable distances form a weapon situated on the ground in friendly territory." (Taylor Comment)

3/40.07 continued

environmental review for the rebuilding of the nuclear weapons complex, which will have a fundamental impact on the international proliferation climate, should address these potential impacts

1/40.60 continued

DOE finally argues that the NPT "does not mandate stockpile reductions by nuclear states, and it does not address actions of nuclear states in maintaining their stockpiles." (S-19) This argument is sufficiently addressed by Australia's statement to the World Court The NPT contains an obligation to pursue reduction and elimination of nuclear weapons, and states understand this obligation to apply within a reasonable time period, as Australia and New Zealand made clear, not at a point in time beyond the "foreseeable future". DOE argues that "even relatively simple bilateral treaties, such as START I and START II, require more than 10 years to implement, not counting the years of negotiation". (S-10) This argument fails on several counts. In general, nothing prevents DOE from including within a zero option the possibility that elimination would take place within a longer time frame (say 30 years) as well as the shorter time frame we and others have proposed for analysis (15 years). DOE's no-action baseline begins in 2005, and proposed facilities have a 30-year life, so DOE is already analyzing a relatively long period Also, it is not true that we can only imagine a series of elaborate treaties, bilateral and multilateral, taking the global arsenal from tens of thousands to thousands to hundreds and below. It is perfectly feasible for reduction to very low numbers (say 1-10) or elimination to take place by means of an agreement that started with arsenals still numbering in the thousands. This is what is contemplated in some versions of the abolition convention now under study by several groups (see below). Further, it is not the case that reductions can take place only by means of elaborate treaties. Perhaps the most significant arms control measure ever undertaken, the withdrawal of short-range "tactical" nuclear weapons based in land forces and surface ships, was executed by means of coordinated unilateral steps taken by the United States and the Soviet Union under Bush and Gorbachev.

The feasibility of a global process consistent with NPT Article VI leading to the elimination of nuclear weapons is demonstrated by the fact that it is now under serious study In connection with several factors, including understanding of the need for a viable, permanent NPT; the altered global situation in the wake of the disintegration of the Soviet Union; and a reawakening to the intractable problems posed by nuclear weapons from the standpoints of both morality and security, there has recently been much serious discussion of paths to a nuclear weapons free world, all involving not "unilateral disarmament" but rather a global process This was evident at the NPT Conference

1) A caucus of non-governmental organizations (NGOs) eventually supported by more than 200 groups around the world, and including major international organizations like International Physicians for the Prevention of Nuclear War and Greenpeace, agreed upon a specific, 11-point statement calling for commencement of negotiations on a nuclear weapons convention, modeled on the biological and chemical weapons conventions, that would provide for the elimination of nuclear weapons and provide effective mechanisms of verification and enforcement for a nuclear weapons free

1/40.60
continued

regime. This plan envisages the convention setting out a time bound framework for the elimination of the weapons and other necessary measures, and calls for conclusion of the convention by the year 2000, with the elimination taking place in an unspecified number of years following that year. See Statement of the NGO Abolition Caucus.

2) The International Network of Engineers and Scientists Against Proliferation, including distinguished physicists, international lawyers, and others from around the world, presented a study that examined the elements of a nuclear weapons free world (control of weapons usable fissile materials, control of delivery systems, etc.). This study also contemplated a nuclear weapons convention being achieved at some point in the process. It included no specific time frame. See Executive Summary: Beyond the NPT: A Nuclear-Weapon-Free World, April 1995.

3) Another group of NGOS, including such groups as the Union of Concerned Scientists and the Lawyers Alliance for World Security affiliated with the tradition of "arms control" in the United States, presented a plan that called for a phased approach, first bilateral, then multilateral, leading to a stage in which all nuclear weapons states would have arsenals on the order of 200 warheads, with various mechanisms in place making use of nuclear weapons unlikely. Once this stage was achieved and stabilized, the plan assumes, the world would be in a position to take the final steps to eliminate the weapons. See NGO Recommendations for the Review of the NPT, Disarmament Times, 19 April 1995.[a]

4) The Pugwash group was also represented at the Conference, and presented its recent monograph A Nuclear-Weapon- Free World: Desirable? Feasible? (Boulder: Westview Press 1993). This book includes articles by well-known analysts, including "Technological Problems of Verification" by Theodore Taylor; "Nuclear Weapons After the Cold War" by Robert McNamara and others; the "Breakout Problem" by Marvin Miller and Jack Ruina.

5) Outside the NPT Conference, interest in paths to a nuclear weapons free world also is evident. For example, the Stimson Center based in Washington D.C. has a multi-year project to study "Eliminating Weapons of Mass Destruction." The Stimson Center recently released its study, "An Evolving US Nuclear Posture" (Washington, DC: December 1995), which proposes a phased approach leading to the elimination of nuclear weapons. Its authors include General (ret'd) Goodpaster (former Supreme Allied Commander in Europe), General (ret'd) Horner (former Commander-in-Chief, North American Aerospace Defense Command), Robert McNamara (former Secretary of Defense), and Paul Nitze (former arms control negotiator). See also Robert S.

[a] WSLF provided copies of the abolition proposals referenced here as attachments to our scoping comments. We will provide additional copies upon request.

1/40.60
continued

McNamara, "Free the World of Nuclear Arms", Los Angeles Times, August 7, 1995, Metro section, p. 5.

6) The Canberra Commission, established by the Australian government last fall at the close of the World Court case on the illegality of threat or use of nuclear weapons, is mandated to prepare a plan to eliminate nuclear weapons for presentation to the United Nations General Assembly in August 1996. The Commission, which is made up of well-known diplomats, generals, scientists, and others, from around the world, including, for example, former Prime Minister Michel Rocard of France, Robert McNamara, Joseph Rotblat (1995 Nobel Peace Prize winner and head of Pugwash), Maj Britt Theorin (former ambassador for disarmament, Sweden), General (ret.) George Lee Butler (former commander in chief, U.S. Strategic Air Command), and Jacques Cousteau, has already unanimously endorsed the goal of a nuclear weapons free world.

7) The Lawyers Committee on Nuclear Policy, Abolition 2000 - A Global Network to Eliminate Nuclear Weapons, the International Network of Scientists and Engineers Against Nuclear Proliferation, the International Association of Lawyers Against Nuclear Arms, and other groups have recently formed a committee to draft a model nuclear weapons abolition convention. While these approaches and others differ significantly as to legal and institutional mechanisms, they are united in projecting a global process of reduction and elimination of nuclear weapons that would involve multilateral negotiations and other initiatives on several fronts (e.g. commitments regarding non-use, control of "civilian" weapons usable material, etc.)

To examine a zero option within programmatic review, DOE will need to determine the facilities required to support phases of reduction and elimination and describe the environmental and proliferation impacts. While this is a question that deserves serious analysis, it appears a zero option would entail the "no action" alternative (no new facilities) plus elimination over time of existing facilities. The zero option would thus serve as a true "no action" alternative, yielding after zero is achieved a baseline of no infrastructure for design and production of nuclear weapons, and no waste output. This would serve as a baseline to assess the costs and any benefits of facilities operated under SS&M, or in the path of maintenance of the existing infrastructure, or in paths of "remanufacture" or "maintenance".

Illustratively, a path including the following consecutive stages could be studied: the post START II arsenal; an arsenal of 1000 warheads; an arsenal of 200 warheads; an arsenal of less than 10 warheads; a zero arsenal but including a residual capability to produce warheads; and finally, elimination of both warheads and the capability to produce them. At the same time this phased approach is pursued, the U.S. should negotiate the end phase, a nuclear weapons abolition convention, comparable to the Chemical Weapons Convention. This abolition regime could be injected into the phased approach at any point; thus we do not mean to imply that elimination of nuclear weapons must necessarily await the

1/40.60 continued

completion of several distinct phases of reduction. Within the zero option, DOE will need to examine a range of timelines for reduction toward and achievement of zero, with their associated facilities and impacts. These timelines should include a schedule of no more than 15 years for elimination of nuclear weapons, and others DOE determines to be reasonable. DOE could consult with the above-mentioned groups and others concerned with these issues, as well as with the Arms Control and Disarmament Agency, under whose aegis such planning should be taking place. We urge the inclusion of a timeline of no more than 15 years on the basis that the process cannot be so long as to seem illusory, as this would erode the NPT regime and squander the historical opportunity now presented by the end of the Cold War and the relative cooperation now prevailing among the major world powers.

Other elements of U.S. policy and law. In addition to its dismissal of the NPT Article VI obligation, DOE relies on other elements of U S. policy and law to support its decision not to analyze a zero option and true programmatic alternatives. (S-7, S-10, 11) While these may in some degree support the examination of DOE's preferred alternative of an ambitious SS&M Program, they do not support ignoring an alternative based upon compliance with NPT Article VI, which itself is the law of the United States, having at least equal stature with statutes (see Constitution, Art. VI, cl 2) We are of course aware that the Nuclear Posture Review does not set forth any paths to a nuclear weapons free world, and indeed seems inconsistent with the recent U.S reaffirmation of its Article VI obligation. Again, however, the purpose of NEPA review is to enable the examination of a range of reasonable alternatives, and the zero option is certainly a reasonable alternative, in view of Article VI as well as the fact that a nuclear weapons free world in the view of many would be highly desirable for the United States even in terms of a relatively narrow definition of "national security". Further, the DOE has an obligation independent of its relationship with the DOD to comply with NEPA and with national law and policy including the NPT. In addition, individuals working in DOE themselves have moral and legal obligations with respect to issues as grave as those posed by planning the future complex. Finally, a large portion of the informed public that has been monitoring DOE planning and the PEIS has consistently and strongly advocated that DOE include a zero option.

Concerning START I and II (S-7, 10), while they are the present framework for arms reduction, there is no reason to take them as an indefinite framework, as explained above. Concerning the CTBT (S-10), again it must be stated that whether SS&M is necessary to maintain "safety" and "reliability" in the absence of test explosions is a matter of controversy, which must not be assumed. Further, U S. Director of ACDA, John Holum, justified the CTBT at the test ban negotiations in Geneva on January 23, 1996 on the ground that it will serve to prevent nuclear states from further development of their arsenals (vertical proliferation) as well as the spread of nuclear weapons (horizontal proliferation). Holum stated, "So the CTB's Fundamental effect is less to preclude the acquisition of nuclear weapons as such, which the NPT addresses, than to constrain the advancement of nuclear weapons capabilities by any country." (Text released by ACDA, as delivered.) Consistent with this justification, many states are supporting the inclusion of preambular language that the principal objective of the CTBT to halt qualitative improvement of nuclear weapons.

1/40.60 continued

Whether or not such language is included, this will be the global expectation for a CTBT. Thus to the perhaps large extent that SS&M is aimed at preserving design and development capabilities, it will be contrary to the CTBT as the U.S has justified it to the world.

4/40.31

A DOE Office of Research and Inertial Fusion (ORIF) document, which WSLF pulled off the DOE's Defense Programs INTERNET homepage in January 1996, describing Core Research and Advanced Technology Program Elements including Concept Design and Assessment activities ranging from "relatively minor modifications in the components of existing weapons to major changes in warhead subsystems or to entirely new candidate designs for proposed or candidate weapon". The document also states, "at such time that a new concept matures [it] would be transferred into a program .. such as a Stockpile Stewardship Program" It further states that "examples of this work include .. concept design studies, arising out of the experiences during and after the Gulf War that indicated potential military utility for types of nuclear weapons not currently in the stockpile".[7] Remarkably, DOE has claimed that this document does not reflect current plans. However, the program elements set forth in the ORIF document are mirrored in the FY 97 DOE Defense Activities Congressional Budget Request At vol 1, p 78, the request describes "Conceptual Design and Assessment" as including a "limited amount of prototyping or experimentation" and lists areas of interest as including advanced electromagnetic radiation and stealth as well as safety features. (emphasis added) The DOE also is continuing to make militarily significant modifications to existing design types, for example the modification of the B-61 for use as an earth penetrator, a weapon which the government apparently intends to deploy without underground testing. All of this supports the conclusion that DOE is currently engaged in design and development of nuclear weapons, though "new types" of weapons are not being manufactured, and further supports the inference that the enhancement of design and development capabilities is a principal aim of SS&M[8]

1/40.60 continued

The entire structure of the PEIS is designed to foreclose evaluation of the alternatives for the future of the Nuclear Weapons Complex. Rather than engage in a reasoned comparison of different means to assure, separately or together, the safety and the reliability of the existing arsenal, the PEIS authors sometimes descend to a level of argument that is little better than veiled threat in order to dismiss all options other than their proposed action. For example, the DPEIS warns that without the NIF, "Alternatives to achieve higher temperatures and pressures than are presently available may eventually be proposed, but they would not be available when several of the remaining types of nuclear weapons age beyond their original design lifetime, between 2005 and 2010 Thus, issues may arise that decrease

[7] DOE, Office of Research and Inertial Fusion, "Core R&AT Program Elements (Detail)." Attachment F Also included in attachment F are the Office of Research and Inertial Fusion Home Page document, bearing the legend "Last Modified: Wednesday, 11-Sept-95," with which the "Core R&AT Program Elements Documents" is cross-linked, and the "Programmatic Overview," with which it also is cross-linked

[8] See generally "Comment of the Western States Legal Foundation on the National Ignition Facility (NIF) and the Issue of Nonproliferation, Attachment E

1/40.60 continued

confidence in the reliability of these weapons and increase the probability that the United States may need to invoke 'supreme National Interest' and withdraw from any Comprehensive Test Ban Treaty in effect". (Vol. III, I-S.4.2) Statements of this kind are particularly

5/40.03

disturbing in a context where the responsibility for certification of nuclear weapons rests solely in the hands of the weapons laboratories, with no outside review by parties who do not have a direct interest in the advancement of weapons design and the construction of extremely expensive new facilities.

Finally, concerning Presidential Decision Directives and the 1994 Defense Authorization Act (S-11), the same considerations apply as noted above with respect to the Nuclear Posture Review. Further, whether SS&M as planned by DOE is necessary to objectives they set forth is, once more, debatable. Also, these are policy determinations that can change and that are supposed to be informed by the environmental review DOE is undertaking. That review will have failed its purpose if it assumes one policy course among the several possible.

1/40.60 continued

The DPEIS seems to conflate the concept of reasonable alternatives with the concept of a preferred alternative. "The 'agency's preferred alternative' is the alternative which the agency believes would fulfill its statutory mission and responsibilities, giving consideration to economic, environmental, technical, and other factors." "Memorandum: NEPA's Forty Most Asked Questions Concerning CEQ's NEPA Regulations," ("40 Questions") 4a, 46 Fed. Reg. 18026 (March 23, 1981) The DPEIS states that its planning assumptions limit alternatives to those "that are consistent with, and supportive of, national security policies" pV.I p.3-1. The difficulty here is that "national security policies" are unclear and in some cases contradictory. There is an inherent tension between U.S. obligations under the NPT and stated intentions to enter into a meaningful Comprehensive Test Ban Treaty, on the one hand, and those policies which DOE claims support a proposal to modernize the nuclear weapons research, testing, and production infrastructure on the other. The purpose of an EIS, and particularly of a Programmatic EIS, is to inform decision makers and the public about the benefits and potential environmental risks and effects of various "national security policies" which might be chosen and the means to achieve them -- not merely to examine the impacts of the means for accomplishing a choice already made. Otherwise reasonable alternatives should not be omitted from detailed analysis, even if they are beyond the jurisdiction of the agency conducting the review, or not fully consistent with current policy.

"Alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable, because the EIS may serve as the basis for modifying Congressional approval or funding in light of NEPA's goals and policies." 40 Questions 2b. Addressing alternatives which may not be current Administration or Congressional policy is particularly appropriate here, where the environmental review is for decisions with a time horizon of at least several decades, and where U.S. treaty obligations would point toward, at the very least, serious consideration of policy alternatives to indefinite maintenance of a large nuclear arsenal, and of "all historical capabilities of the weapons laboratories, industrial plants, and NTS." See DPEIS S-2. It is impossible to weigh the

impacts against the purported benefits of a huge, complex program of action, which will shape the international nuclear proliferation context for decades to come, cost tens of billions of dollars, and which will build facilities which will use large quantities of radioactive and hazardous materials and generate large quantities of radioactive and hazardous waste at sites across the nation, without comparison to a substantially different range of alternative approaches to an appropriate nuclear weapons policy for the 21st century.

1/40.60 continued

Meaningful programmatic environmental review requires programmatic alternatives - not simply a collection of site-specific reviews combined with a decision process for locating functions and facilities among sites. Yet DOE has eliminated programmatic alternatives from consideration. The "denuclearization" option must be considered for all the reasons stated above relating to NPT Article VI (this would also apply to "dismantling the nuclear weapons complex"). "Remanufacturing" and "maintenance" must also be considered, because they are technically plausible, less expensive alternatives, with lesser environmental impacts. Note that these alternatives do not assume a path toward zero, though they are more consistent with this path than SS&M. Consideration of the two

6/40.27

laboratory alternative and location of laboratory testing at manufacturing facilities is required because, while not "programmatic" in the sense of the above alternatives, they involve considerably more policy choices within the reasonable universe of options than does DOE's SS&M analysis. In particular, the two laboratory option merits consideration for reasons stated by the Galvin Commission report. Moreover, the two laboratory option appears more consistent with the programmatic alternatives excluded from consideration, "remanufacture," "maintenance", and, to a lesser extent, "denuclearization."

The analysis in this DPEIS begins, in essence, with the conclusion that the policy debate over Stockpile Stewardship and Management is over, and that the Program alternative already has been chosen. The purpose of a Programmatic environmental impact statement should be to provide environmental analysis to accompany and inform the policy analysis which will shape the program. Like any other EIS, a PEIS is supposed to be done early enough in the decision making process to actually have some meaningful role in the decision to be made.

1/40.60 continued

IN ADDITION TO ANALYZING A RANGE OF ALTERNATIVES WHICH IS TOO NARROW TO ALLOW MEANINGFUL EVALUATION OF THE PROPOSED ACTION, THE ALTERNATIVES DISCUSSED ARE NOT ANALYZED IN A WAY WHICH ALLOWS FOR COMPARISON OF THEIR RESPECTIVE IMPACTS.

No true alternatives to the Program, aside from a no action alternative, are actually analyzed. "All of the existing basic capabilities of the laboratory and industrial base continue to be needed even though there have been changes in national security policy since the end of the Cold War. These changes do not affect the standards for stockpile safety and reliability." p.2-10 The "reasonable alternatives" analyzed in detail by the PEIS for rebuilding the nuclear weapons complex for the next fifty years are largely limited to various locations for siting facilities to accomplish one particular approach to the modernization of DOE's

1/40.60 continued — nuclear weapons research and testing facilities. The legally mandated "no action" alternative is under analyzed. Even the stockpile "cases" DOE employs to provide a narrow, partial substitute for an alternatives analysis, all of which are based on the assumption one or another combination of DOE's proposed facilities will be built, are treated unevenly.

7/40.36 — For stockpile stewardship experimental capabilities, DOE proposes building three expensive new facilities, the NIF, ATLAS, and the CFF facility at the FXR. The only alternative to building these facilities analyzed in detail is a "no action" alternative continuing operation of existing facilities with the same function. the PEIS stresses that these facilities "are complementary in nature and are not alternatives to one another." For NIF, the PEIS provides an analysis of alternative sites, but no program alternatives besides "no action" are provided for any of the facilities, for their specific program roles, or for their broader, separable functions of assuring weapons safety and reliability. Despite requests in scoping comments, the DPEIS does not analyze whether individual stockpile stewardship facilities are

8/40.22 — needed to diagnosis safety problems, on the one hand, and reliability problems, on the other.[9]

1/40.60 continued — For "Stockpile Management," the only "program alternative" considered in detail aside from "no action" is "to rightsize functions to provide an effective and efficient manufacturing capability for a smaller stockpile." The analysis is somewhat more elaborate here, because two alternatives are considered for each function in addition to no action. "downsizing in place" at the current location, or transfer to a new laboratory and NTS-centered complex. The alternatives analyzed still are limited mainly to where facilities will be located, and do not include alternatives other than "no action" to building what will be the modern nuclear weapons production capacity in the world. The analysis of the environmental impacts of stockpile management levels other than the preferred alternative "base case" is conducted principally via a "sensitivity analysis of the differences, if any, from the base case alternatives for the high and low case stockpiles." DPEIS v.I 3-1.

9/40.26 — The DPEIS continues that "Since it is assumed that the annual workload will be very close to the base case capacity assumptions, the base case is analyzed in the greatest detail." PEIS v.1 3-1. This approach reveals the extent to which the PEIS is narrowly focussed on a single, pre-chosen alternative. There is no separate analysis of the "high" and "low" stockpile cases in which the impacts of these "alternatives" can be comprehensively compared to the "base case" alternative. Indeed, it is not clear that the different "stockpile cases" really represent "alternatives" in the traditional NEPA sense at all, since they apparently will require construction of the same facilities and will have, according to this document, very similar impacts (although we do not share DOE's apparent confidence that operating its new weapons complex at "surge capacity" can be done largely without waste management and

10/11.16 — capacity difficulties, and more than proportionally increased risk of both routine and accidental releases of radioactive and hazardous materials and of worker exposures).

[9] See "Comment of the Western States Legal Foundation on the Scope of the Stockpile Stewardship and Management Programmatic Environmental Impact Statement," August 11, 1995, Attachment A

9/40.26 continued — The DPEIS also does not analyze whether the "low" stockpile case could be supported with a different set of facilities or with differently designed facilities. In the "Comparison of Alternatives" section (3-86 et seq.) there is no comparative analysis of stockpile cases. If the stockpile cases are in fact intended to function as "alternatives," this approach also contravenes the requirement an EIS "[d]evote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits." 40 CFR 1502.14.

Pit fabrication and re-use is treated slightly differently, because there is no functioning large-scale production facility now operating. Here too, however, the only alternatives analyzed in detail are alternative sites. The "no action" alternative of relying on existing R&D capabilities at LANL and LLNL receives little actual analysis; the way the "no action" alternative is treated here manifests fundamental deficiencies in DOE's analytical approach.

11/40.19 — The description of the "base case" for pit fabrication, to start with, is confusing. Section 3.4.3 , at 3-50, states that the "base case production rate is approximately 20 pits per year." In the same paragraph, the single shift capacity of the proposed facility is given as 50 pits per year. The 20 pits per year corresponds not to the base case, but to the "low case" in the "Stockpile Management Facility Sizing assumptions (Annual Activity on Single Operating Shift) table 3.1.1.1-1, p.3-3, which describes the "base case" as 50 pits per year. The table itself is unclear, since it does not state whether greater than one shift operation is necessary for the "high case" numbers. The accompanying text refers to a "bounding analysis" for three shift operation (at 3-3), but the "high case" numbers in table 3.1.1.1-1 do not seem high enough to reflect three shift operation, unless information is provided for why additional production drops off dramatically with added shifts. The table for resource requirements (table 3.4.4.2-2) for LANL pit fabrication is labeled "Surge Operation Annual Requirements," but no pit figure is provided for "Surge operation." Table 3.4..3.2-3, "Los Alamos National Laboratory Pit Fabrication Facility Waste Volumes," is based on an 80 pits per year figure for "surge capacity," but this does not match the 100 pits per year "High Case" in table 3.1.1.1-1. The parallel Savannah River table is based on a 120 pits per year surge capacity. (table 3.4.4.4-3)

12/32.18 — In addition, the description of the proposed Pit Fabrication and Intrusive Modification Pit Reuse Alternatives states that "nonintrusive modification pit reuse... is an inherent capability of the pit fabrication facility..." Table 3.1.1.1-1 cites a "High Case" figure for nonintrusive pit modification of 200 per year. There is no mention in Table 3.4..3.2-3, "Los Alamos National Laboratory Pit Fabrication Facility Waste Volumes," of whether waste volumes include nonintrusive pit reuse operations. There is no analysis of whether the pit fabrication and nonintrusive pit reuse activities can be carried out simultaneously so that the impacts are cumulative.

A better explanation of these programs is provided in v.II, Appendix A, but this Appendix is referenced for the Savannah River discussion, and not in the discussion of locating the facilities at Los Alamos. The Appendix does not provide further information

12/32.18 continued

concerning whether impacts of nonintrusive pit reuse and new pit fabrication are cumulative. In general, the description of the proposed action alternatives for pit fabrication and reuse is confusing, omits important information, and the Appendices are inadequately summarized and referenced in the text

13/32.07

The "No Action" alternative for pit fabrication and reuse, furthermore, is virtually invisible. The entire "No Action" alternative description for "Pit Fabrication and Intrusive Pit Reuse Alternatives" for LANL consists of one paragraph, 12 lines, which informs us that "LANL maintains a limited capability to fabricate plutonium components using its Plutonium Research and Development Facility.." and that there are "less extensive capabilities at LLNL to support material and process technology development. Under No Action, DOE would not have the capability to perform pit fabrication to meet the requirements described in section 3 1 for the base case." There is no further description of existing facilities, of their capacities, or of their requirements or impacts; the alternatives for DOE's proposed action receive seven and three quarters pages of text, maps, and tables

14/40.90

There is also no discussion of what facilities are expected to be built as part of the "no project" alternative by the baseline year of 2005. This is of particular importance at LANL, where ongoing projects include, for example, the upgrade of the Chemistry and Metallurgy Research Facility (CMR). Presumably, the CMR will provide part of the "no action" capability for pit fabrication, modification, and reuse at LANL. The DOE FY 1997 Congressional Budget Request v.I indicates that Phases 1 and 2 of the CMR upgrade are expected to be complete by 2002, and hence may be encompassed in the PEIS "No Action" alternative. (at v I p.138 et seq.) The FY 1997 Budget request states that "Phase 3 scope, cost, and schedule are contingent upon future programmatic requirements based upon the results of the Programmatic Environmental Impact Statement (PEIS) and Sitewide Environmental Impact Statement (SWEIS). Therefore, detailed scope, cost, and schedule for Phase 3 are not specifically addressed." at 146a.b. It is unclear, for example, whether a PEIS decision to choose the "no action" alternative would result in more or less extensive renovations of the CMR, or at other LANL facilities, and hence whether DOE's 2005 "no action" plan consists of expanded pit fabrication and reuse capabilities at the laboratories, or only the capabilities which currently exist. This obviously is a key consideration in attempting to evaluate the nature of the "no action" alternative and its potential impacts

13/32.07 continued

Unfortunately, the impacts of the "No Action" alternative for pit fabrication and reuse are not analyzed separately They are aggregated together for all impacts in the general LANL "no action" baseline (deficiencies of which are discussed further elsewhere in this comment) Impacts of the proposed pit fabrication and reuse facility are not compared with a separately analyzed "No Action" alternative, but only with the aggregated site wide "No Action" baseline This has several consequences which detract severely from the usefulness of this document for comparison of alternatives, "the heart of the environmental impact statement 40 CFR1502 14. It makes it impossible to compare the impacts of existing pit modification and reuse capabilities with proposed new capabilities. This problem is exacerbated by the fact that existing capabilities are split between LANL and LLNL, and by

13/32.07 continued

the failure of DOE to detail what capabilities it envisions constituting the "No Action" alternative for pit fabrication and reuse in 2005. There is no separate discussion of impacts of "No Action" pit fabrication and reuse activities at LLNL. In the analysis of impacts for pit fabrication and reuse at SRS, there is no comparison with the "no action" alternative for pit fabrication and reuse, only with the baseline no action conditions for SRS. For LANL, the PEIS compares impacts for its proposed pit fabrication and reuse alternatives only with aggregated total site activities under a "no action" alternative.[10] In the "Comparison of Alternatives" section, the two proposed action alternatives are compared to one another, but only to aggregate "No Action" baseline conditions at the affected sites, rather than to "no action" pit fabrication and reuse activities. p.3-89.

The "no action" alternative must be included in an EIS, whether or not an agency thinks it is reasonable. 40 CFR 1502.14.(d) It must, furthermore, actually be analyzed; an EIS must "[d]evote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their respective merits." 40 CFR 1502.14 (b). The PEIS provides no separate treatment of the "no action" alternative for pit reuse and modification, much less one which is "substantial." The failure to provide a separate "No Action" alternative analysis makes any meaningful evaluation of the particular alternatives for pit modification and reuse impossible The absence of any alternatives in which pit fabrication and reuse will not continue, or will be phased out over time, further impedes any useful understanding of the environmental impacts of the DOE's proposed action

THE NO ACTION ALTERNATIVE IN GENERAL

15/40.56

The "no action" alternative in general is so poorly described that it is difficult to understand what it really is. It is important to keep in mind that the "no action" alternative does not describe currently existing operations and facilities at DOE sites-- rather, it is an arbitrarily chosen set of "not stockpile stewardship and management" activities, some of them in fact part of the stockpile stewardship and management programs, which are expected to be in operation almost a decade from now. It is difficult to discern from the PEIS exactly what the "no action" set of facilities constitutes at any given site. The PEIS tells us that "As a general rule, projects which had begun actual construction (i.e., ground breaking) prior to September 1995 are considered in the No Action alternative." at 3-7. At another place, we are told that "The no action alternative includes all existing site facilities plus all facilities for which Congressional Budget 'line item' construction was started by the end of fiscal year 1995 (September 30, 1995)." p.3-4 The impact comparisons for No Action and the site-

[10] The impact comparisons also seem implausible in places, see, e.g., Table 4 6 3.9-1 where the "Potential Radiological Impacts to the Public Resulting from Normal Operation" of a three shift pit fabrication facility, aggregated with other emissions site-wide, at Los Alamos are calculated to be identical, down to the last decimal place, with the "No Action" alternative A footnote to the same table states that the "Total Site" figure "[i]ncludes impacts from No Action." Hence the radiological impacts to the public of normal operation at surge capacity of a nuclear weapon pit fabrication facility apparently were calculated as zero, or incalculably small

15/40.56 continued

specific variations of the proposed action in some places refer to the "no action" alternative as "no action" and in other places as "2005 no action." Accident analyses, we are told, "are based upon facility conditions expected to exist in 2005" 3-4. The "No Action" project description concludes with a broad summary of programs which will continue at affected sites. It states that "no further rightsizing or consolidation beyond *currently planned initiatives* would take place." (p.3-8. emphasis added), but does not tell us what those initiatives are or whether they would be part of the 2005 "no action" baseline.

16/41.17

Some projects may have the paradoxical status of being both too remote to receive detailed analysis and included in the 2005 baseline. One example is the Advanced Radiation Source (ARS [X-1]), which is part of the set of "next generation" facilities that "cannot be defined to the degree necessary to perform detailed environmental analysis," but which apparently is slated to be completed by 2003.[11]

15/40.56 continued

So how does one figure out what DOE expects to exist in 2005? Section 3.2 contains sketchy descriptions of each site as currently constituted, with no way to tell what will exist in 2005, or what is a "currently planned initiative," or what has broken ground, (depending on which "no action" version DOE really is using). The descriptions of the "affected environment" at each site in the "affected environment" section refer us back to the cryptic site descriptions in Section 3.2 (e.g.,the entire project description of the "no action" alternative in Section 4 for LANL reads: "LANL would continue to perform the missions in section 3.2.6" at 4-232) Descriptions of particular impacts in section 4 use 2005 as the "no action" year, without further elucidation of what facilities and operations the impact estimates are based on. An Appendix in v.II (not referenced in the site descriptions) provides somewhat more information on currently existing site operations, but no further illumination of DOE's plans for 2005.

The cumulative impacts section also states that "The No Action alternative takes into account existing site operations and includes the impacts resulting from planned changes to operations until the year 2005. Projects planned for beyond the 2005 No Action baseline would be in such a preliminary stage as to make analysis speculative." 4-532. This section provides us with a list of 12 NEPA documents, including 10 EIS's, which were "eliminated from further study because they do not contribute to cumulative impacts or had impacts that were already included in the 2005 No Action alternative." 4-531 It does not, however, state what projects or programs "were already included in the 2005 No Action alternative."

---

[11] "Construction of the X-1 ARS, to be located in Area 4, would begin in 2000 and be completed by 2003 The pulsed power team hopes to reach the accelerator's maximum output levels by about 2005 Then, if results on the X-1 warrant scaling up further, construction of a new super accelerator currently known as Jupiter would produce as much as 32 megajoules of energy by around 2015" "Turn-of-the-century X-1 Advanced Radiation Source to succeed PBFA II," Sandia Lab News, March 29, 1996

15/40.56 continued

In sum, the "no action" description is confusing, and does not provide information sufficient to inform the reader of the actual activities it encompasses. This renders it virtually useless for comparison with the already too narrow range of alternatives. The alternatives analysis is "the heart of the environmental impact statement" (40 CFR 1502.14), and the no-action alternative is "a benchmark, enabling decisionmakers to compare the magnitude of environmental effects of the action alternatives" (Forty Questions, no.3). The deficiency of the no action alternative alone is sufficient reason to withdraw this PEIS and republish the draft.

17/40.58

THE STOCKPILE STEWARDSHIP AND MANAGEMENT PROGRAM IS NOT DESCRIBED IN A MANNER WHICH WOULD ALLOW FOR MEANINGFUL COMPARISON WITH OTHER TRUE PROGRAM ALTERNATIVES.

Even if true program alternatives had been examined, the "stockpile stewardship and management" program itself is defined in a manner which does not allow meaningful comparison with other program options. Major parts of the program, including facilities and actions which either are incomplete or have not been started, have been eliminated from consideration, including, for example, DARHT and tritium production facility options. In this regard, it is important to note that DOE initiated the environmental review for rebuilding its nuclear weapons complex almost five years ago In the interim, DOE has initiated or completed hundreds of millions of dollars worth of new facilities and facilities upgrades throughout the nuclear weapons complex, apparently implementing portions of the program which the reconfiguration PEIS was supposed to review (Most prominent among these facilities is the DARHT, initiated without an EIS, but see also, for example, the various non-maintenance projects encompassed in "CMR Upgrades Projects" and "Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phases II, II, and V, U.S. DOE, FY 1997 Congressional Budget Request, pp. 129 et seq.) It is likely that the commitment of extensive resources over the past five years to the refurbishment of the weapons complex in the absence of programmatic review has substantially narrowed the range of options which DOE is likely to conceive as feasible.

Throughout this period, citizens groups consistently have asked for a programmatic environmental review of the reconfiguration of the nuclear weapons complex which included alternatives in which testing and production of nuclear weapons is phased out DOE has refused to broaden the scope of its environmental review in any substantive way, instead steadily fragmenting its Programmatic review into an ever more confusing welter of inconsistent NEPA documents whose relationship to one another is obscure, meanwhile continuing to rebuild the complex in bits and pieces, apparently seeking to provide the lowest possible level of environmental review for every project. DOE blames its constant rescoping on changes in the international policy context, but DOE has failed repeatedly to listen to a public which has consistently been ahead of its government in recognizing that a broad reevaluation of nuclear weapons policy is necessary. The end result of this five year process is the presentation to the public of a fait accompli, with the fundamental policy decisions already made and major program components (e g the DARHT) already underway

17/40.58 continued

If the DOE had responded more substantively to scoping comments five years ago, it might have begun a comprehensive, public, environmental and policy analysis of the real program alternatives for the nuclear weapons complex for the next fifty years. Instead, it has chosen at every turn to limit debate to policy options which, unsurprisingly, will keep most current major program elements funded; and so we stumble blindly onward into another half century of nuclear weapons research, design, production, and threatened use. It has chosen to use this PEIS as a document of administrative convenience to consolidate and accelerate environmental review for site selection for facilities which are part of a program already largely decided on. The public would have been far better served by using this PEIS for a comprehensive look at the environmental impacts of the full stockpile stewardship and management program, the weapons complex of the future as envisioned by DOE, in comparison with other programmatic options for managing the nuclear arsenal.

RADIATION RELEASES AND WASTE MANAGEMENT

18/11.32

The analysis of radiological impacts is, to begin with, too limited. It omits entirely the impacts of radioactive releases on aspects of the biosphere other than human health, stating that "Impacts on biotic resources from the release of radionuclides would be expected to be less than on the human population, and, therefore, are not evaluated." 4-5 NEPA does not require analysis only of the worst impacts, or only of impacts on human health. "Effects includes ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative" 40 CFR 1508.8.

The analysis for radiation releases for normal operations of the proposed stockpile stewardship and management facilities is difficult to follow, and appears to be based on assumptions which may substantially understate potential impacts. The explanation of the health effects calculations in Appendix E states that source terms for radiological releases are for "stockpile management alternatives," there is no reference to or data for releases from stockpile stewardship alternatives provided in that section Section E.2.3. The source terms include "only atmospheric releases," we are told, "because liquid radiological discharges are not expected from any of the alternatives at any of the sites." p. E-10. There is no explanation of why this is so. One possibility is that emissions analyzed have been limited to direct emissions from proposed new stockpile management facilities, and that the calculated impacts do not include the total impacts of radioactive materials handling to serve stockpile management alternatives, and of treatment, storage, and disposal of stockpile management waste.

19/42.12

The DPEIS waste management analyses for each site for the proposed stockpile stewardship and management alternatives do not provide impacts of waste management, but rather impacts on waste management facilities, being largely limited to descriptions of waste quantities which will flow in or out of waste management facilities. There is no analysis of health and environmental impacts of waste management activities which will be attributable to the individual stockpile management alternatives, despite the fact that much of the contamination of air, soil, and water resulting from the past decades of nuclear weapons research and production have been the direct result of waste management operations--

19/42.12 continued

emissions from waste processing, leaks from tanks and underground containments, spills, releases in public sewer systems and releases to waterways.

It is not sufficient to point to the Waste Management PEIS as the solution to these problems, as this document still would require that data from that PEIS be adequately summarized and incorporated by reference to allow meaningful comparision of the alternatives offered here. In addition, due to the continuing fragmentation of the Nuclear Weapons Complex reconfiguration environmental review, the programs whose waste is addressed in the Waste Management DPEIS and this DPEIS are different in scope, and the Waste Management DPEIS does not break down data or waste stream information in a way which allows meaningful comparison of the Stockpile Stewardship and Management DPEIS alternatives Finally, it is unclear how the DPEIS year 2005 "No Action" baseline is related to the organization of data and analysis in the WM DPEIS. DOE's approach to the relationship between its NEPA review for its rebuilt nuclear weapons complex and for management of waste from that complex seems to be to simply assume in this DPEIS that all waste management problems will be solved through the WM DPEIS, and in the WM DPEIS it is assumed that all potential conflicts with the WM DPEIS will be resolved in the Stockpile Stewardship and Management PEIS ("The Stockpile Stewardship and Management DPEIS will assure that all wastes generated as a result of stockpile stewardship and management activities are compatible with treatment, storage, and disposal decisions resulting from the WM PEIS." U.S. DOE, <u>Draft Waste Management Programmatic Environmental Impact Statement</u>, v.I p.1-34).

20/41.16

The result is that the analysis needed to determine some of the most critical impacts of programmatic alternatives for rebuilding the nuclear weapons complex falls through the cracks. There is no analysis in any document which allows citizens or policy makers to compare the aggregate environmental impacts of the various programmatic alternatives for the future of the U.S. nuclear weapons complex, no document that provides for any program alternative or comprehensive picture of that alternative's impacts from materials handling and use in manufacturing, through waste management, to long-term storage or disposal This is precisely the outcome we hoped to avoid when we raised concerns, almost five years ago, about the initial division of the programmatic review of weapons complex reconfiguration into separate analyses for weapons research and production, on one hand, and waste management, on the other.[12]

21/10.03

This compartmentalization of environmental review has had results which are puzzling, and which compromise the usefulness of the Stockpile Stewardship and Management DPEIS as a serious analytical document. The descriptions of cumulative impacts for several of the affected sites state that "Cumulatively, the increased waste production from the Stockpile Stewardship and Management alternatives would be a minor contribution to waste

[12] See generally "Comment of the Western States Legal Foundation Regarding the Proposed Scope of the Programmatic Environmental Impact Statement for the Department of Energy's Proposed Reconfiguration og the Nuclear Weapons Complex," September 30, 1991.

21/10.03 continued

management cumulative impacts when compared to potential Waste Management PEIS impacts." (LANL cumulative impacts, 4-545, see also LLNL, 4-550, SRS, 4-538). This implies that the wastes addressed in the WM PEIS come from some other program entirely. The WM DPEIS, however, states that its focus is the waste management facilities needed to "treat, store, and dispose of existing wastes and wastes that will be generated in the future as a result of DOE nuclear weapons stockpile stewardship and research programs." WM DPEIS Summary, p.13. A WM DPEIS table, which specifically excludes environmental restoration wastes, indicates that a major portion of the waste addressed is expected to be generated in the future -- presumably by "nuclear weapons stockpile stewardship and research programs."[11] "Quantities of Waste," WM DPEIS Summary, p.11. In effect, the Stockpile Stewardship and Management DPEIS seems to be saying that stockpile stewardship and management waste streams will be minor compared with waste streams generated in substantial part by the stockpile stewardship and management programs themselves. This result is either absurd, or, if the Stockpile Stewardship and Management programs which will generate most of this waste are not addressed in the Stockpile Stewardship and Management DPEIS, a strong indication that this DPEIS has been improperly scoped.

CUMULATIVE IMPACTS

22/13.04

The discussion of the cumulative impacts of waste management demands from stockpile stewardship and management programs also typifies the defects in the DPEIS cumulative impacts analysis. First, the DPEIS "cumulative impacts" analysis really is not, in many instances, a cumulative impacts analysis, but rather an incremental impact analysis. The purpose of a cumulative impacts analysis is not to illustrate the relative insignificance of the proposed action's contribution to ongoing, similar degradation of the environment; rather, it is to determine the aggregate, or "cumulative," effects of related impacts, to determine whether, taken together, those impacts are significant.

21/10.03 continued

In discussing waste management impacts, for example, the approach taken in each instance is to claim that wastes added from the DPEIS alternatives will be small in relation to existing waste management operations at each site or in comparison to additional waste management loads expected from additional alternatives, e.g., regional consolidation of certain types of waste management at sites slated for stockpile stewardship and management programs. There is no real analysis of whether the proposed DPEIS alternatives, in combination with other foreseeable activities in the same area, will have significant waste management impacts. More important, the environmental impact of waste management is not merely that quantities of waste will be managed; that is a fiscal and bureaucratic, not an environmental, impact. Rather, the environmental impacts of waste management are the use of resources and impacts on the biosphere and on human health from routine and accidental releases from waste management facilities, none of which are analyzed in the waste

[11] Presumably, from the waste volumes, "stockpile stewardship and research programs" here also include "stockpile management" as defined in the Stockpile Stewardship and Management DPEIS

21/10.03 continued

management cumulative impacts discussion for each site. It is also noteworthy that the contribution from the WM PEIS alternatives, the main standard of comparison used to render Stockpile Stewardship and Management Waste insignificant, in the narrative discussion, is not analyzed quantitatively In most instances, in the spaces in tables where waste management alternative waste should be represented, there is only a footnote reference indicating that a facility "could receive waste as a result of the Waste Management PEIS." see, e.g., Table 4.13.1.2-6, p. 4-540; Table 4.13.1.5-6, p. 4-546 (Waste Management Cumulative Impacts for SRS and LANL)

22/13.04 continued

The cumulative impacts analysis also is not done on an alternative by alternative basis, so it is difficult to compare alternatives to one another. This is undoubtedly due in part to the fact that there really is little variation in the alternatives DOE has chosen to present, and is a manifestation of the inadequacy of the alternatives analysis -- the alternatives which DOE has permitted within its narrow view of what is "reasonable" do not vary enough, at least given the kind of analysis done in this DPEIS, to allow for very meaningful comparison of environmental impacts. Another factor is the cursory and conclusory character of the cumulative impacts analysis itself. The cumulative impacts analysis is so sketchy that it would not be likely to differ from alternative to alternative. The main cumulative impacts

23/13.05

analysis for non-accident radiological impacts for rebuilding the nuclear weapons complex at sites which bear fifty years of contamination from past nuclear weapons operations, and where a number of other activities continue which handle large quantities of radioactive materials and generate large quantities of radioactive waste, is one paragraph long. p 4-533 It consists entirely of conclusions -- that "all program totals would be within radiological limits to the public and the effects to workers would be small," and that "[c]umulatively, radiological impacts are expected to be within radiological limits." There is no supporting analysis, and no indication where such analysis could be found

24/13.06

The individual site cumulative impact discussions of radiological impacts provide only accident analyses for earthquakes affecting multiple facilities; we are told we can add these together ourselves with data presented in the general impacts analysis for each site to derive cumulative impacts. see, e.g., 4-538. The accident analysis data provided cover only radiological releases, there is no mention of other hazardous materials. see, e.g., 4-538-9, text and table 4.13.1.2-5; 4-541, 4-545, etc.. In effect, we are told to assemble the cumulative impacts analysis ourselves by combining "beyond design basis earthquake" release impact projections with routine release data presented in an earlier section (which themselves may have deficiencies -- see discussion of radiation release analysis above). These are the components of the DPEIS cumulative impacts analysis on this issue of perhaps the greatest concern to the public-- the continuing, long-term health and ecological effects of releases of radioactive materials: one paragraph of unsupported conclusions, and site by site sets of mismatched parts for an uncompleted analysis.

25/40.15

Viewed against the background of a nuclear weapons complex for which the cleanup bill may run to hundreds of billions of dollars, and which still has not resolved fundamental issues of waste stabilization, cleanup, and long-term disposition, the DPEIS cumulative

25/40.15 continued

impacts analysis clearly is inadequate. It manifests a cavalier attitude towards the complexity of the nuclear weapons enterprise itself, and towards the potential dangers of rebuilding the complex amidst the unsolved problems of the past, all the while creating wastes for which no permanent storage solutions have been found.

> Many factors have contributed to the current waste and contamination problems at the weapon sites: the nature of manufacturing processes, which are inherently waste producing; a long history of emphasizing the interest of national security, to the neglect of environmental considerations; a lack of knowledge about, or attention to, the consequences of environmental contamination; and an enterprise that has operated in secrecy for decades, without any independent oversight or meaningful public scrutiny. Congress of the United States, Office of Technology Assessment, Complex Cleanup: The Environmental Legacy of Nuclear Weapons Production (1991), p.4

The paucity of substantive, useful environmental analysis in this DPEIS, and the apparent lack of interest in creating a document which might be useful in comparing a range of truly different options for developing an appropriate set of nuclear weapons facilities for the coming decades, suggests that we have learned little from this history, and are likely to repeat it.

1/40.60 continued

In general, the impact analysis techniques used in this environmental review -- bounding analyses which aggregate the placement of the largest feasible number of facilities at each site, and which aggregate both maximum numbers of facilities and other actions when discussing cumulative impacts; detailed analysis of a most likely "base case" for stockpile management operation rates, with only a "sensitivity analysis" for the other stockpile cases, minimal explanation and analysis of the "No Action" alternative; all make it difficult for the reader to make meaningful comparisons even among the limited range of stockpile management alternatives analyzed (although it is doubtful whether the stockpile cases really can be characterized as alternatives). No program alternatives (as opposed to site alternatives) other than DOE's proposed facilities and "no action" are analyzed for the portion of the Stockpile Stewardship program addressed in the document. The very narrow range of alternatives considered -- essentially operating the existing weapons complex or operating the existing weapons complex with certain facilities upgraded or added --makes it hard to get any real sense of the relationship between the environmental costs and the purported benefits of the particular nuclear weapons policy DOE is advocating. Several of the program alternatives rejected by DOE, including, for example, denuclearization, maintenance, and the two laboratory alternatives, most likely would have very different environmental impacts than the proposed Stockpile Stewardship and Management program, and would have allowed the comparison of substantially different alternatives needed for effective environmental review.

The only kind of judgment which can be made on the basis of this DPEIS is an impressionistic, general up or down vote on DOE's stated intentions to modernize the complex. The combination of an extremely one-sided analysis of potential effects on the weapons nonproliferation climate, the elimination from detailed analysis of all substantive

1/40.60 continued

program alternatives to the proposed action, and technical analyses which conclude that a large nuclear weapons research, production, and testing complex can be rebuilt and operated with few significant health or environmental impacts at facilities with still unsolved waste and contamination problems, leave little doubt what our conclusions are supposed to be. This is a classic example of an environmental document whose purpose is "to justify decisions already made." see 40 CFR 1502.5

THE DPEIS SHOULD NOT INCLUDE SITE SPECIFIC ANALYSES FOR STOCKPILE STEWARDSHIP FACILITIES.

26/21.05

In regard to the site specific review of the various stockpile stewardship facilities, and the NIF in particular, we reiterate our scoping comment that we believe that it is inappropriate to include site-specific facilities review in this programmatic EIS. It is a further manifestation of the fact that the meaningful program decisions already have been made. Combining three separate site specific EIS's with a programmatic review of one of the most complex programs ever put forward by the government also places an insupportable burden on commenters. There is no way that citizens and public interest groups can be expected to examine this varied and complex a set of multi-level environmental review documents in the time allowed for comment. Given the inadequacy of the larger DPEIS and its necessary role in providing the programmatic context for the site specific decisions, we also believe that a meaningful evaluation of the adequacy of the stockpile stewardship site-specific portions of the DPEIS cannot be made. We would note that upon first impression, the NIF site specific review is similar in character to the larger DPEIS, in that it fails to address a reasonable range of other alternatives for achieving stockpile stewardship program goals, provides no substantial analysis of the ongoing controversy on potential proliferation impacts of NIF both independently and in combination with other Stockpile Stewardship and Management facilities, and discusses project benefits without analyzing concomitant environmental impacts.

27/21.17

In regard to proliferation effects, the NIF impact review here bases its short, conclusory discussion on DOE's The National Ignition Facility and the Issue of Nonproliferation (1995). We commented extensively on the deficiences in the draft of that report;[14] those comments remain relevant since there was little substantive change in the final document. Particularly relevant in the NEPA context is that The National Ignition Facility and the Issue of Nonproliferation did not analyze alternatives to the NIF.

26/21.05 continued

We note again that nuclear weapons proliferation poses the possibility of extensive adverse environmental impacts as the result of the proliferation of nuclear weapons research, testing, and production programs with their attendant multiplicity of environmental effects. Similarly, the NIF analysis in the DPEIS discusses other benefits of the facility, stating, for example, that "the most significant long-term civilian application of ICF is the generation of electric power." If benefits of a project are discussed, environmental impacts must be

[14] See generally "Comment of the Western States Legal Foundation on the National Ignition Facility (NIF) and the Issue of Nonproliferation, Draft Study," (October 10, 1995, attachment 1)

26/21.05 continued
discussed as well in order to provide the fair and impartial analysis NEPA requires. In our comment on the draft of the NIF Nonproliferation study we described the potential for nuclear weapons proliferation both in the spread of ICF technology and also in the successful deployment of fusion as a commercial power source. (at p.13 et seq.) In both instances, the spread of the technology necessarily entails the spread of knowledge applicable to nuclear weapons development, and also perhaps the building of numerous facilities which will have the potential for production of materials used in nuclear weapons. DOE cannot promote the long-term benefits of inertial confinement fusion without acknowledging these potential adverse impacts, and the potential impacts of commercial-scale fusion power plants as well

Dear Sir:

1/40.12
I am opposed to your Stockpile Stewardship and Management Program which will cost as much as $55 billion.

I agree with the Australian Prime Minister Paul Keating who said:

2/40.06
"What we need now is action to achieve the abolition of all nuclear weapons."

Sincerely,

Virginia Fabilli

COMMENT LETTER
PAGE 1 OF 2

Dear Ms O'Leary ①

1/40.06 We went to Santa Fe on Apr 25 to notify your agents that citizens of northern New Mex do not like your plans called "Stockpile Stewardship Myth" (SSM). It is not alright with us if you wish to proceed on the plan for global destruction. Nuclear war is not

2/41.03 a sane alternative. It ain't easy goin to your meetings. And though we talk, it's hard to believe anyone listens. Anyone from your side that is. [Your shur godsit is]

3/43.18 Now wild fires blaze around the Lab and yeah though we're asked for places for earthquake, volcano and evacuation route considerations, no real thought had been given to forest fires but now they may have to add another lie to the mitigation or improbable scenario blurb. This is real folks!

SSM-M-092
COMMENT LETTER
PAGE 2 OF 2

② At LANL they live in a dream world. "no significant impact upshure." The

4/40.21 impacts of nature be they earthquake, volcano, wildfire or flood are significant and you need to wake up to the danger that DOE risks to your own employees, neighbors and friends as well as those you regard as enemies. I spent much time reading and here's a quote I left out "You can't destroy an enemy by shooting him. That only creates more enemies. The only way to destroy an enemy is to make him your friend." Rescue Mission Planet Earth by Children of the world.

5/41.04 The way you've turned one PEIS into seven has fragmented this absurd program and never addresses a need for global sustainability,

6/40.07 implications to non-proliferation and test ban, nuclear terrorism and so many vital global issues. Stop this madness now!

Thanks Bennie Bennett

ECOLOGY - SANTA FE STYLE

Hearings on the Los Alamos National Laboratory - April 25

For hours I sat in the meeting room
Focused, mystified and shocked.

1/41.03

I heard teams of concerned citizens
Plead for national consciousness to protect
Our land from nuclear disaster.

I saw the DOE team pay polite attention,
With not a flicker of recognition
That we were of the same land
And of the same family of man.

The occasion was to allow free speech.
For citizens to voice choice,
(We chose "No")
To be recorded for the ears
Of Ms. O'Leary before her decision.

Yet, one citizen asked whether the DOE
Had already determined the lab's fate;
Making the hearing a charade.
(We will see, or will we?)

Some citizens have been speaking for the last
Thirty years against nuclear development
To deaf ears and blank faces.

Now he stands in his eighty years,
Fragile-voiced, but vehement:

"Wake up - to our unconscious addiction to
Expediency and denial of reality!"

Forest Fires in Santa Fe - April 26

2/43.18

For hours I watched through binoculars the dome fire.
Focused, alert and shocked.

I was awed by the density of the smoke
That almost blotted out the red sun,
That put our town in shadow;

By the red sunset carving fiery forms
From the smoky mass along the horizon.
The next day the horizon was gone.
The town hidden by haze.

I started to rage in helpless concern.
I started to ask questions.

The nursery owner laughed at my horror:
"It is natural - Ponderosa Forests
Need fire every five years."
Mary of Cerrillos, age 75, says:
"Natural? My foot!"

Thousands of forested acres lost in flames
Ignited by careless campers - natural?
Anna, permaculturist, concluded:
"Natural? Totally unnecessary!"
Is this season's dry climate an ecological alarm?

Is this potential too intense to be comprehensible?
"The dome fire's flames are two miles from the Los Alamos Lab"
Announced blandly by TV news.

Are there thorough decision-processes around the Lab?
" ...Weapons-grade plutonium is pyrophoric -
Meaning it can ignite in air...stored in PF-4 building...
Built to withstand four hours of intense burning." (!)

Yet New Mexico hesitates to call the National Guard.
" ...If flames were to burn into these buildings
(Abandoned buildings at TA-16 contaminated
With high explosive materials...)
Small explosions could result...chunks of high explosion
Materials at TA-16 could detonate if burned."

SSM-M-093
Comment Letter

I found dialogue and some conclusions.
We grieved over lost forests, wildlife, soil, water and Indian ruins.
We concluded that this drought is the worst since 1950.

I concluded earlier this spring.
That an "Arbor Initiative" could begin
A micro-climate-change to create rainfall.
A community tree-planting project
Could help heal land and hearts.

Maybe now, tree-aware community concern
Will be ignited?

We concluded that speeches do not convert minds.

We concluded that prayers with energy
Beamed on healing fearful minds
Could cause change.

Shall we begin?

Comment Letter

U.S. Department of Energy
Office of Reconfiguration
P.O. Box 3417
Alexandria, VA 22302

Dear Sirs:

Thank you for the opportunity to comment on the Programmatic Environmental Impact Statement for Stockpile Stewardship and Management Summary

1/40.52 Initially, I would like to say that Pantex has always been safe and responsible, and I have no doubt that they will continue to be so. I am in favor of Pantex being the choice for the Stock Pile Stewardship

My question and comments relate to S.4.1, page S-32. The second paragraph on the right side of the page states: "The loss of 3549 total jobs would cause . . . housing/rental vacancies and public finance expenditures/revenues would change by less than 1%."

Upon questioning this conclusion at the public hearings, basically the response was that the study took in such a large geographic area that this was an accurate number This area is large enough that if it was in the New England area, it would take in parts of all of several states. The true economic effect of Pantex's present existence has a great effect on a smaller area, but minimal or no effect on communities 1 to 2 hours away

With this logic, the study could have taken in the whole state of Texas, in that contractors from Dallas or Austin will feel the effects more than someone in Dalhart or Perryton This would have reduced the supposed impact even more

2/08.15

- Why was such a large geographic and economic area used for this study?
- Was there any attempt to qualify if this area was currently affected by Pantex's presence before it was used to determine the true economic impact?
- The first paragraph on the same page, S-32, tells us that an addition of 1282 jobs in the NTS Las Vegas area would have about the same (less than 1%) impact as the loss of 3549 jobs in the Amarillo area. Comparing the population and economic base of both areas, do you truly believe that the Amarillo area economy will be affected so slightly?
- If the impact study was supposed to take into account the cumulative economic effects, was the loss of the sight characterization in Hereford taken into account? Was the probable loss of the Helium Operations, or even the loss of Reese Air Force Base taken into account? Was there any comparison to the devastating effect of the loss of the Amarillo Air Force Base on Amarillo's economy?

It appears that these numbers were intentionally minimized to make the impact seem as small as possible. The loss of 3549 high-paying jobs would have great economic consequences Just the proposed down-sizing would have a much larger effect than is stated in the study

SSM-M-094
COMMENT LETTER **PAGE 2 OF 2**

Thank you again for the opportunity to make these comments. I urge the DOE to designate Pantex as the preferred alternative site for the Stock Pile Stewardship.

Sincerely,

Jerry Goebel

USDOE
PO Box 3417
Alexandria, VA 22302

Dear Friends,

I attended the DOE hearing on Apr. 25, 1996 in Santa Fe, NM. regarding future nuclear weapons design, testing & production and its impact on Los Alamos National Laboratory.

I did not speak at that time but do now want to go on record opposing actions proposed by the DOE. The SS&M program is not a scaling down of nuclear weapons but an expensive proposal for new or upgraded facilities. The staggering possible cost of $30 billion & the generation of more nuclear waste is unacceptable to me & my family.

1/40.07

Experts agree that accidental detonation will not happen. Therefore I believe a passive caretaker role is sufficient and more in keeping with our international agreements.

I believe the SS&M program poses a threat to international security & may encourage other countries to abandon their treaty obligations

2/40.72 And I am particularly opposed to LANL becoming the "prime steward" of our nation's nuclear weapons arsenal. I believe the $4.5 billion in proposals for upgrading facilities there for research & testing, for plutonium processing and other activities, would be, if acted upon, a grievous error and a gigantic waste of our nation's resources. And it becomes additionally painful in view of the fact that lab clean-up & technology transfer programs are being cut and that LANL remains out of compliance with environmental law.

I am grateful to be a resident of New Mexico & cherish the beauty and tranquility this state offers. I fear that your actions threaten the health & safety of all of us who live near Los Alamos National Laboratory.

Sincerely,
Lorraine Schuster

<u>Comments on Stockpile Stewardship and Management DPEIS</u>

By: Thomas M. Rauch, Director, Disarmament/Rocky Flats Program, American Friends Service Committee, 1664 Lafayette Street, Denver, Colorado 80218

I appreciate the opportunity to offer comments on the Stockpile Stewardship and Management DPEIS.

1/40.60 1. <u>Assumptions about stockpile size</u>: the PEIS assumes three stockpile sizes: one that is consistent with the START II protocol; one that is consistent with START I Treaty but larger than 6000 weapons; one that is described as a "hypothetical low case" of approximately 1000 weapons. These assumptions are flawed because they do not consider a zero-option stockpile. An option of no nuclear weapons should be considered because the United States, by ratifying the Nuclear Non-Proliferation Treaty in 1970--a commitment renewed indefinitely in 1995--committed itself "to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international controls." (Article VI, Nuclear Non-Proliferation Treaty)

2/40.22 2. <u>Need for New Facilities</u>: the SS&M Program proposes the construction of new facilities to assure "safety and reliability" of nuclear weapons currently in the stockpile. The DPEIS does not argue convincingly that new facilities are needed for these purposes. In fact, the DPEIS downplays the conclusions of the Sandia Stockpile Life Study, which shows that currently stockpiled warheads, rebuilt to original specifications, will perform reliably without the need for new facilities. The alternative of using present

NATIONAL OFFICE: 1501 CHERRY STREET, PHILADELPHIA, PENNSYLVANIA 19102
An Affirmative Action Employer

2/40.22 continued

facilities to assure "safety and reliability" should be considered thoroughly in the DPEIS, with input from previous studies, such as the Sandia Stockpile Life Study, and from citizens' groups that work on these issues.

3/40.85

3. Scope of SS&M PEIS: this draft looks only at the potential impacts of three proposed facilities: the National Ignition Facility, the Contained Firing Facility, and the Atlas Facility. It does not consider other facilities being proposed and/or built as part of the SS&M program. The LYNER and BEEF facilities at the Nevada Test Site, and the DARHT facility at the Los Alamos National Lab were not evaluated in the draft SS&M PEIS. This is a serious omission. This PEIS should examine all of the facilities that are proposed or being built as part of the SS&M program. The PEIS should examine these facilities both as a whole and individually in light of true national security needs now that the Cold War is over.

4/40.36

4. Justification for SS&M program with its new facilities: this is one of the weakest parts of the DPEIS. The claim is made that this program, with all of its new facilities, is needed to assure the safety and reliability of the current nuclear stockpile in the absence of underground testing. Arguments opposing this claim are not taken seriously in the DPEIS even though experienced and reputable scientists assert that the SS&M program is not needed to assure the safety and reliability of the current stockpile. The PEIS should incorporate all the data supporting the position that the SS&M program is not needed for safety and reliability purposes, and then make conclusions as determined by the evidence.

5/40.50

5. New Weapons: the facilities proposed in the SS&M PEIS, though described as necessary to assure the safety and reliability of the current nuclear stockpile, in reality will enable the United States to continue research, development, testing, engineering and production of new nuclear warheads. This potential for the new SS&M facilities should be clearly laid out in the PEIS, and the pro's and con's considered thoroughly. Without presenting this potential of the SS&M program, the PEIS is very incomplete and seriously deceptive.

6/40.15

6. The Problem of Wastes: the United States is faced with the very challenging, very expensive task of stabilizing, storing and disposing of wastes from fifty years of nuclear weapons production. No final disposal site for the radioactive wastes has yet been found. But the SS&M program will, by DOE estimates, generate 1,370,000 cubic meters of additional low-level waste and 144,000 additional cubic meters of low-level mixed waste over the next 20 years. It is irrational to propose a program that will generate so much additional waste when the government has barely begun

6/40.15 continued

to deal with wastes already in existence as a result of past weapons production.

7/40.12

7. Costs of SS&M Program: Costs of the SS&M program for ten years are estimated at approximately $40 billion. The PEIS should examine a range of alternatives for use of $40 billion dollars in that time frame, including accelerated waste management and environmental restoration at DOE nuclear weapons facilities, decontamination and decommissioning of those facilities, economic conversion efforts for the communities surrounding those facilities, and verification activities to assure that disarmament treaties are being adhered to and proliferation of nuclear weapons is not occurring.

8/40.14

8. Nevada Test Site: the PEIS should seriously consider the option of closing the underground portion of the Nevada Test Site. Some experienced scientists see no technical justifications for keeping the underground part of the Nevada Test Site open. In addition, closure of this test area would be one demonstration of U.S. commitment to end weapons development, and so would give the U.S. a stronger position from which to work for the end of nuclear weapons development by all nations.

9/40.87

9. Another Draft SS&M PEIS: because the deficiencies of this draft PEIS--as indicated above--are so serious, I think it is important to the credibility of this process that a second Draft PEIS be produced which will incorporate these recommendations and those of many others who have also identified serious deficiencies. The publication of this second Draft PEIS should be followed by another round of public comment hearings and opportunities for written comments before a final PEIS is prepared.

HE FABRICATION QUESTIONS

SSM PEIS
H.E. FABRICATION QUESTIONS

1/34.13

* The implementation schedule on page 36 of the Preferred Alternatives Report gives the impression that the decision to transfer the high explosives mission to the laboratories has been made.
  - Is this true ?
  - If not, on what basis will it be made ?
  - What part will cost and technical risk play in the decision ?

2/40.23

* On page 17 of the Preferred Alternatives Report the statement is made that the two-laboratory alternative (although more expensive) best preserves the DOE core competency in high explosives.
  - How does the transfer of the H.E. production mission to the labs preserved their R&D core competency ?
  - How has the laboratory H.E. core competency been preserved heretofore ?
  - Is the transfer of the H.E. production mission the most cost effective option to address the core competency issue ?
  - What other options were considered and how did their cost compare to the mission transfer option ?
  - How will the laboratories maintain core competencies in other components produced at the Kansas City and Oak Ridge plants ? Core competency is not mentioned as a consideration in the nonnuclear mission discussions on pages 20-22 of the Preferred Alternatives Report ?

1/34.13 continued

* How does the DOE propose to maintain the high explosives safety and health protection infrastructure required for assembly / disassembly at Pantex if the H.E. mission is transferred to the laboratories ?
  - On page 37 of the Preferred Alternatives Report the text says that this risk must be addressed by retaining

1/34.13 continued	the high explosives expertise at Pantex to support both the assembly / disassembly operations and the fabric-ation of high explosive components. This sounds like a slight of hand to both transfer the mission to the labs yet retain the expertise at Pantex. Please explain. - Was the cost to transfer the mission but not the key expertise considered in the cost comparisons ? • Sandia is not mentioned in the high explosives options. - Are they not invoved in the design and development of high explosives components ? - Will the production of such components be transferred to Sandia ? - If so, have the corresponding transfer costs and risks been evaluated for incorporation into the decision process ?
3/09.06	• If the H.E. mission is transferred to the laboratories what will be the resulting impact on the transportation of explosives between the laboratories and Pantex ? - Have the risks to the public and costs of the high explosives movements been determined for use in the decision process ? - Will scrap explosives be returned to the laboratories for disposal ? If not, will Pantex be responsible for disposition ?
2/40.23 continued	• Do the laboratories have the H.E. production surge capability in terms of facilities and equipment equal to that which exists at Pantex ? - How does the DOE propose to produce new weapons if the world situation changes and the production sites have been stripped of their capabilities ? - Several production plants such as Mound, Pinellas, and Rocky Flats are in the process of being closed. How well have the laboratories have performed in assuming the production capabilities of these plants ?

	-The DoD has attempted to combine some of their R&D and production operations . Is the DOE aware of the results of the DoD experience ?
4/40.13	• If the H.E. production mission is transferred to the laboratories, what will be the transition cost to move equipment and re-establish the production capabilities at the labs compared with keeping the mission at Pantex ?
5/08.24	• How many new employees will the laboratories hire for H.E. work if the mission is transferred ? How does this compare with the number of employees that will be associated with H.E. work at Pantex if the mission is not transferred ?
1/34.13 continued	• Discuss how the laboratory explosives facilities compare with those at Pantex ? - Since some were built in the 1950's do they meet the same safety criteria ? Explain.

SOCIOECONOMIC QUESTIONS (ATTACHED)
PANTEX PLANT WATER USAGE (ATTACHED)

SSM PEIS and S&D PEIS SOCIOECONOMIC QUESTIONS

1/40.83
* Please explain why LLNL and LANL Stockpile Management budgets show projected increases from 1996 to 2004 since the US has terminated the development of new nuclear weapons ?
  Ref. SSM PEIS Preferred Alternatives Report, pp 26,30.

* Are these projected increases in Stockpile Management at the two labs based on transferring missions to them which have previously been done at the production plants ?

2/40.23
* Please elaborate on a statement made on page 34 of the SSM PEIS Preferred Alternatives Report that " personnel from the laboratories could perform assembly / disassembly for some weapon surveillance operations to improve the programmatic tie between Stockpile Stewardship and Stockpile Management ".
  - Would laboratory personnel replace Pantex personnel for this work ? If not, explain.
  - Would this add to the projected layoffs at Pantex ? If not, explain.
  - Would the laboratory personnel be trained and certified to perform this work ?

3/40.21
  - What organization(s) would be responsible for safety, safeguards, and conduct of operations associated with this work ?
  - Explain how this would improve Stockpile Stewardship and Management ?

* Under Phaseout (page S-21) of the S&D PEIS the statement is made " All of the regional economic areas surrounding the DOE sites would experience a loss in employment with

SSM-M-098
COMMENT LETTER

phaseout. However, compared to total employment in these areas, the loss of jobs would have no or negligible impacts at all the DOE sites."

- For which sites would the impact be negligible ?
- For which sites would the impact be significant ?
- What is the basis for determining the significance of the impacts ?
- How does the DOE plan to use this significance in their selection process ?

4/08.25

• The socioeconomic analyses of the three EIS's are not consistent. The SWEIS (p. S-17) assumes 1.65 indirect jobs in the region for every job at Pantex. The SSM PEIS (p. S-32) assumes 1.16 and the S&D PEIS (p. 4-205) assumes 3.51.
  - Please explain these differences ?
  - Why didn't the DOE use the analysis of the Amarillo Economic Development Commission (AEDC) which is based on local knowledge of the area ? Their analysis gives a ratio of 2.87 to 1 (REF. Chamber Quarterly, 2nd Quarter, 1996, Amarillo Chamber of Commerce).

5/12.07

• Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, and President Clinton's February 11, 1994 Memorandum for the Heads of all Departments and Agencies requires an analysis of environmental effects on low-income and minority populations to include human health, social, and economic effects.
Why do the draft SWEIS, SSM PEIS, and S&D PEIS analyze only human health effects of the proposed actions and not the social and economic effects as required ?

SSM-M-098
COMMENT LETTER

• In the draft SWEIS (p. S-17) it is stated that at the 500 weapon activity level Pantex " would support 2,400 direct jobs and 3,949 secondary jobs" and that " personal income additions to the economy would be reduced to $365 million annually ?
-Please explain why this degree of economic loss would not only be an adverse but a Significant Adverse Impact to the community.
- At the 500 weapon activity employment level what would be the impact to the revenues for the governing bodies within the Pantex ROI compared with the current revenues presented in Table 4.11.1.6-1 (p.4-165) ?

6/08.22

• In the draft SSM PEIS (I-4-450) please explain the statement
" The downsizing A/D and HE fabrication alternative would result in the addition of 280 workers at Pantex "
- If the statement is incorrect what would be the result ?

SSM-M-098
COMMENT LETTER

WATER USAGE : PANTEX PLANT

- Plant used 230 million gallons in 1995.
  - Texas Tech Farms used 66 million gallons (29%) of the total plant water usage.
  - Nuclear weapons operations used 163 million gallons (71%).
- Amarillo Water District consumed 16 billion gallons in FY 1995.
- Pantex Plant including Texas Tech Farms used 1.4% as much water as Amarillo District.
- Nuclear weapons operations used 1% of the water used by Amarillo.
- Considering the water also used for irrigation, the Plant withdrew 0.6% of the regional withdrawal from the Ogallala aquifer.* Nuclear weapons operations consumed 0.43% of the regional withdrawal.
- Draft Environmental Impact Statement for the Continued Operation of the Pantex Plant and Associated Storage of Nuclear Weapon Components, March 1996, page S-15.

COMMENT (and background information):

1/04.15 NTS workers and their families associated with the 2,253 new jobs (p. S-32) would likely reside in Las Vegas, NV, which is one of the fastest growing areas in the country.

QUESTION:

Has an analysis been made of the impact of these additional residents on the Las Vegas municipal water supply?

COMMENT (and background information):

2/34.11 The preferred alternative for the location of explosives development has not yet been determined. Moving HE production from Pantex to one of the laboratories is under consideration. Note that there have been attempts to develop the land right next to LLNL's Site 300 fence for new housing.

QUESTION:

a. If the operation is moved to either LLNL or LANL, where would the buildings be placed and the testing be done?

3/01.03 b. What is the current and projected land use around LANL and LLNL (particularly, Site 300)?

DRAFT SSMPEIS

COMMENT (and background information):

4/09.06 **Separation of the explosive fabrication and assembly/disassembly missions would require that explosives be transported over long distances in order to be mated with the physics packages. In the case of LLNL, the extensive winter fogs of the San Joaquin Valley that create near zero visibility, sometimes for weeks-on-end, should be considered in any safety analysis.**

QUESTION:

a. Has an analysis been made of the additional hazards of transportation of HE from either of the national laboratories to where it would be used?

b. What would be the increased costs of intersite transportation?

My name is John M. Napier

I live at 113 Dartmouth Circle, Oak Ridge, TN 37830.

My question relates to the Draft Program Environmental Statement for Stockpile Stewardship and Management.

1/03.03 Table 4.6.3.3-1 states that LANL will be out of compliance for nitrogen dioxide release (24 hour basis) if the work from Y-12 is moved to LANL. What treatment is planned for the nitrogen dioxide release and is the costs estimated in this PEIS?

Please include the answer to this question in the final Stockpile Stewardship and Management Environmental Impact Statement.

My question relates to the Draft Program Environmental Statement for Stockpile Stewardship and Management.

1/33.09 Relative to Table 4.17-4, how is LANL going to use only 1,568,333 kg/y of chemicals when Y-12 plans to use 6,488,333 kg/y of chemicals (a 76% reduction) or is the LANL chemical use only an estimated amount?

Please include the answer to this question in the final Stockpile Stewardship and Management Environmental Impact Statement.

COMMENTS

ON THE

STOCKPILE STEWARDSHIP

AND MANAGEMENT

plan

James T. WABER	2651 Caminito Carlitos, Santa Fe, N. M. 87505	Tele: 986-6134
ER/WM Sub-Committee	Citizens Advisory Board	Fax: 986-9710

Many of the persons who chose to speak at the Meeting in the High Mesa Inn, seemed to think that now that the USSR has collapsed, that there is no longer any likelihood of a credible attack on the US. This is in my mind is a very myopic and short-sighted view of the world.

We live in a hostile world and even though we don't yet see it so clearly, it doesn't mean that it does not exist. We are induced to lay down our arms and live in peace and love. The argument is simply stated that by our moral example, we will induce the remainder of the nations to follow suite. I can reflect on this idea personally.

no page two

When I was living in England in the 60's, there were protest marches and public confrontation, People laid down in front of the laboratory gates, imploring the English to abandon their nuclear capabilities so as to induce the French to abandon their nuclear plans. The protesters had to be dragged away by the British police.

Did it work? NO. The French just went ahead with their **FORCE DE FRAPPE** and ignored these English protests.

One of the speakers towards the end of the session (nearing midnight) stated that Premier Chirac having suffered the voluble international protests over the tests in the Pacific, was going to abandon them. Perhaps so, but he will abandon only the tests. The **EDF** France's very large electricity combine, will continue to operate well into the forseeble future. The French simply need the electricity and hence will produce plutonium.. Further, the French continue, as far as I know, with their Pu Breeder reactor work to produce even more Pu.

The US researchers abandoned this idea several years ago, but not because it wasn't feasible. It is! But presumably because we did not as a nation lack sufficient plutonium, it was because we alredy had a surfeit.

So our moral persuasion, simply did not prevent other nations from making their own plutonium. I could cite Israel, China, Pakistan, North Korea and India as potential producers. I cannot personally assert that they have Pu based weapons. But I think the evidence is compelling that they have the necessary technologies to proceed whenever they feel that it is in their perceived national interests to finish the job.

Turning for the moment to my technical experience and background, I was graduated from IIT as a Ph.D. in Chemical Engineering and Metallurgy. I was second in command in a Corrosion Research Lab team. Then I took a job at Los Alamos for almost twenty years, working on the metallurgy of plutonium. Particularly, I studied the corrosion of uranium and plutonium as it pertained to storage problems. The last seven or eight of that period, I turned to computational physics, and did research related to the possibility that there could be additional elements.

I left the Lab in 1967 to teach Material Sciences at Northwestern University and conduct research particularly on surface related problems such as catalysis. The new element research noted above on unknown elements called *Superactinides* was completed at NU. The Periodic Table was extended well beyond a realisitic limit, beyond element 162.

After about 20 years, I became dissatisfied and when I was invited to join the Physics faculty of Michigan Technological University, I took it. There I concentrated on computationl chemistry and physics. But the writing was on the wall, namely conventional physics was a relatively dead field and I decided to pursue another more practical career, namely one in Hazardous Materials and Waste Management at the

Arizona State University. The degree requirements for a Master's degree are not yet quite complete. I have several long term papers yet to write and edit.

I have taken the required training (48 hours mandated by OHSA plus the yearly two day refresher course and the additional supervisor training) here in Santa Fe. The three day on-site training in handling hazardous wastes is still incomplete. But I think I can easily qualify by virtue of handling Pu, U, tritium and various other toxic substances for years. So I think I am qualified to have and voice an opinion on these matters.

Plutonium is abundantly available in the world. I have been invited to visit a small Pu laboratory in Sweden about twenty years ago when I was at Northwestern University. I had virtually nothing to say to them.

I have a friend in the Denver area who toured the uranium fabrication plants in western China, but they would not let him and his group into the higher level facilities or discuss any plutonium capability.

The situation in USSR is really dangerous. Typical salaries of even high ranking generals and similar officials are pitifully low. Perhaps they are **as low as fifty or a hundred dollars per month**. One of the late speakers at the session, indicated that the US was paying salaries of 200/month to such persons. I have no way to verify the idea. I had informally proposed a very much higher salary and to bring them to the US (where they might be useful in other ways), to various people including a Russian trained professor - a former Russian Lab director - employed by MTU, my University. His answer was that the Russians would never let such persons leave their country. But the nuclear scientist, Dr. Andrei Sakarov did. He was responsible for independently developing their thermonuclear device.

But why worry? The southern underbelly of the USSR consists of primarily Moslem nations. Those people are influenced by their religion to die as martyrs in the "service of Allah." Further, they have great animosity towards the US and Israel after the recent conflict with Iran and the continuence of the embargo. These various Arab states are wealthy with oil dollars. They can easily offer a Soviet citizen a 100,000 dollars a year to proceed with the development of good nuclear weapons. I don't think that we cannot stop this from happening, because Western experts do not understand the lure of martyrdom.

Dr. Theodore Taylor, (not the curremt DOE director for Waste Management) wrote a long *New Yorker* article about ten or fifteen years ago, pointing how relatively easy it would be with available declassified documents to make a poor nuclear device or even a good, low yield one. He was not an idle dreamer. He was one of the brilliant young bomb designers working for Carson MarK in T-Division along with Conrad Longmire and Marshall Rosenbluth. Fortunately, the IRA or other terrorist groups have apparently not followed his model.

1/40.04 Yes, I feel strongly that we need the continuing capability to use these safe weapons when threatened. Their mere presence is a deterrent to adventurous terrorist groups bent on glory to attempt to use nuclear weapons.

2/32.01 Granted that we need the availability of nuclear bombs, but do we need the increased Pu Pit production? The answer is, probably no. There are repeated references in the PEIS to repairing defects in the stockpiled weapons, to improve their safety. What are these undisclosed defects? There seem to consist of two classes, (one) defects within the devices manufactured in the 60's and (two) new (but unknown) defects which may occur in the near future in the enduring stockpile. Both of these, from my understanding, are now merged into the counts of defect problems, to indicate future potential problems. Those in the 60's were introduced with inadequate testing.

Quoting from a senior weapons scientist Ray Kidder in his 1987 study, his conclusions that

> "...(1) these resulted from rushing inadequately tested designs into the stockpile, and (2) that these problems are all lessons learned, i.e., of historical, but not predictive importance - still stand."

In his 1987 paper, Kidder wrote

> "During the past decade [1977-1986], new boosted primaries have been designed and developed by the weapons laboratories ... performed satisfactorily the very first time they were

2/32.01 continued

tested, the observed yield in no case falling short of the expected by ...."

Quoting from Conclusion 3 of the declassified summary and concluions of the Jason report JSR 95-320,

"(U) The individual weapon types in the enduring stockpile have a range of performance margins (see their footnote[1]), all of which we judge to be adequate at this time. In each case we have identified opportunities for further enhancing their performance margins by means that are straightforward and can be incorporated with deliberate speed during scheduled maintenance or remanufacturing activities. *However the greatest care in the form of self-discipline will be required to avoid system modifications, even if aimed at "improvements," which may compromise reliability.*" (emphasis is mine).

In Kibber's 1987 paper, one finds:

"During the last decade (1977-1986), new boosted primaries have been designed and developed by the weapons laboratories... performed satisfactorily the very first time they were tested, the observed yield in no case falling short of the expected by more than ....(see [his] tables H1 and H2 and Fig. H1) The one new primary that failed was a more complex. less predictive design than the others. This primary that failed was subsequently redesigned, tested and failed

[1] Defined as the difference between the minimum expected yield and the minimum needed yield of the primary,

2/32.01 continued

again. None of the primaries in the existing stockpile employ ..." (this principle).

In the September 22, 1994 briefing on Nuclear Posture Review, DOD requirements to DOE were to:

"- Demonstrate capabilty to refabricate and certify weapon types in the enduring stockpile

- Maintain capabilty to design, fabricate and certify *new warheads*" (emphasis is mine)

So the primary justification for the enhanced pit production is to develop NEW weapon designs undoubtedly without testing or with very minimal unrealistic testing, i.e., low yield experiments.

So in face of the strong *caveat* from the Jason panel, we, nevertheless, are going ahead with weapons modifications, According to the statement of Asst. Secretary Reis before the Energy and Water Development Subcommitte of the Senate Appropriations Committee on April 16, 1996.

"The Accelerated Strategic Computing Inititive will build on the core stockpile computing program ... [to develop] ...a predcitive aging capability to enable a focus on extending the lifetime of the current stockpile... [and] a r e absolutely essential for stockpile stewardship success."

" ...The development plans for these [weapons] codes include the delivery of initial capabilities needed to certify planned near-term stockpile modifications (e.g. W76 re-certification, W88 pit rebuild and B61 Mod 11.)

.... we can begin to interpret complex fluid instabilities near special weapon features, provided essential data on design changes to the W-87 warhead. This data was a significant factor in allowing us to proceed without testing."

But can we really be assured that sometime in the future, that some justification will not be found for carrying out more than some sub-crtical experiments, i.e., for proper certification. Will the DOD be satisfied with just computer testing?

Quoting again Asst. Secretary's statement,
"The Nevada Test Site is planning training exercises to practice the skills and functions necessary for nuclear testing which are not involved in either subcritical experiments or high explosives experiments..."

3/40.11 We need in the forseeble future to retain some nuclear weapon scientists - it is not clear that we need to retain thousands of them. It is proposed that we need to retain experienced people and advanced computer technology. We could retain the unique knowledge in sealed archives and involve a few staff members. There is sufficient current computer expertise in this country to handle large complicated weapons codes. So that is not a real problem, when they can easily become acquainted with the details. *The emphasis should be on uniqeness not on quantity.*

After all, the bomb was developed starting almost from scratch with a few theorists, with Monroe "hand

cranked" calculators, with well-trained machinists and with rather limited experimental facilities and in **27 months elapsed time.** Why can't we do it again and much faster, when and if we need to?

According to presentation by Larry Woodruf of LLNL to the Galvin panel in August 1994, there currently is "...the capacity of making 150 pits/yr in the [current] downsized complex, i.e., at LANL." *Source: Briefing Charts prepared for presentation to the Galvin Panel.* Why do we need more capacity now?

Turning back to aging problems, they do not affect safety. This was the first question posed to Dr. Kibber by the US senators and he made it clear that aging does not create safety problems. More specifically he said,

"Metals may corrode and organic materials such as plastics, adhesives and HE that are present in a nuclear warhead will deteriorate with age. Such aging effects degrade a weapon's reliability rather than its safety. (The sensitivity to impact or fire of the HE used in nuclear warheads does not increase significantly with age...The reliability, but not the safety of the warhead was [is] affected." *Source: UCRL 53820*

Dr. John Immele, director of Los Alamos Laboratory's Nuclear Weapons Technologies Program spoke to the same point in December 8. 1994 in a public hearing:

"<u>Audience</u>: ...They may age or crack. What does that mean, is there a risk to the public?
<u>Immele</u>: No. there's not a safety risk, There's a

performance problem...because insensitive high explosive is so insensitive that sometime if it's cracked it won't light on the other side when it is supposed to, so it's basically a performance problem.
<u>Audience</u>: A reliability problem?
<u>Immele</u>; That's right, it's a reliability issue. We have not found aging problems that affect safety, that make the explosive more sensitive."

Concerning accidental plutonum dispersal, according to a safety report of the ****** Los alamos Study group, plutonium

> " ...can be dispersed into the atmosphere in any accident in which the conventional explosive in a nuclear weapon burns or explodes. If the explosive involved is 1HB, an explosion is highly unlikely, since 1HE is remarkably difficult to detonate. In case of a fire, plutonium will burn along with the 1HB. Warheads made with HE may also burn in a fire rather than explode, and in fact this happened six times at U. S. Air Force bases between 1958 and 1965 when nuclear warheads were involved in fires.
>
> "All in all, between 1950 and 1980 there were 32 serious nuclear weapon accidents ('Broken Arrows'), [BUT] None have occurred since 1980. .... there were two accidents that involved explosions with plutonium. These were airplane crashes at Palomares, Spain in 1966 and at Thule, Greenland in 1968. Luckily, these occurred in relatively unpopulated areas, and no public exposures resulted."

Fortunately these are now past history, from which we have learned,

The DARHT and the Los Alamos Neutron Science Center (LANSE) projects may not be aimed at improved safety. There is a claim that 1 mm. resolution in neutron radiography is "perhaps" enough to see cracks, etc. in pits, [that] seems optomistic. The study of such cracks on the implosion process need not be of great importance and of limited interest. If one wants reliable weapons of mass destruction, simply replace those cracked pits, or better, retire them. To deter one or two countries, one needs only a FEW weapons.

2/32.01 continued

To summarize, we need the continuing presence of safe, reliable weapons so as not to harm workers and/or the public. The testimony above does not indicate that defects in previous weapons or aging of the enduring stockpile weapons pose a great safety risk.

All the pit manufacture program and (similar new projects) seem to be directed at maintaining a large expert scientific and calculational presence. Do they solve all of the the problem of accidental plutonium dispersal?

"There has been 50 years of experience and more than 1000 nuclear tests, including perhaps 150 nuclear test of the modern weapon types, in the past 20 years." from the Jason Report cited above.

4/40.07

More significantly, efforts to improve the weapons carry with them, the concommitant need to test

4/40.07 continued

these improved weapons perhaps at a later time. These efforts are in direct opposition to the nation's commitment to Non-poliferation (NPL) and the zero yield Comprehensive Test Ban Treaty (CTBT).

5/40.05

Thus the Stockpile Stewardship and Management program is apparently "misdirected" towards improved safety when the less apparent real goal seems to be improved weapon design and implementation. These factors carry with them, increased risks both to the workers and the public in terms of hazardous materials and delayed environmental remediation.

Comments on the
Draft Programmatic Environmental Impact Statement
for Stockpile Stewardship and Management

May 7, 1996

Don Larkin
2227 Seventh Street
Berkeley, CA 94710

1/40.07

The draft Programmatic Environmental Impact Statement (PEIS) doesn't consider anything except what the Department of Energy (DOE) has already made its mind up to do. The preferred and no-action alternatives alike support the continued design, development, testing, and production of nuclear weapons into the future indefinitely.

2/40.85

DOE refuses to look at other programmatic possibilities for achieving any objectives of the United States. It rejects them without analysis. The PEIS thus fails to be a document that anyone can rely on to understand the real options before us, but instead becomes an advertisement and political apology for nuclear weapons and the institutional priorities of the weapons establishment. The character of the document is revealed even in DOE's choice of language. For example:

> For the Stockpile Stewardship and Management PEIS, speculation on the terms and conditions of a "zero level" U.S. stockpile with international verification, as some have suggested during the scoping meetings, goes beyond the bounds of a reasonably foreseeable future. For the same reason, DOE has not chosen to speculate on a return to the nuclear arms race requiring a stockpile larger than START-I size. [page S-10]

The use of the word "speculation" here (and on the part of DOE officials at the hearing held in Livermore) is meant to be pejorative and dismissive. To my knowledge, no one asked DOE to "speculate" and DOE has not pointed to any comments that used that word.

1/40.07 continued

Instead, scoping comments (including my own) asked DOE to "consider," "investigate," "study," "analyze," and "plan" for the sort of reduction in nuclear arms that the US government promised, and is legally bound to negotiate, in Article VI of the Non-Proliferation Treaty (NPT). I'm sure our NPT partners would be interested to learn that it is "speculation" and "beyond the bounds of a reasonably foreseeable future" to consider actually meeting the obligations that the United States undertook at the extension conference in April 1995.

A derisive comment cannot substitute for analysis and argumentation. As DOE well knows, many people—including many that DOE would consider knowledgeable and expert in these matters—are considering how, in concrete terms, the world might move toward the abolition of nuclear weapons worldwide. It is clearly not unreasonable for DOE to examine how the weapons complex might accommodate that movement while keeping the stockpile "safe" and "reliable" until it is dismantled

3/40.60

It should not be necessary to repeat scoping comments here. But I would refer you to those of the Western States Legal Foundation and also to those that I submitted. I urge DOE to look at them again and retract its pejorative dismissal of their content. It should withdraw this PEIS and redo it with a reasonable array of options, including one or more "zero level" options.

The other linguistic trick of the quoted paragraph above is to equate "speculation" about reducing nuclear arms with speculation about increasing them under a renewed arms race. It takes "a return to the nuclear arms race" as an exterior event in which DOE would respond, rather than as something it would participate in and could precipitate. It wrongly presupposes that the arms race has ended and that nothing proposed in the Stockpile Stewardship and Management Program (SS&M) would continue it.

1/40.07 continued

In fact, as will be discussed below, proposed SS&M facilities would contribute to increased weapons research and development—the driving force behind the arms race. The PEIS is silent on this important issue; it fails to address the relationship between the SS&M program and future advances in weapons technology.

Long-Term Effects

As discussed later in these comments, the facilities of the SS&M program will be used for nuclear weapon design and, inevitably, for the development of new weapons. This activity will have long-term effects—on the environment, on future problems that might confront the United States and available policy options, on the social arrangements we must make to contend with continued nuclear development and proliferation, on the future costs of indefinitely maintaining the nuclear weapons establishment on education, health care, and social services, on the possibility of successfully achieving a nonproliferation regime, and so on. The PEIS fails to address any of them.

Consider here just the issue of proliferation. A new generation of advanced design facilities is likely to yield, in time, a new generation of advanced weapons. Eventually these inventions and refinements of weapons technology will proliferate and come back to target our children and grandchildren.

There is dispute over exactly what refinements and inventions might come out of the SS&M program—whether, for example, NIF can provide a pathway to fusion-only weapons and other profound breakthroughs. But there should be no dispute that NIF and the other proposed facilities will open design possibilities that were previously closed.

One set of easily predicable outcomes is that weapons designs will:

- Become smaller,
- Become simpler to build, and
- Permit greater specialization.

These developments are almost inherent in technological practice, especially as new diagnostic tools come into the hands of the practitioners. Computer technology provides perhaps the most dramatic examples of these developments, but they're also evident in other technologies—internal combustion engines, radios, electric motors, telephones, and so on. One need look no farther than the history of nuclear weapons over the past 50 years.

The possibility of such refinements to weapons design should be especially troubling to those in DOE concerned about proliferation. Smaller weapons are easier to transport and harder to detect. Simplified weapons are easier to produce. Specialized weapons expand the potential, and lower the acceptable threshold, for their use.

4/40.32

Incredibly, however, the PEIS doesn't take proliferation seriously. It seems to take the stance that labeling something secret will keep it secret indefinitely. For example, it says:

> Much of this testing [to assess the safety and reliability of the remaining weapons in the stockpile] is classified and could not lead to proliferation without a breach of security. [page S-19]

But people don't have to steal your secrets to learn what you know. They can observe what you do, work backward from bits and pieces, follow parallel unclassified developments, and so on. All technologies eventually proliferate or become useless as they're superceded by other technologies. DOE would be hard pressed to name one weapons technology—gunpowder, cannons, repeating revolvers, submarines, long-range bombers, cruise missiles—that did not proliferate over time.

Elsewhere, DOE is less self-serving. Its December 19, 1995, report, *The National Ignition Facility and the Issue of Nonproliferation*, more correctly calls classification "a temporary stop-gap" [page 31] while still offering it as a way of managing the problem. That report is included by reference in the Project-Specific Analysis (PSA) on NIF, Appendix I, and its conclusions are repeated:

> (1) the technical proliferation concerns at NIF are manageable and therefore can be made acceptable, and (2) NIF can contribute positively to U.S. arms control and nonproliferation goals. [pages I-5 and I-6]

5/21.17

However, managing a concern about proliferation is not by any means the same as preventing it. And the only way that NIF contributes to U.S. nonproliferation goals is by making the test ban acceptable to the U.S. weapons establishment; it does nothing concrete to advance nonproliferation.

DOE's stubborn myopia and its lack of interest in the processes of proliferation are staggering, especially for an agency that's in the business of inventing the tools of mass destruction.

Enhanced Experimental Capability

6/40.36

The principal proposal of the SS&M program is to build a new generation of nuclear weapons facilities. These facilities provide "enhanced experimental capability" [page S-18], but what activities do they support? DOE would have us understand them in the context that the PEIS succinctly summarizes as follows:

> The United States has halted the development and production of new design nuclear weapons. The experimental testing program will be used to assess the safety and reliability of the nuclear weapons in the remaining stockpile. [page S-19]

Pronouncements like these have led many people to believe that the SS&M program is a change in the mission of the weapons establishment, that weapons design has ended and all future efforts are directed at keeping existing weapons reliably safe.

1/40.07 continued

However, an examination of the proposal leads to the opposite conclusion—that the stated focus on the "safety and reliability" of remaining weapons is misleading and that the design, development, and production of new weapons is very much on the agenda.

1/40.07 continued

A weapons-design program. First, it's important to look at what the new facilities are and to examine them in the overall context of the weapons complex. Stockpile stewardship centers on the Accelerated Strategic Computing Initiative (ASCI), which will provide the computing power for advanced nuclear weapons models, and on new experimental capabilities that will help refine and validate those models.

> Without nuclear testing, science-based stockpile stewardship will focus on obtaining the more accurate scientific and experimental data that will be needed for more accurate computer simulations of nuclear performance. [page S-16]

As others have pointed out, there has been a qualitative change in scientific practice over the past few years, aided by the advent of fast computers with ample storage capacity. The trend is away from full-scale experiments (like underground explosions) and toward information-based modeling supported by precise experimentation to test and supply data for critical parts of the model. Genetic modeling in biology is a well-known example, as are models in astronomy, climatology, and physical oceanography. In "weapons science," advanced models running on ASCI computers will provide the test beds for future weapons experimentation and development. As Vladimir Iakamets has said, "informational testing" will replace "underground testing."

The new generation of weapons facilities fits this paradigm perfectly. They're intended, at great cost, to produce the precise parameterized data that's needed to refine and test the models. As the PEIS says, they "provide experimental data that can be used to adjust (normalize) the computational models in conjunction with past nuclear test data" [page S-18].

For example, the new Dual-Axis Radiographic Hydrodynamic Test Facility (DARHT) at Los Alamos National Laboratory will "enable two radiographic images to be captured simultaneously or sequentially" and will thus permit weapons scientists "to perform three dimensional diagnostics of a simulated nuclear weapon primary" [page S-27]. Existing test facilities, used to design all weapons now in the stockpile, capture only one image of a surrogate primary during a test implosion, and therefore don't allow three-dimensional diagnostics.

The centerpiece of the SS&M program, the National Ignition Facility (NIF), will isolate thermonuclear explosions in the laboratory. Previously, the fusion physics of an H-bomb could be studied only by exploding a weapon underground. The fusion reaction would occur in an environment created by the high explosive that set the bomb off, the fission primary that triggers the fusion secondary, the boost to the fission explosion, the transport of x-ray radiation from the primary to the secondary, the imploding tamper that compresses the fusion fuel, and so on. In this environment, it's very difficult to isolate and focus on the fusion itself, especially when the explosion immediately destroys the instruments that are being used to gather the data.

With NIF, however, weapons researchers can isolate the fusion reaction and take it out of the noisy environment of a bomb blast. They can gather specific sorts of data unavailable from test explosions. Experiments can be focused and replicated, many more of them can be conducted in a shorter period of time. So, in many ways, NIF is an advance over underground tests.

It's somewhat disingenuous, therefore, for DOE to present this enhanced experimental capability as a poor substitute for nuclear testing. Although underground tests might still be useful, they belong to the old paradigm; the weapons designers can do without them.

It's also misleading for the PEIS to talk only of how these facilities will be used to "assess the safety and reliability of the nuclear weapon in the remaining stockpile." It's clear that what is taking place is a paradigm shift in the way "weapons science" is conducted. The ability to design new nuclear

1/40.07 continued

weapons is not being lost, but in many ways is being enhanced. It's impossible, therefore, not to conclude that stockpile stewardship is, in large part, the infrastructure for a weapons-design program.

Unchanged mission. Second, although current policy may prohibit "the development and production of new design nuclear weapons," it doesn't prohibit their design. Weapons researchers at the laboratories will continue their efforts to invent new nuclear devices. The new designs will be informed by and tested against the computer models, and the models will be validated and refined by the new experimental capabilities. Although a test ban treaty would prevent full-scale prototypes from being exploded underground, hardware components of the new designs may also be built and tested. All that current policy prevents is "development"—turning these designs into production models.

Thus, despite the new language that DOE employs, the mission of the nuclear weapons complex hasn't changed. It's the same mission as before with, at most, its tail cut off. The driving force of weapons development—weapons research—is not only in place, but strengthened under stockpile stewardship.

It's interesting to contemplate what the United States would do if some other country—India perhaps, or Sudan, or China—announced that it was investing billions in facilities for nuclear weapons design, but that it would not actually construct the new weapons. This country would not be reassured by the policy proclamation; it would view the planned facilities for what they inherently were, and would evaluate them as such. We—and the PEIS—should similarly evaluate the facilities of the SS&M program.

New design weapons. Third, there is reason to disbelieve the claim that "the development and production of new design nuclear weapons" has ended. The language of this claim is important: DOE says that it won't produce "new design weapons," not that it won't put any new weapon designs into production. In fact, much of the SS&M program rests on the twin justifications that safety and reliability concerns may force some redesign of weapons in the stockpile and that aging weapons can't be replaced with identical designs (due, for example, to the unavailability of original materials). If engineering changes to the stockpile were not contemplated, there would be no reason for most of the SS&M program.

What then, is the difference between a "new design weapon" and a new weapon design? The PEIS, is silent on this issue. Although it says, for example, that during the 1980s "the production of new design weapons" replaced "dismantled weapons nearly one for one" [page S-12], it doesn't say what distinguishes the new designs of the 1980s from the new weapons (but presumably not new designs) of the 1990s and beyond.

When asked to explain the difference in concrete terms focusing on weapons capabilities, Steve Guidice said that "we are not developing and producing new design weapons, meaning there are no mark numbers like the last weapon we put into the stockpile was the W-88, so there's no W-89 or W-90 planned to be developed or produced" [April 11, 1996, hearing, evening session, pages 25-6 of the transcript] and that "there are no new mark numbers, as happened, as been continuous for the last four decades, of new mark weapons -- new design weapons being generated to replace old ones. We're sticking with the same basic set." [page 27] In other words, when a new weapon replaced an old one, former practice was to assign it a new number. Current practice is to reuse the old numbers. This is a bookkeeping difference, not a real one.

The recent decision to introduce a redesigned B-61 weapon into the stockpile may be a case in point. The new B-61 will have an earth-penetrating capability that the old weapon lacked.

1/40.07
continued

The PEIS ought to be forthright on this point and spell out exactly—concretely in terms of weapons capabilities—what kinds of changes to the stockpile are permitted under the "no new design weapons" policy.

Changing the policy. Fourth, even if we take the DOE at its word and accept that the "United States has halted the development and production of new design nuclear weapons," and further accept that there is no intention to change this policy (despite continued weapons design), it still remains a matter of policy. Administrations change; conditions change; policies change. The ban on new design weapons is not a permanent part of the SS&M facilities. In the absence of international agreements and guarantees, only capabilities count.

Furthermore, the SS&M program will sow the seeds for a change of policy. It will generate the very conditions that will argue strongly for putting new design weapons in the stockpile, and it will do so on several fronts:

- For example, the very justification that's now used for NIF—that it's needed to attract and retain the best minds—will likely resurface later to argue for renewed development and production. At first, NIF may attract some people to weapons work, but over time, as "weapons science" advances and weapons inventions accumulate, weapons designers will want to see the results of their work come to fruition in the stockpile. Experience with high tech companies shows that the most talented people don't stick around if the product never goes out the door. As long as the product remains nuclear weapons, organizational pressures will build to carry the product cycle through to completion.

  In other words, the SS&M program will generate an *organizational imperative* for the development and production of new design weapons. This follows from the fact that DOE has not changed the mission of the nuclear weapons complex, but contemplates a curtailment at the production end only. If the mission were true stewardship (keeping weapons safe until they can be dismantled under international agreement), competent personnel could be found and retained for that mission.

- Moreover, new weapons designs will make current weapons "obsolete." The new designs may be more cost-efficient to produce and maintain, they may be better adapted to some supposed war scenario, or they may just be smaller and produce a more "reliable" explosion. As "weapons science" advances, so will weapons design.

  The existence of these new possibilities will generate arguments for their inclusion in the stockpile on technological grounds—as "better" weapons. Why should you drive a 20-year-old gas guzzler, when you can have efficient modern car—and in fact have already paid for most of it? Thus, the SS&M program will generate a *technical imperative* for a change in policy.

- Over time, the inventions and ideas of the SS&M weaponeers will surely proliferate. Moreover, proliferation is aided by DOE's promotion of internal confinement fusion abroad and as a dual-use technology—for both weapons and energy research.

  As the inventions of the weaponeers find their way into the hands of others, we will begin to hear arguments that the US must put the new designs in the stockpile before someone else beats us to it, or as a counter to the technological developments of some other country. So the SS&M program will generate a *competitive imperative* for a change in policy.

1/40.07
continued

- The amount of money that will be spent on the nuclear weapons complex will eventually argue for a better payoff on the investment. Why should we invest billions in state-of the-art facilities and settle for 25-year old designs? Thus, in order to justify itself, the SS&M program will generate a *political imperative* for a change in policy. This may be the first argument we hear, before the new facilities are finished.

Any long-term evaluation of the SS&M program must come to grips with the fact that it not only puts into place the infrastructure for a new round of weapons research and development, but that it also undermines any policies that would seek to prevent their addition to the stockpile.

7/21.01

Purpose and Need for the National Ignition Facility

The PEIS is charged with justifying the National Ignition Facility (NIF) as part of a stockpile stewardship program whose purpose is "to ensure the continued safety and reliability of the remaining nuclear weapons and to preserve the core intellectual and technical competencies of the United States in nuclear weapons in the absence of nuclear testing" [page I-S1]. It attempts to do so mainly in Appendix I. The argumentation is obscured in the draft, but seems to follows these steps:

1 The PEIS posits that because the policy of nuclear deterrence has not changed, DOE's responsibilities for "safety and reliability" haven't either:

> [N]uclear deterrence will continue to be an important element of the U.S. national security posture. Thus, DOE's responsibilities for ensuring the safety and reliability of the Nation's nuclear stockpile and for maintaining expertise in nuclear weapons generally will continue for the foreseeable future. [page I-5]

2 It derives the need for a new science-based stockpile stewardship program from the unavailability of full-scale nuclear tests:

> [T]he size of the Nation's nuclear stockpile is being considerably reduced, and the Nation has halted all nuclear weapons testing. Consequently, DOE has been directed . . . to establish a stockpile stewardship program to ensure the continued safety and reliability of the remaining nuclear weapons and to preserve the core intellectual and technical competencies of the United States in nuclear weapons in the absence of nuclear testing. [page I-S1]

3 It next bases the stockpile stewardship program on computer modeling supported by experimentation:

> Building on existing capabilities, the DOE science-based stockpile stewardship program includes an accelerated strategic computing initiative and several new experimental facilities that . . . provide the data needed to verify the models and help assess specific problems that arise. The stewardship program consists of three major components that are used to evaluate stockpile surveillance data: (1) experimental capabilities and facilities, (2) scientific evaluation by competent scientists of the information from the experimental capabilities and facilities, and (3) validation of the computer models using the accelerated strategic computing initiative. These

three components lead to the development of a corrective action to resolve the identified problem. [page I-6]

4 It then requires the models to cover all aspects of nuclear weapons performance, not just the effects of aging or specific safety and reliability concerns as weapons remain protected in a quiescent state:

> Because nuclear tests would not be available, more sophisticated and comprehensive computer models would be needed to conduct essential evaluations. For confidence to be established in these new models, experimental facilities must be able to provide data on all processes in the relevant physical regimes that occur in weapons. [page I-6]

5 Finally, it lists the ways that NIF experiments might help provide data concerning weapons performance (section 1.2.2.3).

7/21.01 continued

This chain has a number of weak links. Before examining them, it should be noted that the PEIS does not claim that NIF is needed to ensure the "safety" of weapons in the stockpile. Only "reliability" is mentioned. The claim is only that without NIF, "DOE would lack the ability to evaluate some significant reliability issues, which could adversely affect confidence in the Nation's nuclear deterrent" [page S-27].

First, at step 1, the PEIS presents no rationale for the link between deterrence and the particular standards of reliability that DOE employs. If deterrence is the threat of a retaliatory second strike, how closely a weapon in the stockpile adheres to a precise performance profile would probably not matter much. Even considerable deviation from the profile wouldn't affect its ability to deter a first strike. In other forums, DOE has admitted that the reliability concern with, say, a replacement material is not whether the weapon would perform at all, but with the precise calibration of yield and other performance factors. It's necessary to bring all arguments for NIF back to deterrence, not just to some arbitrary and unstated reliability standard.

6/40.36 continued

Second, the argument at step 2—that new facilities are needed to "to ensure the continued safety and reliability of the remaining nuclear weapons . . . in the absence of nuclear testing"—can only be substantiated by showing that there aren't other means available to do the job. This demonstration could begin by recounting how underground tests were formerly used to do it. (In fact, underground tests were used for design purposes, as the new facilities will be.)

Third, between steps 3 and 4 there's a leap from experimental facilities that "are used to evaluate stockpile surveillance data" to those that "must be able to provide data on all processes in the relevant physical regimes that occur in weapons" explosions. The PEIS should explain why experimentation should not be limited to the particular areas where "safety" and "reliability" concerns arise. On the other hand, it's clear why "all processes in the relevant physical regimes" must be covered by models used to design new weapon types.

7/21.01 continued

Fourth, the discussion of the kinds of information that NIF research would provide (step 5) fails to explore whether there are alternative routes to the same information. NIF can do it, but is it really needed for this purpose?

Fifth, with one exception, the examples given for NIF experiments are concerned with the basic processes of weapons performance, not with any discernible reliability issue. A later statement that these "processes are very important in assessing a weapon's reliability" [page I-8] is not an argument, but an unsubstantiated claim.

7/21.01 continued

Sixth, the one example that's presented to show that "NIF would also play a role in evaluating specific problems that arise in the stockpile" [page I-8] is seriously deficient. The example is of a material, a glue, that has changed composition with age. To determine whether the opacity of the glue has been affected "it may be necessary to put some of the changed material into a NIF target, raise its temperature and pressure to near those that would occur when the weapon is exploded, and measure its opacity" [page I-8]. Those measurements would be used to refine the model, and the model would then be used to re-evaluate the performance characteristics of the weapon.

It's unclear, first of all, how necessary the NIF experiment really is. Are there other ways to correct the problem—such as rebuilding the weapon with newer glue? It's also unclear how severe such problems might be. How does the indeterminacy that results from aging affect the deterrent posture that "reliability" is meant to support? In other words, could we live with the indeterminacy and still maintain deterrence?

The PEIS, thus, not only fails to convince, it demonstrates how irrelevant NIF is to the central stockpile stewardship concern of "safety" and how marginal it is even to "reliability."

8/21.15

At the same time, it shows that NIF would probably have a major role to play in continued weapons research and design. However, the PEIS doesn't analyze the impacts of this activity—either long-term or short-term. It must.

I was at the hearings April, 26,1996 about stockpile stewardship. If you want to know why the majority of the people I heard who gave speeches were irate, infuriated by Los Alamos, ready to keep writing letters, suing in legal battles, resisting by non violent protest, even risking their own lives for the future generations to protect themselves and their families from LANL's latest schemes, (30 year war plans/goals whether we have an enemy or not), it is because the scientists in Los Alamos are not making radio parts, they are not a quilting bee, (a guilting bee maybe), or a social organization to end world hunger or help the homeless, (those don't make mega-bucks), LANL is a major cog in the war making machine, a major recipient of the 75% of the U.S. dollar that benefit no one but go into war manufacturers pockets, a hiree of nuclear corporations. The LANL scientists have bought into this nuclear mania and LANL has made a lot of money making bombs. LANL in the cold war mania benefited greatly monetarily, they made astounding amounts of money, for the work they did in making bombs. These bombs effect us all personally! They can cause us to fear, to get sick, to watch our children die of emissions/plutonium pollution/wastes, they can cause us to die in nuclear war, nuclear winter, nuclear fallout and nuclear testing fallout, they can destroy the world 2 3 times over and Russia could destroy the world 2 times over... that's 5 times the amount of bombs we ever needed! That is why people feel the nuclear issue is entirely a problem, not a solution and has never been anything but a problem for mankind at this stage of evolution and the world's people often feel they can bear it no more. If DOE's and LANL's over protective wives and scientists, confused at the vehement reaction to their way of getting "bread and butter" (bombs and butter) and are wondering what all the fuss is about and how we could ever say such "not nice things" to such nice, nice scientists, that is why! These

1/40.72

2/40.50

two world views, whole different worlds it seems, are not on different planets! "Through the clash of differing opinions the spark of truth arises." (Baha'i paraphrase.) The point is if any one of us is not sincere, avoiding the truth, nursing big time cases of running denial, I would first see who it might possibly be, (I wonder, I wonder, who could possibly have a vested interest, DOE/LANL's well paid scientists or mothers and fathers, citizens and laymen protecting their children from nuclear catastrophes.)

LANL is asking New Mexicans to welcome with open arms the agonized and screaming with guilt broken and run out of town, infamous, catastrophic failures of all the riff raff dirty and outlawed, (the outlawed and the outlaws to boot), nuclear projects that absolutely NO STATE OR NO PERSON WANTS ANYMORE! No one in their right mind wants nuclear production, (which makes you wonder if LANL IS in their right mind), in their back yard! It's the end of nuclear production, the cold war is over, the nuclear waste has caused untold U.S. casualties and suffering, every knowledgeable citizen is at the emotional breaking point, people are getting hysterical, they can't and feel like they won't take this hideous affront to our lives anymore. The whole planet is at this point! The whole planet is sick of nuclear madness and will arise as one body to say no! Nuclear production is over, LANL just doesn't know it yet! Years ago the LANL was told by the government to change over to peace time occupations...they didn't listen. THE FIRE/NEAR MELTDOWN THAT RECENTLY THREATENED LANL WAS GOD'S/NATURE'S WAY OF SAYING YOU WILL BE DESTROYED BECAUSE YOU ARE NOT IN HARMONY WITH THE PLANET'S BLOOMING/UNFOLDING/PLAN. DID LANL HEED THIS WARNING OR WILL THEY SHRUG IT OFF? Heck! They have not heeded warnings that what they were doing could destroy civilization as we know it, annihilate the human race and all life on earth and still insist that they are saving us! (Balony!) In spite of the

1/40.72 continued

3/43.18

fact that it is not legally supposed to be impossible to sue DOE they have been sued and are in a myriad of lawsuits, they have been literally run out on the rail in disgrace everywhere they have operated. Rocky Flats won 35 million in damages for the outrage that DOE perpetuated on their town. Rocky Flats was shut down in disgrace and run out of town practically tar and feathered or worse. How dare LANL bring all that horror to us! The health costs to the children in Rocky Flats have no monetary price and you can not bring back dead children from the grave! DOE has no shame!

1/40.72 continued

After all New Mexicans have been through, even if I believed we needed more weapons, and I DO NOT, with nuclear problems and fall out and waste, with Sandia the stockholder for the most nuclear weapons, with WIPP slated for the first major joke of a convenient rug to hide waste under so they can weasel out of the numerous lawsuits and angry contaminees, with all the Indian pueblos on or near uranium mines and uranium run off (and not to mention all the Indian children getting groin cancer and living in uranium trailings, <u>and not one person in Washington or LANL has ever showed a shred of concern and not one person).</u> DOE or any nuclear corporation blinks an eye as they designate New Mexico as the convenient Nuclear center for all nuclear projects, the nuclear sacrifice zone, no one protests that a whole state is now to be sacrificed for "national Security", forget the money, they seem to be crying over the money and ignoring the screams of children in hospitals dying of cancer!)

2/40.50 continued

That we have to bear this hideous nuclear anomaly, like a horrible mutated hump on our back, a horrible malignant cancerous growth on our once enchanted and fair face is an outrage! I say NO to LANL stockpile stewardship just as all the other states now all say no! NO ONE WANTS THE NUCLEAR WASTE, NO ONE WANTS TO DEAL WITH IT FOR 240,000 YEARS, IT MAKES ALL THE SENSE IN THE WORLD TO STOP MAKING THE DARNED, DEMONIC (lack

4/40.15

of good purpose, ill intentioned), ANTI-HUMAN STUFF! With all the nuclear problems we have already, to be burdened with weapons production is adding <u>contamination on top of contamination</u>, never bothering to clean up the nuclear nightmare before piling more nuclear stockpiles on top of us. IT'S AN OUTRAGE!

4/40.15 continued

(Never bothering to comply with international treaties signed by the president himself and backed by all nations of goodwill.)

5/40.07

The fact that LANL fired and laid off the Tiger Team (who I heard speaking their outrage at the LANL stockpile stewardship hearings), rejecting their expert work to troubleshoot LANL problems of which they were at first hired for, found 700 problems and were therefore considered whistle blowers and fired! IT IS AN OUTRAGE TO MY SENSIBILITIES THAT THE TIGER TEAM AND THE CLEAN UP TEAM WAS FIRED, THAT THERE IS ALL THIS MONEY, THE MONEY THAT COULD HEAL OUR GAPING AND SUCKING NATIONAL DEFICIT, TO PRODUCE MORE BOMBS WHEN EVEN ONE IS AN OUTRAGE TO ALL THAT IS HOLY AND GOOD AND A DETRIMENT TO ALL LIFE, AND NO MONEY IS SLATED FOR CLEAN UP, SAFETY OR TROUBLESHOOTING. THIS TESTIMONY FROM THE OUSTED TOP EXPERT WORKERS <u>WHO ARE ACCOUNTABLE</u> IS HEARTBREAKING FOR NEW MEXICO.

1/40.72 continued

We have been completely betrayed! Never once can the 2,000 known leaking waste dumps be cleaned! NOW THE 2,000 DUMPSITES ARE NOT THERE SCIENTISTS AT LANL SAY! I GUESS IF THEY ARE LEFT IN PAPER BAGS FOR A FEW MONTHS THE PLUTONIUM MAGICALLY DISAPPEARS INTO THE GROUND! OUT OF SIGHT, OUT OF MIND IS DOE'S/LANL'S MOTTO! I GUESS PLUTONIUM CONTAMINATING OUR WATER SUPPLY ISN'T SUCH A BIG DEAL TO THEM! WHAT NONSENSE! WHAT A PERFECT CRIME! The horrible truth is evident to me: LANL and DOE know that plutonium, a substance that has no known way to dissolve, lasts 240,000 years before it starts to break down, has a charge/ray so powerfull that the human body runs on about 5 % of it's energy and it puts out rays hundreds of times more

4/40.15 continued

powerful than the amount it takes to run a human body, a ray that bombards passing cars with rays that knock out human genes, as the truck passes you get the equivalent of hundreds of x-rays while you sit at a stop light BY A NUCLEAR WASTEBEARING TRUCK, a substance that erodes 2 feet of concrete every 3 to 50 years, that erodes metal drums every few years and needs to be recontained, (that put into a hole at WIPP to let the containers erode into salt and get liquified by underground aquifers and swept into the Rio Grande and on to Mexio is a indicent, detrimental and ignorant as an idea can ever get), that mimics iodine and goes into the thyroid causing thyroid cancer, that mimics calcium and gets into the bones to cause leukemia, that mutates the genes of the young girls and pregnant mothers,our mothers and daughters, the carriers of the genetic content that makes the human body, the blue print to human beings, (they are holy and need protecting, they should be cherished, honored, beolved!), mutating the gene pool for generations to come, that effects children more than any adult because they are so young and vulnerable, that is invisable but gets into the invironment, comes down with the rain, becomes part of the natural cycles, becomes apart of every day life, never biodegrading and so causing disease for 240,000 years, messing up generation after generation! The native Americans say we should take care of 7 generations and not do anything that affects that far ahead. Who can see 240,000 years into the future? Who can monitor this waste for that long? How can we pass this nuclear burdon onto our children? Here, you have no life now. YOUR LIFE IS TO SIT ON THIS STUFF AND KEEP IT OUT OF THE HANDS OF TERRORISTS, TO RECONTAIN IT EVERY FEW YEARS, TO DIE OF ACCIDENTS AND DISASTERS AS IT GOES OUT OF CONTROL IN WILDFIRES AND GETS LOOSE IN EARTHQUAKES AND LOOSE LIVES DUE TO HUMAN ERROR. Some people say there has to evolve a brotherhood of nuclear guardian

angels, men and women are needed to devote their entire lives to guarding this stuff and tending to it. You and all your relatives need to sit and watch this nuclear waste for 240,000 years! The outrage comes in DOE's irresponsibility of caring for plutonium/nuclear fallout. Not only are they going to let this lethal dose upon mankind, it is being premeditated, lot's of people like me have expressed outrage and horror at what they are doing right now and if they put the waste in the ground or burn it off into the air you might as well kiss the United States Of America, the land of the free, good bye because we will have been poisoned from within! Slowely but surely we will all die! RADIATION HAS TO BE CONTAINED AND RECONTAINED DILIGENTLY AS LONG AS IT TAKES, ABOVE GROUND, EASILY ACCESSIBLE, NEAR THE SITES THAT CREATED IT, UNTIL A WAY IS FOUND TO REDUCE IT THAT DOES NOT PRODUCE EMMISSIONS EITHER,WHICH MAY BE NEVER! The point here is that we will accept nothing less than 100% accountability for nuclear waste containment and 100% non emmision policies! But the outrage comes from the tossing the HOT wastes to the 4 winds and into the nations water supplies, like an old toy! CLEANING NUCLEAR WASTE WILL WIN A FEW PORK BARRELS, A FEW BILLIONS, BUT IF THERE IS NO MORE BOMBS TO MAKE, REMAKE (Bombs=Mega bucks), PERFECT and perfect, make and remake, drain the nationl budget and go for broke remaking more perfect bombs after the old bombs are taken apart! IT IS ONLY THE PERFECT BOMBS THAT MAKE MONEY, IF IT IS OF HUMAN INTEREST, SAFETY OR NATIONAL SUCURITY IN HUMAN ARENAS, IF IT MAKES NO MONEY, THAN IT IS OF NO INTEREST. NUCLEAR CLEAN UP DOES NOT MAKE MEGA BUCKS, SO NUCLEAR CLEAN UP IS ABANDONED. I'VE HEARD OF IRRESPONSIBLE, CHILDISH IMMATURE, INFANTILE, MATURITY CHALLENGED, (THESE ARE THE NICE WORDS, WORDS LIKE SCOUNDRELS, PSYCHOPATHIC, INSANE, IMMORAL COME TO MIND), OUT OF TOUCH WITH REALITY PEOPLE, BUT THIS TAKES THE CAKE! RATHER THAN DEAL

4/40.15
continued

4/40.15 continued

WITH A SUBSTANCE THAT IS, UNLIKE ANY OTHER KIND OF POISON, HOT/EXTREMELY DANGEROUS FOR 240,000 YEARS, AND IS THE MOST DESTRUCTIVE ELEMENT TO THE HUMAN RACE OF ANY POISON, (IT BEING SAID A POUND OF PLUTONIUM COULD DESTROY THE HUMAN RACE), AND NOT SAID LIGHTLY, THE DOE TOOK NO RESPONSIBILITY FOR IT'S(plutonium's) EXISTENCE, WENT INTO DENIAL, WENT WEAK IN THE MORAL KNEES AND WAS SEDUCED INTO THE ARMS OF MULTI-MILLIONS, AND ZONED OUT ON STATISTICS, CHARTS AND MENTAL EQUATIONS, FOLLOWING THE ELUSIVE "PERFECT WEAPON" INTO LA LA LAND. SO THE SAYING FITS LOS ALAMOS NATIONAL LABS PERFECTLY/TRAGICALLY,"Deniel is not a river in Egypt."

It is totally unacceptable that New Mexicans be burdened with weapons production. It make me sick to think of the contamination we have suffered already. I can tell you right now that the workers in LANL are not the only people in total denial. Many people have bought the lie, hook line and sinker that LANL is pristine, sanctified, above question, clean, etc., etc....mostly the 1/3 of the population here who hold jobs in the LANL, but I can tell you these people are in the majority now. I have been to every nuclear hearing I could possibly get to for the last 20 years! I am a good, decent, citizen exercising my democratic rights, of course. I have trunks full of magazine clippings and testimonies I copied. I wish I could die of cancer in ignorant bliss blaming the 240 other contaminants. The difference is, if we are stupid enough to buy cancer causing cigarettes, nitrate laden meat, radiated food, etc. than only we pay the price of our poor consumer choices and die the lonely death of the stupid. If any person who lives next to factories of any kind dies of toxins and waste dumps that is a tragedy/blood on the hands of negligent factory owners who would rather get money than take responsibility for running non polluting factories, (the

pollution stopping devices are a loss of profits), the planet is getting an extra unbearable burden of toxins which is totally inexcusable but only those people next to the pollution die. The culmination of negligent humans, billions strong, polluting, wasting, killing and decimating nature for profit, collectively add up to planetary death too, but if we snap and stop, the pollution will clean, the rivers will heal (as has been seen in the great lakes, the animals return and repopulate, if not extinct), oh no.....but not radiation, ONCE MADE it has to be watched and contained for 240,000 years, once released into the environment it goes on for 240,000 years taking it's toll on life and mutating our genes! LOW LEVEL PLUTONIUM WILL NOT MAKE YOU DROP DEAD, YOU CAN GET IT ON YOUR ARM AND IT WILL NOT BURN YOU IF YOU WASH IT OFF RIGHT AWAY, IT IS MORE LIKE A POWERFUL RAY THAT CONTINUALLY KNOCKS OUR GENES OUT OF PLACE. WHAT A WEIRD AND TERRIFYING POISON! If it gets into your body, it will take 5-15 years to turn into cancer but like the first atomic explosion observers, the Hiroshima survivors, etc., etc., etc., etc...it inevitably comes. IT IS WELL DOCUMENTED WHAT HAPPENS TO HUMAN BEINGS WHO ARE CONTAMINATED BY NUCLEAR RADIATION. In the prime of your life you nevertheless will be cut down with an excruciating cancer that is as predictable as the sun rising, unless you get drastic cleansing like fasting and special food treatments, the plutonium could be flushed from your thyroid or organs deep inside your fat, (fat stores toxins), your tissues and your bones, even the cancers stopped and remised but the mutated genes will not be able to be repaired by genetic experts (or all the kings horses) who have no business meddling with the human gene pool either, making everything even worse! PLUTONIUM THEREFORE, IS SAID TO BE THE WORST POISON ON EARTH! WE HAVE NO BUSINESS MAKING IT, SELLING IT OR RELEASING IT INTO THE ATMOSPHERE.

Technology has no answers, humans cannot deal with plutonium and most people I know say NO to making more of this plutonium, no one yet on earth knows what to do with! I SAY NO TO THE MINDLESS PRODUCTION OF MORE PLUTONIUM, THROUGH NUCLEAR POWER PLANTS (CHERNOBLY, 3 MILE ISLAND) OR NUCLEAR WEAPONS PRODUCTION! NUCLEAR POWER PLANTS ARE UTTERLY AND TOTALLY CORRUPT AND EVIL TO THE CORE AS THEY USE THE INNOCENCE OF MAKING ELECTRICITY TO GENERATE PLUTONIUM THAT IS MADE FOR BOMBS! NUCLEAR POWER PLANTS SACRIFICE THE HEALTH OF THOSE CLOSEST TO THEM, MUTATE THE BABIES, ETC, AND CAUSE UNTOLD HUMAN HORROR! IS THAT THE WAY WE TREAT OUR FELLOW HUMAN BEINGS? DOE AND LANL NOT ONLY TAKE ADVANTAGE OF HUMAN NAIVETÉ, TRUST IN THE GOVERNMENT AND INNOCENCE/APATHY/OVERWHELMED BY SURVIVAL BUSINESS, BUT THEY SPEND MILLIONS OF DOLLARS ON BRAINWASHING, ADVERTISING AND PROPAGANDA TO PULL THE WOOL OVER THE PEOPLE'S EYES ABOUT THE HORRIFIC NATURE OF THE COMBINATION OF ANY FUSION PROCESS THAT ALWAYS RESULTS IN PLUTONIUM, THAT ALWAYS RESULTS IN ESCAPING NUCLEAR PARTICLES, THAT IS STORED IN ASTRONOMICAL AMOUNTS, STAGGERING AMOUNTS, THAT ARE RIGHT NOW IN DANGER OF SOME CARELESS HANDLING THAT WILL AUGMENT THE ALREADY MASSIVE CONTAMINATION PROBLEMS (AND STILL LANL HAS NO CONCERN FOR WHAT THEIR HANDS HAVE WROUGHT BUT CAN ONLY CHASE THEIR "PERFECT" BOMBS STRAIGHT INTO THE PITS OF HELL AND TAKE US ALL WITH THEM IF THEY COULD) Why can't LANL find a way to make a living that doesn't emit plutonium as it's by product! Is that too much to ask of human beings! Live and let live does not include plutonium! Say no to PLUTONIUM! I am not sorry AT ALL if LANL sell out's of humanity for money scientists loose their jobs. I could be sorrier for common crooks who loose their job's stealing and drug smuggling when they get put in jail! LANL knows the cold war is over! I HEARD ON PUBLIC RADIO THAT THE PRESIDENT O.K.'d a huge military

budget for the military, comparable to the cold/(hot) war budget even though the cold war is over, just to appease the military and prove that he wasn't too far left in the dove category. Our government approved dangerous and outdated practices and allotted enough money to cure our budget deficit FOR WEAPONS PRODUCTION just to make the military complex happy! THIS IS AN OUTRAGE TO ALL I HOLD SACRED! OUR COUNTRY NEEDS PROGRAMS FOR THE POOR, THE AT RISK, THE MINORITIES, THE REGULAR PEOPLE, THE ALIENATED, THE INNER CITIES, TO ELIMINATE RACISM BEFORE OUR STREETS RUN WITH BLOOD, THE BACK WOODS, LEFT OUT, THE HOMELESS, FOR ENVIRONMENTAL HEALING (OUR LAST UNTOUCHED FOREST , THE LAST 1% OF THE MIGHTY AMERICAN FORESTS IS BEING CUT, 98% OF THE NATURAL FORESTS ARE NOW GONE!), FOR EDUCATION REFORM, FOR HEALTH, FOR ORGANIC AGRICULTURE, FOR GOOD THINGS THAT REAL HUMANS CAN USE AND THE GOVERNMENT BUDGETS ALL THAT MUCH NEEDED MONEY TO THE MILITARY INDUSTRY COMPLEX TO LINE THEIR POCKETS AND GIVE US NOTHING FOR ALL THE HARD EARNED MONEY WE SWEAT AND SLAVE FOR EVERY DAY/THE TAX MONEY WE GENERATE, FOR MULTI BILLION DOLLAR BOMBS THAT ENDANGER NATIONAL PEACE AGREEMENTS. WHAT IS WRONG WITH THIS PICTURE?????

6/40.12

Already I am fairly sure, I and my family have had contact with plutonium/we are contaminated! My children put their hands into the pond, innocently, at Fuller Lodge to play with the ducks! I find out later that is LANL's first nuclear Dump! Couldn't they have put up a sign warning kids not to put their hands in the lake stating the truth that it has plutonium in it? Thier denial made them think the lake clean, their conscience became entrophied from misuse from these first omissions of emissions, that the poison, to them, didn't exist, because they didn't want it to, because the money was so good it some how made the poisons invisible/nonexistent! WHAT LANL DID TO THE CHILDREN IN HIROSHIMA THEY CAN'T SEEM TO HELP DO TO THEIR OWN

1/40.72 continued

CHILDREN WHO'S SUFFERING FROM FATAL CANCERS (THYROD, BONE, BRAIN TUMORS) ARE AMONG THE HIGHEST STATISTICS IN THE UNITED STATES! My children played in the Bandilier River now known to be toxic. Does Bandeliar Park warn children not to play in the rivers? I've drunk water at San Ildifonso Pueblo after a hot day at a sacred dance. San Ildefonso has contaminated water! How terrible! I swam in Bandaliar river and the Rio Grande as a teenager. Now I know these rivers also had radioactive contamination. LANL still insists they are not polluting! The Geiger counters must be broken! Now the river Rio Grande is endangered because of all the pollution! Can you imagine New Mexico without the Rio Grande? All the time I was growing up in New Mexico LANL was burning radiation into the air as a way to get rid of the plutonium! I'll tell you where it went! Right into my and other New Mexican's lungs. Unless we are lucky the wind didn't come near us...we got contaminated! LANL, don't tell me you don't have a nuclear waste problem when I have seen charts warning people worldwide that New Mexico's LANL is one of the worst contaminated sites. If there was no nuclear waste problem, why has LANL been trying to get permits to burn radiation in furnaces all these years! In 1977 the forest fire burned the labs and there may have been releases then. What happened in 1983 to get Geiger counters registering illegal emissions? WHY DID LANL HAVE TENS OF THOUSANDS OF TRUCKLOADS OF WASTE TO GO TO WIPP IF IT HAD NO CONTAMINATION? Why was it so anxious to fill WIPP up and LANL had enough plutonium to fill plenty of space at WIPP and it reserved plenty of room to make more waste! There was even talk of making WIPP just for all the waste LANL was generating! Now when we had the big fire,(1996), they said they took the explosives out as if it fit in a few boxes! What a sham this radiation truth is! I DON'T BUY LANL'S NEW STORY THAT THEY HAVE NO CLEAN UP PROBLEM. IN THESE

FIRES THE GROUND THAT HAS LONG AGO ERODED RADIATION CONTAINERS ALTHOUGH THEY MAY HAVE REMOVED THE EVIDENCE, (THE RUSTED OUT CONTAINERS), THE AREA STILL HOLDS RADIATION, YOU CAN'T MOVE WHOLE MOUNTAINS FULL OF DIRT AND WATER, BUT IT IS THERE AND IT GETS IN THE PLANTS AND IN A FIRE THE RADIATION STILL GETS OUT WHEN THE PLANTS BURN. LITTLE BITS OF RADIATION ARE ALL OVER THE PLACE. CLEAN UP IS JUST A HOPEFUL STATEMENT MEANT TO APPEASE THE PUBLIC. LANL AND DOE HAVE NO INTENTIONS OF SERIOUSLY EVEN TRYING TO CLEAN UP THE AREA AND THEY NOW SAY, AS IF WE CAN FORGET WHAT THEY SAID A YEAR AGO, THAT THEY HAVE NO PROBLEM! I HAVE A PROBLEM WITH LANL SAYING THEY DON'T HAVE A PROBLEM! What about the 2,000 uncleaned dumpsites, workers in the lab reported were in paper bags, cardboard boxes and eroded metal drums? Everyone hates the feeling of secrecy in LANL. WHAT'S REALLY GOING ON? WE WANT TO KNOW! They poison your land, water and air but they are not criminals but heroes defending U.S. from national foes. Yeah right! EVEN IF BOMBS ARE THE CURE ALL FOR ALL OUR INTERNATIONAL ILLS, (eliminating THE NEED FOR TREATIES AND INTERNATIONAL AGREEMENTS, PEACEFUL COEXISTENCE AND UNDERSTANDING THE REAL ISSUES AND PERCEPTIONS), BECAUSE WE CAN SIMPLY NUK THEM /ANYONE TO DEATH IF THEY SO MUCH AS DARE TO NOT BEHAVE), WE HAD TO LIVE KNOWING WE WERE BEING RADIATED! We had to live knowing our children could be radiated! All this time I had to grow up in these beautiful mountains, with all these good hearted and well intentioned Hispanic people, not knowing if the air is clean or foul beyond belief! When you can't even take a clean breath of air isn't there something wrong! No wonder some people go into deep denial, how can we be expected to sanely carry on our normal lives in this insane and abusive constant nuclear contamination? IF YOU NUK US WITH CONTAMINATION WE WON'T BE ABLE TO MAKE MONEY, WE WON'T PAY TAXES AND EVENTUALLY THE BOMB MONEY WILL RUN OUT!

7/40.69

This secrecy is undermining a lot of people's faith in their government. I think if people loose faith that their country is good and well intentioned and has their best interest at heart, personally, every single person no matter what their circumstances, race or economic background OR STATE the government will face an erosion from within that is anarchy at best and a condition that will take revolution/civil wars at worst to straighten. I'll tell you right now people don't take it lightly when they are poisoned, outright poisoned. Why should they? Do you like the thought that we could be facing anarchy as more and more people turn against their own country as it turns against them and their very right to breath a clean breath of air, for heavens sake, what do LANL and DOE expect when they are killing people? THAT LANL AND DOE DON'T ADMIT THAT THEY ARE KILLING PEOPLE DOESN'T MEAN THAT PEOPLE ARE NOT DROPPING LIKE FLIES BY WHAT LANL AND OTHER DOE SITES HAVE DONE TO PEOPLE! IT'S AN OUTRAGE! I wish that I was just being paranoid as some people accuse. I wish I could sleep at night without thinking about what terrible new plans LANL is coming up with now. NOW I KNOW THEIR STOCKPILE STEWARDSHIP PLAN, THEY ARE PROUD OF IT, AND I SAY NO WAY, I hate IT. I HATE THE STOCKPILE STEWARDSHIP PLAN! As if this isn't enough LANL has to come up with excess of 100 deadly and monstrous new nuclear projects! It's too much for my soul to bear! I can't bear being contaminated every day, incidents over and over again go unpunished. We get no relief. There is no end to this pollution. THIS RADIATION NIGHTMARE SEEMS TO GET MORE DEADLY AND SCARY EVERY DAY AS LANL TAKE ON EVER MORE HORRIFIC PROJECTS. LANL CLEARLY WANTS TO MAKE NEW MEXICO THE CENTER FOR ALL RADIATION, WEAPON AND PLUTONIUM RELATED PROJECTS. I FEEL LIKE A VICTIM THAT JUST HAD A DEADLY TAPE WORM SETTLE IN MY HEART. I FEEL LIKE ALL EVIL HAS COME TO SETTLE IN THIS VALLEY. I KNOW THERE IS EVIL ENOUGH IN THIS WORLD TO GO AROUND BUT I FEEL WE

HAVE TAKEN ON MOST OF THE MAJOR EVIL OF THE WORLD. IF WAR IS A SATANIC INSTITUTION (WAR CAN BE A HEALING IF IT IS TOTALLY NECESSARY AND WORLD SANCTIONED BUT AS AN INSTITUTION, A WAY OF LIFE, PERPETUATING WAR'S WHERE NO WARS EXIST, EVIL ON TOP OF EVIL) THEN I FEEL LIKE ALL THE DEVILS IN THE UNITED STATES HAVE DESCENDED ON OUR STATE. WHAT ONCE WAS A RURAL COMMUNITY NOW HAS BECOME A HIGH TECH NIGHTMARE. We now have not a moments peace! I can say I will devote my life to saying no to LANL and DOE's contaminated ideas but what a waste of my artistic and spiritual talents! I can say I will die saying no to weapons of mass destruction but my soul cries out at this prospect. I want to live! I don't want to die defending my air and a healthy environment and I don't want to see anyone die defending the rights and lives of people on this planet! HUMAN RIGHTS ARE GOD GIVEN RIGHTS! How can people pervert and twist the law, Thou Shalt Not Kill to include making weapons of masser destruction without batting an eye? How can they do that! MY WHOLE SOUL CRIES OUT AT THE WASTE OF ALL THIS IDEA OF DEATH! CAN'T WE ALL JUST KILL OUR EGO'S IN THERAPY AND REALIZE THE END OF THE WORLD IS THE END TO CONTROL, FORCE, VIOLENCE AND DISRESPECT FOR LIFE ON EARTH AND IS NOT THE END OF THE PHYSICAL WORLD! Stop trying so hard to make the end of the world prophesy come true. This whole concept is a total misunderstanding. It's just the death of a cycle! The prospect of a life of hearings, you cut off one head and ten spring up, you cut that head off an 100 spring up syndrome is draining! Everyone says DOE and the military problem is too big FOR THE PEOPLE OF THE UNITED STATES TO EFFECTIVELY TACKLE. The government is a practically a military government, not a democracy, if it gives up what is right to appease and pacify big out of control, tyrannical babies. WHO DOES RUN THIS GOVERNMENT, I WONDER, THE MILITARY OR THE PEOPLE, WHO AFTER ALL ARE SUPPOSED TO HAVE THE RIGHT TO LIFE

LIBERTY AND THE PURSUIT OF HAPPINESS. WHAT HAPPENED TO MY RIGHT TO LIVE WHEN I AM DESIGNATED INTO A HUMAN SACRIFICE (TO THE BOMB MAKING MACHINERY), ZONE! ARE YOU SAYING I HAVE NO RIGHTS! YES, I DO HAVE RIGHTS! NEW MEXICO CAN SAY NO TO DRUGS AND NEW MEXICO CAN SAY NO! TO BECOMING THE MILITARY NUCLEAR SACRIFICE ZONE AND NEW MEXICO CAN INSIST ON NOT ACCEPTING ANY HAREBRAINED PROJECT THAT DOESN'T COMPLY WITH EVERY SINGLE SOLITARY ENVIRONMENTAL SECURITY MEASURE THAT 100% GUARANTEES THE HEALTH AND SAFETY OF EVERY SINGLE NEW MEXICAN MAN, WOMEN, CHILD AND EVERY SINGLE SOLITARY FUTURE CHILD. UNTIL THEIR RIGHTS ARE SAFEGUARDED, NOW AND FOREVER, AS LONG AS THE EARTH SHALL EXIST, I WILL NOT BE HAPPY. I WILL NOT ACCEPT COMPROMISES FOR THE FUTURE OF THE BEAUTIFUL AND SPIRITUALLY GIFTED NEW MEXICAN CHILDREN! Whoever says that THEY CAN MAKE UNITED STATES SACRIFICE ZONES (AND WHAT LANL PREPOSSESS WITH THE STOCKPILE STEWARDSHIP PROGRAM DOES MAKE US INTO A SACRIFICE ZONE FOR WASTE AND EMISSIONS), has given up on a government of the people and for the people! That is a terrible and hopeless thing to say! Could the DOE AND LANL and other culprits, knowingly or unknowingly be conspiring in a way, by it's secret ways, that will defeat democracy, by not listening to the people about their outrage at being contaminated by the fallout from nuclear industries everywhere around them? DOE AND LANL would be the first to say we are defending our democracy. They are not listening to the people about not building bombs and nuclear power plants! They can not at the same time prepare for war and negotiate for peace and they cannot at the same time say they are our big brother's (where have I heard that name) protecting us and at the same time contaminate us with no mercy and no regret. Maybe they aren't protecting national interests or international interests or the American people's interests but their own financial interests! This is why

we need international laws to protect us from corporations or governments or militaries, from being contaminated/corrupted beyond hope AND GOING OFF HALF CAULKED, TAKING OVER INNOCENT COUNTRIES, POLLUTING AND ENDANGERING SPECIES, COMMITTING GENOCIDE, OPPRESSING AND ENSLAVING PEOPLE AND DEVELOPING NUCLEAR BOMBS. ANY NATION CAN GO BERSERK, LIKE OUR MILITARY IS RIGHT NOW, IN THE FUTURE ALL WORLD AFFECTING ENVIRONMENTAL AND WAR MAKING EFFORTS WILL BE SCRUTINIZED AND OUTLAWED IF DANGEROUS TO THE WORLD BY THE LAWS ENFORCED BY THE LEAGUE OF NATIONS. RIGHT NOW THE UNITED STATES OF AMERICA NEEDS WORLDWIDE INTERVENTION AND WE SHOULD BE CALLED TO ACCOUNT FOR WHAT LANL PREPOSSESS AND LANL SHOULD BE CONVICTED OF CRIMES AGAINST HUMANITY. I'm here to tell you from everything I see and know, LANL and DOE (with the exception of a few whistle blowers), as regards to upholding any kind of standards on clean and safe facilities, (regardless of any national security issues), is corrupted beyond hope of repair! LANL is like a criminal who cannot stop being a criminal until they realize what they have done is wrong. The prisons are full of prisoners who think they are innocent, it was everyone else's fault, who have no integrity, it was because the women dress was sexy that he killed her.! The labs say because terrorists might get their hands on atomic power or a bad country might make one atom bomb that we must make enough bombs to bomb the earth three times!!!!!! The labs are full of scientists who innocently make bombs of mass destruction who say they hurt no one, are benefiting mankind and have pure and crystalline manna as by products we should go out and catch like bread and honey to feed our babes from the sky and say thank you big brother, thank you! This is another case of hypocrisy! Just like building bombs while we signed treaties not to make bombs is hypocrisy. It is hypocrisy to tell other countries not to build bombs while we build them. "Do what I say, not what I do is the message." People say coal killed people too. I say, "coal killed 1 generation and did not last for 240,000 years! People are saying," stop killing us!" WHAT IS THE USE OF DEFENDING A COUNTRY DESTINED TO DIE FROM CANCERS FROM WITHIN? WHO EVEN WANTS TO TAKE OVER A COUNTRY FULL OF RADIATION FALLOUT THE DEAD AND DYING? WHO WOULD EVEN WANT A CONTAMINATED COUNTRY? What kind of idiots are we to fight over land: our grave? NO ONE WILL EVEN WANT OUR WRETCHED COUNTRY AFTER ALL THAT! WHY PRIDE OURSELVES LIKE AN OLD WITHERED SOCIAL BUTTERFLY/far from the prime of youth THINKS ALL THE MEN ARE AFTER HER? IN A FEW GENERATIONS THE PEOPLE WILL LOOK BACK AT US AND CURSE US. If they weren't so mad they'd laugh at us as pompous fools.

I had to become a women still under nuclear threat and I had to live with the knowledge that my little blooming love nest was being radiated! Every breath could mean death, mutation. This toxic stew was not the result of national security! Even if there was a sane need for more bombs, if we already didn't have enough to destroy the world 3 times sane scientists would have made every effort, every human effort possible to protect us from the fallout, the toxic emissions, the waste! HAZEL O'LEARY OUR GREAT DOE LEADER SEEMS TO HAVE PILFERED THE FILTHY DOE FUNDS, AS IF SHE DOESN'T MAKE ENOUGH MONEY ALREADY! The bald face disregard cannot be hidden under the cloak of national security! Does national security give you the right to kill your own country folk? When do statistics of: so many people are to die from security, turn into real people to love and cherish? When will statistics of so many people have to die to save the rest of the country stop after A WAR IS ENDED AND WE ARE PEACEFULLY NEGOTIATING WITH OUR FORMER ENEMY? The longest path is often from the head to the heart! LANL HAS THAT LONG JOURNEY TO GO AND THEY HAVE NOT STARTED

EVEN WITH THE FIRST BABY STEP! WHAT IS A HEART... THEY AREN'T EVEN ASKING YET!

Friends of mine were jailed stopping the opening of WIPP. Fine people with more love and compassion for humanity in their little fingers than LANL has among every scientist since it's start combined! Wipp and it's chaos had us all traumatized and horrified by visions of unreported spills, two radiation carrying trucks colliding and releasing the deadly airborne variety of plutonium we all dread, 2 OR MORE NUCLEAR ACCIDENTS A YEAR, unreported emissions, mixing high level and low level wastes and getting the foot in the door to store more and more deadly waste, getting the o.k. to make endless more waste because they felt they had a place to tuck it away from public view and away from criticism, 20,000 trucks on the road carrying waste 1 mile from my house. We were trying to build our own home in peace amidst all this! I spent all those child raising years and home building years in agony, despair, rage and horror at what DOE and LANL were trying to do to our state by making it the nuclear waste dump of the nation. Meanwhile the incriminating evidence of DOE's scandalous negligence mounted nationally along with the hairs on my neck. DOE contaminated every single solitary site they used (abused) they deceived the people, never once telling people of dangerous nuclear levels, spills, contamination or disasters. DOE had no regard for human safety and they took only the most nill precautions and only the most lackadaisical efforts were made to protect the people, inform them of the dangers, keep records of the accidents and health risks that did happen (most of the records they did keep were probably distorted, evidence in itself) or even make any effort to clean up the nuclear messes. NOW THEY ARE TRYING TO PRETEND THE NUCLEAR MESSES DON'T EXIST SO THE GOVERNMENT WON'T HAVE TO PAY THE BILLIONS AND BILLIONS TO EVEN ATTEMPT TO CLEAN THEM

UP. IF THE GOVERNMENT HAS THE MONEY TO MAKE MORE BOMBS YOU CAN BET YOU LIFE THAT THEY HAVE THE FUNDS TO CLEAN UP THE NUCLEAR MESSES. THE TRUTH...THEY DON'T CARE...IF DOE CAN GET AWAY WITH IT THEY WON'T TRY TO GET THE FUNDS, THEY WILL FIRE THE CLEAN UP CREWS AND EVEN KILL THE MOST ADAMANT PROTESTERS THAT GET RIGHT IN THEIR FACE!

I'm ashamed and feel dishonored, as a state, by LANL. I am disappointed in LANL all along the treacherous nuclear path they took. A rotten evil foundation (war is a satanic institution) was formed when they dropped the bombs on Japanese cities. Why 2 weeks after they were invented? Why 2 cities? Two cities! Why cities empty of all soldiers, what an evil, evil thing! Now there is mounting evidence that Japan would have surrendered if we had just assured them that they could keep their leader! What an evil and pointless beginning LANL has. MANY OF THE FIRST SCIENTISTS, EVEN EINSTEIN ,PROTESTED BITTERLY, EVEN TOOK THEIR LIVES AS A PROTEST AND REFLECTION OF PERSONAL RESPONSIBILITY THEY COULDN'T LIVE WITH. The foundation concepts AT LANL are evil and the evil has continued to grow and gross us out with it's ever more erroneous and outlandish behavior. LANL continues to abhor us and this stockpile stewardship fe-pa abhors me infinitum! The only good thing I can say about all this is, thank God more nuclear bombs haven't gone off! We can all breath a sigh of relief and take apart the bombs, as Russia has and be glad it's over! But no, LANL wants to make the cold war go on FOREVER....it was so monetarily profitable! When will bombs making not be considered a business a corporation chooses because it generates more revenue? When will the people of the United States, all of us not be statistics/pawns to barter for more investment in bombs? Just enough weapons to defend the borders is a far cry from amassing masses and masses of weapons of mass destruction! The president of the

United States and the congress has to stop LANL before they get us all embroiled in more world anarchy and more nuclear proliferation by setting a bad example to the other upcoming nations and making treaties totally obsolete by loosing our credibility, this is serious. OUR NATION IS SETTING A BAD EXAMPLE TO EVERY BOY IN THIS NATION. EVERY BOY IS COPYING THE U.S. IN IT'S "VIOLENCE CURES EVERYTHING STAND." THE MESSAGE IS LOUD AND CLEAR TO SOLVE EVERY PROBLEM WITH VIOLENCE AND WE NOW HAVE BY FAR THE MOST INTERNALLY VIOLENT NATION IN THE WORLD. THE MILITARY PERPETUATES THE BRAINWASHING OF LITTLE BOYS AS SOLDIERS AND SO WE HAVE THE MENTALITY OF LOTS OF BOYS WILLING TO SOLVE PROBLEMS WITH VIOLENCE. WE HAVE THE PROBLEM OF THE MILITARY BEING A KIND OF JOB CORE TRAINING PROGRAM FOR POOR MEN AND SO A MAJORITY OF OUR MEN GET TRAINED IN HOW TO KILL. THEY KILL IN WARS AND COME BACK AND KILL U.S. CITIZENS BECAUSE THEY ARE TRAINED TO USE VIOLENCE FOLLOWING BLIND ORDERS AND VIOLENCE TO SOLVE PROBLEMS. THEY HAVE NO WORLD SKILLS! PRESIDENT CLINTON IS THE FIRST PRESIDENT TO SET A GOOD EXAMPLE BY HAVING THE ARMIES STOP WARS, DEFEND HELPLESS PEOPLE FOR NO PROFIT OF OUR OWN AND I FEEL PRESIDENT CLINTON AND PAST PRESIDENT CARTER ARE SOME OF THE MOST BRAVE PEOPLE ON THIS PLANET. I WOULD FOLLOW PRESIDENT CLINTON'S LEAD IN CUTTING MILITARY SPENDING! PRESIDENT CLINTON WAS RIGHT TO PROTEST THE VIET NAM WAR THAT IN THE END ONLY BROUGHT HUMILIATION TO OUR COUNTRY. Sure there may be terrorists and rouge nations but the allied nations must unite now into some semblance of agreement or all is nearly lost. The time is now!

It was the evil in man that won out that day the U.S. dropped the bomb on Hiroshima. All nations have committed genocide including the Native American Indians in wars against each other and Eskimo's, Mao killing a million of the rich and elite, Hitler defying every law of human decency perpetuating mass genocide, The first non Indian Americans killing the Native Americans in a genocide so horrendous it parallels Hitler in racism run rampant, Stalin's murdering masses of people, Spain and it's decimation of the Inca people and so it goes. The point is the U.S. is not totally innocent and we still hope not to be bombed. Japan might have been guilty but the children who were bombed were innocent. If we, in the U.S. were bombed for what we did to the Indians we would not say we deserved it, but we do, for what we did to other human beings to take their country, to conquer a people. However wretched we are for supporting Hitler before he turned Monstrous, Saddam Hussan and other military dictators who turned sour, the children and future generations deserve a chance. I am saying there is no excuse good enough for us to hold whole countries hostage with our bombs. If God asked me to bomb other nations to save our own I would say if humans have gotten to that stage of evil we don't deserve to exist and I would refuse to bomb Japan or any other nation. THE TRUTH, AS I SEE IT IS THIS: NOT GOD, NOT ANY FORCE OR INTELLIGENCE ON EARTH WOULD MAKE HUMAN SOUL'S BOMB WHOLE NATIONS TO STAY ALIVE. GOD WOULDN'T MAKE A MOTHER DECIDE BETWEEN HER TWO CHILDREN LIKE A MOTHER IN THE HOLOCAUST WHO HAD TO DECIDE WHICH CHILD A NAZI WOULD KEEP TO TRAIN AS A NAZI AND WHICH ONE WOULD BURN IN THE GAS CHAMBERS. GOD DOESN'T SET UP SUCH SINARIOS IN THE FIRST PLACE BY SAFEGUARDING PEACE AND GOOD RELATIONS AND WORLD WIDE HUMAN RIGHTS INSTITUTIONS. THERE IS NO ALTERNATIVE OR SUBSTITUTE FOR WORLD ORDER AND PEACE. GOD DOES NOT EXPECT US TO DO SUCH SOUL KILLING THINGS (EVEN TO KILL ONE HUMAN BEING CONDEMNS YOUR SOUL TO DEATH,) I KNOW GOD WOULD HAVE A BETTER PLAN. IF GOD PUT ME IN THAT SITUATION OF HAVING TO KILL A HUMAN BEING OR DIE MYSELF, I WOULD DIE. I WOULD PROTECT MY FAMILY BUT NOT IF I ALSO HAD TO KILL A WHOLE OTHER FAMILY FOR SOME REASON. I WOULD TRUST IN GOD'S

UNIVERSE AND DIE MYSELF AND LET MY FAMILY DIE RATHER THAT COMMIT A HEINOUS ACT. SCIENTISTS AT LANL HAVE TO WRESTLE WITH THEIR SOUL AND THEY ARE BREAKING PSYCHOLOGICALLY UNDER THE STRAIN. THEY ARE CRACKING UP. DON'T MAKE YOUNG SCIENTISTS CARRY THIS TERRIBLE FATE AND BE CONDEMNED TO THE DIVERSE FORMS OF INSANITY. DON'T SCIENTISTS HAVE THE RIGHT TO SANITY TOO? JUST AS THE WHOLE GERMAN COUNTRY, COLLUDED WITH HITLER TO LET WHAT HAPPEN HAPPEN, THE WHOLE U.S. IS WILLING TO BE PROTECTED BY DECIMATING WHOLE NATIONS, WE ARE WELL COLLUDED IN THIS MASS DESTRUCTION THING. JUST AS MALES COLLUDE IN NOT GIVING FEMALES RIGHTS AND SOCIETIES COLLUDE TO PERPETUATE RACISM SO MINORITIES ARE THE HAVE NOT'S, THE SLAVES. JUST AS A GROUP OF MEN ALL COLLUDE IN GANG RAPE BY NOT STOPPING IT AND SPOUSES COLLUDE IN ALLOWING INCEST BY NOT STOPPING IT, WE IN NEW MEXICO COLLUDE IN CREATING WEAPONS OF MASS DESTRUCTION BY NOT STOPPING LANL AND DOE. MANY PEOPLE SEE IT THAT WAY. THERE IS NO RAIN NOW MAYBE BECAUSE WE HAVE LOST IT SPIRITUALLY. Maybe New Mexico has been spiritually broken. We have sold our souls to the devil/war/death and we are now corrupted and so the really big guns can now be wheeled in. That is how I see it! GOD IS ALL POWERFUL AND LOVE IS TRULY THE STRONGEST FORCE ON EARTH. I KNOW THE PROPHET FOUNDER OF THE BAHA'I FAITH PROCLAIMED THAT <u>HE WAS THE PHYSICIAN</u> OF THE SPIRITUAL DISEASE THAT THREATENED THE LIFE OF THIS PLANET AND THE ONLY CURE IS TO ELIMINATE RACISM, UNITE HUMANITY AS ONE FAMILY AND UNIT THE NATIONS INTO STRONG LEAGUES OF NATIONS WHO UPHOLD HUMAN RIGHTS AND WORK AS A UNIT TO FURTHER THE RIGHTS OF LIFE ON EARTH. DO YOU THINK BOMBS ELIMINATE RACISM? NO! BOMBS PERPETUATE FEAR AND SUSPICION AND ARE THE EPITOME OF RACISM. <u>BOMBS, IT TURNS OUT, ARE NOT THE CURE BUT IN VERY FACT THE DISEASE INCARNATE!</u>

The people who speak out against nuclear proliferation have been working to educate themselves, like I have, for 40 years or more sometimes. The people who have really made it their business to be informed, nuclear proliferation comes out to be in their minds anti-life. If you analyze the comments you will hear many people defending life against the death that nuclear proliferation represents. LANL's stockpile stewardship is nuclear proliferation and that is why so many thoughtful people object adamantly to it. LANL is perpetuating racism by making bombs to kill "the others" the "enemy. LANL is motivated by fear....fear that another country will try to bomb us...it goes way beyond fear of having our country taken over. When I attended the TRINITY mediations between the LANL hawks and the Peace doves the scientists justified their position by saying making bombs was a deterrent to make other nations too afraid to bomb us. In the arms race this may have had some truth but now that the arms race is over the deterrent decoy is nonsense. If we needed an atom bomb for every terrorist atom bomb we could never generate the cold war again no matter how exaggerated and blown up we tried to make the threat! The cold war is over and to continue to proliferate arms is absurd! Times change and thank GOD! WHAT real enemy can we conjure up? USSR is a broken and torn country and it is, as we are, sorely contaminated and suffering greatly from Chernobyl and other contaminated facilities.

The U.S., like a young native of New Mexico so eloquently said, is not the bully or the policeman of the world. The anarchy of the world has lead us to take some dramatic and heroic stands but the energy gets drained if we don't take care of internal conflicts and problems. Like the work alcoholic husband who says he is working for the family but is abusive and cold to them personally, never giving priority to internal

affairs, coming home to find his bride absconded with another man, a country who neglects it's people and gives all the funds to the military, (children can't eat bombs), finds the loyalty to others. I feel democracy would have been winning converts on a social level if we had put all that money into helping feed and cloth other nations instead of bombs to make them scared of us.

We are only one nation, not the only important nation. Someday we will be only one of many nations, one vote, one voice. We are destined spiritually to lead the other nations but like any spiritual gift we can squander it and let it atrophy. Our strength is that we are multi national and that we have worked with the United Nations for so long. Our positive side is working for peace but our shadow side is scheming war. If we don't provide an impeccable example of non proliferation we could fall on our face and loose credibility and who will lead the world then? The world could truly go through anarchy and a time of terrible tests.,,eventually we will get back to the united nations idea because nations are not going away! Our making bombs arouses suspicions and perpetuates bomb making. As with inter community violence if there are people arming themselves, more people arm themselves and now in America there are reportedly three guns for every man women and child, 250 gun related deaths a week and rising fear/alarm of violence which makes more violence by the fearful killing more easily because they trust less. The fact that a lot of toxic dumps of all kinds are being put by minority neighborhoods underlines the racism and speaks loud and clear that we haven't defined who in the nation the bombs are defending. Could it be we are dehumanizing 'the others" in our nation as well as dehumanizing "the others" outside our nation and sometimes we get confused what nation we are defending. Could we be defending the same "White supremacy " nation Hitler espoused? If we look deep what do we see....racism or love for all nations and races? COULD IT BE THAT RACIST LEADERS ARE FIGHTING THEIR FEARS OF EACH OTHER WHILE PEOPLE LIKE BAHA'I AND OTHER OPEN HEARTED FOLK ARE MAKING FRIENDS WITH THE "ENEMIES" EVERYWHERE AND FINDING LOVE, FRIENDSHIP AND PEACE WITHOUT THE GOVERNMENTS?

That bomb making machinery is so expensive it drains off 35% of our tax dollars, leaves the congress bald facedly debating to take away children from unwed mothers and cutting off their welfare and food. The same people who protest abortion refuse to care for the poor unborn causing mass abortion to happen. When we are so stingy that we take away all the social programs, the art grants, the libraries, the educational system, the children's school lunches, the public broadcasting input, the forest services, parks, museums, social services, the social security, the health benefits for the poor, the help to illegal aliens who are in desperate of medical care, the very things that make life civilized, pleasant and beautiful. That make us able to help the really weak and helpless people, the old, the young, the retarded, the sick, the handicapped, the pregnant women, the unborn child, the educable youth, the jobless man, the struggling recovering substance abuse victim, the environmental concerns, the endangered animals....the list goes on and on and on. I sit incredulous as I hear of large bomber planes getting billions of dollars and the military blood suckers like LANL get billions and then I hear congress stingily taking away all the social services. Thank God President Clinton doesn't compromise all these important social programs. The schools need art so kids can be less physical and material and value the creative process. The jails need programs for rehabilitation that might work, the at risk kids need help integrating into society before they get criminally hardened....so it goes!

This nuclear tick is a time bomb that sucks our nations blood dry. The military sucks our blood like a vampire, our monetary lifeblood and leaves our nation weak and emaciated. Our rage grows as we get nothing much back from our taxes. I don't mind paying taxes if it goes for the nation's well being. LANL and DOE facilities are a tragedy when they make bombs with the money we make and pay in taxes instead of for causes benefiting mankind. I resent every penny that goes to defense.

I AM OUTRAGED THAT LANL SAYS THAT ALL THOSE BILLIONS OF DOLLARS TO MAKE BILLIONS AND BILLIONS AND BILLIONS AND BILLIONS AND BILLIONS OF DOLLARS WORTH OF BOMBS, BOMBS LIKE CRAZY THAT DRAINED OUR NATIONAL BUDGET DURING THE COLD WAR ARE NOT UP TO DATE! NOW THEY NEED THE MONEY EQUIVALENT TO THE WHOLE NATIONAL BUDGET TO MAKE NEWER UP TO DATE BOMBS!!!!!! I OBJECT! THE NUCLEAR BOMBS NOW (IT HAS BEEN WELL RESEARCHED), DO NOT GET DANGEROUS AND DETONATE BY THEMSELVES FOR ANY REASON INCLUDING AGE AND WE DO NOT NEED TO MAKE NEW BOMBS. THE HYDROGEN BOMBS ARE VASTLY DESTRUCTIVE COMPARED TO THE ONES THEY DROPPED ON HIROSHIMA AND THE OTHER HIDEOUS BOMBS, ONES THAT KILL ALL LIVING THINGS BUT LEAVE THE HOUSES ARE TOO DEMONIC TO IMAGINE THE MAKERS TWISTED AND MOLDING HEART. NO MORE BOMBS SHOULD BE MADE! THE BOMBS CAN BE LEFT UNTIL THEY ARE TAKEN APART AND THERE IS NO EMERGENCY TO MAKE MORE BOMBS. THERE IS NO EMERGENCY TO TAKE THEM APART RIGHT NOW EXCEPT INTERNATIONAL TREATIES...A GOOD ENOUGH REASON FOR ME.... BUT THERE IS AN EMERGENCY TO CLEAN UP AND STABILIZE OUR OWN LIVING ENVIRONMENT BY CONTAINING EVERY SCRAP/ATOM OF PLUTONIUM WE CAN AND RECONTAINING IT AS OFTEN AS NECESSARY TO PROTECT THE AMERICAN PUBLIC FROM AN INTERNAL CRISIS. WHEN WOULD DOE CARE ABOUT PLUTONIUM CAUSED CANCERS...WHEN ONE IN EVERY TWO PEOPLE DIE OF

CANCER.... INSTEAD OF THE ONE IN THREE ALREADY...WHEN CANCER BECOMES THE MAJOR KILLER OF CHILDREN(IT IS NEAR THAT).....WHEN THEIR OWN CHILDREN DIE......WHEN MUTATIONS ARE APPEARING REGULARLY IN THE VAST POPULATIONS? The horrible rational of DOE is that they are immune to suit because they are protecting us, exempt by law from litigation, plutonium is invisible and it doesn't hurt anyone as the atom goes into you it just sits quietly knocking off genes until, years later you die of cancer or have a mutated child and then DOE is not to blame...how can anyone prove that it was plutonium or DOE that did it? If it was plutonium that killed someone you can be sure it was Doe's poison that did it.

I can even, possibly understand dying for the world as a person or a state if it did save the world in some way. But how did destroying the world, in some way, end up as being able to be seen as saving it? I just don't get it! Even if I did believe it, how can I tell the young boy in the 7th grade I knew who won the Odyssey of the Mind contest statewide only to be shot down with crippling leukemia? How could I allow my own child to be the national sacrifice? How could I tell my son or daughter they had to die for us? How could the government pin awards of purple hearts on little 3 year olds and thank them for giving their lives for us?

THE WAY WE ARE BRAINWASHED TO THINK OUR GOVERNMENT CAN DO NO WRONG AND IS TAKING CARE OF US BENIFICANTLY/TOTALLY TO THE POINT WE DO NOT HAVE TO QUESTION OR THINK ABOUT IT, WHETHER IT MAKES SENSE OR NOT, WHILE IT ALL ALONG AMASS'S WEAPONS OF MASS DESTRUCTION TO PROTECT OUR NATION WHEN ANY ONE BOMB COULD DESTROY THE WORLD AS WE KNOW IT BY NUCLEAR WINTER OR RADIATION POISONING, AND CALL THIS NATIONAL SECURITY? IF YOU REALLY THINK OF IT, IT REALLY IS ABSURD. SINCE IT REALLY IS SO COMPLETELY AND UTTERLY LUDICROUS, ANY CHILD COULD SEE THE FALLACY. I BELIEVE IN MY HEART OF HEARTS THAT LANL

AND DOE AND OTHER NUCLEAR PROMOTING CORPORATIONS TRULY DO NOT MAKE BOMBS TO PROTECT US BUT TO MAKE MONEY. I WOULD DIE TO REALLY PROTECT THE EARTH, OUR NATION OR ANY CHILD ON EARTH. WHAT COULD BE WORSE THAN THE EARTH HAVING THE POTENTIAL OF DESTRUCTION, MASS DESTRUCTION AND ALL FOR GREED. I still insist that no human should ever, ever take money for making war machines or bombs. If it truly had to be done, as a mercy killing, to utterly destroy a government by any means to protect the world,(and we might be such a nation right now) all negotiations and means possible should provide alternatives first and all avenues explored and tried to the full extent humanly possible and no money should be taken. It would be like a mother taking money for pulling the plug on a vegetable/brain dead son or a father taking money for mercy killing a daughter's beloved but broken legged horse or a Nazi taking money for running the gas chambers, etc. Enough money to survive is respectable but to line your pockets fatly with other's misery and tragedy is inexcusable. Make all the bomb builders work as volunteers and give money to scientists who make cakes for their children's bake sales for school activities and see how many dedicated bomb building corporations stick around! Would we see the true colors of why scientists work? Would scientists work for free to make weapens of mass destruction or do we still see visions of world glory, pride, ego gratification, awards, money and lots of it as part of the picture.

OUR NATION'S DESTINY AND THE WORLD'S DESTINY SHOULDN'T BE DECIDED BY THE WAR PUSHING OBVIOUSLY IMMORAL AND INDECENT ENOUGH TO DENY THEIR PREDICAMENT AND INVOLVEMENT IN THE POSSIBLE DESTRUCTION OF THE WHOLE PLANET. I KNOW THAT THE PLANET IS GOD'S SPIRITUAL STEP STOOL AND WILL NOT BE DESTROYED, BUT IF THE SCIENTISTS MAKE BOMBS THAT CAN DESTROY THE world/ NOT TO DESTROY THE WORLD AND MAKE

WEAPONS OF MASS DESTRUCTION NOT TO DESTROY WHOLE CONTINENTS OF MEN WOMEN AND CHILDREN THAN WHY DO THEY CALL THEM WEAPONS OF MASS DESTRUCTION AND REALLY BUILD REAL BOMBS THAT REALLY COULD DESTROY THE WORLD? IF THEY WERE BOMBS MADE OF FELT AND FAKE PUPPETS TO THREATEN PEOPLE AND INTIMIDATE THEM I COULD SAY THEY ARE MAKING DETERRENTS. BUT NO, THEY ARE MAKING REAL BOMBS THAT KILL VERY REAL PEOPLE AND COULD KILL WHOLE NATIONS OF VERY REAL CITIZENS, INNOCENT CIVILIANS.

THE DECISION OF WHETHER OR NOT WE SHOULD HAVE WHICH BOMBS TO DEFEND OUR NATIONAL BORDERS SHOULD BE DECIDED BY WORLD FEDERATIONS NOT BY A ROOM FULL OF OUT OF A JOB SCIENTISTS AND CONFUSED DOE FACILITATORS WHO ARE JUST LAMELY FOLLOWING ORDERS. FOR A ROOM FULL OF OUTRAGED CITIZENS AND CONFUSED SCIENTISTS TO SIT AND DEBATE THE FATE OF THE WORLD, SCREAMING AT EACH OTHER PSYCHICALLY IS AN INCOMPARABLE SITUATION UNLIKE ANY OTHER HUMAN SITUATION I HAVE SEEN! THE HUMAN AGONY OF DECIDING THE FATE OF THE WORLD IS A JOKE UNLAUGHABLE. THIS KIND OF DECISION BELONGS NOT WITH THE PRESIDENT OR THE CONGRESS BUT IN THE UNITED NATIONS WHERE LANL AND IT'S ROLE SHOULD BE CAREFULLY CONSIDERED AND FULLY DEBATED IN A WOULD CONFERENCE LASTING MANY MONTHS. ANY STATE, PERSON, LABORATORY CAPABLE OF OR CONSIDERING MANUFACTURING BOMBS IS THE BUSINESS OF THE WORLD HUMAN RIGHTS DELIBERATORS, THE HUMAN RIGHTS PROTECTORS, THE WORLD FEDERATION OF NATIONS AND NO ONE ELSE. SINCE ALREADY WE HAVE A SUFFICIENT LEAGUE OF ALLIED NATIONS AGREEING TO NONPROLIFERATION WE MUST ABIDE BY THOSE DECISIONS ABOVE AND BEYOND CONGRESS. HERE IS ANOTHER DISCREPANCY. DOE OFFICIALS SAY THEY ARE JUST FOLLOWING ORDERS AND THAT NOT THEY BUT THE PRESIDENT AND CONGRESS DECIDES THE FATE OF BOMB MAKING AND THAT THEY DECIDED TO LET LANL MAKE BOMBS....I JUST DON'T UNDERSTAND WHY OUR PRESIDENT SIGNED THE

NONPROLIFERATION TREATIES IF WE DIDN'T MEAN IT! DO I LOOSE FAITH IN OUR GOVERNMENT'S WORD AS TRUE ON INTERNATIONAL TREATIES?

EVERY PERSON OF GOODWILL, LOVE AND ALL DEFENDERS OF THE INNOCENT CHILDREN ,(WHO DON'T MAKE BOMBS THAT COULD SIMULTANEOUSLY DECIMATE THEM IRONICALLY AT THE SAME TIME). THE VOICELESS CREATION WILL ARISE AS ONE BODY AND DEFEND THEIR LIVES BY STOPPING bomb PROLIFERATION... NUCLEAR PROLIFERATION, IN ITSELF, IS THE ONLY ACTIVITY HUMANS ARE DOING THAT COULD DESTROY THE WHOLE PLANET IN ONE FELL SWOOP! MILITARY DIRECTED, BOMB MAKING CORPORATIONS ARE MAN MADE INSTITUTIONS, HOWEVER SATANIC, HAVE BEEN MADE AND THEREFORE CAN BE UNMADE, TAKEN APART AND UNDONE. LUCKILY TAKING THE BOMBS APART IS WITHIN HUMAN CAPACITY AND ALTHOUGH ALMOST BEYOND HUMAN CAPACITY, CONTAINING AND RECONTAINING NUCLEAR WASTE CAN BE ACCOMPLISHED BY HUMAN BEINGS AND MUST BE ACCOMPLISHED BY HUMAN BEINGS IF WE ARE TO SURVIVE. RADIOACTIVE WASTE IS THREATENING OUR NATION AND OUR PEOPLE WAY MORE THAN NUCLEAR BOMBS FROM TERRORIST NATIONS ARE RIGHT NOW. IN THE FUTURE THAT IS POSSIBLE UNLESS WE UNITE AS NATIONS AND STRONGLY OUTLAW THE USE OF WEAPONS CAPABLE OF DESTROYING THE WORLD!!!!!

IT IS UNCONSCIONABLE TO LEAVE ALL THIS NUCLEAR WASTE FOR OUR CHILDREN TO RECLAIM AFTER IT HAS GOTTEN OUT OF CONTAINMENT AND INTO EVERY OCEAN, STREAM, LAKE AND CITY WATER SUPPLY? WHAT WILL OUR CHILDREN DO THEN? IF WE SUPPORT HITLER'S, SIDDAMS AND DOE'S AND THEY BECOME MONSTERS... SOMEONE HAS TO INTERVENE AND STOP THEM. AT THIS POINT THE CANCER WON'T CUT ITSELF OUT. THE CANCER HAS TO BE REMOVED. DOE WILL NEVER STOP REPLICATING THE CANCEROUS CELL BECAUSE IT IS AS UNHEALTHY AS IT'S COUNTERPOINT/MATERIAL SYMBOL THE BOMB AND CAN'T STOP, JUST LIKE HITLER COULDN'T STOP. MAYBE A WORLD BODY NEEDS TO COME AND POLICE THE UNITED STATES AND

FORCE US INTO ABIDING INTERNATIONAL LAW AND PROVIDING JUSTICE FOR IT'S OWN PEOPLE. THIS IS A LIKELY SITUATION UNLESS WE STRAIGHTEN UP AND FLY RIGHT! THAT WE, THE U.S. ARE PRIM AND PRISTINE, BLAMELESS AND PRAISEWORTHY IS NOT SO OBVIOUS TO THE REST OF THE WORLD AS IT IS TO THE POMPOUS NATION FANATICS WHO PROMOTE THAT IMAGE BUT WHO DON'T SEE THAT THEY HAVE NO CLOTHES AND EVERYONE NOW SEES THE TRUTH.....U.S. HAS A DARK SIDE...LIKE EVERYONE ELSE THAT MUST BE CONTROLLED AND REGULATED THE SAME AS ANY OTHER NATION. IS IT ANY WONDER THAT DOE IS CALLED DEPT. OF EVIL OR DEPT. OF ENTROPY AND HOW COULD WAR MAKING COMPANIES CALL THEMSELVES HONEYWELL AND OTHER SWEET SOUNDING NAMES? THESE SWEET SOUNDING NAMES ARE A COVER UP FOR SOME OF THE MOST HEINOUS CRIMES AGAINST HUMANITY EVER TO EXIST ON THE PLANET: HIROSHIMA BEING ONE AND PREMEDITATING THE PULVERIZING INTO DUST WHOLE NATIONS/CITIES/CONTINENTS IS ANOTHER . THAT IS WHY THESE NEXT 4 YEARS ARE THE MOST IMPORTANT YEARS OF THE LIFE ON THIS PLANET. IN EVERY WAY THE MASSIVE HEMORRHAGES OF SPECIES EXTINCTION, OZONE LAYER DESTRUCTION, GLOBAL WARMING, MASS FIRES AND EARTHQUAKES, GERMS/VIRUSES LIKE AIDS WHICH HALF OF AFRICA HAS ALREADY AND LOSS OF OUR GLOBAL AIR/MOISTURE MAKING AND TEMPERATURE REGULATING RAIN FORESTS ARE DECIMATED AND MOWED DOWN AND INTERNAL VIOLENCE, OUT OF CONTROL CONSUMERISM THAT IS USING 2/3 OF THE RESOURCES OF THE PLANET, DUMPING IN THE OCEAN THREATENING OUR WORLD'S FOOD SUPPLY, MEAT CONSUMPTION AND AGRICULTURAL PRACTICES THAT ARE CAUSING MASS EROSION AND PESTICIDE CONTAMINATION AND OTHER IMBALANCES THAT THREATEN LIFE ALSO. ALL THIS MUST STOP NOW!

THE FACT THAT NATIONS DON'T GET ALONG IS SOLVED BY TRYING TO GET ALONG WITH OTHER NATIONS, NOT BOMBS. DO YOU THINK I COULD BE FRIENDS WITH SOMEONE WHO IS PUTTING BOMBS IN MY FACE AND THREATENING TO BLOW

MY HEAD OFF AND ALL MY FAMILY IF WE DON'T WATCH OUT? HOW DOES THIS BEHAVIOR LOOK TO THE REST OF THE PLANET? In the next 4 years the Baha'i faith prophesies that the nations will SIMULTANEOUSLY lay down their arms in order that we not destroy the planet. THE POINT HERE IS THAT WHAT WE ARE DOING IS INDEED THREATENING THE TOTAL PLANET AND THE ONLY THING TO DO NOW IS TO AGREE NATIONWIDE TO NOT DESTROY THE PLANET! THIS IS CLEAR TO EVERYONE WHO THINKS ABOUT IT! This must happen! As we empower the U.N. by honoring it's agreements we become stronger, by our lead more nations join and become strong allies, the more nations that join the stronger the U.N. becomes and the stronger the U.N. becomes the more peace on planet earth is safeguarded against anarchy/anything goes, of out of control nations. Pretty soon we will not have many nations who are not benefited by this alliance and few that won't want to belong to this alliance with the rest of the world and any problem will be solved as a world. WHEN WE ARE AS CONCERNED ABOUT OUR BROTHER NATIONS AS WE ARE ABOUT OUR OWN NATION THEN WE WILL HAVE SOME ORDER. I CAN SEE LOTS OF SIGNS OF ALL THIS HAPPENING! ALL THE GOOD THINGS ARE HAPPENING. THE ONLY BAD I SEE IS WHAT AMERICA AND PEOPLE LIKE SADDAM HUSSAIN ARE DOING!

I don't buy that old excuse of DOE/LANL that they do what they are told by congress and the president. There are ample examples of men in Viet Nam, the Holocost, South Africa, Rhowanda, etc. of people who were tried in international war crimes courts and who are now imprisoned who said we were following orders. There are higher orders of truth on this planet than people's orders. If people don't see for themselves and hear for themselves do you think they can excuse their actions by saying someone else did it or I was following orders? Why don't the scientists just come out and admit that they are very proud of all these beautifully crafted bombs that are so hard to make and that they believe "might makes right" and they would push the button if the president said to and decimate nations because we have the right to show the world that no one can mess with us! We all have to follow our heart as to what is true. Deep in every scientist's heart don't you think they know they are doing something wrong? Of course they do! Their conscience bothers them daily but they probably shrug it off. Has the heart ever lied to us? I think not because the heart, a true heart where God sits on the throne and rules cannot go wrong. If every day we cleanse our heart and try to be true to our inner gifts and ultimate dreams I think all the nuclear scientists would feel compromised, used and misunderstood and misled. I am a servant to God's plan and I bend my will to God because I believe in His plan and I see myself a visitor to God's planet. I own none of this and I don't try to control what happens around me. I try to see everything as furthering God's plan and so I am one of the few who still have faith. As such I am a valuable asset to these times. I see the truth, I stand up for the truth, I identify myself with the truth and I refuse to be a bystander on the important issues and circumstances effecting my times. I refuse to be a by stander to crime, a coward who saves their wretched skin and has to answer to God for what they did or didn't do on ~~my~~ that stay on earth. Powerful social powers can be wrong, and not all brave men die for good causes. Lots of Hitler's army died to commit genocide on the human race. Absolute power corrupts absolutely and so the military complex has to be careful about acting on their own behalf inspite of the outraged cries of large populations, world treaties and the victim's wails. All evil deeds have doers because only humans can do evil.

Who asked the future generations, the youth, to whom the world belongs, (as us old foggies step out of their way or serve them as their generals), if this is the

future they want to care for? The youth I heard at the stockpile stewardship hearing said no, they didn't want that kind of a future for New Mexico and stop what we are doing now. All their friends are moving away. Why weren't they consulted? As we go lax and dump the nation's toxic bowels in an act of fear so crippling, mind clogging and soul numbing...we all seem to go into denial and go blank, the youth are young and fresh and still have visions that could help us out of these strangleholds. The new and upcoming scientists may be a new breed too and have been given by God the answers to our problems. We need to listen to the young and upcoming generations and let them lead us to a saner world. If the young scientists are as insane and heartless as the old scientists then they will need to be stopped too. Not just the scientists or the government rules the world. God is in charge here. All the youth need to be empowered by having a say in what will be their responsibility and what they feel about 240,000 years of watching over plutonium in New Mexico. Let the youth of New Mexico decide what they want for our state...quiet tourism and local culture/agriculture, artists, healing centers, autonomy, integrity, self sufficiency, educational facilities, parks and wildlife refugees or a military complex that spins it's deadly web throughout our state that slowly strangles out all the original life, leaves death, pollution and broken souls everywhere it touches and lose any say over our state because the whole thing is top secret, top priority and we are the nobody's who are the national sacrifice zone? Don't the young people deserve to say no to their future children getting cancer? Don't they have a right to a healthy life with no fear of being an enemy target? Don't we have the right to not be the waste dump for the nation's hot garbage? Is there any amount of money that makes up for high rates of cancer in small children just beginning their lives? Don't our youth have a right to jobs that don't tear their psyche apart by making them into military pawns, expendable, with no voice still, schizophrenic and unhappy? The old guard, the old foggies, the good old boys need to step down, lay our problems before the world, come clean and pay for our sins if we have sinned.

I say NO, we cannot let Doe, however arrogant, bloated heavily with our tax money, enough money to make bombs far into the world's future to their hearts content, fat with money, (the money rightfully that should go to heal the budget deficit....that much money!) and making more bombs, glutted with pork from pay off, dirty deals, slimy deals, fat, far too fat to move over or change. But order will prevail in the world and our lives depend on it. Our very spiritual lives, our soul's growth individually and collectively depend on the truth. LANL has not had to tell the truth for so long, has been able to justify lying as a policy of national security for so long, that they have forgotten how to tell the truth and are so double crossed and crosswired that LANL cannot grow in a healthy direction until they do tell the truth to themselves and to the world. THE TROUBLE WITH LANL AND OTHER DOE PROJECTS IS THAT THEY SPRUNG UP IN THE CLIMATE OF THE WORLD WARS AND THE COLD WAR AND WERE GIVEN CREDENCE. LANL IS TAKING ADVANTAGE OF THE TRUST WE PUT IN THEM TO RIPP OFF THE AMERICAN PUBLIC NOW WHEN WE DON'T NEED THESE BOMBS AT ALL...THERE IS NO POSSIBLE JUSTIFICATION. TO KEEP PERFECTING BOMBS, TO SAY WE NEED NEWER UPDATED BOMBS AFTER THEY SPENT ALL THAT MONEY, ENOUGH TO BREAK THE COUNTRY, AND MAKE MILLIONS OF MILLIONAIRES AND THOUSANDS OF BILLIONAIRES IS INCOMPETENCE, WASTING GOVERNMENT FUNDS AND NOW WHEN AMERICANS ARE DESPERATELY, FRANTICALLY WORKING 2-3 JOBS TO JUST GET BY, DEPRIVING THEIR CHILDREN OF LOVE AND ATTENTION, MOTHERS HAVING TO WORK TOO, ADDING TO THE PROBLEM OF VIOLENCE AND MORAL POVERTY, JUST TO MAKE BOMBS

WE DON'T NEED AND DON'T WANT, DON'T KNOW WHAT TO DO WITH THE ONES WE HAVE, MUST TAKE THE ONES WE HAVE APART AND MUST NEVER MAKE ANY MORE NOT TO THREATEN WORLD NONPROLIFERATION TREATIES, WASTING OUR COUNTRY WITH THE NUCLEAR WASTE AND CAUSING A DEEP AND ABIDING MISTRUST IN THE AMERICAN GOVERNMENT AND RAISING SERIOUS DOUBTS IF THIS COUNTRY IS A MILITARY GOVERNMENT, ON THE WAY TO BEING A DICTATORSHIP OR FASCIST REGIME....WASTING THE HARD WORKING AMERICAN'S TAX MONEY WILLFULLY WILLY NILLY, THROWING IT TO THE WINDS ON BOMBS THAT NEVER PUT A BLESSED THING BACK INTO THE ECONOMY FOR THE NON BOMB MAKERS, MAKING BOMBS THAT NO ONE CAN BENEFIT AND THAT HARM AND SCARE AND TERRIFY EVERYONE....MAKES ME SICK TO MY STOMACH!. Part of the truth may be that LANL scientists don't know what to do right now and that they need help. Even if they loose their jobs, like the whistle blowers before them, they can feel good about themselves again in some way. They need to say, "help! Help us! This whole thing is a mess! We are being pressured by the higher ups to take on more than we can handle here at LANL! How can one little lab take on 100 of the nation's hot and controversial projects on top of the serious clean up projects they haven't even started? The public is fit to be tied even over the first 2 we proposed, the scientists are flocking to psychiatrists chairs, we have all these angry whistle blowers who are telling it like it is, we can't keep secrets anymore, citizens groups are demanding to know the truth about what we are doing, skeptics are all over the place....." When I hear LANL come clean then I will know there is some heart at LANL and that it is o.k. to be a human being with feelings! I have seen the children of scientists who are angry and full of hate and who use force to solve problems. What people do in the work force comes home into the family life. If soldiers truly believe in what they are doing they won't go crazy in a war. If they don't truly believe in what they are doing they are in for serious trouble, psychologically, spiritually and morally. They will be insane. Rarely will insane people know they are insane and put themselves in mental institutes and rarely do criminals put themselves into jail. Rarely would a body reject a cancer, cut it out of itself, (healing from within comes only from deep and lasting changes in mental, spiritual and physical changes), someone has to stop the cancerous proliferation, put the criminals in jail and the over the edgers in the mental hospitals...it has come to that! Nuclear proliferation is in every way the equivalent of a cancer in the human body. The disease itself is racism and bombs instead of eliminating racism, perpetuate it. Bombs are the incarnation of hate. Bombs and weapons have only one purpose and only one purpose...to kill other human beings! The toxic waste dumps are the incarnate and toxic/deadly racism of fear of other people different than us and belonging to different nations we have no control over, but who need to be treated like equals. If any policing is to be done the responsibility needs to be shared by the federation of nations acting on joint/world collective decisions. There is nothing worse than this cancer for the body or soul of the earth. The body suffers but the soul is in greater agony because we are one race and one family on earth and as human beings we are the soul of this earth. If the soul is sick how can we expect the body to be well? All this focus on the physical is wasted energy. The spiritual work has to be done for the human world to be healed and the work is to love each other. This seems so simple as to be ridiculous. IF THE NATIONS ARE LIKE MEMBERS OF ONE FAMILY AND SHOULD TREAT EACH OTHER LIKE THIS AND THE PLANET IS SUFFERING FROM BEING A DYSFUNCTIONAL FAMILY, THEN OUR SOLUTION IS TO REALLY LISTEN TO OTHER NATIONS, THEIR PROBLEMS, HELP EACH OTHER, LEARN APPROPRIATE SKILLS FOR SOLVING PROBLEMS (NOT

KILLING EACH OTHER IN DOMESTIC VIOLENCE, TEMPER TANTRUMS AND SUICIDE) AND HELP EACH OTHER FEEL INCLUDED, HELP EQUALIZE AND SHARE THE RESOURCES SO AS NOT TO FIGHT OVER THEM, ETC. ETC. I AM ONE OF THE OLDER OF THE YOUNGER GENERATION AND THIS IS WHAT I HAVE TO SAY!

JUSTICE MUST PREVAIL! This intervention will happen because the consequences for the planet of this proliferation are too heinous for even the most numbed of us to bear. In one big collective yell the world will say NO and do anything in their power to stop the potential destruction of planet earth. If we have any soul in our bodies we have to defend the beautiful, sacred life on this earth. Every life on this planet is worth dying for! Justice must be upheld, in every aspect of our national lives, we must be accountable for our every action and it's consequences on the world population. Mass destruction bombs do not help the populations. The world being held as a hostage to bombs makes everyone nervous and makes a lot of the kids give up hope. Not having the world hostage to bombs of planetary destruction is not too big a concept for any of us to grasp. If LANL doesn't see their part in all this then they are really in denial that is so serious as to be incredulous. The world's populations know that they are held hostage and they don't like it! The world's people see all the way through this big lie osculating from, "we are providing national security by holding the world hostage, we are only doing what we are told, we don't want to loose our jobs, we need to make more perfect bombs, we are holding the world together because if we didn't threaten to bomb the whole world every minute some terrible dictator or terrorist MIGHT try to blow us up! All of these are lame excuses and they don't hold any water to thoughtful people! WEAPONS OF MASS DESTRUCTION DO NOT PROTECT US THEY THREATEN US WITH MASS DESTRUCTION!!!!!!!!WHEN CAN WE GET THAT THROUGH OUR THICK SKULLS????????

I live to tell people about Baha'ullah, the Prophet founder of the Baha'i faith, the Promised One of all ages, the culmination of all religions, civilizations, the Physician of the world, the Major Manifestation for this age and the bringer of the Universal Truth about our spiritual nature and true place in this Universe. I believe that these Prophets are the reason we exist. They exist to tell us that God is love and we are love exactly so we don't get into these kind of situations where we think bombs are keeping the world from destroying itself just as alcoholics feels that alcohol is the only thing that can feed their body. These addictions to bombs or alcohol are just that: addictions. In reality the addiction is killing the person/planet and needs to be stopped for the body to survive. We must love or die in spiritual evolution on this planet. I do not believe in the survival of the fittest because like the dinosaurs, if a being gets too big and unbalanced they topple over. LANL will be like the greedy dog dropping the real bone (green/helpful technologies) for the greedy image (more and more wars) that need more and more paranoid fears, that need more and more hideous weapons of mass destruction to appease people's fears in negative shame cycles that never seem to end. This is Heaven on Earth and not the devil's (lack of good/light or selflessness) playground! This peace of Heaven is all I know and all I have but because of it I have faith. I have faith that God is guiding us. No matter how helpless or hopeless the situation I have faith that God, (if we listen to him, and believe me He is speaking), will get us out of this. I reach deep into the heart of LANL every day and I pray with all my heart to end this nuclear nightmare/human drama/trauma! LANL has to say no to more nuclear projects! LANL should lead the world in being diplomats/Raisons in world conversations, plead access and funding to take the right path even if it means less money. Money isn't

everything and money is one of God's greatest tests for us. Did we sell our soul and the human race to the devil/war? LANL has to have a conscience! LANL needs to not fire the people of conscience/whistle blowers, but use them as spokes people for needed change in war entrenched, muck covered, prehistoric idea laden institutions and make them leaders into new times. WHISTLE BLOWERS ARE THE ONLY ONES WITH CONSCIENCE. THEY ARE THE ONES WHO PASSED GOD'S TEST. THEY RISKED PERSONAL COMFORT TO DO WHAT THEY FELT WAS RIGHT! LANL should say no to burdens that will in the end ironically end up destroying them physically in the waste or explosions that kill the rest of us or through evolution/spiritual evolution as mankind passes this treacherous stage and grows into maturity out of a very fool hardy and turbulent adolescence. IT IS A BAHA'I PROPHESY THAT THE WORLD WILL LAY DOWN THE WEAPONS CAPABLE OF DESTROYING THE WORLD BEFORE THE YEAR 2000. WHEN THEY DO LANL WILL BE OUT OF A JOB AND MANY OF THE GREEN FUNDS WOULD PROBABLY HAVE GONE ELSEWHERE. AS I SEE IT LANL AND DOE HAVE 3 YEARS TO CHANGE THEIR ACT OR EVERYONE INVOLVED WILL BE OUT OF A JOB. PEACE IS NOT THE ENEMY..PEACE IS HUMANITIES GOAL! WHEN PEACE IS HERE WAR MONGERS AND WEAPONS PRODUCTION ZEALOTS WILL BE OUT OF A JOB. SO PREPARE FOR PEACE! LANL is up to their ears in nasty nuclear projects so hot and hated and controversial, so loathed they put people into a rage even to think of them!

If LANL is sincere in doing the right thing for the world,(so as not to Rob Peter to pay Paul), they cannot sacrifice huge zones of U.S. states for military machinery/waste and production that causes most of the people around them to die slow but inevitable deaths from cancer to save the world by making more and more glitsy and "efficient" bombs that can destroy the world three times or nations once or whatever... GOD IS ONE. WE ARE ALL INTERCONNECTED. IF YOU BOMB ONE PART OF THE WORLD YOU HAVE BOMBED YOUR OWN FOOT

OR HAND. WE SHOULD WORK AS ONE SOUL IN MANY BODIES. WHAT IS HEALING FOR ONE PART OF THE EARTH IS HEALING FOR US ALL. WHAT IS HEALING FOR THE MAJOR ORGANS IS HEALING FOR THE WHOLE BODY OF MANKIND. WHAT IS GOOD FOR ONE PART OF CREATION IS GOOD FOR ANOTHER PART OF CREATION. IF SOMETHING IS BAD FOR ONE PERSON OR BEING IT IS BAD FOR ALL CREATION. ONLY IN VERY ADVANCED CASES WOULD A GOOD PHYSICIAN AMPUTATE AN ARM OR LEG/WAR. IN CASES THAT DIRE, ANY PHYSICIAN WOULD AGREE, THE WHOLE BODY IS IN EXTREME DANGER AND THAT DEATH FOR THAT PERSON IS VERY CLOSE. IF THE WHOLE OF CREATION DOES NOT GET BALANCED AND PEOPLE HAVE THE PHILOSOPHY, NEVER KILL A LIVING THING UNLESS YOUR LIFE DEPENDS ON IT AND NEVER KILL A HUMAN BEING UNLESS THEY ATTACK YOUR HOME OR NATIONAL BORDERS. HAVE STRONG LEAGUES OF ALLIED/GOOD NATIONS AND THIS ANARCHY WILL EVAPORATE. IF AN INDIVIDUAL MURDERS ANOTHER IT IS AN ACT OF MURDER AND YET WAR, EVEN UNDECLARED WAR IS GLORIFIED, PRAISED.

IN HUMAN TERMS ADAM AND EVE TAUGHT US THE LESSONS OF COUPLES; TO MAKE THE RIGHT CHOICES CONSCIOUSLY, BUDDHA-KRISHNA TAUGHT US OF INDIVIDUAL/INNER LIFE; MEDITATION, YOGA, ABRAHAM TAUGHT US OF FAMILY; LOYALTY TO GOD FIRST, MOSES TAUGHT US THE LESSON OF TRIBE; TEN COMMANDMENTS FOR SOCIAL BEHAVIOR, JESUS TAUGHT US TO LOVE OUR NEIGHBOR OR OTHER TRIBES, MOHAMMED TAUGHT US TO BUILD NATIONS AND COMPLETED THE NATION BUILDING CYCLE. MOHAMMED WAS THE LAST OF THIS CYCLE, NOT THE LAST, AS MISTAKEN MUSLIMS STATE. MOHAMMED WAS THE RETURN OF CHRIST CHRISTIANS WERE WAITING FOR BUT ONLY 75 CHRISTIANS TURNED INTO MUSLIMS. THE BAB AND BAHA'U'LLAH WERE DOUBLE/TWIN PROPHETS AND THEIR JOB WAS TO START THE NEW CYCLE THAT WILL LAST FOR MANY THOUSANDS OF YEARS, THEIR ROLE IS TO UNITE THE NATIONS. IN ANOTHER 1,000 YEARS ANOTHER PROPHET WILL APPEAR TO PERHAPS UNITE EARTH WITH OTHER PLANETS OR WHATEVER IS THE NEXT STEP!

EACH CELL IN THE BODY MUST BE NOURISHED, EACH LINK IN ECO CYCLES, EACH HUMAN AND EACH HUMAN ORGANIZATION (INDIVIDUAL, COUPLE, FAMILY, TRIBE, STATE OR CULTURAL GROUPING, EACH NATION.) EACH GROUPING HAS TO BE NOURISHED AND IT'S NEEDS ATTENDED TO MAKE A HUMAN BEING. YOU CANNOT, IN THIS AGE, REMAIN IN THE DARK AGES AND NOT ATTEND TO THE FACT THAT NATIONS EXIST AND NEED OUR FULL PARTICIPATION AND ATTENTION IN WORKING WITH OTHER NATIONS. EACH HUMAN GROUPING HAS TO BELONG TO THE WHOLE! YOU CANNOT LEAVE HUMANS ISOLATED, SEPARATE, APART, ABUSED, TORTURED, ISOLATED, NEGLECTED, OPPRESSED, INJUSTICE DELT TO THEM...THOSE PEOPLE BECOME OUTCASTS, ANTI-SOCIAL, DISSOCIATED. ~~OUTCASTS~~, FORM COUNTER-CULTURES SOME OF THEM EXTREMELY IMMORAL AND VIOLENT, BACKWARDS, OUT OF TOUCH (LIKE LANL IN A WAY IS OUT OF TOUCH AND SO BECOMES VIOLENT/IGNORANT OF SOCIAL NORMS AND TRENDS) AND BECOME A MENACE TO ALL CITIZENS OF FAIR MIND. THESE ANTI-SOCIAL, UNLAWFUL PEOPLE SET UP THEIR OWN RULES AND PLAY THEIR OWN GAMES AND SERVE THEIR OWN NEEDS (SOUNDS LIKE DOE TO ME) AND ARE THE TRUE DANGER TO THE WORLD. INDIVIDUALS WHO HATE, WHO DEMEAN OTHERS, PREJUDICE THAT DEGRADES OTHERS AND IRRESPONSIBLE PEOPLE WHO PROJECT THEIR TORTURED CONDITION ONTO OTHERS....THESE ARE THE ENEMIES OF CIVILIZATION. THIS TYPE OF HATER TYPE IS FOUND IN ALL ISOLATED PEOPLE OF EVERY ECONOMIC STRATA AND IN GOVERNMENTS WHO STRAY FROM HUMAN DECENCY IN EVEN THE SLIGHTEST WAY. IF YOU CAN SACRIFICE A CITY FULL OF JAPANESE CHILDREN, TOTALLY INNOCENT AND NEW TO THE WORLD, PRETTY SOON IT IS O.K. TO MAKE BOMBS TO BOMB OTHERS, PRETTY SOON IT IS O.K. TO SACRIFICE THE CHILDREN OF NEW MEXICO OR IDAHO OR COLORADO FOR MILITARY ENDS, PRETTY SOON WE ALL HAVE THE CREEPS!

If LANL doesn't care one wit about me and my family how can they expect me to support them and their projects, their dirty, filthy, contaminated, emission laden, outlawed and outmoded industries?

LANL IS A LOST CAUSE, A FAILING ORGANIZATION, A CORRUPT AND CORRUPTING INFLUENCE TO NEW MEXICO, A LIABILITY, A HOPELESS CASE. LANL is weak spirited, subject to arbitrary hierarchies, functions with unity only on the basest premises: we must make bombs, we must have jobs, function on control and manipulate tactics that are as faulty and questionable as their political stances in the world arenas the manufacture and promote expensive dodo's that serve no earthly purpose! I say NO to LANL stockpile stewardship. You can not be a steward of non living/lethal, evil intended bombs like Jeff Dauber stewarded his victim's bones in the wall! You steward the earth, the animals, the children of all races, the water so it is clean, the plants that grow in the mountains! What a choice of names! Dragons, children of alcoholics, obsessive and crazy people hoard bombs and only a very far gone organization would go crazy with glee at the prospect of hoarding, not stewarding, all those dangerous bombs! I feel the glee of madmen and I feel always that underneath the objectionable project they propose evil bomb pushers are really closing in for the kill so they can do something even more sinister and dangerous than they are even saying! I feel DOE would stop at nothing and would make New Mexico a den for the highest level waste, the most horrendous weapon production and the most evil and secret of plans to disrupt peace so they can keep making bombs! LANL is not making model t's to polish and fawn over! LANL couldn't be sentimentally making a scrap book of catastrophes they hope to gloat over and covet like a psychopath goes back and covets a bone or a token from their kill. They have Hiroshima in their scrap book and all the contaminated dumpsites...could LANL want all the cast off projects no one else wants? It would be karmic ally correct if LANL gathered all the children

of the children back into their fold...the bombs of all their bombs of the mentality they created. They could want to be a museum of horrors/atomic relics and show what they could do to people. These bombs, once dismantled, can only exist in museums and in madmen's grandiose schemes in loony bins. AS THE WORLD OF PEACE AND ORDER RISE THE WORLD OF CHAOS, WAR AND INJUSTICE DISINTEGRATE. SINCE THE LANL REJECTED THE CHILDREN'S PEACE STATUE I GET THE FEELING THAT LANL IS THE ENEMY OF PEACE. LANL FEEL THAT A PEACE STATUE IN THEIR CITY IS THREATENING THEIR BOMB MAKING GOALS! THAT CHILDREN'S LONGING FOR PEACE IS THE ENEMY TO BOMB PRODUCTION AND EVEN THE IDEA IS ABHORRENT/ALIEN TO THEM! WHEN PEACE IS YOUR ENEMY DOESN'T THAT SAY SOMETHING ABOUT YOUR STATE OF MIND? DOE MUST FORM A SANE PHILOSOPHICAL BASE IF IT WISHES TO HAVE ANY CREDIBILITY IN THE HUMAN WORLD!
WHAT DISTINGUISHES LANL FROM A DAVID KORRESH, MINUTE MEN, KKK, SADDAM HUSSSAIN, CORRUPT POLICE, PILFERING POLITICIANS OR LYNCHERS? States can become corrupt and want to detach from the united nations...but the nation building time is over. Nations can get corrupt governments, dictators who create wars, invade other nations, try to kill opposing voices, disobey world treaties, back other tyrants, steal the people's money by pilfering and squandering taxes, focus on nation fanaticism and discourage working with other nations, scoffing at inter affairs and concerns, starving and neglecting their own people, blaming real people for taking government funds from bomb making for legitimate human problems like health care, not becoming fully involved in international regulation and human rights laws and not help enforce them making the commitment lip service and not a heartfelt or acted upon commitment, making the U.N. weak, not supporting peace keeping and humanitarian groups, mocking and belittling gentle, sensitive, peaceful people for avoiding wars (like the

war mongers mocked Carter for stopping a war in Haiti instead of praising him, neglect the environment, back corporations- right to not put anti-pollution devices or comply with environmental clean air and water acts, bully, bribe, co-erce others to do what they want, squandering resources for future generations (maybe all this uranium could've gotten us off planet earth to a new planet as the sun runs out), squandering human health for CO-orporate benefit, acting spoiled, obnoxious and irresponsible in every way unaccountable, etc., etc., etc.,

LANL, in every way fits in with the corrupted who make money off of human misery (like people who sell arms to both sides and enemy countries, co-orporations who sell outlawed chemicals and pesticides like DDT to foreign countries who have no laws banning it, clothes companies who sold pajama's with cancer causing chemical outlawed in the U.S., drug lords, gangsters, Mophia) secrets to Russia, mischief makers who focus on the worst of human nature to justify extreme acts of cruelty and depravity. The Germans justified their cruelty and depravity by blaming the Jews for being good at business affairs and hard working and prosperous...as if being smart and industrious justified Jews being put into the gas chambers by the millions! LANL AND DOE HAVE TO BE CAREFUL ABOUT HOW THEY JUSTIFY WHAT THEY ARE DOING BECAUSE WE ARE LISTENING! There is viscous murderous evil in planning to murder people and LANL has to see how evil they have become in order to stop what they are doing. LANL justifies it's horrible job by stating how horrible the world is!

The world is hard and to stay alive is hard in and of itself, that is part of the struggle. No one gets out of life alive anyway. The point is our souls are eternal and we are not here to protect our bodies by doing anything or just about anything to survival (survival of the fittest.) If we do what is right by disregarding our

own discomfort, growing pains, public opinion, monetary reward or even torture and death then we are on the road to understanding the true purpose of this life is to let our souls be purified by the tests of life, not to avoid them at all costs or at the price of our very soul. Bad people can't say they are creating struggle and are growing because they have antrophied, stagnated and fight for materialistic gains and not human life. Bad people choose materialism instead of spiritual growth and rot in jails, hell and in their own rotten existence they can get no satisfaction because spiritual qualities like forgiveness, generosity, mercy, compassion and kindness are foreign. Building bombs won't get you a red carpet to God, the nation's heart, the mother's blessing. WAR IS DEATH PEACE IS LIFE. LANL IS DEATH PEACE TREATIES ARE LIFE.

What you do to the least of us you do to the rest of us. I can't understand how the scientists are lured to Los Alamos by the porked up Public School's good educational opportunities, and yet their children suffer the highest rates of skin cancer,(radioactive calcium goes into the bone and multiplies the bone), childhood cancer, leukemia/cancer of the bone and thyroid cancer (radioactive iodine goes right to the thyroid.), and other scary maladies. Don't these statistics scare you scientists and warn you that these types of cancer are high where radioactive contamination is taking place! How can scientists be in such a trance/state of denial not to see what living near plutonium does to their families? To some extent all of us around nuclear facilities are in denial about the statistics. Even if you cockily say we are contaminated already if your child got cancer you would be bitter as all get out. A lot of people I know right now are fighting cancers of all kinds. I know many, many people who have died of cancer already!

DURING THE FIRES THE WIND QUICKLY BLEW THE SMOKE AT 35MPH TO US AND WE HAD TO BREATH! I WAS UPSET THAT

LANL HAD NO EVACUATION OR WARNING PLAN IN CASE LANL CAUGHT FIRE! I FELT THEY WOULDN'T TELL US THE DANGERS AND THEY DIDN'T. DO THE HOSPITALS HAVE RADIATION ANTIDOTE (FOR WHAT LITTLE GOOD IT'S WORTH!) I WAS IN TERROR. THOSE OF US WHO ARE EDUCATED ABOUT THE TOXIC WASTE ACCUMULATIONS, THE NUCLEAR POWER PLANT THERE WERE SCARED TO DEATH. WE COULD'VE BEEN DYING LIKE FLIES N A MELT DOWN, PLUTONIUM LADEN SMOKE AND EXPLOSIONS. EVERYONE WAS PACIFIED THAT IT WAS SAFE AND THE ONLY BOXES OF BOMB MAKINGS WERE IN BOXES AND CARTED AWAY. I KNOW THERE ARE 2,000 TOXIC DUMP SITES AND YOU CAN'T CART THEM AWAY IN HUNDREDS OF TRUCKS! IF LANL WAS A WEAPONS COMPLEX THIS FIRE COULD'VE BEEN THE END FOR US IF IT HAD CAUGHT. FIRES ARE A COMMON OCCURRENCE IN LANL. THE TREACHEROUS MOUNTAIN ROADS AND THE FIRE HAZARDS MAKE LOS ALAMOS A TERRIBLE PLACE TO MAKE BOMBS. EVERYWHERE IS A TERRIBLE PLACE TO MAKE BOMBS FOR THE PEOPLE WHO LIVE THERE!

I know there are a few good projects going on in LANL but I haven't heard of a great deal of thought being given to alternative purposes for LANL. We poured out our heart after LANL asked for our input about LANL and I have heard of not a single idea we suggested as being contemplated. The evil and horror of bomb production make doing any good project impossible. The choice is still ours. LANL never apologizes to us for the contamination, suffering and psychic pain we endure and even envision an end to all this madness. <u>A scientist there said he could throw up on the statistics for stockpile stewardship they were so haphazard and random and the emission standards were so low they let way more toxic emissions out into the community than many facilities in the world allowed even! What kind of protection is this for us? I DEMAND A POLICY OF NO EMISSIONS FOR PLUTONIUM AND SINCE THAT CAN'T BE ACCOMPLISHED I SUGGEST YOU ABANDON THESE NUCLEAR PROJECTS ALTOGETHER!</u> More

than that, I demand no emission whatsoever as the standard for my family safety, compliance with all EPA standards and all RICRA standards.

We are all family here. All of New Mexico would like to see sanity and balance returned to LANL. The mental contortions needed to make bombs must be straightened out, loosened up and set straight. Set the poor twisted scientists to pasture. They must be exhausted from all the tension of the cold war and they need a rest...a long rest! They remind me of old mill horses who went around and around to grind the wheat. When they were retired they would go around and around a tree and make well worn paths deeper and deeper. That is what the horses did all their lives and they couldn't stop even if they were free to roam and buck and explore. The LANL scientists have helped to make bombs and make bombs and they want to continue to make bombs just as they always have even if they can now explore other ideas. Let these tortured souls free to lay on psychiatrists couches to try to straighten out their split from sanity and humanity. Let their trigger happy, caulked and ready, fight and flight reflex muscles relax in the many massage tables and bath their toxic cancers in the many health institutions available (if they aren't radioactive to touch) and give them lots of pain killers as they live out their operations and treatments for tumors. Let them write out their memoirs as the confusion mists and blurs and the try to make sense of their times and lives. As peace is established let them try to come to terms with their "role." They will complain to people, lament and wail, " They took apart all the bombs we worked so hard to make! We spent our whole lives to create them and it isn't fair!" "There, there", we'll say, "times change!"
As they wake up with nightmares in a cold sweat, " The Russians are coming! They are going to get us! Must make more bombs! Must make more and better

SSM-M-107
COMMENT LETTER
PAGE 49 OF 49

bombs!" we'll say, "don't worry love, the cold war is over. The USSR isn't a country anymore. The Russians took apart their bombs. Go back to bed dear."

I feel sorry for all these tortured minds who blew their main, most vital fuses trying to find a way, trying, trying to make bombs the way to solve the world's main problems of lack of order, stability or world peace. Trying to make bombs feed the hungry, put down tyrants, educate children, win wars and make make the U.S. the permanent world leader and top dog. To make bombs justify their existence is a very hard job for the psyche.

Let's unclench their fists from their bombs, lead them away from the bombs as they babble. "We understand," we'll say. It's been very stressful. Bomb making is a very stressful occupation. There! there! Lets forget the whole thing now! The leaders of the nations are uniting and the peace talks are well under way, peace treaties have been singed by everyone. Your work is done. No human being should live with the pressure you do. Many scientists would've committed suicide long ago, but you didn't, it's amazing, we'll have to think about this sometime! You're a survivor of the cold war, dear, but the cold war is over!"

I for one am glad the cold war is over. I am one of many who say no to upgrading the bombs we already have for the myriad reasons I can think of right now and the myriad of reasons myriads of brilliant and competent citizens think of to stop nuclear proliferation, under whatever disguise it takes,,,,modernizing the bomb industry or whatever...it is all unacceptable to me. Just stop making bombs! If LANL does not make some effort to use the billions of dollars they need for clean up... to clean up the toxic dumpgrounds in this country, I am going to be really disappointed once again at this total sloppy DOE way of doing things that endangers us all!

Attention; SSM PEIS
(202) 586-5484

Dear Mr. Rose:

Following this cover letter are my comments on the "Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management-February 1996" DOE/EIS-0236 (SS&M DPEIS).

1/40.87

Although I was quite impressed with the quantity of information that was contained in this PEIS I found the layout and the content of the various alternatives to be quite troublesome.

The alternatives seem to comply with neither, the desires of the majority of the public, who commented on the Implementation Plan, or with the spirit and intent of NEPA.

I can not see how the present PEIS can be fixed without a major rewriting an resubmission of the document for public comments.

I was only able to comment on about 5% of the document that I had marked up. I hope you take my comments seriously.

Sincerely,

Vernon J. Brechin

Comments on the 'Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management' - February 1996 (DOE/EIS-0236).

General comments:

The 'Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management' - February 1996 (DOE/EIS-0236), (SS&M DPEIS) performs a poor job of evaluating a multibillion dollar program which the DOE is claiming will maintain U.S. deterrence based upon a large nuclear weapons arsenal. As envisioned, by the DOE, this program would consume about as much public funds for the maintenance of nuclear weapons and for the readiness to test as was expended on the testing and maintenance program during the Cold War period.

2/40.13

The SS&M DPEIS fails to mention that, before the fall of the Berlin Wall when our nuclear arsenal was much larger and weapons development and production were the primary focus of DOE's Defense Program office, the annual expenditures, for nuclear weapons maintenance as well as for safety and reliability testing, were a small fraction of the latest program cost. Presently, the field maintenance of nuclear weapons usually involves the infrequent visit by a Special Weapons test technician who plugs a test box into the nuclear weapon to check whether it still meets the test specifications. If it does not, which is very rare, then the nuclear device is removed from service. The cost of this field test procedure is thousands of times less than the cost of the new SS&M program.

3/40.15

The SS&M DPEIS mentions that maintaining a state of readiness to resume underground testing is part of the new program. No mention is made about the history of a previous test readiness program. The Final PEIS should provide details of the embarrassing history of the Safeguard C atmospheric nuclear testing readiness capability program. This program involved the operation of facilities on Johnston Atoll to permit the swift resumption of atmospheric nuclear testing. The operation lasted for 29 years, from 1964 until 1993, when Congress was made aware of its continued existence. Despite the fact that during the last 25 years of the program's existence there was virtually a zero likelihood that atmospheric testing would resume, the Safeguard C program managed to consume about 1.6 billion tax dollars. The SS&M program could consume that amount in a year. How many tens of billions of tax dollars will be spent by the time Congress discovers that we were prepared to resume underground testing when that likelihood was essentially zero?

This SS&M DPEIS needs to do a much better job of comparing the past activities with the new activities in order to justify the need for a whole new set of, extremely expensive, nuclear weapons simulation and test machines. The lessons learned from the 1,054 nuclear tests conducted by the U.S. will not be forgotten. Hundreds of billions of dollars of damage has been acknowledged by the DOE and much of this will be passed on to future taxpayers. Lets not add to that squandering of our nation's precious resources by spending tens of billions on machines of questionable value.

"Summary" document
SUMMARY
S.2 Purpose OF AND NEED FOR THE STOCKPILE STEWARDSHIP AND MANAGEMENT ACTION
S.2.3 Purpose and Need
Stockpile Stewardship--The Laboratories and Nevada Test Site
p. S-16, 1st column, 3rd paragraph, 9th line from bottom
"Assessment and certification of nuclear performance is a nonstatistical, technical judgement by the weapons laboratories based on scientific theory, experimental data, and computational modeling. The scientific practice of 'peer review' has been fundamental to these judgements. Experts from the two nuclear design laboratories review each other's data and conclusions on important issues, thereby providing an independent check and balance."

4/40.08

001. Internal checks and balances can not substitute for external checks and balances. The high levels of secrecy associated with nuclear weapons related work tends to severely limit the "peer review" network to a small group of people at the weapons labs who depend on weapons work for their livelihood. Many scientist avoid going to work for the nuclear weapons labs precisely because they believe the lab's "peer review" processes are not in the best spirit of the scientific process. Associated with restrictive secrecy classification processes are the "need-to-know" requirements which are usually controlled by highly bureaucratic institutions. These need to know requirements further narrows the scope of the lab's peer review process by limiting the knowledge diversity of the reviewers. Such a process is not considered to be good science by many researchers who work outside our weapons labs.
It has also become common knowledge that our secrecy laws are sometimes used to hide scientific results that could prove embarrassing to the labs. In secret labs, troublesome projects can be quietly phased out without revealing the true nature of the problems. Politicians and bureaucrats can, and often do cut scientific studies short, thus preventing the publication of final reports on projects that may have been funded for many years. Many scientists have come to realize this kind of process has a lot more to do with politics than with real science.

Stockpile Management--The Industrial Base
Weapon Assembly/Disassembly (A/D)
p. S-17, left column, middle paragraph
"The Pantex Plant (Pantex) is the only DOE site currently authorized to assemble or dissemble stockpile weapons." "However, NTS(Nevada Test Site) has few of the support facilities required for volume assembly or dissembly of stockpile weapons. A major programmatic consideration is the cost of re-creating facilities that already exist at Pantex. Due to ongoing weapon dismantement requirements, the alternative to transfer this function to NTS

would be slow but achievable within a 10-year period."

5/30.02

002. Whenever mention is made, throughout the SS&M DPEIS, of the "Weapon Assembly/Disassembly" function, the names of the specific facilities seems to be avoided, especially in the case of the new and very costly "Device Assembly Facility" (DAP) at the NTS. The NTS contains the older Able and Baker A/D facilities in a remote section of Area 27 of the NTS. The, just completed, $100 million DAP complex was originally funded for the purpose of replacing and expanding the functions of the old Able and Baker sites. The construction of the DAP complex started about a decade ago when there were expectations of an expanded underground nuclear test program at the NTS. The facility was designed, funded and constructed primarily for the purpose of assemblying a maximum of a few dozen nuclear explosive test devices, for use at the NTS's underground test areas. Construction of the facility was completed about three years after the U.S.underground nuclear test moratorium went into effect. The final construction was halted and then restarted with the belief that this facility could eventually be used to supplement some of the nuclear weapons disassembly functions of the Pantex Plant in Texas. Since the DAP facility was not originally intended for this purpose, significant and very costly expansions to the facility will be needed to significantly increase the nuclear weapons disassembly work that the Pantex Plant is presently performing.
Although the quote above states that "A major programmatic consideration is the cost of re-creating facilities....," this SS&M PEIS fails to provide such cost analysis for this or for the dozens of other projects that are proposed or are already under construction. This SS&M PEIS mentioned that more detailed consideration of the DAP would be provided in the "Environmental Impact Statement for the Nevada Test Site and Off-site Locations in the State of Nevada" (DOE/EIS 0243) (NTS EIS). A through review of the draft version of this document indicates that there is little consideration given to the expansion of the DAP complex and no analysis of the cost of such an expansion.

2/40.13
continued

The Final SS&M PEIS should frequently refer to the official names of the various facilities so the analyst, at the executive Office of Management and Budget (OMB) and the Congressional Budget Office, can properly compare the facilities mentioned in this document with the facilities that are listed as "line items" in the proposed U.S. Budget.

S.3 ALTERNATIVES
S.3.1 Development of Stockpile Stewardship and Management Program Alternatives
Stockpile Management Assumptions
p. S-22, left column, first bullet
"The No Action alternative includes all existing site facilities plus all facilities for which Congressional budget 'line item' construction was started by the end of fiscal year 1995 (September 30, 1995)."
003. The No Action should not be based upon the ground breaking of new construction projects that were started by September 30, 1995. Many of these projects will require many more

Congressional appropriations and many more years of construction before they will be completed. The DOE's Defense Program funding level, on September 30, 1995, was not substantially less then the levels that existed before the end of the Cold War. The No Action alternative and the Downsize Existing Capability alternatives are not crafted in ways that will produce the so called "Peace Dividend" for the American tax payers.

5/30.02 continued

004. The Downsize alternative, is presented in this SS&M DPEIS, as part of a plan of "relocating" the functions of one facility to another facility. As this plan is presented, it could in some cases actually increase the cost of performing a function. For example, transferring the A/D functions of the Pantex Plant to the DAF complex at the NTS would require major expenditures for expanding the existing DAF complex. Even then, the transfer might take nearly a decade to complete. If the U.S. nuclear arsenal was limited to less than 100 nuclear weapons then upgrade, to the DAF complex would be unnecessary and the Pantex A. functions could be closed down.

1/40.87 continued

The Downsize alternative, as presented in this DPEIS, fails to address the concerns, expressed by a great many of the commentators, during the scoping and implementation phase of the present SS&M DPEIS. As a result, it does not comply with the spirit and intent of the National Environmental Policy Act (NEPA). Before a Final PEIS is issued, the draft study needs to be completely reworked so that it reflects the desires of the public rather than the wishes of the Defense Program division of the DOE. After this rework, the DOE should again submit the revised document for public comment.

S.3.4 No Action Alternative
p. S-24, left column, last paragraph
"From a programmatic perspective, the No Action alternative would not ensure DOE's ability to maintain core U.S. competencies in nuclear weapons while also maintaining a safe and reliable smaller, aging U.S. stockpile. Because this is not acceptable, the No Action alternative is not considered to be reasonable. However, in accordance with the CEQ regulations, the No Action alternative is presented and assessed in this PEIS."

6/41.18

005. The leading sentence expresses a very one-sided view point of Defense Program division of the DOE. The second sentence states that this is not acceptable and therefore it renders the No Action alternative to be unreasonable. Just because DOE's Defense Program office views this as "not acceptable," does not necessarily mean that it is unacceptable to the folks who pay their salaries. The last sentence indicates that the No Action alternative was only provided in this SS&M DPEIS in order to satisfy the President's Council on Environmental Quality (CEQ) regulations.
The last two quoted sentences demonstrate, more than any other passage in this nine pound set of documents, the extreme levels of self serving arrogance still present in some sectors of the DOE. Such expressions of human

6/41.18 continued

arrogance are not appropriate in a document that is supposed to put the environment and public's needs first. Government officials, who exercise some control over a massive nuclear arsenal that is capable of extinguishing human life on this planet, need to be held to a higher level of accountability than that which is evidenced in this set of SS&M PEIS documents.

Volume I
Chapter 4: AFFECTED ENVIRONMENT AND ENVIRONMENTAL IMPACTS
4.9 NEVADA TEST SITE
4.9.2 Affected Environment
4.9.2.1 Land Resources
p. 4-444, Figure 4.9-2.--Principal Facilities and Testing Areas 2535-NTS/SSM at Nevada Test Site.

7/01.02

006. This figure contains a map of the Nevada Test Site in which a specific area of the test site, once labled as "Area 51," has been deliberately removed from the map drawing. The test site boundary line, at the northeast corner of Area 15, is shown incorrectly as enclosing Area 15 rather than as extending around Area 51 before returning to Area 15.
In this SS&M DPEIS, all 17 of the figures, which contain maps of the Nevada Test Site, exhibit the same deletion. This is not totally surprising to me since the folks at the DOE's Nevada Operations Office (DOE/NV), which is located in Las Vegas and manages the NTS, has been allowed to supply these deceptive NTS maps for the last 38 years. These deliberately deceptive maps have been widely distributed to the general public, to the public's elected representitives, to State government officials, and to federal executive agencies which are supposed to exercise oversight functions. The deceptive maps have wound up at the Presidential Office of Management and Budget (OBB) and at the Inspector Generals Office. These deceptive maps can be found in libraries all across this country, whether they be public or highly specilized government document repositories. Presently the DOE is distributing dozens of tons of NEPA documentation that contain these defective maps. Rather than enhansing our democracy, such actions damage our democracy by eroding the public trust. It is about time that this lie be ended.

The figures that are in error are as follows:

Volume I
p. 3-30 Figure 3.4.1.3.--Weapons Assembly/Disassembly Site Map 2839/SSM for Nevada Test Site.
p. 4-443 Figure 4.9-1.--Nevada Test Site, Nevada, and Region. 2885/SSM
p. 4-444 Figure 4.9-2.--Principal Facilities and Testing Areas 2535-NTS/SSM at Nevada Test Site.
p. 4-445 Figure 4.9.2.1-1.--Generalized Land Use at Nevada Test 2651/SSM Site.
p. 4-446 Figure 4.9.2.1-2.--Primary Facilities, Assessembly/ 2652/SSM Disassembly Area, and Testing Areas at Nevada Test Site.

7/01.02 continued

p. 4-453 Figure 4.9.2.4-1.--Groundwater Hydrologic Units at 2643/SSM Nevada Test Site and Vicinity.
p. 4-456 Figure 4.9.2.5-1.--Major Fault Systems and Historic 2537/SSM Earthquakes in Nevada Test Site Region.
p. 4-458 Figure 4.9.2.6-1.--Distribution of Plant Communities at 2538/SSM Nevada Test Site.
p. 4-460 Figure 4.9.2.6-2.--Distribution of Desert Tortoise at 2886/SSM Nevada Test Site.
p. 4-526 Figure 4.12-2.--Locations of Underground Testing Areas 2879/SSM and Tests on the Nevada Test Site.

Compare this last map with the one found on p. 4-107 of the NTS DEIS (DOE/EIS 0243). You might want to alter the title.

Volume II
p. A-41 Figure A.1.8-1.--Nevada Test Site, Nevada, and Region. 2885/SSM/App
p. A-42 Figure A.1.8-2.--Principal Facilities and Testing Areas 2535-NTS/SSM/App at Nevada Test Site.
p. A-71 Figure A.3.1.2-1--Location of Facilities at Nevada Test 3058/SSM Site.
p D-52 Figure D.2.4-8.--Minority Population Distribution for 3119/SSM Nevada Test Site Surrounding Area.
p D-64 Figure D.2.4-16.--Low-Income Population Distribution by 3120/SSM Poverty Status for Nevada Test Site and Surrounding Area.
p. I-118 Figure I.4.3.1.1-1.--Generalized Land Use at Nevada 3157/SSM Test Site and Vicinity.
p. I-123 Figure I.4.3.1.4-1.--Distribution of the Desert Tortoise 3159/SSM at the Nevada Test Site.

A single map, that contains Area 51, can be found in the NTS DEIS (DOE/EIS 0243) on page 4-10. All the other dozens of maps, contained in this 8+ volume document, are intended to be deceptive.

==

8/40.41

007. The SS&M DPEIS "COVER SHEET" briefly mentions in the next to the last paragraph that, "A classified appendix has also been prepared to support the purpose of and need for the plutonium-242 to be stabilized at SRS for use in future weapons complex research and development activities." At the very least, this classified appendix should be listed in the "Table of Contents" of the Final SS&M PEIS. In addition, at the location where this appendix would appear, in the publicly released SS&M FPEIS, there should be an appendix that provides a full accounting of the reasons for the classification of this information . This accounting should include the level of classification and any special handling requirements. If this document is assigned an automatic declassification date, this too should be noted. All the rules and regulations under which the document was classified should be provided and an explanation of how the release of this information could jeopardize national security should also be provided. Finally the name and title of the person or persons who were responsible for

8/40.41 continued

classifying the document should be provided along with their phone number and other contact information such as Fax numbers and possible e-mail address.
Better yet, reform the secrecy laws in such a way that government officials will be just as likely to be prosecuted for withholding vital environmental information from the public, as they are now libel for revealing similar information that has undergone the classification process.

4.12 ENVIRONMENTAL IMPACTS OF UNDERGROUND NUCLEAR TESTING
Geology.
p. 4-525, right column, 4th paragraph
"Underground conventional HE, hydrodynamic, and hydronuclear experiments would produce some of the physical effects on geologic media and processes associated with underground tests of nuclear devices (e.g., compression and fracturing). These effects are anticipated to be significant and irrevocable although small in relation to the effects of detonation of nuclear devices."

9/05.04

008. Before the word "hydronuclear" add the phrase "zero yield subcritical." Either remove the word "processes" or define what geologic processes refers to in this context. In two places, replace the word "devices" with the word explosives. Replace the phrase "geologic media" with the phrase "underground soil, rock and groundwater." Explain the meaning of the term significant in this context. For example place a dollar amount on it. The term irrevocable at the NTS often refers to environmental damage which is so extreme that there is no practical economic remedy for it. A trillion dollars could be spent on cleanup at the site and it still would not be fixed. Explain, quantitatively what is meant by "small in relation to the effects of detonation of nuclear devices." What is considered to be small in relationship to a trillion dollars worth of existing damage?

10/40.02

Presently the Nevada Test Site is preparing to perform a set of six zero yield subcritical hydronuclear experiments that are estimated to cost $20 million each. The first experiment, "Rebound," is scheduled to take place on June 18, 1996. It will involve the explosive dispersal of substantial quantities of plutonium in an underground room. After each test, the plutonium contaminated room will be abandoned and another test will be conducted in a adjacent room. These tests are to be conducted at the Lyner Complex which lies 26 miles to the northeast of the Yucca Mountain nuclear waste study site. At Yucca Mountain, scientist have spent billions of dollars for about a decade to determine if they can safely contain plutonium, produced by nuclear power reactors. This waste plutonium is supposed to be surrounded by multiple engineered barriers that are expected to last for thousands of years. The containment standards, for the plutonium that may wind up in Yucca Mountain, are very strict and are derived from Environmental Protection Agency (EPA) and Nuclear Regulatory Commission (NRC) regulations. The underground nuclear experiments, that are conducted at the NTS, are not subject to the same set of rigorous

10/40.02 continued

standards. This is because the Defense Program office, of the DOE, is largely self regulating. The estimated cost of of cleaning and stabilizing some of the DOE's weapons production facilities is over $200 billion and much of that cost will be passed on to future tax payers. A lot of this cost can be attributed to the self-regulatory nature of the DOE's Defense Program.

Though, these subcritical experiments will present a major environmental hazard that will persists for around a quarter million years, the SS&M PEIS makes no mention of these specific tests. Part of the reason for this lack of candidness can be found in the NTS DEIS, where an obscure notice in the rear of the summary mentions that there is a classified appendix that deals with the environmental impacts at the Lyner Complex. The one aspect of the Lyner, subcritical experiments, that might need to be classified as secret, is the specific data that would be produced by these equation-of-state experiments. An environmental analysis, that describes the explosive dispersal of plutonium dust in an underground room, is not going to give away the family jewels concerning the equation-of-state data. It is much more likely that the DOE's Defense Program office has, misused its secrecy laws in order to protect itself from potential environmental liability problems that could come from its restarted reprocessing program at SRS and from the subcritical experiments at the NTS.

The DOE should explain, in the Final SS&M PEIS, why there was a mention of one classified appendix in the DPEIS but not another. It should also come clean with references to any other classified environmental impact analysis that will be applied to the SS&M PEIS "Record of Decision" (ROD). The suggestions, listed in comment 007, should also be applied in the case of the classified Lyner study. As long as the DOE attempts to hide behind its walls of secrecy, the public and Congress will be unlikely to continue their support.

11/01.04

4.9 NEVADA TEST SITE
p. 4-442, left column, first line
"NTS was established in 1950 and currently occupies approximately 351,000 ha (867,000 acres) located 105 km (65 mi) northwest of Las Vegas, NV."
009. Replace the area with the legal size of 792,650 acres. It may have been established in 1950 but it was not legally withdrawn until 1952.

4.9.2 Affected Environment
4.9.2.1 Land Resources
Land Use
p. 4-442, right column, second line
010. Refer to comment 009.

eight line from top
"All of the land within NTS is owned by the Federal Government and is administered, managed, and controlled by DOE."

11/01.04 continued

011. Area 51 is not managed by the DOE. The Final PEIS should also indicate all the other properties that the Nevada Operations Office is responsible for including the Remote Sensing Laboratory on the Nellis AFB.in North Las Vegas, Nevada, the Project Faultless underground nuclear explosion site at the Central Nevada Test Area, the Project Shoal underground nuclear explosion site near Fallon, Nevada, the Salmon underground nuclear explosion site in Mississippi, the Projects Long Shot, Milrow, and Cannikan underground nuclear explosion sites on Amchitka Island, Alaska, the Rulison and Rio Blanco underground nuclear explosion sites in Colorado, and the Gnome and Gasbuggy underground nuclear explosion sites in New Mexico.

12/04.07

4.9.2.4 Water Resources
Groundwater
Groundwater Quality
p. 4-454 right column, first line
"Groundwater at portions of NTS has been affected by nuclear testing activities conducted during the last 43 years."
012. Replace the word "affected" with the word "contaminated."

sixth line
"Because the watertable lies at considerable depth, most radionuclides are absorbed before they can reach the groundwater."
013. Remove or correct this statement since it does not make much sense. Tests that are conducted below the water table will be in direct contact with the groundwater and therefore some radionuclides will be in the surrounding groundwater.

13/11.37

4.9.2.9 Radiation and Hazardous Chemical Environment
Environment
Accident History
p. 4-472, left column,third paragraph, first line
"Since 1970, there have been 126 nuclear tests that released approximately 54,000 Ci (2,000 TBq) of radioactivity to the atmosphere. Of this amount, 11,500 Ci (430 TBq) were accidental due to containment failure (massive releases or seeps) and late-timeseeps."
014. Remove the word "radioactivity" and before the word "approximately" insert the phrase "radioactive activity level." Replace the phrase "were accidental" with the phrase "was an accidental release."
The leading paragraph under the heading "Accident History" is not needed since it does not relate to accidents. It simply serves as neutral filler.
The end of this section provides an interesting example which is a good example of how NTS "scientist" play with data. The date chosen, in this accident history section, was done quite deliberately so that the Baneberry venting accident, in 1970, wouldn't inflate the radiation release figures. The Baneberry accident released 6,700,000 Ci. Before 1971 there was more than 25,300,000 Ci released from underground tests.
The NTS atmospheric tests released 12,000,000,000 Ci into atmosphere. It should be remembered, that many NTS scientis:

SSM-M-108
COMMENT LETTER

PAGE 12 OF 13

argued that atmospheric testing was performed safely and were opposed to underground testing.

4.12 ENVIRONMENTAL IMPACTS OF UNDERGROUND TESTING
p. 4-522, left column, first paragraph, fourth line
"More detailed information on the environmental impacts of underground nuclear testing is contained in the 'Environmental Impact Statement for the Nevada Test Site and Offsite Locations in the State of Nevada (DOE/EIS 0243) January 1996.'"

14/04.09

015. The entire section from the Draft NTS EIS that covers "RADIOLOGIC SOURCES IN GROUNDWATER" should be transfered to the SS&M PEIS. This extends from p. 4-159, line 8 to p. 4-163, line 24. This should include: "Table 4-27. Remaining isotope inventory under or within 100 m (330 ft) of the water table." The type of units needs to be labled in the table and another set of columns should provide the quantity of each isotope in terms of their mass in grams. The text should also mention the total quantity of plutonium-239 that has been deposited i , or near the water table. According to the data in the table, this comes to somthing like 0.76 metric tons. If these tests constitute only about 20% of the total number of underground tests then then that suggest that over three metric tons of plutonium-239 lie buried under the testing grounds of the NTS.

15/10.23

p. 4-522, right column, first and second paragraphs
016. Based upon the materials that remain from a typical underground explosion it appears that large volumes of mixed transuranic waste may be the product of these explosions. The text should provide an estimate of the volume of this waste and the volume of the potentially affected rock, soil and groundwater. This should be expressed in terms of cubic kilometers. The text should also indicate whether or not this mixed waste material might come under the terms of the Federal Facilities Compliance Act and if it does, will it require treatment.

16/01.05

Land
p. 4-523, right column, second paragraph
017. After the description of the area of land that is ruined after each test and the description that these are unavoidable impacts, provide a infrared satellite image of the surface of yucca flat.

9/05.04 continued

Geology
p. 4-527, left column, second paragraph, last three lines
"The effects of subsidence and the confined radioactivity on the environment will persist for many years."
018. Place the word 'partially' before the word "confined." Replace the word "many" with the phrase " at least a quarter million."

12/04.07 continued

Water Resources
p. 4-527, left column, last paragraph
"Because underground nuclear testing does not utilize any significant amount of groundwater, it is unlikely that there

SSM-M-108
COMMENT LETTER

PAGE 13 OF 13

12/04.07 continued

would be any potential impact to groundwater availability.
019. Groundwater that may be potentially contaminated is water that people are likely to avoid. The subsistence farmer, in the distant future, may not have his well water checked on a regular basis.

p. 4-527, right column, first paragraph, first line
"However, as an unavoidable consequence of underground nuclear testing, the quality of the groundwater under some portions of NTS has been affected. If any underground tests were to be detonated under or near the water table, additional impacts to water quality could be expected.
020. In two places, replace the word "quality" with the word "purity." Replace the word "some" with the word extensive." Replace the word "impacts" with the word "damage." Replace the phrase "could be expected" with the phrase "would take place."
I'm sure the environment appreciates such highly creative bureaucratic styles of writing. Future generations, who have to pay for the cleanup cost, will appreciate the style as well.

17/42.08

p. 4-527, right column, third paragraph
"The exact quantity of substances that are released during a given test is unknown, but can be approximated based upon the similarity in materials used and in the overall testing procedures.
021. After most test were conducted, a drill back operation was performed which retrieved a sample of the melt pool. The analysis of this sample provides data on what has been deposited by the nuclear explosion. Unfortunately, this data is classified and as a result, many other extremely expensive procedures are employed, including the drilling of monitoring wells. Because the monitoring contractors are prevented, by the DOE, from drilling into the immediate vicinity of a test cavity they often only obtain water samples which are little more than control samples. It is time the DOE came clean with all the data that would allow site characterization researchers to fully characterize and evaluate the underground contamination situation at the Nevada Test Site and all the offsite nuclear test areas.

This ends my comments on the SS&M DPEIS.

Re: Public comment on DOE/DEIS-0236, Stockpile Stewardship and Management.

1/42.18

- RFCC agrees the Rocky Flats Environmental Technology Site is not suitable for the stewardship and management of nuclear weapon components and special nuclear materials and that RFETS must have these materials removed at the earliest date. There are multiple reasons beyond the scope of this report, but suffice to say "about 2 million people are in eminent danger" by nuclear materials. RFETS is in a total decontamination and decommissioning program. In addition to nuclear weapon components and SNM, there are large quantities of Plutonium waste to be removed before D&D can begin. Also, the existing buildings are not suitable for this storage according to the DNFSB. The cost of a temporary D&D program to strengthen the storage buildings and the mortgage of about $2 million/day would deplete the budget. The RFCC urgently requests an immediate decision on the disposition and schedule of this liability or permission to provide interim storage at a dedicated off-site facility.
- A recent conceptual design type Proposal has been submitted by my firm - Stone Environmental Engineering Services, Inc. See attached Prospectus. It describes a Site for 3 options: Open drum/crate storage; Stabilization/cementation monofill disposal; and a Sub-terrainian building for open storage, monofill disposal; storage vaults; and research facilities. The preliminary evaluation by RFETS is "An advantage this alternative has over other offsite disposal alternatives is the reduced transportation costs and risks".
- The Site provides for near term compliance with requirements of the "Settlement Agreement and Compliance Order on Consent No.93-04-23-01", which compels DOE and its contractors to implement the Mixed Residue Reduction Program in a timely and adequate manner.
- Site graded 87 to 95% in Geotechnical, Hydrological, Environmental, and Economical rating matrix in the DOE Technical Approach Document (050425 Rev.1, 4/88).
- The SS&M Program provides DOE an opportunity to check my hypothesis that some Beryllium pits fabricated at Rocky Flats between 1975 and 1990 by Rockwell International, may have a fatal flaw. These pits were machine finished on a lathe dry (without the benefit of cutting/cooling media.) I believe that some pits may have gotten case hardened (brittle) areas and none were heat treated after machining. This may cause a non-symmetrical implosion, leakage of tritium gas and a malfunction of the thermal-nuclear device. DOE could test this hypothesis on a few dismantled Be pits for a structural failure of this configuration. I reported this to Rockwell in about 1982 and to the FBI in about 1992. There was no response.

Sincerely,

James S. Stone

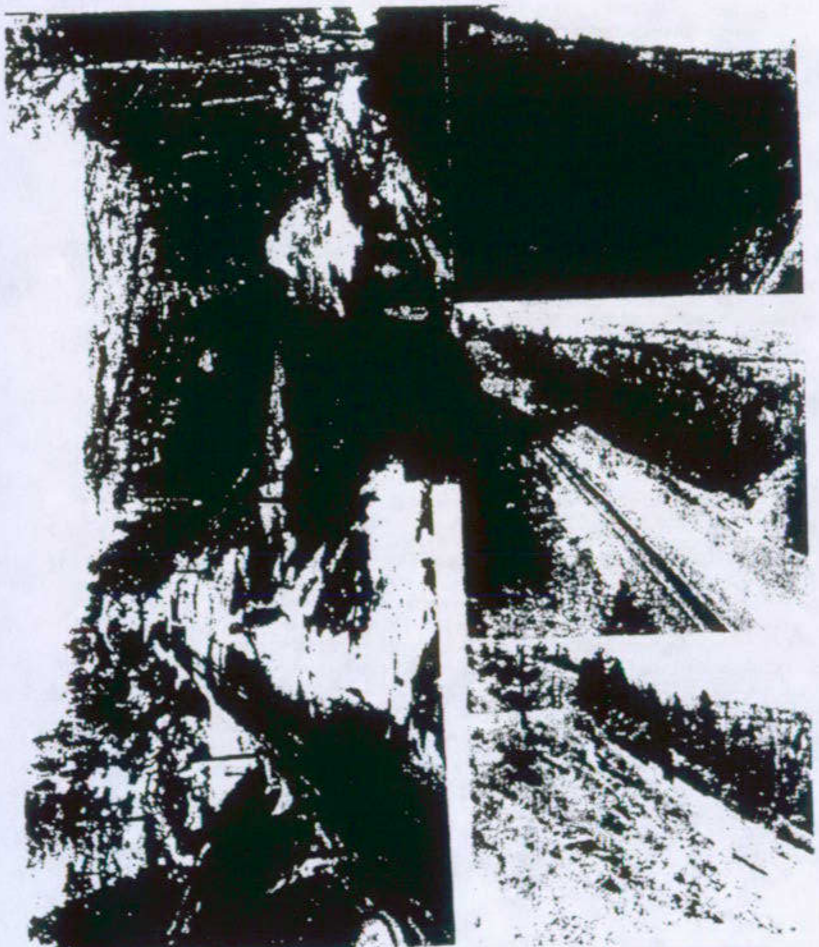
ACCELERATED SITE ACTION PROJECT

Rocky Flats Environmental Technology Site, Denver, Colorado

PROPOSED NEAR OFF-SITE DISPOSAL/STORAGE FACILITY FOR ASAP II SCENARIO 1 WITH MONITORED AND RETRIEVABLE DISPOSAL SITE FOR ALL RADIOACTIVE WASTE, SAFE REPOSITORY FOR ALL SPECIAL NUCLEAR MATERIALS, AND A RESEARCH FACILITY.



PHOTOS OF THE UNDEVELOPED SITE LOOKING NORTHWEST - GROSS VOLUME - 3 MILLION CU. YDS.

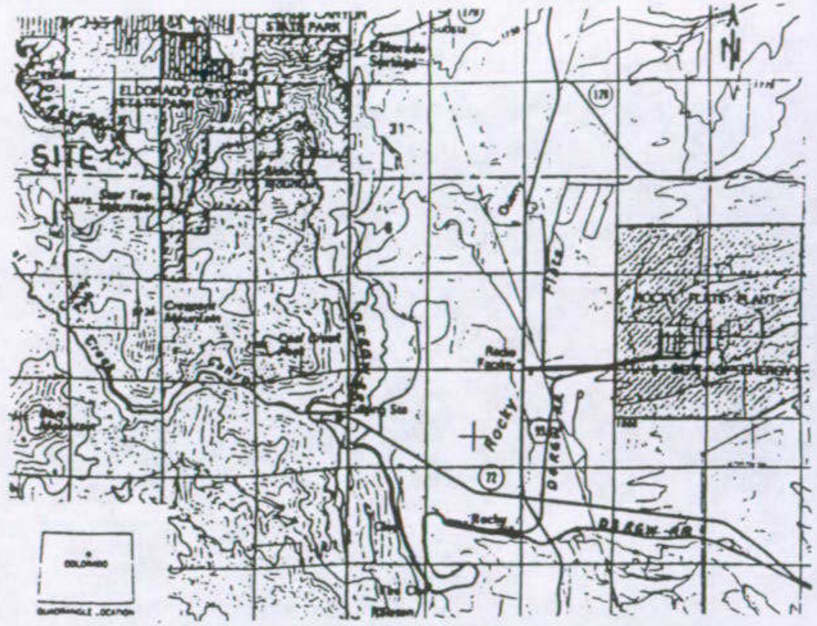


FIG. 1 SURFACE MANAGEMENT STATUS 1986

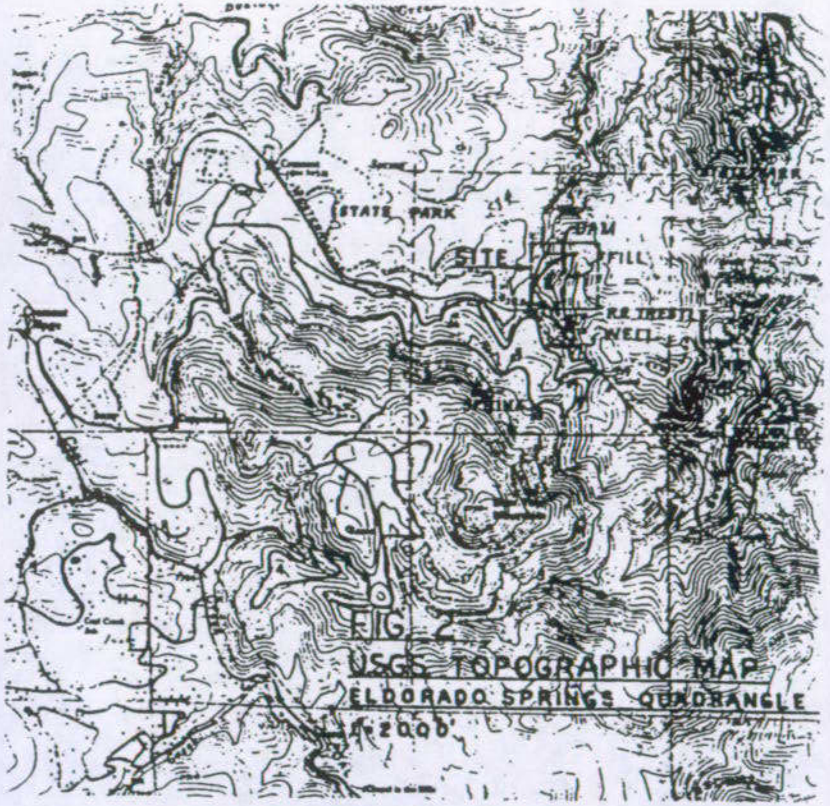
B.L.M., DENVER WEST, COLORADO QUADRANGLE, 1" = 1 mile

I: **SURFACE MANAGEMENT STATUS:** Stone Environmental Engineering Services, Inc. owns a 38 acre, remote, dry, stable., granite ravine located in the foothills ~ 6 miles W-NW in a straight line from the Rocky Flats Environmental Technology Site. SEES offers the site and 3 conceptual designs that complement Kaiser-Hill's Accelerated Site Action Project. Our version of Scenario No. 1 (Greenfield) provides for off-site monitored and retrievable disposal of Low Level & Low Level Mixed Waste, with the option for different price ranges, and the safe monitored storage of Transuranic Waste and Special Nuclear Material and a Research Facility. The site is ~ 20 miles by railroad from RFETS and ~ 3 miles East from Crescent Village, Boulder County, Colorado. The site is bordered on the West by the Eldorado Canyon State Park; on the South by the Denver & Rio Grande Western Railroad; and on the North and East by private property. In 1963, D&RGW RR designed the railroad spur track and trestle for ash disposal at this site from our proposed municipal waste incinerator in Denver. In 1965, the County of Boulder administration approved the site for ash disposal, but the City Council of Denver opted to develop the Lowry Landfill. In 1986, U.S. Environmental Protection Agency considered the site for disposal of Radium from Denver, but opted to move the Radium into storage sheds in Denver. In 1992, U.S. Department of Energy considered SEES' proposal for Interim Storage of TRUW at the site, but opted for completion of the Waste Isolation Pilot Plant in New Mexico. The site is surrounded by abandoned Uranium mines and is naturally radioactive, which has curtailed local residential development. This design provides adequate protection from all other foreseeable hazards. See the USDOE "TECHNICAL APPROACH DOCUMENT - Table 5.3 Geotechnical, hydrological, environmental, and economic rating matrix" shown. Rating = 87%. Residences and the Research Center (Opt. 3.3 only) would be located on the east access road overlooking the planned monofill, Gore Mountain Range, and Gross Reservoir or located in Crescent Village/RR Jct. Recreation includes hiking, horseback riding, fishing, rock climbing, and serenity. We hope you will approve this plan. We would be pleased to answer questions at your convenience. Please call Jim Stone, P.E. (303) 237 8058). Thanks for your consideration.



2. TOPOGRAPHY: The site was formed by flow foliation of Precambrian granitic bedrock. There is no recorded seismic activity in the last 10,000 years, within 10 miles of the site. The floor of the ravine appears to be dry, unfractured, and drains into Johnson Gulch at the NW property corner. The ravine has a plan area of ~ 15 acres; is ~ 1800 ft. long; ~ 1100 ft. wide; ~ 250 ft. deep at the maximum fill elevation of 7280 ft.; and gross volume of ~ 2.5 million cu. yds. The storm water shed on the north slope of Scar Top Mountain is ~ 124 acres and would produce ~ 61 cu. ft./sec. runoff from a 100 year storm. The railroad track berm has always diverted the runoff into Johnson Gulch. A perennial spring is located ~ 3600 ft. NW from the NW property corner. Well # 10, near the north end of Tunnel # 17, is rated at ~ 10 gals/min. The population density is ~ 4 residences per adjacent square mile and the closest residence is ~ 3/4 mile from the site. The primary route to the site is by D&RGW RR. The secondary roads, built by the defunct developer are obsolete, but are passable with a four-wheel vehicle. It is proposed that the original right-of-way road to the site, just inside the south fence line, would be improved from Crescent RR Junction to extend across the dam and double back on an improved abandoned road. Potentials for transporting LL/LLM waste to the site are to use an aerial cable-bucket line or a buried belt-conveyor corridor. A secured railroad car would be used to transport TRUW/SNM. Additional land (~ 100 acres) will be required for a buffer zone.

OPTIONS FOR A "NEAR OFF-SITE" WASTE FACILITY

3. CONSTRUCTION OPTIONS FOR KAISER-HILL's ASAP for RFETS: The background for the project is described in Fig's 1 & 2. This general preconstruction work applies to all Options and includes: Purchase of ~ 100 acres for a secured buffer zone; Improve ~ 9,000 ft. access road; Clear-cut trees & rock clearance on ~ 25 acres; Use 2 security guards, full time ~ 2 yrs.; Construct ~ 2,000 ft. RR spur, ~ 600 ft. long x 30 ft. high trestle, & RR on-off loading dock; Install ~ 6,000 ft. security fence, with 1 dock gate and 2 road gates; Install site facilities and utilities to suit the respective Option. Comply with all applicable USDOE design and constructions standards for the respective type facility.

Opt. 3.1 This option specifies an open ravine, that is safe, dry, stable, granite, accessible by D&RGW RR, to provide for the off-site/safe/retrievable storage of ~ 1,500,000 net cu. yds. of LL/LLMW/DDW, in bulk, 55 gal. drums, & large crates from RFETS.
The work required includes: Seal floor and walls of ravine; Construct a concrete mix plant in the track area; Construct a concrete, roller-compacted, monolithic, gravity dam/shield, with granitic face surfaces, in 12" lifts; Maintain a 4 ft. min. freeboard height above the anticipated waste supply level; Install structural steel racks & aisles (~ 6,850,000 gross sq. ft. floor total area on 24 - 10 ft. levels) for receiving/retrieving waste in concert with the characteristics & volume of the waste supply; Install vent/drain piping for each container; Install an automatic sump/pump/holding tank system (s), to monitor surface runoff and drainage from containers; Install a site security facility including: A 2,000 sq. ft. building for living/office/service with: Facilities & utilities; Service vehicles; Site & building fire protection systems; Remote waste monitoring, communications by phone/radio; Propane tank, 30,000 gal.; Water well, with 30 gpm pump/hydrostatic system/10,000 gal. storage tank.

*Opt. 3.2 This option specifies a ravine per Opt. 3.1, filled with a 3,200,000 gross cu. yds. of stabilized waste/solidified cement monofill, to provide for the off-site/ disposal of ~ 2,500,000 net cu. yds. LL/LLMW/ DDW, from RFETS.
The required work includes: Construct a concrete mix/cement/waste mix plant in the track area; Construct a concrete, roller-compacted face shield, with a granitic face surface, monolithic with the cement/waste solidified monofill, in 12" lifts. Install all applicable facilities, utilities, similar features and requirements, as described in Opt.3.1. Install road and a planted soil cover on the roof.

Opt. 3.3 This option provides for off-site/monitored/retrievable/storage of ~ 1,200,000 net cu. yds. LL/LLMW/DDW, safe/monitored/retrievable/storage of ~ 10,000 net cu. yds. TRUW/SNM, from RFETS, and a Waste Management Research Facility, together in a secured/modern/subterranean building.
The required work includes: Seal floor and walls of ravine; Construct a fire/earthquake resistant, reinforced concrete, subterranean building in the ravine, with an occupancy partition between the Repository/Office section & the Retrievable Storage section. Backfill the void outside the walls with sand/gravel. The R/O is ~ 30 ft. wide x ~ 1100 ft. long x ~ 250 ft. (24 floors) high, with ~ 350,000 sq. ft. gross floor space for Offices, Laboratory, Equipment/Maintenance rooms, and Vaults for TRUW/SNM. The R/O has the main access road on top, Secured access sites & guard towers; Freight site with elevator. The RS has 24 matching floors in height and ~ 6,500,000 sq. ft. open floor space for retrievable storage of LL/LLMW. Install a network of access holes in each floor and the roof, connecting to road network on the roof. Install all applicable facilities, utilities, similar features and requirements, as described in Opt.3.1. Install a planted soil cover on roof.

4. ATTRIBUTES:
4.1 The concept of an off-site Repository in Colorado to care for our own radioactive waste is unique and laudable.
4.2 This proposal offers an off-site facility with three design options, as follows:
4.2.1 Safe/monitored/retrievable/storage of 1,500,000 net cu. yds. of LL/LLMW/DDW in an open facility.
4.2.2 Safe/monitored/disposal of 2,500,000 net cu. yds. of LL/LLMW/DDW in a 3,200,000 gross cu. yds. stabilized waste/solidified cement monofill.
4.2.3 Safe/monitored/retrievable/storage of 1,200,000 net cu. yds. of LL/LLMW/DDW, and safe/monitored/retrievable/storage of 10,000 net cu. yds. of TRUW/SNM, and a secured, modern Waste Management Research Facility.
4.3 The evaluation of this site was 87% in USDOE's "Technical Approach Document on geotechnical, hydrological, environmental and economic rating matrix.
4.4 We believe this site is more acceptable to the Stakeholders &
4.4.1 This proposal allows Kaiser-Hill's ASAP *GREENFIELD* scenario to be better evaluated.
4.4.2 This proposal allows a 20 mi. safe railroad haul, eliminates a lot of truck traffic/air pollution, and promotes research the control of radioactivity.

Comments:

The chemical usage and emissions data do not make sense. In fact I believe the numbers have been fabricated by the contractor. If this is true the whole PEIS is suspect and needs to be redone! Examples follow!

1/34.16

High Explosive Operations:	? Alt	? Alt	? Alt
	LANL	LLNL	Pantex
Ethyl Acetate usage	• 454 KG	136 KG	1360 KG
High Explosive usage	• 45360 KG	• 72,567 KG	47400 KG
Acetone usage	• 2722 KG	227 KG	—
Acetonitrile usage	• 1814 KG	91 KG	—
Carbon Monoxide Emissions	• 4540 KG	1315 KG	413 KG
Nitrogen Oxides "	• 22700 KG	349 KG	1560 KG
Volatile Organics "	• 4540 KG	45 KG	122 KG

Comments (cont'd):

The other disturbing pattern of the LANL emission estimates is the occurrence of number sequences. (4,540, 22700, 4540, 227, 454, 4.5, 454, 22.7, 22.7) Comparing these numbers to Pantex, where there is a history of High Explosives Production, Pantex shows no such patterns. I believe the numbers were fabricated! My friend, a PhD in Chemistry agrees with my conclusion. As estimates of ES&H impacts are driven by emissions, these estimates are all, essentially, suspect.

2/03.05

Pit Fabrication	? Alt LANL	Alt Savannah River
Hydrofluoric Acid Usage	• 340 KG	10 KG
Nitric Acid Usage	• 32,886 KG	3420 KG

Reviewer's Initials: ______

Sheet 2

Comments (cont'd):

The pattern here is: LANL & Y-12 show the same numbers with a few very odd exceptions (Nitric & Sulphuric Acids) and LLNL has estimates which range from 1/3 to 1/4 the other sites. Very odd indeed as they are doing the same mission.

4/02.01

The utility requirements are quite bizarre:

	LANL	LLNL	Y12
Electricity	36,000 MWh	15,000 MWh	•118,000 MWh
Diesel	100,000 liters	85,200 Liters	•250,000 Liters
Water	55,000,000 liters	36,000,000 liters	•1,510,000,000 L

5/33.05

Staff	•523	760	•870

These numbers show little basis in fact.

Summary: This PEIS presents a unique chance to identify the requirements for the same mission at different sites. The data reveal disparities which can't be explained. The PEIS in this aspect, on the chemical usage & emissions data, are the core of evaluating ES&H concerns.

Comments:

1/41.03 The environmental impact of this country's nuclear program, at LANL and elsewhere, will be greatly influenced by the nature and extent of the nuclear program. The foregoing statement would be a truism and not worth anyone's time to read if it were not the case that citizens are being invited to comment on the environmental impact of a nuclear program and the program itself was decided upon almost behind closed doors. The nature and extent of this country's nuclear program is too important a question to be passed over quickly as a few items in a very long budget. Let us determine in an open national debate what kind of nuclear program the country needs, and then making the nuclear program environmentally acceptable might be much less difficult.

Thank you,
Madeleine Nells

SUBJECT: Comments on draft PEIS for the SS&M Program:

1/40.54 East Bay Peace Action feels that the draft PEIS on the Stockpile Stewardship & Management program is FATALLY FLAWED.

We feel that it is so lacking in dealing with the real problem of how to rid the world of the threats of Nuclear war that it is useless to make any comments on the details.

2/40.07 Instead we will just emphasis our position that the only reasonable alternative is diligent working toward the complete abolition of all weapons of mass destruction. We believe that the SS&M program is absolutely going in the wrong direction. It certainly does not in any way comply with article IV of the NPT.

Sincerely

Elizabeth Brown

PLAN FOR ZERO!

Comment on the Department of Energy (DOE) Draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement (SS&M PEIS)

Contrary to global expectations that a Comprehensive Test Ban Treaty (CTBT) will halt nuclear weapons development and lead inexorably to disarmament, as we await the signing of the treaty this year it appears that nuclear weapons research, development and testing by the United States will continue unabated. The National Ignition Facility (NIF), planned for the Lawrence Livermore National Laboratory, is intended to produce miniature thermonuclear explosions to provide data for the "advance" of nuclear weapons science. Slated to go on line in 2002, *ten years after the end of the Cold War*, the NIF represents the single largest military program ever planned for the Livermore Lab. The NIF, which will cost more than $1 billion to build, with a projected lifetime cost of over $4.5 billion, is the most expensive element of a vast laboratory-based infrastructure to preserve the capacity to maintain, test, modify, design and produce nuclear weapons well into the 21st century — *with or without underground testing*. The Department of Energy's (DOE) multi-billion dollar "Stockpile Stewardship and Management" (SS&M) Program includes an elaborate system of high-tech laboratory facilities consisting of explosives testing installations as large as sports stadiums, extensive new manufacturing capabilities, and the world's fastest supercomputers.

When President Clinton announced his support for a "zero-yield" CTBT last August, he strongly endorsed the SS&M Program as a necessary means of maintaining the U.S. "nuclear deterrent" without underground testing. This coupling is strikingly reminiscent of the deal struck during negotiation of the 1963 Partial Test Ban Treaty (PTBT) which banned nuclear tests in the atmosphere, in space, and under water. At that time, the nuclear weapons establishment and its allies in Congress and the Administration insisted as a condition for ratification that the U.S. pursue an extensive underground nuclear weapons testing program while maintaining the nuclear weapons laboratories and the capacity to speedily resume atmospheric testing. In the years immediately following conclusion of the PTBT U.S. nuclear testing increased and the weapons labs grew stronger. Thirty-three years later, the U.S. nuclear arsenal far exceeds that of 1963 in sophistication. *The SS&M Program anticipates maintenance of thousands of these weapons of unspeakable mass destruction for the foreseeable future.* (DOE's "base case" planning scenario assumes maintenance of at least 3,500 "strategic" nuclear weapons plus an estimated 5,000 non-strategic and reserve weapons.)

By allowing for the preservation, indeed, expansion of U.S. nuclear weapons capabilities through underground testing, the 1963 PTBT represented a lost opportunity to pursue nuclear disarmament. This suggests that the substitution of a laboratory-based infrastructure for underground testing proposed by the SS&M Program will recapitulate the profound failure of the PTBT to end the nuclear arms race. Replacing underground nuclear

2/40.07 continued | testing with an expanded laboratory infrastructure exemplifies a continued U.S. commitment to nuclear weapons as core instruments of national policy. The Nuclear Non-Proliferation Treaty (NPT) -- signed in 1970 and reaffirmed by the U.S. and 177 other countries in 1995 -- forbids non-weapons states from acquiring nuclear weapons, in exchange for which nuclear

2/40.07 continued | powers pledge eventually to disarm. Article VI of the NPT states: "*Each of the Parties to the Treaty undertakes to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament . . .*" The SS&M Program poses a threat to international security by perpetuating the legitimacy of nuclear weapons. This, in turn, may encourage other countries to abandon their NPT obligations.

The U.S. has squandered more than $4 trillion on nuclear weapons over the last 50 years, *an amount roughly equivalent to the national debt.* Including new or upgraded tritium facilities and production, SS&M Program operating costs are likely to exceed $40 billion within a decade. Moreover, the fifty year U.S. embrace of the atom as an instrument of military technology and an energy panacea has created an enormous environmental burden in

3/10.11 | the form of contaminated air, land, and water, and vast quantities of radioactive wastes. As a byproduct of the SS&M Program, DOE projects staggering rates of more nuclear waste generation for at least the next two decades.

2/40.07 continued | If the U.S. is serious about stemming the spread of nuclear weapons, it must take leadership in ending the international nuclear double standard and make disablement, dismantlement, and eventual abolition of nuclear weapons a top priority. *Nonproliferation requires unconditional, irreversible disarmament.* The SS&M Program is antithetical to this approach.

4/41.17 | The National Environmental Policy Act, the statute under which the SS&M Programmatic Environmental Impact Statement (PEIS) is being prepared, requires a comparative analysis of *all* reasonable alternatives. Yet, despite the NPT obligation to disarmament and international expectations for a CTBT, the draft PEIS rejects consideration of *any* alternative based on indefinite maintenance of a hypothetical stockpile of less than 1000 nuclear weapons, or *any* alternative scenario based on "passive" maintenance of the existing stockpile through inspection and identical remanufacture of parts (as opposed to building and operating a massive array of sophisticated experimental facilities that can be used for continuing nuclear weapons design). It also dismisses any "denuclearization" option out of hand, despite an avalanche of public comments, since 1991, demanding inclusion of a "plan for zero" stockpile option. ***In fact, denuclearization is the only reasonable alternative.***

5/40.12 | **The undersigned organizations agree that as a nation we cannot afford the economic, environmental and national security costs of the SS&M Program described in the draft PEIS.** Continued nuclear weapons research, testing and production cannot be justified. The SS&M Program is a budgetary black hole; it endangers public health and the environment and drains resources badly needed for more constructive purposes such as environmental restoration, education, health care and affordable housing. By providing a means for nuclear weapons

2/40.07 continued | designers to continue their deadly pursuits and supporting the maintenance of a huge nuclear arsenal well into the 21st century, the SS&M Program undermines the stated U.S. goal of encouraging nonproliferation by sending a hypocritical message to other nations: "Do as we say, not as we do." We call on the DOE to listen to what thousands of U.S. citizens have been telling them for years. nuclear weapons make us *less* secure -- let's get rid of them! The draft SS&M PEIS is wholly inadequate. **DOE, go back to the drawing board and plan for the elimination of nuclear weapons. It's the *only reasonable* alternative.**

Mr. Jay Rose, SSM PEIS
Office of Reconfiguration
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Mr. Rose:

I'd like to offer these comments on the EIS for *StockpileStewardship and Management*.

1/40.35 Throughout the EIS there are assertions about our ability to maintain a safe and reliable nuclear weapons stockpile based on factors such as technical competency and resources. While I agree that a strong technical program is necessary to safeguard these weapons, questions of nuclear weapons safety go far beyond those of technical competency. Assertions that a science-based program can "maintain a safe... nuclear weapons stockpile" may overstate the program's value. Should the risks and benefits of the nuclear weapons programs be stated more carefully?

2/40.32 The summary document section S.2.5 on Nonproliferation concludes that "Much of the (experimental weapons) testing is classified and could not lead to proliferation without a breach of security". This statement implies that adequate security classification of this component of the nuclear weapons program will somehow preclude proliferation. Is it possible that the postulated relation between adequate classification and weapons proliferation is not so simple?

Thank you for the opportunity to comment on this program.

Sincerely,

David C. Losey

1000 Independence Avenue, S. W.
Washington, D.C. 20585

Dear Mr. Rose,

I am concerned about the disposal and storage of nuclear wastes at a site within 30 miles of my home and directly over my water supply. We live in a area which is not served by a water supply provided by a municipality. We have our own well which is tapped directly into the Ogallala Aquifer. It is frightening to think that in a few years I may be drinking contaminated water without even knowing it.

1/04.05 Even if the possibility of contamination did not exist, the accelerated draining of the aquifer necessitated by the processing of nuclear wastes is a threat not only to agriculture, but to the quality of life in the Texas Panhandle. The aquifer is being drained at an alarming rate by irrigation of crops. We must find a way to use less water, not more.

Surely there is a site available which is not over an aquifer that supplies water to 8 food producing states. The Chamber of Commerce of Amarillo and the Department of Energy are using faulty logic to protect current jobs at the expense of our very survival in the future

Please do not store surplus plutonium at Pantex. Please do not process plutonium at Pantex, and please do not store hazardous wastes at Pantex.

Sincerely,

Isabel Davis

Upon reviewing the Draft DOE PEIS, for Stockpile Stewardship and Management, DOE/EIS 0326, 1996, I wish to offer the following comments.

1/21.14

APPENDIX I: (1) Suggest that the proposed areas considered for "laydown" or temporary staging of equipment, materials, and supplies at LLNL, to be used in construction of the National Ignition Facility (NIF), be designated in the project-specific assessment at Appendix I.

APPENDIX I: (2) Suggest that the potential impacts of the staging of NIF construction equipment and supplies at LLNL, as well as the impacts of construction of the proposed NIF, also be addressed in Appendix I, as well as in the PEIS text, as appropriate.

Sincerely,

Kenneth C. Zahn, PhD.

Dear Mr. Rose:

1/40.07

I am opposed to continuing nuclear weapons design improvement and increased production capability for several reasons:

Risk of destroying trust among others in the Non-Proliferation Treaty,

Damage to the environment of producing new wastes which we don't know what to do with,

The lack of need, since we are light years ahead of anyone else in nuclear capability;

The expense for something not needed when there are so many desperate needs in our country.

Sincerely,

Dear Sir:

I am sure you receive all sorts of pleas from Pantex employees and Amarillo business people to expand Pantex activities in any manner. And why not? These employees could not earn comparable wages at any other place, and this does bring revenue to the business community.

1/40.15 Great minds produced Atomic energy, of which they had no knowledge of its long term affects on human life or the environment. Thus every area of nuclear production is contaminated — some uninhabitable sacrificial zones of waste lands.

2/04.05 My point is enough of this United States has been sacrificed to the Nuclear Process. Use plants and resources already in use. Make do with what you have. Do not mess up or use up more land or water resources. Pantex Plant site over the Ogallala Aquifer, the only source of water to many people and agribusinesses in a semi state area of great agricultural production. Nothing should be done to risk contamination to the water or environment of so great an area of God's Good Earth.

Thank you for your time.

To whom it may concern:

1/42.15 As a person who lives in New Mexico near Los Alamos National Laboratory, I would like to register a strong vote against DARHT as well as any increased weapons production.

2/43.18 The recent forest fire brought into the headlines something of which those of us who live here are constantly aware -- we are very vulnerable to nuclear contamination. That fire got to within 3/4 mile of LANL, if it had continued in the direction in which it was headed my family and I would be contaminated with radiation.

You may not think that New Mexico is very heavily populated or has much political clout. But those of us who live here value our lives and our future and we have already put up with enough contamination and lies from LANL. Please don't endanger us any more.

Thank you.

Sincerely.

Robbie Miller

To Whom It May Concern:

1/40.50 I am writing to register my objection to the proposed Stockpile Stewardship Program at Los Alamos National Laboratory, for the following reasons:
1) The proposed cost of almost 4 billion is too much
2) The program is not needed.
3) Treaties require us to disarm not escalate
4)The waste will endanger this area.

Please note my objections accordingly.

Dear Mr. Rose:

RE: DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT FOR STOCKPILE STEWARDSHIP AND MANAGEMENT (DOE/EIS-0236); UNITED STATES DEPARTMENT OF ENERGY; FEBRUARY 1996

The following provides New Mexico Environment Department (NMED) staff comments concerning the above-referenced Draft Programmatic Environmental Impact Statement (DPEIS).

A. HAZARDOUS AND RADIOACTIVE MATERIALS ISSUES

1. A number of items in the DPEIS appear to be in conflict with NMED laws and regulations

a) Volume I, page 4-237, 4.6 LANL, 4.6.2.3 Air Quality, Ambient Air Quality, "As shown in the table [Table 4.6.2.3-1. Comparisons of Baseline Ambient Air Concentrations with Most Stringent Applicable Regulations and Guidelines at LANL, 1990 and 1992] baseline concentrations are in compliance with applicable guidelines and regulations with the exception of the 1-hour photochemical oxidants."

1/03.04 (1) Photochemical oxidants were out of compliance with New Mexico Ambient Air Concentrations standards for these years.
(2) Are the years 1990 and 1992 representative years for air emissions? Are they a conservative/ non-conservative example? Why not use more recent years, such as 1994 or 1995? Are other years in compliance with air standards?
(3) On page 4-264, under 4.6.3.3 Air Quality, No Action, "No action air quality utilizes estimated air emissions data from operations at LANL in 2005 assuming continuation of current site missions to calculate pollutant concentrations at or beyond LANL site boundary."

James Rose
May 6, 1996
Page 2

1/03.04 continued

The photochemical oxidant concentration was not addressed. The estimated concentration of this pollutant was not in the table presented; why was this pollutant not included?

2/03.06

b) Volume I, Page 4-285, 4.6 LANL, 4.6.3.3 Air Quality, Management Alternatives, Sensitivity Analysis, "The concentrations of pollutants for the high case pit fabrication, HE, and non-nuclear fabrication missions are expected to be within applicable Federal and state regulations and guidelines. The 24-hour concentrations of nitrogen dioxide for the high case secondary and case fabrication mission may be above applicable standards and guidelines." (Table 4.6.3.3-1. Estimated Concentrations of Pollutants from No Action and Stockpile Stewardship and Management Alternatives at LANL is identified in neighboring sections for reference of the estimated emissions mentioned above.)

(1) For the case of nitrogen dioxide, the estimated concentrations of the combined program impacts is estimated to be 276.69 micrograms/cubic meters and the most stringent guidelines are 188 micrograms/cubic meters (24 hour average). In Volume II, Appendix B, Air Quality, Table B.1.3.1-1. Ambient Air Quality Standards Applicable to the Candidate Sites, the New Mexico guideline listed for nitrogen dioxide is 117 micrograms/cubic meter (24 hour average); this air quality value was also exceeded. This value is more stringent than the 188 micrograms/cubic meter value, mentioned previously. Values should be rechecked or text should be modified.

2 There were some deficiencies in the information provided which prevent an adequate environmental assessment of the project.

a) Some of the comments for the issues above (1) apply.

3/11.38

b) Volume I, Page 4-12, 4.1.9.2 Facility Accidents, Accident Analysis for Postulated Accident Scenarios, "Accident risk to collocated workers was calculated for a hypothetical worker at 1000 m from the facility, or at the site boundary, whichever is closer."

(1) Usually in EISs, EAs, and SARs, the collocated workers are located at a much closer distance, such as 100 m and then at increments to 1000 m. The closer distances provide a more conservative (and more realistic) risk analysis for accidents.

4/11.39

c) Volume I, Page 4-300, 4.6 LANL, 4.6.3.9 Radiation and Hazardous Chemical Environment, Management Alternatives, Pit Fabrication, "...the presented noninvolved worker impacts were not modeled due to the unavailability of certain site-specific information. There may also be small risks to construction workers who are involved with tasks that are in close proximity to potentially contaminated areas."

(1) Noninvolved workers were not modeled.
(2) If risks to construction workers were not modeled, how can they be quantified as "small". If the source term of contaminated soil that they may be exposed to is a low activity, or limited to a small area, it should be indicated in text.

James Rose
May 6, 1996
Page 3

5/11.40

d) Volume I, Page 4-304, 4.6 LANL, 4.6.3.9 Radiation and Hazardous Chemical Environment, Stewardship Alternatives, Combined Program Impacts, Facility Accidents, "...there are potential impacts to involved workers who would be located in the facilities. Quantitative statements of these impacts cannot be made until design details are developed further, at which time the number and location of facility workers can be estimated to support accident impact analyses. However, depending on the type of accident, facility workers in close proximity to the point of the accident could receive high levels of exposure to radiation, with potentially fatal impacts."

(1) Impacts to workers were not modeled for accident analysis, however, fatalities may occur, but the number of deaths is not estimated nor projected

6/11.07

e) Volume 1, page 4-300, 4.6 LANL, 4.6.3.9 Radiation and Hazardous Chemical Environment, Management Alternatives, Pit Fabrication, Radiological Impacts, "The average annual dose to involved workers for this alternative would be 380 mrem. The dose to the entire facility workforce would be 55.8 person-rem. As stated in the methodology section 4.1.9, all worker doses were referenced either from alternative-specific working group data reports or from the radiation exposures for DOE and DOE contractor employees 1992 database which reports doses for similar types of operations...."

(1) Is the 1992 database representative for the projected years? Do working group data contain situation-specific source terms and shielding considerations?

f) Volume I, page 4-300, 4.6 LANL, 4.6.3.9 Radiation and Hazardous Chemical Environment, Management Alternatives, Secondary and Case Fabrication, Radiological Impacts.

(1) same as e) above.

7/11.42

g) Volume II, Appendix E, Human Health, page E-9, E.2.2 Methodology for Estimating Radiological Impacts of Normal Operation, E.2.2.2 Data and Assumptions, Meteorological Data, "For use in design basis accidents, the 50 percentile option was used."

(1) The 50 percentile option depicts conditions that are "average". Usually in EISs, EAs and routine site analyses for risk from accidents, risks are analyzed under "worst-case" conditions, which are also known as 95 percentile conditions (when using certain codes). Accident risks were not analyzed under worst-case conditions in this DPEIS and an underestimation for accidents under extreme conditions could result

8/11.43

h) Volume II, Appendix F, Accidents.

(1) Solid uranium criticalities were modeled, and plutonium liquid criticalities were modeled, however, no plutonium metal criticalities (solid) were analyzed This accident analysis may

James Rose
May 6, 1996
Page 4

8/11.43 continued

not have been performed in the past, however, the accident scenario should be considered due to the projected increases in the number of pits under the "pit fabrication alternative"

(2) The methodology section should mention how the source terms for the criticalities are determined, and source terms should be listed by radionuclide and activity, not only as the number of fissions. From the information presented in the dPEIS, it is not possible to determine whether the criticality analyses are valid.

4/11.39 continued

i) Volume I, page 4-435, 4.8 Sandia National Laboratories, 4.8.3.9 Radiological and Hazardous Chemical Environment, Stewardship Alternatives, Proposed National Ignition Facility, Radiological Impacts, "The presented total dose to noninvolved workers was not modeled due to the unavailability of certain site-specific information."

(1) Radiological impacts to noninvolved worker were not performed.

B. AIR QUALITY ISSUES

9/40.51

1. It appears that the "stewardship" portion of the plan, or the science-based program to maintain the reliability of the nuclear weapon stockpile in the absence of nuclear testing, requiring studies of materials in extreme conditions similar to nuclear detonation conditions, would release small to minimal amounts of air pollutants. The research aspect of the stewardship fits in very well with the activities for which Los Alamos National Laboratory (LANL) is already known. Siting these activities at LANL would have a positive impact on the Stockpile Stewardship program as well as on LANL itself.

10/03.08

The "management" part of the plan is of greater environmental concern, as it involves additional emissions. In this part of the plan, a significant portion of nuclear weapon maintenance and pit handling and nonnuclear component manufacturing would be shifted to LANL. The management aspect of the plan actually refers to manufacturing and involves activities previously handled at weapons manufacturing plants such as Rocky Flats and Pantex. "Management" of the nuclear stockpile would result in emission of both radioactive and nonradioactive pollutants, some modeled at levels higher than applicable standards. Carrying out Stockpile Management at LANL would have a detrimental effect both on the lab and the surrounding community, and we do not recommend LANL to be considered as a site for this portion of the program.

11/03.07

2. The DPEIS contains no plans to monitor directly the emissions from these projects or to conduct ambient monitoring in the community if the projects are implemented. As of October 1994, with the termination of a 5-year contract between NMED and the National Park Service, non-radioactive ambient monitoring for criteria pollutants was discontinued at the Bandelier site on the southern boundary of LANL adjacent to the Bandelier National Monument. We are not aware of any other ambient monitoring for criteria pollutants being conducted at LANL or in the Los Alamos community. The radioactive ambient monitoring being conducted by LANL focuses mostly on LAMPF, which is currently the largest source of radioactive emissions. Monitoring of actual conditions around the proposed projects is of prime importance to verify the modeled emissions presented in the DPEIS.

James Rose
May 6, 1996
Page 5

12/40.15

In addition to monitoring, there should also be remediation plans in place in the event of actual emissions being measured higher than modeled ones

2/03.06 continued

3. In terms of nonradioactive air pollution, on page 4-265, col 1, and in table 4.6.3.3-1, the environmental impact resulting from secondary and case fabrication shows that modeled estimates for 24-hour average concentrations of nitrogen dioxide would be 231 micrograms per cubic meter (ug/m3) and 277 ug/m3 from the combined programs, thereby greatly exceeding the applicable state standard and worsening the air quality of the area. There are two points to be made about this. First, the State of New Mexico cannot permit such large exceedances of its standard. Second, the exceedance of the standard is even greater than that shown in tables 4.6.3.3-1 and 4.13.1.5-2. These tables show the most stringent regulation or guideline for nitrogen dioxide to be the state standard, which is listed as 188 ug/m3. However, this figure does not reflect a correction for the altitude of Los Alamos, which is approximately 7200 feet above sea level. Correcting for altitude, the state standard of 0.10 ppm is calculated to be 146 ug/m3[1]. It is our view that LANL should be

---

[1] The equation used for adjusting the concentration of nitrogen dioxide for altitude is:

$$C = \frac{Mw \times ppm}{4.553 \times 10^{-5} \times T \times 10^{Z \times 1.598 \times 10}}$$

where

C = concentration of the gas in micrograms per cubic meter

Mw = molecular weight of the gas

ppm = concentration of the gas in parts per million by volume

T = average summer morning temperature in Rankin at site (typically 530 deg.)

Z = site elevation in feet

(This equation is taken from New Mexico Air Pollution Control Bureau Dispersion Modeling Guidelines , p.25)

James Rose
May 6, 1996
Page 6

2/03.06 continued

omitted as a possible site for secondary and case fabrication because of the high concentration of nitrogen dioxide that would be emitted.

4. In table 4.6.2.3-1 and in other tables containing most stringent regulations or guidelines for gaseous criteria pollutants, these concentrations have not been adjusted to Los Alamos altitude which is 7200 feet above sea level.

13/11.44

5. On page E-64, cols 1-2, the discussion revolves around an investigation undertaken to assess melanoma risk at LANL because of worker exposure to low-level ionizing radiation. The study was the result of "a reported threefold excess of melanoma among laboratory workers" at Lawrence Livermore National Laboratory (LLNL) in California. The study was applied to LANL because of the similarity of the work done at both labs. At the end of the first paragraph in col 2, it is stated that "the only significant association with diagnosis of melanoma for males was being a college graduate...or having a graduate degree ..." To us it follows obviously that the vast majority of workers at both LLNL and LANL are males who are college graduates or who have graduate degrees and that the workers at LANL are significantly at risk for melanoma resulting from exposure to low-level ionizing radiation. Will workers be informed of the risk? Is this an acceptable risk, and can anything be done to diminish it?

14/11.45

6. NMED is sometimes referred to by its previous name, Environmental Improvement Division or by the incorrect form, NM Health and Environmental Department. Examples of incorrect naming can be found in the following:

page K-17, col 1, paragraph 2

pages 5-15 and 5-16, table 5.3-4

These should all be changed to New Mexico Environment Department.

15/03.10

7. There is a factual error on page 4-542, col 2, paragraph titled "Air Quality." The last sentence stating that LANL is in a nonattainment area for ozone is incorrect. Attainment is determined by comparison with the federal standard, which for ozone is 0.12 ppm for an hourly average. The rule for determining a nonattainment area is explained in this same document on page 4-236, col 2, paragraph 3. At the ambient air monitoring site operated by NMED at southern boundary of LANL, adjacent to Bandelier National Monument, the highest value measured for ozone between 1989 and 1994 was 0.090 ppm for a one-hour average. Please note also that there is no state standard for ozone and, as of December, 1995, neither is there a state standard for photochemical oxidants.

16/03.11

8. The New Mexico regulations alluded to on page K-17, col 1, paragraph 2 are obsolete or contain errors. First, the reference to "total suspended particulates" as "PM10" is incorrect. Although both names refer to particulates, they are measured by different monitors and have different standards. Second, the reference to New Mexico standards for beryllium, asbestos, heavy metals,

James Rose
May 6, 1996
Page 7

16/03.11 continued

photochemical oxidants, and nonmethane hydrocarbons is now obsolete. In 1995, these pollutants were eliminated from the New Mexico regulations. Federal regulations remain in existence for some of these pollutants. The pollutants eliminated from state standards are also mentioned in tables in section 4 and in Appendix B.

9. The document contains some usage or typographical errors which should be corrected, including the following:

page E-63, col 2, last paragraph: repetition of the sentence "Population exposures are confounded by occupational exposures."

17/11.46

page E-64, col 1, towards the end of the large paragraph where the Wilkinson study is being explained, the word "countries" should be "counties"

page F-13, col 2, in the last paragraph, jumbled spelling of the word "National"

18/11.47

page F-17, col 2, scenario 1, the sentence "The fire releases the plutonium contamination from the inner surfaces of the gloves" should read "... the inner surfaces of the glovebox"

We appreciate the opportunity to comment on this document. Please let us know if you have any questions on the above.

Sincerely,

Gedi Cibas, Ph.D.
Environmental Impact Review Coordinator

Comments:

Please continue on the other side if you wish to use additional space. THANK YOU—your comments are important to us.

I have two points to make in connection with the Stockpile Stewardship and Management Program and its possible role at Los Alamos National Laboratory.

1/40.21 My first point concerns the present management at LANL. My opinion as a citizen observer of LANL since 1967 is that this management has lost the trust of many of its employees and much of the public familiar with its record. If either the U of C or DOE were doing effective oversight of this Lab management, management would be looking for work elsewhere. If Stockpile Stewardship and Management work came to LANL, employees with jobs related to health and safety would be hindered from truth-telling for fear of management pressure or job loss. LANL is a very dangerous place to speak your mind. Current management implements and blesses a subjective and undemocratic system of employee evaluation and control. Many LANL employees lack clear, measurable work goals and objective performance appraisals. This is how they are disempowered and demoralized and made subject to the personal favor or disfavor of managers. There is intimidation and fear of job loss for whistle blowers. Could current management survive a truthful accounting of health and environmental problems occurring on the Parajito Plateau during its watch? I have almost no confidence in Lab health and safety pronouncements. These are LANL cultural reasons why I feel SS and M work must not come here. We the wider citizenry of the state cannot be safe if those responsible for our safety are afraid to speak openly.

2/40.72 My second point concerns the Stockpile Stewardship and Management Program itself, SSand M. I have a second acronym for it: FBFW -- feather-bed for weaponeers...who continue the arguments that have successfully emptied 4 trillion dollars from the American taxpayers' wallets directly into their intestines for the last 50 years. Since the end of the cold war 5 years ago, billions have been spent at LANL but I am unable to name a single product or useful technology benefiting the taxpayer and resulting from this expenditure. The public is endlessly susceptible to fear mongering... weaponeers and their business supporters always characterize the world as full of dragons and dragon-want-a-bes. They sell the public the idea that only by spending billions of tax dollars on nuclear technologies for a future of geological proportions can we hope to be safe from the likes of North Korea and other third world countries. One supporter of the nuclear agenda recently answered the question of -who was the enemy likely to be in the future -with the response that we might face the French someday.

SSM-M-124
COMMENT LETTER **PAGE 3 OF 3**

3/40.69 I note a point made to me not long ago: how do I, a U S taxpayer, measure success in programs like SS and M......how do I know the weaponeers won't just acquire their wish list of computer capacity and instrumentation they now want and then in 5 years announce that they just really can't do a first rate job after all without testing. I have no confidence in their scenarios or their word.

4/40.07 My personal preference is a custodial program for nuclear stockpiles based on minimal production of replacement parts funded at a small fraction of proposed SS and M amounts. Such a program will tell the rest of the world that we are capable of honoring our Non Proliferation Treaty obligations, my government will appear sensible at last to the immorality of weapons of genocidal scope ...and I will look forward to paying my taxes on April 15th each year. I don't want LANL or Livermore, or Sandia doing SS and M

5/40.27 work, I want them all to "get a life" in the real world. I want labs where the future is seen as more than recreating the past.

SSM-M-125
COMMENT LETTER **PAGE 1 OF 6**

April 23, 1996

124 Hampshire Court
Oak Ridge, TN 37830

US Department of Energy
Office of Reconfiguration
PO Box 3417
Alexandria, VA 22302

Sir:

I am forwarding my comments on the Draft Programmatic Environmental Impact Statement on the DOE Stockpile Stewardship and Management Program. I have divided these comments into comments on major issues. remanufacturing, protection of response capability, protection of skills, data included in the document, and a tabulation of specific comments.

1/40.11 Many of the comments reflect the fact that the SSMP fails to meet it original objectives, protection of the stockpile and protection of the ability f the nation to respond to changing national security challenges. The DOE Weapons Program continues to be a high cost

2/40.13 program, but the bulk of the cost is tied up in large experimental facilities which will make a minimal contribution to weapons science, other than to maintain and challenge a core physics group. Meanwhile, the management of the production technology development

3/40.24 program is being turned over to the weapons laboratories, with dollars being moved into facilities and personnel to bring them up to a par with the development staffs at the production plants which they are being asked to manage.

I recognize that the preparation of the draft PEIS represents a major effort and that the production organizations have contributed to the documents. However, until a revised plan geared to true national security needs has been generated, a revision to the draft PEIS will be a futile effort.

Sincerely,

Robert B. Burditt
retired Program Manager for Weapons Manufacturing Development, Y-12

STOCKPILE MANAGEMENT QUESTIONS/COMMENTS

A. REMANUFACTURING

4/40.33

Was there an overt attempt to prejudice the whole perspective of the assessment of alternative by selecting the term 'science based" for the laboratory management generated DOE plan, with the automatic categorization of all the alternatives as 'non-scientific'? Why do we consider remanufacturing to be 'non-scientific' and unacceptable (3.1.2.4) when our standard method of doing business has been to run a single or a few tests of a device tailored to fit the constraints of test limitations and then manufacture production weapons against a set of specifications which is written to control the product to within an acceptable range of the design. In some cases production cycles have lasted for ten and more years after the original test.

Why is remanufacturing not considered feasible on page S23 of the Summary SS&M draft PEIS, but is considered to provide a great advantage to the Soviet Union in the testimony of C. Paul Robinson before the Strategic Forces Subcommittee of the Senate Armed Forces Committee?

The term reliability is used extensively through the document to justify laboratory investment and has been used in the past to justify nuclear testing. Reliability has been used in terms of the match of a device to the projected design yield, using a precision measure that was based on potential tactical applications. In the absence of a tactical weapons stockpile, a revised definition of reliability would appear to be necessary. In a similar vein, yield select capability no longer seems appropriate and adds to complexity.

B. PROTECTION OF RESPONSE CAPABILITY

If, as claimed by C. Paul Robinson in his congressional hearing testimony, the Russians are planning to maintain their stockpile by replacing 1000 units per year, a change in their attitude would permit them to double a START II level in three years, whereas the capacity we are planning to provide would give us the same doubling in somewhere between 10 and 30 years and our capability for adding new facilities appears to be 10 years or more Is this an accurate assessment and is it acceptable?

Unless we protect a standby capability for production and provide for a true plutonium pit production capability, we will leave ourselves vulnerable to both a restoration of the cold war and to an effort by a significant industrial nation to create a nuclear force, which could be competitive in five years.

C. PROTECTION OF SKILLS

5/40.23

Nuclear components are manufactured in house so that materials and processes can be replicated. The materials which are most subject to subtle changes are plastics and electronics, which can be tested to a establish a statistical confidence that they are acceptable and which do not perform any nuclear function which must be verified in a nuclear test. Is the continued production of weapons to specification at a low rate not a more reliable method of providing confidence by maintaining skills, materials and processes than shutting down the complex and then hoping that because of NIF and ATLAS we can somehow assure that a new process will produce an acceptable weapon? Can you identify a single past safety or reliability issue that NIF would provide the ability to evaluate?

Relative to paragraph 3.1.2 4 is there not a contradiction between the concern expressed in this paragraph about subtle changes in materials and processes and the push for new processes which shows up later, particularly in the area of casting to shape?

D. PEIS NUMBERS

6/08.10

The numbers included in the PEIS contain innumerable inconsistencies in logic and inconsistencies in mathematics. For example, in 3.4 why is surge operation used for generating the operations analysis numbers, rather than the base case, which would presumably be the actual staffing level and would be a more realistic identification of the manpower and socioeconomic impact? In the analysis in 3.7.1.1, why are the impact numbers calculated based on the three shift surge operation, when single shift operation is the base case (3 1.1 1-1), other than that this reduces the socioeconomic impact?

7/08.09

Was any type of referee review of the input numbers used by DOE in preparing this report, since idiosyncrasies such as order of magnitude differences in utilities, and peculiarities such as the concept that LANL would impact no indirect people for the 523 workers and 321 incremental workers associated with the secondary/case mission (3.4.4.3-2), need to be resolved? The LANL no indirect numbers make no sense, some of the utility requirements make no sense and some of the discharge numbers make no sense. The numbers used in Table 3.7.1-5 imply that people required for D&D would provide an immediate amelioration of the socioeconomic impact of change in staffing, but what fiscal year budget does the reduction come in and what fiscal year is the D&D work budgets in? The D&D on building 9201-4 has been on the long range schedule on and off for fifteen years and still has not risen to a level which would rate priority and considering the priority problems associated with D&D of plutonium facilities, does it not seem probable that this work might be scheduled thirty years from now? Would this work be done by Lockheed-Martin people or by contract workers, and how soon would it have to be scheduled in order for L-M workers to be kept on the

8/11.09

payroll to do it? Table 4.2.3.9-2 shows 0 involved workers for the phaseout alternative, but a flat 14,200 workers for the non-involved category. Where are the D&D workers? Why do the non-involved workers have a higher exposure level than involved workers? If

8/11.09 continued	it is a characteristic of the estimating process (because of the absence of site specific information), then what is the quality of our estimates for the general public?
9/08.01	How many of the new ER jobs at Y-12 which supposedly ameliorate the socio-economic impact in Oak Ridge are truly new jobs and how many of them are merely a relocation from K-25? The document postulates that 95% of the jobs which would be eliminated in the event of the transfer of Y-12 missions would be replaced by D&D jobs. Will these jobs not inherently be temporary, low paying jobs? Is there any likelihood that the funding, in excess of 100 million per year, will actually be available, particularly since priority must be given to the Rocky Flats site?
	E. INDIVIDUAL COMMENTS
10/40.68	1. Surely, contrary to the statement in paragraph 1.1, there must be some stockpile size (10, 100) at which the size of the stewardship facilities facilities could be smaller? Are not other countries which have smaller nuclear stockpiles operating with smaller laboratories and science bases?
1/40.11 continued	2. (1 1) Why have we chosen to use START II as a base case when there are uncertainties about START II? Has this not us in on tritium facilities?
11/42.11	Relative to paragraph 1.6.1, what would the need date be for a new tritium facility if we had used START I as a planning base?
12/40.82	3. (3 2 2) Relative to this paragraph, what ORR DP assignments are not performed at Y-12?
13/40.63	4 (3.3.4.2) What prohibitively expensive alternative to the HEPPF is referred to here as being
14/40.36	5. Has any consideration been given to the truly long term, 100s of years and more? Ideally, there should be no more need for a stockpile, but we still need to have a strategic option
15/40.64	6 (3.5) After all the concern expressed about subtle changes in materials and processes, emerging technologies proposes continuing work in areas which represent significant changes in processes and materials. Is the intent to protect technical capability, to have technologies available in case of a resumption of testing or a breakthrough in experimental technology, or is there an expectation that we can just go ahead and use them regardless of our previous protestations?
16/40.65	2.3.4 What are the different materials referred to in this paragraph whose aging characteristics are not well understood and could they not be replaced without compromising the military objectives of the stockpile? 3.5.1 Rocky Flats spent on the order of ten years and tens of millions of dollars on near-net-shape casting without success due to the complex metallurgical phase structure of the plutonium system; why do we think that better computer modeling will change the problem?

17/40.80	7. In paragraph 3.7 I did not see any reference to E-U for primaries, would it go with the secondary mission or what?
18/08.28	8 Is the statement in paragraph 4.2.2.8 that all jurisdictions have positive fund balances not misleading, since state law requires positive fund balances and jurisdictions deal with this by generating capital obligations, which are not included in fund balance calculations?
19/08.23	4.2.3.8/Public Finance Who projected that total expenditures for the public area would increase an average of less than 1% per year from the year 2000 to 2030?
20/08.12	In Figure 4.2.3.8-4 why does the text under public finance only discuss ROI impacts when the Oak Ridge impacts are 5 1/2 and 7 1/2%? Since these numbers are for 2005 and the staffing levels show a level for 2030 only half of 2005, what do we project the impact will be then?
21/04.03	9. (4.2.3.4 Para 2) What are the increased operating requirements of existing secondary and case fabrication facilities in the no action case? (No action does not imply resumed production and this projection is not made with regard to other sites.)
22/11.02	10. Why do we use the year 2030 staff levels for rad doses (P4-60 and 4-61) and use 2005 for economic impacts?
23/11.29	11. (P4-61) Is it really true that hazardous impacts would be reduced to zero as a result of secondary and case fabrication phaseout, unless we completely greenfield the site, including recovery of material from burial grounds?
24/11.30	12. (Table 4.2.3.9-4) How were accident numbers generated, e.g. it is not clear why the probability of a significant BeO release is so high?
25/10.02	13. In paragraph 4.2.3 10, how do we project zero waste associated with the move of HEU to another location unless containers can be removed and shipped in existing trucks with no repackaging?
26/33.06	14. (4.6.3) Does someone really believe that only minimal modification to existing facilities at LANL would be required for the secondary and case fabrication mission? No facilities exist for large LiH fabrication and processing exist and only minimal uranium and assembly facilities exist and facilities must be adequate to deal with potential surge requirements? This type of equipment costs tens of millions of dollars
27/40.40	15. As a follow-up to my concerns about the capacity/capability of the complex to respond to unanticipated needs, page -2 of the Analysis of Stockpile Management Alternatives, build rates above 100 per year would adversely impact the ability of LANL to perform their surveillance, research and development missions Does this mean that there is no way that we could truly support a surge capacity need.
	16 What, if any consideration has been given to safeguards/inspection provisions in these studies?

SSM-M-125
COMMENT LETTER
PAGE 6 OF 6

28/08.11 | 17. In the discussion on page S36, why are only direct employment impacts considered in socioeconomics? If there are negative factors, such as land use, waste management, hazardous operations, transportation problems, would these not have negative socioeconomic impacts.

3/40.24 continued | 18. How are the production plants to maintain high quality technical staffs if all technical decisions are made by the Laboratories? (This was always a problem at Pinellas, which interacted with Sandia in the manner proposed for the future of all the Plants?) The previous mode of operation already led to problems in retaining some staff members because of problems in publishing by plant members and constraints on their activities

29/33.08 | The analysis with regard to this study discusses the preproduction of a supply of enriched uranium and lithium hydride sufficient to provide for (base line?) needs for up to 100 years. Does not past experience indicate that this will guarantee the loss of the associated technology.

30/33.07 | 19. Who, by name, are the supposed experts at the Laboratories in uranium and lithium hydride? What are their qualifications?

31/32.16 | 20. If laboratory facilities are so capable, why are we investing in new facilities at LANL and why are we postulating that it will be another five years before LANL can make a production pit?

32/32.13 | 21. How long can pits remain in the stockpile before buildup of decay products becomes a design concern or a handling concern?

CCNS
Concerned Citizens for Nuclear Safety

May 16, 1996

Mr. Steve Guidice
USDOE
Albuquerque Operations Office
P.O. Box 5400
Albuquerque, NM 87185

Dear Mr. Guidice,

Please accept my apologies for my tardiness in submitting CCNS's comments on the Draft Stockpile Stewardship and Management PEIS. As I told you in our phone conversation, my mother-in-law (who lived at my residence) recently died. The events preceding and following her death made it impossible for me to prepare adequate comments on a subject as complex and important as the Stockpile Stewardship and Management Program. I hope that DOE will understand my extraordinary circumstances during this period of time and still consider my comments.

I have expressed a copy to Mr. Jay Rose at the DOE Office of Reconfiguration as well.

Thank you for your understanding.

Sincerely,

Jay Coghlan,
CCNS

Concerned Citizens for Nuclear Safety • 107 Cienega St., Santa Fe 87501; 505/986-1973 • April 25, 1996

107 Cienega Santa Fe • New Mexico • 87501 • USA (505) 986-1973

Comments on the

Draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement

Submitted by

Jay Coghlan, Program Director
Concerned Citizens for Nuclear Safety

Submitted to

Mr. Jay Rose, Director
Office of Reconfiguration
U.S. Department of Energy
PO Box 3417
Alexandria, VA 22302

Concerned Citizens for Nuclear Safety (CCNS) submits the following comments on the Draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement (hereafter DPEIS). CCNS is a public education organization focusing on nuclear weapons policies and issues impacting the State of New Mexico. We have been actively involved in DOE nuclear weapons complex reconfiguration issues, particularly those affecting Los Alamos National Laboratory, since 1990.

These comments are organized as follows:

I. The Stockpile Stewardship and Management Program and Nonproliferation Issues

The July, 1995, Notice of Intent to prepare a Stockpile Stewardship and Management (SSM) Programmatic Environmental Impact Statement (PEIS) stated that three particular SSM Program challenges must be met:

- Full support at all times of the nation's nuclear deterrent with safe and reliable nuclear weapons while downsizing the nuclear weapons complex;
- Preservation of the core intellectual and technical competencies of the weapons laboratories; and
- Assurance that the activities needed to maintain the nation's nuclear deterrent are consistent with the nation's arms control and nonproliferation efforts.

1/40.60 In the DPEIS, DOE quotes Article VI of the Nonproliferation Treaty which obligates the nuclear powers "to pursue negotiations in good faith on effective measures relating to the cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control." (Article VI, NPT, 1970) DOE then notes that the NPT does not provide any time period for achieving this goal. "However, in keeping with these NPT goals, the NPR [Nuclear Weapons Posture Review] strategy does express the U.S. intent to pursue further reductions in nuclear forces beyond START II. Therefore, the implications of further reductions below the START II-sized stockpile are discussed in the Stockpile Stewardship and Management PEIS where they are relevant." (DPEIS p. S-10) However, throughout the document, DOE does little more than to posit an hypothetical low case of a 1,000 weapons in some theoretical START III" scenario, while at the same time asserting that the size and quality of SSM Program activities are independent of future stockpile sizes.

2/40.07 Despite accelerated rates of dismantlement since the end of the Cold War, there are still more nuclear weapons in global stockpiles than when the NPT was first signed in 1970. The SSM Program, as proposed, will likely be an obstacle to a stringent nonproliferation regime under a renewed NPT. The SSM Program constitutes a mere reduction-in-place of the past nuclear weapons complex, rather than the fundamental change mandated by the NPT. This opposition to the NPT is further compounded by the program's aggressive pursuit of improved computational abilities, simulated testing facilities and agile manufacturing techniques. Future SSM facilities will certainly improve capabilities for new design and production, and will thereby arguably discourage strict observance of the NPT by other countries. Since the SSM Program allows for continuing improvements and seeks to indefinitely preserve the stockpile, it is fundamentally at odds with the international commitment to disarm.

The NPT disarmament goal should be progressively implemented through deliberate and carefully phased multilateral arms reductions, in time involving all declared and undeclared nuclear weapons states. Important initial and intermediate steps towards disarmament are the achievement of a CTBT, proportional reduction of all stockpiles into the hundreds and below, a global ban

2/40.07 continued

on the development of new nuclear weapons systems,[1] and a corresponding global ban on the reprocessing of fissile materials.

The aim of this comment section is to point out the inherent contradiction in the program challenges stated above. The SSM Program, as constituted, gives predominant weight to the Nuclear Weapons Posture Review, specifically its directives to maintain design and production capabilities. At least equal weight needs to be given in program planning to the NPT which, as a treaty, is enshrined as national law and which precedes the Posture Review. The SSM PEIS, within the limits of its planning window, should provide interim steps towards final resolution of the contradiction inherent in the three program challenges. The SSM PEIS should recognize the primacy of the NPT which requires corresponding recognition that the ultimate baseline for the future stockpile is already in the terms of the NPT and which is zero.

1/40.60 continued

Given that it is folly to unilaterally disarm, interim stockpile sizes should be recognized and planned for, but with emphasis placed on their continuing diminishing interim status as we seek to honor our NPT commitment. The SSM PEIS should help provide a road map towards eventual disarmament, rather than creating obstacles to it.

2/40.07 continued

The JASONs have touched upon the danger that the SSM Program can present.

> One worrisome aspect of the Stewardship program is that it may be perceived by other nations as part of an attempt by the U.S. to continue the development of ever more sophisticated nuclear weapons. This perception is particularly likely to be held by countries which are not very advanced technologically since they are less able to appreciate the limits on advanced weapons design that a lack of testing enforces. The stewardship program, unless managed with restraint and openness, including international collaboration and cooperation where appropriate, might end up as an obstacle to the Nonproliferation Treaty.
>
> The United States, as the world's preeminent conventional military power, has the strongest security motivation to prevent nuclear proliferation, with its "equalizing" aspects.[2]

This quote is relevant today to the ongoing CTBT negotiations. The aim of the CTBT is, of course, to deny nations weapons design capability. To the extent that other nations perceive, rightly or wrongly, that the U.S. has circumvented that prohibition through the creation of a sophisticated AGEX program, they may be encouraged to pursue their own weapons programs. DOE must avoid this possible encouragement by, as the JASONs suggest, implementing the SSM program with restraint and openness. However, restraint is hardly the operative word for the

---

1 Here, a ban of new nuclear weapons systems is emphasized so that future mating of existing physics packages to new delivery systems is also included (for example, see discussion of the B-61 modification). In addition, the SSM PEIS needs to explicitly acknowledge that the number of remaining weapons systems in the post-START II arsenal is limited to the seven commonly referred to.

2 Draft Stockpile Stewardship Report, JASONs, August 1994 (writing before 1995 NPT renewal), pp. 16 and 15.

3/41.19

SSM Program as it stands now, given the $2.7 billion in proposals for facility construction/upgrades and $2.1 billion for the Accelerated Strategic Computing Initiative (see attached table).

2/40.07 continued

Adverse international perception was undoubtedly heightened by last month's threats to destroy Libya's reported deeply-buried chemical weapons factory. Asst. DoD Secretary Harold Smith is quoted as saying that "[i]f we wanted to destroy (the chemical weapons factory), [the] B-61 is the nuclear weapon of choice."[3] This is germane to SSM Program discussion for at least two reasons. First, the specific type of the B-61 that Smith referred to is a modification currently being worked on by LANL and SNL under the SSM Program. DOE plans to "[d]eliver first production unit kit for B61-11 in FY 1997."[4] It also demonstrates that the CTBT will not halt weapons development by the U.S. Secondly, this threat was made two weeks after the U.S. signed protocols declaring an African Nuclear Weapons free zone which forbade the use or the threat of use of nuclear weapons in Africa. This whole incident serves to illustrate the schizophrenia, even hypocrisy, of both the SSM Program and national nonproliferation strategies.

DOE and the Administration have stated as a matter of policy that new warheads will not be produced. But under the Nuclear Weapons Posture Review and the SSM Program there is no prohibition on weapons design *per se*, meaning that work at the conceptual design and feasibility stage are acceptable. Additionally, there is no clear definition of "new" warhead versus "modified" warhead. In answer to an explicit question, DOE essentially said that it could change the nonnuclear components, the primary, the secondary, the yield, the military characteristics, and still call it a modification of an existing design.[5] Internationally, it is difficult for the U.S. to argue that the SSM Program's sole aim is to maintain stockpile safety and reliability when not only have existing facilities been used for design but are also being greatly augmented by new facilities. Continuing conceptual development of next generation facilities, such as the Advanced Hydrotest Facility, further aggravate the situation.

The B-61 modification program is not the only current area of continuing design work. Submarine Launched Ballistic Missiles are also listed as a major area of study.[6] Asst. Secretary Reis has testified that planned near-term stockpile modifications include W76 re-certification, W88 pit rebuild, and the B61 Mod 11.[7] LANL states that "[f]uture initiatives may include the application of robust design concepts from a current DOE/Department of Defense (DoD) to assess proposed strategies for replacing weapons in the stockpile in the absence of nuclear tests and an extensive production complex."[8] Moreover, DOE states that it will "[c]onduct other weapons studies as requested by the Department of Defense."[9]

2/40.07 continued

In the future, the intervening time between design and production will be greatly compressed. For example, "Sandia has demonstrated feasibility of very tight coupling of design and production processes....Weapons systems designers will be able to determine if their designs-are manufacturable with the available production systems."[10] "They will permit more rapid prototyping by simulating and validating process options on computers, rather than on the factory floor."[11] "Advanced rapid manufacturing is the logical successor to rapid prototyping."[12] Thus, in the near future, it appears that the U.S. nuclear weapons complex will be capable of holding designs "on the shelf" for rapid small-lot production when it is deemed necessary.

1/40.60 continued

In addition to possible future design and production, the planned longevity of U.S. nuclear weapons programs contradicts NPT Article VI. It is mere lip service for the DPEIS Summary to state that "the NPR strategy does express the U.S. intent to pursue further arms reductions in nuclear forces beyond START II." The fact is that the SSM Program, asproposed, explicitly builds in direct opposition to our NPT obligations. Throughout the DPEIS, three stockpile size cases are assumed in order to arrive at production capacity assumptions. They are 1) a base case of 3,500 "accountable" warheads (START II level), 2) a high case of 6,000 accountable warheads (START I level), and a low case of 1,000 accountable warheads (<START I level).[13] In all preferred Stockpile Management alternatives, activity costs are projected out to the year 2020. To postulate the existence of even a 1,000 warheads (not to mention continuing R&D) to the year 2020 is not acceptable. It is not enough to state that the NPR strategy expresses intent to pursue reductions beyond the START II level. If SM activities are projected until the year 20020, then DOE must include in the SSM PEIS a stockpile in the few hundreds as demonstration of a national commitment to the NPT. DOE's two previous attempts to complete the Reconfiguration PEIS were doomed by failures to consider smaller stockpile sizes. This mistake should not be repeated.

4/32.12

As it is, not only is an appropriately low stockpile size not considered, but under all considered stockpile sizes, costs for SM activities continue to rise every year until the year 2020. Under DOE's preferred alternative to perform pit fabrication, requalification and reuse at LANL, program costs are described as consisting of 1) capital investment, 2) steady-state operations, and 3) cost of the ongoing pit evaluation and R&D program.[14] First of all, CCNS does not believe that further capital investment above maintenance is required. Secondly, there is not meant to be any "steady-state" costs. As per a genuine commitment to NPT Article VI, stockpile sizes and infrastructure are to continually decline until the disarmament goal is finally honored.

5/32.01

Thirdly, proposed plutonium R&D programs are in large part for the express purpose of re-establishing the capability for larger-scale pit production.[15 16 17] Asst. Secretary Reis states that "[m]aintaining the stockpile has

10 *FY 1995 SNL Institutional Plan*, chapter 5-p. 3.
11 *FY 1995 SNL Institutional Plan*, chapter 5-p. 5.
12 *FY 1995 SNL Institutional Plan*, chapter 5-p. 9.
13 From *Draft Stockpile Management Preferred Alternatives Report*, DOE, February 1996.
14 Ibid.
15 DOE states that it "will perform development and demonstration work at its operating plutonium facilities over the next five years to study alternative facility concepts which could be utilized in the future in the construction of a larger fabrication capacity." *Draft Stockpile Management Preferred Alternatives Report*, DOE, February 1996, p 13.
16 LANL Director Hecker testifies that "[w]e are also teaming with colleagues at Lawrence Livermore, Savannah River, and Pantex to develop contigencies for larger-scale pit production requirements. We expect to learn much from the W88 pit rebuild program and the 50-pit manufacturing module at TA-55 that would allow the team to design a modular, large-scale production capability that could be deployed rapidly should requirements change." Hearing of the Subcommittee on Military Procurement, Committee on National Security, March 12, 1996, Dr. Hecker, p. 12.
17 LANL states that the "long-term Los Alamos National Laboratory mission needs for such capabilities [*which an upgraded Chemical and Metallurgical Research Building would provide in support of LANL's plutonium processing at TA-55*] are currently programmed for at least another 20 to 30 years." *FY 1997 LANL Capital Assets Management Plan*, CMR Activit y Data Sheet, p. A-17.
18 Hearing of the Subcommittee on Military Procurement, Committee on National Security, March 12, 1996, Asst. Sec. Reis, p. 5.
19 Hearing of the Subcommittee on Military Procurement, Committee on National Security, March 12, 1996, Dr. Tarter, pp. 7 and 11.

2/40.07 continued

become a program which will provide for indefinite life extension."[18] LLNL Director Tarter states that "the laboratories and plants are developing comprehensive life-extension plans for each weapon system slated for the enduring stockpile" and "[t]he objective is to enhance the structural integrity of the W87 so that it may remain part of the enduring stockpile beyond the year 2025...."[19] All of this is backwards and contrary to the NPT.

6/40.02

DOE planned subcritical experiments at NTS are poorly rationalized and certainly poorly timed. That these tests are slated to be performed underground, even as negotiations for the CTBT are expected to be their concluding phase, raises serious verification problems that could help stymie achievement of the CTBT. While the first two tests will reportedly not involve weapons configurations, DOE has not stated that future tests will have this prohibition. If weapons configurations are used, this could result in fission yields that, while small, would nevertheless contradict the express goal of achieving a "zero-yield" CTBT. Subcritical tests are not required to maintain NTS readiness. Nor is there reported evidence that suggests that plutonium aging affects weapons performance, which is the touted area of study for these tests. The subcritical tests are ill advised and should be canceled. They should under no circumstances be performed underground. If DOE is rash enough to proceed with these tests, they should be conducted above ground in containment vessels under international monitoring.

2/40.07 continued

In sum, the SSM Program, proclaimed as the safeguarding mechanism for U.S. participation in a Comprehensive Test Ban Treaty, can have the end effect of seriously undermining universal observance of the NPT and may help hinder completion of the CTBT. Keeping the Nevada Test Site open, planning the subcritical tests, maintaining stockpile sizes beyond what is required for minimal deterrence, all the while making massive investments in future nuclear weapons facilities, will be widely viewed as violating NPT Article VI.

7/40.22

II. SSM Program Rationale, the *Stockpile Life Study* and *Stockpile Surveillance: Past and Future*

The underlying rationale for the SSM Program is that the loss of full-scale underground testing will lead to decreasing confidence in the safety and reliability of the aging nuclear weapons stockpile. Absent this rationale, it would be difficult for DOE to justify operating current facilities, much less build new ones, since official policy now proclaims that no new nuclear weapons will be produced. In December, 1993, SNL completed its *Stockpile Life Study* (hereafter "Study" or SLS), which largely undercuts the SSM Program's rationale. The Study reviewed the entire history of the modern nuclear weapons stockpile, analyzing data from the testing and evaluation of 13,500 weapons out of a total of 70,000 stockpile weapons. Historically, 2,330 "defects", including multiple occurrences, were discovered. Out of these, 257 "actionable" defect types were identified, of which 32% led to "product change proposals" (PCPs) involving retrofits and major design changes. About half of all PCPs were due to new weapons requirements rather than defects.

The Study found that with surveillance and repair, U.S. nuclear weapons retain high safety and reliability: "[A]lthough nuclear weapons age, they do not wear out; they last as long as the nuclear weapons community (DoD and DOE) desires. In fact, we can find no example of a nuclear weapon where age was ever a major factor in the retirement decision." In the viewgraph "Factors Affecting Weapons Retirements" states that "missions, policy, standards, delivery systems, and state-of-technology change; however, nuclear weapons do not wear out." "Mk Number Lifetime" demonstrates extensive experience with "old" weapons, some with stockpile lives of 35 years or more. "Average 'Actionable' Defect Types...." demonstrates (with archival data of 28 years) that nearly half of all defect types are discovered in the weapon's first three years and 80% in the weapon's first fifteen years. Defects caused by aging are rare and have not increased over time since a weapon's first production unit. Additionally, the stockpile is not now reaching an advanced age due to scheduled retirements under arms reduction agreements. Weapon systems designated to remain in the post-START II stockpile currently range between seven and seventeen years of age.

Only a very small fraction of the *few* defects discovered have significantly affected reliability: "Failures, defects, and aging problems have been discovered, but these have been rare." Of these already rare defects, 57% were found to have no effect on reliability. Ninety-six per cent of those defect types considered significant enough to be "actionable" were subsequently judged to affect reliability less than 10%. A total of 10 defect types were found that resulted in a reliability decrement of 10% or more.

Very few defect types have been discovered in nuclear weapons primaries or secondaries. "257 'Actionable' Defect Types...." shows that only 5% of defect types have involved primaries. Conspicuous in their absence are any defects in weapons secondaries.

Underground nuclear tests (UGTs) have not uncovered defects and have not been used to design fixes: "The Stockpile Evaluation Process" depicts a robust existing stockpile surveillance program. "The Stockpile Evaluation Program does not

7/40.22 continued

include underground testing." "Nuclear Weapons Defects, Where....Discovered" states that "actionable" defects were never first discovered in stockpile confidence underground testing. Underground tests have been used to confirm the reliability of only four changes to stockpile weapons since 1970.

Past defects have been fixed and few are anticipated in the future: Nuclear weapons "are not allowed to degrade." The Study does not identify any defect that could not be understood or any component that could not be replaced in the last thirty years. "Future Workload Issues" anticipates that an average of "1 [one] 'actionable' defect will be discovered each year."

The Study adds weight to previous studies and expert opinion showing that the safety and reliability of the U.S. nuclear weapons stockpile can be maintained under a comprehensive nuclear testing ban. The key implications of the SLS – that the U.S. arsenal is highly "reliable;" that underground testing has rarely been used to confirm the reliability of stockpiled weapons; and that future defects can be fixed with existing surveillance programs and facilities – are highly relevant to the proposed SSM Program.

The Study was prepared by SNL's New Materials and Stockpile Evaluation Program. SNL designs the nonnuclear components of nuclear weapons, while LANL and LLNL design the nuclear components. SNL conducts the stockpile evaluation process. Although written by SNL, the Study incorporates all defects that were significant enough to merit "product change proposals," including the few defects found in the nuclear components.

In fall, 1994, LANL and LLNL weapons scientists were unable to provide the Galvin Commission with any examples of defects in the enduring stockpile that were not already counted in the Study. All 26 PCPs in the enduring stockpile were individually reviewed. The findings of the Stockpile Life Study raise questions not only about any supposed need for additional nuclear testing, but also about the purpose and justification for the SSM Program. Under the guise of carefully and conservatively managing an aging stockpile's safety and reliability without underground testing, the weapons laboratories have pushed for a set of new facilities that have little to do with stockpile management. None of DOE's proposed SSM program facilities, nor its Advanced Strategic Computing Initiative, have been needed to maintain the arsenal up to now. Underground testing has played only a very limited role in stockpile evaluation and maintenance for the last 25 years. Despite the rarity of defects involving primaries, and none involving secondaries, nearly all of the proposed SSM Program investment is directed at the nuclear portion of weapons. Certainty about the performance of the exhaustively-tested weapons in the so-called "enduring stockpile" has never been higher. The SLS undercuts the rationale that the loss of underground testing creates the urgent need for future facilities to ensure stockpile safety and reliability.

Subsequent to disclosure of the Study, DOE has criticized the SLS as having been the work of one weapon laboratory, and a primarily nonnuclear laboratory at that. In response, DOE prepared a new study *Stockpile Surveillance: Past and Future*, signed off on by all three weapons laboratories. This study has in turn been incorporated

7/40.22 continued

by reference into the DARHT FEIS, and excerpted at length in the DPEIS. As the DPEIS Summary puts it, "The past role of nuclear testing is emphasized [in the new study] because such testing can no longer be relied on to provide unambiguous high confidence in the future safety and reliability of an aging stockpile." By inference, this provides the justification for the many proposed Stockpile Stewardship facilities.

As the DPEIS Summary readily agrees with the SLS, three-quarters of weapons defects have been detected by the existing Stockpile Surveillance Program. However, the Summary goes on to say that "[n]uclear tests have identified certain classes of stockpile problems not observable in the surveillance program." First of all, as a baseline, all current weapons are certified to be safe and reliable. From here, analysis of past problems and anticipation of future problems must be separated into safety and reliability issues. The two paragraph discussion of stockpile data in the DPEIS (p. 2-6) is wholly inadequate for this purpose. Future iterations of the SSM PEIS must explicitly separate the two issues.

Historically, safety problems have been addressed through operational changes and the scheduled retirement of weapons that do no not meet modern safety standards. Dr. Ray Kidder, former LLNL senior physicist, has stated that aging affects reliability rather than safety.[20] As to the need for testing for reliability, Richard Garwin has stated "[t]hat's a red herring. Historically, nuclear test explosions have not been the mechanism used to determine the reliability of the stockpile. Further, reliability cannot be verified in that way" and "because 'reliability' is a statistical construction, it is clear - or it should be clear - that not enough weapons can be fired to insure statistical reliability."[21]

J. Carson Mark, ex-director of LANL's Theoretical Division, has argued that "the reliability, effectiveness, safety and security of our nuclear arsenal can be maintained without nuclear tests" long in advance of the proposed SSM Program. He said:

> For a more meaningful perspective [on historical defects] one needs to know something of the actual course of events. It is true that checking on or solving problems with some 14 weapon models out of a (then) total of 41 has involved some post-deployment nuclear tests. Nine of these involved weapons which were deployed, or scheduled for deployment, during the 1958 - 1961 testing moratorium, and simply had not been adequately tested in their final configuration before being placed in the stockpile....They convey a very clear message: A weapon should not be deployed before all of the tests necessary to certify it for deployment have been made and provided acceptable results....This lesson has been learned. It has nothing to do with

20 "Metals corrode, and organic matererials such as plastics, adhesives, and HE that are present in a nuclear warhead will deteriorate with age. Such aging effects degrade a warhead's reliability rather than its safety...A severe case of aging was the deterioation of the HE in the W68 Poseidon warhead....The reliability, but not the safety, of the warhead was affected." Report to Congress: *Assessment of the Safety of U.S. Nuclear Weapons and Related Nuclear Test Requirements*, R.E. Kidder, July 26, 1991, p.6.
21 "Atoms Do Not Age," *Bulletin of Atomic Scientists*, October 1993.

> the need for continued testing to maintain the reliability of the existing U.S. stockpile...If the surveillance program reveals a major problem with an important weapon - such as explosive deterioration or fissile material corrosion - the weapon can then be manufactured to exactly its original specifications, without further testing...Most important, no changes or improvements in matters which could affect the behavior of the nuclear system in an existing, certified weapon design would be acceptable."[22]

7/40.22 continued

Earlier, in 1987, Dr. Kidder expressed a similar view:

> The test record indicates that the nuclear weapons in the existing U.S. stockpile are sufficiently robust to allow for future replication....the test record does not support the thesis that reliable manufacture cannot be accomplished...Assuming, therefore, that vendor-supplied materials and components are still available at the time desired for remanufacture (and this will not necessarily be the case), the remanufacture of existing, well-tested warheads is possible...It seems clear that if appropriate action were taken in advance, the future validity of these components and materials could be assured.[23]

8/40.33

The DPEIS is deeply flawed through its categorical rejections of the *Remanufacturing* and *Maintenance Alternatives*. DOE's bottom line is that "emphasis on nuclear components which can no longer be functionally evaluated by nuclear tests" precludes adoption of the *Remanufacturing Alternative*. CCNS believes that 1) if the political will were present in the weapons community to provide in advance for remanufacturing of all components, the validity of remanufacturing would be assured; and 2) that (as Kidder and Mark indicate) the history of testing does not support exclusion of nuclear components in an overall remanufacturing approach. Similarly, we believe that DOE's rejection of the *Maintenance Alternative* is baseless, given the evidence of the Stockpile Life Study and other citations included in these comments.

7/40.22 continued

DOE's new report *Stockpile Surveillance: Past and Future* is disingenuous in a number of ways. First, for reasons discussed in the preceding section, it puts undue emphasis on the role of underground testing in the discovery of historic defects. The Tri-Lab study also performs a sleight of hand by adding three weapons for a total of ten in the "planned" stockpile (year 2000), as opposed to the SLS's seven weapons in the "enduring" stockpile (post-START II and -year 2004). The SLS also has explicit categories for "explosive components" and "nuclear parts (pits)." The newer study combines the two into the category "primary," thereby inflating the overall number of defects in this crucial category. By claiming over 200 findings for the planned stockpile, in comparison to the 26 major "product change proposals" (PCPs) reported in the SLS, it would indeed appear that problems with an aging stockpile would be more severe than originally thought. However, when the 29

22 "Do We Need Nuclear Testing?" J.Carson Mark, *Arms Control Today*, November 1990.
23 *Maintaining the U.S. Stockpile of Nuclear Weapons During a Low-Threshold or Comprehensive Test Ban*, R.E. Kidder, October 1987, pp. 6 & 7.

7/40.22 continued

"actionable" findings for the extra three weapons in the "planned" stockpile[24] are subtracted from the 110 "investigated-corrective action" findings in the Tri-Lab study,[25] 81 actions remain. Employing the stated ratio of 31%[26] implemented retrofits or major design changes to total actionable findings, 25 retrofits or major design changes are found to have been implemented for weapons remaining in the enduring stockpile. The SLS had reported 26 retrofits or design changes for those same weapons.[27]

Both studies reach the same bottom line for future necessary changes as well. The SLS states under "Future Workload Issues" that "For the enduring stockpile (comprised of 7 systems), historical data suggest that : 1 'actionable defect' will be discovered each year. About 2 PCPs will approved each year - 1 of these will constitute a major change." The Tri-Lab study states "based on the age of the planned stockpile over the next ten years, historical data would project an average of one to two change proposals per year, with one of these resulting in a major change."[28] The Tri-Lab study, however, immediately spins that "these projections are most likely minimum numbers," arguing that the stockpile these projections were derived from was on average younger than the "planned" stockpile in future years. As already discussed, the SLS clearly shows that defects decrease with age. Moreover, the stockpile is not now advancing into an overly "old" age because of the already scheduled retirement of older weapons.

In private conversation, senior DOE officials have presented the imagery of the "bathtub curve," where after a weapon's first production unit the number of defects sharply decline, then remain fairly stable, to finally rise in time with age. These officials acknowledge that the data doesn't yet exist to support this hypothetical rise in defects. The salient fact, with respect to SSM Program rationale, is that existing programs and existing facilities have successfully dealt with historic defects rates that exceed those that are now anticipated for the future. DOE and the DPEIS provide insufficient justification for the expensive and internationally provocative SSM Program. Because the rationale is so baseless, CCNS is forced to conclude that the SSM Program is political cover for maintaining the design and production capabilities mandated by the Nuclear Weapons Posture Review.

With respect to possible expansion of weapons effects R&D capabilities through the construction of future facilities (such Jupiter) under the SSM Program, CCNS sees no underlying rationale whatsoever.

9/40.39

Finally, DOE has acknowledged that weapons scientists had the foresight some time ago to set aside carefully measured quantities of special nuclear material (perhaps in actual weapons configurations) for the express purpose of studying future aging

24 *Stockpile Surveillance: Past and Future*, September, 1995, graph, p.38.
25 Ibid, graph, p.31
26 Ibid, graph, p.26.
27 CCNS does not claim that these numbers are definitive. The bar charts in both studies are crude in their precision, and exact numbers of findings per defect category could vary by plus or minus one in some cases. The overall point stands: *Stockpile Surveillance: Past and Future*, once corrected for the "enduring stockpile," validates the findings of the *Stockpile Life Study*.
28 *Stockpile Surveillance: Past and Future*, September, 1995, p.13.

9/40.39 continued

effects. The results of these studies could be central to the debate over age-induced defects. DOE should release relevant data on this subject in the SSM PEIS.

III. DOE's NEPA Hierarchy

DOE's programmatic reviews have been compelled by litigation by citizens groups, originally in 1989, which led to an agreement by DOE to perform the Reconfiguration PEIS (R-PEIS) and the Environmental Restoration and Waste Management PEIS. Subsequent litigation in 1994 led to a resumption of the R-PEIS, which was then renamed the SSM PEIS. DOE has improved its NEPA compliance, and there is now a proliferation of PEISs. The aim of this section is to point out the gaps or inconsistencies between these PEISs and other DOE NEPA processes.

10/42.12

Consideration of environmental impacts caused by environmental restoration activities has been completely dropped in the current Waste Management PEIS (WM PEIS). Overall, there is no adequate discussion of potential wastes from disposition activities, "reasonable" alternatives for reprocessing found in various EISs, and wastes from proposed MOX-fuel reactors. Under the WM PEIS, large volumes of future wastes to be explicitly generated by the SSM Program[29] are being preliminarily evaluated.[30] There is no link between the WM PEIS and the SSM PEIS in discussion and consideration of the environmental effects and costs of future wastes generated by the SSM Program. The SSM PEIS, with a scheduled completion date of August 1996, will no doubt precede completion of the WM PEIS (which, at this time, has no announced completion date). Hence, DOE will be implementing its SSM Program before the effects and costs of program wastes have been fully evaluated against the matrix of all other DOE waste issues.

11/42.05

No NEPA process programmatically covers the increasingly important issue of reprocessing. Reprocessing is partially covered in different aspects by a pyroprocessing EA for INEL, the Disposition PEIS (which covers only "surplus" materials and hence is not relevant to the SSM Program), the Foreign Research Reactor Spent Nuclear Fuel EIS (not relevant to the SSM Program), and two SRS EISs (see Section V below). There is a need for an integrated document that evaluates reprocessing as a whole across the residual complex, in contrast to the incoherent formulation of reprocessing policy through disparate documents. An overall document is needed to evaluate possible proliferation impacts, environmental impacts and program costs, instead of a piece-meal drift back into reprocessing.

12/42.10

For obvious reasons, the DPEIS is linked to the Tritium Supply and Recycling PEIS. As a matter of process, the old R-PEIS was bifurcated into the two individual PEISs

29 "As modified, the WM PEIS focuses on waste management facilities (those required to treat, store, or dispose of existing wastes and wastes that will be generated in the future as a result of DOE nuclear weapons stockpile and stewardship and research programs". Draft WM PEIS Summary, USDOE, August 1995, p. 13.
30 For example, "Low-level waste. Approximately 114,000 cubic meters of LLW are stored, and an estimated 1,378,000 cubic meters are expected to generated over the next 20 years....Volumes do not include environmental restoration wastes." Ibid, p.11.

12/42.10 continued

only in October 1994. Since the DPEIS rejects consideration of stockpile sizes below a thousand warheads (despite the DPEIS's inherent conflict between considering SM activities until the year 2020 and NPT Article VI), the DPEIS builds in a bias towards the necessity for future tritium production. Furthermore, as discussed in the section below, the DPEIS's assumption of the START II base case for planned stockpile size may well inexorably lead to higher stockpile sizes. This in turn will boost the need for tritium production. The point is that better integration between the two PEISs is required.

13/42.01

Plutonium pit storage is considered in at least three different documents: strategic pit storage in the DPEIS, interim surplus pit storage in the Pantex Site-Wide EIS (SWEIS), and long-term surplus pit storage in the Disposition PEIS. DoD sites are not considered for long-term pit storage, although the Manzano Weapons Storage Area near Albuquerque is the largest existing facility for such storage and is listed as a reasonable alternative for interim storage in the Pantex SWEIS. Again, better program integration is required.

At the site level, present NEPA documentation is not adequate for sites potentially impacted by SSM Program alternatives and/or reprocessing options. SNL has never had a SWEIS. LANL's last SWEIS is hopelessly outdated (a new one is now in process, but it appears questionable that all likely SSM Program projects will be addressed). The in-process Pantex SWEIS covers pit storage, but not adequate analysis of low-level waste, mixed waste, and other SSM Program or Disposition PEIS activities at the site. For INEL, pyroprocessing impacts and management of all existing LLW, Tru, and HLW is not integrated into one single site document. Similarly, for SRS the impacts of tritium production, future MOX fuel reactor operations, reprocessing, and waste management activities are not integrated into one site document.

14/40.90

At the site level, it appears at times that a deliberate policy of inappropriate NEPA segmentation is being pursued. A good case in point are the proposed upgrades for LANL's Chemical and Metallurgical Research Building. The three planned upgrade phases have historically lacked clear demarcation between them. All phases have been combined into a single budget line item. The Defense Nuclear Facilities Safety Board has commented on how technical inconsistencies exist between what is described in program documents and what is actually being implemented in the Phase 1 Upgrade. In addition to a draft EA for the Phase 2 Upgrade, separate EAs were done for the Fire Resistant Pit Program and the Radioactive Resource Recovery Program, despite the fact that all of these activities are occurring in the same building and closely in time. Finally, interim storage of 46 spent fuel rods in the CMR Building is "presumably only valid for a short time"[31] and no reported decision has been made on their long-term storage. All of this takes place against the backdrop of a laboratory with repeated NEPA violations and no currently valid SWEIS from which to tier project-specific reviews.

15/41.16

CCNS believes that a policy document is needed as the "mother" of all of these NEPA processes. Such a document would provide the bridge between the PEISs

31 *Spent Fuel Working Group Report*, USDOE, November, 1993.

15/41.16 continued

(and other NEPA processes as needed) and consider their inter-relatedness. We believe that such an effort, fully integrated between DOE DP and EM, would greatly enhance the Department's decision-making capabilities and result in better decisions.

IV. SSM PEIS Stockpile Sizes and SSM Capabilities

1/40.60 continued

In the DPEIS, "DOE assumes that facilities would be sized and operated to support a base case stockpile size consistent with the START II protocol. This PEIS also discusses impacts that would be expected for supporting a larger stockpile based on START I Treaty Levels, and a hypothetical stockpile smaller than the START II protocol." (DPEIS p. S-3) This assumption is somewhat glib in that the DPEIS totally ignores the relationship between Russian Duma ratification of the START II protocol and further arms control negotiations. Sentiment is strong in the Duma that the U.S. is essentially outsmarting Russia, leaving it at a strategic disadvantage. This is, in large part, due to Russian suspicions over tighter strategic encirclement by the West through the eastern expansion of NATO and current American proposals for an anti-ballistic missile defense (which theoretically could enhance U.S. first-strike capabilities). More germane to the DPEIS is that START II is widely perceived in the Duma has being inherently unfair. Under the protocol, land-based ballistic missiles would be prohibited from deploying more than one nuclear warhead. This is a distinct disadvantage to Russia, which predominantly relies on its land-based arsenal. It favors the U.S. with its fleet of submarine-launched missiles, which face no similar restriction. These fears on the part of the Duma may keep it from ratifying START II.

As Jack Mendelsohn of the Arms Control Association put it, "An awful lot is riding on the continued reduction of these missile systems. If you reverse this process, you begin to slip back into action-reaction, move-countermove, and the potentially confrontational and distrustful atmosphere that existed before the collapse of the Soviet Union."[32] From this perspective, the DPEIS baseline is not the passive base case it may appear to be. Due to "move-countermove," the planned composition of the U.S. stockpile under the START II protocol may in and of itself initiate the need to "hedge" backs towards the higher START I level. Therefore, an inherent prejudice is built into the DPEIS. Rather than treating a sub-START II stockpile as hypothetical, the DPEIS needs to aggressively plan for further arms cuts in order to help assure START II ratification by the Duma. The alternative may inevitably be stockpile sizes greater than the START II level.

16/40.36

DOE claims that "National security policies in the post-Cold War era require that all the historical capabilities of the weapons laboratories, industrial plants, and NTS be maintained. Capability is the practical ability to perform a basic function or activity. Stockpile stewardship and management capabilities are independent of foreseeable future stockpile sizes." (DPEIS p. S-3) As previously discussed, existing surveillance programs and facilities appear to be more than adequate to fulfill the proclaimed

32 "Russian, U.S. Politics May Rekindle N-Tensions," Peter Slevin, Knight-Ridder Newspapers, May 12, 1996.

16/40.36 continued

SSM Program mission of ensuring the safety and reliability of the enduring stockpile. However, beyond merely maintaining historic capabilities of stockpile stewardship facilities, DOE is instead seeking to aggressively expand their capabilities through proposed facilities. This is rejection of stockpile curatorship. Curatorship, underpinned by existing surveillance programs and facilities and remanufacturing as needed, would maintain a credible deterrence. The DPEIS is deficient through its failure to examine and justify what is genuinely needed for deterrence.

17/40.56

The DPEIS inappropriately constricts the window of time that is considered in the document. As already mentioned, the R-PEIS was in process for six years without coming to completion. During that time, the second alternative of the revised R-PEIS (the modify- and upgrade-in-place alternative) was being incrementally implemented without the benefit of a ROD. Now the DPEIS designates the No Action Alternative to include "all existing facilities for which Congressional budget 'line item' construction was started by the end of fiscal year 1995 (September 30, 1995)." (DPEIS p. S-22) For the out years, DOE claims that future major facilities are

18/41.17

not to be included in the DPEIS "because they have not reached the stage of development and definition that is necessary for evaluation and decision making." [See discussion of the Advanced Hydrotest Facility below.] Yet the DPEIS plans for Stockpile Management activities until the year 2020. The SSM PEIS can't have it both ways.

1/40.60 continued

CCNS rejects DOE's assertion that needed Stockpile Management capabilities are independent of future stockpile sizes. As previously explained, assumption of the START II stockpile size may in turn lead towards higher stockpile sizes. This, in turn, can lead to implementation of the plans now being developed for larger scale pit production. On the other side, a drive for continually decreasing stockpile sizes could concomitantly lower the need for long-range maintenance of SM capabilities, at the same time better coinciding with national and international nonproliferation efforts.[33]

6/40.02 continued

The NTS budget should be cut to a skeletal budget in order to demonstrate a genuine commitment to the CTBT. The proposed subcritical tests at NTS should be permanently canceled. Under no circumstances should they be held underground because of the accompanying transparency problems.

19/40.41

V. DARHT, Plutonium-242 Reprocessing and the SSM Program

The abstract to the SSM PEIS contains the following sentence: "A classified supplement has also been prepared to support the purpose of and need for the plutonium-242 to be stabilized at SRS for use in future weapons complex research and development activities." In other recent NEPA analysis, DOE had designated

33 DOE personnel have made the argument that the existing suite of SM facilities needs to be maintained so that dismantlement activities can continue. This obviously applies to some facilities, such as Pantex, but does not explain, for example, $300 million in upgrades TA-55 and $240 million in CMR Building upgrades at LANL.

19/40.41 continued

Pu-242 in solution at the Savannah River Site as "Programmatic" material, had stated that it is not in a form that can presently be used, and that future DOE decisions will decide on its use.[34]

Pu-242 is not fissile like Pu-239 that is used in weapons, hence it is ideal for future use in hydrotesting at DARHT. That rate of use is likely to be above the historic rate of use at PHERMEX.[35]

The DPEIS recognizes that the Interim Management ROD "left programmatic decisions for the plutonium-242 to DP." Subsequently, "DP has determined that the plutonium from-242 from SRS would be useful for future R&D activities." DOE then constricts discussion by stating that "the issue for this PEIS concerns where to store the plutonium for such use. This section provides an analysis of the alternatives for storing SRS plutonium material for future R&D use. Further information regarding shipping, storage and use of this material is contained in a classified appendix to this PEIS." (DPEIS p. 4-571 & 472, *"Use of Plutonium-242 for Research and Development"*)

In the DPEIS, alternatives being evaluated for Pu-242 storage are to leave the material in place at SRS (the No Action Alternative), or to transport the material to LANL or LLNL for use in R&D. The DPEIS notes that LLNL is currently reducing its plutonium inventory. For LANL, the expected storage site is TA-55, presumably at the Nuclear Materials Storage Facility which is linked via tunnel to PF-4, the only currently operating plutonium fabrication facility in the country. The DARHT FEIS notes that the "plutonium processing capability at TA-55 is extensive and adequate for the required operations: chemical separation, alloy preparation, foundry capability, casting and machining."[36] PF-4 also has a dedicated Pu-242 scrap recovery area.[37]

34 "DOE categorized certain nuclear materials as Programmatic ....These consultations identified plutonium-242....as potentially required ...." "At present, DOE uses plutonium-242 for research...." (p.1-22) Under table 1-1, DOE has 13,000 liters of Pu-242 solution stored in H canyon. "Plutonium-242, which DOE could use in the nuclear weapons stockpile stewardship program..." and "All the programmatic material already exists at the Savannah River Site. However, none of the material is in a form that DOE could use at present." (p.2-5) "Future DOE decisions will determine if these materials will actually be used." (p.2-6) *Interim Management of Nuclear Materials FEIS*, DOE SRS, August 1995.

35 This can only be inferred by comparison to past rates of uranium use since information on plutonium is classified. On DARHT FEIS page 3-24, DOE states that in 1988 EPA NESHAPs approval was obtained for the DARHT baseline alternative. This approval limited the annual expenditure of uranium to 220 kg. "This limit was based on the amount of depleted uranium used at PHERMEX during the mid-1980s. However, since that time, underground nuclear testing has ceased, programmatic objectives have changed, and a limit of 1,540 lb (700 kg) would be required to meet all objectives under this alternative."

36 DARHT FEIS, USDOE, August 1995, p.3-6.

37 "The north half of Building 4 houses plutonium source production facilities, plutonium metal equation of state and chemistry research, and PU-242 scrap recovery areas in the 200 area compartment." Point Summary for TA55-4, November 23, 1992.

20/41.18

In the DPEIS, DOE repeats its assertion that "DOE has determined that implementing the DARHT ROD will not prejudice any ultimate decisions in the Stockpile Stewardship and Management Program." (Volume 1, page 1-9, emphasis added) In the course of DARHT litigation, DOE had claimed that "proceeding with DARHT now will not prejudice any decisions to be made pursuant to the Stockpile Stewardship and Management Programmatic EIS or the Los Alamos National Laboratory Site-Wide EIS."[38] DOE does, however, admit to DARHT's relevance to both the PEIS and LANL SWEIS.[39]

19/40.41 continued

The Department states that "DOE addressed production/processing of plutonium within the LANL infrastructure, relevant to all isotopes, in the [DARHT] FEIS."[40] While that discussion in the DARHT FEIS is only cursory, at least DOE concedes to the necessity of discussing production/processing relevant to all isotopes. What the DARHT FEIS failed to raise were impacts on plutonium infrastructure outside of LANL related to the DARHT decision.

In sum, extensive future use of Pu-242 at DARHT is possible; that use may help prompt resumption of processing of Pu-242 at SRS; therefore, implementing the DARHT ROD can arguably prejudice decisions to be made in the SSM Program. These DOE decisions related to the reprocessing and use of Pu-242 need consideration in the SSM PEIS. Furthermore, any resumption of reprocessing needs programmatic analysis of possible proliferation and environmental impacts.

VI. The SSM PEIS and DARHT's Second Axis

20/41.18 continued

DOE successfully argued in federal court that DARHT is an independently justifiable interim action, one that could proceed in advance of completion of the SSM PEIS and a new LANL SWEIS. Therefore, the injunction against construction and operation of the facility was dissolved.[41] In his opinion, the judge noted that LANL "currently has a single-axis radiographic hydrotest facility called PHERMEX which was constructed in the 1960's, however its penetration and the resolution of its images are markedly inferior to that expected from DARHT. Moreover, the addition of a second axis at DARHT creates the capability to obtain time-sequenced images and three-dimensional data. DOE has therefore decided to replace PHERMEX with DARHT and dismantle PHERMEX entirely."[42] It remains to be seen if LANL will dismantle PHERMEX, given current upgrades to that facility.

21/41.20

DARHT's second axis is, however, a separate and distinct budget line item. It was intentionally programmed that way because it was judged that the technology of the accelerator for the first axis needed to be demonstrated before

42 Ibid, p. 3.

21/41.20 continued

installation of the second axis.[43] Moreover, there is not consensus on the fundamental issue of the need and benefits of dual-axis technology at DARHT.[44] As mentioned, DOE admits to the relevance of DARHT to both the SSM PEIS and the LANL SWEIS. DARHT's Second Axis construction start date is 1997; it's costs are at $37.4 million. The Atlas Facility has a start date of 1996; its costs are $43.3 million.[45] Hence, the two projects are roughly comparable in costs and start dates. Whereas the Atlas Facility is included in the DPEIS, it is unacceptable that the DARHT Second Axis is not. The SSM PEIS should include consideration of DARHT's second axis.

VII. The Advanced Hydrotest Facility

18/41.17 continued

CCNS offered extensive comment on DARHT and the SSM Program in August 1995 SSM PEIS scoping comments. Those comments addressed DARHT's future relationship to possible nuclear weapons design and remanufacturing and NEPA issues concerning the DARHT EIS. As mentioned above, DOE has continually maintained that DARHT is an independenty justifiable project. One step under NEPA in determining whether a project is independently justified is a finding that a project will not lead to subsequent developments. CCNS argued that DARHT does lead to subsequent development. First and obvious is DARHT's proposed second axis, which is a separate budget line item. Yet more significant is the proposed $422 million Advanced Hydrotest Facility (AHF). LANL states that "[t]he Advanced Hydrotest Facility (AHF) will consist of a large radiographic accelerator system that builds on current flash x-ray (FXR) machine technology and that is planned for DARHT."[46] The JASONs describe the AHF as "the next major step in improving hydrotest capabilities" after DARHT. They also state that "[f]urther simulations and analysis, and experience with DARHT, are needed before one can judge the cost/benefit of further improvements in hydrotest capabilities, such as envisioned for a future Advanced Hydrotest Facility...."[47]

In the course of the DARHT litigation, Asst. Secretary Reis declared the following:

> "The SS&M PEIS will not consider any other new facility to provide the necessary enhanced radiographic hydrotest capability. Early in the planning

---

43 "Prior to the construction of the second leg of the facility, I would suggest a comprehensive review of the experience of others with dual-axis experiments." Dave Hall.
"The second DARHT leg will be useful, but not nearly so important as attaining or exceeding the accelerator performance goals for the first leg." Ray Pollock.
"However, these uses and possibilities [of dual-axis experiments] seem to be niceties rather than significant capabilities, and they hardly justify the cost (and relative inflexibility) of a second LIA axis, with a fixed focal point and severe constraints on containment sphere design." Seymour Sack, *Hydrotest Program Assessment*, HPAIC, October, 1992.
44 "There was no consensus position presented to this panel on the needs and benefits of two beam radiography." Juan Ramirez, DARHT Feasibility Assessment Independent Consultants *Final Report*, March 1995, p. 36.
45 Costs and construction start dates from the *FY 1996 LANL Institutional Plan*, p.82.
46 FY 1996 LANL CAMP AHF Activity Data Sheet.
47 Draft Stockpile Stewardship Report, JASON, August 1994, pp. 29 and 4

stages for the PEIS, DOE proposed that an Advanced Hydrotest facility (AHF), representing the next generation of hydrotest capability beyond DARHT, be included within the scope of the PEIS. Conceptually, the AHF would improve on the capabilities of DARHT by applying the data and information gained through the operation of DARHT. The AHF thus could never be an alternative to DARHT, because DARHT is an essential precursor to the AHF. The AHF was proposed initially for inclusion in the scope of the PEIS in order to make that document as forward looking as possible with regard to the future of science-based stewardship. Upon further reflection, however, DOE has decided to not address the AHF in the PEIS, because the AHF's parameters are so minimally defined at this point that a meaningful analysis of its environmental impacts would be impossible to perform. The potential role of the AHF in science-based stockpile stewardship, and the nature of its environmental impacts, must await the development of better information.[48]

18/41.17 continued

The AHF is not so "minimally defined," as the following DOE quotes demonstrate:
- In FY 1994, "The major components for an Advanced Hydrotest Facility accelerator were constructed and successfully tested. An interLaboratory Physics Requirements Committee was established to provide the requirements for an Advanced Hydrotest Facility."[49]
- In FY 1995, "Tested technology for an Advanced Hydrotest facility, including the development of a full inductive adder power modulator."
- In FY 1996, "Continue[d] Advanced Hydrotest Facility development activities."
- For FY 1997, "Continue Advanced Hydrotest Facility development activities including development of physics design requirements and research of potential pulse power machine technologies."[50]

The AHF is expensive and, if built, will obviously be central to future stockpile stewardship activities. The AHF should be put back into the scope of the PEIS. Stockpile management activities are being considered in the PEIS until the year 2020. There is no reason why the AHF, with a construction start date of 2001,[51] should be excluded. Dropping the AHF from consideration in the SSM PEIS smacks of evasion of the NEPA issue concerning determination of DARHT as an independently justified project. A decision to build the AHF, irrespective of the question of inclusion in the PEIS, would also inevitably conflict with NPT Article VI.

VIII. The Tail Wags the Dog

14/40.90 continued

In 1989, DOE prepared an environmental assessment for the Special Nuclear Materials Research and Development (SNMR&D) Laboratory. This laboratory was

48 Declaration of Victor H. Reis, November 17, 1994.
49 FY 1996 DOE Congressional Budget Request, Atomic Energy Defense Activities, p .77.
50 Last three quotes from FY 1997 DOE Congressional Budget Request, Atomic Energy Defense Activities, p. 76.
51 Construction start date from the *FY 1996 LANL Institutional Plan*, p. 83.

the largest capital project ever proposed for LANL, with one estimate above $400 million in construction. The SNMR&D lab was to be one of a triad of facilities which would create a "special nuclear materials park" at Technical Area-55. TA-55 already sites PF-4, the only currently operating plutonium processing facility in the country, and the NMSF, an underground storage vault for weapons-grade materials (currently undergoing renovation for fundamental design deficiencies). Congress declined to fund the SNMR&D lab, the fundamental reason being the lack of clear programmatic need for the facility given the recent end of the Cold War.

The SNMR&D lab proposal, far from being dead, is still alive in the form of the various proposed upgrades to LANL's CMR Building (which the defunct SNMR&D lab proposal was suppose to replace). The relationship between PF-4, the plutonium processing facility at TA-55, and the CMR Building is made clear in the following quote:

14/40.90 continued

> The CMR Building and TA-55 are the largest mission-related facilities in the Los Alamos National Laboratory installation. Specific analytical chemistry support for plutonium processing at TA-55 includes SNM accountability, waste characterization, and certification of materials. The CMR Building is now 40 years old; however, the systems and space to support chemical and metallurgical laboratories can be made acceptable for meeting the needs of current and projected activities by providing for the upgrades identified in this project. *The long-term Los Alamos National Laboratory mission needs for such capability are currently programmed for at least another 20 to 30 years.*[52] (emphasis added)

CCNS submits that the italicized portion of the quote above is a stunning admission by LANL which lays bare a central problem in the SSM PEIS. The fact is that the SSM PEIS, with respect to future activities at LANL, is merely rubber stamping what the lab has been pursuing for a number of years. LANL management is already anticipating the probability that production activities will spill over from PF-4 to the CMR Building.

> The prospect of additional limited manufacturing roles for the Laboratory, especially those involving nuclear materials, places a premium on viable space.....Are there options for PF-4 activities to relocate in wings 3, 5, or 7 of CMR?....Wings 2 and 4 are being mentioned as a location for CSA [canned subassemblies, i.e., highly enriched uranium components for weapons secondaries] work.[53]

It is likely that DOE and LANL are already reserving space in the CMR Building for these future operations. That this process has been ongoing for some years now is supported by the quotation below.

> A meeting was held at Germantown Headquarters (HQ) on September 1, 1992, to review the status of new programs being planned for the Chemistry

52 FY 1997 LANL CAMP, CMR Activity Data Sheet, p. A-17.
53 "Manufacturing Assignments and the PEIS," LANL Memo, February 6, 1995.

14/40.90 continued

and Metallurgical Research (CMR) Building. The meeting was attended by members of my staff (the Office of RD&T Facilities and the Office of Engineering and Operations Support), Program Secretarial Officers (PSO) program sponsors, program management from your office, and personnel from the Los Alamos National Laboratory (LANL) representing CMR programs. The meeting objective was to reconcile the schedules for the preparation, review, and approval of the safety analysis documentation with the programmatic schedules.[54]

The Defense Nuclear Facilities Safety Board, while commenting on the Fire Resistant Pit program at the CMR Building, noted: "Technical inconsistencies exist between what is actually being done in the CMR building upgrade design and what is described in program documents, and also between key program documents themselves."[55]

DOE has prudently decided to defer from formulating details in a proposed Phase III CMR Upgrade until the completion of both the SSM PEIS and the LANL SWEIS. This position is possibly disingenuous as the old and dead R-PEIS listed three alternatives for the reconfiguration of the complex: 1) the construction and operation of new facilities; 2) the modification/upgrading of existing facilities; and 3) no action (continued operation of existing facilities). On February 14, 1995, DP Asst. Secretary Victor Reis was quoted in The Albuquerque Journal as stating to a Los Alamos audience, "The laboratories have to take on a manufacturing role." He acknowledged that using the laboratories as production sites is the primary option under study for the reconfiguration of the complex.

In CCNS' view, the modify and upgrade alternative was not merely under study, but was being incrementally implemented at this time. LANL is the principal site for implementation of the modify/upgrade alternative for reconfiguring processing operations involving strategic plutonium. LANL management is clear on the subject:

> A consolidation strategy is being followed to effect cost reduction and streamlining of operations. Outdated and less-used facilities are being closed and others are being modified and upgraded to accommodate consolidation of activities. For example, the Chemistry and Metallurgical Research (CMR) facility upgrade allows the consolidation of currently dispersed nuclear materials capabilities together with the attainment of new capabilities at a substantial cost savings over a completely new facility.[56]

This is consistent with the July 1993 R-PEIS Revised NOI's proposal for co-locating RD&T functions with nuclear materials storage, processing and component manufacturing operations involving the same material. Together, the CMR

56 The 1993 LANL Strategic Plan, "Nuclear Weapons Sector Overview," p.10.

14/40.90 continued

upgrades and existing capabilities at TA-55 give LANL the ability to provide plutonium processing operations for a reconfigured nuclear weapons complex with the capability of fabricating 100 to 200 warheads per year.[57] These programmatic decisions have been predetermined and the CMR upgrades are central to the process.

LANL management has already effectively preselected the Expanded Operations Alternative listed in the LANL SWEIS's May 1995 Notice of Intent. The 1993 LANL Strategic Plan is explicit in stating that the Lab's "unique reason-to-be" will remain nuclear weapons technologies, and makes clear that LANL's goal is to become "the prime...steward for the nation's stockpile." In its vision of prime stewardship, LANL management called for the establishment by FY 96 at the Lab of "complete pit fabrication and inspection capability" and "a complete capability..... to prototype war reserve pits." According to the Plan, the future expanded LANL role will involve all of these manufacturing capabilities and activities:

--fabrication of plutonium triggers,
--manufacture of uranium components,
--manufacture of lithium components,
--fire-testing of new plutonium pits at full scale,
--expanded plutonium and SNM storage,
--loading of tritium into nuclear weapons,
--further development of plutonium and uranium processing technologies,
--development of tritium manufacturing techniques,
--manufacture of detonators for weapons, and
--fabrication of beryllium components.

Acquiring or enhancing these capabilities or activities would then give the Lab the ability to manufacture complete nuclear weapons prototypes. In addition, the Strategic Plan called for the consolidation of LLNL plutonium R&D activities at LANL.

The infrastructure to support LANL strategic planning is being implemented through proposals for future facility construction or upgrades in the FY 1996 LANL CAMP. Through the year 2015, $4.85 billion in proposals for construction or upgrading of facilities at LANL breaks down as:
• $2.936 billion for nuclear weapons research, development and testing facilities;
• $629 million for plutonium, enriched uranium, tritium, etc. processing and fabrication facilities sufficient for producing complete nuclear weapons;
• $364 million for waste management facilities in support of nuclear weapons programs; and

57 "The capability to fabricate a modest number of new warheads or remanufacture those in the enduring stockpile will be optimally located at the chosen nuclear-materials storage and processing site. (One way of assessing the needed capacity for fabrication is to compare the number of weapons in the long-term stockpile with a typical weapon lifetime. From this basis we can estimate a need for about 100 to 200 units per year.)...

In ther future, the traditional distinction between responsibilities of the production complex and the design laboratories will become somewhat more diffuse."

John D. Immele (then-LANL Assoc. Director for Nuclear Weapons Technologies) and Phillip D. Goldstone (then-Chief scientist for LANL ICF Programs), "Redefining the U.S. Nuclear Weapons Program and the DOE Nuclear Weapons Complex," 1993 Los Alamos Science, p.47.

14/40.90 continued

• $783 million for redirecting the Lab's primary energy research facility into a center for nuclear weapons surveillance and experimental tritium production.

[On an up-to-date note, LANL Director Hecker has recently testified before Congress that the lab has "completed the transfer of necessary Rocky Flats hardware and gauging equipment" for pit rebuild activities.[58] This is strikingly in advance of a ROD for the SSM PEIS.]

In all, over 95% of all future LANL facilities are for nuclear weapons programs or are in support of those programs. CCNS presents all of the above to demonstrate that with respect to SSM Program alternatives at LANL, the entire SSM PEIS process is a mere rubber stamping of what the lab has been pursuing all along.

IX. LANL Issues

Laboratory Contract Mangement

22/40.78

Nowhere in the DPEIS are management contracts discussed for the sites affected by the proposed SSM Program. This is of special concern for LANL because of what is widely perceived as serious mismanagement by UC over 53 years. Under UC management, LANL has been allowed to operate under continuing noncompliance with environmental law.[59] Numerous instances of NEPA violations, such as the initial construction of the DARHT facility without an EIS and the lack of a currently valid SWEIS, have been found. The lack of economic spin off to the region is a common complaint. The UC Regents have refused to meet with prominent members of the New Mexico State Legislature. The laboratory has recently conducted a divisive series of employee reductions-in-force (RIFs) which has aroused much regional bitterness and is now being contested in court. These RIFs have had a disproportional affect on minorities and ES&H personnel. Work related accidents are currently on the rise. The lab environmental program is widely perceived as ineffective, slow, and a waste of taxpayers' money. The integrity of LANL's scientific programs themselves is under question due to a dispute over the selection of alternative ICF programs at LANL. There is a serious discrepancy in accountable plutonium inventories at the lab. Under the current contract, UC remains indemnified from financial responsibility in the event of litigation. There is no evidence that the performance-based review is anything more than a rubber stamp. Nevertheless, this is the style of management under which DOE intends to reconstitute plutonium fabrication capability. This flies in the face of good ownership by DOE.

58 Hearing of the Subcommittee on Military Procurement, Committee on National Security, March 12, 1996, Hecker, p. 11.
59 See Memorandum Opinion and Order in CCNS vs. DOE, Senior Judge R.L. Mechem, U.S. District Court for the District of New Mexico, April 2, 1996.

Fire

The Dome Fire of this month illustrates the grave potential impacts that major forest fires in the Jemez Mountains could inflict a result of LANL operations. During the fire, CCNS logged 100+ telephone calls from citizens concerned with possible fire-induced radioactive releases. Fortunately, the fire remained 2 - 3 miles south of the LANL boundary. However, due to present drought conditions in New Mexico, the risk of fire remains very high. It is possible that New Mexico is entering into a drought cycle that will last some years.

23/43.18

DOE needs to carefully evaluate fire suppression techniques in and adjacent to LANL property. Of particular concern is the yet-to-be-decided alternative to move HE fabrication operations to LANL's TA-16. TA-16, already inflicted with much residual tritium and HE contamination, is particularly vulnerable to a fire, especially should another crown fire develop in taller timber (as was the case in the Dome Fire). The entire southern segment of LANL, which has been the location for many open-air dynamic experiments, should be rigorously cleaned up.

DOE needs to carefully consider all aspects of the LANL SSM Program from the perspective of a potentially catastrophic fire. In order to allay future public concerns, DOE should redouble efforts to make the LANL ambient air monitoring system (AIRNET) credible and continue to fund on-line public access to AIRNET data (NEWNET). Unconfirmed reports that some AIRNET stations went offline during the fire, along with possible funding cuts to NEWNET, are disconcerting.

The DPEIS's *Affected Environment and Environmental Impacts at LANL*

24/03.04

The DPEIS uses 1990 and 1992 data for comparision of baseline ambient air concentrations with the most stringent applicable regulations (DPEIS 4-237 & 4-238). It is inexcusable that more recent data is not employed. It is also inexcusable that many of the listed pollutants are not monitored and that baseline concentrations for these pollutants are just assumed to be less than applicable standards.

25/04.16

The NMED OB has pointed out numerous inadequacies or factual errors in Section 4.6.2.4, Water Resources at LANL (pp. 4-237 to 4-245). Throughout this section, the data in the tables are from 1992. More recent data (e.g. the 1993 LANL Environmental Surveillance Report[60]) is available and should have been used. "In Parajito Canyon, Homestead Spring feeds a perennial stream only a few hundred yards long." The stream is instead 2 -3 miles long, and is fed by other springs in addition to Homestead Spring. "Only during periods of heavy paricipation or snowmelt would waters form Pueblo, Los Alamos, or Sandia Canyons extend beyond LANL boundaries and reach the Rio Grande." This needs to be backed up with good volumetric data. The gauging stations are reportedly in place in those canyons to provide years of data. "In Mortandad Canyon, no surface runoff to

60 The 1993 LANL Environmental Surveillance Report was received by this office only some four months ago. At this time in the year 1996, it should be expected that 1995 data would be available. LANL has had a continuing problem in getting out environmental data in a timely fashion. This should be corrected by DOE. In general, one of the fundamental deficiencies in the DPEIS is the lack of up-to-date environmental information for all affected sites.

SSM-M-126
COMMENT LETTER

PAGE 26 OF 32

25/04.16 continued — LANL's boundary has occurred since studies were initiated in 1960." Is this information based on physical data such as gauging data or is this an assumption?

26/04.17 — "Groundwater in the LANL area exists in three modes - in shallow alluvium in canyons, intermediate perched groundwater and in the main aquifer." There is a forth mode - shallow perched water in the Bandelier tuff. Under *Groundwater Availibility and Use*, downgradient users besides the communities of Los Alamos and White Rock are not mentioned. What about San Ildefonso and Santa Clara Pueblos?

27/04.18 — With respect to groundwater monitoring wells, there is little consistency in the placement of wells. As a system, the existing wells are inadequate. They are also old (the most recent was drilled in 1963), in many cases not throughly grouted and may be leaking. They also generally have lenghtly intervals between sampling screens (some greater than a 100 feet, e.g. DT-9 is screened from 1040' to 1500') and hence are likely to miss the contaminants that they are suppose to detect. Finally, the LANL surface water discussion is entirely devoid of any discussion on how the contaminants are inflicting ecological damage through adverse effects on biota.

28/06.02 — There is no discussion in Section 4.6.2.6 *Biotic Resources* on the effects that any of LANL's contaminants may have on wildlife.

29/11.06 — The DPEIS states that "the estimated probability of this person [the maximally exposed member of the public] dying of cancer at some point in the future from radiation exposure associated with one year of LANL operations is about 4 chances in 1 million." (DPEIS 4-256) Then, under *Health Effects Studies*, are the following paraphrased entries:

> "[M]odest elevations in brain and nervous system cancer incidence during the mid- to late-1980s[61]....The 1986 to 1990 thyroid cancer incidence rate was nearly four-fold higher than for the reference population,[62] and county breast cancer rates were consistently higher[63]...Ovarian incidence[64] and melanoma incidence in the county during this time period was approximately two-fold greater..." (DPEIS 4-258)

These past incidences are, of course, not from present lab operations. They do, however, engender deep skepticism over the claim that a 4 in 1 million chance of a cancer fatality annually will occur due to one year of LANL operations. Concerns over cancer rates in Los Alamos County merit credible epidemeological study.

---

61 DPEIS Appendix E.4.6 states "Incidence in the county during this time period was 70- to 80-percent greater than that observed in a New Mexico state and national reference population."
62 Ibid, "Los Alamos County experienced a sudden and marked increase in thyroid cancer incidence in the mid-1980s."
63 Ibid, "County breast cancer incidence rates consistently were 10- to 65-percent higher than state and national reference rates."
64 Ibid, "For the 1986 through 1990 period, ovarian cancer incidence was roughly two-fold higher than that observed in a New Mexico state population. The majority of the excess ovarian cancer incidence was confined to the census tract corresponding to two neighborhoods and was four to six-fold higher than that observed in the remaining census tracts."

SSM-M-126
COMMENT LETTER

PAGE 27 OF 32

30/40.21 — Under *Accident History*, the SSM PEIS needs to note the recent forklift accident and the fatality due to an electrocution. Root causes need to be identified. Analysis needs to be made of the effect that the recent reduction-in-force has had on occupational safety. Reportedly a number of qualified safety personnel were let go.

31/40.57 — Under *Emergency Preparedness*, what evacuations plans have developed in the event of a nuclear accident or catastophic fire? Because of the limited egress in and out of the Los Alamos region, the lack of well thought out and publicized evacuation plans can have grave consequences.

Under *Waste Management*, LANL and DOE need to note that compliance with environmental law is <u>compliance</u> with environmental law, <u>not</u> compliance with compromises negotiated behind closed doors with EPA.

32/43.19 — The DPEIS states that because "there is no spent nuclear fuel or HLW associated with any of the proposed activities at LANL, there is no discussion in this PEIS of spent nuclear fuel or HLW generation and management at LANL." NEPA segmentation concerning the CMR Building has already been discussed. The CMR Building is central to future SSM programmatic activities at LANL. Apparently, 46 fuel rods from the Omega West Reactor are being stored in the CMR Building's basement, with no decision in sight for long-term storage. In addition, the CMR Building is not currently considered to be seismically safe. DOE needs to reach a decision on long-term storage of these fuel rods.

33/10.34 — Under *Transuranic Wastes* and *Low-Level Wastes*: Both sections note the treatment of liquid wastes at the Radioactive Liquid Waste Treatment Facility (RLWTF). The DPEIS states that liquid LLW from pit fabrication and reuse "would be processed, with radioactive constituents removed, in accordance with the treatment permit issued by the State of New Mexico, and discharged through permitted NPDES outfalls." (DPEIS p. A-120) While the RLWTF does discharge liquid effluent through NPDES-permitted outfalls, there is no such treatment permit issued by the State of New Mexico. According to the NMED OB, nitrate and nitrite levels on the Mortandad Canyon floor as a result of RLWTF effluent greatly exceeds state water quality levels. In addition, the RLWTF outfall #051 is suspected to be the source of serious beta and alpha contamination in the canyon. The lack of adequate groundwater monitoring has already been noted.

Atlas Facility Project-Specific Analysis

34/22.03 — For the general reasons discussed in sections I and II of these comments, CCNS believes that the Altas Facility is not needed. Defects in secondaries (the reported primary area for research by Atlas) are quite rare. It has been commonly stated by various weapons experts that the physics of secondaries is already well understood.

35/11.45 — A minor point: In the Appendix K acronym list, NMEID is listed for the New Mexico Environmental Improvement Division. Please note that the division was elevated to state cabinet status some years ago. It is now the New Mexico Environment Department.

34/22.03 continued

It is stated that the Pegasus II facility is used for up to 24 experiments annually. Atlas, on the other hand, will perform up to 100 experiments. What is the need for the dramatic rise in experiments?

36/40.55

Referencing the 1992 LANL Environmental Surveillance Report as "LANL 1994b" is deceptive, giving the impression the data is more recent than it really is. The outdatedness of all LANL environmental data is one of the fundamental flaws in the DPEIS.

37/03.12

The DPEIS states that the "irregular terrain at Los Alamos affects wind motion and spreading. Localized wind gusts may not be in the same direction as average wind patterns." (DPEIS K-17) This illustrates the need for LANL to correlate ambient air monitoring to LANL's complex topography.

XI. Summarized Points and Conclusion

I. The SSM PEIS and Nonproliferation Issues

- The DPEIS's brief nonproliferation analysis is wholly inadequate.
- The three stated program challenges in the proposed SSM Program are inherently contradictory. In program planning, at least equal weight needs to be given to NPT Article VI instead of predominant reliance on the Nuclear Weapons Posture Review. The SSM Program should help provide a road map towards eventual disarmament, rather than creating obstacles to it.
- There will inevitably be strong international concern over the proposed SSM Program. These misgivings may well encourage the further proliferation of weapons of mass destruction by undermining the NPT and discouraging international ratification of the CTBT.
- DOE needs to provide strict definition between warhead "modification" and "new" designs.
- The DPEIS projects stockpile management activities until the year 2020, with costs for those activities continuing to rise year after year. Life extension programs are currently being developed to ensure the viability of individual weapons systems to the year 2025 and beyond. Yet the DPEIS is incapable of projecting stockpile sizes below 1,000 weapons as a means of demonstrating commitment to NPT Article VI.
- DOE makes no adequate assessment of what constitutes minimally required deterrence in order to better reconcile contradictory program challenges.

II. SSM Program Rationale

- The stated rationale that the proposed SSM Program is needed to maintain stockpile safety and reliability does not square with available data. Once corrected for additional weapons systems, the 1995 *Stockpile Surveillance: Past and Future* report essentially validates the 1993 *Stockpile Life Study*.
- The emphasis on testing in the later report is not really relevant to the "enduring" START II stockpile. The issues of safety and reliability need to separated

in analysis. Aging affects reliability rather than safety. Because reliability is a statistical construction, reliability cannot be established through individual tests.
- The stockpile is currently certified to be both safe and reliable. There is no publicly available body of data that suggests that aging effects are expected to dramatically rise. Existing programs and facilities have successfully detected and fixed defects at rates that exceed what is now estimated for the future. The stated rationale for the SSM Program is political cover for maintaining design and production capabilities.
- The DPEIS's categorical rejection of the *Remanufacturing* and *Maintenance Alternatives* is not adequately supported and is not justified.
- There is no justifiable rationale for more weapons effects R&D facilities.
- DOE should release data on quantities of special nuclear material set aside decades ago for the purpose of measuring aging effects.

III. DOE's NEPA Hierarchy

- The WM PEIS and the SSM PEIS need to be linked. Environmental restoration activities need programmatic analysis.
- DOE needs to undertake programmatic review of all potential reprocessing activities for their proliferation and environmental impacts. All forms of pit storage need integration at the policy level.
- Sites affected by the SSM Program need up-to-date site-wide analysis. NEPA segmentation needs to be avoided.
- An overall Departmental policy document is required to link the PEISs and other relevant NEPA processes together in a cohesive manner.

IV. SSM PEIS Stockpile Sizes and SSM Capabilities

- Assumption of START II stockpile size as a base case may inherently prejudice the SSM Program towards higher stockpile sizes. In order to help assure Russian Duma START II ratification, the SSM Program should aggressively drive towards further arms cuts and plan accordingly.
- The DPEIS inappropriately constricts its planning horizon in the present and the future. *The No Action Alternative* inherently prejudices the outcome of the SSM PEIS.
- The DOE assertion that SSM Program capabilities are independent of stockpile size is not justified.
- The NTS budget should be cut to a skeletal budget.

V. DARHT, Plutonium-242 Reprocessing and the SSM Program

- The DOE assertion that the DARHT decision will not prejudice any decisions to be made in the SSM PEIS needs support. The relationship of DOE decisions relating to the use of plutonium-242 at DARHT to the resumption of reprocessing at SRS need analysis.

VI. The SSM PEIS and DARHT'S Second Axis

- DOE's omission of analysis of DARHT's second axis in the SSM PEIS is not supportable, especially given that the Atlas Facility is included for analysis in the DPEIS.

VII. The Advanced Hydrotest Facility

- DOE's decision to drop the AHF from consideration in the SSM PEIS is not supportable. This facility should be included in further DPEIS analysis.

VIII. The Tail Wags the Dog

- The SSM PEIS process merely sanctions what LANL has already strategically planned for. Many decisions appear to have been predetermined and some actions already illegally implemented in advance of a SSM PEIS ROD.

IX. LANL Issues

- DOE needs to seriously consider whether continued UC LANL mangement is in the best interests of the lab, the region and the nation.
- The potential impacts of a catastrophic fire at LANL needs analysis. The adequateness of the ambient air monitoring system at LANL and public access to its data needs to be assured.
- The lack of more up-to-date environmental data renders LANL environmental analysis inadequate. Some of the stated environmental facts are incorrect. The lack of comprehensive and/or complying monitoring systems renders all data suspect.
- In light of recorded cancer rate incidences in Los Alamos County, the DPEIS's projected cancer fatality rate due to one year of LANL operations is suspect.
- The DPEIS needs to evaluate the recent rise in occupational accidents at LANL.

X. Atlas Facility Project-Specific Analysis

- The SSM Program rationale as a whole provides insufficient justification for the Atlas Facility.

In conclusion, for all of the reasons mentioned above, the DPEIS is flawed and should be withdrawn. CCNS encourages DOE to re-issue the DPEIS.

Acronyms Used

AGEX	Above Ground Experiments

UGT:	Underground Testing

DOE Stockpile Stewardship Facilities Costs

Facility	Location	Purpose	Construction Cost
Advanced Hydrotest Facility	NTS or LANL	6 - 8 simultaneous views of imploding simulated primaries; will use DARHT technologies	$422 million
Atlas Facility	LANL	capacitor bank for simulated weapons environments; for study of secondaries	$48.4 million
Chemical and Metallurgical Research (CMR) Building	LANL	3 phases of upgrades to LANL's largest building; analytical chemistry of plutonium and highly enriched uranium; first phase currently under way	$223.6 million
Contained Firing Facility	LLNL	contained hydrodynamic testing; for study of nuclear weapons primaries	$48.5 million
Dual Axis Radiographic Hydrotest Facility (DARHT)	LANL	open-air hydrodynamic testing; for study of nuclear weapons primaries; under construction, currently enjoined by court order	$148 million
Explosives Components Facility	SNL	contained high explosives testing; under construction	$27.8 million
Jupiter Facility	SNL	x-ray weapons effects facility; jointly funded by DOE and Defense Nuclear Agency	$240 million
National Ignition Facility	LLNL	192 beam laser system for fusion ignition and study of secondaries	$1.0736 billion
Facilities Revitalization, Phase II	3 labs & NTS	9 subprojects for new or upgraded facilities *	$248.3 million
Phase III	SNL & NTS	infrastructure	$111.6 million
Phase V	SNL	infrastructure	$34.6 million
Phase VI	LANL	infrastructure	$34.7 million

Total cost for proposed facilities construction and revitalization: $2,661,100,000

Accelerated Strategic Computing Initiative (ASCI); complex-wide; future interlinked secure computer network with massively enhanced computational abilities; slated for implementation through the year 2010; cost extrapolated through 2010 at currently projected levels: $2,104,300,000

Combined costs (facilities + revitalization phases + ASCI) = $4,765,400,000

LANL=Los Alamos, LLNL=Lawrence Livermore, and SNL=Sandia National Laboratories; NTS=Nevada Test Site. Sources: DOE FY96 Congressional Budget Request, Project Data Sheets; Draft ASCI Program Plan, DOE, June 1995; FY96 LANL and SNL Capital Assets Management Plans. * In DOE budget requests, DARHT is one of the nine subprojects in Phase II. In this table, DARHT costs are separated.

COMMENT LETTER

PAGE 1 OF 2

April 22, 1996

Jay Rose
Office of Reconfiguration
1000 Independence Avenue, S.W
Washington, D.C. 20585

Dear Mr. Rose,

It is widely acknowledged, even by highly respected military officers, that the proliferation of nuclear weapons is now among the greatest threats to national security of the United States. Our government has recently engaged in an extension of the Non-Proliferation Treaty, and is currently negotiating for a zero threshold for a Comprehensive Test Ban. The success of these activities to prevent nuclear weapons proliferation is entirely dependent on the ability of our government to inspire genuine confidence in other nuclear weapon states and those who have or who are approaching nuclear weapons capability that we are indeed serious about our treaty agreements.

1/40.05 What the Department of Energy has produced is an aggressive plan to continue nuclear weapons design and production capability. It is far more likely to provoke proliferation than lower the risks.

2/40.12 The SSM-PEIS document is also economically irresponsible. Although it presents itself as a plan for scaling down the nuclear weapons complex, the SSM-PEIS outlines at least $2.6 billion in capital costs for new and upgraded facilities. It also proposes more than $2 billion for accelerated computer capabilities. When plans for new tritium production are included, SSM program operating costs are likely to exceed $30 billion within a decade. At a time when federal spending programs are being slashed right and left, and many Americans, especially children, left in desperate need, this is unconscionable.

3/40.15 The proposed activities also project staggering rates of nuclear waste generation for at least 20 years. These wastes will produce additional waste management and cleanup costs far into the future, and put valuable environmental resources at risk.

Safety and reliability of the existing arsenal, the "rationale" presented for this proposal, do not require these expensive facilities. The DOE should think carefully about producing new wastes, given its inability to develop solutions for existing nuclear waste.

4/40.36 I urge the Department of Energy to implement a passive stewardship program, called a curatorship by many, to replace this aggressive and provocative SSM proposal.

Sincerely,

Doris Smith #50619

5/34.14 I am a member of the Pantex Plant Citizens Advisory Board and as such I have grave concerns about HE fabrication continuing at Pantex because of the severe problems the site presently has from HE waste. The ditches & playas are contaminated with chemicals, solvents, metals, HE and radionuclides. The perched aquifer beneath Pantex is contaminated and HE has been detected in wells on site & offsite.

SSM-M-129
COMMENT LETTER — **PAGE 2 OF 2**

5/34.14 continued

With downsizing and tight budget constraints we feel the DOE should consider these issues in determining the preferred option for HE work and related environmental issues. We have grave misgivings about using the Burning Grounds to dispose of HE and HE contaminated materials. We urge the DOE to discontinue this practice in our agricultural area. The threat of contaminating the meat products and cereal grains from this practice is all too real.

SSM-M-130
COMMENT LETTER — **PAGE 1 OF 1**

RE: Draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement

Dear Secretary O'Leary:

1/40.85

We are writing to express our profound disappointment and concern about your Department's draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement (SS&M PEIS or PEIS). We were, frankly, surprised by the depth and breadth of its noncompliance with the requirements of the National Environmental Policy Act (NEPA), all the more so because under your leadership, many of us have come to expect a higher level of performance from the Department in this area.

Regrettably, despite the considerable effort expended on it, the Department's draft SS&M PEIS precludes meaningful analysis of the SS&M program by failing to analyze the lion's share of the projects that constitute the program and by failing to discuss the full spectrum of reasonable alternatives. The PEIS is so fundamentally flawed that even a substantially revised version of the present draft will not satisfy NEPA requirements. Instead, the Department must begin by withdrawing the current draft PEIS. The revised scope of a new draft PEIS should and we believe could be swiftly established by taking into account the multitude of comments already received (and largely ignored) during the previous scoping process, and by incorporating the comments received on the present draft. The Department would then issue a new draft for public comment.

In conjunction with the Department's withdrawal of the draft SS&M PEIS, it will be necessary for the Department to place a number of SS&M projects on hold pending completion of an adequate PEIS and subsequent site-specific analyses.

The reasons for these conclusions are many and have been detailed in comments numerous organizations have already provided. Without attempting to recap here the full range of issues raised in all of our comments, perhaps the most important and central of them are these:

- The Department has inappropriately excluded its current stockpile stewardship program, including facilities now under construction, from programmatic

The Honorable Hazel O'Leary
May 31, 1996
Page 2

1/40.85 continued

analysis by including them in a mis-named, and ever-growing, "no action" alternative;

2/41.17

- Virtually all the planned stockpile stewardship facilities are excluded from analysis because they are said to be too far in the future, when in fact they are not—indeed, the Department is already investing considerable sums in designing, and developing the technology for, such facilities;

3/41.18

- The only three stockpile stewardship facilities actually analyzed in the PEIS are presented without meaningful alternatives and without supporting programmatic analysis, let alone any prior programmatic record of decision; and

4/40.60

- Overall, there are no programmatic alternatives analyzed for stockpile stewardship, and only siting alternatives are analyzed for stockpile management. The result is that there is no meaningful programmatic analysis of alternatives for stockpile stewardship and management. A short list of omitted reasonable alternatives would include: options implementing gradual but complete denuclearization (a reasonable alternative by virtue of U.S. obligations under the Nuclear Nonproliferation Treaty); options involving maintenance of a minimal stockpile of one to ten warheads, and a stockpile in the range of 100-500 warheads, the present size of the arsenals of the declared nuclear weapon states except Russia; options involving simple maintenance and remanufacturing of the arsenal; options involving fewer nuclear weapon laboratories; options involving Nevada Test Site closure; as well as options involving removing redundant technologies from each of the Department's SS&M subprograms, which would enable DOE to meet its stated objectives with fewer facilities, much lower costs, and greatly lessened environmental impacts.

3/41.18 continued

It is by no means just the SS&M PEIS as a document which concerns us, but the ongoing real projects in the stockpile stewardship and management program that are now proceeding prior to programmatic NEPA analysis. In this regard, it is important to note that DOE initiated the environmental review for rebuilding its nuclear weapons complex almost five years ago. In the interim, DOE has initiated or completed hundreds of millions of dollars worth of new facilities and facilities upgrades throughout the nuclear weapons complex, implementing substantial portions of the program which the subject PEIS and its predecessors were supposed to review. Many of these projects have as a result reached a stage of investment or commitment to completion likely to determine subsequent development or restrict later alternatives, in violation of NEPA.

The Honorable Hazel O'Leary
May 31, 1996
Page 3

While we greatly appreciate your intention to increase the Department's environmental compliance, we note that in several instances this compliance has still been achieved only pursuant to litigation, or the threat of litigation, by public interest groups. In view of DOE's manifest and willful noncompliance with both the letter and spirit of NEPA and its implementing regulations in preparing the current draft PEIS, we respectfully ask you to withdraw it, and to meet with our designated representatives regarding the PEIS and the projects now proceeding without adequate programmatic analysis, in violation of NEPA.

While we regret the additional burden on the Department that may be occasioned by our request, we note that this burden is entirely of the Department's own making. Had DOE taken its NEPA programmatic review obligations--and previously submitted public comments--seriously; the current situation would in all likelihood not have arisen. While we are prepared to negotiate in good faith, we cannot stand idly by while the Department's hasty, ill- considered, and on-going actions in pursuit of its nuclear weapons SS&M program effectively render NEPA a dead letter. That we will not do. The starting point for negotiations must be the Department's full compliance with its NEPA obligations.

RE: Comment on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile materials Draft Programmatic Environmental Impact Statements (PEISs)

Thank you for this opportunity to comment on the U.S. Department of Energy's (DOE) Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials. These comments are also directed toward the Pantex Site-Wide Draft Environmental Impact Statement, as most issues addressed in both these documents are identical.

1/40.52 Texas Tech University Health Sciences Center School of Pharmacy fully supports the retention and expansion of the Pantex facility as a storage, processing and component fabrication complex with capabilities for non-nuclear manufacturing and also research, development and testing. Pantex has been an integral part of this community for more than forty years, and has done so as a safe and environmental "clean" complex. There is every reason to believe that the facility would continue operating in such a manner. Pantex has been a pivotal force in expanding the economic base of the Panhandle from agrarian to industrial. As part of the community of Amarillo, we at Texas Tech University Health Sciences Center at Amarillo, depend on the socio/economic impact Pantex provides our area.

2/30.01 I am pleased that the DOE selected Pantex as the preferred alternative for assembly/disassembly. It is hopeful that Pantex will also be recognized as the preferred candidate site for new and/or consolidated stockpile management facilities. Pantex is the best site for maintaining the integrity of the U.S. nuclear stockpile because of maximum efficiencies and cost savings.

Labor cost, utility rates and water and land availability at Pantex make it the best site and perhaps the most cost-effective alternative for any new construction of SSM facilities. As an alternative site for all future defense-related facilities, Pantex would complement activities at the national

An EEO / Affirmative Action Institution

labs (such as the planned Atlas Facility and plutonium pit fabrication site at Los Alamos National Laboratory). Additional defense-related activities at Pantex would ensure that core technical capabilities are preserved at a location that can secure them at the most efficient cost.
3/40.13 The DOE should insist that, in its deliberations, budgetary comparisons between Pantex and the other sites are accurate and include capital, transportation, training, remediation and other costs.

4/34.01 The high explosives (HE) functions should also remain at Pantex in conjunction with the assembly/disassembly functions. HE capabilities must be retained to process the inventories on site from dismantling. This is also the least expensive alternative. Transfer of HE functions away from Pantex would cost between $40 and $50 million. Should future need arise for new weapon production it would be critical to have the HE facility at the weapons production/assembly site.

Pantex currently safely stores more than 8,000 surplus pits and plans are being made to ship additional pits from Rocky Flats to Pantex. I does not make sense to re-create storage facilities at another site and transport large amounts of plutonium across the country.Pantex should be designated the preferred site for any disposition options and related functions. Pantex could continue to store plutonium which is already on site and upgrade facilities for any and all storage options by DOE with minimal cost. It makes budgetary and policy sense to site disposition where storage already exists. Pantex already has the necessary safety , security and surveillance capabilities to accommodate an expanded role and is the production site closest to Los Alamos, the planned pit fabrication site.

1/40.52 continued I respectfully request DOE to designate Pantex as the preferred alternative site for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition and any related functions.

Thank you for the opportunity to comment on these documents.

Sincerely,

Arthur A. Nelson, R.Ph., Ph.D., Dean vk# 51187

To Whom This May Concern:

1/40.06 There is no problem greater that nuclear weapons and power solve than the problems they create. In fact, denuclearization is the only reasonable alternative. I demand that we act in this way immediately to make a more hospitable environment in which we can raise our children and future generations.

Sincerely,
Michael Caldemeyer

SSM-C-003
COMMENT LETTER **PAGE 1 OF 1**

Dear D.O.E.

1/40.06 In the Stockpile Stewardship PEIS, it is my comment that "Abolition is the ONLY REASONABLE ALTERNATIVE". Do not disregard abolition as an alternative - rethink your conclusions in the Draft SS+M PEIS.

1/30.01 **Comments on Stockpile Stewardship and Management (SSM) PEIS:** I support the selection of Pantex for weapons assembly and disassembly functions. I strongly favor the continuation of high explosives functions at Pantex, and oppose any plan to move these functions to the national labs. Since Pantex is the most cost-effective DOE facility and enjoys the strongest local support, I also support the addition of other environmentally sound stewardship and management functions at Pantex.

Comments on Fissile Materials Storage and Disposition (MD) PEIS: I believe that Pantex should be chosen as the location for fissile materials storage and disposition functions. Pantex already stores surplus plutonium, and has the needed safety and security capabilities to cost-effectively accommodate an expanded role. Fair budgetary comparisons, strong local support, and national security concerns, should lead DOE to choose Pantex for new fissile material storage and disposition functions that are conducted in a safe and environmentally sound fashion.

1000 Independence Ave. S.W.
Washington, D.C. 20585

Dear Mr Rose,

1/40.07 | Nuclear weapons is among the greatest threats to national security of the United States. Our government has recently engaged in a Non-Proliferation Treaty and is negotiating for a zero threshold for a Comprehensive Test Ban. It is imperative that our government inspire confidence in other nuclear weapons states and other nations who may soon have nuclear capabilities that we are serious about our treaty agreements.

Aggressive plans to continue nuclear weapons design and production capability by the Department of Energy is very likely to provoke proliferation by other nations

2/40.12 | The SSM-PEIS document outlines plans for upgraded and new facilities, accelerated computer capabilities, and tritium production. It is very possible that the SSM program operating costs will exceed $30 billion in the next ten years. This is economically irresponsible. To put so much of our national budget into an SSM program when so many Americans, especially children, are living in poverty and need is unconscionable

3/10.11 | Staggering rates of nuclear waste will be generated by these proposed activities creating a need for more waste management and future clean up costs. Why put more of our environment at risk? The DOE should think carefully about producing new wastes, given its inability to develop solutions for existing nuclear waste

4/40.36 | This SSM proposal is aggressive, provocative, and unnecessary. I urge the DOE to implement a passive and less costly program

Sincerely,

Subject: Draft PEIS: Stockpile Stewardship and Management

Greetings,

This letter is in response to the above subject dealing with the long-term storage alternatives for plutonium and highly enriched uranium. We concerned citizens raise the following objections to the proposal:

1/40.36 — 1. Rather than constructing new facilities at added expense, a passive stewardship and management plan could consist of weapons surveillance, pending future arms reductions. With such a strategy weapons defects could be resolved by replacing weapons components. Existing facilities could be used to test and certify remanufactured warheads, so that a high degree of confidence in our nuclear arsenal's safety and reliability would be continued.

2/40.12 — 2. In consideration of a diminishing nuclear stockpile, the proposed new facilities at an estimated cost of $2.6 billion would be wasteful and represent less an effort to provide for national security, than an effort to create jobs, in an era when we pay lip service to balancing the national budget.

3/40.07 — 3. One of our greatest objections is that new weapons experiment facilities are irreconcilable with our stated non-proliferation goals. Here we go again proposing to spend billions of dollars on nuclear weapons, including the designing of new ones, when we have recently agreed to a new Nuclear Non-Proliferation Treaty and are actively negotiating for a world-wide Comprehensive Test Ban Treaty.

Furthermore, we advocate the eventual establishment of a nuclear weapons free world. We encourage our leadership to move relentlessly in that direction. This message is also being conveyed to the President & our Congressional representatives.

Sincerely yours,

SSM-C-008

Dear Sirs:

Please consider this letter as comment on the Programmatic Environmental Impact Statement (PEIS), the Stock Pile Stewardship and Management (SSM) and the Storage and Disposition of Weapons Usable Fissile Material (S & D).

The safety of our environment and community are of primary importance when it comes to any change or expansion at Pantex. To date, I think that Mason & Hanger has proven their ability to run a safe and responsible operation. I trust that they would do so in the future.

1/40.52 I believe Pantex to be the best site for the SSM, the S & D Missions, as well as the High Explosives functions for several reasons.

1. The operating costs would lower Utilities, labor, cost of living and land costs are lower than at any other facility
2. The people at Pantex have the knowledge and ability to handle high explosives, fissile materials, and stock pile materials. They have been doing it safely for years and there is no reason to expect them to change.
3. The costs to move these functions to other sites would be very expensive.
4. The community has traditionally supported the work done at Pantex.
5. If the DOE chooses to down-size and locates vital assembly, manufacturing and storage missions in smaller facilities, what happens if we have an immediate need to produce larger quantities? If we cannot respond quickly to a major national crisis, our nuclear deterrent capabilities will be compromised.
6. It seems that most of the possible solutions of moving functions will require more transportation of dangerous materials exposing the population to risk.

Thank you for the opportunity to make these comments. I urge the DOE to designate Pantex as the preferred alternative for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition.

Sincerely,

Karen Riley

MR. KOBASA: Stephen Kobasa, 46 Hobart Street, 06511-4033.

Yes. I would, I am at the moment on the list.

Again, I am on the mailing list.

Bits of all the amazing technical data that have been included in the draft programmatic environmental impact statement. I think it's important for us to think of what the term stewardship means.

1/40.06 And it should be included, I think, in your report, that real stewardship involving nuclear weapons would mean the complete abolition of all such devices and the careful and systematic treatment of all nuclear pollution which has resulted from the manufacture and production of nuclear weapons in the United States.

It's really time that we think in terms of abolition rather than renewal of programs. This is a special opportunity for us. It would be real stewardship, and not the technical variation and adaptions that are being considered right now.

Thank you very much.

[End of tape.]

United States Senate
COMMITTEE ON ARMED SERVICES
WASHINGTON, DC 20510-6050

May 3, 1996

Honorable Hazel R. O'Leary
Secretary of Energy
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Madam Secretary:

This letter constitutes the collective formal comments of the undersigned members of the United States Senate on the Department of Energy's (DOE's) Draft Environmental Impact Statement (PEIS) for Stockpile Stewardship and Management (DOE/EIS-0236).

1/40.62

The fundamental deficiencies in the analysis and conclusions of the DOE Draft PEIS for Stockpile Stewardship and Management are related to the incomplete nature of the National Security Policy Considerations upon which the analysis, conclusion, and preferred alternatives are based.

The most egregious deficiency is the total failure to include current Congressional legislation (National Defense Authorization Act for Fiscal Year 1996, Title XXXI, particularly sections 3137 and 3153) and associated national security policy guidance in the PEIS assumptions, analyses, and conclusions. This is totally unacceptable. This PEIS needs to be redone based on the full range of national security policies, both Presidential and Congressional. The conclusions of the just completed House and Senate markups for Fiscal Year 1997 must also be taken into consideration in the Final PEIS.

2/40.18

The draft PEIS recommended alternative results from the Department's almost exclusive planning focus on preserving the capabilities and core competencies of the national nuclear weapons laboratories. We recognize that preserving the weapons capabilities of these laboratories reflects essential national requirements. But very little attention has been paid to preserving the critical capacity and unique assets that exist at the Department's production plants, in spite of two years of Senate Armed Services Committee hearings which continue to point toward this deficiency in Departmental planning and strategy. The Final PEIS must take this into account.

3/40.17

Nowhere does the PEIS reference the significant body of Congressional hearings and testimony on the Stockpile Stewardship and Management Programs, particularly those before the Strategic Forces Subcommittee of the Senate Armed Services Committee. In particular, the PEIS ignores several critical facts brought out in testimony. For example, the PEIS does not note DOE testimony that science-based stewardship is not guaranteed to work, or that if it works it will not be ready for at least another ten years.

2/40.18 continued

The PEIS does not deal adequately with the need to maintain the stockpile and adequate production capacity over the next ten or more years. During this period, it is the Stockpile Management Program at the four production plants which is essential to replace weapons components, rebuild weapons, and maintain the capability and expertise to reconstitute the nuclear weapons stockpile should world events require it. In fact, the entire PEIS analysis about the size of the stockpile and associated manufacturing capacity is based on optimistic assumptions about future arms control agreements. The conclusion of the draft PEIS appears to reflect these initial assumptions rather than insights gained in analysis. In particular, the PEIS (p. S-11, line 12, Summary) states that the PEIS forecast for a smaller production complex results from unspecified "technical judgement" rather than technical analysis. This must be corrected in the Final PEIS analysis and preferred alternative.

The preservation of the nuclear production plant capabilities and capacities must receive full and fair consideration in the Final Stockpile Stewardship and Management PEIS. We are concerned that the planned reductions at the four production plants, as portrayed in the PEIS, are so severe that they will seriously impact the plants' ability to properly support the near-term and long-term safety and reliability of the Nation's nuclear weapons stockpile. This is an unacceptable situation which we look forward to seeing corrected in the Final PEIS.

We look forward to your assurance that the Department will thoroughly and fairly reevaluate ways to enhance and maintain the capabilities and production capacities at the Department's nuclear weapons production sites.

Strom Thurmond   Dirk Kempthorne
Fred Thompson   Bill Frist

Office of Reconfiguration
P.O. Box 3417
Alexandria, VA 22302

Dear Dr. Reis:

These comments are submitted in response to the Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management, DOE/EIS-0236, February 1996. Thank you for the opportunity to comment on maintaining the safety and reliability of the enduring weapons stockpile.

1/40.76

In the area of stockpile management, the Savannah River Site could provide full plutonium production scale capability, as opposed to extending the research and development capability of a national laboratory into a production arena.

The Savannah River Site, the nation's only functional, large-scale plutonium operation, offers the potential to achieve cost savings through common use of the site's existing facilities and infrastructure among all of the Department's nuclear material missions in the areas of defense, stabilization, and disposition. The Department should evaluate these programs from a holistic view, not in a piecemeal manner. This could save the taxpayers' millions of dollars

Sincerely,

Charlie Norwood
Member of Congress

Re: Comments on Stockpile Stewardship and Management and Storage and Disposition of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statements.

Dear Madam Secretary:

The Pantex Nuclear Weapons Plant has been a key component in our nation's ability to achieve and maintain a strong national defense. The success at Pantex is a result of several factors, including good managers and dedicated, skilled, hard-working, efficient, and safety-conscious employees.

1/40.52

This nation continues to face an uncertain future with many risks. An effective strategy for diminishing those risks is to retain our core of expertise at the Pantex Plant. The Programmatic Environmental Impact Statements now being reviewed demonstrate that such a strategy is the best option for our nation's taxpayers.

The Pantex Plant enjoys broad community support because it has successfully demonstrated it can safely carry out its mission of assembling and disassembling nuclear weapons. That history of safety, success, and efficiency is the foundation for the future of the Pantex Plant.

The State of Texas is prepared to continue to assist Pantex with the significant role it plays in keeping the United States the defender of the free world.

Sincerely,

GEORGE W. BUSH

Washington, D.C. 20026

Re: Comments on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statements (PEISs).

On behalf of the State of Texas, the Office of the Governor would like to thank you for the opportunity to comment on the U.S. Department of Energy's PEISs on Stockpile Stewardship and Management, and Storage and Disposition of Weapons-Usable Fissile Materials. Because those issues are so closely intertwined with the Pantex Site-Wide EIS, some of my comments may address that document as well.

1/40.52 continued

First and foremost, the State of Texas would like to re-emphasize our insistence that all current and future missions at Pantex be conducted in a safe and environmentally sound manner. Pantex has a long history of being a good neighbor, and one of the primary reasons is because it believes in protecting human health and safety, and the environment.

Based upon a review of all of the PEIS volumes, and statements made during the public hearings in Amarillo by DOE officials on April 22 and 23, 1996, our conclusions were confirmed that all actions considered for Pantex will have no significant impact on the health of workers nor any significant adverse impacts on the environment in the Amarillo area.

Post Office Box 12428 Austin, Texas 78711 (512) 463-2000 (Voice)/(512) 475-3165 (TDD)

DOE PEIS Comments
May 6, 1996
Page Two

However, as stated numerous times in the public hearings, there is concern that this statement of no significant impact is not clear in the summary document of the Storage and Disposition PEIS.

Instead, what is stated numerous times is: "Adverse impacts to water resources at Pantex would result from the continued local draw down of the Ogallala Aquifer, but Pantex's contribution to this draw down is expected to continue to decrease due to a decrease in other DOE activities at Pantex. Neither surface or ground water resources at other DOE sites would be affected."

The State of Texas believes this statement inaccurately and incorrectly singles out Pantex as an unacceptable site for its existing mission, as well as for any future missions. We ask that this be corrected immediately.

In reference to the statements regarding adverse impacts, the Amarillo community was told by DOE officials during the public hearings that there were no significant impacts on the environment, safety, or health from current or future missions proposed at Pantex. Therefore, the inaccurate perception of adverse affects, noted in the summary S&D document, should be corrected in the final document.

Toward that end, the State of Texas requests that in the S&D PEIS summary document, a clear statement should be added that no significant environmental impact would result from any considered alternatives at Pantex. In addition, the ranking of sites based upon these insignificant impacts (found in the sections Long-Term Storage Alternatives (page S-46), Disposition Alternatives (page S-46), and Comparison of Sites Within Alternatives (page S-48)) should be removed from the final report.

If the DOE insists upon using the word *adverse* in the final document to denote any deviation from the "natural state" of the environment, it should be applied equitably among all sites and quantified with the level of significance, since any action that disturbs nature could be considered adverse and every site considered would have adverse impacts for all alternatives.

3/30.01

The State of Texas is pleased that DOE selected Pantex as the preferred alternative for assembly/disassembly, thereby abandoning earlier plans to transfer those functions to the Nevada Test Site.

DOE PEIS Comments
May 6, 1996
Page Three

4/34.01 The same factors that lead DOE to make the correct decision in assembly/disassembly activities, should be applied to the issue of moving the High Explosives production operations from Pantex. DOE's own estimate that such a move would cost at least $40-$50 million should make Pantex the only choice for those activities.

Another factor is the risk involved in transporting the material from Pantex. And finally, there is a significant technology risk, should the High Explosives production program leave Pantex, while the highly skilled, experienced workers choose to remain in the Amarillo area.

If the statement is made that there simply is not enough work to keep workers busy in both the New Mexico labs and Pantex, the obvious choice is to keep the work at Pantex and allow the lab personnel the opportunity to maintain their proficiency by visiting Pantex.

Since that work is done at Pantex today, how are the lab personnel currently maintaining the desired level of proficiency?

STORAGE OPTIONS

5/40.20 Pantex has a proven history of safely storing nuclear weapons over the past 40 years.

Pantex could continue to store plutonium which is already at the site and upgrade facilities for the storage options being considered by DOE with minimal cost and difficulty. Pantex currently safely houses more than 8,000 surplus pits. It makes little sense to re-create storage facilities at another site and then unnecessarily transport large amounts of plutonium across the country from Pantex.

Pantex has the necessary safety, security, and surveillance capabilities to accommodate an expanded role with minimal costs and it is the production site closest to Los Alamos, the planned pit fabrication site.

DOE PEIS Comments
May 6, 1996
Page Four

We believe any future missions at Pantex related to plutonium can be successfully carried out, provided the following three criteria are met:

1. Continued Local Support
2. Proven Technology
3. Independent Oversight

OFF-LINE ISSUES

During the public hearings in Amarillo, a number of comments were made from the audience requiring clarification from the DOE presenters.

Unfortunately, on more than one occasion, the response from the DOE official was that he and the questioner should "discuss that issue off-line."

Because the State of Texas believes that to be a totally inappropriate and unacceptable response to make, especially at a public hearing called for the sole purpose of discussing the issues contained in the PEISs, I attempted to capture as many of those questions in writing as possible.

STORAGE AND DISPOSITION OF WEAPONS-USABLE FISSILE MATERIALS PEIS ISSUES

Comment:

Section 1502.1 of 40 CFR Parts 1500-1508, the regulations implementing the National Environmental Policy Act, states:

DOE PEIS Comments
May 6, 1996
Page Five

"The primary purpose of an environmental impact statement is to serve as an action-forcing device to ensure that the policies and goals defined in the Act are infused into the ongoing programs and actions of the Federal Government. It should provide full and fair discussion of significant environmental impacts and shall inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment. Agencies shall focus on significant environmental issues. . . Statements shall be concise, clear and to the point, and shall be supported by evidence that the agency has made the necessary environmental analyses." (Emphasis added)

Question

In light of these very clear and concise instructions based in law, how does DOE rationalize that Pantex is identified as having:

"the greatest potential to experience adverse cumulative impacts, particularly because of its relatively small, compact area. Water resources and biological resources would be vulnerable, and land resources . . . could be susceptible to adverse cumulative impacts" (p. S-46) (Emphasis added)

Comment

The Summary discusses three plutonium disposition categories (deep borehole, immobilization and reactor) consisting of nine alternatives, and ultimate high-level waste disposition.

Questions:

a If the immobilization alternatives and reactor alternatives (except CANDU) result in the same ultimate disposition, i.e. a high-level waste repository, what is the cost/benefit of the reactor alternatives?

b Are the references to a high-level waste repository referring to DOE's Yucca Mountain project in Nevada?

c What would constitute ultimate disposition in the case of the CANDU reactor alternative? Would the Canadians be allowed to send the resultant high-level nuclear waste back to the U.S.?

DOE PEIS Comments
May 6, 1996
Page Six

Comment

The oft-repeated phrase appears in the Summary:

"Potential adverse intersite transportation impacts related to all DOE sites could occur because of the increased risk of traffic accident fatalities."

Question:

Does any other site, except Pantex, have the capability to avoid the problem of having to ship the 21.8 metric tons of plutonium declared surplus by the President, since the material is already at Pantex?

Is there no risk to human health associated with intersite transportation of radioactive materials? Has a dose risk assessment been made?

Comment

In the Storage and Disposition Summary it is stated (page S-20) that "Potential adverse impacts to waste management would occur at Pantex, ORR (all three options), and SRS, because the construction of sanitary, utility, and process waste water treatment systems to treat non hazardous liquid wastes may be required."

Question

- How can the construction of facilities and systems to treat waste have the potential to adversely impact the *management* of waste? Is this a significant environmental impact as intended by Section 1502.1 of the NEPA regulations?

Comment

In Volume III of the Storage and Disposition PEIS (pp. M-131 through M-155), the chemicals used are as follows:

Hanford reports 3 chemicals, none with slope factors
NTS reports NO chemicals
INEL reports 28 chemicals, 12 with slope factors
Pantex reports 25 chemicals, 6 with slope factors
ORR reports 10 chemicals, none with slope factors
SRS reports 15 chemicals, 5 with slope factors
Rocky Flats reports 10 chemicals, 3 with slope factors.

These reported chemical usages present an erroneous comparison, as all sites under consideration will use similar chemicals. For example, benzene is a combustion product of both diesel fuel and gasoline, and would be common to all sites.

Question:

Was the manner by which the information was requested not specific enough to ensure accurate reporting or are the records at some sites incomplete? Please correct.

Comment

In the Summary (p. S-46), it is stated that "When the other DOE programs previously identified in this section are considered, the rank order of DOE sites in terms of their descending potential for cumulative impacts changes to SRS, INEL, Pantex, NTS, Hanford and ORR." A similar statement appears on p. S-47.

Question

What does this statement mean? It is obscure and demands an explanation that is concise, clear, and supported by evidence.

DOE PEIS Comments
May 6, 1996

STOCKPILE STEWARDSHIP AND MANAGEMENT PEIS ISSUES

Comment

Separation of the explosive fabrication and assembly/disassembly missions would require that explosives be transported over long distances in order to be mated with the physics packages. In the case of LLNL, the extensive winter fogs of the San Joaquin Valley that create near zero visibility, sometimes for weeks-on-end, should be considered in any safety analysis.

Question:

6/09.06

a. Has an analysis been made of the additional hazards of transportation of HE from either of the national laboratories to where it would be used?

b. What would be the increased costs of intersite transportation?

Comment:

7/04.15

NTS workers and their families associated with the 2,253 new jobs (SSM Summary p. S-32) would likely reside in Las Vegas, NV, which is one of the fastest growing areas in the country.

Question:

Has an analysis been made of the impact of these additional residents on the Las Vegas municipal water supply?

Comment:

The preferred alternative for the location of explosives development has not yet been determined. Moving HE production from Pantex to one of the laboratories is under consideration. Note that there have been attempts to develop the land right next to LLNL's Site 300 fence for new housing.

DOE PEIS Comments
May 6, 1996
Page Nine

Question:

8/01.03
a. If the operation is moved to either LLNL or LANL, where would the building be placed and the testing be done?

b. What is the current and projected land use around LANL and LLNL (particularly, Site 300)?

A number of questions were also raised during the April 22-23 hearings in Amarillo that were addressed specifically to the Pantex Site-Wide EIS. Those questions will be included when the State issues its comments on that document.

If you have any questions or need additional information, please write or call me at 512/463-2198.

Sincerely,

Roger Mulder

ROGER MULDER
Director, Pantex

Support Material

The major impact areas covered by the S&D PEIS focus on water, air, and land resources. Pantex was named 3 times with air impacts, 4 times with land impacts, 6 times with waste impacts, and at least 11 times with ADVERSE water resource impacts. The statements about air and land impacts may be reasonable because at least one other site was mentioned with similar impacts (i.e. Pantex was not singled out to a large extreme. However a more accurate picture would result if DOE stated that these impacts are not significant). The most inaccurate representation in the summary is the discussion of adverse water resource impact, for which Pantex was incorrectly singled out at least 11 times above the other sites. Details are provided below.

Water Resources

- Water Availability:

All comparisons on water resources were made relative to the NO ACTION ALTERNATIVE for each site, with no absolute basis among sites, and always expressed as a percentage of the NO ACTION ALTERNATIVE. Without an absolute basis among sites to ascertain the "true impact on the environment", no rank ordering of sites or preferred alternatives based upon environmental impact can be justified. However, contrary to logic, this was done in the sections titled *Long-Term Storage Alternatives* (page S-40), *Disposition Alternatives* (page S-46), and *Comparison of Sites Within Alternatives* (page S-48).

To make this point clear, for a site that has worked to conserve water in the past, and which has a small water demand, the percentage increase due to any increase in construction or operation activity are disproportionately large relative to a site which has not applied water conservation techniques and which has a large water usage at the NO ACTION ALTERNATIVE (see item #1 below). On the percentage basis used relative only to the NO ACTION ALTERNATIVE, sites which apply conservation techniques are unfairly singled out.

Second, relating everything to the NO ACTION ALTERNATIVE without an absolute basis, implies that the current water demand significantly impacts the available supply or is a significant part of the demand of the local community such that a large percentage increase in water demand detrimentally affects the amount of water available for the local community (i.e. farmers and ranchers). Contrary to that implication in the summary, the impact of any of these activities on the Amarillo area water consumption would be less than 1% (see item #2 below).

To put this issue in perspective, the baseline (NO ACTION ALTERNATIVE) water consumptions are summarized below taken from the Summary S&D PEIS in million liters per year (MLY) focused only on the ground water component:

NO ACTION ALTERNATIVE (MLY)

Hanford	NTS	INEL	Pantex	Oak Ridge	SRS	RFETS
13,511	2,400	7,570	249*	14,760	13,247	439

* note the water use at Pantex for 1994 was 836 MLY and is "expected" to decrease to 249 MLY by 2005 due to drawdown (a small baseline made smaller). Ref. Vol II, p 4-167.

Item #1: The PEIS quotes increases in ground water usage for Pantex for the various alternatives from 2.8% to 44.2% above the NO ACTION ALTERNATIVE (this percentage increase is based upon the projected baseline of 249 MLY for the year 2005, a decrease from the current use rate of 836 MLY). Taken out of context, these numbers seem extreme. Indeed, these percentages were incorrectly brought forward in the word summary using this statement repeatedly: *"Adverse impacts to water resources at Pantex would result from the continued local drawdown of the Ogallala Aquifer, but Pantex's contribution to this drawdown is expected to continue to decrease due to a decrease in other DOE activities at Pantex. Neither surface or ground water resources at other DOE sites would be affected."* This causes the inaccurate perception that the large projected percentage increase in water use would be detrimental to the welfare of the local community. This might have been true if indeed the absolute demand placed on the available resources was significant. But, the maximum estimated increase is less than 1% of the water use in the area and a 44% increase of 1% is only 0.4% absolute increase (and this was based upon the 2005 projection, relative to current operations it would be a 67% decrease in water usage).

Item #2 (Ref: Vol 1, p 3-159 to 3-162):

- A: In 1994 while Pantex was drawing 836 MLY (836×10^6 L), the city of Amarillo pumped 23.9 BLY (23.9×10^9 L), from the Carson County well field. Using the PEIS number of 249 MLY in 2005, this equates to about 1% of the Town's water use. If water pumped directly by agriculture (which does not go through the Amarillo's water plant) were included this figure the relative demand by Pantex on the water drawn from the Ogallala Aquifer would be well below 1%.
- B: The recoverable water volume in storage and available for use in the Ogallala Aquifer in the High Plains Aquifer system is estimated at 5.15×10^{14} L. At this rate, if Pantex were operated for 1000 years using the highest water demand of all alternatives (Collocation - 379 MLY), Pantex would use less than 7/100% of the available water.

In summary, the repeated statements of adverse impacts on groundwater resources for any and all alternatives is based upon an inaccurate reference point and the actual impact brought out in the draft summary has no basis. To satisfy the requirement to make comparisons of water usage against the no action alternative, we suggest that the no action alternative be place on a percentage basis of actual area water usage to allow for an equitable and objective comparison between sites. For any sites where this percentage increase is insignificant, the PEIS and its Summary should state that fact clearly.

Mr. Jay Rose
Department of Energy
Office of Reconfiguration
1,000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Mr. Rose:

Enclosed are comments on the Draft Programmatic Environmental Impact Statement (PEIS) for Stockpile Stewardship and Management. We appreciate having been provided the opportunity to participate in this process and sincerely hope that our efforts contribute to overall success in resolving the difficult issues now before you.

9/40.51 | The Stockpile Management Preferred Alternatives, briefed at the April 22 and 23 1996 Amarillo Public Meetings, consisting of downsizing most Weapons Complex operations in place augmented by re-establishment of pit component manufacturing capability at Los Alamos National Laboratory, would have the least negative radiological impact on the affected regions of interest.

4/34.01 continued | The noted inclination to duplicate high explosives operations at Los Alamos National Laboratory, Lawrence Livermore National Laboratory, or both raises many more serious safety issues, however, than are presented in the PEIS, or are adequately addressed in the Stockpile Management Preferred Alternatives Report.

Efforts now underway and programmed to begin in the near future to update assessments and refine estimates of radiological and other health impacts from Pantex Plant operations on the worker and general populations must be maintained on schedule to increase public confidence in and acceptance of the continued mission at Pantex. We will continue to follow this important issue, and provide appropriate insight and assistance.

If we can be of any further assistance, please do not hesitate to contact us.

Sincerely,

Joseph A. Martillotti

Stockpile Stewardship and Management
DRAFT PEIS Comments

4/34.01 continued
6/09.06 continued
Summary, Page S-17 - High Explosive Components - The DRAFT PEIS documents do not provide sufficient information to support the claims that "...either laboratory has sufficient capacity to meet..." high explosives needs, or that "Costs for this function are relatively low...". In addition, safety issues related to shipment of shaped charges were not assessed in detail, either in terms of increased volume of shipments of shaped components over raw high explosives, or in terms of the technical vulnerabilities of the components.

10/34.11
Summary, Page S-31 - Relocate To Los Alamos - The statements that LANL research and development facilities currently possess sufficient (operational) capacity with little or no building construction/modification was apparently not based totally in fact, as evidenced by the failure to adequately address concerns expressed in the April 22 and 23, 1996 Amarillo public meetings. Further review of the Stockpile Management Alternatives Report and Analysis of Stockpile Management Alternatives Report verified that the DOE requirements for certification of those buildings to current standards was apparently ignored.

11/34.12
Volume I, Table 3.4.5.3-1, Page 3-76 contains insufficient information for analysis. The baseline numerical information contained in Table 3.4.5.2-1 cannot be compared reasonably with "minimal" resource requirements. It would appear, based upon a simple comparison between Table 3.4.5.2-2 and Table 3.4.5.3-2 that the missing "baseline" data should have been readily available for insertion in the table.

Mr. J. David Nulton
Department of Energy
Office of Fissile Materials Disposition
P. O. Box 23786
Washington, D.C. 20026-3786

Dear Mr. Nulton:

Enclosed are comments on the Storage and Disposition of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statement. Under the Atomic Energy Act, the Department of Energy is not subject to external regulation of use and handling of Special Nuclear Materials. The Secretary of Energy has committed to determining the feasibility of external regulation by the Nuclear Regulatory Commission (NRC), the Defense Nuclear Facilities Safety Board and/or NRC Agreement States. We believe that some form of external oversight of DOE activities in the Long-Term Storage phase of this project is in the best interest of the Department and stakeholders, and encourage the Department to move ahead with this initiative without delay.

Any change in the mission or operations at Pantex resulting from this PEIS must be undertaken with maximum consideration given to full compliance with published standards for protection of the public and environment against the effects of radiation. Future management of Pantex is crucial to the future of the Texas Panhandle, not only in near term socioeconomic terms, but also in fulfilling responsible stewardship of the environment for our successors. Decisions made in this process should be made giving full consideration to the needs of local citizens as well as the nation.

We appreciate having been given the opportunity to participate in this process and sincerely hope that our efforts contribute to overall success in resolving the difficult issues.

Sincerely,

Joseph A. Martillotti

Storage and Disposition
DRAFT PEIS Comments

Summary, Page S-46 - Long-Term Storage Alternatives - The statements concerning land use appear to conflict with Volume II, Pages 4-175 and 4-191 text.

Summary, Page S-48 - Comparison of Sites Within Alternatives - The statements concerning environmental impacts do not appear to be supported by the text and appear to be in conflict with Volume II, Pages 4-175 and 4-191 text.

Summary, Page S-67 - Facility Accidents - The statements do not provide any information or discussion upon which decisions might be based. A discussion of accident assessments previously documented would provide clarification. Volume I, Chapter 1.1.1, Page 1-2 "Materials Covered in This PEIS" describes the base condition and storage configuration from which decisions will be made. Discussion of the Plutonium Working Group findings, Defense Nuclear Facility Safety Board recommendations and the DOE standard for long-term storage of the fissile materials appears to be absent from the text. Provision of a general summary of the identified vulnerabilities or upgrades to storage conditions would be a useful addition to this table.

Summary, Page S-78 - Upgrade Existing Facility for Continued Storage - The "estimated impacts from a set of accidents that propagate radioactive releases" data appear to be a replica of Table 2.5.1, Volume I, Page 2-180. This is identical to "Beyond design basis earthquake" data contained in Table 4.2.3.9-4, Volume II, Page 4-160. Table M.5.2.3.2-1, Volume III, Page M-269, presents "Upgrade of Pantex Interim Storage" "Evaluation of a Composite Set of Accidents" impacts which are similar (within order of magnitude) but not totally consistent with the above information.

Summary, Page S-96 - Consolidate all Pu Material at One Site - The "impacts from a set of accidents that propagate radioactive releases" data appear to be a replica of Table 4.2.4.9-6, Volume II, Page 4-218, "Beyond design basis earthquake" scenario. The Table on Page S-96 replicates Table 2.5.1, Volume I, Page 2-199. However, Table 5.2.1.2-4, Volume III, Page M-242 contains a summary entitled "Evaluation of Composite Set of Accidents" which presents conflicting information.

Summary, Page S-117 - Collocation of Pu with HEU Storage Upgrade and/or New Facility - The headers of data columns indicate that the projections reflect a "set of accidents that propagate radioactive releases." The data presented, with the exception of MEI statistics, match exactly with Table 4.2.4.9-7, Volume II, Page 4-222. The table on S-117 replicates Table 2.5-1, Volume I, Page 2-219. Table 5.2.2.2-4, Volume III, Page M-251 "Collocation Alternative" contains a summary entitled "Evaluation of Composite Set of Accidents" which presents conflicting information.

Summary, Pages 149 and 150 appear to be out of order.

COMMENTS
BY
DAVID BOYLE
TEXAS A&M UNIVERSITY

4/34.01 continued

1. High Explosives (HE) Manufacturing.
The PEIS's assessment of key factors for this issue is generally inadequate and, in some cases, blatantly biased. The draft PEIS inaccurately "stacks the deck" in favor of moving HE manufacturing from Pantex to the labs. Draft findings on costs, core technical competency, and safety and environmental impact of the alternatives all need an improved, more objective analysis.

(A) Costs. The PEIS frequently dismisses as unimportant the cost differential between right-sizing HE manufacturing at Pantex and establishing it as a new mission at LANL and/or LLNL. The cost analyses are opaque and do not properly consider:

1) the higher cost of manufacturing man-hours at the labs versus Pantex.
2) the extra cost of transporting HE pieces manufactured at the labs to Pantex for warhead assembly.
3) the wasted sunk costs for the extensive high-tech HE manufacturing equipment recently installed as part of a Pantex upgrade.

The PEIS and various DOE spokespersons frequently claim "savings to the taxpayer" as a critical factor for the right-sizing decisions that hurt the economies of specific communities. When objectively determined costs for moving HE manufacturing to the labs are integrated over the long term (50 years or more), taxpayer savings is significant. Why does DOE dismiss cost savings as unimportant in this one case?

(B) Core Technical Competency.

1) The SSM PEIS ignores or seriously undervalues the significant technical risk to the enduring stockpile of moving HE manufacturing out of Pantex. All three lab directors have testified under oath to Congress about the serious risks involved with changing warhead manufacturing processes in the absence of nuclear testing. According to the PEIS, each of the warhead designs in the enduring stockpile have undergone at least one stockpile confidence test (SCT). The SCT provides our best and only real-world certification that the manufactured warheads are truly reliable (this reliability is the critical element of deterrence—the whole reason for having the weapons in the first place). These confidence-tested weapons were Pantex-built, including HE manufacturing. We know they work. We know the Pantex HE

4/34.01 continued

manufacturing procedures and people perform the HE manufacturing function properly. Starting up this critical production process as a new mission at the labs and adding the subtle, unstable effect of long distance transport between HE manufacturing site and weapon assembly certainly adds serious technical risks that the PEIS does not adequately recognize.

2) The PEIS unfairly and incorrectly undermines the Pantex alternative for HE manufacturing by its egregiously unbalanced description of the alternative sites' technical qualities. An informal content analysis of the site descriptions illustrates the significant degree of bias in favor of moving HE manufacturing to the labs. For example, the description of LANL as a potential alternative contains such glowing phrases as:

—LANL has continued to upgrade and modernize..
—State-of-the-art processing equipment .
—Full range of HE-processing equipment
—Proven quality assurance processes
—Stringent disposal requirements
—Continuous process improvements drive an effective best practices program
—Important safety considerations are incorporated
—Etc. (the list could be much longer).

The above short list describing LANL's qualities applies equally well to Pantex. Yet, the analogous PEIS segment on Pantex is a matter-of-fact, spare- the-superlatives description of Pantex HE manufacturing capability which explicitly understates the same qualities that the authors found so advantageous at LANL.

(C) Safety and Environment.

6/09.06 continued

1) The PEIS does not adequately evaluate the the safety impact of transporting hundreds of HE hemispheres from the labs to Pantex each year should HE manufacturing be moved to the labs.

4/34.01 continued

2) The safety and environmental impacts on the labs and their local communities of conducting this potential new mission at the labs are glossed over as "insignificant" without a serious analysis.

12/34.15

3) Providing the labs the economic benefit of taking over the Pantex HE manufacturing mission seems particularly unfair in light of the fact that Pantex, and the citizens of Amarillo, will retain the environmentally problematic mission of disposing of the replaced HE components, while suffering the economic insult of losing the environmentally cleaner manufacturing mission.

13/11.01

2. Aircraft Accident Analysis. The aircraft crash frequency determination and supporting consequence analysis appears inconsistent with that in the Pantex Site-Wide PEIS. In general, a corrected analysis should explicitly take into account such factors as:

--Actions taken or planned to reduce overflight frequencies.
--Future facility and storage consolidation that can reduce the footprint for aircraft/warhead interaction.
--The expected widespread use of insensitive high explosives in most, if not all, enduring warheads; also the introduction of fire resistant pits.
--Aircraft size and mass, building structures, and other factors that affect the consequence calculations.

May 3, 1996

U.S. Department of Energy
Office of Reconfiguration
P.O. Box 3417
Alexandria VA 22302

Dear Sir or Madam:

The following are review comments on the "Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management" from staff at the Bureau of Economic Geology of The University of Texas at Austin.

General Comment:

14/05.02
15/04.14 | Sections 4.5.2.4 and 4.5.2.5, which describe water resources and geology and soils, do not provide adequate information for the reader to determine if environmental impacts could result from proposed alternative actions at Pantex.

Specific Comments:

16/01.02 | Figures 4.5-2, 4.5.2.1-1, and 4.5.2.4-1. Playas are incorrectly labeled as dry lakes on these maps. Playas should be described as ephemeral lakes, as they are in the text. Most playas, including playas 2, 3, 4, 5, and Pantex Lake, hold water for 1 to 3 months per year. Playa 1 holds water throughout the year because it receives discharge from the Pantex waste water treatment plant.
Figure 4.5.2.1-1. Scale is incorrect. Compare with that of figure 4.5-2, which is correct.

4.5.2.4 Water Resources
Ground water

17/04.05 | Page. 4-179, para. 1-3. There is no significant discussion of recharge to the Ogallala aquifer. It should be described that most recharge is derived from runoff that collects in playa lakes. Recharge is focused through playas, moves through the vadose zone, collects in the perched aquifer, flows slowly through the fine-grained zone beneath the perched aquifer, and eventually flows through the unsaturated zone between the perched aquifer and the Ogallala aquifer to finally collect in the Ogallala aquifer. No mention is made of the velocity of water moving through the vadose zone to the perched aquifer. For example, "bomb" tritium has been detected in the perched aquifer, which means that precipitation that fell after 1950 has already reached the aquifer. There is no discussion of ground-water flow in either the perched or Ogallala aquifers. There is no discussion of the fact that contaminants in the perched aquifer have already moved off the Pantex Plant to the east.

4.5.2.5 Geology and Soils

U.S. Department of Energy
Office of Reconfiguration
May 3, 1996
Page 2

16/01.02 continued | Page. 4-182, para. 2. All playas shown in figures 4.5-2, 4.5.2.1-1, and 4.5.2.4-1 except playa 3 are approximately 900 to 1000 m in diameter.

18/05.03 | Page. 4-182, para. 3. The lithology of the Ogallala Formation is not described. The description should include a brief discussion of the complex heterogeneity of the Ogallala because the variation in sediment types controls ground-water flow in the formation. The significance of the fine-grained zone as well as gravels in buried channels beneath the plant should be explained.

14/05.02 continued | Page. 4-182, para. 3 or 4. No attempt is made to describe the role of salt dissolution and subsidence in the formation of playa basins. High solute loads in streams draining the region indicate that these processes are active regionally. No mention is made of the potential effects, if any, of dissolution-induced subsidence at the plant.

19/05.05 | Page. 4-182, para. 5. No attempt is made to point out that Randall clay soils are Vertisols and that deep desiccation cracks and root tubules, which are potential pathways for recharge, are characteristic of these soils. Furthermore, these soils have a ustic moisture regime, which means that water moves down through the soil at some time in most years. That is, recharge occurs through even these clay soils.

14/05.02 continued | 4.5.3.5 Geology and Soils
Page. 4-206, para. 2. Because the description of geology and soils in section 4.5.2.5 is inadequate, the reader cannot determine that "hazards posed by geological conditions are negligible at Pantex."

If you have any questions concerning these comments please call me at (512) 471-0232.

Sincerely yours,

Thomas C. Gustavson
Senior Research Scientist

April 29, 1996

U.S. Department of Energy
Office of Fissile Materials
P.O. Box 23786
Washington, DC 20026

Dear Sir or Madam:

The following are review comments on the "Storage and Disposition of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statement" from staff at the Bureau of Economic Geology of The University of Texas at Austin.

General Comment:

Sections 3.5.4. and 3.5.5., which describe water resources and geology and soils, do not provide adequate information for the reader to determine if environmental impacts could result from proposed alternative actions at Pantex.

Specific Comments:

Page 846, para. 3. Potential impacts of the long-term storage alternative at Pantex depend greatly on waste disposal practices in addition to the natural characteristics of the site. Although the Ogallala is a valuable and critically important ground-water resource, the presence of the resource does not necessarily make it vulnerable to impacts of waste storage. Detailed studies by the Bureau of Economic Geology and other entities have shown that recharge to the perched and Ogallala aquifers is focused through playas or artificially ponded areas such as ditches and that recharge in upland or interplaya areas is negligible. Recharge occurs where surface water accumulates and develops sufficient hydraulic head over sufficient time to drive waters below the zone of evapotranspiration. Recharge of water or contaminants may also occur beneath manmade excavations such as ditches and landfill sites where runoff can accumulate (these are roughly analogous to playas) or as the result of leaking underground storage tanks. Appropriate engineering practices to prevent releases from storage sites and placement of storage facilities in upland (interplaya) areas at the Pantex Plant should limit the potential for adverse impacts to water resources at Pantex. As long as no wastes are introduced into the playas, buried on site, or placed in an area where water can flow through the wastes or pond in contact with the wastes, contaminants should not be transported into the subsurface and the Ogallala should not be impacted by Pantex activities. Proper engineering and adequate monitoring and maintenance would, however, minimize impacts of long-term storage on the Ogallala at the Pantex Plant.

U.S. Department of Energy
Office of Fissile Materials
May 3, 1996
Page 2

Figures 3.5.4-1 and 3.5.4-2. Playas are incorrectly labeled as dry lakes on these maps. Playas should be described as ephemeral lakes, as they are in Figure 3.5.1.-1. Most playas, including playas 2, 3, 4, 5, and Pantex Lake, hold water for 1 to 3 months per year. Playa 1 holds water throughout the year because it receives discharge from the Pantex waste water treatment plant.

Figures 3.5.4-1 and 3.5.4-2. These maps indicate that the southern boundary of the Pantex site includes the rights-of-way for both U.S. Highway 60 and the Burlington Northern and Santa Fe Railroad. Compare with figure 3.5.1-1 where the southern boundary is shown correctly.

Page 3-164, para. 2. Data from seismic surveys and playa basin cores acquired by the Bureau of Economic Geology suggest that playas 3 and 5 and Pantex lake are surface expressions of local subsidence related to dissolution of underlying Permian salt beds.

P. 3-164, para. 1. All playas shown in figures 3.5.1-1, 3.5.4-1, and 3.5.4-2 except playa 3 are approximately 900 to 1000 m in diameter.

P. 3-164, para. 2. The lithology of the Ogallala Formation is not described. The description should include a brief discussion of the complex heterogeneity of the Ogallala because the variation in sediment types controls ground water flow in the formation. The significance of the fine-grained zone as well as gravels in buried channels beneath the plant should be explained.

P. 3-164, para. 2 or 3. No attempt is made to describe the role of salt dissolution and subsidence in the formation of playa basins. High solute loads in streams draining the region indicate that these processes are active regionally. No mention is made of the potential effects, if any, of dissolution-induced subsidence at the plant.

P. 3-164, para. 5. No attempt is made to point out that Randall clay soils are Vertisols and that deep desiccation cracks and root tubules, which are potential pathways for recharge, are characteristic of these soils. Furthermore, these soils have a udic moisture regime, which means that water moves down through the soil at some time in most years. That is, recharge occurs through even these clay soils.

Page 4-187, para. 1. It is stated that the TNRCC projects that there will be adequate water until the year 2040. In fact this projection is probably from a Texas Water Development Board report from the early or mid-1980's.

Page 4-187, para. 3. It is stated that "I'o additic al impacts to groundwater quality are anticipated because there are no direct discharges to groundwater". This seems at least a little misleading in two areas. First, exactly how does one define direct discharge? The contaminants east of Zone 12 south document a fairly direct pathway for recharge water from the surface to the aquifer. Second, the current plans for treating contaminated water at the plant rely on the reinjection

U.S. Department of Energy
Office of Fissile Materials
May 3, 1996
Page 3

of treated water into the aquifer. This injection would also qualify as direct discharge to the aquifer.

Page 4-194, para. 1. Data from seismic surveys and playa basin cores acquired by the Bureau of Economic Geology suggest that playas 3 and 5 and Pantex lake are surface expressions of local subsidence related to dissolution of underlying Permian salt beds. Estimated average subsidence rates are low (about 0.01 mm/yr), but vertical movement may be episodic.

Page 4-859. The amount of ground-water decline that will result from projected production rates is given as 1.5 ft/yr. What is the source of this number. The writer also fails to mention that this incremental increase will be in addition to the drawdowns resulting from the Amarillo well field. Current rates of decline in the area of the Pantex well field are approximately 2 ft/yr. It would seem appropriate in a discussion of ground-water resources to include the impact of the Amarillo well field on the ground-water resources at the Pantex Plant.

If you have any questions concerning these comments please call me at (512) 471-0232.

Sincerely yours,

Thomas C. Gustavson

Re: COMMENTS REGARDING FUTURE ACTIVITIES AT PANTEX

Dear Secretary O'Leary:

1/40.73

Upon review of the three interrelated environmental impact statements ("EISs") regarding the reconfiguration and future of the Department of Energy's nuclear weapons complex,[1] I am becoming increasingly concerned that the Department of Energy ("DoE") may soon decide to process plutonium pits at the Pantex facility. I am furthermore concerned--once again--that the Texas Panhandle will become the *de facto* permanent dump for the nation's surplus plutonium supply. Given the 24,000 year half-life of plutonium and the distinct possibility that the environmental, political, and social issues surrounding any other permanent disposition of plutonium will not be resolved in the foreseeable future, this is an ominous development for Texas.

I have attached previous correspondence between DoE and my office dating back to 1991. As is readily apparent from that correspondence, I have long been firmly opposed to both propositions. Unfortunately, it now appears that we are moving closer to decisions by DoE that will unfairly burden Texans during the coming decades and needlessly impose risks on the farmers and ranchers who depend upon the Ogalalla Aquifer underlying Pantex.

A decision by DoE to begin plutonium reprocessing, with its attendant problems and risks for residents throughout the Panhandle, or a decision to store surplus plutonium (*i.e.*, nuclear waste) on a medium- or long-term basis, is unacceptable to this office. Accordingly, I have instructed my staff to renew its efforts to develop all available legal options to prevent DoE from turning the Texas Panhandle into a *de facto* nuclear waste dump, or another Rocky Flats.

I realize that you and your office have made great strides in incorporating the concerns of all stakeholders in your decision-making process. For that, you deserve much credit. Unfortunately, I do not believe that the

[1] The three EISs are: (a) the PEIS on Storage and Disposition of Weapons-Usable Fissile Materials (which discusses, *inter alia*, the mixed-oxide fuel option in the most detail and discusses the alternatives, including a facility to cut the pits in two and process them into metal or oxide, to process other types of plutonium; and to mix plutonium with uranium to make mixed oxide fuel (MOX) to be used in nuclear power plants); (b) the Site Wide EIS for Pantex (which discusses the Pit Reuse facility in lesser detail), and (c) the PEIS on Stockpile Stewardship and Management.

United States Senate
WASHINGTON, D.C. 20510-4302

May 5, 1996

The Honorable Hazel O'Leary
Secretary
U.S. Department of Energy
Forrestal Building
1000 Independence Avenue, S.W.
Washington, DC 20585

Dear Secretary O'Leary:

Thank you for the opportunity to comment on the U.S. Department of Energy's (DOE) Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials. Please also consider this our comment on the Pantex Site-Wide Environmental Impact Statement, since most of the issues addressed in these documents are identical.

1/40.52 | First and foremost, we are adamant that any current and future functions at Pantex be conducted in a safe and environmentally sound manner. Our first priority is to ensure that any expansion at Pantex be implemented in a way that does not impair the health or safety of area residents or have an adverse effect on the environment. These goals serve as a prerequisite to any current and future activities at Pantex, including expansion.

2/40.66 | We are pleased that DOE selected Pantex as the preferred alternative for assembly/disassembly, thereby abandoning earlier plans to transfer those functions to the Nevada Test Site (NTS). However, by failing to recognize Pantex as the preferred candidate site for new and/or consolidated stockpile management facilities, the DOE overlooked the best site for maintaining the integrity of the U.S. nuclear stockpile and attaining maximum efficiencies and cost savings.

Pantex is perhaps the most cost-effective alternative for any new construction of SSM facilities. First, labor costs, utility rates, and water and land availability at Pantex, as well as public support, are more amenable than those at any other Complex site. It is appropriate to consider Pantex as an alternative site for all future defense-related facilities to complement activities at the national labs (such as the planned Atlas Facility and plutonium pit fabrication site at Los Alamos National Laboratory [LANL]). DOE makes no mention of a strategic plutonium reserve that we believe is important to our future national security needs, even though the PEIS mentions that strategic storage should be co-located with disassembly. We believe Pantex should be the preferred site for such a mission in coordination with its management functions. The location of additional defense-related activities at Pantex would ensure that core technical capabilities are preserved at a location that can secure them at the most efficient cost to the American people. In its deliberations, DOE should insist that budgetary comparisons between Pantex and other sites are accurate, and include capital, transportation, training, remediation, and other costs.

SSM-EF-005
COMMENT LETTER

PAGE 2 OF 2

Page 2

3/34.01 Consistent with the strengths identified above for increased stewardship and management duties, the high explosives (HE) functions should also remain at Pantex. Because the production assembly/disassembly functions remain at Pantex, the HE fabrication duties should be present at the corresponding site. After all, the SSM draft admits that Pantex must retain HE capabilities to process the inventories already on site from dismantling. Therefore, the least expensive alternative is to maintain HE functions at Pantex. We adamantly disagree with the statement in the PEIS that there are no advantages to siting high explosives at Pantex rather than the national labs. The capitol outlay alone necessary for transfer is cost prohibitive. In addition, should future need arise for new weapons production, it will be critical to have the HE facilities at the weapons production/assembly site.

4/40.20 As the sole DOE-authorized facility for assembly and disassembly of nuclear weapons, Pantex has historically handled these functions in a safe and efficient manner for more than 40 years. One of the challenges faced after dismantling a significant portion of the nuclear stockpile is the processing or disposal of the materials that remain. In meeting this challenge, Pantex could continue to store plutonium which is already at the site and upgrade facilities for any and all storage options being considered by DOE with minimal cost and difficulty. Pantex currently safehouses more than 8,000 surplus pits, and plans are being made to ship additional pits from Rocky Flats to Pantex. It makes little sense to re-create storage facilities at another site and then unnecessarily transport large amounts of plutonium across the county from Pantex.

We also believe Pantex should be designated the preferred site for any disposition options and related functions. It makes budgetary and policy sense to site disposition where storage already exists. Furthermore, it makes no sense from any perspective, budget or otherwise, to site strategic storage at one site and surplus at another. Pantex should be selected for both storage functions. Pantex has the necessary safety, security, and surveillance capabilities to accommodate an expanded role with minimal costs and it is the production site closest to Los Alamos, the planned pit fabrication site.

Based upon these reasons, we respectfully urge DOE to designate Pantex as the preferred alternative site for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition and any related functions. Thank you again for the opportunity to comment on these documents.

Yours respectfully,

PHIL GRAMM

Statement of Congresswoman Karen McCarthy
Fifth District of Missouri

before the

U.S. Department of Energy
Public Hearing on Stockpile Stewardship and
Management Programmatic EIS
Kansas City, Missouri
April 9, 1996

ALLIED SIGNAL PUBLIC HEARING
TESTIMONY OF CONGRESSWOMAN KAREN McCARTHY
MISSOURI'S FIFTH DISTRICT
KANSAS CITY, MISSOURI
TUESDAY, APRIL 9, 1996

Our nation has relied on Kansas City Plant to produce high quality, reliable weapons technologies since 1945. At that time, we were trying to recover from one of our nation's most volatile international conflicts. The memories of World War II left lasting impressions of ghastly dictatorships and unconscionable war tactics that threatened nations throughout the world.

1/31.01

In order to suppress future global threats and use our strength to encourage peace beyond our borders, our nation must maintain critical weapons technologies and highly skilled human resources like those found at the Kansas City Plant. Allied Signal is a leader in developing quality, cost effective materials and processes to preserve our current nuclear weapons stockpile.

1/31.01 continued

It is the only fully capable, non-nuclear production center which produces components designed to enhance these preservation efforts.

Kansas City has remained a top choice for locating and expanding industries primarily because of our outstanding work force. At Allied Signal dedicated plant employees work as a team to ensure the continued safety and reliability of our nuclear weapons stockpile. Last year the plant's quality system earned ISO 9000 status, the highest international certification level. Allied Signal also has been recognized for its outstanding safety record.

1/31.01 continued

As plant officials accomplish downsizing goals through budget cuts and staff reductions, they have proven themselves an integral part of the nuclear weapons complex through the Logistics and Manufacturing Center (LMC). The LMC aims to increase efficiency and lower costs, as well as integrate stockpile support functions. The plant currently supplies about 60 percent of DOE's logistics and nonnuclear manufacturing product and could expand to provide more vital products and services more resourcefully with the support of the Department of Energy (DOE).

Allied has successfully transitioned from a Cold War weapons factory to a high-tech national security center. The Kansas City plant enhances our nation's economic competitiveness by sharing the latest technological applications with government agencies, private companies and educational

1/31.01 continued

institutions. Employees have also developed new environmental technologies that can be applied to industries unrelated to defense.

Allied Signal is developing partnerships with the Sandia and Los Alamos National Laboratories to coordinate future efforts. They also plan to better meet the DOE's future production needs by changing from a production-based system to a process-based system.

The United States has the most powerful defense in the world thanks in large part to the efforts of Allied Signal and its employees. We in the Congress will be closely watching the DOE's decision making process during the coming months to ensure the nation's security is held in the highest regard.

I appreciate DOE's initial support of the Kansas City Plant through the draft Stockpile Stewardship and Management Programmatic Environmental Impact Statement (PEIS), and I hope DOE will continue to recognize the national significance and technological potential of Allied Signal as we prepare for the 21st century. Thank you for this opportunity to add my voice to the many others supporting Allied Signal, a valued corporate partner and employer in Kansas City, and a vital resource to our nation.

BILL BAKER

Congress of the United States
House of Representatives

April 10, 1996

**STATEMENT OF U.S. REP. BILL BAKER
ON THE STOCKPILE STEWARDSHIP PROGRAM AT
LAWRENCE LIVERMORE NATIONAL LABORATORY**

I appreciate this opportunity to share my thoughts with you about the maintenance of America's nuclear weapons stockpile, specifically how to enhance the reliability and safety of that stockpile through technology developed by the Lawrence Livermore National Laboratory.

Nuclear weapons have been a central component of the national defense posture of the United States for decades. They have deterred both superpower and non-superpower alike from aggressive action in many tense international situations. The credibility of the U.S. nuclear deterrent has never been questioned, in part because we have maintained a program in the science and technology of nuclear weapons at our national laboratories. The Lawrence Livermore National Laboratory can be justly proud of its very important role in this effort throughout its history.

1/21.06

The current easing of tensions with the former Soviet Union has led many to question the need for our existing stockpile of nuclear weapons. In a democracy such as ours, such discussions serve to reinvigorate our national dialogue concerning the nature of our nuclear deterrent and also what we need to keep pace with our potential adversaries in a rapidly changing world.

Regardless of the future of the Russian Confederation, thousands of nuclear weapons will continue to exist. Moreover, the prospect for proliferation is very real. While an indefinite extension of the Nuclear Nonproliferation Treaty has been agreed upon by its signatories, there is compelling evidence that some countries are seeking to develop nuclear or other weapons of mass destruction. In such an uncertain world, an effective American nuclear deterrent must be a top priority of our national defense effort.

At the same time, national and world opinion is predominantly against the resumption of nuclear testing. Thus, the Department of Energy and our national weapons laboratories have been asked by Congress and the Administration to develop a new program to assure the continued safety, reliability, and dependability of the nuclear stockpile without the use of nuclear testing.

The laboratories have responded to this challenge by developing a science-based stockpile stewardship and management program that will use advanced computer capabilities and a complete set of laboratory experimental facilities. They will thereby provide a full range of weapons data scientists need to verify computer models, evaluate problems that arise in the stockpile, and help scientists correct them.

1/21.06 continued

The National Ignition Facility (NIF) is a cornerstone of that program. The computers and the experimental facilities of the NIF are the main tools with which scientists will maintain our nuclear weapons stockpile.

The United States must also continue its historic commitment to arms control and nonproliferation of weapons of mass destruction. This is why we are pursuing a "zero"-yield Comprehensive Test Ban Treaty. We can do this today only by building a credible science-based Stockpile Stewardship and Management Program that contains all necessary elements. According to the preferred alternative of the draft Programmatic Environmental Impact Statement (PEIS) under consideration, these elements include the Accelerated Strategic Computing Initiative (ASCI), the NIF, the Atlas facility at Los Alamos, and the Contained Firing Facility at Site 300. Indeed, the recent study of the NIF and its relationship with nonproliferation concluded that the NIF can help implement our joint goals of nonproliferation and arms control.

The draft Programmatic Environmental Impact Statement makes several observations about the NIF. In its consideration of the so-called "no action alternative," which assumes that the NIF would not be built, the Statement says, "issues may arise that decrease confidence in the reliability of these weapons and increase the probability that the United States may need to invoke 'supreme national interest' and withdraw from any Comprehensive Test Ban treaty in effect." This warning underscores the critical importance of the NIF to maintaining confidence in our stockpile and its important for our arms control objectives.

In addition, I was pleased that the draft Statement confirmed earlier studies of the benign nature of the NIF with respect to environmental impact and safety issues. The analysis, done by an independent organization, confirmed that the NIF will have minimal on-site and negligible off-site effects during its construction and operation.

2/21.09

Finally, we must consider the assessed economic impact of the NIF. The analysis previously noted concluded that the NIF construction project would create 3320 jobs at its peak in Alameda, Contra Costa, and San Joaquin counties. Maintaining and operating the NIF after completion of its construction would create 890 permanent jobs, a conservative estimate that does not count the people in programs which would use the facility for experiments. Such an employment boost is welcome news to the greater East Bay region.

1/21.06 continued

The NIF is especially important to this discussion because Lawrence Livermore National Laboratory has been named the preferred site by the Department of Energy for the NIF's construction. With its multiple missions, the NIF is not only a key element of the Stockpile Stewardship and Management Program but it will also answer vital questions about how to develop inertial fusion energy. The NIF will also create a new capability for high temperature and density basic science. These exciting scientific challenges will attract the best scientists and engineers in the country to work at LLNL and contribute to the solutions of the questions noted above.

The Livermore community and the Tri-Valley region support construction of the NIF at Lawrence Livermore National Laboratory. I support the conclusions of the draft Programmatic Environmental Impact Statement and applaud the Department

1/21.06 continued

of Energy and the Lawrence Livermore Lab for their commitment to developing the NIF. Sound stewardship of our nuclear weapons is too important to leave to chance - - which is why I support the NIF at Lawrence Livermore Lab.

Thank you for letting me present my views to you today.

JOHN J. DUNCAN, JR.

Congress of the United States
House of Representatives
Washington, DC 20515–4202

March 29, 1996

The Honorable Hazel R. O'Leary
Secretary
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Dear Secretary O'Leary:

I appreciate the opportunity to become better informed on the Programmatic Environmental Impact Statement (PEIS) which will determine a reasonable range of alternatives for carrying out the responsibilities of the Stockpile Stewardship and Management Program. In the months to come, I am sure this issue will receive much attention in the Congress.

I am most pleased with the decision that the Oak Ridge National Laboratory (ORNL) and the Y-12 core missions will remain in Oak Ridge, Tennessee. I sincerely believe that our constituents are best able to perform this function that is vital to national security.

However, I do have a few questions remaining. At a time when budget cuts affect virtually all federal programs, I agree that it is time to eliminate bureaucratic waste and abuse in DOE.

1/40.13 Specifically, what is the total cost for downsizing under the PEIS proposal? I am very concerned that the total cost of downsizing might not include the decontamination and decommissioning of specific sites, such as Y-12. Is clean-up at the Y-12 site a part of this plan and how would it be funded? How much money would be saved if the PEIS process were stopped today?

2/08.01 Also, while the PEIS talks about jobs being transferred, what assurances can you give that this will not result in a sharp decline in area-wide employment until the decontamination and decommissioning funds are available?

I have always been a strong supporter of the work done at Oak Ridge National Lab, Y-12, and K-25. Although the complex is not located in my Congressional District, more employees live in the 2nd District than in any other. As a result, I am certainly aware of the benefits this facility has to both East Tennessee and the Country.

COMMENT LETTER

PAGE 1 OF 2

Senate Chamber
State of Tennessee
NASHVILLE

March 26, 1996

Ms. Hazel O'Leary
Office of the Secretary of Energy
U. S. Department of Energy
S/7A-257/FORS Bldg.
1000 Independence Ave, S.W.
Washington, D.C. 20585

Dear Secretary O'Leary:

1/33.01 As long time residents and now State Senator and Representative for Oak Ridge, we each have a thorough understanding of the Y-12 Plant and its unique manufacturing capabilities for which our nation's defense has relied upon for several decades. We completely support the preferred alternative listed in the Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management that has Y-12 retaining its secondary and fabrication mission in a downsized in-place status. However, we still have a continued concern about the PEIS process.

2/41.10 In preparation for public comment meetings to be held in Oak Ridge on April 1 and 2, our community is being asked to review and comment on two separate draft PEIS statements that collectively are more than 12 inches thick. These volumes total ten times the size of the Anderson County telephone directory. While our community, loyal citizens, and regional political leaders are appreciative of the opportunity and continue to attend these public hearings, we are beginning to seriously question this public comment process. The number of public hearings and associated PEIS documents our community has been asked to review since the Complex Reconfiguration hearings four years ago have been overwhelming. The cost and credibility of the hearings is a concern. The fact remains that Y-12 is the one best place to perform secondary and fabrication missions as well as the associated uranium storage mission.

SSM-EH-ORR-002
COMMENT LETTER

PAGE 2 OF 2

Ms. Hazel O'Leary
page two
March 26, 1996

2/41.10 continued We are not questioning the NEPA process, nor the need for public input and participation. We are questioning the cost and effectiveness of the multitude of PEIS efforts that are redundant and that often appear manipulated for the best interest of the weapons design laboratories at the expense of weapon production sites.

1/33.01 continued It is now time for a decision. We support keeping the Y-12 missions in place and we realize some downsizing will and must occur. We resent, however, the continued effort of some DOE officials to attempt to move these historic Y-12 missions to the weapons design laboratories and to "cherry pick" the technology associated with these missions. We will continue to diligently protect what is best not only for our community but for the national security of our country. Thank you for your consideration of our comments.

Sincerely,

Randy

Senator Randy McNally

David L. Coffey

Representative David Coffey

Hand-In Received from Congressman Mac Thornberry.

Thank you for allowing me the opportunity to make a few remarks.

Many of the others who will testify
will discuss the outstanding record of the Pantex plant,
the unparalleled level of community support which the plant enjoys,
and the willingness to consider other missions
as we sort out the nuclear weapons complex after the Cold War.

I'm going to focus on some broader questions
which certainly affect Pantex
but also the larger security needs of the country.

I do so not because I disagree with the other points
or because I don't think they are important.
1/40.52 Pantex's record, its people, its community support,
and its openness to other possibilities are its key strengths
and no one else can match them.

But during my tenure in Congress, [illegible]
I have attempted to make a serious study
of our nuclear weapons complex,
in part because I represent one of its crown jewels
and in part because I believe
that a modern, effective nuclear capability
is absolutely necessary to our national security.

I won't say that I have learned all I can or intend to,
and I won't represent to you that I know all the answers
during this time of change and turmoil.

But I am confident that I know enough to raise some serious questions
that relate to the subject today and to our children's security.

This is, of course, a time of great change
brought about by the end of the Cold War,
by the fact that the DOE was not as careful
in the past as it should have been,
and by this administration's decision to stop all nuclear testing.

Stockpile Stewardship and Stockpile Management

2/40.44 In my view, stockpile stewardship and stockpile management
are important for the nation
regardless of whether we conduct nuclear tests or not.

We should use a number of methods to make as sure as we can
that our nuclear weapons are safe and reliable.
In doing so, we are making a serious mistake
if we neglect to factor in the importance
of highly skilled workers at production plants.

I tend to agree with those who argue that we need smart people in labs
and maybe even that we need smart people at two labs
to compete against one another.

3/40.23 But every bit as much as we need smart people in labs,
we need experienced, knowledgeable people in production plants
who know how to take a design or a procedure
and produce a product that meets the requirements
safely and efficiently
time after time
so that we have weapons that are safe and reliable
on which we can stake our children's freedom.

That's what people at plants like Pantex do.

3/40.23 continued

It's like if you're building a house,
you need architects to draw up the blueprints and to consult with,
but there is absolutely no substitute
for skilled carpenters, and plumbers and painters
who know how to get the work done,
who know what problems there may be
in translating the blueprints and procedures into precise components;
and who have a proven track record
of having done it — time after time.

I am afraid that an undercurrent in DOE today,
that sometimes even rises to the surface,
is a lack of appreciation
for the importance of those workers on the assembly line
at Pantex and elsewhere.

If we lose them, we are a weaker nation
and no number of PhD's at the labs
will replace what we've lost.

I find it incredible that DOE would ask more and more
of at least one of our production plants
and yet allocate less money for it to fulfill its mission.

If we can't keep the trained, experienced personnel at Pantex,
the country won't reach its goals for Stockpile Stewardshp and Mgmt
We will begin to lose confidence in our nuclear deterrent,
and we will have been penny wise and pound foolish.

I am also concerned
that we are just focusing on dragging out the life
of current weapons
without taking positive steps

3/40.23 continued

toward replacing our existing weapons
which will all too soon be at the end of their intended design life.

A real question is whether we will be able to build nuclear weapons again
and how.
There are many improvements which could be made now,
others which we will want to make in the near future,
and all the while we have to be prepared
to deal with changes in Russia, China and elsewhere.
I'm not sure we're ready.

<u>High Explosives</u>

Let me address the one issue in the PEIS
for which no preferred alternative was included,
that is high explosives.

When you compare apples to apples,
no one seriously disputes
that the most cost effective option
is retaining the existing mission at Pantex.

4/34.01

The sole justification to moving high explosives
to Los Alamos and Livermore
is that we need to keep knowledge and competence
of high explosives in the Labs.
OK - but we need to keep it at the production level too.

You can do all the research you want
and have all the knowledge you can handle,
but if you can't reliably and safely translate that knowledge
into real production,
you have nothing.

SSM-EH-PTX-001
COMMENT LETTER

PAGE 5 OF 5

4/34.01 continued

There is no reason in the world
that the Labs can't continue to send people to Pantex as needed
for the manufacture of high explosives,
but to remove high explosives
completely out of the production complex
would be a big mistake.

<u>Disposition</u> -

The issue of what we're going to do
with the excess plutonium and uranium is of key concern here.

As you know, we've got several thousand pits stored here
with more being added every day.
I am disappointed that the PEIS gives so little guidance
on what's to be done.

We need to get on with making these key decisions.
Two weeks ago at Los Alamos,
I was able to see firsthand some of the work involved in the Aries project.

We have some very promising technologies,
but the country needs leadership.
and our area needs confidence that DOE knows what it is doing
and is doing the right thing.

As long as I am in the Congress,
I will be involved in making these decisions
and I will do everything I can
to see that our area is protected,
to see that our nation is secure,
and to see that our children have the opportunity to live in freedom.

RE: Comment on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons Usable Fissile Material Draft Programmatic Environmental Impact Statements (PEIS)

To Whom It May Concern:

As the Texas State Senator representing 36 Northern Texas Counties, including Carson County in which the Pantex facility is located, I want to thank you for the opportunity to provide comment on the United States Department of Energy's (DOE) Draft Programmatic Environmental Impact Statements (PEIS) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons Usable Fissile Materials. This letter will also serve as my comment on the Pantex Site-Wide Draft Environmental Impact Statement, as most of the issues addressed in that document are identical to the issues addressed in the SSM and S&D PEISs.

1/30.01 I want to stress my support for DOE's earlier decision to abandon plans to transfer assembly/disassembly function to the Nevada Test Site. Your decision to select Pantex as the preferred alternative for those functions recognizes that transfer to Nevada would have been cost prohibitive, and would not have provided adequate facilities to meet future needs.

2/40.52 However, the failure to recognize Pantex as the preferred site for new and/or consolidated stockpile management facilities has overlooked the best site for maintaining the integrity of the United States nuclear stock-

U.S. Department of Energy
April 19, 1996
Page Two

2/40.52 continued

pile and attaining maximum efficiencies and cost savings.

Before addressing the two Impact Statements individually, I want to stress that any current or future Department of Energy functions at Pantex must be conducted in a safe and environmentally sound manner. While I am confident that current procedures are more than adequate, I also am adamant that any expansion at Pantex be implemented in the same fashion. The residents of the Texas Panhandle have come to expect Pantex operations to be handled in a way that does not impair their health or safety, and future plans should recognize that necessity.

Stockpile Stewardship and Management PEIS

Pantex is the most cost effective alternative for any new construction of SSM facilities. Labor costs, utility rates, and water and land availability at Pantex, as well as public and political support in the surrounding community, are more amenable to DOE needs than at any other site.

Pantex should be considered as a site for all future defense related programs to complement activities at the national laboratories, including the planned Atlas Facility and the plutonium pit fabrication site at Los Alamos National Laboratory. The location of additional defense related programs at Pantex would ensure that core technical capabilities are preserved at a location that can secure them at the most efficient cost.

While the Department of Energy makes no mention of a strategic plutonium reserve to meet future national security needs, the PEIS mentions that strategic storage should be co-located with disassembly. Pantex should clearly be the preferred site for such a mission in coordination with its management functions.

3/34.01

The strengths identified above supporting increased stewardship and management for Pantex also support the continuation of High Explosives (HE) fabrication at that site. Just as strategic and surplus storage should remain with disassembly, HE functions should remain co-located with assembly. The DOE SSM draft indicates that Pantex should retain HE capabilities on site to process inventories accrued from dismantling; therefore the continuation of HE functions at Pantex is clearly the least expensive alternative available to DOE. I strongly disagree with the draft PEIS statement that siting HE activities at Pantex offers no advantages over the national labs. The cost of transferring such functions is cost prohibitive, and such plans ignore the possibility of future weapon production activities, which would require a full HE capability at Pantex, and ignore the admitted necessity of continued limited HE activity at Pantex.

U.S. Department of Energy
April 19, 1996
Page Three

3/34.01 continued

I believe that many factors argue for the continued operation of HE activities at Pantex, in addition to an expansion of its existing stewardship and management activities. In all of the above cases, I want to stress that the Department of Energy should insist that budgetary comparisons between Pantex and other sites are accurate and include capital, transportation, training, remediation, and other costs.

Fissile Materials (Plutonium) Storage and Disposition PEIS

As the sole Department of Energy authorized facility for assembly and disassembly of nuclear weapons, Pantex has served our country for more than 40 years. It has handled these functions in a safe and efficient manner, and should continue to do so.

As our nation continues its program of dismantling a large portion of our nuclear deterrent, one of the challenges we face is processing, storing, or disposing the fissile materials that remain. Pantex clearly offers the best solution to this vexing problem.

Acknowledging the importance of cost savings, Pantex has the existing capability to store the plutonium already at the site, and could easily expand and upgrade existing facilities to meet any or all of the storage options being considered by DOE. For the reasons identified in the SSM PEIS, the Pantex facility could accomplish this with minimal cost and difficulty.

Pantex already houses more than 8,000 surplus pits, with more pits scheduled for transfer from the Rocky Flats facility. The re-creation of storage facilities at another site, and the costs and dangers associated with transporting large amounts of plutonium across the country, makes little sense budgetarily or politically. The common sense solution to this problem is to site strategic storage and surplus functions at the same place as disassembly. Since facilities for all three functions already exist at Pantex, this common sense solution is practical, reasonable, and unarguable.

All possible factors argue for Pantex's continued and expanded role in storage of disassembled fissile material. It has the necessary safety, security, and surveillance, it has the most cost efficient operations, it has existing structures and facilities, and it is the closest production site to Los Alamos, the planned pit fabrication site.

2/40.52 continued

Based on the reasons outlined in the above two comments on the draft Programmatic Environmental Impact Statements, I urge the Department of Energy to designate Pantex as the preferred alternative site for all existing and new stockpile management and stewardship functions, as well as consolidation of all plutonium storage, disposition, and related functions.

RICHARD W. POMBO

Congress of the United States
House of Representatives
Washington, DC 20515–0511

Statement by
The Hon. Richard Pombo (CA-11)
on the
Programmatic Environmental Impact Statement
for Stockpile Stewardship Management
April 15, 1996

1/21.06

I have had the opportunity recently to see the work that is being done in the Laser Program of the Lawrence Livermore National Laboratory and to review their plans to build, with their colleagues at Los Alamos, Sandia, and the University of Rochester, the National Ignition Facility. They are extremely competent people who have done a thoroughly professional job of considering all the pros and cons of taking this next step in the inertial confinement fusion program. The DOE's draft Programmatic Environment Impact Statement, which is the subject of this hearing, reinforces what I heard at LLNL. My conclusions can be summed up in a few simple statements.

- The NIF is needed as a part of the Stockpile Stewardship and Management program to assure the safety and reliability of our nuclear weapons without nuclear testing.
- Building the NIF and the other components of this program will enable the world to obtain a comprehensive test ban treaty, thereby strengthening the world's commitment to nonproliferation and arms control for weapons of mass destruction in general
- Building the NIF will produce benefits in non weapons' applications such as fusion energy and basic science and technology
- Building the NIF will not be an environmental nor a safety hazard and will produce significant economic benefits to the local region.

Whether you like them or not, nuclear weapons are a fact of life. Under the Start II agreements, assuming they are fully implemented, there will still be thousands of such weapons ten to twenty years from now. Even if the world someday were to find the political way to get rid of all such weapons, the knowledge of how to build them will not disappear

As long as this knowledge exists in the world it is critical that the U.S. has the best scientists and

SSM-EM-002
COMMENT LETTER **PAGE 2 OF 2**

1/21.06 continued

engineers available understanding them and that we, as a society, give them the tools necessary for that understanding. The weapon's scientists and the DOE have defined in this Stockpile Stewardship and Management program the minimum set of tools necessary to do the job. Just like a basic tool box, each tool does something different and a complete basic set is necessary to handle the jobs that are likely to arise. The NIF is a unique tool that will be the only one to produce fusion ignition and to reach the highest temperatures and pressures attainable on earth. We shouldn't short change our scientists on this. We all know what happens when we use the wrong tool for the job. Nuclear weapons are too dangerous for us to allow that to happen.

It is because the science and technology to build NIF and the other components of the Stockpile Stewardship and Management program are now available to the U.S. that we can now seek a Comprehensive Test Ban Treaty. This is an admirable goal in and of itself. However, it turns out that it is also cost effective. In spite of the fact that the NIF will cost $1.1 billion over seven years to build, the entire SSM program will still have lower annual costs by more than a factor of two than the program it replaces, ie. the program that depended upon doing nuclear tests

The decision to build NIF will depend upon its contributions to the National defense. However, it is a bonus that NIF will also contribute to the basic sciences, to technology that American industry can use, and to the possibility of fusion energy. All these things contribute to our economic security.

I was pleased to see that the draft PEIS concluded that building the NIF would be environmentally benign and would be safe for the public and for the employees. Frankly, when the LLNL study of hazards allowed the DOE to conclude that the NIF would be a "nonhazardous, non-nuclear, radiological facility" it sounded somewhat confusing. How could it be "non-nuclear" and still produce fusion ignition, which is a nuclear reaction? The answer, I learned, is that while there are nuclear reactions and radioactivity, the amounts are so small that there are minor on-site and negligible off-site hazards. The claims of extreme hazards made by some who oppose NIF just aren't true.

Finally, I was very interested to see the statements in the draft PEIS concerning the number of jobs created by this project in its so-called "region of influence," which includes Alameda, Contra Costa, and San Joaquin Counties. Contrary to the opponents claim that the project will produce a negligible number of temporary and permanent jobs, the draft PEIS detailed economic analysis (done by a laboratory in Illinois, not by LLNL) shows that during the seven-year construction period the peak number of jobs created in the region of influence will be 3320. After construction is complete, 890 permanent jobs will be created. That is hardly a negligible impact and this region can benefit from these jobs and this economic activity. Frankly, we are likely to benefit even more from the technology developed.

In summation, I want to urge support of NIF and praise the conclusions of the draft PEIS.

LC/mrd
Enclosure

U.S. REPRESENTATIVE LARRY COMBEST
(TEXAS--19)
THE U.S. DEPARTMENT OF ENERGY'S
PUBLIC HEARINGS
AMARILLO, TEXAS
APRIL 22, 1996

I would like to thank the Department of Energy (DOE) for holding these series of public hearings in Amarillo so that our Panhandle neighbors can have an opportunity to share their views on the DOE's Programmatic Environmental Impact Statements (PEISs) on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons Usable Fissile Materials. I am pleased to be a participant in these public hearings to discuss Pantex's future.

1/40.52 Since the Pantex Plant's earliest origins in World War II as a site that built conventional bombs for the U.S. Army, countless numbers of individuals from across the Panhandle have made instrumental contributions to the United States' winning of the Cold War. In the post-Cold War era, Pantex workers have once again answered the call to duty in peacetime and found a new role in disassembling nuclear weapons. I stand here today to tell you that Pantex is not only ready, but uniquely qualified to continue to enhance its role as a vital component of our nation's nuclear weapons industrial base as we prepare for our national security needs for the 21st Century.

I can fully appreciate the DOE's responsibility to reconfigure the country's nuclear weapons production complex for the 21st Century. As the Chairman for the U.S. House of Representatives' Permanent Select Committee on Intelligence, I recently conducted a year-long review of what is commonly referred to as the "intelligence community," the classified government agencies that collect information to advise the president and Congress on actions of foreign governments and terrorists. The legislative proposal I introduced as a result of this year-long review will ready the nation's secret intelligence-gathering efforts for the 21st Century. The approach I took in crafting this proposal brings these agencies to end unnecessary duplication and work efficiently for better intelligence to keep America safe from nuclear proliferation, from terrorism, and from narcotics.

2/40.04 America continues to need strong, highly-capable and ever-flexible intelligence community to provide the earliest-possible warning and analysis in a world that is still a very dangerous place. I want our nation to continue to meet the challenges of the next century, we should ask no less of our nation's nuclear weapon complex.

In the post-Cold War era, many have called for a retreat of our resources and readiness regarding national security. I believe that the post-Cold War era with nuclear proliferation leaves our nation more vulnerable than ever. Now that we no longer have the Soviet Union, we never know where our next threat is going to

2/40.04 continued

come from. I urge the DOE to reject these specious arguments, and ensure that the nuclear weapons complex of the 21st century maintains our nuclear deterrent for the foreseeable future. With nuclear weapons remaining a vital component of our national security into the 21st Century, Pantex is the only facility that can fulfill this mission.

1/40.52 continued

However, first and foremost I am adamant that any current and future functions at Pantex will be conducted in a safe and environmentally sound manner. The first priority for any expansion at Pantex is that it be implemented in a way that does not impair the health or safety of area residents or have an adverse affect on the environment. I believe these points serve as a prerequisite to any current or future activities at Pantex.

I do not take these points lightly. I was born and raised in the Panhandle. I grew-up not far from the Pantex Plant on a family farm. I would never support any proposal or effort that would endanger the lives or environment of this region. This is my home and members of my family reside here.

I am proud of the Pantex Plant's reputation as one of the cleanest facilities in the DOE's nuclear weapons complex. They have been good stewards of the land. As a matter fact, if I were not in Amarillo today talking about the importance of Pantex to our country, I would be singing their praises from back in Washington, D.C. Today, in Washington, the DOE's Pantex Plant is being recognized as a "Model Facility" and will receive the "White House Closing the Circle Award" for its efforts on waste minimization and recycling activities. Only twenty-two federal facilities from across the country received a "Closing the Circle" award. Clearly, Pantex takes its environmental safety responsibilities very seriously and I am pleased that this national award is highlighting their hard work.

3/30.01 In the DOE's draft PEIS, I am pleased that the department selected Pantex as the preferred alternative for assembly and disassembly. Wisely abandoning earlier plans to transfer those functions to the Nevada Test Site (NTS) which would have been cost prohibitive and painfully inadequate to meet future needs. In addition, I am pleased the DOE draft recognized the importance of Pantex to the country's nuclear weapons complex.

1/40.52 continued

Pantex is perhaps the most cost-effective alternative for any new construction of Stockpile Stewardship and Management facilities. Among many of the reasons, labor, costs, utility rates and water and land availability at Pantex, as well as public and political support, are more agreeable than those at any other site in the complex. Pantex should be considered as an alternative site for future defense-related facilities to complement activities at the national labs. Location of additional defense-related activities at Pantex would ensure that core technical capabilities are preserved at a location that can secure them at the most efficient cost to American taxpayers. In deliberations, the DOE

1/40.52 continued — should insist that budgetary comparisons between Pantex and other sites are accurate, and include capital, transportation, training, remediation, and other costs.

4/34.01 — With the production assembly and disassembly functions remaining at Pantex, the high explosives functions should be present at the corresponding site. Even the DOE draft admits that Pantex must retain high explosives capabilities to process the inventories already on site from dismantling. Therefore, the least expensive alternative is to maintain high explosives functions at Pantex. I would also take issue with the draft PEIS statement that there are no advantages to siting high explosives at Pantex as opposed to the national labs. The capital outlay alone necessary for transfer is cost prohibitive. Also of importance, should future need arise for new weapons production it will be critical to have the high explosives facilities at the weapons production and assembly site.

1/40.52 continued — As the DOE considers its options regarding the dismantling of a significant portions of the nuclear stockpile and searches for productive and environmentally sound uses for the dismantled components of our nuclear arsenal, Pantex and its functions are uniquely qualified for these new missions. Pantex has the necessary safety, security and surveillance capabilities to accommodate and expanded role with minimal costs to the federal government.

Once again, I would like to thank the Department of Energy for holding these hearings on the future of Pantex. I firmly believe the Pantex Plant will continue to play a vital role in our nuclear weapons complex well into the 21st Century. I applaud all of you who are here tonight to make your views known on this critical issue. I pledge to you that I will work with Representative Mac Thornberry and the rest of the Texas delegation in Congress to ensure that Pantex is a vital component of our country's nuclear weapons industrial base. I appreciate the opportunity to participate in this public hearing, and respectfully request the DOE to consider my recommendations. Thank you.

MAC THORNBERRY

Congress of the United States
House of Representatives
April 3, 1996

COMMITTEE ON NATIONAL SECURITY
COMMITTEE ON RESOURCES
JOINT ECONOMIC COMMITTEE

The Honorable Hazel R. O'Leary
Secretary of Energy
1000 Independence Avenue, S.W.
Washington, D.C. 20585

Re: Comment on Stockpile Stewardship and Management (SSM) and Storage and Disposition (S&D) of Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statements (PEISs), and the Pantex Site-Wide Draft Environmental Impact Statement.

Dear Secretary O'Leary:

I made oral comments at the April 22 hearing in Amarillo on the pending PEISs affecting Pantex and the nuclear weapons complex. I am writing to re-emphasize some of my remarks and provide additional comment on other issues.

I believe the analysis in the Draft PEIS for Stockpile Stewardship and Management is deficient for a number of reasons, as described below:

1/40.18 — The SSM PEIS does not deal adequately with the need to maintain adequate production capacity over the next ten or more years. During this period, it will be the Stockpile Management program at the four production plants which will replace weapons components, rebuild weapons, and maintain the capability and expertise to reconstitute the nuclear weapons stockpile should world events require it. However, the draft PEIS focuses almost exclusively on preserving the capabilities and core competencies of the national nuclear weapons laboratories. I recognize that preserving the weapons capabilities of these laboratories reflects essential national requirements. But too little attention has been paid to preserving the critical capacity and unique assets that exist at the department's productions plants. I am concerned that the planned reductions at Pantex and the other production plants, as portrayed in the PEIS, are so severe that they will seriously impact the plants' ability to properly support the near-term and long-term safety and reliability of the nation's nuclear weapons stockpile.

The entire SSM analysis regarding the size of the stockpile and associated manufacturing capacity is based on optimistic, rather than conservative, assumptions about future arms control agreements. The SSM PEIS relies too heavily on a workload assumption of 1,000 warheads in the future stockpile, a number far lower than even the 3,500 set in the unratified START II treaty. The administration's budget request also reflects this unjustified optimism. We must not cede the victory we gained in the Cold War through the planned obsolescence of our production capability, which can only be regained at greater cost in later years.

SSM-EM-004
COMMENT LETTER

PAGE 2 OF 2

2/40.62 The SSM PEIS analysis and preferred alternatives are based on incomplete national security policy considerations. The most dramatic deficiency is the failure to include current Congressional legislation (e.g. the National Defense Authorization Act for Fiscal Year 1996) and associated national security policy guidance in the PEIS assumptions, analyses, and conclusions. This PEIS needs to be redone based on the full range of national security policies, both Presidential and Congressional. The conclusions of the just completed House and Senate markups for Fiscal Year 1997 should also be taken into consideration in the final PEIS.

3/34.01 Regarding where the high explosives production mission should be sited, I have been to Los Alamos and Pantex and talked to officials at both sites. However, I have yet to hear a credible explanation as to why that mission should not remain at Pantex. The public hearings only served to strengthen my conviction that Pantex is the best and most economical site. At the hearing, an official from the Albuquerque Operations Office admitted that Pantex presently has all of the needed capability and that it would be more expensive to move high explosives functions to the labs. I urge you to select as the preferred alternative the best and most cost-effective site -- Pantex.

Regarding the Pantex Site-Wide Draft Environmental Impact Statement, I believe the analysis of the "airplane crash" scenario is deficient. How can it be that the probability of a crash causing a release has increased since your 1994 Finding of No Significant Impact, particularly after Pantex and the Amarillo Airport have worked together to reduce overflights of the plant and taken other preventative measures? I urge the DoE to correct the analytical errors and act to avoid wrongfully depriving Pantex of future functions for which it may be selected.

4/40.48 As a final note, I am very concerned about the Albuquerque Operations Office criticizing DoE and contractor officials for having contractor employees comment at the hearings. In effect, Albuquerque is censoring those individuals on issues, such as cost, on which they are the best source of information. I find it remarkable that the exercise of First Amendment rights at a hearing of this importance, which has the stated purpose of eliciting information and public comment, would cause officials at Albuquerque to call on the Amarillo Area Office to "control their people." That this occurred in the aftermath of the "gag order" incident is even more egregious.

I look forward to our continued work together on these issues. I would appreciate a response from you on these matters.

Sincerely,

Mac Thornberry
Member of Congress

STOCKPILE STEWARDSHIP & MANAGEMENT

DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

AND

STORAGE & DISPOSITION

DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

PUBLIC MEETINGS

OAK RIDGE, TENNESSEE

MORNING SESSION - April 2, 1996

PART I

8:30-10:30

LESLIE A. ZINNKE

MILLER & MILLER COURT REPORTERS

12804 UNION ROAD, KNOXVILLE, TENNESSEE 37922

Phone (423) 675-1471

2

CONGRESSMAN WAMP: Concerns have not been about Oak Ridge jobs. They have been genuine concerns about the future of the free world and what we must do to maintain our capability and preserve freedom for the citizens in our country and in doing so literally lead the world into the future.

I also commend Senator Thompson and Senator Frisk, and for that matter Vice President Gore, for their involvements and support of what we have done here in the past at Y-12 and what we are doing today and what we should do in the future.

We were able to secure — Senator Thompson, Senator Frisk, and myself -- basically full funding for Y-12 from the fiscal '95 budget to the fiscal '96 budget.

When we analyze the actual revenue, the actual allocations to Y-12 with Lockheed Martin Energy Systems in December, we realized that in fact it was pretty close to level funding; basically level funding from FY '95 to FY '96.

1/40.18 When I met with, as I do very often, Secretary O'Leary about this potential threat of relocating our nuclear weapons capability --

3

1/40.18 continued production capabilities here in Oak Ridge to anywhere other than Y-12, she literally said that was a no brainer; quote, no brainer. That we should leave the weapons production capabilities at Y-12 and downsize in place.

Now that's reassuring, except all the other activities that we know of that are going on would not reassure you quite so much.

It's been frustrating for me to see that in 1994 the stand down that set into Y-12 has probably actually given rise to some of the concerns that we have and justifiably are vigilant about, about any relocation of our core functions.

It's given rise for some to say, "Well, Y-12 is not in full operation so possibly some of these functions may need to be considered for a short period of time or permanently for other areas." It's been very frustrating for me.

The Defense Safety Board obviously is requiring a new culture to come to Y-12, and I understand that. I commend Admiral Gustavson for his leadership bringing Y-12 into this new culture, but I have a genuine concern because it seems to me that this prolonged stand down --

4

and while we are making great strides towards lifting it and moving forward and resuming full operations at Y-12, the timing of this stand down left us in an awkward position in recent months while all of the confusion and chaos broke out through this PEIS process.

And to me it seems that there has been a tremendous amount of money spent that might not have been necessary. And it seems to me that a lot of what is involved in this new culture -- it seems to slow down the process; it seems -- some of it seems to be unnecessary.

With all of this in mind, I chose to go to Los Alamos in February and physically see all that I could see there at the production facilities at Los Alamos in New Mexico.

And I took Margaret Morrow with me. And I want to say for those of you who have worked with her in the past, she is a jewel and does a great job for us here at Y-12; a very capable lady. And for her and I to go and be prepared as we went I think was a very productive effort.

Not only did we ask a lot of questions while we were there and actually toured the facilities that we heard so much about in recent

5

months here in Oak Ridge, but we left eighteen or so questions in writing. I have the answers in writing to all eighteen of those questions here today.

My staff members, Jack Copeland and Ann Cook, actually will begin at this time, if you don't mind, handing out for all of your perusal and anyone else in the community that would like a copy of what they had to say about their activities.

We asked as you will see some very specific questions about what are you doing and for what purpose, where are you going, how do you see all of this change shaken out with your -- their assuming of Rocky Flats Mission with regard to pits, and what's the traditional relationship between Oak Ridge and Los Alamos as it involves uranium and secondaries of case manufacturing, et cetera, et cetera.

And I think these answers will enlighten you on what the position of our friends at Los Alamos is today with regard to what their responsibilities are and with regard to what our responsibilities are.

I think the PEIS process, while it's

6

frustrating for a lot of people to go through this PEIS process, is good certainly for some reasons.

One of those is that it allows input from some people who really know what they're doing. And I commend to you Bill Bibb, who I believe knows his stuff. I commend to you other members of Citizens for National Security who have decades of experience in the precision manufacturing of nuclear weapons components here at Y-12.

2/41.03

These people understand why we did what we did, how we did what we did, and how we were able to win the Cold War as a result of this detailed precision and near perfect execution of our missions here. And it's very important for our current friends at DOE to listen to those who have come before us. Just like we should learn from our history, DOE needs to -- through this PEIS process -- to listen to those who have come before us.

3/41.06

One of the most unfortunate results of this PEIS process or the actions that preceded the PEIS process is DOE actually pitted against each other the original partners in the

7

Manhattan Project.

If you'll look at what happened with our friends at Los Alamos and you listen to the stories -- I'm sort of young; thirty-eight years old, and I've only been a student of Oak Ridge for a little over five years. So I yield to many of you and your decades of experience here.

3/41.06
continued

But to listen how Los Alamos and Oak Ridge had such a cooperative relationship throughout the Manhattan Project. How we shared personnel, and how we were all on the same team. And how through some of the, I think, DOE's desire to try to drive down costs by creating competition within the complex, we actually pitted the partners in the Manhattan Project against each other.

And I think that's real unfortunate because if there's ever a time were DOE needs to be a team, believe me, it is today. I am one of a very few Republican members of Congress that works cooperatively with DOE. That is a DOE supporter; a DOE backer. This is the time DOE needs to come together, not pull apart and start playing parochial games with one another and trying to preserve their own facilities at the

8

expense of the entire complex.

In the tradition of Marilyn Wood, my predecessor -- who I respect and admire very much and did a great job working for Oak Ridge for twenty years -- I chose to work with DOE. To engage in bipartisan cooperation. To support Secretary O'Leary, who I again speak with regularly. I spoke with her in detail this past Friday.

I want to say however, though -- and I have very high regard and much respect for our Vice President and fellow Tennessean Albert Gore, Junior -- but I want to say today because I say it consistently. I say it in front of DOE audiences and I'm going to say it here in Oak Ridge.

4/40.04

I strongly disagree with what seems to be our new found fear of nuclear weapons, nuclear energy, and for that matter nuclear waste.

I think our country can handle this. I think we are smart enough; I think we work hard enough to deal with the complexities of the nuclear legacy and the nuclear weapons capability that has kept our country free and

9

4/40.04 continued

strong. The nuclear deterrent is why our country has remained free and strong, and why we won the Cold War.

I see, feel, and hear a real fear of nuclear anything that involves a reactor or that involves waste. We can deal with these issues. We shouldn't close down every nuclear reactor in this country. We shouldn't retreat from our nuclear capabilities in our defense force.

We must maintain the nuclear deterrent. We must maintain our nuclear weapons stockpile. We must maintain our nuclear weapons production capabilities at the production sites.

My input is, don't even try to justify manufacturing cases and secondaries at the weapons lab. Leave uranium enrichment, shipping, and storage right here where it belongs at Y-12.

We don't manufacture surgical equipment at centers for disease control. So we shouldn't try to manufacture our nuclear weapon components at the weapons laboratories.

We should not move these facilities; we should downsize in place. Some friendly advice to our friends at DOE as we move through this

PEIS process is be careful not to violate the National Environmental Policy Act.

5/40.13

Do not allow green field sites to be developed and contaminated while we are taking brown field sites and moving them from defense programs to environmental management.

Of all things DOE -- which has a very high sensitivity level for environmental concerns and some of which I totally understand -- why it would even dream of going and contaminating new green field sites while we're taking brown field, already contaminated sites, and shrinking them down and moving them from defense programs over to environmental management while we're going to leave them in environmental management for a long time.

We as a nation have not even established what is the diminimous levels yet that we're going to take these brown field sites back to. How clean are we going to take them back up to. And here we're talking about contaminating new green field sites or even exploring the opportunity to contaminate new green field sites; that makes no sense to me. Downsize in place, yes; but slow down. Do not move so

quickly. Be careful about the process of moving our nuclear weapons capabilities anywhere.

6/40.18

And above all in closing let me say this. Please do not allow partisan or parochial politics to drive the future policy with regard to our nuclear weapons capabilities in this country. Too much is at stake for any parochial or partisan objectives to even come into the discussion at this critical time in the history of this country.

You need not look any further than the Middle East the Far East or the Soviet Union. All three areas -- North Korea today, the Persian Gulf today, Iran, Iraq. You look at the Soviet Union and the upcoming elections. Ladies and gentlemen, we better maintain our nuclear capabilities. We better maintain our nuclear deterrent.

7/40.08

And if we move away from the experience and the precision of the past that created the capabilities that kept the entire world at peace and literally broke the walls down and won the Cold War -- if we move away from that too quickly, we'll never get back to where we were in time.

(806/355-8181)

Federal representatives who would like to speak? Then I would move on to the State. I understand that State Senator Teel Bivins -- is he here?

1/41.10 **SENATOR TEEL BIVINS:** Thank you very much. I too would like to thank the Department of Energy for making these public forums available. I have to admit that stacking EIS on EIS on EIS has gotten a little bit confusing, at least for me and my staff. But we're trying to keep up with the rapidly changing developments that I know the agency has to face.

2/30.01 First let me say generally that I'm pleased that the DOE has selected Pantex as the preferred alternative for assembly, disassembly, thereby abandoning their earlier thoughts of transferring those functions to the Nevada test site. I think that would have been cost prohibitive, and certainly that decision is based on common sense.

3/40.52 However, I would add that by failing to recognize Pantex as the preferred candidate site for new and/or consolidated stockpile management facilities, that the DOE overlooks the best site for maintaining the integrity of U.S. nuclear stockpile and obtaining maximum efficiency for cost and savings. With regard to the stockpile stewardship and maintenance, the PEIS, a couple of thoughts. First of all, I think that Pantex is clearly the best place to site new construction for

3/40.52 continued stewardship activities. Pantex is perhaps the most cost effective alternative to any of the new construction that is contemplated under this EIS.

4/34.01 Secondly, I would echo what Congressman Combest stated with regard to high explosives. I too disagree with the PEIS statement that there are no advantages to siting the continuation of high explosive work at Pantex. That is in the face of common sense. Clearly we have a trained work force who has been conducting this function for many years now. And secondly, the cost of physically moving the infrastructure needed to conduct the activities is cost prohibitive and doesn't make economic sense.

The EIS that deals with fissile materials, storage, and disposition is one that I have spent a good deal of time with. On the topic of storage, I feel like that we're seeing that Pantex in its current role is ideally sited for storage of plutonium pits. If it is anticipated that storage would be -- continue to be in that form, I don't think there's any question that Pantex, which is already contemplated to have, and I think the chart -- or will have 21,000 pits in storage of the -- I may be getting pits and tonnage mixed up. But certainly the vast majority of the pits in storage at Pantex, it makes sense to continue that function in that location. The issue of disposition and possibly the issue of storage, depending on how or what form the storage will be in, is one that I have given the most amount of thought to. In all the years that we've been looking at the future of Pantex here in Amarillo and concerned about its future, I think that the support for this institution has been demonstrated over and over again. And I believe that we would have that support for new missions in Pantex, but I believe there have to be three criteria that would be met before we should go forward. First of all, and I think probably most importantly, when we're thinking about disposition, as I understand it, the mixed oxide fuel process is probably the only one that would apply to Pantex, from my discussions. Vitrification and some of the other deep bore hole might not have a place in the Pantex future. But with regard to mixed oxide fuel reduction, I think that we've got to demonstrate that the process that is envisioned, the dry process, is one that is technologically feasible and is demonstrably safe. As I understand the process today, it is experimental and it shows great promise. But I think before we launch into such an exercise, we've got to demonstrate beyond a shadow of a doubt that that procedure can be done safely and environmentally soundly. The second criteria is that we've got to have community support for future missions at Pantex. To

date, Pantex has enjoyed incredible community support, not just the city of Amarillo but the whole 26-county area of this region of Texas. I believe that that community support will be forthcoming for future missions at Pantex if the first criteria is met. And finally, as I have said before, I would reiterate, and I believe the third criteria for this type of future mission at Pantex has to be coupled with independent regulatory oversight of the Department of Energy. As I understand today, nuclear materials at DOE are not subject to independent regulatory oversight. And I think because all politics is perceptional, we have got to give the perception and the reality to the people of this area that these missions will be conducted safely. I think when you think about the material we're dealing with, public policy demands that we have checks and balances to ensure that we won't make mistakes that quite frankly this agency has made in the past. With those three criteria in place, I believe that the support that this facility has had will continue well into the future, and the people that have worked here and have families here will be able to continue working and living in the best place in the United States.

Thank you very much.

COMMENT SUMMARIES AND RESPONSES

Comment Summaries and Responses

CHAPTER 3: COMMENT SUMMARIES AND RESPONSES

This chapter summarizes the comments the Department of Energy received on the* Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management *during the public comment period, and provides responses to those comments. Identical or similar comments provided by more than one commentor were grouped together in one comment summary for response. The responses indicate whether any changes were made to the Programmatic Environmental Impact Statement and the rationale behind those decisions. Section 1.3 describes the organization of this Comment Response Document and discusses the tables provided in chapter 1 to assist readers in tracking their comments to the respective comment summary and response.

01 LAND RESOURCES

01.01 A commentor is concerned that other Department of Energy (DOE) sites do not have a future use plan like the Savannah River Site (SRS). The commentor also states that the SRS future use plan restricts future development to areas with prior development. The commentor wants this to become a DOE-wide policy. Another commentor proposes a land-use concept of multiple use for SRS. Primary uses would be located within the center, and environmental uses would occur within the surrounding buffer area.

Response: *All sites in the Nuclear Weapons Complex (Complex) have future land-use plans. Each site structures its future land-use plan in accordance with DOE guidance, program needs, and security requirements. For the proposed action in this programmatic environmental impact statement (PEIS), SRS is an alternative for plutonium fabrication. That mission would be conducted in developed areas (F- and H-Areas) using existing facilities.*

01.02 On Pantex Plant (Pantex) figures 4.5–2 and 4.5.2.1–1, a commentor notes that the playas are incorrectly labeled as dry lakes; they should be described as ephemeral lakes. In addition, the commentor states that all playas shown on these figures, except playa 3, are approximately 900 to 1,000 meters (m) (2,953 to 3,281 feet [ft]) in diameter. Also, the scale on figure 4.5.2.1–1 is incorrect (compared with that of figure 4.5–2, which is correct). Another commentor notes that the maps of the Nevada Test Site (NTS) presented in the document need to depict Area 51.

Response: *The phrase "dry lake" has been deleted from figures 3.4.1.2–1, 4.5–2, 4.5.2.1–1, 4.5.2.4–1, A.1.4–2, and A.3.5.1–1. Furthermore, a definition of playa can be found in the glossary (chapter 9) of the* Final Programmatic Environmental Impact Statement for Stockpile Stewardship and Management *(Final PEIS). The scale on figure 4.5.2.1–1 has been changed to match that of figure 4.5–2. Regarding Area 51, the maps of NTS do not depict this area since it is not a part of NTS. Lands withdrawn under* Public Land Order 1662 *are used by the Department of Defense (DOD) for their ongoing operations and are not considered in this PEIS for use by DOE.*

01.03 The commentor asks if high explosives (HE) production is moved from Pantex to Los Alamos National Laboratory (LANL) or Lawrence Livermore National Laboratory (LLNL), where would the building be placed and the testing be done. The commentor also asks what the current and projected land use is around LANL and LLNL (particularly Site 300).

Response: *LANL HE fabrication process capability is already established. HE fabrication and storage functions would be supported in existing facilities at LANL Technical Areas (TAs) -9, -16, and -37. Since LANL HE plant facilities already exist and have sufficient capacity for stockpile management requirements, no new building construction and no significant modifications would be required. LANL assembles and detonates explosive test configurations in TA-15, TA-40, and TA-11 through TA-25. The commentor is referred to section 3.4.5.3 and appendix section A.3.5.2 for more information on the LANL HE alternative.*

The LLNL HE fabrication alternative would require construction of one new facility and would use 23 existing buildings, 66 existing magazines, and various utilities and services at Site 300. The new facility would be constructed at the HE storage area near M30 and M34. Energetic materials components are test fired at the HE Applications Facility, Building 191, at the Livermore Site. The remote firing facility, Building 851 at Site 300, is remotely located from HE fabrication operations and includes an outdoor firing capability to conduct large-scale explosives tests that cannot be performed in a test chamber. The commentor is referred to section 3.4.5.4 and appendix section A.3.5.3 for more information on the LLNL HE alternative. Regarding current and projected land use around LANL and LLNL, the commentor is referred to sections 4.6.2.1 and 4.6.3.1 for land use at LANL and sections 4.7.2.1 and 4.7.3.1 for land use at LLNL.

01.04 The commentor refers to section 4.9, Nevada Test Site, and suggests that the stated area be replaced with the legal size of 320,778 hectares (ha) (792,650 acres). The commentor notes that NTS may have been established in 1950, but it was not legally withdrawn until 1952. The commentor also believes that the PEIS should indicate all of the properties (underground nuclear explosion sites) that the Nevada Operations Office is responsible for such as Nellis Air Force Base Remote Sensing Laboratory, the Project Faultless site, the Project Shoal site, the Salmon site, the sites on Amchitka Island, as well as the Rulison, Rio Blanco, Gnome, and Gasbuggy sites.

Response: *The area given in the PEIS for NTS (approximately 350,866 ha [867,000 acres]) is based upon the definition of the land area presented in the* Draft Environmental Impact Statement for the Nevada Test Site and Offsite Locations in the State of Nevada *(NTS Site-Wide EIS) (DOE/EIS 0243) and is consistent with the NTS Site Development Plan. DOE is unaware of the origin of the legal size of NTS that the commentor asserts. In addition, this discrepancy in the size of NTS would not affect the impact analysis presented in this PEIS. For more information on public land orders and withdrawals concerning NTS, the commentor is referred to the response to comment summary 01.06 and the NTS Site-Wide EIS. Regarding the other properties for which the Nevada Operations Office is responsible, they are not discussed because they are not relevant to the analysis of the alternatives in the PEIS. None of these sites is considered as a candidate location for future activities within the Stockpile Stewardship and Management Program.*

01.05 The commentor refers to section 4.12, Environmental Impacts of Underground Testing, and asks that after the description of the land area ruined after each test, an infrared satellite image of the surface of Yucca Flat be provided.

Response: *Section 4.12 provides a programmatic evaluation of the potential environmental impacts of underground nuclear testing. The inclusion of an infrared satellite image of the surface of Yucca Flat would not be a meaningful contribution at this level of programmatic review. The commentor is referred to the NTS Site-Wide EIS for more detailed information on the potential environmental impacts of underground nuclear testing.*

01.06 The commentor states that the lands comprising NTS are, in fact, public lands that have been withdrawn for a specific national defense purpose, as stipulated in the current public land orders. That purpose, according to the commentor, does not include large scale weapons assembly and disassembly (A/D) and/or the siting of laser fusion technologies such as the National Ignition Facility (NIF). The commentor states that if NTS is chosen for one or more of these functions, an analysis must be contained in the Final PEIS that addresses the facility-use restrictions in the public land orders.

Response: *In 1983, the U.S. Bureau of Land Management, in accordance with the* Federal Land Policy and Management Act *of 1976 (Public Law 94-579, October 21, 1976), conducted a review of the existing four land withdrawals that comprise NTS. The Bureau of Land Management report compiled during its review, acknowledged that while the primary mission of NTS continued to be weapons testing, other activities and projects are also being pursued. The reports specifically referred the readers to the Final EIS (1977) for "a more detailed explanation of activities and projects." Thus, it is clear that the Bureau of Land Management was well aware of DOE's multiple land uses, including radioactive waste disposal, NTS farm experiments, emergency response tests, etc. Thus informed, the Bureau of Land Management District Manager concurred with the review's conclusion that the lands were still being used for the purpose for which they were withdrawn. The Bureau of Land Management found that any new land uses at NTS at the time were not inconsistent with that original use.*

The Federal Land Policy and Management Act *of 1976, implementing regulations, and the public land orders themselves, are silent on the use of withdrawn lands for related purposes or purposes in addition to those for which the land was originally reserved. There are no specific prohibitions against additional use, if the purpose for which the withdrawal was authorized remains valid. There is clearly no prohibition of the consideration of alternative uses, through an EIS or otherwise, of withdrawn lands as a management or administrative action to assess the potential for additional beneficial uses of such lands.*

The Department of the Interior is vested with oversight responsibility to review existing land withdrawals under the Federal Land Policy and Management Act *of 1976. The Department of Interior's San Francisco Office has suggested in its comments on the NTS Site-Wide EIS that substantial changes in land use at NTS may require a new land withdrawal. While DOE believes that any new or proposed land use at NTS is compatible with the primary purpose of each land withdrawal, the most recent comments from the San Francisco Office of the Department of Interior indicate that a review of the existing land withdrawals may be prudent.*

As has been its past practice, DOE continues to be committed to ensuring that all future activities contemplated at NTS, are conducted in compliance with the Federal Land Policy and Management Act *of 1976 and Federal land withdrawal policy. In this regard, DOE has begun informal consultation with the Department of Interior to ensure that the appropriate process is followed to enable DOE to fulfill this commitment.*

02 SITE INFRASTRUCTURE

02.01 Several commentors question the estimates for power requirements given in the PEIS, specifically tables 3.4.4.2–2 and 3.4.4.3–2. Commentors note discrepancies between the utility requirements for the secondary and case fabrication mission for the Y-12 Plant (Y-12) at Oak Ridge Reservation (ORR) (appendix section A.3.2.1), LANL (appendix section A.3.2.2), and LLNL (appendix section A.3.2.3), and believe that these numbers show little basis in fact. Y-12, LANL, and LLNL propose to use 118,000, 36,000, and 15,000 megawatt hours (MWh) of electricity; 250,000, 100,00, and 85,200 liters (L) (66,042, 26,417, and 22,507 gallons [gal]) of diesel fuel; and 1.5 billion, 55 million, and 36 million L (0.4 billion, 14.5 million, and 9.5 million gal) of water, respectively. However, the tables state that Y-12 will use 118,000 MWh with a peak of 19 megawatts electric (MWe), 17 million cubic feet (ft^3) (0.14 cubic meters [m^3]) of natural gas and 250,000 L (66,042 gal) of liquid fuel, but LANL will only use 36,000 MWh, 5 MWe peak, 100,000 L (26,417 gal) of liquid fuel, and no natural gas. Since the manufacturing processes require electricity and gas to operate and since each plant would produce the same number of parts, the commentors ask why the energy requirements at LANL are so low. According to the commentors these tables show an order of magnitude difference in the estimates for the power requirements for Y-12 and LANL to do the same job. The commentors also question why Y-12 would use 1.5 billion L (0.4 billion gal) of water and LANL only 55 million L (14.5 million gal) to do the same mission.

Response: *As stated in section 3.4.4 of the* Draft Programmatic Environmental Impact Statement for Stockpile Stewardship and Management *(Draft PEIS), when comparing data between secondary and case manufacturing alternatives it is important to note that there are differences in the facility designs. The production capabilities of each of the three sites at surge capacity are different, with Y-12 the highest and LLNL the lowest. This is further explained in section 3.1.1.1.*

02.02 The commentor requests resolution of the discrepancy between table 4.13.1.5–1 which states that LANL will use 4,491,240 m^3/yr (158,608, 141 ft^3/yr) of natural gas and table 3.4.4.3–2 which states that LANL will use no natural gas.

Response: *Table 4.13.1.5–1 presents the site infrastructure combined impacts at LANL, that is, the total quantity of resources required to implement all missions for which LANL is a candidate. Table 3.4.4.3–2 provides the annual operating requirements to implement only the secondary and case fabrication mission. As presented in sections 3.3 and 3.4, LANL is a candidate for the stockpile stewardship alternatives associated with the physics of nuclear weapons primaries (ongoing work) and for the physics of nuclear weapons secondaries (ongoing work as well as NIF and the Atlas Facility). LANL is also a candidate for the stockpile management alternatives of nonnuclear fabrication, pit fabrication and intrusive modification pit reuse, secondary and case fabrication, and HE fabrication. Table 4.13.1.5–1 reflects the summation of all of the natural gas requirements to implement all of the above Stockpile Stewardship and Management Program missions at LANL.*

03 AIR QUALITY

03.01 The commentor states that with respect to air quality at LANL using in-house data is unacceptable to the State of New Mexico, the Environmental Protection Agency (EPA), and the citizens of New Mexico.

Response: *LANL is required to comply with the Federal* Clean Air Act *(CAA) of 1990 and amendments and the* New Mexico Air Quality Control Act *of 1978, as amended. The ambient air quality standards for the State of New Mexico were recently amended January 10, 1996. These acts establish ambient air quality standards, require permits for new sources, and set acceptable emission limits. To accomplish compliance with these regulations, LANL implemented a site-wide evaluation of chemical emissions from all routine and experimental operations in response to reporting requirements specified in the CAA. These regulations require the laboratory to report all air emissions of criteria pollutants, as well as all hazardous air pollutants. The estimates of air pollutant concentrations presented in the PEIS for LANL were based upon those emissions of air pollutants as reported by LANL in response to reporting requirements specified in the CAA. These emissions are monitored by DOE as specified in permits issued by the State of New Mexico and EPA.*

03.02 The commentor questions the use of 4.X.2.3 and 4.X.3.3 in appendix section B.1.1 and requests a statement, complete with verifying signature, on the level of quality assurance supporting the air quality sections.

Response: *A reference is made to appendix section B.1.1, Introduction, which states, "This appendix provides detailed data that support impact assessments for air quality addressed in sections 4.X.2.3, Affected Environment—Air Quality, and 4.X.3.3, Environmental Impacts—Air Quality." The "X" in* *the referenced section numbers is a generic symbol representing affected environment and environmental impacts for each site. This is an abbreviated format used in lieu of sections 4.2.2.3, 4.3.2.3, 4.4.2.3, 4.5.2.3, 4.6.2.3, 4.7.2.3, 4.8.2.3, and 4.9.2.3, Affected Environment—Air Quality, and 4.2.3.3, 4.3.3.3, 4.4.3.3, 4.5.3.3, 4.6.3.3, 4.7.3.3, 4.8.3.3, and 4.9.3.3, Environmental Impacts—Air Quality. The air quality analysis has received a complete internal quality assurance review.*

03.03 The commentor refers to table 4.6.3.3–1 in the PEIS and states that LANL will be out of compliance for nitrogen dioxide release (24-hour basis) if the work from Y-12 is moved to LANL. The commentor asks what treatment is planned for the nitrogen dioxide release and if the cost is estimated in the PEIS.

Response: *The PEIS is a multi-site study performed at the programmatic level with the intent of comparing the air quality impacts among alternative sites. Table 4.6.3.3–1 presents the estimated air quality impacts at LANL for each of the proposed alternatives. The estimated 24-hour nitrogen dioxide concentration for the secondary and case fabrication alternative indicates that mitigation measures may be necessary to ensure that compliance is achieved. The degree of mitigation would be determined in a site- or project-specific* National Environmental Policy Act *(NEPA) of 1969 document containing refined air quality modeling. Cost estimates are not included in the PEIS.*

03.04 Commentors refer to section 4.6.2.3, table 4.6.2.3–1, Comparisons of Baseline Ambient Air Concentrations with Most Stringent Applicable Regulations and Guidelines at LANL, 1990 and 1992. Referring to the statement that baseline concentrations are in compliance with applicable guidelines and regulations with the exception of the 1-hour photochemical oxidants, a commentor states that photochemical oxidants were out of compliance with New Mexico ambient air concentrations standards for these years. Another commentor states that it is inexcusable that many of the listed pollutants are not monitored and that the baseline concentrations for these pollutants are just assumed to be less than applicable standards. The commentor suggests that more recent data be used.

The commentors also raise the following questions concerning the air quality material: are the years 1990 and 1992 representative years for air emissions, are they a conservative/nonconservative example, are other years in compliance with air standards, and why not use more recent years, such as 1994 or 1995? A commentor refers to section 4.6.3.3, Air Quality, No Action, "No action air quality utilizes estimated air emissions data from operations at LANL in 2005 assuming continuation of current site missions to calculate pollutant concentrations at or beyond LANL site boundary." The commentor states that the photochemical oxidant concentration was not addressed. The commentor states that the estimated concentration of this pollutant was not in the table presented and asks why this pollutant was not included.

Response: *The estimated air quality concentrations at LANL represent a snapshot in time which is used for comparative purposes among the sites presented in the PEIS. The baseline air quality concentrations presented in table 4.6.2.3–1 are based upon the latest air quality emissions data (1990 to 1992) available at the time the air quality analysis was performed. These data are considered representative of recent air quality emissions when compared with those emission data presented in the* Environmental Surveillance at Los Alamos During 1993 (1993 Environmental Surveillance Report) *(LA-12973-ENV, October 1995).*

Table 4.6.3.3–1, Estimated Concentrations of Pollutants from No Action and Stockpile Stewardship and Management Alternatives at Los Alamos National Laboratory, no longer presents photochemical oxidants. In December 1995, the State of New Mexico removed photochemical oxidants from the State's Ambient Air Quality Standard (20 NMAC 2.3). Tables 4.6.2.3–1 and 4.6.3.3–1 and appendix table B.3.1–1 have been updated to reflect the changes in the New Mexico state standards.

03.05 The commentor points out that there is a recurrence of number sequences with LANL (appendix section A.3.5.2 emissions estimates [4,540, 22,700, 4,540, 227, 454, 4.5, 45.4, 22.7, and 22.7]), and on comparing these numbers with Pantex, where there is a history of HE production, Pantex shows no such patterns. The commentor believes the LANL numbers have been fabricated. The commentor states that since estimates of environmental, safety, and health (ES&H) impacts are driven by emissions, those estimates are inevitably suspect.

Response: *The commentor refers to appendix table A.3.5.2–6. The emissions presented in this table are estimates of emissions from the LANL HE fabrication surge operation. The emissions presented in this table represent an HE fabrication output which is different than the historical output at Pantex. Air emissions estimates provided in the PEIS have been confirmed with LANL as being correct.*

03.06 The commentor refers to section 4.6.3.3, Air Quality, subsection on Sensitivity Analysis, and the statement, "The concentrations of pollutants for the high case pit fabrication, HE, and nonnuclear fabrication missions are expected to be within applicable Federal and state regulations and guidelines. The 24-hour concentrations of nitrogen dioxide for the high case secondary and case fabrication mission may be above applicable standards and guidelines." (Table 4.6.3.3–1, Estimated Concentrations of Pollutants from No Action and Stockpile Stewardship and Management Alternatives at Los Alamos National Laboratory, is identified in neighboring sections for reference of the estimated emissions mentioned above.) The commentor states that the estimated concentrations of nitrogen dioxide in the combined program impacts is 276.69 micrograms per cubic meters ($\mu g/m^3$) and the most stringent guidelines are 188 $\mu g/m^3$ (24-hour average). The commentor also states that in appendix table B.3.1–1, Ambient Air Quality Standards Applicable to the Candidate Sites, the New Mexico guideline listed for nitrogen dioxide is 117 $\mu g/m^3$ (24-hour average). The commentor states that this air quality value was also exceeded and is more stringent than the 188 $\mu g/m^3$ value mentioned previously. The commentor suggests that the values should be rechecked or the text should be modified.

Response: *Section 4.6.3.3 has been changed in the Final PEIS to state, "The 24-hour concentration of nitrogen dioxide for the high case secondary and case fabrication mission is above applicable standards and guidelines." In addition, a change has been made in the heading of the last column in appendix table B.3.1–1, Ambient Air Quality Standards Applicable to the Candidate Sites, from "New Mexico (LANL and Sandia National Laboratories [SNL])" to "New Mexico (LANL/SNL)" and the entry for 24-hour nitrogen dioxide under this column changed from "117" to "145/117." This change indicates that the 24-hour nitrogen dioxide state standard for LANL is 145* $\mu g/m^3$ *while the city/county standard for SNL is 117* $\mu g/m^3$.

03.07 The commentor states that for LANL the Draft PEIS contains no plans to directly monitor the emissions from these projects or to conduct ambient monitoring in the community if the projects are implemented. The commentor notes that as of October 1994, with the termination of a 5-year contract between the New Mexico Environment Department and the National Park Service, nonradioactive ambient monitoring for criteria pollutants was discontinued at the Bandelier site on the southern boundary of LANL adjacent to the Bandelier National Monument. The commentor states that he is not aware of any other ambient monitoring for criteria pollutants being conducted at LANL or in the Los Alamos community. The commentor further states that the radioactive ambient monitoring being conducted by LANL focuses mostly on the Los Alamos Meson Physics Facility, which is currently the largest source of radioactive emissions. In the commentor's opinion, monitoring of actual conditions around the proposed projects is of prime importance to verify the modeled emissions presented in the Draft PEIS. In addition to monitoring, the commentor believes there should also be remediation plans in place in the event of actual emissions being measured higher than modeled ones.

Response: *The air quality analysis was performed at a programmatic level, which is a less detailed level of analysis than would be performed for a site-specific NEPA analysis. The goal of the analysis was to screen for potential major impacts and provide a means to compare air quality impacts among sites. If the site is selected for a specific mission then a more detailed air quality modeling analysis would be performed and appropriate mitigation measures would be undertaken to ensure compliance with Federal and New Mexico state standards.*

03.08 The commentor states that in LANL table 4.6.3.3–1, the environmental impact resulting from secondary and case fabrication shows that model estimates for 24-hour average concentrations of nitrogen dioxide would be 231 $\mu g/m^3$ and 277 $\mu g/m^3$ from the combined program, levels which greatly exceed the applicable state standard and worsen the air quality of the area. The commentor states that the State of New Mexico cannot permit such large exceedances of its standard and that the exceedance of the standard is even greater than that shown in tables 4.6.3.3–1 and 4.13.1.5–2. These tables show the most stringent regulation or guideline for nitrogen dioxide to be the state standard, which is listed as 188 $\mu g/m^3$. However, this figure does not reflect a correction for the altitude of LANL, which is approximately 2,194 m (7,200 ft) above sea level. Correcting for altitude, the state standard of 0.10 parts per million (ppm) is calculated to be 146 $\mu g/m^3$. The commentor states that LANL should be omitted as a possible site for secondary and case fabrication because of the high concentration of nitrogen dioxide that would be emitted. (See comment document SSM–M–123, page 5, for the equation used for adjusting the concentration of nitrogen dioxide for altitude.) Another commentor states that in table 4.6.2.3–1 and in other tables containing the most stringent regulations or guidelines for gaseous criteria pollutants, these concentrations have not been adjusted to LANL's altitude which is 2,194 m (7,200 ft) above sea level.

Response: *The PEIS is a multi-site study performed at the programmatic level with the intent of comparing the air quality impacts among alternative sites. Tables 4.6.3.3–1 and 4.13.1.5–2 present the estimated air quality impacts at LANL for each of the proposed alternatives and cumulative impacts, including other proposed actions, respectively. The estimated 24-hour nitrogen dioxide concentration for the secondary and case fabrication alternative indicates that mitigation measures may be necessary to ensure that compliance is achieved. The actual emissions and the degree of mitigation would be determined in a site- or project-specific NEPA document containing refined air quality modeling.*

The New Mexico state standard for 24-hour nitrogen dioxide, which is given as 0.10 ppm in state regulations, when adjusted for a site altitude of 2,255 m (7,400 ft) above sea level converts to 145 $\mu g/m^3$. The Final PEIS has been changed to reflect the adjustment for altitude for those New Mexico state standards given as ppm.

The New Mexico state ambient air quality standards for sulfur dioxide, carbon monoxide, nitrogen dioxide, hydrogen sulfide, and total reduced sulfur are given in ppm in state regulations. These standards were converted to $\mu g/m^3$ at 1 atmosphere and 25 degrees Celsius (°C) 77 degrees Fahrenheit (°F) to be consistent with other Federal and state standards. The results of the modeling were then compared to these standards with the result that the 24-hour nitrogen dioxide concentration exceeds the state standard for the secondary and case fabrication alternative. Adjusting the standards for altitude results in the same conclusions.

If LANL is selected for a new or enhanced mission, then a refined air quality modeling analysis would be performed and appropriate adjustments for altitude would be made to the state standards to ensure compliance with Federal and New Mexico state standards. Performing the adjustment for altitude of the LANL site (2,255 m [7,400 ft] above mean sea level) results in the following New Mexico state standards: sulfur dioxide annual, 40 $\mu g/m^3$, 24-hour, 202 $\mu g/m^3$; carbon monoxide 8-hour, 7,689 $\mu g/m^3$, 1-hour, 11,578 $\mu g/m^3$; nitrogen dioxide annual, 73 $\mu g/m^3$, 24-hour, 145 $\mu g/m^3$;

hydrogen sulfide, 1-hour, 11 µg/m³; and total reduced sulfur, 30-minute, 3 µg/m³. The tables presenting New Mexico state standards have been changed to reflect standards adjusted for altitude in the Final PEIS.

03.09 The commentor states that the emission rates reported in appendix B and the estimated pollutant concentrations listed in the Pantex table 4.5.3.3–1 are the same as discussed in the *Weapons-Usable Fissile Materials Draft Programmatic Environmental Impact Statement* (Storage and Disposition Draft PEIS) (DOE/EIS-0229-D, February 1996). Therefore the comments regarding the discrepancy between estimated concentrations and Texas Natural Resources Conservation Commission monitored concentrations of particulate matter holds true for the Draft PEIS. In addition, the commentor believes that the conclusion that the No Action alternative and the downsize A/D and HE fabrication alternative will not produce air pollutant concentrations exceeding Federal and state regulations and guidelines is acceptable.

Response: *The concentrations presented for Pantex in the Stockpile Stewardship and Management Draft PEIS and Storage and Disposition Draft PEIS represent the results of modeling using EPA's Industrial Source Complex Short-Term Model 2 and Industrial Source Complex Long-Term Model 2. The concentrations represent the maximum estimated concentration of particulate matter (PM_{10}) based upon a base case surge level of activity discussed in section 3.1.1. The PM_{10} monitoring data from Texas Natural Resources Conservation Commission monitors at Pantex were not used since these data do not reflect the anticipated future level of activity at the site.*

03.10 The commentor states that there is a factual error in section 4.13.1.5, in the paragraph titled Air Quality. According to the commentor, the last sentence describing LANL as a nonattainment area for ozone is incorrect. The commentor states that attainment is determined by comparison with the Federal standard, which for ozone is 0.12 ppm/hour average. The rule for determining a nonattainment area is explained in section 4.5.2.3. At the ambient air monitoring site operated by the New Mexico Environment Department at the southern boundary of LANL, adjacent to Bandelier National Monument, the highest value measured for ozone between 1989 and 1994 was 0.090 ppm/hour average. The commentor also notes that there is no state standard for ozone and, as of December 1995, there is not a state standard for photochemical oxidants.

Response: *The commentor is correct. The sentence in section 4.13.1.5, Air Quality, "LANL is in a nonattainment area for ozone concentrations" has been deleted from the document.*

03.11 The commentor states that the New Mexico regulations alluded to in appendix section K.3.3.1 are obsolete or contain errors. The reference to "total suspended particulates" as "PM_{10}" is incorrect. Although both names refer to particulates, they are measured by different monitors and have different standards. The commentor also states that the reference to New Mexico standards for beryllium, asbestos, heavy metals, photochemical oxidants, and nonmethane hydrocarbons is now obsolete. In 1995, these pollutants were eliminated from the New Mexico regulations. Federal regulations remain in existence for some of these pollutants. The pollutants eliminated from state standards are also mentioned in tables in section 4 and in appendix B.

Response: *The commentor is correct. The text in appendix section K.3.3.1, "total suspended particulates (PM_{10}), including beryllium, asbestos, and heavy metals; sulfur dioxide; total reduced sulfur; carbon monoxide; nitrogen oxides; photochemical oxidants; and nonmethane hydrocarbons" has been changed to "total suspended particulates (TSP), particulate matter less than or equal to 10 microns in diameter (PM_{10}), sulfur dioxide, total reduced sulfur, hydrogen sulfide, carbon monoxide, and nitrogen oxides." Tables in section 4 and in appendix B have also been changed to reflect the pollutants eliminated from state standards.*

03.12 The commentor points out that the Draft PEIS states that "the irregular terrain of Los Alamos affects wind motion and spreading. Localized wind gusts may not be in the same direction as average wind patterns" (appendix section K.3.3.1). In light of this information, the commentor suggests LANL correlate ambient air monitoring to the complex topography.

Response: *DOE agrees with the comment regarding the correlation between air quality and LANL's complex topography. Air monitoring does correlate to the topography of LANL. The local meteorology is just one of many factors considered in the design of the air sampling network as a whole and when locating individual air quality monitoring stations.*

04 WATER RESOURCES

04.01 A commentor indicates that the proposed construction of NIF and other upgrades at SNL would violate the city of Albuquerque's water use and discharge policies. The commentor suggests that water conservation issues in the city of Albuquerque should be discussed in the document relative to the proposed action at SNL.

Response: *As discussed in sections 4.8.2.4 and 4.8.3.4, SNL receives only 30 percent of its water from the city of Albuquerque. The remaining 70 percent is pumped from water supply wells on Kirtland Air Force Base, which has groundwater rights of 7,900 million liters per year (MLY) (2,089 million gallons per year [MGY]) and is currently operating at only a 50-percent capacity. NIF would increase SNL's water usage by 152 MLY (40 MGY) over No Action water use; this equates to less than 0.2 percent of the city of Albuquerque's annual consumptive water rights. Nonnuclear fabrication would increase SNL's water usage by 893 MLY (236 MGY) over No Action water use; this would total less than 1 percent of the city of Albuquerque's annual consumptive water rights. In addition, the city of Albuquerque also receives a 50-percent return flow credit for sanitary wastewater discharged to the Rio Grande, and the city has the rights to 56,800 MLY (15,005 MGY) of San Juan Chama water. The potential water used by NIF and the nonnuclear fabrication mission would meet the city of Albuquerque's water usage, discharge, and water conservation policies. Discharges from NIF and nonnuclear fabrication would be treated and monitored to meet the standards of the city of Albuquerque's Sewer Use and Wastewater Control Ordinance as well as National Pollutant Discharge Elimination System (NPDES) permits. Discharges would not exceed wastewater treatment capacities. As discussed in section 3.8, the preferred alternative is to downsize nonnuclear fabrication at Kansas City Plant (KCP) and construct and operate NIF at LLNL.*

04.02 A commentor states that section 4.6.2.4 indicated that LANL water resource allotment would be used up by the year 2000, and questions how LANL can produce weapons such as Y-12 has done without an adequate water supply.

Response: *The Draft PEIS incorrectly stated the projected groundwater requirements. Section 4.6.2.4 has been revised based on more accurate No Action water use estimates. The present groundwater allotment at LANL, based on the new data, would be fully used by about 2052 instead of the previously estimated year of 2000. If San Juan Chama water is included, the site would not require the total available supply until 2072.*

04.03 The commentor, referring to section 4.2.3.4, asks what the increased operating requirements of the existing Y-12 secondary and case fabrication facilities are in the No Action case.

Response: *The Y-12 No Action estimates for various resource consumption and waste generation show an increase over current values primarily due to increased dismantlement activity projections. This increased workload is expected because Y-12 would be working down the backlog of canned subassem-*

blies received from weapons dismantlement activities at Pantex. The Y-12 dismantlement rate has been lower than the Pantex rate because of a production stand-down during portions of 1994 and 1995.

04.04 The commentor states that a contaminated water plume is drifting offsite at LLNL, yet budget cuts may not allow for cleanup.

Response: *The Livermore Site was placed on the National Priorities List (NPL) for Superfund cleanup in 1987. Several documents assessing the area and planning remedial action have been published since that date. As stated in section 4.7.2.4, approximately 150 million L (40 million gal) of groundwater in the southwest corner of the facility have been treated to remove volatile organic compounds (VOCs). Five treatment facilities, A, B, C, D, and F, built from 1989 to 1994, currently treat VOC-contaminated water. As of 1994, over 470 million L (124 million gal) of water with approximately 50 kilograms (kg) (110 pounds [lb]) of VOCs and 300 L (79 gal) of gasoline have been treated. Facilities E and G were in the planning stages at the time this document was being written.*

At Site 300, ongoing remedial investigations, feasibility studies, and remedial actions are being performed as part of the environmental restoration project. Site 300 was placed on the NPL under the Comprehensive Environmental Response, Compensation, and Liability Act *(CERCLA) in August 1990. During 1993 and 1994, 903,000 L (238,545 gal) of groundwater containing 2,350 grams (g) (5 lb) of VOCs were treated by an air sparging groundwater treatment and vapor extraction system. In addition, pilot vapor extraction treatment of VOCs is ongoing. Environmental restoration budgets are outside the scope of this PEIS.*

04.05 One commentor believes that to expand the Pantex role is irresponsible in view of the fact that the plant lies above the largest freshwater aquifer in the United States, and that the aquifer is the lifeblood of the area's agriculture industry. Why the Ogallala aquifer has not been classified as a Class 1 water source is puzzling to the commentor. Another commentor states that the document fails to address the issue of the location of Pantex over the Ogallala aquifer. One commentor states that it is a contention by Pantex boosters that no substantial water pollution has occurred except for the perched water above the Ogallala aquifer. The commentor wants to know how much contamination levels will rise if Pantex's role is expanded and if an expansion is worth the risk. Another commentor believes that concerns about the Ogallala aquifer are unfounded. One commentor also notes that there is no significant discussion of recharge to the Ogallala aquifer, nor is there discussion of groundwater flow in either the perched or Ogallala aquifers. Also, a discussion of the fact that contaminants in the perched aquifer have already moved off Pantex to the east is lacking.

Response: *The only Pantex alternatives discussed in the Stockpile Stewardship and Management PEIS are downsizing (with the establishment of nonintrusive pit reuse) and phaseout of existing missions. As mentioned in section 4.5.3.4, these alternatives, as well as the No Action alternative, will reduce the water requirements at Pantex by at least 69 percent from current use. No expansion is taking place under the Stockpile Stewardship and Management Program.*

Sections 4.5.2.4 and 4.5.3.4 address the issue of the location of Pantex over the Ogallala aquifer. Despite the decreases in groundwater use, at the conclusion of every alternative in the groundwater impact sections is the statement "although Pantex water use would decrease, operational water use would still contribute to the overall decline of the Ogallala aquifer because the area groundwater withdrawal rate would exceed the recharge rate."

A detailed discussion of groundwater recharge exceeds the scope of the Stockpile Stewardship and Management PEIS. For more specific information, the reader should refer to the Draft Environmental Impact Statement for the Continued Operation of the Pantex Plant and Associated Storage of Nuclear

Weapons Components (Pantex Site-Wide Draft EIS) (DOE/EIS-0225 D, March 1996). This PEIS summarizes the recharge data available and draws conclusions from that data. Estimates of groundwater recharge are given in section 4.5.2.4 as 0.02 to 4.1 centimeter (cm)/yr (0.0079 to 1.6 inches [in]/yr) in comparison with withdrawal rates of 0.6 to 2 m/yr (1.97 to 6.56 ft/yr). The extent of the contaminants in the perched aquifer moving off Pantex to the east is under investigation as discussed in the groundwater quality section of the Pantex Site-Wide Draft EIS.

04.06 A commentor states that the information presented on groundwater quality at LANL is misleading. The commentor further states that contaminant levels have fluctuated over time and that there is evidence that contaminants are reaching the deeper aquifer from surface discharges and shallower, more contaminated areas. The commentor cites considerable mobility of contaminants in the subsurface at Mortandad Canyon which has been discovered and states that this is an area into which LANL currently discharges a significant portion of its liquid radioactive waste.

Other commentors express concern about the nuclear laundry in Santa Fe and suggest that it be closed. Another commentor states that the public does not want LANL wandering up Cerrillos Road, two blocks up beyond the old Ramada Inn, pumping radioactive waste into the Santa Fe water table.

Response: *The information presented in the PEIS is based on the best available data. Since publication of the Draft PEIS, the 1993 Environmental Surveillance Report data was published in October 1995. This new data shows four monitoring well locations in Los Alamos, Pueblo, and Mortandad Canyons with low levels of tritium contamination. The highest tritium concentration is approximately 2 percent of the Federal drinking water limit. Other contaminants were not found in measurable amounts. This is consistent with past monitoring results. As stated in section 4.6.3.4, no process wastes would be discharged directly to the groundwater. All treated wastewater discharges to the canyons would be monitored to comply with NPDES permits and other applicable discharge requirements.*

The commentor is referring to a privately operated commercial laundry, located in the vicinity of Cerrillos Road in Santa Fe. The facility launders laboratory coats, booties, and other clothing used in operations around radioactive materials. LANL has been a customer of this laundry for several years, but not the only customer. The vendor operates several laundry facilities around the country. Discharges from the commercial laundry are monitored by the New Mexico Environment Department, which has permitting authority over the facility.

04.07 The commentor refers to the NTS section 4.9.2.4 and suggests that the word "affected" be replaced with the word "contaminated." In addition, the commentor suggests that the sixth line be removed or corrected because the statement does not make sense. According to the commentor, tests conducted below the NTS water table contaminate the surrounding groundwater with radionuclides. The commentor also refers to section 4.12 and states that groundwater that may be potentially contaminated is water that people are likely to avoid. The subsistence farmer, in the distant future, may not have his well water checked on a regular basis. The commentor feels phrases such as "quality," "some," "impacts," and "could be expected" should be replaced with "purity," "extensive," "damage," and "would take place," respectively, when describing the unavoidable impacts that underground testing has on groundwater.

Response: *The terminology used in the Stockpile Stewardship and Management PEIS is accepted within the environmental community to characterize conditions at the site and is consistent with the terminology used in the NTS Site-Wide EIS. In reference to the commentor's suggestion about the sixth line, the following statement in section 4.9.2.4 has been removed from the Final PEIS, "subsurface migration of tritium to offsite areas is possible, but the probability of tritium reaching offsite wells or springs is minimal."*

As stated in section 4.12, underground testing would be expected to have a significant impact on groundwater quality only if the testing is conducted in, or near, the water table. In this event, large scale contamination of the near-test groundwater resources could occur. However, because of the conditions at NTS (low hydraulic conductivities, high absorption geologic media, and slight hydraulic gradients), it is not considered likely that any significant impacts would occur in areas downgradient of the underground testing locations.

04.08 The commentor states that maximum groundwater concentrations at LLNL, reported in the PEIS, of gross alpha, nitrate/nitrite, trichloroethylene, and tritium exceeded water quality criteria/standards in 1993. According to the commentor, VOC-contaminated water is present under 85 percent of the Livermore Site and various other examples of groundwater contamination exist. The commentor asks what measures are proposed to mitigate further groundwater contamination at LLNL resulting from proposed actions.

Response: *DOE agrees that the current groundwater monitoring system is inadequate. LLNL has implemented a system of satellite monitoring stations positioned at strategic locations within the main sewer system. Each station has an automatic sampler which, in the event of a release, can be used to find the origin of the spill. During 1993, no releases warranted a sewer diversion. In comparison, during 1991 and 1992, 15 and 13 releases, respectively, were detected. In addition, all building drains were tested to determine their points of discharge and all deficiencies were categorized and are being corrected (major deficiencies were remedied immediately). Relining of the major laterals of the sanitary sewer system also began in 1993.*

The preferred stockpile stewardship alternative site for NIF is LLNL. The increase in wastewater discharges due to NIF is 3.9 percent over No Action. Since there are no direct discharges to surface or groundwater, no adverse impacts are anticipated. At Site 300, the Contained Firing Facility (CFF) is the preferred stockpile stewardship alternative. Wastewater discharge is expected to increase 6.8 percent over No Action. Wastewater is discharged to leach fields and septic systems at Site 300. These discharges are monitored and must comply with NPDES permits and waste discharge requirements.

04.09 The commentor states that the radiological sources in the groundwater section of the NTS Site-Wide EIS should be included in the Stockpile Stewardship and Management PEIS. According to the commentor, the text in question extends from page 4–159, line 8 to page 4–163, line 24 and should include table 4–27. Further, the commentor disputes the amount of plutonium-239 buried under the NTS testing grounds.

Response: *Section 4.9.2.4 discusses groundwater monitoring at NTS. As stated in this section, tritium is the only radionuclide that appears in sampled groundwater at significant levels. These levels (120 picocuries [pCi]/L for 1993) are well below the National Primary Drinking Water Regulations (40 CFR 141) of 20,000 pCi/L. In section 4.12 of the PEIS, the effects of underground nuclear testing on several resources, including groundwater, are discussed. In addition, radiological impacts are discussed in the Radiation and Hazardous Chemical Environment sections 4.2.9.3 through 4.9.9.3. For more detailed analysis beyond the scope of the Stockpile Stewardship and Management PEIS, site-specific documents such as the NTS Site-Wide EIS should be reviewed.*

04.10 The commentor asks why the uranium in water values in tables 4.2.2.4–1, 4.5.2.4–1, and 4.6.2.4–1 are different (20 pCi/L and 20 μg/L). In addition, the commentor asks why these tables state that the uranium value of 20 pCi/L or 20 μg/L is a National Primary Drinking Water Standard, when it is only a proposed standard.

Response: *The proposed National Primary Drinking Water Standard (56 FR 33050) for uranium (20 μg/L) only applies to table 4.6.2.4–1. The other tables reflect Derived Concentration Guides in* *pCi/L as the standard because the samples reflect total uranium concentrations which do not apply to the proposed National Primary Drinking Water Standard.*

04.11 The commentor believes that the PEIS should evaluate hydrology of surface and subsurface waters at LANL and SNL, not just potable water sources. Hydrology involves the potential for subsurface travel of materials such as petrochemicals and the resultant contamination of the Southern Valley of Albuquerque, according to the commentor. Another commentor asks where hydrology is discussed in the PEIS.

Response: *Surface water quality at LANL and SNL is evaluated in sections 4.6.2.4 and 4.6.3.4, and 4.8.2.4 and 4.8.3.4, respectively. Groundwater monitoring wells exist at several depths, both in perched aquifers and deeper aquifers, potable and nonpotable. Drinking water standards are listed in tables 4.6.2.4–1 and 4.8.2.4–1 for comparison purposes only.*

All treated wastewater discharges would be monitored to comply with NPDES permits and other applicable discharge requirements. The preferred alternatives of pit fabrication and the Atlas Facility at LANL would only increase wastewater discharges by 1.8 percent. These discharges would be treated before release to the canyons. No adverse impacts to either surface or groundwater are expected. There are no stockpile stewardship and management preferred alternatives identified for SNL.

04.12 The commentor expresses concern about the quality of the drinking water at Pantex. The commentor notes that Pantex is monitored for 160 contaminants, the majority of which ended up being discharged to groundwater. The commentor wants a broader spectrum of contaminant analysis for drinking water.

Response: *Pantex is monitored to comply with all Federal, state, and site-specific regulations. The groundwater monitoring program is constantly being updated based on past results to provide the best analysis possible. As discussed in sections 4.5.2.4 and 4.5.3.4, there are no direct discharges to groundwater. All wastewater is processed at the Pantex wastewater treatment facility before release to the playas. All discharges comply with NPDES permits and surface water monitoring is conducted regularly.*

04.13 The commentor asks if, in section 4.2.3.4, the statements are correct that the phaseout of work at Y-12 would reduce the flow in the East Fork of Poplar Creek to zero and would have no impact on the water quality in the creek, and that there are no natural springs beneath some buildings in the plant that run continuously into the East Fork of Poplar Creek (very low flow rates). The commentor asks further, if it is not correct that the city of Oak Ridge must have a flow in the East Fork of Poplar Creek in order to discharge the treated sewerage water from the city, and if the flow from Y-12 is zero, would the city of Oak Ridge be allowed to continue to discharge the treated water into the creek.

Response: *In section 4.2.3.4, the statement should read that the phaseout of secondary and case fabrication would decrease the discharges from the mission to zero; other missions at Y-12 would continue to discharge to East Fork Poplar Creek. Phaseout would not be expected to impact the city of Oak Ridge discharge of treated sewage water.*

04.14 According to the commentor, section 4.5.2.4 does not provide adequate information for the reader to determine if environmental impacts could result from the proposed alternative actions at Pantex.

Response: *Chapter 4 of the PEIS is broken down into two sections, the affected environment and environmental impacts. Section 4.5.2.4 is intended to provide only the affected environment, or a* *baseline for comparison of environmental issues. Water impacts due to No Action and proposed alternatives at Pantex are discussed in section 4.5.3.4. In addition, all of the alternatives considered for Pantex decrease the amount of water used and discharged.*

04.15 Commentors ask if an analysis has been made of the impact on the Las Vegas municipal water supply of NTS workers and their families associated with the 2,253 new jobs at NTS (Stockpile Stewardship and Management Summary section S.4.1) who are likely to reside in Las Vegas.

Response: *Based on the population of Las Vegas (327,878), the 2,253 new workers associated with the A/D mission at NTS would represent less than a 1-percent population growth. The population growth in the area is approximately 7 percent per year. Because this increase in population is within normal growth rates, minimal impacts to the municipal water supply are expected and no specific analysis was included in the PEIS.*

04.16 The commentor states that there are numerous factual errors in section 4.6.2.4, Water Resources at LANL. The commentor points out that the 1992 data is being used and suggests using more recent data (for example, the 1993 Environmental Surveillance Report). The commentor notes that in Parajito Canyon, Homestead Spring feeds a perennial stream only a few hundred yards long. The stream is fed by other springs in addition to Homestead Spring. According to the commentor, only during periods of heavy precipitation or snowmelt would water from Pueblo, Los Alamos, or Sandia Canyons extend beyond LANL boundaries and reach the Rio Grande. The commentor suggests that this information be supported by good volumetric data which can be obtained from the data provided by the gauging stations.

Response: *The water resource data has been updated with information from the 1993 Environmental Surveillance Report, which had not been published at the time the Stockpile Stewardship and Management Draft PEIS was prepared. DOE agrees with the commentor that Homestead Spring feeds a perennial stream 3 to 5 kilometers (km) (2 to 3 miles [mi]) long, and the Final PEIS has been corrected accordingly (see section 4.6.2.4); however, the 3- to 5-km (2- to 3-mi) distance is largely due to contributions from other springs and runoff, and not solely to Homestead Spring discharge.*

The following volumetric data regarding surface water runoff beyond LANL boundaries is provided at the commentor's request. At the LANL boundary during water year 1995 (fiscal year 1995), the last year for which data is available, the streams mentioned in the PEIS flowed as follows:

Pueblo: 365 days with flow (typically about 0.03 m^3 [51 ft^3] per second)
Los Alamos: 94 days with flow
Sandia: 6 days with flow
Mortandad: 0 days with flow

In addition, visual and chemical observations from Mortandad Canyon since 1960 by U.S. Geological Survey and LANL hydrologists have not noted any continuous flow from the upper canyon to the LANL boundary.

04.17 The commentor points out that according to the PEIS, groundwater in the LANL area exists in three modes. The commentor advises that there is a fourth mode-shallow perched in the Bandelier Tuff. In addition, the commentor states that in the PEIS, under Groundwater Availability and Use, downgradient users beside the communities of Los Alamos and White Rock are not mentioned. The commentor asks about other possible usage by pueblos such as San Ildefonso and Santa Clara.

Response: *The commentor notes a fourth occurrence of groundwater: shallow perched water in the Bandelier Tuff. This mode of groundwater occurrence is known to be present west of LANL on the flanks* *of the Jemez Mountains. While it is possible that this form is present beneath LANL, it is not known to be present, and hydrologic studies would have to be performed to confirm this condition.*

04.18 The commentor is of the opinion that there is little consistency in the placement of groundwater monitoring wells at LANL and that existing wells are inadequate. The commentor points out that the wells are very old (the most recent was drilled in 1963), and may not be thoroughly grouted and may be leaking. The commentor is concerned that contaminants may not be detected because of the lengthy intervals between sampling screens (some greater than 30.5 m [100 ft], e.g. DT-9 is screened at 317 m [1,040 ft] and 457 m [1,500 ft]).

Response: *DOE agrees with the commentor that the present groundwater monitoring network is inadequate. DOE and LANL have initiated a major upgrade to the monitoring network to include additional wells drilled to monitor all zones of groundwater beneath LANL (see the* LANL Groundwater Protection Management Program Plan, *January 31, 1996).*

05 GEOLOGY AND SOILS

05.01 The commentor states contamination in soils has been omitted almost entirely from the discussion of the current environment at LANL.

Response: *LANL has a long-standing soils monitoring program to identify potential contamination of soils; this is reported to the public annually in LANL's* Environmental Surveillance Report *and other publications. DOE is working with Federal and state regulatory authorities to address compliance and cleanup obligations arising from its operation of LANL and is engaged in several activities to bring its current operations into full regulatory compliance. Although LANL is not listed on the NPL, it is required to obtain a* Resource Conservation and Recovery Act *(RCRA) permit in accordance with the Hazardous and Solid Waste Amendments of 1984. This requires that permits for treatment, storage, and disposal facilities include provisions for corrective action to mitigate releases from facilities in operation and to clean up contamination in areas designated as solid waste management units at LANL. The commentor is referred to sections 4.6.2.10, 4.6.3.10, and appendix section H.2.5 of the Final PEIS for more information about waste management and identified release sites at LANL.*

05.02 Commentors believe that the description of the geology and soils at Pantex is inadequate. According to one commentor, section 4.5.2.5 does not provide adequate information for the reader to determine if environmental impacts could result from the proposed alternative actions at Pantex. It is therefore not possible to determine that "hazards posed by geological conditions are negligible at Pantex." The commentor also states that the role of salt dissolution and subsidence in the formation of the playa basins should be described, as well as the potential effects, if any, of dissolution-induced subsidence at the plant. Another commentor notes that Pantex is located on a geological fault that has been active enough in the last century to cause damage to farm buildings.

Response: *The discussion in sections 4.5.2.5 and 4.5.3.5 now includes the two main geological processes that are relevant to the Pantex area: subsidence and seismic activity. The following text has been added to section 4.5.2.5 in the Final PEIS, "In the High Plains area, salt dissolution in Permian formations is an active process which can lead to sinkholes and fractures. Such surficial expressions have not been identified in Carson County, where Pantex is located. Sinkholes and fractures have been identified, however, in adjacent Armstrong County to the south and Hutchinson County to the north." The following text has been added to section 4.5.3.5, "Potential subsidence impacts resulting from salt dissolution are considered negligible at Pantex because salt dissolution is a slow process relative to human activities." While there are no active faults identified beneath Pantex, it is true that seismic events have occurred in the region which have caused damage to residential buildings. The level of* *seismicity historically associated with the Pantex region, however, is low. The seismic risk at Pantex, therefore, is judged to be low.*

The commentors are referred to the geology and soils section of the Pantex Site-Wide Draft EIS for a more detailed discussion of salt dissolution and seismicity in the Pantex region. Aside from these geological processes, it should be noted that the proposed alternatives at Pantex involve no new construction. As a result, no adverse geological or soils impacts are anticipated.

05.03 The commentor states that the lithology of the Ogallala Formation is not described in the PEIS. The significance to groundwater flow of the fine-grained zone as well as gravels in buried channels beneath the plant should be described, according to the commentor.

Response: *A detailed discussion of the lithology of the Ogallala Formation is more information than necessary to evaluate potential aquifer impacts for a programmatic review. The commentor is referred to the groundwater section of the Pantex Site-Wide Draft EIS for a discussion of the fine-grained zone and buried channels beneath Pantex.*

05.04 The commentor refers to section 4.12, Environmental Impacts of Underground Nuclear Testing, and requests correction of the effects of subsidence to state that radioactivity is only partially confined and that the effects will persist for at least a quarter million years.

Response: *The commentor is correct, radioactivity from some materials in NTS soils would remain for a long time. As stated in section 4.12, radioactive noble gases and tritium may be released to the surface by gradual seepage from the cavities and by escape of gases during sampling operations. This statement is meant to indicate that the radioactivity is not entirely confined.*

05.05 The commentor notes that no mention is made that the Randall clay soils at Pantex contain potential pathways for groundwater recharge (i.e., deep desiccation cracks and root tubules).

Response: *The fact that Randall clay soils at Pantex contain potential pathways for groundwater recharge is considered in the estimates of annual recharge rates to the Ogallala aquifer. The commentor is referred to section 4.5.2.4, Water Resources, for a discussion of aquifer recharge.*

06 BIOTIC RESOURCES

06.01 The commentor is concerned that SRS is destroying the natural habitat along the Savannah River.

Response: *Impacts to natural habitat along the Savannah River would not be expected from either the No Action or management alternative (i.e., pit fabrication mission). Under the No Action alternative, there would be no change to current biological conditions of the site, including habitat along the Savannah River. The pit fabrication mission also would not be expected to adversely affect habitat along the Savannah River since existing facilities within the F- and H-Areas would be used and wastewater would be released through NPDES-permitted discharges.*

06.02 The commentor states that there is no discussion in section 4.6.2.6, Biotic Resources, of the effects that LANL contaminants may have on wildlife.

Response: *Section 4.6.3.6 discusses the potential impacts of the No Action, management, and stewardship alternatives at LANL on terrestrial resources, wetlands, aquatic resources, and threatened and endangered species. LANL conducts ongoing studies to monitor the effects of LANL operations on biota. LANL monitors plants and wildlife populations on and near laboratory property to determine if there* *are impacts from LANL activities to individual animals or entire populations. LANL has issued numerous publications over the past 20 years regarding its findings, which do not indicate significant adverse effects to laboratory biota as a whole.*

07 CULTURAL AND PALEONTOLOGICAL

07.01 One commentor asks what the Stockpile Stewardship and Management PEIS cultural and paleontological analysis involved.

Response: *The analysis involved is described in section 4.1.7 for the affected environment and environmental impacts descriptions. The affected environment descriptions resulted from documentary research, including examination of previous site documents such as archaeological and historic structure survey reports, reports of interviews with Native Americans, general texts about an area's history and geology, National Register of Historic Places (NRHP) guidelines, and discussions with the alternative sites and with the NRHP.*

The impacts analysis involved identifying the areas (and standing structures) that might be affected by the potential alternatives, comparing the affected environment resources data to the potentially affected areas, and determining whether or not the alternatives might affect cultural and paleontological resources.

07.02 The commentor states that DOE is taking and has taken land from the Western Shoshones. The commentor claims that DOE has ignored the native peoples who own the land at NTS and Yucca Mountain through treaties. Another commentor states that DOE should keep its word and return Indian land to its rightful owners.

Response: *DOE is aware that the Western Shoshone have disputed the U.S. Government's ownership of lands on NTS and Yucca Mountain. The land ownership issue has been brought to court on several occasions. In the early 1950s, the Western Shoshone filed a claim concerning the lands at issue under the* Indian Claims Commission Act *of 1946. This Act provided that if a claim against the Government for unkept treaty promises was upheld, the tribe making the claim could receive only a monetary award, not land or other remuneration. In 1962, the Commission ruled that all Western Shoshone land titles had been extinguished, and later, to establish valuation for a monetary award, set July 1, 1872, as the date the land was taken. In 1976, the Commission awarded the Western Shoshone $26 million as payment for the land. The Western Shoshone refused to accept payment, arguing that rejection of the money meant that they had not been compensated and their claim to the land was still alive. With interest, the award, held in the U.S. Treasury in trust for the Western Shoshone, is now more than $100 million.*

The land ownership issue has been brought to court on several occasions. In 1984, the U.S. Supreme Court agreed to hear the case, considering only the issue of whether "payment" for the land had been made. In 1985, the Supreme Court held that the payment had been made in accordance with the Indian Claims Commission Act *of 1946. This constituted full and final settlement for the land. Whether or not the Western Shoshone accepted the payment had no effect on the transaction; the land was ruled to belong to the United States. Subsequent challenges to this ruling have been made before the U.S. Court of Appeals who reiterated the Supreme Court decision: the Western Shoshone have no right to the land. In response to a subsequent appeal, the U.S. Supreme Court refused to hear the case, letting the appellate court decision stand.*

The U.S. Government (and DOE) must abide by the current U.S. Supreme Court rulings on this issue. The U.S. Government is aware of significant disagreement with the rulings, especially by the Western Shoshone, and realizes there are likely to be additional challenges and appeals. The U.S. Government must abide by any new rulings made on this subject.

08 SOCIOECONOMICS

08.01 Commentors express concern that the perceived mitigative effects of decontamination and decommissioning (D&D) jobs at ORR described in Summary section S.4.1 and table 3.7.1–5 would not materialize based on previous experience. The commentors are concerned about when the D&D work would be budgeted and whether these jobs would begin immediately or would be phased in. One commentor wants to know specifically what jobs are going to be created and if Washington agrees that these new jobs are going to be funded and asks that a table be provided showing employment and socioeconomic impacts through 2030. The commentors ask if Washington does intend on funding the (proposed 1,318) D&D jobs, is this a steady state requirement and how many years can the level of expenditure continue once it starts. A commentor states as an example that the D&D on Building 9201-4 has been scheduled for 15 years and does not seem to be a priority. A commentor is also concerned about who would do the D&D work (Lockheed-Martin people or contract workers), and how soon it would have to be scheduled in order for Lockheed-Martin workers to be kept on the payroll. Another commentor is concerned that people from K-25 are included in the D&D figures that are planned for Y-12. The commentor is concerned that DOE is just shifting people and money for D&D.

Response: *For base case single-shift operations, the total Y-12 workforce would fall to 3,916 from the No Action level of 4,721. The workforce would consist of 1,980 workers conducting nonstockpile management activities, 784 core stockpile management workers, and 1,152 workers performing landlord activities in preparation for D&D of the facilities. The projected D&D employment at Y-12 is shown in section 4.2.3.8. Workers performing landlord activities are necessary for transition of the facility and would be in place whether the funding comes from the Environmental Management program or continues to come from DOE's Office of Defense Programs (DP). Over the period 2005 to 2030, the number of these workers would range from a high of 1,522 in 2016 to a low of 557 in 2030. When D&D activities reach a peak in 2016, Y-12 would employ 435 fewer workers than under the No Action alternative.*

08.02 The commentor wants to know where the impacts to the agricultural economy were analyzed in the PEIS.

Response: *The Stockpile Stewardship and Management PEIS does not analyze the economic impacts to particular sectors such as the agriculture sector. Rather, the document evaluates impacts to the regional economy as a whole, which includes the agricultural sector. However, none of the proposed alternatives would make use of prime farmland or involve activities affecting farm production. Under normal operation, there would be no direct impacts to the agricultural economy. Any potential impacts to agriculture resulting from an accident are analyzed in appendix section F.4.*

08.03 Commentors state that the socioeconomic impact to Oak Ridge and the surrounding communities has not been appropriately analyzed. One commentor expresses concern about the data used for the socioeconomic study and the financial impact studies which show little impact on the city of Oak Ridge and the ORR region. Another commentor asks what the community will do with the unemployed workers that have been at ORR for 20 to 25 years. The commentors also indicate that the study's results must be questioned because personnel from the city of Oak Ridge were not directly involved in the analysis.

Response: *The socioeconomic impacts associated with the alternatives at ORR extend beyond the city of Oak Ridge and include all the jurisdictions within the four-county region of influence (ROI). The database used for the socioeconomic study was developed using the most recent information* *available from the Departments of Commerce and Labor, as well as financial reports provided by cities, counties, and school districts. The impacts were measured using the latest version of Regional Input-Output Modeling System II (RIMS II), a model developed by the U.S. Bureau of Economic Analysis. The model is used by Government agencies, university researchers, and private economists to measure economic impacts. The socioeconomic impacts for the alternatives considered for ORR are discussed in section 4.2.3.8. DOE has created the Office of Worker and Community Transition to help ease the unavoidable impacts associated with the restructuring of the contractor workforce at DOE sites. The office has issued its Interim Guidance for Contractor Workforce Restructuring which includes options to encourage voluntary separations and assist affected workers in transition to new careers. The final guidance also includes measures such as transferring employees to other missions or other sites, providing additional training and educational assistance, or counseling for the employees. In addition, DOE anticipates working closely with other businesses in the communities surrounding the sites to keep them informed of skilled personnel in the labor market.*

In accordance with the NEPA process, the city of Oak Ridge has been invited to provide comments on the proposed alternatives from the time of initial scoping to the Final PEIS. Any comments provided by the city or any other commentors are taken into account and incorporated into the Final PEIS.

08.04 Commentors recognize that downsizing the nonnuclear fabrication mission at KCP will result in a loss of possibly 300 to 900 jobs over a period of time. The commentors want to know what can be done, what resources can be utilized, and how the business community can help lessen the number of jobs lost. The commentors point out that even with the possibility of additional future work at KCP, there is concern and they want to know if it is possible to maintain a higher rate of employment in the Kansas City area.

Response: *In September 1994, DOE created the Office of Worker and Community Transition to help ease the unavoidable impacts associated with the restructuring of the contractor workforce at DOE sites. The office has issued its Interim Guidance for Contractor Workforce Restructuring which includes options to encourage voluntary separations and assist workers in transition to new careers. The final guidance also includes measures such as transferring employees to other missions or other sites, providing additional training and educational assistance, or counseling for the employees. In addition, DOE anticipates working closely with other businesses in the communities surrounding the sites to keep them informed of skilled personnel in the labor market. Because KCP is small relative to the large, diversified economy of the Kansas City region, the downsizing is expected to have little effect on the regional economy. Kansas City derives almost all of its employment growth from non-DOE activities.*

08.05 The commentor believes that the socioeconomic analysis does not consider the social and economic impact of the people at LANL who were laid off at the plutonium facility. The commentor believes that DOE needs to look at the integrity of the people in the socioeconomic analysis. The commentor also believes that the 22 people laid off at the plutonium facility should be interviewed for the socio-economic analysis.

Response: *The Stockpile Stewardship and Management PEIS identifies and analyzes potential impacts of the proposed Stockpile Stewardship and Management Program alternatives, including the reestablishing of pit fabrication at LANL. The PEIS does include in the analysis the impacts of previous actions, such as layoffs at the LANL plutonium facility. The commentor's concerns about downsizing and the effects on site employees are being addressed by DOE's Office of Worker and Community Transition. This office oversees DOE policies to facilitate worker transition, including* *worker retraining, education, and relocation assistance. The socioeconomic impact analysis estimates direct and indirect economic impacts, including employment and income. The PEIS also estimates impacts to the regional population and the housing market, as well as impacts to public finance.*

08.06 The commentor believes that any additional work that would come to Los Alamos from pit production should be contracted out to a private taxpaying company instead of going to the University of California, which does not pay taxes to the state or the community.

Response: *The economic analysis does not take into account what type of contractor would be managing the implementation of the proposed alternatives. The purpose of the economic analysis is to evaluate the socioeconomic impacts of the proposed alternatives on employment and income in the regional economic area. The socioeconomic impact analysis also addresses impacts to population, housing, and public finances. Selection of the preferred alternative would not be affected if LANL's contractor were a private in-state company instead of the University of California. This is because the benefits to the local communities from a private contractor as opposed to a non-profit contractor are likely to be small. Any revenues generated by corporate taxes levied on a private company would be the result of a state corporate income tax. This revenue could then be dispersed throughout the state, rather than remain in the LANL region. It is unknown what portion of these funds would actually be allocated to the LANL region. Impacts to the local community public finance would more likely stem from local taxes paid by workers directly associated with the facility. Furthermore, the process of selecting a contractor for performing proposed alternatives would be accomplished separately from the NEPA process.*

08.07 Several commentors believe that the laboratories do not understand the various processes at Y-12 to estimate accurate employment figures. The commentors state that a detailed breakdown of the job structure does not exist. The commentors wonder how the waste job structures at Y-12 will be moved to LANL and how many people for each function will be at all three of the sites. In addition, the commentors state that there is no description on a function-by-function basis of how the fabrication process can be implemented at another site, and this oversight allows for wildly unrealistic estimates at the other sites. Further, the commentors would like the PEIS to address the difference in worker experience between Y-12 and the laboratories and the cost of having to train a new workforce if the secondary and case fabrication mission were moved.

Response: *In developing the data used in the PEIS and in the cost estimates, DOE formed a working group for each functional area that included all affected sites in order to share information and provide consistent data for all of the proposed alternatives. In the case of secondary and case manufacturing, this included knowledgable personnel from both Y-12 and the laboratories so that all three alternatives would be evaluating the same mission and requirements. Appendix A gives a breakdown of employment by labor category for each alternative at each site, and also includes details on how the process would be implemented at each site. This functional breakdown estimates the workers needed at Y-12, LANL, or LLNL.*

08.08 Commentors ask about the difference between socioeconomics and environmental justice.

Response: *Environmental justice analysis, as defined in Executive Order 12898, is performed to assess whether the proposed alternatives would have a disproportionately high and adverse effect on minority and low-income populations. The analysis is accomplished by examining the size and distribution of these populations and determining if adverse health and economic impacts would be borne by these groups to a greater degree than the population as a whole. Socioeconomics has a* *broader focus. Socioeconomics addresses the impacts of the alternatives on the economic and social characteristics of a region, such as population, employment, housing, and public finances. The socioeconomic impact sections analyze the effect the alternatives would have on the entire region, rather than on particular populations.*

08.09 The commentor points out peculiarities, such as the concept that no indirect jobs would be generated for the 523 workers and 321 incremental workers associated with the secondary/case mission (table 3.4.4.3–2), that need to be resolved.

Response: *The number of indirect jobs generated by each alternative depends on the mission performed and the types of existing industries within the region. In the region around LANL, there are few or no industries that would support the secondary and case fabrication mission. Therefore, the increase in site employment (direct jobs) would not result in a corresponding increase in supporting industry employment (indirect jobs).*

08.10 The commentor states that the numbers included in the PEIS contain inconsistencies in logic and mathematics. For example, in section 3.4, the commentor notes surge operation is used for generating the operations analysis numbers, rather than the base case, which would presumably be the actual staffing levels and would be a more realistic identification of the manpower and socioeconomic impact. The commentor also wonders why the impact numbers calculated in the analysis in section 3.7.1.1 are based on the three-shift surge operation, when single-shift operation is the base case (table 3.1.1.1–1). The commentor feels this may have been done to reduce the socioeconomic impacts.

Response: *The Final PEIS assesses socioeconomic impacts using both the base case single-shift and the base case surge (three-shift) production scenarios. However, DOE has analyzed the base case surge scenario (as well as a high case scenario where appropriate) to fully capture the bounding case. This is because a surge operation would require more workers than a one-shift operation and could potentially cause greater disruption of the local infrastructure (e.g., housing and public finances).*

08.11 The commentor expresses confusion about the difference between direct and indirect jobs and requests that the glossary include these terms. Another commentor refers to the discussion in the Summary section S.4.1 and states that only direct employment impacts are considered in socioeconomics. The commentor questions whether negative factors (such as land use, waste management, hazardous operations, and transportation problems) would have negative socioeconomic impacts.

Response: *The socioeconomic analysis assesses both direct and indirect economic employment impacts. Indirect employment refers to jobs created or lost in industries that support activities associated with the proposed alternatives while direct employment refers to changes in site workforce. These definitions are included in chapter 9, Glossary. Waste management, transportation, and hazardous operations are assessed in terms of health risks to workers and the public.*

08.12 The commentor refers to figure 4.2.3.8–4 and states that the text under public finance only discusses ROI impacts when the city of Oak Ridge impacts are 5.5 and 7.5 percent. The commentor asks, since these numbers are for 2005 and the staffing levels in 2030 are only half of the 2005 level, how this affects projected impacts in 2030.

Response: *The text presents overall ROI impacts while the figures show the effects to individual cities and counties. In the Final PEIS, the range of the effects on cities and counties is included in the text.*

08.13 Commentors state there are inconsistencies between the Draft PEIS (figure 4.2.3.8-1) and the Stockpile Management Preferred Alternatives Report (page 39) regarding employment figures. The commentors note that the Draft PEIS projects a continuously decreasing employment level for the downsizing ORR alternative until the year 2030. The commentors note that section 4.2.3.8 is the only section which mentions Environmental Management support employment figures. The commentors point out that the Stockpile Management Preferred Alternatives Report contradicts the information in the Draft PEIS by reporting employment levels that will not continue to decline after the year 2008 and will in fact remain constant between the years 2008 and 2030. The commentors state the public is unsure which figures are accurate.

Response: *Figure 4.2.3.8–1 was incorrect and did not properly reflect the employment numbers presented in the PEIS which represent DOE's most recent estimates of the labor force required for the mission. The ORR labor requirements have been revised since the publication of the Draft PEIS. The base case single-shift core stockpile management workforce will be 784 in 2005, while the base case surge (three-shift) core stockpile management workforce would be 1,376 in 2005. In addition, D&D employment would begin in 2003, increase its employment requirements until 2016, and gradually decrease until 2030. This is shown in section 4.2.3.8. The preferred alternative number of workers expected at Y-12 is 1,080, which falls between the two bounding values analyzed in the PEIS.*

08.14 The commentor states that the 1,100 employees that have been added to the Pantex workforce in the past few years are mostly ES&H workers and not A/D workers.

Response: *Of the 1,100 worker increase at Pantex over the past 5 years, approximately 25 percent are associated with ES&H and waste management activities. About 75 percent of the additional workforce is employed in production and dismantlement operations.*

08.15 The commentor urges DOE to correct the socioeconomic impact portions of the PEIS to accurately reflect the impact of Pantex on the local economy, stating that employment related to Pantex represents over 12 percent of all jobs in the Amarillo metropolitan area. The commentor's assertion is based on the fact that the money Pantex brings into the local economy supports many retail, medical, educational, finance, insurance, and real estate jobs. Other commentors state that the dramatic employment reduction of 3,549 jobs forecasted in the Draft PEIS will severely impact the Panhandle economy and that any reductions should come only after intensive cost and technical analyses. The commentors feel the loss of 3,549 high paying jobs would have greater than a 1-percent impact.

Response: *The socioeconomic impact sections look at the entire regional economic area around the site, rather than the nearest metropolitan area. The jobs considered are those jobs associated with the mission at the site, and those jobs in other industries in the area that are related to and support the mission activities. Other changes to the local economy, such as changes in tax revenues and Government expenditures, are analyzed in the public finance portions of the socioeconomic sections. Total phaseout of Pantex would result in a loss of 3,549 jobs (1,644 direct and 1,905 indirect). This represents 1.4 percent of total employment in the Pantex regional economic area. The downsize A/D and HE fabrication alternative would result in a loss of 475 jobs (220 direct and 255 indirect), which is 0.2 percent of total regional economic area employment. While these job losses could negatively affect the Panhandle region, DOE's Office of Worker and Community Transition would work with the area to lessen any impacts.*

08.16 The commentor states that the PEIS does not address the social impacts that go beyond the direct number of jobs, such as unnecessary infrastructure and empty schools. The commentor believes the main adverse impacts of a stockpile stewardship program would be associated with the construction of new facilities and in the societal effects of shifting responsibilities among installations.

Response: *The socioeconomic impact analysis estimates direct and indirect economic impacts, including employment and income. The PEIS also estimates impacts to regional population and the housing market, as well as impacts to public finance for all sites and all alternatives. The analysis of population impacts indicates that any population change would be small relative to the resident population, and would not significantly impact school populations or existing infrastructure.*

08.17 The commentor notes that in the Summary section entitled Secondary and Case Fabrication, the proposed plan is to cut Y-12's manufacturing capability from 2,350 current DP workers to 870, but that the data presented at the April 1 and 2, 1996 meetings in Oak Ridge were 3,126 current DP workers at Y-12 to be reduced to a downsized level of 1,080 in the year 2003. The commentor points out that the meeting data indicate a cut of 2,046 employees while the PEIS shows a reduction in DP supported workers of 1,480 for the same years. The commentor wants to know the impact of the new data which calls for a cut of 2,046 workers which is 38-percent higher than the data in the Summary section S.4.1 and in section 4.2.3.8.

Response: *For base case single-shift production in 2005, the number of core stockpile management workers at Y-12 would fall from the No Action level of 2,741 to 784 while landlord responsibilities in preparation for D&D would require 1,152 workers. An additional 1,980 workers would be required for other program activities at the Y-12 facility under both the No Action or the downsize alternative. Total Y-12 workforce (core stockpile management and other programs) would be reduced from the No Action level of 4,721 to 3,916, a loss of 805 jobs. Employment in the ORR regional economic area would fall by less than 1 percent as a result of the change in site workforce.*

08.18 The commentor refers to the Summary section S.4.1 and the proposed plan to cut Y-12's manufacturing capability from the current 2,350 workers to 870. The commentor wants to know the skill mix that will comprise the proposed 131 craftworkers and the 93 operatives identified in order to evaluate the feasibility of meeting the proposed production requirements. The commentor is interested in knowing how many workers will be involved in quality and certification and process development.

Response: *The socioeconomic impact sections analyze changes to regional economics, employment, population, housing, and public finance resulting from changes in site employment. The detailed data requested by the commentor is not available because the types of craftworkers and operators were not needed for determining environmental impacts. The skill mix of the workers does not change the environmental impacts of the proposed alternatives. The* Stockpile Management Preferred Alternatives Report *presents an evaluation of the technical ability of the alternatives to meet the proposed production requirements. This report is available in the DOE Public Reading Rooms near each site.*

08.19 The commentor contends that substantial local public and private money was put into building infrastructure to support DOE operations (i.e., roads, schools, and utilities). The commentor states that the PEIS does not consider the total national impact on local socioeconomics (i.e., cuts at ORR, expansion at another site). The commentor suggests that the PEIS needs to account for and address these "stranded costs."

Response: *As seen in the socioeconomic analysis, the impacts to the regional economies from any of the proposed alternatives is small. In the case of the preferred alternative, the losses to the regional economy would be diminished by D&D activities associated with downsizing. Population* *decrease in any ROI jurisdiction would not exceed 4 percent as a result of downsizing to the preferred alternative. Therefore, there would be no large changes in the utilization of local services or utilities.*

08.20 The commentor requests clarification on the level of importance placed on the impact of jobs lost or jobs gained in any particular area in making recommendations.

Response: *The primary purpose of the Stockpile Stewardship and Management Program is to continue to support U.S. national security policies as directed by the President and Congress. The final decision to select a preferred alternative takes into account impacts to various environmental resources, including socioeconomics. The Record of Decision (ROD) will explain the rationale and the factors for DOE's decisions.*

08.21 The commentor states that DOE should have analyzed in more detail the socioeconomic impacts associated with each of the proposed alternatives, including impacts associated with loss of employment population, unnecessary infrastructure, and empty schools, as well as other financial impacts on the region's economy. The commentor believes that local government representatives should be included in this more detailed analysis.

Response: *The PEIS analyzes impacts to regional employment and income, as well as any changes to population or housing markets that could result from the proposed alternatives. In addition, impacts to local government and school district finances are assessed. Information on public finances were obtained from each city, county, and school district. Other data came from sources such as the U.S. Census Bureau and the U.S. Bureau of Economic Statistics. Input from local government officials and other stakeholders is obtained from public meetings, including scoping meetings.*

08.22 The commentor states that DOE should explain the statement in the Stockpile Stewardship and Management Draft PEIS, "The downsizing A/D and HE fabrication alternative would result in the addition of 280 workers at Pantex."

Response: *A majority of the worker reductions at Pantex would have already occurred under No Action. Under the base case single-shift scenario, downsizing Pantex (retaining A/D and HE missions) would result in the loss of 189 jobs from the No Action level of 1,644 jobs. A base case surge (three-shift) operation would require 1,927 workers. This represents an increase in employment requirements over No Action of 283 jobs. This number was rounded to 280 in the Draft PEIS.*

08.23 The commentor refers to the ORR section 4.2.3.8 on public finance and wonders who projected that total expenditures for the public area would increase an average of less than 1 percent per year from the year 2000 to 2030.

Response: *Section 4.2.3.8 on public finance at ORR states that total expenditures are projected to increase at an annual average of less than 1 percent during the period 2000 to 2005, and that this rate of increase should continue until 2030. The increase for the ORR combined ROI cities and counties expenditures between 2000 and 2030 is 9 percent. These projections are developed from financial forecasting models described in the methodology section and are based upon financial statements and budgets from these cities and counties; the latest available projections for population, income, and employment from the U.S. Bureau of Economic Analysis; and other data.*

08.24 The commentor requests that the Comment Response Document contain a description of the statistical rationale which supports the PEIS statement that direct and indirect jobs lost (from transfer of

HE mission to laboratories) would not change the Pantex regional economic area's unemployment rate, housing/rental vacancies, and public finance expenditures/revenues. Another commentor feels DOE should not consider 33 HE jobs as insignificant.

Response: *Under No Action, the HE mission at Pantex would employ 105 workers and generate an additional 122 jobs in related industries within the region. Phaseout of this mission would therefore result in a total loss of 227 jobs in the Pantex regional economic area. Total employment in the region is projected to be 248,442 in 2005. Therefore, the jobs lost as a result of the phaseout of the HE mission would result in a loss of less than one tenth of 1 percent of total regional employment and would not have a measurable effect on the unemployment rate. Even if all of the displaced workers were to leave the area, the impacts on population, housing, and public finance would be negligible. As described in section 3.8, the preferred alternative is to assign the HE mission to Pantex.*

08.25 The commentor requests an explanation be given in the Comment Response Document regarding the apparent inconsistencies between the Pantex Site-Wide Draft EIS, the Stockpile Stewardship and Management Draft PEIS, and the Storage and Disposition Draft PEIS regarding the numbers of indirect jobs created in the region for each direct job at Pantex. The commentor notes that the Pantex Site-Wide Draft EIS, page S–17; Stockpile Stewardship and Management Draft PEIS, Summary section S.4.1; and Storage and Disposition Draft PEIS, page 4–205 assume an economic multiplier of 1.65, 1.16, and 3.51 indirect jobs in the region for every direct job created at Pantex, respectively.

Response: *Projections of the number of indirect jobs generated depends on a number of factors, including the type of mission activity performed, the type of data used, and the methodology employed. This PEIS evaluates the socioeconomic impact of weapons A/D at Pantex, while the Storage and Disposition Draft PEIS evaluates the impacts from the storage and disposition of fissile material. The activities involved in the two programs are quite different and each requires vastly different inputs. The availability of inputs within the region is what determines the multiplier. For example, if the Pantex region contains industries that produce the inputs required for storage and disposition activities, but no industries that produce stockpile stewardship and management required inputs, the storage and disposition mission would generate a greater number of indirect jobs in the region. The Pantex Site-Wide Draft EIS impact analysis was conducted at a different level of detail, and the analysis employed a somewhat different methodology.*

08.26 The commentor requests an explanation in the Comment Response Document as to why DOE did not consult with the Amarillo Economic Development Commission and/or the city of Amarillo regarding the ratio of additional jobs in the region related to each job at Pantex and use the information that taxpayers had already paid for.

Response: *The number of indirect jobs generated by any of the alternatives was determined using RIMS II from the U.S. Bureau of Economic Analysis. This information is available for every economic region in the Nation, and therefore lends consistency to the analysis across sites.*

08.27 The commentor states that the resulting benefits to the regional economy, if the Stockpile Stewardship and Management PEIS alternatives were located at LLNL, would be less than 1 percent. Given the additional radioactive and hazardous materials and wastes to be shipped to and from LLNL and handled at the facility, which projects a certain radiological risk to the public (albeit small, as estimated by DOE), the commentor states that the PEIS should contain an explanation which details how regional/state costs resulting from the proposed action will be offset by benefits to the regional economy.

Response: *The benefits to the local economy in terms of increased regional income and employment and public finance impacts are discussed in the socioeconomic section 4.7.3.8. These benefits can be compared to the costs of the alternatives.*

08.28 The commentor feels the statement in the ORR section 4.2.2.8, that all jurisdictions have positive fund balances, may be misleading, since state law requires positive fund balances and jurisdictions deal with this by generating capital obligations, which are not included in fund balance calculations.

Response: *Not all states require positive fund balances. The statement that all jurisdictions have positive fund balances was used in all sections where applicable. Otherwise, local governments without positive fund balances were identified. The analysis of public finances includes past capital bonding obligations and the projected payout of these existing obligations. However, as stated in the methodology, there was no attempt to project capital bonding that may be made in the future. The purpose of analysis was to compare effects of the proposed alternatives to No Action. Both were projected using the same assumptions and methodology.*

09 INTERSITE TRANSPORTATION

09.01 One commentor asks DOE to comment on its methodology for choosing transportation routes, parking areas, and the overall transportation plan. Several commentors urge DOE to educate the public about the risks associated with hazardous shipments and to consult and coordinate with local communities and interested parties along proposed transportation routes regarding each community's transportation responsibilities and needs (such as additional roads); the routing of hazardous shipments and notification of interested parties; the effects of these additional shipments on traffic patterns; and the effect on property values. One commentor asks that DOE expand the ROI beyond 80 km (50 mi), as these people could be affected by transportation issues as well. Another commentor urges DOE to use every safeguard possible to ensure that the public is not at risk from transportation of nuclear materials.

Response: *The intersite transportation of Stockpile Stewardship and Management Program materials is discussed in section 4.10 of the PEIS. Hazardous materials transportation routes are predetermined by the Department of Transportation (DOT) in conjunction with the individual states. Parking areas are generally at DOE sites, military bases, and other predetermined locations. The transportation planning for plutonium and highly enriched uranium (HEU) shipments is carefully prepared by the DOE Transportation Safeguards Division to provide both safety and cargo security. The risk from normal (accident-free) transportation of radioactive materials by DOE is minimal. Even severe accidents are highly unlikely to cause injury or death from a radiological release because of the stringent Federal DOT/Nuclear Regulatory Commission (NRC) packaging design and transport safety requirements. In over 40 years of shipment activity, neither DOE nor its predecessor has ever experienced an injury or death from a radiological release during transportation. The volume of radioactive shipments associated with this PEIS would be small and would have negligible effects on the number of shipments in transportation corridors. The transportation risk analysis for the alternatives presented in section 4.10 of the PEIS included the entire route, which is beyond the 80-km (50-mi) ROI.*

09.02 Several commentors contend that DOE has not provided equal treatment to local communities and Native Americans in regard to transportation issues such as emergency response and preparedness, and urge DOE to inform all local communities of important transportation issues. Another commentor notes that there are no evacuation plans for the people of Santa Fe and Albuquerque in case of a transportation accident involving nuclear materials. The commentor feels that the PEIS does not adequately analyze the impacts of accidents at LANL on the Pueblo of San Ildefonso. One commentor states that DOE needs to provide better oversight and notification regarding shipments through the city of Pahrump and Nye County, specifically emergency preparedness, as Pahrump does not have the population to be trained. Another commentor states that the emergency response personnel along the transportation routes are not properly trained and equipped to handle an accident involving nuclear materials.

Response: *DOT is responsible for coordinating Federal training programs and for providing technical assistance to states, tribes, and local governments for emergency response training and planning. Evacuation plans and emergency response are local jurisdictional responsibilities. However, DOE voluntarily provides limited free training and technical assistance to local jurisdictions when there is a specific special interest (e.g., in areas most likely to be traversed by safe secure trailer shipments). Training is also provided separately to law enforcement and emergency services personnel to familiarize them with DOE's system for the safe transport of nuclear materials. Interested parties can request this free training through the DOE Community Advisory Board for each site. Regarding the impacts of accidents at LANL and their effects on the Pueblo of San Ildefonso, the PEIS describes postulated transportation accident impacts at LANL and their effects on surrounding communities in section 4.10.*

If NTS were selected as the weapons A/D site, it is unlikely that radioactive shipments would pass through Pahrump because of its out-of-the-way location. The Federal officers who escort plutonium and HEU shipments are trained to actuate the National Emergency Response System if they, themselves, cannot handle emergencies that may occur en route. First responders, such as state police or other emergency services personnel, also know how to actuate this system.

09.03 Commentors state that there is local concern about the transportation of nuclear weapons parts and materials on the highways of Nevada, Clark County in particular. The commentors do not want these types of materials to go through Clark County and urge implementation of a rail system through low-population areas. The rail system could serve a multitude of purposes (e.g., mining) in addition to DOE transportation, and would eliminate the danger of highway transportation. The commentors urge a study of this alternative and state that the rail system would provide equity to the people of Nevada.

Response: *The methodology for the safe secure transportation of nuclear materials (plutonium and HEU) is well established. Acceptable risk is not dependent upon the transportation mode (truck versus rail) but rather upon the rigorous packaging design requiring Federal safety certification. The packaging must retain its contents under the most severe accident conditions (i.e., fire, impact, puncture, or water immersion). Rail transportation for plutonium and HEU was abandoned in favor of the safe secure trailers several years ago and is not now considered a viable transportation alternative for these materials related to the Stockpile Stewardship and Management Program.*

09.04 The commentor believes that the PEIS should consider the risks of hijacking when looking at the intersite transport of nuclear materials.

Response: *All potential threats (including hijacking) to the safety and security of nuclear materials in transit are considered by DOE's Transportation Safeguards Division.*

09.05 The commentor questions the safety record of nuclear shipments in the Los Alamos area. Another commentor cites a safe secure trailer turnover in Colorado about 5 years ago as proof that there have been accidents with nuclear cargo.

Response: *Although DOE's transportation safeguards system has experienced traffic accidents involving vehicles carrying interstate shipments of radioactive materials, none, including the accident in Colorado referred to by the commentor, have resulted in a release of radioactive material. The safety of the system is attributable in part to the training and certification of vehicle operators and the design of the vehicles themselves. However, the safety of DOE shipments does not rely just on these measures. Primary containment of radioactive materials is provided by the containers within which the material is placed for shipment. These containers are designed to conform to the requirements for Type B packages as specified by the NRC in 10 CFR 71. The packages are fabricated and tested to ensure compliance with the standard under normal conditions of transport and hypothetical accident conditions including fire, impact, puncture, and water immersion.*

09.06 The commentor refers to the Summary section S.2.3, High Explosive Components, and states that safety issues related to shipment of shaped charges were not assessed in detail, either in terms of increased volume of shipments of shaped components over raw HE, or in terms of the technical vulnerabilities of the components. Another commentor questions whether hearings have been held to discuss main charge transportation through the appropriately affected states. Other commentors ask if an analysis has been made of the additional hazards of transportation of HE from either of the national laboratories to where it would be used, and what are the increased costs of intersite transportation of HE from either of the national laboratories to where it will be used. One commentor contends that the safety impact of transporting hundreds of HE hemispheres from the laboratories to Pantex (should HE manufacturing be moved) is not adequately evaluated. A commentor also asks if scrap explosives will be returned to the laboratories for disposal or if Pantex will be responsible for disposition. Another commentor states that separation of the explosive fabrication and A/D missions would require that explosives be transported over long distances in order to be mated with the physics packages. Therefore, the commentor believes that in the case of LLNL, the extensive fogs that create near zero visibility should be considered in any safety analysis.

Response: *Transferring the HE fabrication mission from Pantex to LANL and/or LLNL would require an estimated 150 rebuilds to be shipped per year from the HE fabrication site to the weapons A/D site. The accident risk from transporting this material would be no greater than the risk encountered by the public from industry's transport of similar explosives. Hearings are not required for shipments of HE made in compliance with Federal transportation regulations.*

Transferring all or part of the HE fabrication mission from Pantex to LANL and/or LLNL would require an estimated 12 round trips per year to transport HE materials including the return of scrap HE to the laboratories. The transportation of HE is described in section 4.10 and appendix G of the PEIS. There would be no impact from normal (accident-free) transportation. HE accident impacts from transportation are bounded by the risk analyzed and presented in the Facility Accident sections. Weapon component shapes are classified and are shipped using the appropriate safeguard measures in accordance with approved Federal regulations. HE main charges would not be shipped with detonators installed and would meet all DOT safety requirements.

09.07 The commentor asks how reliable the PEIS transportation computer modeling is.

Response: *The RADTRAN computer code has been used in risk analysis for over 10 years and is being constantly improved and updated. It is accepted by the International Atomic Energy Agency and its worldwide member countries as a reliable risk assessment tool. RADTRAN calculates the* *collective dose to the exposed population (workers and the public) from a postulated accident as well as the collective dose from accident-free transportation. It produces conservative estimates (those that tend to overstate impacts) of radiation dose rates in a way that can be supported by available data.*

09.08 The commentor recommends that DOE should (a) directly involve corridor states and tribes in preparing for large quantity radioactive material shipments associated with the Stockpile Stewardship and Management Program and other DOE programs; this would include developing rail and truck transport plans, preferred routes, and procedures prior to shipment (similar to the plans developed by DOE and the Western Governors' Association for transuranic [TRU] waste shipments to the Waste Isolation Pilot Plant [WIPP]); (b) use only shipping containers that can be manufactured to meet current Federal transport safety requirements; and (c) provide accurate projected shipment information (i.e., quantities, schedules), as well as necessary assistance and lead time for state emergency response preparation. The commentor feels the Draft PEIS should quantify the number, volume, transport mode, and characteristics of radioactive materials being transported under the proposed alternatives relative to baseline shipments.

Response: *Large numbers of radioactive shipments are not expected under the Stockpile Stewardship and Management Program. The actual route and quantity of material transported would be classified information for purposes of national security, including security of the shipments against attempts of diversion. However, DOE has, on occasion, been able to identify to specific concerned communities that shipments are not planned through their location. The analysis presented in section 4.10 of the PEIS shows the risk to the public to be low. Plutonium and HEU will be transported exclusively in a Government-owned and -operated transportation system that provides maximum safety and security. All shipments are escorted by Federal officers, and only packaging that meets stringent Federal standards for the shipment of these materials is used. The packaging and transportation vehicles have, for example, been extensively tested and certified to assure their safety against material dispersal to the environment in hypothetical accidents involving such events as crashes, fires, and water immersion. Packaging and transportation methods and impacts are discussed in section 4.10 of the PEIS and appendix G of the PEIS. Projected estimates of plutonium and HEU shipments for the proposed alternatives are considered in the transportation risk analysis. Information is provided by DOE to state law enforcement and emergency services personnel on a regular basis.*

09.09 The commentor asks if it would violate security to tell us how many shipments of radioactive material are going through Santa Fe at this time.

Response: *Appendix section G.3 summarizes the shipments of these radioactive materials between the sites. For the PEIS, shipment numbers, routing, and date and time of shipments of plutonium and HEU would be classified. See also the response to comment summary 09.08.*

09.10 Commentors express opposition to the transport of nuclear waste and other deadly toxins. One commentor states that the transportation risk numbers are terrifying.

Response: *Transport of nuclear materials has been ongoing safely for more than 40 years. The analysis in this PEIS for transporting nuclear materials shows that risks to the public are low. The plutonium and HEU would be transported exclusively in a Government-owned and -operated transportation system that provides maximum safety and security. These hazardous materials shipments would be escorted by Federal officers who can handle transport emergencies or actuate the National Emergency Response System for assistance.*

09.11 Commentors feel that transporting nuclear waste through New Mexico's cities and countryside is dangerous, irresponsible, and the chance for accident is too big to be taken. One commentor states that they do not want high-level waste (HLW) trucked to LANL or on New Mexico's highways. The commentor states that Federal Emergency Management Agency does not even have a protocol for dealing with a collision spill.

Response: *The Stockpile Stewardship and Management Program does not generate HLW; however, under the preferred alternative, there would be TRU waste shipments from LANL as discussed in section 4.6.3.10. The transportation of hazardous materials, including radioactive waste, is essential for national commerce. The methodology for the safe transport of these materials is well established. The packaging is federally certified for safety and must retain its contents under the most severe accident conditions (e.g., fire, impact, puncture, or water immersion). The transport of all hazardous materials is regulated by Federal hazardous materials laws that are applicable to DOE and other hazardous material shippers, and cannot be preempted by individual states.*

09.12 One commentor wants to know the extent of transportation (number of trucks, routes, safety precautions, accident mitigation, and such) of all nuclear materials along New Mexico's roads and the extent to which this will increase once the pit fabrication mission is implemented at LANL. Another commentor is concerned about the number of pits that would be transferred between Santa Fe and Pantex, and asks if there would be trucks going through Santa Fe with Hiroshima-size nuclear potentials on them. Finally, one commentor asks if there are trucks right now on the highway that are transporting waste between Pantex and LANL.

Response: *Pit fabrication is not a new function at LANL; they already have a research and development (R&D) pit fabrication mission. As discussed in section 4.10, pit transportation would include about four round trips per year of safe secure trailer shipments. For the transportation of pits under this PEIS, the shipment numbers, routing, and date and time of shipments would be classified. These materials, however, would be transported exclusively by the Government-owned and -operated transportation system that provides maximum safety and security. A pit would be shipped as a separate weapon component (without HE) and, as such, would be unable to explode as a nuclear weapon. The potential risk from transporting pits would be radiation exposure as a result of a traffic accident. Nuclear materials in shipment are contained in packages that have been designed and certified to meet NRC standards to prevent a radioactive release during an accident. There are currently no trucks on the highway transporting waste between Pantex and LANL.*

09.13 The commentor expresses concern about the transportation and safety of low-level radioactive waste on commercial carriers.

Response: *DOE low-level waste (LLW), which consists primarily of materials such as radioactively contaminated paper, protective clothing, or cleaning materials that result from industrial processes, has been transported safely and securely by commercial carriers for more than 40 years. DOT requires high-integrity packaging for such materials to the extent that potential exposure of radiation at the outside of the package is insignificant (typically less than 1 millirem (mrem) per hour per package at 1 m from the package). DOE selects its commercial motor freight carriers of radioactive material very carefully and subjects each carrier to routine evaluation of its operating practices to ensure that they meet DOE and DOT standards.*

10 Waste Management

10.01 One commentor states that DOE plans to continue the production of nuclear waste but does not talk about what they plan to do with the waste. The proposed expansion of Area G at LANL is unacceptable to the commentor. Another commentor asks what kind of waste will be put into the LANL expanded Area G and what safety measures will be used at the facility. Another commentor believes that the expansion of Area G would not have any adverse affects on the area. One commentor suggests that waste should be stored aboveground.

Response: *The PEIS describes impacts and management of wastes in the waste impacts analysis in chapter 4. Waste management activities that would support the Stockpile Stewardship and Management Program are assumed to be per current site practice and are contingent upon decisions to be made through the* Draft Waste Management Programmatic Environmental Impact Statement for Managing Treatment, Storage, and Disposal of Radioactive and Hazardous Waste *(Waste Management Draft PEIS) (DOE/EIS-0200-D, August 1995) and the LANL Site-Wide EIS. Thus, as currently envisioned, LLW would go to Area G for disposal. Appendix section A.3.3.1 provides a description of the kinds of LLW that would require disposal. The decision as to whether or not to expand the low-level disposal facility at Area G is not within the scope of this PEIS. Decisions concerning the Area G expansion will be made as a result of the LANL Site-Wide EIS. The proposed expansion of Area G is driven by existing and continuing operations.*

The potential human health risks, environmental impacts, and costs associated with waste management alternatives could be reduced or mitigated through the implementation of programmatic and site-specific mitigation measures. Chapter 12 of the Waste Management Draft PEIS provides a description of these programmatic and site-specific mitigation measures. Appropriate control procedures, engineered safety systems, and worker training programs are established and implemented to ensure compliance with all applicable ES&H regulations before beginning any radioactive operation of any facility. In addition to DOE assessments and independent internal appraisals, there are external appraisals such as those conducted by the New Mexico Environment Department to ensure the effectiveness of the ES&H program.

10.02 In section 4.2.3.10, a commentor inquires how DOE projects zero waste associated with the move of HEU to another location unless containers can be removed and shipped in existing trucks with no repackaging.

Response: *The paragraph referred to by the commentor has been rewritten in the Final PEIS as follows: "The waste volumes given in table 4.2.3.10–2 include the storage of the strategic reserve of HEU. The volume of waste associated with the storage of the strategic reserve HEU is very small (less than 0.01 percent) in relation to the total amount of wastes generated from the secondary and case fabrication mission and is an even smaller percentage of the total ORR waste generation volume. Therefore, the continued storage of the strategic reserve HEU would have a negligible impact on waste management at ORR. The impact of continuing to store the strategic reserve HEU as part of the total inventory of nonsurplus HEU at ORR is also addressed in the Storage and Disposition Draft PEIS. In addition, the Storage and Disposition Draft PEIS also analyzes moving the HEU to another DOE site location. Since the HEU is already packaged, it is expected that any waste generated from repackaging, health physics, and analytical chemistry activities would be very small in comparison to the total wastes generated at ORR. Therefore, the moving of HEU would have a minimal impact on ORR waste management."*

10.03 Commentors note that the Waste Management Draft PEIS summary shows a large amount of waste generation related to the Stockpile Stewardship and Management Program. The commentors also note that for LLW, mixed LLW, and TRU wastes, the volumes differ between the Stockpile Stewardship and Management Draft PEIS and Waste Management Draft PEIS. The commentors also believe DOE has not changed directions from the past practices of producing massive quantities of nuclear waste and express concern about the nuclear waste that would be generated. One commentor questions the statements in the cumulative impact section "that wastes would be minor."

Response: *The waste volumes presented in the Waste Management Draft PEIS are for all DOE facilities not just the Stockpile Stewardship and Management Program. The waste volumes from the Stockpile Stewardship and Management Program have been provided to Environmental Management to include in the Waste Management Final PEIS analysis. The statements in section 4.13, Cumulative Impacts, regarding whether wastes generated by stockpile stewardship and management alternatives would be minor compared to other programs have been deleted. DOE has a waste reduction policy that requires DOE sites to employ waste minimization and pollution prevention strategies. To implement these requirements, DOE issued the* 1994 Waste Minimization/Pollution Prevention Crosscut Plan *that establishes a DOE-wide goal to meet pollution prevention targets (Executive Order 12856* Federal Compliance with Right-to-Know Laws and Pollution Prevention Requirements*)—a 50-percent reduction in total releases and offsite shipment of toxic chemicals and pollutants by December 31, 1999. The 1994 Crosscut Plan calls for each DOE site to establish site-specific reduction goals for hazardous, radioactive, radioactive mixed, and sanitary wastes and pollutants.*

10.04 Commentors question the sites' estimates of waste streams. A commentor states that LANL and LLNL claim moving the secondary and case mission to their site is going to generate 102,000 m^3 (133,416 cubic yards [yd^3]) of sanitary waste and that they will be able to handle these huge volumes of waste with no changes whatsoever. One commentor does not believe that other sites have adequate infrastructure to handle waste without having to build new facilities. The commentor states that ORR has available infrastructure in the private sector that are outstanding and a model for the world.

Response: *The site estimates of waste volumes were coordinated among the sites through a coordination data committee chaired by a DOE official and represent the best estimates available. All of the DOE sites analyzed in the PEIS have adequate capability to handle the onsite waste volumes generated as a result of the Stockpile Stewardship and Management Program.*

10.05 The commentor wants to know what portion of the DOE budget is going towards site cleanup and solution of the nuclear waste problem. The commentor believes that new solutions need to be developed to handle the terrible problem of nuclear waste because the current practices are not working.

Response: *The entire DOE budget for 1996 is approximately $14.2 billion of which $6 billion is for environmental management. The DOE Office of the Assistant Secretary for Environmental Management through its Office of Research and Development (EM-53) is continually investigating and developing new technologies to treat radioactive waste.*

10.06 Commentors express negative feelings about LANL's record involving radioactive waste and emissions, and state that New Mexico is contaminated in many places and that DOE should not dump any more nuclear waste in the state.

Response: *DOE is committed to operating its facilities in compliance with all applicable Federal and state regulations, and DOE orders. To fulfill its mission under the* Atomic Energy Act *of 1954, as amended, the generation of radioactive, mixed, hazardous, and nonhazardous wastes is unavoidable. Per DOE policy, the facilities that would support the Stockpile Stewardship and Management Program incorporate waste minimization and pollution prevention. Appropriate control procedures, engineered safety systems, and worker training programs are established and implemented to ensure compliance with all applicable ES&H regulations before beginning any radioactive operation of any facility. In addition to DOE assessments and independent internal appraisals, there are external appraisals such as those conducted by the New Mexico Environment Department to ensure the effectiveness of the ES&H program. Radioactive wastes generated by the Stockpile Stewardship and Management Program would be managed in accordance with decisions made as a result of the Waste Management PEIS and any respective site-specific NEPA documentation. The Waste Management PEIS considers alternatives that include local, regional, and/or consolidated waste management facilities. Regardless of the decisions from the Waste Management PEIS or any respective site-specific NEPA documentation, wastes generated from the Program will be managed in accordance with all applicable Federal and state regulations, and DOE orders.*

10.07 A commentor believes that nuclear waste should be centralized into a repository to provide better safety monitoring for the material. The commentor does not believe that there would be significant risk in transporting nuclear materials to a repository. Another commentor believes that consolidating waste at one site would lead to increased risks due to the risks involved with transportation of the nuclear materials. Another commentor thinks there should be a concerted effort to open Yucca Mountain.

Response: *Decisions regarding the management (treatment, storage, and disposal) of radioactive and hazardous wastes from a DOE-wide perspective are not within the scope of this PEIS. Waste management activities that would support the Stockpile Stewardship and Management Program are assumed to be per current site practice and are contingent upon decisions to be made through the Waste Management PEIS and any respective site-specific NEPA documentation. The Waste Management PEIS will assist DOE in making decisions regarding the sites at which it should locate waste management facilities to include treatment and disposal facilities for mixed LLW, treatment and disposal facilities for LLW, treatment and storage facilities for TRU waste, storage facilities for treated HLW canisters until a geologic repository is available, and treatment facilities for hazardous nonwastewater. The Waste Management PEIS considers four broad categories of alternatives for each waste type: No Action, decentralized, regionalized, and centralized.*

10.08 The commentor wonders if the PEIS includes an analysis of the overall waste management plans at LLNL for the next 20 years.

Response: *Two site-specific waste management plan documents were used in the stockpile stewardship and management analysis at LLNL:* Waste Management Plan FY 1995 Update in Accordance with DOE Order 5820.2A, *and the* Federal Facility Compliance Act Proposed Site Treatment Plan for LLNL. *The full document reference citations are provided in the chapter 6 reference list see LLNL 1995d and LLNL 1995h). Radioactive waste generated by the Stockpile Stewardship and Management Program would be managed in accordance with decisions made as a result of the Waste Management PEIS and any respective site-specific NEPA documentation. Regardless of the decisions from the Waste Management PEIS or any respective site-specific NEPA documentation, wastes generated from the Stockpile Stewardship and Management Program will be managed in accordance with all applicable Federal and state regulations, and DOE orders.*

10.09 The commentor notes that in addition to waste created from the Stockpile Stewardship and Management Program, there is a proposal to construct an incinerator to handle mixed nuclear waste at Site 300.

Response: *Waste generated at Site 300 includes explosive waste from testing activities and waste from various other operations, and environmental restoration generated waste. The LLNL Site Treatment Plan once approved will include a description of the technology and capacity needs to treat each mixed waste stream, along with a preferred option. The LLNL Site Treatment Plan in its present form does not include a proposal for an incinerator at Site 300.*

10.10 The commentor's primary concern is that an increased stockpile and resulting waste disposal problems at LANL are a direct threat to the Penasco Valley watershed and communities.

Response: *The nuclear stockpile is not increasing. The nuclear stockpile level is set by a Presidential Decision Directive (PDD) and has been decreasing due to negotiated treaties and unilateral reductions. Due to waste minimization and pollution prevention practices, the volume of wastes generated from weapons program activities are decreasing. Wastes generated by the Stockpile Stewardship and Management Program would be managed in accordance with all applicable Federal and state regulations, and DOE orders. Waste management activities that would support the Stockpile Stewardship and Management Program at LANL are assumed to be per current site practice and are contingent upon decisions to be made through the Waste Management PEIS and the LANL Site-Wide EIS.*

10.11 The commentor believes that staggering rates of nuclear waste will be generated by the proposed stockpile stewardship and management activities thereby creating a need for more waste management and future cleanup costs. The commentor questions why we should put more of our environment at risk and cautions DOE to think carefully about producing new wastes given its inability to develop solutions for existing nuclear waste.

Response: *DOE is required by the* Atomic Energy Act *of 1954, as amended, to support a nuclear weapons stockpile as defined in a PDD signed by the President. All of the existing basic capabilities continue to be needed even though there have been changes in national security policy since the end of the Cold War. To fulfill its mission under the* Atomic Energy Act *of 1954, as amended, generation of radioactive, mixed, hazardous, and nonhazardous wastes are unavoidable. All of the alternative sites have adequate capability to manage the wastes generated from the Stockpile Stewardship and Management Program in accordance with all applicable Federal and state regulations, and DOE orders. Under the preferred alternative of downsizing and consolidating A/D, nonnuclear fabrication, and secondary and case fabrication, the waste generation would actually decrease at Pantex, KCP, and ORR.*

10.12 The commentor states that the PEIS activities will have a significant impact on the numbers and quantities of nuclear and hazardous materials and wastes moved in and out of the LLNL site and to and from NTS. The large number of nuclear waste shipments anticipated in the Waste Management Draft PEIS and the Stockpile Stewardship and Management Draft PEIS, combined with waste shipments from other DOE proposed activities at LLNL, including environmental restoration activities, would be unprecedented. Commentor states that in the Draft PEIS the No Action alternative estimates of cumulative waste impacts should use current waste generation annual rates at LLNL, not waste generation rates from a nonexistent waste treatment and disposal facility at LLNL. The commentor adds that the Draft PEIS should state what options are available for LLW and mixed LLW disposal in the event that NTS and the proposed LLW/mixed LLW treatment and disposal facility at LLNL are not available.

Response: *The amount of hazardous waste requiring shipment to RCRA-permitted treatment and disposal facilities, and LLW requiring shipment to NTS is described in section 4.7.3.10. These waste shipments must meet the packaging (containment) requirements prescribed by DOT under 49 CFR and other applicable Federal regulations. The transportation analysis in section 4.10 of the PEIS and in the Waste Management Draft PEIS illustrates that the risks associated with the movement of these wastes are minimal. The use of current generation rates (1994) for No Action would not provide an accurate representation of the LLNL site in 2005. However, the 2005 projection was based on 1994 generation rates with the appropriate adjustments made for those changing operational requirements where the volume of wastes generated is identifiable. The projection does not include wastes from future, as yet uncharacterized, environmental restoration activities. For the purposes of analysis, waste management activities that would support the Stockpile Stewardship and Management Program are assumed to be per current site practice. If the LLNL Site Treatment Plan, when approved, or the ROD from the Waste Management PEIS change the site practice, the waste management activities that would support the Stockpile Stewardship and Management Program would change accordingly. In any case, wastes generated from the Stockpile Stewardship and Management Program will be managed in accordance with all applicable Federal and state regulations, and DOE orders.*

10.13 The commentor asks what DOE and "we" will do with all the waste that will be generated for at least the next 20 years. Commentor states there are no licensed facilities to accept the wastes that are piled up on facilities throughout the DOE Complex at this time and asks, "Why generate more than needs to be generated?" The commentor adds that we are now faced with storage and disposition of surplus fissile materials and that every option considered has tremendous waste streams attached to it. The commentor asks where this waste will go. It seems quite evident that the site that creates the waste, keeps the waste. Commentors ask if that will saddle communities across this country with the economic and environmental problems of hosting waste treatment, storage, and processing facilities.

Response: *It is incorrect to state that there are no licensed facilities to dispose of waste generated at DOE facilities. At most DOE sites, hazardous waste is shipped to offsite commercial RCRA-permitted treatment and disposal facilities. LLW is shipped to one of the DOE low-level disposal facilities in accordance with the waste acceptance criteria of that facility. Mixed waste would be treated and disposed of in accordance with the site treatment plans that have been negotiated between the DOE sites and the appropriate state regulatory authority. TRU waste is destined for a geologic repository. The Stockpile Stewardship and Management Program would not generate any HLW. To fulfill its mission under the* Atomic Energy Act *of 1954, as amended, the generation of radioactive, mixed, hazardous, and nonhazardous wastes is unavoidable. Per DOE policy, the facilities that support the Stockpile Stewardship and Management Program incorporate waste minimization and pollution prevention. The storage and disposition of surplus fissile materials are not within the scope of the Stockpile Stewardship and Management PEIS; however, it is addressed in the Storage and Disposition PEIS, section 4.7, Potential Cumulative Impacts of the Storage and Disposition Program.*

10.14 The commentor asks how LANL treats current nitrate liquid waste and if the site is planning any new treatment plants for the future nitrate liquid waste that would be generated if the uranium processes are moved to LANL.

Response: *Nitrate liquid waste from uranium processes is currently treated at TA-50. No new treatment plants would be required to treat the nitrate liquid waste from the secondary and case fabrication mission if it were moved to LANL.*

10.15 The commentor states that both LLNL and SRS are still practicing shallow land burial of radioactive wastes and this practice must be stopped, not continued and increased as contemplated in the Draft PEIS.

Response: *Only solid LLW is suitable for shallow land burial. LLNL does not dispose of LLW onsite as it ships its LLW to NTS for disposal. Shallow land burial for SRS was analyzed in the* Savannah River Site Waste Management Final Environmental Impact Statement *(DOE/EIS-0217, July 1995). Radiological performance assessments are conducted to ensure that disposal facilities meet the performance objectives of DOE Order 5820.2A,* Radioactive Waste Management. *At SRS, only stabilized LLW forms and selected LLW (suspect soils and naval hardware) are planned for shallow land burial.*

10.16 The commentor states that WIPP must not be opened without meeting environmental standards. Another commentor asserts that the reason DOE wants to move all the waste to WIPP is so that they can continue plutonium production.

Response: *There are a number of requirements that must be met before the Secretary of Energy will approve the opening of WIPP. The State of New Mexico must issue the RCRA Part B Permit. This permit application has been submitted to the state. EPA must (1) grant the no-migration variance petition and (2) certify compliance with requirements that WIPP is safe to operate. The no-migration variance petition and the application for certification have been submitted to EPA. The NRC has already approved the TRUPACT II container for shipment of contact-handled TRU waste, and has yet to approve the application for certification of the container for remote-handled waste. A supplemental EIS covering the phased development of WIPP is currently being prepared.*

10.17 The commentor cites section 3.5.2, Uranium Fabrication and Processing, and asks is it not true that recycled materials are defined as a "solid waste." Commentor asks what DOE's legal interpretation of their statement is, what the definition of "recycled" is and if EPA and the Department of Justice concur. Commentor asks, "If I machined lead, are the residuals a hazardous waste?" The commentor also asks what is meant by the term "residue production," and if it is DOE's policy to prevent and minimize residue, not produce it.

Response: *The paragraph referred to by the commentor is addressing the machining of HEU. "Source, special nuclear or by-product material as defined by the* Atomic Energy Act *of 1954, as amended, 42 U.S.C. 2011 et. seq." is not solid waste as defined by 40 CFR 261.4. Residues are materials that contain sufficient quantities of recoverable fissile material. It is part of DOE's waste minimization policy to minimize the production of residues. The processes that would be used in the secondary and case fabrication facility would not generate any residue that would require long-term storage. No residues would be generated in which the HEU could not be recovered. Materials contaminated with HEU would only be declared waste if the HEU can no longer be recovered and the materials meets one of the radioactive waste definitions as outlined in chapter 9, Glossary. Guidance provided in 40 CFR 261.2 would determine whether or not the lead residuals would be considered a hazardous waste.*

10.18 The commentor refers to section 3.7.1, Stockpile Management, and asks if it is true that both NTS and Pantex have adequate waste management facilities to treat, store, and/or dispose. Commentor thought NTS mixed waste disposal was limited to environmental remediation activities from certain projects. The commentor asks if there is mixed waste disposal for operational waste streams. Commentor also asks if it is not true that at Pantex they are planning to treat mixed waste but currently have limited disposal. Commentor asks how many offsite disposal shipments they have done since 1984 and since 1987.

Response: *The existing waste management infrastructure at NTS and Pantex is adequate to manage the anticipated waste streams from the Stockpile Stewardship and Management Program. Waste management activities that would support the Stockpile Stewardship and Management Program were assumed to be per current site practice which includes the use of offsite RCRA-permitted treatment and disposal facilities such as Envirocare, Inc., in Utah and offsite disposal such as LLW from Pantex being shipped to NTS. No new waste management facilities will be constructed for the expressed purpose of supporting the Stockpile Stewardship and Management Program. Any mixed waste generated in the State of Nevada that meets the Land Disposal Restrictions of RCRA can be disposed of at NTS in the Area 5, Mixed Waste Disposal Unit (Pit 3). Mixed waste generated at NTS or Pantex would be managed in accordance with the site treatment that was developed to comply with the* Federal Facility Compliance Act *of 1992 and in accordance with any decisions resulting from the respective site-wide EISs for continued operations.*

10.19 The commentor references section 4.1.10 and asks if it is prudent to include waste minimization in the analysis. Commentor says the impact assessment is reduced and does not bound the impacts.

Response: *The waste minimization and pollution prevention strategies employed in the waste estimates are achievable with current technology. In addition to following waste-disposal policies, DOE is committed to and expects to further reduce the waste generated from the Stockpile Stewardship and Management Program.*

10.20 One commentor cites appendix figure A.3.1–2, and asks if an unusable part is a waste or inherently waste-like. The commentor asks for a description of sanitize and demilitarize, if it is a treatment process, and what are the processes and their purpose. Another commentor cites appendix figure A.3.1.1–5 and asks if classified waste (parts) are solid waste as the figure shows classified waste being sent to sanitization, since it is the commentor's understanding that classified material is sent to sanitization before becoming waste. The commentor also asks where the exit arrows are for sanitization and demilitarization, and if sanitizing is a RCRA treatment. A commentor also cites appendix table A.3.5.1–2 and asks where the sanitization and demilitarization facilities are; if the Burning Ground is limited to explosives disposal; and if it completes sanitization and demilitarization through open burning. Another commentor also cites appendix figures A.3.3–1 and A.3.3.1–3 and states that according to these figures, explosive components are solid waste. The commentor asks where treatment and disposal fit into demilitarization, sanitization, and disposition.

Response: *Weapons components or parts of a component that are not being reused cannot be declared waste until they have been demilitarized and sanitized. As noted in chapter 9, Glossary, sanitization is the irreversible modification or destruction of a component or part of a component to the extent required to prevent revealing classified or otherwise controlled information; whereas, demilitarization is the irreversible modification or destruction of a component or part of a component to the extent required to prevent use in its original weapon purpose. These are not considered waste treatment processes but procedures in order for DOE to meet its statutory requirements of the* Atomic Energy Act *of 1954, as amended. For example, sanitization and demilitarization of classified HE components is accomplished at the Burning Ground. The Burning Ground is used for the burning of HE components and disposal of HE waste, HE-contaminated waste, and various HE-contaminated liquids and solvents. Disposal of solvents at the site was discontinued in the early 1980s. Once materials are declared waste, they would be managed in accordance with all applicable Federal and state regulations, and DOE orders. Appendix figure A.3.1.1–5 has been redone in the Final PEIS to more clearly show how sanitization and demilitarization fit in process flow at Pantex.*

10.21 Commentors refer to section 3.5.1, Plutonium Fabrication and Processing, and ask, based on the discussion of reduced scrap, waste, and residue, if plutonium and HEU pits, scrap, materials, and residue placed into storage are considered a solid waste. One commentor cites appendix section A.3.2.1 and asks, what the statement, "Classified wastes enter a declassification step resulting in classified and unclassified waste" means. The commentor asks if DOE is stating that some materials will be classified no matter what physical or administrative actions occur.

Response: *The purpose of the declassification step for waste in the secondary and case fabrication facility is to process material or weapon components to the point where they no longer reveal classified information. The vast majority of this material is successfully declassified or processed to enable reuse of the classified constituents. A very small amount of material cannot readily be declassified. Of this material, a small amount is disposed of onsite in a permitted land-fill as nonhazardous classified waste. Additionally, a very small amount of hazardous or mixed classified waste is stored until treatment/processing capabilities are established to eliminate the hazardous or mixed waste component of the classified material. This then enables either reuse of the classified material or disposal onsite as a nonhazardous classified waste. No classified waste is disposed of offsite.*

10.22 The commentor references appendix section A.3.5.2, which states HE-contaminated process water is not a waste, but HE-contaminated process water is collected in tanks and then treated with activated carbon filters. Commentor asks if this means "filtered." The commentor suggests a change from waste minimization and recycle to pollution prevention, and adds, technically speaking, one cannot minimize or recycle a material that is not a waste. The commentor also cites the waste management text in appendix section A.3.5.3 and has the same comments. Another commentor cites the waste management text in appendix section A.3.5.2, and asks why recycling scrap HE is not a waste (both recycle and scrap are clearly associated with solid waste definition in 40 CFR 261); and under what solid waste exclusion in 40 CFR 261 does DOE claim.

Response: *Scrap HE that is recycled is not considered a solid waste as it is returned to the HE fabrication process to be used as a substitute for raw material feedstock (40 CFR 261.2[e]). Scrap HE that is excess to needs is thermally treated and disposed of in accordance with applicable Federal and state regulations. HE-contaminated process water is filtered before being collected in holding tanks. From the holding tanks, it is returned to be used as cooling water for the HE fabrication process. At LANL, recycled process water that can no longer be used is sent to the LANL HE waste- water treatment facility where it is treated using activated carbon filtration. In the Final PEIS the paragraph has been rewritten for clarification.*

10.23 The commentor refers to section 4.2.2, Oak Ridge Reservation, and states that the PEIS should provide an estimate of the volume, in km^3, of TRU waste, affected rock, soil, and groundwater at NTS as a result of underground tests. The text should also indicate whether this material comes under the *Federal Facilities Compliance Act* and if it does, if it will require treatment.

Response: *Estimates of the waste volumes that would be generated from environmental restoration activities in the Central Nevada Test Area of NTS have not been determined. The waste volumes generated during environmental restoration activities would be greatly dependent on the cleanup criteria which have not been established. Any wastes generated as part of these activities would be managed in accordance with all applicable Federal and state regulations, and DOE orders to include the* Federal Facility Compliance Act *and the NTS Site Treatment Plan which was developed to comply with the* Federal Facility Compliance Act.

10.24 Commentors ask that waste be stored where it happens to be, not shipped from all around the country to further endanger American citizens. One commentor adds that waste should be stored aboveground.

Response: *Waste shipments must meet the packaging (containment) requirements prescribed by DOT under 49 CFR and other applicable Federal regulations. The transportation analysis in section 4.10 of the PEIS and in the Waste Management Draft PEIS clearly illustrates that the risks associated with the movement of these wastes is minimal. It is impractical and in some cases not permissible under the law (e.g., RCRA) to store wastes aboveground indefinitely.*

10.25 The commentor feels that DOE should focus massive attention on the subject of transmutation; it is critical that we learn how to neutralize nuclear waste onsite.

Response: *Environmental Management, through its Office of Research and Development (EM-53), is continually investigating and developing new technologies to treat radioactive waste. Radioactive wastes generated from the Stockpile Stewardship and Management Program will be treated in existing onsite radioactive waste treatment facilities.*

10.26 The commentor urges DOE to figure out a way to dispose of plutonium onsite.

Response: *The disposition of surplus weapons-usable fissile materials such as plutonium is not within the scope of the PEIS. The* Storage and Disposition Draft PEIS *analyzes the disposition of surplus weapons-usable fissile materials. Due to environmental considerations, it is not always possible to dispose of waste contaminated with plutonium onsite. Radioactive waste generated from the Stockpile Stewardship and Management Program will be categorized according to the definitions in chapter 9, Glossary, and will be managed in accordance with all applicable Federal and state regulations, and DOE Order 5820.2A,* Radioactive Waste Management.

10.27 The commentor feels that efforts should be concentrated towards D&D.

Response: *None of the manufacturing and surveillance capabilities of the current industrial base can be eliminated on the basis of the post-Cold War changes in national security policies. The industrial base possesses core competencies, such as manufacturing product, process, and quality control know-how. However, with a smaller stockpile and no new-design weapons production, industrial capacity can be reduced to meet anticipated manufacturing requirements for stockpile repair and replacement activities. This reduction in industrial capacity would lead to deactivation of some facilities. After proper characterization these facilities would be transferred to Environmental Management for eventual D&D. The waste volumes associated with D&D have been estimated and presented in the waste management impacts analysis in chapter 4.*

10.28 The commentor cites section 3.5.1, Plutonium Fabrication and Processing, and asks when plutonium and HEU meet the definition of a solid waste. Commentor asks if stored plutonium and HEU in any form is a solid waste as defined under RCRA. Commentor asks DOE to provide independent confirmation of this issue by EPA and the Department of Justice.

Response: *Weapons-usable fissile materials such as plutonium and HEU are not considered waste. The President has declared that some quantities of fissile materials are declared surplus to national defense and defense-related program needs. DOE is developing an integrated strategy for storage and disposition of weapons-usable fissile materials. The Storage and Disposition Draft PEIS is focused on the storage of all plutonium and nonsurplus HEU, and the disposition of surplus plutonium. The* Disposition of Surplus Highly Enriched Uranium Final Environmental

Impact Statement *(DOE/EIS-0240-F, June 1996) addresses the disposition of surplus HEU. Materials contaminated with plutonium and HEU would only be declared waste if the plutonium and HEU are at levels defined as discard limits and the materials meets one of the radioactive waste definitions as outlined in chapter 9, Glossary. "Source, special nuclear, or by-product material as defined by the* Atomic Energy Act *of 1954, as amended, 42 U.S.C. 2011 et. seq." is not solid waste as defined by 40 CFR 261.4. Under 10 CFR 962, all DOE radioactive waste contaminated with hazardous constituents as defined by RCRA is subject to regulation under both RCRA and the* Atomic Energy Act *of 1954, as amended.*

10.29 The commentor states that LANL has not shown good faith in developing and maintaining safety standards while involved in nuclear weapons research and application. The commentor is concerned about exposure to radioactive waste that is produced in the name of "safety and reliability" of nuclear stockpiles.

Response: *To fulfill its mission under the* Atomic Energy Act *of 1954, as amended, DOE will unavoidably generate radioactive, mixed, hazardous, and nonhazardous wastes. Appropriate control procedures, engineered safety systems, and worker training programs are established and implemented to ensure compliance with all applicable ES&H regulations before beginning any radioactive operation of any facility. In addition to DOE assessments and independent internal appraisals, there are external appraisals such as those conducted by the New Mexico Environment Department to ensure the effectiveness of the ES&H program.*

10.30 Commentors feel that it is immoral and unfair to consider New Mexico as an empty state into which garbage can be piled with no opposition. One commentor adds that nuclear waste should be treated properly onsite and if it cannot then it should not be produced. Another commentor is opposed to increasing activities at LANL that would increase production of radioactive waste because by implementing this project, DOE is creating a nuclear waste dump upwind of most of northern New Mexico.

Response: *LANL was identified as the preferred alternative because it ranked highest in the selection criteria: basic production capability to support scheduled work, capability of production infrastructure to support scheduled work, and minimized cost. LANL has adequate capacity through its TA-50 and TA-55 facilities to treat the radioactive waste that would be generated in support of the Stockpile Stewardship and Management Program. These facilities would treat and package all radioactive waste into forms that would enable long-term storage and/or disposal in accordance with the* Atomic Energy Act *of 1954, as amended, other applicable Federal and state regulations, and DOE orders.*

10.31 The commentor would like the PEIS to discuss the capability of existing processing facilities and disposal sites to handle the projected quantities of radioactive and mixed waste generated by the Stockpile Stewardship and Management Program.

Response: *Under each alternative description in chapter 3, it is explicitly stated that the existing site "waste management infrastructure can be applied to manage and treat all anticipated waste streams from this alternative." Appendix H lists the existing waste treatment capability by waste category for each of the alternative sites. All hazardous, radioactive, and mixed waste generated would be managed in accordance with all applicable Federal and state waste regulations.*

10.32 The commentor wants to know where the nuclear waste from the pit fabrication mission at LANL will be stored, how much it will cost, and where will the money come from.

Response: *There are no plans to store radioactive waste from the pit fabrication mission at LANL indefinitely. LLW would be treated and then disposed of in Area G per current site practice. Radioactive mixed waste would be treated and disposed of in accordance with the LANL Site Treatment Plan which was negotiated between LANL and the State of New Mexico. TRU waste would be stored temporarily at Area G until the Federal geologic repository is approved by EPA and NRC and a supplemental EIS is completed. Costs associated with the Stockpile Stewardship and Management Program can be found in the* Analysis of Stockpile Management Alternatives *report produced by the DOE Albuquerque Operations Office. Congress funds the Stockpile Stewardship and Management Program through the* Defense Appropriations Bill.

10.33 The commentor questions the readiness of the environmental treatment systems placed in cold standby at ORR, should future increases in production occur.

Response: *The preferred alternative does not put any of the waste management facilities into cold standby at ORR. The buildings designated to be placed in cold standby as a result of downsizing the secondary and case fabrication mission are buildings that have a production mission only.*

10.34 The commentor states that the Radioactive Liquid Waste Treatment Facility (TA-50) at LANL does not have a treatment permit issued by the State of New Mexico as stated in appendix section A.3.3.1.

Response: *The commentor is correct. The text has been changed in the Final PEIS to read, "the waste would be processed, with radioactive constituents removed, in accordance with the NPDES permit."*

11 RADIATION AND HAZARDOUS CHEMICALS

11.01 The commentor asks DOE to address a worst-case accident analysis for a "parking lot" nuclear weapons accident for Pantex and NTS, and asks how on a safety-to-the public basis DOE can justify operations at Pantex instead of at NTS. The commentor states that DOE is taking special mitigating actions at Pantex to keep site boundary dose under 100 rem per person in the event of an accident at Pantex. The same accident at the NTS Device Assembly Facility must be less than 1 percent of this, according to the commentor, since no one lives at the NTS site boundary. The commentor asks what the dose to the public is if there is an aircraft accident at Pantex, since that site is in the flight path of Amarillo airport and has a much greater risk of experiencing an accident than does NTS, which is in completely controlled airspace. Commentor asks how can DOE justify exposing the public to this additional risk in order to save money.

Response: *The accident analyses assume a hypothetical member of the public (the maximum exposed individual) resides at the nearest site boundary. Based on the accident analysis for NTS and Pantex, the maximum exposed individual at Pantex would have a fatality risk of $5.6x10^{-8}$, while at NTS that risk would be $8.1x10^{-9}$. While it is true there is a lower risk at NTS than at Pantex, the risk at both sites is low. The potential for severe accidents including those involving an aircraft at Pantex, is provided in sections 4.5.3.9. Additional details on potential accidents are also given in appendix F and in a topical report:* Supporting Documentation for the Accident Impacts Presented in the Stockpile Stewardship and Management Programmatic Environmental Impact Statement, *(HNUS Report No. ARP-96-042) which has been placed in the DOE Public Reading Rooms near each site. The final selection of a site for the A/D mission will be announced in the ROD, which will take into account all relevant factors including accident risks.*

11.02 The commentor asks why we use the year 2030 staff levels for radiation doses (section 4.3.2.9) and use 2005 for economic impacts.

Response: *The cumulative effects of both radiation and socioeconomics are calculated over a 25-year period from 2005 to 2030.*

11.03 The commentor believes that DOE uses different risk standards for different programs (specifically Yucca Mountain versus other programs) and that the public does not understand the risks associated with DOE activities. The commentor voices concern over the 300 million curies (Ci) at NTS. The commentor urges DOE to use one risk standard in its analyses and educate the public about the risk numbers and what they mean.

Response: *To ensure a consistent set of risk standards in the preparation of environmental assessments (EAs) and EISs, DOE has established recommended guidelines for the preparation of human health impact sections in these documents (*Recommendations for the Preparation of Environmental Assessments and Environmental Impact Statements, *Office of NEPA Oversight, May 1993). The public and occupational health risk for normal radiological operations analyzed in the Stockpile Stewardship and Management PEIS uses the two dose-to-risk conversion factors for the public and workers recommended by DOE's Office of NEPA Oversight and established in the National Research Council's Committee on the Biological Effects of Ionizing Radiation* Health Effects of Exposure to Low Levels of Ionizing Radiation BEIR V *(BEIR V Report) published in 1990. These risk factors are 0.0005 deaths per person-rem to the general public and 0.0004 deaths per person-rem to workers (the lower number for workers accounts for the absence of children in the workforce).*

Appendix E, Human Health, presents a detailed discussion of the methodology used to determine the radiological impacts to human health. The appendix also includes a section on the development and use of the risk factors presented in the Stockpile Stewardship and Management PEIS.

11.04 The commentor believes that a 160-km (100-mi) radius would be more appropriate for the analysis of radiation health effects to the public.

Response: *The 80-km (50-mi) radius for calculating collective dose is a practical limitation for analytical purposes in this PEIS. NRC guidance requires that an 80-km (50-mi) radius be investigated for potential impacts to the population living within 80 km (50 mi) of a radiation source. Studies have shown that at some distance, frequently within 80 km (50 mi), the magnitude of variations in doses from background radiation becomes greater than the doses from radiological releases from DOE and NRC sites.*

11.05 The commentor asks if the PEIS considers multigenerational problems in the analysis of cancer fatalities. The commentor also asks if the cancer statistics and studies from Chernobyl and Nagasaki are taken into consideration in the calculation of the PEIS cancer fatality numbers.

Response: *When modeling is performed to determine human health impacts, "nonfatal cancer" risks and "genetic (multigenerational) effects" risks are tabulated in appendix section E.2.1.2. Cancer statistics and studies from Nagasaki are included within the risk estimation parameters associated with presented cancer fatality numbers (refer to the BEIR V Report). The methodology outlining these "multigenerational effect" tabulations is presented in appendix section E.2.1.2 of the PEIS. The data available from the Chernobyl incident are still being analyzed and have not been used in the human health analyses investigated in this PEIS. However, national and international regulatory bodies continually review the results of new research in order to determine whether changes should be made to recommended dose limits.*

11.06 Several commentors believe that DOE downplays the dangers of radiation and that the PEIS accident analysis tends to trivialize accidents. One commentor states that DOE should investigate the elevated levels of thyroid and breast cancer in Los Alamos, Bernalillo County, and surrounding towns. Another commentor disagrees, stating that cancer rates in Los Alamos are in line with cancer rates expected from a town at an elevation of 2,438 m (8,000 ft). Another commentor believes that DOE should initiate a series of health studies to determine the extent of contamination in the State of New Mexico. The commentor believes that these studies have not been carried out in the past because it would indicate public health problems.

Response: *The accident analyses were performed in accordance with DOE guidance (refer to the Office of NEPA Oversight document). A set of accidents have been analyzed that include high-probability/low-consequence accidents as well as low-probability/high-consequence accidents that are not expected to occur during the lifetime of the facility but have been included to show the consequences of an accident. The levels of thyroid and breast cancer are discussed in section 4.6.2.9, Health Effects Studies. Additional information is presented in appendix section E.4.6. DOE puts a great deal of emphasis on protecting the public and occupational workers from radiation exposure. There are numerous promulgated DOE orders which establish conservative dose limits to both the public and workers at risk of exposure.*

In section 4.1.9.1, subsection on Epidemiological Studies, there is a statement that defines DOE's program to monitor health effects on workers and the public in the communities surrounding DOE facilities. An independent agency, Health and Human Services, has been conducting a health effects research program on DOE facilities under a 1991 Memorandum of Agreement. The National Institute for Occupational Safety and Health initiated a study in 1994, but does not expect results before 1997. However, extensive health studies have already been conducted on the public within the State of New Mexico in the counties surrounding both LANL and SNL, as well as workers within those facilities. Summaries of the results of the studies at LANL and Los Alamos County are presented under Health Effect Studies in section 4.6.2.9, with details presented in appendix section E.4.6. Summaries of the results of the studies at SNL and the surrounding county, Bernalillo, are presented in section 4.8.2.9 under Health Effects Studies, with details presented in appendix section E.4.8. All studies reported are referenced. Past and present radiation and hazardous chemical releases have been documented and are used as one of the bases for predicting future releases when the proposed actions, if approved, are implemented.

The impacts of potential accidents at LANL are discussed in section 4.6.3.9. Figure 4.6.3.9–1 and tables 4.6.3.9–3 through 4.6.3.9–7 present the impacts of accidents. The graph in figure 4.6.3.9–1 indicates the probability of fatalities due to accidents associated with the proposed actions.

11.07 The commentors refer to LANL section 4.6.3.9 and the following text, "The average annual dose to involved workers for this alternative would be 380 mrem. The dose to the entire facility workforce would be 55.6 person-rem. As stated in the methodology, section 4.1.9, all worker doses were referenced either from alternative-specific working group data reports or from the Radiation Exposures for DOE and DOE Contractor Employees 1992 Database which reports doses for similar types of operations...." A commentor asks if the 1992 database is representative for the projected years and if working group data contain situation-specific source terms and shielding considerations. Another commentor asks if linear extrapolation was used to determine the doses to the workers at LANL and SRS in the Summary section S.4.1. The commentor believes that these are overestimates of what would happen to the workers. The commentor asks if LANL ever had pit production capacity and if data on worker safety, accidents, and contamination were used in the PEIS. The commentor also asks how the radiation doses to workers calculated in the PEIS for pit fabrication at LANL compare to the doses that were observed at Rocky Flats when pit fabrication was performed there.

Response: *The conservative 380 mrem/yr dose to involved workers at LANL and SRS for pit fabrication operations was arrived at through direct measurement and calculation. In 1995, LANL started work on Defense Nuclear Facilities Safety Board Recommendation 94-1, processing a full load of pits for the pit surveillance program and the Cassini project. Many of the operations for these programs at LANL are considered comparable to "pit manufacturing" operations. The total annual dose for TA-55 personnel during full operations was 153.8 person-rem. By dividing this number by 405, the number of personnel who received a nonzero dose during that period (i.e., the hands-on workers and support personnel, but not office workers), the resulting average dose for plutonium manufacturing personnel is approximately 380 mrem per worker.*

Comparing the historic Rocky Flats Plant pit fabrication activities and doses to workers to the proposed pit fabrication mission at LANL would not be appropriate. The pit fabrication mission at Rocky Flats used a different process than the one proposed for LANL, and the production volume at Rocky Flats was much larger because of the larger stockpile levels at that time.

LANL currently maintains a limited capability to fabricate plutonium components using its Plutonium Research and Development Facility and provides safety and reliability assessments of the stockpile (section 3.4.3.1). Sections 4.6.2.9 and 4.6.3.9 provide a description of the radiation and hazardous chemical environment at LANL, including descriptions of health effects studies, a brief accident history, and emergency preparedness considerations. Data on worker safety, accidents, and contamination at LANL were analyzed in the preparation of this PEIS. The safety analysis report prepared by LANL for the TA-55 plutonium operations was a source of considerable data used in this PEIS for identifying and estimating the impacts of accidents.

The 1992 database is representative of worker dose data for the year 1992. This report provides a recent source of dose data through which estimations of potential doses to stockpile stewardship and management involved and noninvolved workers can be made. These doses are based on actual dosimeter measurements and therefore take into account existing shielding at the work site. The working group data report does contain source terms associated with this Stockpile Stewardship and Management Program activity.

11.08 The commentor asks what DOE considers to be an accident and if there is enough historical data to constitute a fair analysis of pit fabrication related accidents. The commentor asks if the analysis examines risks to the workers in the workplace. The commentor also asks if the accident modeling included real accidents at TA-55 reported to the Occurrence Reporting System.

Response: *DOE considers an accident to be an unplanned sequence of events that results in undesirable consequences. More information on accidents is provided in a DOE standard,* (DOE DP-STD-3005-93 Proposed, Definitions and Criteria for Accident Analysis, *DOE, March 8, 1993). Accidents that are of the highest concern have high consequences and low probabilities of occurrence and therefore have never occurred. However, even without historical data, techniques are available to predict the sequence of events that may lead to an accident and to estimate the accident's impacts. The PEIS contains an evaluation of the risk of accidental exposure of a hypothetical worker located at either 1,000 m (3,281 ft) or the nearest site boundary, whichever is smaller, to radioactive substances released during an accident. An important source of data for accidents at LANL is the safety analysis report recently prepared for TA-55, which includes any applicable accidents reported to the Occurrence Reporting System.*

11.09 Commentors question the exposure limits for noninvolved and involved workers in the ORR table 4.2.3.9–2. Commentors are concerned that the exposure limits for noninvolved workers is higher than for involved workers and wants to know where the D&D workers are in the table. In addition, commentors are concerned with the quality of estimated health impacts to the general public.

Response: *The exposure limits (i.e., average worker dose) to the noninvolved worker represents the estimated average dose to all noninvolved workers from all radiological sources at ORR. Conversely, the average worker dose to the involved worker represents the estimated average dose from the downsized secondary and case fabrication three-shift operation only. The average dose to the involved worker does not include the average dose from all other sources. If one were to include the additional dose from all other sources at ORR, the average dose to the involved worker is expected to be slightly higher than the average dose to the noninvolved worker. D&D workers are not included here, because they are not present during the normal operation of the stockpile management alternative at ORR. Site-specific information was used in the preparation of this analysis.*

In regard to the integrity (quality) of the general public dose estimates, the analytical "worker dose" methodology and associated data used in the PEIS were independent of those utilized for public dose calculations. For public health impacts, an indepth assessment was made using the GENII computer code. This type of analysis uses site-dependent factors including meteorology, population distributions, agricultural production, and an assumed facility location on a given site.

11.10 The commentor questions the accident history in section 4.2.2.9, which states that the most noteworthy accident at Y-12 resulted in temporary radiation sickness for a few ORR employees. The commentor would like to know whether the employees involved in this accident view its effects as temporary radiation sickness.

Response: *All accidents at DOE facilities are investigated in detail in order to understand the root causes and to identify corrective actions to prevent their recurrence. The health of workers following an accident is closely monitored to ensure every opportunity is taken for a complete recovery. There are a number of DOE orders in effect to protect the health and safety of workers. The requirements for investigation and documentation of the circumstances surrounding an accident are specified in DOE O 232.1,* Occurrence Reporting and Processing of Operations Information. *Other DOE orders that address a worker's health and safety include DOE O 231.1,* Environment, Safety, and Health Reporting, *and DOE O 440.1,* Worker Protection Management for DOE Federal and Contractor Employees.

11.11 Commentors express concern about the health of area residents. One commentor believes that the breast cancer rate in Livermore is the highest in the nation. Other commentors state that activities at LLNL have created plutonium pollution at nearby parks, tritium contamination of the water, and onsite contamination from leaking drums. Another commentor states that workers at LLNL are 400 percent more likely to develop malignant melanoma than the general public. The commentor also contends that the children of Livermore are 6 times more likely to develop skin cancer as a result of activities at LLNL.

Response: *The environmental impacts associated with radiological and hazardous chemical operations at LLNL are described in section 4.7.3.9, in appendix E for normal operations, and appendix F for potential accidents. The human health analyses presented for LLNL in the PEIS, conclude that "adverse health effects to the public and to workers will be small." This conclusion pertains only to the "alternatives" presented in the PEIS. Historical contamination and cancer incidences are discussed in section 4.7.2.9, the subsections on Accident History and Health Effects Studies.*

11.12 The commentor states that the PEIS does not clearly differentiate the safety risks associated with each alternative if an accident were to occur.

Response: *The composite risk value for accident impacts provided for each alternative in the main body of the PEIS and in appendix F can be used to differentiate the safety risks associated with each alternative. Appendix F also provides risk information for individual accidents in terms of accident consequences and probability of occurrence which can also be used to differentiate between alternatives. In addition, complimentary cumulative distribution functions are provided for each alternative at each site in the PEIS as an indication of the full range of probable impacts.*

11.13 The commentor believes that none of the Draft PEISs have adequately addressed what would happen to the area's farm and ranch economy if a significant accident, releasing substantial quantities of radionuclides, were to occur, regardless of how well it were to be cleaned up. The commentor thinks that the public's perception of the contamination would be such as to make local products unmerchantable not just for the immediately affected area, but for the entire Panhandle's products.

Response: *The likelihood of a significant accident that would impact the area's farm and ranch economy is very small. The PEIS identifies several potential accidents that can result in undesirable offsite consequences, measured in terms of the risk of cancer fatalities to the workers and members of the public. Secondary impacts of accidents affecting elements of the environment other than humans are also presented in a new section, appendix section F.4. This section identifies the extent of radiological releases due to accidents that may result in the contamination of farmland, surface and groundwater, recreational areas, industrial parks, cultural resources, or habitat of endangered species. The accident analyses were performed in accordance with DOE guidance (refer to the Office of NEPA Oversight document).*

11.14 The commentor would like the PEIS to address the impacts which would result from a nuclear explosion, including the resulting deaths, the cancers created, and the spread of radioactivity.

Response: *The devastating effect of a nuclear explosion is clearly recognized and has been the driving force to prevent any accidental or intentional occurrence. Within the DOE system, strict compliance with DOE orders and procedures is enforced to minimize the probability of any technical or human cause of an inadvertent nuclear explosion. Some examples of applicable DOE orders are DOE O 452.1,* Nuclear Explosive and Weapons Surety, *and DOE O 452.2,* Safety of Nuclear Explosive Operations. *Inadvertent detonation of a nuclear weapon has a probability of occurrence which is much less than 10^{-7} per year or once in 10 million years and is not evaluated. The risk of an explosive dispersal of nuclear materials is evaluated for weapons A/D operations at Pantex and NTS where work is performed on nuclear components in the presence of explosive materials.*

11.15 The commentor suggests that DOE provide additional information and clarity concerning the accident risk analysis. Another commentor believes that the accident analysis tends to trivialize accidents and notes that very low-probability events that have very catastrophic consequences are difficult to comprehend.

Response: *The accident analyses were performed in accordance with DOE guidance (refer to the Office of NEPA Oversight document). A set of accidents have been analyzed that include high probability/low consequence as well as low probability/high consequence events to show the range of possible impacts. The low probability/high consequence accidents are not expected to occur during the lifetime of the facility but have been included to show the worst possible consequences of an accident.*

11.16 The commentor does not share DOE's confidence that operating its new weapons complex at surge capacity can be done largely without waste management and capacity difficulties, and more than proportionally increased risk of both routine and accidental releases of radioactive and hazardous materials and of worker exposures.

Response: *The PEIS analysis bounds potential environmental impacts by assuming operations at a surge capacity. This means greater wastes and greater radiation doses are assessed than we would normally expect. It provides a reasonable level of conservatism such that DOE can be confident that any impacts would stay within the bounding envelope provided in the PEIS.*

11.17 The commentor views the reservations near Los Alamos, NM, as a "dump" (i.e., nuclear waste and radiation) and believes the populations are affected.

Response: *LANL health effects studies are presented in section 4.6.2.9 and appendix section E.4.6 of the PEIS. Several key facets of concern including cancer incidences among the general public (including those who may reside on the nearby reservations) have been addressed. Table 4.6.2.9–2 conveys data on the total annual radiological dose incurred to the LANL surrounding population (within an 80-km [50-mi] radius). The extremely small annual population-dose imparted in this table yields an associated cancer risk which is also very small (i.e., 0.0015 of one fatal cancer per year).*

11.18 The commentor wants to know to what extent the analysis of cancer risk factors into different schools of thought. The commentor notes that others have different views on exposure to radiation and its effects. The commentor wants a balanced view in the PEIS.

Response: *To ensure a consistent set of risk standards in the preparation of EAs and EISs, DOE has established recommended guidelines for the preparation of human health impact sections in these documents (refer to the Office of NEPA Oversight document). The public and occupational health risk for normal radiological operations analyzed in the PEIS uses the two dose-to-risk conversion factors for the public and workers recommended by DOE's Office of NEPA Oversight and established in the BEIR V Report. These risk factors are 0.0005 deaths per person-rem to the general public and 0.0004 deaths per person-rem to workers (the lower number for workers accounts for the absence of children in the workforce). Appendix E, Human Health, presents a detailed discussion of the methodology used to determine the radiological impacts to human health. The appendix also includes a section on the development and use of the risk factors presented in the Stockpile Stewardship and Management PEIS.*

11.19 The commentor asks if the PEIS projects what would be considered a safe dose of radiation in the future. The commentor notes that what we may have considered safe 25 years ago is much different based on today's knowledge.

Response: *Radiological doses during normal operations (to both the public and workers) associated with all future Stockpile Stewardship and Management Program activities would be well below regulatory standards established by the NRC and EPA. Over the last 20 to 30 years, enormous progress has been made in the study of biological effects resulting from radiation exposure; today's "conservative" exposure limits are a reflection of these research results. Over the past 25 years, a concept known "as low as reasonably achievable" has been the benchmark goal of all nuclear-oriented facilities licensed in the United States. Regularly "lowered" dose limits are a prime example of how much emphasis has been placed upon radiation safety in recent years. As to whether the dose limits will conservatively change in the coming years will be subject to the results of further data analyses, such as from the Chernobyl accident.*

11.20 The commentor states that Savannah, GA, is known to be a cancer site. The commentor asks if the PEIS contains statistics on the amount of radiation that flows through Savannah via SRS plus the existing high cancer rate.

Response: *For the purposes of this analysis, a radius of up to 80 km (50 mi) around a site was investigated for potential radiological impacts to public health. The city of Savannah is beyond this 80-km (50-mi) zone (roughly 160 km [100 mi]) and therefore has not been analyzed for potential impacts from SRS radiological airborne releases. However, potential radiological impacts to the Savannah area through the drinking water pathway are routinely assessed via the monitoring of offsite water treatment plants at Beaufort-Jasper and Port Wentworth, which are both located in reasonably close proximity to the city of Savannah. The PEIS reports these normal operational radiological impacts (incurred from the liquid pathway) in table 4.3.2.9–2. These liquid doses include constituents from drinking water, sampled at the site boundary—downstream to the Atlantic Ocean (i.e., Savannah River). The cancer risks per year associated with these modeled liquid doses are extremely small (0.0008 of one fatal cancer is estimated within the total population under investigation). For further information on health risk studies involving communities around the SRS area, see appendix section E.4.3.*

11.21 The commentor wants to know how old the epidemiological studies are that were used in the PEIS.

Response: *They began as early as 1942, but some reports are as recent as 1996.*

11.22 The commentor is concerned that a direct link cannot be identified between SRS radiation releases and latent cancer. The commentor also states that at the same time, it cannot be proven scientifically that radiation from Federal facilities does not cause cancer.

Response: *In 1984, Sauer and Associates examined mortality rates in Georgia and South Carolina by distance from SRS (see Volume I, chapter 6, SR duPont 1984b). Rates for areas near the plant were compared with U.S. rates and with rates for counties located more than 80-km (50-mi) away. Breast cancer, respiratory cancer, leukemia, thyroid cancer, bone cancer, malignant melanoma of the skin, nonrespiratory cancer, congenital anomalies or birth defects, early infancy death rates, stroke, or cardiovascular disease in the populations living within 80 km (50 mi) of the plant did not show any excess risk compared with the reference populations. Historical data and associated statistics have indicated that there have been essentially no significant health risk increases as a result of normal operation radiological releases. EPA and NRC regulatory standards are designed to protect the public from potential health impacts resulting from normal operational radiological releases.*

11.23 The commentor wants to know the impact of radiation as a result of the Stockpile Stewardship and Management Program on children, particularly birth defects. Another commentor believes that the PEIS's risk analysis is one-dimensional and not accurate; it cannot take into account the future legacy of radioactivity, the future health and genetic consequences, or the environmental impacts.

Response: *Radiological impacts to the public (including children) from planned Stockpile Stewardship and Management Program activities are presented in section 4.3.3.9 of the PEIS. Modeling has shown that potential doses to adults and children alike, would be extremely small (billions of times lower than that incurred from natural background radiation). Appendix section E.2.1.2 of the PEIS presents risk estimations for "genetic effects." The risk of incurring these effects are even smaller than that for fatal cancer (about 75-percent smaller).*

11.24 The commentor asks for the basis of the assumption that, in the accident scenarios, the worker is assumed to be a kilometer away.

Response: *In general, exposures to workers decrease with increasing distance away from the location of the accident. The evaluation of impacts to noninvolved workers (i.e., workers that are located on the site independent of the proposed action) assumed a hypothetical noninvolved worker located at 1,000 m (3,281 ft) from the location of the accident or the nearest site boundary, which ever is closer. For distances less than 1,000 m (3,281 ft), modeling techniques are less effective because of the effects of buildings on meteorology and dispersion.*

11.25 Referring to the uncertainty of potential, long-term health effects due to exposure at Pantex, the commentor would like to know how DOE can be so sure of the consequences of future missions that may be brought to the site.

Response: *Section 4.5.2.9 presents a discussion of health effects studies which have been previously conducted in the communities surrounding Pantex. These studies indicated that there have been no significant excess cancer mortality incidences in the Pantex area; thus, there have been no verifiable indicators as to any short- or long-term health impacts at the Pantex site. Public exposure to radiological effluents has conventionally been of extremely small quantity due to DOE safeguards and the nature of the missions conducted at the facility. In addition, DOE orders and required standard operating procedures have been established in order to ensure the safe and reliable operation of DOE facilities. The planned stockpile management program options at Pantex would not alter these circumstances. DOE's utilization of radiological dose modeling techniques quantitatively estimates exposure to the public and workers as a result of potential future stockpile management missions. Appendix section E.2.2 describes the methodology used to estimate radiological impacts during normal operations from DOE facilities analyzed in the PEIS such as tritium in the environment.*

The risk analysis employed in the PEIS for normal radiological releases takes into account the potential future health consequences which may occur from planned Stockpile Stewardship and Management Program activities. Expected radiological release quantities from each Program alternative are modeled to determine potential doses which may be incurred to members of the public in future years. Hypothesized future residential populations are included within the calculations in an effort to calculate future population-dose values. The future "behavior" (or "legacy") of radiological material(s) related to Stockpile Stewardship and Management Program operations are analyzed for anticipated characteristics which are to be expected over the coming years, including: decay rates, transport through air and water media, and uptake frequencies. When modeling is performed to determine human health impacts, "genetic consequences" can be calculated from information presented in appendix section E.2.1.2 of the PEIS. The risk of incurring "genetic effects" is even smaller than that for fatal cancer (about 75-percent smaller).

11.26 The commentor, a landowner near Pantex, is concerned about the integrity of her property and her personal safety, claiming that past accidents and explosions at Pantex have adversely affected her and others in the neighborhood of Pantex.

Response: *All facilities at Pantex and other DOE facilities are operated in strict compliance with DOE orders to minimize the chances of an accident that would release radioactivity to the surrounding area and to also mitigate the effects of a release if one were to occur. Any accident that has occurred is thoroughly investigated to identify its cause. Corrective actions that minimize or eliminate any repetition of the accident are also identified and implemented to maintain operations that are safe for workers and the public. For the preparation of the PEIS, a variety of potential* *accidents that may be initiated by operational causes, such as an explosion, or by natural phenomena, such as earthquakes, were identified and their impacts estimated using appropriate analytical methods. The results, as well as the history of Pantex accidents, are discussed in section 4.5.3.9 of the PEIS.*

11.27 The commentor states that Santa Fe is the capital of New Mexico and therefore has an increasing populace. The commentor is concerned that the area surrounding LANL is very near Santa Fe. The commentor feels possible contamination of the water, groundwater, and radioactive accident or sabotage, if they would occur, would make Santa Fe and the surrounding area uninhabitable. Another commentor suggests that the mere perception that an accident is possible could damage the tourist industry in New Mexico. Other commentors state that one nuclear accident would destroy the tourist, manufacturing, and agrarian industries in the State of New Mexico.

Response: *For the PEIS, a variety of potential accidents that may be initiated by operational causes or by natural phenomena, such as earthquakes, were identified and their impacts estimated using appropriate analytical methods. The results are documented in the PEIS. Appendix section F.4 discusses the secondary accident impacts to these types of resources for each site. In addition, other recent NEPA reviews for prior or interim actions (such as the Dual Axis Radiographic Hydrodynamic Test [DARHT] Facility EIS, DOE/EIS-0228) have analyzed the potential impacts of specific hypothetical facility accidents on the environment around LANL, including Santa Fe.*

11.28 The commentor states that the PEIS needs to document more fully why the assumptions associated with the PEIS accident scenarios are reasonable, and how these assumptions and other inputs are used by the Melcor Accident Consequence Code System model.

Response: *Additional information on accident scenarios and source terms for the accidents described in the PEIS are documented in a topical report (refer to HNUS Report No. ARP-96-042), which has been placed in the DOE Public Reading Rooms near each site. The Final PEIS contains an expanded discussion to further explain how data and assumptions are used by the Melcor Accident Consequence Code System model.*

11.29 The commentor refers to the ORR section 4.2.3.9, Radiation and Hazardous Chemical Environment, and asks if it is true that hazardous impacts would be reduced to zero as a result of secondary and case fabrication phaseout, unless we completely greenfield the site, including recovery of material from burial grounds.

Response: *Phaseout of these activities would reduce the added burden (beyond No Action) to zero because only other unrelated No Action activities would remain.*

11.30 The commentor refers to the ORR table 4.2.3.9–4 and asks how accident numbers were generated, and states that it is not clear why the probability of a significant beryllium oxide release is so high.

Response: *Additional information on accident scenarios, frequencies and source terms for the accidents described in the PEIS is documented in a topical report (refer to HNUS Report No. ARP-96-042), which has been placed in the DOE Public Reading Rooms near each site. The accident scenarios and related parameter values are based on safety analyses of facilities that perform operations at Y-12. The probability of a release is conservatively high in order to bound the impacts of the event.*

11.31 The commentor notes, with regard to nuclear weapons "safety," that morbidity and mortality in the cleanup crews at nuclear weapons accidents have not been studied, and long-term effects at these sites are unknown. The commentor states that with these possible exceptions, no one is known to have ever been injured from a nuclear weapon in an accident. Another commentor states, with regard to nuclear weapons "safety," that a risk of death from a nuclear weapons accident appears to be about a million times smaller than other causes of accidental death and about 100 to 1,000 times smaller than the public health risks from exposure to environmental pollution at current health standards.

Response: *The PEIS presents a full disclosure of all the human health risks associated with each of the alternatives based on best available data. All new construction and modifications to existing structures would meet or exceed applicable environmental, health, and safety standards for the public and workers. Because of these factors, the measures taken by DOE to limit impacts to human health from normal operations, and to prevent accidents which would impact human health, the analysis in this PEIS shows the risks associated with these technologies to be low.*

11.32 The commentor contends that the analysis of radiological impacts is too limited. It omits entirely the impacts of radioactive releases on aspects of the biosphere other than human health (see section 4.1.6). The commentor states that the analysis for radiation releases for normal operations of the proposed stockpile stewardship and management facilities is difficult to follow, and appears to be based on assumptions which may substantially understate potential impacts. The explanation of the health effects calculations in appendix E states that source terms for radiological releases are for "stockpile management alternatives," and there is no reference to or data for releases from stockpile stewardship alternatives provided in appendix section E.2.3. The source terms include "only atmospheric releases, because liquid radiological discharges are not expected from any of the alternatives at any of the sites" (appendix section E.2.3). The commentor believes there is no explanation of why this is so.

Response: *As discussed in section 4.1.6 of the PEIS, impacts on biotic resources from the release of radionuclides would be expected to be less than that on the human population based on studies which have shown humans to be the most sensitive organism to radiation release.*

Regarding the analysis of radiation releases for normal operations, section 4.1.9.1 discusses the methodology that was employed to estimate potential impacts. Appendix E provides greater detail of how health effects were estimated, including the reasons why the analysis in the PEIS is conservative.

The source terms for radiological releases from stockpile stewardship alternatives are not included in appendix E of the PEIS. Because each of the stockpile stewardship facilities are addressed in greater detail in appendix I (NIF), appendix J (CFF), and appendix K (Atlas), source term information for each of these facilities is addressed in those appendices, as appropriate.

The statement, "source terms include only atmospheric releases because liquid radiological discharges are not expected from any of the alternatives at any of the sites" found in appendix section E.2.3 of the PEIS is correct. During normal operations, no liquid releases of radionuclides are expected. This is because the facilities are designed to have no liquid radionuclide discharges.

11.33 The commentor cites section 3.7.1, Stockpile Management, "Worker exposure to radiation is expected to be about equal" and asks if it is reasonable to believe that NTS workers might receive higher doses for several years because of the lack of experience compared to Pantex workers. Commentor believes nothing replaces actual experience and thinks DOE should consider a learning curve at NTS.

Response: *The worker dose estimates presented (i.e., the 10 mrem/yr) are tabulated via historical worker dose data for comparable operations. These data provide the most accurate values available for the planned program activities being analyzed in the PEIS.*

11.34 The commentor cites section 4.1.9.1, Hazardous Chemical Impacts, and asks why CERCLA guidance was used. Commentor does not believe the CERCLA guidance bounds the issue because the higher risk occupations such as medical personnel, fire fighters, radiation workers, HE workers, roofers, machine operators, security personnel, and such would not be covered.

Response: *This section has been modified to reflect that CERCLA does not override the Occupational Safety and Health Administration's (OSHA) regulations for workers and EPA guidance for calculating risk to the public and workers relative to cancer risk. Instead, CERCLA should be correctly used in setting the cancer deminimus risk of 10^{-6} and the range of acceptable cancer risks for specific carcinogens based on how they are used and their mechanism of action (i.e., threshold versus nonthreshold carcinogens); the range of 10^{-4} to 10^{-6} specified under CERCLA covers the chemical-specific assessment as to whether a cancer risk is acceptable. Calculations for worker exposures were always done based on OSHA regulations for exposures to noncarcinogens and guidance for safety required for carcinogens.*

11.35 The commentor believes, contrary to the statement in appendix section E.3.1, that exposure to hazardous chemical releases to surface water, groundwater, and soils should be included when assessing the risk to the public and site workers.

Response: *The text cited by the commentor in appendix section E.3.1 refers to conditions under normal operations. Under such conditions hazardous chemicals are not released into surface water or groundwater or onto soil; therefore, inhalation is assumed to be the only route of exposure. For accident scenarios involving the release of hazardous chemicals into the environment, refer to appendix F, Facility Accidents.*

11.36 The commentor expresses concern that the hazard indexes and total cancer risk provided for the phaseout alternative at Pantex (appendix table E.3.4–12) are not properly evaluated. The commentor points out the risks for the phaseout of Pantex are lower than the risks cited for the other programmatic alternatives, with the exception of the A/D and HE fabrication alternative, which essentially equal the risk of the phaseout alternative. However, the amounts of hazardous and mixed LLW generated during phaseout of Pantex are anticipated to be 100 to 1,000 times greater than the other alternatives (tables 4.5.3.10–2 and 4.3.5.10–3). According to the commentor, section 4.5.3.9 of the PEIS states that no hazardous chemical emissions are anticipated for the phaseout alternative at Pantex, and the hazard index and cancer risk to the public and onsite workers would be zero. The commentor believes that it is more reasonable to assume that some exposure will occur during a phaseout of Pantex when over 6 million m^3 of waste is generated.

Response: *The fact that all hazardous chemical emissions are lower than other programmatic alternatives is attributed to the emissions that would no longer occur should this activity cease (i.e., the greater the contribution of an activity the more the reduction when it is phased out). In fact, table 4.5.3.10–2 shows that there is a reduction in solid hazardous waste generated from No Action and no change in liquid waste from No Action whereas solid mixed LLW is reduced and liquid wastes are reduced slightly. However, disposing of wastes using state-of-the-art technologies is not expected to result in increased releases to the environment. In fact, as is shown by appendix table E.3.4–12, the hazard indexes would be between 4- and 5-fold below a safe level (1.0) and the cancer risks contributed would be 2 to 3 orders of magnitude below that in the general unexposed population.*

11.37 The commentor refers to the NTS section 4.9.2.9, Radiation and Hazardous Chemical Environment, and suggests that the word "radioactivity" be removed, and the phrase "radioactive activity level" be inserted before the word "approximately." The commentor also suggests the words "were accidental" be replaced with "was an accidental release" in the sentence. The commentor further states that the NTS Accident History is inaccurate and has been manipulated to exclude the Baneberry venting accident (1970), and that NTS atmospheric tests released 1.2×10^{10} Ci into the atmosphere.

Response: *The releases from underground tests stated in the Draft PEIS are for the period from 1971 to 1988. Tests prior to 1971 were the cause of releases totaling 25,300,000 Ci, which includes the Baneberry release in 1970 (6,700,000 Ci). The discussion of NTS accident history has been expanded in the Final PEIS to include the Baneberry release and other atmospheric test releases. Additional details on accidental releases are documented in the report,* The Containment of Underground Nuclear Explosions, *Congress of the United States (OTA-ISC-414, October 1989).*

11.38 The commentor refers to section 4.1.9.2, Facility Accidents, "Accident risk to collocated workers was calculated for a hypothetical worker at 1,000 m (3,281 ft) from the facility, or at the site boundary, whichever is closer." The commentor states that usually in EISs, EAs, and safety analysis reports, the collocated workers are located at a much closer distance, such as 100 m (328 ft) and then at increments to 1,000 m (3,281 ft). The closer distances provide a more conservative (and more realistic) risk analysis for accidents.

Response: *In general, exposures to workers decrease with increasing distance away from the location of the accident. The programmatic level evaluation of impacts to noninvolved workers (i.e., workers that are located on the site independent of the proposed action) assumed a hypothetical noninvolved worker located at 1,000 m (3,281 ft) from the location of the accident or the nearest site boundary, whichever is closer. For distances less than 1,000 m (3,281 ft), the screening model techniques used in the programmatic level analyses are less effective because of the effects of buildings on meteorology and dispersion. For site-specific assessments, specialized modeling techniques would be used for estimating exposures at closer distances.*

11.39 The commentor refers to the LANL section 4.6.3.9, "... the presented noninvolved worker impacts were not modeled due to the unavailability of certain site-specific information. There also may be small risks to construction workers who are involved with tasks that are in close proximity to potentially contaminated areas." The commentor states the following: 1) noninvolved workers were not modeled; and 2) if risks to construction workers were not modeled, how can they be quantified as "small." If the source term of contaminated soil that they may be exposed to is a low activity or limited to a small area, it should be indicated in text. In addition, the commentor refers to the SNL section 4.8.3.9, "The presented total dose to noninvolved workers was not modeled due to the unavailability of certain site-specific information." The commentor states that radiological impacts to noninvolved workers were not performed.

Response: *Impacts to noninvolved workers and construction workers may be described in this manner because historical data and experience indicate that these workers would primarily be subjected only to radiation exposure from their designated job tasks. There are no verifiable "contaminated soil" source terms available to model radiological impacts to construction workers.*

A dose (impact) assessment for the LANL and SNL noninvolved worker was performed for the PEIS (sections 4.6.3.9 and 4.8.3.9, respectively). Noninvolved worker impacts were determined from information presented in the annually published report Compilation of Doses to Workers at DOE

Facilities, *for the year 1992. This report (database) provides a recent source of dose data from operations which are comparable to planned stockpile stewardship and management activities. Estimations of potential doses to stockpile stewardship and management workers were calculated from this historic record.*

11.40 The commentor refers to the LANL section 4.6.3.9, "... there are potential impacts to involved workers who would be located in the facilities. Quantitative statements of these impacts cannot be made until design details are developed further, at which time the number and location of facility workers can be estimated to support accident impact analyses. However, depending on the type of accident, facility workers in close proximity to the point of the accident could receive high levels of exposure to radiation, with potentially fatal impacts." The commentor states that impacts to workers were not modeled for accident analysis, however, fatalities may occur and the number of deaths is not estimated nor projected.

Response: *The design and layout of facilities, operating procedures, protective features, training and other safety measures all serve to prevent the occurrence of accidents and mitigate its effects if one were to occur. This is not a discriminator for mission siting and not addressed at the programmatic level. However, for any alternative that is selected, tiered NEPA studies and safety analysis reports required before operations are permitted to commence, will include estimates of impacts to involved workers that are based on well-defined safety measures.*

11.41 The commentor states that it is not clear whether DOE's risk assessment includes those hazardous constituents that do not meet the narrow definition of hazardous waste under RCRA or toxic substances under the *Toxic Substances Control Act* (TSCA). The commentor suggests DOE consider the risk posed to human health and the environment by what DOE defines as nonhazardous waste constituents (appendix table H.1.1–1).

Response: *DOE's risk assessment includes chemicals considered hazardous under RCRA or TSCA, and any others regulated by EPA or OSHA for which there is information that describes the nature of the hazard (e.g., National Institute of Safety and Health handbook, American Conference of Governmental Industrial Hygienists [threshold limit values and biological exposure indices], etc.). The nonhazardous waste constituents are not included in the assessment because they are not considered to pose a human health or environmental hazard. However, many of these constituents are considered in the air quality and water quality sections of the document.*

11.42 The commentor refers to appendix section E.2.2 and the statement, "For use in design basis accidents, the 50-percentile option was used." The commentor states that the 50-percentile option depicts conditions that are "average." Usually in EISs, environmental assessments, and routine site analyses for risk from accidents, risks are analyzed under "worst-case" conditions, which are also known as 95-percentile conditions (when using certain codes). Accident risks were not analyzed under worst-case conditions in the PEIS, and an underestimation for accidents under extreme conditions could result.

Response: *The accident analyses were performed in accordance with DOE guidance. This guidance states that "Analyses generally should be based on realistic exposure conditions ... and characterize the "average" or "probable exposure conditions ..." and therefore the results in the Draft PEIS are based on 50-percentile meteorological conditions (refer to the Office of NEPA Oversight document, page 21). Other conservative assumptions are made in the accident analyses in order to bound potential impacts. In addition, a spectrum of accidents is evaluated ranging from low-consequence/high-probability events to high-consequence/low-probability events to reflect bounding-case impacts. The complimentary cumulative distribution functions included in the Final PEIS also show the bounding-case impacts.*

11.43 The commentor refers to appendix F, Accidents, and states that solid uranium and plutonium liquid criticalities were modeled; however, no plutonium metal criticalities (solid) were analyzed. This accident analysis may not have been performed in the past; however, the accident scenario should be considered due to the projected increases in the number of pits under the "Pit Fabrication alternative." In addition, the commentor states that the methodology section should mention how the source terms for the criticalities are determined, and source terms should be listed by radionuclide and activity, not only as the number of fissions. From the information presented in the PEIS, the commentor says it is not possible to determine whether the criticality analyses are valid.

Response: *The PEIS identifies appropriate accident scenarios based on existing safety analysis reports and operating procedures which are analyzed to estimate bounding impacts. In this case, the liquid plutonium criticality was selected because it has higher impacts to workers and the public than a solid criticality. Additional information on accident scenarios and source terms for the accidents described in the PEIS are documented in a topical report (refer to HNUS Report No. ARP-96-042), which has been placed in the DOE Public Reading Rooms located near each site.*

11.44 The commentor states that in appendix section E.4.6, the discussion revolves around an investigation undertaken to assess melanoma risk at LANL because of worker exposure to low-level ionizing radiation. The study was the result of "a reported three-fold excess of melanoma among laboratory workers" at LLNL in California. The study was applied to LANL because of the similarity of the work done at both labs. At the end of the first paragraph in column 2, it is stated that "the only significant association with diagnosis of melanoma for males was being a college graduate ... or having a graduate degree...." To the commentor, it follows obviously that the vast majority of workers at both LLNL and LANL are males who are college graduates or who have graduate degrees and that the workers at LANL are significantly at risk for melanoma resulting from exposure to low-level ionizing radiation. The commentor asks if workers will be informed of the risk, if this is an acceptable risk, and if anything can be done to diminish it.

Response: *The commentor fails to mention that no excess risk for melanoma was detected at LANL among 11,308 workers between 1969 and 1978 (see Volume I, chapter 6, Lancet 1982a:883-884). Other studies clearly established no association between external radiation or chemical exposures in the workplace and melanoma. The association between melanoma and a college graduate or graduate degree (as the only association) then takes on lifestyle rather than work-related cause and effect (e.g., college graduates and those with graduate degrees have lifestyles that may differ from the general population, which could well be associated with how they spend their leisure time). DOE workers receive occupational safety and health training, which places a prime emphasis on "as low as reasonably achievable" principles. Through an "as low as reasonably achievable" program, workers are made aware of potential risks, and are trained to minimize (diminish) these risks to the lowest levels possible.*

11.45 Commentors state that the New Mexico Environment Department is sometimes referred to by its previous name, Environmental Improvement Division, or by the incorrect form, New Mexico Health and Environmental Department. Examples of incorrect naming can be found in appendix section K.3.3.1 and table 5.3–4. The commentor states that these should all be changed to New Mexico Environment Department.

Response: *In accordance with the commentor's suggestions, these changes have been made in the Final PEIS.*

11.46 The commentor identifies the following errors in appendix section E.4.6: there is repetition of the sentence "Population exposures are confounded by occupational exposures," and the word "countries" should be "counties."

Response: *Appendix section E.4.6 in the Final PEIS has been rewritten and the errors the commentor noted have been corrected.*

11.47 The commentor identifies the following errors in appendix F: in section F.2.2.1, there is jumbled spelling of the word "national," and in section F.2.3.1, the sentence, "The fire releases the plutonium contamination from the inner surfaces of the gloves" should read "... the inner surfaces of the glovebox."

Response: *The spelling has been corrected in the Final PEIS. The contamination that is released is from the outer surface of the gloves that are in the glovebox. The statement has been modified in the Final PEIS.*

12 ENVIRONMENTAL JUSTICE

12.01 The commentor believes that DOE has unfairly placed their nuclear facilities in low-income areas. The commentor notes that New Mexico, "the home of the bomb," has a low per capita income and a high minority population. Another commentor believes that the PEIS minority population maps for LANL and SNL have errors in them.

Response: *LANL and SNL were established in 1943 and 1945, respectively. These sites were selected, in part, due to their isolation from large population centers. The fact that the State of New Mexico has a relatively low per capita income played no role in siting these facilities and does not influence DOE decisions on whether to continue operating these facilities. Los Alamos and Bernalillo Counties, where most of the LANL and SNL workers reside, both had 1993 per capita incomes ($28,753 and $19,854, respectively), significantly higher than the average for the State of New Mexico ($16,346). The per capita income of these counties approached or exceeded the national average per capita income, of $20,800. Only one county (Rio Arriba) in either ROI had a per capita income significantly lower than the State of New Mexico. Less than 5 percent of the SNL workforce resides in Rio Arriba County.*

The environmental justice maps have been reviewed and revised, as appropriate. Several counties and census tracts were improperly categorized for both low-income and minority populations. The Final PEIS contains revised maps that are demographically correct.

12.02 The commentor states that DOE has polluted Western Shoshone land and that, as a result, cancer rates are high in the area. The commentor urges moving activities at the site elsewhere.

Response: *Appendix section E.4.9 describes epidemiological studies performed in the area around NTS, which includes the Western Shoshone land. These studies were performed to evaluate adverse health impacts on the exposed populations in Nevada and Utah from aboveground nuclear testing carried out by DOE at NTS in the 1950s. The results of the studies are inconclusive and contradictory. Underground testing that followed did contaminate land on NTS, but resulted in no additional exposure to surrounding populations. None of the proposed alternatives would result in adverse health impacts to the surrounding populations or cause disproportionate adverse health impacts to the Western Shoshone.*

12.03 The commentor wants to know exactly what was analyzed under environmental justice in the Stockpile Stewardship and Management Draft PEIS, the Pantex Site-Wide Draft EIS, and the Storage and Disposition Draft PEIS.

Response: *Environmental justice is the equal treatment of all races, cultures, incomes, and educational levels with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. The environmental justice analyses examine the distribution of low-income and racial and ethnic minority populations in the areas surrounding the alternative sites. Demographic analyses are performed at the census tract level for the area within 80 km (50 mi) of the alternative sites. Proposed alternatives are assessed to determine if these populations would receive disproportionate adverse health and socioeconomic impacts.*

12.04 Commentor asks if it is a Government policy to view certain demographic groups as less valuable or more expendable than institutions like SRS.

Response: *No, the Government has no such policy.*

12.05 Commentor believes that African Americans and low-income populations are being affected by SRS activities.

Response: *The analysis of demographic data for the communities surrounding SRS, as well as the health data presented elsewhere in the document, shows that any air or chemical releases would not exceed the threshold of regulatory concern, and that these impacts would not disproportionately affect minority or low-income groups.*

12.06 Commentor wants the impact analyses to include the combined exposure of not only SRS, but other non-DOE industrial uses on low-income and affected communities.

Response: *The PEIS assesses potential impacts from proposed DOE stockpile stewardship and management alternatives. The impacts of other sources of pollution are taken into account as a part of the No Action alternative in the human health analysis. For example, the air and water analyses evaluate whether incremental emissions from the proposed alternatives would lead to any exceedance of air and water quality standards. As noted in the document, DOE will operate in full compliance with all Federal, state, and local regulations. Furthermore, the impacts of other potential DOE and non-DOE activities are explicitly evaluated in section 4.13, Cumulative Impacts.*

12.07 Commentor requests an explanation in the Comment Response Document regarding the apparent failure of the PEIS to comply with Executive Order 12898 *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, and President Clinton's memo to heads of all departments and agencies of February 11, 1994, on the subject of environmental justice in minority populations and low-income populations. The commentor states the PEIS did not address the social and economic effects, as required.

Response: *DOE is committed to full compliance with all provisions of Executive Order 12898. The environmental justice sections explicitly analyze the proposed alternatives at each alternative site to determine if any of the proposed actions would result in disproportionate adverse health impacts on low-income or minority populations. The PEIS also addresses socioeconomic impacts, including impacts to employment, income, housing, population, and public finances, for all of the proposed actions. The socioeconomic impact analyses indicate that none of the proposed actions* *would result in either significant impacts to the entire affected populations or disproportionate adverse impacts to low-income or minority populations.*

12.08 The commentor states that LANL has had, and threatens to continue to have, disproportionate impacts on the Pueblo of San Ildefonso, and that because of this, the issue of environmental justice is not given adequate attention in the PEIS. The commentor states that LANL's use and disposal of radioactive materials has caused serious contamination to the air, soil, and water, and continued operations threaten the destruction of sacred sites.

Response: *Continued operations of the LANL mission will be conducted in compliance with Federal, state, and local regulations. The PEIS assesses the potential health impacts from chemical and radioactive emissions during normal operations as well as from accidents. The analysis indicates there would be no disproportionate adverse health impacts to the Pueblo of San Ildefonso.*

12.09 The commentor states that in the environmental justice sections of the PEIS, human health is covered, but no socioeconomic analysis is done.

Response: *The environmental justice section addresses potential disproportionate adverse impacts to minority populations and low-income populations. The socioeconomic analyses include impacts to regional economies, population, housing, and public finance characteristics. These impacts are determined at a regional level. The analyses performed for the PEIS indicate that none of the downsizing alternatives would result in significant economic impact on the affected regional economies. For those alternatives involving new workers at alternative sites, there would be small economic benefits. Therefore, there would be no environmental justice impacts. For the proposed phaseout alternatives, impacts would be larger but would still not be economically significant. Both the regional economic area and ROI around each site include areas where environmental justice principles apply. The impacts to these areas are included in the regional impact analysis.*

12.10 According to the commentor, Executive Order 12898, requires special attention to be given to subsistence consumption of fish and wildlife. The commentor adds that the order requires Federal agencies to publish guidance reflecting the latest scientific information available concerning methods for evaluating the human health risk associated with the consumption of pollutant-bearing fish and wildlife. The commentor feels that consumption issues are important to address in the PEIS because of their uniqueness in minority and low-income populations and the detrimental range of impacts they may have.

Response: *Subsistence is defined as the traditional use by rural residents of wild, renewable resources for direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation. Subsistence populations heavily rely on local fish and wildlife to meet their food supply. DOE is unaware of any identified subsistence populations residing on or near any of the alternative sites.*

DOE also notes that because none of the proposed alternatives would lead to radiological releases to water, there would be no impacts to fish or other edible aquatic life in the areas surrounding the alternative sites. All chemical releases would be regulated by NPDES permits and would be in compliance with Federal and state regulations. Furthermore, chapter 4 in the PEIS evaluated doses to the surrounding population through air and liquid exposures for all of the proposed alternatives, including No Action. The analysis indicates that there would be no adverse disproportionate impacts to minority or low-income populations.

13 CUMULATIVE IMPACTS

13.01 The commentor expresses concern about the cumulative impact of different programs on local communities. The commentor urges DOE to adopt a "local community" perspective and create a document that would detail the cumulative impacts (e.g., in transportation and waste management) of different programs. DOE should present this document to the public to increase their awareness of the overall impact of DOE activities.

Response: *The cumulative impact analysis of the Stockpile Stewardship and Management Program is discussed in section 4.13 of this PEIS. Other Federal, state, and local actions all have the potential to contribute to cumulative impacts, and all planned, reasonably foreseeable actions are considered in the cumulative impact analysis of this PEIS. However, as stated in section 4.13, programs planned for beyond the 2005 No Action baseline considered in this PEIS would be in such a preliminary stage as to make detailed analysis speculative; these activities are more effectively addressed in site-specific, tiered NEPA documentation.*

13.02 The commentor quotes from the cumulative impact section of the Council on Environmental Quality (CEQ) regulations and asks why past socioeconomic actions (that led to reductions in employment and that are still felt today) are not discussed in the cumulative impact section of the PEIS. Specifically, the commentor mentions the cancellation in 1988 of the DOE program of a mine geologic repository for spent nuclear fuel and high-level radioactive waste in Deaf Smith County.

Response: *Although the socioeconomic effects of past actions are not specifically addressed in the cumulative impacts section, these effects are reflected in the affected environment discussion for each site. As shown in appendix section D.2, Deaf Smith County is one of 26 counties included in Pantex's regional economic area; however, Deaf Smith County is not located within the ROI used in the PEIS. Information on the current and projected civilian labor force, employment, unemployment, personal income, and per capita income were considered for each of these counties in the PEIS. Yucca Mountain Site in Nevada has been selected for detailed study as the candidate for the Nation's first geologic repository. The disposal of HLW and commercial spent nuclear fuel in a radioactive waste geologic repository is discussed in the* Environmental Assessment, Yucca Mountain Site, Nevada Research and Development Area, Nevada *(DOE/RW-0073, May 1986). The impacts described in that EA are included in section 4.13, Cumulative Impacts, of this PEIS.*

13.03 The commentor believes that DOE should look at the cumulative impact of the Stockpile Stewardship and Management, the Storage and Disposition, and the Pantex programs.

Response: *Section 4.13 of this PEIS discusses the cumulative impacts of the Stockpile Stewardship and Management Program, the Storage and Disposition Program, and other proposed actions. As stated in section 4.1.12, Cumulative Impacts, continuing DOE missions and any reasonably foreseeable changes to these missions are addressed as part of the affected environment baseline, or No Action. The Pantex Site-Wide Draft EIS which analyzes impacts associated with conducting nuclear weapons operations at Pantex for the next 5 to 10 years, is included in No Action for the PEIS. The ROD for this PEIS will determine which facilities at Pantex should be upgraded, downsized, or replaced as part of the Stockpile Stewardship and Management Program and will take into consideration all of Pantex's current and reasonably foreseeable activities.*

13.04 The commentor argues that the Draft PEIS cumulative impacts analysis is more like an incremental impact analysis, illustrating the relative insignificance of the proposed action's contribution to ongoing, similar degradation of the environment, instead of determining the aggregate or cumulative effects of related impacts in order to judge whether those impacts, taken together, are significant. The commentor cites waste management as an example, contending that there is no real analysis of whether the proposed Draft PEIS alternatives, in combination with other foreseeable activities in the same area, will have significant waste management impacts. The commentor further states that the use of resources and impacts on the biosphere and on human health from routine and accidental releases from waste management facilities are not analyzed in the waste management cumulative impacts discussion for each site. The commentor also states that the cumulative impacts analysis is not done on an alternative-by-alternative basis, so it is difficult to compare alternatives to one another. The commentor calls the cumulative impacts analysis cursory and conclusory, offering no supporting analysis and no indication where such analysis could be found. The commentor cites section 4.13.1.1 where the cumulative impacts analysis for nonaccident radiological impacts for rebuilding the complex is one paragraph long.

Response: *Impacts from past actions and continuing actions contribute to the affected environment at each of the sites as described in sections 4.2.2 through 4.9.2. In sections 4.2.3 through 4.9.3, the impacts from continuing actions are presented in the No Action alternative. The impacts from the proposed action and the alternatives are also discussed in those sections to allow for comparison to the No Action alternative. Section 4.13 of the PEIS includes a site-by-site discussion of cumulative impacts, focusing not only on the future impacts from the Stockpile Stewardship and Management Program, but also on the future impacts from other reasonably foreseeable programs and actions. As discussed in that section, many other significant programs are included in that cumulative impact analysis, including Environmental Management and Materials Disposition Programs. That analysis focuses on those resources that were judged to have the greatest potential to be impacted. Depending on the particular site of concern, these resources included air quality, water resources, socioeconomics, radiation and human health, and waste management.*

The cumulative impact assessment was done for a bounding analysis on a site-by-site basis. This means that at a given site the contribution from stockpile stewardship and management alternatives was based on the maximum number of potential missions added to other programs' potential impacts at that site. The intent of the analysis was not to illustrate the relative significance of the Stockpile Stewardship and Management Program alternative impacts, but rather to determine whether the Stockpile Stewardship and Management Program potential impacts, in combination with other programs' potential impacts, could produce significant impacts.

13.05 The commentor questions where the supporting analysis was for the statements in the Draft PEIS that "all program totals would be within radiological limits to the public and the effects to workers would be small," and that "[c]umulatively, radiological impacts are expected to be within radiological limits."

Response: *Section 4.13 in the Final PEIS has been expanded to include tables identifying the normal operation cumulative radiological doses and resulting health effects for the potential stockpile stewardship and management alternatives at each site alongside other potential site activities.*

13.06 A commentor questions cumulative impacts associated with accidents. Specifically, the commentor questions the potential radiological impacts associated with earthquakes affecting multiple facilities.

Response: *For purposes of analyzing the potential cumulative environmental impacts associated with accidents, the information presented is based on the conservative assumption that the worst consequence accident for the activity has occurred, based on existing NEPA analyses.*

20 STEWARDSHIP—CONTAINED FIRING FACILITY

20.01 The commentor asks how much CFF will cost.

Response: *Design and construction of CFF is expected to total $53 million. While cost and whether and how the President and Congress should allocate funds for CFF is outside the scope of the PEIS, cost is one of the many factors which will be considered by decisionmakers in the PEIS ROD as it relates to CFF.*

21 STEWARDSHIP—NATIONAL IGNITION FACILITY

21.01 The commentors believe the technical justification for NIF in the PEIS is poor and not cogent and the facility will only benefit an elite few. Commentors believe that NIF is the least relevant alternative as far as safety and reliability and it will provide only marginal information on reliability. Commentors question whether there are alternative means of obtaining each of the categories of data that NIF is intended to provide. Another commentor asks if DOE could identify a single past safety or reliability issue that NIF would have the ability to evaluate. The commentor states that the PEIS does not acknowledge that DOE cannot assure high confidence in achieving ignition at NIF and that construction of NIF should be delayed.

Response: *The President has declared that the maintenance of a safe and reliable nuclear weapons stockpile will remain a cornerstone of national security policy for the foreseeable future. Changes to U.S. national security policies in the post-Cold War have placed two significant constraints on the way DOE has traditionally accomplished its statutory nuclear mission: the United States has declared a moratorium on underground nuclear testing, and has stopped the production of new-design nuclear weapons. In August 1995, the President declared that the United States was seeking ratification of a zero-yield Comprehensive Test Ban Treaty (CTBT). Within these constraints, the proposed actions in the Stockpile Stewardship and Management PEIS will enable DOE to maintain the core intellectual and technical competencies necessary to ensure the continued safety and reliability of the stockpile under a CTBT. In this situation, the United States needs a comprehensive computational ability and a set of experimental facilities that can replicate conditions expected to occur within a nuclear detonation. NIF is one of those experimental facilities. It is a key component of the Stockpile Stewardship and Management Program and is necessary to help maintain confidence in the reliability of the nuclear deterrent.*

As stated in the appendix section I.2.2, the purpose and need for NIF is to achieve fusion ignition and to use inertial fusion technology for helping nuclear weapons scientists maintain the safety and reliability of the nuclear weapons stockpile in the absence of nuclear testing. Therefore, NIF experiments can be used to verify computer models associated with the reliability of nuclear weapons and assess the impact of age- or remanufacture-related changes in the weapon. NIF would reach temperatures and pressures closer to those in a nuclear detonation than any other technology and is the only facility in the program capable of fusion ignition. This national security mission is the principal justification for NIF; it is necessary to help maintain confidence in the reliability of the nuclear deterrent. However, the high energy density experiments proposed to be performed at NIF would also help determine if inertial fusion can be developed as a practical energy source. The challenging science at NIF would help attract the best scientists and engineers to work on these issues of national importance (appendix section I.2.2.3).

The facilities for enhanced experimental capability would complement each other and produce more sophisticated and comprehensive computer models which would be able to provide data on all processes in the seven relevant physical regimes (appendix section I.2.2.2) that occur in *weapons. NIF was designed to be a minimum-sized facility that has a reasonable probability of achieving ignition and the same ability to access high temperatures and densities that occur in weapons materials. NIF would address weapons processes that occur in five of the seven regimes, including some of the processes that occur in weapons' primaries and secondaries. The purpose of NIF is to study isolated phenomena in weapons in the stockpile. In the future, the complex interactions which occur in the detonation of a complete weapon would be investigated through advanced computer modeling.*

There is a high probability that NIF would achieve ignition and an even higher probability that NIF would achieve its weapon physics mission. A 1990 National Academy of Sciences study, Second Review of the Department of Energy's Inertial Confinement Fusion Program, Final Report, *September 1990 (1990 National Academy of Sciences study) (cited as NAS 1990 in appendix I), concluded that the probability of achieving ignition was great enough to justify proceeding with the next steps in designing such a facility. It also recommended that DOE establish a standing review group to continue tracking progress in target physics. That group, the Inertial Confinement Fusion Advisory Committee, has followed the program for more than three years and concluded (Inertial Confinement Fusion Advisory Committee Report, January 1996) that there is a high probability of achieving ignition if NIF is built as currently designed.*

To fulfill its mission in stockpile stewardship, NIF is designed to achieve ignition and, in addition, to perform experiments at high temperatures and densities using the laser energy alone. Many of the needs of the weapons program can be met with these ignitionless experiments. Indeed, experiments are planned well before it is expected that ignition is likely to occur. Ignition would enhance NIF's capabilities for weapons studies but NIF is not necessary for many of them. In 1994, the JASONs group of independent academic scientists reviewed the science-based stockpile stewardship program and concluded that NIF is "... the most scientifically valuable of the programs proposed for SBSS [science based stockpile stewardship]..." In 1996 JASONs reiterated this position and stated its "... support for proceeding to the next step of achieving ignition with NIF because of NIF's expected value to science-based stockpile stewardship as well as its collateral scientific and energy interest." In summary, the Inertial Confinement Fusion Program and NIF have been reviewed by many independent expert groups, such as the National Academy of Sciences, Inertial Confinement Fusion Advisory Committee, and the JASONs, over the years and all have endorsed moving ahead quickly with a facility as currently designed.

*A projection from past experience with the stockpile (*Stockpile Surveillance: Past and Future, *SAND95-2751, January 1996) indicates that there will be cases that will require a weapon scientist to make a judgment about a change that could affect safety or reliability. NIF would be able to help with many of them.*

If NIF would not achieve ignition, the environmental impacts associated with construction would not change; however, the potential environmental impacts associated with operation could be smaller, but probably similar, to those presented in the PEIS. Delaying the construction of NIF would not cause any planned differences in the inertial confinement fusion R&D nor change the environmental impacts which are described in the PEIS.

21.02 A commentor notes that with respect to environmental impacts the public should be skeptical with the statement "... there will be no significant impacts." Another commentor notes that LLNL's environmental report claims "no significant impact" yet over a million Ci of radiation has been released in the air. The commentor states that 120 cancers and 60 cancer deaths resulted from the top 10 accidents that occurred at LLNL. A commentor points out that tritium levels in rainwater and drinking water in Livermore has been measured to be over seven times the acceptable level. The commentor also points out that plutonium-contaminated soil was discovered at a local playground.

Response: *Over the past 40 years of operations at LLNL, tritium gas was released as a result of accidents and normal operations. The releases consisted of mostly tritium gas which is much less of a hazard to human health than tritiated water which can be absorbed more easily into the body. Additional information concerning radiological health impacts can be found in appendix section E.2 of the PEIS.*

The 1994 LLNL Environmental Monitoring Report *states that the tritium activity levels in drinking water in the Livermore Valley are less than 1 percent of the EPA drinking water standard. Over the past 40 years, there was one rainwater sample that read seven times the EPA guideline for tritium in potable water. This occurrence may have been caused by tritium releases during cleanup operations.*

There is some groundwater (not drinking water) tritium contamination greater than EPA standards for drinking water under the eastern portion of the LLNL site. However, the tritium in this groundwater will decay (due to radioactive disintegration) to levels well below EPA standards before it leaves the site boundary. Therefore, it presents no health impact to humans or the environment. In addition, LLNL monitors the groundwater under the site on a regular basis (as reported in the annual LLNL Environmental Monitoring Reports*) and can ensure that the public will not be exposed to tritium at levels that exceed EPA standards. Additional information concerning accidental release can be found in a report by Myers, et al.,* Health Physics Aspects of a Large Accidental Tritium Release, *published in 1993.*

Routine releases from NIF are estimated to be about 30 Ci/yr (0.003 g/yr), which is roughly 100 times lower than the routine average annual releases that took place from the LLNL tritium facility prior to 1989. Therefore, the use of standard risk coefficients for the extremely low doses and dose rates under discussion in the PEIS is at the least, extremely health conservative, and may, in fact, be significantly overestimating the risks (if any) associated with such low doses.

The commentor refers to levels of plutonium that were detected in soil samples taken from Big Trees Park in Livermore. The plutonium levels in two of the 16 areas sampled in the park were found to be above the normal range of global fallout levels (from aboveground nuclear weapons testing many years ago). The soil in this park was investigated for plutonium in 1995 as a joint effort among LLNL, EPA, and the California Department of Health Services. The investigation of park soils also involved various community stakeholders—the city of Livermore, the park and school districts, the local homeowners association, and Tri-Valley Citizens Against a Radioactive Environment. The investigation found that there is no soil at the park that has plutonium levels above the current EPA risk-based preliminary remediation goal of 2.5 pCi/g for residential areas. The EPA concluded that there is no health risk from this plutonium and that no remedial action is necessary.

21.03 Commentor wants to know what the key factors were in the NIF preferred alternative decision and if the timetable for NIF is the same as the PEIS.

Response: *The Secretary of Energy stated in a press release in October 1994, "Lawrence Livermore National Laboratory was chosen as the preferred site because it contains the Nation's leading experts in large laser facilities. Lawrence Livermore National Laboratory has con-*

structed five consecutive versions of the world's largest laser, including the currently operational Nova laser. The National Ignition Facility would be the successor to Nova. Alternative sites will be examined, and a final site selection will be not be made until completion of the National Environmental Policy Act *process, which includes public meetings." In the letter approving Key Decision 1 (approval for start of a major new project), the Secretary supported the statement "The* National Environmental Policy Act *requires that any preference related to the siting of a facility be stated by the Department of Energy. Given the resident technical expertise and existing infrastructure at LLNL, we believe that Lawrence Livermore National Laboratory is preferable at this time to other candidate sites."*

Following completion of the Final PEIS, but at least 30 days after it is issued, DOE will issue an ROD. The ROD will explain all factors, including environmental impacts, that DOE considered in its decisions for NIF. The timetable for NIF is within the envelope for the PEIS. It is anticipated that NIF would be constructed between late 1996 and 2002, with operations commencing in 2003.

21.04 Several commentors do not support NIF, a new experimental $4.5 billion facility, feeling that it is not the policy direction the United States should undertake and the public should inform elected officials that NIF is not necessary. Some commentors disapprove of the funding allocation on the basis that NIF competes for funds with cleanup programs and waste management. Other commentors feel it costs too much and the funds could be better spent on health care, social services, low-income housing, education, and infrastructure. Still others prefer funds spent on socially beneficial programs, such as conservation, renewable energy, and clean cars.

Response: *The cost of NIF is estimated at $1.1 billion for construction (including escalation and contingency) through 2002. After construction is complete, NIF operating costs are anticipated to be $60 million per year (in fiscal year 1996 dollars) to provide approximately 600 experiments per year. The incremental cost of the Inertial Confinement Fusion Research Program is estimated to be $55 million per year (in fiscal year 1996). Cost is one of many factors which will be considered by decisionmakers in the ROD for NIF.*

DOE has the responsibility for ensuring the safety and reliability of the downsized U.S. nuclear weapons stockpile, a policy priority for the President and Congress. Congress determines how the funds are allocated among programs.

21.05 Commentors believe that the discussion of NIF in the PEIS is inadequate in scope and content. A commentor believes that a reasonable range of alternatives is not provided for the NIF in the NEPA context. The commentors also question whether there are alternative means of obtaining each of the categories of data that NIF is intended to provide. A commentor states a fair and impartial environmental analysis of NIF, as required by NEPA, should include the extensive concomitant environmental impacts from the potential for nuclear weapons proliferation resulting from the spread of inertial confinement fusion technology and the environmental impacts from the successful deployment of fusion as a commercial power source. Several commentors state that in regard to the site-specific review of the various stockpile stewardship facilities, and NIF in particular, that it is inappropriate to include site-specific reviews in the PEIS.

Response: *DOE believes that appendix I, the National Ignition Facility Project-Specific Analysis, was adequate. The NIF project-specific analysis assessed the direct, indirect, and cumulative environmental impacts of the proposed action (appendix section I.3.2), which is to construct and operate NIF (two operational options—Conceptual Design Option and Enhanced Option) and the*

No Action alternative (appendix section I.3.3). NIF was designed to be the minimum-sized facility that has a reasonable probability of achieving ignition and achieving its high temperature density weapon physics goals. No other known technologies are capable of achieving ignition and the high temperatures and densities that occur in weapons materials. Specifically, the pulsed-power technology alluded to in a commentor's letter is not a substitute for NIF capabilities. In general, high intensity laser facilities, like NIF, can achieve temperatures and pressures closer to those in a weapon than can pulsed-power facilities. On the other hand, pulsed-power facilities can put more but less concentrated energy on target than laser facilities, and are, therefore, able to follow certain phenomena for longer times, albeit at much lower temperatures. Thus, rather than providing the same capabilities, laser and pulsed-power facilities complement one another. There are no other design alternatives that would enable NIF to perform its intended mission, therefore, no others were assessed. Thus, the only alternatives that are judged reasonable are to build NIF or not to build it, and if so, where. These two alternatives were explained in detail in appendix I.

Section 1.5 of the PEIS explains the DOE NEPA strategy for the Stockpile Stewardship and Management Program. During the second phase of the NEPA strategy, which would follow the ROD, DOE would prepare any necessary tiered project-specific NEPA documents to implement any programmatic decisions. However, for the three facilities in the proposed action for stockpile stewardship—NIF, CFF, and Atlas—the Stockpile Stewardship and Management PEIS is intended to include sufficient project-specific analyses to complete NEPA requirements for siting, construction, and operation, and thus, satisfy both phases of the NEPA strategy. Including the project-specific analyses for the three facilities in the PEIS does not prejudice the programmatic review. In addition, the CEQ regulations do not preclude this approach.

NIF is not capable of being a prototype for a commercial inertial confinement fusion reactor. As stated in the Justification of Mission Need, the purpose of NIF is to achieve fusion ignition and to use inertial fusion technology for helping nuclear weapons scientists maintain the reliability of the nuclear weapons stockpile in the absence of nuclear testing. This national security mission is the principal justification for NIF. However, the high energy density experiments done at NIF would also help determine if inertial fusion can be developed as a practical energy source. In this context, obtaining ignition on NIF at the lowest laser energy possible would be an important set of experiments. If this is successful, other experiments would study target science that is applicable to any laser or particle accelerator driver that may be used in the future to study inertial confinement fusion as an energy source. NIF experiments could also provide the data necessary to design an engineering test facility, which would be the true engineering basis for a commercial reactor.

*A comparative study of the four driver concepts under consideration (*Laboratory Microfusion Capability Study Phase I Report, *DOE/DP-0069, April 1989)—the solid state laser, the krypton flouride laser, the heavy ion accelerator, and the light ion driver—was done in the late 1980s for what was called the Laboratory Microfusion Facility. This study provided a technical analysis of each driver, a description of their respective research programs, their status, cost, and, in general, the features asked for in the above comment. The Laboratory Microfusion Facility was designed to achieve ignition and high gain, with fusion yields of 200 to 1000 megajoules (MJ), a much larger facility than NIF. During 1989 and 1990, the National Academy of Sciences reviewed the Inertial Confinement Fusion Program and all of these drivers. It was given the information from the previous comparative study. Some of the drivers required several intermediate facilities before the technologies would be mature enough to propose as the driver for a machine of the scale required. In its 1990 study, the National Academy of Sciences recommended that DOE plan on building an ignition facility (eventually this was called NIF) rather than the Laboratory Microfusion Facility and it recommended that DOE pursue this option quickly. Indeed, it suggested that* *start of the project be in 1992. Finally, the study also concluded that the only driver capable of achieving ignition within the next decade or so is the neodymium glass laser.*

DOE accepted the recommendations of the 1990 National Academy of Sciences study and began concentrating resources on NIF, driven by a neodymium glass laser. Four inertial confinement fusion laboratories participated in the conceptual design study for a neodymium glass driven NIF. A prototype beamline of the NIF neodymium glass laser was built and tested successfully. While there has been progress in all driver technologies since the 1990 National Academy of Sciences study, it is clear that the neodymium glass laser's readiness to perform the NIF mission has grown faster than that of any other driver. Thus, for NIF's mission, the neodymium glass laser was judged to be the only reasonable option that would meet program goals.

The programs and facilities that make up the existing weapons program have evolved to their present state because of diverse technical, programmatic, and budgetary considerations. The present programmatic change is the need for improved science-basis to ensure the safety and reliability of our nuclear weapons within a zero-yield test ban. In the case of inertial confinement fusion, technical reviews by the JASONs and the Inertial Confinement Fusion Advisory Committee specifically questioned the technical status, issues, and activities mix of the program within the context of changed programmatic need. Neither the programmatic changes nor the technical reviews have provided any basis for defining a change in the existing program other than adding the significant new capabilities that NIF could contribute. The technical reviews provide a strong basis for continuing today's program and facilities except that the NOVA laser might reasonably stop operation after "NIF construction is well underway ..." (JASONs JSR 96-300 p.16).

Since there is no reasonable basis for defining an option for inertial fusion that is a reduction from today's program, no such option has been considered in the PEIS. Like most research programs, inertial fusion can be adjusted in pace and level of effort based on scientific findings or budget considerations. Any required changes in the program, including reductions, would be accommodated but there are no apparent break points for existing facilities and activities, in a programmatic or environmental sense, that suggest analysis of a particular reduced case.

The addition of an ignition facility to the program has been technically defined and endorsed since 1990. The addition of NIF is considered because it addresses science-based stockpile stewardship needs and is technically consistent with the logic and status of inertial fusion research. Technical reviews have not identified any alternatives to NIF for the mission needs. Any follow on facilities are, at present, too ill defined and speculative to analyze.

Issues such as the environmental impacts from nuclear weapons proliferation resulting from the spread of inertial confinement fusion technology and the environmental impacts from the successful deployment of fusion as a commercial power source are beyond the scope of the PEIS. Knowledge does not, in itself, have environmental impacts, and thus is not analyzed in the PEIS.

21.06 Many commentors support the NIF project on the basis of their perception that NIF would: 1) ensure world peace; 2) maintain a safe, reliable, and viable stockpile through science-based stewardship; 3) keep weapons scientists knowledgeable and equipped with the best available tools; 4) increase security of the United States; 5) continue the evolutionary process for eventual cessation of nuclear weapons and final disarmament; 6) not contribute to proliferation; 7) provide economic benefits; 8) create data on enhanced nuclear fusion energy; 9) help negotiations for the Nuclear Nonproliferation Treaty (NPT) and CTBT; 10) justify the need to eliminate underground nuclear testing; 11) create many employment opportunities in the region as a result of new fusion technology; and 12) have a benign environmental and safety impact with mitigation measures minimizing any possible impacts.

Response: *The purpose of and need for the Stockpile Stewardship and Management Program, and NIF's role within a science-based stockpile stewardship program, are detailed in chapter 2 of the PEIS. The purpose of and need for the NIF project are detailed in appendix section I.2.1. NIF is one of the technologies that is enabling the United States to seek a CTBT. The study,* The National Ignition Facility (NIF) and the Issues of Nonproliferation, Draft Study, Office of Arms Control and Nonproliferation, *August 23, 1995 (citation: U.S. Department of Energy, 1995a in appendix I) concluded that NIF can contribute positively to the U.S. nonproliferation policy and arms control goals. NIF would perform a key role in ensuring the reliability of the Nation's nuclear weapons stockpile without the need for underground testing. Performing this function requires extensive research and experimentation in the areas of weapons physics and advanced computation that can only be provided at the proposed NIF. In addition, through the same scientific accomplishments resulting from stockpile stewardship, science and technological research endeavors can be advanced, including optics, lasers, materials, and measurement techniques, fostered by the challenges of constructing and operating this facility (appendix section I.2.3).*

21.07 The commentors believe the NIF superlaser affords excellent nonweapons research opportunities into the potential of thermonuclear fusion energy without damaging the environment. Commentors believe advancing research into areas such as new energy sources are vital to our civilization considering there may be a lack of natural resources in the 21st century. A commentor states there is no programmatic discussion of the full Inertial Confinement Fusion Program and the follow-on facilities to NIF or other inertial confinement fusion programs in operation. Other commentors state NIF's justification of inertial confinement fusion as a commercial energy source is suspect because inertial confinement fusion cannot serve as the basis for a commercial reactor since it has high cost, low driver efficiency, and the needed repetition rate of target implosions cannot be obtained with neodymium glass lasers. The commentors also state that the NIF design should be modified to increase driver energy to a higher level to give a greater confidence that ignition could be achieved. A commentor believes that no nuclear waste will be generated because fusion will be studied, not fission. Another commentor notes that if NIF is to be used for civilian purposes like DOE claims, then let private companies compete for the funding for this program.

Response: *Research opportunities and scientific and technological benefits would derive from NIF being a multipurpose, multi-use facility. NIF would be constructed for its national security and weapons research role, but it also would present the scientific community with a range of civilian applications. The unique properties of NIF are attracting a broad spectrum of interest from the international community for basic science applications. Although diverse programs of scientific and technological research have been conducted at large lasers in the United Kingdom, France, Germany, and Japan, information on equivalent research in the United States has been restricted because of past substantial classification requirements on much of the research and development associated with the Inertial Confinement Fusion Program.*

Recent changes in U.S. classification guidelines have modified the atmosphere for research at NIF, with the result that U.S. scientists are designing programs of basic and applied research that could be accomplished openly at NIF. The NIF role in fusion energy would be to demonstrate ignition, optimize target gain curves, provide initial data on fusion reactor materials, and allow sound decisions to be made concerning inertial confinement energy development. These data would determine if inertial confinement fusion can be a viable source of electrical power in the future. NIF is not intended to be the basis for a commercial inertial confinement fusion reactor. The neodymium glass laser that would power NIF is recognized not to be a good *candidate for a reactor. Several other drivers, including crystalline solid state lasers, krypton flouride lasers, heavy ion accelerators, and light ion diodes are under development. The National Academy of Sciences stated that ignition should be the next goal for inertial confinement fusion and that the only way to achieve that in the next decade or so is with a neodymium glass laser driver (1990 National Academy of Sciences study). The Inertial Confinement Fusion Advisory Committee stated that achieving ignition by any driver was the most important next step in development of inertial fusion energy.*

NIF would also establish new capabilities in many other potential areas of study, including: astrophysics, hydrodynamics, material properties, plasma physics, radiation sources, radiative properties, and other potential applications, such as nonlinear physics, geophysics, other atomic physics applications, and optical physics. NIF could also spur high-technology industries in optics, lasers, materials, high-speed instrumentation, semiconductors, and precision manufacturing. Further discussion is included in appendix section I.2.3.

Any follow-on facilities to NIF are, at present, too ill defined and speculative to include. For accomplishing the mission of NIF, there are no reasonable alternatives.

Article IV of the NPT commits parties to facilitating the "fullest possible exchange of "... scientific and technological information" related to peaceful uses of nuclear energy. This commitment was included in the NPT at the insistence of nonnuclear weapons states that were concerned that they would suffer scientific and technological disadvantages compared to the nuclear weapon states.

Environmental impacts associated with the construction and operation of NIF are detailed in appendix sections I.4.1.2, I.4.2.2, I.4.3.2, I.4.4.2, and I.4.5.2. The comment that no nuclear work would be generated by NIF is incorrect; however, the small quantities of low-level radioactive wastes estimated to be generated by NIF can be handled by current or planned waste management capabilities at each alternative site for NIF.

21.08 The commentor suggests the unevenness of LLNL's early expenditure estimates, coupled with the rapid growth of spending a year ahead of when it would be expected to occur based on past projects, leads commentor to conclude that NIF may overspend early in the project cycle and may experience significant delays due to the attempt to "push" the project in the first four years.

Response: *The proposed NIF funding profile is based on the annual funding necessary to construct a facility which begins operation in 2003. The apparent rapid growth of funding "a year ahead of when it would be expected to occur based on past projects" is required so that initial construction contracts and long lead procurements can be placed near the end of fiscal year 1997 for actual accomplishment during fiscal year 1998.*

21.09 Commentors note that there are several varying estimates regarding the number of jobs which would be created each year by NIF and the regional economic impacts were misleading. One commentor notes that the regional economic impacts from building NIF cited in the Conceptual Design Report are inflated and misleading. According to the commentor, the regional economic effects of the construction and pre-operation of NIF will be small over the 7-year construction period. A large influx of construction employees during years 3, 4, and 5 of the construction period and a correspondingly large decrease in construction employees during 6 and 7 has the potential to create a boom-and-bust scenario in the Livermore region since approximately 1,200 people would move in and out during the last 4 years of the construction of NIF. The commentor states that the jobs will vary during each year of construction from 22 jobs the first year to 600 jobs the fifth year. The commentor contends that construction jobs would decrease to 120 by year 7 and only about 230 long-term jobs will stay at NIF.

Response: *The socioeconomic analysis provides data on the peak number of jobs, in-migrating population, number of housing units required, increase in local jurisdiction (revenues and expenditures), and number of daily vehicle trips associated with the construction and operation of NIF. Several other sources have analyzed the impact of NIF on employment, and have reached different conclusions regarding the employment impact of the facility. The differences are attributable to different data, methodologies, and assumptions used in the studies. For example, the project-specific analysis supporting NIF in appendix I is of greater depth than that performed for the PEIS alternatives.*

Socioeconomic impacts were measured using the latest version of RIMS II, an accounting framework model developed by the U.S. Bureau of Economic Analysis (section 4.1.8). The model is used by Government agencies, university researchers, and economists to measure economic impacts. The database used for the socioeconomic study was developed using the most recent information available from the Departments of Commerce and Labor, as well as financial reports provided by cities, counties, and school districts. The model estimates impacts occurring in the local area surrounding each site and those that occur in the regional and national economy as well. Appendix table I.3.6.1–1 provides a comparison of socioeconomic impacts across the five candidate sites.

Appendix section I.4.1.2.6 provides information on the effects of constructing and operating NIF at LLNL in the San Francisco Bay area economy. A number of related industries are located outside the San Francisco Bay area, and therefore, some of the economic benefits would be gained elsewhere in the U.S. economy. However, in terms of impacts across all industries that would provide inputs to NIF, the majority of employment created from construction at LLNL would occur in the San Francisco Bay area economy. The expected demand for housing for in-migrating construction workers is less than 2 percent of the housing units available, therefore NIF construction would not create a boom-bust effect in the local housing market (appendix section I.4.2.6). Text has been added in appendix I to explicitly address the issue of retained jobs.

The analysis performed for the NIF project-specific analysis (appendix section I.4.1.2.6) estimated that a total of 1,900 construction-related workers and their families would move into the LLNL area from the start of construction in 1996 to the peak in 1998. The project-specific analysis estimates that this would result in the demand for an additional 690 housing units in the area surrounding LLNL. Baseline projections show that 54,000 housing units would be available over this period in the local area, indicating that NIF-related in-migration would use less than 2 percent of locally available housing. It is unlikely, therefore, that NIF construction would create the boom-bust effect in the local housing market described by the commentor.

21.10 Commentors feel that jobs being created by NIF would be costly, not prosperous, come at the risk to other LLNL programs, ignore those created from technological inventions, and are at risk because of the annual budget process. Other commentors support NIF at LLNL and feel that NIF is a responsible project which would not be trivial work and should not be minimized.

Response: *NIF would be a unique, state-of-the-art scientific facility whose primary mission would be to ensure the continued reliability of the nuclear weapons stockpile. Creating employment at the site chosen and for the surrounding economy is secondary to this objective. Many commercial facilities are likely to create more employment than NIF at a lower cost of investment, but many of these facilities do not have a research mission and none use comparable technologies. It is not,* *therefore, possible to compare the costs and benefits of NIF versus commercial facilities solely on the basis of the number of jobs created.*

The estimates of employment impacts associated with NIF do not include the economic benefits of any additional new technologies and scientific enterprises that might result from experimentation at NIF and that could be transferred to the commercial sector. For example, no assessment was made of the potential economic benefits from a possible development of inertial fusion as a source of electrical power for use by the commercial sector. As the nature, scale, and timing of any future benefits of new technological and scientific developments associated with NIF are uncertain, these are not currently included in the assessment of economic impacts in the EIS.

As with any government research facility and program funded through the annual appropriation process, funding for NIF would be dependent on annual decisions by the President and Congress. The purpose and need for NIF are tied directly to U.S. decisions to maintain a safe and reliable weapons stockpile as a key element of the deterrence policy. In the appropriations process, all Government programs compete for funding based on their merits. There is no direct causal relationship between funding one program and an increase or decrease in funding for another program at the same site.

21.11 The commentor feels the construction of NIF will be delayed because the decision regarding NIF will drag on for the next few years.

Response: *DOE has developed a timeline of numbered sequential Key Decisions, now known as critical decisions. This management system will be used to ensure the orderly progress of the proposed NIF project. The Secretary of Energy in Key Decision 0 (January 1993) affirmed the need for NIF. Key Decision 1 (October 1994) approved the preliminary engineering design and site evaluation. Critical decision 3, scheduled in 1997 after the PEIS ROD, would authorize construction and major procurements. Critical decision 4, scheduled in late 2002, would authorize operation and first experiments.*

21.12 The commentors state that DOE cannot state that the radiological health threat of NIF is small with certainty from a threshold exposure basis. Commentors are concerned that the use of tritium and deuterium fuel at NIF will add to the amount of tritium and other toxic chemicals being released into the environment and create radioactive waste. Another commentor is concerned that plutonium-239 or tritium would be produced at NIF. Other commentors express confidence that NIF is a safe facility which is not hazardous to the environment and that they believe that LLNL will accept and diligently implement any mitigation measures contained in the NIF appendix.

Response: *Appendix section I.3.6.7 summarizes and compares the radioactive and hazardous chemicals impacts from normal operations at NIF, a low hazard radiological facility, to the general public surrounding all candidate sites. Conservative assumptions were used to ensure estimated potential radiological doses were maximized in the PEIS analysis. The calculated doses were then multiplied by 0.0005 fatal cancers per rem to obtain radiological health effects, assuming no threshold exposure limits. Results indicated that no cancer deaths would occur among workers and in the general public due to construction and operation of NIF.*

The maximum tritium effluent (atmospheric release) from normal operations would be 10 Ci/yr (0.001 g/yr) for conceptual design operations and 30 Ci/yr (0.003 g/yr) for enhanced operations (appendix sections I.3.2.2.1 and I.3.2.2.2). No latent cancers are projected from NIF's 30 years of operation at any of the candidate sites. The quantities of hazardous chemicals used are small and the only emissions would be from the small quantities of volatile materials used for optics cleaning.

Under the postulated accident conditions at any candidate site over the 30-year lifetime, the risk of radiation-caused cancer fatalities to the public would be essentially zero (less than 1 in 700,000) when the anticipated extremely low accident frequency during NIF operations is taken into account. Modeling of four release scenarios covering a wide range of nonradiological chemical releases for each candidate site for NIF revealed that offsite nonradiological impacts would be negligible and no fatalities would occur (appendix section I.3.6.7).

The fuel for NIF experiments would consist of a mixture of tritium and deuterium and the experiments would create small amounts of activation products. The ratio of the mixture of tritium to deuterium, however, has not been determined. The unignited fuel and any activation products would be removed from the target chamber as described in the NIF appendix (appendix section I.4.1.2.8.1) and disposed of according to established procedures. The amount of low level radioactive waste projected to be generated is small and it is analyzed in the PEIS (appendix section I.3.6.8) for all candidate sites. Although each alternative site would implement waste minimization practices, the generation of additional wastes would be unavoidable. All alternative sites have current or planned capacity to handle wastes associated with construction and operation of NIF; however, this would entail offsite shipment of some of the wastes for all sites, except at LANL.

Experiments that use fissile material, such as plutonium-239, have been postulated, but not defined. However, no experiments of this type are foreseen in planned NIF operations and thus are not considered in this document. Any future determination to conduct experiments that have implications beyond the currently defined operational envelope and safety analysis would require both additional safety analysis and NEPA action in addition to possible facility modifications. Additional information can be found in appendix section I.3.5 of the PEIS.

NIF would monitor the release of elemental tritium and tritiated water. In addition, the tritium air monitoring system would measure NIF tritium emissions as part of the total from all site operations. Since tritiated water is 25,000 times as toxic as tritium in the hydrogen gas form, the site monitoring system concentrates on measurement of tritiated water. These measurements would be peer reviewed and would be done in accordance with the procedures approved by the respective regulatory agencies.

NIF would be constructed and operated in compliance with all applicable statutes, regulations, and standards (see appendix section I.5). In addition, specific mitigation measures that the selected site would implement are addressed in appendix section I.4.7. If specific mitigation measures, monitoring, or other conditions are required, they will be adopted as part of the ROD.

21.13 The commentor states that a "total systems life-cycle-cost" study should be performed, and updated every few years, for NIF. This would be similar to what is required of the Yucca Mountain project under the *Nuclear Waste Policy Act*. Another commentor states that whatever the estimate of how much NIF is going to cost, the life-cycle cost will probably end up being greater than the estimate.

Response: *The individual elements of the NIF life-cycle costs such as design, construction and equipment procurement, installation and inspection, start-up testing, environmental and safety reviews, operations, and D&D were estimated in the* Conceptual Design Report, *which is available in the DOE Public Reading Rooms near each site. These cost elements, except for D&D, were independently reviewed in 1994. The review of D&D costs was performed in 1996. DOE requires that all projects conduct a life-cycle cost study, though not in the depth and complexity of that performed for the Yucca Mountain project under the* Nuclear Waste Policy Act.

NIF would perform a life-cycle cost study as part of the design process. The life-cycle cost study would be updated if any significant assumptions change.

21.14 The commentor suggests that both the proposed areas considered for "laydown" or temporary staging of equipment, materials, and supplies at LLNL, in the construction of NIF, be designated in the project-specific assessment in appendix I. The commentor also suggests that the potential impacts of the staging of NIF construction equipment and supplies at LLNL, as well as the impacts of construction of the proposed NIF, also be addressed in appendix I, as well as in the PEIS text.

Response: *The proposed areas considered for "laydown" or temporary staging of equipment, materials, and supplies at LLNL, in the construction of NIF, are designated in appendix section I.3.4.1.3 and shown in appendix figure I.3.4.1.1–2 of the project-specific assessment in appendix I. The potential impacts of the staging of NIF construction equipment and supplies at LLNL, as well as the impacts of construction of the proposed NIF are addressed in appendix section I.4.1.2, as well as in the main text of the PEIS. Discussions of this same topic are also included in the appropriate sections of appendix I for the other alternative sites for construction and operation of NIF.*

21.15 Commentors believe that the purpose of NIF is to advance nuclear weapons research, science, design, development, and testing. Commentors believe new materials require new designs, as occurred from the 1960s through the 1980s, and the combination of new materials and NIF will help contribute to new designs today. One commentor states that it is already known and certified through nuclear tests that the secondaries will operate as designed, if driven by the test certified primary, and questions the need for NIF for stockpile stewardship. Another commentor thinks NIF will probably have a major role in weapons research and design, wants an analysis of the long- and short-term impacts. Another commentor states that because NIF will continue weapons development that the PEIS should evaluate the impacts of nuclear explosions. A commentor is concerned with NIF being like a "super-oven" and is opposed to it being sited at LLNL.

Response: *The President has declared that the maintenance of a safe and reliable nuclear weapons stockpile will remain a cornerstone of national security policy for the foreseeable future. Changes to U.S. national security policies in the post-Cold War period have placed two significant constraints on the way DOE has traditionally accomplished its statutory nuclear mission: the United States has declared a moratorium on underground nuclear testing, and has stopped the development and production of new-design weapons. In August 1995, the President declared that the United States was seeking ratification of a zero-yield CTBT. Within these constraints, the proposed actions in the Stockpile Stewardship and Management PEIS will enable DOE to maintain the core intellectual and technical competencies necessary to ensure the continued safety and reliability of the stockpile under a CTBT. In this situation the United States needs a comprehensive calculational ability and a set of experimental facilities that can access the physical regimes that exist inside exploding weapons. NIF is one of those experimental facilities. The Stockpile Stewardship and Management Program was constructed with the national mission of maintaining U.S. security in response to requests from the President and Congress.*

In the science-based stockpile stewardship program, NIF nuclear weapons research experiments can be used to verify increasingly sophisticated and comprehensive computer models and codes of the performance (reliability) of nuclear weapons and to assess the impact of changes in that performance due to age- or remanufacture-related changes in the remaining weapons stockpile in the absence of nuclear testing. This type of evaluation can be done for a weapon that has been tested before. NIF experiments, in combination with the existing nuclear test database, would be *used in the computer calculations to determine if changes detected have an adverse effect on weapon reliability.*

A study of the technical vertical and horizontal proliferation concerns surrounding NIF occurred between September 1994 and December 1995, including external reviewers, interagency coordination (DOD, Department of State, the Central Intelligence Agency, and the National Security Council), and public meetings. The unclassified results were published in the DOE document, NIF and the Issues of Nonproliferation Draft Study. *In that study, the weapons design capabilities of NIF were extensively examined. It concluded that the development of new weapons requires integrated testing, such as occurs in nuclear explosive tests, in order to determine if the thousands of individual events interact properly. NIF by itself cannot perform such integrated testing of new concepts and, therefore, cannot replace nuclear testing for development of new nuclear weapons designs.*

21.16 The commentor wants DOE to take a leadership role in preventing NIF from polluting the San Francisco Bay area.

Response: *The construction and operation of NIF would not pollute the San Francisco Bay area. The analysis has shown that NIF would have no significant impacts to workers, the environment, or the public. The public would be exposed to a very small dose of radiation over the 30-year operating lifetime of NIF. No cancer fatalities would be expected to occur from exposures associated with routine operations (appendix section I.3.6.7). The release of volatile organic materials used for optics cleaning is small. All candidate sites have current or planned waste management capability to handle the wastes generated by operation (appendix section I.3.6.8).*

21.17 Commentors feel that NIF will contribute to proliferation and lead to a less secure nation. Several commentors request that the short- and long-term nonproliferation aspects of NIF be further analyzed and included in the EIS. One commentor states that the detailed analysis in the report, *National Ignition Facility and the Issue of Nonproliferation*, does not support its conclusions. A commentor states there is no substantial analysis of the ongoing controversy on potential proliferation impacts of NIF. Another commentor believes that the only way NIF contributes to U.S. nonproliferation goals is by making the test ban acceptable to the U.S. weapons establishment. One commentor feels that discussions to determine the impacts of NIF on proliferation had occurred. A commentor states that the Draft PEIS does not have substantive detailed discussions about specific experiments NIF will do, such as studies of mixing of fissionable material into fusion fuel, on which to base a conclusion about NIF's worth and effect on nonproliferation.

Response: *The Secretary of Energy committed the DOE's Office of Arms Control and Nonproliferation, an independent branch of DOE, which has no programmatic responsibility for NIF, to examine whether the facility would aid or hinder U.S. nonproliferation efforts before proceeding with substantial budgetary commitments to construct NIF. A study of the technical vertical and horizontal proliferation concerns surrounding NIF occurred between September 1994 and December 1995, including external reviewers, interagency coordination (DOD, Department of State, the Central Intelligence Agency, and the National Security Council), and public meetings. The original draft was classified so that all aspects of NIF operations could be analyzed. An unclassified version was then prepared and both versions were reviewed by seven independent experts in the technical, policy, and arms control fields to ensure accuracy, comprehensiveness, and consistency. The unclassified results were published in the DOE document,* NIF and the Issues of Nonproliferation Draft Study *and submitted to the Secretary of Energy for her decision. It concluded that the technical vertical and horizontal proliferation issues of NIF are manageable and can be made acceptable, and that NIF can contribute positively to the U.S. nonproliferation policy and arms control goals. DOE believes that the conclusions of the report are supported by* *the body of the report and the process that was followed assured that all views were accounted for and dealt with.*

Article VI of the NPT calls for all of the parties to the NPT to "undertake to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a Treaty on general and complete disarmament under strict and effective international control." NIF and other stockpile stewardship programs are designed to provide the United States with the confidence that its arsenal is adequately maintained during size reduction without testing.

The NIF and the Issues of Nonproliferation Draft Study *does discuss, to the extent allowed by classification, the areas of weapons physics that can be addressed by NIF and the types of transparency and access control measures that can be used to assure support of the U.S. goals for nonproliferation. Detailed discussions, such as the mixing of fissionable material into fusion fuel, and its specific relevance to weapons physics issues remains classified. Such specific issues were addressed in detail in the classified version of the study and in classified discussions with the independent expert reviewers. These reviewers determined the conclusions of the unclassified report were supported by the full content of the study.*

21.18 The commentor believes that NIF may contribute to exceedances of state standards for PM_{10} and VOC emissions and that complying with air quality standards will help sustain economic growth and vitality in the San Francisco Bay area. Therefore, the commentor recommends that NIF obtain offsets to mitigate its emissions of PM_{10} and VOC from operation even if they are not legally mandated.

Response: *NIF would have small PM_{10} emissions during construction and small VOC emissions from operation largely from optics cleaning. Emission offsets will be provided for this project as required by air district regulation. California law prohibits any air district from issuing a permit which represents a growth in emissions after January 1, 1988. The air districts comply with this requirement by offsetting emissions from other sources. Each permit application is evaluated and offsets are provided from the Small Facility Bank, which is operated by the district or by the facility making the application in the form of emission reductions or emission banking certificates. Sources such as LLNL, with very small total emissions, may use the Small Facility Bank until their growth reaches a trigger level where the facility is required to offset all they have borrowed from the Small Facility Bank plus the emissions for the permit tripping the requirement. This offsetting policy provides for economic growth while at the same time reducing emissions. Facilities must offset to "permitted" emission levels and operate at "actual" emissions levels. The difference between "permitted" and "actual" levels is a reduction in the district's total emissions as required by California law. Also facilities may only obtain banking certificates for "actual" emissions while offsetting to "permitted" levels for their next project. This also provides for a reduction in emissions and is often referred to as the "transaction cost."*

21.19 The commentor feels LLNL is not accurately reporting tritium in the yearly annual environmental report and values presented are underestimated. The commentor feels the tritium released from NIF will probably not be reported accurately as well. The commentor points out that the problem exists because the values reported represent contaminated water only. The commentor notes that tritium organically bound in organic surroundings, such as grass and tritiated water, is not being measured and it represents a hazard which is approximately 25,000 to 2,500,000 times more toxic than tritium gas.

Response: *As described in the* 1994 LLNL Environmental Monitoring Report. *LLNL collects vegetation samples (usually annual grasses) quarterly from about 15 different locations throughout the Livermore, San Joaquin, and San Ramon Valleys. Vegetation samples are analyzed using a freeze-drying method, which removes essentially all of the water (which would, of course, include any tritium) from the sample. It is possible that some small fraction of tritium in the vegetation may be "organically bound," and not recovered in the freeze-drying process. However, this small fraction of unrecovered tritium would not add significantly to the amount of tritium reported. These measurements have been peer reviewed and are completely accepted by state and Federal agencies.*

NIF would emit less than 30 Ci/yr (0.003 g/yr) of tritium. The impact of this small release to the public or the environment would be negligible. NIF would continuously monitor the release of elemental tritium and tritiated water. The LLNL sitewide monitoring system will monitor tritium emissions as part of the total from laboratory operations.

21.20 Commentors ask how LLNL became the preferred site, several encourage a Federal decision to proceed with NIF at the LLNL site because of the site's advantages and the analyses of environmental impacts showing any adverse impacts are generally not significant. Commentors desire to know if there was any possibility that NIF may come to NTS or LANL. Commentors are troubled by political siting decisions, including that elected officials lobby for NIF at LLNL on the basis of jobs and economics.

Response: *Five locations (LLNL, LANL, NTS, North Las Vegas Facility [NLVF], and SNL) are considered in the PEIS for the NIF based on a two-step process for selection (appendix section I.3.4) and DOE has assessed the impacts of constructing and operating NIF at all of the candidate locations at the candidate sites. The PEIS provides information to decision-makers and the public to allow a comprehensive assessment of the purpose and need, and to compare potential environmental impacts of constructing and operating NIF at all of the candidate sites. In the ROD, the Secretary of Energy will make a final site selection taking into account the results of the PEIS and other considerations such as cost differences, availability of scientific and technical personnel, and capability of facility infrastructure to support NIF. In the ROD, to be published at least 30 days after the Final PEIS is completed, DOE will explain all the factors, including environmental impacts, that DOE considered in reaching its decision on siting NIF.*

In her October 20, 1994 approval letter for Key Decision 1, Energy Secretary Hazel O'Leary announced LLNL as the preferred site (appendix section I-5.6) because of its prominence as a leading center for laser science, engineering, and technology. LLNL has the required combination of existing facilities, equipment, infrastructure, and technical and management personnel required. The other weapons laboratories, SNL and LANL, meet all of the criteria, but not to the extent of LLNL. NTS meets four of the five primary siting criteria, lacking only a significant inertial confinement fusion infrastructure.

The environmental analysis for the construction and operation of NIF at each of the alternative sites is described in appendix sections I.4.1.2, I.4.2.2, I.4.3.2, I.4.4.2, and I.4.5.2. Impacts to human health from NIF operations would be within regulatory limits. NIF would be operated in accordance with applicable statutes, regulations, and standards (appendix section I.5) and enacting appropriate mitigation measures, including the development of a monitoring and mitigation plan which accompanies the ROD.

22 STEWARDSHIP—ATLAS FACILITY

22.01 The commentor asks why a new Atlas Facility is under construction in Los Alamos when DOE already has an Atlas Facility in North Las Vegas, NV. The commentor questions why both are needed if they are the same. If they are different, the commentor states, the name of the new one should be changed to avoid confusion.

Response: *The two facilities are not the same and have different purposes. The Atlas Facility in North Las Vegas was developed by LLNL from a plan called the Augmented Test Logistics Assembly System (ATLAS). The purpose of the facility was to provide a location for canister fabrication, instrumentation preparation, and other prestaging operations prior to vertical emplacement for underground nuclear testing at NTS. These activities were related to mechanical operations of the past experimental program. As a potential future stockpile stewardship facility, the purpose of Atlas at LANL is to perform high-energy pulsed-power experiments to simulate certain hydrodynamic and radiation effects and to predict the effects of aging on the weapons in the existing stockpile.*

22.02 The commentor states that the description of the Atlas Facility is limited in both the executive summary and in section 3.3.2.3 of Volume I. Commentor recommends that DOE expand the discussion of the uses of the facility since it is unclear and, therefore, difficult to review the potential environmental impacts.

Response: *A detailed description of the Atlas Facility and its potential environmental impacts and accidents are included in appendix K, Volume III of the PEIS.*

22.03 The commentor states that the Atlas Facility is not needed because defects in secondaries (the primary area of research for Atlas) are quite rare. The commentor, noting that the Pegasus II Facility is used for up to 24 experiments annually while Atlas is supposed to perform up to 100 experiments, asks what is the need for the dramatic rise in experiments.

Response: *This stockpile stewardship facility would be used to gauge the safety and reliability of weapons in the enduring stockpile. As noted in section 2.3.3, of the approximately 400 defects which required some corrective action since 1958, 110 were in the nuclear package. Of these the majority (approximately 90) were indeed associated with the weapon primary. However, the remaining number were still associated with the weapon secondary. The lower frequency of these relative to the primary related defects does not imply that DOE need not develop capabilities to address such defects, which might otherwise compromise stockpile reliability, when they arise. The existing weapons will age beyond the point in which DOE has historical experience. Furthermore, even defects which are determined to not require corrective action would have to be evaluated by DOE through the stockpile stewardship program including relevant experiments such as those for which Atlas is proposed.*

There is no correlation between the number of experiments conducted annually at the Pegasus II Facility and the design capacity for Atlas because Pegasus II currently supplies limited data regarding weapons physics and Pegasus II's power capacity is insufficient to reach the conditions necessary for experiments planned for Atlas. Pegasus II, which was developed before the cessation of nuclear testing, does not readily support larger numbers of experiments because of operational procedures related to the facility design. The capability of Atlas to support up to 100 experiments per year, to meet anticipated programmatic needs, would be enabled by the design of that new facility.

30 MANAGEMENT—WEAPONS ASSEMBLY/DISASSEMBLY

30.01 Several commentors express support for continued operation of Pantex, citing lower costs, sound environmental and safety record, and local support. Some commentors specifically endorse continuance of the weapons A/D and HE fabrication missions.

As the commentors note, the preferred alternative for the weapons A/D mission is to downsize operations at Pantex. The HE production mission includes HE procurement, formulation, component fabrication, characterization, surveillance, disposal, and storage. As discussed in the Analysis of Stockpile Management Alternatives *report, DOE's goal for the HE fabrication mission is to assure core competency maintenance while achieving cost efficiencies. At the time the Draft PEIS was issued, the HE production mission which best achieved these objectives was not clear, therefore DOE deferred identification of a preferred alternative for the HE production mission while further analysis was performed. Since that time, DOE has completed the analysis and has identified the preferred alternative for the HE production mission which is to downsize the production mission at Pantex. The decisions on the A/D mission and the HE fabrication mission will be documented in the ROD. The* Analysis of Stockpile Management Alternatives *report is available for public review at the DOE Public Reading Rooms near each site.*

30.02 Several commentors request additional cost information or express dissatisfaction with the selection of Pantex as the preferred alternative over NTS. Information requested includes specific differences in security guard costs and estimated dollar savings for Pantex versus NTS. Another commentor requests that DOE use a "fair and open cost comparison" of all alternatives in analyzing sites and that this information be shared with the public.

Response: *The preferred alternative for the A/D mission is to downsize the current operations at Pantex. The final decision will be documented in the ROD. Cost effectiveness is only one of the many factors DOE used to arrive at the preferred alternative. The PEIS analysis shows that while there is some potential for adverse environmental impacts associated with continuing A/D operations at Pantex, the impacts would be less for the downsized facilities than for the No Action alternative. Additionally, there is less technical risk associated with the Pantex alternative because Pantex personnel are currently performing this mission, whereas similar operations for assembly of nuclear test devices at NTS have historically been performed by laboratory personnel. Specific program and alternative costs are not part of the PEIS analysis. Stockpile management alternative costs have been analyzed in two supplementary documents provided by the DOE Albuquerque Operations Office. These reports, the* Analysis of Stockpile Management Alternatives *report, and the* Stockpile Management Preferred Alternatives Report, *are available for public review at the DOE Public Reading Rooms near each site.*

30.03 Several commentors express support for NTS and for moving the A/D mission to NTS. Commentors state that NTS has the established infrastructure, trained workforce, and ideal location to accept such a mission. Commentors also state that even with the past nuclear activities conducted at the site, tourism and area growth was not affected. Some commentors suggest that NTS has not been properly represented in the Draft PEIS.

Response: *For the weapons A/D mission, only Pantex and NTS were considered as reasonable alternatives because no other DOE sites possess the experience and infrastructure to perform this mission. The preferred alternative is to downsize at Pantex because analysis discussed in the* Analysis of Stockpile Management Alternatives *report and the* Stockpile Management Preferred Alternatives Report *shows that Pantex is a lower cost and lower technical and schedule risk alternative than NTS. The preferred alternatives were developed by DOE using data and* *studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. Retaining the weapons A/D mission at Pantex presents less cost and technical risk than relocating to NTS because Pantex personnel are currently performing this mission, whereas similar operations for assembly of nuclear test devices at NTS have historically been performed by laboratory personnel. Hence, additional risk is added to the NTS alternative due to: the support that would be required from the laboratories to assist in the qualification of production operations, the uncertainty of laboratory personnel availability, the significant amount of construction required on a very aggressive schedule, and the 1-year gap in operations which would result from transition of the mission to NTS. The two stockpile management alternatives reports are available for public review at the DOE Public Reading Rooms near each site.*

30.04 The commentor cites section 3.7.1, Stockpile Management, and thinks the last sentence of the last paragraph should read "in the unlikely event ... of an accident instead of "... in the event of an accident."

Response: *The sentence in question is correct as stated since it refers to the consequences of a postulated accident, not the probability that it would occur. The PEIS analysis, as detailed in appendix F and as discussed in section 4.1.9.2, Facility Accidents, includes both the probability and the consequences of selected representative accidents. These accidents include both beyond design basis (high-consequence, low-probability) and design basis (low-consequence, high-probability) accidents.*

30.05 The commentor cites appendix table A.3.1.1–1, states that the table should include the Burning Ground, and inquires about the location of the sanitization and demilitarization facilities and the waste treatment facilities.

Response: *The Burning Ground is not considered part of the A/D operation, but is covered separately in the HE fabrication function (see appendix table A.3.5.1–2). There is some uncertainty associated with the time period for the elimination of projected inventories of HE from weapon dismantlement, and consequently there is currently no approved schedule for this activity. A completion date of fiscal year 2000 is assumed in the PEIS and is considered conservative, as it allows for 2 additional years to complete the disposition of HE that would be generated at Pantex through 1998. In other words, the HE waste produced during dismantlements should be disposed of prior to the implementation of the downsized facility at Pantex. Appendix table A.3.1.1–1 is not intended to include all of the facilities needed to support A/D operations, only "key" facilities. Although some sanitization and demilitarization actions are conducted at Pantex, there are no facilities dedicated solely to these activities. Parts resulting from the A/D operations may be recertified and staged for reassembly, shipped to the originating site for evaluation or disposition, or processed as residual material in the waste management process. Waste management affected environment and environmental consequences of proposed stockpile stewardship and management actions at Pantex are discussed in sections 4.5.2.10 and 4.5.3.10, respectively, and appendix section H.2.4.*

30.06 The commentor wants to know what DOE means by stating they would like to keep the stockpile as young as possible and asks if A/D will continue in order to keep the stockpile fresh. In addition, the commentor asks what happens to pits that come out of the disassembled weapons.

Response: *Weapons would be refurbished, modified, and retrofitted as needed for components that have, or are expected to be, degraded due to age. In many cases, the A/D site would be involved in fixing those components. The pits from disassembled weapons are either used in rebuilt weapons or are surplused and disposed of by the DOE Office of Fissile Materials Disposition.*

30.07 The commentor thinks that there is no recognition throughout the PEIS that the Device Assembly Facility is a backup to Pantex, which could be critical to the successful implementation of treaty requirements. The Device Assembly Facility could act as a backup facility should Pantex be shut down as a result of a natural disaster or a safety violation. The commentor states that the PEIS process has analyzed two options: (1) to keep A/D operations at Pantex and (2) to transfer those operations to NTS. The commentor believes that the option to combine operations in a way that more completely protects the national options of the President has been completely disregarded.

Response: *The design of the Device Assembly Facility is identical to the facilities at Pantex and was recently built to support the underground testing program at NTS. It does not, however, have the space and capacity to serve as a complete backup to Pantex without significant construction that would take many years to accomplish. In addition, many of the existing bays and cells at Pantex would not be utilized by A/D operations but could be rapidly put to that use if some of the other facilities become inoperable.*

At one time there was another site performing A/D work, but the need for a redundant operation was not considered necessary; therefore, that site was closed. Given that the need for a backup facility was considered unnecessary during the Cold War, it is not reasonable to plan to have this capability at NTS at this time.

30.08 Referencing page 7–17 of the *Analysis of Stockpile Management Alternatives* report, the commentor believes a stockpile of 1,000 weapons was analyzed in order to increase the chance that production work would be moved to the laboratories. The 1,000 level favors lower production capability at the laboratories and makes Pantex look extremely large in cost, according to the commentor.

Response: *DOE established the baseline workload based on the best estimate of the future size and composition of the stockpile. In addition to the base case, two other workload levels were established as a means of providing a sensitivity analysis among the various alternatives. As such, the 1,000 weapon stockpile was considered to be a reasonable lower stockpile level and was used by all sites for all missions. It was not devised as a means to make one site appear more favorable than another.*

31 MANAGEMENT—NONNUCLEAR COMPONENTS

31.01 Several commentors express support for KCP and the Secretary of Energy's decision to downsize the nonnuclear fabrication mission at KCP rather than transfer this mission to an alternative site; however, they are concerned about the loss of expertise and skill base. One commentor wants to know what level of flexibility is built into decisions should things change in the future, and one suggests an expansion of KCP's role in providing nonnuclear fabrication support.

Response: *As the commentors noted, the preferred alternative for the nonnuclear fabrication mission is to downsize KCP. The preferred alternatives were developed by DOE, using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. The PEIS does not analyze how well the preferred alternative meets operational needs. This analysis can be found in the* Stockpile Management Preferred Alternatives Report *and the* Analysis of Stockpile Management Alternatives *report, which show that the KCP alternative is lower in cost and has less technical risk than relocation to the laboratories. Technical risk is greater for the laboratory alternatives because KCP currently has an existing production infrastructure to support scheduled work, whereas the laboratories currently do not possess the required production capacity, and their production capability and infrastructure are less mature* *than that of KCP. The design of the downsized production alternative at KCP provides the technical capability, production capacity, and flexibility necessary to allow KCP to support scheduled nonnuclear production and a wide range of unanticipated production requirements. The two stockpile management alternatives reports are available for public review at the DOE Public Reading Rooms near each site.*

32 MANAGEMENT—PITS

32.01 Several commentors are concerned that reestablishing pit production would lead to either increased weapons production, larger scale pit production capacity, or new designs of weapons. The commentors want clarification of proposed pit production capacities at LANL, historical pit production capacities at Rocky Flats, and the relationship between replacement pit production and the possibility of pit processing leading to new or improved weapons design. One commentor opposes continued production of plutonium pits and is of the opinion that the nuclear industry is the greatest threat to life on this planet.

Response: *The mission of the pit fabrication facility would be to reestablish the national security capability required to provide replacement pits for any stockpile weapon. Safety improvements to existing weapons pit designs could be incorporated if necessary and if directed by the President. Although there are presently no plans to develop any new weapons, the facility would be capable of fabricating new pit designs, should the President so direct in the national interest. DOE does not propose to establish higher manufacturing capacities than are inherent with the basic manufacturing capability. As discussed in section 3.1.1.1, stockpile management facilities analyzed in the PEIS are sized to support a base case stockpile size consistent with the Strategic Arms Reduction Treaty (START) II protocol and are therefore consistent with U.S. arms control policy. The capacity of the LANL pit fabrication facility is discussed in appendix section A.3.3.1, and is shown as a maximum of 80 pits per year, assuming surge (multiple-shift) operation, and use of equipment at full capacity. The capacity of Rocky Flats for pit production was about 2,000 per year. Actual production numbers are classified. With regards to larger-scale pit production, in sizing pit fabrication for the foreseeable future, consideration was given to establishing a larger fabrication capacity in line with the capacity planned for other portions of the Complex. However, after review of historical pit surveillance data, larger capacity was rejected because of the expected small demand for the fabrication of new replacement pits for the foreseeable future covered in this PEIS. Section 3.6 of this PEIS explains this in greater detail.*

32.02 A few commentors question specific historical and proposed pit processing technologies. Specifically, commentors ask if the fissile materials will be melted and purified before being remanufactured and wonder if DOE would replace the pits with a different alloy or use the same alloy if a pit metal problem developed. If a different alloy is used, the commentors question whether DOE currently has the technology to change the plutonium alloy mix if a problem develops. One commentor states that the complex metallurgical structure of plutonium limits the processing possibilities and as an example gave the perceived failure of the near-net shape casting process employed at Rocky Flats. In the commentor's opinion, better computer modeling will not change the problem.

Response: *The mission of the pit fabrication facility would be to provide replacement pits for any stockpile weapon. Thus, the pit design and alloys would remain the same. New alloys or designs would relate to new weapon designs which are presently not planned, but may be implemented, should the President direct it in the interest of national security. The facility would have the capability to develop and fabricate new pit designs in that case. This capability would include testing and analysis to address the complexities inherent in plutonium processing.*

32.03 The commentors oppose or express concern about reestablishing pit production at LANL and the oversight of ES&H issues by site management and personnel. Some commentors feel that a sound ES&H culture does not exist at LANL and that LANL has failed to implement "Conduct of Operations" successfully. These commentors also suggest that DOE institute a separate "chain of authority" for ES&H personnel to eliminate a conflict of interest that can currently occur when such personnel report to line management. Other commentors express concern about LANL's security and relationship with DOE, personnel management, plutonium handling, and waste management.

Response: *As stated in section 3.1.1, Planning Assumptions and Basis for Analysis, DOE will emphasize compliance with applicable laws and regulations and accepted practices regarding industrial and weapons safety, safeguarding the health of workers and the general public, and protecting the environment. Section 4.14 describes the regulations and requirements under which all DOE sites conduct their operations during the normal course of their work activities, including potential accidents and associated human health and environmental consequences of an accident. Although the commentor correctly points out that operations at LANL have occasionally been found to be out of compliance with various environmental laws, DOE and LANL management have made good faith efforts to bring laboratory facilities into compliance in a timely fashion. DOE expects its management and operating contractors operate its facilities in compliance with all Federal, state, and local laws. As explained in section 3.1.1.1, No Action Alternative Assumptions, conservative estimates were purposely used in the PEIS to provide a bounding analysis for the environmental impacts. New or better processes as described in section 3.5, Emerging Technologies, can reduce waste streams and lower the environmental impacts. Analyses discussed in the* Analysis of Stockpile Management Alternatives *report show that the LANL alternative is lower in cost and has less technical risk than the SRS alternative. Technical risk is lower for LANL because of recent experience in providing pits for nuclear explosive testing. The* Analysis of Stockpile Management Alternatives *report is available for public review at the DOE Public Reading Rooms near each site.*

32.04 The commentor asks how often a flaw in a pit applies to an entire weapon type.

Response: *Whether or not a flaw in a pit applies to an entire weapon type depends on whether the flaw is a result of a design shortcoming or the manufacturing process. In the case of either a design or manufacturing shortcoming resulting in a flaw, the entire weapons type may well be affected, but these shortcomings could make only some units, subject to a particular history, susceptible. Similarly aging defects can affect a few weapons or many, depending on whether they uniformly affect the system or whether individual history of some of the units, is a factor in how the system ages or responds to an aging-related defect. A more detailed unclassified discussion of weapon defect history can be found in the tri-laboratory report* Stockpile Surveillance: Past and Future *(SAND95-2751, January 1996).*

32.05 The commentor asks what the economic impacts associated with pit production would be at LANL. The commentor also inquires about the budget for the pit fabrication facility.

Response: *The economic effects of pit production at LANL on regional economy and employment, population and housing, and public finance are discussed in section 4.6.3.8. The budget for the pit fabrication facility is not part of the PEIS. However, estimates of the operating costs for stockpile management alternatives at the various stockpile levels can be found in the* Analysis of Stockpile Management Alternatives *report, prepared by the DOE Albuquerque Operations Office. This report is available in the DOE Public Reading Rooms near each site.*

32.06 Several commentors express support for SRS and its continued operation in support of existing and new DOE missions. One commentor asks if pit fabrication at SRS would be shut down. Another asks if Pantex or other sites would conduct pit fabrication. Several commentors express specific support for SRS to conduct pit fabrication activities.

Response: *SRS currently has no pit fabrication capability. SRS does maintain a major role in tritium recycling and is the preferred alternative site for tritium supply if accelerator production of tritium is ultimately chosen, as discussed in the Tritium Supply and Recycling ROD. As discussed in section 3.2.1, Site Selection, only those sites with existing infrastructure or facilities capable of supporting a given stockpile stewardship or stockpile management mission were considered reasonable site alternatives for detailed study in the PEIS. DOE analyzed only two sites as reasonable alternatives for pit fabrication and intrusive modification pit reuse: LANL and SRS. SRS was considered a reasonable alternative for only the pit fabrication mission because of its plutonium processing infrastructure. Although the final decision as to where this specific mission would be located will not occur until the ROD, the preferred alternative site for the mission is LANL.*

The analysis discussed in the Analysis of Stockpile Management Alternatives *report shows that the LANL alternative is lower cost and has less technical risk than the SRS alternative. Technical risk is greater for the SRS alternative because LANL has recent experience in providing pits for nuclear explosive testing, whereas SRS has no experience with the kind of capabilities required for precision nuclear component manufacturing. Additionally, the LANL capability could be in place 2 years earlier than the SRS capability. The* Analysis of Stockpile Management Alternatives *report is available for public review at the DOE Public Reading Rooms near each site. As discussed in section 2.4.2, the Rocky Flats Plant formerly produced pits, and is no longer available for this mission. Therefore, DOE currently has no pit fabrication capability except for the limited R&D capabilities at LANL and LLNL.*

The weapons A/D mission, for which Pantex is the preferred alternative, includes provisions for nonintrusive modification pit reuse. This is not pit fabrication. As discussed in section 3.4.1 and appendix section A.3.4 of the PEIS, nonintrusive modification pit reuse does not involve plutonium processing or disassembly of the pit. The modifications would be to external features of the pit and would not result in handling exposed plutonium. After modification and inspection, the pit would be mated to main charge HE, which is a function of the A/D mission. Since the nonintrusive modification function is essentially a step between receipt of the pit and assembly with HE, DOE considers it reasonable and prudent to perform this function at the A/D facility.

32.07 The commentor notes that the stated objective in the PEIS is to preserve "core competency," but the Program fails to address this issue with regard to pit manufacturing. The commentor feels that a pseudo-manufacturing capability in an R&D laboratory is not the same. Another commentor believes that the No Action alternative description for pit fabrication was inadequate.

Response: *Currently, there is an R&D plutonium capability at LANL. The No Action alternative discussed in section 3.4.3.1 of the PEIS would maintain only a limited plutonium component fabrication capability at LANL and a less extensive capability at LLNL, and therefore would not provide sufficient pit fabrication capability to meet the requirements stated in section 3.1. Reestablishing pit fabrication at LANL would allow for the entire pit-related workload to be accomplished at the laboratory, which would preserve core competency better than having less work at each of two sites, the laboratory and the fabrication site. Analysis discussed in the* Analysis of Stockpile Management Alternatives *report shows that the LANL alternative is lower in cost and has less technical risk than the SRS alternative. Technical risk is lower for LANL because of recent experience in providing pits for nuclear explosive testing. The* Analysis of Stockpile Management Alternatives *report is available for public review at the DOE Public Reading Rooms near each site.*

32.08 The commentor questions where pit components and beryllium components will be manufactured. The commentor believes that Y-12 has the experience and capability for recycling chips.

Response: *The manufacturing of pit components is an integral part of the pit fabrication mission and would be included with that mission which, in the preferred alternative, is LANL. The mission of fabrication of beryllium components that was formerly assigned to the Rocky Flats Plant was reassigned to LANL as a result of the Nonnuclear Consolidation Program in 1993. The Y-12 Plant would continue its historical role of manufacturing HEU parts for pits.*

32.09 The commentor believes that SRS should close down and operations be transferred to another DOE site, preferably ORR or Pantex. Other commentors wonder what impact their comments on closing SRS have on the decisionmaking process, and what the best way is to do this.

Response: *Closing of SRS was not an alternative under consideration in the PEIS. The only alternative relating to SRS was for reestablishing pit fabrication and LANL was identified as the preferred alternative site for that mission. Over the past several years, some DP missions at SRS have been terminated and the majority of facilities turned over to Environmental Management. The remaining DP activities are associated with tritium, and are primarily located in H-Area, a small portion of the entire site.*

32.10 The commentor notes that the environmental impacts per pit produced would be reduced by using advancements such as new welding techniques, dry machining, and the reduction of oils and organic solvent usage. The commentor also points out that the actual environmental impacts may be less than the impacts outlined in the document since conservative estimates were used in the analysis of the impacts.

Response: *New or better processes can reduce waste streams and lower the environmental impacts. Section 3.5 describes the emerging technologies for the stockpile management processes. The baseline flow sheet for plutonium fabrication did assume dry machining as suggested by the commentor, consequently a waste stream consisting of cutting oils is not analyzed in this PEIS. As explained in section 3.1.1.1, No Action Alternative Assumptions, conservative estimates were purposely used in the PEIS to provide a bounding analysis for the environmental impacts.*

32.11 The commentor asks if the need for pit production outweighs the additional risks to the citizens of Los Alamos. The commentor asks what the citizens of Los Alamos will gain from bringing pit production to LANL.

Response: *Section 4.6.3.9, Radiation and Hazardous Chemical Environment, presents the incremental risk to members of the public in the LANL vicinity. Table 4.6.9.3–1 shows the annual exposure to the maximally exposed member of the public would be 8.7 mrem, which is 2.6 percent of the natural background radiation exposure of 340 mrem to the average individual. The total dose to the public within 80 km (50 mi) of LANL would be 1.4 person-rem, which is approximately 0.15 percent of the natural background total dose. Hazardous chemical exposures are also presented in section 4.6.3.9. For the pit fabrication alternative, the incremental hazard index (HI) for the maximally exposed member of the public would be $2.18x10^{-4}$ which is approximately 0.16 percent of the No Action HI of 0.0135. This increase in HI corresponds to essentially a 0-percent increase in cancer risk. Benefits to the community are largely socioeconomic in nature. Section 4.6.3.8, Socioeconomics, provides information concerning jobs to be generated by the pit fabrication alternative. Facility modification activities would generate approximately 140 direct and 90 indirect jobs during the peak year of construction. Operation of the facility would generate about 260 direct jobs.*

32.12 The commentor wants to know the pit production capacity at TA-55 in LANL. The commentor also wants to know how easily the pit production capacity at TA-55 could be expanded. Another commentor states that there should not be any further capital investment above maintenance or steady state costs.

Response: *The TA-55 facility currently has the ability to make a few pits per year as part of the stockpile surveillance and rebuild program, but it is not a production facility or program. The expansion of TA-55 is discussed in section 3.4.3.2. Stockpile management facilities analyzed in the PEIS are sized to support a base case stockpile size consistent with the START II protocol, and are therefore consistent with U.S. nonproliferation policy. The capacity of the proposed LANL pit fabrication facility is discussed in appendix section A.3.3.1, of the PEIS, and is shown as a maximum of 80 pits per year, assuming surge (multiple-shift) operation, and use of equipment at full capacity. For information on cost and schedule for modification of the TA-55 plutonium facility, the commentor is referred to the* Analysis of Stockpile Management Alternatives *report which is available at the DOE Public Reading Rooms near each site.*

32.13 The commentor asks how long pits can remain in the stockpile before buildup of decay products become a design or handling concern.

Response: *Modern nuclear weapons were designed with a minimum design life of 20 to 25 years. Based on existing surveillance data, DOE expects the pits to last at least this long, and probably considerably longer. However, very little historical and applicable data exists beyond 30 years. With regard to the buildup of decay products alone, DOE does not currently believe this will become a problem in less than 50 years. Other combined effects (radioactive and chemical) are not as well understood. Science-based stockpile stewardship, and enhanced surveillance technology in particular, will focus on improved predictive capability in this area.*

32.14 The commentor points out a disparity in the amount of chemicals being used for fabricating pits at LANL and SRS. According to the commentor, SRS proposes to use 3,420 kg (7,536 lb) and LANL 32,886 kg (72,461 lb) which is a difference of a factor of about 10.

Response: *The processes at both SRS and LANL are the same. These numbers show only annual make-up after recycling of nitric acid (annual usage after the first year of surge production). The LANL number shows the first year requirement for surge production (e.g., 32,886 kg [72,461 lb] the first year with 3,420 kg (7,536 lb) of make-up each following year). Usage in subsequent years would be comparable to the SRS figure. Appendix tables A.3.3.1–4 and A.3.3.2–4 have been changed to reflect this fact in the Final PEIS.*

32.15 The commentor wants to know if there will be waste management associated with the pit fabrication mission at LANL.

Response: *Waste generated from the pit fabrication mission would be managed within the existing and planned waste management infrastructure at LANL. No new waste management facilities would be needed to support the pit fabrication mission.*

32.16 The commentor asks, if laboratory facilities are so capable, why are we investing in new facilities at LANL and why postulate that it will be another 5 years before LANL can make a production pit.

Response: *The laboratories are indeed capable, but are presently established as R&D facilities, not as production facilities. The assumed 5-year timeframe includes necessary equipment and facility modifications and establishment of appropriate quality and process control measures to* *ensure quality requirements would be met. The TA-55 plutonium facility is approaching 20 years of service, and many components of the facility need replacement or upgrading in order to sustain the R&D mission of the laboratory. This refurbishment constitutes the major portion of the DOE investment at the TA-55 plutonium facility. Reconfiguration of the internal arrangements of one of the wings of the building to provide for pit fabrication is a relatively minor part of the total task.*

32.17 The commentor wants to know, for the pit production mission at LANL, if DOE will focus its attention on the greater hazards of processing and handling of plutonium and the eventual disposal of the waste or on simply the shipment of the finished product.

Response: *As stated in section 3.1.1, Planning Assumptions and Basis for Analysis, DOE will emphasize compliance with applicable laws and regulations and accepted practices regarding industrial and weapons safety, safeguarding the health of workers and the general public, and protecting the environment. Section 4.14 describes the regulations and requirements under which all of the DOE sites conduct their operations during the normal course of their work activities. This also includes potential accidents and associated human health and environmental consequences of an accident.*

32.18 One commentor questions whether waste volumes include nonintrusive pit reuse operations, and whether the pit fabrication and nonintrusive pit reuse can be carried out simultaneously.

Response: *Waste volumes are analyzed for three-shift pit fabrication operations. This analysis is designed to bound the environmental impacts for any reasonably foreseeable workload. As discussed in section 3.4.1 and appendix section A.3.4 of the PEIS, nonintrusive modification pit reuse does not involve plutonium processing or disassembly of the pit. The modifications would be to external features of the pit and would not result in handling exposed plutonium. Estimated waste volumes from nonintrusive modification pit reuse are included in the weapons A/D estimates.*

33 MANAGEMENT—SECONDARIES AND CASES

33.01 Several commentors express support for continued operation of Y-12 and for retaining the secondary and case fabrication mission there. Reasons cited include past frequent upgrades of the facilities and processes at Y-12, historical expertise, and the exceptional troubleshooting and problem-solving experience of Y-12 personnel. Commentors suggest laboratory personnel are not experienced in manufacturing processes and cannot replace the experience of Y-12 personnel, and were concerned that the PEIS implied the Y-12 processes were out-of-date.

Response: *As noted by the commentors, the preferred alternative for the secondary and case fabrication mission is to downsize at Y-12. In addition to the No Action alternative at Y-12, DOE considered three alternative sites for the future secondary and case fabrication mission: Y-12, LANL, and LLNL. DOE considered the weapons laboratories at LANL and LLNL for secondary and case manufacturing as reasonable alternative sites to be evaluated as part of the NEPA process because of their design and existing limited R&D manufacturing capabilities. In appendix section A.3.2.1, the PEIS does state that Y-12 has performed the secondary fabrication mission in the Complex for over 40 years. This was not intended to imply that the production facilities are old and use old processes. In this section, the PEIS recognizes that during the past 12 years major restoration projects have brought the infrastructure support of this facility (Y-12) up to current standards and should allow the use of these facilities for up to an additional 40 years.*

Analyses discussed in the Analysis of Stockpile Management Alternatives *report show that the Y-12 alternative is lower in cost and has less technical risk than either of the laboratory alternatives. DOE considers the existing infrastructure and personnel resources at Y-12 as important and valuable Complex assets in implementing Program requirements. The existing facilities and worker skills at Y-12 were taken into account in the ranking system used by DOE in the* Analysis of Stockpile Management Alternatives *report. In this analysis, Y-12 received a much higher score in "Basic Production Capability" and in "Capability of Production Infrastructure" than either LANL or LLNL. These scores were important in the selection of Y-12 as the preferred alternative site for performing future secondary and case component production. Technical risk is lower for the Y-12 alternative because it is the current secondary and case fabrication facility for DOE and has produced components for all weapons in the current stockpile. Although some process development would be required to fully satisfy this mission at Y-12, the risk is low. Both the LANL and LLNL alternatives would involve modifications to Y-12 processes or a new process, which would require additional process development, qualification, and prove-in, and thus the technical risks are higher. The* Analysis of Stockpile Management Alternatives *report is available for public review at the DOE Public Reading Rooms near each site.*

33.02 The commentor would like the PEIS to provide specific examples of the HEU recycling purification or processing technology as well as lithium processing technology that exists to a comparable extent with either of the design agencies as well as Y-12.

Response: *As stated in the PEIS Summary, Y-12 produces the secondary and case components and uniquely possesses the complex technological capability for processing HEU and lithium materials. The design agencies, LANL and LLNL, do not have in place the HEU and lithium processing facilities or infrastructure to any extent comparable to Y-12. These design laboratories have a uranium technology base and facility infrastructure which are only capable of supporting a very limited R&D fabrication capability.*

33.03 One commentor states that the A/D activities at ORR/Y-12 should be moved to SRS because there is more acreage to provide an environmental impact buffer zone.

Response: *In referring to "the A/D activities at ORR/Y-12," DOE assumes that the commentor means the secondary and case fabrication mission. SRS was not considered a reasonable alternative for this mission for several reasons. Although SRS has processed uranium fuel, it does not have the necessary equipment and facilities for large scale machining and processing of HEU and other special materials needed for secondaries and cases. Y-12 and both of the laboratories have existing facilities which could, with some modifications, fulfill the secondary and case fabrication mission. The* Analysis of Stockpile Management Alternatives *report discusses the secondary and case fabrication alternative in more detail and is available for public review at the DOE Public Reading Rooms near each site.*

33.04 The commentor wonders what will happen to the buildings and infrastructure if downsizing of Y-12 occurs.

Response: *Downsizing of Y-12 would result in the plant being multi-program sponsored. Seventy-six percent of the building floor area and associated infrastructure would be transferred to Environmental Management; 14 percent would belong to DP departments engaged in conducting the stockpile management mission; and the remaining 10 percent would belong to other programs such as Materials Disposition, Nuclear Energy, and Work for Others. After transfer to Environmental Management, a transition plan is developed, detailing the cleanup plans, disposition of equipment, and ultimate disposition. There is an established process for including the adjacent* *communities in this process and DOE's Office of Economic Assistance has grants and other support services to assist in the retraining and out-placement of all adversely affected employees.*

33.05 The commentor is of the opinion that the proposals of LANL and LLNL in the Summary suggest some lack of appreciation for what is involved. According to the commentor, LANL and LLNL claim to do the downsize secondary and cases fabrication mission with 321 and 290 workers, respectively. The commentor points out that Y-12 will require 1,080 workers for the mission which is 3 to 4 times, as many workers as the laboratories proposals. The commentor wants to know if DOE believes the laboratories proposals and is concerned that at some time in the future DOE or some oversight group may be misled (by the apparently large savings) into assuming the laboratories can do the job as well as Y-12, and subsequently transfer the mission. The commentor believes this would be a major loss to the Nation in abandoned stretch capacity, overall cost, safety, and quality.

Response: *For the secondary and case fabrication mission, the data supplied by Y-12, LANL, and LLNL differ in many factors such as surge capacity, facility designs, processes, work plans, floor plans, and the utilization of in-house production versus vendor supplied materials. These factors account for the large differences in the workers requirements at Y-12 versus those presented for the weapons laboratories. These considerations were reflected in the evaluation performed by DOE and documented in the* Analysis of Stockpile Management Alternatives *report. Data for the PEIS were developed by working groups for each stockpile management mission. These working groups consisted of experts from each of the potentially affected sites. A review of data for consistency and accuracy was performed at both the working team level and at a senior management level. To bound the potential environmental impacts at each site, the PEIS uses data reflecting "surge," or maximum production scenario. Because it is expected that this workload would be performed in existing facilities, not surprisingly the maximum potential environmental impacts varied somewhat between the sites for this bounding surge case. In addition, however, each alternative was assessed for the same single low and high single shift workloads.*

33.06 The commentor refers to section 4.6.3 and questions whether anyone really believes that only minimal modification to existing facilities at LANL would be required for the secondary and case fabrication mission. The commentor states that no facilities exist for large lithium hydride fabrication and processing, that only minimal uranium and assembly facilities exist, and that facilities must be adequate to deal with potential surge requirements. In addition, the commentor states that this type of equipment costs tens of millions of dollars.

Response: *Section 4.6.3 addresses the environmental impacts by disciplines (land use, water resources, and site infrastructure) of proposed stockpile stewardship and management alternative actions. Section A.3.2.2 describes in some detail the modifications of existing facilities that would be required at LANL to support the relocation of secondary and case fabrication. The statement in section 4.6.3.1, "Only minimal modifications to existing facilities at LANL would be required," is made in the context of land-use impacts due to the relocation of the secondary and case fabrication mission. The minimal land-related modification is associated with providing a nominal area for equipment staging, material laydown, and parking during the modification of LANL facilities. As indicated in section 2.4.2, DOE recognizes that the cost of transferring production technologies to the weapons laboratories and the re-creation of capital facilities are major Program considerations. These were important factors in the selection of Y-12 as the preferred site for performing the future stockpile management secondary and case fabrication mission.*

33.07 The commentor asks, who, by name, are the supposed experts at the laboratories in uranium and lithium hydride, and what are their qualifications.

Response: *There are numerous experts at the laboratories. However, their names have no bearing on the environmental impacts addressed in this PEIS.*

33.08 The commentor states that the analysis with regard to this study discusses the preproduction of a supply of enriched uranium and lithium hydride sufficient to provide for needs for up to 100 years. The commentor questions if past experience does not indicate that this will guarantee the loss of the associated technology.

Response: *Not providing in-house production capability does not guarantee the loss of the needed supplies of these materials or the requisite technologies to support the weapons program needs. Sufficient supply of enriched uranium and lithium hydride would be removed from existing stocks, processed, and stored during the transition period (in fiscal year 1998) to supply DP needs for greater than 100 years at the current PEIS base case workload, therefore there is little justification for providing in-house production capability. Various contingencies are readily available to justify not providing the capability for lithium hydride/deuteride and enriched uranium purification. These contingencies include: feed material preproduction and storage, increased direct recycle of the materials, commercial procurement of service as a backup, disposition of material to other DOE programs, and placing processing equipment in cold standby for reactivation. If unforeseen stockpile problems or demands increase the secondary workload significantly, contingency plans to reactivate equipment in cold standby or to procure additional processing can be developed. The preferred alternative at Y-12 includes a small capability for lithium salt production.*

33.09 The commentor points out the differences in the amounts of chemicals being used for the same mission at different sites. One commentor cites table 4.17–4 and asks how LANL is going to use only 1,568,333 kg/yr (3,455,665 lb/yr) of chemicals when Y-12 plans to use 6,488,333 kg/yr (14,296,393 lb/yr) of chemicals (a 76-percent reduction) or whether the LANL chemical use is only an estimated amount. Another commentor questions specified differences in nitric acid and sulfuric acid consumption at Y-12, LLNL, and LANL.

Response: *Table 4.17–4 provides estimates of the irreversible and irretrievable consumption of annual operating resources for the stockpile management alternatives. The differences in the secondary and case fabrication chemical usage between Y-12 and LANL is a direct result of differences in the proposed processing techniques utilized at Y-12 versus those proposed to be used at LANL. As given in appendix table A.3.2.1–6, the annual chemical requirement for Y-12 is a total of 19,088,334 kg/yr (42,059,235 lb/yr), of which 14,000,000 kg/yr (30,847,600 lb/yr) is argon and 5,000,000 kg/yr (11,017,000 lb/yr) is nitrogen. Of this total quantity, 6,488,333 kg/yr (14,296,393 lb/yr) are estimated to be irretrievably lost. LANL did not propose to duplicate the current processes or work plans in use at Y-12 for the secondary and case fabrication mission, consequently a direct comparison on gaseous chemical consumptive use cannot be made. For example, the Y-12 enriched and depleted uranium processes utilize vacuum induction casting furnaces with leakage rate of approximately 30 microns/minute whereas LANL proposes to utilize furnaces with lower leakage rate (5 microns/minute) eliminating the need to employ an argon purge (Argon Lance). LANL also proposes to utilize commercial and government furnished products to the maximum extent possible and may well incorporate an optimistic view of vendor availability and qualifications. Therefore LANL's quantities are considered estimates based on reasoned judgment. The nitric acid and sulfuric acid figures given in appendix table A.3.2.2–6 for LANL were in error and have been corrected. The values are now the same as for Y-12 (1,000 kg [2,203 lb] of nitric acid and no sulfuric acid). The LLNL values are less than either Y-12 or LANL due to the smaller capacity of the LLNL facility in the surge mode.*

33.10 The commentor requests an explanation of the impacts on downsizing Y-12 should the secondary and case component fabrication/downsize at Y-12 alternative be chosen. Specifically, explanations are requested regarding the impacts on the D&D program at Y-12, the impact to future continued operation of the facilities, operating systems, and programs.

Response: *The environmental impacts resulting from downsizing Y-12 are discussed in detail in section 4.2.3 of this PEIS.*

33.11 Commentor recommends that DOE have the funding mechanisms for proposed downsized Y-12 facilities in place prior to the ROD.

Response: *Funding for the downsizing of Y-12 would follow the normal Government budgetary process with a submission to Congress for this project after the ROD is issued.*

34 **MANAGEMENT—HIGH EXPLOSIVES COMPONENTS**

34.01 A large number of commentors believe that HE functions should remain at Pantex. The commentors note that the Draft PEIS states that Pantex must retain HE capabilities to process the inventories already onsite from dismantling. Therefore, the least expensive option is to maintain HE functions at Pantex, according to the commentors. Commentors also indicate their disagreement with the statement in the Draft PEIS that there are no advantages to siting HE at Pantex as opposed to the national laboratories. The commentors cite the capital outlay for such a transfer as being cost prohibitive and the fact that if the need arises in future for new weapons production, the commentors believe it will be critical to have the HE facilities at the weapons production/assembly site.

Response: *The HE production mission includes HE procurement, formulation, component fabrication, characterization, surveillance, disposal, and storage. As discussed in the* Analysis of Stockpile Management Alternatives *report, DOE's goal for the HE fabrication mission is to assure core competency maintenance while achieving cost efficiencies. At the time the Draft PEIS was issued, the HE production mission which best achieved the overall objectives was not clear, therefore DOE deferred identification of a preferred alternative for the HE production mission while further analysis was performed. Since that time, DOE has completed the analysis and the preferred alternative for the HE production mission is to downsize the production mission at Pantex. The preferred alternative for HE fabrication was developed by DOE using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. The analysis of these factors are presented in the* Analysis of Stockpile Management Alternatives *report, and the rationale for the preferred alternative is found in the* Stockpile Management Preferred Alternatives Report. *Both reports are available for public review at the DOE Public Reading Rooms near each site.*

34.02 Some commentors state that the HE mission be moved from Pantex to another site. Specifically, one commentor believes that the HE mission should be brought to LANL because a synergism exists between the research and design mission and the production of HE. Another commentor believes that the A/D and HE operations currently at Pantex and HE operations at Site 300, LLNL, should be consolidated at NTS.

Response: *NTS was not considered a reasonable alternative for the HE fabrication mission for several reasons. First, unlike the A/D mission, NTS does not have existing facilities designed for HE fabrication. As a result, transfer of the HE fabrication mission to NTS would require construction of a completely new facility. Second, both LANL and LLNL have existing facilities capable of meeting the HE fabrication requirements analyzed in the PEIS. However, in determining reason-*

able alternatives for these missions, DOE considered that, should weapons A/D be relocated, that it would be reasonable and prudent to use existing HE fabrication facilities at LANL or LLNL, rather than constructing new facilities, which would be required at NTS. The analysis of these factors are presented in the Analysis of Stockpile Management Alternatives *report, and the rationale for selecting Pantex as the preferred alternative for A/D and HE fabrication can be found in the* Stockpile Management Preferred Alternatives Report. *Both reports are available for public review at the DOE Public Reading Rooms near each site.*

34.03 The commentor states that the HE mission is to be assigned only to facilities with existing infrastructure. The commentor notes that according to the *Draft Analysis of Stockpile Management Alternatives* report, LANL is currently establishing a production infrastructure for the manufacture of detonators. As late as December 1995, however, no detonators have been produced. Also, the commentor notes that according to the Activity Implementation Plan, LLNL will restructure Site 300 to meet manufacturing requirements.

Response: *Four alternatives for the HE production mission were evaluated according to three ranking criteria. One criteria is capability of production support infrastructure. The* Analysis of Stockpile Management Alternatives *report provides a summary of all ranking criteria scores and explains the basis for these scores. DOE sought future Complex configurations that simultaneously maintained technical competence, minimized technical risk, and minimized costs. All technologies required for the HE mission have been previously demonstrated at LANL and LLNL. Both have in the recent past produced HE components in numbers greater than and at specifications comparable to those required for future production. The LANL and LLNL formulation, synthesis, and fabrication processes would require production qualification. Establishing the production and control processes necessary for production qualification represents a risk at an R&D laboratory; however, DOE has successfully qualified laboratory processes for production applications in the past.*

34.04 The commentor states that in the PEIS, four HE alternatives are proposed and discussed, but in the Draft *Stockpile Management Preferred Alternatives Report*, only two options are recognized—downsizing of Pantex and the two-laboratory concept.

Response: *As shown in the* Stockpile Management Preferred Alternatives Report, *four HE production alternatives have been analyzed and ranked: downsize at Pantex, relocate to LANL, relocate to LLNL, and the two-laboratory alternative. DOE is also required by NEPA and CEQ to describe and evaluate the environmental impacts of a No Action alternative. The PEIS does not attempt to quantify or analyze the impacts of the two-laboratory alternative because the environmental impacts at either LLNL or LANL from the two-laboratory HE production alternative would not be greater than the environmental impacts which are analyzed in the PEIS for the entire HE production mission at LANL or at LLNL singularly.*

34.05 The commentor believes that the transfer of operations from Rocky Flats to the laboratories was unsuccessful and that the lessons learned from that transfer should carry weight in the decision to site HE operations.

Response: *DOE assigned several missions previously conducted at Rocky Flats to LANL—pit surveillance, pit support, beryllium technology, and joint test assembly support. The transfer of the pit surveillance mission from Rocky Flats has been successfully completed and is currently being conducted at LANL. Transfer of remaining processes are in progress. Lessons learned from the transfer of the processes from donor to the receiver sites in the Nonnuclear Consolidation Program, including those from Rocky Flats to LANL are being recorded. This information would be used to improve the future transfers of operations under the stockpile management program. The technical* *risk of transferring the HE mission to the laboratories was analyzed in the* Analysis of Stockpile Management Alternatives *report. This report determined the risk of transferring HE operations to be minimal.*

34.06 The commentor questions what the operating cost for the HE fabrication mission is in the Laboratory Implementation Plan.

Response: *It is not a straightforward exercise to estimate the annual costs to operate the HE plant. DOE chose to assume that the costs of operating the HE plant at each site would be estimated as increments to the assumed site missions. Pantex was assumed to have the weapons A/D mission, and the HE costs were estimated as incremental to that mission. Likewise, LANL and LLNL were assumed to continue their R&D mission, and the HE costs were estimated as incremental to that mission. The LLNL projected incremental increase in cost for manufacturing HE components is $560,000 per year; LANL incremental cost increase was estimated at $2.3 million; and Pantex incremental cost increase was estimated at $2.25 million. Details for these cost estimates can be found in the* Analysis of Stockpile Management Alternatives *report which is available for public review at the DOE Public Reading Rooms near each site.*

34.07 The commentor wants to know if the HE manufacturing facilities at the weapons laboratories are as new and technologically advanced as the facilities at Pantex.

Response: *The HE facilities at LANL were designed and built for production scale operations, and were in fact, operated as production facilities supplying nuclear weapons HE components for many years. LANL has continually upgraded and modernized processing equipment in these existing facilities to provide prototype HE components to meet hydrodynamic and NTS program requirements. The equipment and processes used at LANL are very similar and in some cases identical to those used at Pantex for production. The HE facilities at Pantex were built during the 1980s, and are newer than LANL or LLNL facilities. The equipment in all three facilities was procured at about the same time (sometimes on the same purchase order).*

Similarly, the production scenarios envisioned for LLNL are well within their current capabilities using equipment and processes that are similar if not identical to Pantex. The LLNL High Explosives Application Facility is DOE's most recently activated major HE facility and meets or exceeds all modern ES&H requirements for explosive research, development, and production support.

34.08 In regard to HE fabrication, the commentor asks if the primary work is in the development program as opposed to fabrication.

Response: *For HE fabrication there is a minimum level of effort in both the development program and in the production mission that must be achieved to maintain competence. DOE has sought to address the level of expected future production requirements, and whether this level of work is sufficient to maintain competence. There is also synergy between HE fabrication work required for the development program and for the production mission. The level of effort for either is not steady and can be cyclical. DOE has taken these factors into account in determining its preferred alternative for the HE production mission.*

34.09 The commentor states that according to the ranking criteria process, the two-laboratory concept ranks significantly lower than Pantex, which itself received a rating of 100 in all categories. The commentor notes that as the Ranking Criteria Process was applied to each category throughout the Stockpile Stewardship and Management PEIS, the facility which ranked highest received the mission, but HE fabrication is the only category which seems to run contrary to that rule.

Response: *DOE sought future Complex configurations that simultaneously maintained technical competence, minimized technical risk, and minimized costs. In the case of HE fabrication, downsizing operations at Pantex or relocation to one of the weapon laboratories would be the low cost alternative. However, concerns about potential loss of competency in HE at one or both of the laboratories may make the low-cost alternative a higher technical risk alternative. While the ranking criteria process shows the two-laboratory concept lower than Pantex, the decision as to a preferred alternative is not automatic. At the time the Draft PEIS was issued, the HE production mission which best achieved the overall objectives was not clear, therefore DOE deferred identification of a preferred alternative for the HE production mission while further analysis was performed. Since that time, DOE has completed the analysis and the preferred alternative for the HE production mission is to downsize the production mission at Pantex. The preferred alternative for HE fabrication was developed by DOE using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. The analysis of these factors is presented in the* Analysis of Stockpile Management Alternatives *report, and the rationale for selecting the preferred alternative is found in the* Stockpile Management Preferred Alternatives Report. *Both reports are available for public review at the DOE Public Reading Rooms near each site.*

34.10 The commentors question why 432 people are required at the weapons laboratories to manufacture explosive components when Pantex has identified about 50 people to perform the operation, and how DOE justifies this additional cost.

Response: *The numbers 432 and 50 cannot be compared. The employment at the laboratories, 200 at LANL (table 3.4.5.3–2) and 232 at LLNL (table 3.4.5.4–2) include both HE workers and various direct support workers, while the employment at Pantex, revised to 37 in the Final PEIS (table 3.4.5.2–2) includes only HE workers, since the A/D support workers would be sufficient to also cover HE fabrication. Each site's employment impacts assume that site takes on the entire HE production mission; therefore, these numbers should not be added. To bound the potential environmental impacts at each site, the PEIS estimates the number of workers that could be used in a "surge," or maximum production scenario. Because it is expected that this workload would be performed in existing facilities (in the case of Pantex they were downsized current facilities), not surprisingly the maximum potential environmental and employment impacts varied somewhat between the sites for this bounding surge case. In addition, however, each alternative was assessed for the same low and high single-shift workloads.*

34.11 The commentors request the locations of proposed HE fabrication and testing facilities at LANL. One commentor refers to Summary section 5.3.7, Relocate to Los Alamos, and states that the statements that LANL R&D facilities currently possess sufficient (operational) capacity with little or no building construction/modification was not based totally on fact, as evidenced by the failure to adequately address concerns expressed in the April 22 and 23, 1996, Amarillo public meeting. In addition, the commentor states that further review of the *Stockpile Management Preferred Alternatives Report* and the *Analysis of Stockpile Management Alternatives* report verified that the DOE requirements for certification of those buildings to current standards was apparently ignored.

Response: *LANL HE fabrication process capability is already established. HE fabrication and storage functions would be supported in existing facilities at LANL TAs -9, -16, and -37. Since LANL HE facilities already exist and have sufficient capacity for stockpile management requirements, no new building construction and no significant modifications would be required. DOE requirements for certification of these buildings to current standards is an ongoing process and would continue as required. To assure that the laboratories would successfully implement HE production on the magnitude necessary to meet national security needs, the LANL formulation, synthesis, and fabrication processes would require production qualification.*

34.12 The commentor refers to the LANL table 3.4.5.3–1 and states that this table contains insufficient information for analysis. The commentor states that the baseline numerical information contained in table 3.4.5.2–1 cannot be compared reasonably with "minimal" resource requirements. The commentor states that based upon simple comparison between tables 3.4.5.2–2 and 3.4.5.3–2, the missing "baseline" data should have been readily available for insertion in the table.

Response: *The tables in question display consumption requirements for the construction period and for 1 year of operations. Because the LANL HE fabrication process capability is already established, quantifying the minimal consumption requirements for construction/modification at LANL would not be useful to DOE in decisionmaking. HE fabrication and storage functions would be supported in existing facilities at LANL TAs -9, -16, and -37. Since LANL HE facilities already exist and have sufficient capacity for stockpile management requirements, no new building construction and no significant modifications would be required.*

34.13 Several commentors ask when the preferred alternative for HE fabrication will be identified. One commentor states that the *Stockpile Management Preferred Alternatives Report* gives the impression that the decision has been made to transfer HE work to the laboratories. The commentor asks if this is true. If not, the commentor would like to know on what basis the decision on the preferred alternative for HE fabrication will be made.

Response: *Pantex, LANL, and LLNL were candidate sites for the HE fabrication mission. As discussed in the* Analysis of Stockpile Management Alternatives *report, DOE's goal for the HE fabrication mission is to assure core competency maintenance while achieving cost efficiencies. At the time the Draft PEIS was issued, the HE production mission which best achieved the overall objectives was not clear, therefore DOE deferred selection of a preferred alternative for the HE production mission while further analysis was performed. Since that time, DOE has completed the analysis and has determined that the preferred alternative for the HE production mission is to downsize the production mission at Pantex. The preferred alternative for HE fabrication was developed by DOE using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. The analysis of these factors are presented in the* Analysis of Stockpile Management Alternatives *report, and the rationale for selecting the preferred alternative is found in the* Stockpile Management Preferred Alternatives Report. *Both reports are available for public review at the DOE Public Reading Rooms near each site.*

34.14 The commentor expresses concern about HE fabrication continuing at Pantex because of existing contamination problems from HE work. The commentor states that the first priority at Pantex should be the protection of the environment and public safety.

Response: *Pantex will continue operations in compliance with all applicable Federal, state, and local ES&H requirements, as well as all DOE-mandated standards that insure the protection of the environment and public safety.*

34.15 The commentor believes it is unfair to provide the laboratories the economic benefit of taking over the Pantex HE manufacturing mission while Pantex and the citizens of Amarillo will retain the environmentally problematic mission of disposing of the replaced HE components and suffering economically by losing the environmentally cleaner manufacturing mission.

Response: *DOE's preferred alternative for the HE production mission is to downsize the production mission at Pantex. The preferred alternative for HE fabrication was developed by DOE using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and* *national security. The analysis of these factors are presented in the* Analysis of Stockpile Management Alternatives *report, and the rationale for selecting the preferred alternative is found in the* Stockpile Management Preferred Alternatives Report. *Both reports are available for public review at the DOE Public Reading Rooms near each site.*

34.16 The commentor points out that there is a disparity in the air emissions data being presented for sites conducting the same missions. According to the commentor, for the HE fabrication mission, Pantex, LLNL, and LANL propose to emit 413, 1,315, and 4,530 kg/yr (910, 2,897, and 9,981 lb/yr) of carbon monoxide; 122, 45, and 4,540 kg/yr (269, 99, and 10,003 lb/yr) for organics; 1,560, 349, and 22,700 kg/yr (3,437, 769, and 50,017 lb/yr) of nitrous oxides; and 0.02, 4.5, and 454 kg/yr (0.044, 9.9, and 1,000 lb/yr) of ammonia, respectively. In addition, the amount of HE powder required is different at each site. The commentor does not understand the reason for the disparity in both inputs and emissions for the same mission at different sites and wants to know where the numbers are coming from.

Response: *To bound the potential environmental impacts at each site, the PEIS estimates the workload that could be performed in a "surge," or maximum production scenario. Because it is expected that this workload would be performed in existing facilities (in the case of Pantex they were downsized current facilities), not surprisingly the maximum potential environmental impacts varied somewhat between the sites for this bounding surge case. The differences in the amounts and types of explosives shown in appendix tables G.3-2 and G.3-3 are due to the overall differences in work done by the three sites. This work includes at the laboratories both stockpile stewardship and potentially stockpile management workload in addition to reimbursable work for other customers. For Pantex, it includes potential stockpile management work plus an estimate of work for other Federal agencies. In addition, however, each alternative was assessed for the same low and high single-shift workloads.*

The differences in air emission numbers relate to inherent differences in the existing facilities and air emission control equipment at the three sites. Each alternative would utilize essentially the same production processes, and few of the criteria pollutant air emissions stem directly from these production processes.

DOE recognized the apparent differences in these numbers between the alternatives during the development of the PEIS source data. Reviews were conducted to assure consistency and comparability by a team of technical experts with representation from each site. The numbers reflected in the PEIS reflect the consensus opinion of this intersite team.

34.17 The commentor believes that the HE fabrication mission at Pantex is the root of the excellent safety record at Pantex, and that separating the two missions at Pantex would destroy the synergistic safety benefits. The commentor expresses concern about accidental explosions that might result from A/D activities at Pantex without benefits of the safety expertise generated by the HE fabrication mission.

Response: *DOE has established procedures to ensure the safety of its workers at all sites. The preferred alternative for HE fabrication was developed by DOE using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. The analysis of these factors is presented in the* Analysis of Stockpile Management Alternatives *report, and the rationale for selecting the preferred alternative is found in the* Stockpile Management Preferred Alternatives Report. *Both reports are available for public review at the DOE Public Reading Rooms near each site.*

40 Nuclear Weapons Policies

40.01 The commentors suggest that underground testing should be resumed and/or that the capability to resume nuclear testing should be maintained. Commentors state that the proposed stewardship facilities are new and unproven and are skeptical about the future safety and reliability of the Nation's stockpile without underground testing at NTS. Other commentors state that the United States is required by the *National Defense Authorization Act* to maintain a readiness posture, and that to be without testing capability with the possibility of unanticipated international developments would be unrealistic and perhaps foolhardy. Other commentors feel that the capability and reliability of our nuclear weapons will be greatly reduced without underground testing, and that the effects of changes or modifications to weapons can only be verified through testing.

Response: *As part of the August 1995 announcement to pursue a CTBT, the President stated that he had been assured "that we can meet the challenge of maintaining our nuclear deterrent under a Comprehensive Test Ban Treaty through a science-based stockpile stewardship program without nuclear testing." However, the President cautioned that, "while I am optimistic that the stockpile stewardship program will be successful, as President I cannot dismiss the possibility, however unlikely, that the program will fall short of its objectives." The President went on further to say that, "In the event that I were informed by the Secretary of Defense and Secretary of Energy... that a high level of confidence in the safety or reliability of a nuclear weapons type which the two Secretaries consider to be critical to our nuclear deterrent could no longer be certified, I would be prepared, in consultation with Congress, to exercise our 'supreme national interests' rights under the Comprehensive Test Ban Treaty in order to conduct whatever testing might be required."*

Thus, it is possible—although not probable—that under a CTBT, the United States might one day exercise its "supreme national interests" rights to conduct underground nuclear testing to certify the safety and reliability of its nuclear weapons. Consequently, section 4.12 of the PEIS includes a programmatic evaluation of the environmental impacts of underground nuclear testing at NTS.

40.02 The commentors question the rationale, timing, purpose, and need for planned subcritical testing at NTS. One commentor believes that the Draft PEIS fails to consider the programmatic decision on whether to proceed with proposed subcritical hydronuclear experiments as part of the Stockpile Stewardship and Management Program and, if so, where to conduct such experiments. The commentor also believes that the proposed subcritical tests are clearly part of DOE's Stockpile Stewardship and Management Program and that there is no justification for failing to analyze the proposed subcritical tests in the Draft PEIS. Specifically, the commentors are concerned about the need for these tests since the stockpile has been certified to be safe and reliable as recently as November 1995. One commentor asks if subcritical tests are included in the NTS Site-Wide EIS. Other commentors express concern that these tests would be seen internationally as nuclear tests, and that they may affect the Russian elections and the CTBT. One commentor states that weapon configurations could result in fission yields that, while small, would nevertheless contradict the express goal of achieving a zero-yield CTBT. Another commentor states that subcritical testing is a necessary component of the stockpile mission and can only be performed at NTS. Other commentors state that the PEIS does not adequately consider or analyze these tests, that they should be included in the Final PEIS, and that the tests should be postponed if necessary for inclusion. One commentor states that these tests are necessary, but should be carried out at LANL or LLNL, not NTS. Another commentor questions whether the subcritical tests are a legitimate interim action.

Response: *DOE believes subcritical experiments do not constitute a new activity at NTS. In addition, the Lyner Complex is not a new facility. Subcritical experiments have been conducted* *at NTS over many years. Historically, operations at NTS have included tests or experiments that included both HE and special nuclear materials that were intended to produce no nuclear yield or negligible nuclear energy releases. These experiments frequently remained subcritical (i.e., they did not achieve a self-sustaining fission chain reaction). They were often performed as dedicated, stand-alone experiments. Such experiments were described, for example, as one point safety tests and equations of state tests, and, in the prior terminology, were included under the broad umbrella of nuclear testing since testing with nuclear explosive yield was the predominant activity. Some of these earlier subcritical experiments were conducted on the surface while others were conducted underground in shafts, shallow boreholes, and tunnels. However, environmental considerations resulted in a decision to conduct these experiments only underground so that radioactive materials would not be introduced into the surface environment. The environmental impacts of the surface experiments were principally due to dispersal of special nuclear materials, such as plutonium, and other materials, by the detonation of HE. Subcritical experiments were mentioned in environmental statements prepared by the predecessors of DOE in the early 1970s, as well as in the 1977 NTS EIS under the names mentioned above.*

DOE is considering conducting the subcritical experiments referenced by the commentor in the Lyner Complex. Initial work on what is now known as the Lyner Complex began in the late 1960s, but it was not used at that time. Further work took place in the 1980s and early 1990s to develop a complex that could be used to perform intentionally designed low-yield tests or experiments, which, among others, would have included some experiments which would be expected to remain subcritical or provide negligible energy release. The Lyner Complex was completed under the 1977 NTS EIS and was subsequently used for testing purposes. With the moratorium on nuclear testing and the anticipated CTBT, Lyner will be dedicated solely to the conduct of dynamic experiments (including subcritical experiments) and hydrodynamic tests.

The term, "subcritical experiments," does not define a new form of activity at NTS. The use of the term is intended to clarify the fact that such experiments could not achieve the condition of criticality and that they would meet current and prospective U.S. commitments to the moratorium on nuclear testing and the anticipated CTBT. Although the specific term "subcritical" was not used in the previous EISs, some tests and experiments conducted over the past four decades, as well as the impacts of those tests and experiments, are substantially the same as those contemplated by the new terminology.

The principal diagnostic tools that DOE currently uses to study nuclear weapons primaries are hydrodynamic tests and dynamic experiments. The PEIS identifies that DOE, under the No Action alternative, would continue to use testing facilities currently available at NTS and the national laboratories. Additionally, section 3.1.2 of the Final PEIS has been expanded to discuss the issue of subcritical testing.

Note that nuclear detonation does not occur with subcritical testing. The environmental impacts of these tests are well within the previous operational impacts at NTS and are bounded by analyses performed in the NTS Site-Wide EIS as well as this PEIS. The remoteness, large size, and infrastructure at NTS make it a logical location to conduct these experiments.

An analysis of subcritical tests is included in the NTS Site-Wide EIS as part of the continue current operations (No Action) alternative. The impacts which result from operation of the Lyner *facility are analyzed in chapter 5, and a description of the facility is located in appendix A of the NTS Site-Wide EIS. Further Lyner Complex details are addressed in a classified appendix to the NTS Site-Wide EIS.*

Subcritical experiments are a long standing part of NTS's mission and DOE believes that the provisions of CEQ regulations regarding interim actions are inapplicable to a decision by DOE whether to continue conducting these experiments at NTS after completion of the NTS Site-Wide EIS. In the Stockpile Stewardship and Management PEIS, DOE is proposing ways to augment the existing nuclear weapons stockpile stewardship program for the specific purpose of accommodating the lack of underground nuclear testing, rather than reconsidering the entire stewardship program. Ongoing activities, such as the subcritical experiments at NTS, that are not affected by the decisions to be made in the Stockpile Stewardship and Management PEIS process are not interim actions under the regulations. Therefore, if DOE decides to conduct subcritical tests at NTS in the future, that decision will be made after considering the analysis contained in the NTS Site-Wide EIS, and will be documented in an ROD for that EIS.

40.03 Several commentors ask about the circumstances and people responsible for making the recommendations to resume underground nuclear testing under the "supreme national interest" clause of the CTBT. Specifically, who could make the decision to resume testing and how the decision would be implemented if the stockpile were judged to be unreliable. Commentors are specifically concerned about the pressures experienced by laboratory directors while making the certification of reliability, and what other options were available to them instead of resuming underground nuclear testing. Another commentor is concerned that the responsibility for certification of nuclear weapons rests solely in the hands of the weapons laboratories, with no outside review by unbiased parties.

Response: *Every decisionmaker has certain pressures placed upon him or her. The checks and balances designed into the national laboratory system as well as our Nation's system of government help ensure that decisions are made with the best available knowledge and that numerous viewpoints are taken into account. In announcing U.S. plans to pursue a CTBT, the President also announced a decision and coordination process which would require other military and civilian officials (including Congress), in addition to the laboratory directors, to join in any recommendation to resume underground nuclear testing.*

40.04 Several commentors state that nuclear deterrence is necessary and must be maintained and that having a nuclear deterrent permitted the nonproliferation process to work and put the United States in a position to promote peace. Commentors state that our safety and national security has been based on our deterrence policy and that our technological advances, particularly those made by LANL and LLNL, led to the collapse of the Soviet Union. Other commentors state that nuclear deterrence provides for common worldwide security and that a deterrent remains necessary in light of the threats from other nations and terrorist groups.

Response: *The President has declared that the maintenance of a safe and reliable nuclear weapons stockpile will remain a cornerstone of national security policy for the foreseeable future. Changes to U.S. national security policies in the post-Cold War period have placed two significant constraints on the way DOE has traditionally accomplished its statutory nuclear mission: the*

United States has declared a moratorium on underground nuclear testing and is not producing new-design weapons. In August 1995, the President declared that the United States was seeking ratification of a zero-yield CTBT. Within these constraints, the proposed actions in this PEIS would enable DOE to maintain the core intellectual and technical competencies necessary to ensure the continued safety and reliability of the smaller and aging stockpile under a CTBT.

40.05 The commentors believe that DOE is assuming a nuclear war-fighting posture instead of a deterrence posture, that U.S. policy relies on violence and that this threatens the rest of the world. Other commentors state that the Stockpile Stewardship and Management Program is driven by the Nuclear Posture Review (NPR), which is based on U.S. first-strike capability, and that DOE has coupled the terms "deterrence" and "first-strike" in order to diminish the difference between the two. Another commentor states that the PEIS did not clearly state if the Stockpile Stewardship and Management Program is only intended to maintain nuclear retaliation capability, and how it would compare two strategies based on first-strike capability or retaliation against a non-nuclear adversary. Other commentors believe that the safety of the weapons is not in question and that DOE is orienting the Program towards examining the explosive yield of the weapons or towards designing new and/or improved weapons. The commentor states that the deterrence would be just as effective with a lower yield weapon. A commentor feels that DOE should develop skills of mediation to be used nationally and universally, instead of threats of weapons and military might, where everyone loses and nobody wins. Other commentors express opposition to the Program stating that we need to wage a war of peace and have a Department of Peace in this country. Another commentor wants to stop the connection between technical research and development and war and killing, stating that if our scientists would benefit from the development of a super computer then it should be placed in one of our great universities, hospitals, or at the Peace Institute and not used for new bomb making.

Response: *One benefit of science-based stockpile stewardship is to demonstrate the U.S. commitment to NPT goals; however, the U.S. nuclear posture is not the only factor that might affect whether or not other nations might develop nuclear weapons of their own. Some nations that are not declared nuclear states have the ability to develop nuclear weapons. Many of these nations rely on the U.S. nuclear deterrent for security assurance. The loss of confidence in the safety or reliability of the weapons in the U.S. stockpile could result in a corresponding loss of credibility of the U.S. nuclear deterrent and could provide an incentive to other nations to develop their own nuclear weapons programs. Also see the response to comment summary 40.60 for additional discussion of the stockpile stewardship and management alternatives and arms reduction goals.*

40.06 The commentors state that nuclear weapons are not a deterrent; do not maintain peace; are unnecessary, immoral, and unethical; and should be eliminated. Commentors also state that the United States should pursue a policy of complete national and worldwide disarmament and denuclearization, and these options should be considered in the PEIS. The commentors state that these policies would strengthen our national security and our international relations, particularly with respect to our treaty obligations, and that most people worldwide favor the elimination of nuclear weapons. Commentors feel that the United States needs to lead by example and to encourage the rest of the world to follow our lead in disarmament, and that this is the only course of action that will result in nonproliferation. Other commentors state that it is this action that will result in nonproliferation. Other commentors state that the creation and/or maintenance of jobs is not an adequate excuse to continue to build nuclear weapons. One commentor cites the successful disarmament of mustard gas, nerve gas, and antipersonnel weapons as examples for the nuclear weapons industry to follow.

Response: *As a result of the START I Treaty, START II protocol, and NPR, the Nation's nuclear weapons stockpile is being significantly reduced. However, even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be a cornerstone of U.S. national security policy for the foreseeable future. Thus, DOE's responsibilities for ensuring the safety and reliability of the U.S. nuclear weapons stockpile will also continue. Stockpile stewardship contributes positively to U.S. arms control and nonproliferation policy goals by allowing the United States to pursue ratification of a zero-yield CTBT and by providing the United States with continued confidence in its weapons to allow for further reductions and to meet its NPT Article VI obligations.*

40.07 The commentors state that the proposed Stockpile Stewardship and Management Program, and specifically the proposed stewardship facilities, violate existing and proposed treaties, specifically the CTBT and NPT, and agreements on nonproliferation. The commentors believe that these facilities will lead to new and more powerful weapons designs, continued weapons testing, increased competition among nuclear weapons states, advancement of weapons technology, and provide the impetus and capability to other countries and terrorists to develop nuclear weapons. One commentor states that DOE has decoupled the terms "design" and "development," and "nonproliferation" and "disarmament" and that the United States says there are no plans to produce new weapons but that design activities continue. Commentors also state that the Program will give other nations the impression that the United States is moving forward in its nuclear weapons program (e.g., W-76 re-certification, W-88 pit rebuild, and B-61 Modification 11) and is therefore encouraging others to continue with weapons development as well. Commentors state that the long- and short-term nonproliferation impacts have not been fully addressed and analyzed in the PEIS. Other commentors point out that in their view, reestablishing pit fabrication at LANL is against nonproliferation goals and the spirit of the treaties. One commentor states that the nuclear weapons life-extension program is contrary to the NPT. Another commentor feels that the United States should lead the way internationally in START I and II, CTBT, NPT, and all future "nuclear deterrence treaties." International oversight of the stockpile stewardship program could help solve nonproliferation concerns, according to one commentor.

In addition, commentors believe that the PEIS fails to mention that the stewardship program will be used to maintain the expertise of weapons development, research, design, testing, prototyping, and certification. One commentor states that the rationale for designing new weapons to keep the scientists from getting rusty is not enough to warrant continued design of weapons. Another commentor believes the PEIS should consider a future treaty that may require DOE to disclose whether or not the stewardship program does weapon designing. The commentor believes that DOE should separate the advancement of the science of nuclear weapons from the maintenance work. The commentor also states that we do not need to alter the designs to meet new challenges from other countries.

Response: *The issue of nonproliferation is addressed in section 2.6. As stated in that section, on August 11, 1995, the President announced his commitment to seek a zero-yield CTBT. He also established several safeguards that condition U.S. entry into a CTBT. One of these safeguards is the conduct of science-based stewardship, including the conduct of experimental programs. This safeguard would enable the United States to enter into such a treaty while maintaining a safe and reliable nuclear weapons stockpile consistent with U.S. national security policies.*

One benefit of science-based stockpile stewardship is to demonstrate U.S. commitment to NPT goals; however, the U.S. nuclear posture is not the only factor that might affect whether or not other nations might develop nuclear weapons of their own. Some nations that are not declared nuclear states have the ability to develop nuclear weapons. Many of these nations rely on the U.S. nuclear deterrent for security assurance. The loss of confidence in the safety or reliability of the *weapons in the U.S. stockpile could result in a corresponding loss of credibility of the U.S. nuclear deterrent and could provide an incentive to other nations to develop their own nuclear weapons programs.*

The experimental testing program would continue to be used to assess the safety and reliability of the nuclear weapons in the remaining stockpile. Much of this testing is classified and could not lead to proliferation without a breach of security. Use of classified data from past U.S. nuclear tests is also a vital part of the overall process for validation of new experimental data. Most of the component technology used for the proposed enhanced experimental capability is unclassified and is available in open literature, and many other nations have developed a considerable capability.

Proliferation drivers for other states, such as international competition or the desire to deter conventional armed forces, would remain unchanged regardless of whether or not DOE implemented the proposed action analyzed in the PEIS. In the NPT, the parties agree not to transfer nuclear weapons or other devices, or control over them, and not to assist, encourage, or induce nonnuclear states to acquire nuclear weapons. However, the treaty does not mandate stockpile reductions by nuclear states, and it does not address actions of nuclear states in maintaining their stockpiles. Section 3.1.2 of the Final PEIS has been expanded to address these issues. As explained in that section, the national security policy framework discussed in this PEIS seeks a new balance between U.S. arms control and nonproliferation objectives and U.S. national security requirements for nuclear deterrence while pursuing these objectives (section 2.2). In addition, a discussion is provided on some of the more difficult issues that must be considered in determining the balance, including a discussion of experimental capability (section 2.6). In particular, the issue of nonproliferation and the proposed NIF was studied in detail. The NIF and the Issues of Nonproliferation Draft Study, prepared by the DOE Office of Arms Control and Nonproliferation, has been the subject of extensive public involvement, interagency review, and review by outside experts. The study concluded that the technical proliferation concerns of NIF are manageable and can therefore be made acceptable and that NIF can contribute positively to U.S. arms control and nonproliferation policy goals (appendix section I.2.1 of Volume III). NIF is a proliferation concern because of its broader scientific applications and expected frequent use by researchers worldwide and, like the other proposed enhanced experimental facilities, because of its possible relevance to the development of new weapon designs. However, the development of new weapon designs requires integrated testing. None of the proposed facilities, either alone or together, could perform such integrated testing of new concepts and, therefore, cannot replace nuclear testing for the development of new weapon designs. The national security policy framework and the technical issues that drive the proposed action for enhanced experimental capability remain the same.

DOE is directed to maintain nuclear weapon capability, including the capability to design, develop, produce, and certify new warheads. In addition, maintenance of the capability to certify weapon safety and reliability provides a limited inherent capability to design and develop new weapons. However, no new-design nuclear weapon production has been directed. DOE has not advanced a rationale of new weapon design "to keep scientists from getting rusty." Instead, DOE has advanced a comprehensive program of stockpile stewardship and management which maintains essential capabilities for stockpile safety and reliability while meeting other legal and policy directives.

Regarding the comment on the Life Extension Program, the Nation is no longer developing new-design weapons to replace existing weapons. Consequently, weapons' lifetimes are expected to extend beyond their original design goal of about 20 years. In accordance with our international treaty obligations, the Nation's nuclear weapons stockpile is being significantly reduced, and the Nuclear Weapons Stockpile Memorandum (NWSM) accounts for these reductions. The Life Extension Program is a term used to describe the planning activities which ensure that the nuclear *weapons remaining in the stockpile will continue to be safe and reliable. The Life Extension Program is consistent with the NWSM and our international treaty obligations.*

Regarding comments that enhanced experimental capabilities are directed more at the capability to design new weapons in the absence of nuclear testing than at maintaining the safety and reliability of the existing stockpile, this PEIS explains why these capabilities are needed to maintain the safety and reliability of a smaller, aging stockpile in the absence of nuclear testing (chapter 2). The existing U.S. stockpile is highly engineered and technically sophisticated in its design for safety, reliability, and performance. The stewardship capabilities required to make technical judgments about the existing stockpile are likewise technically sophisticated; therefore, it would be unreasonable to say that these stewardship capabilities could not be applied to the design of new weapons, albeit with less confidence than if the weapons could be nuclear tested. The development of new weapon designs requires integrated nuclear testing such as occurs in nuclear explosive tests. Short of nuclear testing, no single stockpile stewardship activity, nor any combination of activities, could confirm that a new-design weapon would work. In fact, a key effect of a zero-yield CTBT would be to prevent the confident development of new-design weapons. National security policy requires DOE to maintain the capability to design and develop new weapons, and it will be a national security policy decision to use or not use that capability. Choosing not to use enhanced experimental capability for new weapon designs would not change the technical issues for the existing stockpile and, therefore, the stewardship alternatives would not change.

The issue of new-design weapons is separate from DOE's need to perform modifications to existing weapons that require research, design, development, and testing. The phrase used in this PEIS, "without the development and production of new-design weapons," is meant to convey the fact that the historical continuous cycle of large-scale development and production of new weapons designs replacing older weapon designs has been halted. For example, during the 1980s, about a dozen new-design weapons were in full-scale development or production. Over the decade, production of new-design weapons replaced dismantled weapons nearly one for one. Today, only modifications to parts of existing weapons are being performed or planned; dismantlement has continued. This results in a smaller aging stockpile that must be assessed and certified without nuclear testing. This is now the primary focus of the stewardship program.

40.08 Some commentors believe that there was no willful collusion among laboratories to further their weapons complex activities; however, the commentors question the ability of the proposed plan to get the job done. A number of commentors believe that political and laboratory interests were influencing the Stockpile Stewardship and Management Program plan and alternatives and that the focus should be on national security and not politics. Commentors state that the laboratory scientists and contractors responsible for developing the program were using "inside" and classified knowledge and influence to advise decisionmakers on furthering their weapons program activities while reducing the manufacturing mission at production plants, and that this could have detrimental long-term effects. A commentor states that the PEIS attempts to justify the stewardship facilities which will primarily benefit the western laboratories, which already provide redundant capabilities. Another commentor refers to the statement made by Dr. Smith to the Armed Forces Subcommittee that, "Today, we do not have the capability to manufacture replacements for warheads that comprise our existing stockpile," and questions why DOE was proposing to slash production capabilities while building up basic programs at the weapon laboratories. Other commentors believe that there were others, such as retired scientists and experts, who should be involved in the study and that the focus on the laboratories and their input was a mistake.

Response: *Production and laboratory functions are different, but the difference is reduced as the size of the production requirements becomes smaller. The first atomic weapons were not only designed but also constructed at the weapons laboratories. The laboratories have always had the capability for small lot production principally in order to test out designers' theories. In some respects, this could be considered an advantage by increasing the synergism between the two activities. Based on the environmental, cost, and technical analyses that have been performed, the preferred alternative is to downsize the stockpile management functions at ORR, KCP, and Pantex, and not transfer them to the laboratories and NTS.*

In the PEIS preferred alternative, the only "production capability" which is being considered for one of the national weapons laboratories is the reestablishment of pit fabrication. This function does not presently exist within the Complex and has not existed for some time due to the 1991 shutdown and subsequent closing of the Rocky Flats Plant. Two sites were considered as alternatives for the pit fabrication mission: LANL, which already has an active program involving both fabrication and recovery of plutonium and has fabricated pits for nuclear explosive testing, and SRS, which has separated and produced plutonium metal from reactor targets and has recovered plutonium from scrap materials. Analysis discussed in the Analysis of Stockpile Management Alternatives *report shows that the LANL alternative is lower in cost and has less technical risk than the SRS alternative. Technical risk is greater for the SRS alternative because LANL has recent experience in providing pits for nuclear explosive testing, whereas SRS has no experience with the kind of capabilities required for precision nuclear component manufacturing. Additionally, the LANL capability could be in place two years earlier than the SRS capability. The* Analysis of Stockpile Management Alternatives *report is available for public review at the DOE Public Reading Rooms near each site.*

It is true that projected needs may actually turn out to be higher or lower than the actual needs. This is one reason why the downsize-in-place alternative is the preferred option for most stockpile management missions. The proposed action for stockpile management would downsize facilities over a number of years, but this action can be reversed if necessary.

In the event science-based stewardship proposals could not assure the continued safety and reliability of the nuclear weapons stockpile, the resumption of underground testing at NTS would be considered. On August 11, 1995, the President stated that if he was informed by the Secretaries of Defense and Energy that a high level of confidence in the safety or reliability of a nuclear weapons type considered critical to the nuclear deterrent could no longer be certified that he would be prepared, in consultation with Congress, to exercise our "supreme national interests" rights under the CTBT to conduct whatever testing might be required.

Chapter 2 of the PEIS discusses the national security policy considerations and the role they play in defining the purpose of and need for the Stockpile Stewardship and Management Program. DOE participates regularly in Congressional hearings on defense issues in which the stockpile stewardship and management issues are discussed. Congress determines how funds are allocated, and DOE spends monies consistent with Congressional direction. Therefore, Congress ultimately determines whether the preferred alternatives of the program will be implemented.

The majority of the U.S. core competencies and capabilities in nuclear weapons reside at the weapons laboratories. Proposing to locate new stewardship facilities at the weapons laboratories and NTS would expand existing facilities at sites with an experienced knowledge base and infrastructure and would help maintain the core intellectual and technical competencies of the weapons laboratories. Proposing to locate stewardship facilities at sites without the knowledge base and infrastructure would be counterproductive to the development of science-based stockpile stewardship.

40.09 One commentor refers to an article in the *New York Times* in February that stated DOE was having trouble verifying that sources of weapon grade materials in Russia were actually coming from the dismantlement of weapons. The commentor suggests that DOE not only look at downsizing, but look at what they are going to do in terms of verifying sources of weapons grade materials in Russia.

Response: *The PEIS does not address actions to secure and dispose of excess fissile materials. A major objective of the programmatic alternatives addressed in the Storage and Disposition Draft PEIS, however, is to demonstrate and encourage bilateral actions on both U.S. and Russian weapons grade plutonium. The commentor is referred to the purpose and need in the Storage and Disposition Draft PEIS for a more complete discussion of this subject.*

40.10 The commentor would like DOE to consider site location (proximity to population centers) in the decisionmaking process and urges DOE to perform their missions somewhere else.

Response: *An indepth analysis was conducted to identify the potential environmental impacts associated with the reasonable alternatives. This analysis included proximity to population centers, along with many other factors so that absolute and comparative impact analyses can be made. Specifically, chapter 4 utilizes proximity to population centers in calculating both normal operational exposures and exposures resulting from accident scenarios for each of the alternatives considered.*

40.11 Several commentors express concern about the optimism of world peace in the future and that we are not protecting the option that the world might revert to a more hostile place. Commentors state that the laboratories need to maintain a complete understanding of nuclear weapons, particularly in light of the CTBT. Commentors would like the PEIS to consider the possibility of nonratification of START II and noncompliance with the CTBT and discuss the possibility that we may need stockpile levels higher than START I. Other commentors note that even if the United States and Russia honor nonproliferation agreements other nations or groups may not and that the United States should prepare for this eventuality. Another commentor states that the Stockpile Stewardship and Management Program fails to meet its objective of protecting the Nation's ability to respond to changing national security needs.

Response: *The base case analyzed in the PEIS assumes a START II-sized stockpile. The PEIS also analyzes a higher case, which represents a START I-sized stockpile. DOE cannot speculate about the pace of Russian nuclear weapon dismantlement. However, by structuring the Stockpile Stewardship and Management Program consistent with the DOD NPR and associated PDDs, DOE has built flexibility into the Program to respond by maintaining at START I stockpile levels (which Russia has ratified) or making faster and deeper stockpile reductions in response to further arms reduction agreements.*

DOE continues to carefully evaluate the size of the weapons complex necessary to support projected stockpile and national security needs. It is true that projected needs may actually turn out to be higher or lower than the assumed needs. This is one reason why the downsize-in-place alternative is the preferred option for most stockpile management missions. The preferred alternatives for stockpile management would downsize facilities over the coming years, but this action can be reversed if necessary. If DOE were to transfer stockpile management missions from a site, those facilities would be less amenable to rapid expansion. Therefore, the downsize-in-place option gives DOE the most flexibility in the next several years to react to changing world events should the need arise.

40.12 Commentors state that the money spent on nuclear weapons and the Stockpile Stewardship and Management Program should be spent on other more needy social programs, and that the jobs created are not worth the negative ramifications of the Program. One commentor believes that enormous amounts of taxpayer money are being wasted on militarily unusable weapons. Other commentors believe that the money should be spent on more useful programs such as medical care, day care, education, feeding the hungry, housing, infrastructure, conservation, renewable energy, and environmental cleanup. Another commentor feels the United States should invest in peace, trust, and equality. Commentors also believe that the Stockpile Stewardship and Management Program is a pork barrel project for the nuclear military industrial complex and the corporations that serve the complex. A commentor also states that national security is really about having a well-educated, nonviolent, clean, and safe community, and not nuclear weapons. Other commentors ask why the public should feel comfortable with a plan that is very costly and gives us less, not more, nuclear deterrent.

Response: *Since the end of the Cold War, the DOE nuclear weapons program budget has been reduced significantly from its Cold War level. The Stockpile Stewardship and Management Program proposes further facility downsizing to optimize U.S. capabilities to meet future reduced stockpile levels. DOE proposes to the Congress a level of funding each year which meets Administration and Congressional policy directions. DOE is not in a position to make the difficult tradeoffs that may be required between alternative Federal programs.*

40.13 Many commentors question the Stockpile Stewardship and Management Program costs and request clarification and more discussion of the details and assumptions used in the cost analysis. Several commentors want to see the cost analysis presented in the PEIS. Specific issues expressed by the commentors include the request for more information on D&D costs, life-cycle costs, transportation costs of moving pits, site transition costs, enhanced experimental program costs, training costs of new workers, remediation and cleanup costs, and program cumulative and annual costs.

Several commentors, concerned with the cost of the stockpile stewardship facilities, ask if current facilities could be used since millions of dollars have been spent on maintaining these capabilities at the Complex sites. Other commentors state that there may be more cost-efficient ways of achieving stockpile stewardship and management goals, such as "piggy-backing" onto the current sites rather than transferring these activities elsewhere. One commentor also asks what is the annual cost of the proposed Stockpile Stewardship and Management Program for the next decade and how does this cost compare to the cost of a conventional surveillance program, such as the one that has been used successfully for the last 50 years. Commentors also express concern that with the current cutbacks in the Federal budget, spending money on new facilities is counterproductive. One commentor asks how much money will be saved by rightsizing the weapons complex as proposed. Another commentor states that the cost analysis was faulty in showing the downsizing of Pantex was more cost-effective than relocating the A/D and HE missions to NTS.

Response: *The PEIS provides documentation on the potential environmental impacts associated with the reasonable alternatives. Cost is one of the factors considered in developing the alternatives and identifying the preferred alternatives. Two separate reports have been prepared, the* Analysis of Stockpile Management Alternatives *report, and the* Stockpile Management Preferred Alternatives Report *which outline the costs of the various alternatives and the role costs play in the rationale for selecting the preferred alternatives. These documents are available for public review at the DOE Public Reading Rooms located near each site.*

The downsize-in-place alternatives were chosen for several reasons including the availability of a trained workforce, existing mission site infrastructures, the ability to expand capabilities in the event of a change in world events, as well as other factors. Clearly cost is an important factor, not only the cost of D&D of surplus facilities but the costs of constructing new facilities and their eventual D&D must also be considered as well.

The cost analysis that DOE has performed to address alternative sites for accomplishment of the stockpile management missions has been performed with participation from all weapons complex sites. To assure peer review of cost estimates, each site was given the opportunity to review and critique the cost estimates provided by the competing sites. In addition, DOE commissioned an independent validation of the cost estimates. Relocation of the HE mission from Pantex to NTS was not considered a reasonable alternative and was not addressed in the PEIS.

In the No Action alternative, the PEIS analyzes the alternative of relying on existing facilities and capabilities to perform the stockpile stewardship mission. However, as explained in section 3.1.4, relying on existing facilities would not ensure DOE's ability to maintain core competencies in nuclear weapons in the long-term while also maintaining a safe and reliable, smaller, aging, U.S. stockpile. Thus, enhanced experimental facilities are proposed and evaluated in the PEIS.

40.14 Commentors state that underground testing should cease, the capability to resume testing should not be maintained, and the NTS testing area should be closed. Commentors state that there is no technological justification for testing, that closing the test site would demonstrate U.S. resolve in ending its weapons programs, and that it would be more fiscally responsible to stop testing. Other commentors state that underground testing contaminates the land and produces more nuclear waste. One commentor compares the Stockpile Stewardship and Management Program to the Safeguard C program, which maintained atmospheric testing readiness but was discontinued when Congress learned of its costs. Another commentor questions the need for funding NTS at such an enormous cost.

Response: *The United States has ceased underground nuclear testing and is pursuing a CTBT. The President also stated that he had been assured "that we can meet the challenge of maintaining our nuclear deterrent under a Comprehensive Test Ban Treaty through a science-based stockpile stewardship program without nuclear testing." However, the President cautioned that, "while I am optimistic that the stockpile stewardship program will be successful, as President I cannot dismiss the possibility, however unlikely, that the program will fall short of its objectives." The President went on further to say that, "In the event that I were informed by the Secretary of Defense and Secretary of Energy... that a high level of confidence in the safety or reliability of a nuclear weapons type which the two Secretaries consider to be critical to our nuclear deterrent could no longer be certified, I would be prepared, in consultation with Congress, to exercise our 'supreme national interests' rights under the Comprehensive Test Ban Treaty in order to conduct whatever testing might be required."*

Thus, it is possible—although not probable—that under a CTBT, the United States might one day exercise its "supreme national interests" rights to conduct underground nuclear testing to certify the safety and reliability of its nuclear weapons. Consequently, section 4.12 of the PEIS includes a programmatic evaluation of the environmental impacts of underground nuclear testing at NTS.

40.15 Several commentors state that DOE should not spend funds to continue the production and maintenance of nuclear weapons, but instead should divert the funds and technical expertise to developing methods of neutralizing radioactive waste and to clean up from past activities.

Commentors state that legacy waste from past weapons complex activities should be cleaned up first (e.g., the Chemistry and Metallurgy Research building at LANL) before any new projects or programs are started and additional wastes are created. One commentor believes that classification issues are hindering cleanup efforts. Another commentor states that contamination problems at NTS should have been addressed earlier in the process before the Draft PEIS was prepared. Commentors are concerned about the availability of funds for proposed cleanup of excess facilities once turned over to Environmental Management for disposition. One commentor states that the Nation could only afford to maintain a minimal stockpile since we are faced with the immense cost of cleaning up the environmental problems caused by the nuclear weapons industry.

Response: *DOE has a program to decontaminate and make available for other uses its excess facilities. The budget for this activity has increased significantly since the end of the Cold War. DOE has made every effort to prioritize the cleanup of these excess facilities based on risk. Therefore, as the commentor alludes, some low risk facilities may wait a significant time period for decontamination because the higher risk facilities are addressed first. However, DOE has demonstrated a commitment to bring excess facilities to a safe shutdown condition awaiting decontamination, and to maintain these excess facilities in a safe condition until decontamination can proceed. DOE is committed to both the cleanup of its excess facilities, but also to maintain a nuclear weapons stockpile to meet national policy directives.*

As stated in section 3.1.1, Planning Assumptions and Basis for Analysis, DOE would emphasize compliance with applicable laws and regulations and accepted practices regarding industrial and weapons safety, safeguarding the health of workers and the general public, protecting the environment, and ensuring the security of nuclear materials, weapons, and weapons components. DOE would also minimize the use of hazardous materials and the number and volume of waste streams consistent with programmatic needs through active pollution prevention programs and waste minimization. The Chemistry and Metallurgy Research building at LANL is an analytical chemistry laboratory that has been in continuous use since 1952. See the response to comment summary 40.90 for further discussion on the Chemistry and Metallurgy Research building.

The LLW disposal facility of NTS has been designed, constructed, and managed in such a way so as to handle safely the materials disposed of in this facility. This facility was sited due to the remoteness of NTS, the depth of the groundwater, and other factors which contribute to assuring the disposal of these materials can be conducted in a safe manner.

40.16 The commentor recognizes the significance of downsizing and wants to know if the PEIS discusses a transition funding similar to that at the Mound Plant (e.g., reuse of plants, refitting, and revised missions that could possibly give futures to some displaced workers).

Response: *This is a programmatic document and, as such, does not address detailed site-specific transition planning. In the event that a decision is made to adopt the preferred alternative, further site-specific review would take place. When DOE closes a facility, a transition plan is developed, detailing the cleanup plans, disposition of equipment, and ultimate disposition of the land. There is an established process for including the adjacent communities in this process and DOE's Office of Economic Assistance has grants and other support services to assist in the retraining and out-placement of all adversely affected employees.*

It is DOE policy to reassign employees to new missions whenever possible. As stated in sections 4.2.3.8, 4.4.3.8, and 4.5.3.8., the DOE Office of Worker and Community Transition would *oversee the workforce restructuring plans for ORR, KCP, and Pantex. This plan would be developed in conjunction with the affected communities, local governments, and elected officials. Factors considered in these plans would include additional professional and vocational training at local schools during the transition period; academic and vocational counseling; help in preparing resumes and preparing for job interviews, financial planning, and job searching techniques; coordination with local businesses and economic development agencies to identify available jobs; and means of informing the business community of skilled personnel in the labor market.*

40.17 The commentors raise concerns that the PEIS ignores the significant body of Congressional hearings and testimony that science-based stewardship is not guaranteed to work, or that if it works it will not be ready for at least another 10 years.

Response: *The purpose of the PEIS is to evaluate reasonable alternatives for the future weapons complex in order that we may determine how best to assure the continued safety and reliability of the nuclear weapons stockpile in the absence of underground nuclear testing. Science-based stewardship is the alternative to underground nuclear testing. While DOE recognizes that there is an inherent risk in any surrogate for underground nuclear testing, we are confident that the science-based stewardship program can be successful. Nonetheless, because there can be no absolute guarantee of complete success in the development of enhanced experimental and computational capabilities, the United States will maintain the capability to conduct underground nuclear tests under a "supreme national interest" provision in the anticipated CTBT.*

40.18 The commentor states that DOE has focused almost exclusively on preserving the capabilities and core competencies of the national laboratories, while paying little attention to the production plants. The commentor also states that the PEIS does not deal adequately with the production capacity that will be needed to maintain the stockpile over the next 10 or more years, and states that the entire PEIS analysis is based on optimistic assumptions about future arms control agreements.

Response: *The preferred alternatives described in the PEIS would preserve the critical capacity and unique assets that exist in DOE's production plants. Although there would be downsizing of the production plants commensurate with a downsized stockpile, none of the production plants would be closed. The PEIS addresses plant operations to support a range of stockpile sizes consistent with DOD plans, as reflected in the NPR and the NWSM. A "No Action" alternative is also addressed which essentially preserves the status quo (no downsizing of facility infrastructure).*

DOE does not believe that the preferred alternative of downsizing reflects undue optimism about future arms control agreements. The stockpile has already been significantly reduced through dismantlement. Post-Cold War dismantlement to the START I-sized stockpile is already more than 70 percent complete and the remainder is scheduled to be completed within a few years. Regarding the production capacity cases analyzed, they reflect our best estimates based on analysis of historical stockpile problems and the current status of the weapons expected to remain in the future stockpile. The technical and cost analyses for production capability and capacity alternatives were published in two draft reports released in support of the Draft PEIS: the Stockpile Management Preferred Alternatives Report; *and the* Analysis of Stockpile Management Alternatives *report, both dated February 1996. These reports will be released in final form to support the Final PEIS. Our analysis indicates that downsizing, which would occur over a protracted period of time, is the most cost-effective solution, involves the least technical risk, and affords the Nation the most flexible strategy in the event that national security policies change or future stockpile problems are greater than we anticipate.*

40.19 Several commentors question the need for new pit manufacturing citing concerns of advancing new nuclear weapons design (e.g., mini nukes) and increasing the pit stockpile when plenty of pits are already available for reuse in weapons. Other commentors express their opposition to pit manufacturing activities at LANL. Another commentor questions the workload associated with the pit fabrication options.

Response: *Because of the small demand for the fabrication of replacement plutonium pits over the next 10 or more years, DOE did not propose a new pit fabrication facility with a capacity equivalent to the capacities required for other portions of the nuclear weapons production complex. However, limited fabrication of new replacement pits would be required to maintain capability and to replace pits lost during weapon surveillance. Section 3.6 discusses DOE's future plans should a life-limiting phenomenon be found in stockpile pits and a larger pit fabrication capacity be required.*

The No Action alternative discussed in section 3.4.3.1 would maintain only a limited plutonium R&D component fabrication capability at LANL and a less extensive capability at LLNL, and it would not provide DOE with sufficient pit fabrication capability to meet the requirements stated in section 3.1. DOE does not consider it prudent to pursue an alternative which would prevent it from fulfilling its national security mission. Additionally, DOE is under the direction of the President and Congress, through PDDs and the National Defense Authorization Act *of 1994, to support the maintenance of a safe and reliable nuclear weapons stockpile, and to maintain the core intellectual and technical competence of the United States in nuclear weapons. This includes competencies in research, design, development, testing, reliability assessment, certification, manufacturing, and surveillance capabilities. The preferred alternative for the pit fabrication mission is to reestablish production capability with a limited capacity at LANL. The preferred alternatives were developed by DOE using data and studies on such factors as cost, technical feasibility, technical risk and schedule, ES&H, and national security. The* Analysis of Stockpile Management Alternatives *report which contains the analysis of these factors is available for public review at the DOE Public Reading Rooms near each site. To bound the potential environmental impacts at each site, the PEIS estimates are based on "surge" or maximum production scenario. Because it is expected that this workload would be performed in existing facilities that would be modified to perform pit fabrication, it is not surprising that the maximum outputs and the maximum potential environmental impacts varied somewhat between LANL and SRS for this bounding surge case. In addition, however, each alternative was assessed for the same low case and high case single-shift workloads.*

40.20 The commentor expresses the view that Pantex should continue to store plutonium, and should be the preferred site for any disposition options and related functions.

Response: *These decisions will not be made until the Storage and Disposition Final PEIS is completed. In that PEIS, Pantex is being considered for the long-term storage of strategic and surplus fissile materials, and as a disposition site for surplus fissile materials. Although no preferred alternatives have been identified for the Fissile Materials Disposition Program, preferred alternatives will be identified in the Final PEIS, expected before the end of 1996. Pantex has many valuable attributes which will be considered in that analysis.*

40.21 The commentors express both praise and criticism of DOE's safety and environmental monitoring programs and protection, and insist that all future DOE missions must be conducted in a safe and environmentally sound manner. Commentors believe that moving missions would potentially lead to a decline in worker health and safety protection and an increased threat to the environment at the mission's new site. Other commentors state that classification and the shift of safety responsibility from workers to management has weakened the DOE safety program at some sites, and that worker knowledge and training were necessary for safe operations. One commentor states that he did not trust DOE when it came to ES&H monitoring and felt that workers' fear of losing their jobs prevented people from raising safety concerns. The commentor believes that the current system within DOE to shelter whistleblowers is not effective in protecting the whistleblowers. The commentor believes that the people at LANL were not laid off because they were whistleblowers. One commentor believes that if stockpile stewardship and management work came to LANL, employees with jobs related to health and safety would be hindered from truth-telling from fear of management pressure or job loss, since current management implements a subjective and undemocratic system of employee evaluation and control.

A commentor refers to the Tiger Team findings and tracking program at LANL as an example of DOE's lack of commitment to reducing environment, health and safety issues. Another commentor questions DOE's stated priority on safety in light of their cancellation of the NEWNET air monitoring system. Other commentors state that DOE has not conducted or released enough studies on worker and public health effects and on past accidents and their results. A commentor states that the recent forklift accident, the fatality due to an electrocution and the root causes need to be identified in the Accident History section of the PEIS. The commentor also wants an analysis of the effect of the recent reduction-in-force on the occupational safety at LANL. Another commentor feels the workers at LANL are eminently competent to monitor their own safety and environmental concerns.

Response: *As stated in section 3.1.1, Planning Assumptions and Basis for Analysis, DOE would emphasize compliance with all applicable laws and regulations and accepted practices regarding industrial and weapons safety, safeguarding the health of workers and the general public, protecting the environment, and ensuring the security of nuclear materials, weapons, and weapons components. DOE would also minimize the use of hazardous materials and the number and volume of waste streams consistent with programmatic needs through active pollution prevention programs and waste minimization. The specific stockpile management assumptions are described in section 3.1.1.1, and the stockpile stewardship assumptions are described in section 3.1.1.2. It is unlikely that a change in environmental regulation would result in a modification to the Stockpile Stewardship and Management Program itself; however, changes to the environmental regulatory setting may necessitate the implementation of additional engineering and administrative controls to meet new standards.*

The overall subject of "whistleblower protection" is one which DOE has given extremely high priority. DOE is pursuing an open environment at its facilities so that employees can raise concerns without fear; improvement in this difficult area is always possible. DOE believes it is essential that workers at its facilities have the opportunity to raise safety and environmental concerns without fear of retribution. DOE has programs at all of its sites to provide anonymity to workers who wish to raise such concerns. All concerns are investigated thoroughly and necessary corrective actions are directed.

AIRNET and NEWNET are the two air quality monitoring systems employed by LANL. AIRNET data are reported to the public annually in the Environmental Surveillance Report, and NEWNET data are publicly accessible over the Internet computer links as they are collected. Neither AIRNET nor NEWNET stations went offline during the Dome Fire. Over the past 8 months, LANL has eliminated several AIRNET stations that are no longer needed or were redundant with other sampling as part of an overall effort to streamline the sampling networks to ensure their effectiveness. Just prior to the outbreak of the Dome Fire, LANL reprogrammed four of five monitoring stations in the southern part of laboratory to transmit data at longer intervals in order to determine long-clock stability, but returned to the original transmittal intervals during the Dome Fire to provide better coverage.

There have been several serious accidents at LANL within the past 18 months. Both DOE and the University of California conducted investigations and developed recommendations to improve *safety awareness at LANL (see* Type A Accident Investigation Report, *DOE, March 1996, and* Final Report of the University of California Fact Finding Team Concerning Recent Accidents at the Los Alamos National Laboratory, *University of California, March 19, 1996). In March 1996, the senior vice president of the University of California directed LANL to implement the University's recommendation, including developing an integrated safety management program. There is no indication that the recent downsizing of LANL staff has had any detrimental effect on occupational safety.*

40.22 The commentors ask why information from the Sandia Stockpile Study was left out of the PEIS. In particular, information stating that weapons defects decrease over time and the statement that nuclear weapons do not age, do not wear out, and are not allowed to degrade. Commentors are of the opinion that historical defect rates exceed the expected future stockpile defects and that the proposed Stockpile Stewardship and Management Program is not required. One commentor asks about the age of the weapons in the stockpile and how long they will be maintained. Another commentor asks about the design life of the remaining stockpile weapons and indicates that an enhanced surveillance program above that currently proposed by DOE may be needed. Despite requests in scoping comments, the commentor states that the Draft PEIS does not analyze whether individual stockpile stewardship facilities are needed to diagnose safety problems, on the one hand, and reliability problems on the other.

Response: *Chapter 2 of the PEIS discusses aging impacts. The information in section 2.3 is based on the latest data published in the tri-laboratory study. Section 2.3.3 of the PEIS, Historical Stockpile Data, provides a summary of stockpile defect and aging data that were used as an input for sizing the Stockpile Stewardship and Management Program. This information was extracted from an unclassified report,* Stockpile Surveillance: Past and Future, *dated September 1995.*

As explained in that section, continuous evaluation of the safety and reliability of the stockpile has always been a major part of the U.S. nuclear weapons program. Since the introduction of sealed-pit weapons more than 35 years ago, a formal surveillance program of nonnuclear laboratory and flight testing has been in existence. More than 13,800 weapons have been evaluated in this program. The Stockpile Evaluation Program, with its reliance on functional testing, has provided information that can be used in the statistical analysis of nonnuclear component and subsystem reliability. This program has detected about 75 percent of all problems ultimately detected, and it has been the principal mechanism for discovering defects and initiating subsequent repairs and replacements. However, not all aspects of a nuclear weapon can be statistically assessed this way. Weapons R&D at the three weapons laboratories and nuclear testing have played an important part in assessing the stockpile and in making corrective changes when needed.

Nuclear tests have been a critical part of the nuclear weapons program. They have contributed to a broad range of activities from development of new weapons to stockpile confidence tests to tests that either identified a concern or showed that remedial actions were not needed. However, the United States has not conducted a sufficient number of nuclear tests for any one weapon type to provide a statistical basis of reliability assessment for the nuclear explosive package. This is why the word "performance" instead of "reliability" is used when discussing a nuclear explosive package.

Although nuclear tests were never a part of the formal Stockpile Evaluation Program, they played an important role in maintaining the safety and performance of the weapons in the stockpile. Every advantage was taken of developmental nuclear tests to eliminate potential nuclear explosive problems. In some cases, nuclear testing during development of one weapon type uncovered a *problem that was pertinent to a previous design already in the stockpile, which then had to be corrected. Nuclear tests identified certain classes of stockpile problems not observable in the surveillance program. Nuclear tests have been used to resolve issues raised by the Stockpile Evaluation Program, such as whether a particular corrosion problem affected the nuclear yield of a weapon. Nuclear tests have also been used to verify the efficacy of design changes. For example, the adequacy of certain mechanical safing techniques was determined through nuclear testing. In the case of a catastrophic defect, tests have been used to certify totally new designs to replace an existing design. Finally, in some cases, nuclear testing proved that a potential problem did not exist.*

Beginning in the late 1970s, DOD and DOE agreed to a formal series of underground nuclear tests of weapons withdrawn from the stockpile. These tests were referred to as Stockpile Confidence Tests. They differed from developmental nuclear tests because the weapons were from actual production, had experienced stockpile conditions, and had minimal changes made to either nuclear or nonnuclear components prior to the test. There have been 17 such confidence tests since 1972, including 4 tests in the early 1970s that were not officially designated as Stockpile Confidence Tests. Confidence tests have been conducted for each of the weapon types expected to remain in the stockpile well into the next century.

In addition to the 17 confidence tests, at least 51 additional underground nuclear tests have been conducted since 1972 involving nuclear components from the stockpile, components from the actual weapon production line, or components built according to stockpile design specifications and tested after system deployment. The objectives of these tests included weapon effects, weapons R&D, confirmation of a fix, or investigation of safety or performance concerns. Three of these tests (in addition to one confidence test) revealed or confirmed a problem that required corrective action. Four tests (in addition to three confidence tests) confirmed a fix to an identified problem. Additionally, five tests were performed to investigate safety concerns affecting three different weapon types. These five tests verified that a problem did not exist.

The confidence in the performance of the nuclear explosive package has been based on underground nuclear test data, aboveground experiments, computer simulations, surveillance data, and technical judgment. The directors of the three weapons laboratories must certify the nuclear performance of the weapons designed by their laboratory. In a future without additional nuclear testing, the core capabilities of the weapons laboratories that were developed to eliminate potential problems in new weapon designs must now be employed to assess stockpile problems. However, in the absence of nuclear testing, the ability to assess nuclear components is more difficult; new methods of assessment, discussed later, will have to be developed to help compensate for this loss.

The historical stockpile database includes more than 2,400 findings from more than 45 weapon types. Findings are any abnormal conditions pertaining to stockpile weapons, such as out-of-specification data. Findings are then investigated and assessed as to whether or not they are a problem. Actionable findings are those that require some form of corrective action. All major components and subsystems have had problems that required corrective actions. The number of findings for nonnuclear components is much larger than that for nuclear components largely because there are so many more nonnuclear components in a nuclear weapon that require testing more frequently. However, the ratio of actionable findings to distinct findings is much greater for the nuclear components. Thus, when a finding has occurred for a nuclear component, it has generally been a serious one requiring corrective action. Often these corrective actions to nuclear components have required changes to all of the weapons comprising the weapon type affected.

For the nuclear explosive package, there were approximately 110 findings on 39 weapon types requiring some remediation either to the entire build of that design or to all weapons produced after *the particular finding. In addition to rebuilds and changes in production procedures, other actions included imposing restrictions on the weapon, accepting a performance decrement, and in several cases, conducting a nuclear test to determine that the finding did not require any physical change. There have been other instances not counted as actionable where a material was chemically changing and the weapon was closely monitored to see if further action was necessary or it was an isolated case that did not require remediation.*

The commentors, in referring to the Sandia Stockpile Study, are referring to briefing materials which were made publicly available earlier in 1995 which dealt with only a portion of the nuclear weapons historical defect and aging information. As described in chapter 2 of the PEIS, the Stockpile Stewardship and Management Program has been constructed to support national security policy directions as provided to DOE by the President and the Congress. Though weapon safety and weapon reliability can be driven at times by different phenomena, they are also related in that an essential ingredient of weapon safety is predictable response in all weapon environments, including potential accidents. Each of the proposed stockpile stewardship facilities would enhance the ability to make judgments about the safety and reliability of the nuclear weapons stockpile in the absence of underground nuclear testing. Section 3.1.2 has been expanded in the Final PEIS to provide a more detailed description and justification of DOE plans relative to national security policy and the issue of weapon safety and reliability. As explained in that section, national security policy from the President and Congress requires a safe and reliable stockpile. In order for the nuclear deterrent to be credible within the current national security policy framework, it must be reliable in a militarily effective way. From a PEIS perspective, separating safety and reliability is similar to the issue discussed under stockpile size (section 3.1.2.4, Denuclearization). It would require DOE to speculate on an alternate concept of nuclear deterrence and a national security policy framework to support it.

Commentors have also suggested acceptance of lower standards of reliability as an alternative to enhanced stewardship capabilities. This PEIS explains how the assessment and certification of nuclear performance is carried out and how this differs from the more conventional statistical methods used for assessing reliability of the nonnuclear portion of the weapon. Assessment and certification of nuclear performance is a technical judgment by the weapons laboratories based on scientific theory, experimental data, and computational modeling (sections 2.3 and 2.4.1). The question is not whether to accept a lower standard of nuclear performance (less nuclear explosive yield), but whether or not there is a technical basis to confidently know how well the weapon will perform at all. Enhanced stewardship capability is focused on the technical ability to confidently judge nuclear safety and performance in the absence of nuclear testing.

Aside from being inconsistent with the national security policy, attempting to separate weapon safety and reliability, is more technically complex than it sounds. A modern nuclear weapon is highly integrated in its design for safety, reliability, and performance. It contains electrical energy sources and many explosive energy sources in addition to the main charge HE. The principal safety concern is accidental detonation of the HE causing dispersal of radioactive materials (plutonium and uranium). Modern weapons are designed and system-engineered to provide a predictable response in accident environments (e.g., fire, crush, or drop). However, because of the technical complexity of potential accident scenarios (i.e., combined environments) and the fact that complete nuclear weapons cannot be used for experimental data, assessment of the design and the effect of changes that might be occurring due to stockpile environments must rely on other sources of experimental data and complex computer modeling. Enhanced experimental capability specifically related to the weapon secondary is a nuclear performance concern. Enhanced computational capability in general, and enhanced experimental capability related to the weapon primary in particular, are both nuclear safety and performance concerns.

40.23 The commentors express support for maintaining production missions at the production sites, and for maintaining the funding required to continue these activities. Commentors urge DOE to keep production missions at production plants that have the experience and proven safety record to complete assigned tasks. Commentors state that the existing production infrastructure, personnel, and experience at production sites made moving these missions to a laboratory an unreasonable alternative. In the view of many commentors, production and R&D cultures were not compatible and merging them would jeopardize the defense of the Nation. One commentor further states that the quality and integrity of today's stockpile is the result of production people and not the laboratories. Commentors believe that there was no adequate peer review of laboratory recommendations or manufacturing capability claims. Commentors also state that design experts were not production literate, and the weapons design and manufacturing functions should remain separate. Other commentors state that the laboratories will not be able to maintain the required quantities and quality of weapons components if they are given the production missions.

Response: *Production and laboratory functions are different, but the difference is reduced as the size of the production requirements becomes smaller. The first atomic weapons were not only designed but also constructed at the weapons laboratories. The laboratories have always had the capability for small lot production principally in order to test out designers' theories. In some respects, this could be considered an advantage by increasing the synergism between the two activities.*

Data for the PEIS were developed by working groups for each stockpile management mission. These working groups consisted of experts from each of the potentially affected sites. A review of data for consistency and accuracy was performed at both the working team level and at a senior management level. The alternative of transferring the stockpile management functions that currently exist at ORR, KCP, and Pantex to the laboratories and NTS are evaluated in the PEIS because they are deemed to be reasonable alternatives. Based on the environmental, cost, and technical analyses that have been performed, the preferred alternative is to downsize the stockpile management functions at ORR, KCP, and Pantex, and not transfer them to the laboratories and NTS.

40.24 The commentors question DOE's commitment to attracting and retaining staff at laboratories and production sites. Some commentors believe that DOE was favoring the design laboratories over the production plants, while others believe that because of the reduced workloads, staff and capabilities are being lost everywhere in the weapons complex. The commentors are also concerned that funding for sites, particularly Y-12, was not adequate in maintaining their mission capabilities let alone sufficient to make necessary upgrades at the site. Other commentors contend that the proposed program reduces the production capabilities and personnel within the complex and shifts most efforts to the R&D laboratories and therefore reduces the long-term success and flexibility of the program to meet national security needs. Commentors also note that all the budget increases are slated for the laboratories, while budget cuts are slated for the production complex.

Response: *Maintenance of competency in critical nuclear weapons technologies is a significant management challenge for DOE at both the production plants and the weapon laboratories. It is for this reason that DOE has proposed actions to promote teamwork and integration of work at the plants and laboratories for unique process and material technologies. DOE plans in this regard are described in more detail in the* Stockpile Management Preferred Alternatives Report. *An important objective of this teamwork and integration program is to provide a technologically challenging program which would assist in the attraction and retention of technical personnel.*

40.25 The commentors state that the analysis and support studies for the management part of the Stockpile Stewardship and Management Program was much more complete and balanced than that for the stewardship part and urged DOE to prepare the same level of analysis for stewardship.

Response: *The PEIS analyzes the potential consequences to the environment if certain programmatic changes to the Complex are implemented. National security policies in the post-Cold War era require that all the historical capabilities of the weapons laboratories, industrial plants, and NTS be maintained. Those processes and facilities, such as stewardship R&D work, that have no potential for being changed or moved as part of this proposal are not analyzed beyond the No Action alternative. DOE is not proposing to make any changes to these existing weapons R&D activities at the three laboratories or NTS. Rather, DOE is proposing to provide enhanced experimental capabilities (NIF, CFF, and Atlas in appendix I, J, and K, respectively) to augment existing R&D activities and stockpile stewardship capabilities so that the safety and reliability of the stockpile can be maintained in the absence of underground testing. The purpose and need for the full range of laboratory capabilities contained at LANL and LLNL and for continued peer review for weapon assessment and certification are explained in chapter 2 of the PEIS.*

40.26 For stockpile management, commentors believe that the approach reveals the extent to which the PEIS is narrowly focused on a single, pre-chosen alternative. The commentors state that there is no separate analysis of the high and low cases in which the impacts of these alternatives can be compared to the base case alternative. According to the commentors it is not clear that the different stockpile cases really represent alternatives in the traditional NEPA sense at all, since they apparently will require construction of the same facilities and will have very similar impacts. The commentors also state that the three cases analyzed by DOE (post-START II, START I plus, 1,000 warheads) have minimal effect on the facilities and configurations proposed by DOE such that there is no true programmatic review.

Response: *Two of the stockpile sizes analyzed in this PEIS, a START I Treaty- and START II protocol-sized stockpile, are the only ones currently defined and directed by national security policy. The PEIS also analyzes a hypothetical 1,000 weapon stockpile for the purpose of a sensitivity analysis for manufacturing capacity decisions. The NWSM specifies the types of weapons and quantities of each weapon type by year (section 1.1). The NWSM is developed based on DOD force structure requirements necessary to maintain nuclear deterrence and comply with existing arms control treaties while pursuing further arms control reductions. The PEIS explains the complexity of this process and why DOE does not believe it reasonable to speculate with a large number of arbitrary assumptions (section 2.2). However, this does not mean DOE has failed to consider that a future national security policy framework could define a path to a smaller stockpile.*

Stockpile stewardship capabilities are currently viewed by the United States as a means to further U.S. nonproliferation objectives in seeking a zero-yield CTBT. Likewise, it would be reasonable to assume that U.S. confidence in its stewardship capabilities would remain as important, if not more important, in future arms control negotiations to further reduce its stockpile. The path to a very small (10s or 100s) or zero stockpile would require the negotiation of complex international treaties that are also likely to require intrusive verification inspections of nuclear weapons related facilities. Therefore, DOE believes it reasonable to assume that complex treaty negotiations, when coupled with complex implementation provisions, would likely stretch over several decades. On a gradual path to a very small or zero stockpile, stockpile size alone would not change the purpose and need, proposed actions, and alternatives in this PEIS as they relate to stewardship capabilities. The issues of maintaining the core competencies of the United States in nuclear weapons, and the technical problems of a smaller, aging stockpile in the absence of nuclear testing, remain the same.

This PEIS evaluates reasonable approaches to stockpile management capability and capacity that are consistent with a gradual path toward a very small or zero stockpile. At some point on this path further downsizing of existing industrial plants or the alternative of consolidating manufacturing functions at stewardship sites would become more attractive as manufacturing capacity becomes a less important consideration. However, in the near term, the preferred alternative of downsizing the existing industrial plants would still be a reasonable action because the projected downsizing investment pays back within a few years through reduced operating expense; in addition, the downsizing actions are consistent with potential future decisions regarding plant closure. In regard to the proposed action for reestablishing pit manufacturing capability, DOE does not propose to establish higher manufacturing capacities than are inherent in the reestablishment of the basic manufacturing capability of LANL, which is the preferred alternative. In developing the criteria for reasonable stockpile management alternatives, DOE was careful not to propose the introduction of significant new types of environmental hazards to any prospective site. Therefore, on a gradual path to a very small or zero stockpile, stockpile size alone would not change the purpose and need, proposed actions, and alternatives in this PEIS with regard to stockpile management capabilities and capacities.

The PEIS does not analyze stockpile size in the PEIS as traditional alternatives in the NEPA sense. Rather, the PEIS analysis is based on the national security policy considerations discussed in chapter 2 of the PEIS and is consistent with and supportive of those national security policies. The PEIS addresses plant operations to support a range of stockpile sizes consistent with recent DOD plans, as reflected in the NPR. More specifically, the PEIS addresses a base case stockpile consistent with the recently ratified START II protocol with additional data for a larger (START I) or smaller (about 1,000 weapons) stockpile. The DOE Stockpile Management Preferred Alternatives Report, *which was released to provide programmatic support to the PEIS, describes the DOE manufacturing capacity strategy in more detail. Given the uncertainties in the world, this strategy retains sufficient manufacturing capacity to support the larger START I, yet is also flexible if the stockpile is reduced below START II levels.*

It should be noted that regardless of stockpile size, a goal of the Stockpile Stewardship and Management Program, as directed by national policy, is to maintain the core competencies of the United States in nuclear weapons. Industrial capacity is only indirectly affected by projected variances in stockpile size and composition. Stockpile size must be linked with historical stockpile data to arrive at estimates of average industrial capacity needed to produce components for repair or replacement. Because this cannot be done with mathematical precision, reasonable technical judgment must be applied. The resulting forecast is a smaller industrial base (with capacities on a scale of hundreds of weapons per year versus the scale of thousands of weapons per year that was the capacity prior to the end of the Cold War).

40.27 Several commentors express opposition to the continued operation of all the major DOE weapons laboratories (LANL, LLNL, and SNL). One commentor states that it is not obvious why we need three R&D laboratories when we are not building any new weapons. Other commentors believe that LLNL is an unjustified costly duplication of LANL. In fact, some commentors referring to the Notice of Intent for the PEIS and the PEIS itself state that descriptions of LANL and LLNL are identical. In light of the duplication of effort and especially the Galvin Committee's recommendation, commentors ask how DOE justifies the continued operation of both LANL and LLNL. Another commentor states that the two laboratory option merits consideration. Other commentors are of the opinion that the national laboratories should cease all related nuclear weapons work and instead the country should divert those technical and monetary resources towards civilian uses. According to the commentors, alternate uses for the laboratories should include research into cleaner sources of energy (e.g., solar, wind, and geothermal), recycling and solving the nuclear waste problem.

Response: *On September 25, 1995, DOE was directed by the President to maintain nuclear weapons responsibilities and capabilities at the three weapons laboratories sufficient to ensure continued confidence in the safety and reliability of the nuclear weapons stockpile in the absence of underground nuclear testing. Consequently, both LANL and LLNL, as well as SNL, are required for the foreseeable future.*

Although with the end of the Cold War and changes in the world's political regimes the emphasis of the U.S. nuclear weapons program has shifted dramatically, nuclear weapons continue to be a "cornerstone" of national security policy. As long as the President and Congress maintain a defense policy based on nuclear weapons, DOE will continue to have the responsibilities for ensuring the safety and reliability of the U.S. nuclear weapon stockpile. Congress determines how funds are allotted to ensure the continued maintenance of a safe and reliable nuclear deterrent. The purpose and need for the full range of laboratory capabilities contained at LANL and LLNL and for continued peer review for weapon assessment and certification are explained in chapter 2 of the PEIS.

40.28 The commentor would like to know what plan the PEIS is based on and whether it is still the Stockpile Stewardship and Management Program plan, dated May 1995, and whether this plan has undergone significant revisions.

Response: *The PEIS is still based on the Stockpile Stewardship and Management Program plan dated May 1995. While that plan has not undergone substantive revisions, detailed planning of ongoing and future R&D activities continues to evolve (as is expected of R&D) and to be reflected in, for example, the evolution of DOE budget requests to Congress. As discussed in sections 3.3.4 and 4.11 of this PEIS, some of the new facilities described in the May 1995 plan are not yet at a state of maturity appropriate for formal proposal or analysis in this PEIS, nor can all facilities needed to fully implement the Program over time be fully identified at present.*

40.29 The commentors state that they were in favor of DOE's plan to downsize the Complex, but did not see these reductions reflected in the PEIS. Nor did the commentors understand how DOE could severely downsize the production plants but at the same time increase the laboratories' capability, capacity, and staff.

Response: *The No Action alternative assumes staffing reductions at DOE facilities over the next several years as overall (primarily weapon dismantlement) workload decreases. Further reductions in facility size and staffing are anticipated under either the "downsize in place" or relocation alternatives for stockpile management functions. Staffing reductions in the core weapons program have occurred at the laboratories in recent years as overall workload and commensurate funding have decreased. Significant staffing increases at the weapons laboratories are not anticipated with the implementation of the stockpile stewardship program. Modest increases would be associated with the introduction of pit fabrication to LANL and the construction and operation of NIF at LLNL. Personnel for new initiatives are expected to come primarily from existing laboratory staff. Employment for other programs at the laboratories (about 50 percent of total employment) is dependent on priorities and decisions outside the scope of the Stockpile Stewardship and Management Program.*

40.30 The commentors express concerns about the threat of layoffs. Commentors believe that employees at LANL were under pressure to support laboratory activities or be threatened with layoffs. The commentors state that employees at TA-55 were laid off even though the future expansion of this area was known. One commentor points out that TA-55 may be vulnerable to sabotage if the constant threat of layoffs exists.

Response: *DOE is aware of the concerns that have been raised by LANL employees whose employment was recently terminated due to overall laboratory downsizing. DOE is working with the University of California to assure fair and equitable treatment of all current and former LANL employees. Overall reductions to laboratory and plant employment, however, have been necessary as overall workload and commensurate budgets have been reduced. Significant staffing increases at the weapons laboratories are not anticipated in the future with the implementation of the stockpile stewardship program. Modest increases would be associated with the introduction of pit fabrication to LANL and the construction and operation of NIF at LLNL.*

40.31 The commentors believe that information available to the public is increasingly being taken out of the public record. A commentor cites the Operating Experience Summary Report which was recently taken offline, presumably to hide the number of troublesome incidents at TA-55. Other commentors cite the new bomb designs that were on the Internet as proof that DOE is still working on new bomb designs. One commentor requests that this Internet document be made available to the public.

Response: *DOE requires its sites to furnish a daily report to notify it of reportable occurrences in the safety and health arena. The daily report provides initial notification for internal use by DOE and the site. After any necessary investigation, DOE and the site prepare a final report which is made available to the public. The daily reports concerning LANL include incidents at TA-55, although that facility is not afforded any special treatment. At LANL, both the final occurrence reports and an online summary prepared by the laboratory are referred to as the Operating Experience Summary Report. In the past, LANL put preliminary daily occurrence notification reports on its computer network. LANL discontinued this practice because the initial reports contain preliminary information that in some cases is incomplete or inaccurate, and which is superceded by the final reports. The final occurrence reports are available to the public in many forms, including online.*

DOE withdrew its DP Home Page from the World Wide Web on March 20, 1996. This action was in response to the discovery that part of the information from the Office of Research and Inertial Fusion came from a number of sources, some of which were outdated. Much of the material in question was drawn from the Report of the Defense Programs Research and Technology Development Program for Fiscal Year 1993, *covering the period from October 1, 1992 to September 30, 1993. This report was issued by the Office of Research and Advanced Technology, a precursor office to the Office of Research and Inertial Fusion. The Office of Research and Inertial Fusion constructed its Home Page in early 1995 from the above-mentioned report with links to other activities and documents in the DP Home Page. The links were regularly updated as the DP Home Page evolved, but the text describing Office of Research and Inertial Fusion activities was not. In particular, the specific information related to the Gulf War was only current in late 1992.*

DOE has halted production of new-design weapons and is, therefore, not performing such activities. DOE is charged with maintaining the safety and reliability of existing nuclear weapons in accordance with National Security Policy. An updated DP Home Page has been prepared. DOE apologizes for the confusion caused by the outdated material.

40.32 The commentor questions if DOE considered, under the nonproliferation mantle, which facilities or sites pose the least security risk. The commentor states that security capabilities should be addressed in the infrastructure impact analysis. In fact, the commentor suggests that the number of security breaches over the last 10 years should be used as the key method to evaluate the sites' security capabilities. Commentor asks whether there are not competitions and assessments of each site's security possibilities and feels that sites that are lacking in security should not be considered for more work. The commentor adds, if LANL has a bad record like the apparent security breach that helped the Russians develop their first [nuclear] weapon, why DOE does not consider an alternative site where security is taken seriously. Another commentor questions the selection of LANL as a site for additional pit production and for DARHT's "non-destructive testing" based on reports of security deficiencies at LANL indicating a general laxness in readiness to accept a 5-fold increase in pit production. Other commentors refer to Summary section S.2.4 and the statement "much of the (experimental weapons) testing is classified and could not lead to proliferation without a breach of security," stating that this implies that adequate security classification of this component of the nuclear weapons program will somehow preclude proliferation. Commentors feel that the postulated relation between adequate classification and weapons proliferation is not so simple.

Response: *DOE maintains a rigorous safeguards and security program as appropriate at each of its installations and for each of its operations. Specific provisions for safeguards/inspections are addressed in site-specific studies. DOE expects compliance with its safeguards and security requirements at all of its sites.*

40.33 A number of commentors state that remanufacturing was a reasonable alternative that should be analyzed in the PEIS. In the view of the commentors, the justification stated in the PEIS for eliminating remanufacturing as an alternative for detailed analysis was inadequate and not supported by appropriate studies. Commentors believe that remanufacturing would be cheaper and more compatible with maintaining the capabilities of production and R&D laboratories than would the proposed stewardship program. Another commentor requests that DOE provide a cost comparison of the remanufacturing alternative as opposed to the proposed science-based approach. Remanufacturing should not be done by design engineers, according to one commentor.

Response: *The remanufacturer's point of view is reflected in this PEIS by the fact that remanufacturing to specification will be attempted when possible and when appropriate to the problem being solved. With more than a half dozen different weapon types projected to remain in the stockpile, and with each weapon type containing thousands of parts, remanufacturing will undoubtedly occur for a significant number of repair and replacement activities. However, remanufacturing is not reasonable as a distinct exclusive alternative to the ongoing stockpile stewardship program or the proposed action of enhanced experimental capability for the technical reasons discussed below. In addition, it would not be a reasonable alternative because it does not fully support national security policies that require the conduct of a science-based stockpile stewardship and maintenance of the capability to design and produce new weapons.*

Remanufacturing weapon components to their original specification, or maintaining weapons to their original design specifications, would superficially appear to be a reasonable approach to maintaining the safety and reliability of the stockpile in the absence of nuclear testing. Precise replication, however, is often not possible. Subtle changes in materials, processing, and fabrication techniques are an ever-present problem. In some cases, specialty materials and components become unavailable for com-

mercial or environmental reasons. Implicit in the remanufacturing assumption is that the design blueprint, manufacturing process, and the materials used are specified in exact detail in every way. However, there is an unwritten element of "know how" that knowledgeable and experienced personnel contribute to any complicated manufacturing process (for this reason, controlling the acquisition of "know how" is a major nuclear weapons nonproliferation objective). Materials and processes are not always specified in important ways because, at the time, they were not known to be important. The problem is illustrated by the following hypothetical example.

A material produced for a critical weld has a specification for a trace impurity; the manufacturing process consistently produced the material with a trace impurity less than the maximum allowed and the welds were satisfactory; the manufacturing process is changed for some reason, such as cost or environmental concerns; the material is now being produced with less trace impurity than before the process was changed; the material is still within specification; however, the welds are no longer satisfactory; it was unknown at the time that the higher level of the trace impurity was necessary to produce a satisfactory weld.

While remanufacturing sounds simple in principle, it is likely in fact to present complex issues of design, manufacturing process, and material variables. A simplified view of remanufacturing cannot serve as a "stand alone" manufacturing approach, let alone an alternative approach to enhanced stewardship capability. In the absence of underground nuclear testing, nuclear components (pits and secondaries) cannot be functionally tested. Stewardship capabilities provide the analytical tools (experimental and computational) to assess the significance of a problem observed during surveillance and to decide if the problem should be fixed; and if fixed, to certify that the fix will work (section 2.4.1). In the past, the decision to fix or not fix an observed problem could be made with nuclear testing (section 2.3). Stockpile stewardship strategies focus on the basic material science and the enhanced experimental and computational tools necessary to better predict age-related defects and to make sound technical judgments on nuclear safety and performance in the absence of nuclear testing.

The DARHT EIS (DOE/EIS-0228, section 2.3.2) provides an additional discussion of the limitations of a remanufacturing-to-specification approach. It discusses, as an example, the actions taken to evaluate and resolve unanticipated deterioration of HE in the now-retired W68 warhead for a submarine-launched ballistic missile. In that case it was necessary to replace the HE with a more chemically stable formulation. In addition, some other materials were no longer commercially available, requiring changes in the rebuilt weapons. Nuclear testing was ultimately used to verify that the necessary changes were acceptable. DOE does not consider it feasible to maintain all potentially obsolescent commercial sources and processes used for materials in existing weapons; aging would still occur in stored reserves of such materials.

With regard to stockpile management, remanufacturing without enhanced stewardship capability would also have notable drawbacks. DOE plans to maintain the capability to produce secondaries, and proposes to reestablish the capability to produce pits, by producing small quantities (10s) of each annually to maintain capability. This capacity should be sufficient to replace components attrited from the stockpile by surveillance testing. Remanufacturing these components, without the enhanced stewardship analytical capability to determine if and when replacement is necessary, is likely to require higher levels of production than DOE believes necessary to maintain production capability. Also, remanufacturing a nuclear component to the original specifications will not prevent age-related problems related to those specifications from recurring. Since these components use plutonium and uranium, radiation exposure to personnel and generation of radioactive waste would also be higher than necessary. If repeated remanufacturing were required, further unnecessary risks would result from additional weapon A/D operations and additional transport of nuclear components between sites.

From an environmental impact point of view, the remanufacturing concept would have greater impacts for the proposed action of reestablishing pit capability because DOE proposes to use a cleaner, less waste-generating process than was used at the Rocky Flats Plant. All other environmental impacts would not be distinguishable from those described in this PEIS because existing manufacturing processes form the Program baseline.

40.34 Several commentors feel that the document presents several misused terms and euphemisms which are intended to deceive the public. The commentor feels the following terms should be changed or decoupled so that there would be less acceptance of the proposed program:

(1) safety and reliability: the commentor feels this phrase translates into the expected blast of a nuclear weapon must be greater than 90-percent yield. The commentor feels reliable weapons are not required and that the stockpile may be maintained with existing technology. The commentor feels that greater unreliability may in fact discourage proliferation.

(2) flexibility: the commentor feels this term translates into continued development of new nuclear weapons.

(3) modification: the commentor feels this term applies to the construction of new nuclear weapons.

(4) national security: the commentor believes this euphemism destructs "true" national security which is the environment. The commentor feels that the Nation is less secure because the money proposed for stockpile stewardship and management may be used for poverty, education, and waste management.

Response: *DOE has reviewed the commentors' statements and has determined that the terms used in the PEIS are appropriate. As described in chapter 2 of the PEIS, the Stockpile Stewardship and Management Program has been constructed to support national security policy directions as provided to DOE by the President and the Congress. Though weapon safety and weapon reliability can be driven at times by different phenomena, they are also related in that an essential ingredient of weapon safety is predictable response in all weapon environments, including potential accidents. Section 3.1.2 has been expanded in the Final PEIS to provide more detailed description and justification of DOE plans relative to national security policy and the issue of weapon safety and reliability.*

40.35 A number of commentors express concern that the proposed Program would not succeed and jeopardizes the defense posture of the country. Commentors state that without underground testing, the proposed stockpile stewardship program is a gamble. A commentor also wants to know what criteria was used by the President, Congress, and DOE in determining the potential success of the program.

Response: *In the event science-based stewardship proposals could not ensure the continued safety and reliability of the nuclear weapons stockpile, the resumption of underground testing at NTS would be considered. On August 11, 1995, the President stated that if he was informed by the Secretaries of Defense and Energy that a high level of confidence in the safety or reliability of a nuclear weapons type considered critical to the nuclear deterrent could no longer be certified that he would be prepared, in consultation with Congress, to exercise our "supreme national interests" rights under the CTBT to conduct whatever testing might be required. The rationale for science based stockpile stewardship is explained in chapter 2 and supported by further discussion in chapter 3 and appendixes I, J, and K.*

40.36 The commentors express concern that DOE did not adequately justify the need for new or upgraded facilities to implement the science-based stockpile stewardship program. Some commentors suggest that rather than constructing new facilities at added expense, a passive stewardship and management plan (i.e., curatorship) should be considered. One commentor asks that DOE look at more "small-scale" techniques and facilities to determine the safety and reliability of the enduring stockpile. Another commentor believes that a non-science-based approach should be studied and analyzed in the PEIS.

Response: *DOE believes that the PEIS discusses a full range of alternatives for implementing the Stockpile Stewardship and Management Program, and that it analyzes in detail those reasonable alternatives that are capable of achieving the goals of the Program. DOE also believes that the PEIS adequately assesses the cumulative impacts of proposed new activities and existing activities at the sites where the Stockpile Stewardship and Management Program would be implemented.*

It is a well established principle under NEPA that the goals of a proposed action delineate the limits of the reasonable alternatives to that action. That is, an alternative which does not accomplish the agency's goals is not a reasonable alternative. Since its inception, one of the primary goals of the U.S. nuclear weapons program has been to ensure the safety, security, and reliability of the Nation's nuclear weapons stockpile. Numerous facilities have been built over the years at the three weapons laboratories (LANL, LLNL, and SNL) and at NTS to conduct various activities necessary to meet this goal.

As described in chapter 2 of the PEIS, recent developments in national security policy have placed new constraints on the types of activities available to achieve this goal. Specifically, the United States is committed to ceasing both the production of new-design nuclear weapons, and the underground nuclear testing of weapons (see section 2.4). DOE's challenge in developing the stewardship portion of the Stockpile Stewardship and Management Program has been to determine whether, and how, to replace, modify, or augment the existing capabilities of the laboratories and NTS so that the goal of maintaining a safe, secure, and reliable stockpile can be met, even as the enduring stockpile ages and underground testing is no longer available.

DOE has examined from a programmatic perspective various approaches to achieving this goal, and has determined that only an aggressive science-based program that relies on sophisticated simulation and computational technology would allow DOE to continue to ensure the safety, security, and reliability of the stockpile. Alternate approaches which are based on principles other than an aggressive pursuit of the knowledge necessary to predict, detect, and correct problems with the stockpile cannot achieve DOE's goals. Section 3.1.2 has been expanded to examine various other alternatives or approaches (such as maintenance, remanufacturing, and a zero-stockpile) that have been suggested, and to explain why each of them are incapable of ensuring the stockpile's safety, security, and reliability, and thus are not reasonable.

Using simulation and computational technology to better understand the characteristics of nuclear weapons has been an element of DOE's weapons program for many years. It was historically part of the Research, Development, and Testing Program, the predecessor of the proposed stewardship portion of the Stockpile Stewardship and Management Program. In determining, for the reasons noted above, that stewardship must be based on similar principles, DOE effectively eliminated the option of replacing the existing proven capabilities at the laboratories and NTS with a different, untried approach. Accordingly, the PEIS focuses on facilities that could modify or augment the existing capabilities in ways that would achieve DOE's goal. In summary, DOE and its predecessors have been "stewarding" the stockpile, utilizing science-based principles, since the dawn of the nuclear era. DOE believes that recent policy developments require an even more aggressive application of these principles to ensure the safety, security, and reliability of the stockpile.

DOE believes that the PEIS appropriately addresses the role of existing facilities in the stewardship program. They are described as part of the No Action alternative, in broad terms in section 3.1.4 and in more detail in chapter 4 and appendix A. This approach to the No Action alternative (i.e., maintaining the status quo) is consistent with guidance issued by CEQ (46 FR 180426, March 23, 1981). The environmental impacts of continuing the existing activities at each of the sites associated with the Complex are described throughout chapter 4. The cumulative effects that could result when the impacts of the proposed new facilities are added to those of existing activities are described in section 4.13. DOE believes that in this way, the PEIS adequately presents the impacts of the entire stewardship program, while focusing specifically on the proposed new facilities that require a DOE decision, and describing them in context with the existing facilities upon which DOE would continue to rely on to achieve the goal of a safe, secure, and reliable stockpile.

Because DOE intends to use the PEIS as a component in decisionmaking in 1996, only those alternatives that are ripe for decisionmaking are assessed in detail in the PEIS. Alternatives not yet reasonably foreseeable, and which have not matured so as to be ripe for decisionmaking, such as next generation facilities (see section 3.3.4), are not assessed in detail in the PEIS. Nonetheless, they are acknowledged and included to the extent practicable.

DOE does not agree with the assertions that stockpile stewardship could be achieved using passive curatorship. Based on the national security policies discussed in chapter 2, the future nuclear deterrent will be based on a smaller, steadily aging nuclear weapons stockpile. As explained in section 2.3 of the PEIS, historical data would project that there will be actionable findings that will require certified repairs or replacements to be made to the nuclear weapons stockpile. Without underground nuclear testing, which was the proof-positive means of determining whether a potential problem existed or whether a problem was corrected, confidence in the safety and reliability of nuclear weapons must be based more on judgment.

Judgment-based confidence demands more than passive curatorship. For judgment-based confidence, DOE is proposing a robust, science-based stewardship program to obtain accurate scientific and experimental data which can be correlated with past nuclear test data and used to validate computer modeling. The existing experimental tools were used in conjunction with nuclear testing and are inadequate if used alone. Passive curatorship, or other stewardship-based approaches which do not include the enhanced experimental tools that would provide the necessary data to assess and certify a stockpile without underground nuclear testing, would be inadequate and unreasonable.

40.37 The commentors state that DOE has been inconsistent in discussing the timeframe analyzed in the PEIS for stockpile stewardship and management. Related to this, a commentor states that it is not clear whether the period analyzed is for 25 years or an indefinite timeframe.

Response: *The Program purpose and need is defined in chapter 2 of the PEIS to be consistent with currently planned national security policy. That policy includes compliance with the START II protocol, whose effective date is 2003. However, further arms reduction treaties beyond START II are possible, and the PEIS discusses further stockpile reductions. However, it would be speculative to prescribe a timeframe for implementation of treaties whose negotiations have yet to begin. To bound the environmental impacts for actions proposed in the PEIS, facility design lifes were by necessity assumed. Generally those facility lifes were assumed to be 25 years.*

40.38 The commentors ask about the three-laboratory stockpile evaluation program, which DOE office would be responsible for running the Program, and how many scientists and other skilled technical workers would be needed to maintain the stockpile and/or reactivate the weapons program in the future. One commentor asks if the laboratories will be downsized with the loss of the new weapons design and testing mission.

Response: *DOE has a stockpile evaluation program (sometimes referred to as stockpile surveillance) which includes component tests and evaluations at laboratory and production facilities. The Stockpile Stewardship and Management Program includes enhanced experimental capabilities to improve the laboratory assessment capability as well as enhanced surveillance testing at laboratory and production facilities. The costs for this evaluation program are a substantial portion of the budgets of each site. Day-to-day management of this program is performed by the DOE Albuquerque Operations Office. The stockpile stewardship and management proposal does not include any alternatives that would result in downsizing of the laboratories.*

40.39 One commentor requests that DOE release the results of studies related to special nuclear materials that had been set-aside for the express purpose of studying future aging effects.

Response: *A limited number of "shelf life units," such as pit components, were typically produced to act as "control samples" for use in stockpile evaluation activities. The component actually evaluated is the one returned from the weapon that was randomly sampled from the stockpile and, therefore, experienced actual stockpile environments while deployed. The "shelf life units" have not experienced actual stockpile environments. They are sometimes useful for comparison purposes to help distinguish cause and effect for observed anomalies in stockpile units. What can be said unclassified about problems with the stockpile is summarized in chapter 2 and the referenced unclassified portion of the tri-laboratory report. To the extent possible, these results have been factored into future stockpile management plans for components containing special nuclear materials.*

40.40 The commentors question the Stockpile Stewardship and Management Program's flexibility to meet changes in stockpile size. Specifically, commentors ask what analysis was done, if any, to indicate the limiting factors for secondaries, pit production, and HE and what is the true surge capabilities for these areas, and DOE's confidence in meeting these capabilities. Regarding the capacity/capability of the Complex to respond to unanticipated needs, one commentor refers to page 8–2 of the *Analysis of Stockpile Management Alternatives* report, which states that build rates above 100 per year would adversely impact the ability of LANL to perform their surveillance and R&D missions. The commentor asks if this means that there is no way that DOE could truly support a surge.

Other commentors ask how the current Stockpile Stewardship and Management Program ensures the timely up-sizing of the nuclear weapons system should it become necessary. One commentor states that the proposed action of increasing production from a one-shift to a full-time basis using the same production equipment seems to ignore the fact that the additional training needed by capable machinists to properly and safely engage in the highly demanding efforts of weapons production is about five years. The commentor states that this is an unreasonable delay in response to an urgent threat. Another commentor suggests that the best way to accomplish a rapid scale-up of nuclear weapons production is to establish a sufficient level of comparable machine work at the production site to employ a staff adequate to go to a full scale production. The commentor states that the technical staff including machinists could then be rotated between the weapons work and the equivalent work to maintain their skills at the proper level. The commentor believes that if machine shop capabilities for prototype work were deliberately pursued it should be possible to employ a staff adequate to ensure a rapid scale-up should it become necessary.

Response: *The PEIS addresses several production capacities, each based on a specific potential stockpile level. Each production capacity assumed single shift operations; therefore, a significant sprint capacity was built into the planning assumptions. Because of the small demand for the fabri-*

cation of replacement plutonium pits over the next 10 or more years, DOE did not propose a new pit fabrication facility with a capacity equivalent to the capacities required for other portions of the nuclear weapons production complex. However, limited fabrication of new replacement pits would be required due to ongoing pit surveillance activities and to replace pits lost during weapon refurbishment. Section 3.6 discusses DOE future plans should a life-limiting phenomenon be found in stockpile pits, and a larger pit fabrication capacity be required.

40.41 The commentors refer to the cover sheet of the Draft PEIS which states that a classified appendix presents the "purpose of and need for the plutonium-242 to be stabilized at SRS for use in future weapons complex research and development activities." Some commentors question why the classified appendix was referenced, while other commentors believe that unclassified portions of the appendix should be provided as part of the Draft PEIS. One commentor further states that the note on the appendix should have been prominently presented in the body of the Draft PEIS, rather than at the end of the cover sheet. In addition, commentors believe that the role of plutonium-242 in the Program and the nonproliferation implications of separating plutonium-242 and its environmental impacts should be explicitly discussed in the context of this PEIS, even though these may be covered in facility-specific statements. Commentors express concern since plutonium-242 has been linked to serious environmental problems at SRS. One commentor states that the DARHT EIS should have addressed all plutonium isotopes, including those outside of LANL.

Response: *The need for plutonium-242 is not classified. Certain information regarding shipping, storage, and the specific use of plutonium-242 is classified. Section 4.19 discusses the use of plutonium-242 for R&D and the potential environmental impacts of transporting this material to the alternative sites. In the* Interim Management of Nuclear Materials Environmental Impact Statement *(DOE/EIS 0220) dated October 20, 1995, DOE indicated that certain quantities of plutonium-242 existed at SRS and that this material has properties which make it useful for future R&D activities. In the PEIS, DOE has indicated two alternatives for this material: to stabilize and continue to store the plutonium-242 at SRS, and to stabilize the plutonium-242 at SRS and transport this material to either LANL or LLNL. The preferred alternative is to transport the material from SRS to LANL for storage. Further details concerning the desirable properties of this material, the actual quantities, or the technical issues associated with its use are classified and are contained in a classified appendix to the PEIS.*

The commentor correctly notes that a classified supplement to the Stockpile Stewardship and Management PEIS has been prepared to support DOE decisions needed regarding future R&D use of plutonium-242 and that DOE has prepared a NEPA review of the environmental impacts from stabilizing plutonium-242 now held in solution at the SRS. DOE has left decisions for storing the material to the Stockpile Stewardship and Management Program ROD.

The actions at SRS to stabilize plutonium solutions, including solutions containing plutonium-242, are directed at addressing vulnerabilities identified in DOE's Plutonium Vulnerability Assessment (DOE/EH-0415, November 1994). Correction of these vulnerabilities has been emphasized by the Defense Nuclear Facilities Safety Board. DOE decided to convert the plutonium-242 currently in solution at SRS to oxide which will be placed in storage containers. DOE has determined that as a matter of policy it has programmatic need for this material for DP R&D activities.

The commentor asks about plutonium infrastructure outside of LANL that would be related to DOE's decision to construct and operate DARHT. As noted in the DARHT EIS, LANL was determined to be the only reasonable location for DARHT capability; in part this was due to the existing plutonium infrastructure at LANL that could support dynamic experiments with plutonium (DARHT EIS, Volume I, section 3.10.1, page 3–41). DOE did not determine that any other plutonium facilities, besides the ones at LANL, would be needed to support operation of DARHT. DOE's decision to operate DARHT is *unrelated to its decisions regarding stabilizing plutonium solutions at SRS. (See DARHT EIS. Volume II, Comment Response 17-37, page RPC-52.)*

40.42 A commentor asks what, if any, consideration has been given to safeguards/inspection provisions in these studies.

Response: *DOE requirements for the safeguarding of accountable quantities of special nuclear materials are assumed in all facility design alternatives for the PEIS. International safeguards and inspection, however, are assumed not to apply to U.S. special nuclear materials reserved for the U.S. nuclear weapons program.*

40.43 The commentors believe DOE "arrogantly" decided which alternatives are reasonable and do not agree with the justification for the No Action alternative in the summary as an unreasonable alternative. One commentor wants to know what are the reasonable alternatives to the items on the list entitled "DOE stockpile stewardship costs" and for anything that DOE does. Another commentor would like more discussion about why there is a need for improvement in the current process for a Complex that is not going to be building new weapons. One commentor further notes that DARHT is considered a fait accompli and the No Action alternative actually contains significant programmatic commitment to a next generation hydrodynamic testing facility as well as many other alternatives mentioned and unmentioned and there have been no programmatic analyses of alternatives for retaining knowledge of secondary physics—DOE proposes to build NIF and the Atlas Facility, but does not mention why this is necessary.

Response: *Reasonable alternatives are those that would accomplish the purposes and needs described in the PEIS. These reasonable alternatives are analyzed in detail in the PEIS. Other alternatives were considered in the PEIS process, but eliminated from detailed study because they were judged to be unreasonable, as described in section 3.1.2 of the PEIS. Section 3.1.4 describes why No Action is not a reasonable alternative. Chapters 2, 3 and appendixes I, J, and K explain the need for and describe enhanced experimental capability.*

DOE believes that the PEIS discusses a full range of alternatives for implementing the Stockpile Stewardship and Management Program, and that it analyzes in detail those reasonable alternatives that are capable of achieving the goals of the Program. DOE also believes that the PEIS adequately assesses the cumulative impacts of proposed new activities and existing activities at the sites where the Stockpile Stewardship and Management Program would be implemented.

It is a well established principle under NEPA that the goals of a proposed action delineate the limits of the reasonable alternatives to that action. That is, an alternative which does not accomplish the agency's goals is not a reasonable alternative. Since its inception, one of the primary goals of the U.S. nuclear weapons program has been to ensure the safety, security, and reliability of the Nation's nuclear weapons stockpile. Numerous facilities have been built over the years at the three weapons laboratories (LANL, LLNL, and SNL) and at NTS to conduct various activities necessary to meet this goal.

As described in chapter 2 of the PEIS, recent developments in national security policy have placed new constraints on the types of activities available to achieve this goal. Specifically, the United States is committed to ceasing both the production of new-design nuclear weapons, and the underground testing of weapons (see section 2.4). DOE's challenge in developing the stewardship portion of the Stockpile Stewardship and Management Program has been to determine whether, and how, to replace, modify, or augment the existing capabilities of the laboratories and NTS so that the goal of maintaining a safe, secure, and reliable stockpile can be met, even as the enduring stockpile ages and underground testing is no longer available.

DOE has examined from a programmatic perspective various approaches to achieving this goal, and has determined that only an aggressive science-based program that relies on sophisticated simulation and computational technology would allow DOE to continue to ensure the safety, security, and reliability of the stockpile. Alternate approaches which are based on principles other than an aggressive pursuit of the knowledge necessary to predict, detect, and correct problems with the stockpile cannot achieve DOE's goals. Section 3.1.2 has been expanded to examine various other alternatives or approaches (such as maintenance, remanufacturing, and a zero stockpile) that have been suggested, and to explain why each of them are incapable of ensuring the stockpile's safety, security, and reliability, and thus are not reasonable.

Using simulation and computational technology to better understand the characteristics of nuclear weapons has been an element of DOE's weapons program for many years. It was historically part of the Research, Development, and Testing Program, the predecessor of the proposed stewardship portion of the Stockpile Stewardship and Management Program. In determining, for the reasons noted above, that stewardship must be based on similar principles, DOE effectively eliminated the option of replacing the existing proven capabilities at the laboratories and NTS with a different, untried approach. Accordingly, the PEIS focuses on facilities that could modify or augment the existing capabilities in ways that would achieve DOE's goal. In summary, DOE and its predecessors have been "stewarding" the stockpile, utilizing science-based principles, since the dawn of the nuclear era. DOE believes that recent policy developments require an even more aggressive application of these principles to ensure the safety, security, and reliability of the stockpile.

DOE believes that the PEIS appropriately addresses the role of existing facilities in the stewardship program. They are described as part of the No Action alternative, in broad terms in section 3.1.4 and in more detail in chapter 4 and appendix A. This approach to the No Action alternative (i.e., maintaining the status quo) is consistent with guidance issued by the CEQ (46 FR 180426, March 23, 1981). The environmental impacts of continuing the existing activities at each of the sites associated with the Complex are described throughout chapter 4. The cumulative effects that could result when the impacts of the proposed new facilities are added to those of existing activities are described in section 4.13. DOE believes that in this way, the PEIS adequately presents the impacts of the entire stewardship program, while focusing specifically on the proposed new facilities that require a DOE decision, and describing them in context with the existing facilities upon which DOE would continue to rely to ensure a safe, secure, and reliable stockpile.

40.44 Commentors feel the Stockpile Stewardship and Management Program is a responsible and necessary program for the U.S. stockpile of nuclear weapons. One commentor states that the NPT and CTBT depend on the Stockpile Stewardship and Management Program, especially NIF. In the absence of underground nuclear testing, other commentors believe that the Stockpile Stewardship and Management Program is absolutely vital for maintaining the basics of nuclear weapons physics and keeping track on the condition of the weapon stockpile. One commentor notes that it is important for the United States to have the leading edge of nuclear weapons know-how, irrespective of the winds of day-to-day politics. Another commentor states that given the requirement for a safe and reliable stockpile, the ban on underground testing, and the shrinking size of the stockpile, downsizing the overall DOE Complex while building new facilities is reasonable. The commentor supports the new facilities proposed because they are necessary to provide missing data for computer modeling which cannot be supplied by underground nuclear testing and can validate fixes for defects discovered during surveillance and testing.

Response: *These comments are reflected in the Stockpile Stewardship and Management Progran plan.*

40.45 The commentor states that NTS has been part of any number of programs that could possibly come to the site, yet those programs end up going to LANL and LLNL and inquires about the possibility of NIF going to NTS. Another commentor thinks that table 3.3–1, section 3.3, should acknowledge the expertise at NTS in the experimental primaries and secondaries and should also recognize NTS as a potential site for the siting of large experimental facilities to do weapons simulation and effects tests.

Response: *DOE has looked at adding several missions to NTS, given that maintenance of the test site for nuclear test readiness remains a national policy requirement. To date, all proposed new missions for stockpile stewardship and management have had compelling cost and technical reasons for selecting other sites as the preferred alternative. DOE will continue to look at NTS for potential future siting of new program missions.*

The preferred site alternative for NIF is LLNL. The preferred alternative does not represent a decision, however. The ROD for NIF will be made no sooner than 30 days after the filing of the Final PEIS with the EPA. NTS is a reasonable site alternative for NIF, and could be selected in the ROD.

Table 3.3–1 is intended to show a broad view of current capabilities and alternatives considered in the PEIS. As stated in section 3.2.9, Nevada Test Site, DP activities, stockpile stewardship activities at NTS include conventional HE tests, dynamic experiments, and hydrodynamic tests. These types of tests can be used to study the physics of weapons primaries. NTS activities relating to weapons effects and the physics of weapons secondaries have historically been nuclear tests, which are considered as an future option only under the "supreme national interests" provisions of any future CTBT. Additionally, as stated in section 3.3.3, Weapons Effects, DOE is not proposing in this PEIS any new facilities or alternatives solely for the study of weapons effects, and would use existing facilities. A table has also been added to appendix section A.1 further describing major existing DP facilities and activities at these sites.

40.46 The commentor recommends a worldwide multi-national testing program at NTS where all nuclear nations may test their own nuclear devices under close supervision and control of the International Atomic Energy Agency. In the commentor's opinion NTS features all required services, support, maintenance, and insularity in place for such an international venture. Commentor feels that a single world testing site would standardize international testing while lowering the cost per user, would allow the definition of a legitimate nuclear club, and the regime could corral mavericks engaged in unannounced and covert buildup of unproved assets.

Response: *The purpose of the Stockpile Stewardship and Management Program is to ensure the safety and reliability of the U.S. stockpile. Other nations' stockpiles are beyond the scope of this PEIS.*

40.47 A commentor wants to know if the sites followed any standards when submitting numbers for the PEIS.

Response: *Cost, technical, and schedule information were provided by senior technical and management personnel from each alternative site. These data underwent peer review and independent validation. ES&H information were provided directly by subject matter experts from each site to DOE. This information also underwent significant comparability and validity reviews before the data was used in the PEIS analysis. Data for the PEIS were developed by working groups for each stockpile management mission. These working groups consisted of experts from each of the potentially affected sites. A review of data for consistency and accuracy was performed at both the working team level and at a senior management level.*

40.48 The commentor raises the concern that the Albuquerque Operations Office was censoring DOE contractor employees from participating in the public hearings.

Response: *DOE sites encourage this participation and generally recommend that the contractor employees identify their company affiliation and distinguish between personal and company positions. DOE contractor executives, however, have other avenues to provide company proposals or revise information to DOE, and DOE believes it more appropriate to receive such information by normal business channels.*

40.49 The commentor thinks that Summary section S.3.6 should list NTS as an alternative site for all of the large experimental physics machines.

Response: *NTS is listed as an alternative site for NIF. For the remaining facilities, NTS was not considered a reasonable alternative and is not listed. As discussed in section 3.3.1.2, Proposed Contained Firing Facility, and in appendix J, CFF would augment and upgrade the existing Flash X-Ray (FXR) Facility at LLNL, and therefore LLNL is the only reasonable site. Similarly, section 3.3.2.3, Proposed Atlas Facility, and appendix K state that Atlas would build on existing special equipment at LANL such as the 1,430 megavolt-ampere (MA) generator in Building 301, and therefore LANL is the only reasonable site.*

40.50 The commentors express opposition to the Stockpile Stewardship and Management Program, including NIF, stating that they are dangerous and morally wrong. Some commentors remark that it is a waste to use "human genius" in this manner since these talents may be used to solve conflicts and the growing inequality of the world. One commentor believes the United States is misinforming people by saying the United States will not be producing and testing nuclear weapons. Another commentor believes that the United States must revise its objectives and should be focusing more on educating the youths of society and finding a cure for cancer. The commentor does not believe the numbers associated with downsizing. The commentor points out that the public knows the truth from a lie, and the lie is the production and expansion of destructive weapons in the society.

Response: *DOE believes it is responsive to national legal and policy directives in the Stockpile Stewardship and Management Program.*

40.51 The commentors express the opinion that stewardship of the nuclear stockpile is a function that is best done at LANL. Stewardship is a critical component of the Nation's security and LANL can guarantee the integrity of the Nation's stockpile, according to the commentors. One commentor indicates support for consolidating a portion of the weapons production capability at LANL. Another commentor notes that LANL is developing technologies for recycling, storage, and disposal of plutonium and enriched uranium; technologies to reclaim contaminated sites and safely dispose of waste; technologies to monitor and analyze the storage of nuclear components; technologies to detect clandestine nuclear tests; and programs to transfer technology to the Soviet Union. Given the state of affairs in the world today with respect to nuclear weapons, the commentor believes that if LANL did not exist, it would have to be invented because this Nation and the world needs LANL and the technologies that it can provide.

Response: *As one of the two nuclear weapons design laboratories, LANL has been, and would remain, a key component in maintaining the safety and reliability of the Nation's nuclear weapons stockpile. However, LLNL and SNL would also remain essential participants for the foreseeable future.*

40.52 The commentors state that DOE overlooked the potential for Pantex, to perform new stewardship functions complementary to its current management functions. Some commentors want DOE to designate Pantex as the preferred alternative for all existing and new stockpile management and stewardship functions as well as consolidation of all plutonium storage and disposition and any related functions. According to the commentors, Pantex has the resources, safeguards and security, existing facilities, and proximity to LANL for technological information exchange (Atlas Facility and proposed plutonium pit fabrication site) to downsize and/or consolidate while preserving the integrity of the nuclear stockpile under increasing budgetary constraints. Utilizing facilities already in place at Pantex could eliminate costs of duplicating facilities, related transportation, environmental remediation, and start-up and training, according to the commentors. Several commentors also note that Pantex is perhaps the most cost effective alternative for any of the new construction that is contemplated. While commentors state that there is a strong history of community support, they caution that current and future functions at Pantex must be conducted in a safe and environmentally sound manner and that expansion must be implemented in a way that does not impair the health or safety of area residents or adversely affect the environment.

Response: *The rationale for the various site alternatives are discussed in chapter 2, as well as in various portions of section 3.1 of the PEIS. Pantex is considered as a reasonable site alternative for the A/D mission, strategic reserve storage, and HE fabrication. Pantex does not have an existing infrastructure for plutonium fabrication, secondary fabrication, and nonnuclear component fabrication. Consequently, Pantex was not considered as a reasonable alternative for these missions. Pantex was not considered as a reasonable site alternative for stockpile stewardship facilities as explained in section 3.1.2.1.*

Pantex has essential capabilities to support the future stockpile management program. In selecting reasonable alternatives for future stockpile stewardship and management missions, however, DOE found it to be unreasonable to address alternatives for new missions where no core capability for that new mission was present at the site. In addition, DOE sought alternatives that tended to further consolidate and streamline the infrastructure for the Program because of the overall general reductions in work to be performed. For these reasons, it was determined to be unreasonable to consider stewardship experimental capabilities and plutonium pit production at Pantex, just as it was unreasonable to consider relocation of the weapon A/D mission to sites which had no core capability or facility infrastructure to deal with nuclear explosives.

40.53 The commentors ask how the current Stockpile Stewardship and Management Program minimizes the impacts on weapons performance due to inadvertent or unavoidable changes in production methods. One commentor believes that the statement that surrogate testing will be used to keep the weapons database current is misleading. The commentor suggests that one method is to devote a new effort to document the details of the current production methods and to establish procedures which will minimize the changes in weapons performance resulting from inadvertent or unavoidable incremental changes in the weapons stockpile. Some commentors express concern that surrogate testing while useful does not ensure unpredicted changes in performance. In addition, commentors do not believe that the PEIS adequately focuses on resources devoted to surrogate testing, the stabilization and preservation of manufacturing capabilities, and the need for weapons experts to participate in the decisionmaking process.

Response: *Without underground nuclear testing as a confirmation tool, the effects of these changes could go undetected. It is for these reasons that DOE has proposed a robust stockpile stewardship program based on improving U.S. abilities to assess weapon performance absent underground nuclear testing. It is also for these reasons that DOE has proposed to further integrate the material and process technology programs at the production plants with the weapon assessment programs at the laboratories.*

40.54 The commentor feels that the overall policy direction is fatally flawed and leading completely in the wrong direction. The commentor states that the overall policy direction leads the environmental study to worry about such minutiae as one fatal cancer every 5 million years when they are concerned with the nuclear safety of the world involving real weapons of mass destruction, literally tons of plutonium, and an environmental mess.

Response: *In accordance with NEPA, the purpose of the PEIS is to assess the environmental impacts of the proposed action, the reasonable alternatives, and the No Action alternative. DOE believes that the Stockpile Stewardship and Management Program is consistent with the legal and policy framework for the current national security environment.*

40.55 The commentor states one of the fundamental flaws of the Draft PEIS is the outdatedness of all LANL environmental data and feels that referencing the *1992 LANL Environmental Surveillance Report* as "LANL 1994b" is deceptive.

Response: *The* 1992 Environmental Surveillance Report *is correctly referenced as a 1994 publication, since that is when it was published. That data represented the best available data for preparing the Draft PEIS. Data for the Final PEIS was updated to include any significant modifications or improvements.*

40.56 The commentor states that the Draft PEIS fails to describe the only programmatic alternatives actually considered, namely Stockpile Stewardship and Management and No Action alternatives, in a way that allows useful comparison. For stewardship, the only alternative to building the proposed facilities is a No Action alternative continuing operation of existing facilities with the same function. The commentor states that the Draft PEIS fails to describe the No Action alternative in a comprehensible manner. The commentor contends that the No Action description is poorly written, confusing, and does not provide information sufficient to inform the reader of the actual activities it encompasses. The commentor states that the No Action alternative does not describe currently existing operations and facilities at DOE sites—rather, it is an arbitrarily chosen set of "not stockpile stewardship and management" activities, some of them in fact part of the stockpile stewardship and management programs, which are expected to be in operation almost a decade from now. The commentor believes that the PEIS does not adequately delineate what the No Action set of facilities are at any given site. This renders it virtually useless for comparison with the already too narrow range of alternatives, according to the commentor. The commentor further argues that the deficiency of the No Action alternative alone is sufficient reason to withdraw the PEIS and republish the draft. One commentor stated that the use of a specific date for ground-breaking (i.e., September 1995) was inappropriate to define the No Action alternative.

Response: *In accordance with NEPA, the PEIS assesses the No Action alternative. The No Action alternative is described in broad terms in section 3.1.4, and in more detail in chapter 4 and appendix A of the PEIS. Under No Action, DOE would not take the actions proposed in the PEIS, but would continue with existing operations. For stockpile stewardship, this means continuing the existing activities at LANL, LLNL, SNL, and NTS related to stockpile stewardship. In order to aid the reader's understanding of the major facilities that make-up the No Action alternative for stockpile stewardship, tables have been added to the site descriptions in appendix section A.1 of the PEIS.*

During preparation of the Draft PEIS, the September 1995 planning assumption was used as one of the considerations in determining whether a new facility or upgrade would be part of No Action. However, it was not the only consideration. DOE also considered whether a particular facility was addressed in prior NEPA documentation, whether a facility met the requirements of the CEQ for an interim action, and whether a facility or a modification was the continuation of an existing mission.

The Final PEIS contains a more appropriate description of the rationale for No Action. As stated in the Final PEIS, the No Action alternative for this PEIS is defined in a way that takes into account the fact that DOE for decades has had in place a program for the stewardship and management of the nuclear weapon stockpile. Consistent with CEQ guidance, the No Action alternative consists of those facilities necessary to maintain the status quo in terms of DOE's current program direction. These consist primarily of existing facilities where DOE conducts weapons activities, including modifications to those facilities necessary to maintain their current mission capabilities. However, the No Action alternative also includes a small number of minor new facilities that will also be needed simply to maintain current mission capabilities at individual sites. Finally, the No Action alternative includes two major new facilities which are proceeding independent of this PEIS, and for which DOE has prepared separate EISs under the interim action provisions of the CEQ regulations. These EISs are the PEIS for Tritium Supply and Recycling (DOE/EIS-0161) and the DARHT EIS (DOE/EIS-0228).

40.57 The commentor wants to know what evacuations plans have been developed in the event of a nuclear accident or catastrophic fire at LANL. Because of the limited egress in and out of the Los Alamos region, the lack of well thought out and publicized evacuation plans can have grave consequences.

Response: *LANL and Los Alamos County have developed emergency management programs to govern evacuations. Los Alamos County is responsible for evacuation of county land (including county communities), and, with LANL's input, has prepared the draft* Los Alamos County All Hazards Plan *which is required by the State of New Mexico. The draft plan has been submitted to the State of New Mexico for review and approval is pending.*

The laboratory has implemented two notification systems to alert LANL and county occupants of emergencies:

Community Alert Network. This system includes all of Los Alamos County and is capable of notifying all occupants by telephone, cable TV subcaption, and radio stations in the event of an emergency.

Site-Wide Area Notification. This system has special two-way radios located in LANL facilities and is capable of site specific or LANL-wide notification in the event of an emergency.

40.58 The commentor states that the Stockpile Stewardship and Management Program is not described in a manner which would allow for meaningful comparison with other true program alternatives. The commentor states that major parts of the Program, including facilities and actions which are incomplete or have not been started, have been eliminated from consideration, including for example, DARHT and tritium production facility options. DOE has initiated or completed hundreds of millions of dollars worth of new facilities and facilities upgrades throughout the Complex, apparently implementing portions of the Program which the reconfiguration PEIS was supposed to review and the commentor contends that this refurbishment of the Complex in the absence of programmatic review has substantially narrowed the range of options which DOE conceives as feasible. The commentor believes that the public would have been far better served by using this PEIS for a comprehensive look at the environmental impacts of the full Stockpile Stewardship and Management Program, the Complex of the future as envisioned by DOE, in comparison with other programmatic options (denuclearization, remanufacture, and such) for managing the nuclear arsenal (which citizen groups have been demanding for 5 years). Instead, the commentor states that the end result of 5 years of reconfiguration is the presentation to the public of a fait accompli, with the fundamental policy decisions already made and major program components (e.g., DARHT) already underway.

Response: *The scope of the PEIS is reflective of the national policy considerations described in chapter 2 of the PEIS. The proposed actions and alternatives analyzed are consistent with and sup-*

portive of these national policy considerations. The PEIS includes all actions that are within the scope of the Stockpile Stewardship and Management Program. See also the response to comment summary 40.85. Two actions, which DOE has evaluated in separate EISs in accordance with CEQ regulations for interim actions (40 CFR 1506.1), are within the scope of the Stockpile Stewardship and Management PEIS. These are the Tritium Supply and Recycling PEIS and DARHT Facility EIS. These two actions, and their relationship to the Stockpile Stewardship and Management PEIS, are described in section 1.6 of the PEIS. See also the response to comment summary 41.18, which discusses why other new facilities or facility upgrades are not included in the PEIS as action alternatives.

40.59 The commentor asks if DOE has integrated the PEIS with the DOD mission.

Response: *A detailed discussion of the planning basis for the PEIS, vis-a-vis DOD mission, is described in chapter 2 of the PEIS. Major policy documents for the PEIS included the NPR, which was approved by the Secretary of Defense and the President, and the annual NWSM, which was jointly prepared with DOD and approved by the Secretaries of Defense and Energy. These policy documents provided assurance that PEIS requirements and assumptions were consistent with DOD missions.*

40.60 The commentors believe that the Draft PEIS does not analyze a range of reasonable programmatic alternatives to meet the goal of maintaining the stockpile safely in accordance with treaty obligations. The commentors contend that the analysis in the Draft PEIS suggests that the debate over stockpile stewardship and management is over and that the program alternative has already been determined. According to the commentors, these are fundamental problems which prevent meaningful participation by the public and obfuscate informed analysis by decisionmakers. The commentors believe that DOE should withdraw the Draft PEIS and prepare a revised Draft PEIS, while all programmatic decisions and activities are put on hold. The revised Draft PEIS should analyze "maintenance," "remanufacturing," interim stockpile sizes, and a "zero" stockpile case—both with and without the capability to reconstitute the arsenal—which is based upon a scenario of global reduction and elimination of nuclear weapons in compliance with Article VI of the NPT over time periods ranging from 15 years to the projected lifetime of the proposed facilities (on the order of 40 years).

The commentors believe that the PEIS should include alternatives examining the impacts of a policy course of reduction of nuclear weapons, ultimately resulting in their elimination pursuant to U.S. obligations under Article VI of the NPT. The commentors state that the PEIS should analyze the environmental impacts for a stockpile size of less than 1,000 weapons. Several commentors, noting the NPT calls for a move toward disarmament, believe that the 0 to 100 stockpile size is a reasonably foreseeable situation and should be analyzed. Other commentors argue that a zero-level stockpile should be considered because it would satisfy nonproliferation obligations and there is overwhelming public support for such an idea. One commentor questions the rationale for the stockpile sizes assessed in the PEIS. More specifically, the commentor implies that the lower case 1,000 weapons stockpile is not well supported. Another commentor disagrees with DOE's assertion that "stockpile management capabilities are independent of stockpile size."

In one commentor's opinion, the combination of an extremely one-sided analysis of potential effects on the weapons nonproliferation climate, the elimination from detailed analysis of all substantive program alternatives to the proposed action, and technical analysis which conclude that a large complex can be rebuilt and operated with few impacts at facilities with still unsolved waste and contamination problems, leaves little doubt that the purpose of this Draft PEIS is "to justify decisions already made" (40 CFR 1502.5).

Response: *DOE believes that the PEIS discusses a full range of alternatives for implementing the Stockpile Stewardship and Management Program, and that it analyzes in detail those reasonable* *alternatives that are capable of achieving the goals of the Program while still fully complying with the treaty and national security policy constraints established independently from the Stockpile Stewardship and Management Program. DOE also believes that the PEIS adequately assesses the cumulative impacts of proposed activities and existing activities at the sites where the Stockpile Stewardship and Management Program would be implemented.*

It is a well-established principle under NEPA that the goals of a proposed action delineate the limits of the reasonable alternatives to that action. That is, an alternative which does not accomplish the agency's goals is not a reasonable alternative. Since its inception, one of the primary goals of the U.S. nuclear weapons program has been to ensure the safety, security, and reliability of the Nation's nuclear weapons stockpile. Numerous facilities have been built over the years at the three weapons laboratories (LANL, LLNL, and SNL) and at NTS to conduct various activities necessary to meet this goal.

As described in chapter 2 of the PEIS, recent developments in national security policy have placed new constraints on the types of activities available to achieve this goal. Specifically, the United States is not producing new-design nuclear weapons or conducting underground nuclear testing (see section 2.4). DOE's challenge in developing the stewardship portion of the Stockpile Stewardship and Management Program has been to determine whether, and how, to replace, modify, or augment the existing capabilities of the laboratories and NTS so that the goal of maintaining a safe and reliable stockpile can be met, even as the enduring stockpile ages and underground testing is no longer available.

DOE has examined from a programmatic perspective various approaches to achieving this goal, and has determined that only an aggressive science-based program that relies on sophisticated simulation and computational technology would allow DOE to continue to ensure the safety and reliability of the stockpile. Alternate approaches which are based on principles other than an aggressive pursuit of the knowledge necessary to predict, detect, and correct problems with the stockpile cannot achieve DOE's goals. Section 3.1.2 has been expanded to examine various other alternatives or approaches (such as maintenance, remanufacturing, and a zero stockpile) that have been suggested, and to explain why each of them are incapable of ensuring the stockpile's safety and reliability, and thus are not reasonable.

Since the end of the Cold War, the United States has significantly reduced the size of its nuclear weapons stockpile and the DOE has dismantled more than 8,000 nuclear weapons. At the present time, the United States is further downsizing the nuclear weapons stockpile consistent with the terms of the START I Treaty, and DOE is continuing dismantlement. The United States has recently ratified the START II Treaty and is hopeful that Russia will likewise ratify this treaty. DOE acknowledges that further multilateral negotiated reductions in the United States nuclear weapons stockpile could occur. However, as discussed below, the negotiations required for such reductions are likely to stretch well into the next century. Therefore, DOE believes the three stockpile sizes utilized for the analysis in the Stockpile Stewardship and Management PEIS fully account for future requirements while still being consistent with and fully supportive of the goals of Article VI of the NPT.

Two of the three stockpile sizes analyzed in this PEIS, a START I Treaty- and START II protocol-sized stockpile, are the only ones currently defined and directed by national security policy. The NWSM specifies the types of weapons and quantities of each weapon type by year (section 1.1). The NWSM is developed based on DOD force structure requirements necessary to maintain nuclear deterrence and comply with existing arms control treaties while pursuing further arms control reduc-

reductions. Chapter 2 of the PEIS explains the complexity of this process. DOE does not believe it reasonable to speculate with a large number of arbitrary assumptions (section 2.2), and has selected a range of stockpile sizes appropriate for the analysis and consistent with relevant policy documents. The "low case" 1,000 weapon stockpile represents a hypothetical case used for the purpose of a sensitivity analysis on manufacturing capacity decisions. No specific DOE force structure projection corresponds to the low case assumed stockpile. However, stockpile sizes in this range have been proposed by others (see for example Foreign Affairs, Spring 1993).

Stockpile stewardship capabilities are currently viewed by the United States as a means to further U.S. nonproliferation objectives in seeking a zero-yield CTBT. Likewise, it would be reasonable to assume that U.S. confidence in its stewardship capabilities would remain as important, if not more important, in future arms control negotiations to further reduce its stockpile. The path to a very small (10s or 100s) or zero stockpile would require the negotiation of complex international treaties that are also likely to require intrusive verification inspections of nuclear weapons-related facilities. Therefore, DOE believes it reasonable to assume that complex treaty negotiations, when coupled with complex implementation provisions, would likely stretch over several decades. On a gradual path to a very small or zero stockpile, stockpile size alone would not change the purpose and need, proposed actions, and alternatives in this PEIS as they relate to stewardship capabilities. The issues of maintaining the core competencies of the United States in nuclear weapons, and the technical problems of a smaller aging stockpile in the absence of nuclear testing, remain the same.

This PEIS evaluates reasonable approaches to stockpile management capability and capacity that is consistent with a gradual path toward a very small or zero stockpile. At some point on this path, further downsizing of existing industrial plants or the alternative of consolidating manufacturing functions at stewardship sites would become more attractive as manufacturing capacity becomes a less important consideration. However, in the near term, the preferred alternative of downsizing the existing industrial plant would still be a reasonable action because the projected downsizing investment pays back within a few years through reduced operating expense; in addition, the downsizing actions are consistent with potential future decisions regarding plant closures. In regard to the proposed action for reestablishing pit manufacturing capability, DOE does not propose to establish higher manufacturing capacities than are inherent in the reestablishment of the basic manufacturing capability of LANL, which is the preferred alternative. In developing the criteria for reasonable stockpile management alternatives, DOE was careful not to propose the introduction of significant new types of environmental hazards to any prospective site. Therefore, on a gradual path to a very small or zero stockpile, stockpile size alone would not change the purpose and need, proposed actions, and alternatives in this PEIS with regard to stockpile management capabilities and capacities.

In conclusion, as a result of the START I Treaty, START II protocol, and the NPR, the Nation's nuclear weapons stockpile is being significantly reduced. However, even in the post-Cold War period, international dangers remain, and nuclear deterrence will continue to be a cornerstone of U.S. national security policy for the foreseeable future. Thus, DOE'S responsibilities for ensuring the safety and reliability of the U.S. nuclear weapons stockpile will also continue.

Regarding the comment that DOE should prepare a revised Draft PEIS, DOE believes that the Draft PEIS was adequate. The Draft PEIS assessed the direct, indirect, and cumulative environmental impacts of the reasonable alternatives for the proposed action and the No Action alternative. In response to public comments on the Draft PEIS, DOE has made changes to the Draft PEIS as described in section 1.8 of the Final PEIS. Additionally, DOE has prepared this Comment Response Document which describes the comments received on the Draft PEIS and DOE's responses to those comments.

40.61 The commentor suggests that DOE provide a definition of hazardous chemicals in the glossary or possibly use the term "hazardous substances."

Response: *A definition of hazardous chemicals has been added to the glossary.*

40.62 The commentor states that the most egregious deficiency of the PEIS is the total failure to include current Congressional legislation (*National Defense Authorization Act for Fiscal Year 1996*, Title XXXI, particularly sections 3137 and 3153) and associated national security policy guidance. The conclusions of the House and Senate markups for fiscal year 1997 must also be considered. The PEIS must be redone based on the full range of national security policies both Congressional and Presidential, according to the commentors.

Response: *Chapter 2 of the PEIS discusses the major national security policy considerations that are most relevant to the PEIS analysis. Included in that discussion are PDDs, Congressional legislation, DOD NPR, the NWSM, and four related treaties. While that list of national security policy considerations is not meant to be exhaustive, it does represent, in DOE's view, the most significant national security policy overlays that define the Stockpile Stewardship and Management Program conditions for the reasonably foreseeable future. Based on our understanding, the Draft PEIS analysis is consistent with the current Congressional legislation (*National Defense Authorization Act for Fiscal Year 1996, *Title XXXI). The Final PEIS analysis takes into account, as appropriate, any other relevant 1997 legislation.*

40.63 The commentor refers to section 3.3.4.2 and asks what are the "prohibitively expensive alternative approaches" to the High Explosives Pulsed-Power Facility (HEPPF).

Response: *HE pulsed-power generators are used to explore higher energy (higher current) frontiers than may be available in existing fixed capacitor-bank facilities without a major capital investment, albeit at a low data rate, while capacitor banks provide repeatable (and indoor) experimental facilities with high data rate for broad experimental use (section 4.11). Given our present understanding, at very high energies far beyond projected Atlas capabilities, a capacitor bank facility would likely be far more expensive than a HEPPF firing site capable of supporting the amount of HE necessary for (less-frequent) HE generator experiments that could provide comparable energy. Conversely, appendix K discusses why reliance on HE generator experiments is not a reasonable alternative to Atlas. The explanation of HEPPF and HE pulsed power has been expanded in sections 3.3.4.2 and 4.11 and the statement referenced by the commentor has been removed.*

40.64 The commentor refers to section 3.5 and states, after all the concern expressed about subtle changes in materials and processes, emerging technologies propose continuing work in areas which represent significant changes in processes and materials. The commentor asks if the intent to protect technical capability is to have technologies available in case of a resumption of testing or a breakthrough in experimental technology, or whether there is an expectation that DOE can just go ahead and use them regardless of our previous protestations.

Response: *Emerging technologies are discussed in section 3.5 to indicate to the public that DOE is continuing to assess its manufacturing process technologies with an objective of reducing waste generation and operating hazards. Use of some of these technologies would be straightforward relative to weapon physics concerns because they can be fully assessed in the absence of underground nuclear testing. Incorporation of some of these technologies, however, would only be done after significant assessment and experimentation by weapon physicists to assure they can be incorporated without adversely affecting weapon safety or performance.*

40.65 The commentor refers to section 2.3.4, and the different materials that are referred to in this section, whose aging characteristics are not well understood. The commentors question whether these materials could not be replaced without compromising the military objectives of the stockpile.

Response: *Without continued development of science-based stockpile stewardship, some of the "different materials" referred to in this section could not be confidently replaced with other materials.*

40.66 The commentor expresses the opinion that Pantex should be the preferred site for future Complex missions.

Response: *One important strategy of the Stockpile Stewardship and Management Program is to maximize the use of existing infrastructure and facilities as we transition to a smaller and more efficient Complex in the 21st century. Consequently, only those sites with an existing infrastructure or facilities capable of supporting a given stockpile stewardship or stockpile management mission are considered reasonable site alternatives. Sites without a technical infrastructure or facilities for a given mission would require significant new construction that would be costly and would create excessive technical risk compared to sites with existing missions. Pantex is only being considered for weapons A/D, HE fabrication, and storage of nuclear materials.*

With regard to stockpile stewardship, the majority of the Nation's core competencies in nuclear weapons, as well as the facilities used for stockpile stewardship, reside at the weapons laboratories and NTS. The President has determined that the continued vitality of all three DOE weapons laboratories and NTS remains essential to meet the requirements of stockpile stewardship as the United States enters into a CTBT regime. Accordingly, to locate stewardship activities at sites without the knowledge base and infrastructure would be counterproductive to the development of science-based stockpile stewardship. Further, two of the proposed stockpile stewardship facilities, the Atlas Facility and CFF utilize existing facility infrastructure at LANL and LLNL, respectively.

40.67 Commentors would like DOE to reconcile a declining budget at Pantex with an increasing workload. The commentors state that the fiscal year 1997 budget as proposed will lead to a reduction in force at Pantex. One commentor, noting that the Stockpile Management Preferred Alternatives Report reveals that Pantex, but not Y-12 or KCP, will undergo this decrease in budget, asks why Pantex is suffering budget cuts if the workload is constant and the other production facilities are not suffering budget cuts.

Response: *It is not possible to compare year-to-year budget changes for different weapon production facilities because each has unique missions and workloads influenced by different factors. The final fiscal year 1997 budgets for all weapons complex sites have not yet been determined. However, the budget for each site would be based on the workload to be performed by that site in fiscal year 1997.*

40.68 The commentor states that the enduring stockpile was built from the late 1970s to the early 1990s, approximately a 12-year period. Assuming the stockpile has 8,400 weapons in it and that the life of a weapon is about 30 years, in 2008, we would have to replace the stockpile at a rate of 700 units per year. DOE is sizing the Complex to handle about 300 units per year. The commentor would like DOE to explain this disconnection and what it proposes to do about it.

Response: *The commentor postulates a disconnection between future workload and planned production capacity that DOE does not believe exists. Sections 2.2.2 and 3.1.1.1 describe the rationale for the production capacities assessed in the PEIS. More detailed information is available in the* Analysis of Stockpile Management Alternatives *report that supports the PEIS. Although DOE proposes to downsize its weapon production capacities, it has the option in the future to run multiple-shift opera-*

tions or reactivate facilities (with appropriate environmental review and documentation) should unforeseen events dictate larger operating capacities.

40.69 The commentors state that they have no confidence in DOE due to a past history of lies and deceptions in the nuclear program. One commentor states that DOE should address the deceptions in the nuclear program. Another commentor believes that a war crime tribunal should be established to review past mistakes of DOE in order to charge them with first degree murder and hang them.

Response: *DOE believes that the PEIS provides a full and fair evaluation of all reasonable alternatives. Other issues addressed by the commentor are beyond the scope of the PEIS.*

40.70 The commentor believes the stated rationale that the proposed Stockpile Stewardship and Management Program is needed to maintain stockpile safety and reliability does not square with available data. The commentor states that without DOE's rationale for the Stockpile Stewardship and Management Program, it would be difficult for DOE to justify operating current facilities, much less build new ones, since official policy now proclaims that no new weapons will be produced. The commentor references that Sandia Stockpile Life Study which found that with surveillance and repair, U.S. nuclear weapons retain high safety and reliability. Further, defects caused by aging are rare and have not increased over time and the stockpile is not now reaching an advanced age due to scheduled retirements under arms reduction agreements. The commentor opines that weapons are becoming safer as older weapons types are retired. According to the commentor, the study adds weight to previous studies and expert opinion showing that the safety and reliability of the U.S. nuclear weapons stockpile can be maintained under a comprehensive nuclear testing ban. Once corrected for additional weapons systems, the commentors believe that the *1995 Stockpile Surveillance: Past and Future* report essentially validates the 1993 Stockpile Life Study. The commentor states that key implication of the stockpile study—the U.S. arsenal is highly reliable, underground testing has rarely been used to confirm the reliability of stockpiled weapons, and future defects can be fixed with existing surveillance programs and facilities—are highly relevant to the proposed Stockpile Stewardship and Management Program.

Response: *The underlying rationale for the Stockpile Stewardship and Management Program is the need to ensure the continued viability of this Nation's nuclear deterrence. The commentor references the Sandia Stockpile Life Study, for which a set of viewgraphs for a status briefing were prepared by SNL in 1993. However, the data used to develop the interim study arose from a database which was recognized to be incomplete and inadequate in that much data, particularly that relating to problems found through methods outside the DOE's formal Stockpile Evaluation Program, were incompletely or inconsistently documented. In particular, findings and "actionable" findings associated with the nuclear package (including the weapons primary and secondary) were not completely documented. DOE understands that Sandia never completed a stand-alone stockpile life study. Instead, at the request of DOE, the three weapons laboratories (LANL, LLNL, and SNL) subsequently conducted a joint study,* Stockpile Surveillance: Past and Future *(Johnson et al., 1995), which has updated Sandia's preliminary data to provide a more accurate look at the condition of the stockpile. This study was made publicly available in 1995 and was discussed in the PEIS. Sandia's preliminary findings were reassessed, corrected, and incorporated into the tri-laboratory study. DOE does not agree that Sandia's preliminary study "undercuts" the Stockpile Stewardship and Management Program, as suggested by commentor; rather, this preliminary study examined some of the types of problems with the enduring stockpile that led to the development of the Stockpile Stewardship and Management Program.*

40.71 The commentor asks what the environmental, social, cultural, and spiritual impacts, of having stockpile stewardship including DARHT, on all the communities near Los Alamos, the people, the air, the flora, the fauna, aquifers, livestock, agriculture, rivers, streams, businesses, and tourism of the states of Arizona, Colorado, New Mexico, Texas, and Utah and on the Nation.

Response: *The PEIS has been prepared in accordance with NEPA and applicable regulations and evaluates direct, indirect, and cumulative environmental impacts. Regarding LANL, the impacts of stockpile stewardship alternatives are discussed in chapter 4 of the PEIS in sections 4.6, 4.7, 4.8, and 4.9. In addition, project- and site-specific analysis is presented in appendix I for NIF, appendix J for CFF, and appendix K for Atlas.*

40.72 The commentors express opposition to all current and future nuclear weapons work at LANL including work associated with the Stockpile Stewardship and Management Program. Another commentor questions the selection of LANL based on allegations of sexual harassment at Albuquerque and pornographic Internet "play" at Sandia.

Response: *LANL and SNL have been selected as reasonable sites for some alternatives because of existing missions and infrastructure. Personnel actions such as those mentioned at these sites are outside the scope of the PEIS.*

40.73 Commentors believe Pantex is the wrong place for plutonium storage. Another commentor believes DOE has decided that long-term storage in Zone 4 is unsafe. One commentor states that he does not want Pantex to become the next Rocky Flats where the only jobs are for nuclear waste handlers and regulators. Another commentor believes plutonium is too dangerous to transport.

Response: *Pantex currently stores plutonium and is a candidate for long-term storage. DOE did not propose to introduce plutonium missions to any locations which did not already have some plutonium capabilities. The storage of plutonium, if selected, would be performed in accordance with applicable environmental regulations. Decisions on long-term storage of plutonium will be made in the ROD for the Storage and Disposition PEIS. DOE has not decided that long-term storage in Zone 4 is unsafe. The downsizing of the A/D mission at Pantex would result in the availability of facilities in Zone 12 which would no longer be needed to support the reduced workload requirements for A/D operations and could be used for storage. DOE has added a more thorough discussion of smaller stockpile sizes in section 3.1.2.*

40.74 Some commentors believe the PEIS should include the new mission of recertifying dispositioned HEU and plutonium in section 2.4, Purpose and Need, and section 3.2, Stockpile Management. One commentor cites section 3.5.4 and questions why explosive materials are disposed of, but plutonium and HEU are dispositioned. The commentor asks if a pit and plutonium/HEU residue are classified, and thus dispositioned, why would HE that is classified be disposed of. Commentor also asks why is classified HE potentially part of "alternative disposal technologies" and not "alternative disposition technologies." Another commentor asks if section 2.4.2, Industrial Base, should include a mission for recertifying non-fissile materials placed into storage and disposition. Another commentor asks what is excess explosive materials and what is the difference between that and surplused plutonium and HEU.

Response: *Disposition of surplus HEU and plutonium is addressed by DOE in the Storage and Disposition PEIS. HE is considered differently than HEU and plutonium because they can be sanitized (their shape declassified) and disposed as hazardous wastes, and because subsequent to sanitization they are not a concern relative to nuclear weapons proliferation. Whether excess materials are "disposed" or "dispositioned" does not relate to their classification, but to whether they are controlled materials relative to nuclear weapons proliferation.*

40.75 The commentors refer to appendix section A.3.1, and based on the estimate of 200 weapon parts per weapon, asks the following questions: how many parts are backlogged waiting for sanitization and demilitarization; if a backlog exists, what are the impacts of downsizing, relocating, and no action, on this backlog; who is responsible for sanitization and demilitarization; why isn't this discussed in infrastructure; why aren't the impacts assessed; and what is the through-put capacity of sanitization and demilitarization for each of the 200 estimated parts; are these processes readily available at other sites; and has DOE considered the nonproliferation capability in selecting alternatives.

Response: *DOE routinely deals with sanitization and demilitarization of components and materials from dismantled weapons at Pantex. Some materials and components are demilitarized and sanitized by Pantex, while others are returned to the manufacturer of the materials or components. This activity has been ongoing at a high level since the end of the Cold War. It will subside to a relatively low level in about 3 years after the large dismantlement workload is completed. All of these demilitarization and sanitization activities occur in existing production facilities, and for the PEIS are considered a part of the ongoing No Action alternative. Though this workload is not facility intensive, alternative locations for the stockpile management missions included facilities to deal with this workload.*

40.76 The commentors believe SRS should receive a major role in the programs as determined in the ROD because it has the people, facilities, security, infrastructure, experience, and support from adjacent communities that will assist DOE in accomplishing the desired missions without adversely affecting the environment and saving taxpayers millions of dollars.

Response: *SRS has been and would remain a key component in maintaining the safety and reliability of the Nation's nuclear weapons stockpile. The* Stockpile Management Preferred Alternatives Report *provides information on the cost of the pit fabrication mission at SRS and LANL.*

40.77 The commentor states that it is impossible to reduce the risk from nuclear weapons accidents to zero; however, and in particular, there will always remain some risk that plutonium will be dispersed by fire or explosion. The commentor believes the simplest and best ways to further minimize this possibility are operational and deployment changes that reduce the chances of an accident and risk to the public and further retirements which lead to a smaller arsenal.

Response: *DOE is committed to minimizing risks to the greatest extent possible consistent with national security requirements.*

40.78 The commentor states that the citizens of Los Alamos are entitled to know the current environmental conditions of LANL before deciding whether the University of California has been good steward of existing hazardous materials. Another commentor believes there is serious mismanagement of the laboratory by the current contractor resulting in continuing non-compliance with environmental laws and NEPA violations.

Response: *DOE is committed to fully complying with all applicable environmental statues, regulatory requirements, and Executive and internal orders. All DOE facilities comply with* the Emergency Planning and Community Right to Know Act *(42 USC § 11001), which requires facilities to report the release of extremely hazardous substances and other specified chemicals; to provide material safety data sheets; and to provide estimates of the amounts of hazardous chemicals onsite. The conditions at LANL are described in section 4.6.2 of the PEIS.*

In general, contracting is not subject to NEPA review (see 10 CFR 1021, subpart D, appendix A, except regarding procurements for developing new or emerging technology).

Although the commentor correctly points out that operations at LANL have occasionally been found to be out of compliance with various environmental laws, DOE and LANL management have made good faith efforts to bring laboratory facilities into compliance in a timely manner. DOE expects its management and operating contractors to operate its facilities in compliance with all Federal, state, and local laws, and the University of California, as management and operating contractor for LANL, has pledged to do so. DOE's confidence in the University of California is reflected in DOE's recent decision to extend the University's management and operating contract for LANL, LLNL, and Lawrence Berkeley Laboratory for another 5 years.

The commentor makes a number of allegations, most of which are unrelated to the University's management of the laboratory. While the courts found that an EIS should be prepared for the DARHT facility, DOE is unaware of any other NEPA violations, although DOE's Tiger Team recommended in 1991 that a site-wide EIS be prepared for LANL; regardless, the NEPA process is conducted by DOE, not the University of California. DOE is unaware of any refusal on the part of the university regents to meet with the citizens or legislators of New Mexico, subject to their schedule constraints, and the regents have held several public meetings in New Mexico on the subject of LANL operations. The laboratory conducted both a voluntary separation program and a reduction in force in 1995 to streamline its operations; these were conducted within the University of California personnel procedures as they apply to LANL and with the support and approval of both the University of California and DOE. Statistics compiled by LANL do not indicate that these actions disproportionately affected minorities or ES&H Division personnel. This matter is the subject of current litigation. DOE supports the LANL practice of debating opposing scientific theories in an atmosphere of academic freedom, and does not agree that the integrity of either the laboratory's environmental or scientific programs are under question.

40.79 The commentor believes that the PEIS does not make a realistic distinction between strategic and surplus plutonium. The commentor believes that the effort to maintain two-thirds of the plutonium in the United States is evidence that the country is not serious about disarmament and also gives rise to the suspicion that some effort is being made towards using plutonium for commerce.

Response: *The distinction between strategic and surplus is made in the NWSM, which is classified. The excess is addressed in the Storage and Disposition PEIS, which describes how much is excess and is evaluating alternatives for future disposition.*

40.80 The commentor asks where fabrication of enriched uranium primaries will be assigned.

Response: *Some nuclear weapon pits contain components fabricated from HEU. These parts require the identical equipment and fabrication processes used for the manufacture of secondary HEU parts. They have traditionally been fabricated at Y-12 and shipped to the plutonium pit fabrication facility for incorporation into the weapon pit. As such, fabrication of these parts was included as a portion of the secondary and case production mission in the PEIS.*

40.81 One commentor requests that economy and safety be the first considerations in Stockpile Stewardship and Management Program. The commentor also expresses concern about the cost of cleanup in the event of a catastrophe. Another commentor does not want decisions concerning the location of operations and activities to fall into the "not in my back yard" syndrome. The commentor believes impacts should be minimized to all workers, families, and communities; and to the environment.

Response: *Safety is a paramount consideration of the Stockpile Stewardship and Management Program. DOE is committed to operating all facilities as safely and cost effectively as possible and in compliance with all applicable regulations.*

40.82 The commentor asks, relative to section 3.2.2, what ORR DP assignments are not performed by Y-12.

Response: *Some central site functions, such as facility engineering and computer operations, exist at ORR and support Y-12 as well as other ORR programs.*

40.83 The commentors request an explanation from DOE on why LANL and LLNL stockpile management budgets show projected increases from 1996 to 2004 since the United States has terminated the development of new nuclear weapons. Commentors reference the *Stockpile Management Preferred Alternatives Report,* pages 26 and 30. One commentor asks if these projected increases are based on transferring of missions from the production plants.

Response: *The LANL and LLNL stockpile management budgets are projected to grow in the next few years if the preferred alternative is implemented. At LLNL, the total present stockpile management budget is relatively small and its growth is small when compared to the total site budget. At LANL, the budget growth would be primarily associated with the preferred alternative assignment of the plutonium pit manufacturing mission.*

40.84 A commentor found the Draft PEIS unclear with respect to the intended aims and plans that are being proposed for the Panhandle area. Other commentors reiterated the community's adamant position that all work performed at Pantex continue to be done in a fashion that protects the environment including national resources such as the Ogallala aquifer and agricultural land.

Response: *Pantex was considered a reasonable alternative site for the weapons A/D mission and the HE fabrication mission. The weapons A/D mission is described in section 3.4.1, and includes provisions for nonintrusive modification pit reuse and strategic storage of plutonium and uranium in the form of pits and secondaries. Secondaries would not be stored at Pantex if Y-12 retains the secondary and case fabrication mission. Additionally, storage of all or a portion of the strategic reserve could be at another site, depending on DOE decisions regarding the Storage and Disposition PEIS. The HE fabrication mission is described in section 3.4.5, and includes HE procurement, formulation, component fabrication, characterization, surveillance, disposal, and storage. Analysis of the water and land-use impacts associated with each Pantex alternative were included in the Draft PEIS. Selection of the preferred alternatives was accomplished with full weight given to the results of this analysis. The* Analysis of Stockpile Management Alternatives *report and the* Stockpile Management Preferred Alternatives Report *are available for public review at the DOE Public Reading Rooms near each site.*

As stated in section 3.1.1, Planning Assumptions and Basis for Analysis, DOE would emphasize compliance with applicable laws and regulations and accepted practices regarding industrial and weapons safety, safeguarding the health of workers and the general public, and protecting the environment. Section 4.14 of the PEIS describes the regulations and requirements under which all DOE sites conduct their operations during the normal course of their work activities, including potential accidents and associated human health and environmental consequences of an accident.

40.85 The commentor believes that the Draft PEIS fails to consider adequately the entire range of current and proposed actions connected with the Stockpile Stewardship and Management Program and reasonable alternatives to such actions. The commentor states that because of substantial changes in the nature and purpose of DOE's atomic energy defense activities, as reflected in the design and implementation of a long-term Stockpile Stewardship and Management Program, the PEIS must consider in a comprehensive manner all related, connected, cumulative, and similar actions designed to achieve the goals of stockpile stewardship and management, including activities asserted to be ongoing, as well as those described as "next generation."

Response: *DOE believes that the PEIS discusses a full range of alternatives for implementing the Stockpile Stewardship and Management Program, and that it analyzes in detail those reasonable alternatives that are capable of achieving the goals of the Program. DOE also believes that the PEIS adequately assesses the cumulative impacts of proposed new activities and existing activities at the sites where the Stockpile Stewardship and Management Program would be implemented.*

It is a well-established principle under NEPA that the goals of a proposed action delineate the limits of the reasonable alternatives to that action. That is, an alternative which does not accomplish the agency's goals is not a reasonable alternative. Since its inception, one of the primary goals of the U.S. nuclear weapons program has been to ensure the safety, security, and reliability of the Nation's nuclear weapons stockpile. Numerous facilities have been built over the years at the three weapons laboratories (LANL, LLNL, and SNL) and at NTS to conduct various activities necessary to meet this goal.

As described in chapter 2 of the PEIS, recent developments in national security policy have placed new constraints on the types of activities available to achieve this goal. Specifically, the United States is not producing new-design nuclear weapons or conducting underground nuclear testing (see section 2.4). DOE's challenge in developing the stewardship portion of the Stockpile Stewardship and Management Program has been to determine whether, and how, to replace, modify, or augment the existing capabilities of the laboratories and NTS so that the goal of maintaining a safe, secure, and reliable stockpile can be met, even as the enduring stockpile ages and underground nuclear testing is no longer available.

DOE has examined from a programmatic perspective various approaches to achieving this goal, and has determined that only an aggressive science-based program that relies on sophisticated simulation and computational technology would allow DOE to continue to ensure the safety, security, and reliability of the stockpile. Alternate approaches which are based on principles other than an aggressive pursuit of the knowledge necessary to predict, detect, and correct problems with the stockpile cannot achieve DOE's goals. Section 3.1.2 has been expanded to examine various other alternatives or approaches (such as maintenance, remanufacturing, and a zero stockpile) that have been suggested, and to explain why each of them are incapable of ensuring the stockpile's safety, security, and reliability, and thus are not reasonable.

Using simulation and computational technology to better understand the characteristics of nuclear weapons has been an element of DOE's weapons program for many years. It was historically part of the Research, Development, and Testing Program, the predecessor of the proposed stewardship portion of the Stockpile Stewardship and Management Program. In determining, for the reasons noted above, that stewardship must be based on similar principles, DOE effectively eliminated the option of replacing the existing proven capabilities at the laboratories and NTS with a different, untried approach. Accordingly, the PEIS focuses on facilities that could modify or augment the existing capabilities in ways that would achieve DOE's goal. In summary, DOE and its predecessors have been "stewarding" the stockpile, utilizing science-based principles, since the dawn of the nuclear era. DOE believes that recent policy developments require an even more aggressive application of these principles to ensure the safety, security, and reliability of the stockpile.

DOE believes that the PEIS appropriately addresses the role of existing facilities in the stewardship program. They are described as part of the No Action alternative, in broad terms in section 3.1.4 *and in more detail in chapter 4 and appendix A. This approach to the No Action alternative (i.e., maintaining the status quo) is consistent with guidance issued by the CEQ (46 FR 180426, March 23, 1981). The environmental impacts of continuing the existing activities at each of the sites associated with the Complex are described throughout chapter 4. The cumulative effects that could result when the impacts of the proposed new facilities are added to those of existing activities are described in section 4.13. DOE believes that in this way, the PEIS adequately presents the impacts of the entire stewardship program, while focusing specifically on the proposed new facilities that require a DOE decision, and describing them in context with the existing facilities upon which DOE would continue to rely to achieve the goal of a safe, secure, and reliable stockpile.*

Because DOE intends to use the PEIS as a component in decisionmaking in 1996, only those alternatives that are ripe for decisionmaking are assessed in detail in the PEIS. Alternatives not yet reasonably foreseeable, and which have not matured so as to be ripe for decisionmaking, such as next generation facilities (see section 3.3.4), are not assessed in detail in the PEIS. Nonetheless, they are acknowledged and included to the extent practicable.

40.86 The commentor thinks that the NTS table 3.2.9-1, should be modified to include subcritical tests, references to high explosive and dynamic experiments, testing of nuclear weapons, and testing of weapon effects.

Response: *The activities described above are a part of stewardship activities, and it was not considered appropriate to enumerate a long list of specific activities in a summary table for a PEIS. The ongoing consequences of these activities are covered in the NTS Site-Wide EIS. A table detailing the specific DP No Action facilities and activities at NTS has been added to appendix section A.1.*

40.87 The commentor states that DOE should not proceed with the stockpile stewardship program until it has prepared and circulated a new Draft PEIS, considered and responded to all comments, and issued a Final PEIS and ROD.

Response: *DOE believes that the Draft PEIS was adequate. In response to public comments on the Draft PEIS, DOE has made changes as described in section 1.8 of the Final PEIS. Additionally, DOE has prepared this* Comment Response Document *which describes the comments received on the Draft PEIS and DOE's responses to those comments. In accordance with NEPA, DOE will not proceed with any of the proposals described in the Final PEIS until an ROD is announced, which can be no sooner than 30 days after the publication of the EPA Notice of Availability of the Final PEIS.*

40.88 Due to its focus away from consolidation, the commentor believes that the Stockpile Stewardship and Management Program is very different from Complex 21.

Response: *The focus of the Stockpile Stewardship and Management Program has not shifted entirely away from consolidation. In fact, although not the preferred alternative, the PEIS evaluates the potential impacts associated with consolidation of weapons production missions at the national laboratories. Based on current policy and directives concerning national security, downsizing of the Complex is the preferred strategy.*

40.89 The commentor states that nuclear weapons stockpile stewardship includes storage security, safety, inspection, and maintenance so that the operability of any stored weapons are known and satisfactory. The commentor further suggests that those who devise plans for stockpile stewardship should remain aware of the technological advances in remote drilling control that might make previously secure storage locations less so.

Response: *DOE constantly evaluates and upgrades its security program to respond to advances in technology, including remote drilling control.*

40.90 The commentor states that the Special Nuclear Materials Research and Development Laboratory proposal is still alive in the form of various proposed upgrades to LANL's Chemistry and Metallurgy Research building and that the relationship of the plutonium processing facility at TA-55 (PF-4), and the Chemistry and Metallurgy Research building is made clear in the quote in the fiscal year 1997 LANL Capital Asset Management Plan, Chemistry and Metallurgy Research Activity Data Sheet, page A-17. The commentor asserts that the Stockpile Stewardship and Management PEIS, with respect to future activities at LANL, is merely rubber stamping what the laboratory has been pursuing for a number of years.

Response: *In the late 1980s, DOE initiated a NEPA review for a proposed facility named the Special Nuclear Materials Laboratory at LANL, and issued its Notice of Intent (NOI) to prepare an EIS for the project (55 FR 1251, January 12, 1990). The new laboratory was proposed to replace the Chemistry and Metallurgy Research building. (Reconfiguration PEIS NOI, 56 FR 5594, February 11, 1991). DOE has since dropped its proposal to construct the Special Nuclear Materials Laboratory, since with a smaller nuclear material requirement the capacity of the Chemistry and Metallurgy Research building, if upgraded, remains adequate.*

The Special Nuclear Materials Laboratory was proposed at a time when there were several new weapons systems in various phases of the development and production cycle and DOE was still operating its Rocky Flats Plant. At that time, DOE and LANL believed that a greater analytical chemistry capability was needed at LANL to support those efforts. DOE notes that a great deal of the background information raised by the commentor reflects the evolution that has occurred over the past 7 years as the Nation has made significant changes in its nuclear deterrence policy. At many times since 1990, the nuclear materials support work performed at LANL has been redirected by DOE to reflect the changing national priorities.

The former special nuclear materials proposal is not embodied in the current plans to upgrade the 44-year-old Chemistry and Metallurgy Research building, as the commentor alleges. DOE has prepared an EA for the Chemistry and Metallurgy Research upgrades (DOE/EA-1101), and has issued that EA in draft for public review and comment. The commentor reviewed the draft EA and extensively commented on that document. At this time, DOE proposes to upgrade space in the Chemistry and Metallurgy Research building only as needed to support the existing set of LANL operations. Two complete wings of the Chemistry and Metallurgy Research building are in the process of being placed in a safe standdown mode, and another wing has been converted to office space only. The analytical laboratory space in the wings currently proposed to be upgraded are those wings that support LANL's existing mission in the nuclear weapons program, deep space probes, nuclear material stabilization programs (including waste management) and environmental restoration.

As noted in this PEIS, in the event that DOE should choose to implement an expanded Stockpile Stewardship and Management Program at LANL, further renovations to the Chemistry and Metallurgy Research building would be needed to support pit production or other missions analyzed in this PEIS. If LANL is selected for an expanded production role as a result of the Stockpile Stewardship and Management ROD, then some activities could be moved into the Chemistry and Metallurgy Research building from building PF-4 at TA-55 into currently unused space that would then be renovated for this purpose. The current proposal to upgrade the analytical chemistry space in the Chemistry and Metal-

lurgy Research building sufficient for existing needs would also support these future needs with no additional building renovation.

The commentor also references the LANL 1993 Strategic Plan. The sketch of a fully renovated Chemistry and Metallurgy Research building referenced in the 1993 plan included essentially all of the building. However, in 1995 DOE and LANL agreed to pursue only those upgrades needed to support the existing nuclear materials mission assignments at LANL which have resulted in changes from the 1993 plan. For example, since the 1993 plan, two complete wings of the Chemistry and Metallurgy Research building are in the process of being placed in a safe standdown mode, and another wing has been converted to office space only.

The Capital Asset Management Plan is an annual listing, for planning purposes, of potential projects that might be required to support current and future missions. DOE requires an annual Capital Asset Management Plan report from all its weapons complex sites. As such, it is not inappropriate for LANL to use this vehicle to alert DOE to facility improvements or new structures that might be required in the event that an enhanced stockpile stewardship and management mission is assigned to LANL.

It is true that DOE has determined that, under the existing stockpile stewardship and management activities that have been ongoing for many years, facilities at LANL will have to be maintained, and in some cases, repaired or upgraded, to allow LANL to continue to fulfill its existing mission. Far from being a "stunning admission" that future assignments are already being implemented, DOE believes that it is simply good management practice to keep its considerable real property—its buildings and other infrastructure—in safe, sound, and operating order.

40.91 The commentor states that the Stone and Webster document referenced in the Stockpile Stewardship and Management PEIS was not made available to the public.

Response: *The document in question was not referenced in the PEIS but was referenced in the* Analysis of Stockpile Management Alternatives *report. That Stone and Webster document is available to the public upon request.*

40.92 The commentor refers to tables 3.7.1–1 through 3.7.1–5 and asks if anyone has placed these numbers into a common reference frame. According to the commentor, the LANL direct employment numbers, utility requirements, and some of the discharge numbers do not make sense.

Response: *DOE recognized the apparent differences in these numbers between the alternatives during the development of the PEIS source data. Reviews were conducted to assure consistency and comparability by a team of technical experts with representation from each site. The numbers reflected in the PEIS reflect the consensus opinion of this intersite team. DOE has checked the figures presented in all of the tables and charts of the Draft PEIS and has made the appropriate changes as presented in the Final PEIS. The changes were not significant and did not change the environmental impacts.*

40.93 The commentor refers to Volume I, tables 3.4.4.2–2, 3.4.4.3–2, 3.4.4.4–1, 3.4.4.4–2, 3.4.5.2–2, 3.4.5.3–2, and 3.4.5.4–2 and requests that the term "surge operations" be defined in chapter 9, Glossary.

Response: *"Surge operations" is defined in section 3.1.1.1, No Action Alternative Assumptions, as a three-shift operation, 5 days a week.*

41 REGULATORY COMPLIANCE

41.01 Commentors state that DOE did not provide enough advance public outreach and notice for the public hearings. Several commentors believe many groups were underrepresented at the hearings including: minority, downstream, and rural communities; Georgia government officials; and SRS employees. The commentors suggest that DOE should make a special effort to involve these groups in public involvement and should also train the minority communities in order for them to contribute substantial comments. Commentors recommend that DOE include visiting schools and universities, and produce better advertisements to notify the public about the program. Another commentor suggests that DOE should automatically notify those who have participated in the past and national offices of groups that would be interested in the topics at stake. One commentor suggests that notices should be at least one month in advance. Other commentors state that there was plenty of notice for meetings and commended DOE for the effort in writing the document, holding the public hearings, and answering questions from the public. One commentor asks how to receive copies of the Stockpile Stewardship and Management PEIS.

Response: *The CEQ's minimum comment period requirement on draft EISs is 45 days (40 CFR 1506.10[c]). The public comment period on the Stockpile Stewardship and Management Draft PEIS was 60 days and was considered appropriate for review and comment on the document since preferred alternatives were identified in the Draft PEIS. DOE has had an extensive and ongoing public outreach program on the Complex since the Reconfiguration Program was proposed in 1990. DOE has utilized several different methods for publicizing public meetings and providing Program information to the public. In addition to advertising in the traditional media, notices and meeting information have been made available electronically and various program documents can be requested or accessed using the toll-free information line, the electronic bulletin board (Internet), and the World Wide Web DOE Home Page. A speaker's bureau has also been established with DOE officials available on a limited basis as requested to speak with interested groups concerning DP activities and issues. This can be requested through the toll-free line or the electronic bulletin board services. DOE has continued to keep the public informed during the public comment period and will continue to do so through the publication of the ROD.*

41.02 The commentor does not understand the recent decision on DAHRT, where the judge claims that it is only required that an environmental study be completed, not that it would be found to not have negative effects. Commentor believes that NEPA just delays actions; it does not change them. The commentor notes that NEPA only requires EISs and public hearings; it does not mandate that anyone choose the least destructive course of action.

Response: *The regulations for implementing NEPA state, "The NEPA process is intended to help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment" (40 CFR 1500.1[c]). Preparation of NEPA documents as the commentor points out are part of the process. "The primary purpose of an environmental impact statement is to serve as an action-forcing device to ensure that the policies and goals defined in the act are infused into the ongoing programs and actions of the Federal Government" (40 CFR 1502.1). The scheduling of proposed actions which require NEPA review includes the necessary time for complying with NEPA and in most cases does not delay the action. NEPA does not mandate that an agency select the least destructive course of action but does require that the agency "... identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment" (40 CFR 1500.2[e]). DOE must demonstrate compliance with the procedural requirements of NEPA before making final decisions on its major Federal actions.*

41.03 Commentors state that decisions to be made in the Stockpile Stewardship and Management Program were predetermined and that input from the public and local officials has little impact on the PEIS or decision process. Commentors express disappointment that DOE did not consider comments and suggestions from the scoping meetings and wonder to what extent public support at various candidate sites was considered in the PEIS process. One commentor points out that the preferred alternative is not always the final choice, while another commentor asks if there was a mechanism for citizens to get the ROD changed. A commentor states that if this is a democracy and majority rules, then the public should be allowed to vote on the PEIS. A commentor warns DOE that they must not underestimate the comments the public makes and that the public will not go away. The commentors also state that Congress and the President control DOE funding and they feel shut out of the defense spending authorization process. Specifically, one commentor notes that money has already been allocated for NIF in DOE's budget for fiscal year 1997. Commentors feel that DOE is withholding important information from the public. Another commentor states that DOE should provide the public with information that would allow them to participate in policy development, and that the "classified for national security" blanket should be removed. Another commentor perceives DOE's position on national security policy as being a policy of so much complexity that it is well beyond the grasp of the public.

Response: *DOE has not made any decisions on the Stockpile Stewardship and Management PEIS proposed actions. DOE has identified in section 3.8 of the Final PEIS the preferred alternatives for both stockpile stewardship and stockpile management. The ROD on the Stockpile Stewardship and Management Program will be issued no earlier than 30 days following the issuance of the Final PEIS. The decisions on the Stockpile Stewardship and Management Program will be identified in the ROD. The ROD, which will be published in the* Federal Register *and is a publicly available document, will also include the rationale and various factors used by DOE in making the decisions on the Stockpile Stewardship and Management Program.*

Chapter 2 of the PEIS discusses the national security policy considerations and the role they play in defining the purpose and need of the Stockpile Stewardship and Management Program. The Stockpile Stewardship and Management Program was developed in response to changing world conditions, an end to the Cold War, and the reaffirmation of the proposed CTBT. DOE participates regularly in Congressional hearings on defense issues in which the stockpile stewardship and management issues are discussed. Congress determines how funds are allocated and DOE spends monies consistent with Congressional direction. Therefore, Congress ultimately determines whether the decisions resulting from the Stockpile Stewardship and Management PEIS will be implemented.

41.04 Commentors state that DOE cannot expect the public to make decisions on DOE programs in bits and pieces.

Response: *Since the time when the original commitment was made to prepare a PEIS on reconfiguration of the Complex and a PEIS on environmental restoration and waste management, the world has changed significantly. Most importantly, the Cold War has ended, the Nation's nuclear arsenal is being reduced significantly, and a significant amount of special nuclear materials have become surplus to national security needs. These changed circumstances have had a significant effect on DOE's strategic planning, and the PEISs being prepared are responsive to these new circumstances. Because of the large scope of these programs there is no way to avoid some overlap of issues. However, the purpose and need for DOE's proposed programs and relationships between these programs are clearly described in each of the PEISs and sitewide NEPA documents. Section 1.7, Other National Environmental Policy Act Reviews, of the PEIS discusses other DOE programs and their relationship to the Stockpile Stewardship and Management Program.*

41.05 The commentors express widely differing views on the PEIS public hearing scheduling, formats, and content. Commentors state that DOE did not tell the truth to the public in the PEIS and the meetings were nothing more than public relations efforts and not worth the cost and effort to hold them; that transcripts be taken at meetings and incorporated into the PEIS so that comments could be accurately tracked and responses verified; that the modified format was better than before because some people may hesitate to approach a microphone during public hearings; that the format should be adhered to and not changed mid-meeting, and that the meetings should focus on environmental impacts, not impacts to peace. Other commentors express the view that the public meetings are a valuable forum for the public and hope that DOE will continue their use. Many commentors favor the formal hearing format rather than the workshop format. One commentor also points out that 1) public meetings are attended by and large by the same people grinding out their own agendas and obviously not interested in facts; 2) too many participants suggest they are representing the public; often this amounts to a public of 1 or 2; and 3) meetings provide a forum for many negative anti-establishment and emotional, vitriolic attacks on any good faith efforts. Commentors ask many questions including: why didn't DOE have a meeting in Oakland, in addition to LLNL, for similar reasons Santa Fe hosted a public meeting; does NEPA allow DOE to lie in the PEIS; is DOE required to respond to comments from the public; why the comments collected do not go through an impartial agency rather than to the reading rooms; and why aren't there more means available for the public to express their opinions to DOE, rather than just NEPA. Another commentor states that the charts handed out at the meetings should be clearly labeled.

Response: *The public hearings on the Draft PEIS were conducted using a modified traditional hearing format. The change in format was in response to past public comments on the interactive public hearing format used for the Tritium Supply and Recycling PEIS and more recent requests by interested parties near several DOE sites. The modified format included a formal statement period in addition to the interactive session, and the recording of a verbatim transcript of the hearing in addition to the notation of comments by designated notetakers. Efforts were made by DOE to accommodate the public to as large an extent as was feasible. For this reason, modifications were also made between sites as necessary to fulfill special needs or requests from the public, elected officials, and site representatives. The additional public hearing was held in Santa Fe because of substantial public requests and because the city is located in proximity to two of the proposed alternative sites (LANL and SNL) which could potentially receive both stockpile stewardship and stockpile management missions. The principal area affected and public interest area for LLNL potential stewardship missions was the city of Livermore; therefore, only one meeting was held at Livermore.*

41.06 Commentors state that the PEIS process was procedurally defective. One commentor states that there are perceived advantages which go to the locations where the PEIS authorship (Albuquerque Area Office) takes place. Another commentor believes that the PEIS pitted LANL and ORR against each other. In addition, the commentor suggests that DOE obtain competent independent evaluations, not location centered, but more broadly centered, using the expertise of people attending the meeting and elsewhere in the Nation to add more credibility to the entire PEIS process.

Response: *The analysis for the PEIS is conducted in accordance with CEQ regulations (40 CFR 1500-1508), and DOE's NEPA regulations (10 CFR 1021) and procedures. The DOE Albuquerque Operations Office's lead in preparing the support stockpile management alternatives reports with oversight of DOE Headquarters represented the best coordination point between stewardship and management elements of the Program. All proposed management alternatives were developed in cooperation with all DOE weapons complex sites. In addition, all supporting data and peer review were provided by each affected site and underwent a substantial comment and revision process. Technical experts at each site with relevant experience in each of the proposed mission areas at both the management and working level provided input and review. The* *process used in developing the management alternatives and the screening process for determining the preferred alternatives can be found in the* Analysis of Stockpile Management Alternatives *report and the* Stockpile Management Preferred Alternatives Report *which are available in the DOE Public Reading Rooms near each site.*

41.07 A commentor suggests that a civilian review board be set up to oversight DOE. Other commentors point out that the Defense Facility Safety Review Board performs that responsibility now and that it has been recommended that EPA and OSHA be added to DOE facility oversight. One commentor states that citizen advisory boards are not accountable to the local citizens and do not speak for the citizens with respect to safety concerns.

Response: *Section 4.14 describes the regulations and requirements under which all DOE sites conduct their operations during the normal course of their work activities. This section also describes the applicable DOE orders requiring the reviews performed by the sites of all planned and existing construction and operation for potential accidents and the assessment of the associated human health and environmental consequences of an accident. The sites associated with the Stockpile Stewardship and Management Program would comply with these DOE orders and update the appropriate safety documentation before authorization of construction or start of operations.*

On January 25, 1995, DOE created the Advisory Committee on External Regulation of Department of Energy Nuclear Safety and charged it with providing advice, information, and recommendations on whether and how new and existing DOE facilities and operations, except those covered under Executive Order 12344, might be externally regulated to ensure nuclear safety. The Advisory Committee has made the following recommendations concerning the structure of the external regulation: (1) an existing agency–either the NRC or a restructured Defense Nuclear Facilities Safety Board–regulate facility safety at all DOE nuclear facilities under the Atomic Energy Act; *(2) OSHA regulate all protection of workers at DOE nuclear facilities under the* Occupational Safety and Health Act, *unless regulation of worker risks at a given facility could significantly interfere with maintaining facility safety in which case all worker protection would be regulated under the* Atomic Energy Act *of 1954; (3) EPA continue to regulate environmental protection matters for all DOE nuclear facilities and sites under the environmental statutes; and (4) states with programs authorized by the EPA, OSHA, or the regulator of facility safety acquire or continue to have roles in regulation of environmental protection, facility safety, and worker protection comparable to those they now exercise in the private sector. The committee believes these recommendations will strengthen, streamline, and simplify the regulation of safety at DOE nuclear facilities. The Secretary of Energy has convened a DOE working group to review the recommendations and determine how to implement them. A report is due to the Secretary by the Fall of 1996. DOE, the Administration, and Congress will be involved in determining external regulations for DOE facilities.*

Advisory boards act as liaisons between the public and Federal, state, and local governments and agencies. The boards provide an important forum for stakeholders and agencies to explore complex problems and generally provide independent policy and technical advice to affected parties.

41.08 The commentors believe that the threat of using nuclear weapons and the environmental impacts that result from using the weapons are impacts that should be analyzed in the PEIS. According to a commentor, the nuclear arsenal is a temptation to those in power. Another commentor adds that stockpile stewardship and management does not cover the global consequences an accident like Chernobyl could cause. One commentor notes that the PEIS should state that the stockpile sizes discussed could obliterate the planet. The commentor believes that LANL is a bomb designer's dream come true and that the United States will use these weapons if it wants to. The commentor believes this because of a quote from DOD attorney John McNeil stating, "Nuclear weapons can be targeted in ways that either increase or decrease resulting incidental civilian injury and collateral damage, and their use may be lawful or not depending upon the enemy's conduct." The commentor does not agree with these views, especially the idea of incidental civilian injuries, considering the fact that there were 210,000 dead within months of the bombing of Hiroshima and Nagasaki, and 300,000 survivors suffering slow deaths and painful lives over the next 50 years. Commentors state that the American people cannot trust that our nuclear weapons, if they exist, will not be used on civilians again. The commentors cite the dropping of the atomic bomb on Japanese cities, stating that it could have been demonstrated in a nonpopulated area to show U.S. capability. Commentors feel that there is no way to be aware of all the possible effects of nuclear weapons at this time. According to commentors technically there is too much that is unknown, and the world needs to obtain a better understanding of the impacts of nuclear materials. A commentor asks where in the PEIS the impacts to the present agricultural economy which has built and sustained the Texas Panhandle were; why were the risks to this economic stronghold not assessed; what will happen when we no longer produce food for people, where is our priority; are bombs more important than food. The commentor states that those in agriculture strive to produce quality, wholesome food for the world population—one farmer feeds in excess of 131 people, yet the industry across the road from us builds bombs to annihilate people. The commentor asks where is our sense of morality and respect for life. Food is the most important commodity we produce—it must be protected.

Response: *The use of nuclear weapons and the resulting environmental impacts are beyond the scope of this PEIS.*

41.09 Commentors are concerned with the cost of the PEIS and would like DOE to spend taxpayer money more frugally. Another commentor asks how much money has been spent on the PEIS.

Response: *NEPA requires DOE to assure that major Federal actions are taken only after due consideration of their environmental impacts. Preparing a PEIS in compliance with NEPA is a complex and costly task for a program as complex as Stockpile Stewardship and Management. The cost to complete the PEIS was approximately $10 million, which is commensurate with the complexity of the issues analyzed.*

41.10 Commentors feel that issuing the Stockpile Stewardship and Management Draft PEIS, and the Storage and Disposition Draft PEIS, the Pantex Site-Wide Draft EIS and NTS Site-Wide EISs at the same time prohibited them from thoroughly and responsibly reviewing and commenting on the proposed programs and actions. The commentors state that DOE has placed an unnecessary and unreasonable burden on the affected communities and the public, and request DOE provide assistance to have an independent evaluation performed. Commentors state that by releasing all these documents, DOE was restricting public comment and placing more emphasis on proposal preparation than proposal analysis and review. Another commentor sees the combined meetings as a step forward and feels that DOE is recognizing that there are some overlaps among programs.

Response: *The CEQ's minimum comment period requirement on draft EISs is 45 days (40 CFR 1506.10[c]). The public comment period on the Stockpile Stewardship and Management Draft PEIS was 60 days and was considered appropriate for review and comment on the document. The public comment period on the Storage and Disposition Draft PEIS, which did not identify any preferred alternatives for storage and disposition, was extended from 60 to 90 days to allow the public to fully review and comment on the proposed alternatives. Each of the other documents, as with all DOE NEPA documents, has a public comment period of at least 45 days. Although DOE coordinates all programs and the preparation of NEPA documents, the sheer number of documents being prepared by DOE sometimes results in the release of several documents at the same time. Every effort is made to provide adequate public review of the documents in these cases, balanced with DOE's needs and mission.*

The PEIS and site-wide EISs prepared by DOE comply with the letter and spirit of NEPA. Each document has a concise summary of the most important information found in the entire document. Moreover, the PEISs are organized so that a focused review of any individual site can be readily accomplished. For example, if a member of the public (or a local community) is most interested in just one site (e.g., ORR), each PEIS covers the potential environmental impacts at that site in about 100 pages. Lastly, the main body of each environmental document is written to be understood by the general public, with more detailed, supporting information in appendixes. As a final point, DOE provides a significant amount of funding to states to oversee DOE's operations at the DOE sites as they relate to the health and safety of the public in surrounding communities. We do not believe it is appropriate to provide separate funding to local governments and organizations for document reviews of this kind when we are providing large block funding to the state for such reviews and oversight.

41.11 The commentor feels the Stockpile Stewardship and Management PEIS represents a sequence of site-specific reviews which is not an adequate EIS.

Response: *The format of the PEIS (i.e., discussion of the environmental impacts of the proposed Stockpile Stewardship and Management Program alternatives by site) was selected as the most efficient and user friendly way to communicate the complex issues covered in the document. It allows members of the public who may only be concerned about potential impacts at the DOE site nearest them to focus their review. The use of the format was for the convenience of the public and does not make the PEIS inadequate.*

41.12 The commentor feels the NEPA process requires by law a range of reasonable alternatives so the public may evaluate an evenhanded analysis which includes many analyzed alternatives and their ramifications on the environment and international policy. Several commentors feel that DOE has unreasonably constrained the alternatives it analyzes in order to support the one alternative that is preferred. Another commentor states that there is no discussion of the current proposed alternatives' relationship to the anticipated next generation stockpile stewardship facilities.

Response: *Chapter 2 of the PEIS discusses the purpose, need, proposed action, and the reasonable alternatives for the Stockpile Stewardship and Management Program. The range of reasonable alternatives was developed based on two different perspectives discussed in detail in this chapter. The discussion of the purpose and need describes the constraints placed upon DOE in meeting the Program objectives and the formulation of reasonable alternatives addressed in the PEIS. One perspective (section 2.2) is from the top level of national security policies for nuclear deterrence, arms control, and nonproliferation. The other perspective (section 2.3) focuses on the relevant technical efforts to maintain a safe and reliable U.S. nuclear weapons stockpile. The alternatives considered and the reasons they were eliminated from detailed study are discussed in section 3.1.2. Also see the response to comment summary 40.85 for additional discussion of the range of reasonable alternatives considered.*

41.13 The commentor feels statements such as "none," "minimal," "within regulatory statutes and guidelines," "manageable," and "amenable" are not credible when describing environmental impacts.

Response: *The terms that the commentor refers to were used by DOE at the public hearings to summarize information presented in the PEIS. Their use was prefaced with the statement that these were DOE's subjective opinions of the impacts described in the PEIS. They were used in an effort to simplify complex information. Others may disagree with these subjective terms. The potential impacts identified in the PEIS are described using some of the terms identified by the commentor as appropriate based on the detail of the analysis. Where data was sufficient to quantify the potential* *effects of the proposed action they are provided. When regulations, guidelines, or standards were available for comparison purposes they are shown in tables or text with appropriate discussion. In some cases the data and level of analysis was insufficient to quantify effects and the description of impacts are described qualitatively. When qualitative analysis is presented, the discussion necessarily uses terms similar to those noted by the commentor. The discussion supporting both quantitative and qualitative analysis is appropriate to aid the reader in interpreting the potential impacts of the proposed action.*

41.14 The commentors request an extension of the public comment period on the Draft PEIS and ask if there will be another public comment period after the Final PEIS.

Response: *DOE did not extend the comment period beyond May 7, 1996, although late comments were considered to the extent possible. Members of the public may submit comments on the Final PEIS, including the preferred alternatives. A decision on the Stockpile Stewardship and Management Program will not be made until at least 30 days after the EPA Notice of Availability of the Final PEIS appears in the* Federal Register.

41.15 The commentor believes that NEPA mandates an analysis of economic and impacts on future generations. The commentor also believes that costs, timing, and consumption of nonrenewable resources should together drive the PEIS. The commentor wants a complete environmental impact assessment which includes the impact on future generations. The commentor points out that the words "future generations" are not stated in the document. The commentor questions why these items are missing.

Response: *Chapter 4 of the PEIS describes the affected environment and the potential environmental impacts, including the socioeconomic impacts, expected from the proposed Stockpile Stewardship and Management Program. Nonenvironmental issues concerning cost, schedule, and technical risk are presented and analyzed in the* Analysis of Stockpile Management Alternatives *report and the* Stockpile Management Preferred Alternatives Report *which are available in the DOE Public Reading Rooms near each site. The consumption of nonrenewable resources for each of the alternatives is discussed in section 4.17. By completing this PEIS, DOE is meeting the requirements of section 101(b)(1) of NEPA (i.e., "it is the continuing responsibility of the Federal Government to use all practicable means, consistent with other essential considerations of national policy, to improve and coordinate Federal plans, functions, programs, and resources to the end that the Nation may fulfill the responsibilities of each generation as trustee of the environment for succeeding generations...").*

41.16 One commentor states that a policy document is needed as the "mother" of all of these NEPA processes. The commentor states that such a document would provide the bridge between the PEISs (and other NEPA processes as needed) and explain their relationship.

Response: *DOE is a diverse and highly complex department with many varied activities. At any given time a number of actions are being planned, constructed, and implemented. Accordingly, there are a number of NEPA actions being conducted simultaneously. In order to explain how the actions proposed by the Stockpile Stewardship and Management PEIS fit into the context of actions proposed by other NEPA documents, section 1.7 was constructed. This section provides the reader with a description of the other major NEPA actions presently being conducted by DOE and describes their relationship to the Stockpile Stewardship and Management PEIS.*

DP has an office solely devoted to NEPA coordination. This office reviews all NEPA actions to assure consistency of assumptions, data, and factual information. Besides this internal DP consistency control, all major NEPA actions are reviewed by the Office of Environment, Safety, and Health, the Office of the General Counsel, and other appropriate departmental elements for consistency with

DOE NEPA requirements, DOE policy, and other DOE actions. Such a review and concurrence process is dynamic and constantly reflects current policy and other program considerations.

41.17 The commentor states that the Draft PEIS has not considered the full range of proposed and potential stockpile stewardship alternatives that is required by NEPA. The commentor states that DOE has characterized a number of potential stockpile stewardship facilities as not "ripe" for NEPA review because they have not reached the stage of development and definition that is necessary for evaluation and decisionmaking (Draft PEIS, section 1.2). The commentor states that next generation facilities are included in budget planning and, thus, should be proposed actions in the PEIS. The commentor also believes the ability to perform detailed (i.e., site-specific) environmental impact analysis is not the relevant standard for inclusion of a project in a PEIS. Commentor contends that the exclusion of the Advanced Hydrotest Facility (AHF), HEPPF, ARS (X-1), and Jupiter facility from the analysis of proposed actions is not supported by the facts, and is a violation of NEPA.

Response: *In the Notice of Intent for the Stockpile Stewardship and Management PEIS (60 FR 31291, June 14, 1995), DOE expressed its intent to propose six new facilities for stockpile stewardship: (1) CFF; (2) Atlas Facility; (3) NIF; (4) HEPPF; (5) AHF; and (6) Jupiter Facility. While DOE recognized that these six facilities were at different stages of research, development, and definition, the intent was to make the PEIS as forward-looking and complete as possible, with regard to the future stockpile stewardship program.*

Following scoping, when preparation of the PEIS actually began, DOE realized that three of these facilities (HEPPF, AHF, and Jupiter) were so minimally defined that it would have been premature to "propose" them, in the NEPA-sense, for the purpose of decisionmaking, since more R&D was needed. Therefore, in section 3.3.3 of the Implementation Plan for the Stockpile Stewardship and Management PEIS (DOE/EIS-0236IP), DOE explained that these three facilities were "not currently defined well enough to be considered as proposed stockpile stewardship alternatives."

Events associated with R&D of the Jupiter facility illustrate the point that the next generation facilities are not currently defined well enough to be considered as proposed stockpile stewardship alternatives. The Jupiter Facility would be a significant technological advancement in the pulsed-power x-ray source capability. During the time the Implementation Plan was being prepared, scientists at SNL realized that, although the concept of Jupiter was defined (a 32 MJ pulsed-power x-ray source), how to achieve that concept was unclear. In fact, SNL scientists concluded that Jupiter represented so large a technological advancement that they developed the concept of the Advanced Radiation Source (ARS) (X-1). The ARS (X-1), which is envisioned as an interim step to an eventual Jupiter facility, would be a four-fold increase over current pulsed-power x-ray sources, yet would only be one-fourth the power envisioned for Jupiter. The performance requirements for the ARS (X-1) have not been fully established; the type of technology to provide the basis for the facility has not been determined, nor have concepts for the resultant physical plant. Consequently, impacts from facility construction as well as from facility operation can only be theorized. Thus, not even ARS (X-1) has reached the stage where the concept can be defined well enough for decisionmaking purposes. Jupiter, which is dependent on ARS (X-1) development, is even further from definition.

However, even though the next generation stockpile stewardship facilities are not defined well enough to be "proposals," they are programmatically assessed in the PEIS to the extent practicable. As DOE stated in section 3.3.3 of the Implementation Plan, "these next generation facilities can be described in general terms such that a consideration of cumulative impacts that might be related to the ultimate science-based stockpile stewardship program can be qualitatively assessed." Section 4.11 of the PEIS describes what the impacts of these three next-generation facilities might be, to the extent they can be forecast at this time. The purpose of section 4.11 is to provide an *assessment of the potential cumulative environmental impacts associated with the ultimate science-based stockpile stewardship program.*

For each next generation facility, data were developed using a surrogate facility. For example, for AHF, which would be a facility for conducting hydrodynamic tests and dynamic experiments, the tests and experiments themselves can be anticipated to be similar to such activities as analyzed at DARHT; therefore, the DARHT impacts were used for reference. For HEPPF, surrogate data from BEEF, an HE test facility at NTS, were utilized. For the ARS (X-1) and Jupiter, surrogate data were developed from the existing Saturn and Particle Beam Fusion Accelerator (PBFA) facilities at SNL. Section 4.11 has been expanded in the Final PEIS to describe more fully the foreseeable impacts of the next generation facilities.

Regarding the comments that next generation facilities are included in budget planning documents and thus, should be analyzed as proposed actions in the PEIS, the budget process does not address the issue of whether, for NEPA purposes, a project has been proposed or not. Because of the time requirements for Congressional funding, projects are often submitted for line item funds before NEPA completion. Some money needs to be spent during R&D in order to define facilities so that they can then be proposed and evaluated; it is therefore consistent with NEPA to spend money to develop this information. In the case of sophisticated scientific R&D like that for enhanced experimental capability for weapon physics, these expenditures often can be substantial, just for the preliminary stages of exploring theories and proving concepts. This process often involves performing complex experiments using existing facilities that have high operating costs. This experimentation occurs well in advance of the development of the basic information needed for eventual conceptual facility design.

DOE agrees that the ability to perform detailed (i.e., site-specific) environmental impact analysis is not the relevant standard for whether a facility should be included in a programmatic EIS. This is why DOE has included the next generation facilities in the PEIS and has developed a programmatic-level evaluation of potential cumulative program impacts. However, in order for a facility to be a "proposal" in the NEPA sense, the facility must be ripe for decisionmaking. This in turn requires more than just speculative definitions of facility designs.

The following is a more detailed discussion of why each of the next generation stockpile stewardship facilities is not included as a proposed action in the PEIS:

***AHF**: DOE has modified the Final PEIS (section 3.1.2) to include additional clarifying information on the status of research toward a definition of a future AHF. The commentor quotes extracts from DOE's fiscal year 1997 budget request, among other items, and concludes that DOE's plans for an AHF are sufficiently mature to warrant full consideration and NEPA analysis in the Stockpile Stewardship and Management PEIS. R&D activities relevant (and indeed, necessary) to DOE's ability to determine the feasibility and form of a future AHF are being pursued within the ongoing DOE R&D program. Such radiographic technology R&D has been a historical part of weapons R&D activities. At this point, the feasibility and definition of an AHF is still insufficiently determined for DOE to propose such a facility or adequately analyze it for the purposes of NEPA. For example, performance requirements for such a facility have not been fully established; the type of technology to provide the basis for the facility has not been determined and concepts for the resultant physical plant vary significantly; and therefore impacts from facility construction and operation remain speculative. DOE's present judgment is that significant R&D activity, spanning years, will be necessary.*

Early in its planning for the Stockpile Stewardship and Management PEIS, DOE intended to propose that an AHF, representing the next generation of hydrotest capability beyond DARHT, be included within the scope of the PEIS. Conceptually, AHF would improve on the capabilities of DARHT and apply data and information gained from DAHRT. AHF thus could never be an alternative to DAHRT, because DAHRT is an essential precursor to AHF. The intent to propose AHF was to make the document as forward-looking as possible with regard to the future of science-based stewardship. Upon further reflection, however, DOE decided not to propose AHF in the PEIS because AHF's parameters were so minimally defined that a meaningful analysis of its environmental impacts would have been impossible to perform.

Possible technology approaches to an AHF have been discussed within the DOE technical community. These technologies still require development and validation. The specifications and technical requirements for an AHF (that is, determination of what capabilities should be required of an AHF for assessment of stockpile aging and related effects, beyond those of DARHT) are also still being defined. This was noted in the DARHT Final EIS (Volume I, page 3-45) and in the Stockpile Stewardship and Management Draft PEIS. The items excerpted by commentors from the DOE fiscal year 1997 budget request reflect a portion of the research activities both ongoing and anticipated, that are necessary to evaluate and develop these technologies, understand requirements, and provide a decision basis for a possible future AHF proposal by DOE.

Three basic technology approaches are currently being examined. These include linear induction accelerators of a type similar to those in the baseline DARHT design, an inductive-adder pulsed-power technology based on technology now in use for other purposes at SNL and elsewhere, and high-energy proton accelerators similar to technology in use at Los Alamos Neutron Science Center and elsewhere in the United States and internationally. The first two represent different approaches to accelerating a high-current burst of electrons, which produce x rays when stopped in a dense target. The x rays actually produce the flash radiograph. This is the approach used in the existing PHERMEX and FXR facilities and to be used in DARHT when completed. The third approach would use bursts of very energetic (approximately 20 billion electron volt) protons, magnetic lenses, and particle detectors to produce the radiographic image. The impacts associated with construction and operation of facilities based on these different technologies cannot be fully defined at this time (because of technical uncertainties) and could be significantly different depending on the technology approach. For example, acreage required could be comparable to or somewhat larger than the 3.6 ha (9 acres) of land resources required for DARHT, but use of proton radiography could require an accelerator comparable in scale to the kilometer-long Los Alamos Neutron Science Center or to other large accelerators operated by DOE. Therefore, the size of the footprint, as well as other factors which to some degree govern environmental impacts, is speculative at this time.

Each of these technology approaches not only has some technical promise, but also has technical issues to be resolved or demonstrated. Therefore, DOE is examining approaches to perform the necessary R&D. As commentors have noted, DOE has proposed increases in future operating budgets to Congress to better address these research issues. DOE does not believe that these individual details of its ongoing and evolving R&D activities, within the historical and ongoing mission of the DOE's weapons R&D responsibilities, in themselves constitute a distinct "proposed action" appropriate for NEPA analysis and alternatives in this PEIS.

<u>HEPPF</u>: DOE has modified the Final PEIS to include additional clarifying information on HEPPF, and its relationship to ongoing pulsed power research and the Atlas Facility. A discussion of the relationship of HE pulsed power with Atlas and of the complementary nature of laser and pulsed-power experiments is also contained in the Atlas site-specific analysis in appendix K, which has also been revised in the Final PEIS to incorporate updated information.

A new HEPPF would be a direct outgrowth of the longstanding Athena program; however, this activity is no longer known by that name. (The name Athena was a Los Alamos identifier only, and such R&D has also been performed under other designations. It is now pursued within the high energy density physics element of Los Alamos' Stockpile Stewardship Program activities.) Since the 1960s, DOE has pursued weapon research applications of electrical pulsed power on the microsecond time scale. This R&D program has involved HE pulsed-power generators of various types, which have been exploded at existing HE firing sites in the Complex, as well as fixed-facility capacitor banks such as Pegasus II. Some HE firing sites (e.g., TA-39 at Los Alamos) have been specially configured to support these pulsed-power experiments; a principal firing site at TA-39 has within its bunker a capacitor bank to provide the seed electrical current for the HE pulsed-power generators. Impacts of these ongoing R&D activities are included in the No Action alternative in the PEIS.

Commentors may be confusing evolutionary development beyond a particular design of HE pulsed-power generator (Procyon), with a possible follow-on HE firing site, configured specially for pulsed-power experiments, beyond the existing capabilities in the Complex. It is the latter that would be the prospective purpose of HEPPF. The Final PEIS has been modified in order to clarify this distinction. An HE pulsed-power generator, such as Procyon, is basically an assembly of HE and metal (e.g., copper) and other components which is explosively and destructively detonated a single time, resulting in a brief pulse of high electrical current being delivered to the experimental configuration. High magnetic fields result from the high current pulse and may either be directly used to study materials phenomena or may be used to produce high pressures and implosions of (typically) cylindrical shells. (See the discussion in the Atlas site-specific analysis, appendix sections K.1 and K.2.1.) Procyon is therefore the name of a type of explosive generator, and is not a facility. A typical Procyon generator with the experimental region attached is about 3 m (10 ft) long. In principle such an experiment could be performed at any appropriately equipped explosive firing location, within applicable environmental limits. DOE believes that the continued evolutionary R&D on explosive generators and their use in pulsed-power experiments, within the historical and ongoing mission of DOE's weapons R&D responsibilities, do not in themselves constitute a distinct "proposed action" appropriate for NEPA analysis and alternatives in this PEIS. Rather, such R&D activities are needed to develop the required information so that DOE can formulate a proposal.

As distinct from an explosive generator, a firing site is a facility typically consisting of a firing location, associated hardened bunkers, and related equipment, in an area from which personnel can be excluded. Many different HE experiments (including those in which pulsed electrical power is produced) can be performed at a HE firing site, as long as the explosive blast, and other experiment parameters, do not exceed the capabilities of the firing site. Currently most of the largest-scale HE pulsed-power experiments in the United States, whether for technology development, weapons stockpile stewardship, or for unclassified scientific collaborations (conducted separately) including those with Russian scientists, are conducted at a Los Alamos pulsed-power firing point at TA-39. As noted in the PEIS, section 3.3.4.2, this experimental capability has a limit of approximately 500 kg (1,100 lbs) of HE. Therefore a potential need for a new HEPPF was postulated to support generators using much larger explosive charges, which though not yet demonstrated could produce higher pressures in larger masses and volumes than can be accessed at the LANL site. Existing laboratory sites cannot readily support experiments with much larger charges, as noted in the section 3.3.4.2.

Since the idea of an HEPPF was first conceived some years ago, BEEF was separately developed as a firing site at the NTS, based on refurbished bunkers originally developed for atmospheric nuclear tests. Although not specially configured for HE pulsed power like the principal LANL firing *site, in its current configuration BEEF is suitable for a variety of HE experiments including many pulsed-power technology experiments, and experiments related to such purposes have been part of recent qualification tests. Therefore, it may be possible to make modifications to BEEF when the need for and definition of such modifications is clear, to satisfy any future need for a new HEPPF. (As at other firing sites many pulsed-power experiments could be performed at BEEF without capital modifications.) At this time, the definition of such modifications is insufficient to make a full analysis meaningful; however, section 4.11 describes these modifications and impacts to the extent that they can currently be foreseen. Analysis of the impacts of operating the existing BEEF facility for explosive experiments, including experiments that involve pulsed-power technology, is incorporated in the NTS Site-Wide EIS.*

Commentors note correctly that both HE pulsed power and R&D associated with capacitor banks, such as Pegasus II or the proposed Atlas, are activities within the Stockpile Stewardship and Management Program. For some years DOE has pursued both capacitor bank facilities and HE experiments in pulsed power, since HE generators offered a means to explore higher energy (higher current) frontiers without major capital investment, albeit at a relatively low data rate, and capacitor banks offered the advantages of repeatable (and indoors) experimental facilities with higher data rates, for broad experimental use. Data from HE experiments, for example, have helped provide validation of technical issues used in the Atlas design concept. Thus both kinds of activities are sensible aspects of DOE's overall R&D program. Appendix K considers reliance on explosive-driven pulsed-power experiments and discusses why this is not a reasonable alternative to Atlas.

While it is true that if pursued a HEPPF could be available sooner and with less expense than NIF, microsecond pulsed power is complementary, rather than a reasonable alternative, to a laser such as NIF. The technologies provide different physical regimes and experimental scales, both necessary to address stockpile stewardship issues. Relative to this specific comment, neither high explosive nor capacitor-bank microsecond pulsed power is able to provide as high a temperature or pressure as would be provided by NIF. Discussion of this point has been expanded in the Final PEIS in section 3.3 and is also provided in appendix K.

ARS (X-1) and Jupiter: ARS (X-1) and Jupiter have been presented in the PEIS as next generation facilities because extensive R&D of this technology in the existing Saturn and PBFA facilities will be required before DOE would be in a position to propose either of these facilities for NEPA evaluation and decisionmaking. To the extent that specifics of these yet-to-be designed facilities are known, the ARS and the Jupiter facilities would both have an advanced pulsed-power x-ray source to provide enhanced experimental capabilities in the areas of weapons physics, inertial confinement fusion, and weapons effects.

The ARS (X-1) facility would utilize a pulsed-power accelerator capable of producing more than 8 MJ of x-ray energy to study the physics of radiation flow, opacities, high energy densities, the effects of radiation on weapons, and potentially inertial confinement fusion relevant physics. Conceptually, the Jupiter would generate about 32 MJ of x-ray energy, compared to the existing PBFA which is expected to generate 2 MJ of x-ray energy. Since both of these facilities would expand on a research and technology infrastructure already existing at SNL, it is expected that they would also be located at SNL.

The concept for ARS (X-1) grew out of the initial vision at SNL to develop an advanced pulsed-power facility that could provide the source environments for weapon effects testing after the loss of underground nuclear testing. That initial capability was called Jupiter; a 60 MA driver generating ~18 MJ of x-ray energy. In assessing the feasibility of successfully building Jupiter, SNL came *to the conclusion that the 36 times increase in x-ray output energy, in going from the existing facility Saturn to Jupiter, represented too high a technical risk. A more logical step is the ARS (X-1), which will allow an increase (by a factor of two) in current to 40 MA and a factor of four in x-ray energy output to 8 MJ over that of the PBFA. Data to support eventual development of the ARS (X-1) will be obtained from research associated with the existing PBFA. This R&D will establish the necessary level-of-confidence to proceed with ARS (X-1). The step to Jupiter, given validation of scaling laws on the ARS (X-1), would follow a similar logical track and would be projected to increase the current by a factor of two (to ~80 MA) and increase x-ray energy output by a factor of four (to ~32 MJ).*

The entire development process may be viewed as risk management. It is not prudent to take too large a technical jump at great risk if it is possible to manage the risk and still achieve significant technical progress. Recent breakthroughs in pulsed power (generating record power and hohlraum temperatures) demonstrated on existing facilities at SNL, may be extrapolated to future facilities such as the ARS (X-1) and Jupiter to predict sources that could provide significant new capabilities to support the stockpile stewardship program. However, the performance requirements for these future facilities have not been fully established; the type of technology to provide the basis for the facility has not been determined, nor have concepts for the resultant physical plant. Consequently, impacts from facility construction as well as from facility operation can only be theorized. Thus, neither the ARS (X-1) nor the Jupiter have reached the stage where the concepts can be defined well enough for decisionmaking purposes.

41.18 Several commentors express disagreement with the justification for the No Action alternative as an unreasonable alternative and also state that the alternative is both misnamed and not clearly explained in the Draft PEIS. Commentors indicate that the No Action alternative effectively embraces most of the DOE's actual proposed Stockpile Stewardship and Management Program, when one looks at new construction planned or underway. The commentors state that as a result of its fragmented and segmented approach, the discussion of the entire Stockpile Stewardship Program has been unreasonably narrowed down to a discussion of three specific projects. The commentors contend that the following list of publicly acknowledged major Stockpile Stewardship and Management Program components were not adequately discussed, or in many cases mentioned in the current Draft PEIS: DARHT, Processing and Environmental Technology Laboratory, Chemistry and Metallurgy Research building, Accelerated Strategic Computing Initiative, Los Alamos Neutron Science Center, Weapons Experimental Tritium Facility, Los Alamos Critical Experiments Facility, Lyner Facility, BEEF, and the contained firing facility at PHERMEX. Another commentor adds that DOE is already building stockpile management facilities like the Chemistry and Metallurgy Research building upgrades at LANL and the Processing and Environmental Technology Laboratory at SNL before any public involvement. Another commentor indicates that the Enhanced Surveillance Program was not addressed in the Draft PEIS.

Response: *Given the national security policy decision by the President to enter into a zero-yield CTBT, our Nation will no longer have a proof-positive means to ensure the continued safety and reliability of the nuclear weapons stockpile. The three specific projects (NIF, Atlas, and CFF) described in the PEIS as enhanced experimental capabilities, represent the proposed action for the stockpile stewardship portion of the Program. Each of these projects would provide new capabilities in distinct weapons physics regimes. They would be used to assist in the assessment and certification that the nuclear weapons stockpile is safe and reliable in the absence of underground nuclear testing. Also see the response to comment summary 40.85.*

In accordance with NEPA, the PEIS also assesses the No Action alternative. The No Action alternative is described in broad terms in section 3.1.4 of the PEIS, and in more detail in chapter 4 and *appendix A of the PEIS. Under No Action, DOE would not take the actions proposed in the PEIS, but would continue with existing actions. For stockpile stewardship, this means continuing the existing actions at LANL, LLNL, SNL, and NTS related to stockpile stewardship. A table has been added to the site descriptions in appendix A of the Final PEIS to identify and describe the major stockpile stewardship facilities and activities. The relationship between the facilities described by the commentor and the Stockpile Stewardship and Management Program is as follows:*

<u>DARHT</u>: Impacts of construction and operation are covered in its own EIS, discussed in section 1.6.2, and DARHT has been judged to be an appropriate interim action by the U.S. District Court for the District of New Mexico (No. 94-1306-m, April 16, 1996). The Stockpile Stewardship and Management PEIS considers DARHT in the No Action alternative in sections 3.1.4 and 3.3.1.1. See the response to comment summary 41.20 for additional discussion on DARHT.

<u>Processing and Environmental Technology Laboratory:</u> This project would construct a new building at SNL to consolidate the activities from three existing buildings that are old and inefficient. No change in mission or capabilities would result from the construction of the Processing and Environmental Technology Laboratory. The EA was completed in November 1995, and a Finding of No Significant Impact (FONSI) was issued in December 1995. Construction and operation of this facility are included in the Stockpile Stewardship and Management PEIS No Action alternative.

<u>Chemistry and Metallurgy Research Building Upgrades Project:</u> Three phases of upgrades have been identified: (1) Phase I–upgrades to fix ES&H deficiencies; required even if the life of Chemistry and Metallurgy Research building is not extended; upgrades were categorically excluded; (2) Phase II–upgrades to extend the life of the Chemistry and Metallurgy Research building for an additional 20 to 30 years to support current R&D mission; an EA is in progress to determine whether a FONSI is appropriate or whether the project should be included in the LANL Site-Wide EIS; (3) Phase III–upgrades not required to support current missions, but rather to support potential future missions; not included in the Chemistry and Metallurgy Research building EA, but is assessed in the Stockpile Stewardship and Management PEIS as appropriate for alternatives that establish new missions at LANL. The Phase III upgrade is also expected to be included in the LANL Site-Wide EIS if the ROD for this PEIS expands LANL missions that require the Chemistry and Metallurgy Research building Phase III upgrades. See the response to comment summary 40.90 for additional discussion on the Chemistry and Metallurgy Research building.

<u>Accelerated Strategic Computing Initiative:</u> Computer systems to be procured to support the science-based stockpile stewardship program. The NOI for the Stockpile Stewardship and Management PEIS discussed computational capabilities as follows: "To handle simulations of weapon performance and assessments of weapons safety without underground nuclear testing, improved computational capabilities are needed. However, because there are not expected to be any environmental impacts from this activity, the PEIS is not expected to provide any assessment of these capabilities." No comments were received on this issue during scoping, and because there are no environmental impacts from procuring and operating computers, they are not assessed in the PEIS. See the response to comment summary 41.19 for additional discussion on the Accelerated Strategic Computing Initiative.

<u>Los Alamos Neutron Science Center:</u> In October 1995, there was an administrative action that transferred landlord responsibility for this facility from Energy Research to DP. Despite this administrative change, this facility still performs the same historic missions. Specific impacts from continued operations are being assessed in the LANL Site-Wide EIS. The Stockpile Stewardship and Management PEIS includes the impacts from Los Alamos Neutron Science Center in No Action.

__Weapons Engineering Tritium Facility:__ An EA covering construction and operation of the Weapons Engineering Tritium Facility was proposed and a FONSI issued in April 1991. This facility has been operational for the past 2 years to support ongoing stockpile stewardship and management missions. Continued operations of this facility are included in the Stockpile Stewardship and Management PEIS No Action alternative.

__Los Alamos Critical Experiments Facility:__ The proposed action would consolidate surplus machines for nuclear materials criticality training and experimentation from various Complex sites to LANL. No change to current activities at LANL and no new capability results from this consolidation. This consolidation improves the efficiency and management of facilities that are used for the hands-on training of workers on nuclear materials criticality issues. The EA was completed in April 1996 and a FONSI was issued in May 1996. The Stockpile Stewardship and Management PEIS includes the impacts from this facility in No Action.

__Lyner Facility:__ Stockpile stewardship activities at NTS have been analyzed in EISs, as well as the NTS Site-Wide EIS. These EISs have identified the impacts of nuclear tests, safety tests, and equation-of-state experiments. Although the term "subcritical" is not used in the previous EISs, some tests and experiments conducted over the past decades, as well as their impacts, are substantially the same as those contemplated by the new terminology. The term "subcritical experiments" is intended to clarify the fact that such experiments would not achieve the condition of criticality, consistent with the President's pursuit of a zero-yield CTBT. The terminology is not intended to define a new form of activity. The NTS Site-Wide EIS, the purpose of which is to evaluate the impacts of near-term (next 5 to 10 years) activities at NTS, includes a project-specific impact analysis of subcritical tests and experiments at the Lyner facility under alternatives 1 and 3. The subcritical tests and experiments are not new activities at NTS for purposes of the Stockpile Stewardship and Management PEIS, but rather are considered in the context of continuing activities, and are included in the No Action alternative. See the response to comment summary 40.02 for additional discussion on the Lyner facility.

__BEEF:__ This facility at NTS is used to study hydrodynamic motion associated with HE detonations as discussed in sections 3.3.1.1 and 3.3.4.3. The operation of BEEF is addressed in the NTS Site-Wide EIS. See the response to comment summary 41.17 for additional discussion on BEEF.

__PHERMEX:__ This facility is used to perform high-speed radiography at LANL. It is discussed in section 3.3.1.1. See the response to comment summary 41.17 for additional discussion on PHERMEX.

__Enhanced Surveillance Program:__ This is a term used to describe R&D activities which are aimed at ensuring that the nuclear weapons remaining in the stockpile will continue to be safe and reliable. The Enhanced Surveillance Program is part of the stockpile stewardship and management ongoing program.

41.19 One commentor cites a figure of $2.1 billion for the cost of the Accelerated Strategic Computing Initiative as proof that the Stockpile Stewardship and Management Program is already proceeding, and is doing so without constraint. The commentor states that the implication of this is that decisions on the Stockpile Stewardship and Management Program have already been made, or will be prejudiced by Accelerated Strategic Computing Initiative.

Response: *No decisions have been made for the proposed actions described in the Stockpile Stewardship and Management PEIS. Any decisions resulting from the PEIS process will not be made until at least 30 days after the Final PEIS has been filed with EPA.*

The Accelerated Strategic Computing Initiative is a multi-staged computer development program whose goal is to increase by more than a thousand-fold the computational speed and data storage that currently exists. Without underground nuclear testing, computational simulation will be an essential (and sometimes only) means of predicting the effects of aging on component and weapon safety and reliability. Due to the complexity of nuclear weapons, increases of more than a thousand-fold are needed to simulate weapon performance and assess weapon safety.

Because each advance in computational speed and data capabilities is a precursor to the next advancement, Accelerated Strategic Computing Initiative can only be developed in stages. Through the end of fiscal year 1996, the commitment of funds to support the Accelerated Strategic Computing Initiative will be less than $90 million. The funds committed to date are for R&D of the prototype system that will eventually support the stockpile stewardship computational requirements. These R&D activities to date are part of the ongoing stockpile stewardship program, which is independent of the proposed actions described in the PEIS (i.e., regardless of whether or not DOE proceeds with enhanced experimental facilities, all of the expected Accelerated Strategic Computing Initiative procurements will be part of the existing program to maintain a safe and reliable stockpile without underground nuclear testing). Because of the independent utility of these Accelerated Strategic Computing Initiative procurements, the commitment of resources that has been made does not prejudice the ultimate decisions related to the proposed actions in the PEIS.

41.20 The commentor believes that it is unacceptable that the DARHT Second Axis is not included in the PEIS whereas the Atlas Facility is. In the commentor's opinion, the two projects (DARHT's Second Axis and Atlas) are roughly comparable in costs and start dates.

Response: *Splitting a construction project into separate line items for Congressional budgeting (or combining previously separate line items) does not automatically imply that additional NEPA review is needed, especially when the entire project has already been subject to a NEPA review. While it is true that in the early 1990s, DOE decided to include funding for the second axis of DARHT as a separate line item for Congressional budgeting purposes, DOE has recently determined that it will not now be a separate line item. Citing its decision in the October 1995 DARHT ROD to complete the dual-axis facility with phased containment, DOE submitted a new Construction Project Data Sheet to Congress as part of its fiscal year 1997 budget request. The new data sheet combines both axes into a single line item (new Budget Number 97-D-102). However, no additional funding was requested in fiscal year 1997 for the second axis. The new Congressional data sheet includes all actions directed by the ROD, including constructing the second axis, but indicates that funding for the second axis will be requested only when the "most optimum" funding profile has been determined.*

DOE has addressed the need for dual-axis radiography, and the environmental impacts from implementing a decision to construct and operate both the first and second axis, in the DARHT EIS and the related ROD. As commentor notes, the courts have found that DOE properly analyzed the DARHT proposal in the DARHT EIS prior to completing the Stockpile Stewardship and Management PEIS. Therefore, there is no need to include in the Stockpile Stewardship and Management PEIS any additional project-specific analyses of the environmental impacts of the 1995 decision to construct and operate the second axis of DARHT since the analysis has already been completed in the DARHT EIS. This PEIS, however, does include the impacts from construction and operation of both axes of DARHT in the cumulative impacts under the No Action alternative.

42 RELATIONSHIP TO OTHER DOE PROGRAMS/ACTIVITIES

42.01 The commentors urge better integration and timing of the NTS and Pantex Site-Wide Draft EISs, the Stockpile Stewardship and Management Draft PEIS, and the Storage and Disposition Draft PEIS. Another commentor suggests an integrated program to find the most cost-effective solution. The commentor states that site-wide decisions will be made before programmatic decisions and that this will limit public involvement and full analysis of the alternatives. The commentor wonders why site-wide decisions will be made before programmatic decisions, especially since the programmatic decisions will have an impact at the site. The commentor also questions why different plutonium pit storage options are considered in the Stockpile Stewardship and Management PEIS, the Storage and Disposition Draft PEIS, and the Pantex Site-Wide Draft EIS. Another commentor asks if there will be an attempt to produce a simplified document showing the relationship between the PEISs and site-wide EISs.

Response: *The CEQ's minimum comment period requirement on draft EISs is 45 days (40 CFR 1506.10(c)). The public comment period on the Stockpile Stewardship and Management Draft PEIS was 60 days and was considered appropriate for review and comment on the document. The public comment period on the Storage and Disposition Draft PEIS, which did not identify any preferred alternatives for storage and disposition, was extended from 60 to 90 days to allow the public to fully review and comment on the proposed alternatives. Each of the other documents, as with all DOE NEPA documents, has a public comment period of at least 45 days. The schedules for release and the duration of the comment periods for each document was determined in accordance with the directives of the individual programs. Although DOE coordinates all programs and the preparation of NEPA documents, the sheer number of documents being prepared by DOE sometimes results in the release of several documents at the same time. Every effort is made to provide adequate public review of the documents in these cases, balanced with DOE's needs and mission.*

Overlapping issues between the PEISs and the site-wide EISs (e.g., storage of plutonium) have been coordinated and analyzed in the respective documents based on the scope of each document. The decision strategy has also been identified in each of these documents for the overlapping issue of concern. For example, the Stockpile Stewardship and Management PEIS will support decisions on the long-term storage of pits that will be needed for national security requirements (strategic reserve pits). The Storage and Disposition PEIS will support decisions on the long-term storage of all pits (strategic reserve and surplus) and the approach for dispositioning pits that are surplus to national security requirements. Decisions on the long-term storage of pits would be made in a joint ROD of the PEISs, and a decision relating to the storage of the pits until implementation of the selected long-term storage option would be made in the ROD for the Pantex Site-Wide EIS.

Sections 1.7.1 through 1.7.5, under Other National Environmental Policy Act Reviews, of the PEIS discuss the relationship between the Stockpile Stewardship and Management PEIS and the Pantex, LANL, and NTS Site-Wide EISs. As described in these sections, any decisions on the future roles of these sites in the Stockpile Stewardship and Management Program will be identified in the ROD for this PEIS. These Stockpile Stewardship and Management Program decisions will not compromise any of the analyses presented in the site-wide documents, but will provide additional information on the future missions at these sites that will require consideration in the site-wide EISs.

42.02 The commentor would like to see additional nonweapons work at LANL and recommends that the site-wide EIS look at the enhancement of nonweapons work. Another commentor thinks it is ironic that the Stockpile Stewardship and Management PEIS proposes an upgrade of pit production at LANL while the Storage and Disposition PEIS is concerned about what to do with these pits.

Response: *LANL is a multi-disciplinary research facility engaged in a variety of programs for DOE and other Government agencies. Its primary mission is the nuclear weapons Stockpile Stewardship and Management Program and related emergency response, arms control, and nonproliferation and environmental activities. It conducts R&D activities in the basic sciences, mathematics, and computing with applications to these mission areas and to a broad range of programs including: nonnuclear defense; nuclear and nonnuclear energy; atmospheric, space, and geosciences; bio-science and biotechnology; and the environment. A more detailed discussion of the complete spectrum of laboratory activities can be found in the current LANL Institutional Plan, which is unclassified and available to the public. The LANL Site-Wide EIS is currently being prepared and analyzes alternatives for LANL's operation over the next 5 to 10 years. Nonweapons work, and any enhancements thereto, would be included in the site-wide EIS.*

42.03 The commentor expresses concern that new programs such as bringing spent nuclear fuel rods from other countries and wastes produced from new programs will contribute to waste management problems since there is no place to dispose of this waste.

Response: *The* Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Study (DOE/EIS-0203-F) *analyzes at a programmatic level the potential environmental impacts over the next 40 years of alternatives related to the transportation, receipt, processing, and storage of spent nuclear fuel under the responsibility of DOE. This EIS formed the basis for deciding, on a programmatic level, which sites will be used for the management of the various types of spent nuclear fuel to which DOE holds title. It included the amount of foreign research reactor spent nuclear fuel that might be accepted in its assessment of potential impacts, and addressed the sites at which the foreign research reactor spent nuclear fuel could be stored if a decision is made to accept foreign research reactor spent nuclear fuel. In addition to this document, the* Final Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel (DOE/EIS-0218F) *evaluates the potential environmental impacts that could result from the DOE and Department of State joint proposal to adopt a policy to manage spent nuclear fuel from foreign research reactors. Based on these and other environmental impact studies, DOE intends to make decisions and take actions to identify sites for waste management facilities in order to protect public health and safety, comply with Federal law, and minimize adverse effects to the environment.*

42.04 The commentor notes that the Lyner facility remains classified so that the "enemy" cannot determine the equation of state information, yet there is no way to determine the environmental impacts of this project.

Response: *A brief description of the Lyner Complex may be found in the NTS Site-Wide EIS appendix section A.1.1.1.3, Dynamic Experiments and Hydrodynamic Tests. Further Lyner Complex details will be addressed in a classified appendix to the document noted above. The details of the Lyner Complex were included in the DP environmental consequences analysis in chapter 5 of the same document. See the response to comment summary 40.02 for additional discussion on the Lyner facility.*

42.05 The commentor states that no DOE NEPA document programmatically covers reprocessing. The commentor states that reprocessing is partially covered in a number of different DOE NEPA documents but that there is a need for an integrated document that evaluates reprocessing as a whole over the Complex.

Response: *As the commentor noted, reprocessing of spent nuclear fuel is not relevant to the Stockpile Stewardship and Management Program. With a decreasing stockpile DOE no longer has* *a need for reprocessing and is not proposing this action as part of the Stockpile Stewardship and Management Program. The recent NEPA studies referred to by the commentor addresses proliferation concerns and issues, or activities to stabilize nuclear materials because of a health, safety, or environmental concern related to the condition of the material. Since the defense-related chemical separations activities (i.e., reprocessing) were shut down at SRS in March 1992, there is a large inventory of in-process solutions containing a wide variety of special isotopes including plutonium-242. These stored solutions could present an unreasonable risk and require continuing vigilance to assure their continued safe storage and to avoid potentially severe radiological impacts should an accident occur. Therefore, the solution containing plutonium-242 is being converted to an oxide which has a stewardship programmatic use. This PEIS analyzes the environmental impacts of storing the oxide material at SRS or transporting the plutonium-242 oxide to LANL or LLNL for storage (section 4.19). Also see the response to comment summary 40.41 for more discussion of plutonium-242.*

42.06 The commentors have reservations about an expanded role for Pantex that would include permanent storage of plutonium pits, plutonium scrap, uranium, and such, as well as processing and reprocessing of plutonium and the possibility that a nuclear reactor would be built there to burn mixed oxide fuel or to produce tritium. One commentor asks what kind of capacity does Pantex have right now and how close are they to reaching that capacity level. Another commentor asks what was the preferred alternative for HEU storage.

Response: *Storage of the plutonium strategic reserve could occur at Pantex and does fall within the Stockpile Stewardship and Management Program. If Y-12 is selected as the site for the secondary and case fabrication mission, HEU strategic reserve storage would remain at ORR. If Y-12 is not selected, then the HEU strategic reserve could also be stored at Pantex. The strategic reserve provides pits and secondaries which could be used for replacement in the enduring stockpile or as feedstock for nuclear fabrication. If the decision is made that strategic reserves be stored with non-strategic reserves, then consolidated storage could be at one of the five sites being considered in the Storage and Disposition PEIS, one of which is Pantex. The commentor is referred to the Storage and Disposition PEIS for information regarding an expanded role at Pantex that would include the long-term storage and disposition of nonstrategic plutonium. Tritium production will not take place at Pantex.*

42.07 The commentor expresses concern regarding the Waste Management Draft PEIS proposed alternative for LLNL's Site 300, which is already on the EPA's Superfund List, as a regional facility for mixed LLW.

Response: *DOE needs to make decisions and take actions to identify sites for waste management facilities in order to protect public health and safety, comply with Federal law, and minimize adverse effects to the environment. The Waste Management Draft PEIS is intended to provide environmental information to assist DOE in determining at which sites it should modify existing waste management facilities or construct new facilities. The waste management facilities proposed in the Waste Management Draft PEIS include treatment and disposal facilities for mixed LLW. The Waste Management Draft PEIS analyzes potential environmental risks and costs associated with a range of mixed LLW management alternatives, including one regionalized alternative involving LLNL. After publication of the Waste Management Final PEIS (in late 1996), DOE will issue RODs on the treatment and disposal of mixed LLW. Please refer to the Waste Management Draft PEIS for more information regarding mixed LLW alternatives.*

42.08 The commentor feels there are many expensive programs that need funding before undertaking unneeded installations that have a strong appearance of tools for the design and development of new weapons—examples include site cleanup, storage of LLW, long-term storage of plutonium, development of theater anti-ballistic missiles, and storage and reprocessing of spent reactor fuel. Commentor further suggests it would even make more sense to drill contingency holes in Nevada in case an unexpected international situation demanded a special nuclear weapon response for which a test would be required.

Response: *In response to direction from the President and Congress, DOE has developed its Stockpile Stewardship and Management Program to provide a single, highly integrated technical program for maintaining the continued safety and reliability of the nuclear weapons stockpile. It has evolved from existing predecessor programs that served this mission over previous decades. With no underground nuclear testing and no new-design nuclear weapons production, DOE expects existing weapons to remain in the stockpile well into the next century. This means that the weapons will age beyond original expectations, and an alternative to underground nuclear testing must be developed to verify the safety and reliability of weapons. To meet these new challenges, DOE's science-based Stockpile Stewardship and Management Program has been developed to increase understanding of the basic phenomena associated with nuclear weapons, to provide better predictive understanding of the safety and reliability of weapons, and to ensure a strong scientific and technical basis for future U.S. nuclear weapons policy objectives.*

Because there can be no absolute guarantee of complete success in the development of enhanced experimental and computational capabilities for stockpile stewardship, the United States will maintain the capability to conduct nuclear tests under a "supreme national interest" provision in the anticipated CTBT. DOE will need to maintain the capability for nuclear testing and experimentation at NTS and the necessary technical capabilities at the weapons laboratories to design and conduct such types.

DOE must set priorities, in consultation with DOD, the National Security Council, and other Federal agencies, in structuring a balanced program to meet national security objectives within constrained funding. The proposed Program is debated each year relative to Program and funding priorities both within the Executive Branch and with the Congress. DOE believes the funded program that results from this debate is one that best strikes a balance between competing interests, and best meets U.S. national security requirements.

42.09 The commentor states that DOE recommends that strategic storage should be collocated with A/D functions, but does not emphasize the protection of those reserves to meet future national security needs. Commentor believes Pantex should be the preferred site for such a mission in coordination with its stewardship functions. In addition, the commentor feels Pantex should be selected for all storage and disposition storage functions as it makes no sense from budget or other perspectives to site strategic storage at one site and surplus at another, and that this would minimize transportation risks and costs.

Response: *Both the Stockpile Stewardship and Management PEIS and the Storage and Disposition PEIS analyze reasonable alternatives for the long-term storage of strategic reserves of plutonium and HEU. Because the overall scope of each PEIS is significantly different, different long-term strategic reserve storage alternatives are reasonable for each PEIS. For example, the Stockpile Stewardship and Management PEIS evaluates alternatives for strategic reserve storage (in the form of pits and secondaries) at the weapons A/D facility (either Pantex or NTS; Pantex is DOE's preferred alternative). The Storage and Disposition PEIS has a relatively broader scope regarding fissile material storage, which will include the storage of all surplus material, Naval reactor fuel,* *and Naval reactor fuel feedstock, as well as nonweapons R&D materials. It analyzes alternatives, among others, that would collocate strategic reserve storage. Pantex is one such alternative for this collocation. Preparation of these two PEISs is being closely coordinated to ensure that all reasonable alternatives for long-term strategic reserve storage are assessed. No decision regarding the long-term storage of strategic reserves is expected to be made until both PEISs have been completed. Cost and other factors will be taken into account during the decisionmaking process.*

42.10 A commentor expresses opposition to building a tritium facility. Another commentor asks that Southwestern Public Service comments on the Tritium Supply and Recycling Draft PEIS be included in the Stockpile Stewardship and Management and Storage and Disposition PEISs, and the Pantex Site-Wide EIS. Another commentor states that better integration between this PEIS and the Tritium Supply and Recycling Draft PEIS is required because the stockpile sizes considered in this PEIS builds in a bias toward future tritium production.

Response: *The* Tritium Supply and Recycling Final Programmatic Environmental Impact Statement *(DOE/EIS-0161, October 1995) details the need for tritium and analyzes the potential environmental impacts associated with various site and technology alternatives for the production of tritium. It also includes responses to all public comments received on the Tritium Supply and Recycling Draft PEIS. In addition, the ROD published in the* Federal Register *(60 FR 63878) on December 12, 1995, outlines DOE's plans in pursuing a tritium supply for the enduring stockpile. Section 1.6 discusses the relationship between tritium supply and recycling and stockpile stewardship and management. The comments received on tritium supply and recycling were responded to in the Tritium Supply and Recycling Comment Response Document and considered in making the tritium supply and recycling ROD. They have not been repeated in this document because tritium is an interim action as discussed in section 1.6 of this PEIS.*

42.11 The commentor asks, relative to section 1.6.1, what would the need date be for a new tritium facility if we had used START I as a planning base.

Response: *The need date for a tritium facility based on START I stockpile levels would be 2005. Producing tritium to support a START I-sized stockpile was analyzed in the Tritium Supply and Recycling Final PEIS in section 4.11.*

42.12 The commentor states that DOE's approach to the relationship between its NEPA review for its rebuilt Complex and for management of waste from that Complex seems to be to simply assume in this Draft PEIS that all waste management problems will be solved through the Waste Management Draft PEIS, and in the Waste Management Draft PEIS it is assumed that all potential conflicts with the Waste Management Draft PEIS will be resolved in the Stockpile Stewardship and Management Draft PEIS. The commentor states that these documents are incompatible for comparison purposes. The commentor points out that there is no analysis in any document which allows citizens or policy makers to compare the aggregate environmental impacts of the various programmatic alternatives for the future of the Complex, no document that provides for any program alternative or comprehensive picture of that alternatives's impacts from materials handling and use in manufacturing, through waste management, to long-term storage or disposal. The compartmentalization of environmental review (separate analyses for weapons research and production and waste management) detracts from the usefulness of the Stockpile Stewardship and Management Draft PEIS. The commentor further states that the Draft PEIS waste management analyses for each site for the stockpile stewardship and management alternatives do not provide impacts of waste management, but rather impacts on waste management facilities. There is no analysis of health and environmental impacts of waste management activities which will be attributable to the individual alternatives, despite the fact that much of the contamination of air, soil, and water in the past has been the result of waste management operations. Additionally, the calculated impacts in the Draft PEIS do not include the total impacts of radioactive materials handling to serve stockpile management alternatives, and of treatment, storage, and disposal of stockpile management waste.

Response: *DOE has coordinated the preparation of the Stockpile Stewardship and Management PEIS with the preparation of the Waste Management Draft PEIS. The relationship between the two documents is discussed in section 1.7.1 of the Stockpile Stewardship and Management PEIS. The waste volume presented in the Waste Management Draft PEIS are for all DOE sites and facilities and not just the Stockpile Stewardship and Management Program activities. Waste management activities that would support the Stockpile Stewardship and Management Program are assumed to be per current site practice and are contingent upon decisions to be made through the Waste Management PEIS. The waste volumes from stockpile stewardship and management alternatives have been provided to the Office of Environmental Management to include in the Waste Management Final PEIS analysis. Section 4.13 of this PEIS includes the potential wastes management cumulative impacts at each site for the different waste categories and the potential program and projects affecting that site.*

Because the nuclear weapon stockpile level is decreasing and due to waste minimization and pollution prevention practices, the volume of wastes generated from weapons program activities is decreasing. In addition, under the preferred alternative of downsizing and consolidating A/D, nonnuclear fabrication, and secondary and case fabrication, the waste generation would actually decrease at Pantex, KCP, and ORR.

The environmental and health impacts of site waste management facilities and activities are included in the description of the affected environment for each site in chapter 4 of the PEIS. The analysis in the PEIS assumes current and planned site waste management facilities and current handling, storage, and disposal practices in place for all site-generated waste. The types and volumes of waste generated by the stockpile stewardship and management activities would be handled in these facilities in the same manner as all other site waste and in accordance with all applicable Federal and state regulations, and DOE orders. Because these facilities are permitted and have been addressed by other NEPA documents and environmental review, and stockpile stewardship and management waste types and volumes would not change or exceed the operating conditions or capacities of these waste management facilities, the environmental and health impacts due to Stockpile Stewardship and Management Program activities would not be substantially different from that described for the existing conditions at each alternative site.

42.13 The commentor recommends that DOE shut-down NTS and convert it to a solar energy testing site if the area is not too hot.

Response: *Chapter 3.2 of the NTS Site-Wide EIS explains DOE's rationale to maintain NTS as a site with multiple programs. NTS has historically been a multi-purpose facility because of its remote location, arid climate, controlled access, and size. For these reasons, a single program alternative, such as the existing Solar Enterprise Zone, as described in the NTS Site-Wide EIS, would fail to meet DOE's need for a site that can support evolving DOE missions, including the capability to resume nuclear testing as mandated by the President.*

42.14 One commentor states that the waste figures presented in the Waste Management Draft PEIS are not consistent with those in the Stockpile Stewardship and Management PEIS. Another commentor expresses shock that the amount of waste to be produced over the next 20 years by the stockpile stewardship and related nuclear research programs, as presented in the Waste Management Draft PEIS is much more than what is currently in storage.

Response: *DOE has sought to assure consistency between the two PEISs. The commentor should realize, however, that the Waste Management Draft PEIS makes a bounding analysis of potential waste generation from all DOE facilities and programs, while the Stockpile Stewardship and Management PEIS limits waste generation estimates to waste generated for the Stockpile Stewardship and Management Program. The Waste Management Final PEIS will be updated to include information consistent with that provided in the Stockpile Stewardship and Management PEIS.*

42.15 The commentor is opposed to DARHT and increased weapons production.

Response: *Facilities required for stewardship purposes, such as DARHT, would be used to assess the safety and reliability of the nuclear weapons in the remaining stockpile. DOE does not plan increased weapons production, but rather is supporting a program to reduce the nuclear weapons stockpile, consistent with international agreements, while keeping the remaining stockpile safe and reliable.*

42.16 The commentor states that the Storage and Disposition Draft PEIS and Stockpile Stewardship and Management Draft PEIS contradict each other in that the Storage and Disposition Draft PEIS indicates that ORR is considered for plutonium and the Stockpile Stewardship and Management Draft PEIS states that plutonium would not be located anywhere it is not already located. Conversely, continues the commentor, one of the sites that was not mentioned at all was LANL. The commentor wants to know why LANL was not included in the Storage and Disposition Draft PEIS.

Response: *The Stockpile Stewardship and Management Program sought alternatives that both built on existing site infrastructure and expertise and tended to further consolidate the Complex to support a smaller nuclear weapons stockpile. For these reasons, sites for plutonium pit production where no existing infrastructure and expertise existed were not considered reasonable. In addition, introducing plutonium to a site with no significant existing infrastructure and expertise would further expand the Complex and be contrary to DOE's desire to further consolidate and/or downsize the Complex. For these reasons, ORR was an unreasonable alternative for the plutonium pit production for the Stockpile Stewardship and Management Program. In contrast, the Storage and Disposition Program sought a broader range of alternatives. These alternatives would, due to international safeguards and inspection considerations, be independent of nuclear weapon program facilities. ORR was considered a reasonable alternative for this mission. Chapter 3 of the Storage and Disposition Draft PEIS provides further justification for the selection of ORR as a reasonable alternative site, and the lack of selection of LANL as a reasonable alternative site.*

42.17 The commentor asks if DOE currently assumes that as material is transferred on the books from strategic into surplus, that it is then covered by the current *Disposition of Surplus Highly Enriched Uranium Environmental Impact Statement* (DOE EIS, June 1996) or will there be additional need for documentation to look at the additional material as it gets transferred over.

Response: *One reason that DOE is covering the storage of strategic reserve material in both the Stockpile Stewardship and Management PEIS and the Storage and Disposition PEIS is to address this comment. Both PEISs cover the storage of this material to assure that future Program decisions, including decisions to transfer material from strategic reserve to excess, have adequate NEPA coverage.*

42.18 The commentor concurs that the Rocky Flats Environmental Technology Site is not suitable for the stewardship and management of nuclear weapon components and special nuclear materials and that these materials must be removed at the earliest date. Commentor indicates that in addition to nuclear weapons components and special nuclear material at Rocky Flats Environmental Technology Site there are large quantities of plutonium waste to be removed before D&D can begin, and that existing buildings are not suitable for this kind of storage. The commentor requests an immediate decision on the disposition and schedule of this liability, or permission for commentor's organization (Rocky Flats Cleanup Commission, Inc.) to provide interim storage at a dedicated offsite facility.

Response: *The Rocky Flats Environmental Technology Site was not considered for any Stockpile Stewardship and Management alternatives, and the comment addresses programmatic issues at Rocky Flats Environmental Technology Site that are outside the scope of the Stockpile Stewardship and Management Program. The commentor should address the DOE Environmental Management Office or the local DOE office at Rocky Flats Environmental Technology Site regarding the potential capabilities of the Rocky Flats Cleanup Commission, and its ability to address current Rocky Flats Environmental Technology Site cleanup problems.*

43 GENERAL/MISCELLANEOUS ENVIRONMENTAL

43.01 The commentor feels that science has been totally neglected. At the last DOE meeting of the Yucca Mountain board, the commentor asked about colloidal studies. The Federal national laboratory did colloidal studies, according to the commentor, and the commentor now wants to know why the studies are not commercialized upon.

Response: *The commentor is referring to the basic issue that radionuclides may attach to colloids and be transported in water when they would otherwise not be expected to move. There have been a number of studies of the colloidal transport of radionuclides from underground nuclear testing in groundwater at NTS. Related studies on similar radionuclides and rocks have been performed for the Yucca Mountain geologic repository project, and DOE's Office of Subsurface Science has conducted studies on other rock types found at NTS. Migration of tritium in groundwater at NTS has been found to be more significant than transport of other radionuclides as colloids. Therefore, present studies focus on transport rates of radionuclides as a result of all mechanisms, not solely colloidal transport. It is also important to distinguish between groundwater flow and the much more rapid flow of water in streams on the earth's surface. Groundwater is subject to distinctly different chemical and physical processes than those applicable to surface waters.*

43.02 The commentor asks why all of DOE's really bad Superfund sites are called a National Environmental Research Park (NERP) and suggests DOE should call it National Environmental Research Disaster Site (NERDS). Commentor's definition of a "park" is a piece of ground for ornament and recreation.

Response: *The naming of these sites is outside the scope of the PEIS.*

43.03 The commentor believes that denial is a major roadblock to making progress towards peace in the United States because the people working in armaments are deep in denial about how their work is affecting the society and the public's health.

Response: *The proposed actions in the PEIS are consistent with national security policies. The impacts of these alternatives on public health are discussed in the PEIS.*

43.04 The commentor wants to know why, in light of the Chernobyl accident and its health and environmental consequences, the U.S. Government insists that it needs to create more radioactive material with the potential for disaster even if the weapons are never used.

Response: *It is assumed that the commentor is referring to the production of special nuclear material (plutonium and HEU). This program does not plan to produce any additional special nuclear material.*

43.05 The commentor does not support the new armory proposed for Taos, NM.

Response: *The siting of a new armory near Taos, NM and the environmental impacts of its construction and operation is not within the scope of this PEIS.*

43.06 The commentor recommends that a section for the catastrophic environmental impacts of the past weapons program should be included in the summary of environmental impacts section. The commentor cites the Rocky Flats Environmental Technology Site as an example of how DOE activities have catastrophically affected the public and the environment. Another commentor suggests that leadership rather than technology was the problem at the Rocky Flats Environmental Technology Site. The commentor wants to know if the corporate culture that lead to the disaster has changed; what happened at the Rocky Flats Environmental Technology Site and why it had to be shut down; how much of the area around Colorado was contaminated; what is DOE's long-range plan for dealing with the waste; why is the pit fabrication mission being brought to LANL; and what measures DOE plans to undertake to ensure that LANL does not become another Rocky Flats Environmental Technology Site.

Response: *The No Action alternative as it relates to the Stockpile Stewardship and Management Program is discussed in section 3.1.4. All activities currently supporting the stockpile stewardship and management activities at each site within the Complex were projected to the year 2005 and were included in the No Action alternative. In this baseline, the environmental impacts of all DP activities, consistent with NEPA requirements, were identified for each resource or issue area and can be compared to the environmental impacts of the various stockpile stewardship and management alternative proposed actions. DOE plans to maintain the weapons stockpile using emerging technologies as appropriate to mitigate environmental impacts. These new technologies have the potential to further reduce waste generation from the rates described in the PEIS and raw material usage while reducing processing steps and operating costs.*

43.07 Commentor suggests that LANL needs competitive bidding for its management contract and oversight by the New Mexican government.

Response: *Federal and state agencies share regulatory authority over DOE facility operations. DOE has entered into agreements with regulatory agencies on behalf of all of the DOE facilities being considered in the PEIS. These agreements normally establish a schedule for achieving full compliance at these DOE facilities. Table 5.3-4 lists the potential requirements imposed by the major state regulations applicable to the PEIS. DOE is committed to managing all facilities in compliance with all applicable regulations and guidelines. Competitive bidding practices are outside the scope of the PEIS.*

43.08 The commentor suggests the United States take a leadership role in the elimination of anti-personnel mines but realizes the U.S. economic motivation of the production of mines may make this difficult.

Response: *Anti-personnel mines are beyond the scope of the PEIS.*

43.09 The commentor states that no consideration is given to all the chemicals that are poisoning the human body by allowing the chemical companies to put all of their chemicals into food supplies which will harm all humanity in the United States. The commentor asks which is worse: the pollutants that go out by Pantex that affect the local population, or all the chemicals that go into our food supplies affecting the whole nation.

Response: *The use and the potential human health and environmental impacts of chemicals by consumers, manufacturing and industrial facilities, and the agricultural industry are beyond the scope of this PEIS. The affected environment section 4.5.2 describes the existing conditions at Pantex. The environmental impacts from the proposed alternatives at Pantex are described in section 4.5.3 including the potential impacts from site chemical use and emissions.*

43.10 The commentor is concerned that the Federal Government is expanding nuclear programs in the State of New Mexico without investing any money in the state. The commentor believes that DOE has no commitment to public health surveillance in the state despite a rapid large-scale expansion of nuclear programs.

Response: *DOE would not be significantly expanding nuclear programs in New Mexico with implementation of its PEIS preferred alternative. However, DOE has and continues to make significant economic investments in the state. A recent University of New Mexico study (The Economic Impact of DOE on the State of New Mexico, jointly prepared by DOE and New Mexico State University, published July 1995, covering fiscal year 1994) attributed more than one in ten jobs in the state directly or indirectly to DOE activities. DOE has also made a significant commitment to public health oversight for its operations in New Mexico. Agreements exist with state regulatory and enforcement organizations for the continued oversight of environmental regulations and waste management. Funding has been provided to the state by DOE for this purpose.*

43.11 The commentor asks all the employees of all the laboratories, all the way up to Hazel O'Leary, if there is a solid foundation in nonweapons production, then "wouldn't that be real job security when the balanced budget axe cutters come after you?" The commentor states that global competition for U.S. businesses could be affected tremendously. The commentor believes that scientists in Japan and Germany are helping their businesses design products to be sold around the world. The commentor states that we are doing great in weapons production, but in everything else, we seem to be falling apart.

Response: *DOE has always encouraged its production and laboratory facilities to perform work for other customers when this work did not interfere with DOE mission work and it could be shown that no private industrial facility was willing and capable of performing the work. Performance of this type of work had the advantage to the Government of deferring overhead costs and helping to retain core competencies. As DOD and other Federal agency procurements have decreased in recent years, it has been increasingly difficult to attract work of this kind to DOE facilities.*

43.12 The commentor sees the nuclear issue as an issue for the rest of human time. We are the last generation, according to the commentor, that will have the opportunity to address this issue in a responsible manner simply because we are responsible for it. The commentor also stresses the need to have the best scientists working in the nuclear arena. Another commentor wants to know why safer alternatives to nuclear weapons are not being utilized.

Response: *The United States is promoting nonproliferation through the NPT and the CTBT and reductions in its nuclear weapon stockpile through treaties such as START II. Congress and the President have directed the Secretary of Energy to ensure that the stewardship program preserves the* *core intellectual and technical competencies of the United States in nuclear weapons without nuclear testing and without new weapons production. This includes competencies in research, design, development, testing, reliability assessment, certification, manufacturing, and surveillance capabilities.*

43.13 The commentor states that Los Alamos has been billed "the little Oak Ridge" for quite some time, and it looks like a $600 million project. The commentor would like the PEIS to discuss whether Los Alamos has received $600 million for a capital project.

Response: *DOE is aware of concerns in the Oak Ridge community that DOE is taking actions at Los Alamos to establish uranium fabrication and processing capability to the detriment of future ORR Y-12 missions. These concerns are unfounded in fact. There has not been, nor is there planned to be, a "$600 million project" at Los Alamos to establish a "little Oak Ridge." The following actions are being taken at Los Alamos that relate to Y-12 missions.*

The Chemistry and Metallurgy Research facility is being upgraded to fix safety deficiencies and to extend the life of the facility. The primary mission of the facility is plutonium analytical chemistry in support of the LANL plutonium facility (TA-55). One of four operating wings of Chemistry and Metallurgy Research facility contains limited capability for HEU operations. A limited amount of DOE funding ($2 to $4 million per year) has been given to Los Alamos for work in this area in recent years. Most of the work has focused on chemical recovery technology for HEU so that LANL can process its onsite legacy residues of enriched uranium.

The Sigma Complex facilities constitute the major LANL facilities for fabrication of components (which do not contain plutonium or HEU) for R&D. Work performed here that relates to Y-12 missions include fabrication of parts from depleted uranium and its alloys, lithium salts, and other specialty metals. These are traditional missions of these facilities that have been ongoing for decades. No significant upgrades have occurred to these facilities in recent years, and the only planned modifications are to accommodate missions transferred from the Rocky Flats Environmental Technology Site under the nonnuclear consolidation program.

43.14 The commentor states that the Government could save $18 million of the laboratory's $40 million travel budget if the top brass drove from Albuquerque airport instead of chartering flights.

Response: *DOE and LANL travel budgets and any potential savings that might be expected from alternative means of travel are beyond the scope of the PEIS. However, if the commentor is referring to the routine flights that were "chartered" between Albuquerque and Los Alamos, these flights were discontinued in 1995 due to reduced traffic demand.*

43.15 The commentor believes that the history discussion in chapter 2 should go back further than the beginning of the Cold War in order to provide a better perspective on nuclear weapons issues. Another commentor asks about the differentiation of the terms "post-Cold War" and "neo-Cold War."

Response: *The purpose of and need for the Stockpile Stewardship and Management Program is discussed in chapter 2. This discussion provides sufficient justification for the proposed actions and the alternatives analyzed in the PEIS, and includes a brief discussion of the Cold War.*

43.16 The commentor feels that a weapons program is needed to ensure national security. Another commentor feels national security will result from people working towards peace and justice.

Response: *Nuclear weapons are a key component of national security and the President has declared the maintenance of a safe and reliable nuclear weapons stockpile to be a supreme national* *interest. DOE has reduced the size of the stockpile as a result of arms control and nonproliferation objectives. DOE responds to the direction of the President and Congress. The preferred alternatives were chosen, in part, because they do satisfy U.S. arms control and nonproliferation objectives. One benefit of science-based stockpile stewardship is to demonstrate the U.S. commitment to NPT goals; however, the U.S. nuclear posture is not the only factor that might affect whether or not other nations might develop nuclear weapons of their own. Some nations that are not declared nuclear states have the ability to develop nuclear weapons. Many of these nations rely on the U.S. nuclear deterrent for security assurance. The loss of confidence in the safety or reliability of the weapons in the U.S. stockpile could result in a corresponding loss of credibility of the U.S. nuclear deterrent and could provide an incentive to other nations to develop their own nuclear weapons programs.*

43.17 The commentor applauds DOE's efforts and the fact that we do have a Nation that is willing to put things together, and consolidate nuclear waste and/or enriched uranium and plutonium.

Response: *Within the Complex, there is a common waste management approach that emphasizes four areas of concern: the reduction of environmental impacts by hazardous or toxic substances, process improvements that minimize waste generation, recycling in order to minimize waste to be disposed and raw material use, and the treatment of generated waste. DOE is increasing its efforts at minimizing the use of hazardous materials and the number and volume of waste streams consistent with programmatic needs through active pollution prevention and waste minimization programs. DOE plans to maintain the weapons stockpile using emerging technologies to mitigate environmental impacts. These new technologies have the potential to reduce waste generation and raw material usage while reducing processing steps and operating costs.*

43.18 The commentor believes that the effects of forest fires must be included in the discussion of the current environment at LANL. The commentor notes that a recent fire in the Los Alamos and Bandelier area came within two miles of LANL before it was brought under control, and any discussion of the current environment at LANL must include consideration of such fires.

Response: *DOE agrees with commentor that the Dome Fire, a wildfire that burned over 16,000 acres of National Forest Service and National Park Service land just south of LANL in April and May 1996, aptly illustrates the potential impact of wildfire on life, safety, property, and natural resources. Accordingly, DOE, LANL, Los Alamos County, and the Forest Service are working together to take immediate actions to reduce the fire hazard on and around LANL, and to plan for long-term forest management that would incorporate fire management techniques.*

AIRNET and NEWNET are the two air quality monitoring systems employed by LANL; AIRNET data are reported to the public annually in the Environmental Surveillance Report, and NEWNET data are publicly accessible over the Internet computer links as they are collected. Neither AIRNET nor NEWNET stations went off-line during the Dome Fire. Over the past 8 months, LANL has eliminated several AIRNET stations that are no longer needed or were redundant with other sampling as part of an overall effort to streamline the sampling networks to ensure their effectiveness. Just prior to the outbreak of the Dome Fire, LANL reprogrammed four of five monitoring stations in the southern part of the laboratory to transmit data at longer intervals in order to determine long-clock stability, but returned to the original transmittal intervals during the Dome Fire to provide better coverage.

43.19 A number of commentors expressed opinions on issues such as changing the DOE seal, undiscovering plutonium, the neutron source of modern warhead designs, the cleanup of nuclear waste at Hanford, and the storage of spent fuel rods.

Response: *These issues are beyond the scope of this PEIS.*
