Conflicts to special status wildlife species from potential disposal of lands would be the same as described for the Proposed RMP except that up to approximately 295,200 acres would be available for possible disposal. Conflicts with utility right-of-way management would result in the same general effects as described under the Proposed RMP, except that existing designated corridors would be increased to 3 miles in width, resulting in greater fragmentation effects. In this alternative, the proposed utility corridor along the western margin of Spring Valley would potentially affect 36 greater sage-grouse leks (within 2 miles on either side of the 3-mile-wide corridor [see **Map 2.4.12-5**]). Potential conflicts with the development of communications sites would be the same as described for Alternative B.

Land use authorizations would likely result in increased habitat degradation and fragmentation on special status species in the long term. New land use authorizations would be evaluated for effects on special status species, in accordance with NEPA. Implementation of requirements that would reduce potential impacts to special status species are presented in Appendix N of the Draft Ely RMP/EIS (July 2005).

Lands and realty management programs would have similar potential impacts to known and potential habitat for the Ute ladies'-tresses orchid and other special status species as described for Alternative A. In addition, new designated corridors (3.0 miles wide) could be established. Pre-construction reviews and detailed analyses would be the same as those described for Alternative A.

Travel Management and Off-highway Vehicle Use and Recreation. Conflicts from travel management and off-highway vehicle use and recreation would be the same as described for Alternative A, except that cross-country off-highway vehicle use would be limited to approximately 32,000 acres on selected dry lake beds. Approximately 1.1 million acres would be closed to off-highway vehicle use and approximately 10.4 million acres would be restricted to existing roads and trails. In addition, 2.6 million acres would be managed as nine dispersed special recreation management areas in the planning area. Four new recreation permit areas totaling 1.3 million acres also would be established for motorcycle special recreation events. As a result, degradation of habitat and habitat fragmentation associated with these uses would occur on a larger area than under Alternative B but a more concentrated area than Alternative A.

Potential impacts (e.g., trampling of vegetation, soil disturbances) to known and potential habitat for the Ute ladies'-tresses orchid or other special status plants may occur as a result of off-highway vehicle trespass use in areas adjacent to designated roads or trails. However, limiting off-highway vehicle use to designated roads and trails on approximately 10.4 million acres of land would have a positive effect on known and potential habitat for special status plants. Known and potential habitat areas for special status species would not be subjected to long-term surface disturbances related to off-highway vehicle use in these areas.

4.0 ENVIRONMENTAL CONSEQUENCES

Recreation. Recreation activities could increase under this alternative, which could result in surface disturbance near water bodies containing special status aquatic species. However, management would be done in a manner that would minimize effects to water bodies.

Livestock Grazing. Effects to special status species from livestock grazing would be similar to those described for Alternative A, except that grazing would not be available on approximately 6,400 acres of newly designated ACECs, which would benefit wildlife by providing additional forage and water for special status species.

Making approximately 6,400 acres within four newly designated ACECs unavailable to livestock grazing would help protect any potential habitats for special status plants that may exist in those areas in the long term.

Watershed Management. Effects to wildlife from watershed management would result in a reduction of available forage and water for special status species in the long term.

Fire Management. The effects of fire management under Alternative C would vary for treated and untreated areas. There would be a buildup of fuel materials in untreated areas, which could contribute to the probability of a major wildland fire event with subsequent erosion input to drainages. Treated areas would reduce material buildup, which would reduce erosion input to drainages on a long-term basis.

Under Alternative C, prescribed fire and wildland fire use would not be the preferred management tools, and wildland fires would be suppressed to the extent practical. Although areas treated may be greater than described for Alternative A, it is anticipated that increased fuel loading from full fire suppression on the planning area would eventually lead to large fire events in untreated areas, which would lead to greater long-term habitat effects to special status species than discussed for the Proposed RMP, Alternative A, or Alternative B.

The suppression of all wildland fires would likely have some effect on known and potential habitat for special status plants in the short term. However, the increase in fuel loads over time would increase the likelihood of widespread catastrophic fires in the long term. Populations of special status plants subjected to these catastrophic fires could be eliminated.

Special Designations.

Big Spring Spinedace. The Condor Canyon ACEC would be managed as a multiple use area with managed recreational development. Recreational use in Condor Canyon could result in increased surface disturbance and sediment input to Meadow Valley Wash, which could affect habitat for Big Spring spinedace.

Meadow Valley Wash Desert Sucker and Meadow Valley Wash Speckled Dace. Potential sediment-related impacts in the Condor Canyon ACEC also could affect these species. The Lower Meadow Valley Wash ACEC would be managed as a multiple use area with managed recreational development.

4.7 Special Status Species

Recreational use in Lower Meadow Valley Wash could result in increased surface disturbance and sediment input to the drainage, which could affect habitat for Meadow Valley Wash desert sucker and Meadow Valley speckled dace. The same mitigation discussed for Big Spring spinedace also would apply to these species.

Seventeen new ACECs totaling approximately 129,700 acres would be established for the protection of other resources. The establishment of these ACECs and the land use restrictions associated with these ACECs would offer protection where and if potential habitat for special status plants exists in these areas.

Conclusion. Program-specific impacts special status aquatic species would be similar to Alternative A. In general, management actions would allow a greater intensity of development, which would result in a higher potential for sedimentation impacts on aquatic habitat. Increased recreation activities could result in additional surface disturbance and sediment impact on habitat for sensitive aquatic species. Alternative C would meet the goal and objectives for federally listed fish species through management actions and compliance with Section 7 of the Endangered Species Act. However, the goal and objectives may not be met for "precluding the need to list additional species".

Management of special status wildlife species would continue to address an immediate need or habitat niche for the maintenance, mitigation, and restoration of a single special status species on a case-by-case basis. On a watershed level, special status species conflicts would include decreased shrub cover, a reduction in vegetation community structure, and increased competition for habitat by sagebrush dependent species. On a long-term basis, Alternative C would not likely achieve the program goal.

A detailed analysis of potential impacts to special status plants would be completed during watershed and habitat analyses. As part of the best management practices, potential mitigation measures and monitoring would be developed on a site-specific basis. In addition, the establishment of 17 new ACECs for the protection of other resources and the land use restrictions associated with these ACECs may offer additional protection where and if habitat for special status plants occur in these areas. However, any ongoing impacts to unknown populations of special status plants would continue until such areas undergo watershed analysis. Overall, this alternative would have a greater risk than the Proposed RMP of failing to achieve the program goal for special status plant species.

Alternative D

Impacts from Special Status Species Management Actions.

Parameter – Special Status Species Habitat

Management of special status fish species under Alternative D would involve a passive and indirect approach to restore habitat throughout the planning area through the exclusion of discretionary commodity uses of public lands. Natural processes would be allowed to restore degraded habitats and determine future habitat conditions. Any active habitat management would emphasize restoration of human-induced changes to the natural environment and the protection of large-core areas of existing intact habitats. The effects of this management approach would be improvement in habitat conditions as a result of decreased surface

4.0 ENVIRONMENTAL CONSEQUENCES

disturbance and surface runoff into watersheds. An exception would be when and where this approach leads to crossing thresholds that cause future vegetation states to inadequately protect watersheds. Some of those areas then would be subject to accelerated erosion due to inadequate vegetation cover, especially where and when the future state burns frequently. Passive management could require a relatively long timeframe (10 to 20 years or longer) before aquatic habitat conditions improve. Direct management involving restoration of human-induced effects on watersheds could be implemented in a shorter timeframe. Restoration efforts would focus on excluding use in riparian areas. As a result, stream banks could become more stabilized and overhanging vegetation along water bodies could be more developed.

Under this alternative, management of special status species would emphasize a passive management approach to restoration through the exclusion of discretionary uses of public lands to achieve the desired range of conditions. Implementation of Alternative D would result in the continuation of habitat transitions (e.g., conifer invasion of aspen stands and establishment of pinyon and juniper trees in sagebrush shrubland), increased tree density and canopy cover, and a reduction of native herbaceous understory (e.g., grasses and forbs). The increased woody fuel and woody competition with herbaceous vegetation would cause some untreated plant communities to cross ecological thresholds. Eventually, these untreated communities would burn, resulting in hotter fires that would cause soil to be more susceptible to accelerated erosion and expansion of weeds. These habitat changes would result in a reduction of herbaceous forage, community structure, and overall suitability of habitats for special status species. Localized restoration activities following fires would improve habitat conditions for special status species, but on a landscape level, changes would continue to result in habitat degradation, reduction in ecological health and resiliency, and reduction in overall biological diversity, largely as a result of increasing numbers of large-scale fires and spread of invasive species. With the resultant loss of habitat for several special status species, particularly those that inhabit sagebrush and salt desert shrub communities, the probability continues to increase for additional listing of such species under the Endangered Species Act. Listing of one or more species within this complex of sensitive species easily could impose major constraints on other multiple uses within the planning area.

Effects to special status bat species under this alternative would be the same as described for Alternative A and similar impact would be expected.

Direct impacts of special status species management direction to potential and known habitat for most special status plant species would be minimal since the special status species management of this alternative would emphasize a passive and indirect management approach. Most of the potential impacts would occur as indirect impacts from other management programs.

Parameter – Great Basin Riparian Habitat

Management for special status aquatic species would be the same as Alternative A, and impacts from special status species management activities would be similar.

4.7 Special Status Species

Impacts to potential habitat for the Ute ladies'-tresses orchid would be the same as described for Alternative B since a specific survey and recovery program would be initiated relative to this particular species. Such efforts would improve the knowledge base and protection measures related to the species.

Parameter – Mojave Desert and Great Basin Riparian Habitats

Management for special status aquatic species would be the same as Alternative A, and impacts from special status species management activities would be similar.

Within riparian habitats, implementation of this alternative would result in the incremental increase in nesting and foraging habitat for riparian special status species (e.g., southwestern willow flycatcher, yellow-billed cuckoo, and Arizona southwestern toad).

Parameter – Mojave Desert Riparian Habitat

Management for special status aquatic species would be the same as Alternative A, and impacts from special status species management activities would be similar.

Parameter – Mojave Desert Scrub Habitat

Within desert scrub habitats of the Mojave Desert ecological system, this alternative would benefit Mojave Desert special status species (e.g., desert tortoise and banded gila monster) by improving herbaceous understory and cover in the long term.

Parameter – Mojave and Great Basin Desert Scrub and Salt Desert Shrub Habitats

Within Mojave Desert mountain and desert scrub habitats, desert scrub and salt desert shrub habitats of the Mojave Desert and Great Basin ecological systems, landscape level changes would continue to result in habitat degradation, reduction in ecological health and resiliency, and reduction in overall biological diversity largely as a result of the potential major fires and spread of invasive species.

Parameter – Great Basin Sagebrush Habitat

Within sagebrush habitats of the Great Basin ecological system, landscape level changes would continue to result in habitat degradation, reduction in ecological health and resiliency, and reduction in overall biological diversity largely as a result of the potential major fires and spread of invasive species.

Impacts from Other Programs. Impacts to sensitive aquatic species and their habitat associated with water resources, noxious and invasive weed management, and special designations management activities would be the same as described for current management.

The following interrelated programs would result in different effects to special status wildlife species as compared to the previous alternatives.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts to special status plants associated with fish and wildlife, watershed management, and noxious and invasive weeds activities would be the same as described for Alternative A. The following interrelated program would result in different impacts compared to Alternative A. Minimal impacts would be associated with management of lands and realty, renewable energy, and geology and mineral extraction since such programs would be reduced or eliminated under this alternative.

Vegetation. Management of riparian areas would involve prohibiting land-disturbing activities. Natural processes would be allowed to occur in riparian areas, which would help stabilize stream banks and provide overhanging cover for aquatic species. No herbicides would be used under this alternative, which would eliminate possible toxicity concerns for special status species.

Management of vegetation would emphasize a passive management approach to restoration with minimal influence from management and resource uses. As a result, degraded and fragmented habitats would be left to recover through natural processes. As discussed in Section 4.5, if such recovery occurs at all, it is expected to be very slow in this environment. Active habitat management would emphasize habitat treatments of invasive vegetation species. Implementation of this alternative would result in the continuation of ongoing habitat transitions (e.g., conifer invasion of aspen stands and establishment of pinyon and juniper trees in sagebrush shrubland), increased tree density and canopy cover, and a reduction of native herbaceous understory (e.g., grasses and forbs) in the long term. In the absence of large fires, these habitat changes would result in a reduction of herbaceous forage, community structure, and overall suitability of habitats for wildlife in the long term. However, with the accumulation of fine fuels in sagebrush (due to reduced livestock grazing) and heavy fuels in dense shrub and tree communities, increased large fire events would remove large areas of woodland and shrubland. Within the dense, overmature stands of sagebrush or pinyon-juniper woodlands, perennial understory species of grasses and forbs are commonly absent. Thus, without costly rehabilitation measures, most of these burned areas would not recover with native perennial herbaceous vegetation. Rather, the freshly burned areas would provide open niches for expansion of nonnative and weedy species including flammable annuals and non-palatable perennials. On a landscape scale, habitats would exhibit a reduction in overall habitat quality, ecological health, and vegetation resiliency in the long term.

Vegetation management programs would include the management of riparian areas and would allow these areas to undergo natural processes as nearly as possible. Riparian areas that have invasive or exotic species would be high priority treatment areas. The implementation of these vegetation management programs in riparian areas would improve the quality of potential habitat for Ute ladies'-tresses orchid in the planning area over the long term. The protection of native vegetation communities and prevention of expansion of annual exotic species would help maintain and improve the quality of known and potential habitat for special status species by reducing the spread and establishment of invasive species. However, the relative scarcity of vegetation treatments would allow fuels to continue to accumulate. Additional areas would cross one or more ecological thresholds. Crossing the threshold to the tree state could decrease water availability for riparian habitats. Crossing thresholds to high fuels states or states with minimal herbaceous understory could lead to major fires and accelerated soil erosion, thus damaging riparian habitats as well as the watersheds that supply them with water.

4.7 Special Status Species

Wild Horses. Habitat for fish and invertebrate species could be affected by wild horse grazing and physical disturbance in the 24 herd management areas where herd growth would be uncontrolled. Streams could include Upper Meadow Wash (Big Spring Spinedace, Meadow Valley Wash Speckled dace, and Meadow Valley Wash desert sucker) and Goshute Creek (Bonneville cutthroat trout). Impacts to unfenced springs could affect habitat for springsnails.

Under this alternative, conflicts with wildlife would be similar to those described for Alternative A except that wild horse populations within these areas would be uncontrolled, substantially increasing the impacts to wildlife. It is expected that these uncontrolled populations would destroy the herbaceous forage and ground cover, reduce habitat structure, and diminish overall habitat quality in the long term.

Wild horse populations would be allowed to increase without limits on the existing 24 herd management areas. This uncontrolled herd growth would soon eliminate almost all forage, including any special status species plants, within these areas.

Lands and Realty. Impacts associated with lands and realty would be similar to Alternative A and would not be expected to affect habitat for special status fish species.

Effects to special status wildlife species and habitats resulting from lands and realty actions would be minimal since no net loss of public lands would occur under this alternative, nor would there be any new land use authorizations such as new rights-of-way.

Renewable Energy. Habitat for sensitive aquatic and terrestrial species would not be affected by this program, since there would be no issuance of rights-of-way for renewable energy development.

Travel Management and Off-highway Vehicle Use. Based on a reduction of off-highway vehicle, surface disturbance in watersheds would be reduced under Alternative D. As a result, sediment input to streams from off-highway use would be reduced, which would improve habitat for special status aquatic species.

Under this alternative, off-highway vehicle use would be restricted to approximately 400,000 acres of designated roads and trails. This closure of approximately 11 million acres to off-highway vehicle use would greatly reduce the effect to special status species by reducing overall habitat degradation and fragmentation.

Potential impacts (e.g., trampling of vegetation, soil disturbances) to known and potential habitat for the Ute ladies'-tresses orchid or other special status plants may occur as a result of off-highway vehicle trespass use adjacent to designated roads and trails. However, limiting off-highway vehicle use and closing most of the planning area to off-highway vehicle use would have a positive effect on known and potential habitat for special status plants. Known and potential habitat areas for special status plants would not be subjected to long-term surface disturbances related to off-highway vehicle use in these areas.

4.0 ENVIRONMENTAL CONSEQUENCES

Recreation. Impacts to aquatic habitat could occur under this alternative, as a result of an increase in dispersed recreation. The types of impacts could include erosion or water quality changes, if activities occurred in stream or springs inhabited by sensitive fish or invertebrate species.

Livestock Grazing. Livestock grazing would be eliminated throughout the planning area, which would eliminate future impacts to special status species habitat such as surface disturbance/sedimentation, loss of riparian vegetation, and direct alteration of stream channel habitat.

No conflicts to special status wildlife species from livestock management would occur under this alternative, since livestock use would not be permitted on the planning area. This aspect of Alternative D would result in higher habitat quality for special status species, at least in the short term.

The elimination of livestock grazing throughout the planning area could allow special status plant habitats that have been heavily grazed to recover in the long term, contingent upon the absence of other major disturbances such as fire. Some vegetation communities containing habitat for special status plant species may not fully recover through removal of grazing alone.

Forest/Woodland and Other Plant Products. Habitat for sensitive aquatic species would not be affected by this program, since there would be no fuelwood collection or other wood products harvests except for personal pinyon pine nut collection and limited seed collection.

Conflicts to special status wildlife species from forest/woodland and other plant products would be minimal since only limited pinyon pine nut harvesting would be permitted.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario (see Section 4.18, Geology and Mineral Extraction). Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Watershed Management. In the short term, Alternative D would have minimal impacts to special status aquatic species, as watershed restoration would be primarily passive. The elimination of grazing and limited vegetation treatment in riparian areas would reduce and minimize stream sedimentation. However in the long term, the loss of resiliency in many of the vegetation communities surrounding aquatic habitat would place these habitats in greater jeopardy from catastrophic wildland fires and increased erosion and sedimentation.

Additional available forage would be allocated for watershed maintenance, wildlife, and wild horses after Standards for Rangeland Health have been met at the watershed level. However, because active management would not be a priority under this alternative, watershed level impacts would continue to result in habitat transitions and increased canopy cover. Landscape level impacts would continue to result in a

4.7 Special Status Species

reduction in overall habitat quality, ecological system health, and ecological resiliency in the long term, largely as the result of increased probability for large fires followed by reduced success probabilities for rehabilitation.

Fire Management. The effects of fire management on aquatic habitat would be similar to Alternative C except that in the absence of grazing and fire suppression, there would be a short-term buildup of fire fuels followed by a higher probability of widespread wildland fires. In terms of effects on aquatic habitat, there would be greater risk of fires burning in drainages, which would result in higher erosion impacts on both a short- and long-term basis.

Implementation of this alternative with minimal fire suppression, limited vegetation treatments, and absence of livestock grazing would result in accumulation of fire fuels in sagebrush and heavy fuels in shrublands and woodlands. This would ultimately lead to fire events that would have a high likelihood of eliminating shrub cover and woodland habitats for special status species in the long term. These impacts would be expected to occur at a large geographic scale with substantial cover losses, especially at lower elevations. Depending on shrub and woodland overstory, recovery rates, fire frequency, and reclamation success, these events could result in short- and long-term impacts. Effects would include long-term diminished habitat productivity and diversity for entire communities of shrubland and woodland wildlife. In the event of unsuccessful fire rehabilitation, these areas could devolve into vast monocultures of herbaceous grasslands dominated by cheatgrass and other invasive species that are of little or no value to special status species.

The minimal suppression of wildland fires under this alternative would lead to widespread major fire events that could jeopardize populations of any special status plant species in the affected areas.

Conclusion. Emphasis on passive management of sensitive aquatic species through exclusion of commodity uses on public lands could result in improved habitat conditions. Less erosion would occur from vegetation treatment, but far more would occur from widespread wildland fires. By implementing the various management actions associated with the special status species management direction and mitigation actions associated with other programs, the goals and objectives for special status aquatic species would be achieved.

Management of habitat for special status species would emphasize a passive management approach through the exclusion of discretionary commodity uses of public lands. On a watershed level, natural habitat transitions would continue with increased canopy cover and possible increased regeneration of palatable species. On a landscape level, habitats would exhibit a reduction in overall habitat quality, ecological health, and resiliency as the result of major, widespread wildland fires resulting in conversion to herbaceous communities. These habitat changes would result in a reduction of vegetation community structure and overall suitability of habitats for special status species. This alternative would likely achieve the program goal in the short term, but fail to sustain this habitat quality and achieve the goal over the long term.

Potential habitat for Ute ladies'-tresses orchid could improve in the planning area with the elimination of grazing and most other physical disturbances. A detailed analysis of potential impacts to special status plants would be completed during watershed and habitat analyses. The additional protection resulting from

4.0 ENVIRONMENTAL CONSEQUENCES

these measures, however, would be offset by the potential damage to special status plant populations resulting from increased wildland fires and uncontrolled wild horse populations under this alternative. Overall, this alternative would have a greater risk than the Proposed RMP of failing to achieve the program goal for special status plant species.

4.8 Wild Horses

Impact Issues

The primary impact issues associated with wild horse management relate to resource conflicts with other resources and uses such as vegetation, watersheds, wildlife habitat, livestock grazing, and erosion prevention/soil stabilization when appropriate management levels are not achieved. In the absence of population controls, most horse herds have the capacity to grow beyond the ability of the habitat to provide forage, water, space, and cover. In several existing herd management areas, the available habitat resources are marginal or inadequate to support healthy herds of wild horses. As herds grow beyond the appropriate management level for a given herd management area, wild horses increasingly compete with both wildlife and livestock for those local resources. Thus, population controls such as periodic gathers or fertility vaccinations are typically necessary to stabilize populations at levels supported by the available resources and compatible with other ongoing land uses.

Assumptions for Analysis

- Appropriate management level would be achieved and maintained in all alternatives except Alternative D.
- Public attitudes toward wild horse protection and adoption would remain similar to those displayed over the past 10 to 20 years.
- Natural reproduction and recruitment rates would continue to exceed natural mortality from predation, disease, and other factors.

Interactions with Other Programs

The wild horse management program within the planning area potentially would be affected by actions within the resource management programs for water resources, vegetation, lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, livestock grazing, geology and mineral extraction, watershed management, fire management, and noxious and invasive weed management.

Goal

Maintain and manage healthy, self-sustaining wild horse herds inside herd management areas within appropriate management levels to ensure a thriving natural ecological balance while preserving a multiple-use relationship with other uses and resources.

Northeastern Great Basin Resource Advisory Council Standard. Healthy wild horse and burro populations exhibit characteristics of healthy, productive, and diverse population. Age structure and sex ratios are appropriate to maintain the long-term viability of the population as a distinct group. Herd

4.0 ENVIRONMENTAL CONSEQUENCES

management areas are able to provide suitable feed, water, cover and living space for wild horses and burros and maintain historic patterns of habitat use.

Mojave-Southern Great Basin Resource Advisory Council Standard. Wild horses and burros within herd management areas should be managed for herd viability and sustainability. Herd management areas should be managed to maintain a healthy ecological balance among wild horse and/or burro populations, wildlife, livestock, and vegetation.

Objective

To maintain wild horse herds at appropriate management levels within herd management areas where sufficient habitat resources exist to sustain healthy populations at those levels. Herds would consist of healthy animals that exhibit diverse age structure, good conformation, and any characteristics unique to the specific herd.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to wild horses also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Wild Horses Management Actions.

Parameter – General Wild Horse Management

In the Proposed RMP, proposed appropriate management levels reflect the recent evaluation using multi-tiered analysis. The first tier consisted of evaluating each herd management area for five essential habitat components and herd characteristics: forage, water, cover, space, and reproductive viability. Additionally, interrelationships between wild horse populations from different herd management areas were analyzed (see **Table 3.8-2**). If one or more of these components were missing, or there was no potential for a stable shared genetic pool, the herd management area was considered unsuitable. If all components were present, the analysis proceeded to the second tier. In the second tier, monitoring data were used to establish the appropriate management level. Key forage utilization, use pattern mapping, and frequency were considered and if allotment objectives were being met, the highest value of historical ranges was used to set the appropriate management level. Where allotment objectives were not being achieved, appropriate

management level was set based on census data relative to range utilization or the past need for emergency wild horse gathers, which suggested overpopulation of the herd management area.

Parameter – Herd Management Area Establishment

If monitoring and analysis showed all the essential habitat components were present to maintain healthy, self-sustaining wild horse populations on either individual herd management areas or two or more adjacent herd management areas and the established appropriate management levels provide for a reproductively viable population (125 individuals with 50 breeding adults), the herd management areas were determined to be viable for long term wild horse management. The evaluation determined that twelve of the current herd management areas (approximately 3.7 million acres) meet the criteria for retention. The twelve that met the criteria are primarily the largest herd management areas or portions of adjacent smaller herd management areas. The majority of acreage (approximately 71 percent) in herd management area status meets the criteria for retention. An additional sixteen herd management areas or portions of herd management areas (1.6 million acres) do not meet the criteria for retention as herd management areas.

Under the Proposed RMP, wild horses would be managed within six consolidated herd management areas that would be created from twelve current herd management areas covering approximately 3.7 million acres as shown in **Table 2.4-11** and illustrated on **Map 2.4.8-1**. The six new herd management areas would be:

- Pancake – made up of Monte Cristo and Sand Springs East herd management areas;
- Triple B – made up of Buck and Bald, Butte, and a portion of Cherry Creek herd management areas;
- Antelope – boundary adjusted due to highway fence;
- Silver King – made up of Dry Lake and portions of Rattlesnake and Highland Peak herd management areas;
- Eagle – made of Wilson Creek and Deer Lodge Canyon herd management areas; and
- Diamond Hills South – no change to herd management area.

The Proposed RMP would retain most large herd management areas and small units adjacent to them. Boundaries would be consistent with neighboring planning areas and agencies as to wild horse management. This would increase operational efficiency, resulting in more on-the-ground management of the six herd management areas, increased effectiveness of maintenance gathers resulting in decreased resource conflict. Further, it allows for the concentration of resources, funding, and management on the six herd management areas, resulting in more effective management of the wild horses and their environment.

Wild horses would no longer be managed in a number of herd management areas considered unsuitable for year-long occupation by horse herds. These areas total approximately 1.6 million acres, including the units shown in **Table 4.8-1**.

The Proposed RMP would result in the removal from management of approximately 1.6 million acres of current herd management areas (as shown in **Table 4.8-1**) that provide very limited habitat for wild horses or do not provide essential habitat components to sustain healthy, thriving herds in these areas. The total reduction in appropriate management level within the planning area associated with this alternative would

4.0 ENVIRONMENTAL CONSEQUENCES

**Table 4.8-1
Herd Management Areas Eliminated in the Proposed RMP**

Herd Management Area	Public Land Area (acres)¹	Approximate Number of Animals Removed
Antelope (west of Highway 93)	62,900	0
Applewhite	30,300	0
Blue Nose Peak	84,600	5
Cherry Creek (eastern portion)	3,200	0
Clover Creek	33,100	10
Clover Mountains	168,000	20
Delamar Mountains	183,600	40
Highland Peak (southern 2/3)	65,500	0
Jakes Wash	153,700	50
Little Mountain	53,000	30
Meadow Valley Mountains	94,500	5
Miller Flat	89,400	30
Moriah	53,300	30
Rattlesnake (southern 1/2)	37,400	0
Seaman	358,800	100
White River	116,300	80
Totals	1,587,600	400

¹ Rounded to hundreds.

be approximately 446 animals or about 21 percent of current appropriate management level for the whole planning area. The described actions would result in a less crowded environment, with less competition for desert tortoise habitat and other limited resources.

Boundary fences would be constructed along the perimeter of herd management areas where necessary to achieve management objectives, including reduction of conflicts with domestic livestock.

This approach would achieve a balance between horse populations on the six herd management areas and the habitat needed to support them on a sustained basis. The resultant herds are expected to be healthier and less susceptible to starvation, disease, and predation.

Parameter – Population Management

Under the Proposed RMP, all appropriate management levels would be expressed as a range with the upper level of the range based on available habitat and the lower level based on the projected recruitment rate between gather cycles as developed from herd monitoring data. The upper limit of the range would be the level at which the maximum number of wild horses could exist without causing resource damage. This population range would ensure that a thriving natural ecological balance is obtained since each herd would be managed in a manner designed to not exceed habitat limitations.

The Proposed RMP would focus wild horse management on population management based on those areas that possess the essential habitat components as described above, and that have the potential for self-sustaining, healthy wild horse populations within each herd management area.

Impacts from Other Programs.

Water Resources. Water is a limiting factor for horse herds on several herd management areas within the planning area, affecting not only the basic survival of horses within these areas, but also the distribution of their use and degree of conflict with other animals, including livestock and wildlife. It is unlikely that the number and locations of water sources within the retained herd management areas would be substantially altered under the Proposed RMP. However, with aggressive watershed restoration, water amounts at these sources should increase as watershed health increases, resulting in higher, and more reliable flows from these sources. Additional water developments for livestock or wildlife also would benefit wild horses.

Vegetation. Restoration treatments would affect wild horse populations where they occur within portions of herd management areas that are the primary use areas to the extent that the population may have to be reduced for a few years while the desired vegetation becomes established. Assuming that treatment activities affect herd management areas proportionately to their distribution within the planning area and assuming that 2 years of establishment without grazing are desirable for seedling establishment following seeding, the maximum total area affected at any one time could be in excess of 100,000 acres.

Total exclusion of wild horses from freshly seeded areas probably would not be practical, but in some herd management areas it may be necessary to fence selected areas or modify water sources to attract animals away from such areas or time treatments to gathers so that numbers are a low range of the appropriate management level. Impacts to wild horses from vegetation treatment activities would be similar in nature to current management, but would be spread over greater area. Long-term effects of the Proposed RMP would include healthier vegetation communities that provide more abundant and diverse forage species. This would result in enhanced nutrition and less stress on wild horses as they live on the range.

With watershed treatment and the removal of pinyon and juniper where they have expanded into sagebrush communities and treatment of pinyon-juniper woodland, cover would be reduced. The reduction in cover would result in easier capture during gather operations resulting in less stress while being gathered. Because tree cover is very important to wild horses in the summer for shade and the winter for thermal protection, watershed treatment also could result in a concentration of wild horses in the hottest and coldest times of year. The watershed treatments also would result in an increase of available forage and healthier vegetation communities.

Lands and Realty. Under the Proposed RMP, the lands identified for possible disposal would be approximately 75,600 acres. Potential disposal of lands in these areas would affect approximately 9,300 acres on the herd management areas identified under this alternative and could necessitate a reduction in the appropriate management level. Because disposals within herd management areas would be limited to prevent a reduction of appropriate management level below a reproductively viable population (125 animals with 50 breeding individuals), and ensure that wild horses can exercise in their free-roaming

4.0 ENVIRONMENTAL CONSEQUENCES

behavior, impacts to wild horses from land disposals would be limited. Among the lands identified for disposal, small areas of overlap with herd management areas occur northeast of Cherry Creek at the edge of the Antelope herd management area and northeast of Pioche at the juncture of the Silver King and Eagle herd management areas. These potential disposals are not expected to noticeably affect wild horse herd on these areas.

Renewable Energy. Under the Proposed RMP, renewable energy development in herd management areas could impact wild horse by preventing wild horses from using portions of the herd management areas due to development. Further, if development occurs in primary use areas within herd management areas for wild horses, the loss of certain summer or winter habitats could impact the long-term management of wild horses. Since the locations of the 40,000 acres of wind energy rights-of-way have not been determined, specific effects on herd management areas cannot be determined. Such effects would be analyzed in project-specific NEPA reviews. Newly-developed wind energy sites along ridge tops in herd management areas could impact wild horse gather operations that use helicopters. Impacts associated with these activities would be mitigated to the extent practicable through management practices from the Wind Energy Programmatic EIS.

Travel Management and Off-highway Vehicle Use. Establishment of six herd management areas and the substantial reduction in amount of area open to off-highway vehicle use in this alternative would effectively reduce encounters and conflicts between off-road vehicle traffic and wild horse herds. Overall impacts of the increasing recreational demand on the planning area on wild horse management probably would be reduced in this alternative compared to current management.

Recreation. The primary interactions between wild horses and recreation are those associated with off-highway vehicle use (see paragraph above) and other dispersed recreation activities such as hunting and hiking. Five special recreation management areas totaling approximately 1.2 million acres would be established under the Proposed RMP. Portions of these would overlap with the Eagle, Silver King, Pancake, and Triple B Herd Management Areas. Some recreational users would seek out opportunities to view wild horses and may affect herd behavior and movement by their presence.

Livestock Grazing. Management of grazing allotments under the Proposed RMP would not involve changes likely to affect wild horse management. Livestock grazing will continue to be authorized for approximately 424,602 animal unit months on 8.4 million acres for allotments that have been determined to be meeting or progressing toward achievement of the standards for rangeland health. These will continue as needed to meet RMP goals and objectives including the standards for rangeland health. Current livestock grazing will be maintained for 120,665 animal unit months on 3.2 million acres until allotments have been evaluated for progress toward achievement of the standards for rangeland health. Changes to livestock grazing use will be made as needed to meet or progress toward achievement of the standards. These actions would lessen the impacts to the resource.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario would be disturbed throughout the 11.5 million acres of the planning area. Potential short-term impacts include vegetation loss, habitat fragmentation, herd displacement, and increased noise and human presence. Long term impacts could include irretrievable loss of habitat, change

in vegetation composition, and continuing habitat fragmentation. All proposed mineral actions would be evaluated on a case-by-case basis with specific recommended mitigations and best management practices. Closed areas and oil-and-gas stipulations will provide further protection and mitigation of potential disturbances to wild horses and their habitat.

Watershed Management. In the short term, the watershed analysis would help to improve wild horse habitat in various herd management areas where they overlap with the 41 high priority watersheds (approximately 2.6 million acres). The rate of completion of watershed analysis, evaluations, and implementation of watershed restoration strategies would be substantially increased compared to current management. Wild horses also would benefit in the allocation of the additional forage produced on watersheds within the herd management areas following vegetation treatments.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available), and other tools would be used to the greatest extent practical under the Proposed RMP. During the short-term, there would be a temporary reduction in forage availability and wild horses would be temporarily displaced from the area. Long-term habitat improvements would provide better forage for the maintenance of wild horses. Restoration of vegetation resilience and return to historical fire regimes would reduce impacts to wild horses when wildland fires occur. Fire suppression activities also may impact wild horses in terms of water withdrawal from local streams and waterbodies, increased human activity and traffic on access routes, and potential spills of fuel and chemicals. These effects generally would be localized and of short duration in comparison to the long-lasting effects of habitat alteration on the burned areas.

Noxious and Invasive Weed Management. Noxious weed management could affect wild horse herds if noxious and invasive weeds occur within the herd management areas to the extent that they replace desirable forage species, thereby reducing availability of quality forage. Some weeds are more toxic to horses than to other types of grazers. Under the Proposed RMP, the vegetation treatment and restoration efforts would help slow the spread of invasive species from those areas being treated and improve habitat for wild horses.

Conclusion. Wild horses would be managed where healthy, self-sustaining populations can be maintained over the long-term. Wild horse populations would be brought into balance with the available habitat resources needed to sustain healthy populations and prevent damage to the environment and surrounding resources. The Proposed RMP would achieve the goal for the wild horse management program.

Alternative A

Impacts from Wild Horses Management Actions.

Parameter – General Wild Horse Management

Wild horses would be managed where herd management areas currently exist regardless of whether habitat conditions can support a long-term reproductively viable population or not. The maintenance of small herds tends to reduce genetic diversity within these populations over several generations and render them more susceptible to various diseases and other maladies. Small herds would continue to be vulnerable to

4.0 ENVIRONMENTAL CONSEQUENCES

starvation and dehydration during drought years in those herd management areas where population numbers substantially exceed the appropriate management level.

Boundary fences along the perimeter of herd management areas would only be constructed where livestock grazing allotment boundaries coincide with herd management area boundaries. Thus, herd movements generally would not be restricted within the herd management areas and conflicts with other resource uses would continue to be largely addressed on a case-by-case basis.

Parameter – Herd Management Area Establishment

The 24 herd management areas presently existing within the planning area would be retained with a collective area of approximately 5.4 million acres (see **Table 2.5-10** and **Map 2.5.8-1**).

Parameter – Population Management

Herd management areas would be managed with an appropriate management level of 2,141 wild horses. As demonstrated by the recent evaluation survey, many of the current herd management areas lack one or more of the necessary habitat components to sustain their numbers on a year-long basis. Especially in the south end of the planning area; where quality forage is limited and water sources are scarce, herds would be in jeopardy from starvation or dehydration. When herd size grows beyond appropriate management level, such hazards to health and well-being would be intensified during periods of drought. At the same time, the wild horse herds could cause substantial, harmful effects on vegetation resources on both public and private lands. Small (non-viable) herds existing in these herd management areas may be extirpated by natural means.

Some herds would continue to be managed with appropriate management levels as a fixed number until another analysis of appropriate management level has been completed and other herds with appropriate management levels as a range, depending upon the existing decision applicable for each herd. For herd management areas with an appropriate management level established as a single number, gathers would be conducted when that number is exceeded to bring populations to far enough below the appropriate management level to allow for natural population growth over a 3- to 4-year period before the next gather. For herd management areas with an appropriate management level set as a range, the wild horse population would be managed within that range.

Impacts from Other Programs.

Water Resources. Water is a limiting factor for horse herds on several herd management areas within the planning area, affecting not only the basic survival of horses within these areas, but also the distribution of their use and degree of conflict with other animals, including livestock and wildlife. Additional water developments for livestock or wildlife also would benefit wild horses. It is unlikely, however, that the number and location of water sources would be substantially altered under Alternative A.

Vegetation. Vegetation treatment and restoration would continue at levels comparable to or somewhat above historic levels. These restoration treatments would affect wild horse populations where they occur within herd management areas and the total herd management area affected at any one time could be in

the tens of thousands of acres. Effects of treatment would be similar to the Proposed RMP but spread over smaller areas of treatments.

Lands and Realty. The lands that are proposed for possible disposal under Alternative A include only about 400 acres within herd management areas and, thus, would not affect wild horses. Any additional parcels disposed of would be subject to additional NEPA review prior to disposal.

Renewable Energy. Impacts from renewable energy development would be the same as discussed for the Proposed RMP.

Travel Management and Off-highway Vehicle Use. Continually increasing recreational demand in the planning area, accompanied by increased off-road vehicle use, would gradually result in increased conflicts with wild horses. Most of the increased recreation and off-highway vehicle use is expected to occur in the southern portions of the planning area where habitat for wild horses is typically of marginal quality and some herd management areas have appropriate management levels of zero. Increasing recreation and transportation areas activities in these herd management areas may result in these herds moving to areas with less noise and activity, potentially resulting in conflicts outside the herd management areas.

Recreation. The primary interactions between wild horses and recreation are those associated with off-highway vehicle use (see paragraph above) and other dispersed recreation activities such as hunting and hiking. In addition, one special recreation management area would be established under Alternative A. Its use is not anticipated to affect wild horse herds.

Livestock Grazing. Management of grazing allotments under Alternative A would be essentially unchanged and would not be expected to result in new impacts on wild horse management. Where they occur, usually where appropriate management levels have not been achieved, existing conflicts for forage and water resources would continue. In all areas, where livestock numbers have been reduced to provide a more balanced use of available resources, such reduction would continue or potentially be reduced further to meet resource management objectives.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that of the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario in the Proposed RMP. The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

4.0 ENVIRONMENTAL CONSEQUENCES

Watershed Management. The increased forage production on the treated areas would provide improved forage and habitat for livestock, wildlife, and wild horses. Under Alternative A, the additional forage would be allocated 70 percent to livestock and wild horses, with the remaining 30 percent reserved for wildlife in the Schell Resource Area. In the remainder of the planning area, additional forage would be allocated or reserved proportionately among all users. Thus, forage available for wild horses likely would increase on treated acres within herd management areas throughout the planning area.

Fire Management. The impacts under Alternative A would be similar to those under the Proposed RMP except on a smaller scale. This, in the long-term, would result in fewer acres with improved ecological health, vegetation resilience, and overall improved habitat quality; fuels would continue to accumulate in untreated areas; and the probability of major, uncontrollable stand replacing fire events would continue.

Fire suppression activities also may impact wild horses in terms of water withdrawal from local streams and waterbodies, increased human activity and traffic on access routes, and potential spills of fuel and chemicals. These effects would generally be localized and of short duration in comparison to the long-lasting effects of habitat alteration on the burned areas.

Noxious and Invasive Weed Management. Noxious weed management could affect wild horse herds if noxious and invasive weeds occur within the herd management areas to the extent that they replace desirable forage species, thereby reducing availability of quality forage. Some weeds are more toxic to horses than to other types of grazers. Under Alternative A, it is highly probable that the spread of invasive alien species would continue at a rate greater than the rate of weed eradication and vegetation treatment.

Conclusion. Alternative A would maintain several herd management areas that possess marginal or inadequate habitat to sustain wild horse populations at a level that would ensure healthy populations over the long-term, thereby resulting in a high probability for continued conflicts with other resources, conflicts with private land owners, and occasional starvation and dehydration of wild horses. Alternative A would fail to achieve the program goal over the long term.

Alternative B

Impacts from Wild Horses Management Actions.

Parameter – General Wild Horse Management

The general management approach and associated impacts would be the same as the Proposed RMP.

Parameter – Herd Management Area Establishment

Alternative B involves the same six herd management areas proposed under the Proposed RMP. The impacts associated with this change in number and location of herd management areas would be the same as the Proposed RMP.

Parameter – Population Management

The emphasis of wild horse management would be on maintenance of healthy, viable herds at levels sustainable under drought conditions. Impacts would be the same as the Proposed RMP.

Impacts from Other Programs. Impacts to wild horse management related to interactions from water resources, vegetation, fish and wildlife, special status species, renewable energy, geology and mineral extraction, fire management, and noxious and invasive weeds would be the same as described for the Proposed RMP. Interaction effects from the following programs would likely differ from the Proposed RMP.

Lands and Realty. An area of approximately 90,600 acres would be available for potential disposal including approximately 17,400 acres within herd management areas. Potential disposal of lands in these areas would have minimal effects on wild horses on the herd management areas identified under this alternative, and would be unlikely to necessitate a reduction in the appropriate management level of affected herd management areas. Impacts associated with these activities would be mitigated to the extent practicable through best management practices (see Appendix F, Section 1).

Recreation. The primary impacts resulting from interactions between wild horses and recreation are those associated with off-highway vehicle use (see paragraph above). In addition, nine special recreation management areas totaling approximately 2.7 million acres would be established under Alternative B. Portions of these would overlap with the Eagle, Silver King, Triple B, and Pancake Herd Management Areas. Wild horse viewing is one of the types of recreation anticipated to occur in these areas and the presence of recreation users may affect herd behavior and movement.

Travel Management and Off-highway Vehicle Use. The reduction of both size and number of herd management areas and the substantial reduction in amount of area open to off-highway vehicle use in this alternative would effectively reduce encounters and conflicts between off-road vehicle traffic and wild horse herds. The off-highway vehicle emphasis areas in this alternative do not overlap with the remaining herd management areas. Therefore, impacts of the increasing recreational demand on the planning area on wild horses would be reduced in this alternative compared to Alternative A, but similar to the Proposed RMP.

Livestock Grazing. Management of grazing allotments under Alternative B would include closure of grazing on approximately 3.0 million acres of bighorn sheep habitat, portions of which occur within various herd management areas. Thus, competition for forage and water resources would be reduced in these areas of livestock closure. Other areas of existing conflict would be eliminated or reduced in those areas where herd management area status is dropped and the wild horses are removed.

Watershed Management. Additional forage resulting from vegetation treatment and restoration activities would be allocated to watershed health and wildlife, thus there would be no net impact to wild horses. Watershed treatments may enhance water availability and quality within herd management areas.

Conclusion. Wild horse populations would be brought into balance with the available habitat resources needed to sustain healthy populations over the long-term and prevent damage to the environment and surrounding resources. Vegetation treatments would, in the long term, enhance habitat conditions within the

4.0 ENVIRONMENTAL CONSEQUENCES

herd management areas to ensure the sustainability of healthy herds maintained at appropriate management levels. Thus, Alternative B would achieve the program goal.

Alternative C

Impacts from Wild Horses Management Actions.

Parameter – General Wild Horse Management

The general management approach and associated impacts would be the same as the Proposed RMP. Wild horse populations would be managed with the same approach for calculating and applying appropriate management level as in the Proposed RMP. Only limited fencing of herd management area boundaries would be done as with Alternative A.

Parameter – Herd Management Area Establishment

Wild horses would be managed in the same reduced set of six consolidated herd management areas as used in the Proposed RMP. The only differences would occur in areas identified for possible disposal where the potential disposal areas would no longer remain in herd management area status. The total area of the herd management areas could be reduced by approximately 66,500 acres in areas identified for proposed land disposals. No land disposals would be permitted to remove the habitat necessary for supporting long-term reproductively viable populations. The impacts associated with this change in number and location of herd management areas would be the similar to those of the Proposed RMP.

Parameter – Population Management

The emphasis of wild horse management would be on maintenance of healthy, viable herds at levels sustainable under drought conditions. Impacts would be the same as the Proposed RMP.

This slight reduction in size of the Eagle and Silver King Herd Management Areas is not considered enough to warrant a change in the proposed appropriate management level for these units.

Impacts from Other Programs. The impacts related to interactions from water resources, vegetation, renewable energy, livestock grazing, geology and mineral extraction, watershed management, and noxious and invasive weed management activities would be the same as or similar to the Proposed RMP. Programs for which the impacts would differ from the Proposed RMP and Alternatives A and B are discussed below.

Lands and Realty. Potential disposal of lands could reduce the herd management areas identified under this alternative by approximately 66,500 acres, possibly necessitating a reduction in the appropriate management level.

Travel Management and Off-highway Vehicle Use. The reduction of both size and number of herd management areas and the substantial reduction in amount of area open to off-highway vehicle use in this alternative would effectively reduce encounters and conflicts between off-road vehicle traffic and wild horse herds. Three of the off-highway vehicle emphasis areas in this alternative do not overlap with the remaining herd management areas. Two areas, however, Silver State and Pancake Summit, overlap almost totally with the Silver King and Pancake Herd Management Areas, respectively. Some degree of impact to the wild

horse population in those herd management areas would be expected. However, overall impacts of the increasing recreational demand on the planning area on wild horse management probably would be reduced in this alternative compared to Alternative A, but similar to the Proposed RMP.

Recreation. The primary impacts resulting from interactions between wild horses and recreation are those associated with off-highway vehicle use (see paragraph above). In addition, nine special recreation management areas totaling approximately 2.6 million acres would be established under Alternative C. Portions of these would overlap with the Eagle, Silver King, Triple B, and Pancake Herd Management Areas. Wild horse viewing is one of the types of recreation anticipated to occur in these areas and the presence of recreation users may affect herd behavior and movement.

Watershed Management. Impacts to wild horses would be the same as the Proposed RMP except that additional forage after restoration would be allocated to livestock, and there would be no change in forage availability for wild horses.

Fire Management. Impacts to forage on herd management areas and thereby to wild horses would probably be less in Alternative C than the Proposed RMP or Alternatives A and B during the short term due to aggressive fire suppression. Over the long term, however, this fire suppression approach is expected to result in more large widespread fires, potentially burning major portions of individual herd management areas with subsequent conversion of these areas to herbaceous dominated plant communities.

Conclusion. Wild horse populations would be brought into balance with the available habitat resources needed to sustain healthy populations and prevent damage to the environment and surrounding resources. Alternative C, however, would likely have greater impacts and risks to wild horse populations than the Proposed RMP over the long term due to increased potential for major wildland fires.

Alternative D

Impacts from Wild Horses Management Actions.

Parameter – General Wild Horse Management

Herd management areas would be the same as under Alternative A, but herds would be unmanaged except for removal of wild horses outside the herd management areas. This alternative, however, would focus on eliminating livestock grazing throughout the planning area to protect vegetation and soil resources. This approach could initially make more forage available to wild horses in those herd management areas where horses and livestock currently compete for forage. This alternative also eliminates other discretionary uses of the public lands including mineral sale and leasing, lands and realty actions, and many recreational uses. This approach would remove or eliminate most resource use conflicts with wild horses, but it would not alter substantially or remedy the unsuitability of several existing herd management areas for maintaining viable, healthy horse populations in thriving ecological balance with other resources.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Herd Management Area Establishment

The 24 herd management areas presently existing within the planning area would be retained with a collective area of approximately 5.4 million acres (see **Table 2.5-10** and **Map 2.5.8-1**).

Parameter – Population Management

Management under this alternative would not constrain population growth within herd management areas. Thus, in the absence of population controls, it is expected that natural population growth at rates of up to 20 percent annually would quickly result in excessive populations and rapid degradation of forage supplies on all herd management areas. Riparian areas within the herd management areas would be particularly vulnerable. As forage supplies become depleted within the herd management areas, it is expected that increasing numbers of animals would move onto adjoining areas where they would be removed. Starvation would be common as would be long-term or permanent damage to the vegetation resource. Foals and old animals would be the most vulnerable to starvation and predation.

Impacts from Other Programs.

Water Resources. Water hauls and other man-made sources of water for livestock would be terminated, thus removing important water sources for wild horses and wildlife as well.

Vegetation. Vegetation treatment and restoration activities would occur under this alternative at about the same scale as Alternative A, but emphasis would be placed on returning previously disturbed sites (including nonnative seedings) to sagebrush or pinyon-juniper communities. Thus, impacts to wild horses would be similar to Alternative A, except that Alternative D would involve a lower overall probability of achieving and maintaining desired range of vegetation conditions within the herd management areas. This would lead to greater impacts on the health of wild horse populations.

Lands and Realty. This alternative emphasizes a policy of "No net loss of lands in the planning area." No new rights-of-way, permits, leases, and easements would be granted. This approach would not directly affect wild horse herds.

Renewable Energy. Since rights-of-way for renewable energy projects would not be granted, impacts to wild horses would not occur.

Travel Management and Off-highway Vehicle Use. Almost all of the planning area would be closed to off-highway vehicle use, effectively eliminating any conflict of such uses with wild horse herds.

Recreation. Alternative D would involve elimination of organized recreational events, thereby eliminating a potential use conflict in wild horse herd management areas.

Livestock Grazing. Livestock grazing would be eliminated under Alternative D. This would remove the conflict between livestock and wild horse for forage, but also would eliminate some of the water sources used by the wild horse herds.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario. Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Watershed Management. After restoration activities have occurred to meet Standards for Rangeland Health at the watershed level, additional forage would be allocated to wild horses within herd management areas, thus providing increased forage for herds using these treated areas.

Fire Management. This alternative would involve the use of fire suppression only for human-caused events and those that threaten human life and private property. For both the short term and the long term, this alternative would result in substantially greater risk for large, widespread fires that could adversely affect entire herd management areas or large portions thereof.

Noxious and Invasive Weed Management. Management would be the same as Alternative A except selected groups of herbicides would not be allowed. Thus, effective and efficient control of some weed species may not be achieved. This change would have few direct effects relative to wild horses, but would substantially reduce the effectiveness of weed control in the planning area. This approach would tend to facilitate the establishment and spread of various noxious and invasive weeds.

Conclusions. The limited management approach in Alternative D for the existing 24 herd management areas and absence of fire management would result in rapid deterioration of ecological systems within these areas and likely starvation of many animals as populations increase beyond the support level of their habitat. Therefore, Alternative D would fail to achieve the stated goal for this program.

4.9 Cultural Resources

Impact Issues

Cultural resources include, but are not limited to, historic cemeteries and townsites, rockshelters, caves, rock art, and Paleoindian sites. The primary impact mechanisms that could affect cultural resources within the planning area include off-highway vehicle and recreational use, minerals development, land disposal, fire, special designations, and livestock grazing. Some of these mechanisms would have a negative impact

on cultural resources, which would be mitigated through project abandonment, redesign, and, if necessary, data recovery. However, some of these mechanisms may have a positive or beneficial impact on cultural resources, such as protection under an ACEC designation.

Any program, activity, or project has an effect on a cultural resource if it alters any of the characteristics or criteria that may qualify the resource for inclusion on the National Register of Historic Places or otherwise affects a cultural

property's legally protected status. Impacts to cultural properties are considered adverse if the effect diminishes the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Negative or adverse effects can include, but are not limited to: physical destruction of or damage to all or part of a property; alteration of a property (e.g., restoration, rehabilitation, stabilization); removal of a property from its historic location; or, transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation.

Assumptions for Analysis

None.

Interactions with Other Programs

The cultural resource management program within the planning area potentially would be affected by actions within the resource management programs for vegetation, wild horses, visual resources, lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, livestock grazing,

4.0 ENVIRONMENTAL CONSEQUENCES

geology and mineral extraction, fire management, noxious and invasive weed management, and special designations.

Goal

Identify, preserve, and protect significant cultural resources and ensure that they are available for appropriate uses by present and future generations (Federal Land Policy and Management Act, Section 103(c), 201(a), and (c); National Historic Preservation Act, Section 110(a); Archaeological Resources Protection Act, Section 14 (a)).

Seek to reduce imminent threats and resolve potential conflicts from natural or human-caused deterioration, or potential conflict with other resource uses (Federal Land Policy and Management Act, Section 103(c), National Historic Preservation Act, Section 106, 110(a)(2)) by ensuring that all authorizations for land use and resource use will comply with the National Historic Preservation Act, Section 106.

Northeastern Great Basin Resource Advisory Council Standard. Land use plan will recognize cultural resources within the context of multiple use.

Objective

To protect and maintain cultural resources on BLM-administered land in stable condition. Appropriate management actions will be determined after evaluation and allocation of cultural resource use categories through cultural resource project plans.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to cultural resources also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Cultural Resources Management Actions. Under the Proposed RMP, the cultural landscape around National Historic Trails would be managed and protected in compliance with the National Historic Preservation Act and BLM policy. An area of direct effect around the trails would be established as 1 mile on each side of the trail centerline, although in some cases, the area of potential effect may be larger or smaller than 1 mile on each side of the centerline. The Proposed RMP focuses on management of the

setting of the Pony Express National Historic Trail and the California Historic Trail, of which the planning area manages about 15 miles. All cultural properties in the decision area, whether already recorded or projected to occur on the basis of existing data synthesis, including cultural landscapes, or not projected to occur, but later identified through inventory, would be allocated to specific uses according to their nature and relative preservation value. Once an cultural resource receives a cultural resource use allocation, it would be managed for that use and other resource uses would be managed in order to be compatible with the cultural resource use allocations. The use allocations would provide management direction, planning, and funding priorities for the thirteen site types identified. They also would provide priorities for writing cultural resource project plans, inventories, restoration, stabilization, rehabilitation, interpretation, protection, monitoring, and research. See the Glossary for the definitions of each resource use allocations and Section 2.4.9 for designations of specific use allocations for site types found in the planning area.

Impacts from Other Programs.

Vegetation. Vegetation management involves treatments to achieve healthy, resilient, and diverse ecological systems. Vegetation treatments typically involve direct manipulation of vegetation resources and include such activities as burning, chaining, tree cutting, and plowing, all of which can negatively affect cultural resources. Treatment projects would be subject to additional NEPA review and impacts to cultural resources would be avoided or mitigated in adherence to the National Historic Preservation Act and Federal Land Policy and Management Act. Vegetation management also may involve the elimination or modification of activities currently degrading watershed conditions, such as vehicle traffic, hiking, and livestock and wild horse grazing would benefit cultural resources by restoring cultural landscapes and reducing impacts to archaeological sites. Under the Proposed RMP, the increase in vegetation treatments would benefit cultural resources by increasing the percent of the planning area inventoried for cultural resources; however, the potential for indirect and inadvertent as well as direct impacts would increase proportionally to the amount of land undergoing ground disturbing vegetation treatment. Restoration projects would be subject to additional NEPA review, and impacts would be avoided or mitigated in adherence to the National Historic Preservation Act and Federal Land Policy and Management Act.

Wild Horses. Cultural resources are impacted by wild horse use in similar manner to livestock grazing impacts. These impacts are trampling, wallowing, and trailing, especially near fenced or unfenced watering areas, stream banks, and spring sources. The impacts caused by wild horses are nearly indistinguishable from those caused by livestock. These impacts would be mitigated on a case-by-case basis when discovered. Under the Proposed RMP, impacts to cultural resources would be reduced as overall horse numbers would be reduced from current management levels. Possible impacts could occur during gather operations but would generally be avoided in compliance with the National Historic Preservation Act and Federal Land Policy and Management Act.

Visual Resources. Under the Proposed RMP, approximately 3.5 million acres would be managed as Visual Resource Management Class I or II. This potentially would result in indirect protection of settings and landscapes of National Register eligible cultural resources.

4.0 ENVIRONMENTAL CONSEQUENCES

Lands and Realty. No unmitigated impacts to cultural resources are anticipated as a result of potential land disposals. Any parcels disposed of would be subject to NEPA review prior to disposal in adherence to the National Historic Preservation Act and the Federal Land Policy and Management Act. Implementation of best management practices and proposed management actions would prevent lands identified for possible disposal from being transferred to other ownership without mitigation if they contain sites determined eligible for inclusion to the National Register of Historic Places. Lands and realty management would benefit cultural resources through acquisition of culturally sensitive properties.

Rights-of-way within newly designated corridors (0.5- to 0.75-mile-wide under this alternative) would result in a greater number of impacts to cultural resources compared to current management under which no additional corridors would be designated. Applicants for rights-of-way for utilities and communication sites would be encouraged to locate such activities within designated corridors or previously disturbed areas; therefore, the potential for impacts to cultural resources associated with these types of rights-of-way would be the same as those occurring under current management. This use consolidation would benefit cultural resources by ensuring public information about site stewardship and monitoring would occur in these corridors. Impacts associated with these activities would be mitigated to the extent practicable through best management practices (see Appendix F, Section 1).

Renewable Energy. Ground-disturbing activities associated with renewable energy development (i.e., wind or solar energy) would result in mitigated impacts to cultural resources. Authorization of renewable energy projects would be evaluated using an interdisciplinary approach and site-specific NEPA analysis would occur for all renewable energy development projects. Under the Proposed RMP, wind and solar energy and biomass resources could be developed (see Section 2.4.13). Direct impacts to cultural resources on the 4,000 acres that could be disturbed for wind energy development would be expected but mitigated in adherence to the National Historic Preservation Act and Federal Land Policy and Management Act. Renewable energy development areas will test site sensitivity models developed for the Ely RMP/EIS and will assist with predicting the severity of impacts to cultural sites. Impacts associated with these activities would be mitigated to the extent practicable through management practices from the Wind Energy Programmatic EIS (see Appendix F, Section 3).

Travel Management and Off-highway Vehicle Use. Off-highway vehicle activities, particularly if unregulated, are increasingly responsible for damage to all types of cultural/archaeological resources. Compaction, altered surface water drainage, and erosion are all negative impacts to the landscape and, by extension, to cultural resources. The weight and torque of off-road vehicles easily can destroy fragile surface artifacts. In addition, as off-highway vehicles take people into generally unvisited or hard-to-reach areas, the integrity of cultural/archaeological resources would be at greater risk of illegal collection, vandalism, surface disturbance, and site damage. The impacts caused by dispersed off-highway vehicle activity would not be mitigated unless discovered. Under the Proposed RMP, direct and indirect impacts to cultural resources would be substantially reduced. Approximately 1.1 million acres would be closed to off-highway vehicle use and approximately 10.3 million acres would be managed with use limited to designated roads and trails. Designations of roads and trails would occur subsequently at the implementation level.

Recreation. Recreation development can be both beneficial and detrimental in its relationship to cultural resources. A greater use of interpretive developments can increase public awareness and education, which can result in decreased illegal collecting and site vandalism. Conversely, increased development, in general, brings more people to the area and more visitors usually means greater illegal collection and site damage. Developed recreation can be slightly more detrimental to cultural resources than dispersed recreation because it tends to concentrate people in small, predictable areas. Dispersed recreation (e.g., hunting, hiking) tends to attract visitors to places that have not received much use in the past; however, this type of use is much less predictable and measurable. The Proposed RMP designates five new special recreation management areas. These designations are likely to attract additional recreational use to these public lands. The potential increase in recreational activity could lead to greater indirect impacts to cultural resources than under the current management.

Special recreation permit areas would be established to provide opportunities for motorcycle competitive events. Direct impacts to cultural/archaeological resources located within the permit areas would be mitigated through adherence to the National Historic Preservation Act and Federal Land Policy and Management Act. However, it is anticipated that a greater number of indirect impacts to cultural/archaeological resources located in the vicinity of the motorcycle events would occur due to the increased number of visitors to these areas. Indirect impacts would be mitigated on a case-by-case basis as discovered.

Livestock Grazing. Direct impacts associated with range improvements would be mitigated; however, other impacts may occur as a result of livestock grazing activities. Livestock congregation and trailing at or across cultural resource site locations can damage artifacts and the contexts in which they occur. Cattle shading and rubbing can damage standing historic structures and petroglyph and pictograph panels. Excessive trampling at spring sources and along stream banks, cattle trailing, and poorly managed grazing can all lead to a denuding of protective vegetation cover and create indirect impacts to cultural/archaeological resources by accelerating natural erosion and exposing artifacts to illegal surface collection and vandalism. These types of impacts generally would be localized at particular site locations, and could range from short-term to long-term to irreversible. Livestock grazing will continue to be authorized for approximately 424,602 animal unit months on 8.4 million acres for allotments that have been determined to be meeting or progressing toward achievement of the standards for rangeland health. These will continue as needed to meet RMP goals and objectives including the standards for rangeland health. Current livestock grazing will be maintained for 120,665 animal unit months on 3.2 million acres until allotments have been evaluated for progress toward achievement of the standards for rangeland health. Changes to livestock grazing use will be made as needed to meet or progress toward achievement of the standards. These actions would lessen the impacts to the resource. Better management and restored forage base through restoration activities could reduce impacts or could be used to draw animals away from sensitive areas, particularly accompanied by awareness briefings to permittees. Possible impacts to cultural resources would occur during construction of range improvements (troughs, pipelines, fencelines, etc.). Impacts to cultural resources would be avoided or mitigated in compliance with the National Historic Preservation Act and Federal Land Policy and Management Act.

4.0 ENVIRONMENTAL CONSEQUENCES

Under the Proposed RMP, there would be fewer acres available for livestock grazing compared to current management on approximately 40 acres in the proposed Snake Creek Indian Burial Cave ACEC and 80 acres on the proposed Baker Archaeological Site ACEC. This would reduce impacts by livestock to cultural resources in the planning area.

Geology and Mineral Extraction. Under the Proposed RMP and under current management, surface-disturbing activities associated with mineral exploration and development would result in mitigated impacts (which may include data recovery) to cultural resources. The potential for indirect and inadvertent impacts would increase proportionally to the amount of land developed, which is expected to total approximately 17,100 acres over the reasonably foreseeable future. Fluid minerals management within the Sunshine Locality National Register District would be changed to a combination of no surface occupancy around the perimeter and closed within the center. Impacts to cultural resources associated with mineral extraction would be avoided or mitigated (which may include data recovery) in compliance with the National Historic Preservation Act and Federal Land Policy and Management Act, and best management procedures for mineral leasing.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available), and other tools would be used to the greatest extent practical under the Proposed RMP. This alternative has the potential for direct as well as indirect and inadvertent impacts to cultural resources as not all cultural resources are fire sensitive, but all are fire suppression sensitive. Planned fires would have less impact on cultural resources than catastrophic wildland fires. Areas proposed for prescribed burning would be inventoried for cultural/archaeological resources and impacts avoided or mitigated. Prescribed fires can indirectly impact archaeological sites by increasing short-term ground surface visibility. The greater visibility makes artifacts more accessible and can lead to increased illegal collection. These short-term impacts are mitigated through prior inventory, systematic surface artifact collection, and post-fire monitoring. Impacts to cultural resources would be avoided or mitigated in compliance with the National Historic Preservation Act and Federal Land Policy and Management Act.

Noxious and Invasive Weed Management. Treatment methods for noxious and invasive weed control include chemical, mechanical, cultural, or biological. Chemical treatments would negatively impact cultural resources (impacting dating accuracy) (BLM 2004a; BLM 2005c), and ground disturbing mechanical treatments can negatively impact cultural resources by disturbance/destruction of the resource. These impacts would primarily be mitigated through avoidance or data recovery in adherence to the National Historic Preservation Act.

Special Designations. Special designations (e.g., ACECs), with an emphasis on natural values, would benefit cultural resources by protecting and preventing irreparable damage to important cultural values, as well as historic and scenic values. The special designation would reduce or eliminate surface disturbances, which often are caused by activities such as off-highway vehicle use, grazing, range improvements, rights-of-way placements, and mineral entry. Restricting these activities would result in increased ground cover, leading to a reduction in soil erosion, which would help to maintain the integrity of cultural sites. While a special designation may emphasize one or more unique resource, other existing multiple-use management can continue within a special designation so long as the uses do not impair the values for which the area was designated.

Under the Proposed RMP, 20 ACECs would be designated, and 8 of these would be designated to protect and preserve relevant and important cultural values. These would include Baker Archaeological Site, Hendry's Creek/Rock Animal Corral, Honeymoon Hill/City of Rocks, Mount Irish, Pahroc Rock Art, Shooting Gallery, Snake Creek Indian Burial Cave, and Swamp Cedar. Designation of these ACECs would help protect cultural resources. Back country byways are not expected to affect cultural resources.

Forest/Woodland and Other Plant Products. Allowing fuelwood harvest throughout the entire planning area (except some restricted locations) could potentially impact cultural resources in areas where surveys have not been completed. Impacts would be mostly to historic features associated with or connected to pinyon and juniper trees. The amount of impacts to these features is expected to be minimal based on the anticipated level of harvest activities and locations where harvest will take place.

Conclusion. There would be a higher level of protection of cultural resources through use allocations, with 100 percent of the sites determined eligible to the National Register of Historic Places allocated and managed for Conservation, Scientific, and Public Use, and the designation of 8 new ACECs. There also would be more protection of cultural/archaeological resources than current management due to the decrease in lands open to off-highway vehicle use, wild horses, and livestock grazing. The level of protection from impacts associated with fire management and recreation activities would be greater than current management. The Proposed RMP would meet the goals for the cultural resources program, including the Resource Advisory Council Standards.

Alternative A

Impacts from Cultural Resources Management Actions. The cultural landscape around National Historic Trails would be managed and protected in compliance with the National Historic Preservation Act and BLM policy. An area of direct effect around the trails would be established as 1 mile on each side of the trail centerline, although in some cases, the area of potential effect may be larger than 1 mile on each side of the centerline. Alternative A focuses on management of the setting of the Pony Express National Historic Trail and the California Historic Trail, of which the Ely Field Office manages about 15 miles.

Class II inventories (sample surveys) would be conducted in areas identified as high potential for aboriginal site occurrence (e.g., rock art sites, rockshelters, caves, toolstone sources or quarries, large or complex prehistoric sites and camps, agave roasting pits, antelope walls, geoglyphs, and intaglios [i.e., engraved designs]). Rock art sites, historic sites, agave roasting pits, antelope walls, geoglyphs, and intaglios would be monitored for vandalism and natural deterioration.

A Cultural Resources Project Plan would be developed for the Mount Irish Archaeological District, Delamar townsite, and Sunshine Locality National Register District. The plan would outline protection measures and discuss use allocation objectives for these sites, as well as specify actions to be taken under the plan. The Delamar townsite and cemetery would be inventoried to determine the cultural and historical values.

4.0 ENVIRONMENTAL CONSEQUENCES

Under Alternative A, cultural resources would continue to be managed for future Cultural Resource Use Allocations. Direct impacts to historic properties eligible to the National Register of Historic Places would be avoided or mitigated in accordance with federal and state laws. Indirect impacts in the form of illegal collecting, vandalism, or inadvertent damage to cultural/archaeological resources would continue to increase over time as the number of visitors to the area increases.

Impacts from Other Programs. Impacts to cultural resources from the noxious and invasive weed management program would be the same as described for the Proposed RMP.

Vegetation. Vegetation restoration and management activities would be undertaken at a relatively low level, and implementation primarily would be in reaction to changes that occur from events such as fire or other disturbance. Similarly, effects on cultural resources would be low to moderate. Restoration treatments would be subject to NEPA review and impacts to cultural resources would be avoided or mitigated in adherence to the National Historic Preservation Act and Federal Land Policy and Management Act.

Wild Horses. Wild horses would be managed within 24 management areas including several areas where scarcity of forage and water result in localized concentrations of use which can be destructive for any cultural/archaeological resources in the vicinity.

Visual Resources. Management of approximately 1.7 million acres under Visual Resource Management Classes I and II would provide less protection of the visual setting where cultural/archaeological resources occur than the Proposed RMP.

Lands and Realty. Cultural resource impacts associated with potential land disposals would be similar to those identified for the Proposed RMP. The negative impacts created by the construction of rights-of-way (e.g., transmission lines, pipelines, and communication sites) would be mitigated by adherence to the National Historic Preservation Act and Federal Land Policy and Management Act. No additional corridors would be designated and all linear rights-of-way would be encouraged to locate within existing designated corridors. Under this alternative, the number of acres withdrawn from mineral entry would be determined on a case-by-case basis.

Renewable Energy. Impacts to cultural/archaeological resources would be similar to those described for the Proposed RMP and would be avoided or mitigated in compliance with the National Historic Preservation Act and Federal Land Policy and Management Act. Impacts associated with these activities would be mitigated to the extent practicable through management practices from the Wind Energy Programmatic EIS (Appendix F, Section 3).

Travel Management and Off-highway Vehicle Use. It is anticipated that occurrences of surface disturbance, illegal collecting, and vandalism associated with off-highway vehicle use would be high due to the open class use designation in the planning area.

Recreation. Recreation development projects and planned off-highway vehicle events would be cleared and impacts to cultural resources mitigated through adherence to the National Historic Preservation Act and Federal Land Policy and Management Act. No organized off-highway vehicle events would be

permitted in the Baker Archaeological Site or Garrison Archaeological Site areas, thereby providing some level of resource protection. The effects of dispersed recreation would be mitigated on a case-by-case basis as discovered.

Livestock Grazing. Livestock grazing impacts and allotment evaluations would continue as described in the Proposed RMP. Impacts associated with livestock activities would be mitigated on a case-by-case basis as discovered.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that of the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP. The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Fire Management. The use of prescribed fire, wildland fire use (approximately 3.6 million acres available) and other tools would not be used to the greatest extent practical as under the Proposed RMP. Impacts from Alternative A would be similar to those in the Proposed RMP. Under Alternative A, puebloan sites would be protected from vehicular traffic associated with fire suppression in the event of fire on or near these sites. Existing standard operating procedures would protect fire-sensitive cultural resources (e.g., rock art sites, historic buildings and structures) located within fire management polygons.

Special Designations. No new ACECs would be designated. The Kane Springs, Mormon Mesa, and Beaver Dam Slope ACECs previously were established and would be retained under Alternative A. These ACECs are managed primarily for the protection of the desert tortoise and would be less important in protecting cultural resources.

Conclusion. Cultural resources would continue to be managed for future resource use allocations. Indirect impacts associated with off-highway vehicle use, wild horses, livestock grazing, and recreational activities would continue to occur under existing management. Alternative A would not meet the goals for the cultural resources program but would meet the Resource Advisory Council Standards.

4.0 ENVIRONMENTAL CONSEQUENCES

Alternative B

Impacts from Cultural Resources Management Actions. Cultural resource impacts as a result of program-specific management activities would be similar to those described for the Proposed RMP; however, the magnitude of effects would vary based on the resource use allocations identified for this alternative (see Section 2.6.9, Cultural Resources).

Impacts from Other Programs. Impacts to cultural resources from vegetation, wild horses, visual resources, renewable energy, travel management and off-highway vehicle use, geology and mineral extraction, fire management, and noxious and invasive weed management essentially would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Lands and Realty. Cultural resource impacts associated with possible land disposal management activities would be the same as described for the Proposed RMP. Under Alternative B, rights-of-way within newly designated corridors (1.0-mile-wide under this alternative) potentially would result in a greater number of cultural resources impacts. However, all linear rights-of-way related to fiber optic cables and specific transmission lines and pipelines would be located within designated corridors; thereby, reducing dispersed rights-of-way and resulting in fewer potential impacts to cultural resources. Impacts associated with these activities would be mitigated to the extent practicable through best management practices (see Appendix F, Section 1).

Recreation. Indirect impacts to cultural resources are expected to increase because there would be greater numbers of special recreation management areas compared to the Proposed RMP.

Livestock Grazing. It is anticipated that livestock grazing management activities under Alternative B would result in fewer impacts to cultural resources compared to Alternative A and the Proposed RMP, because there would be a decrease of approximately 3.0 million acres (bighorn sheep habitat) in the areas available for livestock grazing (see Section 2.6.8). Better management and restored forage base through restoration activities could slightly reduce impacts or could be used to draw animals away from concentrating in or near sensitive areas.

Special Designations. Eighteen ACECs would be designated and 10 of these would be designated to protect and preserve relevant and important cultural values. These would include Baker Archaeological Site, Ward Mining District, Snake Creek Indian Burial Cave, Shooting Gallery, Hendry's Creek/Rock Animal Corral, Honeymoon Hill/City of Rocks, Mount Irish, Pahroc Rock Art, Osceola/Osceola Ditch, and Swamp Cedar. Designation of these ACECs would help protect cultural/archaeological resources.

Conclusion. Management of cultural resources would be the same as the Proposed RMP. The level of protection from recreation activities would be greater than the current management. Alternative B would meet the goals for the cultural resources program, including the Resource Advisory Council Standards.

Alternative C

Impacts from Cultural Resources Management Actions. Cultural resource impacts as a result of program-specific management activities would be similar to those described for the Proposed RMP; however, the magnitude of effects would vary based on the resource use allocations identified for this alternative (see Section 2.7.9, Cultural Resources). The level of protection would be lower as more sites would be allocated as Discharged from Management.

Impacts from Other Programs. Cultural resources impacts associated with wild horses, visual resources, and renewable energy, geology and mineral extraction, and noxious and invasive weed management essentially would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Vegetation. Vegetation restoration activities would be similar in magnitude to the Proposed RMP; however, treatments would focus on creation of plant communities conducive to the commodity emphasis of this alternative. These treatments would involve greater reliance on mechanical and chemical treatments as opposed to prescribed fire. This approach would result in greater potential impacts to cultural resources.

Lands and Realty. Cultural resources impacts associated with possible land disposals would be the same as those identified for the Proposed RMP except for the increased acreage available for possible disposal. Under Alternative C, cultural resources impacts associated with rights-of-way within newly designated corridors would be the same as described for the Proposed RMP, with the exception that these corridors would be 3 miles in width. All linear rights-of-way related to fiber optic cables and specific transmission lines and pipelines would be encouraged to locate within designated corridors; therefore, the potential for cultural resources impacts associated with these types of rights-of-way would be the same as described for the Proposed RMP.

Travel Management and Off-highway Vehicle Use. Reduced impacts to cultural resources would be similar to the Proposed RMP except approximately 32,000 acres would be open to off-highway vehicles on the dry lakebeds in Delamar, Garden, and Dry Lake valleys. The "open" designation on these dry lakebeds would concentrate off-highway vehicle use in these areas. The off-highway vehicle "open" designation would result in impacts to cultural resources on the margins of the dry lakebeds in all three valleys. In addition, this designation would result in impact to cultural resources located on the floor of Garden Valley dry lakebed(s).

Recreation. Indirect impacts to cultural resources are expected to increase because there would be greater numbers of special recreation management areas, special recreation permit areas, and routes for motorcycle and truck events compared to the Proposed RMP.

Livestock Grazing. There would be a slight decrease in the areas available for livestock grazing (see Section 2.7.8), and better management and restored forage base through restoration activities could slightly reduce impacts or could be used to draw animals away from concentrating in or near sensitive areas.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts of livestock grazing on cultural resources would be generally similar to the Proposed RMP and livestock grazing and allotment evaluations would continue as described in the Proposed RMP.

Fire Management. The full suppression approach of Alternative C would initially reduce potential impacts to cultural resources but could increase impacts when fuel accumulations reach the point that suppression efforts fail to control large fires.

Special Designations. Twenty ACECs would be designated, of which 10 would be designated to protect and preserve relevant and important cultural values. The 10 new ACECs would be the same as those identified for Alternative B.

Conclusion. Cultural resource use allocations would protect cultural/archaeological resources; however, there would be a lower level of protection since more sites would be allocated as Discharged from Management. The decrease of lands open to off-highway vehicle use would provide more protection of cultural resources than current management. The level of protection from impacts associated with recreation and fire management would be lower than Alternative A and the Proposed RMP. Alternative C would meet the goals for the cultural resources program, including the Resource Advisory Council Standards.

Alternative D

Impacts from Cultural Resources Management Actions. Cultural resources impacts as a result of program-specific management activities would be similar to those described for the Proposed RMP; however, the magnitude of effects would vary based on the resource use allocations identified for this alternative (see Section 2.8.9, Cultural Resources).

Impacts from Other Programs. Cultural resources impacts associated with wild horses and noxious and invasive weed management activities would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Vegetation. Vegetation restoration activities would not be accelerated in comparison to the Proposed RMP. Restoration would be implemented primarily in areas dominated by invasive nonnative species or seeded nonnative species. Impacts to cultural resources would be similar to but less than the Proposed RMP.

Visual Resources. Approximately 11.5 million acres would be managed as Visual Resource Management Classes I and, II potentially resulting in more indirect protection for cultural/archaeological resources than under the Proposed RMP.

Lands and Realty. There would be no net loss of public lands in the decision area. As a result, there would be a lower potential for impacts to cultural resources as activities on lands retained under BLM jurisdiction would be subject to the requirement of the National Historic Preservation Act and Federal Land Policy Management Act. Under Alternative D, there would be no new land use authorizations such as right-of-way and communication site grants, so there would be no impacts to cultural/archaeological resources.

Renewable Energy. There would be no impact to cultural resources from renewable energy development because there would be no new land use authorizations.

Travel Management and Off-Highway Use. Fewer impacts to cultural resources would be anticipated, since no areas would be open to off-highway vehicle use and 11.0 million acres would be closed to off-highway vehicle use.

Recreation. No motorcycle and truck races would be permitted thus eliminating impacts from these events on cultural resources.

Livestock Grazing. Fewer impacts to cultural resources would occur compared to the Proposed RMP because livestock grazing would be eliminated throughout the decision area.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario. Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development would be much less in Alternative D than in the Proposed RMP.

Fire Management. Alternative D would emphasize reduced suppression of wildland fires except to protect life and property in the long term. Under this alternative, effects would be higher than the Proposed RMP with high potential for major, widespread fires.

Special Designations. No ACECs for the protection of cultural resources would be designated under Alternative D; however, the reduction of other activities would reduce the need for special management. Therefore, impacts to cultural resources are expected to be minimal.

Conclusion. More cultural resources would be allocated and managed for Conservation Use, which would provide a higher level of protection compared to the Proposed RMP. The level of protection of cultural/archaeological resources from off-highway vehicle use, recreation, and livestock grazing would be greater than all other alternatives. Fire management activities would pose a higher risk to cultural resources than all other alternatives. Alternative D would meet the goals for the cultural resources program, but would not meet the Resource Advisory Council Standards.

4.10 Paleontology

Impact Issues

Impacts to paleontological resources would be measured by physical damage to fossil-bearing formations through excavation or surface disturbance. The primary impact mechanisms that could affect paleontological resources within the planning area include off-highway vehicle use, minerals development, land disposal, and special designations. However, some of these mechanisms may have positive or beneficial impacts on paleontological resources.

Fossils are part of the geological units in which they occur and may be extensively distributed both vertically and horizontally throughout the unit. Fossil localities noted to occur within a given geologic unit indicate that the unit may yield fossils throughout its entire areal extent, which may be several hundred or several thousand square miles. Thus, knowledge of the outcrop pattern of geologic units, and the kinds and quality of the fossils produced by such units, is a critical management tool for land-use decision-making where fossils may be involved.

Assumptions for Analysis

None.

Interactions with Other Programs

The paleontology management program within the planning area potentially would be affected by actions within the resource management programs for lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, and geology and mineral extraction.

Goal

Identify and manage at-risk paleontological resources (scientific value), preserve and protect vertebrate fossils through best science methods, and promote public and scientific use of invertebrate and paleobotanical fossils.

Objective

To manage fossil sites with high scientific value in a stable condition, while allowing appropriate research and casual public collecting.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality

4.0 ENVIRONMENTAL CONSEQUENCES

regulations. Impacts to paleontological resources also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Paleontology Management Actions. All paleontological resources in the decision area, whether already recorded or projected to occur on the basis of existing data synthesis, would be allocated for specific uses according to their nature and relative preservation value. The use allocations would reduce impacts thereby increasing the preservation of paleontological resources. See Section 2.4.10 for the definitions of use allocations and their application for specific types of paleontological resources. The no-fee registration system at trilobite collection localities would allow the Ely Field Office to protect the resource while allowing for reasonable collecting by the public.

Impacts from Other Programs.

Lands and Realty. Potential land disposals would not impact known paleontological resources, because the resources would be surveyed prior to land transfers and important paleontological resources would be eliminated from possible disposal parcels. Acquiring lands containing sensitive fossil localities would protect paleontological resources for future public and scientific use. Proposed rights-of-way would be inventoried prior to construction. Fossil specimens located during inventory would be documented and collected. The documentation would add to the body of knowledge about paleontological resources in the planning area; however, any discovered paleontological resources located in proposed disturbance areas would be permanently removed from their original context. Rights-of-way within newly designated corridors (0.5- to 0.75-mile-wide under this alternative) potentially would result in impacts to paleontological resources. All linear rights-of-way, related to fiber optic cables, transmission lines, pipelines, and communication sites would be encouraged to locate within designated corridors and existing sites.

Renewable Energy. Based on estimates of the reasonably foreseeable development of renewable energy resources, approximately 4,000 acres within the planning area could be affected by construction activities. Such activities would be subject to additional site-specific environmental investigation and NEPA analysis prior to development. Appropriate protection or mitigation measures would be identified at that time.

Travel Management and Off-highway Vehicle Use. Unrestricted off-highway vehicle use damages paleontological resources by soil compaction, altered surface water drainage, and erosion. Repeated hill climbing and damage to slopes, soils, and vegetation would result in damage to paleontological resources by directly wearing down rock formations or causing accelerated erosion. Fewer impacts to paleontological resources would be anticipated since there would be a decrease in the area open to off-highway vehicle use and an increase in the area closed to off-highway vehicle use compared to current management.

Approximately 10.3 million acres would be classified as limited, thereby reducing impacts outside of designated roads and trails.

Recreation. The demand for use of both vertebrate and invertebrate fossils has increased in the planning area, as well as the casual-use and collection of invertebrate fossils, in particular trilobites, by rockhounds and fossil collectors. Common invertebrate fossils, such as plants, mollusks, and trilobites may be collected for personal use in reasonable quantities, but may not be bartered or sold. A no-fee registration system would be established for known trilobite localities. It is anticipated that the no-fee registration system would be used as a management tool to track the number of people visiting these localities and associated impacts. If necessary, trilobite collecting localities would be closed if increased use is impacting the resource.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario, would be disturbed throughout the 11.5 million acre decision area. Mineral extraction would have the potential to affect paleontological resources. A review of paleontological resources would be required prior to ground-disturbing activities associated with mineral development, as well as documentation or collection of specimens discovered during operations. The documentation would add to the body of knowledge about paleontological resources in the planning area. Selected paleontological resources discovered in proposed disturbance areas would be placed in museums. This process would add to the body of scientific knowledge.

Conclusion. Paleontological resources would be protected under the Proposed RMP, because they would be allocated and managed for Scientific, Conservation, and/or Public Use. An increase in the number of acres withdrawn from mineral entry and a decrease in lands open to off-highway vehicle use would reduce impacts to paleontological resources. The no-fee registration system would increase the protection of known trilobite localities by tracking the amount of use and associated impacts. The Proposed RMP would meet the goal for the paleontology program.

Alternative A

Impacts from Paleontology Management Actions. Paleontological resource impacts associated with program-specific management activities would be the same as described for the Proposed RMP. There would be no registration system at trilobite collecting localities, which would make it difficult to track and manage the intensity of use of the resource.

Impacts from Other Programs. Impacts to paleontological resources associated with lands and realty and renewable energy would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Travel Management and Off-highway Vehicle Use. The potential for impacts to paleontological resources would be high due to the open use classification on 9.8 million acres in the decision area.

4.0 ENVIRONMENTAL CONSEQUENCES

Recreation. No registration system currently is in place for invertebrate fossil collecting. In the planning area, illegal commercial collecting of trilobites and individuals collecting far more than is considered "reasonable quantities" of trilobites for personal use is occurring, both of which impact the resource and are expected to continue.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals, and mineral materials would be relatively the same as in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP. The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Conclusion. Paleontological resources would be managed the same as the Proposed RMP, but no registration system would be in place for trilobite collecting. The amount of unauthorized collecting of common invertebrate fossils (e.g., trilobites) and impacts associated with off-highway vehicle use would continue to increase as recreation and visitor use increases. Alternative A would not meet the goal for the paleontology program.

Alternative B

Impacts from Paleontology Management Actions. Paleontological resource impacts associated with program-specific management activities would be the same as described for the Proposed RMP.

Impacts from Other Programs. Impacts to paleontological resources associated with renewable energy, travel and off-highway vehicle use, recreation, and geology and mineral extraction would be the same as described for the Proposed RMP.

Lands and Realty. Wider corridors are allowed for under this alternative compared to the Proposed RMP; therefore, additional disturbances could be associated with this alternative.

Conclusion. Paleontological resources would be protected, because they would be allocated and managed for Scientific, Conservation, and/or Public Use. An increase in the number of acres withdrawn from mineral entry and a decrease in lands open to off-highway vehicle use would reduce impacts to paleontological resources. The no-fee registration system would increase the protection of known trilobite localities by tracking the amount of use and associated impacts. Alternative B would meet the goal for the paleontology program.

Alternative C

Impacts from Paleontology Management Actions. Paleontological resource impacts associated with program-specific management activities would be the same as described for the Proposed RMP. The fee-base registration system for trilobite collecting would be expected to reduce the intensity of collecting and impacts to the resource.

Impacts from Other Programs. The level of impacts to paleontological resources associated with lands and realty, renewable energy, travel management and off-highway vehicle use, and geology and mineral extraction would be similar to or the same as those identified for the Proposed RMP. The following interrelated program would result in different impacts compared to the Proposed RMP.

Recreation. Under this alternative, a fee-based registration system would be established for known trilobite localities. It is anticipated that the fee-based registration system would be used as a management tool to track the number of people visiting these localities and associated impacts. If necessary, trilobite collecting localities would be closed if increased use is impacting the resource.

Conclusion. Management of paleontological resources would be the same as the Proposed RMP, with the exception of the registration system. The fee-based registration system could reduce the number of trilobite collectors, as well as increase the protection of trilobite collecting localities and associated impacts by tracking the amount of use and associated impacts. The decrease in lands open to off-highway vehicle use would reduce impacts to paleontological resources. Alternative C would meet the goal for the paleontology program.

Alternative D

Impacts from Paleontology Management Actions. Impacts to paleontological resources as a result of program-specific management activities would be the same as described for the Proposed RMP. Trilobite collecting localities would be closed, further reducing impacts to the resource.

Impacts from Other Programs.

Lands and Realty. There would be no net loss of public lands nor new land use authorizations such as rights-of-way authorizations in the decision area, which would minimize impacts to paleontological resources.

Renewable Energy. With the elimination of discretionary actions and authorizations within the planning area, there would be no wind energy development on public lands and no impacts of such activities to paleontological resources.

Travel Management and Off-highway Vehicle Use. Fewer impacts to paleontological resources would be anticipated, since no areas would be open to off-highway vehicle use and 11.0 million acres would be closed to off-highway vehicle use.

4.0 ENVIRONMENTAL CONSEQUENCES

Geology and Mineral Extraction. The entire decision area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario. Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Recreation. All trilobite collecting locations would be closed, which would reduce impacts to the resource compared to the Proposed RMP.

Conclusion. Management of paleontological resources would be the same as the Proposed RMP, with the exception of trilobite collecting. Under this alternative, all trilobite collecting localities would be closed, which would provide a higher level of protection of these fossils compared to all other alternatives. The increase in lands closed to off-highway vehicle use would reduce impacts to paleontological resources. Alternative D would meet the goal for the paleontology program.

4.11 Visual Resources

Impact Issues

The primary impact issue associated with visual resources management is surface disturbing activities that are a result of management actions of other resource programs.

Assumptions for Analysis

None.

Interactions with Other Programs

The visual resources management program within the decision area potentially would be affected by actions within the resource management programs for vegetation, lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, livestock grazing, forest/woodland and other plant products, geology and mineral extraction, fire management, and special designations.

Goal

Manage public land actions and activities in a manner consistent with Ely Field Office visual resource management class objectives.

Objective

To implement multiple use activities within the decision area with mitigation measures consistent with the visual resource management classes.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to visual resources also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. Mitigation measures were considered within the following impact analysis section in response to anticipated impacts. Additional "proposed mitigation" for visual resources is identified in Section 4.29, Proposed Mitigation and Potential Effectiveness. In order to be carried forward as part of the Approved RMP, these "proposed mitigation measures" would have to be incorporated into the final decision documented in the Record of Decision. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis.

4.0 ENVIRONMENTAL CONSEQUENCES

These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Visual Resources Management Actions. Under the Proposed RMP, visual resource management would be based on the revised visual inventory compiled for the decision area and presented on **Map 2.4.11-1**, Visual Resources Management Classes Proposed RMP and Alternative B. Acreages for the four visual resource management classes are presented in Section 2.4.11. The change in acreage from current management under the Proposed RMP is summarized in **Table 4.11-1**.

Table 4.11-1
Changes in Visual Resource Management Classification in
Proposed RMP from Current Management

Visual Resource Management Class	Approximate Change in Acreage
I	- 0.31 million
II	+ 2.11 million
III	+ 4.20 million
IV	- 2.42 million
No Classification	- 3.58 million

Establishing visual resource management classes for areas that were previously unclassified, increasing the acreage of land in Class II and III, and reducing the acreage of land in Class IV, would preserve or enhance scenic values in the decision area as compared to current management.

By classifying designated utility corridors as Class IV, consistent with their potential future use, project proponents would be encouraged to locate proposed facilities within corridors. The Proposed RMP designates a Class II corridor along the Pony Express Trail. This designation would provide greater protection of scenic values along the trail than current management.

Impacts from Other Programs.

Vegetation. Under the Proposed RMP, the areas identified for potential vegetation treatments would total approximately 7.1 million acres, or 62 percent of the decision area. However, this treatment would be spread over several decades, allowing vegetation in treated areas to recover as new areas are treated. Since the use of fire would be maximized under this alternative, a noticeable change in landscape appearance would occur during the short term on treated areas. However, in the long term, the reestablishment of diverse plant life forms rather than homogenous communities of grasses, shrubs, or trees would improve scenic values. Vegetation treatment areas with linear margins, such as from mechanical treatment, would introduce unnatural visual elements into the landscape. Treating vegetation in wildland/urban interface areas might make these impacts more apparent.

4.11 Visual Resources

Lands and Realty. Under the Proposed RMP, land and realty actions such as utility rights-of-way and communication site development potentially would impact visual resources. However, objectives for each visual resource management class identified in Section 3.11 would be managed for under the Proposed RMP. Visual resource contrast ratings would be completed as part of the evaluation of any proposed project. This analysis would result in recommended mitigation measures that would meet specific objectives for each visual resource management class in the project area. The objective to locate large linear projects within designated 0.5- to 0.75-mile-wide corridors and to co-locate communication sites would localize impacts to visual resources, but also would potentially increase visual impacts in the viewsheds where these corridors are located. The construction of smaller projects or facilities ancillary for larger projects, such as communication lines, electrical lines, pipelines, and access roads, may take place outside of designated corridors. Such projects would have lesser impacts to visual resources, which may be more effectively mitigated to achieve visual resource management objectives. Approximately 75,600 acres would be available for disposal, and development of disposed lands could lead to visual impacts in these areas. Impacts associated with these activities would be mitigated to the extent practicable through best management practices (see Appendix F, Section 1).

Renewable Energy. Renewable energy development would have impacts on visual resources from the construction of wind turbines and solar collectors. Since biomass utilization would be dependent on vegetation treatment, impacts are contained in the Vegetation section above. Renewable energy projects can potentially cover a large surface area (40,000 acres), resulting in a high degree of impact to the visual setting of a project. It may not be possible to mitigate such impacts to meet the visual resource management objectives for affected areas. The impacts from rights-of-way for ancillary access roads, pipelines, and transmission lines are discussed under Lands and Realty above. Impacts associated with these activities would be mitigated to the extent practicable through management practices from the Wind Energy Programmatic EIS.

Travel Management and Off-highway Vehicle Use. Under the Proposed RMP, travel management and off-highway vehicle use management actions would reduce impacts on visual resources by restricting cross-country off-highway vehicle use on approximately 10.3 million acres (90 percent) of the decision area, initially to existing roads and trails and subsequently to designated roads and trails, as determined through a public process and area-specific analysis. No areas would be classified as open. This management action would reduce impacts from surface disturbances and dust generation. Localized disturbances to visual resources could still occur from off-highway vehicle use.

Recreation. There would be a potential for recreation management to affect visual resources. Development of recreation facilities may occur, potentially causing impacts to visual resources. However, implementation of mitigation measures for developed facilities based on the visual resources management class objectives would minimize these impacts. However, mitigation measures to protect scenic values would be identified in site-specific management plans. By emphasizing these recreation activities in specific areas, impacts to visual resources in other parts of the decision area would be limited.

Livestock Grazing. Livestock grazing activities could impact visual resources. Maintenance and potential construction of fencing and water tanks would have minimal impacts on the visual resources of

4.0 ENVIRONMENTAL CONSEQUENCES

existing landscapes. Additionally, grazing activities within riparian areas and other vegetation communities potentially would impact visual resources through vegetation loss and soil exposure in areas of concentrated use. Livestock grazing will continue to be authorized for approximately 424,602 animal unit months on 8.4 million acres for allotments that have been determined to be meeting or progressing toward achievement of the standards for rangeland health. These will continue as needed to meet RMP goals and objectives including the standards for rangeland health. Current livestock grazing will be maintained for 120,665 animal unit months on 3.2 million acres until allotments have been evaluated for progress toward achievement of the standards for rangeland health. Changes to livestock grazing use will be made as needed to meet or progress toward achievement of the standards. These actions would lessen the impacts to the resource.

Forest/Woodland and Other Plant Products. The private and commercial use of forest/woodland and other plant products would have minimal impacts on visual resources. Plant collection activities and Christmas tree collection would have limited impacts on visual resources in and adjacent to collection areas. However, under the forest/woodland products program, all operations would be restricted to areas where resource surveys have been conducted, which would include visual resource management assessment.

Geology and Mineral Extraction. Geology and mineral extraction would impact visual resources. Authorization of surface-disturbing and surface-occupying activities related to mining, oil and gas development, and geothermal development would impact visual resources. However, these impacts would be limited to approximately 17,100 acres of reasonably foreseeable development estimated for the next 20 years (0.14 percent of the planning area). Additionally, mitigation measures would be required for mineral development based on the visual resource management class objectives, thereby reducing overall impacts to visual resources.

Fire Management. Fire management activities have the potential to substantially affect visual resources. Long-term impacts may result from surface-disturbing suppression activities, such as the use of bulldozers to construct fire lines and the driving of fire equipment cross-country. Prescribed fire and wildland fire use activities, which would be maximized under this alternative, may have short-term impacts on visual values. Long-term impacts to visual resources would vary according to spatial arrangement, vegetation mosaics created, and proximity of treatments to high-use locations such as recreation areas.

Special Designations. Special designations would have the potential to reduce impacts to visual resources through special management. Ten of the 20 proposed ACECs would be designated as partially or totally Visual Resource Management Class I areas (see Section 2.4.22). The Blue Mass Scenic Area ACEC would be designated as a Visual Resource Management Class I area, protecting its scenic qualities. Approximately 1.1 million acres of designated wilderness and 81,000 acres in wilderness study areas would be managed as Visual Resource Management Class I. Designating approximately 297,000 acres of new ACECs as right-of-way avoidance areas and 25,000 acres of new ACECs as right-of-way exclusion areas would further protect scenic values in those areas.

Conclusion. Management prescriptions under the Proposed RMP would classify approximately 1.2 million acres as Visual Resource Management Class I and 2.4 million acres as Visual Resource Management Class II. Having classifications for all lands within the decision area would allow for a more comprehensive

framework for preserving and mitigating impacts to visual resources. Maximizing the use of prescribed fire and wildland fire use would create short-term visual impacts that would diminish in the long term after treatments are completed. The Proposed RMP would meet the goal for the visual resources program.

Alternative A

Impacts from Visual Resources Management Actions. Under Alternative A, visual resource management classes would continue to use the visual inventory compiled for the Schell and Caliente Resource Areas, as presented in **Map 2.5.11-1**, Visual Resources Management Classes Alternative A. The balance of the decision area (the Egan Resource area) would remain unclassified, but visual resource management classes would be established on a project-specific level. The lack of comprehensive visual resources management for the entire decision area could reduce visual resource quality due to a lack of coordinated visual resource protection. The lack of comprehensive visual resource management also could result in legal challenges when the classifications are established at the project-specific level.

Impacts from Other Programs. Visual resource impacts associated with renewable energy, livestock grazing, forest/woodland and other plant products, and fire management activities would be similar to those described for the Proposed RMP.

Vegetation. The areas identified for potential vegetation treatments would total approximately 2.9 million acres, or 25 percent of the decision area. The impacts of these treatments to visual resources would be similar to those described for the Proposed RMP.

Lands and Realty. The impacts of land and realty actions on visual resources would be similar to those described for the Proposed RMP. Approximately 31,900 acres would be available for disposal, and development of disposed lands could lead to visual impacts in these areas.

Travel Management and Off-highway Vehicle Use. The open classification for off-highway vehicle use on 9.8 million acres (86 percent) of the decision area would result in impacts to visual resources, including route proliferation, vegetation loss, soil exposure and erosion, and dust emissions.

Recreation. There would be a potential for recreation management to affect visual resources. Existing recreation facilities would be maintained, with minimal impacts to visual resources. Localized impacts to visual resources could result in and around the race routes used for motorcycle and truck events, held under special recreation permits.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that of the Proposed RMP. However, approximately 4 million acres presently are available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

4.0 ENVIRONMENTAL CONSEQUENCES

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP. The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Special Designations. Special designations would have minimal impact on visual resources. While the three existing Desert Tortoise ACECs would be retained, and they contain some Class I areas, no new ACECs are proposed under this alternative.

Conclusion. Management prescriptions for Class I and II areas (approximately 1.5 million acres and 284,000 acres, respectively) would continue to preserve the scenic character of these lands. Although unclassified areas in the historic Egan Resource Area totaling approximately 3.6 million acres (32 percent of the decision area) would be addressed on a project-specific basis, there potentially could be impacts by not having a comprehensive framework for addressing visual resources in place. Continued designation of areas as open to cross-country off-highway vehicle use would result in visual impacts through surface disturbances and dust emissions. Alternative A would not meet the goal for the visual resources program.

Alternative B

Impacts from Visual Resources Management Actions. Impacts from the visual resource management actions would be almost the same as those under the Proposed RMP. The change in acreage from current management under Alternative B is summarized in **Table 4.11-2**.

Table 4.11-2
Changes in Visual Resource Management Classification in
Alternative B from Current Management

Visual Resource Management Class	Approximate Change in Acreage
I	- 0.31 million
II	+ 1.98 million
III	+ 4.25 million
IV	- 2.34 million
No Classification	- 3.58 million

Impacts from Other Programs. Visual resource impacts associated with vegetation, renewable energy, travel management and off-highway vehicle use, forest/woodland and other plant products, geology and mineral extraction, fire management, and special designations would be the same as described for the Proposed RMP.

Lands and Realty. The impacts of land and realty actions on visual resources would be similar to those described for the Proposed RMP. Approximately 90,600 acres would be available for disposal, and development of disposed lands could lead to visual impacts in these areas.

Recreation. There would be a potential for recreation management to affect visual resources. Development of recreation facilities may occur, potentially causing impacts to visual resources. However, implementation of mitigation measures for developed facilities based on the visual resources management class objectives would minimize these impacts. Localized impacts to visual resources could result in and around the 844,000 acres of special recreation management areas that have off-highway vehicle recreational values, the 656,000 acres of special recreation permit areas for motorcycle events, and truck event routes. However, mitigation measures to protect scenic values would be identified in site-specific management plans. By emphasizing these recreation activities in specific areas, impacts to visual resources in other parts of the decision area would be limited.

Livestock Grazing. Livestock grazing would be unavailable on approximately 3.8 million acres. Grazing closure over this area could potentially lead to changes in the visual character of the area associated with vegetation cover and productivity.

Conclusion. Management prescriptions under Alternative B would classify approximately 1.2 million acres as Visual Resource Management Class I and 2.4 million acres as Visual Resource Management Class II. Having classifications for all lands within the decision area would allow for a more comprehensive framework for preserving and mitigating impacts to visual resources. Maximizing the use of prescribed fire would create short-term visual impacts that would diminish in the long term after treatments are completed. Alternative B would meet the goal for the visual resources program.

Alternative C

Impacts from Visual Resources Management Actions. Visual resource management would be based on the revised visual inventory compiled for the decision area and presented on **Map 2.7.11-1**, Visual Resources Management Classes Alternative C. Acreages for the four visual resource management classes are presented in Section 2.7.11. The change in acreage from current management under Alternative C is summarized in **Table 4.11-3**.

**Table 4.11-3
Changes in Visual Resource Management Classification in
Alternative C from Current Management**

Visual Resource Management Class	Approximate Change in Acreage
I	- 0.31 million
II	+ 2.14 million
III	+ 4.34 million
IV	- 2.59 million
No Classification	- 3.58 million

By establishing visual resource management classes for areas that were previously unclassified, increasing the acreage of land in Class II and III, and reducing the acreage of land in Class IV, scenic values in the

4.0 ENVIRONMENTAL CONSEQUENCES

decision area would be preserved or enhanced compared to current management. The decrease of 310,700 acres (approximately 9 percent) of land in Class I could result in noticeable impacts. Other impacts from the visual resource management actions would be the same as those under the Proposed RMP.

Impacts from Other Programs. Visual resource impacts associated with renewable energy, livestock grazing, geology and mineral extraction, and special designations would be similar to those described for the Proposed RMP.

Vegetation. The areas affected by vegetation treatments would total approximately 7.5 million acres, or 68 percent of the decision area. The impacts of these treatments to visual resources would be similar to those described for the Proposed RMP.

Lands and Realty. The impacts of land and realty actions on visual resources would be similar to those described for the Proposed RMP. However, this alternative would designate utility corridors that are three miles wide, and it would not emphasize the co-location of communication sites. These management actions would lead to greater localized impacts to visual resources, and also would spread the visual impacts in a wider area across the viewsheds where the designated corridors are located. Approximately 295,200 acres would be available for disposal, and development of disposed lands could lead to visual impacts in these areas.

Travel Management and Off-highway Vehicle Use. Management action would designate 32,000 acres of dry lake beds as open to cross-country off-highway use, which could result in surface disturbances and dust generation impacts.

Recreation. There would be a potential for recreation management to affect visual resources. Development of recreation facilities may occur, potentially causing impacts to visual resources. However, implementation of mitigation measures for developed facilities based on the visual resources management class objectives would minimize these impacts. Localized impacts to visual resources could result in and around the 730,000 acres of Special Recreation Management Areas that have off-highway vehicle recreational values the 1.3 million acres of special recreation permit areas for motorcycle events, and truck event routes. However, mitigation measures to protect scenic values would be identified in site-specific management plans. By emphasizing these recreation activities in specific areas, impacts to visual resources in other parts of the decision area would be limited.

Forest/Woodland and Other Plant Products. Increased gathering of forest/woodland and other plant products would impact visual resources in both the short and long term.

Fire Management. Wildland fires would be suppressed, reducing impacts to visual resources in the short term. However, long-term impacts caused by wildland fires could result as fires become larger and more difficult to suppress due to increased fuel accumulation. Surface disturbing suppression activities such as the use of bulldozers to construct fire line and the driving of fire equipment cross-country would be greater for larger fires, and since the fires would be expected to be hotter, restoration of burned areas would take longer.

Conclusion. Management prescriptions under Alternative C would classify approximately 1.2 million acres as Visual Resource Management Class I and 2.4 million acres as Visual Resource Management Class II. Having classifications for all lands within the decision area would allow for a more comprehensive framework for preserving and mitigating impacts to visual resources. Utility corridor widths of 3 miles would create greater impacts in localized areas. Suppression of wildland fires would reduce impacts from fire in the short term until wildland fires became impossible to suppress, which could lead to greater long-term impacts. Alternative C would meet the goal for the visual resources program.

Alternative D

Impacts from Visual Resources Management Actions. The entire decision area would be designated as either Visual Resources Management Class I or Class II, which would protect scenic resources. Class I areas would be limited to designated wilderness. The remainder of the decision area would be designated as Class II (**Map 2.8.11-1**). Acreages for the visual resource management classes under this alternative are presented in **Table 2.9-1**. By designating the entire decision area as Class I or II, substantially greater mitigation would be required for projects to meet visual resource management goals.

Impacts from Other Programs.

Vegetation. The areas identified for potential vegetation treatments would total approximately 3.6 million acres, or 32 percent of the decision area. The impacts of these treatments to visual resources would be similar to those described for the Proposed RMP.

Lands and Realty. There would be no new land use authorizations, which would greatly limit impacts to visual resources. There would be no net loss of public land in the decision area, but where disposals did occur, there would be the potential for impacts to visual resources. Approximately 12,400 acres would be available for disposal, and development of disposed lands could lead to visual impacts in these areas.

Renewable Energy. Renewable energy development would have no impacts on visual resources, because no new land use authorizations would be issued, nor would new utility corridors be designated.

Travel Management and Off-highway Vehicle Use. Eleven million acres (96 percent) of the decision area would be closed to off-highway use, which would eliminate all impacts to visual resources in closed areas. No areas would be classified as open. Localized disturbances to visual resources could still occur from off-highway vehicle use on maintained roads and trails.

Recreation. No Special Recreation Management Areas or Special Recreation Permit areas or routes would be designated. Thus, no visual resource impacts would occur from emphasized recreation activities.

Livestock Grazing. Livestock grazing activities would be virtually eliminated and, thus, would have minimal impact on visual resources.

4.0 ENVIRONMENTAL CONSEQUENCES

Forest/Woodland and Other Plant Products. The elimination of the gathering of forest/woodland and other plant products would reduce impacts on visual resources.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario. Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Fire Management. Wildland fires would not be suppressed, potentially increasing impacts to visual resources in the short term, and resulting in long-term impacts as catastrophic fires cause large areas to be denuded.

Special Designations. All special designations except designated wilderness and wilderness study areas would be dropped, but all special designation areas would be managed as Class I. This would result in less protection to visual resources in existing scenic areas.

Conclusion. Management prescriptions under Alternative D would increase the amount of land in Visual Resource Management Class II to approximately 10.3 million acres (90 percent of the decision area). By identifying all areas (11.5 million acres) as either Class I or II, substantial restrictions would be placed on activities that could be allowed under other resource management activities or increase the potential mitigation measures that would be required. The fact that there would be no new land use authorizations, such as rights-of-way, also would reduce impacts in the short and long term. A policy of minimal fire suppression would create short-term visual impacts that would increase over the long term as more catastrophic fires occur. Alternative D would meet the goal for the visual resources program.

4.12 Lands and Realty

Impact Issues

The demand for uses of BLM-administered land within the planning area has grown over the past decade and is expected to continue to grow over the life of the Approved RMP. The challenge for the Ely Field Office would be to accommodate lands and realty needs for community development, rights-of-way, easements, leases, and other permitted uses while minimizing adverse effects on, or conflicts with, other resources.

Assumptions for Analysis

- Land disposals primarily would be limited to lands identified for possible disposal. Requests for possible disposals can be made for any BLM-administered land and would be evaluated on a case-by-case basis.
- Identification of lands for possible disposal does not dictate that these lands would be sold or otherwise disposed.

Interactions with Other Programs

The lands and realty management program within the planning area potentially would be affected by actions within the resource management programs for fish and wildlife, special status species, wild horses, cultural resources, visual resources, recreation, geology and mineral extraction, and special designations.

Goal

Manage public lands in a manner that:

- Allows the retention of public land with high resource values;
- Consolidates public land patterns to ensure effective administration and improve resource management;
- Makes public lands that promote community development available for disposal;
- Meets public, local, state, and federal agency needs for use authorizations such as rights-of-way, permits, leases, and easements while avoiding or minimizing adverse impacts to other resource values; and
- Utilizes withdrawal actions with the least restrictive measures and minimum size necessary to accomplish the desired purpose.

4.0 ENVIRONMENTAL CONSEQUENCES

Objective

To respond to public, local, state, and federal agency needs for land for community development, utility and other associated rights-of-way, communication sites, and other allowed uses of BLM-administered lands.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Mitigation measures also were considered within the following impact analysis section in response to anticipated impacts. Additional "proposed mitigation" for lands and realty is identified in Section 4.29, Proposed Mitigation and Potential Effectiveness. In order to be carried forward as part of the Approved RMP, these "proposed mitigation measures" would have to be incorporated into the final decision documented in the Record of Decision. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Lands and Realty Management Actions.

Parameter – Retention

Under the Proposed RMP, more lands are identified for retention. Having a more clear definition of lands to retain in order to preserve federally listed threatened and endangered species, fisheries, culturally significant lands, and lands of high recreational value serves to allow better resource management in these areas. The elimination of mandatory retention of big and upland game habitat, and wild horse herd management areas would allow more flexibility in management actions while still preserving lands that contribute to the restoration and health of the land.

Parameter – Disposal (Sales, Exchanges, Recreation and Public Purposes Act, and Airport Conveyances)

Under the Proposed RMP, approximately 110,000 acres would be identified for potential disposal, including approximately 75,600 acres identified for disposal by competitive sales. The remainder would be allocated for direct sales or transfers to other governmental entities. These areas would be withdrawn from mineral entry. Having these areas identified or withdrawn facilitates the disposal of land for promoting community development as compared to current management. Withdrawals for resource protection, watershed health, and administration would help to protect watersheds and consolidate land management. Limitations on disposals in designated critical habitat for threatened and endangered species would allow better resource management in these sensitive areas.

Military Operations Areas. The disposal and possible development of land located under Military Operations Areas has the potential to impact military air operations. Development of any land located under the Military Operations Areas would increase the vulnerability of the Department of Defense to complaints concerning the military operations overhead. These complaints could potentially limit, alter, or cease military operations in those areas, adversely affecting the training and readiness of U.S. military combat forces. There also would be an increased safety risk associated with the development of land under the Military Operations Areas. Mishaps such as aircraft crashes, emergency/accidental jettisoning of external fuel tanks, collisions, etc., are risks present in those areas located under Military Operations Areas. In the event of a mishap, developments under Military Operations Areas could be jeopardized. Mitigation measures designed to protect Military Operations Areas and the vital training they provide are discussed in Section 4.29, Proposed Mitigation and Potential Effectiveness.

Parameter – Acquisitions

Under the Proposed RMP, acquisitions would be limited to situations where no other reasonable alternative exists, managing newly acquired lands in a manner comparable to surrounding public lands (or in conformance with established policies for special management areas), and conducting noxious weed assessments prior to acquisitions would allow adequately effective administration and resource management while minimizing expenditures.

Parameter – Withdrawals

Under the Proposed RMP, all lands identified as being available for potential disposal would be withdrawn from mineral entry. This would eliminate some potential conflicts regarding mineral entry on lands identified for potential disposal that could arise under current management, where only 11,525 acres of lands identified for potential disposal would be recommended for withdrawal from mineral entry.

Parameter – Corridors

Under the Proposed RMP, most corridors would be designated as 0.5 mile wide, with the Southwest Intertie Project Corridor being 0.75 mile wide throughout most of its length, and a utility corridor in the southeastern portion of the planning area being retained as 1,000 feet wide. The additional width of the Southwest Intertie Project Corridor would allow for more rights-of-way to be granted in the major north-south corridor through the planning area.

Parameter – Communication Sites

Under the Proposed RMP, communication site locations would be authorized with an emphasis in co-location of sites. This allows for a more proactive approach to communication site development, which could reduce the impacts associated with the proliferation of communication sites through reducing the total number of communication sites.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Land Use Authorizations (Rights-of-way, Permits, Leases, Easements, and Unauthorized Use)

Establishing more avoidance and exclusion areas for special designation areas, and consolidating new land use authorizations within or adjacent to existing authorizations would reduce the impacts associated with those land use authorizations.

Impacts from Other Programs.

Fish and Wildlife. Seasonal restrictions to protect wildlife during crucial seasons of use and periods of their lives may cause right-of-way applicants to modify their projects which could increase the cost of the project. Requiring right-of-way applicants to improve 2 acres of priority wildlife habitat for every 1 acre disturbed would increase the cost of the project or cause the applicant to change the location of the project. This applies to crucial summer range, winter range, calving/fawning/kidding/lambing grounds, and occupied desert bighorn sheep habitat which total about 3.1 million acres (without adjustment for overlapping categories, or 27 percent of the planning area).

Special Status Species. The presence of a special status species may increase the cost of a project because of surveys that may be needed or mitigating measures that may be required to reduce the impacts to that species. Seasonal restrictions to protect raptor nesting, greater sage-grouse breeding and nesting, and greater sage-grouse on winter range may cause right-of-way applicants to modify their projects which could increase the cost of the project. Requiring right-of-way applicants to improve 2 acres of special status species habitat for every 1 acre disturbed would increase the cost of the project or cause the applicant to change the location of the project. This would apply to all sensitive species habitat, including greater sage-grouse habitat but not desert tortoise habitat. Special status species habitats for which map data are available make up about 38 percent of the planning area with desert tortoise and greater sage-grouse habitats being the primary contributors.

Seasonal restrictions to protect desert tortoises during their most active period, other management actions to protect desert tortoises and their habitat, and the payment of a remuneration fee based on acres of habitat disturbed, would increase the cost of a project. There are about 726,000 acres of desert tortoise habitat, or about 7 percent of the planning area.

4.12 Lands and Realty

Wild Horses. Management of wild horses would not typically affect land disposals. The reduction of acreage of herd management areas from 5.4 million acres to approximately 3.7 million acres would potentially reduce conflicts with the lands available for disposal for community development.

Cultural Resources. Lands containing cultural resource sites eligible for the National Register of Historic Places would not be available for possible disposal unless mitigation measures were enacted or if these land exchanges serve the national interest and are beneficial to the Ely Field Office programs or support the programs of other agencies. This could potentially reduce the land available for possible disposal for community development, but would maintain or enhance the protection of resources.

Visual Resources. Visual resource management under the Proposed RMP would affect various land use authorizations. Facilities would strive to meet the objectives of the particular visual resource management class in which a project was proposed. The increase in Classes II and III under the Proposed RMP could result in more mitigation measures to preserve scenic qualities for site-specific projects than under current management. The fact that all utility corridors would be designated Visual Resource Management Class IV would reduce mitigation requirements for developments within those corridors.

Recreation. The retention of lands of high recreational value would reduce the amount of land available for potential disposal.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario (see Section 4.18), would be distributed throughout the 11.5 million acres of the planning area. Mineral exploration and development could preclude land disposals and withdrawals. Mining claims could result in validity exams and increased costs to land disposals and withdrawals.

Special Designations. Approximately 1.4 million acres of special designation areas (including designated wilderness, wilderness study areas, and ACECs) (detailed in Section 2.4.22) would be land use authorization limited/avoidance (135,760 acres), avoidance with exception for existing rights (15,600 acres), avoidance (97,350 acres), or exclusion (1,154,740 acres) areas under this alternative. This would create greater limitations on land uses, such as rights-of-way and communication sites in these areas. This acreage is approximately 13 percent of the total decision area.

Conclusion. Approximately 75,600 acres would be available for possible disposal by competitive sales and would be withdrawn from mineral entry. Having these areas identified would facilitate the disposal of BLM-administered lands for community development. Designated critical habitat for federally listed threatened and endangered species, cultural resources, mineral exploration and development, watershed restoration, and special designation areas could preclude the disposal of certain parcels and land use authorizations. The Proposed RMP would allow a higher degree of flexibility in land use authorizations by identifying the new 0.5-mile-wide Spring Valley corridor. Encouraging co-location of land use authorizations would reduce or localize impacts to other resources. Approximately 1.4 million acres would be identified as avoidance or exclusion areas. The Proposed RMP would meet the goals for the lands and realty program.

4.0 ENVIRONMENTAL CONSEQUENCES

Alternative A

Impacts from Lands and Realty Management Actions.

Parameter – Retention

Big and upland game habitat and wild horse herd management areas would be retained, reducing flexibility in management actions as compared to the Proposed RMP. Other lands, such as areas with high recreation value or having fisheries would not be identified for retention, potentially leading to the degradation of these resources.

Parameter – Disposal

Approximately 44,000 fewer acres would be identified for disposal by competitive sales, less than one-half the amount in the Proposed RMP. Having fewer areas identified for potential disposal could make the disposal of land for promoting community development more difficult and time-consuming compared to the Proposed RMP.

Parameter – Acquisitions

Impacts from acquisitions would be the same as those for the Proposed RMP.

Parameter – Withdrawal

Approximately 265,000 fewer acres would be withdrawn from mineral entry than under the Proposed RMP (see Section 4.18). Having fewer areas withdrawn could lead to potential conflicts if these areas have mineral entry allowed prior to any application to dispose of them.

Parameter – Corridors

There would be slightly less space available for right-of-way authorizations along the Southwest Intertie Project corridor, and no Spring Valley corridor would be designated. This could make right-of-way authorizations in these areas more difficult and time consuming.

Parameter – Communication Sites

The authorization of communication sites on a case-by-case basis could lead to a proliferation of sites and inefficient siting of communication facilities as compared to the Proposed RMP, which would encourage co-location of sites and identify specially designated areas as avoidance or exclusion areas.

Parameter – Land Use Authorizations (Rights-of-way, Permits, Leases, Easements, and Unauthorized Use)

Land use authorizations would be issued on a case-by-case basis. There would be fewer areas identified as avoidance and exclusion areas, and less emphasis on reclamation and resolution of unauthorized uses, as compared to the Proposed RMP. This could result in less effective resource management than the Proposed RMP.

Impacts from Other Programs.

Fish and Wildlife. The retention of big and upland game habitat would prohibit disposal of certain areas and affect selection of areas available for potential disposal.

Special Status Species. The retention of lands to prevent adverse effects on threatened or endangered species or their habitat would prohibit disposal of certain areas and affect selection of areas available for potential disposal.

Wild Horses. The retention of lands in wild horse herd management areas would prohibit disposal of certain areas and affect selection of areas available for potential disposal.

Cultural Resources. Lands containing cultural resource sites eligible for the National Register of Historic Places would not be available for possible disposal unless mitigation measures were enacted or if these lands were exchanged for lands of equal or greater resource value. This could potentially reduce the land available for possible disposal.

Visual Resources. Since only 1.7 million acres would be classified as Visual Resource Management Class I or II, visual management objectives would have only a limited effect on the location of rights-of-way and communication sites within the decision area.

Recreation. Recreation management actions would have minimal effects on the lands and realty program under current management.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that of the Proposed RMP. However, approximately 4 million acres presently are available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP. The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Special Designations. Existing land use authorization avoidance and exclusion areas identified in Section 2.5.22 would continue to be implemented. This would result in fewer acres being identified as avoidance or exclusion areas (approximately 1.3 million acres) as compared to the Proposed RMP and would have a lesser impact on lands and realty actions.

4.0 ENVIRONMENTAL CONSEQUENCES

Conclusion. Under Alternative A, approximately 31,900 acres would be identified for disposal by competitive sales. Having fewer areas identified for potential disposal or withdrawn could make the disposal of land for promoting community development more difficult and time-consuming compared to the Proposed RMP. By not identifying new communication sites or 0.5-mile-wide corridors, the location of future rights-of-way and communication sites would not be addressed proactively and could take longer to occur by being addressed on a case-by-case basis under site-specific NEPA analyses. Alternative A would not meet the goals for the lands and realty program.

Alternative B

Impacts from Lands and Realty Management Actions.

Parameter – Retention

Retentions would be managed in the same way as under the Proposed RMP, with the same impacts.

Parameter – Disposal

Approximately 90,600 acres would be identified for disposal by competitive sales. Impacts would be the same as discussed for the Proposed RMP.

Parameter – Acquisitions

Acquisitions would be managed in the same way as under the Proposed RMP, with the same impacts.

Parameter – Withdrawal

Approximately 209,600 fewer additional acres would be withdrawn from mineral entry as compared to the Proposed RMP.

Parameter – Corridors

Several corridors would be 1 mile wide, as opposed to the 0.5-mile-wide corridors under the Proposed RMP. This would allow more area for right-of-way authorizations within these corridors, though it could lead to greater impacts to other resources.

Parameter – Communication Sites

No new communication sites would be authorized until existing sites had reached maximum capacity. This would reduce the proliferation of communication sites, but also would reduce the ability to establish new sites for community and economic development, as compared to the Proposed RMP.

Parameter – Land Use Authorizations (Rights-of-way, Permits, Leases, Easements, and Unauthorized Use)

Land use authorizations would be managed in the same way as under the Proposed RMP, with the same impacts.

Impacts from Other Programs. Lands and realty impacts associated with vegetation, fish and wildlife, special status species, wild horses, cultural resources, visual resources, renewable energy, recreation,

livestock grazing, geology and mineral extraction, watershed management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Special Designations. Approximately 1.4 million acres of special designation areas (detailed in Section 2.6.22) would be land use authorization avoidance or exclusion areas under this alternative. This would create greater limitations on land use in these areas as compared to the Proposed RMP.

Conclusion. Under Alternative B, there would be 90,600 acres identified for disposal by competitive sales and withdrawn from mineral entry. More area would be available for siting rights-of-way within utility corridors because several corridors would be twice as wide as they would be under the Proposed RMP. This would allow greater flexibility in conducting lands and realty activities. Limitations on siting new communication sites until existing capacity was exceeded would limit the ability to develop new sites to promote community development. Alternative B would meet the goals of the lands and realty program.

Alternative C

Impacts from Lands and Realty Management Actions.

Parameter – Retention

Retentions would be managed in the same way as under the Proposed RMP, with the same impacts.

Parameter – Disposals

Approximately 295,200 additional acres would be identified for disposal by competitive sales while the total amount of land disposed of over the life of the RMP would not change, more flexibility in the disposal of lands would be achieved.

Parameter – Acquisitions

Acquisitions would be managed in the same way as under the Proposed RMP, with the same impacts.

Parameter – Withdrawal

Approximately 11,300 fewer acres would be withdrawn from mineral entry as compared to the Proposed RMP.

Parameter – Corridors

Several corridors would be 3 miles wide, as opposed to the 0.5-mile-wide corridors under the Proposed RMP. This would allow more area for right-of-way authorizations within these corridors, though it could lead to greater impacts to other resources.

Parameter – Communication Sites

Communication site locations that would facilitate community and economic development would be authorized. This, along with the lack of emphasis on co-location, could lead to a greater proliferation of communication sites that could be less efficient than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Land Use Authorizations (Rights-of-way, Permits, Leases, Easements, and Unauthorized Use)

Land use authorizations would be processed to facilitate community and economic development. This could lead to a greater number of land use authorizations, though it could lead to a degradation of other resources.

Impacts from Other Programs.

Lands and realty impacts associated with vegetation, fish and wildlife, special status species, wild horses, cultural resources, visual resources, renewable energy, recreation, livestock grazing, geology and mineral extraction, watershed management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Special Designations. Approximately 1.4 million acres of special designation areas (detailed in Section 2.7.22) would be land use authorization avoidance or exclusion areas under this alternative. This would create greater limitations on land use in these areas as compared to the Proposed RMP.

Conclusion. Under Alternative C, there would be 295,200 acres identified for disposal by competitive sales and withdrawn from mineral entry. More area would be available for siting rights-of-way within utility corridors because several corridors would be six times as wide as they would be under the Proposed RMP. This would allow greater flexibility in conducting these lands and realty activities. Lack of emphasis on co-location of siting new communication sites may lead to a greater proliferation of these sites as compared to the Proposed RMP. Alternative C would meet the goals of the lands and realty program.

Alternative D

Impacts from Lands and Realty Management Actions.

Parameter – Retention

There would be no net loss of public lands in the planning area. The lack of criteria for which lands would be retained as compared to the Proposed RMP would make this alternative less effective for resource management.

Parameter – Disposals

No net loss, by acreage, of public land within the planning area would occur, greatly constraining the ability to resolve known unauthorized use of public lands and conduct other lands and realty actions. Alternative D does not identify additional lands for possible disposal that would meet the objectives of the lands and realty program, benefit communities, or the Lincoln County and White Pine County Conservation, Recreation, and Development Acts.

Parameter – Acquisitions

Impacts from acquisitions would be the same as that under the Proposed RMP, with the same impacts.

Parameter – Withdrawals

Impacts from withdrawals would be the same as those under Alternative A.

Parameter – Corridors

Impacts from corridor designations would be the same as that under Alternative A because no new corridors would be designated.

Parameter – Communication Sites

All existing and pending communications sites would be analyzed, potentially increasing the efficiency of the use of these communication sites, but also may potentially reduce the ability to designate new sites for community and economic development in a timely manner, as compared to the Proposed RMP. The possible elimination of existing communication sites would further reduce the ability to address future needs.

Parameter – Land Use Authorizations (Rights-of-way, Permits, Leases, Easements, and Unauthorized Use)

The absence of new land use authorizations would greatly restrict lands actions such as designating rights-of-way.

Impacts from Other Programs. Lands and realty impacts associated with vegetation, special status species, wild horses, cultural resources, renewable energy, watershed management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Fish and Wildlife. Migratory bird corridors would be identified and these areas closed to any communication or energy tower siting, although siting these facilities would already be precluded by the management direction under lands and realty.

Visual Resources. Visual resource management class objectives would not affect the location of rights-of-way and communication sites as siting these kinds of facilities, although siting these facilities would already be precluded by the management actions under lands and realty.

Recreation. The special recreation management areas and all developed recreation sites would be eliminated, creating more acreage for possible disposal as compared to the Proposed RMP. This acreage would still be subject to the no net loss of public land criteria for this alternative.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario. Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

Special Designations. There would be no net loss of public lands under this alternative. All special designations except designated wilderness and wilderness study areas would be eliminated as unnecessary. Since no new land use authorizations would be granted, special designations would have no impacts on lands and realty.

Conclusion. Approximately 12,400 acres would be identified for possible disposal. Because there would be no net loss of BLM-administered public land, conducting disposals would be much more difficult and time-consuming, as replacement lands would need to be acquired concurrently or prior to disposal. This would limit the ability of the Ely Field Office to dispose of land for community and economic development, or for other purposes. Because requests for new withdrawals, withdrawal relinquishments, or modifications would be processed on a case-by-case basis, there would not be a proactive effort toward identifying areas of sensitive or high resource values for withdrawal from entry. Limitations on new land use authorizations, and the closure of sites within migratory bird corridors and visually sensitive sites would greatly restrict lands and realty actions in Alternative D. The possible elimination of existing communication sites would further reduce the ability of the lands and realty program to address future needs. Alternative D would not meet the goals of the lands and realty program.

4.13 Renewable Energy**Impact Issues**

The primary impact issues associated with renewable energy development are directly related to the large surface area needed for wind, solar, and biomass facilities and infrastructure (geothermal energy is addressed in Section 4.18). Areas that are suitable for renewable energy development are limited to those areas where these resources occur. Thus, conflicts with other resources would have the potential to reduce areas deemed suitable for development. Authorization of renewable energy projects would be evaluated using an interdisciplinary approach, and site-specific NEPA analysis would occur for all renewable energy development projects.

Assumptions for Analysis

- Identification of areas as having high potential for renewable energy does not mean these lands would be developed. The feasibility of development would be determined by project proponents, and all applications for land use authorizations would be subject to site-specific NEPA analysis.
- A reasonably foreseeable development scenario has been assumed for wind energy development based on the current interest in this type of renewable energy development within the planning area. Several projects that may total 5,000 megawatts of electricity output capacity and 40,000 acres of rights-of-way granted by the Ely Field Office are assumed. It also is assumed that 10 percent of the right-of-way area (4,000 acres) would be disturbed for facility construction and operation. (Also see Section 4.28 on cumulative impacts.) Solar and biomass energy developments are more speculative and may not occur during the life of the RMP. No surface disturbance has been assumed for these potential projects.

Interactions with Other Programs

The renewable energy program potentially would be affected by management actions within the resource programs for vegetation, fish and wildlife, special status species, wild horses, cultural resources, visual resources, lands and realty, recreation, livestock grazing, geology and mineral extraction, and special designations.

Goal

Provide opportunities for development of renewable energy sources such as wind, solar, biomass, and other alternative energy sources while minimizing adverse impacts to other resources such as wildlife and visual resources.

4.0 ENVIRONMENTAL CONSEQUENCES

Objective

To be responsive to applications for renewable energy sites and associated rights-of-way, as encouraged by current BLM policy.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Renewable Energy Management Actions. Approximately 273,000 acres of moderate to high potential wind development area and 7.2 million acres of potential solar development area are identified within the Ely RMP decision area, although potential development would not be restricted to those areas. Biomass development would be based on the acreage of restoration needed to restore healthy vegetation communities, and biomass harvesting would not take place independently of vegetation treatment. While not authorized in the RMP, an estimated 4,000 acres could be disturbed by renewable energy development within approximately 40,000 acres of rights-of-way. The primary impact of the Proposed RMP would be to identify the development of these renewable energy resources as allowable within the Ely RMP decision area with the exception of avoidance and exclusion areas (e.g., wilderness study areas, designated wilderness, Visual Resource Management Class I areas, and ACECs). There would be no change in how applications for renewable energy development projects are processed.

Impacts from Other Programs.

Vegetation. Approximately 2.8 million acres of pinyon-juniper woodland would be subject to vegetation treatments under the Proposed RMP. These treatments are expected to involve thinning or removal of trees, thus potentially generating substantial quantities of biomass for energy conversion or other uses.

Fish and Wildlife. Wind energy projects would be required to comply with best management practices outlined in the Appendix F, Section 3. Implementation of these best management practices for a specific project could affect either or both facility location and design to minimize impacts to various wildlife resources. Disturbances within priority wildlife habitats would require improvement of 2 acres of priority habitat for each acre disturbed resulting in additional project costs.

Special Status Species. Renewable energy project would be required to implement measures to minimize effects to special status species. Wind energy projects would be required to comply with best

management practices outlined in Appendix F, Section 3. Renewable energy projects would be required to implement measures to reduce raptor collision potential on wind turbines and electrocution potential on electrical lines, potentially adding costs to the development of renewable energy projects. Implementation of these best management practices for a specific project could affect either or both facility location and design to minimize impacts to various special status species. Disturbances within habitats for special status species other than desert tortoise would require improvement of 2 acres of priority habitat for each acre disturbed, resulting in additional project costs. Projects located within desert tortoise habitat would be subject to seasonal restrictions to avoid primary periods of tortoise activity and the payment of a remuneration fee based on the acreage of habitat disturbed.

Wild Horses, Cultural Resources, Visual Resources, Recreation, Livestock Grazing, and Geology and Mineral Extraction. Interactions of renewable energy projects with other resource programs would be evaluated on a case-by-case basis to determine if proposed land use authorizations for such projects would be appropriate. The presence of special status species, wild horses, archaeological or historical resources, visual resource management objectives, recreation resources, livestock range development (e.g., wells and springs), mineral leases or claims could affect the location, design, and implementation of proposed renewable energy projects. It is anticipated that project-specific mitigation measures would be required for site-specific resource conflicts. In the extreme case, conflicts with these resources could preclude the issuing of a land use authorization for a specific project.

Lands and Realty. Renewable energy projects, such as wind farms and concentrated solar power development, could be impacted by land use authorizations for power plants, disposals of land resulting in commercial or residential developments, and other lands and realty actions resulting in siting constraints for these large facilities. Approximately 75,600 acres are identified for possible disposal, which is a small area relative to the 7.2 million acres of high potential for solar energy within the planning area. While the acreage of moderate to high potential for wind energy (approximately 273,000 acres) is considerably less, these areas typically occur along ridge tops. These areas are not types of lands proposed for disposal.

Special Designations. The designation of 20 ACECs (3 existing plus 17 new) would create right-of-way exclusion and avoidance areas that could limit the siting of renewable energy development projects and the transmission lines required to connect them to the transmission grid. Due to the generally small size and dispersed locations of the proposed ACECs, the impact is expected to be small. The three desert tortoise ACECs located in the Mojave Desert region of the planning area (see Section 2.4.22) and areas designated as wilderness also would affect the location of solar energy projects. New roads would not be constructed in desert tortoise ACECs and designated wilderness, reducing impacts to resources protected by these designations. Approximately 74,500 acres of moderate to high wind potential and 513,700 acres of high solar potential occur within ACECs, designated wilderness, and wilderness study areas.

Conclusion. The primary impact of the Proposed RMP would be to facilitate the development of renewable energy resources. Surface disturbance for an assumed wind energy development scenario could total 4,000 acres, about 0.03 percent of the decision area. Wind and solar power developments would have to be compatible with the management prescriptions for other resources and would be evaluated on a project-specific basis. Biomass development would be based on the acreage of vegetation treatment

4.0 ENVIRONMENTAL CONSEQUENCES

needed to restore healthy vegetation communities. The Proposed RMP would meet the goal for the renewable energy program.

Alternative A

Impacts from Renewable Energy Management Actions. Renewable energy development would continue to be authorized on a case-by-case basis. The lack of identification of areas of resource conflict as avoidance and exclusion areas would not facilitate the planning of potential development of renewable energy resources by project proponents. The number of potential projects would be the same as the Proposed RMP. There would be no change in how applications for renewable energy development projects are processed.

Impacts from Other Programs. Effects on renewable energy development associated with management actions for fish and wildlife, special status species, wild horses, cultural resources, visual resources, recreation, livestock grazing, and geology and mineral extraction would be the same as described for the Proposed RMP.

Vegetation. Approximately 1.1 million acres of pinyon-juniper woodland would be subject to vegetation treatments under Alternative A. These treatments are expected to involve thinning or removal of trees, thus potentially generating substantial quantities of biomass for energy conversion or other uses.

Lands and Realty. Renewable energy projects, such as wind farms and concentrated solar power development, could be impacted by land use authorizations for power plants, disposals of land resulting in commercial or residential developments, and other lands and realty actions resulting in siting constraints for these large facilities. Approximately 31,900 acres are identified for possible disposal, which is a small percentage of the lands with high potential for renewable energy. By not designating any new utility corridors under Alternative A, the current management would limit the consolidation of new transmission lines into corridors.

Special Designations. No new ACECs would be designated, so there would be fewer right-of-way avoidance and exclusion areas that could influence the siting of renewable energy development projects and transmission lines, as compared with the Proposed RMP. However, the three desert tortoise ACECs and three wilderness study areas would be retained, and wilderness has been designated by Congress. ACECs, wilderness study areas, and designated wilderness would affect 65,000 acres with wind energy potential and 451,000 acres with solar energy potential. New roads would not be constructed in desert tortoise ACECs and designated wilderness, reducing impacts to resources protected by these designations.

Conclusion. The current management actions under Alternative A are not specific for the development of renewable energy projects, which could slightly reduce the likelihood of developing such projects. Alternative A would meet the goal for the renewable energy program.

Alternative B

Impacts from Renewable Energy Management Actions. The management actions under Alternative B would be the same as the Proposed RMP. Thus, impacts would be the same. The primary impact of management actions under Alternative B would be to facilitate the development of renewable energy resources. There would be no change in how applications for renewable energy development projects are processed.

Impacts from Other Programs. Effects on renewable energy development associated with management actions for vegetation, fish and wildlife, special status species, wild horses, cultural resources, visual resources, recreation, livestock grazing, and geology and mineral extraction would be the same as described for the Proposed RMP.

Lands and Realty. Renewable energy projects, such as wind farms and concentrated solar power development, could be impacted by land use authorizations for power plants, disposals of land resulting in commercial or residential developments, and other lands and realty actions resulting in siting constraints for these large facilities. Approximately 90,600 acres are identified for possible disposal, which is a small percentage of the lands with high potential for renewable energy.

Special Designations. The designation of 18 ACECs (3 existing plus 15 new) would create right-of-way exclusion and avoidance areas that could limit the siting of renewable energy development projects and the transmission lines required to connect them to the transmission grid. Due to the generally small size, topographic features, and dispersed locations of the proposed ACECs, the impact is expected to be small. The three desert tortoise ACECs located in the Mojave Desert region of the decision area (see Section 2.6.22) would affect the location of solar energy projects. ACECs, wilderness study areas, and designated wilderness would affect 77,000 acres with wind energy potential and 490,800 acres with solar energy potential.

Conclusion. The primary impact of Alternative B would be to facilitate the development of renewable energy resources. Surface disturbance for an assumed renewable energy development scenario could total 4,000 acres, about 0.3 percent of the decision area. Wind and solar power developments would have to be compatible with the management prescriptions for other resources and would be evaluated on a project-specific basis. Biomass development would be based on the acreage of vegetation treatment needed to restore healthy vegetation communities. Alternative B would meet the goal for the renewable energy program.

Alternative C

Impacts from Renewable Energy Management Actions. The management actions under Alternative C would be the same as the Proposed RMP. Thus, impacts would be the same. The primary impact of management actions under Alternative C would be to facilitate the development of renewable energy resources. There would be no change in how applications for renewable energy development projects are processed.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts from Other Programs. Effects on renewable energy development associated with management actions for vegetation, fish and wildlife, special status species, wild horses, cultural resources, visual resources, recreation, livestock grazing, and geology and mineral extraction would be the same as described for the Proposed RMP.

Lands and Realty. Renewable energy projects, such as wind farms and concentrated solar power development, could be impacted by land use authorizations for power plants, disposals of land resulting in commercial or residential developments, and other lands and realty actions resulting in siting constraints for these large facilities. Approximately 295,200 acres are identified for possible disposal, which is a small percentage of the lands with high potential for renewable energy.

Special Designations. The designation of 20 ACECs (3 existing plus 17 new) would create right-of-way exclusion and avoidance areas that could limit the siting of renewable energy development projects and the transmission lines required to connect them to the transmission grid. Due to the generally small size, topographic features, and dispersed locations of the proposed ACECs, the impact is expected to be small. The three desert tortoise ACECs located in the Mojave Desert region of the planning area (see Section 2.7.22) would affect the location of solar energy projects. ACECs, wilderness study areas, and designated wilderness would affect 75,800 acres with wind energy potential and 491,500 acres with solar energy potential.

Conclusion. The primary impact of Alternative C would be to facilitate the development of renewable energy resources. Surface disturbance for an assumed renewable energy development scenario could total 4,000 acres, about 0.03 percent of the decision area. Wind and solar power developments would have to be compatible with the management prescriptions for other resources and would be evaluated on a project-specific basis. Biomass development would be based on the acreage of vegetation treatment needed to restore healthy vegetation communities. Alternative C would meet the goal for the renewable energy program.

Alternative D

Impacts from Renewable Energy Management Actions. By not allowing land use authorizations for renewable energy projects, Alternative D would essentially prohibit the development of renewable energy within the decision area.

Impacts from Other Programs. Because Alternative D would essentially prohibit the development of renewable energy projects, interactions with the management actions of other resource programs would be inconsequential.

Conclusion. Under Alternative D, renewable energy development on public lands would be effectively eliminated through the prohibition on new land use authorizations. Alternative D would not meet the goal for the renewable energy program.

4.14 Travel Management and Off-highway Vehicle Use

Impact Issues

The primary impact issues associated with transportation is accessibility throughout the planning area and the proliferation of roads developed through use. Additionally, the use of motorized vehicles on public lands is increasing for recreation as well as for personal transportation.

Assumptions for Analysis

- The demand for off-highway vehicle use in the planning area would continue to increase over time.
- Transportation plans for the entire planning area would be completed in approximately 10 years following approval of the RMP.

Interactions with Other Programs

The travel management and off-highway vehicle use program within the planning area potentially would be affected by management actions within the resource programs for lands and realty, renewable energy, recreation, livestock grazing, geology and mineral extraction, and special designations.

Goal

Provide and maintain suitable access to public lands. Manage off-highway vehicle use to protect resource values, promote public safety, provide off-highway vehicle opportunities where appropriate, and minimize conflict. Work closely with local, state, tribal, and other affected parties and other resource users to address off-highway vehicle management including land use and route designations, and monitoring and adaptive management strategies such as applying the Limits of Acceptable Change process.

Objective

To manage motorized vehicle traffic to sustain this type of use while protecting sensitive resources and providing access.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to travel management and off-highway vehicle use also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. Mitigation measures were considered within the following impact analysis section in response to anticipated impacts. Additional "proposed

4.0 ENVIRONMENTAL CONSEQUENCES

mitigation" for travel management and off-highway vehicle use is identified in Section 4.29, Proposed Mitigation and Potential Effectiveness. In order to be carried forward as part of the Approved RMP, these "proposed mitigation measures" would have to be incorporated into the final decision documented in the Record of Decision. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Travel Management and Off-highway Vehicle Use Management Actions.

Parameter – Transportation Plan

Under the Proposed RMP, motorized travel on approximately 10.3 million acres (90 percent) of the decision area would be limited initially to existing roads and trails and subsequently to designated roads and trails, as determined through a subsequent public process and area-specific analysis. No areas would be designated as open to cross-country travel. There is a considerable range of public opinion as to how off-highway vehicle use in the planning area should be managed. Some believe that the majority of the planning area should be open to unrestricted cross-country travel, as is the case under current management, while others believe that the entire planning area should be closed to off-highway vehicle use. By preparing area-specific transportation plans over a 10 year period, road and trail designations would be updated to consider current uses and conflicts. While some reduction in access may occur in the short term, the motorized access would be improved in the long term by emphasizing specific needs. The elimination of areas open to cross-country off-highway vehicle use would reduce motorized access to parts of the planning area not served by existing or designated roads and trails in both the short and long terms. However, the Proposed RMP strikes a balance concerning the use of off-highway vehicles and protection of other resources, and this management direction is consistent with BLM policy that is being implemented in other Field Offices as existing RMPs are amended or replaced.

Parameter – Off-highway Vehicles

As discussed above, off-highway vehicle use designations would focus on the elimination of open areas and designating roads and trails in limited areas. Closed areas would be limited to designated wilderness and wilderness study areas. Updating road and trail designations on a watershed basis through the transportation planning process would allow for improved access in the long term, with some reduction in accessibility in the short term, and meet agency, industry, and public transportation and access needs.

Impacts from Other Programs. There are few impacts to travel management from other programs. The implementation-level decisions to be made in travel management, such as the designation of routes as open or closed, would be made with consideration of the competing demands for resource use or protection.

Lands and Realty. The Proposed RMP identifies approximately 75,600 acres for possible disposal in the decision area. The potential transfer of lands to private ownership could impact public motorized access

4.14 Travel Management and Off-highway Vehicle Use

to public lands. Potential increase in travel demand also could occur due to land use authorizations and induced growth caused by land disposals. Retaining public rights-of-way through potential land disposals could decrease the impact to public access. Impacts associated with these activities would be mitigated to the extent practicable through best management practices (see Appendix F, Section 1).

Renewable Energy. Renewable energy development would have impacts on transportation similar to minerals, oil, gas, and geothermal development. There is the potential for increased road use and the construction of new access roads as renewable energy sites are developed. The areas of high wind potential tend to be located on top of ridge lines, which would require the construction of new access roads to reach due to the lack of roads in these areas. Such roads would be incorporated into existing or newly developed transportation plans. Based on the comparatively small acreage of high potential wind areas within the planning area, it is anticipated that impacts on transportation would be minimal. Impacts associated with these activities would be mitigated to the extent practicable through the best management practices in Appendix F, Section 3.

Livestock Grazing. The location of some range developments for livestock grazing could potentially affect designation or use of roads and trails. Overall, livestock grazing and related developments would be expected to have minimal impacts on travel management and off-highway vehicle use.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario (see Section 4.18), would be distributed throughout the 11.5 million acres of the planning area. Management actions relating to minerals, oil, gas, and geothermal development would have minimal impacts on transportation. Although there is the potential for increased road use as well as the construction of new access roads, based on the total acreage of potential development under the Proposed RMP, transportation would not be substantially impacted by these actions.

Special Designations. The Proposed RMP would manage three wilderness study areas as limited or closed to off-highway vehicles. These closures would reduce opportunities for motorized access. There are 20 ACECs proposed in this alternative. ACEC management prescriptions for five of these areas (Baking Powder Flat, Highland Range, Schlessers Pincushion, Swamp Cedar, and White River Valley) would limit motorized access for the protection of sensitive plant species. Management prescriptions for the three desert tortoise ACECs (Mormon Mesa, Kane Springs, and Beaver Dam Slope) would close or limit the areas to motorized access for the protection of desert tortoise.

Conclusion. The elimination of areas open to cross-country vehicle travel would reduce motorized access to parts of the planning area not served by existing or designated roads and trails in the short and long term. Completing road and trail designations in site-specific travel management plans would improve motorized access and road and trail conditions over the long term. The Proposed RMP would meet the goal for the travel management and off-highway vehicle use program.

4.0 ENVIRONMENTAL CONSEQUENCES

Alternative A

Impacts from Travel Management and Off-highway Vehicle Use Management Actions.

Parameter – Transportation Plan

Under Alternative A, motorized vehicle use, including off-highway vehicle use, would be managed in accordance with the current open, limited, and closed designations, allowing cross-country off-highway vehicle use throughout 9.8 million acres (86 percent) of the decision area. Roads and trails would be designated as open or closed on a case-by-case basis, as necessary for resource management. This management approach would result in very limited changes in the transportation and access available in the planning area.

Parameter – Off-highway Vehicles

As discussed above, Alternative A would result in very little change in off-highway vehicle use or motorized access in the planning area. Alternative A would provide the most off-highway vehicle access of all alternatives considered. However, Alternative A also would pose the highest likelihood of potential conflict between off-highway vehicle users and other resource users.

Impacts from Other Programs. Under Alternative A, travel management and off-highway vehicle use impacts associated with renewable energy and livestock grazing activities would be similar to those described for the Proposed RMP.

Lands and Realty. Alternative A identifies approximately 31,900 acres for possible disposal in the decision area. The potential transfer of lands to private ownership could impact public motorized access to public lands. Potential increase in travel demand also could occur due to land use authorizations and induced growth caused by land disposals. Retaining public rights-of-way through potential land disposals could decrease the impact to public access.

Recreation. Recreation management actions would have minimal impacts on transportation under current management.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP (see Section 4.18). The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

4.14 Travel Management and Off-highway Vehicle Use

Special Designations. Vehicle use within the three wilderness study areas would be limited to designated roads and trails or closed. The three existing desert tortoise ACECs also would be designated as limited or closed to off-highway vehicle use. These closures would reduce opportunities for motorized access.

Conclusion. The current management program addresses transportation issues as they arise and on a case-by-case basis. Continuation of an open designation for 9.8 million acres (86 percent) of the decision area provides for the greatest accessibility but would result in increased damage to resources and increased conflicts between other resource users and off-highway vehicle users over time. Alternative A would not meet the goal for the travel management and off-highway vehicle use program.

Alternative B

Impacts from Travel Management and Off-highway Vehicle Use Management Actions.

Parameter – Transportation Plan

Under Alternative B, impacts from the transportation plan management actions would be the same as those discussed for the Proposed RMP.

Parameter – Off-highway Vehicles

Under Alternative B, impacts from the off-highway vehicle use management actions would be the same as those discussed for the Proposed RMP.

Impacts from Other Programs. Travel management and off-highway vehicle use impacts associated with renewable energy, livestock grazing, geology and mineral extraction, and special designations would be similar to those described for the Proposed RMP.

Lands and Realty. Alternative B identifies approximately 90,600 acres for possible disposal in the decision area. The potential transfer of lands to private ownership could impact public motorized access to public lands. Potential increase in travel demand also could occur due to land use authorizations and induced growth caused by land disposals. Retaining public rights-of-way through potential land disposals could decrease the impact to public access.

Recreation. Five special recreation management areas would emphasize motorized recreation. Motorized vehicle routes would be retained in the two special recreation permit areas used for motorcycle race events, and for two competitive truck events. These management actions would enhance motorized access in these 9 areas in the long term.

Conclusion. The elimination of areas open to cross-country vehicle travel would reduce motorized access to parts of the planning area not served by existing or designated roads and trails in the short and long term. Completing road and trail designations in site-specific travel management plans would improve motorized

4.0 ENVIRONMENTAL CONSEQUENCES

access and road and trail conditions over the long term. Alternative B would meet the goal for the travel management and off-highway vehicle use program.

Alternative C

Impacts from Travel Management and Off-highway Vehicle Use Management Actions.

Parameter – Transportation Plan

Under Alternative C, impacts from the transportation plan management actions would be the same as those discussed for the Proposed RMP.

Parameter – Off-highway Vehicles

Impacts from the off-highway vehicle use management actions would be very similar to those discussed for the Proposed RMP. This alternative would designate 32,000 acres of dry lake beds as open to cross-country off-highway vehicle use, which would not substantially change the availability of access in the planning area.

Impacts from Other Programs. Under Alternative C, travel management and off-highway vehicle use impacts associated with renewable energy, livestock grazing, geology and mineral extraction, and special designations activities would be similar to those described for the Proposed RMP.

Lands and Realty. Alternative C identifies approximately 295,200 acres for possible disposal in the decision area. The potential transfer of lands to private ownership could impact public motorized access to public lands. Potential increase in travel demand also could occur due to land use authorizations and induced growth caused by land disposals. Retaining public rights-of-way through potential land disposals could decrease the impact to public access.

Recreation. Five special recreation management areas would include an emphasis on future motorized road and trail designations, as well as new motorized trail construction. Motorized vehicle routes would be retained in the four special recreation permit areas used for motorcycle race events, and 12 routes would be designated for competitive truck events. These management actions would enhance motorized access in these 21 areas in the long term.

Conclusion. The reduction of areas open to cross-country vehicle travel from 9.8 million acres to 32,000 acres would reduce motorized access to parts of the planning area not served by existing or designated roads and trails in the short and long term. Completing road and trail designations in site-specific travel management plans would improve motorized access and road and trail conditions over the long term. Alternative C would meet the goal for the travel management and off-highway vehicle use program.

Alternative D

Impacts from Travel Management and Off-highway Vehicle Use Management Actions.

Parameter – Transportation Plan

Under Alternative D, motorized travel would be limited to currently maintained roads and trails. This management action would not provide for current access needs and would greatly restrict the ability of the Ely Field Office to meet future needs for transportation and access.

Parameter – Off-highway Vehicles

Under Alternative D, 11.0 million acres (96 percent) of the decision area would be closed to off-highway vehicle use. This closure would severely limit the access opportunities for all users of the planning area.

Impacts from Other Programs. Under this alternative, discretionary actions and authorizations would be eliminated within the decision area. Because travel management and off-highway vehicle use also would be limited by closure of most of the planning area, decisions related to the few remaining resource programs would have little additional impact on travel and off-highway vehicle use.

Lands and Realty. Alternative D identifies approximately 12,400 acres for possible disposal in the decision area. The potential transfer of lands to private ownership could impact public motorized access to public lands. Potential increase in travel demand also could occur due to induced growth caused by land disposals. Retaining public rights-of-way through potential land disposals could decrease the impact to public access. No new rights-of-way would be granted. This would limit travel management options in the long term.

Renewable Energy. Under Alternative D, rights-of-way for renewable energy development would not be granted. Thus, this program would have no effects on transportation in the planning area.

Recreation. Under Alternative D, no special recreation management areas that emphasize motorized recreation and no motorcycle or truck race courses would be designated. This would further limit motorized travel and off-highway vehicle access opportunities in the short and long term.

Livestock Grazing. Because livestock grazing would be effectively eliminated within the decision area, there would be no impact of this program on travel and off-highway vehicle use.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario (see Section 4.18). Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

Special Designations. ACECs would not be designated under Alternative D, so these special designations would not have any effect on travel management. Designated wilderness and wilderness study areas would be managed the same as the Proposed RMP.

Conclusion. The management actions under Alternative D would substantially restrict motorized access in the planning area in the short and long term by limiting off-highway vehicle use to maintained roads and trails. The lack of new land authorizations for roads would reduce accessibility in the long term. Alternative D would not meet the goal for the travel management and off-highway vehicle use program.

4.15 Recreation**Impact Issues**

The primary impact issue associated with recreation is related to conflicts with other resource programs. As recreation use in the planning area increases, it is anticipated that recreational activities would have an increasing potential for conflicts with other resources.

Assumptions for Analysis

- Dispersed recreation use in the planning area would continue to increase over time regardless of any management actions proposed in this Proposed RMP.
- Establishing special recreation management areas would increase recreation in these areas.
- All recreation area management plans will incorporate the guidance contained in Appendix C of the BLM Land Use Planning Handbook.

Interactions with Other Programs

The recreation management program within the planning area potentially would be affected by management actions within the resource programs for vegetation, fish and wildlife, special status species, wild horses, cultural resources, paleontological resources, visual resources, lands and realty, renewable energy, travel management and off-highway vehicle use, geology and mineral extraction, noxious and invasive weed management, and special designations.

Goal

Provide quality settings for developed and undeveloped recreation experiences and opportunities while protecting resources. Conduct an assessment of current and future off-highway vehicle demand, and plan for and balance the demand for this use with other multiple uses/users. Develop sustainable off-highway vehicle use areas to meet current and future demands, especially for urban interface areas.

Objective

To provide a wide variety of recreation opportunities to satisfy a growing demand by a public seeking the open, undeveloped spaces that are characteristic of the planning area.

To provide visitor information to familiarize people with recreational opportunities throughout the planning area and encourage minimum impact or "Leave No Trace" and "Tread Lightly" recreational skills and ethics for recreational activities.

4.0 ENVIRONMENTAL CONSEQUENCES

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to recreation also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Recreation Management Actions.

Parameter – Special Recreation Management Areas

The establishment of four new and retention of one existing special recreation management areas totaling approximately 1.2 million acres across the decision area would be responsive to the shift in recreation demand in eastern Nevada in recent years. These areas would include trail designations in subsequent transportation plans and may consider new trail construction during site-specific planning. The Loneliest Highway Special Recreation Management Area would continue to provide recreation opportunities along U.S. Highway 50.

Parameter – Special Recreation Permits

The designation of four motorcycle special recreation permit areas to provide routes for motorcycle competitive events and four truck routes for up to two competitive truck events per calendar year would allow opportunities for competitive motorized vehicle recreation, while providing protection to other resources. Allowing non-competitive off-highway vehicle events on a case-by-case basis would allow flexibility to adapt management to environmental conditions. By monitoring outfitter and guide hunting operations in the planning area over a three-year period, it will be possible to determine if permit special stipulations and conditions are appropriate to protect resources and prevent user conflicts. This system is

not expected to impact the ability of individual outfitters to operate on the planning area, while minimizing the potential for conflicts with other commercial operations.

Impacts from Other Programs.

Vegetation. The areas affected by vegetation treatments would total approximately 7.1 million acres, or 62 percent of the decision area. However, this treatment would be spread over 50 or more years, allowing vegetation in treated areas to recover as new areas are treated. Treatments would result in reduced area available for recreation during the short term after the treatment, but healthier watershed conditions would be present in the long term. Treatment programs that would enhanced aesthetics, such as vegetation management to restore riparian areas and reduce competition in aspen stands, could improve the recreation experience. As watershed restoration occurs, there also is the possibility that closures to motorized vehicles would be required to supplement restoration activities. This could lead to a reduction in recreational opportunities associated with off-highway motorized vehicle use and an increased opportunity for seclusion and primitive recreation.

Fish and Wildlife. Increased species distribution and diversity would enhance aesthetics and increase wildlife viewing opportunities as well as improve fishing and hunting opportunities. Additionally, re-introduction of big game species in cooperation with the Nevada Department of Wildlife would enhance hunting activities. Permitted activities, including special recreation permits, could be restricted during certain periods (e.g., calving/fawning/lambing season and possibly summer or winter) in priority wildlife habitats. This may restrict the scheduling for competitive events within special recreation permit areas.

Special Status Species. Management actions designed to protect special status species (especially greater sage-grouse and desert tortoise) and enhance their habitats would impose some constraints on organized recreational events. For example, permitted activities would be restricted where appropriate from March 1 through May 15 within 2 miles of sage-grouse leks and from May 1 through July 15 within 0.5 miles of raptor nest sites. Within desert tortoise habitat, restrictions include seasonal restriction as well as numerous recreation management actions focused on protection of the species within the three desert tortoise ACECs by limiting number, location, procedures, and timing of events.

Wild Horses. Management for smaller numbers of wild horses would result in a slight reduction in recreation opportunities for viewing wild horses. Where herd management areas overlap with the Chief Mountain Special Recreation Management Area, opportunities for viewing wild horses may be enhanced.

Cultural Resources. The Proposed RMP emphasizes the restoration of at-risk resources. Conservation Use, Scientific Use, and Public Use allocations are being emphasized in this alternative. It is anticipated that these management actions would enhance recreation opportunities and experiences at Public Use sites as compared to current management. They also would place greater recreational use restrictions on Scientific Use and Conservation Use sites.

4.0 ENVIRONMENTAL CONSEQUENCES

Paleontological Resources. Management of paleontological resources under the Proposed RMP would have some minimal impacts on recreation through the implementation of a no-fee registration system established for trilobite collecting.

Visual Resources. An increase in Visual Resource Management Class II and III designations and decrease in Class IV designations across the decision area would place higher emphasis on scenic values than current management. Placing more emphasis on preserving the scenic character would enhance recreational experiences in the planning area.

Lands and Realty. Management actions for the lands and realty program would minimally impact recreation through the possible disposal and leasing of lands containing recreation opportunities. The disposal of lands for the express purpose of creating parks would enhance recreation opportunities. The disposal of lands near communities would move public lands, and the recreational opportunities afforded by those public lands, further away from those living in or visiting those communities. This effect would be partially offset if lands disposed of near communities were designated for recreational purposes.

Renewable Energy. Renewable energy development could have localized impacts on recreation. Although applications for renewable energy development would be processed on a case-by-case basis, the large surface area required for wind (up to 40,000 acres) or solar development would likely exclude recreation in the permitted area.

Travel Management and Off-highway Vehicle Use. The Proposed RMP designates all wilderness study areas as closed to off-highway vehicle use. The remainder of the decision area would be limited to designated roads and trails as determined through subsequent site-specific plans and analyses. These changes in off-highway vehicle designations would enhance opportunities for non-motorized recreation in wilderness study areas and other areas that are remote from designated roads and trails. Changing travel designations from open to limited would reduce opportunities for motorized recreation in the short term, but enhance motorized recreation experiences in the long term by closing poorly engineered and constructed roads and trails and designating or constructing better engineered roads and trails.

Geology and Mineral Extraction. Management actions relating to minerals, oil, gas, and geothermal development would have minimal impacts on recreation. Based on the reasonably foreseeable development scenario, approximately 17,100 acres would be disturbed by mineral activities with a minimal chance for interaction with recreation activities.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available) and other tools would be used to the greatest extent practical under the Proposed RMP. During project implementation, wildland fire use events, and suppression activities associated with wildland fires, recreational opportunities could be temporarily displaced from the area.

Noxious and Invasive Weed Management. Management of noxious and invasive weeds would have minimal impacts on recreation. The elimination of weed infestations would make treated areas more attractive for recreation.

Special Designations. Three existing ACECs, 17 new ACECs, and two new Back Country Byways would be designated. ACECs would be managed to protect the resources for which they were designated. Such management could restrict certain types of recreation (motorized activities for example), but it also may facilitate other types of recreation such as sight seeing. Thus, recreation impacts from ACEC designations are anticipated to be minimal. The Proposed RMP would close all designated wilderness and close or limit wilderness study areas to off-highway vehicle use, affecting recreation activities that use off-highway vehicles as a method of transportation. The Back Country Byways would facilitate motorized viewing of some of the most scenic areas in the planning area.

Conclusion. The Proposed RMP would constitute a comprehensive program that addresses the trend of increasing recreational use as well as provides the opportunity to develop management strategies for anticipated future conditions. Five special recreation management areas totaling approximately 1.2 million acres (10 percent of the decision area) would be designated. Elimination of areas designated as open to cross-country off-highway vehicle use would reduce off-highway motorized recreational opportunities. However, these transportation restrictions also would provide an increased opportunity for seclusion and primitive recreational experiences. A sufficient number of routes would be designated to accommodate motorcycle and truck competitive events. The Proposed RMP would meet the goal for the recreation program.

Alternative A

Impacts from Recreation Management Actions.

Parameter – Special Recreation Management Areas

The Loneliest Highway Special Recreation Management Area would continue to provide recreation opportunities along U.S. Highway 50. However, failure to establish additional special recreation management areas would create a lesser range of recreational opportunities as compared to the Proposed RMP. Existing recreation facilities would be maintained and recreation area management plans would be developed on an as-needed basis. But as recreation use continues to increase over time, the limited number of recreation sites eventually could lead to increased competition for recreation opportunities. With only one special recreation management area in the decision area, which would not emphasize opportunities for motorized recreation, and no further creation of developed recreation sites, the ability to manage recreation as a primary objective in areas with high recreation potential would be constrained.

Parameter – Special Recreation Permits

The failure to create motorcycle special recreation permit areas and truck race routes, while still permitting up to 12 motorcycle and 2 truck events per year, would allow opportunities for competitive motorized vehicle recreation but could cause damage to race routes and other resources due to the number of competitive events being allowed each year. Allowing non-competitive off-highway vehicle events on a case-by-case basis would allow the flexibility to adapt management to environmental conditions. The failure to create a proactive system of managing outfitter and guide permits could lead to the degradation of resources and the recreational experience for all hunters.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts from Other Programs. Recreation impacts associated with special status species, lands and realty, renewable energy, and noxious and invasive weed management activities would be the same as described for the Proposed RMP.

Vegetation. The areas affected by vegetation treatments would total approximately 2.9 million acres, or 25 percent of the decision area. The impacts of these treatments to recreation would be similar to those described for the Proposed RMP.

Fish and Wildlife. This alternative would not involve identification of priority wildlife habitats or recreational constraints in these areas; therefore impacts to recreation from the fish and wildlife program would be substantially less than with the Proposed RMP.

Wild Horses. The current management of wild horses would have minimal impact on recreational viewing opportunities as all existing herd management areas would be retained.

Cultural Resources. Alternative A is primarily a program of monitoring selected sites and managing for future cultural resource use allocations. Restrictions to access of cultural resources of scientific value, such as cave restrictions or closures, would restrict access for recreational activities. However, opportunities for cultural resources interpretation would result in increased interpretive recreation opportunities.

Paleontological Resources. Management of paleontological resources under Alternative A would have minimal impacts on recreation. No registration system would be in place for trilobite collecting, which could lead to over-collection of trilobites and degradation of that recreational resource.

Visual Resources. Having no visual resource management class designations on 3.6 million acres of the decision area would have minimal effects on recreation within the unclassified area. Less land would be managed for Visual Resource Management Class I and II objectives, foregoing indirect enhancement of recreation.

Travel Management and Off-highway Vehicle Use. Approximately 9.8 million acres (86 percent of the decision area) would remain classified as open to off-highway vehicle use. Only the designated wilderness would be closed to vehicle use, while vehicle use would be limited to designated roads and trails in all wilderness study areas and within the Desert Tortoise ACECs. These travel management actions would continue to provide a substantial recreation opportunity for motorized off-highway vehicle use, as well as hunting and other types of recreation activities that would use off-highway vehicles as a transportation method. However, Alternative A also would pose the highest likelihood of conflicts between off-highway vehicle users and other non-motorized recreation users.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be similar to that in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the

8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP (see Section 4.18). The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development. Like the Proposed RMP, this level of expected development would have minimal effect on either permitted recreation events or dispersed recreation.

Fire Management. Prescribed fire, wildland fire use (approximately 3.6 million acres available) and other tools would be used to the greatest extent practical. During project implementation, wildland fire use events, and suppression activities associated with wildland fires, recreational opportunities could be temporarily displaced from the area.

Special Designations. Under Alternative A, special designations impacts would continue as under the current management program since no new special designations would be proposed. Three existing ACECs would be retained, and no new ACECs or back country byways would be designated. Designated wilderness would be closed to vehicles, and all wilderness study areas and ACECs would be closed or limit off-highway vehicles to designated roads and trails. The rest of the planning area would remain designated as open to off-highway vehicle use. Effects on off-highway vehicle use would be minimal, but the benefits of designations to other recreational users would not be realized.

Conclusion. As recreation use continues to increase over time, the limited number of recreation sites in Alternative A eventually would lead to increased competition for recreation opportunities. With only one 750,000-acre special recreation management area in the decision area and no further creation of developed recreation sites, the ability of the Ely Field Office to manage recreation as a primary objective in areas with high recreation potential would be constrained. About 9.8 million acres (86 percent of the decision area) would remain open to cross-country off-highway vehicle travel, resulting in no reduction in off-highway motorized recreational opportunities. No routes would be designated for motorcycle and truck competitive events, but such events would still be permitted. Alternative A would not meet the goal for the recreation program.

Alternative B

Impacts from Recreation Management Actions.

Parameter – Special Recreation Management Areas

The establishment of nine special recreation management areas totaling approximately 2.7 million acres would create a broad range of recreational opportunities. The establishment of three special recreation management areas with off-highway vehicle emphasis totaling 844,000 acres would offset the elimination of all areas designated as open to cross-country off-highway vehicle use. Other impacts would be similar to those discussed for the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Special Recreation Permits

The creation of two motorcycle special recreation permit areas and permitting up to two competitive truck events per calendar year would allow opportunities for competitive motorized vehicle recreation, while providing protection to other resources. Allowing non-competitive off-highway vehicle events on a case-by-case basis would allow the flexibility to adapt management to environmental conditions. The failure to create a proactive system of managing outfitter and guide permits could lead to the degradation of resources and the recreational experience for all hunters.

Impacts from Other Programs. Under Alternative B, recreation impacts associated with vegetation, fish and wildlife, special status species, wild horses, cultural resources, paleontological resources, visual resources, lands and realty, renewable energy, travel management and off-highway vehicle use, geology and mineral extraction, fire management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP.

Special Designations. Under Alternative B, 3 existing ACECs, 15 new ACECs, and 1 new back country byway would be designated. The impacts of these designations to recreation would be similar to those described for the Proposed RMP.

Conclusion. Alternative B would constitute a comprehensive program that addresses the trend of increasing recreational use as well as provides the opportunity to develop management strategies for anticipated future conditions. Nine special recreation management areas totaling approximately 2.7 million acres (24 percent of the decision area) would be designated. Elimination of areas designated as open to cross-country off-highway vehicle use would reduce off-highway motorized recreational opportunities. However, these transportation restrictions also would provide an increased opportunity for seclusion and primitive recreational experiences. A reduced number of routes would be designated for motorcycle and truck competitive events, but such events would still be permitted. The Proposed RMP would meet the goal for the recreation program.

Alternative C

Impacts from Recreation Management Actions.

Parameter – Special Recreation Management Areas

The establishment of nine special recreation management areas totaling approximately 2.6 million acres would create a broad range of recreational opportunities. The establishment of four special recreation management areas with off-highway vehicle emphasis totaling 1.1 million acres would offset the elimination of nearly all areas designated as open to cross-country off-highway vehicle use. Other impacts would be similar to those discussed for the Proposed RMP.

Parameter – Special Recreation Permits

The creation of four motorcycle special recreation permit areas and 12 truck race routes for up to 8 competitive truck events per calendar year would allow opportunities for competitive motorized vehicle

recreation, while providing protection to other resources. There would likely be more damage to race routes and other resources due to a greater number of competitive events being allowed each year as compared to the Proposed RMP. Allowing non-competitive off-highway vehicle events on a case-by-case basis would allow the flexibility to adapt management to environmental conditions. The creation of a competitive bid system for issuing outfitter and guide permits would allow the market to determine who receives these permits. This, and the fact that a monitoring system has not been established to determine the number of permits to be issued, could lead to outfitters and guides with less local knowledge acquiring these permits, which could possibly lead to the degradation of resources and hunter conflicts.

Impacts from Other Programs. Under Alternative C, recreation impacts associated with fish and wildlife, special status species, wild horses, visual resources, lands and realty, renewable energy, geology and mineral extraction, and noxious and invasive weed management activities would be the same as or similar to those described for the Proposed RMP, although the acreage of lands proposed for disposal would be substantially greater.

Vegetation/Watershed Management. Under the Alternative C, the areas affected by vegetation treatments would total approximately 7.5 million acres, or 66 percent of the decision area. The impacts of these treatments to recreation would be similar to those described for the Proposed RMP.

Cultural Resources. Alternative C emphasizes responsible commercial activities. Fee sites would be implemented to cover the cost of public site management for several types of cultural sites open to public use. If no fee sites are established for these types of sites, there would be no public use of the sites, and they would be designated for conservation or scientific use. Those sites designated for conservation use might impact areas designated for developed recreation. Overall, the treatment of cultural/archaeological resources under Alternative C could have the impact of reducing access to recreation.

Paleontological Resources. Management of paleontological resources under Alternative C could have slight impacts on recreation. A fee-based registration system would be established for trilobite collecting. This could reduce recreational trilobite collection due to inconvenience and cost of obtaining a permit.

Travel Management and Off-highway Vehicle Use. Travel management actions would be the same as the Proposed RMP with the exception that approximately 32,000 acres would be designated as open to cross-country off-highway vehicle use in dry lake beds. These open areas would provide for the type of motorized recreation that is not drawn to roads and trails.

Fire Management. The fire management approach to wildland fires would involve aggressive suppression where possible. This would reduce effects of fire management on recreational activities in the short term, but could lead to increased effects at some future date when fuel conditions reach the point where suppression of larger fires is not possible. As with the Proposed RMP, impacts of fire management on the recreation program would involve temporary displacement of recreational pursuits during suppression activities and site rehabilitation.

4.0 ENVIRONMENTAL CONSEQUENCES

Special Designations. Under Alternative C, 3 existing ACECs, 17 new ACECs, and 2 new back country byways would be designated. The impacts of these designations to recreation would be similar to those described for the Proposed RMP.

Conclusion. Alternative C would constitute a comprehensive program that addresses the trend of increasing recreational use as well as provides the opportunity to develop management strategies for anticipated future conditions. Nine special recreation management areas totaling approximately 2.6 million acres (22 percent of the decision area) would be designated. Reduction but not elimination of areas designated as open to cross-country off-highway vehicle use would reduce off-highway motorized recreational opportunities. However, these transportation restrictions also would provide an increased opportunity for seclusion and primitive recreational experiences. An increased number of routes would be designated to accommodate motorcycle and truck competitive events. The Proposed RMP would meet the goal for the recreation program.

Alternative D

Impacts from Recreation Management Actions.

Parameter – Special Recreation Management Areas

Under Alternative D, all special recreation management areas and existing developed recreation sites would be eliminated. The overall effect of management under this alternative would be a large reduction in recreation opportunities across a broad spectrum.

Parameter – Special Recreation Permits

Under Alternative D, no special recreation permit areas would be established for motorcycle events, and routes would not be designated or permits issued for truck events. With a decrease in areas available in Clark County for organized off-highway competitive events due to protection of the desert tortoise and its habitat, more races have shifted to the planning area. The loss of special recreation permits in the planning area would further restrict opportunities for this type of motorized recreation. Participants would have to travel longer distances for races in areas on public or private land where such activity is authorized. Outfitter and guide permits would no longer be issued. This would eliminate outfitter/guide-supported hunting but would not affect self-supported hunting.

Impacts from Other Programs. Under Alternative D, recreation impacts associated with special status species, wild horses, cultural resources, and noxious and invasive weed management activities would be similar to those described for the Proposed RMP. Impacts associated with fish and wildlife management activities would be similar to Alternative A.

Vegetation/Watershed Management. Under Alternative D, the areas affected by vegetation treatments would be similar to Alternative A, but areas of fire rehabilitation would likely be greater as the suppression of wildland fires would be minimized under this alternative. This would result in reduced access for recreation following treatments or catastrophic wildland fires.

Paleontological Resources. Management of paleontological resources under Alternative D would prohibit trilobite collecting, eliminating a potential recreation opportunity.

Visual Resources. Designation of the entire decision area as Visual Resource Management Class I or II would place the highest emphasis on scenic values, thus preserving the scenic character and enhancing recreational experiences in the planning area.

Lands and Realty. Under this alternative, the extent of lands available for disposal (approximately 12,400 acres) and the area affected by corridors and land use authorizations would be substantially less than in the Proposed RMP. Thus, effects to recreation, likewise, would be substantially reduced.

Renewable Energy. Under Alternative D, no renewable energy projects would be authorized, so there would be no impacts to recreation.

Travel Management and Off-highway Vehicle Use. Management actions for off-highway vehicles would restrict motorized vehicles to mechanically maintained roads and trails. This would subsequently reduce recreation opportunities in the planning area.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario (see Section 4.18). Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Special Designations. Removal of all special designations would have moderate impacts on recreation. Special designations are designed to protect resources and prevent conflicts among resource users. Loss of resources and increased conflicts would impact recreation users in the planning area. Further, the elimination of back country byways would reduce recreation opportunities.

Conclusion. Under Alternative D, the spectrum of recreation opportunities on BLM-administered lands would be greatly reduced, as there would be no special recreation management areas designated, no special recreation permits issued, and all existing developed recreation sites would be eliminated. Alternative D would not meet the goal for the recreation program.

4.16 Livestock Grazing

Impact Issues

Almost all of the 11.5 million acres of public land within the planning area, with the exception of 203,670 acres within the three existing ACECs, currently are available for livestock grazing, based on decisions included in previous land use plans prepared for the Egan, Schell, and Caliente resources areas that are now administered by the Ely Field Office. Suitability of the public lands administered by the Ely Field Office for livestock grazing is a decision addressed in previous land use plans and is not addressed in this planning document except as related to specific areas considered within individual alternatives.

The primary impact issues associated with livestock grazing relate to the potential reductions in area available for general livestock grazing or for grazing of specific types of livestock in certain areas (see **Table 4.16-1**). These additional constraints generally relate to land disposals, fire rehabilitation, and protection of habitat for special status species (both within and outside of ACECs). Additionally, livestock grazing may be affected to lesser degrees on areas remaining available for grazing through competition or conflict with other resource users (e.g., mineral development, recreation, wild horses, and wildlife), or through the need to properly protect other resources such as soils, vegetation, and wildlife habitat. Adjustments in season of grazing, grazing intensity, kind and class of livestock, or type of grazing system may be necessary in relation to some of these conflicts.

Table 4.16-1
Summary of Lands Unavailable for Livestock Grazing by Alternative

Acreage Category	Acreages Available or Unavailable for Grazing by Alternative ¹				
	Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Total Public Land in Planning Area	11,500,000	11,500,000	11,500,000	11,500,000	11,500,000
Lands Unavailable for Grazing					
ACECs					
Existing ACECs	203,670	203,670	203,670	203,670	0
New ACECs	120	0	14,900	6,400	0
Private/Utah Allotment	4,400	4,400	4,400	4,400	0
Area West of Highway 93	6,900	6,900	6,900	6,900	0
Leased public land near Coyote Springs Development	6,200	6,200	6,200	6,200	0
Desert Tortoise Habitat Outside ACECs	0	0	542,100	0	0
Bighorn Sheep Habitat	0	0	3,038,100	0	0
General Elimination of Livestock Grazing	0	0	0	0	11,500,000
Total Area Unavailable to All Livestock Grazing	221,290	221,170	3,816,270	227,570	11,500,000
Total Area Available for Livestock Grazing	11,278,710	11,278,830	7,683,730	11,272,430	0

¹ Exclusive of potential losses associated with additional land disposal actions. Numbers rounded to simplify presentation.

Assumptions for Analysis

- Market demands for livestock products are highly variable. It is assumed that current market demands for livestock products would continue throughout the next several decades with a continuing demand for grazing of the public lands.

4.0 ENVIRONMENTAL CONSEQUENCES

- Livestock grazing use would be authorized dependent on forage availability.
- The Nevada Department of Wildlife would manage populations of big game (i.e., mule deer, elk, pronghorn antelope, and bighorn sheep) commensurate with available forage and with consideration of other multiple uses.
- Appropriate management level for wild horse herds would be achieved and maintained for all alternatives except Alternative D.

Interactions with Other Programs

The livestock grazing management program within the planning area potentially would be affected by actions within the resource management programs for vegetation, special status species, wild horses, lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, forest/woodland and other plant products, geology and mineral extraction, watershed management, fire management, noxious and invasive weed management, and special designations.

Goal

Manage livestock grazing on public lands to provide for a level of livestock grazing consistent with multiple use, sustained yield, and watershed function and health.

Northeastern Great Basin Area Standards

- Upland soils exhibit infiltration and permeability rates that are appropriate to soil type, climate and land form.
- Riparian and wetland areas exhibit a properly functioning condition and achieve State water quality criteria.
- Habitats exhibit a healthy, productive, and diverse population of native and/or desirable plant species, appropriate to the site characteristics, to provide suitable feed, water, cover and living space for animal species and maintain ecological processes. Habitat conditions meet the life cycle requirements of threatened and endangered species.

Mojave-Southern Great Basin Area Standards

- Watershed soils and stream banks should have adequate stability to resist accelerated erosion, maintain soil productivity, and sustain the hydrologic cycle.
- Watersheds should possess the necessary ecological components to achieve state water quality criteria, maintain ecological processes, and sustain appropriate uses. Riparian and wetlands vegetation

should have structural and species diversity characteristic of the stage of stream channel succession in order to provide forage and cover, capture sediment, and capture, retain, and safely release water (watershed function).

- Habitats and watersheds should sustain a level of biodiversity appropriate for the area and conducive to appropriate uses. Habitats of special status species should be able to sustain viable populations of those species.

Objective

To allow livestock grazing to occur in a manner and at levels consistent with multiple use, sustained yield, and the standards for rangeland health.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to livestock grazing also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Livestock Grazing Management Actions. The authorization of 545,267 animal unit months on 11.3 million acres of public lands within the Ely planning area is expected to meet the RMP goals and objectives.

Approximately 424,602 animal unit months on 8.4 million acres (72 percent of the Ely planning area) would be authorized on grazing allotments that have been determined to be currently meeting or making progress toward achievement of standards for rangeland health (see **Table 2.4-15**). Approximately 42,576 animal unit months (part of the 424,602 animal unit months) would be continued on grazing allotments within desert tortoise habitat, but outside the three desert tortoise ACECs (see **Table 2.4-14**). Maintenance and improvement in the desired range of conditions for vegetation will continue. Changes, such as improved livestock management, new range improvement projects, and changes in the amount and kinds of forage permanently available for livestock use, can lead to changes in grazing preference, authorized season of use, and kinds of livestock. Over the long term, such changes will continue to meet RMP goals and objectives, including the standards for rangeland health.

4.0 ENVIRONMENTAL CONSEQUENCES

The authorization of 120,665 animal unit months on 3.2 million acres (27 percent of the Ely planning area) would be maintained on grazing allotments pending their evaluation for meeting rangeland health standards which will be completed by 2009 (see **Table 2.4-16**). In the short term, there may be impacts from livestock grazing that would be considered a causal factor in not attaining or making progress towards the rangeland health standards. As the grazing allotments are evaluated and changes, such as improved livestock management, new range improvement projects, and changes in the amount and kinds of forage permanently available for livestock use, may lead to changes in grazing preference, authorized season of use, or kinds of livestock. Over the long term, the implementations of such changes are expected to continue to meet RMP goals and objectives, including the standards for rangeland health.

Approximately 5,658 animal unit months on 203,670 acres (2 percent of the Ely planning area) will remain unavailable for livestock grazing in the Mormon Mesa, Kane Springs, and Beaver Dam Slope ACECs and associated grazing allotments (see **Map 2.4.16-1**).

Protection of newly designated ACECs would result in another 120 acres being unavailable to livestock grazing. Additional rangeland improvements, changes in season of use, or livestock numbers may be required in the short term to ensure protection of the ACECs.

Other areas of public lands unavailable for livestock grazing include the Private/Utah Allotment, lands west of Highway 93 at the south end of the planning area, and leased lands near Coyote Springs Development. As shown in **Table 4.16-1**, these areas total approximately 17,500 acres.

In accordance with current BLM policy, management of domestic sheep and goats in areas of occupied bighorn sheep habitat could potentially be affected. Management changes affecting domestic sheep and goats may occur when proposed changes to BLM grazing permits are considered. **Table 4.16-2** presents the potential animal unit months for domestic sheep and goat grazing that could be affected in association with occupied desert and Rocky Mountain bighorn sheep habitat. Adjustments to animal unit months for sheep and goat grazing will be subject to review on a case-by-case basis.

The Proposed RMP provides for the management of allotments that become vacant where it is consistent with protection of watershed health and multiple use objectives. In the short term, this could offset effects of temporary fire rehabilitation closures, implementation of other vegetation improvement activities, and, in some cases, drought relief. In the long term, relinquished permits will meet RMP goals and objectives including the standards for rangeland health.

**Table 4.16-2
Potential Effect of Desert and Rocky Mountain Bighorn Sheep Management of Occupied Habitat on
Domestic Sheep Allotments**

Allotment Name	Use Area	Map Unit Number ¹	Allotment Area (Acres)	Percent of Allotment in Occupied Habitat	Occupied Habitat (Acres)	Potential Domestic Sheep Use Affected (Animal Unit Months)

Wilson Creek	Muleshoe/Maloy	230i	121,891	15	18,401	ND ²
Wilson Creek	Thorley	230o	27,507	9	2,539	ND ²
Totals					100,041	

¹ Map Unit Number refers to map units shown on Map 2.4.16-1.

² Sheep use not determined for individual use areas.

Implementation of specific management actions (e.g., seasons of use and levels of allowable use) on grazing allotments in desert tortoise habitat will aid in the recovery plan for desert tortoise. In the short term, restricting utilization limits on available forage in specific seasons of use will allow for more available forage for desert tortoise. Continued monitoring of desert tortoise habitat to ensure that a minimum of 15 percent canopy cover remains within each ecological site, adjustment of livestock stocking levels in the event of unusual climatic conditions, and removal of livestock on areas unavailable to livestock grazing will, in the long term, improve habitat for desert tortoise.

Impacts from Other Programs.

Vegetation. The area identified for potential vegetation treatments under the Proposed RMP is more than twice that of current management. It is expected that the area treated each year also would be substantially greater under the Proposed RMP. It is estimated that a total area in excess of 100,000 acres could be affected at a given time under the Proposed RMP. This could require short-term changes to livestock use such as temporary reductions in livestock grazing and temporary closure of the treatment areas on affected allotments. Treatment areas or portions of allotments would be unavailable until objectives are met or other determinations are made by the line officer. Livestock grazing use could be authorized on other areas of the allotment and not require temporary reductions in stocking levels. It is unlikely, however, that all of the treated areas would involve seeding or other activities that would interfere with continuing a livestock grazing program. Selection of areas and methods for treatment would occur at the watershed analysis stage, with efforts being made to prevent excessive areas being treated concurrently within the same grazing allotment or watershed.

4.0 ENVIRONMENTAL CONSEQUENCES

Special Status Species. The three desert tortoise ACECs (totaling 203,670 acres) will continue to be unavailable for livestock grazing and livestock grazing management will be adjusted as necessary to maintain quality habitat in areas of desert tortoise habitat outside the three ACECs. This includes constraints on season of use and level of use by livestock, as well as other specific desert tortoise mitigation measures outlined in Section 2.4.16. Grazing would be permitted from March 1 to October 31 with use not to exceed 40 percent on key perennial plant species. Between November 1 and February 28/29, utilization would be allowed to reach 50 percent on key perennial grasses and 45 percent on key shrubs and forbs. Livestock grazing within the Lower Meadow Valley Wash ACEC would be controlled by terms and conditions and season of use restrictions on the grazing permits to avoid impacts during the nesting season to the Southwestern willow flycatcher and the yellow-billed cuckoo.

Livestock use also would be adjusted to maintain quality habitat for greater sage-grouse and various other special status species. This could affect season of use, level of use, and kind of livestock. Needed adjustments would be determined through the watershed analysis process.

Wild Horses. Under the Proposed RMP, several of the existing herd management areas would be eliminated and wild horse management would focus on those areas where conditions exist to sustain viable populations in a thriving natural ecological balance. This change in management would eliminate wild horse competition and conflicts with livestock in those areas. Management to maintain wild horse populations on the remaining herd management areas to the appropriate management levels would limit the degree of competition with livestock in those areas. Domestic horse grazing permits will not be authorized within wild horse herd management areas, thus limiting where such use could occur.

Lands and Realty. Under the Proposed RMP, approximately 75,600 acres would be available for possible disposal (see Section 2.4.12.2 for details). Adjustment or elimination of affected livestock grazing allotments would occur if and when these lands are sold. Impacts from land disposal would be long term or permanent. Changes to livestock grazing use resulting from reduced land acreage due to land disposals could include one or more of the following actions: reductions in stocking levels; distribution of livestock to other areas; a shorter grazing period; more intensive grazing practices (e.g. water hauling, fencing, and water development); or no changes in grazing management practices.

Renewable Energy. Under the Proposed RMP, development of renewable energy would be allowed, with the possibility that such development may, to a limited degree, conflict with current livestock grazing. These conflicts may include removal of specific facility areas from grazing, construction of access roads and utility rights-of-way, and increased vehicle traffic in remote areas. Although some surface disturbances and vegetation removal may result from renewable energy development (up to 4,000 acres for wind energy), such disturbances generally would be limited in magnitude and extent. Thus, the impacts to livestock grazing from such development are expected to be inconsequential. Impacts associated with these activities would be mitigated to the extent practicable through management practices from the Wind Energy Programmatic EIS (Appendix F, Section 3).

Travel Management and Off-highway Vehicle Use. Off-highway vehicle use would be limited to designated roads and trails as determined through a subsequent public process and area-specific analysis.

Transportation plans for the planning area would be updated and unnecessary roads may be closed and rehabilitated. The reduction of areas open to cross-country off-highway vehicle use would result in substantially fewer conflicts with livestock grazing than under current management. The off-highway vehicle designations and travel management provisions of the Proposed RMP would require permittees to have a special stipulation in their permit to allow cross country motorized travel. This could have a greater effect on the level of effort required by permittees for daily operations than under current management.

Recreation. Increasing recreational demand would continue to create new conflicts with livestock grazing, particularly in the southern portion of the planning area where the greatest recreational demand is expected to occur. Under the Proposed RMP, five special recreation management areas totaling approximately 1.2 million acres would be established in the decision area. With continued grazing in these areas and increased recreational use of the same areas, increased conflicts between recreation and livestock grazing are expected to occur.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario (see Section 4.18), would be distributed throughout the 11.5 million acres of the planning area. The impact to livestock from minerals development could involve temporary removal of vegetation and short-term limitation of grazing. Reclamation would restore vegetation in most cases, but there could be some irretrievable loss of range land or a change in vegetation communities. Site-specific analysis and best management practices would provide further mitigation and protection of range sites.

Watershed Management. Any additional forage produced beyond meeting rangeland health standards as a result of fire rehabilitation or other vegetation manipulation would be allocated to livestock and wild horses, watershed maintenance, and reserved for wildlife on a balanced basis. The level of additional forage resulting from vegetation treatments under the Proposed RMP is expected to be of a magnitude that would largely offset potential reductions in livestock numbers during the treatment process.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available) and other tools would be used to the greatest extent practical under the Proposed RMP. Short-term livestock grazing use on treatment areas would be temporarily displaced during treatment recovery and emergency stabilization and rehabilitation efforts. Long-term livestock grazing opportunities would improve in the treatment areas. Restoration of vegetation resilience and return to historical fire regimes would reduce future impacts to livestock grazing when wildland fires occur.

Noxious and Invasive Weed Management. The spread of noxious and invasive weeds into grazing allotments could result in the temporary closure of affected grazing lands in order to expedite treatment and eradication measures. Livestock grazing may be used to reduce noxious weed infestations and their impacts.

Special Designations. Livestock grazing would be unavailable on approximately 203,670 acres in five ACECs including the three desert tortoise ACECs. Grazing would be restricted in a variety of the other

4.0 ENVIRONMENTAL CONSEQUENCES

proposed ACECs through grazing permit terms and conditions. These restrictions are expected to have minimal effects on grazing operations.

Conclusion. Approximately 11.3 million acres would remain available for grazing following closures on all or portions of five ACECs. Approximately 424,602 animal unit months on 8.4 million acres would be authorized on grazing allotments that have been determined to be meeting or progressing toward achievement of standards for rangeland health. Approximately 120,665 animal unit months on 3.2 million acres would be authorized on grazing allotments pending their evaluation for meeting rangeland health standards. The total acreage available for grazing is subject to change based on approximately 75,600 acres identified for potential sale. Although portions of these lands may continue to be grazed after they are sold, they would no longer be administered as part of the BLM livestock grazing program. Vegetation treatments and protection of freshly seeded areas also could temporarily affect grazing on substantial areas during the treatment process, but it is expected that increased forage production on previously treated areas would offset temporary reductions in those allotments. The Proposed RMP would achieve the stated goal for this program.

Alternative A

Allotment evaluations are being completed primarily in conjunction with grazing term permit renewal and the watershed analysis process. Allotment evaluations and watershed assessments are being conducted to determine if the standards and fundamentals for rangeland health are being achieved. A determination also is made as to whether livestock grazing is maintaining or progressing toward the achievement of standards for rangeland health and if livestock grazing is a significant factor in failing to achieve the standards. Standards and guidelines developed for the planning area include the Northeastern Great Basin Area and the Mojave-Southern Great Basin Area. Standards and guidelines would be implemented through terms and conditions of grazing permits, leases and annual authorizations.

Impacts from Livestock Grazing Management Actions. Grazing allotment allocation would be the same as the Proposed RMP.

Approximately 5,658 animal unit months on 203,670 acres (2 percent of the Ely planning area) will remain unavailable for livestock grazing in the Mormon Mesa, Kane Springs, and Beaver Dam Slope ACECs and associated grazing allotments (see **Map 2.4.16-1**). The continuance of managing the available forage in the ACECs will, in the long term, aid in the recovery of the desert tortoise.

Domestic sheep and goats would continue to be managed in accordance with current BLM policies for management of domestic sheep and goats in bighorn sheep habitat when proposed changes to BLM grazing permits are being considered.

Implementation of specific management actions on grazing allotments in desert tortoise habitat will aid in the recovery plan for desert tortoise. In the short term, restricting utilization limits on available forage in specific seasons of use will allow for more available forage for desert tortoise. Continued monitoring of desert tortoise habitat to ensure that a minimum of 15 percent canopy cover remains within each ecological site,

adjustment of livestock stocking levels in the event of unusual climatic conditions, and removal of livestock for areas unavailable to livestock grazing will, in the long term, improve habitat for desert tortoise.

Impacts from Other Programs. Impacts to livestock grazing from the renewable energy program and noxious and invasive weed management would be the same as described for the Proposed RMP.

Vegetation. Vegetation restoration or watershed treatment activities are expected to continue at the same levels as the present under Alternative A (i.e., approximately 10,000 acres per year based on a historical average). Since seedling establishment and soil stabilization period of at least 2 to 3 years is typically projected for seeding projects, such projects could result in an approximate 20,000 to 30,000-acre (minimum) temporary reduction in available forage at any given point in time until these areas can be safely grazed.

Special Status Species. The three desert tortoise ACECs (totaling 203,670 acres) would continue to be unavailable for livestock grazing, and livestock grazing management outside the ACECs would be similar to the Proposed RMP, except that the restricted period of activities would be 1 month shorter (March 15 to October 15 instead of March 1 to October 31). The Lower Meadow Valley Wash would remain available for livestock grazing. Thus, overall effects of special status species on livestock grazing would be less restrictive than under the Proposed RMP.

Wild Horses. Current competition between wild horses and livestock for forage likely would intensify with any additional deterioration of rangeland health and forage availability. This competition would be alleviated in those herd management areas where wild horse populations are reduced to and maintained at appropriate management levels.

Lands and Realty. To the extent that grazing allotments overlap with lands identified as available for possible disposal (31,900 acres identified for potential disposal under this alternative; see Section 2.4.12 for details), these allotments may be affected (modified or eliminated) by disposal, resulting in a reduction of lands available for grazing.

Travel Management and Off-highway Vehicle Use. The construction of new roads and trails would be relatively limited. Thus, new or additional conflicts between livestock grazing and road construction are expected to be few. However, since the majority of the planning area (about 9.8 million acres) would remain open to off-highway vehicle use and the demand is expected to grow substantially, conflicts with such traffic on existing trails are expected to occur at an ever increasing frequency. Off-highway vehicle traffic, when not using roads and trails, impacts vegetation growth, extent of vegetation cover, and erosion patterns, resulting in secondary impacts on livestock behavior and use patterns.

Recreation. Increasing recreational demand, especially for off road vehicle use, would create new conflicts with livestock grazing. This is especially true in the southern portion of the planning area, where population demographics suggest the greatest future recreational demand. One special recreation management area along Highway U.S. 50 of approximately 750,000 acres would remain in the decision area and would have minimal effects on grazing.

4.0 ENVIRONMENTAL CONSEQUENCES

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP (see Section 4.18). The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Watershed Management. Any additional forage produced within the Schell Resource Area as a result of fire rehabilitation or other vegetation manipulation would be allocated at a ratio of 70 percent to livestock and wild horses and 30 percent reserved for wildlife. In the remainder of the planning area, additional or surplus forage would be allocated proportionately among all qualified users. The level of additional forage resulting from vegetation treatments under Alternative A is not expected to be of a magnitude that would result in noticeable changes in livestock numbers following such allocations.

Fire Management. The impacts under Alternative A would be similar to those under the Proposed RMP except on a smaller scale. This, in the long-term, would result in fewer acres with improved ecological health, vegetation resilience, and overall improved forage quality. Fuels would continue to accumulate in untreated areas, and the probability of major, uncontrollable, stand-replacing fire events would continue. This would result in greater areas being unavailable for livestock grazing during emergency stabilization and rehabilitation efforts.

Special Designations. No additional ACECs (beyond the three desert tortoise ACECs) or other special designations that would result in areas being unavailable for livestock grazing are proposed. As a result, there would be no additional impact to livestock grazing as a result of special designations management activities.

Conclusion. Approximately 11.3 million acres would remain open to grazing. Approximately 424,602 animal unit months on 8.4 million acres would be authorized on grazing allotments that have been determined to be meeting or progressing toward achievement of standards for rangeland health. Approximately 120,665 animal unit months on 3.2 million acres would be authorized on grazing allotments pending their evaluation for meeting rangeland health standards. Potential land disposals would affect total acreage available for grazing.

Alternative B

Impacts from Livestock Grazing Management Actions. Under Alternative B, livestock grazing would continue on approximately 7.7 million acres within the planning area (prior to potential land disposals). Livestock grazing would be authorized on those allotments that have been determined to be meeting the standards for rangeland health. Livestock grazing also would be authorized on allotments pending their evaluation for meeting the standards. The authorization of additional possible land disposal under this alternative may result in the modification or elimination of individual allotments. In addition to those areas previously unavailable for grazing under the Desert Tortoise Amendment to the Caliente MFP, this alternative would render unavailable to grazing the remaining desert tortoise habitat within the Mojave Desert (approximately 523,900 acres), approximately 3.0 million acres of bighorn sheep habitat, and 14,900 acres within new ACECs. These actions would affect a total of 189 of the 234 existing allotments (see **Map 2.4.16-1**).

The non-use relinquished permits could be used for such purposes as establishing forage reserves or providing improved watershed protection. In comparison to Alternative A, this approach would provide: 1) greater flexibility for allocation of increased forage resulting from watershed treatments; 2) a shift toward managing on a watershed rather than an allotment basis; and 3) greater flexibility of management toward achievement of the Resource Advisory Council standards and guidelines (Appendix B).

Additional forage available on treated areas would not be allocated to livestock or reserved for wildlife. Alternately, the additional forage production would contribute toward meeting watershed goals and rangeland health standards.

Impacts from Other Programs. Livestock grazing impacts associated with vegetation, wild horses, renewable energy, travel management and off-highway vehicle use, geology and mineral extraction, fire management, noxious and invasive weed management, and special designations would be the same as described for the Proposed RMP. The following programs would have different impacts on the livestock grazing program in comparison to the Proposed RMP.

Special Status Species. Livestock grazing would be unavailable in the Kane Springs, Mormon Mesa, and Beaver Dam Slope desert tortoise ACECs, and all desert tortoise habitats outside the desert tortoise ACECs (see **Table 4.16-1**) for a total of approximately 727,600 acres removed from grazing for special status species protection.

Lands and Realty. Under Alternative B, approximately 90,600 acres would be available for possible disposal (see Section 2.6.12 for details). Adjustment or elimination of affected livestock grazing allotments would occur if and when these lands are sold. Impacts from land disposal would be long term or permanent.

Recreation. Escalating recreational demand would continue to create new conflicts with livestock grazing, particularly in the southern portion of the planning area where the greatest future recreational demand is expected to occur. Under Alternative B, nine special recreation management areas totaling approximately 2.7 million acres would be established in the decision area. While management of these

4.0 ENVIRONMENTAL CONSEQUENCES

areas would not preclude grazing, the conflicts between grazing use and recreation are expected to increase on and around these areas.

Watershed Management. Any additional forage produced beyond meeting rangeland health standards as a result of fire rehabilitation or other vegetation manipulation would be reserved for watershed maintenance and wildlife, not allocated to livestock.

Conclusion. Approximately 3.8 million acres of additional grazing area affecting 189 total allotments would be unavailable for grazing due to desert tortoise habitat, bighorn sheep habitat, acquisition of former U.S. Forest Service allotments that are currently unavailable for grazing, and new ACECs (beyond the 203,670 acres already unavailable in the existing desert tortoise ACECs) resulting in long-term impacts to livestock grazing. Livestock grazing would be authorized on those allotments that have been determined to be meeting the standards for rangeland health. Livestock grazing also would be authorized on allotments pending their evaluation for meeting the standards. Vegetation treatments and protection of freshly seeded areas also could temporarily affect grazing on substantial areas during the treatment process causing short-term impacts. It is expected, however, that increased forage production on previously treated areas would offset temporary reductions in these allotments. Because this alternative would effectively render one-third of the planning area unavailable for livestock grazing, it is questionable as to whether the alternative could be considered as meeting the program goal, even though the goal would be met on the remainder of the area.

Alternative C

Impacts from Livestock Grazing Management Actions. Areas available for grazing under Alternative C would be the same as Alternative A except that 6,400 additional acres would be unavailable for grazing in four new ACECs. The authorization of additional possible land disposals under this alternative totaling approximately 295,200 acres (see Section 2.7.12 for details) may result in modification or elimination of allotments if and when these lands are sold.

The authorization of 545,267 animal unit months on 11.3 million acres within the Ely planning area is expected to meet the RMP goals and objectives. Grazing allotment allocation would be the same as the Proposed RMP.

Approximately 5,658 animal unit months on 203,670 acres (2 percent of the Ely planning area) will remain unavailable for livestock grazing in the Mormon Mesa, Kane Springs, and Beaver Dam Slope ACECs and associated grazing allotments (see **Map 2.4.16-1**). The continuance of managing the available forage in the ACECs will, in the long term, aid in the recovery of the desert tortoise.

Domestic sheep and goats would continue to be managed in accordance with current BLM policies for management of domestic sheep and goats in bighorn sheep habitat when propose changes to BLM grazing permits are being considered.

Implementation of specific management actions on grazing allotments in desert tortoise habitat will aid in the recovery plan for desert tortoise. In the short term, restricting utilization limits on available forage in specific seasons of use will allow for more available forage for desert tortoise. Continued monitoring of desert tortoise habitat to ensure that a minimum of 15 percent canopy cover remains within each ecological site, adjustment of livestock stocking levels in the event of unusual climatic conditions, and removal of livestock for areas unavailable to livestock grazing will, in the long term, improve habitat for desert tortoise.

Approximately 7,843 acres in the Haypress Allotment would be disposed of if Congressional direction is provided in the future.

Livestock grazing would not be eliminated from bighorn sheep ranges. Management in these areas would be the same as Alternative A. This approach would have little or no change in impacts to rangeland resources or the grazing permittees.

Alternative C would provide the flexibility for BLM to use relinquished permits for the creation of forage reserves available for research or temporary use by permittees who are displaced for any reason. The Tamberlaine Allotment, if relinquished, would be managed as a forage reserve. This alternative would generate positive benefits for other permittees within the planning area.

Impacts from Other Programs. Livestock grazing impacts associated with wild horses, renewable energy, geology and mineral extraction, noxious and invasive weed management, and special designations activities would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Vegetation. Effects of vegetation treatments on livestock grazing would be essentially the same as the Proposed RMP during the period of treatment and restoration. After the first few years of treatments, however, the additional forage produced in these areas would be allocated to livestock (see watershed management) and could, at least partially, offset the reduction in available acreage. Thus, impacts from vegetation treatment would typically be short term on a given allotment.

As a result of vegetation treatments particularly in sagebrush, mountain shrub and mountain mahogany plant communities, short-term reductions in authorized livestock use, restriction or exclusion of livestock, changes in period of use, or other management actions may occur in order to implement restoration actions. Authorized use may increase following the restoration activity based on additional forage produced and achievement of rangeland health objectives. Restoration and maintenance of vegetation communities to achieve desired range of conditions and varying vegetation states or mosaics of the plant communities across the landscape would increase herbaceous production. Effects of vegetation treatments on livestock grazing also may be essentially the same as Alternative B following treatment. Management actions may be required prior to treatment in order to allow and promote treatment effects and restoration. These may include; changes in permitted use within the project area, restriction or exclusion of livestock or other management actions.

4.0 ENVIRONMENTAL CONSEQUENCES

Treatment of pinyon-juniper woodlands and quaking aspen stands also may require adjustments to stocking levels, periods of use or other actions in order to implement actions necessary to maintain or improve pinyon-juniper woodlands and quaking aspen stands. Such impacts would typically be of short duration.

In those vegetation types (e.g., Mojave Desert, salt desert shrub, and riparian/wetland) where the vegetation treatments primarily would be passive in nature (i.e., biological treatments), livestock grazing would be adjusted if current management does not allow for the maintenance or measurable progress toward achieving the desired range of conditions. These impacts could be either short or long term depending on the situation involved.

Special Status Species. The three desert tortoise ACECs (totaling 203,670 acres) would continue to be unavailable for livestock grazing, and livestock grazing management outside the ACECs would be similar to the Proposed RMP, except that the restricted period of activities would be 1 month shorter (March 15 to October 15 instead of March 1 to October 31). Thus, overall effects of special status species on livestock grazing would be less restrictive than under the Proposed RMP within desert tortoise habitat outside the ACECs. Livestock grazing within the Lower Meadow Valley Wash ACEC would be the same as the Proposed RMP and would be controlled by terms and conditions and season of use restrictions on the grazing permits to avoid impacts during the nesting season to the Southwestern willow flycatcher and the yellow-billed cuckoo.

Lands and Realty. Under Alternative C, approximately 295,200 additional acres would be available for possible disposal. Adjustment or elimination of affected livestock grazing allotments would occur if and when these lands are sold. Such impacts would be long term or permanent in nature.

Travel Management and Off-highway Vehicle Use. Under Alternative C, approximately 730,000 acres of special recreation management areas would be identified for off-highway vehicle emphasis areas and 32,000 acres of dry lake beds would be open to cross-country off-highway vehicle use. The remainder either would be closed to off-highway vehicle use or limited to use only on designated roads and trails. The reduced area available for off-highway vehicle use under this alternative likely would result in fewer conflicts with livestock grazing than under Alternative A but more than under the Proposed RMP.

Recreation. Escalating recreational demand would continue to create new conflicts with livestock grazing, particularly in the southern portion of the planning area, where the greatest future recreational demand is expected to occur. Nine special recreation management areas totaling approximately 2.6 million acres would be established in the decision area. While management of these areas may not preclude grazing, the conflicts between grazing use and recreation are expected to increase on and around these areas.

Watershed Management. Any additional forage produced beyond meeting rangeland health standards as a result of fire rehabilitation or other vegetation manipulation would be allocated to livestock. The level of additional forage resulting from vegetation treatments under the Alternative C is expected to be of a magnitude that largely would offset potential reductions in livestock numbers during the treatment process.

Fire Management. Under Alternative C, full suppression of wildland fires would occur and, therefore, the initial affected area of interaction with livestock grazing would be less than or similar to the Proposed RMP and Alternative A. However, with continued fire management under this approach, it is expected that accumulation of heavy fuels in untreated areas would eventually lead to situations where suppression would become impractical, if not impossible, resulting in large-scale, intense fire events. Thus, on a long-term basis, fire impacts to livestock grazing would be greater than either the Proposed RMP or Alternative A.

Conclusion. Approximately 11.3 million acres would remain available for grazing in 234 existing allotments, subject to potential land sales of up to 295,200 acres. These areas would become unavailable for grazing when they are sold. Long-term fire impacts to grazing would be substantial. Vegetation treatments and protection of freshly seeded areas also could temporarily affect grazing on substantial areas during the treatment process, but it is expected that increased forage production on previously treated areas would offset temporary reductions in these allotments. Alternative C would achieve the goal for the livestock grazing program.

Alternative D

Under Alternative D, no livestock grazing would be permitted in the planning area. Therefore, livestock grazing per se would cease to impact or be impacted by other resource uses and users. The termination of livestock grazing, however, would generate substantial impacts to current allotment permittees and to revenues received by the BLM for grazing fees (addressed under Economic and Social Conditions). It also would affect numerous other resource programs. These effects are addressed in those various resource discussions.

Since this decision would not be consistent with current regulations and agency policy, selection of this alternative would require Congressional approval for implementation.

Conclusion. Elimination of the livestock grazing program within the planning area would constitute a major change in policy with attendant impacts to livestock grazing, other resource uses, and users. Since Alternative D does not provide for livestock grazing as a component of multiple use of the public lands, it would not achieve the stated goal for this program.

4.17 Forest/Woodland and Other Plant Products

Impact Issues

Forest/woodland and other plant products would be affected by activities that modify the quantity and quality of vegetation resources either directly or indirectly.

Assumptions for Analysis

- Forest/woodland and other plant products may originate from forest, woodland, or non-woodland plant communities. Demand for forest/woodland and other plant products are expected to increase as population increases.

General Impacts from Vegetation Treatment Tools and Techniques

Please refer to Section 4.5, Vegetation, for general impacts from vegetation tools and techniques. Tools and techniques that may positively or negatively affect availability of forest/woodland and other plant products include fire, mechanical and chemical treatments, and grazing management.

Interactions with Other Programs

The forest/woodland and other plant product management program within the planning area potentially would be affected by actions within the resource management programs for vegetation, lands and realty, renewable energy, travel management and off-highway vehicle use, fire management, and special designations.

Goal

Provide opportunities for traditional and non-traditional uses of vegetation products on a sustainable, multiple-use basis.

Objective

To make healthy forest/woodlands and populations of other plants available for the responsible harvesting of forest/woodland and other plant products by the public, commercial interests, and American Indians and allow access for traditional and non-traditional uses.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation

4.0 ENVIRONMENTAL CONSEQUENCES

measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Forest/Woodland and Other Plant Products Management Actions.

Parameter – General Forest/Woodland and Other Plant Product Management

Prior to, and shortly after (up to nearly 5 years) vegetation treatments are implemented, approximately 3.7 million acres would be available for forest/woodland product use in the planning area. This includes approximately 2.8 million acres of pinyon-juniper woodland, approximately 1.2 million acres of pinyon-juniper vegetation currently occupying sagebrush ecological sites (see **Map 4.5-2**), and approximately 17,000 acres of high elevation conifers (e.g., white fir) and 2,100 acres of aspen. Based on these estimates, the following forest/woodland products would be available within the planning area:

- 11 to 22 million cords of fuelwood (average production – 3 to 6 cords per acre);
- 16.7 million Christmas trees (average production – 15 singleleaf pinyon trees per acre; singleleaf pinyon occur within approximately 30 percent of pinyon-juniper woodlands and within sagebrush areas invaded with pinyon and juniper);
- 56 to 111 million posts and poles (average production – 15 to 30 posts and poles per acre); and
- 167 to 333 million pounds of pinyon nuts (average production during favorable years – 150 to 300 pounds per acre).

Management actions of the Proposed RMP allow harvest of these products while protecting a variety of rare or unique species (e.g., bristlecone pine, limber pine, and swamp cedar). Harvest of desert vegetation (e.g., cactus and yucca) would be allowed primarily on a salvage basis subject to state law and Section 7 consultation with the U.S. Fish and Wildlife Service where appropriate, thus, preventing over-harvest of such species.

Parameter – Fuelwood Collection

The forest/woodland products program for this parameter would allow widespread collection of pinyon, juniper, and mountain mahogany. Additional species (e.g., aspen, ponderosa pine, and white fir) would be made available on a case-by-case basis for fuelwood. Greater availability of species would provide increased choices and encourage additional public use of forest and woodland species and products. The increased number of species available for harvest also would allow greater flexibility in using fuelwood harvest as a tool in the management of these additional forest/woodland communities. By allowing harvest of these additional species on a case-by-case basis, the BLM can control the level of harvest of these species to prevent undue damage to other resources in the harvest area.

4.17 Forest/Woodland and Other Plant Products

Fuelwood cutting would be permitted anywhere within the planning area except in closed areas. This would continue to provide opportunities for personal and commercial use of the woodland/forest resource. Over the past 7 years, the Ely Field Office has issued fuelwood permits for an average of 1,875 cords per year with a high of 2,390 cords in 1998 to a low of 1,515 cords in 2000. Fuelwood cutting is generally conducted within short distances from roads. Allowing harvest of pinyon, juniper, and mountain mahogany across most of the planning area would assist in protecting watersheds and communities from wildland fire as most harvesting would be concentrated in those areas. Harvesting that occurs in areas away from the communities also would reduce fire potential for native vegetation communities. The greatest demands have been for pinyon pine and juniper. This harvest trend would cause tree densities to decrease more near roads that are in close proximity to communities. Tree densities away from roads would begin decreasing as available wood is harvested near roads. Based on the cords estimated in the planning area, the rate at which woodlands are reportedly increasing, and low public demand, this level of green tree fuelwood harvest appears to be more than sustainable, particularly for pinyon and juniper.

Parameter – Pinyon Pine Nut Harvesting

Management actions of the Proposed RMP would allow harvest of pinyon pine nuts for both individual and commercial use with limited changes from current policy. Harvestable pinyon pine nut production in the planning area commonly meets or exceeds harvest demand in favorable years, but this situation will likely change as demand continues to grow in future years. The proposed management actions specify designation of areas for harvest that provide adequate control of commercial harvest levels to ensure that adequate quantities of pinyon pine nuts remain following harvest to provide for wildlife usage and seedling recruitment.

Parameter – Christmas Tree Harvesting

The forest/woodland products program for this parameter would allow private and commercial harvest of pinyon and juniper throughout the planning area, private harvest of white fir throughout the planning area, and commercial harvest of white fir on a site-specific case-by-case basis to help meet vegetation management objectives. Availability of the additional species (white fir) would provide increased choices and encourage additional public use of forest and woodland species and products to achieve management objectives for forested stands. This flexibility would facilitate meeting vegetation objectives for plant communities. By limiting the commercial harvest of this additional species to selected areas, the BLM would have greater flexibility in the management of applicable forest/woodland communities.

Parameter – Post and Pole Harvesting

The forest/woodland products program for this parameter would be similar to current management except additional species (aspen, fir, spruce) would be made available for posts and poles on a case-by-case basis. Greater availability of species would provide increased choices and encourage additional public use of forest and woodland species and products. The availability of additional species for harvest would allow greater flexibility in the management of these forest/woodland communities to enhance understory regeneration and meet site-specific objectives.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Seed Collection

Seed collection would be available for commercial purposes on a case-by-case basis. Commercial collection of seed is unlikely to occur at a substantial level under this alternative, because activities are limited to hand and limited mechanical collection only. Limiting seed collection to no more than 50 percent of the annual seed crop would ensure that an adequate quantity of seed remains for continued regeneration and recruitment of other plant species.

Parameter – Other Vegetation Products Collection

By allowing the harvest of other vegetation products (e.g., wildings and boughs) on a case-by-case basis with limited collection methods, the level of harvest would be controlled and undue damage to other resources in the harvest area would be prevented. Based on current and past use, availability of these products far exceeds demand.

Impacts from Other Programs.

Vegetation. Under the Proposed RMP, woodlands would be treated and managed to achieve the range of healthy conditions identified in Section 2.4.5. This management direction would allow for extensive reductions in tree densities, which would have potential for personal and commercial uses.

As noted in the vegetation section, approximately 2.8 million acres of pinyon-juniper woodlands would be identified for potential treatment. All of the estimated 1.2 million acres of sagebrush ecological sites invaded by pinyon-juniper would most likely be treated. Therefore, approximately 3.3 million acres (77 percent of 2.8 million treated acres of pinyon-juniper woodland and all of sagebrush invaded sites) would be identified for eventual treatment. Assuming treatment over a period of 50 to 100 years (extending well beyond the current planning period), this would allow for an average of 33,000 to 66,000 acres of pinyon-juniper vegetation to be treated annually. Based on annual treatment estimates, and production estimates as listed previously in this section, the following forest/woodland products would be available annually in treated areas:

- 110,000 to 440,000 cords of fuelwood;
- 167,000 to 334,000 Christmas trees;
- 0.5 to 2.2 million posts and poles; and
- 1.7 to 6.7 million pounds of pinyon nuts.

The above products would still be available for product use during the short term (approximately 5 years). Over the long term, production of pinyon nuts, Christmas trees and other products should increase in pinyon-juniper woodland sites as competition is removed and resilience is restored. Woodland product availability after treatments would still meet expected demand.

The removal of pinyon and juniper trees to meet landscape objectives potentially could affect their relative availability for public and commercial use in some areas. How much and what type would depend on many factors such as method of treatment and methods of slash disposal. Tree removal activities implemented in close proximity to roads and communities would provide increased slash and fuelwood for public use. Slash

4.17 Forest/Woodland and Other Plant Products

removal methods involving burning, chipping, or hauling could reduce woodland product availability depending on location. Where vegetation treatments are remote, forest product availability would be less affected. Management activities would include the treatment of approximately 2.8 million acres of pinyon-juniper woodland and maintenance of approximately 827,000 acres that are currently in desired states. General impacts of the vegetation management program to forest/woodland products would be to make quantities of products readily available to the public. On a long-term basis, the production of forest/woodland products from restored and resilient communities is expected to exceed current levels.

Lands and Realty. Approximately 75,600 acres would be designated for possible disposal, but less than 20 percent of this total is occupied by woodlands. These areas would remain available for public uses unless and until a site-specific land transaction is approved. Additional utility rights-of-way may provide additional public access into woodland areas. Land authorizations for rights-of-way and communication sites could provide potential salvage of cactus and yucca.

Renewable Energy. Areas that are developed for renewable energy (up to 40,000 acres for wind energy) may affect the availability of woodland and other vegetation products. Renewable energy development may provide access to new areas of product availability depending on site specific characteristics, type of technology, and the nature of the proposed development.

Travel and Off-highway Vehicle Use. Limiting off-highway vehicle travel to designated roads and trails on approximately 10.3 million acres through subsequent public planning would reduce access to forest/woodland and other plant products through cross-country off-highway travel. Reduced access would reduce the amount of harvesting in outlying areas and increase harvest along designated roads.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available), and other tools would be used to the greatest extent practical under the Proposed RMP. This analysis would likely reduce the amount of pinyon-juniper woodland and forest/woodland products provided from these areas over the long term. However, the availability of forest/woodland products from other pinyon-juniper woodlands within the planning area would continue to exceed the demand for forest/woodland products in the long term. The amount and diversity of seed available for collection would likely remain the same or slightly increase in the long term with the greater frequency and extent of fire. With the restoration of vegetation resilience and return to historical fire regimes and condition classes, impacts to woodland vegetation would be reduced when fires occur.

Special Designations. There is no fuelwood potential within 8 of the 20 proposed ACECs. The remaining 12 ACECs, encompassing a total of 84,400 acres, would be encouraged as open, limited, or closed for availability of forest/woodland and other plant products. Given the broad availability of these resources within the decision area, these restrictions should have minimal effects on the utilization of plant products.

Conclusion. The Proposed RMP would expand the number of species permitted for use as fuelwood, posts and poles, and Christmas trees, providing a greater opportunity for personal and commercial use and greater flexibility in the management of these woodland communities. The increased availability is not likely

4.0 ENVIRONMENTAL CONSEQUENCES

to affect the overall resource supply for any of the species involved. Availability of woodland biomass products would continue to exceed demand on both short and long term basis. Green biomass availability would be replaced with dead wood during treatments, but overall product availability would remain relatively constant. Christmas tree availability would likely be reduced as treatments are implemented in more productive sagebrush ecological sites. Pine nut production would be reduced during the short term after treatments, but should maintain or exceed current production rates in the long term as woodland sites are restored and become resilient. Forest/woodland and other plant product availability would be affected in high priority watershed areas prior to other watersheds. The harvest of forest/woodland products would continue to have minimal effects on the woodland communities involved. The management actions of the Proposed RMP would achieve the goal for this program.

Alternative A

Impacts from Forest/Woodland and Other Plant Products Management Actions.

Parameter – General Forest/Woodland and Other Plant Product Management

Approximately 5.0 million acres would be available for forest/woodland product use in the planning area, of which approximately 3.6 million acres is pinyon-juniper woodland and 1.2 million acres is pinyon-juniper vegetation that has invaded into low elevation sagebrush communities. Rowland et al. (2003) estimated that approximately 35 percent of the sagebrush communities in the planning area are at moderate or high risk for replacement by pinyon-juniper woodlands. Based on these estimates as discussed in detail in Section 3.17.1, the following forest/woodland products would be available within the planning area:

- 15 to 30 million cords of fuelwood (average production – 3 to 6 cords per acre);
- 23 million Christmas trees (based on 15 trees per acre and singleleaf pinyon occurring within 30 percent of the pinyon-juniper woodlands);
- 75 to 150 million posts and poles (average production – 15 to 30 posts and poles per acre); and
- 225 to 450 million pounds of pinyon nuts (average production during favorable years – 150 to 300 pounds per acre).

Management actions of Alternative A allow harvest of these products while protecting a variety of rare or unique species (e.g., bristlecone pine, limber pine, and swamp cedar). Cactus and succulent collection would continue to be allowed for personal use only, primarily on a salvage basis subject to state law and Section 7 consultation with the U.S. Fish and Wildlife Service where appropriate. The collection of these plants only during salvage opportunities is a conservative practice that contributes to the perpetuation of affected plant populations.

Parameter – Fuelwood Collection

Fuelwood cutting for live and dead pinyon, juniper, and mountain mahogany would be permitted anywhere within the planning area except in closed areas. This would continue to provide opportunities for personal

4.17 Forest/Woodland and Other Plant Products

and commercial use of the pinyon-juniper resource. The decision in 2000 to allow fuelwood harvest of live pinyon and juniper throughout the decision area facilitates ease of public harvest and has not led to major increases in overall harvest volumes. Harvesting has shifted from designated cutting areas to areas closer to communities, but harvest levels have been low compared to availability. Impacts associated with the decision to allow pinyon and juniper fuelwood harvest throughout the planning area (except in some areas) would be the same as the Proposed RMP. With designated fuelwood cutting areas, impacts are concentrated in specific areas. Allowing fuelwood harvest throughout the planning area has indirectly minimized impacts within previously designated areas by reducing harvest activities in these areas. Since harvest levels have not increased after the 2000 decision, impacts from fuelwood harvest are expected to be less in previously designated areas as harvest will be spread throughout the planning area. Impacts within the planning area are expected to be minimal based on current and future demand. Over the past 7 years, the Ely Field Office has issued fuelwood permits for an average of 1,875 cords per year with a high of 2,390 cords in 1998 to a low of 1,515 cords in 2000. Fuelwood cutting is generally conducted within short distances from roads, and the greatest demands have been for pinyon pine and juniper. By increasing public access to the fuelwood resources, it is anticipated that hazardous fuels would be reduced around communities, increasing protection for the communities. Based on the cords estimated in the planning area, the rate at which woodlands are reportedly increasing, and low public demand, the current level of green tree fuelwood harvest appears to be more than sustainable.

Parameter – Pinyon Pine Nut Harvesting

Permit sales over the past 7 years for pinyon nuts ranged from 0 pounds in 2000 and 2003 to 26,000 pounds in 2002. Level of production varies widely from year-to-year based on precipitation, fires, insects, and other factors. In high production years demand may not reach supply, while in low production years the available supply may not satisfy the demand. By regulating the availability of commercial harvest contracts, the BLM can ensure that in favorable years an adequate seed supply remains following harvest to provide for wildlife and woodland regeneration.

Parameter – Christmas Tree Harvesting

Permit sales over the past 7 years included Christmas trees ranging from 540 trees in 2004 to 4918 trees in 1999. This level of pinyon and juniper harvest is sustainable with the production level of such trees within the planning area. Identification of designated areas for commercial harvest allow the BLM to use such harvest as a management tool in the vegetation treatment of these communities.

Parameter – Post and Pole Harvesting

Permit sales the past 7 years for posts ranged from 1500 posts in 2002 to 3118 posts in 1998. This level of harvest is sustainable with the production level of such trees within the planning area.

Parameter – Seed Collection

Seed collection would be available for commercial purposes on a case-by-case basis. Commercial collection of seed is unlikely to occur at a substantial level under this alternative, because activities are limited to hand and limited mechanical collection only.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Other Vegetation Products Collection

By allowing the harvest of other vegetation products (e.g., wildings and boughs) on a case-by-case basis with limited collection methods, the level of harvest would be controlled and undue damage to other resources in the harvest area would be prevented. Based on current and past use, availability of these products far exceeds demand.

Impacts from Other Programs.

Vegetation. Pinyon and juniper management in sagebrush communities tends to involve removal of young, small trees with a low volume of wood products. Where these trees are mature with closed canopy in sagebrush communities, thresholds have been crossed that would make restoration costly and difficult.

The planning area has averaged about 10,000 acres per year of fire rehabilitation and other vegetation treatments including aerial seeding. Continued removal of pinyon and juniper trees at the current rate is unlikely to affect their relative availability for public and commercial use. Tree removal activities implemented in close proximity to roads and communities may provide increased slash for public use. Slash removal methods involving burning, chipping, or hauling could reduce woodland product availability depending on location. Where vegetation treatments are remote, forest product availability would be even less affected.

Management activities would include the treatment of approximately 1.1 million acres of pinyon-juniper woodland and maintenance of approximately 2.4 million acres that are currently in desired states. Impacts to pinyon-juniper woodlands from the vegetation treatments would be relatively limited in the short term (next decade) and would gradually increase as more areas are treated over the next 10 to 100 years. Treatment and maintenance activities within pinyon-juniper woodland would likely increase the availability of forest/woodland products, especially if areas are located within close proximity of existing roads. The availability of forest/woodland products from treated and maintained pinyon-juniper woodlands would continue to exceed the demand for forest/woodland products in the long term.

Lands and Realty. Lands currently designated for possible disposal are described in Section 2.5.12.2. Rights-of-way often go through woodlands in remote areas, but access to rights-of-way also can open up woodland access for public use. Approximately 31,900 acres would be available for possible disposal, but only a small portion of this is occupied by woodlands.

Renewable Energy. The impacts of providing opportunities for renewable energies would be the same or similar to those described for lands and realty program, namely creation of additional utility rights-of-way and access roads.

Travel Management and Off-highway Vehicle Use. The woodland and other vegetation products program is largely tied to and dependent upon the transportation system in the planning area. Approximately 9.8 million acres are open to off-highway vehicle use under current management. Current transportation planning accommodates public demand for products, as it is currently perceived. No permanent road closures are planned under Alternative A; although temporary closures could occur for construction, repair, or special events. User conflicts between woodland product activities, including pinyon pine nut collecting,

4.17 Forest/Woodland and Other Plant Products

and off-highway vehicle use or other recreation have not been identified, presumably due to the low level of public activity in the planning area. Forest/woodland and other plant products would still be available through off-road travel access.

Fire Management. Under Alternative A, prescribed fire, wildland fire use (approximately 3.6 million acres available) and other tools would not be used to the greatest extent practical as under the Proposed RMP. The impacts under Alternative A would be similar to those under the Proposed RMP except on a smaller scale. This, in the long-term, would result in fewer acres with improved ecological health, vegetation resilience, and overall improved habitat quality. Because fuels would continue to accumulate in untreated areas; the probability of major, uncontrollable, stand-replacing fire events would continue.

Special Designations. The three desert tortoise ACECs have no fuelwood resources and, therefore, would have no effect upon woodland product availability. Plant collecting is limited within these three areas and would preclude harvest of most, if not all, personal and commercial plant products within a total of 203,670 acres.

Conclusion. Current supplies of forest/woodland and other plant products including fuelwood, posts and poles, Christmas trees, pinyon pine nuts, various native seeds, and live plants of selected species for transplantation are adequate to meet existing demands. It is expected that availability of these forest/woodland products would continue to exceed the expected demand. Thus, this alternative would meet the program goal.

Alternative B

Impacts from Forest/Woodland and Other Plant Products Management Actions.

Parameter – General Forest/Woodland and Other Plant Product Management

Approximately 4.6 million acres would be available for forest/woodland product use in the planning area, including approximately 3.2 million acres of pinyon-juniper woodland and approximately 1.2 million acres of pinyon-juniper vegetation that has invaded into low elevation sagebrush communities (see **Map 4.5-2**). The majority of treatment within pinyon-juniper woodland would occur in the overmature sites where canopy cover would be reduced from an average of approximately 40 percent to an average of approximately 20 to 40 percent. In addition, approximately 4,200 acres of aspen communities (Forestland Ecological Site Description – 28BY055) would be available for fuelwood collection. Fuelwood collection within aspen communities would continue to occur and would be used as a tool for overall management and regeneration of aspen stands in the planning area. Based on these estimates, the following forest/woodland products would be available within the planning area:

- 14 to 28 million cords of fuelwood (average production – 3 to 6 cords per acre);
- 21 million Christmas trees (average production – 15 singleleaf pinyon trees per acre; singleleaf pinyon occur within 30 percent of the pinyon-juniper woodlands);

4.0 ENVIRONMENTAL CONSEQUENCES

- 69 to 138 million posts and poles (average production – 15 to 30 posts and poles per acre);
- 210 to 400 million pounds of pinyon nuts (average production during favorable years – 150 to 300 pounds per acre); and
- 21,000 to 84,000 cords of aspen fuelwood (average production – 5 to 20 cords per acre).

Management actions of Alternative B allow harvest of these products while protecting a variety of rare or unique species (e.g., bristlecone pine, limber pine, and swamp cedar). Harvest of desert vegetation (e.g., cactus and yucca) would be allowed primarily on a salvage basis subject to state law and Section 7 consultation with the U.S. Fish and Wildlife Service where appropriate, thus, preventing over-harvest of such species.

Parameter – Fuelwood Collection

The forest/woodland products program for this parameter would be similar to the Proposed RMP except additional species (Gambel's oak and spruce) would be made available for fuelwood as well as aspen, ponderosa pine, white fir, pinyon, juniper, and mountain mahogany. Greater availability of species would provide increased choices and encourage additional public use of forest and woodland species and products. However, fuelwood collection would only be allowed in designated areas. This constraint, coupled with the increased number of species available for harvest, would allow greater flexibility in using fuelwood harvest as a tool in the management of these forest/woodland communities. By allowing harvest of live trees of the additional species, beyond those allowed in current management, on a case-by-case basis, the BLM can control the level of harvest of these species to prevent undue damage to other resources in the harvest area.

Parameter – Pinyon Pine Nut Harvesting

Management actions of Alternative B would allow harvest of pinyon pine nuts for both individual and commercial use with limited changes from current policy. Harvestable pinyon pine nut production in the planning area commonly meets or exceeds harvest demand in favorable years, but this situation will likely change as demand continues to grow in future years. The proposed management actions specify designation of acres for harvest that provide adequate control of commercial harvest levels to ensure that adequate quantities of pinyon pine nuts remain following harvest to provide for wildlife usage plus seedling recruitment.

Parameter – Christmas Tree Harvesting

The forest/woodland products program for this parameter would allow private and commercial harvest of pinyon and juniper throughout the planning area, private harvest of white fir throughout the planning area, and commercial harvest of white fir on a site-specific case-by-case basis to help meet vegetation management objectives. Availability of the additional species (white fir) would provide increased choices and encourage additional public use of forest and woodland species and products to achieve management objectives based on watershed analyses. By limiting the commercial harvest of this additional species to selected areas, the BLM would have greater flexibility in the management of applicable forest/woodland communities.

Parameter – Post and Pole Harvesting

The forest/woodland products program for this parameter would be similar to current management except additional species (aspen, fir, spruce) would be made available for posts and poles on a case-by-case basis. Greater availability of species would provide increased choices and encourage additional public use of forest and woodland species and products. The availability of additional species for harvest would allow greater flexibility in the management of these forest/woodland communities to enhance understory regeneration.

Parameter – Seed Collection

Alternative B would permit flexibility in the use of mechanical methods for commercial seed harvesting, which would increase the availability of seed for collection over the current policy. Mechanical harvest of seed would be permitted for personal and commercial purposes where compatible with watershed and plant community objectives, potentially making seed resources widely available. This is unlikely to occur on a large-scale based on the existing levels of livestock grazing that occur throughout the planning area precluding seed production on herbaceous grasses and forbs in large areas. For herbaceous plants, there also is unlikely to be large-scale opportunity because of the small stands to harvest from in most areas. Where shrubs such as mountain mahogany are dense, commercial harvest opportunities could be substantial.

The restriction on seed collection in restoration areas would help ensure adequacy of seed supplies for regeneration of desirable species. Limiting seed collection to no more than fifty percent of the annual seed crop would ensure that an adequate quantity of seed remains for continued regeneration and recruitment of other plant species.

Parameter – Other Vegetation Products Collection

By allowing the harvest of other vegetation products (e.g., wildings and boughs) on a case-by-case basis with limited collection methods, the level of harvest would be controlled and undue damage to other resources in the harvest area would be prevented. Based on current and past use, availability of these products far exceeds demand.

Impacts from Other Programs. Impacts to forest/woodland and other plant products associated with vegetation, renewable energy, and fire management activities would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Lands and Realty. Impacts would be the same as the Proposed RMP except approximately 90,600 acres would be designated for possible disposal, but less than 20 percent of this total is occupied by woodlands. These areas would remain available for public uses unless and until a site-specific land transaction is approved.

Travel and Off-highway Vehicle Use. Cross-country off-highway vehicle use would not be allowed and 844,000 acres of the planning area would be designated as off-highway vehicle emphasis areas. The

4.0 ENVIRONMENTAL CONSEQUENCES

combination of these classifications would reduce the availability of forest/woodland and other plant products.

Special Designations. There is no fuelwood potential within the three existing ACECs established in Lincoln County. The designation of 15 additional ACECs totaling approximately 134,350 acres would not affect the availability of forest/woodland and other plant products.

Conclusion. Alternative B would expand the number of species permitted for use as fuelwood, posts and poles, and Christmas trees, providing a wider opportunity for personal and commercial use. The increased availability is not likely to affect the overall resource supply for any of the species involved. Availability of forest/woodland products would exceed the expected demand. On a long-term basis, the production of forest/woodland products from restored and resilient communities is expected to exceed current levels. This alternative would achieve the program goal.

Alternative C

Impacts from Forest/Woodland and Other Plant Products Management Actions.

Parameter – General Forest/Woodland and Other Plant Product Management

Approximately 3.4 million acres would be available for woodland product use in the planning area, including approximately 3.0 million acres of pinyon-juniper woodland and approximately 1.2 million acres of pinyon-juniper vegetation that has invaded into low elevation sagebrush communities. In addition, approximately 2,800 acres of aspen and 11,200 acres of high elevation conifer communities (Forestland Ecological Site Description – 28BY063) would be available for fuelwood collection. Based on these estimates, the following forest/woodland products would be available within the planning area:

- 11 to 20 million cords of fuelwood (average production – 3 to 6 cords per acre);
- 15 million Christmas trees (average production – 15 singleleaf pinyon trees per acre; singleleaf pinyon occur within 30 percent of the pinyon-juniper woodlands);
- 51 to 102 million posts and poles (average production – 15 to 30 posts and poles per acre);
- 153 to 306 million pounds of pinyon nuts (average production during favorable years – 150 to 300 pounds per acre);
- 14,000 to 56,000 cords of aspen fuelwood (average production – 5 to 20 cords per acre); and
- 448,000 to 560,000 cords of white and limber pine fuelwood (average production – 40 to 50 cords per acre).

Management actions of Alternative B allow harvest of these products while protecting a variety of rare or unique species (e.g., bristlecone pine, limber pine, and swamp cedar). Harvest of desert vegetation

4.17 Forest/Woodland and Other Plant Products

(e.g., cactus and yucca) would be allowed primarily on a salvage basis subject to state law and Section 7 consultation with the U.S. Fish and Wildlife Service where appropriate, thus, preventing over-harvest of such species.

Parameter – Fuelwood Collection

The forest/woodland products program for this parameter would be similar to current management except additional species (e.g., aspen, Gambel's oak, ponderosa pine, spruce, and white fir) would be made available as well as pinyon, juniper, and mountain mahogany throughout the planning area except in closed areas. Greater availability of species would provide increased choices and encourage additional public use of forest and woodland species and products. This management approach would encourage demand for a variety of species that are not currently harvested for fuelwood. The increased number of species available for harvest also would allow greater flexibility in using fuelwood harvest as a tool in the management of these additional forest/woodland communities.

This management approach would provide opportunities for personal and commercial use of the most woodland/forest resources. Over the past 7 years, the Ely Field Office has issued fuelwood permits for an average of 1,875 cords per year with a high of 2,390 cords in 1998 to a low of 1,515 cords in 2000. Fuelwood cutting is generally restricted to short distances from roads, and the greatest demand has been for pinyon pine and juniper. Based on the cords estimated in the planning area, the rate at which woodlands are reportedly increasing, and low public demand, this level of green tree fuelwood harvest appears to be more than sustainable, particularly for pinyon and juniper.

Parameter – Pinyon Pine Nut Harvesting

Level of production varies widely from year-to-year based on precipitation, fires, insects, and other factors. In high production years demand may not reach supply, while in low production years the available supply may not satisfy the demand. By allowing mechanical harvest, the Ely Field Office can enable greater use of the available resource in years of high productivity. By regulating the availability of commercial harvest contracts, the BLM can ensure that in favorable years an adequate seed supply remains following harvest to provide for wildlife and woodland regeneration.

Parameter – Christmas Tree Harvesting

The forest/woodland products program for this parameter would be similar to current management except two additional species (spruce and white fir) would be made available for Christmas trees and both personal and commercial harvest would be allowed throughout the planning area. Availability of these additional species would provide increased choices and encourage additional public use of forest and woodland species and products. The absence of designated commercial harvest locations, however, would reduce the management utility of such harvests in relation to desired vegetation treatments.

Parameter – Post and Pole Harvesting

The forest/woodland products program for this parameter would be similar to current management except additional species (aspen, fir, spruce) would be made available for personal and commercial harvest of posts and poles throughout the planning area with emphasis on areas identified for disposal. Greater availability of species would provide increased choices and encourage additional public use of forest and

4.0 ENVIRONMENTAL CONSEQUENCES

woodland species and products. The availability of additional species for harvest would allow greater flexibility in the management of these forest/woodland communities to enhance understory regeneration.

Parameter – Seed Collection

Alternative C would permit flexibility in the use of mechanical methods for commercial seed harvesting, which would increase the opportunity for seed collection over the current policy. Mechanical harvest of seed would be permitted for personal and commercial purposes where compatible with watershed and plant community objectives, potentially making seed resources widely available. This is unlikely to occur on a large-scale based on the small stands and existing levels of livestock grazing that occur throughout the planning area precluding large quantities of seed production on herbaceous grasses and forbs in large areas. For herbaceous plants, there also is unlikely to be large-scale opportunity because of the small stands to harvest from in most areas. Where shrubs such as mountain mahogany are dense, commercial harvest opportunities could be substantial.

The restriction on seed collection in restoration areas would help ensure adequacy of seed supplies for regeneration of desirable species. Limiting seed collection to no more than fifty percent of the annual seed crop would ensure that an adequate quantity of seed remains for continued regeneration and recruitment of other plant species.

Parameter – Other Vegetation Products Collection

By allowing commercial harvest of other vegetation products (e.g., wildings and boughs) throughout the planning area with limited collection methods, it is expected that the level of harvest would increase, but undue damage to other resources in the harvest area would be prevented. Based on current and past use, availability of these products far exceeds demand.

Other Programs Impacts. Impacts to forest/woodland and other plant products associated with vegetation, renewable energy, and special designations management activities would be the same as or similar to those described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Lands and Realty. Impacts would be the same as the Proposed RMP, except that approximately 295,200 acres would be designated for possible disposal. Of these, less than 20 percent would be woodland.

Travel and Off-highway Vehicle Use. Impacts would be similar to those described for the Proposed RMP, except that approximately 1.1 million acres would be designated as off-highway vehicle emphasis areas. Implementation of Alternative C would greatly reduce the area open to off-road activities from the current management situation. This would not be consistent with allowing fuelwood to be collected throughout the decision area because only the fuelwood within extremely short distances of roads would be accessible.

Fire Management. The suppression of fire would increase the availability of pinyon-juniper woodland for woodland product harvesting in the short term and in the long term until these areas burn. However, the

4.17 Forest/Woodland and Other Plant Products

long-term increase in natural fuels would increase the probability of widespread wildland fires within the planning area, which may ultimately reduce the availability of pinyon-juniper woodland for woodland product harvesting.

Conclusion. Alternative C would expand the number of species permitted for use as fuelwood, posts and poles, and Christmas trees and areas in which these products could be collected, thus, providing a greater opportunity for personal and commercial use. The increased availability is not likely to affect the overall resource supply for any of the species involved. Availability of forest/woodland products would exceed the expected demand until major fires eliminated large blocks of pinyon-juniper woodlands. This alternative would achieve the program goal in the short-term, but may fail to achieve sustainability over the long term.

Alternative D

Impacts from Forest/Woodland and Other Plant Products Management Actions.

Parameter – General Forest/Woodland and Other Plant Product Management

Program-specific management activities would not allow the consumptive harvest of woodland/forest and other plant products, except for pinyon nut harvesting for personal use (including American Indians) and hand collection of seeds for personal use. Thus, the supply of forest/woodland and other plant products would increase over the long term. However, the majority of these products would not be available for public use.

Parameter – Fuelwood Collection

No fuelwood harvest would be allowed; therefore, there would be no impacts from such collection.

Parameter – Pinyon Pine Nut Harvesting

Only hand collection of pinyon pine nuts for personal consumption would be allowed, thus, impacts would be inconsequential.

Parameter – Christmas Tree Harvesting

No Christmas tree harvest would be allowed; therefore, there would be no impacts from such activities.

Parameter – Post and Pole Harvesting

No post and pole harvest would be allowed; therefore, there would be no impacts from such activities.

Parameter – Seed Collection

Only hand collection of seed for personal use would be allowed, thus, impacts would be inconsequential.

Parameter – Other Vegetation Products Collection

No collection of other vegetation products would be allowed; therefore, there would be no impacts from such activities.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts from Other Programs. Impacts to forest/woodland and other plant products associated with vegetation, lands and realty, renewable energy, and special designations management activities would be the same as or similar to those described for Alternative A.

Travel Management and Off-highway Vehicle Use. Under Alternative D, off-highway vehicle use would be restricted to maintained roads and trails. This would be a substantial reduction in area open to such use as compared to the other alternatives. This constraint would impose limitations on the areas accessible for woodland product harvest.

Fire Management. Fire management under Alternative D would involve minimal suppression activities. This, coupled with the likely increase in invasive species and current presence of overmature pinyon-juniper woodlands would result in a high risk of catastrophic fire events that would remove considerable acreages of woodlands and result in conversion of these areas to the herbaceous state. With the increase of annual grasses and weeds, fire occurrence would increase, and the reestablishment of forest/woodland and other plant species would be hindered.

Conclusion. It is highly probably that major fires at an early date under this alternative would substantially reduce the long-term supply of forest/woodland products. The harvest constraints under Alternative D would fail to provide the desired opportunities for traditional and non-traditional use of the resource outlined in the program goal.

4.18 Geology and Mineral Extraction

Geological resources are either managed under special designations for unique geological features (see Section 4.22, Special Designations) or under mineral development, as discussed in this section. Impacts to the minerals program are the result of management actions that limit the availability of lands for minerals development or involve restrictions on land use and activities. These impacts vary depending on the type of minerals that would be developed. For leasable minerals, lands may be closed to leasing as well as several categories of restrictions for lands open to leasing. For locatable and mineral materials, management actions by other resource programs would result in either lands being open or proposed for withdrawal from mineral development. Mineral materials (salable minerals) are discretionary and subject to denial of the action where there are unavoidable resource concerns. All mineral actions are subject to mitigation measures to prevent unnecessary and undue degradation of public lands.

The reasonable foreseeable development scenarios for individual categories of minerals are summarized in **Table 4.18-1** with more detailed explanation in the following text sections.

Table 4.18-1
Summary of Anticipated Disturbance from Mineral Extraction

Type of Mineral Development	Approximate Disturbance Acreage	
	(Short-term)	(Long-term)
Fluid Leasable Minerals	8,400	1,400
Solid Leasable Minerals	0	0
Geothermal Development	200	100
Locatable Minerals	7,500	7,500
Mineral Materials	1,000	1,000
Totals Disturbance Acreage	17,100	10,000

Impact Issues

Fluid Leasable Minerals. The impact issues for fluid minerals result from the management actions for the protection of other resources. There are several categories of restrictions on fluid minerals that are a consequence of protecting those other resources. The categories include: 1) areas open to leasing, subject

4.0 ENVIRONMENTAL CONSEQUENCES

to standard lease terms and conditions; 2) areas open to leasing, subject to moderate constraints; 3) areas open to leasing, subject to major constraints such as no surface occupancy; and 4) areas closed to leasing.

The levels of restrictions from "open subject to standard lease terms and conditions" to "closed" have varying levels of impacts on the exploration and development of fluid minerals. The standard lease terms and conditions are provided in Section 6 of BLM's fluid mineral lease form. Stipulations also are attached to the lease form for those areas that have restrictions. Detailed discussions regarding restrictions and closures proposed for each alternative are presented in Chapter 2.0. All fluid mineral developments would be governed by the best management practices contained in the Gold Book: Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development (U.S. Department of the Interior and the U.S. Department of Agriculture 2006). Prior best management practices specific to the Ely Field Office also would be retained and those are included in the Geology and Mineral Extraction section in Appendix F, Section 1. Geophysical exploration operations also would be conducted under the best management practices of the Gold Book and prior best management practices; however, such operations may have additional proposed requirements depending on the alternative as described in Sections 2.4.18, 2.5.18, 2.6.18, 2.7.18, and 2.8.18, Geology and Mineral Extraction.

The restrictions placed on fluid mineral development to protect other resources can affect the ability to develop the mineral resources. Lands open to leasing under standard terms and conditions would represent impacts of little consequence to fluid minerals. Closure of lands to leasing, no surface occupancy designations, and overlapping timing restrictions, however, could result in the loss of the fluid mineral resource, employment opportunities, revenue from production royalties, and taxes.

The lease stipulations have been developed to provide protection for a number of resources such as cultural resources, lands and realty, paleontological resources, recreation, special status species, visual resources, and wildlife resources. The requirements of the stipulations can include restrictions on seasonal access, designation of buffers around sensitive areas, or other mitigations that would be critical to protecting a particular resource.

The Ely Field Office has strived to use the least restrictive constraint to meet the resource protection objective. For example, areas containing resources that require protection from all surface disturbance have generally been designated as no surface occupancy rather than closed. Large ACECs that would need protection through closure also would have their outer half mile designated as a no surface occupancy. The no surface occupancy zone would allow some exploration and production from beneath the protected surfaces through directional and extended reach drilling.

Some areas may be closed to fluid mineral leasing because of statutory requirements. For example, designated wilderness and wilderness study areas are closed to mineral entry. If a wilderness study area is designated as wilderness, then it would continue to be closed to mineral development. If it is dropped from consideration, it could be open to leasing. Others areas can be closed to fluid minerals leasing because of special designations, recreation areas, lands withdrawals, cultural resources, or as part of an ACEC.

4.18 Geology and Mineral Extraction

Solid Leasable Minerals. The solid leasable category includes minerals such as coal, oil shale, phosphorus, sodium, and locatable minerals on acquired lands. The decision area has few if any commercially extractable solid leasable mineral resources. However, planning must consider possible leasing for each of the alternatives. The impact issues for solid leasable minerals result from the management actions for the protection of other resources that could result in the closure of lands available for solid leasable mineral leasing.

Locatable Minerals. The impact issues for locatable minerals are associated with the management actions for the protection of other resources, which could result in the proposed withdrawal of lands available for locatable mineral exploration and development. Other issues include restrictions governing locatable mineral exploration and development.

Mineral Materials. The impact issues for mineral materials are associated with the management actions for the protection of other resources that could result in administrative and discretionary closure of lands available for mineral materials exploration and development. Other impacts may result from restrictions governing mineral material exploration and development.

Assumptions for Analysis

Impacts are analyzed in this section on the basis of reasonable foreseeable development scenarios for each category of minerals. These development scenarios are applied in total in the least constraining alternative and scaled downward in other alternatives as various constraints limit the area of lands available for development in a particular mineral category.

Fluid Leasable Minerals. Fluid mineral development potential in the decision area is based on reasonable foreseeable development scenarios for oil and gas and geothermal energy and was developed in conformance with BLM Instruction Memorandum No. 2004-089 (BLM 2004b). This analysis is based largely on the reasonably foreseeable development scenarios presented in detail in the mineral report prepared for the RMP/EIS (ENSR 2004a). Various additional assumptions have been incorporated based on changes in the mineral markets in the recent past. The minerals report is available at the Ely Field Office. It is impossible to predict with certainty how resource development would occur in the future. The interaction of prices, markets, technology, and environmental concerns all play a role. The reasonable foreseeable development scenarios were developed based on past exploration activities and estimates of future exploration and development activity given the potential occurrence of the resources.

Reasonable Foreseeable Development Scenario – Oil and Gas. The following is a list of major assumptions upon which the reasonable foreseeable development scenario is based:

- There would be no major regulatory changes in federal or state statutes, regulations, policy, and guidance that govern the exploration and development of fluid minerals, including lease royalty provisions and lease rental fees.

4.0 ENVIRONMENTAL CONSEQUENCES

- Oil prices would remain sufficiently high to stimulate continued exploration and drilling. Recent historic highs in the price of oil may stimulate exploration activity above levels of the recent past. It is possible that higher prices may persist for the next few years. The reasonable foreseeable development scenario (ENSR 2004a) is a planning tool that was developed to accommodate the maximum development that could reasonably be expected to occur. However, actual activity levels, as with prices, cannot be predicted with certainty.
- The amount of federal oil and gas acreage under lease in the decision area would range between 1.0 and 1.5 million acres. Increases in the lease inventory above 1.5 million acres would be driven by commodity prices and availability of land for leasing. As of January 2005, there were 459 federal oil and gas leases covering approximately 1.0 million acres in the decision area. In the next year or two, leases may increase to as much as 3 million acres. This would be due to the unprecedented spike in the price of oil, recent discoveries in similar geologic plays in other parts of the Great Basin, and the availability of additional lands for leasing that have not been available for several years due to the lack of appropriate NEPA analysis.
- Based on 2000 to 2004 numbers, additional federal lease sales are projected to average approximately 220,000 acres per year for the next several years. Due to the factors outlined above, lease sales could average as much as 400,000 acres per year within the next 1 to 2 years.
- It cannot be predicted at this time how much acreage eventually would be held by production, which is entirely dependent on the discovery of commercial oil and gas fields.
- Past oil and gas exploration has concentrated on oil plays within valley floors. New regional discoveries and a recent oil and gas resource assessment, however, indicate that a large amount of exploration could take place in the mountains (see **Map 4.18-1**) (U.S. Geological Survey 2005).
- Seismic surveys are a critical part of oil and gas exploration. If new discoveries are made or new plays are developed, seismic activity would increase. It is assumed that approximately 30 miles of seismic survey would be conducted per year, based on recent experience.
- New field discoveries would be similar in size and surface disturbance to the Trap Springs and Kate Springs oil fields within Railroad Valley.
- The reasonable foreseeable development scenario is made without respect to any existing or proposed leasing stipulations and conditions of approval in accordance with BLM guidance.
- Actual locations of potential exploration wells and field development are unknown. The impacts associated with these activities are likely to occur anywhere within the planning area that is of high or moderate, or even low, potential for oil and gas resources.

As shown on **Table 4.18-2**, a total of 448 wells would be drilled resulting in total short-term (5 to 10 years) disturbance of approximately 8,400 acres and a long-term (about 20 years for producing wells) disturbance

4.18 Geology and Mineral Extraction

of approximately 1,400 acres. Short-term disturbance as defined for the reasonably foreseeable development scenario includes locations for wells in the plugged and abandoned category that would be reclaimed immediately after drilling or construction.

**Table 4.18-2
Summary of Surface Disturbance Resulting from Anticipated
Oil and Gas Well Drilling Activity**

Facility Type	Number or Facilities	Short-term Disturbance Factor ¹	Long-term Disturbance Factor ¹	Short-term ² Disturbance (acres)	Long-term Disturbance (acres)
Seismic Survey	30 miles/yr	<2 acres/mile	0	<1,000	0

Total Disturbance				8,406	1,401

¹ BLM 1992b and 1999b.

² Short-term applies to effects occurring in the immediate future and persisting for approximately 5 to 10 years or less; long-term applies to effects lasting or occurring beyond 10 years.

³ Active wells include producers, injectors, and disposal wells.

Reasonable Foreseeable Development Scenario – Geothermal. The following is a list of major assumptions upon which the reasonable foreseeable development scenario for geothermal resources is based:

- There would be no major regulatory changes in federal or state statutes, regulations, policy, and guidance that govern the exploration and development of fluid minerals, including lease royalty provisions and lease rental fees.

4.0 ENVIRONMENTAL CONSEQUENCES

- Geothermal development potential is moderate in the valley areas and low in the mountain areas (Map 4.18-2). The moderate potential areas cover about 49 percent of the decision area. Table 4.18-3 summarizes the disturbances resulting from geothermal development.

**Table 4.18-3
Summary of Surface Disturbance from Anticipated Geothermal Project Development**

Types of Facilities	Number of Facilities	Short-term Disturbance Factor	Long-term Disturbance Factor	Short-term Disturbance ¹ (acres)	Long-term Disturbance ¹ (acres)
Geothermal gradient well pads	30 wells	0.07 acre/well	N/A	2	0
Gradient well access roads	5 miles	4.8 acres/mile	N/A	24	0
Exploratory well	1 well	3.7 acres/well	1.5	4	1

Total				204	134

N/A – Not applicable.

¹ Short-term applies to effects occurring in the immediate future and persisting for approximately 5 to 10 years or less; long-term applies to effects lasting or occurring beyond 10 years.

- As of March 2004, the geothermal leasehold in the decision area is approximately 1,000 acres in a single lease. Geothermal leasing in the future is not expected to greatly increase in the short term, but potential exists for a variety of low-temperature geothermal uses.
- Very limited geothermal exploration and development are expected in the short term.
- If high-temperature geothermal resources are discovered, the reasonably foreseeable development scenario assumes the maximum development would consist of a power plant within a 10- to 15-megawatt generating capacity and associated greenhouse or dehydration facilities.
- Geothermal exploration could take 5 years, development could take 2 to 10 years, and production could last for 30 years.

Solid Leasable Minerals.

Reasonable Foreseeable Development Scenario. There would be no major regulatory changes in federal or state statutes, regulations, policy, and guidance that govern the exploration and development of solid leasable minerals. Although there is a small probability that such minerals are present in commercially exploitable deposits, the Ely Field Office would provide a program for the development of such commodities if solid leasable minerals are found to be commercially developable.

Locatable Minerals.

The following summarizes the locatable mineral development potential in the decision area based on reasonable foreseeable development scenarios for locatable minerals and were developed in conformance with applicable BLM policies. This analysis is presented in detail in the mineral potential report prepared for the RMP/EIS (ENSR 2004b). This document is available at the Ely Field Office. It is difficult to predict with certainty how resource development would occur in the future. The interaction of prices, markets, technology, and environmental concerns all play a role. The reasonable foreseeable development scenarios were developed based on past exploration activities and estimates of future exploration and development activity given the potential occurrence of the resources.

Reasonable Foreseeable Development Scenario. The following is a list of major assumptions from the reasonable foreseeable development scenario (ENSR 2004b) for locatable minerals resources:

- There would be no major regulatory changes in federal or state statutes, regulations, policy, or guidance that govern the exploration and development of locatable minerals.
- Recent historic highs in the price of metallic minerals may stimulate exploration activity above levels of the recent past. It is possible that higher prices may persist for the next few years. The reasonable foreseeable development scenario (ENSR 2004b) is a planning tool that was developed to accommodate the maximum development that could reasonably be expected to occur. However, actual activity levels, as with prices, cannot be predicted with certainty.
- Commodity prices in the future would provide sufficient economic incentive to support the production of locatable mineral commodities.
- Surface mining is expected to remain the primary method of locatable mineral resource extraction in the decision area. Underground methods would be used to mine deeper deposits.
- New ore bodies will continue to be developed to replace reserves as they are mined out. This would be accomplished through both the discovery and development of new mines and expansions of existing mines.
- It is anticipated that one large open-pit mine would be developed or undergo a major expansion during the next 20 years. A large open-pit mine often consists of either one large pit or a number of smaller pits in close proximity to one another. It is assumed that the mine would encompass about 3,000 acres including pits, waste rock piles, processing facilities, roads, exploration drill pads, and operations facilities. These disturbance areas are expected to be long-term effects.
- It is anticipated that three medium sized open-pit mines would be developed or undergo moderate expansion during the next 20 years. The mines would consist of pits, waste rock piles, processing facilities, roads, exploration drill pads, and operations facilities. Each medium open-pit mine would

4.0 ENVIRONMENTAL CONSEQUENCES

disturb about 700 acres resulting in a total disturbance of 2,100 acres that would be of long-term duration.

- It is expected that as many as six small mines would be developed or undergo moderate expansion during the next 20 years. The mines each would consist of small pits, waste rock piles, processing facilities, roads, exploration drill pads, and operations facilities. Each small mine would cover an area of as much as 400 acres resulting in a total disturbance of as much as 2,400 acres. These disturbances could be either short- or long-term in their duration, depending on the specific operation. In this analysis, they are assumed to be long-term in nature.
- Total disturbance during the next 20 years from locatable mining development associated with the above operations would be approximately 7,500 acres, or 0.07 percent of the decision area.
- Reclamation of post-mining disturbance areas would be required by both federal and state regulations.

Mineral Materials. Mineral materials development potential in the decision area is based on reasonable foreseeable development scenarios developed in conformance with applicable BLM policies. This analysis is presented in detail in the mineral potential report prepared for the RMP/EIS (ENSR 2004b). This document is available at the Ely Field Office. It is impossible to predict with certainty how resource development would occur in the future. The interaction of prices, markets, technology, and environmental concerns all play a role. The reasonable foreseeable development scenarios were developed based on known occurrences of mineral materials and estimates of future demand and development.

Reasonable Foreseeable Development Scenario. The following is a list of major assumptions upon which the reasonable foreseeable development scenario for mineral materials is based:

- There would be no major regulatory changes in federal or state statutes, regulations, policy, or guidance that govern the exploration and development of mineral materials.
- The disposal of mineral materials, such as sand, gravel, and decorative rock, which depend on market conditions and demand, would increase because of growth in the decision area and Clark County. In spite of the long haulage distances, mineral materials from the decision area would be competitive with sources closer to Las Vegas. In the near term, the most likely areas to have development of mineral material deposits would be in southern Lincoln County and the larger rural communities.
- The Nevada Department of Transportation would continue to mine gravel resources for road maintenance and construction. The exact location of the pits used by the Nevada Department of Transportation would be dictated by specific construction and maintenance needs.
- Additional Community Pits would be developed for the needs of expanding local communities.
- Current development of mineral materials is estimated at approximately 2,200 acres in approximately 400 existing pits. Projected additional development during the next 20 years is estimated at 1,000 acres.

Interactions with Other Programs

The minerals management program of the Ely Field Office is affected primarily by closures, restrictions, and mitigations as a result of other resource programs.

Goal

Allow for meeting the Nation's energy needs while providing environmentally responsible production of fluid leasable minerals and geophysical exploration for energy resources on public lands. Allow development of solid leasable and locatable minerals in a manner to prevent unnecessary or undue degradation. Allow development of mineral materials in a manner that would prevent unnecessary or undue degradation, meet public demand, and minimize adverse impacts to other resource values.

Objective

To provide for the responsible development of mineral resources to meet local, regional, and national needs, while providing for the protection of other resources and uses.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to geology and mineral extraction also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Geology and Mineral Extraction Management Actions.

Parameter – Fluid Leasable Minerals

The Proposed RMP would use traditional surface use and timing restrictions to estimate the location and acres of the stipulations. As much as possible, sensitive resource areas were designated as "no surface occupancy" as opposed to "closed." For very large areas of sensitive resources, the outer 0.5 mile would be designated as "no surface occupancy" while the core area would be designated as "closed" since this would be essentially unavailable for operations. Exceptions to many of the no surface occupancy designations in

4.0 ENVIRONMENTAL CONSEQUENCES

the Proposed RMP were written into the individual site specific stipulations (see Appendix F, Section 2). The Proposed RMP would give the best balance between protecting the resource and allowing maximum flexibility and availability to the operator.

Under the Proposed RMP, approximately 1.5 million acres (13 percent of the decision area) would be closed to leasing and about 10.0 million acres (about 87 percent) would be open for leasing (see **Table 2.4-18**). Designated wilderness and wilderness study areas, totaling 1.1 million acres, are closed to all mineral entry and are considered non-discretionary closures. The Proposed RMP has discretionary closures totaling about 311,300 acres (2.7 percent of the decision area) outside of designated wilderness and wilderness study areas. Approximately 6.1 million acres (53 percent of the decision area) would be available for leasing under standard lease terms and conditions, 3.7 million acres (32 percent of the decision area) would be available to leasing subject to moderate constraints or surface use and timing stipulations (see **Table 2.4-19**), and approximately 233,600 acres (2.1 percent of the decision area) would be available to leasing subject to major constraints or no surface occupancy (see **Table 2.4-20** and **Map 2.4.18-1**).

About 9.3 million acres (80 percent) of the Ely decision area are considered high to medium potential for oil and gas. For the Proposed RMP, approximately 71 percent of the areas closed or with no surface occupancy restrictions would occur in areas that have a high to moderate potential for the occurrence of fluid minerals. About half of these acres occur in designated wilderness and wilderness study areas. Discretionary closures and no surface occupancy areas make up about 5 percent of the decision area.

Some of the no surface occupancy restrictions in current management were not carried forward to the proposed RMP. A list of these sites is shown in **Table 4.18-4**. These sites did not meet special management criteria and would be adequately protected under the standard lease terms and conditions as well as best management practices, conditions of approval, and site specific mitigations.

Lease notices related to the Pony Express Trail, the Sunshine Locality National Register District and desert tortoise habitat are carried forward to the Proposed RMP from current management. Additional cultural lease notices were identified for the Proposed RMP.

Additional areas of no surface occupancy that met the criteria for an ACEC have been proposed that were not included in Alternative A. **Table 4.18-5** lists all of the ACECs proposed for no surface occupancy.

Other areas proposed for No Surface Occupancy in the Proposed RMP did not meet ACEC criteria, but were selected for no surface occupancy restriction because they may not be adequately protected under standard lease terms and conditions. **Table 4.18-6** lists these areas with the rationale.

**Table 4.18-4
No Surface Occupancy Areas not Carried Forward from Current Management**

4.0 ENVIRONMENTAL CONSEQUENCES

**Table 4.18-6
Additional No Surface Occupancy for Fluid Mineral Leasing**

Name	Acres	Rationale
Andies Mine Trilobite Site	180	Important fossil resource
Ash Springs Proposed Withdrawal	80	Previously applied for withdrawal to protect site
Caliente Field Station	2	Protect administration site
Cleve Creek Recreation Area	90	Important recreation site
Egan Crest Trailhead	250	New recreation site
Garnet Hill Recreation Area	160	Protect recreation site
Illipah Reservoir	290	Previously closed to leasing in Alternative A
Kirch Wildlife Management Area	5,000	New Recreation Development Act
Pony Springs Fire Station	10	New lands decision
Sacramento Pass Recreation Area	440	New recreation site
Sunshine Locality National Register District	6,460	High density of sensitive artifacts
Greater Sage-Grouse Leaks	31,520	Provide protection to greater sage-grouse and consistency with national policy
Ward Mountain Recreation Site	240	Smaller area than Alternative A
White Pine County Shooting Range	255	Previously closed in Alternative A
White River Archaeological District	230	Protect new development areas
Total	45,207	

Some areas closed to leasing in current management were not brought forward as recommendations for closure in the Proposed RMP. These sites did not meet special management criteria and would be adequately protected under the standard lease terms and conditions as well as best management practices, conditions of approval, and site specific mitigations. These areas are shown in **Table 4.18-7**.

**Table 4.18-7
Areas Currently Closed to Leasing That Are Not Closed in the Proposed RMP**

Area	Acres
Cave Valley Cave	40
Cold Creek Reservoir Recreation Area	220
Nevada Division of Forestry Honor Camp	180
Total	440

Additional areas would be closed in the proposed RMP that are not listed under current management. These areas include core areas of large ACECs that could not be accessed if the entire area were to be designated as no surface occupancy. Other areas are protective withdrawals around communities. These areas are summarized in **Table 4.18-8**.

Geophysical exploration would be conducted under the best management practices described in Appendix F, Section 1. Notices of Intent submitted for the conduct of geophysical surveys would be evaluated on case-by-case basis.

White Pine County Conservation, Recreation, and Development Act Additional Withdrawals	98,125
White Pine County Conservation, Recreation, and Development Act Disposals	18,600
Total*	412,405

* Total acres differ from summary table due to overlap among individual areas and categories.

Parameter – Solid Leasable Minerals

Under the Proposed RMP, approximately 9.9 million acres (86 percent of the decision area) would be available to solid leasable minerals and 1.6 million acres (14.3 percent of the decision area) would be closed. Of the closed acreage, 1.1 million acres would be in designated wilderness and wilderness study areas and approximately 494,500 acres (4.3 percent of the decision area) would be discretionary closures (see **Map 2.4.18-2**).

The analysis of closed acres as compared to the proposed action is the same as for locatable minerals. The impact of those closed acres on the solid leasable program is almost inconsequential because the current and future potential for these minerals is extremely low. Currently, there is no solid leasable activity on the decision area and potential is very low.

Parameter – Locatable Minerals

Impacts from Geology and Mineral Extraction Management Actions. Under the Proposed RMP, approximately 9.9 million acres (86 percent of the decision area) would be open to locatable mineral development and 1.6 million acres (14.3 percent of the decision area) would be proposed for closure (**Table 2.4-23**). The proposed closures would include approximately 494,500 acres (4.3 percent of the decision area) outside of designated wilderness and wilderness study areas (see **Map 2.4.18-2**).

4.0 ENVIRONMENTAL CONSEQUENCES

About 3.5 million acres (31 percent) in the decision area are considered to be high to medium potential for some type of locatable mineral. Within this, about 14 percent of the area closed to locatable minerals would be in areas with high to medium potential. Over half these acreages are within designated wilderness.

All areas withdrawn from mineral entry in the current management will be brought forward in the RMP.

Additional areas are proposed for withdrawal in the Proposed RMP that are not listed under Alternative A. Table 4.18-9 lists these areas and their rationale for closure.

Table 4.18-9
Areas Not Closed in Current Management (Alternative A), but Proposed for
Withdrawal for Locatable Mineral and Mineral Material Disposal under the Proposed RMP

Name	Acres	Rationale
Andies Mine Trilobite Site	180	High density of sensitive artifacts
Baker Archaeological Site Proposed ACEC	80	High density of sensitive artifacts
Baker Proposed Withdrawal	6,720	Community withdrawal
Baking Powder Flat Proposed ACEC	13,640	Proposed for ACEC

White River Archaeological District	230	High density of sensitive artifacts
White River Valley Proposed ACEC	13,100	Proposed for ACEC
Total	312,705	

Parameter – Mineral Materials

Under the Proposed RMP, about 9.9 million acres (86 percent of the decision area) would be open to possible disposal for mineral materials development, but subject to discretionary closures and best management practices. Approximately 1.6 million acres (14 percent of the decision area) would be closed to mineral materials development, including 488,800 acres (4.2 percent of the decision area) outside of

4.18 Geology and Mineral Extraction

designated wilderness and wilderness study areas (see **Map 2.4.18-2**). The list of additional closures in the Proposed RMP as compared to Alternative A is shown in **Table 4.18-9**.

Additional site-specific and discretionary closures may be developed with implementation plans that could close some areas to mineral material disposal. Where closures are due to land disposals, there could be an increased demand for mineral materials in the surrounding areas.

Impacts from Other Programs

The management actions in the Proposed RMP contain provisions to protect other resources through stipulations, best management practices, or closures that have varying degrees of impact on the recovery of mineral resources. However, since the majority of the decision area would remain open to leasing, mineral entry, or disposal of mineral materials, the minerals program would not be unduly limited by the proposed management direction.

Fish and Wildlife. Protection measures associated with priority habitats for wildlife would impose constraints on the geology and mineral extraction program. Key examples include the timing stipulations on fluid leasable mineral development activities within the various priority wildlife habitats (e.g., big game crucial winter range, big game calving/fawning/kidding/lambing areas, desert bighorn sheep habitat) (see **Table 2.4-19**). Additionally, operators would be required to improve or replace 2 acres of comparable quality habitat for each acre of priority habitat disturbed.

Special Status Species. Protection measures for several special status species would impose constraints on the geology and mineral extraction program. Key examples include the timing stipulations on fluid leasable mineral development activities within the various habitats managed for the benefit and protection of special status species (e.g., greater sage-grouse nesting habitat, greater sage-grouse winter habitat, raptor nest sites, and desert tortoise habitat) (see **Table 2.4-19**). Disturbances within desert tortoise habitat would require compensation through remuneration fees established under the desert tortoise Biological Opinion.

Cultural Resources and Paleontological Resources. Protection measures associated with cultural and paleontological resource sites outside of ACECs and other special designations (e.g., White River Archaeological District and Andies Mine Trilobite Site) would impose constraints on the geology and mineral extraction program through no surface occupancy stipulations for fluid mineral development and closure to other types of mineral development (see **Tables 2.4-20** and **2.4-23**).

Recreation. Various recreation sites will be removed from potential mineral development through no surface occupancy stipulations on fluid mineral development and closure to other types of minerals (see **Tables 2.4-20** and **2.4-23**). These removals would have minimal effect on mineral development.

Special Designations. Designated wilderness, wilderness study areas, ACECs, the White River Archaeological District, and the Garnet Hill Rock Hounding Area impose closures or various types of constraints on mineral development (see **Tables 2.4-20**, **2.4-21**, and **2.4-23**).

4.0 ENVIRONMENTAL CONSEQUENCES

Conclusions. The majority of the decision area would be open to fluid mineral exploration and development. The areas proposed for closure to leasing or those with no surface occupancy restrictions that are outside of wilderness, yet within high to moderate potential is less than 5 percent of the decision area. Therefore, the proposed management would allow for the exploration and development of oil and gas while protecting important resource values.

The decision area has a low potential for the occurrence of solid leasable mineral resources, so the closure of the lands described would likely have little impact on the exploration and development of solid leasable minerals.

Less than 5 percent of the decision area would involve discretionary closures to locatable minerals within high to medium potential. This small percentage of withdrawn areas is not expected to have a major impact on the recovery of locatable minerals. Therefore, the Proposed RMP would allow for the exploration and development of locatable minerals while protecting important resource values.

Because mineral material occurrences are so common and widespread, there should be little impact to the availability of these deposits despite the proposed closures and areas where discretionary closures are likely. It is expected that there would be sufficient resources available to meet local, regional, and national needs, while providing for the protection of other resources and uses.

Alternative A

Impacts from Geology and Mineral Extraction Management Actions.

Parameter – Fluid Leasable Minerals

Under Alternative A, only the areas covered by the Egan Oil and Gas Leasing Amendment and the Desert Tortoise Amendment would be available for leasing. This involves only about 40 percent of the decision area. Approximately 6.9 million acres would be unavailable to fluid minerals leasing because the impacts of leasing have not been analyzed in this area. Within the areas that are available for leasing, there would be about 2.7 million acres (60 percent of the current leasing area or 24 percent of the decision area) under standard terms and conditions.

Lease Notices. Alternative A has cultural notices for the Pony Express Trail and for the Sunshine Locality National Register District. The Pony Express Trail lease notice lets the operator know that there could be special visual mitigations required within the view shed of the Pony Express Trail. The Sunshine Locality Lease Notice surrounds the core area of the Sunshine Locality National Register District, which has a no surface occupancy designation. The lease notice lets the operator know that there could still be a high density of potentially significant cultural artifacts around that core area that may require consultation, mitigation, or treatment plans.

4.18 Geology and Mineral Extraction

In desert tortoise habitat a lease notice is in effect which informs the lessee that Section 7 consultation will be completed prior to any surface disturbance. **Table 2.5-12** shows the areas that are listed as lease notices in Alternative A.

Moderate Restrictions – Traditional Surface Use/Timing. There would be approximately 1.2 million acres (26 percent of the leasing area or 10 percent of the decision area) open for leasing with surface use and/or timing restrictions. Surface use and/or seasonal timing restrictions would be in place for the protection of greater sage-grouse leks and greater sage-grouse winter habitat, ferruginous hawk nesting territories, and desert tortoise habitat as shown in **Table 2.5-13** and **Map 2.5.18-1**. Timing restrictions for the protection for other raptors, big game, and desert bighorn sheep habitat would be applied as best management practices during ground disturbing activities.

Major Restrictions – No Surface Occupancy. Major restrictions under this alternative consist of 46,000 acres (1 percent of the leasing area or 0.4 percent of the decision area) of no surface occupancy for the resources shown in **Table 2.5-14** and **Map 2.5.18-1**.

Closed to Leasing. There would be approximately 591,700 acres (13.0 percent of the leasing area or 4.5 percent of the decision area) closed to leasing within the limited leasing area. The areas closed to leasing include approximately 471,900 acres within designated wilderness and wilderness study areas, and 119,800 acres (2.6 percent of the leasing area) of additional closures outside of the designated wilderness/wilderness study areas as shown in **Table 2.5-15** and **Map 2.5.18-1**.

In Alternative A there is high to medium oil and gas potential within about 92 percent of the entire area considered for leasing. The areas designated as “closed” and “no surface occupancy” occupy about 13 percent of this high and medium potential with about 80 percent of those acres in designated wilderness.

Parameter – Solid Leasable Minerals

Under Alternative A, about 10.1 million acres (88 percent of the decision area) would be open to solid leasable mineral leasing and 1.4 million acres (12 percent of the decision area) would be closed. Most of the closed acreage would involve designated wilderness and wilderness study areas (about 1.1 million acres), while approximately 212,400 acres would be closed in areas outside of the designated wilderness and wilderness study areas (see **Map 2.5.18-2**). The analysis of closed acres as compared to the proposed action is the same as for locatable minerals. The impact of those closed acres on the solid leasable program is almost inconsequential because the current and future potential for these minerals is extremely low. Currently there is no solid leasable activity on the decision area and potential is very low. Locatable minerals on acquired lands would be managed as solid leasable minerals. However, this would not be any different than in the locatable mineral program because the same areas would be withdrawn in both programs.

Parameter – Locatable Minerals

Under Alternative A, about 10.1 million acres (88 percent of the decision area) would be open to locatable mineral development and 1.4 million acres (12 percent of the decision area) would be proposed for withdrawal including approximately 212,400 acres (1.8 percent of the decision area) outside of wilderness study areas (see **Map 2.5.18-2**).

4.0 ENVIRONMENTAL CONSEQUENCES

The majority (88 percent) of the decision area is open to locatable minerals and solid leasable minerals. High to medium mineral potential of all types of locatable minerals and solid leasables encompass about 31 percent of the decision area. Within this high to medium potential area there are about 13 percent of the area that would be withdrawn or proposed for withdrawal. About 92 percent of the withdrawn areas in high to medium potential are in designated wilderness. The relative small percentage of acreage proposed for withdrawal outside of designated wilderness would not have a major impact on locatable mineral development in general.

Parameter – Mineral Materials

In Alternative A, approximately 10.0 million acres (87 percent of the decision area) would be open to possible disposal for mineral material development. Another 1.5 million acres (13 percent of the decision area) would be closed to mineral material development, including 391,300 acres outside of designated wilderness and wilderness study areas (see **Map 2.5.18-3**).

Impacts from Other Programs. The fluid minerals program is affected by provisions to protect other resources through stipulations, standard operating procedures, and Standard Terms and Conditions for Mineral Development within the Ely District, Appendix J and Appendix M, respectively, of the Draft Ely RMP/EIS (July 2005) that have varying degrees of impact on the recovery of fluid minerals. Therefore, the fluid minerals program would not be adversely affected by additional management direction unique to other resource programs within this alternative.

As for the program involving leasable solid minerals, locatable minerals, and mineral materials, protection of other resources has been incorporated into the management direction for the minerals program through closures, standard operating procedures, and Standard Terms and Conditions for Mineral Development within the Ely District, Appendix J and Appendix M, respectively, of the Draft Ely RMP/EIS (July 2005), and mitigations that may occur during site-specific NEPA analysis. Thus, the minerals program would not be adversely affected by additional management direction unique to other resource programs within this alternative. Because mineral material actions are discretionary, additional management directions in other resource programs could be developed to further mitigate or relocate mineral material disposals within this alternative.

Special Status Species. Protection measures for several special status species would impose constraints on the geology and mineral extraction program. Key examples include the timing and surface use stipulations on fluid leasable mineral development activities within the various habitats managed for the benefit and protection of special status species (e.g., greater sage-grouse nesting habitat, greater sage-grouse winter habitat, ferruginous hawk nest sites, Bonneville cutthroat trout habitat, Railroad Valley springfish habitat, and desert tortoise habitat) (see **Tables 2.5-13 and 2.5-14**).

Fish and Wildlife. Alternative A does not include specific protection measures associated with priority habitats for wildlife. Concerns related to wildlife species would be addressed through the site-specific NEPA analysis associated with individual projects.

4.18 Geology and Mineral Extraction

Cultural Resources and Paleontological Resources. Protection measures associated with cultural resource sites outside of ACECs and other special designations (e.g., Sunshine Locality National Register District, Snake Creek Indian Burial Cave and City of Rocks Archaeological Site) would impose constraints on the geology and mineral extraction program through no surface occupancy stipulations for fluid mineral development and closure to other types of mineral development (see **Tables 2.5-14** and **2.5-18**). No specific paleontological sites are identified for protection under this alternative.

Recreation. Various recreation sites will be removed from potential mineral development through no surface occupancy stipulations on fluid mineral development and closure to other types of minerals (see **Tables 2.5-14** and **2.5-18**). These removals will have minimal effect on mineral development.

Special Designations. Designated wilderness, wilderness study areas, desert tortoise ACECs, various archaeological sites, various recreation sites, and natural areas impose constraints on mineral development (see **Tables 2.5-14**, **2.5-15**, and **2.5-18**) either in terms of areas open for development of the types of activities that are allowed.

Conclusions. Alternative A limits the oil and gas program mostly due to the small percentage of the decision area that is available to leasing due to the limited coverage of previous NEPA analyses. It is difficult to compare Alternative A with the Proposed RMP because of the difference in acres available for leasing. Looking only at the areas available for leasing in both programs, the differences are small. The Proposed RMP identifies more ACECs and emphasizes the use of no surface occupancy more often than in Alternative A. In Alternative A there is high to medium oil and gas potential within about 92 percent of the entire area considered for leasing. The areas designated as "closed" and "no surface occupancy" occupy about 13 percent of this high and medium potential with about 80 percent of those acres in designated wilderness. Under current management there would be noticeable impact on the ability to develop oil and gas resources because over half the decision area is currently not available for leasing.

The decision area has a low potential for the occurrence of solid leasable mineral resources so the closure of the lands described would likely have little impact on the exploration and development of solid leasable minerals.

About 1.8 percent of the decision area in Alternative A as compared to about 4.3 percent in the Proposed RMP would involve discretionary closures to development of locatable minerals within high to medium potential. This small percentage of withdrawn areas is not expected to have a major impact on the recovery of locatable minerals. Therefore, Alternative A might allow for slightly more opportunities (2.5 percent of the decision area) for the exploration and development of locatable minerals but would not protect important resource values as well as the Proposed RMP.

The total acreage open to mineral materials disposal would be about 87 percent of the decision area. Most of the closed areas are non-discretionary closures for designated wilderness or wilderness study areas and not subject to the management of the Ely Field Office. Proposed discretionary closures would be about 3.4 percent of the decision area. Because mineral material occurrences are so common and widespread,

4.0 ENVIRONMENTAL CONSEQUENCES

there should be little impact to the availability of these deposits despite the proposed closures and areas where discretionary closures are likely.

Alternative B

Impacts from Geology and Mineral Extraction Management Actions.

Parameter – Fluid Leasable Minerals

Alternative B attempted to target broad areas with programmatic stipulations that would be dependent on finding the species or resource of concern in the site-specific area for the stipulation to be in effect. The idea was to provide maximum flexibility to the operator while providing better protection to the resource, especially wildlife resources that frequently move. The main concern with this concept was that it created larger areas subject to a potential stipulation as compared to the smaller areas of traditional timing stipulations that would be in effect regardless of whether or not the resource was present.

Geophysical exploration would not occur in areas closed to leasing or designated as no surface occupancy. Where allowed, geophysical exploration would be subject to the standard operating procedures and Standard Terms and Conditions for Mineral Development within the Ely District, Appendix J and Appendix M, respectively, of the Draft Ely RMP/EIS (July 2005).

Under Alternative B, approximately 10.0 million acres (87 percent of the decision area) would be open to leasing. Of this, 1.1 million acres (9.5 percent of the decision area) would be available for leasing under standard terms and conditions, and 8.5 million acres (74 percent of the decision area) would be subject to moderate constraints under programmatic stipulations for wildlife and cultural resources. Approximately 429,600 acres (3.8 percent of the decision area) would be available to leasing subject to moderate constraints with traditional surface use and timing restrictions, and 32,300 acres (0.3 percent of the decision area) would be available to leasing subject to major constraints (no surface occupancy) (see **Map 2.6.18-1**). Approximately 1.6 million acres (13 percent of the decision area) would be closed to leasing with 1,153,500 acres as non-discretionary designated wilderness and wilderness study areas and 347,800 acres (3.0 percent of the decision area) closed as additional discretionary closures.

Under Alternative B, approximately 67 percent of the 1.4 million acres that would be closed to leasing or have a no surface occupancy restriction would occur in areas that were high to moderate for fluid mineral potential. Of this area, over half is in designated wilderness.

Parameter – Solid Leasable Minerals

Under Alternative B, the same statistics that are described for locatable minerals would apply to solid leasable minerals (see **Map 2.6.18-2**).

Parameter – Locatable Minerals

Under Alternative B, about 10.0 million acres (87 percent of the decision area) would be open to locatable mineral development and 1.5 million acres (13 percent of the decision area) would be proposed for closure

4.18 Geology and Mineral Extraction

to mineral entry. The withdrawal acreage would include about an additional 375,100 acres (3.3 percent of the decision area) outside of designated wilderness and wilderness study areas (see **Map 2.6.18-2**).

About 16 percent of the acres closed to locatable minerals would be in areas with high to medium potential for some type of locatable mineral with over half these acres within designated wilderness.

Parameter – Mineral Materials

Under Alternative B, about 9.3 million acres (81 percent of the decision area) would be open to possible disposal for mineral materials development, but subject to standard operating procedures and Standard Terms and Conditions for Mineral Development within the Ely District, Appendix J and Appendix M, respectively, of the Draft Ely RMP/EIS (July 2005). Approximately 2.2 million acres (19 percent of the decision area) would be closed to mineral materials development, including 1.0 million acres (8.9 percent of the decision area) outside of designated wilderness and wilderness study areas (see **Map 2.6.18-3**).

Impacts from Other Programs. The management actions proposed in Alternative B contain provisions to protect other resources through stipulations, standard operating procedures, and Standard Terms and Conditions for Mineral Development within the Ely District, Appendix J and Appendix M, respectively, of the Draft Ely RMP/EIS (July 2005), or closures that have varying degrees of impact on the recovery of mineral resources. However, since the overwhelming majority of the decision area would remain open to leasing, mineral entry, or disposal of mineral materials, the minerals program would not be unduly limited by the proposed management direction. Because mineral material actions are discretionary, additional management directions in other resource programs could be developed to further mitigate or relocate mineral material disposals within this alternative.

Special Status Species. Protection measures for several special status species would impose constraints on the geology and mineral extraction program similar to the Proposed RMP. Key examples include the timing stipulations on fluid leasable mineral development activities within desert tortoise habitat, greater sage-grouse habitat, and near ferruginous hawk nests (see Section 2.6.18).

Fish and Wildlife. Protection measures associated with occupied habitat for bighorn sheep would impose timing stipulations on fluid mineral development activities (see Section 2.6.18).

Cultural Resources. Protection measures associated with cultural resource sites outside of ACECs and other special designations (e.g., Garrison Archaeological Site, Ward Charcoal Ovens) would impose constraints on the geology and mineral extraction program through closure to leasing or no surface occupancy stipulations for fluid mineral development and closure to other types of mineral development (see Section 2.6.18).

Recreation. Various recreation sites will be removed from potential mineral development through closure to leasing or no surface occupancy stipulations on fluid mineral development and closure to other types of minerals (see Section 2.6.18). These removals would have minimal effect on mineral development.

4.0 ENVIRONMENTAL CONSEQUENCES

Special Designations. Designated wilderness, wilderness study areas, ACECs, scenic areas, natural areas, and other types of special designations impose closures or various types of constraints on mineral development (see Section 2.6.18).

Conclusions. The percentage of closed and no surface occupancy areas are not substantially different than for the Proposed RMP. The main difference would be in how the stipulations were applied. All other conclusions would be the same as for the Proposed RMP.

Since the potential for solid leasable minerals in the Ely decision area is extremely low, and there are no current or reasonably foreseeable operations, the areas of closures would have little impact on the exploration and development of solid leasable minerals.

Alternative B would have approximately 119,400 fewer acres withdrawn from locatable mineral entry and a lower percentage of closed areas within areas of high to medium potential in comparison to the Proposed RMP. Alternative B would have slightly less impact to the development of locatable minerals but would not have the more defined protection of critical resources that are found in the Proposed RMP.

Alternative B closes about three quarters of the acreage of discretionary closures for locatable minerals in comparison with the Proposed RMP. The proposed management actions in Alternative B would meet the stated goal of the minerals program to provide for the responsible development of mineral resources to meet local, regional, and national needs, while providing for the protection of other resources and uses.

Alternative C

Impacts from Geology and Mineral Extraction Management Actions.

Parameter – Fluid Leasable Minerals

In comparison with the Proposed RMP, Alternative C would offer fewer acres available for leasing under standard terms and conditions mostly due to an increase in the proposed community withdrawals for this alternative. Moderate constraints such as timing and surface use stipulations would be similar to the Proposed RMP. Alternative C has surface use restrictions on some recreation sites rather than a no surface occupancy or closed designation as in the Proposed RMP.

Geophysical exploration would be considered in areas closed to leasing, designated as “no surface occupancy,” or subject to timing restrictions. Impact analyses would be conducted on a site-specific basis. Geophysical exploration would be subject to the best management practices as described in Appendix M of the Draft Ely RMP/EIS (July 2005). As a result, this alternative would provide for greater geophysical exploration/development potential.

Under Alternative C, 3.5 million acres (30 percent of the decision area) would be available for leasing under standard terms and conditions, 682,900 acres (5.9 percent of the decision area) would be available subject to moderate constraints with programmatic lease stipulations; 5.6 million acres (48 percent of the decision

4.18 Geology and Mineral Extraction

area) would be available to leasing subject to moderate constraints with traditional timing and surface use stipulations; 27,300 acres (0.2 percent of the decision area) would be available to leasing subject to major constraints (no surface occupancy); and 1.7 million acres (15 percent of the decision area) would be closed to leasing (see **Map 2.7.18-1**). Under Alternative C, approximately 68 percent of the 1.7 million acres that would be closed to leasing or have a no surface occupancy restriction would occur in areas that are high to moderate fluid mineral potential. Of this, over half is in designated wilderness.

Parameter – Solid Leasable Minerals

Under Alternative B, the same statistics that are described for locatable minerals would apply to solid leasable minerals (see **Map 2.7.18-2**).

Parameter – Locatable Minerals

Under Alternative C, about 9.8 million acres (85 percent of the decision area) would be open to locatable mineral development and 1.7 million acres (15 percent of the decision area) would be proposed for withdrawal. The withdrawal acreage would include 569,000 acres (4.9 percent of the decision area) withdrawn from mineral entry outside of wilderness study areas (see **Map 2.7.18-2**).

About 18 percent of the acreage closed to locatable minerals would be in areas with high to medium potential for some type of locatable mineral with about half these acres in designated wilderness.

Parameter – Mineral Materials

Under Alternative C, about 9.3 million acres (80 percent of the decision area) would be open to possible disposal for mineral material development. Approximately 2.2 million acres (20 percent of the decision area) would be closed to mineral materials development including 1.1 million acres (10 percent of the decision area) outside of designated wilderness and wilderness study areas (see **Map 2.7.18-3**).

Impacts from Other Programs. The management actions proposed in Alternative C contain provisions to protect other resources through stipulations, best management practices, or closures that have varying degrees of impact on the recovery of mineral resources. However, since the overwhelming majority of the decision area would remain open to leasing, mineral entry, or disposal of mineral materials, the minerals program would not be unduly limited by the proposed management direction. Because mineral material actions are discretionary, additional management directions in other resource programs could be developed to further mitigate or relocate mineral material disposals within this alternative.

Special Status Species. Protection measures for several special status species would impose constraints on the geology and mineral extraction program similar to the Proposed RMP. Key examples include the timing stipulations on fluid leasable mineral development activities within desert tortoise habitat, greater sage-grouse habitat, and near ferruginous hawk nests (see Section 2.7.18.2).

Fish and Wildlife. Protection measures associated with occupied habitat for bighorn sheep would impose timing stipulations on fluid mineral development activities (see Section 2.7.18.2).

4.0 ENVIRONMENTAL CONSEQUENCES

Cultural Resources and Paleontological Resources. Protection measures associated with cultural and paleontological resource sites outside of ACECs and other special designations (e.g., Garrison Archaeological Site and Andies Mine Trilobite Site) would impose constraints on the geology and mineral extraction program through closure to leasing or no surface occupancy stipulations for fluid mineral development and closure to other types of mineral development (see Sections 2.7.18.2 and 2.7.18.4).

Recreation. Various recreation sites and caves would be protected from potential mineral development through no surface occupancy stipulations on fluid mineral development and closure to other types of minerals (see Section 2.7.18.2 and 2.7.18.4). These restrictions would have minimal effect on mineral development.

Special Designations. Designated wilderness, wilderness study areas, ACECs, scenic areas, natural areas, and other types of special designations impose closures or various types of constraints on mineral development (see Sections 2.7.18.2 and 2.7.18.4).

Conclusions. Alternative C would have approximately the same area closed to leasing as the Proposed RMP, but 3 percent less of these closed areas would be in high to medium potential. Alternative C further developed the stipulations from existing management rather than evaluate and identify new areas of resource protection as thoroughly as in the Proposed RMP. The differences in percentages between Alternative C and the Proposed RMP are not enough to state that either alternative would have more impact than the other. The overall differences would be minimal compared to the size of the decision area.

Since the potential for solid leasable minerals in the Ely decision area is extremely low, and there are no current or reasonably foreseeable operations, the areas of closures would have little impact on the exploration and development of solid leasable minerals.

There would be comparable acreage proposed for withdrawal for locatable minerals in Alternative C as in the Proposed RMP. Within the withdrawals there would be approximately 13 percent more within high to medium potential in the Proposed RMP than for Alternative C. Therefore, even though approximately the same acreage is proposed for withdrawal in Alternative C, fewer of those acres are within high to medium potential. Therefore, Alternative C could have less impact to the development of locatable minerals than the Proposed RMP. The overall differences would be minimal compared to the size of the decision area. Because mineral material occurrences are so common and widespread, even with the differences in withdrawals, there should be little impact to the availability of these deposits despite the proposed closures and areas where discretionary closures are likely.

Alternative D

Impacts from Geology and Mineral Extraction Management Actions.

Parameter – Fluid Leasable Minerals

Under Alternative D, the entire decision area would be closed to leasing. Geophysical exploration would not necessarily be conducted under the standard operating procedures and Standard Terms and Conditions for

Mineral Development within the Ely District, Appendix J and Appendix M, respectively, of the Draft Ely RMP/EIS (July 2005), and Notices of Intent submitted for the conduct of geophysical surveys would be evaluated on case-by-case basis.

Parameter – Solid Leasable Minerals

Under Alternative D, the entire decision area would be closed to solid leasable minerals, including 1.1 million acres in wilderness study areas.

Parameter – Locatable Minerals

Under Alternative D, approximately 5.2 million acres (45 percent of the decision area) would be open to locatable mineral development. Approximately 6.3 million acres (55 percent of the decision area) would be closed to locatable mineral development, including 5.2 million acres (45 percent of the decision area) outside of designated wilderness and wilderness study areas (see **Map 2.8.18-1**). Of the acres closed, approximately 32 percent would be in areas of high to medium potential and of that 8 percent is in designated wilderness and wilderness study areas.

Parameter – Mineral Materials

Under Alternative D, the entire decision area would be closed to mineral materials development.

Impacts from Other Programs. The leasable minerals (fluid and solid) program is affected by provisions to protect other resources through stipulations, standard operating procedures, and restrictions that have varying degrees of impact on the recovery of fluid minerals. Since no leasing would occur under Alternative D, the stipulations, standard operating procedures, and restrictions would still be in effect on current leases or leases that may become held by production. The proposed management action to close the entire decision area to leasing would have a much greater impact than the provisions on current leases to protect other resources. Therefore, the fluid minerals program, where it is allowed to exist under this alternative, would not be adversely affected by additional management direction unique to other resource programs within this alternative.

The protection of other resources has been incorporated into the management direction for the locatable minerals program through best management practices, restrictions, and mitigations that may occur during site-specific NEPA analysis. However, the closure of nearly 50 percent of the decision area to locatable mineral entry would have a much greater impact than the management actions to protect other resources on those lands open to locatable minerals. The only other resource management program to have noticeable effect on geology and minerals extraction under this alternative would be special designations, since designated wilderness and wilderness study areas (combined total of 1.1 million acres) would be closed to development of locatable minerals. Otherwise, the locatable minerals program would not be adversely affected by additional management direction unique to other resource programs.

The mineral materials management program of the decision area is affected by closures, restrictions, and mitigations applicable to all alternatives. Because mineral material actions are discretionary, additional management directions in other resource programs could be developed to further mitigate or relocate

4.0 ENVIRONMENTAL CONSEQUENCES

mineral material disposals within this alternative. However, if the entire decision area is closed to mineral material disposal, further management direction in other resource programs would not matter.

Conclusions. The entire decision area would be closed to new fluid minerals leasing, but existing leases would be honored. The effects would be to preclude exploration and development (except on existing leases) and result in the loss of the resource available to the country, loss of potential lease bonus and rental revenue, loss of potential production royalties and property taxes, and other losses to related economic activity in the decision area. If no discoveries are made on existing leases, the leases would expire over time resulting in a total cessation of fluid mineral activities. Since 80 percent of the area has a high to medium potential for fluid minerals (especially oil and gas) and those resources would be unavailable, this extensive closure of lands described above would adversely affect the exploration and development of fluid minerals.

Because there is no current solid leasable activity and the potential is low, the closure of the entire decision area would not be important unless an economical deposit was discovered.

With over half the decision area withdrawn from mineral entry, there would be a major impact on the exploration and development of locatable minerals. Alternative D would not meet the stated goal of the minerals program to provide for the responsible development of mineral resources to meet local, regional, and national needs, while providing for the protection of other resources and uses. The withdrawal of over half the decision area would cause severe limitations on access to current and potential locatable mineral deposits. Inability to explore and develop locatable minerals would result in loss of the resource to the country, loss of tax revenue, and other losses to related economic activity in the decision area.

The high demand for sand, gravel, and other mineral materials for development and construction would not be met under this alternative. Alternative D would not meet the stated goal of the minerals program to provide for the responsible development of mineral resources to meet local, regional, and national needs, while providing for the protection of other resources and uses. The closure would preclude development of mineral materials resources and result in the loss of an important resource to the public and the loss of related economic activity.

4.19 Watershed Management

In the past, projects and resource actions were proposed on a site-specific basis. These projects and actions were consistent with applicable resource management plans and competed for program funds for implementation. In some cases, mid-scale level of analysis from activity level planning may have occurred. Under the new plan, there would be more emphasis on integrated management and funding across programs within a watershed unit.

Currently, watershed analysis is performed to determine if rangeland health standards are being met within a watershed. This involves an analysis of uses of vegetation by livestock, wildlife, and wild horses as appropriate. It also involves analysis of other uses within the watershed. These include such things as: mineral exploration and development, off-highway vehicle use, recreation, and rights-of-way development. If rangeland health standards are being met, the restoration plan (a portion of the watershed analysis) would propose projects and resource uses designed to maintain the healthy condition of the watershed. If standards are not being met, the restoration strategy would propose guidance of resource uses designed to improve the condition of the watershed and meet or achieve rangeland health standards. Watershed analysis would occur according to the priority identified in Chapter 2.0, but could be used independently for small areas to facilitate implementing site-specific restoration activities, such as fuel reduction projects in areas that pose threats to life, property, or special status species, without waiting for the full watershed analysis.

There are 61 watershed units within the planning area. It is expected that completion of watershed analyses, including restoration plans with proposed projects, on the 41 high priority watersheds would take approximately 10 years. Completion of watershed analyses on the remaining 20 lower priority watersheds would occur in the next 10 years.

Primary factors for analysis of the alternatives include: 1) priority of watershed to be analyzed; and 2) the allocation of forage after standards for rangeland health are met.

Impact Issues

Watershed management on the Ely planning area would focus on achieving rangeland health through all available tools. A non-functioning watershed, where rangeland health standards are not being met, may cause a decrease in water yield. Where trees increase in shrub communities, there is a loss of 25 to 40 millimeters for each 10 percent increase in tree cover (Jackson et al. 2000). Attainment of functional watersheds is described as reasonably foreseeable treatments related to soils and associated vegetation in **Tables 3.19-2, 3.19-3, and 3.19-4**. Following restoration of resilient vegetation communities, it is expected that forage productivity would improve in most watersheds. Allocation of this increased production would vary among the alternatives.

As discussed in Section 4.5, Vegetation, where existing vegetation communities are in a resilient state, management actions would be implemented to maintain that resiliency; where they are not presently resilient, efforts would be made to restore resiliency. With the close linkage between watershed health and

4.0 ENVIRONMENTAL CONSEQUENCES

vegetation, any factors or events affecting vegetation also would affect watershed function. Impacts to watersheds would be similar and closely related to impacts to vegetation. To meet watershed objectives, a combination of tools (Appendix G) would be used as appropriate.

Actions designed to enhance wildlife and special status species habitats would be determined in some cases ahead of the watershed analysis. The reader should be aware that actions in all resource programs and uses affect watersheds. This is especially true concerning actions regarding vegetation, fish and wildlife, special status species, wild horses, livestock grazing, fire management and watershed management.

Assumptions for Analysis

- Restoration of watershed health and achievement of desired plant community composition, structure, and function is expected to require several decades.
- The weighting and priority of resource considerations used to establish the watershed priority list would remain static throughout the life of the plan.

Interactions with Other Programs

The watershed management program within the planning area is integrally linked with and potentially would be affected by actions within the resource management programs for vegetation, fish and wildlife, special status species, wild horses, lands and realty, livestock grazing, geology and mineral extraction, fire management, noxious and invasive weed management, and special designations.

Goal

Manage watersheds to achieve and maintain resource functions and conditions required for healthy lands and sustainable uses.

Northeastern Great Basin Resource Advisory Council Standards

- Upland soils exhibit infiltration and permeability rates that are appropriate to soil type, climate, and land form.
- Riparian and wetland areas exhibit a properly functioning condition and achieve state water quality criteria.

4.19 Watershed Management

- Habitats exhibit a healthy, productive, and diverse population of native and/or desirable plant species, appropriate to the site characteristics; to provide suitable feed, water, cover, and living space for animal species; and maintain ecological processes. Habitat conditions meet the life cycle requirements of threatened and endangered species.
- Land use plans will recognize cultural resources within the context of multiple use.

Mojave/Southern Great Basin Resource Advisory Council Standards

- Watershed soils and stream banks should have adequate stability to resist accelerated erosion, maintain soil productivity, and sustain the hydrologic cycle.
- Watersheds should possess the necessary ecological components to achieve state water quality criteria, maintain ecological processes, and sustain appropriate uses.
- Riparian and wetland vegetation should have structural and species diversity characteristic of the stage of stream channel succession in order to provide forage and cover; capture sediment; and capture, retain, and safely release water (watershed function).
- Habitats and watersheds should sustain a level of biodiversity appropriate for the area and conducive to appropriate uses. Habitats of special status species should be able to sustain viable populations of those species.

Objective

To manage watersheds that display physical and biological conditions or functions required for necessary ecological components to achieve state water quality criteria, maintain ecological processes, and sustain appropriate uses.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to watershed management also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

4.0 ENVIRONMENTAL CONSEQUENCES

Proposed RMP

Impacts from Watershed Management Actions. Under the Proposed RMP, attainment of a functioning watershed through watershed restoration would be accelerated substantially and the area planned for treatment would be based on the ranges of healthy conditions and desired vegetation states identified in Section 2.4.5. Total area planned for active vegetation treatment is approximately 7.1 million acres distributed among the various vegetation types over a 50- to 100-year time frame. Upon successful restoration of vegetation communities, additional vegetation could be reserved for watershed protection.

Revegetation success typically is higher in the more mesic, higher elevation vegetation types (e.g., pinyon-juniper, mountain mahogany, and mountain sagebrush). On the other hand, the typical larger watersheds tend to include a higher proportion of low elevation vegetation types such as shadscale and Wyoming sagebrush predominate where soils are drier and revegetation success is less probable. In those vegetation types with the lowest probabilities for successful revegetation (e.g., shadscale and winterfat), treatment techniques involving minimal disturbance, such as changes in livestock grazing, would be favored in most cases other than rehabilitation of wildland fires.

Impacts related to the management actions of the watershed program would relate to the prioritization of watersheds for analysis and treatment and the allocation of additional forage produced on restored areas. Impacts related to prioritization of watersheds are most likely to occur in relation to the deferral of treatment and unexpected changes that may occur in those watersheds considered as lower priority before they undergo analysis and restoration. If unexpected changes are observed in watersheds in the low priority group prior to their scheduled analysis, the Ely Field Office may revise the prioritization list as necessary, based on such data. As indicated above, the greatest potential for increased vegetation production would occur in those areas that have higher probability for revegetation success. The vegetation communities in these areas also typically are those that exhibit higher levels of productivity. Thus, allocation of additional forage following vegetation treatments is most likely to occur in the more mesic, higher elevation vegetation communities.

Impacts from Other Programs.

Vegetation. Under the Proposed RMP, much of the treatment emphasis would focus on treatment of resources at risk of crossing thresholds to tree or shrub states with little or no herbaceous understory. Thus, existing vegetation condition is one of the factors involved in prioritization of watershed for treatments. Sagebrush and pinyon-juniper woodland areas dominated by or containing an understory component of annual invasive species (e.g., cheatgrass) would typically be rehabilitated if and when they burn naturally. With the shift in treatment emphasis and increase in the level of effort involved, the Proposed RMP would produce greater watershed improvements than under current management. This would result in greater productivity, and improved watershed function and stability. It also would increase the amount of plant litter returned to the soil and protect soils from accelerated erosion.

For watersheds, management objectives would be to maintain or establish diversity, mosaics, and connectivity of vegetation communities at a project-level scale. Such scale would vary depending on

watershed size. The overall goal of the Proposed RMP would be to emphasize plant and animal community health at the landscape level. To achieve the desired range of conditions, management would include a variety of methods to increase or decrease the vegetation overstory. Application of treatments to the acreages discussed under the Proposed RMP would result in impacts to vegetation communities, both in the short term (where some temporary effects such as increased risk of weed invasion may hamper restoration) and in the long term (where the treatments are expected to result in increased resiliency and improved ecological health). Implementation of the management actions and best management practices would reduce or eliminate some of the impacts to vegetation communities. For example, the highest return on effort is anticipated in treating areas that have not crossed a threshold and where the desired plant community is still present but approaching a threshold (see Appendix C). The short-term impacts associated with restoration efforts would include temporary reduction in vegetation cover and productivity, which could impact other resource programs. Moving these communities to an earlier vegetation phase, however, would provide long-term benefits to other resources and users. Where existing conditions are within the desired range of conditions, vegetation would be managed in a manner to maintain that status.

Fish and Wildlife. Under the Proposed RMP, watershed restoration would be driven, in large part, by wildlife habitat requirements as defined through the desired future conditions. The effects include the designation of specific wildlife habitat needs such as vegetation species, percent cover, timing of treatment activities, and maintenance of vegetation corridors for movement.

Special Status Species. Presence of special status species is one of the primary factors affecting the prioritization of various watersheds for analysis and treatment.

Wild Horses. The reduction in number and distribution of herd management areas associated with this alternative would help alleviate impacts from wild horses on revegetation efforts and watershed treatments, especially in several drier areas of the planning area. This also would favor maintenance or improvement of watershed function in these areas and reduce the potential need for future treatments of the same areas.

Livestock Grazing. The environmental impacts of grazing on watershed function are similar to livestock grazing effects to Vegetation in Section 4.5, Proposed RMP. The grazing actions presented here would lessen the impacts to the resources. For those allotments that have been evaluated, there may be impacts from livestock grazing that would be considered a causal factor for not attaining or making progress toward the rangeland health standard. The ability of a watershed to withstand disturbance and attain resilient and resistant vegetation communities is partly dependent on the intensity of livestock grazing. With more intense livestock management, watershed function would be reached at a faster rate. Grazing animals affect plant communities through herbivory, trampling, and nutrient redistribution. Grazing can stimulate growth in some plants. It also can reduce plant abundance, density, and vigor. Grazing can be used to generate changes in plant community composition, structure, and function. Spatial variations in grazing can influence patterns of the landscape mosaic and dictate when a site switches to an alternative ecological state (crosses a threshold). Approximately 221,300 acres would be unavailable for livestock grazing as shown in **Table 4.16-1**. Throughout the remainder of the planning area, livestock grazing may be used as a tool to affect implementation and success of other vegetation treatments.

4.0 ENVIRONMENTAL CONSEQUENCES

Lands and Realty. Additional possible land disposal designations proposed under the Proposed RMP would total approximately 75,600 acres, of which approximately 60 percent would be shrubland. Land disposals could affect vegetation treatments and management on large and small watersheds through increased probability for introduction of weeds from disturbance areas associated with development activities, constraints on use of certain vegetation treatments (e.g., fire) in adjoining lands, and changes in priority of areas to be treated. Potential land disposals would not affect vegetation treatments and vegetation management in watersheds on the remainder of the planning area. Rights-of-way and special uses on the planning area, including communication sites, affect vegetation to the extent that ground disturbances are involved. Consolidation of major rights-of-ways into corridors would limit the amount of surface disturbance to vegetation communities. All permits, leases, and contracts are administered with conservation measures such as topsoil salvage and reclamation of all vegetation disturbed or removed. Thus, most impacts associated with these activities are short term and would be mitigated to the extent practicable through best management practices (see Appendix F, Section 1).

Renewable Energy. Development of renewable energy projects could affect watershed management through increased probability for introduction of weeds from disturbance areas, constraints on use of certain vegetation treatments (e.g., fire) in adjoining lands, and changes in priority of areas to be analyzed and treated. Based on the reasonably foreseeable development scenario, a maximum of 40,000 acres of rights-of-way would be granted and 4,000 acres are expected to be disturbed for construction and operation of renewable energy facilities within the decision area during the life of this plan. This area would include several separate facilities constructed at different times. Thus, the acreage disturbed at any one time and contributing to local erosion and sedimentation would be a small fraction of this total.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario (see Section 4.18), would be distributed throughout the 11.5 million acres of the planning area. Mineral development activities may affect the planning and implementation of watershed treatments in terms of either prioritization of or constraints on various treatments.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available) and other tools would be used to the greatest extent practical under the Proposed RMP. During the short term, wildland fire may affect the planning and implementation of treatments within individual watersheds and adjacent areas. In the long term, restoration of vegetation resilience and the return to historical fire regimes and condition classes would result in reduced impacts to watersheds when wildland fires occur.

Noxious and Invasive Weed Management. The management of noxious and invasive weeds is essential for restoration of native plant community health and resiliency. The presence and abundance of noxious and invasive weed populations would be important factors in the planning and implementation of watershed treatments. Management to remove, reduce, and prevent noxious weeds would include the use of chemical, mechanical, biological, and cultural methods. The effects of herbicide use vary with the herbicide used, the application rate, and the proximity of non-target plants to targeted ones. The use of cultural agents (e.g., sheep and goats) to manage noxious weeds would affect native and desirable plants to the degree that non-target species are present in the treatment area and are palatable to animals. These

short-term effects would not be expected to interfere with the accomplishment of the watershed management goal.

Special Designations. The Proposed RMP would involve designation of 20 ACECs and management of designated wilderness and wilderness study areas. These special designations have been considered in the prioritization of watersheds for analysis and restoration. It is not expected that these designations would have additional effects on the planned watershed analysis and treatment process in any major way although they may affect selection of areas and methods for local vegetation treatments. In some cases, these designations would augment the watershed treatment and management process by providing additional protection from disturbances.

Conclusion. The Proposed RMP watershed management actions, in combination with the associated vegetation treatment programs, generally would reduce dominance by woody species; increase the diversity of vegetation communities over the long term; and provide structure with multiple-aged shrubs, forbs and perennial grasses. This would result in greater productivity, improved watershed function, and increased stability. It also would increase the amount of plant litter returned to the soil and protect soils from accelerated erosion. Long term vigor and health of vegetation communities, which includes maintenance of soil stability as well as energy, nutrient, and water cycling, would be maintained and improved across the landscape except at small localized areas of soil disturbing activities. Thus, the Proposed RMP management actions of this and related programs would achieve the program goal for watershed management.

Alternative A

Impacts from Watershed Management Actions. The management action of the watershed program in this alternative relates to how additional forage produced on restored areas would be allocated among various uses. Within the Schell Resource Area, this distribution is defined by the existing land use plan as 70 percent to livestock and wild horses and 30 percent to wildlife. In other portions of the planning area, allocations could be made among uses and reserved to watershed function, as necessary, for individual treatment areas to meet project objectives. Thus, there is greater flexibility of using the additional forage produced to improve watershed function in the former Egan and Caliente Resource Areas than in the Schell Resource Area.

Impacts from Other Programs.

Under Alternative A, renewable energy, noxious and invasive weeds, and special designation management and the associated impacts would be similar to the Proposed RMP.

Vegetation. Under Alternative A, restoration of watershed function would be through the attainment of the desired range of conditions for vegetation communities. Watershed restoration activities, including analysis, would be undertaken at a relatively low level with a slow rate of associated change. Watershed analysis and associated monitoring currently are implemented as funding opportunities and other resources allow. Within this alternative, the treatment emphasis would continue to occur primarily as fire rehabilitation

4.0 ENVIRONMENTAL CONSEQUENCES

within the various sagebrush types (see **Maps 4.5-1** and **4.5-2**) with some treatment components in salt desert shrub and nonnative seedings. In the sagebrush areas, the average revegetation success rate is estimated to be about 50 percent. Vegetation treatments within the Mojave Desert portion of the planning area would consist primarily of fire rehabilitation. As with the Proposed RMP, treatment success would be higher in the more mesic, higher elevation vegetation types and lowest in the lowest elevation areas.

Vegetation treatments would continue to be implemented at rates somewhat above the historic rate of approximately 10,000 acres of vegetation manipulation per year. Vegetation treatments would not be concentrated in any watershed. Thus, the effect on any watershed would be small. The majority of activity would continue to be seeding following wildland fires. Considering a total treatment area of almost 2.8 million acres across the Great Basin portion of the planning area, this rate of treatment is not expected to succeed in reestablishing vegetation resiliency.

Fish and Wildlife. Under Alternative A, fish and wildlife needs are a consideration in the establishment of desired range of conditions for vegetation communities and watershed function. Fish and wildlife values and associated habitat requirements are a substantial factor in the planning and prioritization of watershed treatments and the planning of subsequent management.

Special Status Species. None of the proposed management actions regarding special status species are anticipated to affect the watershed program under this alternative. However, future changes in the list of special status species could change watershed priorities, with the restoration of habitat for such species becoming a major factor in determining where watershed restoration occurs.

Wild Horses. Wild horse herds may adversely affect the success of restoration efforts occurring within the herd management areas since it would be difficult, if not impossible, to exclude wild horses from all new seedings. The effect of wild horses on these treatment areas would be most noticeable and negative in marginal herd management areas where inadequate forage sometimes exists to sustain the horse populations.

Lands and Realty. Under this alternative, lands identified for potential disposal total approximately 31,900 acres, primarily within White Pine County. Applicants for major rights-of-way would be encouraged to use existing corridors to limit disturbance. The potential disposals would have minimal effect on the watershed management program.

Livestock Grazing. Through its effects on vegetation, grazing would continue to be used as a tool for meeting standards in watershed management. The specific manner in which livestock grazing would contribute to watershed restoration would be determined during watershed analysis and the allotment evaluation and term permit renewal process.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the

8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP (see Section 4.18). The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Fire Management. Under Alternative A, prescribed fire, wildland fire use (approximately 3.6 million acres available) and other tools would not be used to the greatest extent practical as under the Proposed RMP. The impacts under Alternative A would be similar to those under the Proposed RMP except on a smaller scale resulting in fewer acres with improved ecological health, vegetation resilience, and watershed function. Because fuels would continue to accumulate in untreated areas, the probability of major, uncontrollable, stand-replacing fire events impacting the watershed would continue.

Conclusion. Existing management in watershed management, vegetation, and related programs, would lead to minimal improvement at the watershed level, moderate reduction in shrub-dominated communities, and a reduction in pinyon/juniper-dominated communities over the long term. Moderate shrub reintroduction into burned sites, as part of rehabilitation efforts, would maintain diversity in the long term at a broad scale. The historic rate of treatment (largely fire rehabilitation) each year to restore desirable perennial herbaceous species and restore ecological resiliency would be increased to the extent allowed under the current fire plan. This rate, however, is not considered adequate to match the current rate of ecological deterioration, increase in woody fuel, and expansion of weedy species throughout the planning area, and substantial long-term effects on watershed function are anticipated. Thus, the rate of treatment under this alternative, when combined with actions proposed for vegetation, fish and wildlife, special status species, wild horses, livestock grazing, and fire management, has a low probability of achieving noticeable gains in vegetation resiliency and watershed function throughout the planning area and is unlikely to achieve the program goal.

Alternative B

Impacts from Watershed Management Actions. Additional forage produced as a result of vegetation treatments would not be allocated to either livestock or wild horses, but would be used to further improve watershed condition and provide forage for wildlife. This approach would tend to accelerate restoration of watershed function in the treated watersheds.

Impacts from Other Programs.

Under Alternative B, most programs directly affecting watershed function and their associated impacts would be similar to the Proposed RMP.

Vegetation. As with the Proposed RMP, treatment success of the Great Basin vegetation types is expected to be highest in the higher elevation areas occupied by pinyon-juniper and mountain sagebrush

4.0 ENVIRONMENTAL CONSEQUENCES

and lowest in the lower elevation areas. Under this alternative, the higher proportion of treatment related to vegetation types with higher success probabilities (i.e., pinyon-juniper) would lead to potentially higher overall success rates and greater forage production than Alternative A. Vegetation treatments as well as other treatments designed to restore vegetation resiliency, improve hydrologic function, increase infiltration, and reduce soil erosion would be concentrated within specific watersheds over time.

Livestock Grazing. Livestock grazing would be closed on approximately 3 million acres of bighorn sheep range and 542,100 acres of desert tortoise habitat outside of the desert tortoise ACECs. This would reduce the effect of livestock grazing as a tool in watershed management for these areas.

Conclusion. Alternative B generally would reduce dominance by woody species and increase the diversity of vegetation communities over the long term, providing structure with multiple-aged shrubs, forbs and perennial grasses. This would result in greater productivity, and improved natural functions and watershed stability. Sustained or slightly reduced levels of livestock grazing would maintain vegetation communities that currently meet the desired range of conditions and allow improvement of remaining vegetation communities to the desired range of conditions over the short and long term. It also would increase the amount of plant litter returned to the soil and protect soils from accelerated erosion. Long term vigor and health of vegetation communities, which includes maintenance of soil stability as well as energy, nutrient, and water cycling, would be maintained across the landscape, except at small localized areas of soil disturbing activities. Additional forage resulting on areas successfully restored would not be allocated to livestock or wild horses and, thus, could help in further improvement of ecological health beyond meeting the standards for rangeland health. Overall, the watershed management aspects of this alternative and effects of most other programs would be similar in effect to the Proposed RMP and would be expected to achieve the goal for watershed management.

Alternative C

Impacts from Watershed Management Actions. Additional forage produced as a result of vegetation treatments would be allocated to livestock. Although this allocation assumes that standards for rangeland health have already been met, the allocation to livestock as opposed to watershed maintenance, on at least a partial basis, would probably cause the recovery of watershed function to be slower in this alternative than in the Proposed RMP or Alternative B.

Impacts from Other Programs. Impacts on watershed restoration associated with fish and wildlife, special status species, wild horses, livestock grazing, geology and mineral extraction, noxious and invasive weed management, and special designations management programs would be the same as described for the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Vegetation. Under Alternative C, attaining watershed function for watersheds through a restoration program involving specific vegetation communities and conditions to be treated would be similar to the Proposed RMP, except for the differences in desired range of conditions identified in Section 2.4.5. This approach would require more frequent future treatments or increased management effort to maintain these

commodity-oriented communities. The total area currently estimated for potential treatment in Alternative C is approximately 7.5 million acres or about 66 percent of the total area occupied by those vegetation communities subject to treatment. Slightly over 90 percent of this potential treatment area occurs in the pinyon-juniper and sagebrush vegetation types. The primary difference in restoration approach between Alternative C and the Proposed RMP is that Alternative C would focus on establishment and maintenance of vegetation communities in a narrower desired range of conditions conducive to the commodity (livestock, forest/woodland products, and big game) emphasis of this alternative. Achievement and maintenance of this desired range of conditions would require greater initial effort and more frequent future treatments. Additional forage would be allocated to livestock after Standards for Rangelands health have been met at the watershed level.

Impacts to watershed management resulting from implementing the vegetation treatments of Alternative C would be generally similar to those described for the Proposed RMP, especially in the short term. However, this alternative would involve only limited use of prescribed fire and would rely on more expensive mechanical and chemical approaches for most treatments. Thus, the area successfully treated within comparable budgets would probably be less in Alternative C, eventually leading to substantial differences between the two alternatives over the long term.

Management within the Mojave Desert and salt desert shrub vegetation types would focus on restoration of healthy ecological systems primarily through application of herbicides on sites infested with annual invasive species and through changes in grazing management to maximize opportunities for natural recovery. Prescribed fire and other tools also would be used where appropriate in these vegetation types.

Lands and Realty. Potential land disposals would total approximately 295,200 acres, about two-thirds of which would be in Lincoln County. Several of the utility corridors under this alternative would be up to 3 miles in width, resulting in over 1.0 million acres of total corridor area (more than three times the potential corridor area under the Proposed RMP).

Fire Management. The full suppression approach to fire management in Alternative C would contribute to the continued accumulation of heavy fuels in untreated areas rendering them more vulnerable to large, intense fires if and when they eventually burn. Restoration of these areas would then be more difficult than if treated or burned in the absence of such heavy fuel loads.

Conclusion. Implementation of this alternative would reduce dominance of woody and exotic annual species, and increase dominance of herbaceous perennials in the long term. Greater productivity for allocation to consumptive uses would result. Limited shrub reintroduction into some burns would maintain diversity at a broad scale. However, the narrower range of desired conditions (with greater emphasis on the herbaceous state) in this alternative as compared to the Proposed RMP would require more effort and more frequent treatments to achieve and maintain. The higher probability for widespread fire over the long term also would necessitate greater efforts for fire suppression and rehabilitation as opposed to planned treatments. As a result of optimizing livestock use of available forage, the benefits of returning vegetation material to the soil would be minimized. Long term vigor and health of vegetation communities would be maintained across the landscape, except at localized areas of concentrated activity. This alternative would

4.0 ENVIRONMENTAL CONSEQUENCES

have a good probability of achieving the program goal, but the probability would be less than for the Proposed RMP or Alternative B.

Alternative D

Impacts from Watershed Management Actions. This alternative would be similar to Alternative A in terms of attaining functionality of watersheds based on the anticipated scale of watershed treatments. However, Alternative D would focus on minimal restoration disturbance, elimination of grazing, use of fewer herbicides, and elimination of all discretionary uses or developments on the public lands. Additional forage produced on treated areas would be available for wildlife, wild horses, and watershed maintenance since no livestock would be present. In areas outside of the herd management areas, this would facilitate restoration of watershed function.

Impacts from Other Programs. Impacts on watershed restoration associated with fish and wildlife, and special designations management activities would be the same as described for Alternative A. The following interrelated programs would result in different impacts compared to Alternative A.

Vegetation. Under this alternative, much of the treatment emphasis would focus on treatment of sites that have understory vegetation dominated by invasive species. This alternative is expected to produce comparable vegetation restoration to Alternative A on individual treated areas, but the focus would be on restoration of native species, not necessarily resilient conditions. To accomplish the desired range of conditions for this alternative as described in Section 2.8, restoration of native plant communities would emphasize replacement of nonnative plants such as cheatgrass and crested wheatgrass with perennial bunchgrasses, primarily within the Great Basin portion of the planning area. Restoration of native plant communities would involve maintenance of the current distribution of species. Areas where sagebrush was previously removed would be revegetated with sagebrush, and similarly, pinyon and juniper would be restored on sites where trees have been removed.

This approach would manage public land to achieve no net loss of native communities, as they currently exist or existed about 1950 prior to widespread shrub and tree removal for enhanced forage production. Therefore, in the short term, vegetation conditions would continue generally as they currently exist with gradual increases in forage production, vegetation resiliency, and watershed function in some communities through limited restoration; increased accumulation of fuel loads in almost all unburned communities; and replacement of invasive or nonnative species in limited treatment areas.

Special Status Species. The special status species program would have minimal effects in the short term. However, over the long term, the substantially higher risks of large intense fires destroying widespread areas of sagebrush habitat would lead to increased probabilities for additional species listings in this category. Thus, there would be reduced probability of future species listings guiding the watershed management program in the short term and increased probability of such direction over the long term.

Wild Horses. Wild horse populations would be uncontrolled within the herd management areas. This would result in severe impacts to vegetation and watershed health in these areas, creating the need for additional, and probably repeated, treatment.

Lands and Realty. Minimal lands and realty actions would occur under Alternative D and effects to watershed management would be absent.

Renewable Energy. Development of renewable energy facilities would be precluded and there would be no effects of such activities on watershed function or management.

Livestock Grazing. Livestock would be removed from the planning area, eliminating any conflict between grazing activities and watershed management. However, removal of livestock would eliminate one of the major tools used for vegetation treatment.

Geology and Mineral Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario (see Section 4.18). Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Fire Management. Under Alternative D, minimal fire suppression would occur. Decreased fuel reduction by grazing, followed by increased fuel proliferation and reduced fire suppression over the long term would result in substantially increased probabilities that wildland fires would be widespread and high in severity. This would ultimately lead to far larger areas requiring fire rehabilitation and more difficulty restoring these areas than if they had been subjected to planned treatments.

Noxious and Invasive Weed Management. Under Alternative D, the removal of cheatgrass without the use of acetolactate synthesis-inhibiting herbicides, which would be prohibited under this alternative, would be less practical and probably less effective.

Conclusion. Improvement in watershed function could be seen with the exclusion of livestock from all public lands and would allow natural succession to improve the condition of many vegetation communities currently supporting desirable species. Altered vegetation communities dominated by annual species would improve little toward the desired range of conditions over the life of the plan. Fine fuels would increase with limited utilization of herbaceous growth, resulting in increased size of wildland fires and increased frequency of fire. Limited suppression of wildland fire also would increase the average fire size, resulting in more frequent impacts to affected vegetation resources. The condition of many vegetation communities currently dominated by desirable mosaics of native species would be maintained or improved in those areas not subject to frequent fire. Intense, hot, wildland fires in healthy, native communities would cause a decline in vegetation diversity and health, leading to a decline in natural levels of nutrients, water, and energy cycling.

4.0 ENVIRONMENTAL CONSEQUENCES

The limited management approach would result in continued proliferation of tree species into historic sagebrush-dominated sites with minimal prospects for restoration of resiliency and watershed function.

Treatments would not occur at a scale and rate, when combined with the actions proposed for vegetation, fish and wildlife, special status species, wild horses, livestock grazing, and fire management, which would reverse the historic deterioration in rangeland health and restore resiliency of vegetation communities. The long-term consequences would be more dramatic and severe than in other alternatives due to the differences in fire management and other programs. Therefore, the watershed management actions, in combination with the related programs of this alternative, would fail to meet the program goal.

4.20 Fire Management

Impact Issues

Restoration of natural fire regimes is a primary long-term goal of the Ely Field Office fire management program. Restoration of natural fire regimes is hindered by profound ecological system changes that have altered and continue to affect fuel amounts, types, and distribution. Fuels management, mainly through vegetation modification, is central to the achievement of this goal.

Assumptions for Analysis

- Natural ignition events would continue to occur in approximately the same distribution and frequency as observed in the past.
- Frequency of human-caused accidental ignitions would increase almost proportionately over time as recreational use increases along transportation corridors and as newly disposed lands are developed.

Interactions with Other Programs

The fire management program within the planning area potentially would be affected by actions within the resource management programs for vegetation, special status species, cultural resources lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, forest/woodland and other plant products, geology and mineral extraction, noxious and invasive weed management, and special designations.

Goal

Provide an appropriate management response to all wildland fires, with emphasis on firefighter and public safety, consistent with overall management objectives. Return fire to its natural role in the ecological system and implement fuels treatments, where applicable, to aid in returning fire to the ecological system. Establish a community education program that includes fuels reduction within the wildland urban interface to create fire-safe communities.

4.0 ENVIRONMENTAL CONSEQUENCES

Objective

To manage wildland and prescribed fires as one of the tools in the treatment of vegetation communities and watersheds to achieve the desired range of condition for vegetation, watersheds, and other resource programs (e.g., livestock, wild horses, soils, etc.).

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to fire management also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Fire Management Actions. Implementation of the Proposed RMP would result in fire management activities (appropriate management response, prescribed fire, and/or mechanical, manual and herbicide application, etc.) occurring year-round to meet resource objectives in accordance with the Ely Fire Management Plan (BLM 2004a), subsequent updates and the goals and objectives of this RMP. Fire management activities would be conducted on watersheds with resilient vegetation, to aid in achieving and maintaining resilience of vegetation. Up to 8.9 million acres may become available for wildland fire use.

Adherence to provisions of the Nevada Smoke Management program will minimize air quality impacts related to prescribed fires. Coordination with the Department of Defense will minimize the safety hazards of prescribed fires in relation to military operating air spaces within the planning area.

Management actions related to desert tortoise habitat will ensure that the fire management program has minimal adverse effects on desert tortoise populations.

Impacts from Other Programs.

Vegetation. Under the Proposed RMP, vegetation treatments, including fuel reductions, would be increased substantially from current levels. Much of this restoration effort would be accomplished through the use of prescribed fire and wildland fire use, as well as the use of mechanical and chemical treatments. Thus, the vegetation program would provide the basis for a substantially increased effort in fire management, particularly in relation to fire use and prescribed burns.

Special Status Species. Fire management activities (i.e., suppression, wildland fire use, prescribed fire) within the planning area would be influenced by constraints to protect and conserve habitat for special status species. For example, several specific and unique operational constraints are identified in Section 2.4.20 for fire suppression activities within desert tortoise habitat (approximately 746,000 acres or 6.5 percent of the decision area).

Cultural Resources. Fire management planning activities would consider the presence of cultural resources, and plans would be modified or areas closed to fire management activities as necessary to avoid impacts to cultural resources.

Lands and Realty. Under the Proposed RMP, an increased area would be designated for possible disposal primarily for community development. Commonly, development can lead to increased ignition sources from human activities and, therefore, potentially increased fire risk on adjacent public lands. In the long term, increases in community development and other developments (e.g., rights-of-ways and communication sites) would lead to an increased need for Wildland Urban Interface Projects along with increased fire suppression responses.

Renewable Energy. Renewable energy development (up to 40,000 acres for wind energy) would likely lead to increased development of rights-of-way access to such areas, which may affect fire management in the same manner as discussed under Lands and Realty. In the long term, increases in community development and other developments (e.g., rights-of-ways and communication sites) would lead to an increased need for Wildland Urban Interface Projects along with increased fire suppression responses.

Travel Management and Off-highway Vehicle Use. Off-highway vehicle use would be limited to designated road and trails as determined through a subsequent public process and area-specific analysis, thereby reducing the risk of ignition sources in remote areas of the planning area.

Recreation. The Proposed RMP includes designation of five special recreation management areas totaling approximately 1.2 million acres. This decision, coupled with the changes in off-highway vehicle use policies discussed above, would tend to reduce the risk of human-caused fires in remote areas of the planning area while increasing the risk in these designated areas. Competitive events are short in duration and permit conditions would include fire prevention measures.

Forest/Woodland and Other Plant Products. Fuelwood activities would occur throughout the planning area, except in restricted areas, under the Proposed RMP, which could potentially increase the number of dispersed ignition sources on the planning area. Harvest also may be encouraged in specific areas to create fire breaks.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario (see Section 4.18), would be distributed throughout the 11.5 million acres of the planning area. The effects of geology and mineral extraction activities on fire management would be similar to those discussed for lands and realty and travel and off-highway vehicle use. Increased

4.0 ENVIRONMENTAL CONSEQUENCES

risk of fire associated with mineral development activities would be addressed through increased readiness for suppression development potential.

Noxious and Invasive Weed Management. Noxious and invasive weeds would continue to affect fire behavior, frequency, and post-fire effects. As noxious and invasive plants dominate plant communities, fuels increase locally. For example, cheatgrass is highly flammable when cured and generates fires that burn frequently and rapidly. The resulting fire behavior dictates appropriate management and fire fighter capabilities. Thus, weeds may limit the appropriate tools regarding fire management actions.

Special Designations. Implementation of the Proposed RMP would retain or designate 20 ACECs for approximately 317,790 acres throughout the decision area. Designation of these ACECs may affect decisions regarding fire management in or near these areas. Ten of the ACECs consisting of approximately 20 percent of the total area in ACECs would be classified as open for fire management. This means that the full range of fire management options (wildland fire use, prescribed fire, mechanical treatments, etc.) could be used within these ACECs without potential restrictions. Ten of the ACECs containing approximately 80 percent of the area within ACECs would be classified as limited for fire management. This means that the full range of fire management options (wildland fire use, prescribed fire, mechanical treatments, etc.) could have restrictions placed or be eliminated from use within these ACECs.

Conclusion. Implementation of the Proposed RMP would result in a major increase in the use of fire throughout the watersheds in the planning area. Fire use and prescribed fire would be implemented year-round in the treatment of vegetation communities and watersheds to achieve the desired range of conditions for vegetation, watersheds, and other resource programs (e.g., livestock grazing, wild horses, soils, etc.). An increase in application of other tools (e.g., herbicides) also may be necessary to meet management goals prior to expanding the use of fire.

Alternative A

Impacts from Fire Management Actions. The Ely Fire Management Plan, which incorporates the Ely Managed Natural and Prescribed Fire Plan, would continue to be implemented (see **Map 2.5.20-1**). This plan has been in effect for several years and would continue to provide effective guidance for responding to and managing wildland fires. This plan would allow fire use fires on approximately 3.6 million acres of the 11.5 million acres in the decision area. This is less than the Proposed RMP and could contribute to continued accumulation of woody fuels in untreated and unburned areas, increasing the risk for eventual large scale wildland fires that not only cause ecological damage but also jeopardize human safety and property. Fire suppression costs associated with Alternative A would be higher than fire suppression costs associated with the Proposed RMP.

Impacts from Other Programs. Impacts to fire management associated with special status species and cultural resources would be the same as discussed for the Proposed RMP.

Vegetation. Impacts under Alternative A are similar to those under the Proposed RMP except on a smaller scale. Thus, the vegetation program would not provide as much of a basis for the fire management program.

Lands and Realty. Impacts of lands and realty to fire management would be similar to those discussed for the Proposed RMP, except they would occur on a smaller scale due to the smaller acreage involved for disposals, corridors, and other authorizations.

Renewable Energy. Under Alternative A, applications for alternative energy sources would continue to be reviewed and approved on a location-by-location basis. This policy has minimal effect, either beneficial or adverse, on fire management. The same general effects would apply as for the Proposed RMP.

Travel Management and Off-highway Vehicle Use. Roads provide access to areas whereby the risk of human-caused fire ignition increases in those areas; however, the same access is afforded to fire fighters for suppressing human- or natural-caused fires. The Ely Field Office policy of allowing off-road travel, and the resulting proliferation of roads, would continue to result in both potential ignition sources as well as access for fire fighters.

Recreation. Recreational activities that occur on the planning area inherently increase the risk of human-caused fire due to the common outdoor use of lighters, campfires, vehicles, and cook stoves. The risk of recreation-related ignitions would be highest around human concentration areas such as planning campgrounds and hunting camps. Only 750,000 acres of special recreation management area would be retained. This area along U.S. Highway 50 is not expected to increase fire ignitions.

Forest/Woodland and Other Plant Products. Forest/woodland and other plant product harvesting affects fuels both positively and negatively. Of the permitted activities, green tree harvesting for fuelwood or posts and poles would reduce and redistribute the greatest amounts of fuel. This break-up of fuel continuity would have a desirable effect for fire management. Tree harvesting, however, generates woody debris (slash). Slash left on the ground increases fire hazards in the short term, depending on the slash treatment method. Collection of dead and down wood for fuelwood would reduce the hazard level for medium to large size woody materials on a very localized basis.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP (see Section 4.18). The impacts from development of solid leasable minerals, locatable

4.0 ENVIRONMENTAL CONSEQUENCES

minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Noxious and Invasive Weed Management. Noxious and invasive weeds would continue to affect fire behavior and frequency. As noxious and invasive plants dominate plant communities, fuels increase locally. Cheatgrass is highly flammable when cured and generates fires that burn frequently and rapidly. The resulting fire behavior dictates appropriate management and fire fighter capabilities.

The treatment or removal of noxious and invasive weeds on the planning area would affect fuels available for fire; however, this change is highly localized and operates on a spatial and temporal scale different than fire. Noxious weed treatment under Alternative A would be concentrated along roads, which are useful as fuelbreaks during suppression activities. Treating roadside weeds would consequently help maintain existing roadways as fuel breaks and decrease the spread of weeds into new undisturbed areas.

Special Designations. Existing management would continue to require designated wilderness classifications to be considered during development of appropriate fire management response. Only the three existing desert tortoise ACECs would be designated under this alternative, resulting in fewer acres with fire management constraints than under the Proposed RMP.

Conclusion. Continued implementation of the Ely Fire Management Plan, which incorporates the Ely Managed Natural and Prescribed Fire Plan, would allow case-by-case decisions based in part on where the fire occurs in relation to where in the planning area such fire would be considered beneficial or detrimental.

Alternative B

Impacts from Fire Management Actions. Impacts to fire management associated with program-specific management activities would be the same as the Proposed RMP. Fire suppression costs associated with Alternative B would be less than fire suppression costs associated with Alternative A, C, or D, but higher than fire suppression costs associated with the Proposed RMP.

Impacts from Other Programs. Impacts to fire management associated with vegetation, special status species, cultural resources, renewable energy, travel management and off-highway vehicle use, forest/woodland and other plant products, geology and mineral extraction, and noxious and invasive weed management activities would be the same as or similar to the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Lands and Realty. Under Alternative B, an increased area would be designated for possible disposal primarily for community development. Commonly, development can lead to increased ignition sources from human activities and therefore potentially increased fire risk on adjacent public lands.

Recreation. Alternative B includes designation of nine special recreation management areas totaling approximately 2.7 million acres. This decision, coupled with the changes in off-highway vehicle use policies

discussed above, would tend to reduce the risk of human-caused fires in remote areas of the planning area while increasing the risk in these designated areas.

Special Designations. Impacts to fire management associated with special designations would be similar to the Proposed RMP. Designation of 18 ACECs may affect decisions regarding fire management in or near these areas.

Conclusion. Implementation would result in a major increase in the use of fire throughout the watersheds in the planning area. Fire use and prescribed fire would be implemented year-round to meet resource objectives in accordance with the Ely Fire Management Plan (BLM 2004a), thus meeting the goal for this management program. An increase in application of other tools (e.g., herbicides) also may be necessary to meet management goals prior to expanding the use of fire.

Alternative C

Impacts from Fire Management Actions. Fire management would focus on full suppression throughout the planning area. This approach is expected to result in continued accumulation of heavy fuel supplies in untreated sagebrush and forest/woodland communities until natural ignition occurs in these areas. At that point, suppression and control of the resulting fires may be difficult, if not impossible. Thus, over the long term, this approach would lead to increased risk of eventual large scale wildland fires that would cause ecological damage and jeopardize human safety and property. Fire suppression costs associated with Alternative C would be higher than fire suppression costs associated with the Proposed RMP.

Impacts from Other Programs. Impacts to fire management associated with vegetation, special status species, cultural resources, lands and realty, renewable energy, forest/woodland and other plant products, geology and mineral extraction, noxious and invasive weed management activities, and special designations would be the same as or similar to the Proposed RMP. The following interrelated program would result in different impacts.

Travel Management and Off-highway Vehicle Use. Approximately 32,000 acres would be classified as open to cross-country off-highway vehicle use under Alternative C. These areas are all within dry lake beds and should pose minimal threat for fire ignitions.

Recreation. Alternative C includes designation of nine special recreation management areas totaling approximately 2.6 million acres. These areas, like the off-highway vehicle emphasis areas, involve an increased risk of human-caused fire ignitions, but the increased risk in these concentrated use areas tends to be offset by the reduction in risk in remote areas of the planning area closed to such activities. Alternative C includes designation of approximately 1.1 million acres for off-highway vehicle emphasis areas, carrying with it associated risks for human-caused fire ignitions. This is a substantially larger area designated for such use than in the Proposed RMP.

Conclusion. Full suppression of fires within the planning area would be practical only on a short-term basis. Over the long term, the attempts at full suppression would probably lead to catastrophic widespread fires

4.0 ENVIRONMENTAL CONSEQUENCES

resulting in long-term ecological damage and increased risk to human safety and property. Thus, this alternative would fail to meet the stated goal and objective for the fire management program.

Alternative D

Impacts from Fire Management Actions. Alternative D would emphasize minimal suppression of wildland fires except for human-caused and those that threaten life or property. This approach would result in increased average size of fires and greater areas being rehabilitated on an annual basis. The relative absence of vegetation treatments in sagebrush and forest/woodland communities and the absence of grazing would lead to continued accumulation of both heavy and fine fuels followed by eventual large-scale fire events that would have a high risk of causing ecological damage and jeopardizing human safety and property. Long-term fire suppression costs associated with Alternative D would be higher than long-term fire suppression costs for the Proposed RMP.

Impacts from Other Programs. Impacts to fire management associated with special status species, cultural resources, and watershed management activities would be the same as or similar to the Proposed RMP. The following interrelated programs would result in different impacts.

Vegetation. Restoration would occur at low levels, and the untreated vegetation communities would continue to accumulate live and dead fuels. Pinyon-juniper woodlands, in particular, would continue to accumulate woody fuels that would contribute to increased fire hazards.

Lands and Realty. There would be no net loss of public land under Alternative D, nor would there be any new land use authorizations such as new rights-of-way. This would serve to reduce ignition sources from human activity.

Renewable Energy. Renewable energy development would be severely curtailed due to the elimination of new land use authorizations. This would have a similar impact as that for Lands and Realty under this alternative.

Travel Management and Off-highway Vehicle Use. Alternative D would restrict off-highway vehicle use to maintained roads and trails throughout the decision area, and there would be no off-road open areas. Roads and trails not mechanically maintained would be rehabilitated. This approach would substantially reduce the risks associated with human-caused fire ignitions throughout much of the planning area but also would reduce access for responding to fires.

Recreation. There would be no Special Recreation Permits issued including outfitter and guide permits, motorcycle race events, and truck race events. As with the off-highway vehicle policy above, this would reduce the risk of human-caused fire ignitions.

Forest/Woodland and Other Plant Products. Harvest of forest/woodland and other plant products would be restricted to small quantities of pinyon pine nuts. This would reduce the potential risk of ignition sources

associated with most harvest activities in other alternatives, but also would contribute to greater fuel accumulations in these woodland areas and potentially result in larger eventual fires.

Geology and Minerals Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral entry, approximately 50 percent less than in the reasonably foreseeable development scenario (see Section 4.18). Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Noxious and Invasive Weed Management. Alternative D would prohibit the use of selected categories of herbicides. This restriction would seriously hamper efforts to control some invasive weeds in numerous settings where they provide a fine fuel supply and contribute to fire susceptibility.

Conclusion. Buildup of fuels would occur throughout the planning area and eventually lead to catastrophic fires, resulting in long-term ecological damage and increased risk to human safety and property. It is expected that such fires would occur earlier in time with this alternative than with Alternative C. Thus, this alternative would fail to meet the stated goal and objective for the fire management program.

4.21 Noxious and Invasive Weed Management

Impact Issues

Noxious and invasive weed introduction and spread generally are functions of vectors (e.g., animals, wind, and vehicles) that transport plant material to and within the planning area and of ground disturbances that promote their establishment. The establishment and spread of noxious and invasive weeds results in the disruption of natural ecological systems. The control of noxious and invasive weeds is dependant on the identification and implementation of appropriate monitoring and treatment methods.

Please refer to Section 4.5, Vegetation, for general impacts from vegetation tools and techniques. Tools and techniques that may affect the potential invasion, establishment, expansion, and control of noxious and invasive weeds include fire, mechanical and chemical treatments, grazing management, and biological agents.

Assumptions for Analysis

- Noxious weed management would continue to operate in concert with, but independent of, watershed restoration priorities.

Interactions with Other Programs

The noxious weeds management program within the planning area potentially would be affected by actions within the resource management programs for vegetation, special status species, wild horses, lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, livestock grazing, forest/woodland and other plant products, geology and mineral extraction, fire management, special designations, and health and safety.

Goal

Prevent the introduction and spread of noxious and invasive weeds. Control or eradicate existing populations.

Objective

To reduce the introduction of, and the areal extent of noxious and invasive weed populations and the spread of these populations.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality

4.0 ENVIRONMENTAL CONSEQUENCES

regulations. Impacts to noxious and invasive weed management also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Noxious and Invasive Weed Management Actions. The majority of the existing management actions and best management practices address noxious weed prevention for all activities on the planning area, although some are focused on program-specific activities. Prevention emphasis currently is placed on reducing weed vectors (e.g., vehicles and equipment) and on post-disturbance monitoring and revegetation. All seed mixes, mulches, topsoil, and hay used in revegetation projects on the planning area are required to be weed-free. Although it is impossible to prevent all noxious and invasive weed species from entering and spreading on the planning area, these measures are expected to continue to substantially reduce weed vectors.

Maintenance or, if necessary, re-establishment of desired vegetation in resilient plant communities is the primary means of preventing weed establishment following disturbance. Revegetation currently is conducted with native and nonnative species following ground disturbing activities throughout the planning area, except in designated wilderness and wilderness study areas, where native species are preferred. Most efforts for revegetation involve seeding. Success rate, in part, is a function of monitoring revegetation efforts to determine the need for re-treatment.

Treatment methods for noxious and invasive weed control include chemical, mechanical, cultural, or biological. However, other tools may be used to achieve site-specific resource objectives. Existing management actions, best management practices, and tools and techniques address use of herbicides, livestock (e.g., sheep, goats), and biological organisms (e.g., insects, pathogens) to manage weed infestations. Under the Proposed RMP, emphasis would continue to be placed on reducing weed vectors and treating weed infestations associated with roads where weed introduction, establishment risks, potential for additional spread, and existing problems are highest. Isolated weed occurrences would continue to have the potential to spread unchecked. Overall weed control costs under the Proposed RMP are expected to increase during the short term along with the increase in vegetation treatments. These costs would then stabilize and diminish over the long term as resilient perennial vegetation is reestablished in the treated areas.

Impacts from Other Programs.

Vegetation. Under the Proposed RMP, there would be a potential for a substantial increase in ground disturbing activities from current levels associated with vegetation treatments. This would correspondingly increase the risk of weed spread on the planning area over current levels in association with vegetation

4.21 Noxious and Invasive Weed Management

treatments. Priorities for active management of vegetation would include an array of vegetation communities identified in Section 2.4.5 where existing conditions do not meet the desired range of conditions. Disturbance of existing vegetation to implement treatments carries with it the risk for additional weed spread if the treatment is not successful. Risk of weed invasion would be reduced on treated areas where resilient vegetation is successfully reestablished.

Special Status Species. Management of specific areas for special status species may restrict the tools used in management of noxious and invasive weeds (e.g., use of pesticides near streams or sensitive special status plant species). These conflicts would be identified and resolved on a case-by-case basis.

Wild Horses. The Proposed RMP would result in elimination of several herd management areas totaling approximately 1.6 million acres that do not provide suitable or adequate habitat to sustain wild horse populations. This action would contribute to vegetation restoration and reduction in weed risks in these areas.

Lands and Realty. Land use permits and rights-of-way provide areas for weeds to establish and spread. Right-of-way management and other permitted lands actions would continue to be conducted in compliance with the management actions and best management practices of the noxious weed management program. These procedures address noxious weed prevention related to equipment use, ground disturbance, and reclamation at the close of permitted activities. Management actions and best management practices that apply to right-of-way permit holders and others under contract require vehicle wash downs, pre-disturbance surveys, and mitigation, as needed. The implementation of best management practices would minimize potential effects associated with the maintenance of unpaved roads on BLM-administered lands. Concentrating major rights-of-way within corridors and communication facilities at existing sites would lessen the impact and spread of noxious and invasive weeds by applying control to a concentrated area.

Depending on planned use, possible land disposals that may occur have the potential to increase noxious and invasive weeds subsequent to change in ownership. For example, if disposed parcels were developed subsequent to leaving public domain and the disposed parcel is adjacent to other public land, the risk of noxious weed establishment and spread may increase on the planning area, depending on the type of development involved.

Renewable Energy. Effects would be similar to lands and realty for areas disturbed in conjunction with renewable energy developments and associated rights-of way. Impacts associated with these activities would be mitigated to the extent practicable through management practices from the Wind Energy Programmatic EIS.

Travel Management and Off-highway Vehicle Use. Road construction, use, abandonment, and maintenance activities all have the potential to transport and proliferate noxious and invasive weeds. Roads are continually disturbed ground surfaces with enhanced water runoff on the adjacent roadsides, both conditions that favor the establishment of weeds. Personal vehicles that use the roads in the planning area can introduce plant materials from elsewhere, thereby increasing the distribution of noxious and invasive

4.0 ENVIRONMENTAL CONSEQUENCES

weeds and introduction of new weed species. Off-highway vehicle use would be limited to designated roads and trails on approximately 10.3 million acres, as determined through a subsequent public process and area-specific analysis, and closed on the remaining approximately 1.2 million acres. This would result in lower risks for weed dispersal through movement of vehicles through infected areas.

Recreation. All developed and dispersed recreational facilities are vulnerable to the introduction and spread of noxious and invasive weeds because of public access via vehicle, the use of pack animals, and the concentration of impacts on the ground. The Proposed RMP includes the designation of five special recreation management areas totaling approximately 1.2 million acres and four special recreation permit areas for competitive events totaling approximately 1.3 million acres. These areas would be particularly vulnerable to introduction and spread of invasive species. Potential impacts associated with outfitters, guides, and recreationists using horses, llamas, or other stock would be minimized because only certified weed-free hay would be allowed to be brought onto public lands.

Livestock Grazing. Livestock grazing is managed to achieve or maintain appropriate rangeland health standards. Typically, rangelands that are in good ecological health are less vulnerable to weed establishment than poor or degraded conditions. Livestock moving from infested areas on private lands to public land allotments can be a major vector for weed seeds.

On all actively grazed allotments, regardless of animal class or numbers, there are animal concentration areas that receive the greatest impacts. Heavily impacted and newly disturbed areas associated with water sources, salt sites, traps, fence lines, range improvements and sheep bedding grounds would remain highly vulnerable to weed establishment. In addition, livestock can transport noxious and invasive weed propagules (e.g., seed and plant parts) into these areas. These hazards and risks would continue at levels dictated by the implementation of best management practices such as monitoring high-risk areas.

Livestock can adversely affect revegetation efforts that are essential to preventing weeds from establishing on recently disturbed areas through trampling and grazing of young plants. For this reason, livestock typically would be excluded from seeded areas until objectives have been met.

No domestic sheep or goat grazing would be allowed within occupied desert bighorn sheep habitat and associated buffer zone except where natural or man-made barriers effectively prevent physical contact. This approach would eliminate the use of domestic sheep or goats for weed control and eradication in such areas and may necessitate greater use of herbicides for such purposes.

Forest/Woodland and Other Plant Products. Forest/woodland products are available across the majority of the planning area. The potential for the spread of noxious and invasive weeds from harvest activities is low to moderate. Stipulations will be included in contracts to reduce potential for spread. Monitoring for weeds during watershed analyses and project planning will be a priority.

Geology and Mineral Extraction. Approximately 17,100 acres, as estimated in the reasonably foreseeable development scenario (see Section 4.18), would be distributed throughout the 11.5 million acres of the planning area. Road construction, use, abandonment, and maintenance related to mineral

4.21 Noxious and Invasive Weed Management

development all provide the potential to transport and proliferate weeds. Mineral operations would be conducted in compliance with best management practices, thereby minimizing weed-related impacts. These best management practices address noxious weed prevention related to equipment use, ground disturbance, and reclamation at the close of exploration, construction, and operation of permitted activities.

The level of risk associated with minerals development is roughly proportional to the level of development. Under this alternative, the current low levels of mineral development would continue to pose moderate to low levels of risk for the introduction and spread of noxious and invasive weeds depending on compliance with leases, permits, and the best management practices contained in them. The greatest risks would be associated with new road construction that penetrates into currently roadless areas.

Fire Management. Prescribed fire, wildland fire use (approximately 8.9 million acres available), and other tools would be used to the greatest extent practical under the Proposed RMP. This would increase the probability for noxious and invasive species expansion and establishment in burned areas if revegetation efforts fail and weed control measures prove ineffective in the short and long term. However, if native vegetation becomes reestablished in burned areas, the resiliency of vegetation to future fires would minimize the likelihood of expansion and establishment of noxious and invasive weed species within new areas.

Special Designations. Actions to nominate and designate special management areas do not directly affect noxious weed management; however, management plans for these areas that attract recreation or exclude mineral entry can have negative or positive weed-related effects.

Health and Safety. Health and safety precautions would continue to be implemented through best management practices, primarily during weed treatment with herbicide. These precautions would not conflict with the treatment of noxious and invasive weeds on the planning area.

Conclusion. The Proposed RMP would involve a substantial increase in vegetation treatments resulting in a temporary increase in the risk of weed invasion and expansion in the areas disturbed by treatments, but a long-term reduction in the vulnerability of these same areas. Additional constraints on off-highway vehicle use throughout the planning area and formalization of weed management actions related to construction and development activities would substantially reduce weed dispersal associated with these activities. However, with the increase in use of off-highway vehicles in designated special recreation management areas and special recreation permit areas, the potential spread of weeds will increase. Monitoring measures will be implemented to ensure containment of any outbreak. Therefore, this alternative would reduce the rate of spread of noxious and invasive weeds on a long-term basis and meet the program goal.

Alternative A

Impacts from Noxious and Invasive Weed Management Actions. Noxious and invasive weed impacts associated with program-specific management activities would be the same as described for the Proposed RMP. Overall weed control costs would continue at current levels over the short term and would likely continue to escalate over the long term.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts from Other Programs. Noxious and invasive weed impacts associated with special status species, renewable energy, and health and safety activities would be the same as or similar to the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Vegetation. Vegetation treatments can introduce or proliferate weeds as a function of ground disturbances. An average of 10,000 acres per year typically would be treated. Any of these areas with ground disturbance or new roads would be highly vulnerable to weed establishment. Although the short-term vulnerability to weed establishment would increase during and immediately following the treatment activity, this would be more than offset by the reduced vulnerability of the resultant perennial communities to new weed infestations.

Revegetation would minimize the potential establishment and spread of noxious and invasive weeds by stabilizing soils and establishing groundcover; however, seeding also could be a vector for weed introduction. Weed-free seed and straw mulch, where used, would be required for revegetation efforts, precluding this threat to the extent that such seed and straw are available and used. Implementation of the other standard operating procedures listed under Noxious and Invasive Weed Management in Appendix J of the Draft Ely RMP/EIS (July 2005) would minimize potential for introduction and spread of these species.

Wild Horses. Wild horses currently affect noxious and invasive weed management primarily through their impacts on rangeland health. Excessive use in riparian areas and other concentration sites contribute to the vulnerability of these areas to weed invasion. Wild horses are not as likely to transport weeds from distant places as often as cattle and sheep that may be trucked from one area to another.

Lands and Realty. Noxious and invasive weed impacts associated with lands and realty management activities would be the same as described for the Proposed RMP except that the total area available for possible disposal would be substantially less.

Travel and Off-highway Vehicle Use. The majority of the decision area (9.8 million acres) would continue to be open for off-highway travel. As a result, the potential for introduction and spread of noxious and invasive weeds beyond existing roads and trails and into unroaded areas would continue. This could be partially minimized through the consideration of off-road closures in weed-infested areas.

Recreation. No additional special recreation management areas or special recreation permit areas would be designated, and dispersed recreation would continue to be heavy and increase rapidly throughout much of the planning area. This, coupled with the "open" approach for recreational off-highway vehicle use, would contribute to the spread of noxious and invasive species.

Livestock Grazing. Under Alternative A, impacts of livestock grazing on noxious weed management would be similar to the Proposed RMP except that this alternative would not involve the closure of sheep and goat grazing in and near occupied desert bighorn sheep habitat. Therefore, this alternative could involve higher risk of weed invasion and spread on those areas than under the Proposed RMP, but also would allow the use of such animals for selective biological control of various weed species in these areas.

4.21 Noxious and Invasive Weed Management

Forest/Woodland and Other Plant Products. Public and commercial fuelwood, post and pole, pinyon pine nut harvest, and Christmas tree cutting activities would be allowed throughout the planning area with few exceptions. Combined with the largely open transportation policy on the planning area, off-road travel and the ultimate establishment of two-track trails that become roads could be associated with the forest/woodland and other plant products program. Due to the broad area open to these public activities, any resulting establishment of noxious or invasive weed populations could quickly lead to widespread dispersal of such species.

Geology and Mineral Extraction. The area available for development of solid leasable minerals, locatable minerals and mineral materials would be relatively similar to that in the Proposed RMP. However, approximately 4 million acres are presently available for oil and gas leasing in contrast to approximately 10 million acres in the Proposed RMP. Therefore, it is expected that only 40 percent (3,400 acres) of the 8,400 acres estimated in the reasonably foreseeable development scenario for oil and gas would be disturbed.

Overall, the total disturbance from mineral development actions would be approximately 12,100 acres in Alternative A in contrast to the 17,100 acres in the reasonably foreseeable development scenario for the Proposed RMP (see Section 4.18). The impacts from development of solid leasable minerals, locatable minerals, and mineral materials would be approximately the same in Alternative A as those described in the Proposed RMP, but much less for oil and gas development.

Fire Management. Impacts of fire management would be the same as the Proposed RMP, except that wildland fire use would be allowed on 3.6 million acres, approximately half of what is available in the Proposed RMP.

Of greatest concern is the relationship between the nonnative, invasive, annual grasses and forbs, and fire. For example, cheatgrass, other annual bromes of Mediterranean origin, and several annual forbs are adapted to fire and proliferate to become a monocultural cover wherever bare ground allows. Management of fire under this alternative would take cheatgrass abundance into account (based on available information), whenever practical; however, cheatgrass would continue to spread following fires.

Special Designations. Impacts associated with special designations would be similar to the Proposed RMP although the total number of new ACECs and their acreages would be less than in the Proposed RMP.

Conclusion. Weed control efforts historically have focused primarily on toxic and noxious weed species with less attention devoted toward the spread of annual invasive species such as cheatgrass, which provide usable forage during a short grazing season each spring. Current management includes emphasis on slowing and reversing the spread of these invasive species through application of integrated pest management methods. The rapidly increasing levels of recreational activities throughout the planning area contribute to the increasing spread of noxious and invasive species. Under this alternative, the rate of spread of noxious and invasive weeds would increase in both the short and long term, thus failing to meet the program goal.

4.0 ENVIRONMENTAL CONSEQUENCES

Alternative B

Impacts from Noxious and Invasive Weed Management Actions. Noxious and invasive weed impacts associated with program-specific management activities would be the same as described for the Proposed RMP. Overall weed control costs are expected to increase in the short term during the period of increased vegetation treatments and then stabilize and diminish over the long term as resilient perennial vegetation is reestablished on treated areas.

Impacts from Other Programs. Noxious and invasive weed impacts associated with vegetation, special status species, wild horses, lands and realty, renewable energy, travel management and off-highway vehicle use, geology and mineral extraction, watershed management, fire management, forest/woodland and other plant products, and health and safety activities would be the same as or similar to the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Recreation. This alternative includes the designation of nine special recreation management areas totaling approximately 2.7 million acres and two special recreation permit areas for competitive events totaling approximately 656,000 acres. Three of the nine special recreation management areas would emphasize recreational use of off-highway vehicles. These areas would be particularly vulnerable to introduction and spread of invasive species.

Livestock Grazing. This alternative includes elimination of livestock grazing from the remainder of the Mojave Desert (542,100 acres) and desert bighorn and Rocky Mountain bighorn sheep ranges and migration routes (3 million acres), thus contributing to the vegetation restoration and reduction in the weed risks in these areas. In the remainder of the planning area, livestock grazing may be used as tool in the control of existing weed populations.

Special Designations. Impacts associated with special designations would be similar to the Proposed RMP although the total number of new ACECs and their acreages would be less than in the Proposed RMP.

Conclusion. Alternative B would be similar to the Proposed RMP in terms of weed management because the substantial increase in vegetation treatments under this alternative would temporarily increase the risk of weed invasion and expansion in areas disturbed by treatment but reduce the vulnerability of these same areas on a long-term basis. Additional constraints on off-highway vehicle use throughout the planning area would substantially reduce weed dispersal associated with this activity. However, with the increase in use of off-highway vehicles in designated special recreation management areas and special recreation permit areas, the potential spread of weeds would increase. Monitoring measures would be implemented to ensure containment of any outbreaks. Therefore, this alternative would reduce the rate of spread of noxious and invasive weeds on a long-term basis and meet the program goal.

Alternative C

Impacts from Noxious and Invasive Weed Management Actions. Noxious and invasive weed impacts associated with program-specific management activities would be the same as or similar to those described for the Proposed RMP. Overall weed control costs are expected to increase in the short term during the period of increased vegetation treatment and then stabilize over the long term as resilient vegetation is reestablished on treated areas. With the intensive commodity use under Alternative C, long-term weed control costs are expected to remain higher than under the Proposed RMP.

Impacts from Other Programs. Noxious and invasive weed impacts associated with vegetation, special status species, wild horses, renewable energy, travel management and off-highway vehicle use, livestock grazing, forest/woodland and other plant products, geology and mineral extraction, special designations, and health and safety would be the same as or similar to the Proposed RMP. The following interrelated programs would result in different impacts compared to the Proposed RMP.

Lands and Realty. Noxious and invasive weed impacts associated with lands and realty management activities would be the same as described for the Proposed RMP except that a total area available for possible disposal would be about four times larger.

Recreation. This alternative includes the designation of nine special recreation management areas totaling approximately 2.6 million acres and four special recreation permit areas for competitive events totaling approximately 1.3 million acres. Four of the nine special recreation management areas would emphasize recreational use of off-highway vehicles. These areas would be particularly vulnerable to introduction and spread of invasive species.

Fire Management. The full suppression approach to fire management would likely result in short-term reduction of fire events followed by increased number of large-scale events over a longer period. The large-scale, intense fire events create burned areas that are typically more difficult to successfully revegetate, thus increasing the risk for establishment and spread of invasive and noxious weed species.

Conclusion. The level of vegetation treatments involved in Alternative C would be approximately the same as the Proposed RMP. This alternative, like the Proposed RMP, would reduce the long-term impacts of noxious and invasive weeds through vegetation treatments, but this would likely be offset by the increased probability of weed establishment and spread following major wildland fire events. With the increase in use of off-highway vehicles in designated special recreation management areas and special recreation permit areas, the potential spread of weeds would increase. Monitoring measures would be implemented to ensure containment of any outbreaks.

Alternative D

Impacts from Noxious and Invasive Weed Management Actions. With the prohibition of use of selected herbicides, such as the sulfonylurea group and other acetolactate synthase inhibitors, as proposed under Alternative D, it is anticipated that there would be an increase in invasive-dominated areas in the planning

4.0 ENVIRONMENTAL CONSEQUENCES

area due to the lack of an effective control method. For example, the sulfonylurea herbicides are highly effective tools for the reduction of hoary cress, tall whitetop, and Russian knapweed. Overall weed control costs would be reduced under Alternative D in the short term, but would escalate dramatically in the long term because of the higher probability of intense fire events and more limited rehabilitation practices.

Impacts from Other Programs. Noxious and invasive weed impacts as a result of special status species, special designations, and health and safety would be similar to those described for the Proposed RMP.

Vegetation. Weed treatment after fire use would minimize the potential for invasion and spread of noxious and invasive species within burned areas in the short term. After several years of weed treatment and revegetation, perennial plant cover would be adequately established, which would minimize invasion by noxious and invasive species.

Wild Horses. Wild horses would be managed in the same 24 herd management areas as in Alternative A, but populations would be uncontrolled in these areas. It is expected that the increasing herds would lead to vegetation deterioration and increased vulnerability of these areas to establishment and spread of noxious and invasive species.

Lands and Realty. This alternative would require no net loss of public lands, reducing the amount of disposal and subsequent development. This also would reduce the spread of weeds. No additional corridors would be designated and this limitation would reduce the spread of weeds.

Renewable Energy. Renewable energy projects would not be authorized under this alternative so effects from such development would not occur.

Travel Management and Off-highway Vehicle Use. This alternative would effectively close the decision area to off-highway vehicle use except on maintained roads and trails, a substantially lower level of authorized use than in the other alternatives. This would reduce the likelihood of weed spread through use of off-highway vehicles.

Recreation. Allowable recreation uses under Alternative D would not include any off-road vehicle races, thereby reducing the likelihood of weed spread through such events and the associated traffic.

Livestock Grazing. No livestock grazing would be permitted, thus removing livestock use not only as a weed vector, but also as a useful management tool in selected settings to control particular weed species or to help incorporate seeds into the soils of areas being rehabilitated.

Forest/Woodland and Other Plant Products. Harvest of forest and woodland products would be limited to pinyon pine nuts by American Indians, thus effects regarding potential spread of invasive species would be minimal.

Geology and Minerals Extraction. The entire planning area would be closed to development of leasable minerals and mineral materials entry. Approximately 5 million acres would be open to locatable mineral

4.21 Noxious and Invasive Weed Management

entry, approximately 50 percent less than in the reasonably foreseeable development scenario (see Section 4.18). Overall, the total disturbance from mineral development actions would be approximately 3,700 acres in contrast to the 17,100 acres in the Proposed RMP. Therefore, the impacts from minerals development, as described in the Proposed RMP, would be much less in Alternative D than in the Proposed RMP.

Fire Management. Fire management would include no suppression of wildland fire except for human-caused and those that threaten life and/or property. Over the long term, this would result in larger wildland fires, increasing the expansion of invasive species.

Special Designations. No ACECs would be designated under this alternative and any potential effects associated with such designation would be eliminated.

Conclusion. Weed management would involve exclusion of some groups of herbicides. This would effectively reduce the capability to control several weed species and increase impacts associated with noxious and invasive weeds. In the short-term, the reduction in discretionary activities that serve as vectors for weed dispersal may temporarily reduce the rate of spread for existing populations and the rate of introduction for new species. However, since very few fires would be suppressed, the spread of noxious and invasive weeds throughout the planning area would likely be accelerated in both the short and long term. Once this occurred, the control of noxious and invasive species would not be attainable. Thus, the combination of weed management actions with other program actions under this alternative is not expected to reduce the rate of spread of noxious and invasive weeds in the long term, and, thus, would fail to meet the program goal.

4.22 Special Designations

Existing and nominated ACECs that met relevance and importance were analyzed in relationship to each of the alternatives (see **Table 4.22-1**).

Impact Issues

Special designation areas are designated based on relevance and importance and contain resources that require special management to preserve their values. The primary impact issue associated with special designation areas is whether the management prescriptions identified for a designated area will in fact protect and preserve its unique and sensitive values.

Assumptions for Analysis

None.

Interactions with Other Programs

The special designations management program would not be affected by the management actions of most other resource programs. Since special designation areas require special management to preserve their values, management prescriptions would be developed that preempt the management actions of other programs as necessary. Initial management prescriptions are presented in Chapter 2.0, and after completion and approval of the RMP, they would be expanded in individual special designation area management plans. Interactions with the lands and realty, fire management, and noxious and invasive weed management programs will be discussed in this section.

Goal

Evaluate areas of interest for special designation and appropriately manage those areas that meet necessary requirements.

Objective

To ensure that multiple use activities within the planning area are consistent with the management plans developed for special designation areas such as ACECs.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation

**Table 4.22-1
Consideration by Alternative of Nominated ACECs that Meet Relevance and Importance**

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
ROCK ART							
Alamo Pictograph Site	480 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Ash Springs (Pahranaगत Rock Art)	160 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Detailed management actions designed to protect rock art are part of the Proposed RMP and Alternatives B, C, and D and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Black Canyon (Pahranaगत Rock Art)	400 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Christmas Wash (Snake Range Rock Art)	1,920 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. This area currently is protected by its location within a designated wilderness, which limits access. The wilderness management plan for this area would address cultural values. Further, under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-2

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Crystal Wash (Pahrnagat Rock Art)	1,440 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Detailed management actions designed to protect rock art are part of the Proposed RMP and Alternatives B, C, and D and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Evergreen Flat (Pahrnagat Rock Art)	960 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Rock art resources are and would be protected because of their location within the existing Kane Springs ACEC, which is recommended to be retained as an ACEC in the Proposed RMP and Alternatives A, B, and C. The Kane Springs ACEC Management Plan would address rock art resources. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, no ACEC designation for rock art is proposed because unwanted public attention to this relatively unknown area could result in damage to the resource.				
Frenchy Flat (Pahrnagat Rock Art)	220 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Hell's Half Acre (Pahrnagat Rock Art)	320 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-3

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Hiko Canyon (Pahranagat Rock Art)	15 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Honeymoon Hill/ City of Rocks	3,900 to 5,900 acres	Rock art	3,900 acres	0 acres	3,900 acres	5,900 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Alternative C proposes the largest ACEC in order to protect the cultural values within this commodity-oriented alternative. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Moriah Site (Pahranagat Rock Art)	640 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Mount Irish	15,100 to 26,200 acres	Rock art	15,100 acres	0 acres	26,200 acres	26,200 acres	0 acres
			This potential ACEC includes the Mount Irish Archeological District. Under Alternative A, this is not an existing ACEC. Even though 15 percent of the nominated area lies within designated wilderness, special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. The wilderness management plan for this area would address cultural values within the designated wilderness. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Negro Creek (Snake Range Rock Art)	560 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Pahroc Rock Art	3,200 acres	Rock art	2,400 acres	0 acres	3,200 acres	3,200 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Even though 30 percent of the nominated area lies within designated wilderness, the rock art location is not within the designated wilderness; therefore, special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. The wilderness management plan for this area would address additional cultural values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Six Mile Flat (Pahrnagat Rock Art)	2,160 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Shooting Gallery	20,700 acres	Rock art	15,600 acres	0 acres	20,700 acres	20,700 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Tunnel Canyon	200 acres	Fremont Pictographs	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-5

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Weepah Spring (Pahranagat Rock Art)	5,120 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art are part of these alternatives and provide sufficient protection for the relevant and important values. This area currently is protected by its location within a designated wilderness, which limits access. The wilderness management plan for this area would address rock art resources. Further, under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
White River Narrows (Pahranagat Rock Art)	8,960 acres	Rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Detailed management actions designed to protect rock within this national register district are part of the Proposed RMP and Alternatives B, C, and D and would provide sufficient protection for the relevant important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
OTHER ARCHAEOLOGICAL RESOURCES AND HISTORIC PRESERVATION							
Baker Archeological Site	80 acres	Fremont habitation site	80 acres	0 acres	80 acres	80 acres	0 acres
			Under Alternative A this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Bennett Springs	520 acres	Historic landscape	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect historic trails are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management. A higher visual resource management class is being assigned to this area through this RMP to protect the landscape under the Proposed RMP and Alternatives B, C, and D.				

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Bristol Wells	400 acres	Historic mining town and cemetery	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Criteria for protection of historic mining towns and cemeteries in the Proposed RMP and Alternatives B, C, and D provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Carbonari Sites	21,279 acres	Scattered charcoal production sites	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, these are not existing ACECs. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to these relatively unknown areas, which could result in damage to the resource. Detailed management actions designed to protect historic mining are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Delamar	4,160 acres	Historic mining town	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Criteria for protection of historic mining towns and cemeteries in the Proposed RMP and Alternatives B, C, and D and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Garrison Archeological Site	160 acres	Fremont Village	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect formative Puebloan sites are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-7

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Gleason Canyon and Panaca Charcoal Kilns	4,000 acres	Charcoal kilns	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. A recreation project plan to be written under the Proposed RMP and Alternatives B, C, and D would address these values and preclude the need for special management through an ACEC. Detailed management actions designed to protect historic mining are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Goshute Lake	18,360 acres	Paleo-Indian site	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to these relatively unknown areas, which could result in damage to the resource. Detailed management actions designed to protect Paleo-Indian sites are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Hendry's Creek/Rock Animal Corral	3,300 acres	Archeological site	3,650 acres	0 acres	3,300 acres	3,300 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Jake's Valley Paleo Shoreline	19,209 acres	Paleo-Indian site	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect Paleo-Indian sites are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.0 ENVIRONMENTAL CONSEQUENCES

4.22-8

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Mahoney Canyon Jasperoid Source	200 acres	Tool stone quarry	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect tool-stone sources or quarries are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Modena Obsidian Source	13,260 acres	Obsidian source	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect tool-stone sources or quarries are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Mormon Peak Caves, Mormon Mountains, and Mormon Peak	123,000 acres	Extensive archaeological resources	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect rock art, rockshelters, and cave sites are part of these alternatives and provide sufficient protection for the relevant and important values. The cultural values are currently protected by their location within a designated wilderness, which limits access. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Osceola and Osceola Ditch	14,600 acres	Historic town and ditch	0 acres	0 acres	14,600 acres	14,600 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-9

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Park Range Aboriginal Sites	42,154 acres	High altitude aboriginal sites	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect prehistoric complex are part of these alternatives and provide sufficient protection for the relevant and important values. Currently this area is protected by its location within a wilderness study area and physical access is extremely difficult. Both of these reasons limit access to the area. Further, under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Rose Guano Bat Cave	40 acres	Historic guano mine and cave, wildlife	40 acres	0 acres	40 acres	40 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Sawmill Canyon	9,920 acres	Historic timber operations and rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect historic mining and rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Snake Creek Indian Burial Cave	40 acres	Archeological resource and cave, zooarchaeological	40 acres	0 acres	40 acres	40 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Stateline Canyon Graveyard (Rice Family Cemetery)	10 acres	Historic graveyard	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Detailed management actions designed to protect historic cemeteries and isolated gravesites are part of the Proposed RMP and Alternatives B, C, and D and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Sunshine Locality National Register District	34,540 acres	Paleo-Indian site	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect Paleo-Indian sites are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Tempiute Obsidian Source	29,767 acres	Obsidian source	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Detailed management actions designed to protect tool-stone sources or quarries are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Tri-County Paleo Site	19,967 acres	Paleo-Indian site	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect Paleo-Indian sites are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-11

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Upper Meadow Valley Archeological Zone	980 acres	Prehistoric camp sites and rock art	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call more unwanted public attention to this known site, which could result in damage to the resource. Detailed management actions designed to protect prehistoric camp sites and rock art are part of these alternatives and provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Ward Mining District	2,500 to 11,000 acres	Historic mining area	0 acres	0 acres	11,000 acres	3,000 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Acreages vary by alternative as do management prescriptions. Management prescriptions are very restrictive for Alternative C in order to protect the cultural values from actions occurring in Alternative C. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
DESERT TORTOISE HABITAT							
Beaver Dam Slope ACEC	36,900 acres	Desert tortoise habitat	36,900 acres	36,900 acres	36,900 acres	36,900 acres	0 acres
			This is an existing ACEC under Alternative A and about half is within designated wilderness. Special management attention is required and designation would be retained for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Kane Springs ACEC	65,900 acres	Desert tortoise habitat	57,190 acres	57,190 acres	57,190 acres	57,190 acres	0 acres
			This is an existing ACEC under Alternative A and about half is within designated wilderness. Special management attention is required and designation would be retained for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Mormon Mesa ACEC	109,700 acres	Desert tortoise habitat	109,700 acres	109,700 acres	109,700 acres	109,700 acres	0 acres
			This is an existing ACEC under Alternative A and about half is within designated wilderness. Special management attention is required and designation would be retained for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
PALEONTOLOGICAL RESOURCES							
Andy's Mine Trilobites	100 acres	Trilobites	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Criteria for protection of paleontological resources in the Proposed RMP and Alternatives B, C, and D provide sufficient protection for the relevant and important values. A recreation project plan to be written under the Proposed RMP and Alternatives B, C, and D would manage the use of all trilobite areas and preclude the need for special management through an ACEC. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Chisholm Mine Trilobite Area	160 acres	Trilobites	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Criteria for protection of paleontological resources in the Proposed RMP and Alternatives B, C, and D provide sufficient protection for the relevant and important values. A recreation project plan to be written under the Proposed RMP and Alternatives B, C, and D would manage the use of all trilobite areas and preclude the need for special management through an ACEC. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Oak Springs Summit Trilobite Trail	40 acres	Trilobites	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Criteria for protection of paleontological resources in the Proposed RMP and Alternatives B, C, and D provide sufficient protection for the relevant and important values. A recreation project plan to be written under the Proposed RMP and Alternatives B, C, and D would manage the use of all trilobite areas and preclude the need for special management through an ACEC. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-13

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Ruin Wash and Klondyke Gap	160 acres	Fossil location	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Criteria for protection of paleontological resources in the Proposed RMP and Alternatives B, C, and D provide sufficient protection for the relevant and important values. A recreation project plan to be written under the Proposed RMP and Alternatives B, C, and D would manage the use of all trilobite areas and preclude the need for special management through an ACEC. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
GEOLOGIC RESOURCES							
Cave Valley Cave Geologic Area	40 acres	Cave resources	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Management under the existing District Cave Management Plan precludes the need for special management through an ACEC for all the alternatives. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Garnet Hill	1,210 acres	Rock hounding for garnets	0 acres	0 acres	0 acres	1,210 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for Alternative C in order to protect the geologic and rockhounding values within this commodity-oriented alternative. Special management attention is not required to protect rockhounding values for the Proposed RMP and Alternative B. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Leviathan Cave Geologic Area	160 acres	Cave resources	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Management under the existing District Cave Management Plan precludes the need for special management through an ACEC for all the alternatives. The cave is located within a designated wilderness. The wilderness management plan for this area would address cave resources. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Whipple Cave Geologic Area	160 acres	Cave resources	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Management under the existing District Cave Management Plan precludes the need for special management through an ACEC for all the alternatives. The cave is located within a designated wilderness. The wilderness management plan for this area would address cave resources. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
SCENIC VALUES							
Blue Mass Scenic area	950 acres	Spectacular rock spires and scenic pastoral setting	950 acres	0 acres	950 acres	950 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Under the Proposed RMP and Alternatives B and C, the special management attention required would be through management as an ACEC instead of the existing scenic area. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Mount Grafton and North Creek Scenic Areas	16,100 acres	Scenic limestone outcrops and vegetation	13,200 acres	0 acres	16,100 acres	16,100 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Under the Proposed RMP and Alternatives B and C, the special management attention required would be through management as an ACEC instead of the existing scenic area. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Rainbow Canyon	45,827 acres	Scenic volcanic gorge	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. The proposed back country byway in the Proposed RMP and Alternative C precludes the need for special management in these alternatives. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management. A higher visual resource management class is being assigned to this area through this RMP to protect the landscape under the Proposed RMP and Alternatives B, C, and D.				
FLORA							
Heusser Bristlecone Research Natural Area	480 acres	Bristlecone pine	480 acres	0 acres	480 acres	480 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management. This area is a wilderness study area because of its instant study area status.				

4.22-15

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Park Range Pristine Meadows	1,280 acres	Pristine meadows	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. ACEC designation under the Proposed RMP and Alternatives B, C, and D would call unwanted public attention to this relatively unknown area, which could result in damage to the resource. Currently this area is protected by its location within a wilderness study area and physical access is extremely difficult. Both of these reasons limit access to the area. Further, under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Pygmy Sage Research Natural Area	160 acres	Pygmy Sage	0 acres	0 acres	0 acres	160 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for Alternative C in order to protect this pygmy sage research natural area within this commodity-oriented alternative. Special management attention is not required to protect pygmy sage for the Proposed RMP and Alternative B. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Scarlet Buckwheat-White Rock	640 acres	BLM sensitive plant species	640 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management is required for the Proposed RMP to protect the relevant and important values.				
Schlesser Pincushion	6,470 acres	Schlesser pincushion cactus	6,470 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management is required for the Proposed RMP to protect relevant and important values.				
Shoshone Ponds Natural Area	1,240 acres	Rocky Mountain juniper (swamp cedar) in alkali valley soils. Ponds with endangered fish	1,240 acres	0 acres	1,240 acres	1,240 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management. This area is a wilderness study area because of its instant study area status.				

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Swamp Cedar Natural Area	3,200 acres	Rocky Mountain juniper (swamp cedar) in alkali valley soils, cultural	3,200 acres	0 acres	3,200 acres	3,200 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management. This area is a wilderness study area because of its instant study area status.				
White River Valley	15,600 acres	BLM sensitive plant species and two sensitive butterflies	15,600 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management is required under the Proposed RMP to protect the relevant and important values.				
FAUNA							
All remaining Greater sage-grouse and pygmy rabbit habitat	Approximately 5 million acres	Greater sage-grouse and pygmy rabbit habitat	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Under all the alternatives, the BLM is directed by bureau policy to prevent listing of BLM and state sensitive species. All of the alternatives provide for appropriate management of greater sage-grouse and pygmy rabbit habitats. The plan includes numerous standard operating procedures identified in the appendices to protect special status species. This would provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Baking Powder Flat	13,000 acres	Baking Powder Flat blue butterfly	13,640 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management is required under the Proposed RMP to protect the relevant and important values.				

4.22-17

4.22 Special Designations

Table 4.22-1 (Continued)

Pine (Ridge) Creek	2.5 miles on public land	Bonneville cutthroat trout	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Under all the alternatives, the BLM is directed by bureau policy to prevent listing of BLM and state sensitive species. This would provide sufficient protection for the relevant and important values. The plan includes numerous standard operating procedures identified in the appendices to protect special status species. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
Steptoe Valley Crescentspot	1,940 acres	BLM and state sensitive species butterfly	1,940 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management is required for the Proposed RMP to protect the relevant and important values.				
Turnley Spring	41 acres	Cold spring system containing <i>Pygulopsis cruciglans</i>	0 acres	0 acres	0 acres	0 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Under all the alternatives, the BLM is directed by bureau policy to prevent listing of BLM and state sensitive species. The plan includes numerous standard operating procedures identified in the appendices to protect special status species. This would provide sufficient protection for the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				
RIPARIAN/SPECIAL STATUS SPECIES							
Condor Canyon	6,900 acres	Riparian and special status species, cultural	4,500 acres	0 acres	6,900 acres	6,900 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

4.22-19

4.22 Special Designations

Table 4.22-1 (Continued)

Nominated ACEC by Category	Acres/Miles of Public Land in Nomination ¹	Primary Resource Value	Management Considerations and Proposed Designations for ACECs				
			Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D
Goshute Canyon Natural Area	7,550 acres	Riparian and special status species and cave	7,100 acres	0 acres	7,100 acres	7,100 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management. This area is a wilderness study area because of its instant study area status.				
Lower Meadow Valley Wash	39,000 acres	Riparian and special status species	25,000 acres	0 acres	39,000 acres	39,000 acres	0 acres
			Under Alternative A, this is not an existing ACEC. Special management attention is required for the Proposed RMP and Alternatives B and C to protect the relevant and important values. Under Alternative D, the restrictions on resource management and permitted uses preclude the need for special management.				

¹ Nomination acreages have been rounded and, in some cases, represent approximate totals of combined sub-areas. The nomination acreages may differ from the acreages proposed for designation under each alternative if portions of the nominated area failed to meet the relevance and importance criteria or failed to require additional management protection.

measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Special Designations Management Actions.

Parameter – Areas of Critical Environmental Concern

Under the Proposed RMP, the three existing desert tortoise ACECs would be retained and 17 new ACECs would be designated. The proposed ACECs were determined to meet the relevance and importance criteria and would require special management in order to protect the resource values. The boundaries of the ACECs enclose a sufficient area to protect the sensitive resources for which the ACEC is proposed. Implementation of the special management prescriptions within the proposed ACECs (as detailed in Section 2.4.22.1) would result in additional resource protection on approximately 317,800 acres within the decision area. This protection is beyond what could be afforded by the other management actions contained in the Proposed RMP.

Parameter – Back Country Byways

One existing (Mount Wilson) and two new (Rainbow Canyon and Silver State Trail) Back Country Byways would be designated, offering additional opportunities for scenic drives. However, such designations would increase the public's awareness of these areas and subsequently the amount of use they receive. Depending on the type of use (e.g., highway vehicle, off-highway vehicle), there would be increased degradation of the routes and increased need for maintenance. Some users would welcome the increased recreation opportunities these designations provide, while others may see the designations resulting in an increase in user impacts and a decrease in the solitude they have experienced previously in these areas.

Parameter – Designated Wilderness

Designated wilderness would be managed effectively under existing laws, regulations, policies, and plans. Direction from these sources is sufficient to manage designated wilderness resources, and no additional management actions are presented in the Proposed RMP.

Parameter – Wilderness Study Areas

Wilderness study areas would be managed under the BLM's Interim Management Policy for Lands Under Wilderness Review to preserve the wilderness characteristics of the area until Congress has made a decision on wilderness designation. Implementation of this policy has proven to be effective in protecting wilderness values.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Other Special Designations

Retention of the White River Narrows Archaeological District and the Garnet Hill Rock Hounding Area would protect the resources in and public uses of these areas. The eight areas dropped from special designations would continue to be managed by the Ely Field Office to protect the resources and uses for which the areas were formerly designated.

Impacts from Other Programs. Other resource programs typically do not affect special designations. Special designation areas typically are used to protect an area from land use planning decisions in other programs. The following impacts associated with other program management actions have been identified.

Lands and Realty. The management prescriptions in Section 2.4.22 identify certain ACECs as "avoidance areas" for rights-of-way. This means that the granting of rights-of-way for low-disturbance facilities such as communication lines could be allowed. Each project would be reviewed on a case-by-case basis to ensure that any impacts from a right-of-way would be acceptable given the resource constraints for which the special designation was made.

Fire Management. Fire suppression activities may require cross-country travel across ACECs or along Back Country Byway routes, resulting in surface disturbance and potentially impacts to the resources for which the special designations were made. While such impacts will be avoided if at all possible, the unique characteristics of a wildland fire may make them unavoidable.

Noxious and Invasive Weed Management. Management actions may be needed in special designation areas to control noxious or invasive weed infestations. Precautions would be taken in developing and implementing weed control plans to ensure that these activities do not impact the resources for which the special designation was made.

Conclusion. Approximately 317,800 acres would be designated as three existing and 17 new ACECs. Management prescriptions would protect the relevant and important values in these ACECs. Opportunities for scenic drives would be created through the designation of one existing and two new back country byways, though there may be some decrease in solitude in these areas. The Proposed RMP would meet the goal for the special designations program.

Alternative A

Impacts from Special Designations Management Actions.

Parameter – Areas of Critical Environmental Concern

Under Alternative A, the three existing desert tortoise ACECs would be retained. The boundaries of these ACECs, developed in coordination with the U.S. Fish and Wildlife Service, enclose a sufficient area to protect desert tortoise. Implementation of the special management prescriptions within the ACECs (as detailed in Section 2.5.22.1) would result in resource protection on approximately 203,670 acres within the decision area. This protection is beyond what could be afforded by the other management actions contained

4.22 Special Designations

in the Proposed RMP. However, no protection would be afforded to the other sites nominated as ACECs and found to meet the relevance and importance criteria for ACECs (see Appendix D).

Parameter – Back Country Byways

Under Alternative A, the Mount Wilson Back Country Byway would be retained. Impacts from this retention are discussed under the Proposed RMP.

Parameter – Designated Wilderness

Under Alternative A, management of designated wilderness would be the same as discussed for the Proposed RMP.

Parameter – Wilderness Study Areas

Under Alternative A, impacts to wilderness study areas would be the same as discussed for the Proposed RMP.

Parameter – Other Special Designations

Under Alternative A, the 23 existing special designation areas identified in Section 2.5.22 would be retained. No new special designation areas would be designated under this alternative. Management of these areas would continue to focus on resource protection.

Impacts from Other Programs. Other resource programs typically do not affect special designations. Special designation areas typically are used to protect an area from land use planning decisions in other programs. Under Alternative A, special designation impacts associated with lands and realty, fire management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP.

Conclusion. Approximately 203,670 acres would be designated as three existing ACECs. Management prescriptions would protect the relevant and important values in these ACECs. However, no other nominated areas would be designated as ACECs, and no back country byways would be designated. These management actions would not protect the resource values deemed relevant and important nor provide the benefits of designated scenic drives. Alternative A would not meet the goal for the special designations program.

Alternative B

Impacts from Special Designations Management Actions.

Parameter – Areas of Critical Environmental Concern

Under Alternative B, the three existing desert tortoise ACECs would be retained and 15 new ACECs would be designated. The proposed ACECs were determined to meet the relevance and importance criteria and would require special management in order to protect the resource values. The boundaries of the ACECs enclose a sufficient area to protect the sensitive resources for which the ACEC is proposed. Implementation of the special management prescriptions within the designated ACECs (as detailed in Section 2.6.22.1)

4.0 ENVIRONMENTAL CONSEQUENCES

would result in additional resource protection on approximately 338,000 acres within the decision area. This protection is beyond what could be afforded by the other management actions contained in the Proposed RMP.

Parameter – Back Country Byways

Under Alternative B, the Silver State Trail Back Country Byway would be designated. Impacts from this designation are discussed under the Proposed RMP.

Parameter – Designated Wilderness

Under Alternative B, management of designated wilderness would be the same as discussed for the Proposed RMP.

Parameter – Wilderness Study Areas

Under Alternative B, impacts to wilderness study areas would be the same as discussed for the Proposed RMP.

Parameter – Other Special Designations

Under Alternative B, impacts to other special designations would be the same as discussed for the Proposed RMP.

Impacts from Other Programs. Other resource programs typically do not affect special designations. Special designation areas typically are used to protect an area from land use planning decisions in other programs. Under Alternative B, special designation impacts associated with lands and realty, fire management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP.

Conclusion. Approximately 338,000 acres would be designated as three existing and 15 new ACECs. Management prescriptions would protect the relevant and important values in these ACECs. Opportunities for scenic drives would be created through the designation of one new back country byway (the Silver State Trail), though there may be some decrease in solitude in this area. The benefits of designating two additional byways would not be realized. Alternative B would meet the goal for the special designations program.

Alternative C

Impacts from Special Designations Management Actions.

Parameter – Areas of Critical Environmental Concern

Under Alternative C, the three existing desert tortoise ACECs would be retained and 17 new ACECs would be designated. The proposed ACECs were determined to meet the relevance and importance criteria and would require special management in order to protect the resource values. The boundaries of the ACECs enclose a sufficient area to protect the sensitive resources for which the ACEC is proposed. Implementation of the special management prescriptions within the designated ACECs (as detailed in Section 2.7.22.1)

4.22 Special Designations

would result in additional resource protection on approximately 333,400 acres within the decision area. This protection is beyond what could be afforded by the other management actions contained in the Proposed RMP.

Parameter – Back Country Byways

Under Alternative C, the Silver State Trail Back Country Byway would be designated. Impacts from this designation are discussed under the Proposed RMP.

Parameter – Designated Wilderness

Under Alternative C, management of designated wilderness would be the same as discussed for the Proposed RMP.

Parameter – Wilderness Study Areas

Under Alternative C, impacts to wilderness study areas would be the same as discussed for the Proposed RMP.

Parameter – Other Special Designations

Under Alternative C, impacts to other special designations would be the same as discussed for the Proposed RMP.

Impacts from Other Programs. Other resource programs typically do not affect special designations. Special designation areas typically are used to protect an area from land use planning decisions in other programs. Under Alternative C, special designation impacts associated with lands and realty, fire management, and noxious and invasive weed management activities would be the same as described for the Proposed RMP.

Conclusion. Approximately 333,400 acres would be designated as three existing and 20 new ACECs. Management prescriptions would protect the relevant and important values in these ACECs. Opportunities for scenic drives would be created through the designation of one new back country byway (the Silver State Trail), though there may be some decrease in solitude in this area. The benefits of designating two additional byways would not be realized. Alternative C would meet the goal for the special designations program.

Alternative D

Impacts from Special Designations Management Actions.

Parameter – Areas of Critical Environmental Concern

Under Alternative D, no ACECs would be retained or designated. Even though minimal discretionary activities would be authorized under other resource programs, the sensitive resources contained within the nominated ACECs, especially the three existing desert tortoise ACECs, could be affected by activities within the planning area.

4.0 ENVIRONMENTAL CONSEQUENCES

Parameter – Back Country Byways

Under Alternative D, the Mount Wilson Back Country Byway would be retained. Impacts from this retention are discussed under the Proposed RMP.

Parameter – Designated Wilderness

Under Alternative D, management of designated wilderness would be the same as discussed for the Proposed RMP.

Parameter – Wilderness Study Areas

Under Alternative D, impacts to wilderness study areas would be the same as discussed for the Proposed RMP.

Parameter – Other Special Designations

Under Alternative D, none of the current special designation areas would be retained. With the minimal activity allowed under discretionary management programs, few impacts to the sensitive resources in the special designation areas would be anticipated from other uses.

Impacts from Other Programs. Under Alternative D, no special designations would be retained and no new areas would be designated. Since most discretionary activities associated with other programs would not be authorized, special designations were not considered necessary as part of this alternative. However, approximately 12,400 acres would be available for disposal, and approximately 5 million acres (50 percent on the decision area) would remain open to locatable minerals. Development of disposed lands and locatable mineral resources could impact resources in areas considered for special designations.

Conclusion. Under Alternative D, all special designations except designated wilderness and wilderness study areas would be eliminated, but with minimal activity allowed under other management programs, few impacts to the sensitive resources would be anticipated from other uses. Nevertheless, no special management or protect would be afforded to areas nominated for ACEC designation, and potential benefits to visitors from back country byway designation (other than the Mount Wilson Back Country Byway) would not be realized. Alternative D would not meet the goal for the special designations program.

4.23 Economic Conditions

Impact Issues

The primary economic and social issue is the relationship between the management of public lands and the support provided for local economic and community development.

Issues of specific economic and social concern to individuals, the state and local governments, and groups include the potential impacts of grazing on farm income and local economies, the impacts of future management on the economic stimulus derived from outdoor recreation, such as hunting, fishing, off-highway vehicle use, and tourism, and access to and use of public lands for various other purposes. Local governments also are concerned about land and realty actions that result in net losses in the amounts of private land in the region, and along with tribal governments, programs that unduly limit possible land disposal viewed as essential for future economic and community development. Local governments also are concerned about potential fiscal impacts of changes in land tenure/ownership on local tax revenues and demands for services, payments in lieu of taxes and impacts on population that also affect the latter. Concerns over the impacts of wildland fires on residents, property, and local fire suppression capabilities and associated budgets also are evident.

Assumptions for Analysis

A premise underlying Alternative A is that continuation of past and ongoing trends in watershed, vegetation, and related environmental conditions would result in continued deterioration in ecological system health in the Great Basin and planning area. Implied therein is a continued risk of frequent and potentially large-scale wildland fires across the planning area. A possibility exists that the combined effects of continued deterioration in ecological system health and the consequences of wildland fire could precipitate one or more ecological threshold conditions being reached within the foreseeable future, say, 50 years, whereby some watersheds lose their remaining functionality, triggering statutory management responses, protections, or recovery programs (e.g., protections under the Endangered Species Act). In turn, those responses and protections, may constrain the Ely Field Office's capacity to manage the planning area effectively for multiple-use and sustained yield to meet a broad spectrum of the needs of present and future generations. To the extent that statutory management responses or protections emphasize wildlife, vegetation, and air and water quality, a possible implication of such responses is restrictions on other uses, including recreation, grazing, possible land disposal, and mineral development. Over the long-term, the cumulative effects of wildland fire also could result in use restrictions, degraded water quality, or reduced commodity production that contribute to the regional economy. Over the long term, such effects have potentially far-reaching social and economic implications, both within and outside the planning area.

All alternatives assume increased funding for the Ely Field Office to implement watershed analysis and ecological system restoration activities. That funding would be over and above the Ely Field Office's base funding and future expenditures associated with wildland fire suppression. The amount of funding varies by alternative. Some of the additional funding could flow through to cooperating federal, state, and local

4.0 ENVIRONMENTAL CONSEQUENCES

government entities, but no specific assumptions about the monetary sums or timing of such flow-through arrangements were developed for this analysis.

Additional assumptions used in this analysis include:

- Under all alternatives, the additional funding for watershed analysis and treatment plans is assumed to be allocated 15 percent to Ely Field Office staff and operating costs and 85 percent for contracted services to be provided by the private sector, state and local governments, universities, or quasi-public non-governmental organizations. The actual allocation and distribution among entities would vary over time.
- The same lands would not necessarily be subject to watershed analysis and treatment plans in any given year.
- The Proposed RMP seeks a balanced management approach accelerating the rate of ecological restoration, while supporting recreation use, commodity production, and support for community and economic development across the planning area. Available funding of \$10 million per year, over and above the future base funding for the Ely Field Office, plus the use of stewardship contracting is assumed to implement the Proposed RMP.
- Alternative A assumes \$500,000 in annual funding for watershed analysis and treatment plans.
- Alternative B emphasizes restoration of at-risk resources, increasing the rate at which the ecological health of public lands within the planning area is evaluated and treatment plans developed and implemented. Alternative B assumes \$10 million in annual funding for the Ely Field Office to achieve accelerated watershed analyses, treatment, and restoration.
- Alternative C emphasizes actions to facilitate community and economic development within White Pine, Lincoln, and eastern Nye counties, through management to support responsible commercial activities including commodity production, recreation, hunting, and tourism. Alternative C assumes \$5 million in annual funding to accomplish the watershed evaluation process, and to formulate and implement management treatment plans and fuels/wildland fire risk reduction. Alternative C also would implement the use of stewardship contracting by the Ely Field Office to accelerate the pace of watershed restoration.
- Alternative D emphasizes the reduction of impacts to vegetation and restoration of properly functioning conditions across the planning area. Grazing and recreation use would be restricted to facilitate restoration and repopulation of wildlife species. Wildland fire management would include minimal fire suppression except to protect life and property. Assumed supplemental funding to implement Alternative D is \$500,000 per year above the Ely Field Office's base funding.
- The employment and personal income implications of the Ely Field Office operations, including the additional funding assumed for watershed analysis and treatment were estimated using the IMPLAN

economic model. IMPLAN is an economic input-output model originally developed by the U.S. Forest Service, subsequently privatized and enhanced. It is widely recognized and accepted in regional economic impact assessment. (For more information see the Minnesota IMPLAN Group, www.implan.com.) The economic effects resulting from long-term changes in ecological conditions and associated changes in outputs, future energy and mineral development, or land disposal actions under the management alternative were not assessed quantitatively using IMPLAN. Rather, a qualitative assessment was completed. The decision to forego the quantitative assessment reflects a lack of information regarding the timing, location, cost, responsiveness and magnitudes of changes achieved across the planning area under the proposed adaptive management processes and alternatives.

Interactions with Other Programs

The economic and social conditions within the planning area potentially would be affected by actions within all of the resource management programs stemming from their ties to individual, community, and societal economic and social well-being. However, the most direct linkages and potentials for affecting such conditions arise in conjunction with resource management activities in the water, vegetation, fish and wildlife, lands and realty, renewable energy, travel management and off-highway vehicle use, recreation, livestock grazing, forest/woodland and other plant products, geology and mineral extraction, and fire management resources and the agency's efforts involving coordination with American Indians and issues of particular concern to them. The primary linkages and interactions are described below.

Management activities affecting vegetation have multiple linkages to economic and social conditions because of the vegetation resource's ties to wildlife (hunting and outfitting), wildland fire risk (economic and social well-being), recreation (local businesses and individual quality of life), livestock grazing (the ranch economy), and plant products (personal and commercial use). The management of fish and wildlife resources also is linked to individual social values and quality of life, as well as income for guides, outfitters, and local trade and service establishments that cater to their operations.

Water resources, renewable energy, mineral development, and lands and realty share linkages to future short-term and long-term job opportunities and incomes, as well as the potential to affect the general community and economic development outlook for the region. Community development in particular, and its implications for population growth, demands for public services and local government fiscal conditions, would be affected by future real estate disposal actions. In turn, the amount, location, and timing of future development are factors in assessing the relative risks associated with fire management in the urban interface. Finally, the management of native plants is tied to the concerns of American Indians, both in terms of cultural significance and personal consumption.

Changes in travel and recreation resource management affect how, how many, and where individuals and groups access and use the public lands. The changes in use patterns have potential economic implications for businesses, communities, and local governments and quality of life and social well-being impacts on individuals, groups, and institutions.

4.0 ENVIRONMENTAL CONSEQUENCES

Unlike most other environmental resources, the RMP/EIS planning process does not include a resource program specifically focused on community economic and social conditions within the planning area. However, the vision statements for the Nevada BLM and the Ely Field Office (see Sections 1.3.2.1 and 1.3.2.2) include social and economic goals for the national, regional, and local communities. The assessment of potential impacts affecting the quality of the human environment, including economic and social conditions, is required under NEPA. The BLM is further required to consider such conditions and the potential impacts of its management actions on those conditions during the preparation of land use plans. The agency must manage public lands on the basis of multiple use and sustained yield to meet the needs of present and future generations (BLM Handbook H-1601-1, Appendix D). BLM regulations also mandate consideration of the consistency of the agency's land use plans with state and local government plans for the affected lands (see Section 1.9.1).

The linkages between local economic and social conditions and the resource programs, land use and management plans, and NEPA arise in the context of the range of program objectives and proposed management actions to achieve those objectives. Implementation of those techniques, or in some cases, the lack of implementation, can alter the existing public use, access, economic stimulus, land use, resource production, and other relationships between the public lands, their management and the local and non-local stakeholders. In turn, individual and community responses to the altered relationships may manifest themselves across a range of economic and social impacts. Therefore, impacts to economic and social conditions and environmental justice are not discussed in terms of individual program interactions but rather the entire proposed alternative.

Economic Conditions and Fiscal Linkages that Apply to All Alternatives

Economic Conditions. Both Lincoln and White Pine counties are engaged in active economic development efforts to attract new industrial development, promote the region's outdoor recreation and western heritage resources to tourists, and attract retirees to live in the area. Those economic development efforts seek additional jobs, income, maintenance and growth for residents, stabilization of county and community fiscal conditions, and enhance local economic diversity and sustainability. The latter objective derives in part from local awareness of the far-reaching shifts away from commodity-based rural economies, as well as the constraints to economic development imposed by the limited amount of privately owned land and corollary dependence on public lands and resources. While some future mineral development and associated short-term employment, population, and tax impacts likely would occur within the planning area, such activity likely would be short-term, repeating past cycles of relative growth and decline. As illustrated in **Table 4.23-1**, population projections, which generally mirror economic trends, call for modest growth in Lincoln County but substantial declines in White Pine County. Only minimal population changes are foreseen in the Nye County portion of the planning area. It should be noted that recent legislation (i.e., the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts) may make these population growth forecasts by the Nevada State Demographer's Office conservative.

**Table 4.23-1
Project Population Growth, 2000 to 2020**

Year	Lincoln County	White Pine County	Nevada
2000	4,178	9,033	2,018,723
2010	4,222	8,545	2,806,940
2020	5,006	7,445	3,412,147
Net Change	828	(1,588)	1,303,424
Compounded annual growth rate	0.9%	-1.0%	2.4%

Source: Nevada State Demographer's Office 2006.

The Lincoln County and White Pine County Conservation, Recreation, and Development Acts allow for the disposal of lands administered by the Ely Field Office within the planning area. A portion of the land disposed of could be used for residential development. For very general analysis purposes, it has been assumed that 27,900 dwelling units would be constructed on 18,600 acres in White Pine County and 86,100 dwelling units on 57,400 acres in Lincoln County. Since many of these dwelling units could have recreational or seasonal occupancy, it has been assumed that each dwelling unit would have one full-time resident. Further, it is assumed that the timeframe for this residential development would exceed the life of the Proposed RMP, something on the order of 50 years.

The economic trends that would interact with management of the planning area include:

- Long-term employment decreases in White Pine County and modest job gains in Lincoln County until land disposal is completed and subsequent development proceeds.
- All alternatives assume the Ely Field Office would proceed with land disposal under the Federal Land Transaction Facilitation Act, Lincoln County and White Pine County Conservation, Recreation, and Development Acts, and other approved mechanisms. No assumptions were developed regarding the geographic locations, specific parcels, acquiring parties, or timing of future land disposals. Disposed lands could be acquired by state, local, and tribal governments for public purposes; by private parties for economic development purposes; or by individuals for commercial, residential, or agricultural uses.
- The mix of future land use for disposed lands cannot be determined with current information. For this analysis, a general land use mix was developed for each alternative to illustrate future development potential. The base mix is: 25 percent open space, recreation, public or unbuildable due to topographic constraints; 5 percent industrial, commercial or office; 2.5 percent medium density residential (10 dwelling units per acre; 7.5 percent single family (6 dwelling units per acre); 15 percent low density single family (2 dwelling units per acre); 20 percent rural estate residential (1 dwelling unit per 2 acres); and 25 percent ranchettes (1 dwelling units per 20 acres). The base assumptions were adjusted to reflect a larger share of open space, recreation, public or unbuildable due to topographic constraints and ranchette development as the disposal acres increased, and lower shares of open space, recreation, public or unbuildable due to topographic constraints, industrial and commercial and medium density residential development as the total disposal acres of assumed disposal land declined. The resulting land use mix for each alternative is shown in **Table 4.23-2**.

4.0 ENVIRONMENTAL CONSEQUENCES

**Table 4.23-2
Assumed Use of Lands Disposed of in the Ely Planning Area**

	Lincoln County	White Pine County	Nye County
Proposed RMP			
Open Space, Recreation, Public or Topographically Constrained (unbuildable) (acres)	14,360	4,660	NA
Industrial or Commercial (acres)	2,870	930	NA
Residential (acres)	40,210	13,033	NA
Alternative A			
Open Space, Recreation, Public or Topographically Constrained (unbuildable) (acres)	180	6,110	1,360
Industrial or Commercial (acres)	180	1,220	580
Residential (acres)	3,220	17,108	1,953
Alternative B			
Open Space, Recreation, Public or Topographically Constrained (unbuildable) (acres)	16,590	5,970	100
Industrial or Commercial (acres)	3,320	1,190	40
Residential (acres)	46,469	16,724	144
Alternative C			
Open Space, Recreation, Public or Topographically Constrained (unbuildable) (acres)	60,940	26,450	1,360
Industrial or Commercial (acres)	10,160	4,410	580
Residential (acres)	132,021	57,309	1,951
Alternative D			
Open Space, Recreation, Public or Topographically Constrained (unbuildable) (acres)	-	2,740	NA
Industrial or Commercial (acres)	140	550	NA
Residential (acres)	1,295	7,668	NA

Notes:

- Residential acres include a mix of medium density multifamily (10 dwelling units/acre), single family (6 dwelling units/acre), low density single family (2 dwelling units/acre), rural/estate development (1 dwelling unit/2 acres) and ranchettes (1 dwelling unit/20 acres).
- Future development of lands involved in disposal actions is likely to extend beyond the life of this plan, particularly in the event of large scale disposal actions.

Source: Nevada State Demographer's Office 2006.

- Completion of the Lincoln County Land Act and Lincoln County and White Pine County Conservation, Recreation, and Development Acts land sales and subsequent development would trigger substantial increases in construction and other jobs in southern Lincoln County and White Pine County, as well as long-term population gains not reflected in current demographic forecasts for the region.
- Over the long term, development and population growth associated with land disposals associated with the three land acts would result in significant changes in fiscal conditions and demands on public facilities and services for affected local governments and school districts. The timing, magnitude and net impact of those changes is uncertain.
- Future mineral and energy development is likely to occur in the planning area. Two separate sponsors have announced preliminary feasibility studies for new electric generating stations in the vicinity of Ely. Construction of one, but not both, could reasonably be foreseen within the life of this plan. No other major projects are presently identified. Construction and operations of a power plant and other mineral and energy development projects would generate new jobs and economic activity not reflected in the

4.23 Economic Conditions

regional long-term forecasts. Such development would contribute to the local tax base, but also to demands on public facilities and services. The economic stimulus provided by project construction would be temporary, with the operational work forces contributing to the region's longer-term economic vitality and stability.

- Government employment, particularly state government, would serve a vital role in the economic foundations of Lincoln and White Pine counties.
- The planning area faces large-scale increases in recreation demand due to projected population gains in Nevada and surrounding states. Nevada, along with neighboring California, Utah, and Arizona, were among the fastest growing states between 1990 and 2000, collectively gaining over 7.1 million residents during the decade. Continued strong population growth is projected in those states through 2020. The combined population of the four states is projected to increase by nearly 15.8 million residents by 2020 (see Table 4.23-3).

Table 4.23-3
Projected Population for Nevada and Three Adjacent States from 2000 to 2020

Year	Nevada	Utah	California	Arizona	Four-state Total
2000	2,018,723	2,233,169	34,480,300	4,961,953	43,694,145
2020	2,910,959	3,371,071	45,821,900	7,363,604	59,467,534
Absolute Change	892,236	1,137,902	11,341,600	2,401,651	15,773,389
Percent Change	44	51	33	48	36

Sources: California Department of Finance, Arizona Department of Economic Security, Utah Governor's Office of Planning and Budget, Nevada Department of Taxation.

- In the short term, increasing demand would result in higher recreation use and associated increases in recreation spending and sales taxes, a portion of which accrue to local establishments and governments. The increased recreation pressure would be more concentrated in Lincoln County due to the proximity to Las Vegas and Interstate 15.
- Future recreation use may plateau over the long term as recreational access and use is limited across more of the planning area in response to environmental protection measures.
- Unemployment in White Pine County would remain above the statewide average under Alternative A until out-migration reestablishes a balance in the labor market.
- Tribal operations and the personal consumption expenditures of individual tribal members in the planning area would continue to provide support for the local retail and service sectors.
- Total personal income would decline in White Pine County as the numbers of jobs and residents decline, but increase slightly in Lincoln County. Average per capita incomes among working households

4.0 ENVIRONMENTAL CONSEQUENCES

in White Pine County may climb due to the large share of government jobs, but the overall average would decline due to the effects of the large inmate population on the computation of average income.

- Temporary increases in employment, income, and trade for local establishments would accompany the construction of transmission lines and pipelines, wildland fire suppression, and other activities that occur within the planning area, but these activities have few or no long-term economic manifestations.
- Construction and operation of a new electric generating station would result in more substantial temporary and long term economic, demographic and fiscal changes for White Pine County.
- Absent development stimulated by the three land disposal acts, the overall economic output of White Pine County would decline over the long term. The economic output of the Nye County portion of the planning area and of Lincoln County would see decreases in farm output tied to grazing. However, increases in other industrial sectors of Lincoln County's economy, tied to population and economic gains associated with recreation use and second home development, may offset those reductions.

Fiscal Linkages. Future land purchases, sales, disposals via other approved mechanisms, and exchanges under the Proposed RMP could affect the acreage of BLM-administered lands in the planning area. Each net acre of change would affect the entitlement acres for computing future payments in lieu of taxes in the respective counties affected by a land action. The reductions in entitlement acres are not material because population, rather than entitlement acreage, is the operative driver for computing those payments in the planning area. In other words, payments in lieu of taxes in the future would be a function of the size of the resident population. Thus, future receipts of payments in lieu of taxes in Lincoln County would remain relatively constant over time, absent development spawned by the Lincoln County Land Act and Lincoln County Conservation, Recreation, and Development Act. Based on projected baseline population growth, annual payment in lieu of tax payments to Lincoln County would increase by about \$22,000 over the next 20 years, but increase dramatically following any future development and corresponding growth spawned by disposals under the land acts. Payments in lieu of taxes in White Pine County would decrease by about \$86,000 annually as population declines, even as the allowable per capita payment increases, but also would increase following future development and population growth. Little change in payments in lieu of taxes payments to Nye County would be expected as a result of changes within the planning area.

Local fiscal linkages between the public lands managed by the Ely Field Office and local communities could be affected by land exchanges or federal land acquisitions in the region. Along with possible land disposals, such actions add or remove lands from the private tax rolls or incidentally affect other sources of revenues and expenditures. Such changes are likely to be relatively small initially, but increase over time. Local government expenditures for law enforcement and fire suppression could increase in response to the recreation and wildland fire management of the public lands. The added pressure on expenditures would not necessarily be accompanied by increases in federal revenues.

Impacts to the levels, mix, and location of future recreation use and tourism in the region would affect the levels of consumer spending and, thereby, future sales tax receipts. Given the anticipated increases in overall recreation use, future sales tax receipts would rise over time. White Pine County and Lincoln County

both may forego the full benefit of the increases by funding mechanisms in place at the statewide level that provide rural counties options to accept a guaranteed level of funding from a portion of the sales tax levy in exchange for foregoing revenues should receipts increase above that level. Local governments may opt out of the program, but such a decision is irrevocable. Hence, retail sales and sales tax receipts would need to increase dramatically and be expected to persist at those higher levels before local governments would choose to end their participation in the program. Those conditions might arise in the context of future development spawned by land disposals under the three recent land acts.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Economic Conditions. The direct and secondary impacts of the Proposed RMP on local employment opportunities and income would be an estimated 255 to 260 additional jobs and \$4.2 million in annual income over the next 20 years. Staffing levels for the Ely Field Office could expand by about 10 percent (11 to 14 jobs) with an estimated 239 to 244 jobs in the private and local public sectors.¹ Although funding for ecological restoration would be channeled through the Ely Field Office, the watershed analysis and treatment efforts, and hence, the employment opportunities and other associated economic benefits, would be dispersed across the planning area. Investment in restoration activities could spawn the establishment of specialized firms and services (e.g., native plant nursery) in the planning area, bringing added economic development to the region beyond the levels projected above. Implementation of stewardship contracting would yield additional new job opportunities. The initial creation of these jobs would lag the watershed analysis process, due to administrative, environmental compliance, and contract requirements. The number of supportable jobs is unknown.

The indirect economic consequences associated with the Proposed RMP with respect to promoting recreation use would alter the level, mix, and distribution of developed and dispersed recreation across the planning area. Dispersed, individual off-highway vehicle use would become more concentrated relative to current management but would likely continue to increase in magnitude. Developed recreation and use in conjunction with organized events also would increase. Future levels of big-game hunting may increase as expanding ranges and populations allow the Nevada Department of Wildlife to increase the number of tags issued. Stipulations on the issuance of outfitter and guide permits leave the total income generated by these

¹ These estimates reflect the default 15 percent BLM / 85 percent contracted services allocation of the additional restoration funds. Variances in allocations from the default assumption would result in some shifting of the employment impacts between the Ely Field Office and other entities, but the order of magnitude of the total job and income impacts would not be substantially different from the levels shown above.

4.0 ENVIRONMENTAL CONSEQUENCES

activities unaffected. Availability of forest/woodland products for personal and commercial use would be expanded over current management. There is no anticipated change in economic value of products involved. Livestock grazing would be available over the long term on approximately 11.2 million acres within the planning area, but subject to fluctuations necessitated by restoration initiatives, adjustments for ecological health, the creation of forage reserves, and achievement of other management objectives.

A wider array of lands would be available for industrial, commercial, residential, and agricultural uses under the Proposed RMP, with the assumed disposal of approximately 75,600 acres during the life of this plan. The timing, type, and extent of subsequent development would depend on the identification of viable markets, individuals, or companies with the expertise and financial resources to start and operate new businesses, and the capability of communities to foster and support such development. To the extent that such development occurs, it would contribute to local employment and income growth and provide a measure of economic diversity and sustainability across the planning area. Such development would boost short-term construction employment in the affected communities. Uncertainties regarding these factors preclude estimation of the indirect employment and income effects that could stem from the Proposed RMP. Full development of disposed lands would be unlikely to occur during the life of this plan.

The Proposed RMP would result in temporary restrictions on livestock grazing that could affect the incomes of operators whose grazing privileges would be displaced. Authorizations of temporary nonrenewable use and establishment of a forage reserve could reduce the impact on income. Additional allotments would be affected in the future due to related constraints regarding Rocky Mountain bighorn habitat. Over the long term, the Proposed RMP could have a net positive impact on grazing and local farm income, as compared to current management, in the event that some share of the gain in available forage is allocated to livestock and wild horses and that such gains are adequate to offset any long-term limitations on grazing associated with the proposed ACECs and special status species habitats. Otherwise, some long-term adverse effects on ranch income could result.

Allowing grazing permits to be relinquished and converted to forage reserves would have minimal effect on the economic and social structure of the counties in the planning area. It would not involve a large number of grazing permits or animal unit months in comparison to animal unit months authorized annually on the planning area. If the Tamberlaine Allotment were to be relinquished the active use would be up to 2002 animal unit months. There would be positive economic impacts associated with allowing grazing use by permittees displaced by activities such as restoration, drought, or fire.

Fiscal Linkages. The effects of the Proposed RMP on established fiscal linkages between the public lands and local governments and businesses in the region would be based on its support for additional employment and population in the region. Over the long-term, population growth under the Proposed RMP would reach the level required to qualify for increased receipts of payment in lieu of taxes. The Proposed RMP also would generate higher grazing fee receipts, a portion of which would return to the local economy.

Future land disposal and subsequent development, combined with the positive effects of the higher employment and population in sustaining real estate values, would boost the ad valorem tax base of local governments and school districts. Increases in the ad valorem tax base generally are perceived as

beneficial. Net changes in the levels of retail sales to residents, travelers, and outdoor recreationists and sportsmen would affect future levels of locally generated sales taxes. However, the net changes in sales may not translate directly into corresponding changes in local sales tax receipts because of provisions in Nevada's local government financing structure that provide rural governments protection against declining sales tax revenues in exchange for a guaranteed level of revenue and foregoing any short-term revenue increases in excess of the guaranteed amount.

Conclusion. The Proposed RMP would result in slight, long-term enhancements of the local economy, e.g., 255 to 260 jobs, across the planning area due to the added restoration funding, stewardship contracting, increased woodland commodity production, and developed and organized recreation. Ranch income would be adversely impacted over the short term, but would increase over the long term. Annual payments in lieu of taxes to Lincoln County would increase slightly and to White Pine County would decrease in the short term, but both would increase in the long term due to land disposal and development. RMP-related impacts on local fiscal conditions would be minimal and long term relative to local budgets.

Alternative A

Economic Conditions. Alternative A maintains current land use and management programs across the planning area. Consequently, fundamental linkages between the public lands, agency management actions, and local economic conditions would be maintained. For example, the agency would continue to process applications for utility and transportation rights-of-way to support mining, and dispersed recreation would be allowed across much of the planning area. Lands presently identified as suitable for possible disposal under various programs would remain eligible for potential disposal and some additional lands could be subject to disposal under the provisions of Congressionally-approved land acts. Disposal of a total of 31,900 acres of public lands, including 3,893 acres in Nye County, is assumed to occur during the life of this plan under Alternative A. The annual operating budget and staffing levels of the Ely Field Office would increase slightly by \$500,000 above recent levels of about \$17.1 million, adjusted for future inflation, and 147 employees, respectively. With 85 percent of the additional funding being channeled to contracted services, the Ely Field Office staffing could increase by 1 or 2 positions, with another 11 or 12 jobs in the private sector. Personal income across the planning area would increase by about \$210,000 per year. The Ely Field Office would continue to be among the largest employers in the planning area.

The timing, type, and extent of subsequent development of disposed lands would depend on the identification of viable markets, individuals, or companies with the expertise and financial resources to start and operate new businesses, and the capability of communities to foster and support such development. To the extent that such development occurs, it would contribute to local employment and income growth and enhance economic diversity and sustainability across the planning area. Such development would boost short-term construction employment in the affected communities. Uncertainties regarding these factors preclude estimation of the indirect employment and income effects stemming from future development. Full development of lands disposed of under Alternative A would likely not occur during the life of this plan.

Wildland fire management and suppression costs represent another source of economic stimulus into the local economy, although not easily predictable in terms of magnitude, timing, and location. The total federal

4.0 ENVIRONMENTAL CONSEQUENCES

expenditures for fire suppression in the planning area would be expected to increase for the foreseeable future under Alternative A.

Maintaining existing linkages between the Field Office and the local economies does not imply the absence of change in future economic conditions.

More far-reaching than the uncertain outlook for commodity development are the potential implications of declining ecological health and other management aspects of Alternative A. Current limitations on lands subject to lease for potential geothermal, oil and gas, and wind energy would remain across much of the planning area, limiting the likelihood for such development occurring. While future development and the associated economic stimuli foregone because of such limitations would not diminish the existing economic support provided by public lands in the planning area, the trends in declining ecological health do have the potential to erode that economic support.

Declining ecological health conditions and the Ely Field Office's constrained budget for restoration are seen as ultimately triggering management actions that reduce the levels of resource utilization having positive regional economic linkages. Such actions include reductions in permitted grazing use, the closure of more areas to off-highway vehicle use and off-road travel, and directly or indirectly limiting dispersed recreation use in connection with ACEC designations. Diminished ecological health and the after-effects of wildland fires may detract from the perceived scenic and amenity values that are viewed as important factors in people's outdoor recreation and vacation travel route planning decisions, relocation decisions by retirees, and the amount of big-game hunting in the region. The after-effects of wildland fire also may include degraded water quality with potential adverse impacts on municipal and agricultural water users. The relationships between ecological health and these other factors are not fully understood; however, a consensus view is emerging that the trends in ecological health are likely to adversely impact, rather than enhance, local economic and social conditions. Additionally, as pointed out by Perryman et al. (2003), the direct costs of wildland fire suppression and rehabilitation throughout the Great Basin are considerable and increasing continually under current management approaches.

Farm income and the numbers of farm jobs would decline as declining rangeland health triggers reductions in livestock grazing on public lands. One recent study estimated the average value of livestock grazing in terms of agricultural output at \$24.40 per animal unit month in Nevada. That study also ascribed a market value to the grazing permit itself (Resource Concepts Inc. 2001), although the BLM does not recognize such a value as it is tied to a permit, not a right. Economic effects would occur in both White Pine and Lincoln counties.

Fiscal Linkages. Over time, grazing fee receipts collected by the Ely Field Office would decline as temporary or permanent reductions in livestock grazing are enacted in response to declining range productivity. Subsequent distributions of those fees include 50 percent to the range improvement fund in the Field Office of origin and 12.5 percent to the state for distribution to the counties. Any reductions in future grazing consequently would correspondingly reduce grazing fee revenues returned to the planning area.

The long-term reductions in livestock grazing could undermine the continued economic viability of one or more ranching operations in the region. Decisions to cease agricultural operations would have fiscal implications for local governments, depending on the subsequent ownership and use of the underlying real property.

Other changes in local fiscal conditions also would occur over time, for example, declines in the ad valorem tax base of White Pine County as housing values decline due to population declines projected under Alternative A that are unrelated to the Ely Field Office management of the planning area. Such changes would be masked by growth associated with increases in retail sales to business and residents associated with the Lincoln County Land Act and Lincoln County and White Pine County Conservation, Recreation, and Development Acts land sales and subsequent development. Counties, municipalities and school districts would benefit from such increases in revenues. Demands on local public services and facilities and the costs of providing services would increase. Meeting these demands may be more challenging in Nye County given the vast area of the county and the relative remoteness of lands in the planning area from other population centers.

Over the long-term, population growth resulting from development of lands disposed under Alternative A could reach levels required to qualify for increased receipts of payment in lieu of taxes.

Conclusion. Alternative A would result in minor, long-term economic impacts (jobs, income, locally derived taxes, etc.) across the planning area. Such impacts would intensify over time, accruing across the entire planning area, though not necessarily uniformly. The adverse economic impacts in Lincoln County would be masked by major, long-term economic growth associated with the Lincoln County Land Act and the Lincoln County Conservation, Recreation, and Development Act. The impacts of these Acts are unrelated to the RMP and would be differentiated across alternatives based on the acreages of affected lands, the timing of disposals, and the type and pace of subsequent development. Federal payments in lieu of taxes and grazing fees received by White Pine County would decline by as much as \$86,000 annually, until development facilitated by the White Pine County Conservation, Recreation, and Development Act is realized, but would increase in Lincoln County. Changes in payments in lieu of taxes and grazing fees would be minor relative to the total budgets of the affected local governments.

Alternative B

Economic Conditions. The incremental direct and secondary impacts of the \$10 million in additional annual restoration funding on local employment and income under Alternative B include an estimated 255 to 260 additional jobs and \$4.2 million in annual income over most of the next 20 years. Staffing levels for the Ely Field Office could expand by about 10 percent (11 to 14 jobs) with an estimated 239 to 244 jobs in the private and local public sectors.² Over time, the cumulative temporary economic stimulus associated with wildland fire suppression costs would be lower under Alternative B than under Alternative A.

² These estimates reflect the default 15 percent BLM / 85 percent contracted services allocation of the additional restoration funds. Variances in allocations from the default assumption would result in some shifting of the employment impacts between the Ely Field Office and other entities, but the order of magnitude of the total job and income impacts would not be substantially different from the levels shown above.

4.0 ENVIRONMENTAL CONSEQUENCES

Projected total annual personal income associated with Alternative B is \$4.2 million within the planning area. Though the incremental funding supporting the income would be channeled through the Ely Field Office, the added economic benefits stimulated by the income would accrue across the region based on the residency pattern of the employees and the geographic distribution of vendors and contractors supporting the program and their expenditure patterns. Those patterns may vary over time in response to shifting geographic distribution of the watershed analysis and treatment priorities.

Disposal of a total of 90,600 acres of public lands is assumed to occur during the life of this plan under Alternative B. The total includes 294 acres in Nye County. The timing, type, and extent of subsequent development of disposed lands are subject to much uncertainty and contingent upon factors unrelated to Ely Field Office management. To the extent that such development occurs, it would contribute to the area's economic welfare, boosting short- and long-term employment opportunities and business activity. Uncertainties regarding these factors preclude estimation of the indirect employment and income effects stemming from future development. Full development of lands disposed of under Alternative B would likely not occur during the life of this plan.

Incremental changes in employment, economic output, and personal income growth, relative to the Proposed RMP, may stem indirectly from management actions and enhanced restoration activities associated with Alternative B. Potential sources of such indirect economic stimuli include the following:

- Construction and operations of mineral, utility, and renewable energy facilities accommodated by changes in land use management policies facilitating more development of these resources in the future.
- The planning area faces major increases in recreation demand, particularly for off-highway vehicle use. Demand for hunting, fishing, and other forms of dispersed and developed recreation also would increase. The closure of 1.1 million acres to off-highway vehicle use, limiting use to designated roads and trails on another 10.3 million acres and interim access changes during the watershed and restoration activities could temporarily reduce off-highway vehicle use and the associated economic stimuli or result in a geographical redistribution of recreation spending tied to changes in off-highway vehicle use patterns as compared to Alternative A.
- Over the long-term, and contingent on the Nevada Department of Wildlife management, big-game hunting levels and the economic stimulus associated with outfitting and guiding could increase as elk, desert bighorn sheep, and Rocky Mountain bighorn sheep ranges and populations expand.
- Farm and ranch income of individual operators holding grazing permits would be adversely affected by temporary restrictions on livestock grazing on allotments undergoing restoration, but livestock stocking rates could return to pre-treatment authorization levels following treatment. Of larger impact would be the total closure of 13 additional allotments within the Mojave Desert and partial to total closure of 189 allotments in areas of occupied or historic bighorn sheep habitat. The loss of income would depend on the individual operator's relative dependence on the affected allotment, the availability and

affordability of alternative grazing or feed, and the operator's ability to adapt to changing livestock management conditions. The number of operators could decline under Alternative B.

- Over the long-term, farm and ranch employment and income would be reduced in relation to Alternative A, due to the elimination of grazing on the remainder of the Mojave Desert and reductions to accommodate the expanded ranges for desert bighorn and Rocky Mountain bighorn sheep. These reductions would be partially offset by long-term stabilization and improvements in rangeland health achieved under Alternative B.
- Potential industrial development opportunities supported by woodland commodity availability (e.g., pinyon-juniper processed for fence posts, fuel pellets, or other commercial products). The accelerated treatment rates would increase biomass availability, both in terms of quantity and variety, enhancing the commercial viability potential. However, the geographic size of the planning area and its implications for the concentrations of resource availability and distances to processing locations and markets may temper the extent of commercial activity.
- Increased commercial and industrial development opportunities spawned by future residential development in response to the land disposal process and indirect consequence of enhanced "lifestyle" migration to the area in response to the accelerated rangeland and watershed restoration efforts.

The magnitude and location of the indirect employment and income growth are subject to the caveats and uncertainties identified above in connection with population change. Many of the potential indirect gains associated with Alternative B would enhance the long-term economic stability and sustainability of the local economy by reducing the dependence on extractive-resource development.

The three Indian Reservations would not experience direct economic impacts from management activities under Alternative B. Increased economic opportunities may result indirectly from the development of any lands transferred to the Tribes or from overall changes in economic conditions related to commodity use, recreation, livestock grazing management, or participation in the ecological restoration programs funding under Alternative B. The magnitude of such economic effects is unknown due to uncertainty regarding the timing, amount, and future use of any possible land disposal or other actions and the extent to which future economic enterprises would be tribal undertakings or activities undertaken by individual members.

Fiscal Linkages. Impacts to the established fiscal linkages and future conditions directly related to Ely Field Office management would not be substantially different for Alternative B than those under Alternative A. Possible land disposal actions would decrease the number of entitlement acres in the respective counties. The vast size of the planning area diminishes the influence of the entitlement acres in determining payments in lieu of taxes as compared to that imposed by the small population base of the planning area. White Pine, Nye, and Lincoln counties collectively would garner about \$38,000 per year in additional payments in lieu of taxes under Alternative B as compared to Alternative A. These changes would be in addition to those associated with future population growth occurring in conjunction with the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts. Induced population changes spawned by other changes in management are too speculative to project, but they

4.0 ENVIRONMENTAL CONSEQUENCES

would result in corresponding gains or reductions in payment in lieu of taxes. Local taxing entities could realize expansions of their respective ad valorem tax bases due to additions associated with potential land disposal and the economic activity associated with the annual budgets for enhanced restoration. Increases in retail sales to residents and visitors would increase sales tax and other state-distributed revenues for the counties, municipalities and school districts. The effects on county fiscal resources, for example, the ad valorem tax base, would be largest in Lincoln County, less in White Pine County, and very limited in Nye County.

Grazing fees collected in the planning area, a portion of which are distributed locally, are expected to decline over time under Alternative A. Similar trends also may occur under Alternative B. However, enhancements in rangeland health could arrest the declines such that the levels of grazing and grazing fee receipts are above those under Alternative A. Increases in retail sales to residents and visitors would increase sales tax and other state-distributed revenues for the counties, municipalities, and school districts.

Local communities would benefit indirectly from the reductions in wildland fire risks associated with the comprehensive watershed analysis, vegetation treatment, and other management techniques included in Alternative B. Over the long-term, the reductions in risk also would result in reduced pressures on local law enforcement and fire suppression support.

Conclusion. Alternative B would result in slight, long-term enhancements of the local economy, e.g., 255 to 260 jobs, across the planning area due to the added restoration funding, enhanced woodland commodity availability, and increases in big-game hunting. Gains would be tempered by long-term decreases in farm/ranch income from allotment closures in the Mojave Desert and bighorn sheep habitat. Lincoln and White Pine counties would see major, long-term economic growth triggered by the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts. Annual payments in lieu of taxes to White Pine County would be lower than at the present, but higher than under Alternative A. Payments in lieu of taxes would increase in Lincoln County. RMP-related impacts on local fiscal conditions would be minimal and long term relative to local budgets.

Alternative C

Economic Conditions. Implementation of Alternative C would result in marginally higher employment and personal income across the planning area relative to Alternative A. The increases would result from the incremental direct and secondary jobs supported by the additional \$5.0 million in the Ely Field Office annual operating budget. The estimated employment increment is 125 to 130 jobs for the 15 to 20 years required to complete the watershed analysis and treatment program for the planning area.³ The total impact would be comprised of 8 to 12 additional Ely Field Office staff and 117 to 122 jobs in the private sector or in local and state government. The total increment is about 116 jobs above the impact associated with Alternative A. Implementation of stewardship contracting would yield additional new job opportunities. The initial creation of these jobs would likely lag the watershed analysis process, due to the need to develop treatment programs, complete site-specific environmental compliance, and advertise and award contracts or enter into

4.23 Economic Conditions

cooperative agreements. The number of supportable jobs is unknown, due to a lack of information regarding the number, type, location, marketable product values, and services to be provided via stewardship projects. Employment impacts beyond the RMP/EIS time horizon would depend on budget availability and subsequent management direction.

Investment in restoration activities and the management emphasis on enhancing of commercial activities could spawn development of specialized facilities and services (e.g., a native plant materials nursery) in the planning area. Such developments, if realized, would bring added economic development and jobs to the region beyond the levels projected above. The economic stimulus would be augmented by increased expenditures associated with full suppression of wildland fires. The level of such expenditures would logically vary from year-to-year and would likely tend to increase over time as heavy fuels accumulate in untreated acres. Although the additional funding for ecological restoration would be channeled through the Ely Field Office, the watershed analysis and treatment efforts, and hence the employment opportunities and other associated economic benefits, would be dispersed across the planning area.

Alternative C would promote increased organized and developed recreation activity in the planning area, compared to Alternative A, and the development of tourism and recreation-oriented facilities by both the public and private sectors. Higher levels of organized use would be counter-balanced by reductions in dispersed off-highway use due to restrictions on use to designated roads and trails across much of the planning area. The former would stimulate recreation spending in the region, providing added stimulus to local retail, eating and drinking, overnight lodging, and other such establishments and increases in the number of local jobs in the affected industries. However, those gains would be offset by reduction in spending by off-highway vehicle users such that the net impacts cannot be determined with the available information.

Alternative C also could promote short-term local economic development benefits associated with commercial development opportunities of biomass due to the enhanced availability, accessibility, and lower commodity costs afforded by the fuels management/wildland fire risk reduction efforts focused around local communities. In remote areas of the planning area, harvesting, and transportation costs may pose substantial barriers to the development of forest products processing and manufacturing. The active suppression of all wildland fires also may poses a risk of large-scale, uncontrollable wildland fires occurring in untreated areas, with attendant potential adverse economic impacts.

Commercial use opportunities under Alternative C would allow planning area-wide harvesting of additional species of trees, live trees, cactus and yucca collection, and the mechanical harvesting of pinyon pine nuts, subject to the constraints imposed by Nevada Revised Statutes 527.050-120. This management provision may encourage landscaping suppliers and contractors serving Las Vegas and other urban markets to explore the commercial viability of local operations. Stewardship contracting, which would provide opportunities for the Ely Field Office to exchange the value of products for restoration services provided, may enhance the commercial viability of such operations.

³ These estimates reflect the default 15 percent BLM / 85 percent contracted services allocation of the additional restoration funds. Variances in allocations from the default assumption would result in some shifting of the employment impacts between the Ely Field Office and other entities, but the order of magnitude of the total job and income impacts would not be substantially different from the levels shown above.

4.0 ENVIRONMENTAL CONSEQUENCES

Up to 295,200 acres of land, distributed over a larger and more geographically diverse area than in Proposed RMP would be designated for possible disposal and ultimately for industrial, commercial, residential, and agricultural uses under Alternative C. The total area includes approximately 3,893 acres in eastern Nye County. The extent, timing, and location of subsequent development would depend on the identification of viable markets, individuals, or companies with the expertise and financial resources to start and operate new businesses, and the capability of communities to support such development. To the extent that such development occurs, it would contribute to increases in local employment, income, and economic diversity and sustainability within the planning area. Such development would boost construction employment in the affected communities. Uncertainties regarding the timing, location, and eventual use of possible land disposals preclude estimation of the indirect employment and income effects that could stem from Alternative C. Full development of lands disposed in Lincoln and White Pine counties under Alternative C would be highly unlikely during the life of this plan. Development of disposed lands in Nye County also is considered unlikely during the life of the plan, but is potentially foreseeable.

Short-term impacts on farm and ranch income tied to temporary restrictions on livestock grazing during treatment under Alternative C would be similar to those described for Alternative B. Fewer allotments within the Mojave Desert would be totally unavailable for grazing than in Alternative B, resulting in less impact to farm and ranch operations than under Alternative B. Other individual operators temporarily could be affected during restoration on any individual allotment. The loss of income would depend on the individual operator's relative dependence on the affected allotment, the availability and affordability of alternative grazing or feed, and the operator's ability to adapt to changing livestock management conditions. Temporary nonrenewable use may buffer impacts in some years. Temporary impacts also could be tempered by the establishment of a forage reserve as could be authorized under Alternative C.

Over the long-term, restoration could allow livestock grazing levels to increase above pre-treatment authorized levels, because additional forage would be allocated to livestock. Under such circumstance, Alternative C would have a net positive impact on grazing and local farm income, as compared to Alternative A. Such benefits may be enhanced in the short term by the increased commercial woodland and native plant commodity production. On a long-term basis, however, the fire suppression policy of this alternative would lead to increased risk of major wildland fires resulting in substantial reduction in availability of forest/woodland products.

Fiscal Linkages. The direct effects on established and future fiscal linkages associated with the Ely Field Office's management of the planning area and local governments in the region would be comparable to those under Alternative B, because both are based on \$5.0 million in higher annual expenditures. Among the alternatives, land disposal under Alternative C would result in the largest net reduction in entitlement acres for purposes of payments in lieu of taxes. Over the long term, however, any effects of those reductions would be offset as the residential development and enhancement of commercial recreation and other business opportunities result in population growth qualifying the counties for higher future payments in lieu of taxes. The relative impacts would be greater in Lincoln and White Pine counties than in Nye County.

Future land disposal and subsequent development also would expand the ad valorem tax base of local governments and school districts. Over time, the expansion would be substantial, particularly in Lincoln

County. Higher volumes of retail sales to residents, travelers, and participants in organized recreation events would increase sales tax and other state-distributed revenues for the counties, municipalities and school districts. The gains in sales tax and business revenues would likely be tempered by minor reductions associated with reductions in off-highway vehicle use.

Conclusion. Alternative C would promote increased organized and developed recreation activity in the planning area, compared to Alternative A, and the development of tourism and recreation-oriented facilities by both the public and private sectors. Higher levels of organized use, in the form of truck and motorcycle events, would augment continued off-highway vehicle use accommodated by a management emphasis to designate roads and trails for such use. The combined organized and dispersed recreation use would stimulate recreation spending in the region, providing added stimulus to local retail, eating and drinking, lodging, and other such establishments, which would increase the number of local jobs in the affected industries.

Alternative D

Economic Conditions. The direct and secondary employment and income effects of the ecological restoration efforts under Alternative D would be equivalent to those under Alternative A given the \$500,000 annual increase in the annual operating budget of the Ely Field Office. Local economies would experience reduced economic benefit from wildland fire management activities, because of the minimal fire suppression policies under Alternative D and also would be at risk of adverse economic impacts due to resource degradation and loss due to the wildland fire.

The elimination of grazing on public lands in the planning area under Alternative D would result in long-term direct and indirect economic impacts to area ranchers, affiliated agri-business firms, and other trade and service sectors of the economy. The impacts would accrue as many of the region's farmers and ranchers are forced to trim or eliminate cattle and sheep herds due to the loss of public grazing forage and lack of replacement grazing on private or other public lands. The reductions in herd sizes would eliminate revenues from livestock marketing. Such revenues were nearly \$13 million in 2002. The loss of public grazing may force some ranchers to cease their agricultural operations entirely. Other farmers and ranchers may offset a portion of the loss from increased sales of hay no longer required for winter feed, but the net effect would likely be a substantial reduction in overall farm income.

Disposal of a total of 12,400 acres of public lands is assumed to occur during the life of this plan under Alternative D. None of the disposed lands would be in Nye County. The timing, type, and extent of subsequent development of disposed lands are subject to much uncertainty and contingent upon factors unrelated to Ely Field Office management. To the extent that such development occurs, it would contribute to the area's economic welfare, boosting short and long-term employment opportunities and business activity. Uncertainties regarding these factors preclude estimation of the indirect employment and income effects stemming from future development. Full development of lands disposed of under Alternative D could potentially occur during the life of this plan.

4.0 ENVIRONMENTAL CONSEQUENCES

The withdrawals of lands open for mineral, geothermal, and wind energy development and the lack of new utility rights-of-way would preclude realization of potential future temporary and long-term economic benefits from such development. Temporary and short-term construction effects attributable to residential and commercial construction would be lower under Alternative D than under the other alternatives.

Fiscal Linkages. Alternative D stipulates no net loss of public lands in the area. Given that policy, the established fiscal linkages between the Ely Field Office's management activities on public lands and local communities would be maintained, because future land disposal would require an offsetting acquisition of lands from private or other non-federal parties. Consequently, changes in future payments in lieu of taxes would be comparable to those under Alternative A.

The indirect consequences of this policy would be of more importance to local communities and generally would be adverse relative to Alternative A. The loss of future development potential related to RMP-related management actions and associated implications for future population growth would diminish the potential for increasing future receipts of payments in lieu of taxes in Lincoln and White Pine counties, local ad valorem tax revenue generating capacity, and transfers for education and other public functions from the state. Such changes may be masked by offsetting changes associated with future potential development related to land disposal under the three land acts. Local distributions of grazing fees would be eliminated with the closure of all allotments. Farmers, ranchers, and others in the community adversely affected by the elimination of public grazing would experience a substantial diminishment in their individual and collective quality of life. Furthermore, they would see the erosion of agricultural viability in the planning area as a loss of an important dimension of the region's social and cultural underpinnings.

Conclusion. Alternative D would result in moderate, long-term economic impacts, due to substantial reductions in ranch income, wildland fire suppression, and withdrawals of lands open for mineral and energy-related development. The latter could result in foregone short-term economic benefits associated with utility construction projects precluded by the lack of utility rights-of-way. The Lincoln County and White Pine County economies would experience major, long-term economic growth associated with development of lands sold under the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts. Absent development spawned by land disposals under the three acts, annual payments in lieu of taxes to White Pine County would be lower than at the present, but comparable to those under Alternative A. The provision for no net loss of public lands may delay or limit land disposal actions that would otherwise foster community and economic development, thereby impacting local fiscal budgets.

4.24 Social Conditions

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Population and Demographics. Effects on regional population change directly attributable to the Ely Field Office's operations under the Proposed RMP are estimated at 510 to 560 residents across the region during the 15 to 20 years required to complete the watershed analysis throughout the planning area. The increase would result from the additional job opportunities supported in the planning area by the additional \$10 million in annual operating budget for the Ely Field Office. Many of the affected households would live in and around Ely, attracted by the location of the Ely Field Office, the community's retail and services sector, and the relative availability of housing. Others may choose to live in nearby unincorporated areas of White Pine County or in Lincoln County, primarily in and around Caliente where the BLM operates a Field Station. The changes in the population of White Pine County would not manifest themselves as new growth per se, but rather as a relative decrease in the level of expected out migration.

The three American Indian reservations would not experience population growth directly as a result of the Proposed RMP, because like the non-reservation communities in White Pine County, the effect of the Proposed RMP would be one of stemming out migration rather than generating net growth. Induced population growth may result indirectly from the development of any lands transferred to the Tribes as part of a larger community and economic development conveyance and disposal process outside the context of the RMP/EIS. The Duckwater Shoshone and Ely Shoshone both have expressed interest in gaining additional lands to expand their respective reservations. The population effects associated with any such transfers is unknown due to the uncertainty regarding the timing, amount, and future use of any such transfers.

Population growth indirectly associated with future land disposal would occur in the planning area under the Proposed RMP. The magnitude, type, timing, and location of such growth are subject to the same caveats and uncertainties identified earlier in connection with the reservations and in Section 4.23 with respect to economic and fiscal effects. Residential development potentials associated with the land use development assumptions outlined in **Table 4.23-2** and assumed development densities, ranging from 10 dwelling units per acres to 1 dwelling unit per 20 acres, are presented in **Table 4.24-1**.

4.0 ENVIRONMENTAL CONSEQUENCES

Table 4.24-1
Potential Residential Development Build-out (Dwelling Units) of Land Disposals¹

	White Pine County	Lincoln County	Nye County
Proposed RMP	18,630	57,450	-
Alternative A	27,170	7,900	2,560
Alternative B	26,590	73,870	120
Alternative C	41,940	96,560	2,560
Alternative D	12,130	3,170	0

¹ Residential development potentials reflect land use assumptions outlined in Table 4.23-2, a range of residential development densities, and the absence of major development obstacles/constraints, such as inadequate water availability.

Under the Proposed RMP, development of over 76,000 additional dwelling units could occur on the disposed lands, more than a 1,100 percent increase over the aggregate housing stock of Lincoln and White Pine counties in 2000. Realization of that level of development during the life of this plan is extremely unlikely. Over time, the incremental growth would represent sizeable population increases in Lincoln County and White Pine County, and to a lesser degree in Nye County given the potential levels of residential development on the disposed lands. The populations associated with new developments would likely be a combination of year-round and seasonal residents.

Through its accelerated effects on improving ecological health, implementation of the Proposed RMP could indirectly contribute to a higher future population in the region, as compared to Alternative A. The higher population could manifest itself as additional growth in Lincoln County and White Pine County. To the extent that environmental conditions are "quality of life" factors affecting the residential choices of retirees, entrepreneurs, and working households with a high degree of flexibility in their employment situation, the potential improvements achieved under the Proposed RMP would diminish the adverse influences of the current conditions and trends. The temporal relationships between the implementation of the Proposed RMP, responses and changes in ecological health, potential indirect effects on population change, as well as the magnitude of such population changes, are unknown.

Population effects associated with the Proposed RMP, particularly those changes related to future growth associated with land disposals, dramatically could alter the demographic characteristics of the planning area. New residents may reflect a broad demographic cross-section in terms of age, race, workforce participation and household size, or may be less representative of the general population. In either case, they would be less connected to the social, cultural, and economic history of the area. Consequently, the influx of many year-round and seasonal residents would affect the social and community dynamics in the area.

Housing. Local housing markets would experience little direct impact under the Proposed RMP due to the limited scale of the anticipated population effects associated with ecological restoration efforts. The incremental population growth and associated housing demand generally would be regarded as beneficial. The incremental demands on community infrastructure and public services also would be considered beneficial by contributing to higher utilization, efficiency, and local government fiscal capacity.

Indirect effects on local housing markets would arise from future residential development on lands disposed of under the Proposed RMP. These effects would be long-term, major, and would have both beneficial and adverse dimensions. While the timing and absorption of such lands is uncertain, such impacts are likely to occur first in Lincoln County, particularly around Pioche, Panaca, and Caliente, followed by White Pine County, particularly around Ely. Development around those communities could take advantage of and benefit the established community infrastructure. However, the level of potential residential development would require expanded infrastructure and service delivery capacity. Active housing markets in both Lincoln and White Pine counties would include both permanent residency and second-home/recreational use. Future development likely would expand the type, variety, and range of values of housing available within the area.

Social Values and Attitudes Regarding Public Land Management. The Proposed RMP responds to a broadly held perspective that ecological health current conditions and trends within the planning area are deteriorating and that commitment of substantial resources are necessary to arrest the rate of decline, begin restoration, and to achieve properly functioning conditions. While many stakeholders would view favorably the increased funding levels and accelerated process of assessment and adaptive management response, concerns regarding the effectiveness of the approach and lengthy period required for implementation may foster concerns among various stakeholders about the need for more immediate or short-term actions. For example, ranchers would oppose the reductions in livestock grazing privileges associated with the temporary closure for treatment, but who support the possible allocation of additional post-treatment forage to grazing would see the short-term impacts as detrimental to their own sense of social and economic well-being as well as that of their neighbors, and their collective descendants.

At the same time, many residents of the area would value the added emphasis directed towards fuels management and wildland fire risk reduction included in this alternative. As that effort is implemented, ranchers, home and business owners of properties closest to the urban/rural interface would sense feelings of relief. Many residents and non-resident familiar with the area also may value the expanded range of woodland and vegetation products available for personal use.

Local and tribal government officials interested in promoting economic development initiatives may support the designation of areas for possible disposal, though some still would consider it insufficient in quantity and not well sited to meet future needs.

Stakeholders interested in ecological restoration and resource protection, as well as some of those interested in increased opportunities for off-highway vehicle use, would experience some degree of dissatisfaction with the Proposed RMP, because it does not include the scale of management response they desire. For example, some groups and individuals interested in environmental restoration would like to see a complete and immediate cessation of grazing, more restrictions on off-highway vehicle travel, and the complete closure of more areas to all off-highway vehicle use. At the same time, individual off-highway vehicle enthusiasts and organizations may have preferred maintaining areas as open and fewer travel restrictions limiting use to designated roads and trails.

4.0 ENVIRONMENTAL CONSEQUENCES

Changes in permit conditions for outfitters and guides under the Proposed RMP may cause concerns among both the outfitters and guides and those who are used to a guided hunting experience but with more flexibility. Differences in viewpoints would resonate with local officials, some of whom may see permit conditions as enhancing the industry and its economic contributions to the regions, others who have a stronger free-market orientation and may see conditions as intrusive.

Groups and individuals interested in resource protection would likely be skeptical or opposed to the emphasis on commercial activities, the expansion of recreation uses, particularly motorcycle and organized truck events, and the expanded designations of lands suitable for possible disposal, particularly those areas seen as having high recreation potential and other resource values. Others would see the consequences of possible land disposal as leading to an increased human presence in the area, adding to existing pressures on other resources that may pose a higher threat to the success of ecological restoration efforts.

Many stakeholders may view the Proposed RMP as a type of a middle ground; addressing a wide array of resource management issues and concerns and promoting multiple-use on a large-scale level.

Conclusion. The Proposed RMP would result in regional population increases of 510 to 560 residents during restoration, with corresponding positive long-term effects on local housing markets. The gains would be relatively more concentrated around Ely. Additional social benefits may be realized from stewardship contracting, the fuels management/wildland fire risk reduction, and potential for developed recreation associated with possible land disposal. This alternative may hold relatively less appeal for those desiring maximum emphasis on resource protection and rangeland health restoration. Additionally, long-term population growth facilitated by land disposal could result in fundamental, long-term changes in social conditions across the area.

Alternative A

Population and Demographics. The Nevada State Demographer's office has prepared statewide and county-specific population projections through the year 2020. The projections are based on the continuation of recent population and demographic trends, absent any growth associated with the recent land acts, and thus, can be viewed as generally consistent with Alternative A. As such, they provide an indication of expected future economic and social conditions in the region absent any major economic shocks, including changes in management activities of the Ely Field Office.

Lincoln County is projected to gain nearly 300 residents through 2020; a modest compounded annual growth rate of 0.3 percent (see **Table 4.23-1**). Those projections imply limited levels of net immigration to augment natural growth of the resident population but do not include allowances for future development in conjunction with the sale and development of lands associated with the Lincoln County Land Act. Such development could result in nearly 58,000 additional residents of Lincoln County over 20 years (BLM 2001c). The effects of the Lincoln County Land Act on Lincoln County population growth, demographics, and social conditions are unrelated to the RMP and would be undifferentiated across alternatives. In addition to the Lincoln County Land Act-related growth, land disposal under the other land acts could facilitate development of more than 35,000 additional dwellings in the planning area.

The corresponding baseline population projections for White Pine County call for long-term declines of more than 2,500 residents by 2020. About 80 percent of the projected decline would occur by 2010 with the rate of decline slowing thereafter. The location of two regionally important highways through the county, and the support for local trade and services establishments provided by the Ely State Prison, the stimulus provided by the recent reopening of the Robinson mine, and other state and federal government activities in the county, suggests that White Pine County's population may stabilize, rather than continuing to decline as projected. The implications of the projections are, however, for substantial net residential out-migration, with attendant effects on local housing markets and other social dimensions of the affected communities. Under such conditions, the median age of an area's population would tend to increase, and the number of school-age children would decline. These trends would be offset in the long-term by the effects of the recently passed White Pine County Conservation, Recreation, and Development Act of 2006, which could stimulate development through disposal of BLM-administered lands for a variety of private and public uses.

Population projections are not available for the Nye County portion of the planning area. Population declined between 1990 and 2000, at least partially in response to limited economic opportunity. Given the outlook for population declines in White Pine County in the near term, to which the Duckwater area maintains close economic and social ties, it is reasonable to expect some further declines.

Projected population changes in the planning area contrast sharply with those for Nevada where net gains of over 892,000 residents are projected statewide by 2020, raising the state's population to 2.91 million.

Housing. Housing is among the more important elements of community development and local socioeconomic conditions. To an extent, changes in housing conditions and markets serve as a proxy for changes in community infrastructure and functioning. Rapid growth and strong housing demand tends to be correlated with rising housing prices, the need for community infrastructure expansion, and increased pressure on community services, while falling demand and prices create strains as communities attempt to sustain services and economic vitality in the face of declining resources.

Alternative A would have little, if any, direct impact on the underlying markets for new housing in the region. Lincoln County's housing market would be comprised of three elements: 1) demand for permanent housing to accommodate new residents moving to the central portion of the county, 2) non-resident demand for homes for seasonal and recreational use, and 3) the potential development of lands in southern Lincoln County associated with the Lincoln County Land Act. The first two of these elements would affect private lands, primarily around Panaca, Pioche, and Caliente. The amount of land to support such development is limited, providing a need for additional lands. Lands identified for possible disposal to meet community expansion needs could satisfy such demand, provided lands are subsequently developed for residential, rather than agricultural, industrial, commercial, or other public uses. The demand for seasonal and recreational use homes could be adversely affected by the continued risk of wildland fires on nearby public lands and restrictions enacted on dispersed recreation and off-highway vehicle use in the wake of continued decline in ecological health.

4.0 ENVIRONMENTAL CONSEQUENCES

Housing demand in White Pine County, absent development associated with land disposal actions, would decline over the long-term in response to the underlying expectations for population declines and out-migration that characterize Alternative A. The long-term trend could be punctuated by short-term increases in demand tied to renewed mineral development or other temporary or cyclical spikes in economic activity. Under the long-term trends of relatively weak demand, housing values would decline and vacancies could rise. The population declines would result in excess service capacity in public infrastructure, along with diminished fiscal capacity for upgrades, maintenance, and repairs. Public services also would be adversely affected as cutbacks are necessitated by the smaller population base and fiscal resources.

Land sales under the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts are congressionally mandated. Market forces would determine whether and when development proceeds, and the nature of that development. The impacts of that development on other development trends in Lincoln County and White Pine County are unclear, though they would contribute to the potential for long-term growth that more than offsets the long-term declines projected absent such development. As under the Proposed RMP, housing variety and the range of values would expand due to future residential development under Alternative A. The impacts on local housing markets of such development would be major, with both beneficial and adverse manifestations.

Residential development associated with land disposal would be of lesser consequence in Nye County due to the relatively limited development potential involved.

Social Values and Attitudes Regarding Public Land Management. Continuation of current management practices under Alternative A would be deemed by many stakeholders as being unresponsive to their multi-faceted and wide-ranging concerns. Whether local resident, non-resident recreation enthusiast, tribal interest, or a business or environmental organization, generally there is a broad consensus that current conditions and trends do not bode well for the long-term environmental, economic, and community well-being of the planning area. There is considerably less consensus regarding the priorities and desired outcomes for future management of the planning area. In part, this stems from the sheer size of the planning area and its pivotal role in the Great Basin ecological system. Not only does the large size provide an opportunity for stakeholders to influence management for a vast area in its own right, but the current RMP/EIS process is seen as providing a forum to influence management policies over much of the western U.S. One outfall of the attention directed toward the Ely RMP/EIS is that most stakeholders and interest groups see themselves as having something at risk, which may or may not promote consensus regarding the desired course of action.

Two trends emerge under the current management that generally characterize the implications of Alternative A in terms of the effects on social values and attitudes toward public land management. On the one hand are local individuals and groups whose economic livelihoods and quality of life are linked to public lands and those who visit the area frequently to hunt, recreate, experience, and enjoy the open space and scenic vistas. Many of these individuals believe that their opportunity to maintain their established use patterns, cultural ties, and other connections to the land are threatened by strict environmental resource protection. An implication of that eventuality is that these parties see themselves as bearing the brunt of forthcoming changes in management and that those changes generally are viewed as being adverse in

nature. They are, therefore, inclined to support more active and aggressive management that stabilizes, and hopefully, restores ecological conditions over time to a point of supporting on-going multiple use across a large portion of the planning area.

A contrasting perspective of the need for action may be held by individuals and groups promoting more active restoration efforts from a more distant or detached vantage, be it scientific, cultural, emotional, or spiritual. Many among these stakeholders also recognize that environmental protections eventually would come into play across broad segments of the planning area. However, there are potentially avoidable adverse consequences associated with delays and the passage of time that motivate these stakeholders to support more active and aggressive restoration efforts. One such consequence is the increasing risk of wildland fires. Such fires would increasingly pose risks to communities, lives, and properties. While such risks raise concerns for local residents, property owners, and officials, the consequences of wildland fires on ecological resources also can be devastating and are something to be avoided, if possible.

It is the shared motivation that changes in management are necessary to address concerns that Alternative A fails to address.

Conclusion. Long-term moderate population declines in White Pine County and moderate to major population increases in Lincoln County are projected under Alternative A absent the indirect growth associated with proposed land disposals and subsequent development. Subsequently, housing demand and prices would fall in White Pine County, while increasing in Lincoln County. Residential development in Lincoln County would increase concerns about wildland fire risks. Continuation of current management practices would be widely perceived as unresponsive to public concerns regarding declining ecological health in the Great Basin and the implications for public land use. Potential long-term development facilitated by land disposal actions under Alternative A would counteract the underlying projections and result in long-term population growth which would be accompanied by changing social dynamics in the planning area.

Alternative B

Population and Demographics. Under Alternative B, the combination of \$10 million in annual funding of ecological restoration activities and the implementation of stewardship contracting would result in population gains larger than the 510 to 560 residents identified under the Proposed RMP. The magnitudes and timing of the incremental gains generally would correspond to the employment effects associated with such contracting, which are presently unknown. Other population and demographic effects in the planning area, including effects on the three American Indian reservations and the effects associated with possible land disposal and improving ecological health, would be more pronounced than those described for the Proposed RMP with capacity for more than 100,000 additional dwelling units under Alternative B. That total represents nearly a 15-fold increase over the aggregate housing stock of Lincoln and White Pine counties in 2000. Realization of that level of development during the life of this plan is extremely unlikely.

Housing. Under Alternative B, major impacts on local housing markets and conditions, including indirect effects associated with potential future residential development on disposed lands would occur and would

4.0 ENVIRONMENTAL CONSEQUENCES

be similar to those described for the Proposed RMP. The impact of that development on other development trends in Lincoln County and White Pine County is unclear, though it would contribute to the potential for long-term growth that offsets the long-term declines projected absent such development. As under the Proposed RMP, housing variety and the range of values would expand over the long-term due to future residential development under Alternative B.

Social Values and Attitudes Regarding Public Land Use Management. Alternative B responds to a broadly held perspective that current conditions and trends in ecological health require a substantial commitment of agency resources to arrest the rate of decline and begin restoration of properly functioning conditions across much of the planning area. While many stakeholders would view favorably the increased funding levels and accelerated process of assessment and adaptive management response, the uncertainties regarding the effectiveness of that approach and the lengthy time required for implementation and the resulting ecological responses could foster concerns among various stakeholders about potential short-term effects. For example, ranchers would oppose the reductions in livestock grazing privileges associated with the closure of the Mojave Desert to grazing and the emphasis given towards expanding the ranges and populations of desert and Rocky Mountain bighorn sheep, particularly given the lack of future forage allocations to livestock grazing as standards for rangeland health are achieved. They would see this as detrimental to their own sense of social and economic well-being, as well as that of their neighbors and their collective descendants.

At the same time, many residents (e.g., ranchers, home, and business owners closest to the urban/rural interface) of the area would value the added emphasis directed towards fuels management and wildland fire risk reduction included in Alternative B. Many residents and non-residents familiar with the area also would value the expanded range of forest/woodland and other plant products available for personal use.

Local and tribal government officials interested in promoting economic development initiatives would support the designation of areas for possible disposal, though some still would consider it insufficient to meet future needs.

Stakeholders interested in ecological restoration and resource protection, as well as some of those interested in increased opportunities for off-highway vehicle use, would experience some degree of dissatisfaction with Alternative B, because it may not include the scale of management response they desire. For example, some groups interested in environmental restoration would like to see a complete and immediate cessation of grazing. At the same time, individual off-highway vehicle enthusiasts and organizations may prefer maintaining more open use areas, fewer travel restrictions limiting use to designated roads and trails.

Conclusion. Alternative B management actions related to restoration would increase regional population by 510 to 560 residents. Generally perceived as beneficial, the gains would be relatively more concentrated around Ely. By accelerating the pace of restoration and improved ecological health, Alternative B would contribute to potential long-term population growth over and above that under Alternative A. Long-term population growth facilitated by land disposal could result in fundamental, long-term changes in social conditions across the planning area. Higher population growth would bolster housing markets in White Pine

County. Many would view the increased restoration funding levels favorably, but would be concerned about short-term impacts on lifestyles and personal use, and future management as rangeland health standards are achieved. Alternative B may hold relatively stronger appeal to those favoring resource protection and restoration.

Alternative C

Population and Demographics. The population effects of Alternative C would be comparable to those identified for the Proposed RMP; a net incremental increase over Alternative A supported by the additional \$5.0 million in annual operating budget for the Ely Field Office. Implementation of stewardship contracting would spawn additional population gains. The magnitudes and timing of the gains generally would correspond to the employment effects associated with such contracting, which are presently unknown.

A secondary consequence of emphasizing responsible commercial development of forest/woodland and other plant products, organized motorized recreation events, and the expanded options of lands designated as suitable for possible disposal is a higher likelihood of stimulating induced economic and population growth beyond that associated directly with the rangeland health restoration initiative. Indirect effects on regional population change under Alternative C would be greater than under the other alternatives because of the increased acreage available for possible disposal. Most of the additional lands designated as eligible for possible disposal under Alternative C are near Ely, communities in Lincoln County, local airports, existing state parks, and other popular recreation areas. The location of these lands would promote interest for public and private sector recreation-oriented, commercial, and residential development, as well as possible agricultural uses. Such development would increase both the full-time residential populations and the seasonal and part-time residents. Criteria established to facilitate the orderly disposal of lands likely would result in paced disposal over time, with subsequent possible disposals contingent upon the utilization, market absorption, and development of previously disposed lands. The indirect effects on population growth would likely be concentrated in Lincoln County due to the proximity to the Las Vegas metropolitan area, Mesquite, and the Interstate 15 corridor.

The social well-being of the three Indian Reservations and respective tribal members and households would not be directly affected by possible land disposal or other aspects of Alternative C.

Population and demographic effects associated with future growth in the planning area in the wake of land disposal actions with capacity for more than 138,000 additional dwelling units would be more pronounced under Alternative C than those described for the Proposed RMP. That total represents a 20-fold increase over the aggregate housing stock of Lincoln and White Pine counties in 2000. As growth and development proceed, local population and demographics could undergo dramatic changes due to the influx of a large number of year-round and seasonal residents. Complete realization of the residential development potential accommodated by land disposal in Alternative C is extremely unlikely during the life of this plan.

Housing. Local housing markets would experience little direct impact under Alternative C because of the limited scale of population effects anticipated and the existing market conditions described under

4.0 ENVIRONMENTAL CONSEQUENCES

Alternative A. The incremental demands on community infrastructure and public services also would contribute to higher utilization, efficiency, and fiscal support.

Major indirect effects on local housing markets would arise from future residential development on lands disposed under Alternative C. The timing and absorption of such lands is uncertain, but such effects would be more likely to occur around Pioche, Panaca, and Caliente in Lincoln County, and in areas in White Pine located near, and having access to, designated off-highway vehicle open use areas. The level of second-home development potentially could be much higher under Alternative C than other alternatives because of the proximity of possible disposal-eligible lands to established recreation areas.

A secondary consequence of new development in more remote locations would be to alter and increase demands on local governments, the Ely Field Office, and other public service providers. For example, increased residential and commercial development outside of the established communities in Lincoln and White Pine counties would increase demands on the sheriff's department, local fire protection, and, to the extent that they attract year-round residents, the school district. Increasing development also would generate additional management demands on Ely Field Office resources, including wildland fire protection, by introducing more development, recreation use, and a higher general level of human presence into areas previously undeveloped. The potential for large-scale demands on local government facilities and services is greatest in Alternative C due to the potential level of residential development supported by land disposals.

Social Values and Attitudes Regarding Public Land Management. Alternative C may garner support among the diverse stakeholders for the increase in spending to implement pro-active restoration efforts, including the use of commercial development and stewardship contracting to effect fuels management/wildland fire risk reduction and other environmental and recreation opportunity restoration and enhancement goals. Because such efforts may promote increased vegetation production and the availability of wood products biomass near local communities, local officials interested in community development likely would favor Alternative C over the other alternatives. Ranchers affected by closure of allotments within the Mojave Desert would oppose this reduction in livestock grazing privileges. Many off-highway vehicle users and other outdoor recreation enthusiasts would prefer the increase in recreation opportunities, less restrictive off-highway vehicle use designations, and private development afforded by the expanded offerings of land designated as suitable for possible disposal, relative to the other alternatives.

Groups and individuals interested in resource protection likely would be skeptical or opposed to the emphasis on commercial activities, the expansion of recreation uses (particularly motorcycle and organized truck events), and the expanded designations of lands suitable for possible disposal under Alternative C, particularly those areas seen as having high recreation potential and other resource values. Others would view the consequences of possible land disposal as leading to an increased human presence in the area, adding to existing pressures on other resources that may pose a higher threat to the success of ecological restoration efforts.

Many stakeholders may view Alternative C as a type of a middle ground; addressing a wide array of resource management issues and concerns, promoting multiple-use on a large-scale level, while avoiding many management options that might be viewed as extreme by one or more interest groups. This is not to

characterize Alternative C as representing any type of a consensus, but rather as an alternative that offers many stakeholders something that they favor or can support.

Conclusion. Alternative C restoration activities would increase regional population by 190 to 210 residents. The gains and corresponding benefits on local housing markets would be concentrated around Ely. Indirect benefits from long-term commodity use, stewardship contracting, and expanded options for land disposal would result in long-term social benefits and adverse impacts due to the scale of potential long-term growth. The management emphasis for Alternative C may hold less appeal to stakeholders desiring stronger resource protection, sportsmen, and those favoring commercial uses of forest/woodland and other plant products than to interests promoting motorized recreation.

Alternative D

Population and Demographics. Direct population effects of Alternative D would be similar to those described for Alternative A; long-term population declines in White Pine County, a stable or declining population in the eastern portion of Nye County, and limited growth in Lincoln County, all absent development resulting from the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts. The land disposal assumptions under Alternative D could result in potential residential development of about 15,300 dwelling units in the planning area. The timing of development, and types and values of housing to be developed is uncertain. Realization of the full development is unlikely to occur during the life of this plan. Future residential development on disposed lands likely would result in increased year-round and seasonal populations within the planning area.

No direct population effects would occur on any of the three Indian Reservations under Alternative D.

Housing. Alternative D would have little direct, but potentially major long-term indirect impacts on local housing conditions or markets.

Social Values and Attitudes Regarding Public Land Management. The effect of Alternative D in terms of social values and attitudes is in large measure the counter-point to Alternative C. Alternative D carries forward several elements of Alternative A, but is dramatically different with respect to constraints on and levels of resource use. Hence, many stakeholders may view this alternative as non-responsive to their concerns about the impacts of future management on their economic and social well-being. Among the few discrete impacts associated with Alternative D would be opposition by many residents and local government officials to the no net loss of public lands provision and the elimination of livestock grazing that would be viewed as constraining future economic and community development. Those same provisions may be supported in principle by environmental advocacy interests, or possibly seen as restricting the potential for land exchanges and other actions involving lands managed by the Ely Field Office to achieve more desired environmental protection and management goals.

Conclusion. Alternative D would have little direct impact on regional population or housing markets, as compared to Alternative A. Alternative D carries forward several elements of Alternative A, but eliminates livestock grazing and places additional constraints on possible land disposal, mineral entry, and energy

4.0 ENVIRONMENTAL CONSEQUENCES

development that are viewed by residents as imperative to community and economic viability. Consequently, this alternative would hold relatively less appeal for area residents and local government officials than for those stakeholders whose specific areas of concern serve as the foundation for this alternative. Alternative D would support the least amount of residential development associated with land disposals, and thereby potentially would introduce the least influence on social dynamics within the planning area.

4.25 American Indian Issues

During the scoping process, several concerns were expressed by American Indian groups residing in or adjacent to the planning area. Foremost was the continuation of pinyon pine nut harvesting for personal and commercial use, followed closely by continued access to harvesting areas and places of spiritual or cultural importance, land disposals, and limitations on outfitter and guide permits and its effect on those tribes that offer guide services. Pinyon pine nut harvesting by American Indians for personal use, as well as access to places of spiritual or cultural importance, would continue under all of the alternatives. For a discussion on land disposals and the effect on the social and economic conditions of American Indian groups, the reader is referred to Section 4.24, Social Conditions. The proposed monitoring of the use and number of outfitter and guide permits for a 3-year period followed by implementation of stipulations and conditions on permits as necessary to protect resources and reduce user conflicts is not expected to disproportionately affect American Indian participants in this industry. The potential use of a competitive bidding process for issuing such permits under Alternative B, however, would be more likely to create disproportionate economic hardship for American Indian participants than for other groups involved in outfitting and guiding. Because Alternatives A and C would have no limits on issuance of outfitter and guide permits, they would have no effect on American Indian participants. Under Alternative D, no outfitter and guide permits would be issued, thus, affecting all participants in the industry.

Impacts associated with American Indian traditional values and their management would be mitigated through the Section 106 government-to-government consultation process. The 1992 National Historic Preservation Act amendments place major emphasis on the role of American Indian groups in the Section 106 review process. Subsequent revisions to the regulations of the Advisory Council on Historic Preservation published May 18, 1999, incorporate specific provisions for federal agencies to involve American Indian groups in land or resource management actions and for consulting with these groups throughout the process. Before making decisions or approving actions that could result in changes in land use, physical changes to lands or resources, changes in access, or alienation of lands, federal managers must determine whether American Indian interests would be affected, observe pertinent consultation requirements, and document how this was done. The consultation record would be the federal agency's basis for demonstrating that the responsible manager has made a reasonable and good faith effort to obtain and consider appropriate American Indian input in decision making.

In the event that human remains, funerary items, sacred objects, or objects of cultural patrimony are discovered during activities associated with management actions, the activities would cease in the immediate vicinity and the authorized officer would be notified of the find. The activities would continue after the authorized officer issues a notice to proceed (see Appendix F, Section 1).

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation

4.0 ENVIRONMENTAL CONSEQUENCES

measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

4.26 Environmental Justice

Impact Issues

Executive Order 12898, "Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations," requires federal agencies to identify and address disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations. The BLM's goal when environmental justice issues arise is to reduce, to the extent practicable, inequitable distributions of environmental benefits and costs, based on race, ethnicity, or income. The Ely Field Office has a proactive program to promote and provide opportunities for full involvement of Tribes in local decisions that may affect their lives, livelihoods, and health (see Section 5.2 for more information about the tribal Consultation effort conducted as part of the Proposed RMP effort.)

Assumptions for Analysis

Completion of the watershed analysis and vegetation treatment programs will be long-term endeavors, with many long-term results not realized during the anticipated life of the Ely RMP. The lengthy time horizon and uncertain sequencing and priorities associated with watershed analysis and restoration activities precludes detailed analysis of potential adverse impacts to minority or low income populations due to the alternatives. Consequently, the Ely Field Office will seek to reduce or mitigate such impacts through the following policies.

- During the watershed analysis and treatment programs, the Ely Field Office will continue its efforts to allow subsistence activities by American Indians on public lands and avoid disproportionate adverse impacts on minority or low-income populations.
- Priorities for watershed analysis and treatments will be based on consistent application of decision criteria grounded in the best available scientific information, with consideration of the spatial distribution across the entire decision area in order to avoid temporal and spatial concentration of beneficial or adverse impacts disproportionately affecting an individual or group.
- The Ely Field Office will consider the potential incidence (magnitude, duration, and relative importance) of short and long-term adverse impacts associated with its treatment programs in its allocation of short and long-term benefits of restored healthy ecological systems.
- Within the frameworks established by BLM policies and applicable laws, the Ely Field Office will promote the training and employment of qualified minority and low-income residents to participate in the watershed analysis and treatment programs.

4.0 ENVIRONMENTAL CONSEQUENCES

Interactions with Other Programs

Management of other resources has the potential to cause environmental justice issues. Thus, other management actions were examined to identify potential areas of concern.

Goal

Continue efforts to avoid, to the extent practicable, inequitable distributions of adverse environment impacts that may arise based on race, ethnicity, or income.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

American Indians within and outside the planning area have subsistence use (e.g., pinyon nut harvesting) and cultural ties to public lands administered by the Ely Field Office. The Proposed RMP would maintain those current ties, inter-governmental coordination efforts, and programs to protect cultural values, and provide for continued access to places of spiritual and cultural importance and to vegetation products.

Several geographical areas of interest to American Indians were identified through interviews and meetings with American Indian tribal leaders and members. If a land use decision was proposed in a geographical area of interest to the Tribes, the Ely Field Office would take into account any concern raised by the Tribes and work with them to address those concerns.

Conclusion. No significant, adverse, or disproportionately high environmental or health effects to minority or low-income populations were identified in conjunction with the resource programs, objectives, or management actions associated with the Proposed RMP.

Alternative A

Environmental justice issues would be the same as described for the Proposed RMP.

Conclusion. No disproportionate adverse impacts to low-income populations were identified in conjunction with the resource programs or management actions associated with Alternative A. Alternative A would meet the goal for environmental justice.

Alternative B

Environmental justice issues would be the same as described for the Proposed RMP.

Based on their established or prospective patterns and locations of use, individuals, households, and groups of individuals who engage in recreation and subsistence uses in the decision area could be temporarily affected by management actions associated with the watershed analysis and treatment/restoration programs, which affect access, harvest limits, seasonal use, or levels of approved grazing.

Conclusion. No significant, adverse, or disproportionately high environmental or health impacts to minority or low-income populations were identified in conjunction with the resource programs, objectives, or management actions associated with Alternative B.

Alternative C

Environmental justice issues would be the same as described for the Proposed RMP.

Conclusion. No significant, adverse, or disproportionately high environmental or health impacts to minority or low-income populations were identified in conjunction with the resource programs, objectives, or management direction associated with Alternative C.

Alternative D

Environmental justice issues would be the same as described for the Proposed RMP.

Conclusion. No significant, adverse, or disproportionately high environmental or health impacts to minority or low-income populations were identified in conjunction with the resource programs, objectives, or management direction associated with Alternative D.

4.27 Health and Safety

Impact Issues

Remediation of contaminated and hazardous sites is necessary for compliance with applicable federal and state rules and regulations governing the remediation of such sites.

Assumptions for Analysis

None.

Interactions with Other Programs

It is expected that the health and safety management program within the planning area potentially would be minimally affected by actions within other resource management programs except for vegetation and fire management.

Goal

The goal of the health and safety program is to ensure that management actions are protective of life and property.

Mitigation Measures

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Impacts to health and safety also would be mitigated through the best management practices listed in Appendix F, Section 1. Best management practices would be implemented by the Ely Field Office on a project-specific basis, as appropriate for the specific characteristics of the project area and the types of disturbance being proposed. After completion and approval of the RMP, during project implementation, additional mitigation measures may be identified, as appropriate, on a site-specific basis. These measures would be identified through the site-specific NEPA analysis in response to anticipated impacts associated with proposed projects.

Proposed RMP

Impacts from Health and Safety Management Actions. Activities under this alternative would be conducted in accordance with applicable regulations and BLM policy with regard to health and safety and protection of personal property. All programs managed by the Ely Field Office would operate under these basic rules and procedures. More stringent procedures could be instituted by the Ely Field Office for certain activities on a case-by-case basis, although none are proposed for this alternative. As a result, there would be no program-specific impacts for health and safety under this alternative.

4.0 ENVIRONMENTAL CONSEQUENCES

Impacts from Other Programs. Minimal effects to health and safety have been identified as a result of management activities associated with other resource management programs.

Vegetation/Fire Management. Vegetation treatments, including fuel reduction in wildland urban interface areas, and fire management plans of this alternative would substantially reduce the long-term risk of large-scale wildland fires and the risk of personal injuries and destruction of personal property associated with wildland fires. The revised Fire Management Plan facilitates prompt fire response and improves guidance and direction for fire use in each Fire Management Unit. Although concern was raised during public scoping regarding emission of radionuclides during wildland fires, there is no evidence that this would occur at a level constituting a health risk (see Section 4.2).

Conclusion. There would be a decrease of risk to public health and safety because of the decreased wildland fire risk. The Proposed RMP would meet the goal for the health and safety program.

Alternative A

Impacts from Health and Safety Management Actions. Impacts would be the same as the Proposed RMP.

Impacts from Other Programs. Minimal effects to health and safety have been identified as a result of management activities associated with other resource management programs.

Vegetation/Fire Management. Fuel supplies would continue to increase, leading to increased wildland fire risk. Risks are primarily related to personal injury and physical destruction of property associated with wildland fires.

Conclusion. There would be a slight increase of risk to public health and safety because of an increased wildland fire risk. Alternative A would meet the goal for the health and safety program.

Alternative B

Impacts from Health and Safety Management Actions. Impacts would be the same as the Proposed RMP.

Impacts from Other Programs. Minimal effects to health and safety have been identified as a result of management activities associated with other resource management programs.

Vegetation/Fire Management. Vegetation treatments, including fuel reduction in wildland urban interface areas, and fire management plans of this alternative would substantially reduce the long-term risk of large-scale wildland fires and the risk of personal injuries and destruction of personal property associated with wildland fires. The revised Fire Management Plan facilitates prompt fire response and improves guidance and direction for fire use in each Fire Management Unit. Although concern was raised during

public scoping regarding emission of radionuclides during wildland fires, there is no evidence that this would occur at a level constituting a health risk (see Section 4.2).

Conclusion. There would be a decrease of risk to public health and safety because of decreased wildland fire risk. Alternative B would meet the goal for the health and safety program.

Alternative C

Impacts from Health and Safety Management Actions. Impacts would be the same as the Proposed RMP.

Impacts from Other Programs. Minimal effects to health and safety have been identified as a result of management activities associated with other resource management programs.

Vegetation/Fire Management. Vegetation treatments focused on removal of large fuels would be less extensive than in Alternative B. The continued accumulation of fuels in untreated areas coupled with wildland fire suppression of this alternative would ultimately lead to major wildland fire risks and the associated risks of personal injuries and destruction of personal property.

Conclusion. There would be an increase of risk to public health and safety because of increased wildland fire risk. Alternative C would not meet the goal for the health and safety program.

Alternative D

Impacts from Health and Safety Management Actions. Impacts would be the same as the Proposed RMP.

Impacts from Other Programs. Minimal effects to health and safety have been identified as a result of management activities associated with other resource management programs.

Vegetation/Fire Management. This alternative would combine minimal fire suppression efforts with very limited vegetation treatments. Thus, major large-scale wildland fire events and increased fire risk and personal injuries and destruction of property associated with wildland fires would be expected over the long term and may occur during the short term.

Conclusion. There would be a great increase of risk to public safety because of the increased wildland fire risk and the potential for large destructive fires. Alternative D would not meet the goal for the health and safety program.

4.28 Cumulative Impacts**4.28.1 Introduction**

Cumulative impacts are those effects on the environment that result from the incremental impacts of the management direction contained in the RMP when added to the effects of other past, present, and reasonably foreseeable future actions, regardless of what agency (federal, tribal, state, or local) or private entity undertakes such other actions. Cumulative impacts can result from individually inconsequential, but collectively significant, actions taking place over a period of time (Title 40 Code of Federal Regulations Subpart 1508.7). This analysis focuses on the cumulative impacts of the Proposed RMP and other actions both within and outside of the planning area. A qualitative description of the differences in cumulative impacts between the Proposed RMP and other alternatives (Alternative A through Alternative D) also is included.

Nevada BLM Instruction Memo NV-90-435 specifies that impacts must first be identified for the proposed action (i.e., the Proposed RMP) before cumulative impacts with other actions can occur. According to the BLM's "Guidelines for Assessing and Documenting Cumulative Impacts" 1994 handbook, cumulative impact analysis should be focused on those issues identified during scoping that are of major importance, in this case the cumulative impacts of new management actions.

4.28.1.1 Assumptions for Cumulative Impact Analysis

- Based on an assumed 5 acre-feet per acre per year for areas currently cultivated in the planning area, there would be an ongoing water demand of 320,000 acre-feet per year for agricultural development.
- Based on an assumed 10 gallons per animal unit per day for livestock and wild horses in the planning area, there would be an ongoing water demand of 550 acre-feet per year for livestock grazing and wild horse management.
- Residential development is assumed to have a water demand of 1 acre-foot per acre of development per year.
- The Lincoln County and White Pine County Conservation, Recreation, and Development Acts will allow for the disposal of lands administered by the Ely Field Office within the planning area. A portion of the land disposed of could be used for residential development. For very general analysis purposes, it has been assumed that 27,900 dwelling units would be constructed on 18,600 acres in White Pine County and 86,100 dwelling units on 57,400 acres in Lincoln County. Since many of these dwelling units could have recreational or seasonal occupancy, it has been assumed that each dwelling unit would have one full-time resident. Further, it is assumed that the timeframe for this residential development would exceed the life of the Proposed RMP, something on the order of 50 years.
- Based on an assumed 10-foot-wide increase in width, the paving of Kane Springs Road would result in a new surface disturbance of approximately 50 acres.

4.0 ENVIRONMENTAL CONSEQUENCES

- Based on an assumed 80-mile-long, 100-foot-wide construction right-of-way, the road from Caliente to Mesquite would result in a new surface disturbance of approximately 970 acres.
- Based on an assumed 1,400-acre site; 20 miles of water pipeline on a 60-foot-wide construction right-of-way; a 2-mile-long, 100-foot-wide rail spur right-of-way; a 34-mile-long, 200-foot-wide transmission line right-of-way; and 52 acres for access roads, electric distribution lines to water wells, construction staging areas, and construction access, new surface disturbance associated with the White Pine Energy Station is estimated at 2,450 acres.
- Based on an assumed 383-mile-long, 400-foot-wide right-of-way, transmission line construction in the Southwest Intertie Project corridor is expected to result in new surface disturbance of approximately 18,600 acres.
- Up to 5,000 megawatts of wind energy capacity would be developed in the planning area, and wind farms and ancillary facilities would have approximately 4,000 acres of temporary and permanent disturbance.
- Based on an assumed 100-mile-long, 200-foot-wide right-of-way within the planning area, the railroad branch line from Caliente, Nevada, to the Yucca Mountain Repository is expected to result in approximately 2,400 acres of new surface disturbance.

4.28.1.2 Timeframe for Analysis

The timeframe for this cumulative impact analysis encompasses past and present activities in the planning area, including historic mining which may date back more than 100 years, and future activities that may extend 20 years into the future.

4.28.1.3 Past, Present, and Reasonably Foreseeable Future Actions

Interrelated projects are defined for this EIS as those activities that could interact with the Proposed RMP in a manner that would result in cumulative impacts. For ease of presentation, interrelated projects and natural processes have been grouped as past, present, and reasonably foreseeable future actions that may interact with the management actions contained in the Proposed RMP. The potentially interrelated projects are listed and described below. **Table 4.28-1** quantifies four important characteristics of each project that are relevant to cumulative impacts. These characteristics were selected to describe the interrelated project because they address the potential physical, biological, and socioeconomic impacts of each project. It also allows the combined impacts of interrelated projects to be totaled. The interrelated projects are shown in **Map 4.28-1**, and **Table 4.28-2** identifies the potential interactions among the interrelated projects and the resource programs. The geographic area for cumulative impacts is determined primarily by the locations of the interrelated projects and the interactions with potentially affected resource programs. The area for certain resources may be restricted to the actual disturbance areas of the interrelated projects (i.e., cultural resources sites), while others may range over a wider area within and beyond the planning area (i.e., air quality).

**Table 4.28-1
Impact Characteristics of Interrelated Projects and Natural Processes**

Interrelated Project	Air Emissions¹	Surface Disturbance within the Planning Area (acres)	Ongoing Water Demand within the Planning Area (acre-feet/year)	Permanent Employment within the Planning Area
Past Actions				
Human Actions				
• Atlanta mining district	Not Applicable	500	Not Applicable	Not Applicable
• Mount Hamilton/ White Pine mining district	Not Applicable	400	Not Applicable	Not Applicable
• Pioche mining district	Not Applicable	700	Not Applicable	Not Applicable
• Robinson mining district	Not Applicable	5,400	Not Applicable	Not Applicable

4.28-3

4.28 Cumulative Impacts

Table 4.28-1 (Continued)

Interrelated Project	Air Emissions ¹	Surface Disturbance within the Planning Area (acres)	Ongoing Water Demand within the Planning Area (acre-feet/year)	Permanent Employment within the Planning Area
Present Actions				
Human Actions				
• Bald Mountain mining district	PM ₁₀ , oxides of nitrogen, carbon monoxide, and sulfur dioxide within National Ambient Air Quality Standards; process emissions less than 100 tons per year	4,200	2,000	100
• Reopening the Robinson Mine	Would meet New Source Performance Standards	No new area	5,700	430
• Reclamation of the McGill tailings	Fugitive dust	3,500	10,000	1
• Reid Gardner Power Plant (Clark County)	Coal-fired; PM ₁₀ , oxides of nitrogen, carbon monoxide, and sulfur dioxide emissions greater than 100 tons per year; Prevention of Significant Deterioration source within National Ambient Air Quality Standards	No Effect	No Effect	No Effect
• Department of Defense activities	No Effect	(Minimal over 691,000 acres of Nevada Test and Training Range within the planning area)	No Effect	No Effect
• Agricultural development	No Effect	64,000	320,000 (assuming 5 acre-feet/acre/year)	320 (split with livestock grazing)
• Livestock grazing	No Effect	(Minimal over 11.2 million acres open to grazing)	550 (assuming 10 gallon/animal unit/day for livestock and wild horses)	320 (split with agricultural development)
• Falcon to Gonder 345-kV transmission line	No Effect	1,200 (assuming a 160-foot-wide right-of-way)	No Effect	No Effect
• Conservation plans for greater sage-grouse	No Effect	Vegetation would be treated to improve habitat for greater sage-grouse but not possible to quantify area	No Effect	No Effect

4.28-4

4.0 ENVIRONMENTAL CONSEQUENCES

Table 4.28-1 (Continued)

Interrelated Project	Air Emissions ¹	Surface Disturbance within the Planning Area (acres)	Ongoing Water Demand within the Planning Area (acre-feet/year)	Permanent Employment within the Planning Area
• Off-highway vehicle recreation use	No Effect	(Entire planning area open except designated wilderness and wilderness study areas)	No Effect	No Effect
Natural Processes				
• Wildland fire	Short term and seasonal	See Future Actions	No Effect	No Effect
• Drought	(Greater during drought)	No Effect	(Would decrease supply)	No Effect
• Expansion of pinyon and juniper trees	(Reduced ground cover)	No Effect	(Increased transpiration)	No Effect
• Spread of forest insects and diseases	(Reduced ground cover)	No Effect	(Reduced transpiration)	No Effect
• Spread of noxious/invasive weeds	No Effect	No Effect	No Effect	No Effect
Subtotal	Not Applicable	72,900	338,250	1,171
Reasonably Foreseeable Future Actions				
Human Actions				
• Lincoln County Land Act development	No Effect	13,500	13,500	Unknown
• Lincoln County Conservation, Recreation, and Development Act	No Effect	Up to approximately 90,000		Unknown
• White Pine County Conservation, Recreation, and Development Act	No Effect	Up to approximately 45,000		Unknown
• Transfer of lands to American Indian Tribes	No Effect	Location and area to be determined by Congress	Unknown	Unknown
• Water development in Lincoln County and White Pine County	No Effect	3,000 (200 wells at 1 acre per well, and 300 miles of 75-foot-wide pipeline right-of-way)	Unknown	20
• Coyote Springs residential development	No Effect	20,000	20,000	Unknown
• Paving Kane Springs Road	No Effect	Approximately 50 acres assuming 10 feet of new disturbance	No Effect	No Effect
• Road from Caliente to Mesquite	No Effect	Approximately 970 acres assuming a 80-mile-long, 100-foot-wide construction right-of-way	No Effect	No Effect

4.28-5

4.28 Cumulative Impacts

Table 4.28-1 (Continued)

Interrelated Project	Air Emissions ¹	Surface Disturbance within the Planning Area (acres)	Ongoing Water Demand within the Planning Area (acre-feet/year)	Permanent Employment within the Planning Area
• Toquop Energy Project	Coal-fired; would meet New Source Performance Standards	500	2,500	110
• White Pine Energy Station	Would meet New Source Performance Standards	Approximately 2,450 (assumes 1,400 acres for site, 20 miles of water pipeline at 60 feet wide, 2 miles of rail spur at 100 feet wide, and 34 miles of transmission line at 200 feet wide)	5,000	150
• Ely Energy Center	Would meet New Source Performance Standards			
• Southwest Intertie Project Corridor	No Effect	Approximately 18,600 acres assuming a 383-mile-long, 400-foot-wide right-of-way	No Effect	No Effect
• Wind energy development	No Effect	4,000 permanent	No Effect	100
• Holly Energy Pipeline	No Effect	Approximately 200 acres assuming a 22.6-mile-long, 75-foot-wide construction right-of-way	No Effect	No Effect
• Expansion of the Bald Mountain Mine	Would meet New Source Performance Standards	3,800	1,100	100
• Barrick Land Sale	No Effect	14,770	Unknown	Unknown
• Expansion of the Panaca pozzolana mine	No Effect	200	No Effect	15
• Department of Defense activities	No Effect	(Minimal over 691,000 acres of Nevada Test and Training Range within the planning area)	No Effect	No Effect
• Yucca Mountain Project	No Effect	No Effect	No Effect	No Effect
• Department of Energy Caliente rail corridor	No Effect	Approximately 2,400 acres assuming a 100-mile-long, 200-foot-wide right-of-way within the planning area	Unknown	10
• Bassett Lake dam rebuild and expansion	No Effect	Unknown	No Effect (no new water use not already prior appropriated)	No Effect
• Cave Lake dam rebuild	No Effect	No Effect	No Effect	No Effect

Table 4.28-1 (Continued)

Interrelated Project	Air Emissions ¹	Surface Disturbance within the Planning Area (acres)	Ongoing Water Demand within the Planning Area (acre-feet/year)	Permanent Employment within the Planning Area
• Comins Lake expansion	No Effect	Lake surface would expand approximately 600 acres	Additional lake surface evaporation (Water use is already appropriated)	No Effect
• Habitat conservation plans for threatened and endangered species	No Effect	Could restrict surface disturbance in certain areas	No Effect	No Effect
• Conservation plans for greater sage-grouse	No Effect	Vegetation would be treated to improve habitat for greater sage-grouse but not possible to quantify area	No Effect	No Effect
• Increased off-highway vehicle use from population growth in Clark County	No Effect	(Limited to existing roads and trails, and 730,000 acres emphasized for use but not all disturbed)	No Effect	No Effect
Natural Processes				
• Wildland fire	Short term and seasonal	60,000	No Effect	No Effect
• Drought	No Effect	No Effect	(Would decrease supply)	No Effect
• Expansion of pinyon and juniper trees	No Effect	No Effect	(Increased transpiration)	No Effect
• Spread of forest insects and diseases	No Effect	No Effect	No Effect	No Effect
• Spread of noxious/invasive weeds	No Effect	No Effect	No Effect	No Effect
• Spread of West Nile virus	No Effect	No Effect	No Effect	No Effect
Subtotal	Not Applicable	781,130	46,600	345
TOTAL	Not Applicable	1,457,330	383,850	1,516

Note: All quantification is approximate.

¹Air emissions from mobile sources and those that would not extend beyond 2 miles would not have any substantial cumulative impact.

Past Actions

- Atlanta Mining District – The Atlanta Mining District was discovered in 1869 and included a historic underground and open pit gold and uranium mine located north of Pioche. Mining commenced in 1871 and continued intermittently until 1996 (Tschanz and Pampeyan 1970).
- Mount Hamilton/White Pine Mining District – The Hamilton or White Pine Mining District was located in 1865 and operations continued through the 1990s. This District experienced one of the largest mining rushes in U.S. history and produced silver, copper, lead, and zinc from underground and open pit mines located west of Ely in the White Pine Range (Hose et al. 1976).
- Pioche/Caselton Mining District – The Pioche/Caselton Mining District was discovered in 1863; production began in 1869 and continued until approximately 1960. Production from underground mines in the District, which was located in the Pioche Hills to the west of Pioche, included silver, zinc, gold copper, and lead (Tschanz and Pampeyan 1970).
- Robinson Mining District – The Robinson Mining District, which is one of the oldest and largest mining districts in the state, is located just west of Ely and dates back to 1867. Silver was the first commodity mined in the district, followed by gold. Copper mining began in 1908 and was active until approximately 1999 (Hose et al. 1976; BLM 1994b).
- Tempiute Mining District – The Tempiute Mining District began as a silver district and was developed from 1869 to 1883. Tungsten was discovered in 1916 and was ultimately mined from the 1930s to 1957 and again from 1977 to 1982. While currently inactive, the district has produced copper, lead, and zinc, in addition to silver and tungsten (Tschanz and Pampeyan 1970; Cox and Singer 1992).
- Nevada Test Site – This 1,375-square-mile area was originally established in the early 1950s as the Atomic Energy Commission's on-continent nuclear weapons proving ground. It lies contiguous with the Nevada Test and Training Range. A moratorium on nuclear weapons testing was implemented in 1992 and since that time, the site, which is located 65 miles north of Las Vegas, has diversified into many other programs such as hazardous chemical spill testing, environmental technology studies, conventional weapons testing, waste management, and emergency response training (U.S. Department of Energy 2004).
- Road and railroad development – Roads and railroads built in the planning area prior to the 1990s largely accommodated mining operations and supplied local communities. The Nevada Northern Ruth to Wendover line and the Union Pacific line from Caliente to Las Vegas are two historic rail lines located within the planning area.
- Agricultural development – Historic agricultural development in the planning area was generally associated with livestock and included irrigated hay pastures.

4.0 ENVIRONMENTAL CONSEQUENCES

- Livestock grazing – Livestock grazing operations in the planning area developed during the mid- to late-1800s. Historic stocking rates were higher than present.
- Critical habitat has been designated for threatened and endangered species within the planning area. The most extensive designation involved the desert tortoise habitat in the Mojave Desert region of the southeastern part of the planning area. In the 2000 Desert Tortoise Amendment to the Caliente MFP, 203,670 acres were designated as three ACECs for the protection of designated critical habitat.
- Wildland fire – Over the 20 years between 1985 and 2005, wildland fire has burned approximately 400,000 acres within the planning area. The area burned varied greatly from year to year. In the year 2005, approximately 600,000 acres burned within the planning area.
- Expansion of pinyon and juniper trees and other woody species – Over the past 150 years, trees have increased in woodlands, spread into shrublands and grasslands, and are expected to continue expansion.
- Spread of noxious/invasive weeds – Noxious weeds have been spreading in the planning area to the point that approximately 168,000 acres managed by the Ely Field Office are now infested. Invasive annual grasses such as cheatgrass and red brome have become a primary problem over a much greater area.

Present Actions

- Bald Mountain Mining District – The Bald Mountain Mining District is located in White Pine County approximately 70 miles northwest of Ely, Nevada. The district dates back to 1869 with open pit gold mining and processing beginning in the 1980s (BLM 1995). Current operations are anticipated to continue through 2010 and beyond.
- Reopening the Robinson Mine – Quadra Mining Ltd. has purchased the Robinson Mine facilities east of Ely and resumed operations in the fourth quarter of 2004. Surface disturbance areas are expected to remain as identified in the 1994 EIS (BLM 1994b).
- Reclamation of the McGill tailings – The McGill tailings were generated through operations associated with a historic copper smelter and gravity separator located north of Ely. The smelter processed ore from 1908 to 1980, had 1,400 employees at its peak, and an 8.5-mile-long water supply pipeline (Hose et al. 1976). The tailings disposal area is currently undergoing reclamation.
- Reid Gardner Power Plant – Reid Gardner is a 590-megawatt, coal-fired power plant that was constructed in the mid-1960s just south of Moapa, Nevada. It is owned and operated by Nevada Power Company. Coal is delivered to the plant site via rail.
- Department of Defense Activities – The Military has used and would like to continue using the public lands in the planning area. A portion of the planning area lands fall under the Desert, Reveille, and

4.28 Cumulative Impacts

Gandy Military Operations Areas and several low-level Military Training Routes. The typical military uses are: overflights; fixed and rotary wing landing areas; Forward Air Refueling Points; electronic communication (fixed and mobile) and threat operations; Drop Zone operations (airdrops from 500 feet above ground level to 10,000 feet above ground level of equipment or personnel); no-drop visual-only convoy targets; and emergency access and response.

- Agricultural development – According to BLM’s geographic information system database, approximately 63,800 acres are currently under agricultural production in the planning area. This amount includes irrigated hay pastures, row crops, grain crops, and orchards (BLM unpublished data).
- Livestock grazing – Approximately 11.2 million acres are currently available for grazing in the decision area. A total of approximately 545,267 animal unit months are permitted in the decision area, with approximately 206,707 animal unit months of use identified in 2002.
- Falcon to Gonder 345-kilovolt Transmission Line – A new 345-kilovolt transmission line has been constructed to connect the Falcon Substation (north of Dunphy and Battle Mountain, Nevada) to the Gonder Substation (north of Ely, Nevada). Reclamation is ongoing. Approximately 60 miles of the line lie within the planning area (BLM 2001h [Falcon to Gonder EIS]).
- Conservation plans for greater sage-grouse – The downward trend in population of the greater sage-grouse throughout the West resulted in petitions for listing the bird range-wide and locally as federally threatened or endangered. On January 4, 2005, the Secretary of the Interior announced that the greater sage-grouse did not warrant protection under the Endangered Species Act. However, implementation of conservation plans for greater sage-grouse within the planning area would include active management techniques to improve habitat quality for greater sage-grouse, maintain or increase management unit populations, and maintain or increase greater sage-grouse numbers.
- Off-highway vehicle recreation use – As large areas of BLM-managed land in Clark County are being closed to off-highway vehicle use due to measures taken to protect the desert tortoise and air quality, more recreation use has shifted to Lincoln and White Pine counties.
- Wildland fire – See Reasonably Foreseeable Future Actions.
- Drought – See Reasonably Foreseeable Future Actions.
- Expansion of pinyon and juniper trees and other woody species – Over the past 150 years, trees have increased in woodlands, spread into shrublands and grasslands, and are expected to continue expansion.
- Spread of forest insects and diseases – Several years of drought in western states have resulted in severe stress on pinyon pines. This stress has made the trees less able to fend off attacks by insects such as the Ips beetle. As mentioned in Section 3.5, white pine blister rust also is infecting and causing

4.0 ENVIRONMENTAL CONSEQUENCES

mortality in bristlecone pines north and west of the planning area. It is expected to infect neighboring mountains in the foreseeable future.

- Spread of noxious/invasive weeds – Noxious and invasive weeds continue to spread on all lands, both public and private, reducing natural biodiversity, vegetation production, and soil quality. Due to their tolerance of fire and rapid spread into burned areas, invasive annual grasses such as cheatgrass and red brome are expected to remain a serious long-term challenge in the planning area.

Reasonably Foreseeable Future Actions

- Lincoln County Land Act development – As mandated by the Lincoln County Land Act of October 13, 2000, the Ely Field Office disposed of 13,500 acres of public land located north and west of Mesquite, Nevada. The sold land would be used to expand the community of Mesquite, Nevada (BLM 2001c).
- Lincoln County Conservation, Recreation, and Development Act of 2004 – The Lincoln County Conservation, Recreation, and Development Act was signed into law on November 30, 2004. The Act authorizes the sale of up to 90,000 acres of BLM-administered land in Lincoln County, with 10 percent of the revenues going to Lincoln County for economic development, 5 percent to the state for education, and 85 percent being retained by the federal government. The Act also designates approximately 770,000 acres of wilderness.
- White Pine County Conservation, Recreation, and Development Act of 2006 – The White Pine County Conservation, Recreation, and Development Act was signed into law on December 20, 2006. The Act authorizes the sale of up to 45,000 acres of BLM-administered land in White Pine County, with 10 percent of the revenues going to White Pine County for economic development, 5 percent to the state for education, and 85 percent being retained by the federal government. The Act also designates approximately 558,000 acres of wilderness.
- Transfer of lands to American Indian Tribes – As part of the White Pine County Conservation, Recreation, and Development Act, four parcels of land totaling 3,526 acres were transferred in trust to the Ely Shoshone Tribe. Proposals for the transfer of public lands within the decision area also have been prepared by the Duckwater Shoshone Tribe and Moapa Band of Paiutes. The location and land area of any such transfers would be determined by Congress.
- Water development in Lincoln County and White Pine County – Groundwater development in Lincoln County and White Pine County may occur. Proposals by the Southern Nevada Water Authority and Lincoln County Water District are currently being evaluated by the Ely Field Office in separate EISs. It is anticipated that the water would be used in White Pine or Lincoln counties for industrial or residential development or would be transported to Clark County. Water development is regulated by the Nevada State Engineer and not by the BLM Field Offices.

4.28 Cumulative Impacts

- Coyote Springs residential development – This planned development of approximately 50,000 people would be located near the Clark and Lincoln County line on Highway 93. Approximately 20,000 acres are designated for the development (Hartmann 2004).
- Paving Kane Springs Road – This approximately 40-mile-long paving project, which would be located between Elgin, Nevada, and Highway 93 northwest of Moapa, would result in minimal land disturbance (slight widening of the existing roadway). The road lies on lands managed by both the Ely Field Office and Lincoln County (Hartmann 2004).
- Road from Caliente to Mesquite – This roadway would provide access to the Lincoln County Land Act area and to the Toquop Energy Project site. The road would involve new construction disturbance along an approximately 80-mile-long, 100-foot-wide construction right-of-way (Hartmann 2004).
- Toquop Energy Project – Toquop Energy, Incorporated has the permits required to construct and operate a 1,100-megawatt, natural gas-fired, water-cooled, electric generating plant in southeastern Lincoln County. The project includes a 12.5-mile-long waterline, 1,300-foot-long electric utility line, a 2,400-foot-long, 20-inch-diameter gas pipeline, and a 14.4-mile-long access road (Toquop Energy 2004). The current proposal is for a coal-fired unit with fuel being delivered by rail to replace the gas-fired unit. The reconfigured project would include a 750-megawatt plant, a 45-mile long rail spur from the Union Pacific mainline in Meadow Valley Wash, and permanent employment of approximately 110 workers. The coal-fired plant is anticipated to have a lower water usage, and the reduced size would bring air emissions more in line with the permitted gas-fired plant. This major revision in the project description requires a supplemental or new EIS before project development could begin (2,500 versus 7,000 acre-feet per year).
- White Pine Energy Station – White Pine Energy Associates, LLC, is proposing to construct a coal-fired power plant in north Steptoe Valley, about 30 miles north of Ely, Nevada, between McGill and Cherry Creek. The project consists of power generation units and related facilities, rail line, and transmission lines connecting northern and southern Nevada. Up to three 530-megawatt units (1,600-megawatts total) could be constructed. As part of the plan, the existing Nevada Northern Railroad would be used to transport coal to the site.
- Ely Energy Center – Sierra Pacific Resources is proposing a coal-fired power plant and related facilities, rail line, and transmission lines connecting northern and southern Nevada. The power generation facility would be located in north Steptoe Valley, about 20 miles north of Ely, Nevada, and would initially consist of two 750-megawatt generation units, with the first unit becoming operational in 2011. The second unit would be operational by 2014. Two 500-megawatt coal gasification units also would be constructed, when the technology becomes commercially viable.
- Southwest Intertie Project Corridor – The Southwest Intertie Project was originally proposed as a 540-mile-long 500-kilovolt transmission line from Idaho to termination points in southern Nevada and Delta, Utah. A right-of way for the project was granted in the 1990s (BLM 2001h), but the project was never constructed. However, approximately 383 miles of the Southwest Intertie Project corridor were

4.0 ENVIRONMENTAL CONSEQUENCES

maintained in the Ely planning area as a designated corridor. Two entities currently are considering use of the Southwest Intertie Project corridor for the construction of north-south transmission lines across the planning area. These are the Great Basin LLC 500-kilovolt line and the TransCanada direct current line.

- Wind energy development – The potential for wind energy development exists within the planning area. Based on Department of Energy evaluation of wind energy potential and current interest within the planning area, up to 40,000 acres of rights-of-way for wind farms could be granted during the life of the RMP. This would accommodate approximately 5,000 megawatts of generating capacity. Entities currently investigating wind energy projects in the planning area (from north to south) include: Nevada Wind (Antelope Range), Power Partners Wind (Diamond Range), Nevada Wind (Egan Range), Enxco Wind (Egan Range), Invenergy Wind (north Spring Valley), Spring Valley Wind (north Spring Valley), Nevada Wind (Schell Creek Range), and Table Mountain-Mount Wilson Wind (Wilson Creek Range).
- Holly Energy is proposing to construct a 12-inch-diameter refined liquids (gasoline and diesel fuel) pipeline from the Salt Lake City area to the Las Vegas area. This pipeline would be constructed in the existing Moapa corridor across the southeast corner of the planning area. Approximately 22.6 miles of the project would cross lands administered by the Ely Field Office.
- Expansion of the Bald Mountain Mine – Barrick Gold Corporation is planning to increase the size of the existing Bald Mountain Mine to enable it to continue mining and gold production for an additional 6 to 10 years. Bald Mountain Mine proposes an additional disturbance of 3,800 acres associated with pits, rock disposal areas, heap leaching, roads, growth media stockpiles, exploration, and underground mining activities. The Proposed North Operations Area would include the 4,200 acres of previously permitted disturbance and 3,800 acres of new disturbance, for a final disturbance footprint of about 8,000 acres. The North Operations Area EIS would incorporate existing analysis that includes several environmental assessments and the 1995 Bald Mountain Mine Expansion EIS.
- Barrick Land Sale – The proposed Northern Nevada Rural Economic Development and Land Consolidation Act of 2003 (H.R. 2869) may direct the Ely Field Office to sell approximately 14,770 acres of land located on Alligator Ridge and Bald Mountain in White Pine County to Barrick Gold Corporation.
- Expansion of the Panaca pozzolana mine – This existing, small-scale mine could be expanded. Pozzolana is a finely divided volcanic ash mineral composed of silica and aluminum that reacts chemically with lime, in the presence of moisture and at ordinary temperature, to form a strong, slow-hardening cement.
- Department of Defense activities – Military operations are described above in the past actions section and are expected to continue through the next 20 years.
- Yucca Mountain operations – On July 9, 2002, the U.S. Senate cast the final legislative vote approving the development of a deep underground facility, or repository, at Yucca Mountain, Nevada, for storage of highly radioactive nuclear waste. The repository is anticipated to store waste for at least

4.28 Cumulative Impacts

10,000 years. The Yucca Mountain Project is currently focused on preparing an application to obtain a license from the U.S. Nuclear Regulatory Commission to construct the repository. No construction date has been set (Office of Civilian Radioactive Waste Management 2004).

- Department of Energy Caliente rail corridor withdrawal – Approximately 308,600 acres in Clark, Esmeralda, Lincoln, and Nye counties has been withdrawn from surface entry and mining for a period of 20 years. During this period the land would be evaluated for potential construction, operation, and maintenance of a 307-mile-long branch rail line for the transportation of spent nuclear fuel and high-level radioactive waste to the proposed Yucca Mountain Repository (Office of Civilian Radioactive Waste Management 2004). Approximately 100 miles of the proposed railroad corridor would be within the planning area. The Department also is evaluating a rail route in western Nevada (the Mina corridor) that does not cross the planning area.
- Bassett Lake is a 77-acre reservoir located northwest of McGill, Nevada, on property owned by Kennecott Minerals Company. Discussions are underway among Kennecott, the Nevada Department of Wildlife, and White Pine County regarding the conversion of the lake from private to public ownership. It has been proposed that the dam creating the reservoir could be rebuilt and the pool size enlarged. Details on the project await resolution of ownership issues and a detailed engineering study.
- Cave Lake dam rebuild – The proposed project would repair the dam at the lake, probably between 2005 and 2007. No additional surface disturbance would be required, the lake would not increase in size, and fewer than 50 people are expected to be involved in construction (Richards 2004).
- Comins Lake expansion – Comins Lake south of Ely provides a productive year-round recreational fishery. Nevada Department of Wildlife is proposing to increase the area of Comins Lake for recreation purposes, effectively doubling its size to about 1,000 acres. A recent study evaluated reinforcing the existing roadway (Highway 93) at the lake crossing to act as a dam. The project is expected to be implemented in 2007 to 2008 (Richards 2004).
- Habitat conservation plans for threatened and endangered species – New habitat conservation plans could be developed for currently listed species. If additional species are listed as threatened or endangered, habitat conservation plans also would be developed for designated critical habitat within the planning area. It is anticipated that if new listings become necessary, they would most likely involve species that are dependent on sagebrush for their habitat requirements.
- Conservation plans for greater sage-grouse – See Present Actions.
- Increased off-highway vehicle use from population growth in Clark County – Off-highway vehicle use has shifted to Lincoln and White Pine counties as areas of BLM-administered public land in Clark County have been closed. As the population of Clark County increases, the demand for recreation use in the planning area is expect to continue increasing through the next 20 years.

4.0 ENVIRONMENTAL CONSEQUENCES

- Wildland fire – The area burned by wildland fire would continue to vary greatly from year to year. While it is very difficult to quantify the number of acres that could be affected, the Proposed RMP would collectively cover larger areas than in past years. For the cumulative impact analysis, it has been assumed that an additional 600,000 acres could be affected.
- Drought – Over the past 6 to 7 years, most of the western U.S. has experienced drought. Parts of Nevada have been described as being in “extreme drought” by the U.S. Department of Agriculture (cited in article of Las Vegas Review-Journal, April 12, 2004). This drought is threatening crops and pastures, has raised the potential for wildland fires, and has affected BLM’s ability to manage and succeed at restoration actions.
- Expansion of pinyon and juniper trees and other woody species – Over the past 150 years, trees have increased in woodlands, spread into shrublands and grasslands, and are expected to continue expansion.
- Spread of forest insects and diseases – Several years of drought in western states have resulted in severe stress on pinyon pines. This stress has made the trees less able to fend off attacks by insects such as the Ips beetle. As mentioned in Section 3.5, white pine blister rust also is infecting and causing mortality in bristlecone pines north and west of the planning area. It is expected to infect neighboring mountains in the foreseeable future.
- Spread of noxious/invasive weeds – Noxious and invasive weeds continue to spread on all lands, both public and private, reducing natural biodiversity, vegetation production, and soil quality. Due to their tolerance of fire and rapid spread into burned areas, invasive annual grasses such as cheatgrass and red brome are expected to remain a serious long-term challenge in the planning area.
- Spread of West Nile virus – In 2002 and 2003, the West Nile virus (transmitted by mosquitoes) began to cause bird, horse, and human deaths in Colorado and Utah. The virus expanded into Nevada in 2004 and is now present in White Pine and Clark counties.

4.28.2 Air Resources

Geographic Area for Analysis

The cumulative effects area for air resources includes projects and sources up to 62 miles (100 kilometers) beyond the planning area boundary.

Impacts of the Proposed RMP

The existing air quality of the planning area is typical of the largely undeveloped regions of the western U.S. For the purposes of statewide regulatory planning, this area has been designated as attainment for particulate matter with an aerodynamic diameter of 10 microns or less. (PM₁₀) and is unclassified for all other criteria air pollutants. The region is designated as a Class II area under the Prevention of Significant Deterioration regulations. The Class II designation allows for moderate growth or some degradation of air quality within certain limits above baseline air quality.

Under the Proposed RMP, emissions from wildland fires would affect the air resource. At the present time, wildland fires produce higher levels of smoke emissions than historical fires, because fuel available to be consumed by wildland fire has increased. Within the decision area, the proposed use of prescribed fire is expected to result in an increase of smoke emissions. As natural sources, wildland fires are not subject to air quality regulations, whereas prescribed fires and wildland fire use are subject to applicable smoke management regulations, including permitting. For each prescribed fire emitting more than 1.0 ton of PM₁₀ and smaller, a permit application must be completed and submitted to the Nevada Division of Environmental Protection. Final approval must be obtained 24 hours prior to ignition and would be based on ambient air quality conditions. Prescribed fires are generally smaller, less intense, and shorter in duration than wildland fires, and would be expected to have fewer impacts to human health and environment in the planning area than unplanned wildland fires.

While the impact would be localized and temporary, the operation of vehicles on unpaved surfaces (including licensed vehicles, recreational off-highway vehicles, and competition off-highway vehicles) would generate PM₁₀ (dust) emissions. Vehicle operation on BLM-administered lands would be restricted to designated roads and trails and permitted race courses.

Impacts of the Interrelated Projects

Present actions in the planning area that affect air resources are mainly related to mining and vegetation management/fire management practices. In the Bald Mountain and Robinson mining districts, open-pit mining generates particulate emissions and gaseous emissions from stationary and mobile sources. The Reid Gardner Station located near Moapa was permitted in 1980 and may emit 675 tons per year of oxides of nitrogen, 317 tons per year of sulfur dioxide, and 33 tons per year of PM₁₀. Particulate matter produced by land management activities or natural events on federally-administered lands originates from wildland fire, prescribed burning, road or wind-blown dust, volcanic eruptions, construction, mining, and vehicle use. Most particulate matter of concern is produced from fire, and most of this is PM₁₀.

4.0 ENVIRONMENTAL CONSEQUENCES

Expected future actions in the planning area that would involve the air resource would be related to potential electric generating power projects. If constructed, the Toquop Energy Project would be a 750-megawatt coal-fired power plant located northwest of Mesquite, Nevada. The White Pine County coal-fired power plants may be constructed in the near future in Steptoe Valley between Lages Junction and McGill, Nevada. These power plants are still in the early design stages. Stringent permitting requirements exist with the Nevada Division of Environmental Protection and U.S. Environmental Protection Agency that would require modern control technology to limit the emissions and impacts from any new power plant that would affect air quality in the cumulative effects area.

Other potential mining sources include the Robinson Mine, a copper mine located west of Ely, Nevada, that has reopened and resumed open-pit mining due to the recent increase in copper prices. The Bald Mountain Mine may expand its operations depending on future gold prices. Mines can be substantial sources of particulates due to fugitive dust from disturbed areas, haul roads, and loading and unloading trucks. Particulates generated during mining activities are generally more coarse than those resulting from combustion and would deposit closer to the sources. As such, mining does not have the potential to contribute as much to cumulative impacts across a broad region, but is more likely to have local impacts.

A number of reasonably foreseeable projects could have shorter-term and smaller air quality impacts (such as fugitive dust) within the planning area including water development projects such as the one proposed by the Southern Nevada Water Authority, the Coyote Springs residential development, paving of the Kane Springs road, construction work on the road from Caliente to Mesquite, creation of a new 31-mile railroad spur to supply coal to the Toquop energy project, creation of new rights-of-way, and potentially rebuilding existing dams. Expansion or reopening of existing mines in the planning area would have similar small effects on the overall air quality within the planning area.

Protection of visibility in Class I areas threatened by reasonably foreseeable development of large stationary sources such as power plants is largely the responsibility of state regulators. Many states have adopted visibility protection plans as part of their State Implementation Plans, which dictate when and how much burning can take place. However, the State Implementation Plan for Nevada does not currently include visibility protection plans. Class I areas are subject to the most limiting restrictions regarding how much additional pollution can be added to the air. Fine particulate matter, PM_{2.5}, is the primary cause of visibility impairment. Emissions from wildland fires and prescribed burning, which stay suspended for many miles, are in the 0.1 to 2.5 micron size class and generally reduce visibility. Management of prescribed burns and reducing the size of wildland fires are measures that could reduce visibility impacts to sensitive areas.

Cumulative Impacts Conclusion

Cumulative impacts include those caused by sources and activities associated directly with the Proposed RMP and those caused by interrelated projects that have occurred historically, projects that are currently underway, and those that might reasonably occur in the future. Air resources in the planning area are mainly affected by mining and vegetation management/fire management practices. Regulatory decisions related to industrial development and mining would help prevent air quality degradation by applying mitigation measures on a case-by-case basis. Three potential electrical generating power projects would affect air

4.28 Cumulative Impacts

quality in the region if constructed. Permitting requirements of the Nevada Division of Environmental Protection and the U.S. Environmental Protection Agency would require modern control technology to limit emissions and impacts from these potential sources. Fire management treatments would include in-depth planning and analysis of potential incident and cumulative air quality impacts to reduce emissions associated with fires. Projected cumulative impacts are of such a nature that the planning area should be able to meet all applicable local, state, tribal, and National Ambient Air Quality Standards under the Clean Air Act (as amended), and help prevent deterioration of air quality within the planning area from all direct and authorized actions.

Variation in Cumulative Impacts between the Proposed RMP and Other Alternatives

Alternative A: Same as the Proposed RMP.

Alternative B: Same as the Proposed RMP.

Alternative C: Same as the Proposed RMP.

Alternative D: Under Alternative D, discretionary actions, such as issuing rights-of-way for new power plants, would be greatly limited. Thus, cumulative impacts to local and regional air quality would be less than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.3 Water Resources

Geographic Area for Analysis

The cumulative effects area for water resources includes the closed to semi-closed basins of White Pine, Lincoln, and northeastern Nye counties located within the boundaries of the planning area. The mountain ranges and valleys that feed into the planning area also are part of the cumulative effects area for water resources. A portion of the lower Colorado River Basin, notably the Virgin River and Muddy River tributaries and downstream, also is included in the cumulative effects area.

Impacts of the Proposed RMP

The Proposed RMP would minimize impacts on water resources through vegetation management, management of wild horses, livestock closures, and administration of commodity-producing activities in balance with ecological system and natural resource objectives. Mineral extraction would be managed to minimize impacts to streams and water bodies, and watershed management would be designed to improve water quality in perennial and intermittent streams. Fire management would reduce the impact of wildland fires, and noxious weed management would enhance water quantity and quality. Livestock grazing, recreation, and other uses would be administered in an approach that is balanced with ecological system objectives. There may be short-term effects on water quality from additional sediment or chemical inputs stemming from vegetation treatments. These are expected to be minimal as a result of the implementation of best management practices by the Ely Field Office.

Water uses by livestock and wild horses may decrease somewhat, and intensively-used areas (such as riparian/wetland areas around springs or ponds) may recover to the extent that water quality characteristics would be expected to improve. Watershed restoration efforts would be expected to improve water quality as well.

Colorado River salinity issues are described in Section 3.3, Water Resources. Salinity is the major quality concern for the river; water resource and land managers along its entire length must consider the consequences of their activities on this issue. The BLM is fully involved in a multi-agency salinity control forum that targets salinity reduction. Efforts by the Ely Field Office to control soil erosion and minimize soil salinization through removal of tamarisk provide benefits to the overall BLM program. However, given the size of the Colorado River tributary watershed within the planning area (6,800 square miles), in comparison to the overall river basin area (250,000 square miles), any management activity or alternative would not have measurable effects on Colorado River salinity. The vast majority of salinity contributions, and potential activities for its control, occur elsewhere in the Colorado River Basin.

Impacts of the Interrelated Projects

Conflicting uses and increasing demands on water resources are common in the western and southwestern U.S. A number of projects have the potential to affect future water availability and beneficial uses in the planning area. These projects are described in general below. NEPA actions and/or state and local

permitting processes pertain to these interrelated projects. In addition, the Nevada Office of the State Engineer administers surface water and groundwater rights throughout the state.

Agricultural development in the planning area consists mainly of irrigated crops in some of the major valleys of White Pine and Lincoln counties, especially those near population centers. Irrigation diversions consume surface water and water from shallow alluvial groundwater found in the valleys, as a general rule. Upstream of planning area lands, the vast majority of perennial streamflows are diverted by agriculture as they exit the mountain fronts. Agriculture in east-central Nevada consumes about 5 acre-feet of water per acre of irrigated land on an average annual basis. For crop irrigation in the planning area, this amounts to a total irrigation use of about 320,000 acre-feet of water per year. This water use for irrigation is expected to continue into the future for at least another 20 years. Due to the privately-held nature of most cropland resources and water rights, the Proposed RMP would have little or no effect on these water uses. Due to their location, extent, and/or compliance with regulatory programs, agricultural practices and industrial activities are expected to generate minimal water quality changes in the planning area overall, both during and after watershed restoration programs. Similarly, the potential for water quality changes resulting from the use of water resources by existing water rights holders in accordance with their current rights, are expected to be comparatively trivial on BLM-administered lands during and after watershed restoration.

Expected future actions in the planning area that would affect water resources involve appropriation and consumption of water for residential development, construction and operation of power plants, reopening of mines, and continued agricultural demand for water. Depending on their location, the sources and availability of water, and the amount and timing of withdrawals, these actions may impact water resource availability for other purposes in the planning area. The Coyote Springs residential development is in the early stages of planning. The estimated groundwater demand for this development is about 20,000 acre-feet per year for an indefinite period of time. The groundwater would probably come from alluvial basin aquifers.

As described in Chapter 3.0, the Southern Nevada Water Authority is considering various water supply alternatives for the Las Vegas region. The proposed project with the highest visibility in relation to the planning area involves the transfer of groundwater from Lincoln, Nye, and White Pine counties via pipeline into the Las Vegas area. Depending on the groundwater source areas and the timing and amount of groundwater withdrawal, implementing such a supply alternative could impact springs, seeps, playas, lakes, and riparian/wetland areas. Similarly, water supply proposals from Lincoln County Water District and other agencies or private groups may create water resource impacts in the planning area.

The Lincoln County Land Act sale for residential development of semi-arid land in southern Lincoln County would entail pumping about 13,500 acre-feet of water per year for an indefinite period of time from hydrologic basins in southern Lincoln County. Basins with pending water applications include Tule Desert, Clover Valley, Kane Springs Valley, and Lower Meadow Valley Wash. The water would be pumped from bedrock aquifers. The long-term impact of pumping this amount of water for an indefinite period of time is uncertain.

It is expected that there also would be some residential developments as a result of the recently passed Lincoln County and White Pine County Conservation, Recreation, and Development Acts, which are only in

4.0 ENVIRONMENTAL CONSEQUENCES

the early stages of planning. These additional residential developments would be expected to have a cumulative effect on groundwater resources through the demand for residential water.

The Toquop Energy Project would be a 750-megawatt coal-fired power plant located northwest of Mesquite, Nevada. Anticipated water consumption would be up to 2,500 acre-feet of water per year for the life of the power plant, which would be approximately 50 years. The water would come from the Tule Desert hydrologic basin and be obtained with bedrock groundwater wells. This groundwater would be in addition to any water taken from the Tule Desert for the Lincoln County Land Act sale residential development. No impacts to natural bedrock springs are expected from these projects, based on conclusions in the original Toquop EIS (BLM 2003e), where analysis was based on water consumption of 7,000 acre-feet per year.

The White Pine County coal-fired power plants may be constructed in the near future in Steptoe Valley between Lages Junction and the town of McGill, Nevada. These power plants are still in the early design stages, but are expected to require a maximum of 5,000 acre-feet of water per year. It is currently expected that the water would come from wells that White Pine County holds the rights on.

The Robinson Mine, a copper mine located west of Ely, Nevada, has reopened and resumed open-pit mining due to the recent increase in copper prices. The mine pits at the Robinson Mine require dewatering and approximately 5,700 acre-feet of water per year would be pumped from bedrock wells to keep the mine pits dry. The water would be consumed by the mine for processing of ore and other mine-related water needs. The projected impact to groundwater resources would not extend beyond the mining district and would not affect municipal water supplies (BLM 1994b). The Bald Mountain Mine may expand its operations depending on future gold prices. If the mine expands to accommodate additional ore bodies, the mine would require about 1,100 acre-feet of additional groundwater per year. This water would come from bedrock groundwater aquifers. Impacts to natural springs are not expected.

An additional effect may be generated by the Comins Lake project. Assuming a free-water surface evaporation rate of about 4 feet per year, a proposed expansion of Comins Lake (near Ely) by about 600 acres, would induce additional surface water losses in the planning area by 2,400 acre-feet per year. This is not expected to affect Ely Field Office management plans, nor are Ely Field Office water resources management effects anticipated to substantially affect the planned lake expansion.

Additional rights-of-way issued through the Ely Field Office would result in alteration of surface drainage patterns and could lead to accelerated erosion and sedimentation on a localized basis. Much of this would be mitigated through the use of best management practices.

Cumulative Impacts Conclusions

Cumulative impacts of the Proposed RMP would be minimized over the long term by extensive vegetation management and administration of other land uses that would consider a balanced ecological system approach. Salinity inputs to the Colorado River system would be reduced over time. Short-term increases in runoff, soil erosion, and related sedimentation may occur on those areas where vegetation treatments occur. Interrelated projects would have the potential to create impacts on both surface and groundwater resources through additional erosion and sedimentation as a result of land disturbance, further consumption

4.28 Cumulative Impacts

of available water resources, and additional releases of undesirable water quality constituents (e.g., industrial chemicals, treated domestic effluent) into receiving waters. The net effects on water resources from the Proposed RMP and the interrelated projects may result in substantial cumulative impacts.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Alternative A: Less short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Similar short-term and long-term impacts to the Proposed RMP.

Alternative C: Greater short-term and long-term impacts than the Proposed RMP.

Alternative D: Greater short-term and long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.4 Soil Resources

Geographic Area for Analysis

The cumulative effects area for soil resources consists of the planning area and a small portion of the Colorado River basin, including portions of the Muddy River and Virgin River drainages.

Impacts of the Proposed RMP

Under the Proposed RMP, short-term increases in erosion and sedimentation would be expected as a result of the substantial area subject to vegetation treatments. Long-term reduction in erosion and sedimentation is anticipated as perennial understory cover and near-surface root biomass increase over the current condition in these areas. Additional soil resources would be exposed to herbicide treatments, but implementation of best management practices would minimize impacts. Soil salinization and resulting salinity inputs to drainages would decrease as a result of tamarisk control. Impacts on soils from producing commodities such as livestock, recreation, wild horses, and minerals would remain similar to or decrease from those of the current conditions and management approaches.

Impacts of Interrelated Projects

Impacts of interrelated projects would include those potentially resulting from the construction of power plants and residential developments, re-opening or expansion of mining activities in the planning area such as the Robinson Mine or the Bald Mountain Mine, and the creation of additional rights-of-way. Soil resource impacts from these projects would include the excavation, removal, and possible replacement of soil materials, which would generally result in a loss of productivity. Additional impacts may include compaction and increased erosion hazard, as well as areas of contaminated soil from inadvertent chemical spills. Such impacts would be minimized to the extent possible by applicable regulatory programs and corresponding implementation of erosion controls, spill prevention and countermeasures, stormwater pollution prevention plans, and reclamation/site restoration activities.

If extensive groundwater withdrawals are made by the Southern Nevada Water Authority, further impacts may occur to soil moisture regimes in riparian/wetland areas. If water tables are lowered as a result of groundwater withdrawals, then it may be possible for riparian/wetland areas to become drier. The potential degree and extent of such effects is unknown.

Cumulative Impacts Conclusion

Cumulative impacts of the Proposed RMP and interrelated projects would involve a short-term increase of erosion and sedimentation, with accompanying reduction in soil quality, when the activities are initially undertaken. Extensive vegetation treatment in the planning area would, in time, result in substantial reduction of erosion and sedimentation. Similarly, soil quality would increase over the long term as a result of vegetation treatments. Impacts from interrelated project development within the planning area would result in permanent removal or alteration of soil resources in specific areas (such as project footprints or some riparian/wetland areas). Regulatory programs (including permit approval and monitoring processes),

4.28 Cumulative Impacts

and the implementation of best management practices and mitigation measures, would reduce the degree of overall erosion and sedimentation impacts. Soil quality would be lost in the comparatively smaller areas affected by interrelated projects, but would improve over widespread areas with successful vegetation restoration.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Alternative A: Less short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Cumulative impacts would be similar to the Proposed RMP.

Alternative C: Cumulative impacts would be greater than the Proposed RMP.

Alternative D: Cumulative impacts would be greater than the Proposed RMP, particularly over the long term.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.5 Vegetation Resources

Geographic Area for Analysis

The geographic area for cumulative impacts to vegetation is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Direct effects of the Proposed RMP on vegetation would be achieving the desired range of conditions expressed in vegetation states for each vegetation community, including treatment over the next several decades of approximately 7.1 million acres that do not currently meet the criteria for being in healthy conditions. Treatment of these sites is necessary to reestablish the desired vegetation composition and restore resiliency. Impacts including increased erosion and spread of invasive species could occur in the event that a treatment is unsuccessful in achieving prompt revegetation. Numerous other aspects of the Proposed RMP would indirectly affect vegetation in an offsetting manner through changes in management of wild horses, travel management and off-highway vehicle use, forest/woodland and other plant products, fire, and special designations. Various additional indirect effects would occur through management changes related to lands and realty, renewable energy, recreation, and geology and mineral extraction.

Impacts of the Interrelated Projects

The primary past actions that have affected vegetation are historic mining activities and other human-caused surface disturbances, wildland fires and fire suppression, and historic grazing practices. Surface disturbances have affected only a small percentage of the total area within the planning area. Past grazing practices (including use by livestock and wild horses) and fire suppression, however, have been major contributors to current deteriorated vegetation conditions throughout the planning area. Partially due to these conditions, the spread of invasive and noxious weeds now threatens most of the ecological systems in the planning area, accentuating the need for prompt and effective restoration treatment.

Present actions affecting vegetation composition and ecological health include livestock and wildlife management, wild horse management, wildland fires, and watershed management. Vegetation also is affected by factors largely outside Ely Field Office's management, such as drought conditions, insects, occurrence of wildland fires, and introduction of invasive species in conjunction with disturbances on nearby private lands.

Key future actions anticipated to affect vegetation include potential restrictions associated with any additional species listings under the Endangered Species Act (a reduced or remote probability under the Proposed RMP), and the same natural processes mentioned above such as fire, insects, and drought. As indicated in **Table 4.28-1**, numerous reasonably foreseeable development projects would contribute to additional surface disturbances and loss of existing vegetation in those areas. These range in size from a few acres to over 100,000 acres of potential loss. These actions have the potential to contribute to further ecological deterioration with increased spread of invasive species.

Cumulative Impacts Conclusion

The actions related to the Proposed RMP would enhance vegetation resiliency on a long-term basis, although some elements of the alternative would contribute to temporary loss of vegetation and potential spread of invasive species. Most of the interrelated projects have produced or would result in the removal of native vegetation and potential spread of invasive species, either through physical disturbance or alteration of vegetation communities. The enhanced vegetation resiliency resulting from the Proposed RMP should offset a large portion of the past and potential future disturbance effects from interrelated projects.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factors involved are those that affect the spread of invasive species, contribute to loss of native vegetation diversity and vigor, or constrain the selection of treatments and resultant success for restoration of deteriorated sites. The primary long-term factors include actions that would impact the maintenance of resiliency on restored areas, such as grazing by livestock, wildlife, and wild horses.

Alternative A: Greater short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Same short-term, same long-term impacts as the Proposed RMP.

Alternative C: Same short-term, greater long-term impacts than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.6 Fish and Wildlife

Aquatic

Geographic Area for Analysis

The geographic area for the cumulative impact analysis for fisheries includes perennial drainages within the planning area that support fish species. The study area also includes downstream extensions of perennial drainages into areas outside the planning area (i.e., Virgin River).

Impacts of the Proposed RMP

Under the Proposed RMP, the Ely Field Office would work with the Nevada Department of Wildlife to manage aquatic and riparian habitat for the purpose of maintaining and enhancing existing fisheries. Other programs such as vegetation treatment, wildlife management, wild horses, lands and realty, travel management, recreation, livestock grazing, woodland product harvests, geology and mineral extraction, fire management, and noxious weeds could cause sedimentation and habitat alteration due to surface disturbance. The Proposed RMP would not result in additional water use or affect fish habitat in terms of stream flows or water levels in reservoirs.

Impacts of the Interrelated Projects

A continuation of current and future activities involving road development, water development, livestock grazing, agricultural development, off-highway vehicle use, and land development would contribute to effects on fish habitat. Natural processes such as wildland fires and drought also would affect habitat by contributing to sedimentation, loss of riparian vegetation, and reduction in available wetted area. Impacts from water use could potentially alter flows in streams and affect the quantity of habitat. Surface disturbance activities could contribute to increased sedimentation in the drainages. Activities on public lands would implement erosion control measures to reduce sediment input to water bodies. Agricultural activities also could contribute fertilizers and pesticides in runoff or irrigation return flows.

Surface disturbance activities involving grazing, new rights-of-way, and recreation use on land surrounding Comins Lake would result in localized sediment effects on fish habitat. The Bassett Lake and Comins Lake expansion projects would enhance fish habitat by increasing wetted area in the reservoirs. Short-term and temporary sedimentation would occur in the construction area in or adjacent to the reservoirs. However, erosion-control would be required to minimize sediment input to the lakes.

During consultation, the U.S. Fish and Wildlife Service and the Ely Field Office determined that none of the proposed management actions in the RMP were likely to result in a "may affect" determination for any of the special status species unique to the Virgin River environment, including the Yuma clapper rail, woundfin, Virgin River chub, and Moapa dace. Similarly, these species would not be affected by cumulative effects related to the RMP management actions. Thus, these species are not addressed in the Biological Assessment associated with the RMP and are not addressed in this cumulative effects analysis.

Cumulative Impacts Conclusion

The cumulative effects of interrelated projects in combination with program-specific management under the Proposed RMP would generally improve maintenance and quality of fish habitat in the long term as restoration efforts improve both upland and riparian habitat conditions. This habitat improvement would tend to offset continued habitat losses and damage resulting from various interrelated projects including potential groundwater withdrawal.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Alternative A: In comparison to the Proposed RMP, Alternative A would be expected to result in slightly less impacts on a short-term basis and greater impacts on a long-term basis. This prediction is based on the differences in treated areas under the Proposed RMP and Alternative A.

Alternative B: Same as the Proposed RMP.

Alternative C: Same as the Proposed RMP, on a short-term basis. On a long-term basis, sediment input could be greater due to widespread fires.

Alternative D: Cumulative effects of interrelated projects in combination with Alternative D would be less than the Proposed RMP in terms of surface disturbance as a result of less vegetation treatments. Under Alternative D, sediment input could be greater on a long-term basis mainly due to widespread fires.

Wildlife

Geographic Area for Analysis

The geographic area for cumulative impacts to wildlife is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

There would be a loss of wildlife habitat on less than 5 percent of the planning area. Direct loss of habitat would occur as a result of land disposals and construction activities associated with energy production and mineral development. Indirect losses would occur through fragmentation of habitat and avoidance of areas adjacent to project sites during construction and operation activities.

The quality of wildlife habitat on the remaining 95 percent of the planning area would improve as a result of wildlife habitat management, wild horse management, livestock grazing management, off-highway vehicle management, vegetation management, watershed management, fire management, and noxious and invasive weed management. The quality of wildlife habitat would be enhanced through increased forage, improved perennial vegetation cover and composition, and better community structure. On a watershed and

4.0 ENVIRONMENTAL CONSEQUENCES

landscape level, restoration actions would create a mosaic of different vegetation phases and states that would provide habitat for a greater diversity of wildlife species.

A reduction in wild horse herd management areas and overall populations would improve wildlife habitats by increasing herbaceous forage and water availability in the short term, followed by an increase in overall habitat quality in the long term, particularly within the southern portion of the planning area.

Impacts of the Interrelated Projects

Cumulative effects to wildlife resources from past, present, and reasonably foreseeable interrelated projects and management actions that result in surface disturbance activities would be directly related to habitat loss or alteration, and habitat fragmentation. Habitat loss or alteration would result in direct losses of smaller, less mobile species (e.g., small mammals and reptiles), and the displacement of more mobile species into adjacent habitats that may currently be at or near carrying capacity, thus increasing the probability of higher mortality rates in the surrounding areas.

Ongoing and future interrelated actions would continue to impact wildlife habitat and species within the planning area. Although restoration of vegetation communities would be managed to promote ecological system health on a watershed management basis, reductions in habitat availability and quality would continue in areas that occur outside of Ely Field Office jurisdiction. Natural processes such as fire and drought would continue to result in localized habitat reductions and the spread of noxious and invasive weed species. Several of the reasonably foreseeable future actions could contribute to additional surface disturbances, loss of habitat, habitat fragmentation, and creation of migration barriers.

Cumulative Impacts Conclusion

The actions related to the Proposed RMP would improve wildlife habitat conditions on the watershed level and landscape level in the short and long term. However, the interrelated projects either have produced or would result in direct wildlife mortality, displacement of wildlife, habitat loss or alteration, and increased habitat fragmentation. The habitat improvement resulting from the vegetation restoration treatments should offset a large portion of the past and potential future habitat losses and damage resulting from interrelated projects.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factors involved are those that affect the spread of invasive vegetation species and the expansion of pinyon and juniper trees, contribute to the loss or reduction of native vegetation cover and structure, or constrain the selection of treatments and resultant success for restoration of deteriorated habitats. The primary long-term factors include actions that would impact or benefit wildlife by reducing habitat degradation and fragmentation and promoting ecological health and resiliency.

Alternative A: Greater short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Same short-term, fewer long-term impacts than the Proposed RMP.

Alternative C: Greater short-term, greater long-term impacts than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.7 Special Status Species

Special Status Plant Species

Geographic Area for Analysis

The geographic area for cumulative impacts to special status plants is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Vegetation management programs would include surveying and monitoring federal lands for Ute ladies'-tresses orchid, based on the availability and assistance of the U.S. Fish and Wildlife Service. The U.S. Fish and Wildlife Service would identify potential habitat areas for the species. Conservation and recovery actions would be implemented for any populations observed within the planning area. Monitoring and inventorying measures would be developed and implemented for other special status plant species.

The Highland Range, Schlessers Pincushion, and White River Valley ACECs will be designated for the protection of known populations of special status plant species. The establishment of these ACECs and the land use restrictions associated with them would improve the protection of known and potential habitat for special status plants in these areas. These and several other ACECs would be closed to locatable and mineral material development and would have no surface occupancy restrictions for leasable minerals. A detailed analysis of potential impacts to special status plants would be completed during watershed and habitat assessments. As part of the best management practices, potential mitigation measures and monitoring would be developed on a site-specific basis. Therefore, implementation of the Proposed RMP would enhance the conservation of special status plants.

Impacts of the Interrelated Projects

Cumulative impacts to special status plants from past, present, and reasonably foreseeable future actions include the loss of habitat and plants and degradation of habitat as a result of surface disturbances associated with natural processes (e.g., wildland fire) or human activities (e.g., mine development, road and railroad construction, and agricultural and livestock uses). Best management practices, mitigation measures, and monitoring have been implemented for some of the past actions and would be implemented for present and reasonably foreseeable future actions to minimize impacts to special status plants. Therefore, impacts to special status plants as a result of interrelated projects would be minimal.

Cumulative Impacts Conclusion

The impacts related to the Proposed RMP would have minimal effect on the Ute ladies'-tresses orchid and other special status plants on an overall basis, while at the same time protection of these species would be enhanced in several ACECs. Most of the interrelated projects have produced or would produce minimal effects to special status plants, either through physical disturbance or alteration of vegetation communities.

The improved knowledge base and potential mitigation measures related to the Proposed RMP should offset a large portion of the past and potential future adverse effects from interrelated projects.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Alternative A: Greater potential for impact than the Proposed RMP because inventories and monitoring would not be completed for the Ute ladies'-tresses orchid, and ACECs would not be designated for this or other special status plant species.

Alternative B: Greater potential for impact than the Proposed RMP because ACECs would not be designated for special status plant species.

Alternative C: Greater potential for impact than the Proposed RMP because inventories and monitoring would not be completed for the Ute ladies'-tresses orchid and ACECs would not be designated for special status plant species.

Alternative D: Greater protection than the Proposed RMP relative to physical disturbances from other uses, but greater risk than the Proposed RMP from major wildland fire events and spread of weeds. Overall, impacts would be comparable to the Proposed RMP.

Special Status Aquatic Species

Geographic Area for Analysis

The geographic area for the cumulative impact analysis for special status aquatic species includes perennial drainages and springs within the planning area that provide occupied and designated critical habitat for sensitive aquatic species. The analysis area also includes perennial streams and springs on private, state, or tribal lands that are connected to drainages within the planning area and located immediately downgradient from the planning area boundary (e.g., Virgin River and springs that provide occupied and designated critical habitat for special status species).

Impacts of the Proposed RMP

Under the Proposed RMP, special status fish species would be managed through evaluations of their overall specific habitat conditions and factors affecting their populations planning area-wide and through habitat restoration and multiple use restrictions at the watershed level. Maintenance would occur where suitable habitat and populations exist, and mitigation would continue to be implemented where multiple-use impacts occur.

Habitat for the Pahrump poolfish (Shoshone Pond) would be improved under the Proposed RMP by building a new fence to exclude both human and livestock access. The fenced area also would be expanded in size to exclude new surface disturbance and minimize sedimentation and runoff from upland areas. The fenced area would be reseeded to minimize sedimentation input to the ponds.

4.0 ENVIRONMENTAL CONSEQUENCES

Three of the ACECs designated in the Proposed RMP are designed to enhance protection and habitat for special status aquatic species. These include: Condor Canyon ACEC – 4,500 acres (Big Spring spinedace); Lower Meadow Valley Wash ACEC – 25,000 acres (Meadow Valley Wash desert sucker and Meadow Valley Wash speckled dace); and Shoshone Ponds ACEC – 1,240 acres (Pahrump poolfish). Additionally, establishment of the Goshute Canyon Natural Area – 7,600 acres would benefit habitat for the Bonneville cutthroat trout.

Impacts of the Interrelated Projects

The following information summarizes cumulative actions in relation to individual species based on geographical areas within the planning area.

- Big Spring Spinedace, Meadow Valley Wash Desert Sucker, and Meadow Valley Wash Speckled Dace: Cumulative actions in the area include the Pioche Mining District, expansion of the Panaca pozzolana mine, grazing, wildland fire, drought, and recreation use. Land development in the general area could use groundwater that may affect surface flows in Meadow Valley Wash. The Condor Canyon Habitat Management Plan was implemented in 1990 to protect the species. However, the management actions ceased after a wildland fire burned the canyon in 1999. The Lower Meadow Valley Multispecies Habitat Conservation Plan (in preparation) is designed to protect habitat for these species in the lower Meadow Valley Wash.
- Pahrump Poolfish: Cumulative actions for the Shoshone Ponds Area include wildland fire, drought, and recreation. Maintenance of adequate water levels, which provide the necessary wetted area and associated habitat parameters, is an important factor for the species.
- White River Springfish: Cumulative actions in the Ash Springs area include agricultural water use and grazing on adjacent private lands. Diseases also provide threats to the species. Maintenance of adequate water levels is an important factor for the species.
- Hiko White River Springfish, Pahrangat Roundtail Chub, and White River Spinedace: These fish species occur on private land in the White River Valley. Cumulative actions for these species include agricultural water use and surface disturbance, grazing, wildland fire, and drought conditions. Maintenance of adequate water levels, which provide the necessary wetted area and associated habitat parameters, is an important factor for the species.
- Railroad Valley Springfish: This fish species occurs on the Duckwater Indian Reservation. Cumulative actions in the area include agricultural water use and surface disturbance, grazing, wildland fire, and drought conditions. The Railroad Valley Habitat Management Plan was implemented to protect spring habitat for this species (U.S. Fish and Wildlife Service 1996).

Maintenance of adequate water resources in springs and streams is a primary key to protecting habitat for various special status aquatic species. Such resources may be potentially affected by various interrelated projects that utilize groundwater and surface water resources. Thus, additional residential/commercial land

development projects and water development projects could affect these species, depending on the specific quantities and locations of water supplies involved. Since the water supplies for the individual interrelated projects have not been identified at this time, it is impossible to analyze the effects on individual special status species. Additional NEPA analyses will be conducted as individual development projects are identified and evaluated for approval.

Cumulative Impacts Conclusion

Surface disturbance activities could result in localized water quality changes due to sedimentation or runoff contaminants, and habitat alteration or loss. Several programs such as vegetation restoration and weed management (i.e., tamarisk removal) could increase stream flows and spring discharges. Several of the interrelated projects could result in changes to surface water quantity in various streams or springs (e.g., groundwater withdrawal). In the long term, vegetation restoration could reduce stream flows originating from surface runoff, but could locally increase stream base flows and spring discharges. Other interrelated actions could combine with these water quantity changes to affect habitat for sensitive species. The cumulative effects of interrelated projects in combination with program-specific management under the Proposed RMP would result in impacts on sensitive fish species habitat due to surface disturbance in watersheds, but this would be balanced by an increased rate of maintenance and restoration of habitat for sensitive fish species.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Alternative A: Cumulative effects would be greater than for the Proposed RMP.

Alternative B: Same as the Proposed RMP.

Alternative C: Same as the Proposed RMP.

Alternative D: Same as the Proposed RMP.

Special Status Wildlife Species

Geographic Area for Analysis

The geographic area for cumulative impacts to special status wildlife is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Impacts would include the reduction of canopy cover of woody species that do not meet the desired range of conditions as stated in Chapter 2.0 (e.g., woodlands, forests lands, and shrubs) and the temporary loss of forage and cover in the areas being treated until the desirable perennial species become reestablished. It is anticipated that treated areas would result in increased herbaceous forage and ground cover for special

4.0 ENVIRONMENTAL CONSEQUENCES

status species in the short term (less than 5 years), followed by the establishment of shrub vegetation in the long term (greater than 50 years) that meet the desired range of conditions for vegetation communities as described in Chapter 2.0, Vegetation. On a watershed level, restoration activities would result in higher quality forage, increased cover and vegetation structure, and increased habitat quality for special status species. On a landscape level, restoration activities to achieve desired ranges of vegetation conditions would improve special status species habitats by reducing habitat degradation and fragmentation, and promoting ecological health and resiliency.

A reduction in wild horse herd management areas and overall populations would improve special status species habitats by increasing herbaceous forage and water availability in the short term, followed by an increase in overall habitat quality in the long term, particularly within the southern portion of the planning area.

Increased management emphasis on habitat protection and improvement for special status wildlife species (e.g., greater sage-grouse) would impose a variety of constraints on other management programs and resource uses.

Impacts of the Interrelated Projects

The following information summarizes cumulative actions in relation to individual species based on geographical areas within the planning area.

- Desert tortoise: Construction activities and traffic related to railroad development, road maintenance, and road construction associated with interrelated projects within desert tortoise habitat could contribute direct impacts to desert tortoise including habitat degradation and direct mortality from collisions with vehicles. Some of the interrelated projects (e.g., land disposals and rights-of-way) also may contribute to indirect effects on desert tortoise (e.g., increased predation opportunities for ravens perching on transmission lines).
- Southwestern willow flycatcher and yellow-billed cuckoo: Construction activities and traffic related to railroad development and maintenance, highway construction and maintenance, and construction within utility corridors associated with interrelated projects within habitat for these species could create impacts in terms of noise and habitat degradation.

Greater sage-grouse: Construction and operation of facilities associated with energy production (i.e., power plants, wind turbines, substations, and transmission lines) could impact greater sage-grouse populations by reducing breeding and nesting habitat and increasing potential predation opportunities for raptor species.

Ongoing and future interrelated actions would continue to impact wildlife habitat and species within the planning area. Although restoration of vegetation communities would be managed to promote ecological system health on a watershed management basis, reductions in habitat availability and quality would continue in areas that occur outside of Ely Field Office jurisdiction. Natural processes such as fire and drought would continue to result in localized habitat reductions and the spread of noxious and invasive weed species.

Cumulative Impacts Conclusion

The impacts related to the Proposed RMP would improve special status species habitat conditions on the watershed and landscape level in the long term. However, the interrelated projects either have produced or would continue to result in direct mortality, displacement of individuals, habitat loss or alteration, habitat fragmentation, and possible population reductions of some special status species. The special status species habitat improvement resulting from the Proposed RMP should offset a large portion of the past and potential future habitat losses and damage resulting from interrelated projects. However, local greater sage-grouse populations may be reduced in numbers because of development in and around breeding habitat (i.e., leks) regardless of the habitat improvement that may occur elsewhere.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factors involved are those that increase the spread of invasive vegetation species and the expansion of pinyon and juniper trees, contribute to the loss or reduction of native vegetation cover and structure, or constrain the selection of treatments and resultant success for restoration of deteriorated habitats. The primary long-term factors include actions that would impact or benefit special status species by reducing habitat degradation and fragmentation, promoting ecological health and resiliency, and increasing overall biological diversity.

Alternative A: Greater short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Same as the Proposed RMP.

Alternative C: Greater short-term, greater long-term impacts than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.8 Wild Horses

Geographic Area for Analysis

The cumulative effects area for wild horses is the array of existing herd management areas, a buffer around these herd management areas that horses occasionally use when they cross the boundaries, and a few herd management areas that abut the planning area boundary with the associated horse herds commonly crossing to adjoining areas outside the planning area.

Impacts of the Proposed RMP

Direct effects of the Proposed RMP on wild horses involve the reduction in herd management areas from 24 to 6 with accompanying reductions in total acreage of herd management areas from 5.4 million to 3.7 million acres and in the appropriate management level from a range of 1,986 to 2,141 to a range of 810 to 1,695. This would be a long-term change that would reduce population numbers but improve habitat conditions, health of individual animals, and long-term herd viability. Indirect effects of the alternative include the effects of proposed vegetation restoration treatments that would generally improve wild horse habitat; changes in management of recreation and off-highway vehicle use that would reduce conflicts of such uses with wild horse herds in some herd management areas while increasing conflicts in others; and allocation of a portion of the increased forage production on vegetation treatment areas within herd management areas to wild horses.

Potential impacts of wild horse management on other resources and management programs include potential conflicts with or constraints imposed on other users of the lands within herd management areas. Resource conflicts may include vegetation, wildlife and fisheries, special status species, visual resources, recreation, and cultural resources. Constraints in relation to other users could affect lands and realty, livestock grazing, renewable energy, travel management, mineral development, and fire management. The reduction in number of herd management areas in the decision area would reduce the occurrences of these conflicts.

Impacts of the Interrelated Projects

The primary past actions that have affected wild horse populations and their habitat are livestock grazing, as it affects vegetation resources of the planning area, and the Wild Free-Roaming Horse and Burro Act, as it affects the process of controlling wild horse populations. Numerous other human-caused surface disturbances, wildland fires, and human activities have contributed to current habitat conditions, but generally to a lesser degree than historic grazing practices. Past grazing practices by both wild horses and livestock have been major contributors to current vegetation conditions throughout the planning area. Partially due to these conditions, the spread of invasive and noxious weeds now threatens most of the ecological systems in the planning area.

Present actions affecting wild horses are mainly those that affect the available habitat, including the supply of both forage and water within the herd management areas. Key examples include drought conditions, wildland fires, and competition with livestock and, to a lesser degree, wildlife.

Key future actions anticipated to affect wild horses include potential restrictions associated with any additional species listings under the Endangered Species Act (a reduced or remote probability under the Proposed RMP) and the same natural processes mentioned above including fire, drought, and climate change. Each of these has the potential to either reduce areas available for grazing or the level of forage production on the available area. It seems probable that the West Nile virus would begin affecting wild horses within the planning area in the next few years. It is not known how the virus would affect horses in the wild, or whether wild herds would be more or less vulnerable to this mosquito-borne disease than domestic horses. Small herds appear to be more vulnerable than larger herds. Several of the reasonably foreseeable future actions could contribute to additional surface disturbances, loss of vegetation or habitat, and creation of migration barriers in one or more of the herd management areas.

Cumulative Impacts Conclusion

The impacts related to the Proposed RMP generally would improve habitat for wild horse herds on a long-term basis, while many of the potential impacts associated with interrelated projects would reduce habitat, but typically to a lesser degree. Thus, the overall cumulative effects would be general improvement in the habitat necessary for long-term herd health and viability.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factor involved is the acreage of current herd management areas that would be temporarily affected by watershed treatment, fire rehabilitation, or increased competition with other users. The primary long-term factor is the potential for permanent or long-range losses or habitat restrictions associated with potential additional species listed under the Endangered Species Act. Overall summary assessments of these combined factors follow below by alternative.

Alternative A: Less short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Same short-term, greater long-term impacts than the Proposed RMP.

Alternative C: Same short-term, greater long-term impacts than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.9 Cultural Resources

Geographic Area for Analysis

The geographic area for cumulative impacts to cultural resources is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Cultural properties within the planning area would continue to deteriorate through natural agents, unauthorized public use, and vandalism. Direct impacts associated with land management actions would be reduced or eliminated in compliance with federal and state cultural resource mandates and existing best management practices, and implementation of use allocations. Under the Proposed RMP, an overall decrease in the number of acres open to livestock/wild horse grazing and off-highway vehicle use and restricting recreational events to specified areas would decrease the use intensity within the planning area, thereby preserving the regional database for cultural resources. The designation of eight ACECs for the protection and preservation of cultural sites within the planning area also may result in an increase in the regional database depending on additional inventories of these sites.

Impacts of the Interrelated Projects

Cumulative impacts to cultural resources could occur through incremental degradation of the resource base from a variety of sources, which reduce the information and interpretive potential of cultural properties. Other regional resource, land use, and economic development planning efforts could affect the types and intensity of uses on private, state, or other federal lands within the planning area and could, therefore, potentially affect the regional cultural resource database. Development of lands that are not protected by federal or state cultural resource statutes and regulatory protections could decrease the regional resource base and potentially limit management options within the planning area.

Surface disturbance activities associated with power plants, mining, land disposal, renewable energy, road development, transmission lines, and fire management have been subject to NEPA review prior to project activities in adherence to federal and state laws. As directed by law, cultural resources eligible to the National Register of Historic Places have been avoided, or if this was not possible, recovered for their scientific value. Data recovery of important cultural resources has expanded the regional database and knowledge of prehistoric and historic contexts. Future actions involving surface disturbing activities as presented in **Table 4.28-1** would require a similar set of procedures. Impacts associated with off-highway vehicle use and livestock grazing have contributed to the degradation of site settings and incidental damage to cultural resources. These impacts would be mitigated on a case-by-case basis as discovered. Natural-caused disturbances, such as wildland fires, damage or completely destroy cultural resources, in particular historic structures and rock art.

Cumulative Impacts Conclusion

There would be a high level of protection of cultural resources under the Proposed RMP (overall decrease in lands available to off-highway vehicle use and livestock/wild horse grazing and the designation of ACECs to protect cultural resources) offsetting the expected increase in visitor and recreation use in the planning area. Thus, the overall cumulative effects would be minimal.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Analysis of cumulative effects focuses primarily on direct and indirect impacts associated with the various alternatives. An overall summary assessment of direct and indirect impacts follows below by alternative.

Alternative A: Greater direct and indirect impacts than the Proposed RMP.

Alternative B: Similar direct and indirect impacts as the Proposed RMP.

Alternative C: Greater direct and indirect impacts than the Proposed RMP.

Alternative D: Less direct and indirect impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.10 Paleontology

Geographic Area for Analysis

The geographic area for cumulative impacts to paleontological resources is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Impacts associated with land management actions in the Proposed RMP would be minimized or reduced in accordance with federal legislation and existing best management practices, and through implementation of use allocations. Under the Proposed RMP, an overall decrease in the number of acres open to off-highway vehicle use and restricting recreational events to specified areas would decrease the use intensity within the planning area; thereby preserving the regional database for paleontological resources. However, impacts to paleontological resources could continue to occur through incremental degradation of the resource base from a variety of sources, which reduce the information and scientific research potential of fossil material. Geological formations with exposures containing vertebrate and invertebrate fossils would continue to be impacted by weathering and other natural agents.

Impacts of the Interrelated Projects

The primary factors that have affected and continue to affect paleontological resources are planned and dispersed off-highway vehicle use, recreation, land disposals, creation of rights-of-way, and mining activities that involve surface disturbing activities as presented in **Table 4.28-1**. The direct effects of planned off-highway vehicle use, developed recreation, lands and realty actions, and mining have been mitigated in compliance with federal legislation and existing best management practices. Impacts associated with dispersed off-highway use and recreation (e.g., trilobite collecting) have increased as visitor and recreational use has increased. Off-highway vehicle use and recreation have been the major contributors to illegal collecting of fossils and soil erosion that exposes subsurface fossil material.

Cumulative Impacts Conclusion

There would be a high level of protection of paleontological resources under the Proposed RMP (overall decrease in lands available to off-highway vehicle use and mineral development) offsetting the expected increase in visitor and recreation use in the planning area. Thus, the overall cumulative effects would be minimal.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Paleontological resources are nonrenewable, therefore, analysis of cumulative effects focuses primarily on direct and indirect impacts associated with the various interrelated projects. An overall summary assessment of direct and indirect impacts follows below by alternative.

4.28 Cumulative Impacts

Alternative A: Greater direct and indirect impacts than the Proposed RMP.

Alternative B: Similar direct and indirect impacts as the Proposed RMP.

Alternative C: Greater direct and indirect impacts than the Proposed RMP.

Alternative D: Less direct and indirect impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.11 Visual Resources

Geographic Area for Analysis

The geographic area for cumulative impact analysis of visual resources lies entirely within the planning area boundary.

Impacts of the Proposed RMP

The primary factor involved for long term impacts is the visual resource management classification system established for the decision area. Effort would be made to design activities to meet the visual resource management classification, and mitigation would be considered to lessen visual impacts. Vegetation treatments could create visual disturbances in the short term that would lessen over the long term. Co-location of utility rights-of-way and communication sites would serve to lessen long-term impacts.

Increased emphasis on visual resource management within the decision area would affect a variety of other resource uses through more emphasis on additional mitigation measures to protect visual resource quality. This may affect actions related to vegetation treatments, lands and realty, renewable energy, forest/woodland products, geology and mineral extraction, and fire management.

Impacts of the Interrelated Projects

Potential impacts to visual resources could occur from mining activities in the Robinson and Bald Mountain mining districts; energy projects such as the transmission lines in the Southwest Intertie Project corridor, the Toquop energy project, the White Pine County power plant projects, and wind energy development; and the development of the Department of Energy and Toquop rail lines.

Cumulative Impacts Conclusion

Cumulative impacts to visual resource use would occur through the degradation of visual resources resulting from a number of activities within the planning area. Under the Proposed RMP, impacts to visual resources would be minimal, those impacts mainly being from surface disturbances associated with the vegetation treatments, and the reduction in surface disturbances associated with the elimination of cross-country off-highway vehicle use and the co-location of utility rights-of-way and communication sites. Some interrelated projects would result in surface disturbances, increased air emissions, and local visual impacts. An increase in the area designated as Class II and III and a decrease in the area designated as Class IV would lead to more emphasis on mitigation for visual impacts from proposed actions across the planning area. The designation of the Pony Express Visual Resource Management Class II corridor places the scenic values of this area at a higher level. Interrelated projects would not occur within Class I areas.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Cumulative impacts would differ due to differences in management direction for off-highway vehicle use, approval of utility rights-of-way and communication sites, and vegetation treatments and fire management.

Alternative A: Greater impacts than the Proposed RMP due to maintaining approximately 9.8 million acres of off-highway vehicle open areas.

Alternative B: Slightly less impacts than the Proposed RMP.

Alternative C: Greater impacts than the Proposed RMP due to wider and additional designated utility corridors.

Alternative D: Greater impacts than the Proposed RMP due to non-suppression of wildland fires.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.12 Lands and Realty

Geographic Area for Analysis

The geographic area for cumulative impacts to lands and realty is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

The cumulative impacts to the management of lands and realty would occur through the changes in ownership and management of land resources, the availability of lands for disposal, and changes in access to land resources. Under the Proposed RMP, there would be more acreage excluded from disposal and more right-of-way exclusion and avoidance areas resulting from the designation of new ACECs. This amount would be very minor in comparison with the size of the planning area. Co-location of utility rights-of-way and communication sites would be encouraged.

Impacts of the lands and realty program on other resources and uses would be widespread involving potential loss of resources, new surface disturbances, habitat losses and fragmentation, degradation of visual resource quality, additional constraints on fire management, and increased potential for introduction and establishment of invasive species.

Impacts of the Interrelated Projects

Impacts from interrelated projects to lands and realty could come from the Lincoln County Conservation, Recreation, and Development Act; the White Pine County Conservation, Recreation, and Development Act; the transfer of lands to American Indian Tribes (the area and location of which are to be determined by Congress); the Barrick Gold Corporation Land Sale; water development in White Pine and Lincoln counties; residential developments; road development; energy development; mining activities; and the development of the Department of Energy and Toquop rail lines. Interrelated projects could reduce the amount of developable land within the planning area and create pressure for development in additional areas. They also would contribute to many of the same impacts noted above as being generated by the lands and realty program and affecting other resources.

Cumulative Impacts Conclusion

Cumulative impacts to the management of lands and realty would occur as a result of new avoidance and exclusion areas and management direction encouraging co-location of utility rights-of-way and communication sites. Interrelated projects could increase pressure for development and create a higher demand for developable lands in the planning area. Cumulative impacts of the lands and realty program and interrelated actions on other resources and uses would be largely a function of the collective disturbance areas involved as shown in **Table 4.28-1**.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The primary factors involved for impacts associated with lands and realty are the amount of lands available for disposal and the designation of utility corridor widths and communication sites.

Alternative A: Less impact than the Proposed RMP.

Alternative B: Similar impacts to the Proposed RMP.

Alternative C: Greater impacts than the Proposed RMP, due to wider utility corridors.

Alternative D: Greater impacts than the Proposed RMP, due to restriction on new land use authorizations and land disposals.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.13 Renewable Energy

Geographic Area for Analysis

The geographic area for cumulative impacts to renewable energy is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Areas with potential for wind and solar energy development exceed the foreseeable demand. Development proposals would be handled on a case-by-case basis subject to NEPA analysis, and not restricted to the areas identified as having high potential for wind and solar development. Development of renewable energy facilities would affect numerous other resources and uses within the planning area through potential loss of resources, new surface disturbances, habitat losses and fragmentation, degradation of visual resource quality, interference with wild horse gathers, additional constraints on fire management, and increased potential for introduction and establishment of invasive species.

Impacts of the Interrelated Projects

Impacts from interrelated projects to renewable energy could come from power plant and transmission line development, as well as water development. Interrelated power and transmission projects could make renewable energy development more economically viable by potentially increasing access to transmission lines, and building more transmission capacity. Power plants, water development, and residential development could have impacts in terms of reducing the amount of water available for solar energy development. These interrelated projects also would contribute to many of the same impacts noted above as being generated by the renewable energy program and affecting other resources.

Cumulative Impacts Conclusion

Interrelated power plant and transmission line projects could create better access to electrical transmission lines. Interrelated power plants, water development, and residential development projects could impact renewable energy development through the use of water that could otherwise be used for development of concentrated solar power. Cumulative impacts of the renewable energy program and interrelated projects on other resources and uses would be largely a function of the collective disturbance areas involved as shown in **Table 4.28-1**.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The primary factors involved for impacts associated with renewable energy are the amount of land available for renewable energy and the resources to develop renewable energy projects. Because renewable energy development proposals would be handled on a case-by-case basis throughout the entire planning area under each alternative, there is little difference in impact between each alternative.

Alternative A: Slightly less impact than the Proposed RMP.

Alternative B: Slightly less impact than the Proposed RMP.

Alternative C: Slightly greater impact than the Proposed RMP, due to designations of wider utility corridors.

Alternative D: Substantially less impact than the Proposed RMP to other resources and uses, but much greater impact to renewable energy because no new rights-of-way would be designated, nor would there be new land use authorizations.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.14 Travel Management and Off-highway Vehicle Use

Geographic Area for Analysis

The geographic area for cumulative impacts associated with travel management and off-highway vehicle use is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Under the Proposed RMP, off-highway use would be restricted to designated roads and trails. This would have a large impact on motorized recreational opportunities. The more proactive approach to prioritizing road and trail designations through an updated transportation plan would have long term impacts to travel management. These changes in approach, however, would substantially reduce the impacts of vehicles and off-highway vehicles on other resources throughout the planning area.

Impacts of the Interrelated Projects

Impacts from interrelated projects would occur due to the paving of Kane Springs Road, the development of a road from Caliente to Mesquite, development of the proposed Department of Energy and Toquop rail lines, and an increase in demand for recreational off-highway vehicle use. New roads could improve accessibility while increased usage of roads and trails could increase maintenance needs and travel times. The proposed rail line could interfere with existing roads and trails and necessitate creation of new segments parallel with the rail lines leading to safe crossing points. Some of the interrelated projects would tend to increase vehicle and off-highway vehicle use on some designated roads and trails, thereby contributing cumulatively to the impacts of travel management and off-highway vehicles on other resources throughout the planning area.

Cumulative Impacts Conclusion

The cumulative impacts of travel management and off-highway vehicle use would occur through the degradation of transportation resources, and changes in designation and management of transportation resources. The reduction of cross-country off-highway vehicle use and the prioritization of road and trail designations through an updated transportation plan would have short and long term impacts to travel management, but would reduce off-highway vehicle use opportunities and impacts of such use on other resources. The interrelated projects would have minimal effects on transportation planning and road and trail designations, although new housing and energy development could contribute additional traffic and increase the need for road maintenance.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The primary factor involved for impacts associated with travel management and off-highway vehicle use is the number of roads and the amount of land available for travel and off-highway vehicle use.

4.28 Cumulative Impacts

Alternative A: Less impact than the Proposed RMP to travel management, but substantially greater impacts of travel on other resources.

Alternative B: Greater impact than the Proposed RMP to travel management and similar impacts of travel on other resources.

Alternative C: Less impact than the Proposed RMP to travel management and similar impacts of travel on other resources.

Alternative D: Greater impacts than the Proposed RMP to travel management, but substantially fewer impacts of travel on other resources.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.15 Recreation

Geographic Area for Analysis

The geographic area for cumulative impacts associated with recreation includes the planning area and population centers outside the planning area that lie within a reasonable driving distance for recreational activities (e.g., Clark County).

Impacts of the Proposed RMP

Impacts to recreation under the Proposed RMP include a reduction of areas offering motorized recreation opportunities, an increase in special recreation management areas, and a potential increase in wildlife, creating more viewing and hunting opportunities. The designation of 20 ACECs would provide management to protect resources in these areas, providing passive recreation opportunities. The elimination of areas open to cross-country off-highway vehicles use would reduce motorized recreation opportunities. The designation of five special recreation management areas totaling over 1.2 million acres and four motorcycle special recreation permit areas totaling approximately 1.33 million acres would serve to focus recreation activities in areas that could be managed to protect relevant resources and the recreation setting. Management activities could potentially place stipulations on outfitter and guide permits, thus affecting recreational hunting opportunities. This overall management approach would substantially reduce impacts from recreational activities on other resources.

Impacts of the Interrelated Projects

Impacts from interrelated projects would occur due to an increase in demand for recreational off-highway vehicle use that would put more pressure on existing resources, and the rebuilding and expansion of reservoirs which would provide more recreational opportunities in the long term. The general effects of the interrelated projects are expected to range from being neutral to substantially increasing the recreational demands within the planning area.

Cumulative Impacts Conclusion

The cumulative impacts to recreation could occur through the degradation of recreation resources, changes in designation and management of recreation resources, and changes in accessibility to and availability of recreation resources. Interrelated projects would have a mixed impact on recreation. Rebuilding of dams and expansion of lakes could reduce recreation opportunities in the short term, while creating an overall increase in recreation opportunities in the long term. Increased residential development and population in the planning area and adjacent areas would lead to an increase in demand for recreational opportunities, with associated increases in impacts to other resources.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The primary factor involved for impacts to recreation is the quantity of land available for recreational activities, and the quality of recreational opportunities available upon that land.

Alternative A: Less impact than the Proposed RMP.

Alternative B: Similar impact to the Proposed RMP.

Alternative C: Slightly greater impact than the Proposed RMP.

Alternative D: Greater impact than the Proposed RMP due to a reduction of recreation opportunities.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.16 Livestock Grazing

Geographic Area for Analysis

The cumulative effects area for livestock grazing includes the entire planning area, a few grazing allotments that cross the planning area boundary (some of these are administered by the Ely Field Office and others are administered by adjoining Field Offices), and the scattered locations throughout Nevada and Utah from which allotment permittees bring livestock to graze within the planning area.

Impacts of the Proposed RMP

The Proposed RMP could affect the current levels of grazing use and the area available for grazing, especially in relation to sheep and goat grazing on 12 allotments in occupied desert bighorn and Rocky Mountain sheep habitat. Adjustments to animal unit months for sheep grazing would be subject to on-the-ground review and evaluation when permit changes are considered. It also would enhance the flexibility of the Ely Field Office to administer grazing permits to meet specific needs on a site-specific basis, managing allotments that become vacant, for any reason, including relinquishment to best meet site-specific and RMP objectives. The allotment evaluation and term permit renewal process would continue to evaluate the 54,357 animal unit months current active use of sheep grazing on approximately 100,000 acres of occupied bighorn sheep habitat within the decision area. Any changes made to livestock use or management resulting from evaluations would continue to affect vegetation, fish and wildlife habitat, wild horse habitat, special status species habitat, cultural resources, visual resources, fire management, and noxious/invasive weed management. These impacts, however, generally would be reduced under the Proposed RMP as a result of the watershed analysis process, and the allotment evaluation and term permit renewal process. Livestock grazing would be indirectly affected by changes in several other resource programs. For example, the extensive vegetation treatments to restore vegetation resiliency would result in short-term reductions in forage and long-term increases in forage available for livestock grazing; a reduction in wild horse herd management areas generally would reduce conflicts with livestock; proposed land disposals would reduce the lands available for grazing; changes in management of off-highway vehicle use and recreation would tend to concentrate and redistribute potential conflicts with livestock grazing; while energy development, mineral extraction, and utility rights-of-way would tend to create inconsequential conflicts with livestock by reducing forage or imposing some constraint on livestock grazing.

Impacts of the Interrelated Projects

The primary past actions that have affected vegetation resources and thereby current livestock grazing in the planning area are historic mining activities and other human-caused surface disturbances, wildland fires and fire suppression, and historic grazing practices that have contributed to current ecological conditions. Surface disturbances have affected only a small percentage of the total area within the planning area; past grazing practices (including use by livestock, wild horses, and wildlife) and fire suppression, however, have been major contributors to current deteriorated vegetation conditions throughout the planning area. Partially due to these conditions, the spread of invasive and noxious weeds now threatens most of the ecological systems in the planning area.

Present actions affecting livestock grazing are mainly those that reduce the areas available for grazing or the level of forage production on those areas. Key examples include drought conditions, wildland fires, land disposal actions, and special designations that restrict grazing.

Key future actions (aside from the Proposed RMP) anticipated to affect livestock grazing include potential restrictions associated with any additional species listings under the Endangered Species Act (a reduced or remote probability under the Proposed RMP), and the same natural processes mentioned above including fire and drought. Each of these has the potential to either reduce areas available for grazing or the level of forage production on the available area. Additionally, several of the reasonably foreseeable actions could contribute to additional surface disturbances, loss of vegetation, and impediments to livestock movement within various allotments.

Cumulative Impacts Conclusion

The impacts of the Proposed RMP and interrelated projects to livestock grazing would reduce forage for livestock in the short-term on any given treatment area during vegetation treatment activities and generally increase forage over the long-term as treated vegetation communities reach their potential productivity. Interrelated projects typically would reduce the area available for grazing. Overall the cumulative effects would enhance available forage on a long-term basis as the increasing forage productivity on treated areas offsets and later exceeds future incremental reductions associated with interrelated projects. Impacts from the allotment evaluation and term permit renewal processes are expected to continue to meet RMP goals and objectives, including the standards for rangeland health.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factor involved is the acreage of current livestock grazing area that would be temporarily removed for watershed treatment, fire rehabilitation, or temporary conflicts with other users. The primary long-term factors include permanent or long-range losses for land disposals, special designations, and habitat restrictions associated with potential additional species listed under the Endangered Species Act. Overall summary assessments of these combined factors follow below by alternative.

Alternative A: Less short-term, greater long-term impacts to livestock grazing than the Proposed RMP.

Alternative B: Greater short-term, greater long-term impacts to livestock grazing than the Proposed RMP.

Alternative C: Same short-term, greater long-term impacts to livestock grazing than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts to livestock grazing than the Proposed RMP. However, impacts of livestock grazing on other resources would be eliminated under this alternative.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.17 Forest/Woodland and Other Plant Products

Geographic Area for Analysis

The cumulative effects area for forest/woodland and other plant products includes pinyon-juniper woodlands throughout east-central Nevada since both the demand for forest/woodland products within the planning area and alternative supply sources involve areas extending beyond the planning area boundaries.

Impacts of the Proposed RMP

The direct effects of the Proposed RMP would include removal of pinyon and juniper trees in a variety of situations to achieve the desired range of conditions for woodland sites (see Sections 2.4.5, 3.5, and 4.5, Vegetation). These actions may reduce the short-term production of pinyon pine nuts and other products in localized areas; however, the expected level of production for most forest/woodland products in the planning area would continue to exceed the anticipated demand over the long term (see Section 4.17, Forest/Woodland and Other Plant Products). The Proposed RMP also would allow and encourage harvesting of a greater variety of forest/woodland and other plant products within the planning area. Indirect effects of the Proposed RMP on forest/woodland and other plant products would include reduced disturbance by off-highway vehicles in woodland communities in large portions of the planning area and reduced risk of catastrophic fire events in overmature woodlands over the long term as vegetation treatments are used to achieve the desired range of conditions. The Proposed RMP also would increase diversity of age classes within the various plant communities, ensuring sustained yield for future generations.

Impacts of the Interrelated Projects

The primary past actions that have affected production of forest/woodland and other plant products are historic mining activities and other consumptive uses of fuelwood, various human-caused surface disturbances, wildland fires, and historic grazing practices. Surface disturbances and fires have affected only a small percentage of the total area within the planning area, but fuelwood harvest occurred over vast areas during the mid to late 1800s and early 1900s. Aggressive fire suppression has been a major contributor to current woodland conditions throughout the planning area. These past actions, along with climate fluctuations, have contributed to the expansion of pinyon pine and juniper into areas once dominated by sagebrush.

Present actions affecting vegetation composition and ecological health, and thereby production of forest/woodland and other plant products, include livestock grazing, wild horse management, wildlife fire management, watershed management, and spread/control of invasive species. To a lesser degree, other land uses such as harvest of forest/woodland and other plant products, geology and mineral extraction, rights-of-way, transportation, wildlife management, and recreation affect woodland conditions in localized areas. Various natural factors such as drought conditions and wildland fire use ignitions also affect woodlands and production of other plant products.

Key future actions, outside the Proposed RMP, anticipated to affect forest/woodland and other plant products include creation of additional rights-of-way, and the same natural processes mentioned above including fire, drought, disease, and insect infestations. Several of the reasonably foreseeable actions could contribute to additional surface disturbances and loss of woodland communities, especially in relation to rights-of-way and land disposals. These have the potential to alter distribution of vegetation communities or contribute to further ecological deterioration with increased spread of invasive species and increased risk of major fire events. Most of these are actions directly addressed in this RMP rather than being cumulative effects contributed by external factors. However, spread of insect infestations such as the Ips beetle, which is now affecting sizeable areas throughout the western U.S., may dramatically alter the regional supplies of pinyon pine nuts. Thus, production of pinyon pine nuts throughout the planning area may be directly affected by local infestations, and demand may be affected as infestations occur in other portions of the region.

Cumulative Impacts Conclusion

The impacts associated with the Proposed RMP and interrelated projects would generally result in reduced acreage of dense, overmature woodlands, increased diversity of age classes within most woodland sites, healthier and more resilient overall woodland communities, and comparable or potentially increased annual production of forest/woodland products on a sustained yield basis.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factors involved are those that affect the production rate and harvest of key forest/woodland products such as fuelwood and pinyon pine nuts. The primary long-term factors include actions that would impact the distribution and resiliency on pinyon-juniper woodlands, such as wildland fires and insect infestations.

Alternative A: Less short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Same short-term and long-term impacts as the Proposed RMP.

Alternative C: Same short-term and greater long-term impacts as the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.18 Geology and Mineral Extraction

Geographic Area of Analysis

The geographic area for cumulative impacts associated with the minerals program is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Under the Proposed RMP, exploration and development for the various categories of minerals would be conducted in accordance with established rules and regulations in a program that allows for reasonable access to lands and provides protection for other resources. The primary impact to other resources would be the potential additional surface disturbance of approximately 18,300 acres over the reasonably foreseeable future. Over the long term, most of these impacts can be mitigated.

Impacts of the Interrelated Projects

The impacts of most of the interrelated projects (as listed in **Table 4.18-2**) to minerals exploration and development would be minimal. Several of the interrelated projects would contribute to increased local demand for sand, gravel, ballast rock, and other types of construction materials. Conservation plans for greater sage-grouse and species under the Endangered Species Act may affect mineral exploration and development. For instance, habitat constraints could affect economic recoverability or have the effect of completely precluding development of mineral resources. Several of the interrelated projects also would contribute to additional surface disturbance of public lands within the planning area, thus adding to the cumulative disturbance area and resultant impacts to various resources.

Cumulative Impacts Conclusion

Impacts of the Proposed RMP and certain interrelated projects on mineral exploration and development could be restrictive, with potential impacts coming primarily from interrelated projects involving endangered species recovery and protection. Cumulative impacts from mineral exploration and development plus interrelated projects would focus primarily on increased surface disturbances and resultant effects on other resources as shown in **Table 4.28-1**.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

Cumulative impacts of the other alternatives would be similar to the Proposed RMP except for Alternative D under which additional mineral development and other industrial activities involving public lands would be severely restricted.

Alternative A: The cumulative impacts of Alternative A would be less than the Proposed RMP.

Alternative B: The cumulative impacts of Alternative B would be the same as the Proposed RMP.

4.28 Cumulative Impacts

Alternative C: The cumulative impacts of Alternative C would be the same as the Proposed RMP.

Alternative D: The cumulative impacts of Alternative D would be essentially limited to the impacts of past mineral development activities plus potential future locatable mineral development restricted to less than half the total decision area.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.19 Watershed Management

Geographic Area for Analysis

The cumulative effects area for watershed management consists of the area within the planning area boundary including land either administered by other agencies or privately owned, plus those portions of individual watersheds that cross the planning area boundaries into areas managed by adjoining BLM Field Offices.

Impacts of the Proposed RMP

Direct effects of the Proposed RMP on watershed management would be to prioritize the watersheds to be treated under the Vegetation Resources Program and to optimize the allocation of additional vegetation production (forage) on areas following watershed analysis and treatment. The prioritization of watershed for analysis and treatment places 41 watersheds in a high priority category to be analyzed within the next 10 years and the remaining 20 watersheds in a low priority category to be analyzed beyond the next 10 years. This prioritization approach focuses initial efforts in those watersheds where the combination of treatment needs, affected resource values (e.g., special status species), and expected beneficial effects are considered to be greatest. Following watershed treatment the additional forage produced on the treated areas would be allocated to livestock, wild horses, and/or reserved for watershed maintenance and wildlife, depending on the degree of watershed function.

Impacts of the Interrelated Projects

The primary past actions that have affected current watershed condition and ecological health are historic mining activities and other human-caused surface disturbances, wildland fires, and historic grazing practices. Surface disturbances and fires have affected only a small percentage of the total area within the planning area. Past grazing management and aggressive fire suppression, however, have been major contributors to current deteriorated ecological conditions throughout the planning area. Partially due to these conditions, the spread of invasive and noxious weeds now threatens most of the ecological systems in the planning area, accentuating the need for prompt and effective restoration treatment.

Present actions affecting watershed management (prioritization) are mainly those that affect the vegetation composition and ecological health of watersheds. Key examples include livestock grazing, wild horse management, drought conditions, wildland fires, and spread of invasive species. To a lesser degree, other land uses such as mineral extraction, rights-of-way, transportation, wildlife management, and recreation affect watershed conditions in selected areas.

Key future actions anticipated to affect watershed management include grazing by livestock and wild horses, creation of additional rights-of-way, potential restrictions associated with any additional species listings under the Endangered Species Act (a reduced or remote probability under the Proposed RMP), and the same natural processes mentioned above including fire, drought, and climate change. These have the potential to contribute to further deterioration of watershed conditions or affect the timing and selection of watershed treatments available for restoration. The potential for such effects would diminish as increasingly

greater portions of the planning area are restored to resilient vegetation conditions. Additional rights-of-way granted throughout the planning area would result in alteration of surface drainage patterns and could lead to accelerated erosion and sedimentation on a localized basis.

Cumulative Impacts Conclusion

Most of the interrelated projects have individually localized, but cumulatively widespread, effects on ecological health and watershed function, depending on the nature and areal extent of disturbances involved. On a short-term basis, the Proposed RMP would tend to be additive to such impacts, but on a long-term basis, the vegetation improvement associated with the treatments should more than offset the effects of the interrelated projects. This expectation of improved conditions, however, could be delayed or reduced by extended periods of drought, major insect infestations, or disease outbreaks. In other cases, insects and disease could help in meeting management goals.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factors involved are those that affect the current condition of watersheds or constrain the selection of treatments and resultant success for restoration of deteriorated sites. The primary long-term factors include actions that would impact the maintenance of resiliency on restored areas, such as grazing by livestock and wild horses.

Alternative A: Greater short-term, greater long-term impacts on ecological health and watershed management than the Proposed RMP.

Alternative B: Same short-term, same long-term impacts on ecological health and watershed management as the Proposed RMP.

Alternative C: Same short-term, greater long-term impacts on ecological health and watershed management than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts on ecological health and watershed management than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.20 Fire Management

Geographic Area for Analysis

The cumulative effects area for fire management includes the planning area and surrounding jurisdictions that also manage fires, such as other BLM Field Offices and National Forest Ranger Districts.

Impacts of the Proposed RMP

The primary direct effect of the Proposed RMP would be substantially greater use of prescribed fire and wildland fire, along with herbicides and mechanical treatments, as vegetation management tools in the vegetation treatment process. Since more fires would be involved, there is a greater short-term risk of a prescribed fire escaping from control, but the effects of vegetation treatments, including the use of fire, would reduce the risk of catastrophic fire events on a long-term basis. Increased use of prescribed fire and other vegetation treatments in wildland urban interface areas would reduce the current fuel loading of these areas and the associated risks of larger fires that would jeopardize human safety and property. Direct effects of the proposed fire management actions would include short-term reductions in forage and habitat for wildlife, wild horses, and livestock on localized areas where fire is used in vegetation treatments. As with the use of other vegetation treatment tools, the long-term effects would be more forage and habitat for these same resource users. Increased use of fires is expected to result in more frequent smoke emissions spread over smaller areas and over shorter time periods when compared to the effects of larger wildland fires.

Impacts of the Interrelated Projects

The primary factors that have affected fire management (and fire history) within the planning area are the same factors that have affected vegetation and ecological health including historic mining activities, historic grazing practices, historic fuelwood harvest, past fire suppression efforts, and expansion of weedy annual species such as cheatgrass. Surface disturbances and fires have affected only a small percentage of the total area within the planning area, a smaller percentage than would have been affected in the absence of fire suppression efforts. Past grazing practices and fire suppression efforts have been major contributors to current deteriorated ecological conditions throughout the planning area. Past fire suppression activities have resulted in dense or overmature stands of pinyon-juniper and sagebrush in numerous areas with accumulation of heavy fuels in many woodland areas. Partially due to these factors plus drought and other climatic changes, the spread of invasive and noxious weeds has provided an abundance of fine fast burning (flashy) fuels across much of the region and contributed to a shorter fire cycle in the affected areas.

Present management actions and natural events affecting fire management include primarily factors addressed herein as parts of Alternative A in Section 4.20, Fire Management, that provide potential ignition sources (e.g., recreation, off-highway vehicle use, and mineral development) and factors that affect fuel supply (e.g., vegetation treatments, livestock grazing, wild horse management, harvest of forest/woodland products, watershed management, and natural events such as spread of invasive species). Interaction of fire management with actions external to the public lands of the planning area primarily involves the presence of potential ignition sources on adjoining properties outside the Ely Field Office's jurisdiction. For

example, wildland fires commonly originate along highways and railroad rights-of-way or from human activities on residential and commercial properties adjoining public lands. Various natural factors such as drought conditions and thunderstorms also affect fire management.

Key future actions (aside from the Proposed RMP) anticipated to affect fire management include construction activities, recreational uses, vehicular traffic, railroad traffic, industrial and residential development adjacent to public lands, and the same natural processes mentioned above including drought, climate change, and continued spread of invasive species. All of the human-related reasonably foreseeable actions mentioned above are expected to provide additional potential fire ignition sources relatively proportional to the level of activity involved.

Cumulative Impacts Conclusion

The cumulative impacts on fire management involve the effects of the Proposed RMP (increased use of prescribed fires to achieve desired range of conditions for vegetation and greater flexibility in responding to accidental or natural ignitions) offsetting the increased frequency of accidental ignitions expected from the escalating use of the planning area for such activities as recreation, industrial development, and off-highway vehicle use.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

In this section, the alternatives are compared on the basis of how they affect overall risks associated with fire and the ability of the Ely Field Office to use natural and prescribed fire as a tool in achieving the stated vegetation management goals. In general, these comparisons are dependent on factors addressed within Section 4.20, Fire Management, and are not driven by external factors associated with a cumulative analysis.

Alternative A: The continuing increase in both flashy and heavy fuels would result in greater short-term and long-term impacts than the Proposed RMP.

Alternative B: Similar short-term and long-term impacts as the Proposed RMP.

Alternative C: Short-term impacts may be similar to or greater than the Proposed RMP; long-term impacts would be greater than the Proposed RMP.

Alternative D: Both short-term and long-term impacts would be greater than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.21 Noxious and Invasive Weed Management

Geographic Area for Analysis

The cumulative effects area for noxious and invasive weed management includes the planning area plus surrounding areas that could be the source of weed seeds transported by motor vehicles, construction vehicles, off-highway vehicles, and railroads.

Impacts of the Proposed RMP

Direct effects of the Proposed RMP on management of invasive and noxious weeds would include widespread treatment of weed populations in association with vegetation treatments to achieve the desired range of conditions within various vegetation communities. Treated areas at or near these desired conditions would have a lower probability for invasion and spread of invasive or noxious weed species. These management activities would improve vegetation resiliency in the long term, but do involve some short-term risk of greater weed spread in the event of treatment failure in drought years or due to other circumstances. Indirect effects of the Proposed RMP include the reduction in disturbance and seed spread from uncontrolled widespread use of off-highway vehicles, the improvement of vegetation communities in wild horse herd management areas currently unable to support existing populations, and improved protection of vulnerable sites such as riparian areas.

The noxious and invasive weed management program has the potential to impact a variety of other resources, including wildlife and special status species, through the toxicity effects associated with pesticides. Under the Proposed RMP and the Ely Field Office's use of chemicals in accordance with applicable BLM policy and label directions, such impacts are expected to be minimal.

Impacts of the Interrelated Projects

The primary past actions that have affected noxious and invasive weed management are those factors that have contributed to the introduction and spread of these weed species throughout the planning area. Key actions include historic mining activities, road construction, vehicle traffic, local agriculture, other human-caused surface disturbances, wildland fires, historic grazing practices, and drought. Although surface disturbances and fires have affected only a small percentage of the total area within the planning area, they provided fresh barren areas for colonization by invasive species. Past grazing practices (including use by wild horses and wildlife) and aggressive fire suppression have been major contributors to current deteriorated vegetation conditions throughout the planning area, which have effectively reduced the ability of native perennial species to compete against weedy species invading native vegetation communities. Agricultural practices, highway and railway traffic, livestock movement, and recreational activities have been common vectors helping to introduce and spread propagules (seeds, spores, etc.) of invasive species.

Present actions affecting noxious and invasive weed management include agriculture, livestock grazing, wild horse management, mineral development and other construction activities, drought conditions, wildland fires, insect infestations, vegetation/watershed treatments, land disposal actions, recreation, highway traffic,

and off-highway vehicle use. Several of these various actions have been addressed in Alternative A in Section 4.21 through specific types of management actions. Others, however, are not subject to Ely Field Office jurisdiction based on where they occur (often on adjoining private lands) or the nature of the activity (e.g., highway traffic, drought, and insect infestations).

Key future actions anticipated to affect noxious and invasive weed management include the same array listed above plus additional rights-of-way and land disposals, most of which are addressed as parts of the Proposed RMP. Each of these actions presents additional risk of introduction and dispersal of noxious or invasive weed seeds.

Cumulative Impacts Conclusion

The Proposed RMP would work to control the spread and reduce the occurrence of invasive and noxious weed species in the planning area. At this time, however, it is undetermined whether the rate of vegetation treatment and improvement toward the desired range of conditions would be adequate to offset the recently increasing rate of introduction and spread of invasive and noxious species, some of which is associated with interrelated past, present, and future projects.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

On a short-term basis, the primary factors involved are those that affect the introduction and spread of invasive species, contribute to loss of native vegetation diversity and vigor, or constrain the selection of treatments and resultant success for restoration of deteriorated sites. The primary long-term factors include actions that would impact the maintenance of resiliency on restored areas, such as grazing by livestock and wild horses.

Alternative A: Same short-term, greater long-term impacts on management of noxious and invasive weeds than the Proposed RMP.

Alternative B: Same short-term, lesser long-term impacts on management of noxious and invasive weeds than the Proposed RMP.

Alternative C: Same short-term, greater long-term impacts on management of noxious and invasive weeds than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts on management of noxious and invasive weeds than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.22 Special Designations

Geographic Area for Analysis

The geographic area for cumulative impacts to special designations is the area within the boundaries of the planning area.

Impacts of the Proposed RMP

Under the Proposed RMP, 20 ACECs totaling approximately 317,800 acres and two new back-country byways would be designated. These designations would provide enhanced protection and management emphasis for the relevant resources of these sites. Eight areas totaling 2,155 acres would be dropped from special designation, which would have minimal impact as management prescriptions under the Proposed RMP have been determined to adequately protect the resource values associated with these areas. Designation of the additional ACECs also would result in potential constraints related to uses of other resources in the areas, thereby impacting other resource programs.

Impacts of the Interrelated Projects

The interrelated projects would increase access to and activity within the special designation areas, the latter resulting from increased population due to residential development. Impacts to special designations could result in the degradation of special designation areas, changes in designation of special designation areas, changes in access to special designation areas, and changes in management prescriptions for special designation areas. For example, impacts from interrelated projects would occur due to an increase in access to the desert tortoise ACECs in the southeastern part of the planning area through the development of a road from Caliente to Mesquite, development of the proposed Department of Energy and Toquop rail lines, and the paving of the Kane Springs Road. These interrelated projects could potentially result in increased mortality of desert tortoise through collisions with vehicles.

Cumulative Impacts Conclusion

Impacts to special designations under the Proposed RMP would be an increase in areas managed as ACECs, providing more effective protection of resources, and the creation of new back-country byways. Impacts from the interrelated projects would include increased use of the designated ACECs and back-country byways, resulting in resource degradation and increased need for management by the Ely Field Office.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The primary factor involved for impacts to special designations is the quantity of land given special designations, and the management prescriptions for these lands.

4.28 Cumulative Impacts

Alternative A: Less impact than the Proposed RMP.

Alternative B: Similar impact to the Proposed RMP.

Alternative C: Slightly greater impact than the Proposed RMP.

Alternative D: Less impact than the Proposed RMP since the need for special designations would be eliminated.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.23 Economic Conditions

Geographic Area of Analysis

For cumulative economic and social effects, the external boundaries of the planning area and surrounding communities extending as far as Las Vegas constitute the relevant geographic area of analysis. This area would capture the preponderance of direct and indirect economic impacts associated with the interrelated projects located within and adjacent to the planning area's boundaries and the management actions associated with the Proposed RMP. Many of the demands and pressures affecting the Ely Field Office originate outside of the planning area and, hence, are captured in this cumulative analysis area.

Impacts of the Proposed RMP

The Proposed RMP would result in slight to moderate, long-term impacts in the form of increased additional local employment opportunities, personal income, sales for local businesses, and tax revenues for local governments. Some of the gains would arise as a result of the increased funding for restoration, while other gains would accrue over the long term, as the level of developed and organized recreation and woodland commodity use increases in response to ecological health restoration. Resident households associated with the incremental jobs would spawn demand for housing along with visitor populations, and demand on local public facilities and services.

Impacts of the Interrelated Projects

Virtually all the identified interrelated past, present, and reasonably foreseeable projects have actual or potential economic and social consequences. Such consequences manifest themselves in the following contexts:

- Capital investments associated with past and present projects result in the development of residential, commercial, and public infrastructure with economic lives extending beyond that of the interrelated project itself.
- Short- and long-term influences of activities in one period that establish land use patterns affecting economic and social conditions in subsequent periods. For example, once built, highways and state parks can stimulate recurring local economic stimulus related to recreational visitors, tourists, and other travelers.
- Private real estate speculation and development and public sector land use, facility, and service planning initiatives prompted by prospective future activities, whether real or merely suggested by information such as the mapping of high potential mineral development areas.
- Effects tied to actions, activities, and projects located outside the planning area, but having indirect connections to resources within the planning area. Examples of such actions include past, current, and

potential future Department of Defense and Department of Energy activities on federal lands adjacent to the planning area, accessed via highway and railroad connections in the planning area.

- Reasonably foreseeable actions can generate subtle economic impacts in the present, with more tangible economic effects arising as a project transitions from concept to reality. Cumulative effects are shaped not just by the characteristics of the specific project, but also by other activities occurring in the same timeframe. In fact, the degree of overlap in schedules and relative scales of interrelated projects are critical factors influencing cumulative impacts. The timing aspects of the majority of the interrelated projects is not available to include in this discussion.
- Temporary, short-term and long-term effects on local employment, population, housing demand, community facilities and services, fiscal conditions, and social values and attitudes towards public land management would be expected.

The recent reopening of the Robinson mine, other mineral development projects, changes in agricultural development, the Yucca Mountain Nuclear Repository, and the White Pine Energy Station and Ely Energy Center are the projects having the highest potential for short and long-term economic and social effects in the planning area. The short-term effects would occur during initial project start-up and construction, with long-term effects associated with the ongoing operations. Water development projects also could have substantial long-term consequences depending upon the timing and use/application of the subsequent water production. These interrelated actions may be accompanied by both positive and negative economic and social effects.

The reasonably foreseeable projects with potential long-term employment effects tend to be somewhat geographically clustered in the northern and southern portions of the planning area. Hence, associated economic and social impacts would tend to be concentrated in the Ely and Caliente areas, or in new development areas such as Coyote Springs or involved with the Lincoln County Land Act and the Lincoln County and White Pine County Conservation, Recreation, and Development Acts. Of themselves, large-scale mineral and energy development projects, the Yucca Mountain – Caliente rail line, and new land development activities are those with the highest potential to be important. That potential increases if multiple projects are simultaneously active. At the same time, the possibility exists for some offsetting impacts; for instance, the expansion of one mine or startup of an energy development project as another mine is closing, thereby dampening the impacts associated with the former.

Cumulative Impacts. Because of the factors described above, almost all of the interrelated projects have actual or potential cumulative economic and social impacts when considered in conjunction with the Proposed RMP. Potential cumulative economic effects associated with the Proposed RMP include the linkages between economic and population growth in Clark County and recreation use, local water development, and demands for land disposal, energy production, transmission capacity, and residential development within the planning area. These uses and demands create pressures on local agricultural operations through indirect impacts on grazing and demand for developable land that could trigger contractions in the local agricultural sector and its economic contributions to the local economy. The increase in BLM funding for watershed restoration, if it coincides with a resurgence in mining and other

4.0 ENVIRONMENTAL CONSEQUENCES

energy development, could create short-term synergistic impacts on the local labor market, housing, and community service conditions. The cumulative effects of these influences accentuate the on-going transition between a commodity-based and more service-based economy.

Another series of cumulative effects involves land use and administration of public lands in and around the planning area by multiple governmental agencies. The Ely Field Office and U.S. Forest Service management of vast tracts of land and resources in the region generate economic effects that vary over time, but are relatively consistent from year-to-year during the short-term. However, activities at the Nellis Air Force Base flight range and the Nevada Test Site, including the potential construction at the Yucca Mountain Nuclear Repository and transportation network, are known to fluctuate and could dramatically alter the planning area's economic setting over the long-term. A decision to proceed with the Yucca Mountain Nuclear Repository could increase demand for land disposal, water development, and recreation and commodity use in the planning area, potentially affecting the Ely Field Office's management. Completion of the Lincoln County Land Act sale and subsequent new development would generate cumulative social and economic effects in nearby Mesquite and Clark County. Employment and population growth also could accompany the project, with the scale and timing dependent on the transportation mode and access routes selected. The development-related economic and social impacts would be substantial.

Cumulative economic impacts would arise in conjunction with Congressionally-mandated land and realty actions in Lincoln and White Pine counties, as they could give rise to future economic development activities, impact future management and watershed restoration priorities within the planning area, and the locations and levels of use on public lands, all of which could indirectly affect local economic conditions.

Potential cumulative economic impacts arising from the other projects could create temporary and short-term economic fluctuations, varying in scale, but similar to those characterizing the region's recent history. For example, mineral resource development in the northern portion of the planning area could result in population, economic, and social effects to nearby communities outside the planning area, such as Elko, Nevada. Most, if not all, of those communities already host businesses and residents associated with mineral development elsewhere in eastern Nevada. As such, the changes may be viewed more in the context of normal or typical events and less as fundamental changes in the region's economic environment.

The cumulative economic effects described above have corollary cumulative effects in terms of social and community well-being. In the case of past actions, the cumulative effects manifest themselves as physical vestiges of the activity, as well as in present social conditions and attitudes. Historical and existing social linkages bind together generations of past, current, and future residents of the region. Past and present residents have contributed to the formation of local governance, community service capabilities, and local organizations and institutions that function today. Development pressures from outside the region may reshape and influence the established social structure and order within the planning area. Given the rural nature of the planning area and the attendant low population base, the opportunities to effect change or address issues within state and federal government arenas may be constrained. The net cumulative effect of these factors maybe a diminished sense of self-determination and local control that characterizes much of the rural West. Cumulative impacts on social conditions associated with the long-term land development activities have the potential to be substantial.

Cumulative Impacts Conclusion

Several of the interrelated projects pose a potential for generating substantial impacts on economic and social conditions in portions of, or across much of the planning area. The greatest likelihood arises in the context of potential long-term changes associated with major future land development activities in southern Lincoln County, the proposed Yucca Mountain Nuclear Repository, water development and pipeline proposals seeking changes in the location and type of use of surface and groundwater resources in the region, and the White Pine Energy Station and Ely Energy Center. The Proposed RMP, and any of the alternatives thereto, would incrementally contribute to those impacts in a cumulative sense, if for no other reason than that several of them would directly or incidentally involve public lands, for utility rights-of-way, for instance. Although the duration, timing, and extent of the overall cumulative effects is indeterminate based on current information, the potential for impacts, including short-term impacts, increases if development of two or more of the interrelated projects were to occur concurrently.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The potential cumulative economic and social effects do not vary appreciably between the RMP management alternatives, because the scale and timing of the interrelated projects, many of which are outside to the region, have few direct linkages to the key local economic parameters affected by the management alternatives. From a cumulative effects perspective, a key issue is whether differences in the alternatives increase or diminish the likelihood of a present action maintaining its current status or of a reasonably foreseeable future action occurring or not occurring. The potential for cumulative social effects does not vary appreciably between the alternatives because the most pronounced influences affecting these impacts are outside the region.

Alternative A: Additional activity in the region associated with the interrelated projects could accelerate the onset of subsequent use restrictions and economic impacts triggered by declining ecological health.

Alternative B: Potential cumulative effects under Alternative B would include substantial economic impacts to affected ranchers with allotment permits in the areas unavailable due to bighorn sheep and desert tortoise habitat.

Alternative C: Corridor management policies under this alternative may increase the likelihood of one or more of the interrelated energy projects occurring, with resulting small increase in cumulative effects on employment, income, and other economic activity. Land use authorization policies may interact with the Yucca Mountain Nuclear Repository and aid other projects to allow more economic growth and community expansion over time.

Alternative D: The no net loss of public lands provision under Alternative D would result in cumulative interactions with interrelated projects requiring public land for development. The prohibition on land use authorizations would severely limit the development of interrelated projects such as power plants and wind energy farms. However, the timing, location, and scale of the impacts are unknown. The removal of

4.0 ENVIRONMENTAL CONSEQUENCES

livestock grazing throughout the decision area would result in substantial economic impacts within the planning area and to surrounding areas where some of the affected ranchers may reside.

4.28.24 Social Conditions

See the preceding section on economic conditions.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.25 American Indian Issues

American Indian issues identified through scoping (land disposals, access to sacred sites, pinyon pine nut harvesting, tribal outfitter guide service) and comments expressed by representatives of American Indian groups participating as cooperators in the RMP process were examined in relation to the Proposed RMP. No cumulative impacts from interrelated projects were identified; however, natural processes such as drought, fire, and insect destruction of pinyon pines, would have an impact on future pine nut harvests.

4.28.26 Environmental Justice

Following the definition for cumulative impacts, an impact must result from Ely Field Office management actions before a cumulative impact would occur. Since no environmental justice issues have been identified in relation to the Proposed RMP, no cumulative impacts are anticipated.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.27 Health and Safety

Geographic Area for Analysis

The cumulative effects area for health and safety includes all areas within the planning area boundary plus adjoining areas and communities potentially affected by atmospheric emissions, hazardous materials spills, or wildland fires originating within the planning area.

Impacts of the Proposed RMP

Direct effects of the Proposed RMP would not differ from the other alternatives with respect to health and safety, in that activities under this alternative would be conducted in accordance with applicable regulations and BLM policy regarding health and safety and protection of personal property. Thus, there are no program-specific impacts for health and safety under the Proposed RMP. However, actions from other resource programs such as vegetation and fire management would have substantial effect on health and safety issues. Vegetation treatments, including fuel reduction in wildland urban interface areas, and the fire management plans of the Proposed RMP would reduce the long-term risk of large-scale fires and the risk of personal injuries and destruction of personal property associated with wildland fires.

Impacts of the Interrelated Projects

The primary past actions that contribute to health and safety issues within the planning area are those that contribute to current fire hazards. Numerous other past actions, such as mining and smelting operations, contributed to previous health and safety issues (mine subsidence and smelter emissions) that no longer persist as major public land issues in the area. Past actions contributing to current fire hazard conditions include historic grazing practices, aggressive fire suppression, and various surface disturbances that have either facilitated expansion of annual weed species or lead to accumulation of unusually heavy fuel loads in various vegetation types. Other activities, such as development of roads, railroads, other rights-of-way, agricultural practices, and mineral extraction have contributed to the presence of widespread human activities that constitute potential ignition sources for wildland fires.

Present and future actions potentially contributing to the current and future fire hazards include almost all human activities occurring on the public lands, particularly those that involve construction equipment and activity, traffic and vehicle use, and recreation involving off-highway vehicle use. Thus, almost any of the interrelated projects involving human activity may be a contributing factor in terms of providing an ignition source.

Cumulative Impacts Conclusion

The Proposed RMP would reduce the long term risk of large-scale fires and the risk of personal injuries and destruction of personal property associated with wildland fires, largely offsetting the anticipated increases in wildland fire risk arising from various interrelated projects.

Variation in Cumulative Impacts Between the Proposed RMP and Other Alternatives

The primary factors involved in health and safety issues related to wildland fires include the following (listed from short term to longer term): 1) suppression of wildland fires as necessary to protect persons and property, 2) the prompt and orderly reduction in fuel loading around vulnerable communities (i.e., wildland urban interface management), and 3) reduction of excessive fuel loadings throughout the planning area so that a more natural fire regime may be reestablished with resilient vegetation communities.

Alternative A: Greater short-term, greater long-term impacts than the Proposed RMP.

Alternative B: Same short-term, same long-term impacts as the Proposed RMP.

Alternative C: Same short-term, greater long-term impacts than the Proposed RMP.

Alternative D: Greater short-term, greater long-term impacts than the Proposed RMP.

4.0 ENVIRONMENTAL CONSEQUENCES

4.28.28 Summary of Cumulative Impacts

Table 4.28-3, which follows, presents a summary of the cumulative impacts to each resource program for the Proposed RMP. The detailed discussion of cumulative impacts begins in Section 4.28.2.

**Table 4.28-3
Cumulative Impacts of the Proposed RMP**

AIR RESOURCES
Cumulative impacts include those caused by sources and activities associated directly with the Proposed RMP and those caused by interrelated projects that have occurred historically, projects that are currently underway, and those that might reasonably occur in the future. Air resources in the planning area are mainly affected by mining and vegetation management/fire management practices. Regulatory decisions related to industrial development and mining would help prevent air quality degradation by applying mitigation measures on a case-by-case basis. Three potential electrical generating power projects would affect air quality in the region if constructed. Permitting requirements of the Nevada Division of Environmental Protection and the U.S. Environmental Protection Agency would require modern control technology to limit emissions and impacts from these potential sources. Fire management treatments would include in-depth planning and analysis of potential incident and cumulative air quality impacts to reduce emissions associated with fires. Projected cumulative impacts are of such a nature that the planning area should be able to meet all applicable local, state, tribal, and National Ambient Air Quality Standards under the Clean Air Act (as amended), and help prevent deterioration of air quality within the planning area from all direct and authorized actions.
WATER RESOURCES
Cumulative impacts of the Proposed RMP would be minimized over the long term by extensive vegetation management and administration of other land uses that would consider a balanced ecological system approach. Salinity inputs to the Colorado River system would be reduced over time. Short-term increases in runoff, soil erosion, and related sedimentation may occur on those areas where vegetation treatments occur. Interrelated projects would have the potential to create impacts on both surface and groundwater resources through additional erosion and sedimentation as a result of land disturbance, further consumption of available water resources, and additional releases of undesirable water quality constituents (e.g., industrial chemicals, treated domestic effluent) into receiving waters. The net effects on water resources from the Proposed RMP and the interrelated projects may result in substantial cumulative impacts.
SOIL RESOURCES
Cumulative impacts of the Proposed RMP and interrelated projects would involve a short-term increase of erosion and sedimentation, with accompanying reduction in soil quality, when the activities are initially undertaken. Extensive vegetation treatment in the planning area would, in time, result in substantial reduction of erosion and sedimentation. Similarly, soil quality would increase over the long term as a result of vegetation treatments. Impacts from interrelated project development within the planning area would result in permanent removal or alteration of soil resources in specific areas (such as project footprints or some riparian/wetland areas). Regulatory programs (including permit approval and monitoring processes), and the implementation of best management practices and mitigation measures, would reduce the degree of overall erosion and sedimentation impacts. Soil quality would be lost in the comparatively smaller areas affected by interrelated projects, but would improve over widespread areas with successful vegetation restoration.
VEGETATION RESOURCES
The actions related to the Proposed RMP would enhance vegetation resiliency on a long-term basis, although some elements of the alternative would contribute to temporary loss of vegetation and potential spread of invasive species. Most of the interrelated projects have produced or would result in the removal of native vegetation and potential spread of invasive species, either through physical disturbance or alteration of vegetation communities. The enhanced vegetation resiliency resulting from the Proposed RMP should offset a large portion of the past and potential future disturbance effects from interrelated projects.
FISH AND WILDLIFE
Aquatic
The cumulative effects of interrelated projects in combination with program-specific management under the Proposed RMP would generally improve maintenance and quality of fish habitat in the long term as restoration efforts improve both upland and riparian habitat conditions. This habitat improvement would tend to offset continued habitat losses and damage resulting from various interrelated projects including potential groundwater withdrawal.
Wildlife
The actions related to the Proposed RMP would improve wildlife habitat conditions on the watershed level and landscape level in the short and long term. However, the interrelated projects either have produced or would result in direct wildlife mortality, displacement of wildlife, habitat loss or alteration, and increased habitat fragmentation. The habitat improvement resulting from the vegetation restoration treatments should offset a large portion of the past and potential future habitat losses and damage resulting from interrelated projects.

4.28-85

4.28 Cumulative Impacts

Table 4.28-3 (Continued)

SPECIAL STATUS SPECIES
Plant Species
The impacts related to the Proposed RMP would have minimal effect on the Ute ladies'-tresses orchid and other special status plants on an overall basis, while at the same time protection of these species would be enhanced in several ACECs. Most of the interrelated projects have produced or would produce minimal effects to special status plants, either through physical disturbance or alteration of vegetation communities. The improved knowledge base and potential mitigation measures related to the Proposed RMP should offset a large portion of the past and potential future adverse effects from interrelated projects.
Aquatic Species
Surface disturbance activities could result in localized water quality changes due to sedimentation or runoff contaminants, and habitat alteration or loss. Several programs such as vegetation restoration and weed management (i.e., tamarisk removal) could increase stream flows and spring discharges. Several of the interrelated projects could result in changes to surface water quantity in various streams or springs (e.g., groundwater withdrawal). In the long term, vegetation restoration could reduce stream flows originating from surface runoff, but could locally increase stream base flows and spring discharges. Other interrelated actions could combine with these water quantity changes to affect habitat for sensitive species. The cumulative effects of interrelated projects in combination with program-specific management under the Proposed RMP would result in impacts on sensitive fish species habitat due to surface disturbance in watersheds, but this would be balanced by an increased rate of maintenance and restoration of habitat for sensitive fish species.
Wildlife Species
The impacts related to the Proposed RMP would improve special status species habitat conditions on the watershed and landscape level in the long term. However, the interrelated projects either have produced or would continue to result in direct mortality, displacement of individuals, habitat loss or alteration, habitat fragmentation, and possible population reductions of some special status species. The special status species habitat improvement resulting from the Proposed RMP should offset a large portion of the past and potential future habitat losses and damage resulting from interrelated projects. However, local greater sage-grouse populations may be reduced in numbers because of development in and around breeding habitat (i.e., leks) regardless of the habitat improvement that may occur elsewhere.
WILD HORSES
The impacts related to the Proposed RMP generally would improve habitat for wild horse herds on a long-term basis, while many of the potential impacts associated with interrelated projects would reduce habitat, but typically to a lesser degree. Thus, the overall cumulative effects would be general improvement in the habitat necessary for long-term herd health and viability.
CULTURAL RESOURCES
There would be a high level of protection of cultural resources under the Proposed RMP (overall decrease in lands available to off-highway vehicle use and livestock/wild horse grazing and the designation of ACECs to protect cultural resources) offsetting the expected increase in visitor and recreation use in the planning area. Thus, the overall cumulative effects would be minimal.
PALEONTOLOGICAL RESOURCES
There would be a high level of protection of paleontological resources under the Proposed RMP (overall decrease in lands available to off-highway vehicle use and mineral development) offsetting the expected increase in visitor and recreation use in the planning area. Thus, the overall cumulative effects would be minimal.
VISUAL RESOURCES
Cumulative impacts to visual resource use would occur through the degradation of visual resources resulting from a number of activities within the planning area. Under the Proposed RMP, impacts to visual resources would be minimal, those impacts mainly being from surface disturbances associated with the vegetation treatments, and the reduction in surface disturbances associated with the elimination of cross-country off-highway vehicle use and the co-location of utility rights-of-way and communication sites. Some interrelated projects would result in surface disturbances, increased air emissions, and local visual impacts. An increase in the area designated as Class II and III and a decrease in the area designated as Class IV would lead to more emphasis on mitigation for visual impacts from proposed actions across the planning area. The designation of the Pony Express Visual Resource Management Class II corridor places the scenic values of this area at a higher level. Interrelated projects would not occur within Class I areas.

Table 4.28-3 (Continued)

LANDS AND REALTY
Cumulative impacts to the management of lands and realty would occur as a result of new avoidance and exclusion areas and management direction encouraging co-location of utility rights-of-way and communication sites. Interrelated projects could increase pressure for development and create a higher demand for developable lands in the planning area. Cumulative impacts of the lands and realty program and interrelated actions on other resources and uses would be largely a function of the collective disturbance areas involved as shown in Table 4.28-1 .
RENEWABLE ENERGY
Interrelated power plant and transmission line projects could create better access to electrical transmission lines. Interrelated power plants, water development, and residential development projects could impact renewable energy development through the use of water that could otherwise be used for development of concentrated solar power. Cumulative impacts of the renewable energy program and interrelated projects on other resources and uses would be largely a function of the collective disturbance areas involved as shown in Table 4.28-1 .
TRAVEL MANAGEMENT AND OFF-HIGHWAY VEHICLE USE
The cumulative impacts of travel management and off-highway vehicle use would occur through the degradation of transportation resources, and changes in designation and management of transportation resources. The reduction of cross-country off-highway vehicle use and the prioritization of road and trail designations through an updated transportation plan would have short and long term impacts to travel management, but would reduce off-highway vehicle use opportunities and impacts of such use on other resources. The interrelated projects would have minimal effects on transportation planning and road and trail designations, although new housing and energy development could contribute additional traffic and increase the need for road maintenance.
RECREATION
The cumulative impacts to recreation could occur through the degradation of recreation resources, changes in designation and management of recreation resources, and changes in accessibility to and availability of recreation resources. Interrelated projects would have a mixed impact on recreation. Rebuilding of dams and expansion of lakes could reduce recreation opportunities in the short term, while creating an overall increase in recreation opportunities in the long term. Increased residential development and population in the planning area and adjacent areas would lead to an increase in demand for recreational opportunities, with associated increases in impacts to other resources.
LIVESTOCK GRAZING
The impacts of the Proposed RMP and interrelated projects to livestock grazing would reduce forage for livestock in the short-term on any given treatment area during vegetation treatment activities and generally increase forage over the long-term as treated vegetation communities reach their potential productivity. Interrelated projects typically would reduce the area available for grazing. Overall the cumulative effects would enhance available forage on a long-term basis as the increasing forage productivity on treated areas offsets and later exceeds future incremental reductions associated with interrelated projects. Impacts from the allotment evaluation and term permit renewal processes are expected to continue to meet RMP goals and objectives, including the standards for rangeland health.
FOREST/WOODLAND AND OTHER PLANT PRODUCTS
The impacts associated with the Proposed RMP and interrelated projects would generally result in reduced acreage of dense, overmature woodlands, increased diversity of age classes within most woodland sites, healthier and more resilient overall woodland communities, and comparable or potentially increased annual production of forest/woodland products on a sustained yield basis.
GEOLOGY AND MINERAL EXTRACTION
Impacts of the Proposed RMP and certain interrelated projects on mineral exploration and development could be restrictive, with potential impacts coming primarily from interrelated projects involving endangered species recovery and protection. Cumulative impacts from mineral exploration and development plus interrelated projects would focus primarily on increased surface disturbances and resultant effects on other resources as shown in Table 4.28-1 .
WATERSHED MANAGEMENT
Most of the interrelated projects have individually localized, but cumulatively widespread, effects on ecological health and watershed function, depending on the nature and areal extent of disturbances involved. On a short-term basis, the Proposed RMP would tend to be additive to such impacts, but on a long-term basis, the vegetation improvement associated with the treatments should more than offset the effects of the interrelated projects. This expectation of improved conditions, however, could be delayed or reduced by extended periods of drought, major insect infestations, or disease outbreaks. In other cases, insects and disease could help in meeting management goals.

4.28-87

4.28 Cumulative Impacts

Table 4.28-3 (Continued)

FIRE MANAGEMENT
The cumulative impacts on fire management involve the effects of the Proposed RMP (increased use of prescribed fires to achieve desired range of conditions for vegetation and greater flexibility in responding to accidental or natural ignitions) offsetting the increased frequency of accidental ignitions expected from the escalating use of the planning area for such activities as recreation, industrial development, and off-highway vehicle use.
NOXIOUS AND INVASIVE WEED MANAGEMENT
The Proposed RMP would work to control the spread and reduce the occurrence of invasive and noxious weed species in the planning area. At this time, however, it is undetermined whether the rate of vegetation treatment and improvement toward the desired range of conditions would be adequate to offset the recently increasing rate of introduction and spread of invasive and noxious species, some of which is associated with interrelated past, present, and future projects.
SPECIAL DESIGNATIONS
Impacts to special designations under the Proposed RMP would be an increase in areas managed as ACECs, providing more effective protection of resources, and the creation of new back-country byways. Impacts from the interrelated projects would include increased use of the designated ACECs and back-country byways, resulting in resource degradation and increased need for management by the Ely Field Office.
ECONOMIC CONDITIONS
Several of the interrelated projects pose a potential for generating substantial impacts on economic and social conditions in portions of, or across much of the planning area. The greatest likelihood arises in the context of potential long-term changes associated with major future land development activities in southern Lincoln County, the proposed Yucca Mountain Nuclear Repository, water development and pipeline proposals seeking changes in the location and type of use of surface and groundwater resources in the region, and the White Pine Energy Station and Ely Energy Center. The Proposed RMP, and any of the alternatives thereto, would incrementally contribute to those impacts in a cumulative sense, if for no other reason than that several of them would directly or incidentally involve public lands, for utility rights-of-way, for instance. Although the duration, timing, and extent of the overall cumulative effects is indeterminate based on current information, the potential for impacts, including short-term impacts, increases if development of two or more of the interrelated projects were to occur concurrently.
SOCIAL CONDITIONS
See economic conditions.
AMERICAN INDIAN ISSUES
Cumulative impacts, if present, are identified in the corresponding topic areas of Section 4.28.
ENVIRONMENTAL JUSTICE
Following the definition for cumulative impacts presented at the beginning of this section, an impact must result from BLM management direction before a cumulative impact will occur. Since no environmental justice issues have been identified in relation to the Proposed RMP, no cumulative impacts are anticipated.
HEALTH AND SAFETY
The Proposed RMP would reduce the long term risk of large-scale fires and the risk of personal injuries and destruction of personal property associated with wildland fires, largely offsetting the anticipated increases in wildland fire risk arising from various interrelated projects.

4.29 Potential Mitigation and Potential Effectiveness

4.29 Proposed Mitigation and Potential Effectiveness

Mitigation of impacts can be addressed in many different ways. According to the Council on Environmental Quality regulations, mitigation includes:

- a) Avoiding the impact altogether by not taking a certain action or parts of an action.
- b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
- d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- e) Compensating for the impact by replacing or providing substitute resources or environments (Title 40 Code of Federal Regulations Subpart 1508.20).

Mitigation has been built into the Proposed RMP through the development of management actions that address programmatic management issues, while also reducing impacts. That is, management actions have been structured to avoid or minimize impacts, as specified by the Council on Environmental Quality regulations. Further, the best management practices presented in Section 1 of Appendix F would be implemented by the Ely Field Office on a project-specific basis, as appropriate for site conditions and the proposed disturbance. The Ely Field Office and other BLM offices have developed these best management practices through many years of experience with on-the-ground projects. The following proposed mitigation is in response to anticipated impacts and would be in addition to the best management practices. The potential effectiveness of the proposed mitigation measures is addressed in order for the BLM Nevada State Director to make an informed decision regarding whether to include the proposed mitigation as part of his final decision, documented in the Record of Decision.

Vegetation

Impact: Increased frequency and size of wildland fires in the Mojave Desert due to invasive annual species.

Proposed Mitigation 1: Increase fire suppression forces within the Mojave Desert through the establishment of a fire station in the Mojave Desert and increased aerial resources in Mesquite, Nevada.

Effectiveness: A shorter response time with more suppression forces could reduce the size of wildland fires.

4.0 ENVIRONMENTAL CONSEQUENCES

Fish and Wildlife

Impact: Disturbance of wildlife during sensitive times or in sensitive locations as a result of designating special recreation management areas and special recreation permit areas where off-highway vehicle use is anticipated to increase.

Proposed Mitigation 2: The following adaptive management measures may be identified during activity level planning for special recreation management areas and special recreation permit areas to mitigate potential localized disturbances to wildlife: placement of signs and public education at key recreation access areas; identification of seasonal motorized route closures to protect wildlife during sensitive periods in their lifecycle; re-routes of existing roads and trails; permanent closures of existing routes; and the establishment of recreation use limitations.

Effectiveness: These measures would reduce the potential disturbances to wildlife during sensitive times of their lifecycle or sensitive areas identified during activity level planning. Monitoring would be implemented as a component of activity level plans to determine the overall effectiveness of any mitigation measures.

Impact: Loss of wildlife habitat as a result of energy production and mineral development.

Proposed Mitigation 3: Enhance wildlife habitat (based on the acres disturbed/lost) in another area away from the energy or mineral project site. Enhancement would be performed on a case-by-case basis in accordance with NEPA, and funding would be provided by the Proponent.

Effectiveness: Improving wildlife habitat away from the project site would provide quality habitat for those animals that are displaced by the project. This would reduce impacts to wildlife populations in the development area.

Special Status Species

Impact: Impacts to special status sagebrush obligate species from vegetation treatments and restoration.

Proposed Mitigation 4: Initiate quantitative habitat evaluations of areas proposed for treatment to ensure that:

- 1) Within Wyoming big sagebrush, no more than 20 percent of the greater sage-grouse breeding habitat serviced by any single lek location is treated (including areas burned by wildland fire) within a 30-year period, regardless of the techniques used.
- 2) In mountain big sagebrush, no more than 20 percent of the greater sage-grouse breeding habitat serviced by any single lek location is treated (including areas burned by wildland fire) within a 20-year period, regardless of the techniques used.

Effectiveness: These measures would maintain adequate greater sage-grouse breeding habitat during the period of vegetation treatments. Site-specific evaluations would occur as part of watershed planning, and follow-up monitoring would be implemented to determine the overall effectiveness of any treatment program.

Lands and Realty

Impact: The disposal and potential development of lands under the military operations areas could adversely affect the vital training of U.S. combat forces and negatively impact military combat readiness.

Proposed Mitigation 5: The two possible forms of mitigation are proposed as follows:

- 1) The Ely Field Office would provide public notice prior to disposal of public land under military operations areas, acknowledging the risks associated with the development of the land and the possible restrictions to uses that would be compatible with the military operations areas.
- 2) The Department of Defense proposes that lands disposed under military operations areas would be subject to an easement acknowledging the existing military operations areas and the risks associated with the development of the land. Land use would be restricted to uses compatible with the military operations areas. The specific details of the easement would be approved by the Department of Defense and the Federal Aviation Administration in conjunction with the Ely Field Office at a later date.

Effectiveness: By restricting land use to those uses compatible with military operations areas, the ability to conduct training essential to the combat readiness of the U.S. military would be preserved.

4.30 Unavoidable Adverse Impacts

Unavoidable adverse impacts are impacts that remain following the implementation of mitigation measures, or impacts for which there are no mitigation measures. Some unavoidable adverse impacts occur as a result of proposed management under one or more of the alternatives, while others are a result of public use of the BLM-administered lands within the decision area. For example, watershed restoration activities would be the primary cause of unavoidable adverse impacts from management actions; while public uses such as livestock grazing, mineral development, and off-highway vehicle use would be the primary causes of unavoidable adverse impacts by the public. Potential unavoidable adverse impacts are difficult to quantify and could extend far into the future. The following sections discuss those unavoidable adverse impacts that have been identified for the proposed management actions in the decision area. If a resource program is not mentioned, it was determined that there would be no important unavoidable adverse impacts to that resource or resource use.

Air Quality – Smoke generated from wildland fires, wildland fire use, and prescribed burns would be unavoidable, but impacts would be short term.

Water Resources – Vegetation treatment that is part of watershed restoration could result in increased sedimentation of surface waters. This impact is expected to be short term until new vegetation stabilizes treated areas.

Soils Resources – Vegetation treatment that is part of watershed restoration could result in increased soil erosion. This impact is expected to be short term until new vegetation stabilizes treated areas. Authorized and unauthorized off-highway vehicle use would continue to be a concern as it relates to rutting and soil erosion.

Vegetation and Special Status Plants – Vegetation treatment that is part of watershed restoration would alter vegetation communities and could result in the direct loss of special status plant populations that have not been previously discovered. Field investigations conducted as part of the watershed analysis process would minimize this risk of adversely affecting undiscovered rare plant populations. Special status plants would have better survival prospects in restored watersheds.

Fish, Wildlife, and Special Status Species – Vegetation treatment that is part of watershed restoration, particularly managed/prescribed fire and mechanical tools and techniques, could result in increased sedimentation to surface waters and a reduction of certain types of wildlife habitat. These effects could lead to increased mortality of some individuals on a local basis. These impacts are expected to be short term until new vegetation stabilizes treated areas, and restored watersheds would provide better habitat for fish and wildlife in the long term. Off-highway vehicle use also could disturb sensitive wildlife.

Wild Horses – The public would have less opportunity to view wild horses due to reduction in wild horse management areas.

4.0 ENVIRONMENTAL CONSEQUENCES

Cultural Resources – While measures are in place to identify and mitigate impacts to cultural resources, some impacts would be unavoidable. Vegetation treatment tools and techniques have the potential to disturb recorded and unrecorded cultural resource sites. Off-highway vehicle use, other forms of recreation that could result in casual collecting or vandalism, and mineral exploration and development activities would continue to result in adverse impacts to cultural resources. Lastly, natural processes of erosion and weathering would continue to degrade cultural resources.

Visual Resources – Wildland fire and vegetation treatment, particularly wildland fire use/prescribed fire and mechanical tools and techniques, would cause changes in the visual character of those areas affected. Pinyon-juniper woodlands would experience the most noticeable changes. Treated areas may display reduced or unnoticeable visual contrast once vegetation has become reestablished, or they may show signs of human intervention for decades following treatment. Mineral development would have adverse but localized impacts to visual resources. Unauthorized, cross-country, off-highway vehicle travel could create linear scarring of the landscape.

Renewable Energy – The development of wind and solar energy projects would result in unavoidable adverse impacts to a number of resources due to the large amount of land and number of large facilities required for such renewable energy projects. Surface disturbance and facility construction primarily would impact soils, vegetation, wildlife, special status species, visual resources, dispersed recreation, livestock grazing, and weed management. Operation of wind turbines would cause some direct mortality of birds and bats. While mitigation measures would be required in the construction and operation plans submitted by private developers, it would not be possible to mitigate many of the impacts entirely.

Recreation – Watershed restoration and mineral development activities could displace recreation during active periods. Once restoration is established and development areas are reclaimed, recreation could once again take place in these areas. Changes in the amount and patterns of off-highway vehicle use could result in increased conflicts between users and unanticipated changes in recreation resource conditions.

Livestock Grazing – Watershed restoration would modify range conditions, potentially reducing areas available for grazing in treated watersheds until vegetation in treated areas has recovered sufficiently to withstand grazing. In the long term, restored watersheds would provide improved range and increased forage. There would be a loss of grazing on approximately 94,400 acres due to land disposals (76,000), mineral development (18,300), and designation of ACECs (120).

Forest/Woodland and Other Plant Products – An unavoidable impact of watershed restoration would be a reduction in the number of mature pinyon pines found in the decision area. (Pinyon pine would not be removed under Alternative D.) This reduction would not adversely affect fuelwood and pinyon pine nut harvesting, as supply would continue to exceed demand. Other plants also would be affected by vegetation treatment, which could adversely affect their use until restoration is completed.

Geology and Mineral Extraction – An unavoidable effect of closing areas to mineral leasing, entry, or sales, is the requirement to forego the development of potential mineral resources in these areas and the societal benefits that would be derived from these minerals.

4.30 Unavoidable Adverse Impacts

Watershed Management – Livestock grazing, fire management, off-highway vehicle use, and mineral exploration and development activities could slow watershed restoration success.

Fire Management – Off-highway vehicle use, other forms of recreation, and mineral exploration and development activities would continue to be potential causes of wildland fires.

4.31 Relationship Between the Short-Term Uses of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity

Not all of the management actions proposed for the decision area have implications for short-term uses and long-term productivity. Short-term is defined as 10 years beginning with the signing of the Record of Decision. Long-term is defined as greater than 10 years beginning at the same point. Managed short-term uses of renewable resources, such as forage use for livestock grazing and forest/woodland products use for commercial and personal needs, would not cause reductions in long-term productivity. Management would be expected to maintain and enhance long-term productivity. Use of nonrenewable resources, such as oil, gas, and other mineral development, would eliminate the availability of these resources for future generations. Thus, by their extractive nature, these short-term uses would not maintain long-term productivity.

The component of the Ely RMP/EIS that would have the greatest influence on the maintenance and enhancement of long-term productivity is the restoration of watersheds through implementation of the watershed analysis process. The alternatives analyzed in the RMP/EIS would implement restoration activities on individual watersheds, targeting different numbers of acres to be treated each year. The vegetation treatment component of watershed restoration can be viewed as a short-term use of the environment, since the various tools and techniques that may be used (such as wildland fire use, herbicide treatment, or mechanical treatment) would disturb the communities being treated. However in the long term, the goal of the treatments is to restore the communities to a more resilient and productive state through the removal of over-mature or invasive-dominated vegetation. The restoration process could take 50 to 100 years, depending on the vegetation community being treated and climatic factors following treatment. Thus, restoration activities could reduce productivity in the short term but would ultimately enhance productivity in the long term.

4.32 Irreversible or Irretrievable Commitments of Resources

4.32 Irreversible or Irretrievable Commitments of Resources

The management actions proposed for the decision area could result in either the irreversible or irretrievable commitment of certain resources. Irreversible is a term that describes the loss of future options. It applies primarily to the effects of use of nonrenewable resources, such as minerals or cultural resources, or to those factors, such as soil quality, that are renewable only over very long periods of time. Irretrievable is a term that applies to the loss of production, harvest, or use of natural resources. For example, livestock forage production from an area is lost while an area is undergoing landscape restoration. The production lost is irretrievable, but the action is not irreversible. Once the watershed is restored, forage production would increase and livestock grazing could resume, potentially at a higher rate. Irreversible and irretrievable commitments for the Proposed RMP are summarized on **Table 4.32-1**.

**Table 4.32-1
Irreversible and Irretrievable Commitment of Resources for the Proposed RMP**

Resource Program	Irreversible Commitments	Irretrievable Commitments	Explanation
Physical and Biological Resources			
Air Quality	No	No	No decisions that would permanently degrade air quality are proposed.
Water Resources	No	No	Water quality effects that occur during watershed restoration would be reversible.
Soil Resources	Yes	No	Loss of soils due to erosion during watershed restoration would be irreversible.
Vegetation	Yes	Yes	Changes in vegetation communities from wildland fire, cheatgrass invasion, or watershed restoration activities may not be reversible or may be reversible only after many decades. Vegetation production lost to drought, wildland fire, and invasive plants and resources committed for vegetation treatment would be irretrievable.
Fish and Wildlife			
Aquatic Habitat and Fisheries	No	No	No decisions that would permanently degrade aquatic habitat are proposed. Water quality effects that occur during watershed restoration would be reversible.
Wildlife	Yes	Yes	Changes in wildlife habitat from wildland fire, invasive plants, or watershed restoration activities may not be reversible or may be reversible only after many decades. Big game production lost to wildland fire and habitat changes would be irretrievable.
Special Status Species			
Plant Species	Yes	No	Effects to special status plants from authorized and unauthorized activities, wildland fire, invasive plants, or watershed restoration activities may not be reversible.
Aquatic Species	No	No	No decisions that would permanently degrade aquatic habitat are proposed. Water quality effects that occur during watershed restoration would be reversible.
Wildlife Species	Yes	No	Effects to special status animals from authorized and unauthorized activities, wildland fire, invasive plants, or watershed restoration activities may not be reversible.

4.32-2

4.0 ENVIRONMENTAL CONSEQUENCES

Table 4.32-1 (Continued)

Resource Program	Irreversible Commitments	Irretrievable Commitments	Explanation
Wild Horses	No	No	No decisions that would preclude the management of wild horse herds at the appropriate management level are proposed.
Cultural Resources	Yes	No	Authorized mitigation of cultural sites prior to disturbance and unauthorized collecting and vandalism would result in an irreversible commitment of the resource.
Paleontological Resources	Yes	No	Authorized and unauthorized collecting of fossils would result in an irreversible commitment of the resource.
Visual Resources	No	Yes	The opportunities to view undisturbed settings that are lost during watershed restoration activities would be irretrievable.
Resource Uses			
Lands and Realty	Yes	No	As a practical matter, disposal of public lands would be irreversible. Authorized activities that make lands unsuitable for disposal would be minimal.
Renewable Energy	No	No	No decisions that would limit the development of renewable energy are proposed.
Travel Management and Off-highway Vehicle Use	Yes	No	Scarring of the landscape that results from authorized and unauthorized off-highway vehicle use can be irreversible.
Recreation	No	Yes	Recreation opportunities that are lost during watershed restoration activities would be irretrievable.
Livestock Grazing	Yes	Yes	Invasion of rangelands by cheatgrass may be irreversible. Loss of forage production during watershed restoration would be irretrievable.
Forest/Woodland and Other Plant Products	No	Yes	Loss of forest/woodland and other plant products during watershed restoration would be irretrievable.
Geology and Mineral Extraction			
Leasable Minerals	Yes	Yes	Production of oil and gas would be an irreversible use of the resource. Closing an area to leasing would constitute an irretrievable commitment of the potential resources for the life of the RMP.
Locatable Minerals	Yes	Yes	Mining of locatable minerals (primarily hard-rock) would be an irreversible use of the resource. Withdrawal of an area from mineral entry would constitute an irretrievable commitment of the potential resources for the life of the RMP.

4.32-3

4.32 Irreversible or Irretrievable Commitments of Resources

Table 4.32-1 (Continued)

Resource Program	Irreversible Commitments	Irretrievable Commitments	Explanation
Mineral Materials	Yes	Yes	Mining of mineral materials (e.g. sand and gravel) would be an irreversible use of the resource. Denial of the sale of mineral materials would constitute an irretrievable commitment of the resources for the life of the RMP.
Watershed Management	Yes	Yes	Changes in vegetation communities that would result from restoring or not restoring watersheds may not be reversible or may be reversible only after many decades. Resources committed for watershed restoration would be irretrievable.
Fire Management	Yes	Yes	The effects of a high intensity wildland fire would be reversible only after several decades. Resources committed for fire suppression and rehabilitation would be irretrievable.
Noxious and Invasive Weed Management	Yes	Yes	Invasion of vegetation treatment areas by cheatgrass and other noxious or invasive weeds may be irreversible. The resources committed to manage weeds (e.g., fuel, herbicides) would be irretrievable.
Special Designations	No	No	Special designations require no irreversible or irretrievable commitment of resources.
Economic and Social Conditions			
Economic Conditions	Yes	No	Disposal of public land to facilitate economic development of the cities and counties within the planning area would be irreversible.
Social Conditions	No	No	No decisions that would affect social conditions are proposed.
Native American Issues	No	No	No decisions that result in Native American issues are proposed.
Environmental Justice	No	No	No decisions that would affect environmental justice are proposed.
Health and Safety	No	No	No decisions that would degrade health or safety are proposed.

4.32-4

4.0 ENVIRONMENTAL CONSEQUENCES

4.33 Energy Requirements and Conservation Potential of Alternatives and Mitigation Measures

Since the majority of the management direction contained in the Ely RMP/EIS is at the land use planning level, no direct energy consumption is involved. Site-specific restoration activities require energy in the form of liquid fuels for vehicles and equipment. The amount of fuel consumed and the potential for conservation would depend on the tools and techniques being applied to a specific watershed, the remoteness of the treatment area, and a number of other factors. The NEPA analysis that is completed for the individual projects would consider the energy requirements and conservation potential of the tools and techniques that are being proposed.

4.34 Natural or Depletable Resource Requirements and Conservation Potential of Alternatives and Mitigation Measures

Since the majority of the management direction contained in the Ely RMP/EIS is at the land use planning level, specific natural or depletable resource requirements are not identified as part of the proposed management actions. Certain programs by their nature utilize renewable and nonrenewable resources, as specified by BLM's multiple use policies. For example, the livestock grazing and wild horse programs utilize forage for domestic livestock and wild horses, while the minerals program develops depletable fluid and non-fluid minerals. However, the alternatives analyzed in this Final EIS, aside from Alternative D, do not differ in any significant way as to their natural or depletable resource utilization or conservation potential. Alternative D includes provisions that would seriously constrain or preclude utilization or development of these same natural and depletable resources.

4.35 Urban Quality, Cultural Resources, and the Design of the Built Environment, Including the Reuse and Conservation Potential of Various Alternatives and Mitigation Measures

The management actions contained in the Proposed RMP and other alternatives would have no effect on urban quality or the built environment. Various historic and cultural resources are found throughout the planning area. One of the three management choices for these resources is their conservation for future generations; the other two are scientific study and public use.

Management of cultural resources in the decision area would vary not only by the alternative chosen, but also by site type and its specific use allocation. Overall, the majority of sites types would be best protected and preserved in place under the Proposed RMP and Alternative A, since most sites would be allocated and managed for Conservation, Scientific, or Public Use, with greater emphasis on Conservation Use. Alternative B is similar to Alternative A for prehistoric sites; however, for all other site types, the emphasis would be to allocate and manage the resources for Public Use. Under Alternative C, a greater number of sites would be discharged from management. Alternative D would manage cultural resources the same as Alternative A, which does not designate use allocations for individual site types.

4.36 Adverse Energy Impact

BLM Instruction Memorandum No. 2002-053 directs that the adverse impacts of decisions on "energy development, production, supply, and/or distribution" be considered. The Approved RMP would provide NEPA coverage for oil and gas leasing in the entire decision area. Adequate analysis under NEPA would ensure that legally defensible leases can be issued and industry can have confidence that challenges to leases can be successfully defended. The decisions that would result from this planning process do not address any specific energy project. Provisions have been made in the Proposed RMP for energy development, production, and distribution. However, closing certain areas to oil, gas, and geothermal leasing has been proposed and has the potential to affect future energy development. Of the total of 6.76 million acres having high potential for oil and gas resources, about 0.29 million acres would be closed to leasing on a discretionary basis under the Proposed RMP. Of the total of 4.67 million acres having medium potential for geothermal resources, about 0.29 million acres would be closed to leasing on a discretionary basis under the Proposed RMP.

Under Alternative A, approximately 60 percent of the decision area would remain unavailable for oil and gas leasing due to the absence of appropriate planning decisions with adequate NEPA analysis. The other alternatives considered in this EIS would have essentially the same area closed to leasing as the Proposed RMP with the exception of Alternative D. Alternative D would close 6.76 million acres of high potential areas to oil and gas leasing and 5.28 million acres of medium potential areas to geothermal leasing.

The reasonably foreseeable development scenarios anticipate 8,400 acres of disturbance for oil and gas exploration and development, and 134 acres of disturbance for geothermal exploration and development. Given that 10.1 million acres would remain open to oil and gas leasing and 10.1 million acres would remain open to geothermal leasing, the proposed closing to leasing of those areas outlined in the Proposed RMP would have a minimal adverse energy impact. When specific proposals are made for energy development, production, supply, and/or distribution, the decisions reached by the Ely Field Office would be reviewed again for adverse energy impact, and the results of that review would be disclosed.

5.0 CONSULTATION AND COORDINATION

5.1 Description of Specific Actions Taken to Consult and Coordinate

From the initiation of work on the RMP/EIS, the Ely Field Office has set consultation and coordination with affected or interested parties as a key priority. There have been seven primary elements of consultation through preparation of the Proposed RMP/Final EIS:

- RMP/EIS scoping process
- Planning bulletin mailings
- RMP/EIS web page
- Informal presentations to interested groups
- Cooperating agency involvement
- Public comment period on the Draft RMP/EIS
- Public meetings on the Draft RMP/EIS

Each of these activities is summarized below.

5.1.1 RMP/EIS Scoping Process

On February 10, 2003, with the publication in the Federal Register of the Notice of Intent (60[27]:6770-6771) to begin the planning process, the BLM Ely Field Office initiated public scoping for issues pertaining to the RMP/EIS. Scoping is the process required in the early stages of developing an EIS to encourage public participation and solicit public input on the scope and significance of the proposed action (Council on Environmental Quality Regulations, Title 40 Code of Federal Regulations Subpart 1501.7). Scoping helps identify issues important to the management of the area and assists in determining the extent of the analysis as well as specific issues to be examined in the planning process.

A 60-day scoping period formally began with the publication of the Notice of Intent in the Federal Register on February 10, 2003, documenting BLM's intent to prepare an EIS. Individuals and organizations were invited to submit comments in writing to the BLM. The notice also published information on the web site address where public scoping meeting dates would be posted and described how the scoping meetings would be publicized in local media before the meetings were to take place.

On February 24, 2003, a Planning Bulletin was sent to over 3,000 homes and organizations. The bulletin again provided information on how the public could obtain information about the upcoming public scoping meetings. Additionally, the bulletin provided an overview of the EIS process and timeline and general information about the RMP/EIS scope and issues to be addressed.

Once scoping meetings were scheduled, public notice of the meetings was published in local newspapers (see **Table 5.1-1**).

Table 5.1-1
List of Paid Newspaper Advertisements Announcing Scoping Meetings

Location	Periodical

Las Vegas, Nevada	Las Vegas Review Journal Las Vegas Sun
Mesquite, Nevada	Desert Valley Times
Pioche, Nevada	Lincoln County Record
Tonopah, Nevada	Tonopah Times-Bonanza
St. George, Utah	The Spectrum

Additional press releases noting meeting dates and providing an explanation of the planning process were sent to numerous media outlets. See **Table 5.1-2** for a list of print and radio media that received various press releases.

Table 5.1-2
List of Media Outlets Receiving Various Press Releases

St. George, Utah	The Spectrum	--

Six public meetings were held in March/April, 2003. During the meetings, the BLM took notes as the public provided oral comments. Written comments also were received throughout the 60-day comment period, ending April 10, 2003. Both written comments and those received at scoping meetings are in the administrative record. Summaries of these comments are contained in the scoping report for the RMP/EIS. **Table 5.1-3** provides the date, location, and attendance for the six scoping meetings. The Scoping Report has been incorporated into the administrative record and is available for review at the Ely Field Office.

5.0 CONSULTATION AND COORDINATION

**Table 5.1-3
Public Scoping Meeting Locations and Dates**

City, State	Location	Date	Attendance
Ely, Nevada	Bristlecone Convention Center	Monday, March 24, 2003	33
Caliente, Nevada	Caliente Elementary School Gymnasium	Tuesday, March 25, 2003	12
Mesquite, Nevada	City Hall	Wednesday, March 26, 2003	10
Las Vegas, Nevada	BLM Las Vegas Field Office	Thursday, March 27, 2003	12
Reno, Nevada	Airport Plaza Hotel	Monday, March 31, 2003	14
Tonopah, Nevada	Tonopah Convention Center	Tuesday, April 1, 2003	4
Total			85

Written comments also were solicited during the scoping process. Ninety-three (93) letters were received via mail, fax, e-mail, an on-line web comment form, or handed in during the scoping meetings. These letters from individuals and organizations contained 798 unique comments for consideration in the planning process. Comment letters were received primarily from Nevada, but a few comments also were received from the states of Washington, Idaho, Montana, Wyoming, Utah, and Colorado. Comments from Nevada were distributed by county as shown in **Table 5.1-4**.

**Table 5.1-4
Comment Letters Received by County in Nevada**

County	Letters	Percent
Carson	11	13
Clark	35	42
Elko	2	2
Eureka	1	1
Lincoln	9	11
Nye	1	1
Washoe	17	19
White Pine	8	10
Total	84	100

5.1.2 Planning Bulletins

A total of four planning bulletins have been sent to all parties who had previously indicated their desire to be included on the project mailing list. These bulletins were distributed to a mailing list of over 3,000 interested parties. The planning bulletins provide updates on the project progress, schedule, and information on important milestones and events. Planning Bulletin #1 became available in late February 2003 and Planning Bulletin #2 in late August 2003. These planning bulletins have discussed topics such as:

- The purpose of and schedule for the RMP/EIS;
- The need for ecological restoration within the planning area;
- Opportunities for public involvement;
- Results of the scoping process;

5.0 CONSULTATION AND COORDINATION

- Nomination of ACECs;
- The involvement of cooperating agencies;
- Progress on developing alternatives to be analyzed in the RMP/EIS;
- Interesting information about the planning area and the activities of the Ely Field Office; and
- Short biographies of team members that are preparing the RMP/EIS.

Planning Bulletin #3, sent in September of 2005, provided a summary of the content of the Draft RMP/EIS, notified the recipients that public meetings on the Draft were scheduled to be held in six locations in Nevada, and outlined the schedule and steps for completion of the Proposed RMP/Final EIS. In addition, a mailer was included to allow the planning bulletin recipients to indicate their preference for receiving a copy of the Proposed RMP/Final EIS.

Planning Bulletin #4 was sent to the public in January of 2007 to update the public on the status of the Proposed RMP/Final EIS. This bulletin informed the readers of planning activities during the past year and the approximate schedule for mailing of the Proposed RMP/Final EIS.

5.1.3 RMP/EIS Web Page

During the preparation of the Draft RMP/EIS, a web page was available to the public to access background information on the planning area as well as information on the ongoing planning and EIS process. In August 2005, it was necessary to close the RMP/EIS web site (as well as most Department of the Interior web sites) in response to a court order that was unrelated to the Ely RMP/EIS.

5.1.4 Informal Presentations

The Ely Field Office has strived to make the EIS process as inclusive as possible. In addition to input from the general public, BLM staff has encouraged participation and collaboration from multiple governmental entities and public organizations. BLM staff has attended numerous meetings in addition to the six official public scoping meetings and provided presentations to organizations and commissions as invited (see **Table 5.1-5**).

**Table 5.1-5
Presentations Provided to Organizations**

Meeting/Organization	Date	Approximate Attendance
White Pine County Public Land Users Advisory Committee	10/08/02	8
Ely Shoshone Tribe	10/17/02	6
Northeastern Great Basin Resource Advisory Council	12/06/02	20
Nevada Department of Wildlife (Northern Division)	03/06/03	10
Nevada Department of Wildlife (Southern Division)	03/13/03	10
Ely Rotary Club	03/20/03	25
Mojave Southern Resource Advisory Council	04/04/03	20
Mount Wheeler Power Board of Directors	04/08/03	10
Duckwater Shoshone Tribe	04/10/03	5
Tri-County (White Pine, Lincoln, Nye) Meeting	04/30/03	20
White Pine Economic Development Committee	05/07/03	15
Coyotes Motorcycle Club	05/15/03	15
Goshute Tribal Council	09/12/03	10
Mojave Southern Resources Advisory Council	10/17/03	20
Utility Organizations	10/23/03	6
Total		200

5.1.5 Cooperating Agencies

Letters inviting various agencies and organizations to participate in the RMP/EIS planning process as formal cooperating agencies were sent to over 30 groups. Cooperating agencies are requested to assist in developing management direction and alternatives, reviewing environmental effects, and selecting a preferred alternative. They also are invited to participate on RMP/EIS-related conference calls and attend RMP/EIS-related meetings. Entities invited to serve as cooperating agencies are as follows:

Federal Government

- Forest Service
- Army Corps of Engineers
- Fish and Wildlife Service
- Bureau of Indian Affairs
- National Park Service
- Department of Defense
- Minerals Management Service
- Department of Energy
- Natural Resource Conservation Service

State Government

Nevada Division of State Lands
Nevada Division of State Parks
Nevada Department of Transportation
University and Community College System of Nevada
Nevada Department of Wildlife
Nevada Department of Agriculture
Nevada Division of Water Resources
Nevada Division of Environmental Protection
Nevada State Historic Preservation Office
Nevada Division of Minerals
Nevada Wildhorse Commission

County Government

White Pine County
Lincoln County
Nye County

Tribal Governments

Duckwater Shoshone
Ely Shoshone
Goshute Shoshone
Moapa Paiute
Paiute Indian Tribe of Utah
Las Vegas Paiute
Yomba Shoshone

Several of the entities agreed to serve as cooperating agencies and had varying levels of involvement in the development of the Draft RMP/EIS. These agencies and groups continued to be involved through preparation of the Proposed RMP/Final EIS. All cooperating agencies were briefed on a regular basis regarding the status of and modifications to the Proposed RMP and Final EIS. Cooperating agencies for the Ely RMP/EIS are as follows:

- Great Basin National Park
- Humboldt-Toiyabe National Forest
- Nellis Air Force Base
- Nevada Department of Transportation
- Nevada Department of Wildlife
- Nevada Division of Minerals
- Nevada State Historic Preservation Office
- Lincoln County
- Nye County
- White Pine County
- Duckwater Shoshone Tribe
- Ely Shoshone Tribe
- Moapa Band of Paiutes
- Yomba Shoshone Tribe

5.1.6 Public Comment on the Draft RMP/EIS

On July 29, 2005, a Notice of Availability was published in the Federal Register (70[145]:43902-43903) announcing the availability of the Draft Ely District RMP/EIS for public review and comment. This began a 120-day comment period that ended on November 28, 2005. The minimum comment period required by BLM regulations for a Draft RMP is 90 days, but the Ely Field Office deemed it more appropriate to specify a 120-day review due to the size and complexity of the Draft RMP/EIS. Although the comment period was not formally extended, BLM did accept, review, and respond to comments received after November 28, 2005.

As described in Section 5.5 of the Draft RMP/EIS, copies of the Draft were sent to over 600 agencies, organizations, and individuals. A total of 650 comment letters on the Draft RMP/EIS were received via U.S. mail and email. These included 81 unique letters and 569 form letters. **Table 5.1-6** summarizes the type of entity that submitted comments. A complete list of commenters can be found in Appendix I.

**Table 5.1-6
Comment Letters Received on the Draft RMP/EIS**

Federal Agency	6
State Agency	6
Local Government	4
Tribal	1
Non Governmental Organization	20
Business	16
Individual	28
Form Letter	569

Each comment letter was assigned a unique number and then reviewed by BLM.

Comments within the letter were identified and assigned a unique number using the letter number as a prefix. A total of 1667 comments were identified in the set of comment letters received on the Draft RMP/EIS. The next step in the process was for BLM to prepare a response to each comment. Appendix I contains copies of the main body of the comment letters with individual comments contained in each letter bracketed and numbered. Copies of attachments to those letters are not included in Appendix I; these attachments also were reviewed and are included in the Administrative Record. Opposite each comment is BLM's response. Although multiple copies of form letters or form emails may have been received, only one representation of each is reproduced and responded to in Appendix I. However, a list of all commenters that submitted the form letter is included.

Responses to comments take different forms depending on the content of the comment. Some responses answer a comment in total, while others refer the commenter to sections of the RMP/EIS where a topic is discussed. In response to some comments, text, tables, or maps in the Proposed RMP/Final EIS have been revised or expanded. Per Council on Environmental Quality Regulations, BLM has explained why other comments do not warrant further agency response. Such comments may express statements of opinion

5.0 CONSULTATION AND COORDINATION

(including agreement or opposition), may raise topics that are beyond the scope of the Ely RMP/EIS, or may request information that was not deemed necessary to prepare the RMP/EIS.

Verbal comments also were received at the public meetings that were held on the Draft RMP/EIS. These meetings are discussed further in the following section. Transcripts of the meetings are also included in Appendix I, along with responses to the verbal comments that were contained in the statements made at the meetings.

5.1.7 Public Meetings

Public meetings on the Draft RMP/EIS were held in October, 2005 in six locations in Nevada. **Table 5.1-7** provides the meeting locations, dates, and attendance.

**Table 5.1-7
Public Meeting Locations, Dates, and Attendance**

City, State	Location	Date	Attendance
Ely, Nevada	Bristlecone Convention Center	October 17, 2005	3
Caliente, Nevada	Caliente Elementary School Gymnasium	October 18, 2005	3
Mesquite, Nevada	Mesquite Campus Library	October 19, 2005	8
Las Vegas, Nevada	BLM Las Vegas Field Office	October 20, 2005	18
Reno, Nevada	Airport Plaza Hotel	October 24, 2005	6
Tonopah, Nevada	Tonopah Convention Center	October 25, 2005	0
Total			38

After a brief introduction by BLM staff, the meeting attendees were invited to provide oral and written comments on the Draft RMP/EIS. BLM staff took notes and a verbatim account of each meeting was recorded by a court reporter. Appendix I presents the comments received from the public on the Draft RMP/EIS. Transcripts from the public meetings are presented in their entirety in that appendix; comments are bracketed and responses to those comments are provided.

5.2 Tribal Consultation**5.2.1 Tribal Consultation Responsibilities**

As a federal agency, the BLM is mandated to consult with American Indian tribes concerning the identification of cultural values, religious beliefs, and traditional practices of American Indian people, as well as other possible environmental and social concerns that may be affected by actions on federal lands. Tribal consultation is the active, affirmative process of: 1) identifying and seeking input from appropriate American Indian governing bodies, community groups, and individuals; and 2) considering their interests as a necessary and integral part of the BLM's decision making process. The aim of consultation is to involve affected American Indian groups in the identification of issues and the definition of the range of acceptable management options.

Tribal consultation includes the identification of places (i.e., physical locations) of cultural value to American Indian groups. Places that may be of cultural value include, but are not limited to, locations associated with the traditional beliefs concerning tribal origins, cultural history, or the nature of the world; locations where religious practitioners go, either in the past or the present, to perform ceremonial activities based on traditional cultural rules or practice; ancestral habitation sites; trails; burial sites; and places from which plants, animals, minerals, and waters possessing healing powers or used for other subsistence purposes, may be taken. Additionally, some of these locations may be considered sacred to particular American Indian individuals or tribes. Under the auspices of the American Indian Religious Freedom Act of 1978, Executive Order 13007, the Native American Graves Protection and Repatriation Act of 1990, and the National Historic Preservation Act, as amended, the BLM must take into account the effects of land use decisions on these types of locations. See Traditional Cultural Properties under Section 3.9, Cultural Resources, for a summary on tribal consultation conducted as part of the RMP/EIS process.

The BLM works in cooperation with American Indian tribes to coordinate and consult before making decisions or approving actions that could result in changes in land use, physical changes to lands or resources, changes in access, or alienation of lands. The Federal Land Policy and Management Act and the National Historic Preservation Act of 1966, as amended, require coordination with tribes in preparing and maintaining inventories of the public lands and determining their various resources and other values, developing and maintaining long-range plans providing for the use of the public lands, and managing the public lands. Federal programs are required to be carried out in a manner sensitive to American Indian concerns and tribal government planning and resource management programs.

In compliance with the federal mandates identified above, a number of Western Shoshone, Goshute, and Southern Paiute reservations, colonies, organizations, and individuals were contacted for the Ely RMP/EIS. The Western Shoshone included the Te-Moak Tribes, Battle Mountain Band, Elko Band, South Fork Band, Wells Band, Duckwater Shoshone Tribe, Ely Shoshone Tribe, Timbisha Shoshone Tribe, Yomba Shoshone Tribe, Duck Valley Sho-Pai Tribes, the Western Shoshone Historic Preservation Society, Nevada Indian Commission, Intertribal Council of Nevada, and Western Shoshone Defense Project. Included for the Gosiute were the Goshute Tribe (Ibapah) and Skull Valley Band of Gosiute. The Southern Paiute included

5.0 CONSULTATION AND COORDINATION

the Paiute Tribe of Utah, Las Vegas Paiute Tribe, Moapa Paiute Tribe, the Colorado Indian Tribes, the Chemehuevi Tribe, and individuals residing in Eagle Valley and Caliente.

The coordination and consultation process was initiated with mail and telephone correspondence. Letters were posted describing the RMP/EIS process and soliciting input from the tribes and individuals. The letters were followed by telephone calls to discuss the RMP/EIS, potential cultural concerns and sites, individuals knowledgeable about the area, and possible meetings. Meetings and interviews were then scheduled and held over a 2-week period. Participants included the Ely Shoshone, Duckwater Shoshone, Yomba Shoshone, Battle Mountain Shoshone, Ibapah Goshute, Paiute Tribe of Utah, Moapa Paiute, and individuals residing in Caliente and Eagle Valley. In the meetings and interviews, the RMP/EIS was described and discussions were held regarding places of importance to the tribes. Questions were asked about tribal concerns for these places, and the nature and importance of the overall cultural landscapes. Details of the correspondence and meetings with the tribes and individuals are detailed in a separate, confidential report.

5.3 Agencies Contacted During Preparation of the Ely RMP/EIS

5.3 Agencies Contacted During Preparation of the Ely RMP/EIS

Bureau of Land Management, Arizona Strip Field Office, Utah
Bureau of Land Management, Battle Mountain Field Office
Bureau of Land Management, Cedar City Field Office, Utah
Bureau of Land Management, Elko Field Office
Bureau of Land Management, Fillmore Field Office, Utah
Bureau of Land Management, Las Vegas Field Office
Bureau of Land Management, Salt Lake Field Office, Utah

U.S. Army Corps of Engineers
U.S. Department of Agriculture, Animal and Plant Health Inspection Service, Wildlife Services
U.S. Department of Energy, National Renewable Energy Laboratory
U.S. Fish and Wildlife Service
U.S. Geological Survey

5.4 Plan Distribution

Since initial scoping, BLM has maintained a mailing list of individuals, businesses, special interest groups, and federal, state, Tribal, and local government representatives interested in development of the Ely RMP. In an effort to reduce printing costs, BLM has continued to update the RMP/EIS mailing list by removing those no longer interested in the process and addresses from which mailings have been returned.

Copies of the Proposed RMP/Final EIS also are available for public inspection at the following locations:

BLM Battle Mountain Field Office	Caliente Branch Library
BLM Billings Field Office	Colorado State University Library
BLM Caliente Field Station	Goldfield Public Library
BLM Carson City Field Office	Government Publications Library
BLM Denver Field Office	Lincoln County Courthouse
BLM Elko Field Office	Lincoln County Public Library
BLM Ely Field Office	Nye County Courthouse
BLM Las Cruces Field Office	Nye County Public Library
BLM Las Vegas Field Office	Round Mountain Public Library
Great Basin National Park	Tonopah Library District
U.S. Forest Service, Ely Ranger District	University of Nevada Libraries
Austin Branch Library	Washoe County Library
Battle Mountain Branch Library	White Pine County Courthouse
BLM Library	White Pine County Public Library

The Proposed RMP/Final EIS also is available electronically at the Ely RMP/EIS website: http://www.blm.gov/nv/st/en/fo/ely_field_office.html.

Concurrent with the distribution of the Proposed RMP/Final EIS, a Notice of Availability was published by the Environmental Protection Agency in the Federal Register, which marks the beginning of the 30-day protest period. BLM also published a Notice of Availability in the Federal Register announcing the availability of the Proposed RMP/Final EIS for public review and comment.

**5.5 List of Agencies, Organizations, and Persons
to whom Copies of this Statement are Sent**

5.5 List of Agencies, Organizations, and Persons to whom Copies of this Statement are Sent

The Proposed RMP/Final EIS has been mailed to agencies, organizations, and individuals in hard copy, CD-ROM, or Summary format per their requested media type. All persons who commented on the Draft RMP/EIS but did not request a specific media type of the Proposed RMP/Final EIS were sent a CD-ROM containing the entire document, plus a mailer they could use to request a printed Summary or hard copy. Hard copies of the Proposed RMP/Final EIS also have been distributed to agencies and Tribal governments as required by regulation or policy.

6.0 PREPARERS AND REVIEWERS

Agency	Name	Role
Cooperating Agencies and Contacts		
Great Basin National Park	Todd Williams	Baker, Nevada
Humboldt-Toiyabe National Forest	Patricia Irwin	Ely, Nevada
Nellis Air Force Base	Eloisa Hopper	Nellis Air Force Base, Nevada
Nevada Department of Transportation	Kent Cooper	Carson City, Nevada
Nevada Department of Wildlife	Rory Lamp	Elko, Nevada
Nevada Division of Minerals	John Snow	Carson City, Nevada
State Historic Preservation Office	Alice Baldrice	Carson City, Nevada
Lincoln County	Ronda Hornbeck	Pioche, Nevada
Nye County	Jim Marble	Tonopah, Nevada
White Pine County	Brent Eldridge	Ely, Nevada
Duckwater Shoshone Tribe	Lisa George	Duckwater, Nevada
Ely Shoshone Tribe	Diana Buckner	Ely, Nevada
Moapa Band of Paiutes	Ralph Ortegon	Moapa, Nevada
Yomba Shoshone Tribe	Bonnie Bobb	Austin, Nevada
Other Interested Parties		
Ruby Lake National Wildlife Refuge	Martha Collins	Ruby Valley, Nevada
U.S. Fish and Wildlife Service	Jody Frasier	Reno, Nevada

GLOSSARY**GENERAL**

Adaptive Management. A process for continually improving management policies and practices by learning from outcomes of operation programs and new scientific information.

Assumptions (for analysis). The supposition that something is true (Webster's). Assumptions are identified at the beginning of the environmental consequences section, and, as needed, at the beginning of the program-specific environmental consequences analysis.

Best Management Practices. A set of practices which, when applied during implementation of management actions, ensures that negative impacts to natural resources are minimized. BMPs are applied based on site-specific evaluation and represent the most effective and practical means to achieve management goals for a given site.

BLM Sensitive Species. Plant or animal species that could become endangered or extirpated from a state, or within a significant portion of its range in the foreseeable future; is undergoing status review by the U.S. Fish and Wildlife Service; is undergoing significant current or predicted downward trend in habitat capability that would reduce a species' existing distribution, and/or downward trend in population or density such that federally listed, proposed, or candidate status may become necessary; typically consists of small and widely dispersed populations; inhabits ecological refugia, or specialized or unique habitats; or is state-listed, but which may be better conserved through application of BLM sensitive species status. Listing is approved by the BLM State Director, Director of the Nevada Department of Wildlife, and Director of the Department of Conservation and Natural Resources.

Biodiversity. The variety of organisms considered at all levels, from genetic variants of a single species, through arrays of species, genera, families, and still higher taxonomic levels.

Biological Diversity. The variety of all forms of life, used herein primarily in a general sense to refer to variety of both species and communities.

Biomass. Vegetative material left over from stand treatments. This term usually refers to such material that can be gathered and transported to cogeneration plants, and there utilized for production of electricity.

Candidate Species. Those plants and animals included in Federal Register "Notices of Review" that are being considered by the Fish and Wildlife Service for listing as threatened or endangered.

Cave Resource. Any naturally occurring void, cavity, recess, or system of interconnected passages beneath the surface of the earth or within a cliff or ledge, including any cave resource therein, that is large enough to permit a person to enter, whether the entrance is excavated or naturally formed. Also included is any natural pit or sinkhole.

GLOSSARY

Climate. The average or prevailing weather conditions of a place over a period of years. (BLM Technical Reference 4400-7)

Cumulative Effect. The impact that results from identified actions when they are added to other past, present, and reasonably foreseeable future actions regardless of who undertakes such other actions. Cumulative effects can result from individually minor but collectively significant actions taking place over a period of time.

Desired Range of Conditions. The expected outcome to be produced by implementation of the identified management actions over the period of time on which this plan is based. Synonymous with Desired Outcomes and Desired Future Conditions.

Diversity. 1) The absolute number of species in a community; species richness; 2) A measure of the number of species and their relative abundance in a community; low diversity refers to few species or unequal abundances, high diversity to many species or equal abundances.

Earnings. Wages and salaries, other labor income, and proprietor's income (including inventory valuation and capital consumption adjustments).

Ecological Analysis. A study and evaluation of the ecological system components and processes present on a given site or geographic area (e.g., watershed) with the intent of identifying 1) the degree to which the components and processes approximate what is considered to be natural and healthy conditions for this type of ecological system, and 2) the causative factors for any observed variations from healthy conditions.

Ecological Balance (also see Ecological Health). The conceptual relationship among ecological system components and processes in which the overall ecological system exists in what is considered to be a healthy condition without evidence of ongoing deterioration or changes toward some less healthy state.

Ecological Functions. Any of a wide variety of natural processes that fit within the general definition of ecological processes.

Ecological Gradients. The gradual transition in individual ecological factors, especially physical factors, from one location to another.

Ecological Health. The degree to which the integrity of the soil, vegetation, water, and air, as well as the ecological processes of an ecological system, are balanced and sustained.

Ecological Processes. The flow and cycling of energy, nutrients, and organisms in an ecological system. (See also 43 Code of Federal Regulations 4180.1(b).)

Ecological System. All the organisms in a particular region and the environment in which they live. The elements interact with each other in some way, and so are depend on each other either directly or indirectly.

Ecological Zones. Ecological systems or groups of systems that occupy particular topographic settings that are repeated at other locations of similar topographic settings throughout the region.

Ecologically Equivalent. An organism which functions in an ecological system in the same manner and with similar results to another organism even though the two may not be related or possess similar physical characteristics.

Ecology. The science of the interrelationships between organisms and their environment; from the Greek "Oikos" meaning "house" or "place to live."

Economically Viable. Possessing the promise of reasonable economic returns following consideration of investment costs and probable economic risks.

Ecosystem Approach. The ecosystem approach is the evaluation of the ecological system of both living organisms and non-living components in a defined area. This approach considers the structure, composition, function, and interrelationships of those components, as well as the societal considerations. The term ecosystem approach employs the perspective of different spatial scales with longer or shorter time frames. While the size and temporal consideration of ecological systems may vary, the watershed level is the primary scale of analysis within this RMP/EIS.

Ecosystem. The complex of a community of organisms and its environment.

Ecosystem-based Management. 1) management driven by explicit goals, executed by policies, protocols, and practices, and made adaptable by monitoring and research based on our best understanding of the ecological interactions and processes necessary to sustain ecosystem composition, structure, and function; 2) any land management system that seeks to protect viable populations of all native species, perpetuate natural-disturbance regimes on the regional scale, adopt a planning timeline of centuries, and allow human use at levels that do not result in long-term ecological degradation.

Ely Decision Area. The geographic area managed by the Ely Field Office. The area the BLM manages is approximately 11.4 million acres. The area within the boundaries of the decision area is approximately 13.9 million acres and includes National Forest, National Park, Department of Defense, Fish and Wildlife Service, state, private, etc.

Ely Field Office. The administrative unit of the BLM that manages the Ely decision area.

Endangered Species. Any species defined through the Endangered Species Act as being in danger of extinction throughout all or a significant portion of its range and published in the Federal Register.

Endemic Species. Native to, and restricted to, a particular geographical region, community type, or specific habitat.

GLOSSARY

Environmental Assessment. A systematic analysis of site-specific BLM activities used to determine whether such activities have a significant effect on the quality of the human environment and whether a formal environmental impact statement is required and also to aid an agency's compliance with the National Environmental Policy Act when no EIS is necessary.

Environmental Impact Statement (EIS). A formal document to be filed with the Environmental Protection Agency and that considers significant environmental impacts expected from implementation of a major federal action.

Exotic Species. An organism or species that is not native to the region in which it is found. Synonym nonnative: Not native; alien; a species that has been introduced into an area.

Extirpation. The localized disappearance of a species from an area.

Fragile Ecosystems. Uncommon ecosystems of limited distribution and size that support unique sensitive/endemic species or communities; ecosystems that have low resilience to environmental stress or to disturbance.

Geographic Information System (GIS). A computer system capable of storing, analyzing, and displaying data and describing places on the earth's surface.

Goal. Broad statements about desired outcomes (e.g., maintain ecosystem health and productivity). They are not quantifiable.

Habitat. The natural abode of a plant or animal, including all biotic, climatic, and edaphic factors affecting life.

Habitat management scales:

Large scale = RMP planning area

Mid scale = Watershed

Fine scale = Allotment, project, portion of a watershed

Hazardous Materials. Anything that poses a substantive present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed.

Incomplete or Unavailable Information. When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information, the agency shall always make it clear that such information is lacking (Council on Environmental Quality 1502.22). These are identified at the beginning of the environmental consequences section.

Indicators. Indicators are observations or measurements of physical, chemical, or biological factors used to evaluate site conditions or trends, appropriate to the potential of the site. Indicators will be used to determine whether or not standards are being met.

Indigenous. Living naturally within a given area and was part of the area's flora or fauna prior to human settlement of the region.

Introduction. Intentional or unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity.

Management Framework Plan (MFP). Planning decision document prepared before the effective date of the regulations implementing the land use planning provisions of the FLPMA, which establishes, for a given area of land, land-use allocations, coordination guidelines for multiple-use, and objectives to be achieved for each class of land use or protection.

Management Guidelines Common to All Alternatives. Management guidance that applies to any and all of the alternatives, including the No Action and the agency-preferred alternative. These are identified at the beginning of the description of the alternatives.

Management Objective. The objectives for which rangeland and rangeland resources are managed which includes specified uses accompanied by a description of the desired vegetation and the expected products and/or values.

Management Plan. A program of action designed to reach a given set of objectives.

Management. Any actions or activities that are undertaken by the staff of the Ely Field Office that deal with the physical or biological resources found on Public lands within the Ely planning area or with the use of those resources.

Monitoring. Monitoring means the periodic observation and orderly collection of data to evaluate: 1) Effects of management actions; and 2) Effectiveness of actions in meeting management objectives. (43 Code of Federal Regulations 4100.0.5.) The orderly collection, analysis, and interpretation of resource data to evaluate progress toward meeting management objectives. (BLM Technical Reference 4400-7)

Morphology. The form and structure of an organism, with special emphasis on external features.

Multiple Use. "The management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; the use of some land for less than uses that takes into account the long-term needs of future generations for renewable and nonrenewable resources, including, but not limited to, recreation, range, timber, minerals watershed, wildlife and fish, natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the

GLOSSARY

resources and not necessarily to the combination of uses that will give the greatest economic return of the greatest unit output" (Federal Land Policy and Management Act).

Multiplier. A change in an economic measure resulting from a specified change in some other economic measure.

National Ambient Air Quality Standards. The allowable concentrations of air pollutants in the ambient (public outdoor) air. National ambient air quality standards are based on the air quality criteria and divided into primary standards (allowing an adequate margin of safety to protect the public health) and secondary standards (allowing an adequate margin of safety to protect the public welfare). Welfare is defined as including (but not limited to) effects on soils, water, crops, vegetation, human-made materials, animals, wildlife, weather, visibility, climate, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being.

National Environmental Policy Act of 1969 (NEPA). NEPA is the basic national charter for protection of the environment. It establishes policy, sets goals, and provides means for carrying out the policy. It also contains action-forcing provisions to ensure that federal agencies follow the letter and spirit of the Act.

National Natural Landmarks. This is an area designated by the Secretary of the Interior as being of national significance to the U.S. because it is an outstanding example(s) of major biological or geological features found within the boundaries of the U.S. or its Territories or on the Outer Continental Shelf.

National significance describes an area that is one of the best examples of a biological community or geological feature within a natural region of the U.S., including terrestrial communities, landforms, geological features and processes, habitats of native plant and animal species or fossil evidence of the development of life.

This program aims to encourage and support voluntary preservation of sites that illustrate the geological and ecological history of the U.S., and to strengthen the public's appreciation of America's natural heritage. To be considered for National Natural Landmark status, a site must be one of the best examples of a natural region's characteristic biotic or geologic features.

Native Species. With respect to a particular ecological system, a species that, other than as a result of an introduction, historically occurred or currently occurs in that ecological system.

Natural Resources. These include topography (consider slope and drainage patterns), soil, water courses and/or waterbodies, geological formations, vegetation (consider rare, threatened, or endangered species), and fish and wildlife (consider rare, threatened, or endangered species).

Natural System. This refers to a biological, soil, and physical environment largely, but not necessarily entirely, controlled by natural processes rather than by intensive human activity, e.g., the comparison between rangelands and tilled agricultural croplands.

Naturalized Species. An exotic or introduced species that has become established and exhibits successful reproduction in an ecosystem.

Net Value Change. The sum of the changes resulting from increases (benefits) and decreases (damages) in the value of outputs from the land area affected as the consequences of fire. An average dollar value per acre is assigned based on the change to all resources including range, watershed, wildlife, soils, and recreation.

Objective. Objectives identify specific desired conditions for resources. They can be quantified and measured and may have established timeframes for achievement (e.g., manage vegetative communities on the upland portion of the Clear Creek watershed to achieve by 2020 an average 30 to 40 percent canopy cover of sagebrush).

Permit. Authorization in writing by the authorized officer or other person authorized by the U.S. Government, and is a contract between the permittee and the U.S.

Personal Income. Employee compensation plus property income.

Physiographic Province. A geographic region with similar climatic, land form, and geologic features, and which is significantly different from adjacent regions.

Planning Criteria. Guidelines for the planning effort that serve as the sideboards.

Productivity. The potential rate of incorporation or generation of energy or organic matter (biomass) by an organism, population or trophic unit per unit time per unit area; plant productivity is termed primary production, and animal productivity is termed secondary production.

Rangeland Health. The degree to which the integrity of the soil and the ecological processes of rangeland ecosystems are sustained.

Resistance. The ability to resist; especially, the inherent capacity of a living organism (or assemblage of organisms) to resist external forces and adverse circumstances such as disease, drought, lack of nourishment, or toxic agents.

Resource. Any component of the environment that can be utilized by an organism.

Resource Advisory Council. A citizen-based group of 10 to 15 members chartered under the Federal Advisory Committee Act and appointed by the Secretary of the Interior to forward advice on public land planning and management issues to the BLM. Council membership reflects a balance of various interests concerned with the management of the public lands and users of the public lands.

Resource Management Plan (RMP). A BLM multiple-use planning document, prepared in accordance with Section 202 of the Federal Land Policy and Management Act, that:

GLOSSARY

- Establishes resource conditions goals and objectives to be attained;
- Allocates resources and identifies allowable uses;
- Identifies land area for limited, restrictive, or exclusive uses; and
- Provides guidance for implementation of the decisions made in the plan.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. For example, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance.

Special Status Species. Plant or animal species that are federally listed, proposed, or candidate species; state protected species; or BLM sensitive species.

Species. A taxon of the rank species; which is the basic unit, and lowest principal category, of biological classification; in the hierarchy of biological classification, the category below genus; a group of organisms formally recognized as distinct from other groups.

Stakeholders. Stakeholders means, but is not limited to, state, Tribal, and local government agencies, academic institutions, the scientific community, nongovernmental entities including environmental, agricultural, and conservation organizations, trade groups, commercial interests, and private landowners.

Standard Operating Procedures. Synonymous with "mitigating measures"; a standard operating procedure would mitigate a potential impact. These are actions that the Ely Field Office automatically takes as part of a management action or project (e.g., flagging a new fence for visibility by wildlife and horses). These may be common to all alternatives.

Standards. The goal to be strived for.

Sustainability. The ability to maintain diversity, productivity, resilience to stress, health, renewability, and yields of desired values, resource uses, products, or services over time in an ecosystem while maintaining its integrity.

Threatened Species. Any plant or animal species defined under the Endangered Species Act as likely to become endangered within the foreseeable future throughout all or a significant portion of its range; listings are published in the Federal Register.

Trend. The direction of change over time, either toward or away from desired management objectives.

Upland. Terrestrial ecosystems located away from riparian zones, wetlands, springs, seeps and dry washes; ecosystems made up of vegetation not in contact with groundwater or other permanent water sources.

Urban Interface. An area where urban encroachment into adjacent wildland areas is increasing the complexity and magnitude of problems related to all aspects of natural resource management and protection, including increased fire risks, unauthorized use, and littering.

CULTURAL RESOURCES

Archaeological Resource. Any material remains of past human life or activities which are of archaeological interest. These include, but are not limited to: pottery, basketry, bottles, weapons, projectiles, tools, structures or portions of structures, pit houses, rock paintings, rock carvings, intaglios, graves, human skeletal materials, or any portion or piece of any of the foregoing items. Nonfossilized and fossilized paleontological specimens, or any portion or piece thereof, shall not be considered archaeological resources unless found in an archaeological context. No item shall be treated as an archaeological resource unless such item is at least 100 years of age. (Archaeological Resources Protection Act of 1979: Definitions 16 USC 470bb).

Archaeological Site. A geographic locale that contains the material remains of prehistoric and/or historic human activity.

Archaeology. The reconstruction of past cultures through their material remains and the study of how cultures change over time.

Conservation for Future Use. This category is reserved for any unusual cultural property which, because of scarcity, a research potential that surpasses the current state of the art, singular historic importance, cultural importance, architectural interest, or comparable reasons, is not currently available for consideration as the subject of scientific or historical study that would result in its physical alteration. A cultural property included in this category is deemed worthy of segregation from all other land or resource uses, including cultural resources uses that would threaten the maintenance of its present condition or setting, as pertinent, and will remain in this use category until specified provisions are met in the future.

- Where the primary allocation is to Conservation for Future Use:
 - Data recovery would not be permitted
 - Scientific Use would only occur when non-destructive
 - Experimental Use would be incompatible with Conservation for Future Use
 - No new actions would be approved that would require data recovery or diminish the scientific value of the resource

Cultural Property. A definite location of past human activity, occupation, or use identifiable through field inventory (survey), historical documentation, or oral evidence (BLM Manual 8100).

Cultural Resource Inventory Classes.

Kinds of Inventory: the BLM cultural resource inventory system is composed of three kinds of inventory: Class I – existing information inventory; Class II – probabilistic field survey; and Class III – intensive field

GLOSSARY

survey. Each is designed to provide specific cultural resource information for various planning and resource needs.

Class I – existing information inventory: a study of published and unpublished documents, records, files, registers, and other sources resulting in an analysis and synthesis of all reasonably available data. Class I inventories encompass prehistoric, historic, and ethnological/sociological elements, and are in large part chronicles of past land uses. They may have major relevance to current land use decisions.

Class II – probabilistic field survey: a statistically based sample survey designed to help characterize the probable density, diversity, and distribution of archaeological properties in a large area by interpreting the results of surveying limited and discontinuous portions of the target area (reconnaissance survey). For example, Class II level inventories are appropriate for Caves and Rockshelters, which normally can be detected with this type of sample design inventory.

Class III – intensive field survey: a continuous, intensive survey of an entire target area, aimed at locating and recording all archaeological properties that have surface indications, by walking close-interval parallel transects until the area has been thoroughly examined.

Cultural Resources. A broad general term meaning any cultural property and any traditional lifeway value (BLM Manual 8100). It includes prehistoric, historic, ethnographic, tribal heritage, ethnohistoric, engineering, architectural, and technological resources.

Discharged from Management. This category is assigned to cultural properties that have no remaining identifiable use. Most often these are prehistoric and historic archaeological properties, such as small surface scatters of artifacts or debris, whose limited research potential is effectively exhausted as soon as they have been documented. Also, more complex archaeological properties that have had their salient information collected and preserved through mitigation or research may be discharged from management, as should cultural properties destroyed by any natural event or human activity. Properties discharged from management remain in the inventory, but they are removed from further management attention and do not constrain other land uses. Particular classes of unrecorded cultural properties may be named and described in advance as dischargeable upon documentation, but specific cultural properties must be inspected in the field and recorded before they may be discharged from management.

Experimental Use. This category may be applied to a cultural property judged well-suited for controlled experimental study, to be conducted by BLM or others concerned with the techniques of managing cultural properties, which would result in the property's alteration, possibly including loss of integrity and destruction of physical elements. Committing cultural properties or the data they contain to loss must be justified in terms of specific information that would be gained and how it would aid in the management of other cultural properties. Experimental study should aim toward understanding the kinds and rates of natural or human-caused deterioration, testing the effectiveness of protection measures, or developing new research or interpretation methods and similar kinds of practical management information. It should not be applied to cultural properties with strong research potential, traditional cultural importance, or good public use potential, if it would substantially diminish those uses.

Historic. Period wherein nonnative cultural activities took place, based primarily upon European roots, having no origin in the traditional Native American culture(s).

Historic Property. "...any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register. The term includes, for purposes of these regulations, artifacts, records, and remains that are related to and located within such properties. The term 'eligible for inclusion in the National Register' includes both properties formally determined as such by the Secretary of the Interior and all other proper-ties that meet National Register listing criteria..." {quoted from 36 CFR 900.2(e)}.

National Register of Historic Places. A register of districts, sites, buildings, structures, and objects, significant in American history, architecture, archaeology and culture, established by the "Historic Preservation Act" of 1966 and maintained by the Secretary of the Interior.

Paleontology. The study of fossils; what fossils tell us about the ecologies of the past, about evolution, and about our place, as humans, in the world. Informs us about interrelationship between the biological and geological components of ecosystems over time.

Public Use. This category may be applied to any cultural property found to be appropriate for use as an interpretative exhibit in place, or for related educational and recreational uses by members of the general public. The category may also be applied to buildings suitable for continued use or adaptive use, for example, as staff housing or administrative facilities at a visitor contact or interpretative site, or as shelter along a cross-country ski trail. Criteria to recognize Public Use at an archaeological/historic site:

- Physical evidence of public use at an archaeological site
 - evidence of display piles
 - trash
 - fire rings/campfires
 - tire tracks leading to site
 - visitor trails through site
- Monitoring of site by volunteers
- Location identified on public maps and websites, in guidebooks and newsletters

Rock Art. Petroglyphs or pictographs.

Sacred Site. Any specific, discrete, narrowly delineated location of federal land that is identified by an Indian tribe, or individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion; provided that the tribe or appropriately authoritative representative of an Indian religion has informed the agency of the existence of such a site (quoted from Executive Order 13007, Section 7 1(b)(iii)).

Scientific Use. This category applies to any cultural property determined to be available for scientific or historical study using currently available research techniques, including methods that would result in the

GLOSSARY

property's physical alternation or destruction. The category applies almost entirely to prehistoric and historic archaeological properties, where the method of use is generally archaeological excavation, controlled surface collection, and/or controlled recordation (data recovery). Recommendations to allocate individual properties to this use must be based on documentation of the kinds of data the property is thought to contain and the data's importance for pursuing specified research topics. Properties in this category need not be conserved in the face of a research or data recovery (mitigation) proposal that would make adequate and appropriate use of the property's research importance.

Traditional Cultural Property. A cultural property that derives significance from traditional lifeway values associated with it. A traditional cultural property may qualify for the National Register if it meets the criteria and criteria exceptions at 36 Code of Federal Regulations 60.4 (BLM Manual 8100 – The Foundations for Managing Cultural Resources, page 34).

Traditional Lifeway Values. The quality of being useful in or important to the maintenance of a specified social and/or cultural group's traditional systems of (a) religious belief, (b) cultural practice, or (c) social interaction, not closely identified with definite locations. Another group's shared values are abstract, nonmaterial, ascribed ideas that one cannot know about without being told (BLM Manual 8100).

Traditional Use. This category is to be applied to any cultural resource known to be perceived by a specified social and/or cultural group as important in maintaining the cultural identity, heritage, or well-being of the group. Cultural properties assigned to this category are to be maintained in ways that recognize the importance ascribed to them and seek to accommodate their continuing traditional use.

FIRE

Appropriate Management Response. Specific actions taken in response to a wildland fire to implement protection and fire use objectives.

Emergency Stabilization. Actions taken immediately following a fire event to 1) stabilize soils against erosion, 2) protect threatened and endangered species habitats against further degradation, 3) prevent further damage to known fire-damaged historic properties, and 4) prevent invasive plant establishment.

Escaped Fire. A fire that has exceeded initial attack capabilities.

Fire Effects. The physical, biological, and ecological impact of fire on the environment.

Fire Intensity. The product of the available heat of combustion per unit area of ground and the rate of spread of the fire.

Fire Management Area. One or more parcels of land having a common set of fire management objectives.

Fire Regime. Periodicity and pattern of naturally occurring fire in a particular area or vegetative type, described in terms of frequency, biological severity, and area extent (Society of American Foresters 1996).

Fire Return Interval. The number of years between two successive fires documented in a designated area (such as the interval between two successive fire occurrences).

Fire Strategy. An overall plan of action for fighting a fire that gives regard to the most cost-efficient use of personnel and equipment in consideration of values threatened, fire behavior, legal constraints, and objectives established for resource management. Leaves decisions on the tactical use of personnel and equipment to line commanders in the suppression function.

Fire Suppression. All the work activities connected with fire-extinguishing operations, beginning with the discovery and continuing until the fire is completely extinguished.

Fuel Type. An identification association of fuel elements of distinctive species, form, size, arrangement or other characteristics that will cause a predictable rate of spread or resistance to control under specific weather conditions.

Fuels. Includes living and dead plant materials that are capable of burning.

Greenstripping. The practice of establishing or using patterns of fire-resilient vegetation and/or material to reduce wildfire occurrence and size. Examples are establishing fire-resilient vegetation adjacent to roads or railways, around or interspersed in valuable shrub stands, or within large blocks of flash fuels.

Phase 1 Fire Planning. The first phase of a two-stage fire management planning process that identifies desired resource conditions and fire management direction, including fire management strategies, which will promote achievement of resource objectives.

Prescribed Fire. Any fire ignited by management actions to meet specific objectives. A written, approved prescribed fire plan must exist, and National Environmental Policy Act requirements must be met, prior to ignition.

Rehabilitation. The activities necessary to repair damage or disturbance caused by wildfire or the fire suppression activity.

Risk Assessment. Assessing the chance of fire starting, natural or human-caused, and its potential risk to life, resources, and property.

Values-at-risk. Any or all natural resources, improvements, or other values that may be jeopardized if a fire occurs (value-at-risk, risk of resource values).

Wildland Fire. Any nonstructure fire, other than prescribed fire, that occurs in the wildland.

GLOSSARY

Wildland Fire Implementation Plan. A decision-making process that evaluates alternative management strategies against selected safety, environmental, social, economical, political, and resource management objectives as selected criteria for the management of wildland fire use.

Wildland Fire Situation Analysis. A decision-making process that evaluates alternative management strategies against selected safety, environmental, social, economical, political, and resource management objectives as selection criteria for suppression of a fire.

Wildland Fire Use. Any fire ignited by natural means, such as lightning, which is managed for resource benefits.

Wildland Urban Interface. The line, area, or zone where structures and other human development meet or intermingle with undeveloped wildland or vegetation fuels.

GEOLOGY AND MINERALS

Alluvium. Material deposited on the land by water, such as gravel, sand, silt, or clay.

Badlands. Steep or very steep, commonly nonstony, barren land dissected by many intermittent drainage channels, most common in semiarid and arid regions where streams are entrenched in soft geologic material. Local relief generally ranges from 25 to 500 feet. Runoff potential is very high, and geologic erosion is active.

Clay (Geology). A rock or mineral fragment of any composition finer than 0.00016 inches in diameter. Mineral: A hydrous aluminum-silicate that occurs as microscopic plates, and commonly has the ability to absorb substantial quantities of water on the surface of the plates.

Erosion (Geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains; synonymous with *natural erosion*.

Fluvial (Fluviatile) Deposit. A sedimentary deposit laid down, transported by, or suspended in, a stream.

Graben. A fault-bounded down-dropped portion of the Earth's crust.

Gravel (Geology). Fragments of rock worn by the action of air and water, larger and coarser than sand.

Hot-springs Deposit. A type of hydrothermal deposit formed in a hot-springs environment.

Hydrothermal Deposit. A mineral deposit formed by hot, mineral-laden fluids.

Igneous Rock. Rock that solidified from a molten or semimolten state. The major varieties include intrusive (solidified beneath the surface of the Earth) and volcanic (solidified on or very near the surface of the Earth).

Known Geothermal Resource Area. "An area in which the geology, nearby discoveries, competitive interest, or other indicia would, in the opinion of the Secretary, engender the belief in men who are experienced in the subject matter that the prospect for extraction of geothermal steam or associated geothermal resources are good enough to warrant expenditures or money for that purpose" [43 Code of Federal Regulations 3200.0-5(k)].

Lacustrine Deposit (Geology). Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

Leasable Minerals. Those minerals that are leased to individuals for their exploration and development. The leasable minerals have been subdivided into two classes, fluid and solid. Fluid minerals include oil and gas; geothermal resources and associated by-products; and oil shale, native asphalt, oil impregnated sands and any other material in which oil is recoverable only by special treatment after the deposit is mined or quarried. Solid leasable minerals are specific minerals such as coal and phosphates. All minerals on acquired lands are considered to be leasable minerals. Leasable minerals are associated with the following laws: Mineral Leasing Act of 1920, as amended and supplemented, Mineral Leasing Act for Acquired Lands of 1947, as amended, and the Geothermal Steam Act of 1970, as amended.

Limestone. A sedimentary rock consisting chiefly of calcium carbonate.

Locatable Minerals. Those that have been described as "valuable mineral deposits." These include precious and base metal ores such as gold, silver, copper, or lead, and certain industrial minerals such as gypsum, chemical grade limestone, and chemical grade silica sand. Uncommon varieties of mineral materials such as pozzolan, pumice, decorative rock, and cinders also are regulated as locatable minerals. These minerals are regulated under the General Mining Law of 1872, as amended, and Surface Use and Occupancy Act of July 23, 1955.

Magma. Molten rock from within the Earth capable of flowing like liquid.

Metamorphosed. Rock that has been altered in composition, texture, or structure by heat and/or pressure.

Mineral Materials. Common geologic materials that include sand, gravel, and common clay. Mineral materials are sold through contract and are regulated under the Mineral Material Act of July 23, 1947, as amended, and the Surface Use and Occupancy Act of July 23, 1955.

No Surface Occupancy. A fluid mineral leasing stipulation that prohibits occupancy or disturbance on all or part of the lease surface to protect special values of uses. Lessees may explore for or exploit the fluid minerals under leases restricted by this stipulation by using directional drilling from sites outside the no surface occupancy area.

Porphyry Deposit. A large, low-grade metallic mineral deposit containing disseminated sulfide minerals (examples: copper, gold, molybdenum, or tin).

GLOSSARY

Rhyolite. A fine-grained light-colored silica-rich igneous rock composed largely of potash feldspars and quartz.

Salable Minerals. See Mineral Materials.

Sand. (geology) A rock fragment or detrital particle between 0.0025 and 0.08 inches in diameter.

Schist. A metamorphic rock characterized by coarse-grained minerals oriented approximately parallel.

Silt (Geology). A rock fragment or detrital particle smaller than very fine sand and larger than coarse clay, ranging from 0.0024 to 0.00016 inches in diameter and commonly having a high content of clay minerals.

Slate. A compact, fine-grained, platy metamorphic rock formed from shale or claystone.

Special Stipulation. A specific operating condition or limitation added to a mineral lease to protect sensitive resources. It modifies the original terms and conditions of that lease.

Surface Occupancy. See definition for No Surface Occupancy.

Terrace (geologic). An old alluvial plain, ordinarily flat or undulating, bordering a river, a lake, or the sea.

Upland (geology). Land at a higher elevation, in general, than the alluvial plain or stream terrace; land above the lowlands along streams.

Valid Existing Rights. Locatable mineral development rights that existed when the Federal Land Policy and Management Act was enacted on October 21, 1976. Some areas are segregated from entry and location under the Mining Law to protect certain values or allow certain uses. Mining claims that existed as of the effective date of the segregation may still be valid if they can meet the test of discovery of a valuable mineral required under the Mining Law. Determining the validity of mining claims located in segregated lands requires BLM to conduct a validity examination and is called a "valid existing rights" determination.

GRAZING

Active Use. The current authorized use, including livestock grazing and conservation use. Active use may constitute a portion, or all, of permitted use. Active use does not include temporary nonuse or suspended use of forage within all or a portion of an allotment.

Actual Use Data. The number of livestock, kind or class of those livestock, and time period those livestock actually grazed a specific allotment or pasture.

Animal Unit. One cow, one cow/calf pair, one horse, or five sheep.

Animal Unit Month. The forage needed to support one cow, one cow/calf pair, one horse, or five sheep for one month. Approximately 800 pounds of forage.

Authorized Use. This is the amount of use a permittee is billed for (the bill is the authorization to graze). It may or may not be the total active use. Example: If a permittee has 500 animal unit months of active use, he may only be authorized 300 animal unit months for a certain year, but cannot be authorized above 500 animal unit months. This changes from year to year, based on fluctuation of the permittees livestock herd, vegetation production, drought, etc.

Deferred Grazing. Discontinuance of grazing by livestock on an area for a specified period of time during the growing season to promote plant growth, reproduction, establishment of new plants, or restoration of vigor by old plants.

Deferred Rotation Grazing. Discontinuance of grazing on various parts of a range in succeeding years, allowing each part to rest successively during the growing season to permit seed production, establishment of seedlings, or restoration of plant vigor. Two, but usually three or more, separate units are required. Control is usually insured by unit fencing, but may be obtained by camp unit herding.

Distribution (Grazing). Dispersion of grazing animals within a management unit or area.

Ecological Site Inventory. The basic inventory of present and potential vegetation on BLM rangelands. Ecological sites are differentiated on the basis of the kind, proportion, or amount of plant species.

Forage. The plant material actually consumed by (or available to) grazing animals.

Grazing Distribution. Dispersion of livestock grazing within a management unit or area.

Guidelines. Guidelines are livestock management practices (e.g., tools, methods, strategies, and techniques) designed to achieve healthy public lands as defined by Standards and portrayed by Indicators. Guidelines are designed to provide direction, yet offer flexibility for local implementation through activity plans and grazing permits. Activity plans may add specificity to the Guidelines based on local goals and objectives as provided for in adopted manuals, handbooks, and policy. Not all Guidelines fit all circumstances. Monitoring or site specific evaluation will determine if significant progress is being made towards achieving the Standards, and if the appropriate Guidelines are being applied.

Intensity (Grazing). A reference to grazing density per unit of time.

Performance-based Grazing Management (Conservation Partnerships). A voluntary arrangement in which a grazing permit holder enters into a performance-based agreement with the agency aimed at promoting ecological health of an allotment. Performance-based actions would include those that help restore stream banks and wetlands, enhance water quality and quantity, improve wildlife habitat, and promote recovery of special status species. In return the permittee receives greater management flexibility and the potential for increased livestock grazing made possible by success in the conservation efforts.

GLOSSARY

Permitted Use. The forage allocated by, or under the guidance of, an applicable land use plan for livestock grazing in an allotment under a permit or lease and is expressed in animal unit months.

Range Improvement. Range improvement means an authorized physical modification or treatment that is designed to improve production of forage; change vegetation composition; control patterns of use; provide water; stabilize soil and water conditions; restore, protect and improve the condition of rangeland ecosystems to benefit livestock, wild horses, and fish and wildlife. The term includes but is not limited to, structures, treatment projects, and use of mechanical devices or modifications achieved through mechanical means.

Residual Vegetation. Amount, cover, and species composition of the vegetation on a site after it has been grazed for a period of time.

Rest-rotation Grazing. An intensive system of management whereby grazing is deferred on various parts of the range during succeeding years, allowing the deferred part complete rest for one year. Two or more units are required. Control by fencing is usually necessary on cattle range, but may be obtained by herding on sheep ranges.

Surface Characteristics. The amount of bare ground, litter, rock, and basal cover of live vegetation, which may include cryptogams (Nevada Rangeland Monitoring Handbook).

Sustained Yield. "The achievement and maintenance in perpetuity of a high level annual or regular periodic output of the various renewable resources of the public lands consistent with multiple use" (Federal Land Policy and Management Act of 1976).

LANDS, RECREATION, AND SPECIAL DESIGNATIONS

Access. The physical ability to have legal ingress to and egress from public lands via public roads or on routes having public easements.

Acquired Lands. Lands acquired for BLM administration in various ways, such as but not limited to: 1) any lands purchased by congressionally appropriated funds, 2) land donations, 3) land exchanges, 4) Land and Water Conservation Fund acquisitions, 5) land withdrawals returned to public land status through withdrawal revocations and/or relinquishments, etc., 6) split-estate acquisitions, 7) federal agency jurisdictional transfers, 8) easement acquisitions, and/or 9) lands acquired by any other means.

Area Of Critical Environmental Concern (ACEC). Area where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect humans from natural hazards.

Avoidance Areas. Areas with sensitive resource values where rights-of-way would be strongly discouraged. Authorizations made in avoidance areas would have to be compatible with the purpose for which the area was designated and not be otherwise feasible on lands outside the avoidance area.

Back-country Byway. Vehicle routes that traverse scenic corridors utilizing secondary or back-country road systems. National back-country byways are designated by the type of road and vehicle needed to travel the byway.

Closed. Generally denotes that an area is not available for a particular use or uses; refer to specific definitions found in law, regulations, or policy guidance for application to individual programs.

Corridor. A wide strip of land within which a proposed linear facility could be located.

Designated Corridor. A parcel of land identified by law, Secretarial order, through a land use plan or by other management decision as being the preferred location for existing and future right-of-way grants and suitable to accommodate one type of right-of-way or one or more rights-of-way that are similar, identical or compatible.

Designation. The approval of a resource management plan, plan revision, or plan amendment constitutes formal designation of off-highway vehicle use areas.

Exclusion Areas. Areas with sensitive resource values where rights-of-way would be prohibited.

Extensive Recreation Management Area. Area where recreation management is less structured (than within a special recreation management area) and recreation use more dispersed with minimal regulatory constraints and where minimal recreation-related investments are required.

High Resource Values. Lands with high resource values are considered to be public lands that have the caliber of resources to qualify them for inclusion in special management areas such as ACECs, National Wild and Scenic Rivers, Wilderness Study Areas, and high resource areas such as critical wildlife habitat areas, wild horse herd areas, critical fish habitat areas, cultural site areas, threatened and endangered species habitats, etc. Long-term retention of Public lands in these special management areas is either required by law through Congressional action or identified through the land use planning process.

Integrated Use. To merge the use of each type of public land use through a series of land management practices.

Interim Management Policy. Policy for managing public lands under wilderness review. Section 603 (c) of the Federal Land Policy and Management Act of 1976 states: "During the period of review of such areas and until Congress has determined otherwise, the Secretary shall continue to manage such lands according to his authority under this Act and other applicable law in a manner so as not to impair the suitability of such areas for preservation as wilderness, subject, however, to the continuation of existing mining and grazing uses and mineral leasing in the manner and degree in which the same was being conducted on the date of

GLOSSARY

approval of this Act: Provided, that, in managing the public lands the Secretary shall by regulation or otherwise take any action required to prevent unnecessary or undue degradation of the lands and their resources or to afford environmental protection.”

Land Use Allocations. Allocations that define allowable uses/activities, restricted uses/activities, and prohibited uses/activities. They may be expressed in terms of area such as acres or miles. Each allocation is associated with a specific management objective.

Land Use Plan. Land use plan means a resource management plan, developed under the provisions of 43 Code of Federal Regulations part 1600, or management framework plan. These plans are developed through public participation in accordance with the provisions of the Federal Land Policy and Management Act of 1976 and establish management direction for resource uses of public lands. (43 Code of Federal Regulations 4100)

Limits of Acceptable Change. For recreation management, a nine-step process used to define the desired resource conditions for an area and to determine acceptable levels of resource change due to recreation use. The process helps to develop management actions to avoid exceeding standards.

Mechanized Vehicle. Any non-motorized vehicle capable of or designed for travel on land. An example of a mechanized vehicle is a mountain bike.

Military Operations Area. A type of low-altitude military airspace that is controlled, when active, to separate military activities from civilian air traffic. Depending on the specific military operations area, military aircraft may maneuver to altitudes as high as 18,000 feet above mean sea level, and supersonic flight may be authorized. Training activities typically include basic fighter maneuvers, air combat tactics, low-altitude tactical navigation, and simulated air-to-surface missions.

Naturalness (a primary wilderness value). An area that generally appears to have been affected primarily by the forces of nature with the imprint of people's work substantially unnoticeable.

Off-highway Vehicle. A vehicle that can be operated off of improved and regularly maintained roads with hardened or gravel surfaces.

Off-highway Vehicle Designation:

- **Open:** Designated areas and trails where off-highway vehicles may be operated subject to operating regulations and vehicle standards set forth in BLM Manuals 8341 and 8343.
- **Limited:** Designated areas and trails where off-highway vehicles are subject to restrictions limiting the number or types of vehicles, date, and time of use; limited to existing or designated roads and trails.
- **Closed:** Areas and trails where the use of off-highway vehicles is permanently or temporarily prohibited. Emergency use is allowed.

Off-Highway Vehicle Emphasis Area. A special recreation management area that emphasizes motorized recreation over other recreational opportunities. These are not designated off-highway vehicle open areas. Within the special recreation management area, trails and routes would be designated for motorized recreational opportunities. Off-road motorized travel would not be permitted for recreational purposes.

Patent. The instrument by which the Federal Government conveys title to the public lands.

Primary Wilderness Values. The primary or key wilderness values described in the "Wilderness Act" by which Wilderness Study Areas and designated wilderness are managed to protect and enhance the wilderness resource. Values include roadlessness, naturalness, solitude, primitive and unconfined recreation, and size.

Primitive and Unconfined Recreation (a primary wilderness value). Nonmotorized and undeveloped types of outdoor recreation activities. Refers to wilderness recreation opportunities, such as nature study, hiking, photography, backpacking, fishing, hunting, and other related activities. Does not include the use of motorized vehicles, bicycles, or other mechanized means of travel.

Public Land. Any land or interest in land owned by the U.S. and administered by the Secretary of the Interior through the BLM.

Recreation Opportunity Spectrum. A means of characterizing recreation opportunities in terms of setting, activity, and experience opportunities.

Recreation Site. An area where management actions are required to provide a specific recreation setting and activity opportunities, to protect resource values, provide public visitor safety and health, and/or to meet public recreational use demands and recreation partnership commitments. A site may or may not have permanent facilities.

Research Natural Area. An area where natural processes predominate and which is preserved for research and education. Under current BLM policy, these areas must meet the relevance and importance criteria of ACECs and are designated as ACECs.

Right-of-way. A permit or an easement authorizing the use of public land for certain specified purposes, commonly for pipelines, roads, telephone lines, electric lines, reservoirs, etc. Also, the reference to the land covered by such an easement or permit.

Road. Travel route that has been improved and maintained by mechanical means to ensure relatively regular and continuous use.

Rural Interface Areas. Areas where BLM-administered lands are adjacent to or intermingled with privately owned lands zoned for 1- to 20-acre lots, or areas that already have residential development.

GLOSSARY

Solitude (a primary wilderness value). The state of being alone or remote from habitations; a lonely, unfrequented, or secluded place. The intent is to evaluate the opportunity for solitude in comparison to habitations of people.

Special Recreation Management Area. An area where recreation is one of the principal management objectives, where intensive recreation management is needed, and where more than minimal recreation-related investments are required.

Special Recreation Permit. Authorizations, which allow for recreational uses of the public lands and related waters. They are issued as a means to control visitor use, protect recreational and natural resources, provide for the health and safety of visitors, and as a mechanism to accommodate commercial recreational use of public lands.

Trail. A pathway usually created and maintained by human foot traffic, beasts-of-burden, livestock, or wildlife.

Visit. A unit of measure for evaluating the amount of recreational activity on public land; equivalent to one person spending any part of a day recreating on Public land.

Visual Resource Management Classes. A classification of landscapes according to the kinds of structures and changes that are acceptable to meet established visual goals (BLM).

Visual Resources. The visible physical features of a landscape (topography, water, vegetation, animals, structures, and other features) that constitute the scenery of an area.

Way. A trace maintained solely by the passage of vehicles which has not been improved and/or maintained by mechanical means to ensure relatively regular and continuous use.

Wilderness Inventory. A written description of resource information and data, and a map of those public lands that meet the wilderness criteria as established under Section 603 (a) of the Federal Land Policy and Management Act of 1976 and Section 2 (c) of "The Wilderness Act."

Wilderness Study Area. A roadless area or island that has been inventoried and found to have wilderness characteristics as described in section 603 of the Federal Land Policy and Management Act of 1976 and section 2 (c) of "The Wilderness Act." Wilderness Study Areas were administratively designated by BLM following evaluation of wilderness inventories.

Withdrawal. A withdrawal is a formal action that transfers total or partial jurisdiction of federal land between federal agencies, segregates (closes) federal land to some or all of the public land laws and/or mineral laws, or dedicates land for a specific public purpose. There are three major categories: Congressional, administrative, and Federal Energy Regulatory Commission withdrawals.

SOIL

Association, Soil. A group of soils geographically associated in a characteristic repeating pattern and defined and delineated as a single soil map unit.

Biological (Cryptogamic) Soil or Crust. Community of non-vascular primary producers that occur as a "crust" on the surface of soils; made up of a mixture of algae, lichens, mosses, and cyanobacteria (bluegreen algae).

Calcareous Soil. A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.

Classification, Soil. The systematic arrangement of soils into groups or categories on the basis of their characteristics.

Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.

Clayey Soil. Silty clay, sandy clay, or clay.

Coarse Textured Soil. Sand or loamy sand.

Colluvium. Soil material, rock fragments, or both, moved by creep, slide, or local wash and deposited at the base of steep slopes.

Compaction, Soil. An increase in soil bulk density of 15 percent or more from the undisturbed level.

Complex, Soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Cryptogamic Crust. See microbiotic crust.

Erosion. (v.) Detachment and movement of soil or rock fragments by water, wind, ice, or gravity. (n.) The land surface worn away by running water, wind, ice, or other geologic agents, including such processes as gravitational creep.

Erosion (Accelerated). Erosion much more rapid than geologic erosion, occurring mainly as a result of human or animal activities or of a catastrophe in nature, such as with fire, that exposes the surface.

Fertility, Soil. The quality that enables a soil to provide plant nutrients in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.

GLOSSARY

Fine Textured Soil. Sandy clay, silty clay, or clay.

Functionality, Soil. The maintaining of soil structure and texture characteristics, such as aeration, temperature, moisture, nutrition and the organisms that live in the soil.

Gravel. (Geology) Unconsolidated, rounded rock fragments greater than 0.08 inch in diameter. Sizes range from pebbles (0.008 to 2.5 inches) to cobbles (2.5 to 10 inches) to boulders (greater than 10 inches).

Horizon, Soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Map Unit. The basic system of description in a soil survey and delineation on a soil map. Can vary in level of detail.

Medium Textured Soil. Very fine sandy loam, loam, silt loam, or silt.

Microbiotic Crust. Lichens, mosses, green algae, fungi, cyanobacteria, and bacteria growing on or just below the surface of soils.

Order 3 Soil Survey. A reconnaissance survey with extensive ground truthing. Minimum delineation sizes are typically on the order of 40 to 80 acres.

Organic Matter. Plant and animal residue in the soil in various stages of decomposition.

Permeability. The quality of the soil that enables water to move downward through the profile, measured as the number of inches per hour that water moves downward through the saturated soil.

pH Value. A numerical designation of acidity and alkalinity in soil (see "reaction, soil").

Productivity, Soil. The organic fertility or capacity of a given area or habitat.

Profile, Soil. A vertical section of the soil extending through all its horizons and into the parent material.

Quality, Soil. Soil quality is the capacity of a specific kind of soil to function, within natural or managed ecological system boundaries, to sustain plant and animal productivity, maintain or enhance water and air quality, and support human health and habitation. Changes in the capacity of soil to function are reflected in soil properties that change in response to management or climate.

Saline Soil. A soil containing soluble salts in an amount that impairs the growth of plants. A saline soil does not contain excess exchangeable sodium.

Sediment. Soil, rock particles, and organic or other debris carried from one place to another by wind, water or gravity.

Series, Soil. A nationally defined soil type set apart on distinct soil properties that affect use and management. In a soil survey, this includes a group of soils that have profiles that are almost alike, except for differences in texture of the surface layer or of the underlying material. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Silt (Soil). Individual mineral particles ranging in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class: Soil that is 80 percent or more silt and less than 12 percent clay.

Sodic (alkali) Soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Soil. 1) The unconsolidated mineral and organic material on the immediate surface of the earth that serves as a natural medium for the growth of land plants; 2) the unconsolidated mineral matter on the surface of the earth that has been subjected to and influenced by genetic and environmental factors of parent material, climate (including moisture and temperature effects), macro- and micro-organisms, and topography, all acting over a period of time and producing a product -soil- that differs from the material it was derived in many physical, chemical, biological, and morphological properties and characteristics.

Structure, Soil. The arrangement of primary soil particles into compound particles or aggregates.

Survey, Soil. A field investigation resulting in a soil map showing the geographic distribution of various kinds of soil and an accompanying report that describes the soil types and interprets the findings.

Texture, Soil. The relative proportions of sand, silt, and clay particles in a mass of soil.

VEGETATION AND WOODLANDS

Annual Growth. The amount of production of new above-ground plant biomass for a given site during a given year.

Attribute. A discreet feature or characteristic of biotic or physical resources that can be measured (example: plant density, which is the number of individuals or stems per unit area).

GLOSSARY

Canopy Cover. The percentage of ground covered by a vertical projection of the outermost perimeter of the natural spread of foliage of plants. Small openings within the canopy are included. (BLM Technical Reference 4400-7)

Community Structure. Refers to the presence of multiple plant life forms (trees, shrubs, grasses, and forbs) and their relative abundance within a given vegetation community.

Conifer. A tree of the order Coniferae with cones and needle-shaped or scale-like leaves.

Control. Control means, as appropriate, eradicating, suppressing, reducing, or managing invasive species populations, preventing spread of invasive species from areas where they are present, and taking steps such as restoration of native species and habitats to reduce the effects of invasive species and to prevent further invasions.

Desired Natural Plant Community. The type of plant community which is desired for a particular ecological site. This could include native and non-native species depending on the desired land use, but as a natural plant community it must have native species adapted to the climate and soil type as dominants or co-dominants in the community.

Desired Plant Community. Of the several plant communities that may occupy a site, the one that has been identified through a management plan to best meet the plan's objectives for the site. It must protect the site as a minimum.

Deterioration or Decline (of vegetation communities). A pattern of changes in vegetation communities leading to loss of perennial understory species, reduction in overall species diversity, increase in shrub or tree dominance in communities that are not naturally shrublands or woodlands. These changes indicate that the vegetation community is approaching or undergoing a transition to another vegetation state from which conditions are not easily reversible.

Diameter at Breast Height (DBH). The diameter of a tree measured 4.5 feet above the ground.

Ecological Site. A distinctive kind of land with specific physical characteristics that differ from other kinds of land in its ability to produce a distinctive kind and amount of vegetation.

Ecological Status. The present state of vegetation of a range site in relation to the potential natural community for that site. Four classes are used to express the degree to which the production or composition of the present plant community reflects that of the potential natural community (climax):

Ecological Status (Seral stage)	Percent of Community in Climax Condition
Potential natural community	76-100
Late seral	51-75
Mid-seral	26-50
Early seral	0-25

As stated in Section 2.5.5, this concept has been superseded by state-and-transition models, which serve as the basis for vegetation management in this RMP.

Forb. Any herbaceous plant not a grass or a grasslike species.

Forest Health. The condition in which forest ecosystems sustain their complexity, diversity, resiliency, and productivity while providing for human needs and values.

Fragmentation. Process of reducing the size and connectivity of vegetated stands and/or habitat that comprise a rangeland or forest; a measure of connectivity in vegetative and/or habitat conditions across a landscape.

Ground Cover. The percentage of material, other than bare ground, covering the land surface. It may include live and standing dead vegetation, litter, cobble, gravel, stones and bedrock. Ground cover plus bare ground would total 100 percent (BLM Technical Reference 4400-4).

Invasive. Describes a species which takes over a new habitat where it was not previously found, often to the detriment of species which were there before.

Invasive Species. A nonnative plant species that is capable of dominating over native or other nonnative plant species in such a way that it interferes with natural ecological processes of plant community functionality. If introduced into a plant community it does, or is likely to, cause economic harm, environmental harm, or harm to human health.

LANDFIRE Biophysical Setting Models. Predictive models developed under the LANDFIRE collaborative partnership of the USDA Forest Service, the Department of Interior, and the Nature Conservancy to describe how ecosystems function in relation to their environmental setting and various disturbances such as fire. Biophysical settings represent natural plant communities that would become established in later stages of successional development given natural ecological processes such as fire. Biophysical settings are matched one-to-one with vegetation succession models used to simulate historical reference conditions. The biophysical settings represent the vegetation that can potentially exist at a given site based on both the biophysical environment and an approximation of the historical fire regime (www.reo.gov/ecoshare/publications/documents/LANDFIRE_outputs.pdf).

Litter. The uppermost layer of organic debris on the soil surface; essentially the freshly fallen or slightly decomposed vegetal material (BLM Technical Reference 4400-4).

Maintenance of Desired Range of Conditions (Vegetation). Management of watersheds, allotments, or local sites that possess the desired plant communities in a manner to ensure continued survival and health of these desired communities. As used in the context of this RMP, maintenance activities typically focus on grazing management and other "passive" management tools as opposed to fire, chemical applications, seeding, or other "active treatment" management tools. It is important to emphasize that in dynamic natural

GLOSSARY

systems, some type and degree of disturbance is generally necessary to maintain current conditions, whatever they may be.

Marsh. Flat, wet, treeless areas usually covered by standing water and supporting a native growth of grasses and grasslike plants.

Mechanical Treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Natural System. This refers to a biological, soil, and physical environment largely, but not necessarily entirely, controlled by natural processes rather than by intensive human activity, e.g., the comparison between rangelands and tilled agricultural croplands.

Noxious Weed. Any plant designated by a federal, state, or county government as injurious to public health, agriculture, recreation, wildlife, or property.

Nutrient, Plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil, and carbon, hydrogen, and oxygen obtained from the air and water.

Old-growth. A stage that constitutes the potential plant community, characterized by large, old trees, and capable of existing on a site given the frequency of natural disturbance events. Identification of old-growth species is dependant on the forest/woodland type. In most forest/woodland stands, old-growth tree species have large diameters relative to average, and are resilient and able to withstand natural disturbance events (i.e., fire).

Overmature Woodland. A vegetation state whereby the woodland community has crossed a threshold into a state where the canopy cover exceeds optimum percentages and the herbaceous perennial understory has been reduced to rare or absent. In this state, tree density and fuel accumulation have reached the point of promoting large hot fires.

Overstory. The upper canopy or canopies of plants. Usually refers to trees, tall shrubs, and vines.

Phase. A descriptor used to describe multiple identifiable plant communities within a particular state of the state-and-transition model. Communities may shift over time in a reversible manner among phases in a state in response to climate, grazing, and numerous other disturbance factors. As vegetation communities shift among phases, the vegetation and soil maintain resilience to return with similar characteristics.

Plant Cover. 1) The plants or plant parts, living or dead, on the surface of the ground. Vegetative cover or herbage cover is composed of living plants and litter cover of dead parts of plants; 2) the area of ground cover by plants of one or more species.

Proper Functioning Condition. Riparian-wetland areas are functioning properly when adequate vegetation, landform, or large woody debris is present to dissipate stream energy associated with high waterflows, thereby reducing erosion and improving water quality; filter sediment, capture bedload, and aid floodplain development; improve flood-water retention and groundwater recharge; develop root masses that stabilize streambank against cutting action; develop diverse ponding and channel characteristics to provide the habitat and the water depth, duration, and temperature necessary for fish production, waterfowl breeding, and other uses; and support greater biodiversity (BLM Technical Reference 1737-9).

Range of Healthy Conditions (vegetation). The set of primary vegetation community characteristics that determine whether a given vegetation community is considered to be "healthy" with respect to the agency goals of ecological health and resilience. Ranges of healthy conditions are based primarily on composition of perennial species present in the overstory vegetation and the presence or absence of native perennial species in the herbaceous understory.

Resilience. The ability of a natural vegetation community to recover following a disturbance such as fire with recruitment of native plants in a manner that eventually leads back to the pre-disturbance condition. Resilient communities typically exhibit perennial herbaceous understory; non-resilient communities commonly exhibit no understory or understories dominated by invasive exotic species.

Resistance. The capability to stay near equilibrium conditions with less variation in ecological processes. Resistant plant communities accommodate more outside influences. Resilience and resistance determine the stability of a state or of the various phases within a state (Swanson 2005).

Riparian. Referring to or relating to areas adjacent to water or influenced by free water associated with streams or rivers on geologic surfaces occupying the lowest position of a watershed. Pertaining to, living or situated on, the banks of rivers and streams. 'Xeroriparian' refers to being situated on dry washes (ephemeral streams).

Seral Stage. The developmental phase of a forest stand or rangeland with characteristic structure and plant species composition.

Scrub. Refers to a stand of vegetation characterized by thick growth of dwarf or stunted trees and shrubs and a poor soil.

Shrub. A low woody plant.

Site Preparation. Any action taken in conjunction with a reforest effort (natural or artificial) to create an environment that is favorable for survival of suitable vegetation during the first growing season. This environment can be created by altering ground cover, soil, or microsite conditions through using biological, mechanical, or manual clearing, prescribed burns, herbicides, or a combination of methods.

Slash. The branches, bark, treetops, reject logs, and broken or uprooted trees left on the ground after logging.

GLOSSARY

State. A descriptor used to describe a recognizable, resistant, and resilient complex of soil and vegetation for an ecological site. The plant communities within a state are different from those of other states in the state-and-transition model. When a vegetation community loses resilience and characteristic ecological processes, it crosses a threshold into another state. Such transitions are not readily reversible like the shift among phases within a state.

State and Transition Models. Models that diagram the variety of stable states for a given ecological site. Such models identify the potential array of disturbance factors affecting vegetation communities for the ecological site and are used to explain and predict vegetation changes in response to these factors. Such responses may involve a transition from one state to a different state on the ecological site.

Threshold. A point of irreversible transition to a new state. After the transition, significant management effort (e.g., seeding, herbicide control, fire control, etc.) is needed to restore the ecological processes of the other state (Swanson 2005).

Transition. The trajectory of system change between states that lead to the establishment of a new state. The transition may be reversible for a time and may become irreversible after the new state has been reached. A transition involves the loss or significant change of ecological processes such as soil capture of water, reproduction of key species or species groups, resilience after fire, etc. Lost or changed processes do not recover without intervention (Swanson 2005).

Vegetation Manipulation. Alteration of present vegetation by using fire, plowing, or other means to manipulate natural succession trends.

Weed. A plant considered undesirable, unattractive, or troublesome, usually introduced and growing without intentional cultivation.

Wetlands. Areas characterized by soils that are usually saturated or ponded, i.e., hydric soils, that support mostly water-loving plants (hydrophytic plants).

Wilding. A plant growing uncultivated in the wild either as a native or an escape.

Woodland. A forest community occupied primarily by noncommercial species such as juniper, mountain mahogany, or aspen.

WATER

Aquifer. A body of rock that is sufficiently permeable to conduct groundwater and to yield economically significant quantities of water to wells and springs.

Beneficial Use. Any of various uses of water in an area. Water may be for agricultural, domestic, or industrial use, fish spawning, recreation, wildlife habitat, or other uses.

Channeled. Refers to a drainage area in which natural meandering or repeated branching and convergence of a streambed have created deeply incised cuts, either active or abandoned, in alluvial material.

Drainage, Surface. Runoff, or surface flow of water, from an area.

Drawdown. The lowering of the water level in a well as a result of withdrawal; the reduction in head at a point caused by the withdrawal of water from an aquifer.

Ephemeral Stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no continuous supply from melting snow or other source, and its channel is above the water table at all times.

Flood Plain. A nearly level alluvial plain that borders a stream and is subject to inundation under flood-stage conditions unless protected artificially. It is usually a constructional landform built of sediment deposited during overflow and lateral migration of the stream.

Groundwater. Subsurface water that is in the zone of saturation. The top surface of the groundwater is the "water table." Source of water for wells, seepage, springs.

Gully. A miniature valley with steep sides cut by running water and through which water ordinarily runs only after rainfall. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

Infiltration. The flow of a fluid into a substance through pores or small openings. It connotes flow into a substance in contradistinction to the word percolation. The process by which water seeps into a soil, as influenced by soil texture, aspect, and vegetation cover.

Infiltration Rate. Maximum rate at which soil under specified conditions can absorb rain or shallow impounded water, expressed in quantity of water absorbed by the soil per unit of time, e.g., inches/hour.

Interior Drainage. Streams with no outlet to the sea.

Intermittent Stream. A stream, or reach of a stream, that flows for prolonged periods only when it receives groundwater discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Microsiemens Per Centimeter. A unit of measure for specific or electrical conductivity of water. Higher values reflect greater levels of dissolved conductors (e.g., sodium, calcium, or magnesium salts).

Percolation. The flow of a liquid through a porous substance.

Perennial Stream. A stream in which water is present during all seasons of the year.

GLOSSARY

Perennial Yield. Water that is available in a shallow alluvial aquifer that can be withdrawn without creating substantial drawdown in the aquifer's water table.

Pluvial Lake. A lake formed during a period of exceptionally high rainfall (such as during a time of glacial advance during the Pleistocene epoch) and now either extinct or existing as a remnant, such as Lake Bonneville.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called groundwater runoff or seepage flow from groundwater.

Seep. Wet areas, normally not flowing, arising from an underground water source.

Specific Conductance. A measurement that indicates the capacity of a sample of water to transmit an electrical current, which is associated with the concentration of ionized substances in the water.

Spring. Flowing water originating from an underground source.

Stream Channel. The hollow bed where a natural stream of surface water flows or may flow; the deepest or central part of the bed, formed by the main current and covered more or less continuously by water.

Total Dissolved Solids. Total amount of dissolved material, organic or inorganic, contained in a sample of water.

Wellhead Protection Area. The land surface area in which activities and land uses must be managed to protect the underlying ground water. A wellhead protection area is designated to protect the groundwater flowing to a well or group of wells and is represented on the land surface generally as a circular or elliptical shape around the well. In some cases, it also may be necessary to manage the activities in a recharge zone located some distance from the well.

WATERSHED

Ecological Site Description – Ecological Site Inventory is the BLM's approved and accepted rangeland vegetation/soil survey method based on current year's vegetation growth, and an Order 3 soil survey. The BLM follows the survey processes and techniques defined in the Natural Resources Conservation Service (NRCS) "National Range and Pasture Handbook", with some slight adaptations to BLM's needs.

In order to properly inventory, assess, and manage the conditions of rangelands they must be divided into basic units of study. On rangelands and some forest lands this is called an ecological site. An ecological site, according to the National Range and Pasture Handbook, is

...a distinctive kind of land with specific physical characteristics that differs from other kinds of land in its ability to produce a distinctive kind and amount of vegetation....An ecological site is the product of all the environmental factors responsible for its development, and it has a set of key characteristics that are included in the ecological site description. Ecological sites have characteristic soils that have developed over time throughout the soil development process. The factors of soil development are parent material, climate, living organisms, topography or landscape position, and time. An ecological site has a characteristic hydrology, particularly infiltration and runoff that has developed over time. The development of the hydrology is influenced by development of the soil and plant community. An ecological site has evolved a characteristic plant community kind (cool season, warm season, grassland, shrub-grass, sedge meadow) and amount of vegetation. The development of the vegetation, the soil, and the hydrology are all interrelated. Each is influenced by the others and influences the development of the others. The plant community on an ecological site is typified by an association of species that differs from that of other ecological sites in the kind and/or proportion of species, or in total production.

Hydrologic Balance. The balance between hydrological inputs (infiltration of incident precipitation, run-on) and hydrological outputs (run-off, deep drainage) for an ecological site.

Hydrologic Subbasins. See watershed.

Hydrologic Unit. A geographic area representing part or all of a surface drainage basin or distinct hydrologic feature.

REGAP. Re-mapping under the Gap Analysis Program. The purpose of the National Gap Analysis Program (GAP) is to provide broad geographic information on the status of ordinary species (those not threatened with extinction or naturally rare) and their habitats in order to provide land managers, planners, scientists, and policy makers with the information they need to make better-informed decisions. Existing natural vegetation is mapped from satellite imagery and other records using the National Vegetation Classification System to the level of dominant or co-dominant plant species.

Restoration. Holistic actions taken to modify an ecological system to achieve desired, healthy, and functioning conditions and processes. Generally refers to the process of enabling the system to resume its resiliency to disturbances.

Site Potential. A measure of resource availability based on interactions among soils, climate, hydrology, and vegetation.

Watershed. 1) A total area of land above a given point on a waterway that contributes runoff water to the flow at that point; 2) A major subdivision of a drainage basin.

GLOSSARY

WILD HORSES

Appropriate Management Level. The optimum number of wild horses that provides a thriving natural ecological balance on the public range.

Band. A group of wild horses running together or a lone wild horse.

Herd. One or more wild horse bands using the same general area.

Herd Area. Herd Areas are limited to areas of the public lands identified as being habitat used by wild horses and burros at the time of the passage of the Wild Horse and Burro Act, as amended (16 U.S.C. 1331-1340). Herd Area boundaries may only be changed when it is determined that: 1) areas once listed as Herd Areas are later found to be used only by privately owned horses or burros, or 2) the Herd Area Boundary does not correctly portray where wild horses and burros were found in 1971.

Herd Management Area. Areas within Herd Areas that are designated for management of wild horses as one of the multiple uses, where the long term maintenance and management of wild horses can occur due to adequate resources.

Herd Management Area Plan. A plan that prescribes measures for the protection, management, and control of wild horses and their habitat on one or more herd management areas, in conformance with decisions made in approved management framework or resource management plans.

Wild Horses. Unbranded and unclaimed horses that use Public land as all or part of their habitat, or that have been removed from such land by an Authorized Officer but have not lost their status under Section 3 of the "Wild Free-Roaming Horse and Burro Act."

WILDERNESS

Designated Wilderness. An area designated by Congress and defined in Section 2(c) of the Wilderness Act of 1964 as an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined as an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which 1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; 2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; 3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and 4) also may contain ecological, geological, or other features of scientific, educational, scenic, or historical values.

Wilderness Study Area. A roadless area of 5,000 acres or more or a roadless island that has been inventoried and found to possess wilderness characteristics as described in Section 2(c) of the Wilderness Act of 1964.

WILDLIFE

Connectivity. A network of habitat patches linked by areas or corridors of like habitat; it affects how organisms can move through the landscape.

Cover. Any form of environmental protection that helps an animal stay alive (mainly shelter from weather and concealment from predators); any vegetation material that overlies the soil surface and protects it against erosion.

Critical Habitat. Specific areas within the geographical area occupied by the species at the time of listing, if they contain physical or biological features essential to conservation, and those features may require special management considerations or protection; and specific areas outside the geographical area occupied by the species if the agency determines that the area itself is essential for conservation.

Crucial Habitat. Wildlife habitat vital to the existence of a particular wildlife species during a certain season of the year or period of its life.

Habitat Degradation. The pattern of changes in vegetation and other habitat components that result in loss of food supplies, water sources, cover quality, or space for a wildlife species.

Habitat Fragmentation. The division of large contiguous blocks of wildlife habitat into isolated smaller parcels separated by distances great enough to discourage wildlife movement between parcels.

Lek. An assembly area where birds, especially sage grouse, carry on display and courtship behavior.

Lek, Active. A lek that had two or more birds present during at least one of three or more visitations in a given breeding season. For a strutting ground to attain this status it must also have had two or more birds present during at least 2 years in a 5-year period (Connelly et al. 2003).

Occupied Isolated Habitat. Isolated segments of discontinuous wildlife habitat occupied by an individual wildlife species in circumstances where the habitat discontinuities prevent migration of excess population members into additional habitat segments.

Occupied Source Habitat. Wildlife habitat occupied by an individual wildlife species at population levels and under circumstances where members of the population may migrate into adjoining unoccupied habitats to expand the overall species population.

Priority Habitat. A priority habitat may be described by a unique vegetation type or by a dominant plant species that is of primary importance to priority fish and wildlife. A priority habitat may also be described by a successional stage (such as, old growth and mature forests). Alternatively, a priority habitat may consist of a specific habitat element (such as a spring, stream, or cave) of key value to priority fish and wildlife. A priority habitat may contain priority and non-priority fish and wildlife.

GLOSSARY

Priority Species. A species requiring protective measures and/or management guidelines to ensure their persistence at genetically viable population levels and recognized by the BLM as significant for at least one factor such as density, diversity, size, public interest, remnant character, or age.

Thermal Cover. Cover used by animals to protect them against weather.

Alternative A	2.1-1, 2.2-2, 2.5-1, 2.9-1, 4.1-13, 4.2-7, 4.3-7, 4.4-6, 4.5-11, 4.6-2, 4.6-17, 4.7-2, 4.7-49, 4.8-7, 4.9-7, 4.10-3, 4.11-5, 4.12-6, 4.13-4, 4.14-4, 4.15-5, 4.16-1, 4.16-8, 4.17-6, 4.18-10, 4.18-16, 4.19-7, 4.20-4, 4.21-5, 4.22-2, 4.22-22, 4.23-1, 4.23-11, 4.24-2, 4.24-4, 4.26-2, 4.27-2, 4.28-1, 4.35-1, 4.36-1
Alternative B	2.2-2, 2.6-1, 2.7-26, 2.9-2, 4.1-13, 4.2-9, 4.3-9, 4.4-9, 4.5-16, 4.6-2, 4.6-23, 4.7-2, 4.7-64, 4.8-10, 4.9-10, 4.10-4, 4.11-6, 4.12-8, 4.13-5, 4.14-5, 4.15-7, 4.16-1, 4.16-11, 4.17-9, 4.18-20, 4.19-9, 4.20-6, 4.21-8, 4.22-2, 4.22-23, 4.23-2, 4.23-13, 4.24-2, 4.24-7, 4.25-1, 4.26-3, 4.27-2, 4.28-1, 4.35-1
Alternative C	2.2-3, 2.7-1, 2.9-2, 4.1-13, 4.2-9, 4.3-10, 4.4-10, 4.5-19, 4.6-2, 4.6-26, 4.7-2, 4.7-70, 4.8-12, 4.9-11, 4.10-5, 4.11-7, 4.12-9, 4.13-5, 4.14-6, 4.15-8, 4.16-1, 4.16-12, 4.17-12, 4.18-22, 4.19-10, 4.20-7, 4.21-9, 4.22-2, 4.22-24, 4.23-2, 4.23-16, 4.24-2, 4.24-9, 4.25-1, 4.26-3, 4.27-3, 4.28-1, 4.35-1
Alternative D	1.8-7, 2.2-4, 2.8-1, 2.9-2, 4.1-4, 4.1-13, 4.2-10, 4.3-11, 4.4-11, 4.5-24, 4.6-2, 4.6-29, 4.7-2, 4.7-75, 4.8-13, 4.9-12, 4.10-5, 4.11-9, 4.12-10, 4.13-6, 4.14-7, 4.15-10, 4.16-1, 4.16-15, 4.17-15, 4.18-24, 4.19-12, 4.20-8, 4.21-9, 4.22-2, 4.22-25, 4.23-2, 4.23-19, 4.24-2, 4.24-11, 4.25-1, 4.26-3, 4.27-3, 4.28-1, 4.30-2, 4.34-1, 4.35-1, 4.36-1
American Indians	2.4-34, 2.4-75, 2.7-14, 2.9-32, 3.9-7, 3.9-9, 3.17-2, 3.24-4, 3.26-1, 4.17-1, 4.21-10, 4.23-3, 4.25-1, 4.26-1

INDEX

Aquatic species.....	2.4-14, 2.8-2, 3.6-1, 3.7-11, 4.1-16, 4.3-4, 4.6-1, 4.7-1, 4.28-39,
Archaeological sites.....	1.6-4, 2.4-31, 3.9-6, 3.22-3, 4.9-3, 4.18-19
Areas of critical environmental concern.....	1.5-3, 1.6-4, 2.1-1, 2.2-1, 2.4-20, 2.5-20, 2.6-5, 2.7-20, 2.8-11, 2.9-15, 3.7-3, 3.18-16, 3.22-1, 4.1-17, 4.5-9, 4.6-1, 4.7-2, 4.9-1, 4.11-4, 4.12-5, 4.13-2, 4.14-3, 4.15-3, 4.16-1, 4.17-5, 4.18-2, 4.19-7, 4.20-4, 4.21-7, 4.22-1, 4.23-10, 4.28-16, 4.30-2, 5.1-4
Assumptions for analysis.....	4.1-1
Back country byways.....	2.4-97, 2.5-36, 2.6-24, 2.7-33, 2.8-26, 2.9-37, 3.22-1, 4.1-34, 4.7-46, 4.9-7, 4.15-5, 4.22-15, 4.28-72,
Bighorn sheep.....	1.8-3, 2.4-14, 2.5-8, 2.6-4, 2.7-10, 2.8-9, 2.9-10, 3.6-6, 3.23-10, 4.1-8, 4.3-9, 4.4-9, 4.5-19, 4.6-1, 4.7-30, 4.8-11, 4.9-10, 4.12-4, 4.16-1, 4.18-15, 4.19-10, 4.21-4, 4.23-14, 4.24-8, 4.28-60
Biological assessment.....	1.7-1, 3.7-1, 4.28-34
BLM planning process.....	1.1-1, 1.4-1
Comparison of impacts.....	2.2-4, 2.8-1, 4.1-12
Cooperating Agencies.....	1.5-2, 1.6-1, 1.7-1, 1.8-1, 3.24-7, 5.1-1, 6.2-2
Consultation (U.S. Fish and Wildlife Service).....	1.5-3, 1.7-1, 2.4-21, 2.5-26, 2.6-19, 2.9-14, 3.7-3, 3.9-7, 4.7-37, 4.17-2, 4.28-34, 5.1-5, 5.5-2
Corridors.....	1.3-3, 1.8-8, 2.4-26, 2.5-9, 2.6-12, 2.7-19, 2.8-18, 2.9-17, 3.7-10, 3.12-4, 3.19-7, 3.22-2, 4.1-8, 4.2-2, 4.3-4, 4.4-3, 4.5-7, 4.6-1, 4.7-2, 4.9-4, 4.10-2, 4.11-2, 4.12-3, 4.13-4, 4.15-11, 4.18-13, 4.19-5, 4.20-1, 4.21-3, 4.24-9, 4.28-2
Critical elements of the human environment.....	4.1-1
Cultural resources.....	1.3-5, 1.5-3, 1.6-2, 1.7-3, 2.4-30, 2.5-14, 2.6-7, 2.7-14, 2.8-13, 2.9-20, 3.9-1, 3.20-9, 3.22-3, 3.24-6, 4.1-3, 4.7-10, 4.9-1, 4.12-1, 4.13-1, 4.15-1, 4.18-2, 4.19-3, 4.20-1, 4.28-2, 4.30-2, 4.32-2, 4.35-1, 5.2-1
Cumulative impacts.....	4.1-1, 4.2-4, 4.28-1
Decision area.....	1.2-1, 1.3-2, 1.6-3, 1.8-5, 2.2-3, 2.4-1, 2.5-1, 2.8-20, 3.3-9, 4.1-3, 4.4-3, 4.5-7, 4.6-2, 4.7-3, 4.9-3, 4.10-2, 4.11-1, 4.12-5, 4.13-2, 4.14-2, 4.15-2, 4.16-7, 4.17-5, 4.18-3, 4.19-6, 4.20-3, 4.21-6, 4.22-21, 4.26-1, 4.28-17, 4.30-1, 4.31-1, 4.32-1, 4.35-1, 4.36-1
Economic conditions.....	3.16-6, 3.23-1, 3.24-5, 4.1-35, 4.23-1, 4.24-5, 4.25-1, 4.28-74, 4.32-4
Elk.....	1.8-3, 2.4-14, 2.5-8, 2.6-4, 2.7-10, 2.8-9, 2.9-10, 3.6-5, 3.15-3, 3.23-10, 4.6-1, 4.16-2, 4.23-14
Environmental justice.....	3.23-1, 3.26-1, 4.1-3, 4.23-4, 4.26-1, 4.28-81, 4.32-4
Fire regimes.....	3.5-4, 3.6-11, 3.20-1, 3.21-3, 4.1-14, 4.4-9, 4.5-10, 4.6-15, 4.7-40, 4.8-7, 4.16-7, 4.17-5, 4.19-6, 4.20-1

Fish	1.3-1, 1.6-3, 1.7-3, 1.8-9, 2.2-1, 2.4-13, 2.5-8, 2.6-4, 2.7-9, 2.8-8, 2.9-9, 3.3-8, 3.6-1, 3.7-4, 3.10-1, 3.22-5, 4.1-16, 4.3-4, 4.5-1, 4.6-1, 4.7-4, 4.8-11, 4.12-1, 4.13-1, 4.15-1, 4.18-11, 4.19-2, 4.22-16, 4.23-3, 4.28-8, 4.28-34, 4.29-2, 4.30-1, 4.32-2
Forest/woodland and other plant products	2.4-74, 2.5-23, 2.6-16, 2.7-2, 2.8-20, 2.9-32, 3.17-1, 3.23-11, 3.24-8, 4.1-28, 4.3-2, 4.4-1, 4.5-9, 4.6-3, 4.7-4, 4.9-7, 4.11-1, 4.16-2, 4.17-1, 4.19-11, 4.20-1, 4.21-1, 4.23-3, 4.24-8, 4.28-32, 4.30-2, 4.31-1, 4.32-3
Geology	2.4-77, 2.5-25, 2.6-18, 2.7-25, 2.8-22, 2.9-33, 3.4-1, 3.12-8, 3.18-1, 4.1-29, 4.2-4, 4.3-2, 4.4-1, 4.5-2, 4.6-3, 4.7-4, 4.8-1, 4.9-2, 4.10-1, 4.11-1, 4.12-1, 4.13-1, 4.14-1, 4.15-1, 4.16-2, 4.18-1, 4.19-2, 4.20-1, 4.21-1, 4.23-3, 4.28-32, 4.30-2, 4.32-3
Greater Sage-grouse	1.3-2, 1.8-3, 2.4-25, 2.5-12, 2.6-6, 2.7-13, 2.8-12, 2.9-17, 3.6-9, 3.7-14, 4.5-7, 4.6-3, 4.7-1, 4.12-4, 4.15-3, 4.16-6, 4.18-12, 4.22-17, 4.28-4, 4.29-2
Groundwater	1.6-2, 2.4-4, 2.9-2, 3.3-1, 3.5-7, 3.18-9, 4.1-11, 4.3-1, 4.4-5, 4.6-23, 4.28-18
Hazardous materials	1.8-3, 2.4-24, 3.12-10, 3.27-1, 4.3-6, 4.28-82
Herd management area	1.6-3, 2.4-27, 2.5-12, 2.6-7, 2.7-10, 2.8-9, 2.9-19, 3.8-3, 3.16-3, 4.1-14, 4.3-5, 4.4-7, 4.5-7, 4.6-8, 4.7-2, 4.8-1, 4.12-2, 4.15-3, 4.16-6, 4.19-5, 4.21-3, 4.28-36
Historic areas	1.6-4, 3.22-1, 3.22-3
Indian Trust Resources	3.25-1
Incomplete and unavailable information	4.1-1, 4.1-5
Invasive species	1.8-9, 2.2-4, 2.4-6, 2.5-2, 2.6-2, 2.7-2, 2.8-2, 2.9-4, 3.6-12, 3.19-5, 3.20-2, 3.21-1, 4.1-34, 4.4-12, 4.5-1, 4.6-7, 4.7-12, 4.8-7, 4.17-16, 4.19-4, 4.21-4, 4.28-32
Land acquisitions	3.12-10, 4.6-20, 4.23-8

APPENDIX A
PHASES OF THE WATERSHED ANALYSIS PROCESS AND THE
GRAZING ALLOTMENT EVALUATION PROCESS

**APPENDIX A
PHASES OF THE WATERSHED ANALYSIS PROCESSES AND
THE GRAZING ALLOTMENT EVALUATION PROCESS**

The watershed analysis process described in the BLM Handbook, *H-4180-1 Rangeland Health Standards* is being used to analyze 61 watersheds and associated grazing allotments in the planning area. This watershed approach allows the BLM to focus on the flexible management techniques necessary to accommodate the functionality of the watershed. It allows for a shift from species and individual use-driven management to the natural systems that support watersheds in properly functioning conditions (see the Glossary).

Assessment Phase

The assessment of the watershed is the first step in the analysis process. It involves the collection of indicator data pertinent to the Resource Advisory Council Standards and Guidelines for Rangeland Health (Appendix B). An interdisciplinary team coordinates the collection of indicator data such as ground cover, ecological site inventory data, fire regime condition classes (see Appendix C), riparian proper function and condition ratings, vegetation structure and composition, or other indicator data such as road density, current cultural resource inventory data, and noxious and invasive weed data. The data is collected at an appropriate intensity and scale. In this phase of the analysis, the status of resource conditions is assessed and summarized. Information pertinent to livestock grazing management such as utilization, and trend and use pattern mapping, also is gathered and summarized. These data and information are then compiled and organized for the development of an overview of the physical and biological conditions of the watershed.

Evaluation Phase

To evaluate a watershed, assessment data is compared against the Resource Advisory Council Standards for rangeland health using methods outlined in *H-4180-1 Rangeland Health Standards*. The evaluation phase is done in accordance with Title 43 Code of Federal Regulation, subpart 4180; BLM Handbook *H-4180-1 Rangeland Health Standards*; and Resource Advisory Council Standards and Guidelines.

The purpose of the standards and guidelines at Title 43 Code of Federal Regulations § 4180 is to provide measures (standards) to determine land health, and methods (guidelines) to improve the health of the public rangelands. The standards are intended to help the BLM, public land users, and others focus on a common understanding of acceptable resource conditions. The guidelines provide a basis for working together to achieve that vision. The standards are used to communicate current and desired resource conditions among the various groups.

Four fundamentals of rangeland health are listed in Title 43 Code of Federal Regulation § 4180.1. They combine the basic precepts of physical function and biological health with elements of law relating to water quality and plant and animal populations and communities. The fundamentals provide the basis for the development and implementation of the standards for land health. The standards were developed by regional Resource Advisory Councils.

APPENDIX A

Standards are statements of physical and biological condition or degree of function required for healthy sustainable rangelands. Achieving or making "significant" progress towards these functions and conditions is required of all uses of public rangelands as stated in Title 43 Code of Federal Regulation 4180.1. Guidelines are practices, methods, or techniques. They are also tools such as grazing systems, and vegetation treatments that help achieve standards. Guidelines are used to describe or communicate techniques for managing activities to achieve desired healthy watershed conditions.

Standards often make reference to site potential. This potential can be described in ecological site descriptions at a site-specific level or when applied generally at a landscape scale. LANDFIRE biophysical setting models (Appendix C) also describe reference conditions at the landscape scale. These descriptions and models may be applied as reference conditions for the evaluation process. The evaluation is done at the landscape scale and not the site-specific scale.

During the evaluation process, interdisciplinary team members, cooperating agency, landowners and public land user groups meet during the evaluation process in both a formal setting and in the field to evaluate the assessment data against these reference conditions. When one or more standard(s) is not achieved or making substantial progress toward achievement, or when there is a lack of conformance with guidelines, causal factors would be identified by resource. The interdisciplinary team then makes recommendations of actions necessary to meet the standard. These recommendations form the foundation of the implementation strategy.

If the standards are met, then monitoring would continue to occur as necessary to ensure that standards would continue to be met. If current livestock management or levels of livestock use are determined to be significant factors in failing to achieve the standards and conform with the guidelines, then appropriate action as soon as practicable but not later than the start of the next grazing year is to occur through current BLM regulation. The evaluation process is documented in a report.

Determination Phase

Once the evaluation is complete, and if standards are not being met, the determination that existing activity management is a significant causal factor for not achieving standards must be documented. Because the standards are developed to ensure the conditions described in 43 Code of Federal Regulation § 4180.1 exist, achievement of standards would mean that the four fundamentals of rangeland health are "in or making significant progress toward" being met.

The determination includes at a minimum:

1. Statement of achievement or non-achievement for each standard;
2. List of causal factors for not achieving standards;
3. Statement of conformance or non-conformance with guidelines; and
4. Date determination is made and signature of the authorized officer.

Documentation of causal factors should clearly identify the evidence used to reach conclusions regarding whether a standard is or is not being met, and which activities are causal factors for not achieving the standard.

The grazing-related questions that must be answered "Yes" or "No" as part of the determination process are listed below:

1. Is it more likely than not that existing grazing management practices or levels of grazing use are significant factors in failing to either achieve the standards or conform to the guidelines?
2. Is it more likely than not that existing grazing management should be modified to ensure that the fundamentals of rangeland health are met, or are making significant progress toward being met?

The authorized officer is responsible for making the determination based on the evaluation provided by the interdisciplinary team, and information gathered from other sources. The determination document is completed as soon as the evaluation is complete and any additional information is reviewed, normally no more than four months from completion of the evaluation. Following the determination, grazing permits will be fully processed using information from the land health standards evaluation to complete the environmental analysis.

Implementation Phase

In this final phase, the watershed interdisciplinary team would develop an implementation strategy, which would address all of the standards not achieved, or condition where fundamentals of land health are not met or are not making substantial progress toward being met. The strategy would promote an interdisciplinary process to address all programs, and would use applicable BLM technical manuals, handbooks, etc. The interdisciplinary team would use the recommendations for modifications to existing land uses and decisions.

Objectives for each recommendation would be clearly stated. Recommendations would have an overall goal in mind, such as protecting (e.g. threatened and endangered species habitat), maintaining, or restoring ecological system processes that are not meeting standards or conforming to guidelines. Management actions would be consistent with state and transition models at a project level and with LANDFIRE biophysical setting models at the watershed level as well as other guidelines for meeting objective from the published Resource Advisory Councils standards. Site specific NEPA analysis would be completed on any proposed actions designed to achieve goals, except those specifically covered in the RMP/EIS. These actions would be monitored over the long-term to determine success.

Monitoring Plan

Each watershed implementation strategy would have a monitoring plan developed. Monitoring is integral for implementation of adaptive management, and the relative importance of monitoring increases with uncertainty about the outcomes of management actions (Hellowell 1991).

APPENDIX A

Treatment level effectiveness monitoring would verify that the restoration treatments achieved the goals identified. Such monitoring can answer key questions about the effect of a particular type or suite of treatment types in a particular ecological site and reduce uncertainty about management outcomes, effectively guiding future management.

Watershed-level Monitoring

The goal of the watershed monitoring program will be to determine the condition of the Ely Field Office's 61 watershed management units and to compare their condition to a reference condition both before and after implementation of restoration plans. This level of monitoring will not determine the effectiveness of particular restoration techniques or offer direct information about causes of change in ecological condition. Rather, it will evaluate the data against rangeland health standards.

Baseline watershed-level monitoring will initially take place through the watershed analysis process. Data will be collected using BLM-approved quantitative methods, in a statistically valid fashion (Scheiner and Gurevich 2001), using random sampling stratified by Natural Resource Conservation Service ecological site, and/or other resource uses. Power analyses will be performed using methods described in Elzinga et al. (1998). Data will be either collected electronically or entered into a database, and will be housed in a central location, and overseen by a data manager. Data will be analyzed using a variety of valid procedures and metadata and reports will be available through the Ely Field Office. At the time of baseline assessment, data will be compared to a reference condition (such as in Natural Resource Conservation Service Ecological Site Descriptions as interpreted for state and transition models) on a landscape basis in LANDFIRE, biophysical setting models, and post-implementation monitoring data will be compared both with the reference condition and with the baseline condition.

Treatment-level Effectiveness Monitoring

Some level of monitoring will be carried out for every restoration project; however, the method and level of monitoring will vary with the objectives and type of project. This project-level monitoring will address the attributes listed above, and methods will follow BLM-approved manuals but could employ future methods that address the selected indicators and offer statistical vigor. Data may be collected using statistically valid research designs when possible, and power analysis.

APPENDIX B
RESOURCE ADVISORY COUNCIL STANDARDS AND GUIDELINES

**NORTHEASTERN GREAT BASIN RESOURCE ADVISORY COUNCIL
STANDARDS AND GUIDELINES**

The Nevada Northeastern Great Basin Resource Advisory Council, as chartered by the Department of the Interior to promote healthy rangelands, has developed standards and guidelines for grazing administration on about 16.2 million acres of public lands administered by the Bureau of Land Management (BLM) within the designated geographic area of the Northeastern Great Basin. The Resource Advisory Council in developing these standards and guidelines, understands and agrees that grazing is only one of the multiple uses recognized under the Federal Land Policy and Management Act of 1976 (43 U.S.C. 1739, 1740). These recommended standards and guidelines reflect the stated goals of improving rangeland health while providing for the viability of the livestock industry in the Northeastern Great Basin.

1. Upland Sites

- Upland soils exhibit infiltration and permeability rates that are appropriate to soil type, climate and landform.

As indicated by:

- Indicators are canopy and ground cover, including litter, live vegetation and rock, appropriate to the potential of the site.

Guidelines

- 1.1 Livestock grazing management and wild horse and burro population levels are appropriate when in combination with other multiple uses they maintain or promote upland vegetation and other organisms and provide for infiltration and permeability rates, soil moisture storage, and soil stability appropriate to the ecological site within management units.
- 1.2 When livestock grazing management and wild horse and burro herd management alone are not likely to restore areas of low infiltration or permeability, land management treatments should be designed and implemented where appropriate.
- 1.3 Livestock grazing management and wild horse and burro herd management are adequate when significant progress is being made toward this standard.

2. Riparian and Wetland Sites

- Riparian and wetland areas exhibit a properly functioning condition and achieve state water quality criteria.

APPENDIX B

As indicated by:

- Streamside riparian areas are functioning properly when adequate vegetation, large woody debris, or rock is present to dissipate stream energy associated with high water flows. Elements indicating proper functioning condition such as avoiding accelerating erosion, capturing sediment, and providing for groundwater recharge and release are determined by the following measurements as appropriate to the site characteristics.
- Width/Depth ration, Channel roughness, Sinuosity of stream channel, Bank stability, Vegetative cover (amount, spacing, life form), and Other cover (large woody debris, rock).
- Natural springs, seeps, and marsh areas are functioning properly when adequate vegetation is present to facilitate water retention, filtering, and release as indicated by plant species and cover appropriate to the site characteristics.
- Chemical, physical and biological water constituents are not exceeding the state water quality standards.

Guidelines

- 2.1 Livestock grazing management and wild horse and burro population levels will maintain or promote sufficient vegetation cover, large woody debris, or rock to achieve proper functioning condition in riparian and wetland areas. Supporting the processes of energy dissipation, sediment capture, groundwater recharge, and stream bank stability will thus promote stream channel morphology (e.g., width/depth ration, channel roughness, and sinuosity) appropriate to climate, landform, gradient, and erosion history.
- 2.2 Where livestock grazing management and wild horse and burro herd management are not likely to restore riparian and wetland sites, land management treatments should be designed and implemented where appropriate to the site.
- 2.3 Livestock grazing management and wild horse and burro herd management will maintain, restore or enhance water quality and ensure the attainment of water quality that meets or exceeds state standards.
- 2.4 Livestock grazing management and wild horse and burro herd management are adequate when significant progress is being made toward this standard.

3. Habitat

- Habitats exhibit a healthy, productive, and diverse population of native and/or desirable plant species, appropriate to the site characteristics, to provide suitable feed, water, cover and living space for animal species and maintain ecological processes. Habitat conditions meet the life cycle requirements of threatened and endangered species.

As indicated by:

- Vegetation composition (relative abundance of species);
- Vegetation structure (life forms, cover, heights, or age classes);
- Vegetation distribution (patchiness, corridors); and
- Vegetation productivity, and Vegetation nutritional value.

Guidelines

- 3.1 Livestock grazing management and wild horse and burro population levels will promote the conservation, restoration and maintenance of habitat for threatened and endangered species, and other special status species as may be appropriate.
- 3.2 Livestock grazing intensity, frequency, season of use and distribution and wild horse and burro population levels should provide for growth and reproduction of those plant species needed to reach long-term land use plan objectives. Measurements of ecological condition and trend/utilization will be in accordance with techniques identified in the Nevada Rangeland Monitoring Handbook.
- 3.3 Livestock grazing management and wild horse and burro management should be planned and implemented to allow for integrated use by domestic livestock, wildlife, and wild horses and burros consistent with land use plan objectives.
- 3.4 Where livestock grazing management and wild horse and burro herd management alone are not likely to achieve habitat objectives, land treatments may be designed and implemented as appropriate.
- 3.5 When native plant species adapted to the site are available in sufficient quantities, and it is economically and biologically feasible to establish or increase them to meet management objectives, they will be emphasized over non-native species.
- 3.6 Livestock grazing management and wild horse and burro herd management are adequate when significant progress is being made toward this Standard.

4. Cultural Resources

- Land use plans will recognize cultural resources within the context of multiple uses.

Guidelines

- 4.1 Rangeland management plans will consider listings of known sites that are National Historic Register eligible or considered to be of cultural significance and new eligible sites, as they become known.
-

APPENDIX B

- 4.2 Wild horses and burro herd management will be designed to avoid or mitigate damage to significant cultural resources.

5. Healthy Wild Horse and Burro Populations

- Wild horses and burros exhibit characteristics of a healthy, productive, and diverse population. Age structure and sex ratios are appropriate to maintain the long-term viability of the population as a distinct group. Herd management areas are able to provide suitable feed, water, cover and living space for wild horses and burros and maintain historic patterns of habitat use.

As indicated by:

- Healthy rangelands that provide sufficient quantities and quality of forage and water to sustain the appropriate management level on a year long basis within a herd management area.
- Wild horses and/or burros managed on a yearlong basis for a condition class greater than or equal to five to allow them normal chances for survival in the winter (see glossary for equine body conditioning definitions).
- Highly adoptable wild horses and burros that are readily available from herd management areas.
- Wild horse and burro herds that exhibit appropriate age structure and sex ratio for short-term and long-term genetic and reproductive health.

Guidelines

- 5.1 Implement the objectives outlined in the Wild Free-Roaming Horse and Burros Tactical Plan for Nevada (May 1999).
- 5.2 Manage for wild horses and/or burros in herd management areas based on the capability of the HMA to provide suitable feed, water, cover and living space for all multiple use.
- 5.3 Set appropriate Management Levels based on the most limiting habitat factor (e.g., available water, suitable forage, living space and cover) in the context of multiple uses.
- 5.4 Manage herd management area populations to preserve and enhance physical and biological characteristics that are of historical significance to the herd.
- 5.5 Manage wild horse and burro herds for short-term and long-term increases and to enhance adoptability by ensuring that wild horses and burros displaying desirable traits are preserved in the herd thus providing a reproductive base to increase highly adoptable horses and burros for future demands.

- 5.6 Identify and preserve historic traits and characteristics within the herd which have proven to be highly desirable by the adoption public to increase the long-term availability of animals bearing these features.

- 5.7 Wild horse and burro selective removal criteria are modified on a per herd basis to correct deficiencies in population age and sex ratios, which threaten short-term and long-term genetic diversity and reproductive health.

**MOJAVE/SOUTHERN GREAT BASIN RESOURCE ADVISORY COUNCIL
STANDARDS AND GUIDELINES**

The standards and guidelines for grazing administration on BLM lands in southern Nevada apply to livestock grazing. The Mojave/Southern Great Basin Resource Advisory Council intends that the standards and guidelines will result in a balance of sustainable development and multiple use along with progress, over time, toward attaining desired rangeland conditions. Standards are expressions of physical and biological conditions required for sustaining rangelands for multiple uses. Guidelines point to management actions related to livestock grazing for achieving the standards. Guidelines are options that move rangeland conditions toward the multiple use standards. Guidelines are based on science, best rangeland management practices, and public input. Guidelines indicate the types of grazing methods and practices for achieving the standards for multiple use, are developed for functional watersheds and implemented at the allotment level.

The Mojave-Southern Great Basin Resource Advisory Council recognizes that it will sometimes be a long-term process to restore rangelands to proper functioning condition. In some areas, it may take many years to achieve healthy rangelands.

The Resource Advisory Council may be requested by any party to assist reaching agreement in resolving disputes.

1. Soils

- Watershed soils and stream banks should have adequate stability to resist accelerated erosion, maintain soil productivity, and sustain the hydrologic cycle.

Soil indicators:

- Ground cover (vegetation, litter, rock, bare ground);
- Surfaces (e.g., biological crusts, pavement); and
- Compaction/infiltration.

Riparian soil indicators:

- Stream bank stability.

All of the above indicators are appropriate to the potential of the ecological site.

Guidelines

- 1.1 Upland management practices should maintain or promote adequate vegetative ground cover to achieve the Standards.

- 1.2 Riparian-wetland management practices should maintain or promote sufficient residual vegetation to maintain, improve, or restore functions such as stream flow energy dissipation, sediment capture, groundwater recharge, and streambank stability.
- 1.3 When proper grazing practices alone are not likely to restore areas, land management practices may be designed and implemented where appropriate.
- 1.4 Rangeland management practices should address improvement beyond this Standard, significant progress toward achieving Standards, time necessary for recovery, and time necessary for predicting trends.

2. Ecosystem Components

- Watersheds should possess necessary ecological components to achieve state water criteria, maintain ecosystems and sustain uses.
- Riparian and watershed vegetation should have structural and species diversity characteristic of the stage of stream channel succession in order to provide forage and cover, capture sediment, and capture, retain, and safely release water (watershed function).

Upland indicators:

- Canopy and ground cover, including litter, live vegetation, biological crust, and rock appropriate to the potential of the ecological site.
- Ecological processes are adequate for the vegetative communities.

Riparian indicators:

- Streamside riparian areas are functioning properly when adequate vegetation, large woody debris, or rock is present to dissipate stream energy associated with high water flows.
- Elements indicating proper functioning condition such as avoiding accelerating erosion, capturing sediment, and providing for groundwater recharge and release are determined by the following measurements as appropriate to the site characteristics:
 - Width/Depth ratio;
 - Channel roughness;
 - Sinuosity of stream channel;
 - Bank stability;
 - Vegetative cover (amount, spacing, life form); and
 - Other cover (large woody debris, rock).

APPENDIX B

- Natural springs, seeps, and marsh areas are functioning properly when adequate vegetation is present to facilitate water retention, filtering, and release as indicated by plant species and cover appropriate to the site characteristics.

Water quality indicators:

- Chemical, physical and biological constituents do not exceed the state water quality standards.

The above indicators shall be applied to the potential of the ecological site.

Guidelines

- 2.1 Management practices should maintain or promote appropriate stream channel morphology and structure consistent with the watershed.
- 2.2 Watershed management practices should maintain, restore or enhance water quality and flow rate to support desired ecological conditions.
- 2.3 Management practices should maintain or promote the physical and biological conditions necessary for achieving surface characteristics and desired natural plant community.
- 2.4 Grazing management practices will consider both the economic and physical environment, and will address all multiple uses including, but not limited to, (i) recreation, (ii) minerals, (iii) cultural resources and values, and (iv) designated wilderness and wilderness study areas.
- 2.5 New livestock facilities will be located away from riparian and wetland areas if they conflict with achieving or maintaining riparian and wetland functions. Existing facilities will be used in a way that does not conflict with achieving or maintaining riparian and wetland functions, or they will be relocated or modified when necessary to mitigate adverse impacts on riparian and wetland functions. The location, relocation, design and use of livestock facilities will consider economic feasibility and benefits to be gained for management of lands outside the riparian area along with the effects on riparian functions.
- 2.6 Subject to all valid existing rights, the design of spring and seep developments shall include provisions to protect ecological functions and processes.
- 2.7 When proper grazing practices alone are not likely to restore areas of low infiltration or permeability, land management practices may be designed and implemented where appropriate. Grazing on designated ephemeral rangeland watersheds should be allowed only if (i) reliable estimates of production have been made, (ii) an identified level of annual growth or residue to remain on site at the end of the grazing season has been established, and (iii) adverse effects on perennial species and ecosystem processes are avoided.

2.8 Rangeland management practices should address improvement beyond these Standards, significant progress toward achieving Standards, time necessary for recovery, and time necessary for predicting trends.

3. Habitat and Biota

- Habitats and watersheds should sustain a level of biodiversity appropriate for the area and conducive to appropriate uses. Habitats of special status species should be able to sustain viable populations of those species.

Habitat indicators:

- Vegetation composition (relative abundance of species);
- Vegetation structure (life forms, cover, height, and age classes);
- Vegetation distribution (patchiness, corridors);
- Vegetation productivity; and
- Vegetation nutritional value.

Wildlife indicators:

- Escape terrain;
- Relative abundance;
- Composition;
- Distribution;
- Nutritional value; and
- Edge-patch snags.

The above Indicators shall be applied to the potential of the ecological site.

Guidelines

- 3.1 Mosaics of plant and animal communities that foster diverse and productive ecosystems should be maintained or achieved.
- 3.2 Management practices should emphasize native species except when others would serve better for attaining desired communities.
- 3.3 Intensity, frequency, season of use and distribution of grazing use should provide for growth, reproduction, and, when environmental conditions permit, seedling establishment of those plant species needed to reach long-term land use plan objectives. Measurements of ecological condition, trend, and utilization will be in accordance with techniques identified in the Nevada Rangeland Handbook.

APPENDIX B

- 3.4 Grazing management practices should be planned and implemented to provide for integrated use by domestic livestock and wildlife, as well as wild horses and burros inside Herd Management Areas.
- 3.5 Management practices will promote the conservation, restoration, and maintenance of habitat for special status species.
- 3.6 Livestock grazing practices will be designed to protect fragile ecosystems of limited distribution and size that support unique sensitive/endemic species or communities. Where these practices are not successful, grazing will be excluded from these areas.
- 3.7 Where grazing practices alone are not likely to achieve habitat objectives, land management practices may be designed and implemented as appropriate.
- 3.8 Vegetation manipulation treatments may be implemented to improve native plant communities, consistent with appropriate land use plans, in areas where identified Standards cannot be achieved through proper grazing management practices alone. Fire is the preferred vegetation manipulation practice on areas historically adapted to fire; treatment of native vegetation with herbicides or through mechanical means will be used only when other management techniques are not effective.
- 3.9 Rangeland management practices should address improvement beyond these Standards, significant progress toward achieving Standards, time necessary for recovery, and time necessary for predicting trends.

**MOJAVE/SOUTHERN GREAT BASIN RESOURCE ADVISORY COUNCIL
STANDARDS AND GUIDELINES FOR WILD HORSES AND BURRO**

Nevada is an arid state. The standards for rangeland health and guidelines for wild horse and burro management on BLM lands in southern Nevada apply to Herd Management Areas. The Mojave/Southern Great Basin Resource Advisory Council intends that the standards and guidelines will result in a balance of sustainable development and multiple use.

The standards for rangeland health will be reached and maintained by managing wild horse and burro numbers so as not to exceed appropriate management levels for each Herd Management Area. Controlling wild horse and burro numbers through gathers and other control programs is essential.

Standards are expressions of physical and biological conditions required for sustaining rangelands for multiple uses. Guidelines point to management actions related to Horse Management Areas for achieving the standards. Guidelines are options that move rangeland conditions toward the multiple use standards. Guidelines are based on science, best rangeland management practices, and public input. Guidelines indicate the types of management methods and practices for achieving the standards for multiple use and are developed for functional watersheds and implemented within Horse Management Areas.

The Mojave/Southern Great Basin Resource Advisory Council recognizes that it may be a long-term process to achieve proper functioning condition(s) on degraded rangelands. Healthy rangelands contribute to healthy herds.

The Resource Advisory Council may be requested by any party to assist in addressing issues related to these standards and guidelines.

1. Soils

- Watershed soils and stream banks should have adequate stability to resist accelerated erosion, maintain soil productivity, and sustain the hydrologic cycle.

Soil indicators:

- Ground cover (vegetation, litter, rock, bare ground);
- Surfaces (e.g., biological crusts, pavement); and
- Compaction/infiltration.

Riparian soil indicators:

- Stream bank stability.

All of the above indicators are appropriate to the potential of the ecological site.

APPENDIX B

Guidelines

- 1.1 Upland management practices should maintain or promote adequate vegetative ground cover to achieve the standards.
- 1.2 Riparian-wetland management practices should maintain or promote sufficient residual vegetation to maintain, improve, or restore functions such as stream flow energy dissipation, sediment capture, groundwater recharge, and streambank stability.
- 1.3 When wild horse and burro herd management practices alone are not likely to restore areas, land management practices may be designed and implemented where appropriate.
- 1.4 Wild horse and burro herd management practices should address improvement beyond this standard, significant process toward achieving standards, time necessary for recovery, and time necessary for predicting trends.

2. Ecosystem Components

- Watersheds should possess the necessary ecological components to achieve State water quality criteria, maintain ecological processes, and sustain appropriate uses.
- Riparian and wetland vegetation should have structural and species diversity characteristic of the stage of stream channel succession in order to provide forage and cover, capture sediment, and capture, retain, and safely release water (watershed function).

Upland indicators:

- Canopy and ground cover, including litter, live vegetation, biological crust, and rock appropriate to the potential of the ecological site.
- Ecological processes are adequate for the vegetative communities.

Riparian indicators:

- Stream side riparian areas are functioning properly when adequate vegetation, large woody debris, or rock is present to dissipate stream energy associated with high water flows.
- Elements indicating proper functioning condition such as avoiding accelerating erosion, capturing sediment, and providing for groundwater recharge and release are determined by the following measurements as appropriate to the site characteristics:
 - Width/depth ratio;
 - Channel roughness;
 - Sinuosity of stream channel;
 - Bank stability;

- Vegetative cover (among, spacing, life form); and
 - Other cover (large woody debris, rock).
- Natural springs, seeps, and marsh areas are functioning properly when adequate vegetation is present to facilitate water retention, filtering, and release as indicated by plant species and cover appropriate to the site characteristics.

Water quality indicators:

- Chemical, physical, and biological constituents do not exceed the State water quality Standards.

Guidelines

- 2.1 Management practices should maintain or promote appropriate stream channel morphology and structure consistent with the watershed.
- 2.2 Watershed management practices should maintain, restore, or enhance water quality and flow rate to support desired ecological conditions.
- 2.3 Management practices should maintain or promote the physical and biological conditions necessary for achieving surface characteristics and desired natural plant community.
- 2.4 Wild horse and burro herd management practices will consider both economic and physical environment and will address all multiple uses including, but not limited to, (i) recreation, (ii) minerals, (iii) cultural resources, (iv) wildlife, (v) domestic livestock, (vi) community economics, (vii) Areas of Critical Environmental Concern, and (viii) designated wilderness (iv) and wilderness study areas (WSAs).
- 2.5 New facilities should be located away from riparian and wetland areas if existing facilities conflict with achieving or maintaining riparian and wetland functions. Existing facilities will be used in a way that does not conflict with achieving or maintaining riparian and wetland functions or they will be relocated or modified when necessary to mitigate adverse impacts on riparian and wetland functions.
- 2.6 Subject to all valid existing rights, the design of spring and seep developments shall include provisions to maintain or promote ecological functions and processes.
- 2.7 When proper wild horse and burro herd management is not likely to restore areas of low infiltration or permeability, land management practices may be designed and implemented where appropriate. When setting herd management levels on ephemeral rangeland watersheds, reliable estimates of production for drought conditions should be used to avoid adverse effects on perennial species and ecosystem processes and retain a desired minimum level of annual growth or residue remaining.

APPENDIX B

- 2.8 Wild horse and burro herd management practices should address improvement beyond this standard, significant process toward achieving standards, time necessary for recovery, and time necessary for predicting trends.

3. Habitat and Biota

- Habitats and watersheds should sustain a level of biodiversity appropriate for the area and conducive to appropriate uses. Habitats of special status species should be able to sustain viable populations of those species.

Habitat indicators:

- Vegetation composition (relative abundance of species);
- Vegetation structure (life forms, cover, height, and age classes);
- Vegetation distribution (patchiness, corridors);
- Vegetation productivity; and
- Vegetation nutritional value.

Wildlife indicators:

- Escape terrain;
- Relative abundance;
- Composition;
- Distribution;
- Nutritional value; and
- Edge-patch snags.

The above indicators shall be applied to the potential of the ecological site.

Guidelines:

- 3.1 Mosaics of plant and animal communities that foster diverse and productive ecosystems should be maintained or achieved.
- 3.2 Management practices should emphasize native species except when others would serve better for attaining desired communities.
- 3.3 Wild horse and burro herd management should provide for growth, reproduction, and seedling establishment of those plant species needed to reach long-term land use plan objectives. Measurements of ecological conditions, trend, and utilization will be in accordance with techniques identified in the Nevada Rangeland Handbook.
- 3.4 Wild horse and burro herd management practices should be planned and implemented to provide for integrated use by domestic livestock and wildlife.

- 3.5 Wild horse and burro herd management practices will promote the conservation, restoration, and maintenance of habitat for special status species.
- 3.6 Wild horse and burro herd management practices will be designed to protect fragile ecosystems of limited distribution and size that support unique sensitive/endemic species or communities. Where these practices are not successful, herd levels will be reduced or eliminated from these areas.
- 3.7 When wild horse and burro herd management practices alone are not likely to restore areas, land management practices may be designed and implemented where appropriate.
- 3.8 Vegetation manipulation treatments may be implemented to improve native plant communities, consistent with appropriate land use plans, in areas where identified standards cannot be achieved through wild horse and burro herd management practices alone. Fire is the preferred vegetation manipulation practice on areas historically adapted to fire; treatment of native vegetation with herbicides or through mechanical means will be used only when other management techniques are not effective.
- 3.9 Wild horse and burro herd management practices should address improvement beyond this standard, significant progress toward achieving standards, time necessary for recovery, and time necessary for predicting trends.

4. Wild Horse and Burro Standard

- Wild horses and burros within Herd Management Areas should be managed for herd viability and sustainability. Herd Management Areas should be managed to maintain a healthy ecological balance among wild horse and/or burro populations, wildlife, livestock, and vegetation.

Herd health indicators:

- General horse and/or burro appearance: Problems are often apparent and can be easily identified by just looking at the herd.
- Crippled or injured horses and/or burros: Excessive injuries can indicate problems.

Herd demographics indicators:

- Size of bands: A band with one stud or jack, one mare or jenny, and one foal indicates a problem. An oversized band also indicates there is a problem. Band sizes of 5 to 10 animals with one dominant stud per band is a good indicator.
- Size of bachelor bands: Large bachelor bands in the immediate vicinity of other bands could indicate potential problems.

APPENDIX B

Herd viability indicators:

- Heavy trailing into water sources may indicate a significant problem with forage availability or water distribution. Animals may be travelling considerable distances to obtain water or forage.
- Waiting for water. When available water becomes so scarce that a waiting line develops, horses and burros are in trouble.
- Availability of water. Address legal and/or climatic considerations. Situations exist where wild horse and burros are present only because they currently have access to water, which they could legally be deprived of under Nevada water laws. Situations exist where existing wild horse and burro populations are dependent upon water hauling. If water hauling were to cease, these animals would die within a matter of days.
- Depleted forage near all available water sources. Adequate water, and forage adjacent to water sources, are essential.

Guidelines:

- 4.1 Wild horse and burro population levels in Horse Management Areas should not exceed appropriate management levels.
- 4.2 Appropriate management levels should be set to reflect the carrying capacity of the land in dry conditions based upon the most limiting factor: living space, water, or forage. Management levels will not conflict with achieving or maintaining standards for soils, ecological components, or diversity of habitat and biota.
- 4.3 Interaction with herds should be minimized. Intrusive gathers should remove sufficient numbers of animals to ensure a period between gathers that reflects national wild horse and burro management strategies. Non-intrusive gathers such as water trapping can be done on an 'as needed' basis.
- 4.4 Herd Management Plans should be made with the best predictive information available. When emergency actions occur, the Herd Management Plan should be re-evaluated.
- 4.5 Viable sex and age distribution should be a long term goal of any wild horse and burro Herd Management Plan. Sex and age distribution of the herd should be addressed when (after) appropriate management level has been reached.
- 4.6 When wild horse and burro herd management alone is not likely to restore areas, land management practices may be designed and implemented where appropriate.

- 4.7 Wild horse and burro herd management practices should address improvement beyond this standard, significant progress toward achieving standards, time necessary for recovery, and time necessary for predicting trends.

**OFF-HIGHWAY VEHICLE ADMINISTRATION GUIDELINES
FOR NEVADA PUBLIC LANDS**

The Nevada Northeastern Great Basin Resource Advisory Council, the Sierra Front Northwestern Great Basin Resource Advisory Council and the Mojave/Southern Great Basin Resource Advisory Council, as chartered by the Department of the Interior, have developed Guidelines for the administration of off-highway vehicle use on public lands within the State of Nevada. These guidelines are intended to promote cooperation among user groups, to share resources, and to minimize conflicts in accordance with the Nevada Standards for Rangeland Health. While recognizing the legitimacy and necessity of off-highway vehicle use on public lands, it has become necessary to define guidelines for management of off-highway vehicles to insure the protection of land health and the availability of the public lands for all multiple users. These guidelines are to assist land managers in administrative and planning decisions. Administrators can use the guidelines for managing for land health and making decisions with regard to restricting, or not restricting off-highway vehicle activity. Additionally, administrators can use the educational guidelines as tools to provide training for land managers and to inform the public on off-highway vehicle use issues and ethics. Planners should use these guidelines in developing timely plans for resources and recreation use, while addressing the increasing demand for off-highway vehicle use.

On-the-ground Management Guidelines

- Encourage off-highway vehicle use on existing or designated roads and trails, except in closed areas, prior to land use plans being updated and road and trail inventories completed.
- Locate and manage off-highway vehicle use to conserve soil functionality, vegetative cover, and watershed health. Manage off-highway vehicle use to minimize the impact on the land, while maintaining off-highway vehicle access.
- Manage off-highway vehicle use by type, season, intensity, distribution, and/or duration to minimize the impact on plant and animal habitats. If seasonal closures become appropriate to minimize adverse off-highway vehicle impact(s) on public lands resources, managers will strive to preserve public access by designating alternative routes.
- Manage off-highway vehicle activities to conserve watershed and water quality.
- Monitor the impact(s) of off-highway vehicle activities on all public land, water, air and other resources and uses.
- Maintain an inventory of existing road and trail systems.
- Manage off-highway vehicle use to preserve cultural, historical, archeological, and paleontological resources.

- Engineer, locate, and relocate roads and trails to accommodate off-highway vehicle activities while minimizing resource impacts.
- Encourage cooperation in law enforcement among all agencies.
- Off-highway vehicle use pursuant to a permitted activity shall be governed by the terms of the permit.

Planning Guidelines

- In land use plans or plan amendments, designate areas as open, limited, or closed to off-highway vehicle use.
- Address off-highway vehicle management including land use and/or route designations, monitoring and adaptive management strategies, such as applying the Limits of Acceptable Change process, when developing new land use plans or amending existing land use plans. Work closely with local, state, tribal, and other affected parties and other resource users in off-highway vehicle planning.
- Establish and maintain an inventory of existing routes and trails as part of the land use planning process.
- Provide for other resources and uses in off-highway vehicle planning. This includes livestock grazing, other recreational uses, archeological sites, wildlife, horses and burros, and mineral extractions and coordinate with other users of public lands.
- Conduct an assessment of current and future off-highway vehicle demand, and plan for and balance the demand for this use with other multiple uses/users when developing all land use plans.
- Include in land use plans, social/economic effects of off-highway vehicle use, including special recreation events.
- Integrate concepts of habitat connectivity into off-highway vehicle planning to minimize habitat fragmentation.
- For addressing/resolving local site-specific off-highway vehicle issues/concerns, use collaborative planning groups consisting of local representative(s), affected/interested group(s) and agency(s).
- Clearly identify route and area designations.
- Where land health permits develop sustainable off-highway vehicle use areas to meet current and future demands, especially for urban interface.

APPENDIX B

Education Guidelines

- Cooperatively develop/improve public outreach programs to promote trail etiquette, environmental ethics, and responsible-use stewardship ethic.
- Promote/expand/disseminate materials from programs such as (but not limited to) "Tread Lightly!" and "Leave No Trace".
- Provide off-highway vehicle management education and training for managers, staff, partners and volunteers. Training should focus on state of the art practices and be tailored to meet local needs. Encourage communication between agencies, managers, staff, partners and volunteers to share expertise and effective techniques.
- Encourage the private sector, as well as the public sector, to conduct responsible marketing of activities on public lands while avoiding the promotion of products, behaviors and services that are inconsistent with existing regulations and land use plans.
- Develop communication and environmental education plan(s). Assess all situations where off-highway vehicle use may require public information and education. Develop materials and programs appropriate to each situation.
- Utilize high use areas and special events to maximize the dissemination of responsible use education materials and concepts to the public.

APPENDIX C
STATE AND TRANSITION MODELS
LANDFIRE AND FIRE REGIME CONDITION CLASS

APPENDIX C

STATE AND TRANSITION MODELS, LANDFIRE, AND FIRE REGIME CONDITION CLASS

A number of plant community models are referred to in this RMP including state and transition models, LANDFIRE biophysical models, and Fire Regime Condition Class. Each is used where appropriate, to provide information and context for vegetation management and interpretation of plant community succession. The ecological site inventory is designed to serve as the basic inventory of present and potential vegetation on BLM rangelands. This procedure is based on Natural Resource Conservation Service soil surveys and ecological site descriptions. The BLM has been using ecological site inventory and ecological site descriptions in its vegetation and range management programs for a longer period of time than the other models mentioned and so a state and transition model is provided as an example.

The following is a generalized explanation of some of the ecological principles involved in State and Transition Pathway Modeling. The presentation of this material is intended to be simplified for ease of communication. For a more in-depth explanation, please see Inventory and Monitoring, Technical Reference 1734-3, USDI-BLM, 2001, Chapter 3 – available at: <http://www.blm.gov/nstc>. Also refer to the National Range and Pasture Handbook of the National Resource Conservation Service.

Different Plants

Travel anywhere in the planning area and you will see areas that appear to have very different plants. Some plants are green trees, while others are medium sized shrubs (called sagebrush) and still other plant types are grass or forbs (flowers and weeds).

Different Ecological Sites Meet Different Needs

Different plant types have different needs. The soils of each site hold water and nutrients for plants, and rain and sunlight are also important. That's one reason why different plants are found in different places.

Ecological Sites

As knowledge and experience have increased, the information, detail, and concepts contained in ecological site descriptions also have changed. Many plant communities did not follow the linear succession models pioneered by Frederic Clements and developed through the first three quarters of the 20th century. The state and transition concept was developed to describe and explain observed non-equilibrium succession. In the state and transition concept, several separate and possibly long-duration plant communities may occur at a given ecological site. In between these separate communities are thresholds. As long as a threshold is not crossed, succession can move between plant communities. When a threshold is crossed, extraordinary effort, beyond routine management, must be expended to move the community back to the previous threshold. This new state also may have several plant communities that will occur due to routine management and ecologically normal weather variation and disturbances. An ecological site may have several states and the thresholds between the states are all difficult to reverse. As knowledge of where transitions lie, and values for thresholds and other state and transition relationships increase, the model also will evolve. The state and transition model for Wyoming Big sagebrush in Nevada is included in this appendix.

APPENDIX C

Disturbance and Renewal

Most often healthy sites have some kind of disturbance (like fire). Fire is a natural and historical disturbance in eastern Nevada. Fire will burn the plants, killing some and renewing others, often making it a younger image (a phase of the previous state) of the plant community before the fire. Then the movement begins all over again.

Threshold and Transition

Sometimes, if the disturbance does not happen to renew the plants on the ecological site, the site itself will cross (transition) a threshold and other plants (better suited to the conditions without disturbance) will become established. The site may look quite different but will have the same soil characteristics. After the threshold is crossed, it is very rare that the site will ever return to its original plant community or state even after disturbance. Keeping the site from crossing a threshold makes disturbance both beneficial and important.

All of This Happens in the Planning Area

All of these things happen in the planning area, different state on ecological sites, different phases in each state, disturbance, renewal, and sometimes without disturbance, thresholds are (have been) crossed and other plants established.

Ely Field Office Required to Manage

The Ely Field Office is required to manage the land in the planning area in a manner that provides for both uses today and good condition for the future. The Ely Field Office recognizes the need for prescribed vegetation management to renew plant communities, so the plants can resist transitions across thresholds.

Good Communication Tool

State and transition models provide a good way for managers and scientists to not only understand what is happening on the landscape, but to communicate that to each other and the owners of the land, the American people.

Summary

State and transition models help managers and scientists to look at an ecological site and tell what state it is in and what phase is within that state. This understanding of ecological sites and their condition gives managers a way to know whether they must act immediately to keep a vegetation state from crossing (transitioning across) a threshold. Or if a site has crossed a threshold, immediate action may not be the best action or the most cost effective alternative. Keep in mind, the Ely Field Office must balance uses today with the future of the resource. In any event, this type of information helps to understand and communicate what is happening on the landscape and to help set priorities for management choices.

**A GENERALIZED WYOMING BIG SAGEBRUSH
STATE AND TRANSITION MODEL AND MANAGEMENT KEY
FIRST APPROXIMATION**

INTRODUCTION

During the late twentieth century, Wyoming big sagebrush (*Artemisia tridentata* ssp. *wyomingensis*) [Beetle & A. Young] went from a 'weed' to a valuable resource in danger of extirpation in some landscapes. Neither perceiving it to be of no value and only competitive with grasses, nor perceiving it to be so valuable and scarce that we must never control it, serves land managers or the wildlife that depend on this important habitat. During this period, a focus on range condition has shifted to a focus on ecological thresholds, and the information needed to allocate limited financial and other resources to those areas, times, and actions that are most important for maintaining rangeland health.

This publication focuses on land capable of supporting plant communities dominated by Wyoming big sagebrush. This shrub occurs at lower elevations on valley bottoms, alluvial slopes, foothills, and mountain side slopes. It typically inhabits areas too moist for salt desert shrub species and too dry for mountain big sagebrush. While this subspecies is somewhat palatable to sheep and mule deer, it is not as palatable to these animals as black sagebrush (*Artemisia nova* [Nelson]) and it is not palatable to cattle.

This state and transition model and management key generally describes vegetation change and management alternatives for the Natural Resources Conservation Service ecological sites listed in **Table C-1**. However, some areas where these sites occur are better understood by disregarding their potential for transitioning to a tree state because they are far from those sites that generally have juniper (*Juniperus* sp.) and/or pinyon pine (*Pinus monophylla* [Torr. & Frem.]) trees. In general, the potential for transitioning to the tree state is greater for *Wyomingensis* sites that are higher in precipitation or elevation, have deeper soils, or are closer to sites with these characteristics.

For the areas within these sites that this model and management key applies, we discuss two management situations: 1) areas where cheatgrass (*Bromus tectorum* L.) and other invasive weeds (annuals and perennials) are established and becoming, or are already, an important management factor; and 2) areas where natives are the only ecologically important species established in the area or at least they still dominate ecological processes and management concerns.

MANAGEMENT WITH CHEATGRASS AND OTHER INVASIVE WEEDS

On these landscapes, the presence of annual and/or perennial exotic (largely noxious) and invasive weeds threatens the natural resilience and utility of most if not all Wyoming sagebrush plant communities. These species compete very effectively with native plants. They can transition plant communities to new states (**Figure C-1**) or dominate after certain disturbances without appropriate and timely management action. Their presence is always a hazardous situation. When common, their presence typically results in a transition to a new state because the exotic weeds, not the desired species, determine ecological processes.

PERENNIAL HERBACEOUS STATE

Description: The plant community is dominated by deep-rooted perennial bunchgrasses, with perennial forbs and varying amounts of Wyoming big sagebrush and other shrubs. Sagebrush can dominate the plant community and juniper and/or pinyon pine trees may be present as seedlings, saplings, or very sparse mature trees as long as the understory remains robust. If the perennial understory is dense and vigorous enough to recover quickly after being released from the competition of woody plants, the vegetation has not crossed a threshold to the shrub or tree state. Descriptions of the ecological sites listed in **Table C-1** provide relative species composition and production data for each ecological site in this perennial herbaceous state. Cheatgrass (or other nonnative annual plants) is a minor component of the understory vegetation.

Successional trajectories: The perennial herbaceous state plant community is resilient or cyclic because secondary succession processes and disturbance regimes are functional. Periodic release of the understory perennials from increasing competition from sagebrush is facilitated primarily by fire. However, other causes for widespread shrub die-offs have been noted. Normal fire frequency is approximately 50 to 100 years (Wright and Bailey 1982). Without woody plant removal, the plant community transitions to the shrub state or if trees are present, to the tree state. On drier sites, juniper may increase and on more mesic sites, pinyon may increase. As transition to shrubs or trees occurs, the proportion of cheatgrass in the herbaceous understory increases as perennial herbaceous species decline. Poor grazing management of large domestic and/or wild herbivores can diminish the vigor and expression of palatable perennial herbaceous plants. Removal of deep-rooted species may leave only or primarily sandberg's bluegrass (*Poa secunda* [J.S. Presl.]) or cheatgrass. This makes summer moisture and other resources more available to nonpalatable shrubs and/or trees and accelerates and increases the likelihood of the transition to the shrub, tree, or annual grass fire cycle state.

Management strategies to maintain the state: Manage for the vigor, density, and diversity of perennial herbaceous species. Include sagebrush and other woody species in management objectives as desired. However, manage for no more shrub and young tree canopy cover than is appropriate for the site in order to maintain a resilient understory. Management should not allow the plant community to transition across a

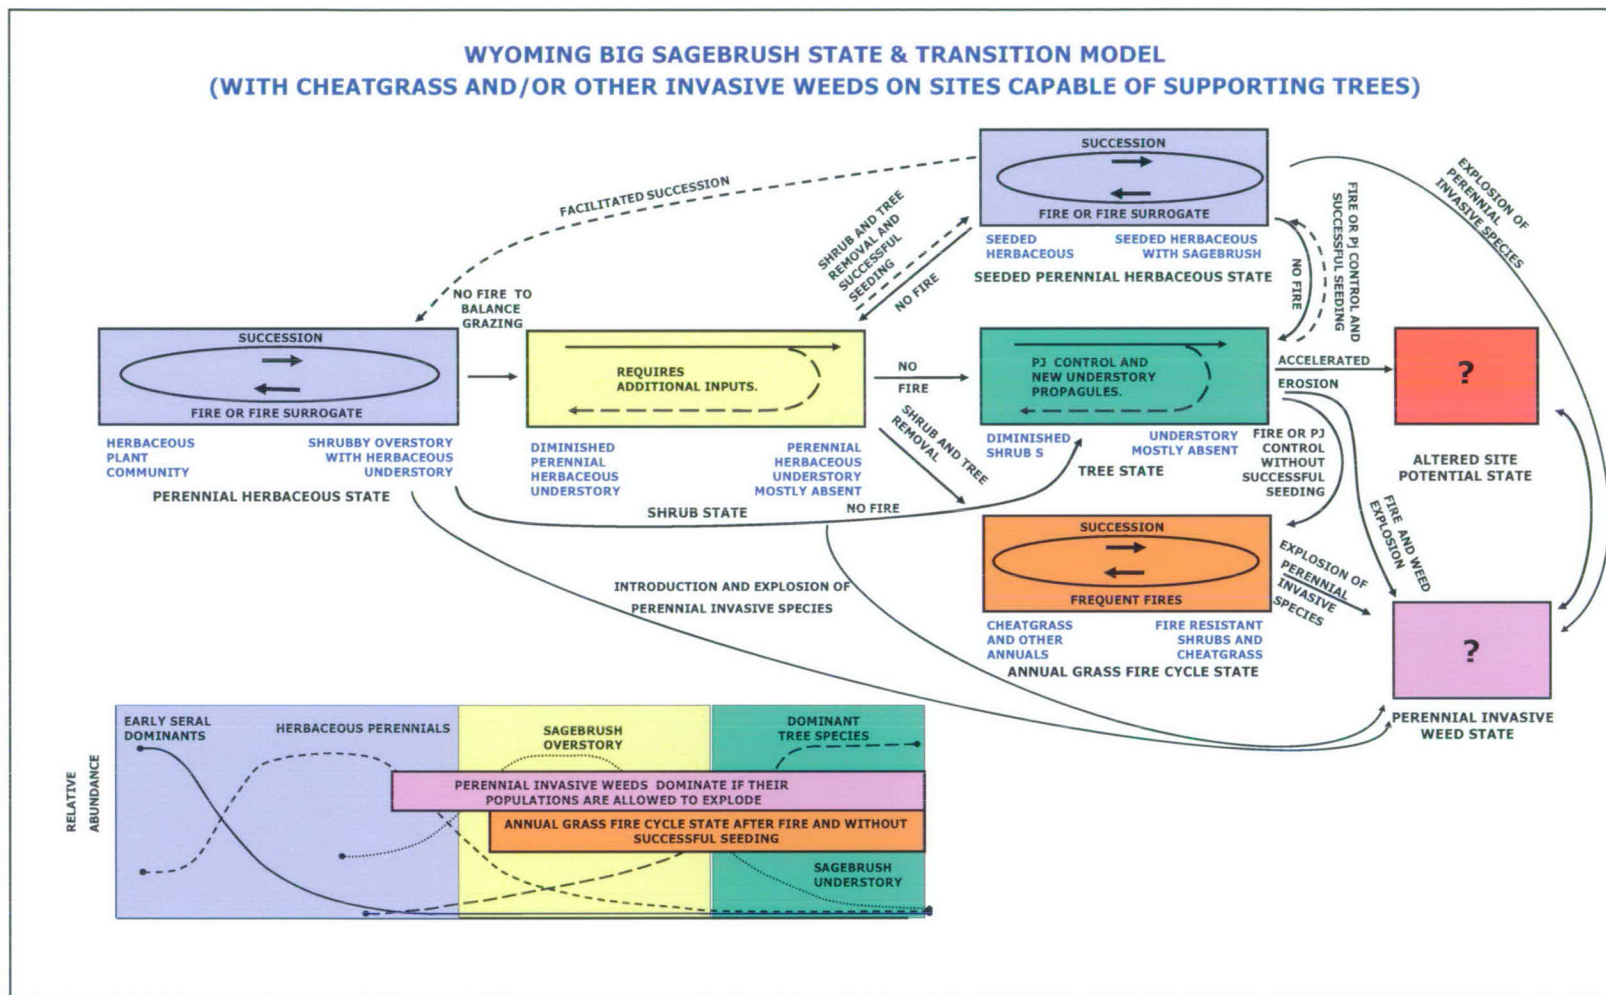

Figure C-1 Each box is shown as a different color to identify that it is a different state. The arrows between boxes are transitions across thresholds. Solid line arrows are irreversible transitions without active restoration of ecological processes, dashed arrows. Inset box shows relative abundance of plant groups and relative sequence of transitions through succession without proactive management.

threshold to the shrub or tree state. To increase the vigor and density of the native perennial herbaceous plants, intervene with mechanical control measures, prescription grazing, herbicides, or very judicious use of prescribed fire. Shrub and young tree control should be practiced as woody plant cover increases. However, caution is advised because cheatgrass can erupt from a seed bank soon after control of woody plants opens niches that a sparse understory cannot rapidly fill. The winter-annual, cheatgrass, outcompetes perennial seedlings in most years on all but the sandiest soils. To minimize bare patches, woody plant management may be needed more frequently than where only native perennial plants occur in the understory. Where soils are erodible, minimize soil surface disturbance. Wherever treatments disturb soil, ensure that adapted perennial plants or seeds are available to compete with cheatgrass given the specific treatment conditions, such as seedbed preparation, grazing regime, etc.

Grazing management should be designed to foster perennial herbaceous species in the community. Excessive or prolonged grazing, especially during the growing season by herb-consuming herbivores, can increase shrubs. Whereas, shrubs can be decreased by relatively intense winter grazing by shrub-consuming herbivores. Supplemental feeding, to concentrate cattle for mechanical damage, controls sagebrush in small patches, especially when the shrubs are dry and brittle. To limit bare ground after future disturbances, grazing and other land or vegetation management actions should not weaken the perennial herbaceous community. Bare ground is more susceptible to accelerated erosion, and invasive plants establish faster in open niches. Management to maintain the perennial herbaceous state (prescribed grazing and periodic control of woody plants) is much more cost effective than management to return to this state once a threshold has been crossed (control of woody plants, weed control, reseeding and temporary rest from grazing).

SHRUB STATE

Description: Shrub cover has increased and perennial herbaceous understory cover has decreased across a threshold level. Deep-rooted, perennial bunchgrasses are rare to absent in the understory. The cheatgrass component varies from present to dominant in the herbaceous understory. This state is very susceptible to invasion by annual weeds before and especially after fire or other large scale disturbance. Wyoming big sagebrush and other shrubs dominate the plant community. Juniper and/or pinyon pine trees may be established on the site but do not yet dominate ecological processes.

Successional trajectories: Native herbaceous understory is diminished from the perennial herbaceous state levels and may be absent or nearly so when sagebrush cover reaches its maximum for the site. The relative abundance of cheatgrass in the understory increases as perennial grasses decline. Eventually cheatgrass dominates the sparse understory but drives long-term community change for both shrubs and herbaceous species. Because a threshold has been crossed, removal of grazing pressure will not restore the native herbaceous component. This will coincidentally require fire or other shrub control measures. However, burning or other woody plant control measures without reseeding will not return a mix of deep-rooted bunchgrasses and other plants characteristic of the perennial herbaceous state. Return to the perennial herbaceous state requires shrub control, cheatgrass control, reseeding and possibly additional management, depending on site-specific conditions. Thus return to the perennial herbaceous state requires facilitated succession starting with the seeded perennial herbaceous state.

APPENDIX C

Fire or other major disturbance will increase the abundance of cheatgrass and other annuals. A decline of big sagebrush in the overstory, coupled with an increase in cheatgrass density indicates a transitional pathway to the annual grass fire cycle state. With increasing cheatgrass fuel loads, the threat of wildfire increases due to better fuel continuity and the much higher flammability of this fine-stemmed, often evenly distributed, early growing and early drying, annual grass. This change in fuel characteristics indicates a transition to the annual grass fire cycle state that is completed by an inevitable fire. Or, if trees are present, fire is delayed, and tree invasion is not controlled, the plant community will transition to the tree state. At the landscape scale, the rate of transition largely depends on the size of the fires, which can be very large (100,000 acres).

Management strategies: To maintain the shrub state, or at least sagebrush, prevention of wildfire is critical. Strategies often include creation of green strips or other fuel breaks to keep wild fires small so that all sagebrush habitats are not lost at once. Prescribed grazing may be used to reduce fine and/or woody fuels.

To transition to the seeded perennial herbaceous state, apply shrub and weed control in conjunction with reseeding operations. Shrub control measures could include herbicide, mechanical, or shrub-consuming herbivore treatments or the judicious application of prescribed fire. After wildfire or other shrub removal, reseeding becomes urgent. Seeding is absolutely required before or within the first fall or early winter after shrub control. Thereafter, competition from a rapidly expanding cheatgrass population may prevent seeding success. Reseeding requires cheatgrass control unless a very hot fire removed all but 0 to 3 cheatgrass seeds per square foot. It also requires appropriate seedbed preparation, planting date and follow-up management. Reseeding treatments could include native perennials, grasses, forbs and shrubs and/or adapted nonnative perennial species. Where soil stabilization following wildfire is a priority objective, seeding nonnative perennial grasses having high seedling vigor may be the best option.

Where perennial herbaceous understory is weak and shrub cover is still well below maximum, consider using selective herbicides to manage cheatgrass and adjusting grazing management to restore vigor and density of desirable understory species several growing seasons prior to controlling shrubs. Investigate the feasibility of facilitated succession, seeding initially with adapted nonnative grasses and later inter-seeding with adapted native herbaceous and/or shrub species.

SEEDED PERENNIAL HERBACEOUS STATE

Description: The choice of species in the seed mix, species in the pre-existing seed bank, and the growing conditions in the first few years after the seeding largely determine the species composition of the seeding. On many Wyoming big sagebrush sites, not very many species will predictably do well. Even for crested wheatgrass (*Agropyron cristatum* L. Gaertner), the most commonly seeded and most dependable species, moisture following seedings is sometimes insufficient, especially in the driest sites with the greatest soil limitations. Because perennial bunchgrasses provide a clumped fuel composed of coarser stems that stay green longer than cheatgrass, they depress fire spread rates and the fire interval is generally long enough to allow sagebrush to become well established unless seeding design or management keeps it out. Although

functionally quite similar to the perennial herbaceous state, the seeded perennial herbaceous state is shown as a separate state because there is always a loss of genetic diversity once seeding is required.

Successional trajectories: Seedlings often begin with expression of early seral species present in the seed bank such as annual forbs. As perennials and shrubs become better established, they typically exclude or severely diminish all but the most aggressive of these early seral species or limit them to small disturbed areas. If sagebrush was initially established by seeding or from seeds left in safe sites, it structurally dominates a seeding more quickly. If not, recruitment occurs from the edges or from unburned or untreated shrub islands. Other species move in depending on the mechanisms of their seed dispersal and their success in finding favorable microsites, or on treatments designed to facilitate succession.

Management strategies: Seeding size, shape or amount of edge and orientation with respect to prevailing winds, as well as fire management strategies to leave shrub islands or create a mosaic, can influence the process of sagebrush re-establishment. During and after seeding establishment, livestock grazing can be used to encourage niches for sagebrush and other species that may be present. Conversely, grazing can be discouraged or managed conservatively to favor only those species more palatable to livestock. Once the seeding has been used to avoid the transition to an annual grass fire cycle state, management and additional seeding can be used to facilitate succession toward various species compositions. Natives can be interseeded but often do not compete well with the initially seeded species unless steps like soil disturbance are used to open new niches. Often the focus for management is simply maintaining the seeding. This requires maintenance of ecological processes and therefore keeping the seeding from becoming so dominated by shrubs or weeds that the seeded understory becomes unable to survive a fire or otherwise thrive. Management strategies described for the perennial herbaceous state also apply to the seeded perennial herbaceous state. However, specifics of grazing management may differ according to the needs of the seeded species.

TREE STATE

Description: Juniper and/or pinyon pine has established on a site and has caused a decline in understory (herbaceous and shrub) cover and production due to extended fire return interval. Although trees generally establish under shrub canopies, they can invade the perennial herbaceous, seeded perennial herbaceous, and shrub states. The trees have assumed ecological dominance, driving future ecological processes. Understory (herbaceous and/or sagebrush) has decreased across a threshold level defined by its lack of resilience to a tree-removing disturbance. Tree biomass now dominates the plant community, with leaf and fuel biomass as much as seven to eleven times the levels of perennial herbaceous or shrub states. However, tree cover is highly concentrated, often leaving large bare interspaces that are susceptible to rill erosion, especially on drier sites. Cheatgrass is present and often dominates the understory as trees mature. Although live cheatgrass density and vigor may be lower in the tree state than in other states, its seed bank is often large.

Successional trajectories: Herbaceous and/or shrub understory diminished from previous state levels to almost absent where trees are mature and the site fully stocked. Shrub cover declines to approximately 20 to 25 percent of potential when tree cover approaches 50 percent of maximum potential for the site

APPENDIX C

(Tausch and West 1995; Miller et al. 2000). During this process a ten percent increase in tree cover can result in a fifty percent decline in understory production. The degree of resilience of the understory is determined in part by the tree-removing disturbance. A very hot wildfire may remove remaining herbaceous species and their seed reserves (indicating the threshold to the tree state has been crossed) while a more gentle form of tree removal may release these species from the tree competition (indicating that the threshold had not yet been crossed). Once one or more thresholds have been crossed in getting to the tree state, return to the perennial herbaceous state requires going to the seeded perennial herbaceous state first. This requires shrub and/or tree control, reseeding, and generally other management actions such as weed control. Cheatgrass is present and its proportion in the understory tends to increase as native understory species decline. If the native perennial understory is absent or sparse, fire or other tree control measures alone will not increase most herbaceous/shrub understory species of the perennial herbaceous state. Rather the cheatgrass seed bank will increase cheatgrass abundance after the release from tree competition and transition of the site to the annual grass fire cycle state. Major soil erosion events from severe wind after large and/or hot fires, or from major precipitation events on moderate or steeper slopes, can trigger a transition to an altered site potential state. Mature tree stands may increase this risk by allowing rills to form in large bare interspaces.

Management strategies: To manage this state for continued tree production, protection from fire is essential. However, as trees grow, fuel accumulates and tree canopies grow closer to each other. This increases the likelihood of a catastrophic fire spreading across the landscape. Thinning a stand reduces fuel loads. However, larger bare interspaces increase erosion hazard. Continued net fuel production on this type often increases the risk of fires in neighboring woodland types including areas where trees are very old because fire was historically rare or involved only single trees. Management plans designed to break up the landscape scale continuity of fuels with firebreaks, greenstrips, or imposed differences in vegetation structure serve to reduce the risk of large fires that leave watersheds barren. Applying tree control and rehabilitation treatments in smaller patches increases the likelihood of fires creating a diverse mosaic of habitats. This reduces the cost of future fire fighting, increases the opportunity for fire use, and increases sustainability for ecological processes.

To transition to the seeded perennial herbaceous state, apply tree and weed control and seed adapted perennials. After successfully attaining the seeded perennial herbaceous state, facilitated succession can return the site to the perennial herbaceous state. Tree control measures could include prescribed fire, herbicide, or mechanical treatments. Restoration requires the use of site-adapted grass, forb, and shrub species and methods. If site stabilization is a priority objective, nonnative perennial herbaceous species may be the best option for revegetation. Rehabilitation is required in the fall or early winter immediately following tree removal.

ANNUAL GRASS FIRE CYCLE STATE

Description: Cheatgrass and/or other annual grasses and forbs (e.g., mustards) dominate the herbaceous community. Most perennial herbaceous species cannot compete with the dense population of cheatgrass and are absent or nearly so. Fire intervals often shorten to 2 to 10 years. Sagebrush is generally unable to

survive and reproduce with this fire frequency. Sprouting, fire-tolerant shrubs may form a shrub overstory where fires are too frequent for sagebrush but infrequent enough to support non-palatable sprouting shrubs.

Successional trajectories: This plant community is functionally an annual grassland. Cheatgrass initially dominates the site following wildfire. Sprouting, fire-tolerant shrubs are the only woody plants and these shrubs may eventually dominate the visual aspects of the area if fires do not return too frequently. Cheatgrass and annual forbs become the dominant vegetation after repeated frequent fires. Poor grazing management can shift species composition toward less palatable species and decrease soil cover, thereby increasing erosion hazard. Thus, the level of risk has increased for the community to transition to a perennial invasive weed state. If perennial invasive species such as knapweeds (*Centaurea* sp.) are introduced to the system, the plant community could rapidly become dominated by these species, marking a transition to the perennial invasive weed state. This makes rehabilitation to a seeded perennial herbaceous state more difficult, even with extensive and intensive inputs. Fires export nitrogen and frequent fires may shift the plant community toward undesired species tolerant of low-nitrogen soils. Repeated fires expose soil to erosion more often. During severe hydrologic or wind events this may facilitate transition to the altered site potential state.

Management strategies: To manage this state for continual annual grass production, apply proper grazing for annual grassland. Leave sufficient residue for seed production and soil protection while consuming sufficient fuel to reduce fire risk. This can be challenging due to highly variable production among wet and dry years. In the wettest years, grazing may consume the abundant forage in only some pastures or use areas, or in fuel breaks. In the driest years forage may be essentially absent. To transition to the perennial herbaceous state, cheatgrass control and reseeding operations are required. Mechanical, chemical, or herbivory treatments can reduce cheatgrass seed. If fire intolerant shrubs like sagebrush are included in the seed mix, a fuel management strategy must be employed to reduce fire danger to newly established species. Prescription grazing and green stripping can be used across a landscape to reduce fuel loads and fire size (reducing fire frequency). Establishment of seeded perennial herbaceous species (such as bunchgrasses) also will reduce fuel continuity, potentially reducing the rate of fire spread and size of fires.

PERENNIAL INVASIVE WEED STATE

Description: One or more of the weeds that are on the state noxious or invasive weed lists, or a new invasive weed, dominates the herbaceous vegetation, competitively excluding the native perennial herbaceous dominants. Such weeds may burn readily and typically exclude sagebrush and/or pinyon and juniper trees. Their competitive advantage in an environment without diseases, insects, etc., from their ancestral home allows them to displace most other plants to form virtual monocultures. Initial weeds may facilitate the establishment of even more competitive invasive weeds.

Successional trajectories: The risk of transitioning to the perennial invasive weed state increases after transition to the Shrub, Tree, Annual Grassland Fire Cycle, and the Altered Site Potential states. Risk increases as soon as invasive perennial plants, such as one of several knapweed species, begin to colonize an area; unless they are eradicated immediately upon discovery. Otherwise, initial colonization generally expands toward a monoculture. Experience in other parts of the western U.S. demonstrates the highly

APPENDIX C

competitive nature of some invasive weeds. However, which species will be most competitive on each ecological site, state, or phase is still unknown. As initial infestations change species composition and/or soil characteristics and site potential, other weeds will likely become more competitive, causing instability in species composition. Many invasive weeds are competitive, but do not effectively protect soil from erosion or they are highly flammable, leading to unprotected soils after frequent fires. These increase the risk of transitioning to the Altered Site Potential state.

Management strategies: Invasive plant colonies should be eradicated immediately upon discovery. Once invasive weeds dominate a site, the expense of weed control, follow-up control, and revegetation treatments generally exceed on-site economic returns. However, these management strategies are justified to quarantine weeds in one area, reducing spread potentials. Herbicides and/or hand grubbing should be used to eradicate small populations. Where eradication is no longer possible, mechanical, chemical, and/or biological controls such as insects or prescribed grazing should be used to control/confine infestations. Weed control areas will require reseeding with the most competitive of adapted (native or nonnative) desired species and careful post-seeding grazing management to reduce the risk and consequences of reinvasion. They may also require periodic treatment for residual weeds. For whole landscapes dominated by noxious weeds, there may be little option other than biological control. Yet biological controls are not available for many weed species.

To accomplish the vegetation management objectives suggested for this state and transition model, care should be taken to avoid facilitating the spread of invasive weeds. Expansions to the road network and soil disturbances increase bare areas where invasive weeds can more easily establish. Virtually every invasive weed population is first a roadside weed before its population explodes. Many weed infestations begin in areas disturbed by machines, and some of these are for vegetation management purposes. To prevent weed infestations from spreading, it is important to routinely scout for new invasive weeds, especially in areas likely to be initially colonized (roadsides, waters, riparian areas, turnout areas, corrals, utility corridors, borrow pits, etc.). Also, remove/alter stresses that can aid expansion from an affected area.

ALTERED SITE POTENTIAL STATE

Description: Accelerated erosion has resulted in loss of topsoil, altered hydrologic characteristics (i.e., reduced infiltration and increased runoff), and lowered water and nutrient storage capacity. These changes to the growing environment have resulted in an altered ecological potential for the site. For example, a Wyoming big sagebrush site may become a shadscale (*Atriplex confertifolia* [Torr. & Frem.]) site. Lowered site potential means lowered vegetation production, less soil protection, and increased soil loss until a new equilibrium is reached.

Successional trajectories: The risk of transitioning to the altered site potential state increases after transitioning to the shrub, tree, annual grass fire cycle or perennial invasive weed states. The new site potential and the array of possible plant species and successional trajectories greatly depend on the soil remaining as the rate of soil erosion stabilizes. For very shallow soils, plants survive by tolerating extended periods without available soil moisture or by sending roots deep into rock fissures. Cheatgrass, a winter annual, survives drought as seeds that do not germinate in some years and by developing seed early. On

sites where the topsoil has been eroded away, clayey subsoil becomes exposed at the surface. Roots must penetrate the heavy clay and tolerate any shrinking and swelling of the clayey soil during germination. Then the plants must be able to persist with less soil moisture than available within an intact, non-eroded soil. Clayey sites are susceptible to invasion by medusahead rye (*Taeniatherum caput-medusa* [L. Nevski]).

Management strategies: Because topsoil or even subsoil has been lost, return of the native perennial herbs and shrubs characteristic of the perennial herbaceous state depends on soil forming processes that are slow under most conditions. The area should now be managed under the guidance provided by the state and transition model and ecological site description for the new ecological site if available. It is expected that the species composition and limited productivity of the vegetation established on the altered site will have a low resiliency and minimal utility.

NATIVES ONLY

In these plant communities and landscapes, exotic plants are not usually present. Only plant species native to the Great Basin are important in ecological processes and management. If present, exotics reflect a disturbance of vegetation that has left an open niche that can easily be filled through recovery of native vegetation. Any exotics present are not strongly competitive with native vegetation. This general model (Figure C-2) may describe historic ecological processes and is still relevant in some areas.

PERENNIAL HERBACEOUS STATE

Description: The plant community is dominated by deep-rooted perennial bunchgrasses, perennial forbs, and varying amounts of Wyoming big sagebrush. Sagebrush can dominate the plant community and juniper and/or pinyon pine trees may be present as seedlings, saplings, or very sparse mature trees, as long as the understory remains robust. If the perennial understory is dense and vigorous enough to recover after being released from the competition of woody plants, the vegetation has not crossed a threshold to the shrub or tree state. Descriptions of the ecological sites listed in Table C-1 provide relative species composition and production data for each ecological site in this perennial herbaceous state.

Successional trajectories: Plant community is resilient or cyclic because secondary succession processes and disturbance regimes are functional. Life-form dominance (species composition) is controlled primarily by fire, although aroga moth, or other phenomena can also thin or kill patches of Wyoming big sagebrush. Normal fire frequency is approximately 50 to 100 years (Wright and Bailey 1982). Without periodic woody plant removal, a plant community will transition toward the shrub state or if trees are adjacent to the site, to the tree state. On drier sites, juniper may increase and on more mesic sites, pinyon may increase. Following wildfire sprouting shrubs may dominate but will be gradually replaced by perennial bunchgrasses and sagebrush. If the area is devoid of big sagebrush, it could be restored through time with seeds from surrounding areas and it could be re-established more quickly with seeding and without the need for vegetation control. Poor grazing management of large domestic and/or wild herbivores can diminish the vigor and expression of deep-rooted perennial herbaceous plants leaving primarily sandberg's bluegrass. This makes soil moisture and other site resources more available to competitive shrubs and/or trees and accelerates and increases the likelihood of the transition to the shrub, or tree state. If the perennial

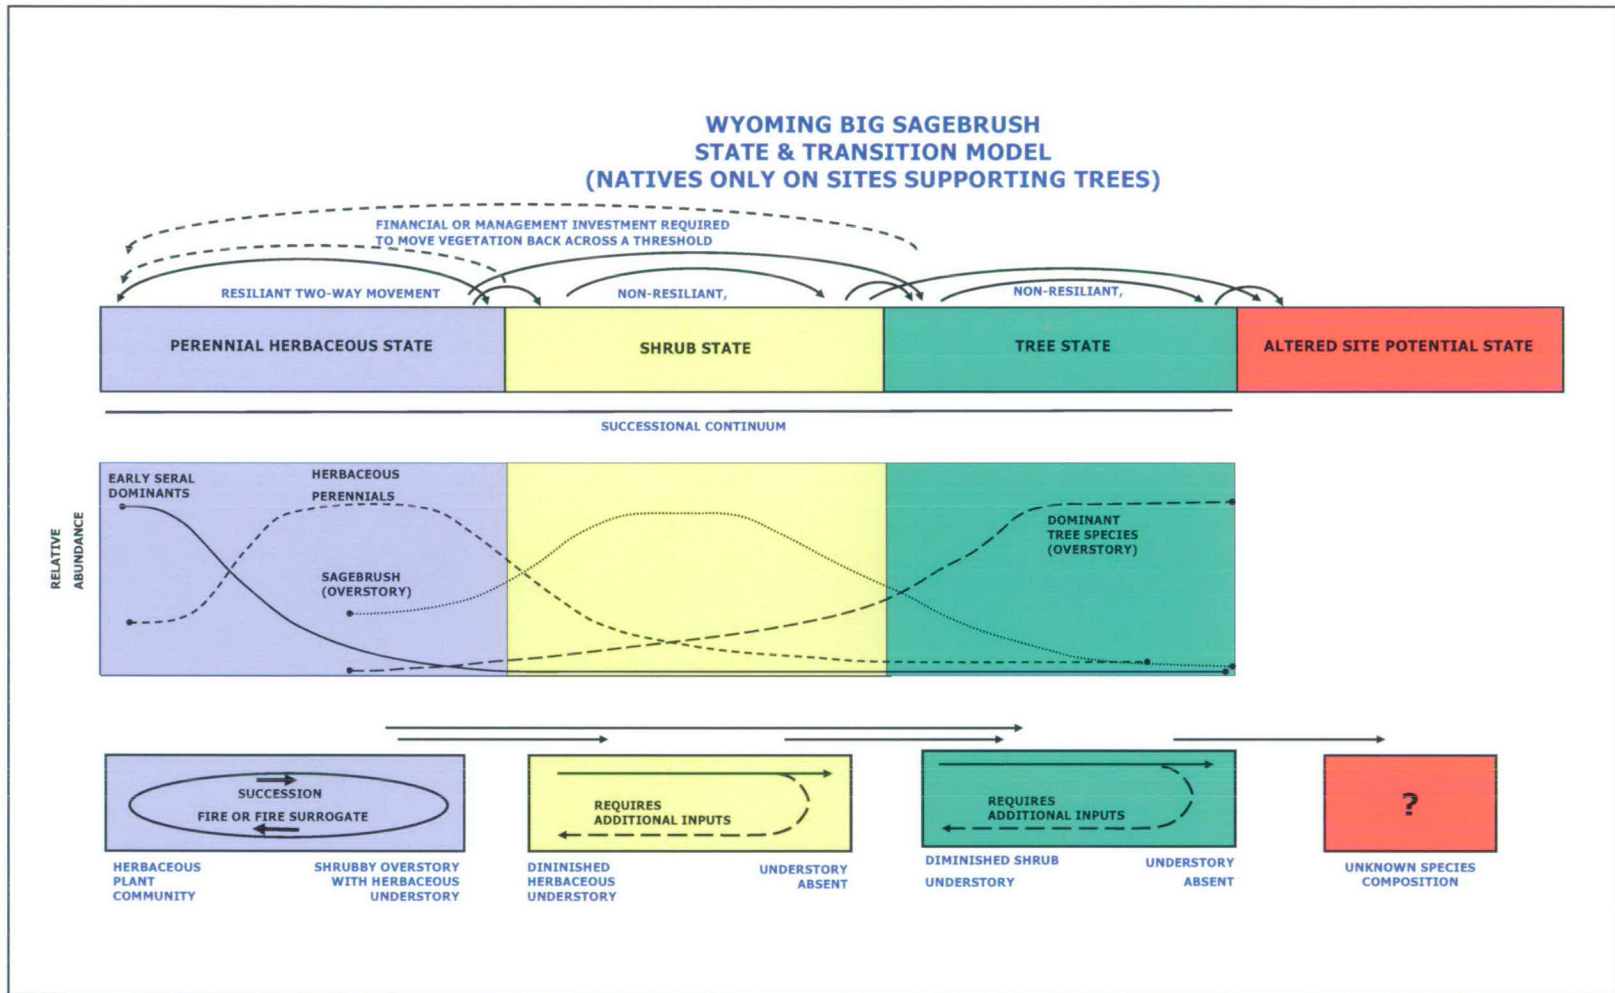

Figure C-2 Each box is shown as a different color to identify that it is a different state. The arrows between boxes are transitions across thresholds. Solid line arrows are irreversible transitions without active restoration of ecological processes, dashed arrows. Middle box shows relative abundance of plant groups and relative sequence of transitions through succession without proactive management.

understory is too sparse or weak to recover quickly after being released by fire or other major disturbance, the vegetation has crossed a threshold to the shrub or tree state. Large fires that remove sagebrush by leaving no islands and/or repeated fires that remove succeeding generations before their reproductive age (about five years) may create large landscape areas with few or no sagebrush plants for extended periods.

Management strategies: To maintain the state, limit over-development of shrub or tree cover to what is appropriate for a resilient herbaceous understory on the site. Intervene with prescribed fire, herbicide, mechanical control measures, or prescription grazing. Grazing can be managed to reduce stress to palatable species, especially during the growing season, which slows the advance of woody species. Grazing also can be used to accelerate the process of sagebrush recolonization after a fire. Shrub decrease can be fostered by relatively intense winter grazing by shrub-consuming herbivores. Concentration of livestock at feeding sites can reduce shrub density through mechanical damage to sagebrush, especially when these shrubs are frozen or dry and brittle. Grazing prescriptions should strive to maintain the vigor of the herbaceous community. Management to maintain the perennial herbaceous state is often much more cost effective than management to return to this state once a threshold has been crossed.

SHRUB STATE

Description: Herbaceous understory cover has decreased below a threshold level. Shrub cover has, or will soon, increase above a threshold level. Wyoming big sagebrush and/or unpalatable sprouting shrubs dominate the plant community. Spiny hop sage and other palatable shrubs are usually absent or rare in the shrub state. Perennial understory vegetation, especially deep-rooted bunchgrasses, is not capable of recovery after fire.

Successional trajectories: Native herbaceous understory declines substantially from perennial herbaceous state levels and trends toward absence when sagebrush cover reaches its maximum. If trees are present and not controlled, a plant community will transition to tree state. Because a threshold has been crossed, transition to the seeded perennial herbaceous state requires fire or other shrub control measures, reseeding operations, and follow-up management. Removal of grazing pressure alone may not restore the native herbaceous understory characteristic of the perennial herbaceous state or reduce shrub abundance. Burning or other shrub or tree control measures alone will not return the mix of deep-rooted bunchgrasses and other perennial herbaceous plants largely because the seed bank and seed source has been depleted. Woody plant removal will release fire-adapted shrubs and create open areas for early seral species, sagebrush, and invasive species, and/or accelerate erosion.

Management strategies: To maintain sagebrush stands, prevent wildfires but control junipers and/or pinyon pines as needed. To transition to the seeded perennial herbaceous state, apply shrub control measures in conjunction with reseeding. Shrub control measures could include prescribed fire, herbicide, mechanical, or shrub consuming herbivores. Because one or more thresholds have been crossed, reseeding is essential after wildfire. Reseeding, with appropriate seedbed preparation, planting date, and other methods should include a mix of adapted desired (native or nonnative) grass, forb, and shrub species. Where perennial herbaceous understory is weak and shrub cover is still well below maximum, investigate the feasibility of reseeding or adjusting grazing management to improve the vigor and density of desirable

APPENDIX C

species in the understory several growing seasons prior to controlling shrubs. The goal of re-establishing a desired herbaceous component may require a multi-step approach through many years or decades.

TREE STATE

Description: Juniper and/or pinyon pine has established on the area due to extended fire return interval. Although trees generally establish under shrub canopies, they can invade both the perennial herbaceous and shrub states. The understory (herbaceous and shrub) has decreased below a threshold level because tree cover has increased above a threshold level. Trees dominate the plant community, with leaf biomass and fuel buildup often 7 to 11 times the level of the perennial herbaceous or shrub states. However, canopy cover is concentrated, leaving large bare interspaces where rills can erode soil. The depleted perennial understory can no longer respond to fire or other tree-removing disturbances because seed banks and seed sources have been depleted.

Successional trajectories: The perennial herbaceous and/or shrub understory declines from previous state levels to almost absent as trees attain their mature height at normal density. Shrub cover declines to approximately 20 to 25 percent of potential when tree cover approaches 50 percent of maximum potential for the site (Tausch and West 1995; Miller et al. 2000). Each 1 percent increase in tree cover can lead to approximately a 5 percent decline in understory production. Post fire vegetation is dominated by early seral species and the limited number of species that survived tree dominance and fire or other tree removal. Because one or more thresholds have been crossed, transition to the seeded perennial herbaceous state requires shrub and/or tree control and reseeding. If native perennial understory is absent, fire or other tree control measures alone will not increase most herbaceous/shrub understory species to levels found in the perennial herbaceous state. Removing the trees will create open areas susceptible to invasive species, sagebrush and fire-tolerant shrubs and/or accelerated erosion. After large and/or hot fires, major soil erosion from severe wind or major precipitation events on moderate or steeper slopes, can trigger a transition to an altered site potential state. Accelerated soil erosion can also occur in large bare interspaces where rills can develop and erode soil quickly. This is more common on arid sites.

Management strategies: To manage this state for continued tree production, protection from fire is essential. However, as trees grow, fuel accumulates and tree canopies grow closer to each other, increasing the likelihood of a hot crown fire spreading across the landscape. Thinning to reduce crown cover, fuel load, and fuel connectivity, is critical to long-term maintenance of a woodland plant community. Continued net fuel production on this type often increases the risk of fires in neighboring woodland types including areas where trees are much older because fire was historically infrequent or lightning strikes caused only single-tree fires. Management plans should be designed to break up the landscape scale continuity of fuels with firebreaks, greenstrips, or imposed differences in vegetation structure.

To transition to the seeded perennial herbaceous state, apply tree control measures in conjunction with reseeding. Tree control measures could include prescribed fire, herbicide, or mechanical treatments. Reseeding should include adapted grass, forb, and shrub species and appropriate seedbed preparation, planting date, and follow-up grazing management and weed control where needed. Because one or more thresholds have been crossed, reseeding is essential after wildfire.

ALTERED SITE POTENTIAL STATE

Description: Accelerated erosion has thinned or eliminated the topsoil, altered hydrologic characteristics, and lowered water and nutrient holding capacity. These changes alter the ecological potential of the site. Thereafter, reduced vegetation cover and infiltration rate cause increased erosion that continues to diminish site potential until a new equilibrium is established.

Successional trajectories: The new site potential, the possible plant species for revegetation, and subsequent successional trajectories greatly depend on the soil remaining. For very shallow soils, plants survive by tolerating extended periods without available soil moisture or by sending roots deep into rock fissures. On sites where clayey subsoil becomes exposed at the surface after topsoil has been eroded away, roots must tolerate any shrink-swell characteristics of a clayey soil during germination. Their roots must be able to penetrate a heavy soil and they must be able to persist with less available soil moisture than within the intact non-eroded soil.

Management strategies: Because topsoil or even subsoil has been lost, return of the native perennial herbs and shrubs characteristic of the perennial herbaceous state depends on soil forming processes that are very slow under most conditions. The area should now be managed under the guidance provided by the state and transition model and ecological site description most similar to the altered site. It is expected that the species composition and limited productivity of the vegetation established on the altered site will have low resilience and minimal utility.

CONCLUSION

This state and transition model and management key is designed to help managers recognize opportunities to influence vegetation in a positive manner. It can be used for analysis at the site-specific or the landscape scale. Management opportunities are identified by determining the state and successional trajectory by examining the vegetation. Pathways toward thresholds indicate a need for action to prevent a transition to an unwanted state. Thus, the model and management key helps set short-term or long-term management objectives. Usually these objectives call for restoring resilience by encouraging natural processes. Management actions are less risky, less expensive, and more satisfying when or where important biological diversity remains and before difficult species, dangerous fuels, or accelerated soil erosion dominate ecological processes. That is, before crossing a threshold.

Across a landscape, the model helps focus attention on the highest priorities, those areas where an important management action or change has become urgent. Across most landscapes, there are hot spots where site specific management is urgently needed. There are other areas where the vegetation will remain resilient into the future and areas where the threshold has been crossed. Once the threshold is crossed and one state has transitioned into another, much resilience has been lost and the cost for vegetation treatments escalates. Management action may no longer be urgent or economically justified unless the new state puts neighboring areas at risk with invasive weed seeds or accumulating fuels.

APPENDIX C

In general the risk of losing the perennial herbaceous state is the highest priority. This state cycles among a variety of native plant communities to which many wildlife and other species have adapted, including the many sagebrush-dependent species. In addition, many other resource values are produced in one or more of the seral phases of this state. Its natural resistance to transitioning across a threshold due to its resilience following natural disturbances, makes this state a low-cost management objective. However, after the introduction of exotic invasive weeds and a century of altered fire regimes, this state is often at risk. Its increasing scarcity, and the presence of invasive weeds that can more easily dominate after transitioning to the shrub state, elevates its value and its priority for management. Where it no longer remains, the seeded perennial herbaceous state is its closest alternative.

Management does not equal preservation without disturbance. This state is maintained by periodic disturbance. The focus of land management in the Wyoming sagebrush type is to use management tools to simulate natural disturbances at the right times and with the right combination of other actions.

LANDFIRE AND FIRE REGIME CONDITION CLASS

LANDFIRE is a 5-year, multi-partner wildland fire, ecosystem, and wildland fuel mapping project that will generate consistent, comprehensive maps and data describing vegetation, fire, and fuel characteristics across the United States. These maps can assist in prioritizing and planning hazardous fuel reduction and ecosystem restoration efforts. The consistent and comprehensive nature of LANDFIRE methods ensures that data will be nationally relevant, while the 30-meter grid resolution ensures that data can be locally applicable. LANDFIRE meets agency, partner, and stakeholder needs for data to support landscape fire management planning, prioritization of fuel treatments, collaboration, community and firefighter protection, and effective resource allocation.

The objective of LANDFIRE is to provide consistent, nationwide data describing wildland fuel, existing vegetation composition and structure, historical vegetation conditions, and historical fire regimes to:

- Identify areas at risk due to accumulation of hazardous fuel
- Prioritize hazardous fuel reduction projects
- Improve coordination between agencies with regard to fire and other resource management
- Model real-time fire behavior to support tactical decisions to ensure sufficient wildland firefighting capacity and safety
- Model potential fire behavior and effects to strategically plan projects for hazardous fuel reduction and the restoration of ecosystem integrity on fire-adapted landscapes

Further information on LANDFIRE can be found at www.landfire.gov.

Fire Regime Condition Class is a standardized, interagency tool for determining the degree to which current landscape conditions have departed from historical reference condition vegetation, fuel, and disturbance regimes. Assessing Fire Regime Condition Class can help guide management objectives and assist in setting priorities for hazardous fuel treatments and ecological restoration.

Information on Fire Regime Condition Class can be found at www.frcc.org. An expanded definition for Fire Regime Condition Class is also included below.

APPENDIX C

FIRE REGIME CONDITION CLASS DEFINITION

A natural fire regime is a general classification of the role fire would play across a landscape in the absence of modern human mechanical intervention, but including the influence of aboriginal burning (Agee 1993, Brown 1995). Coarse-scale definitions for natural (historical) fire regimes have been developed by Hardy et al. (2001) and Schmidt et al. (2002) and interpreted for fire and fuels management by Hann and Bunnell (2001). The five natural (historical) fire regimes are classified based on average number of years between fires (fire frequency) combined with the severity (amount of replacement) of the fire on the dominant overstory vegetation. These five regimes include:

I – 0 to 35 year frequency and low (surface fires most common) to mixed severity (less than 75 percent of the dominant overstory vegetation replaced);

II – 0 to 35 year frequency and high (stand replacement) severity (greater than 75 percent of the dominant overstory vegetation replaced);

III – 35 to 100+ year frequency and mixed severity (less than 75 percent of the dominant overstory vegetation replaced);

IV – 35 to 100+ year frequency and high (stand replacement) severity (greater than 75 percent of the dominant overstory vegetation replaced); and

V – 200+ year frequency and high (stand replacement) severity.

As scale of application becomes finer, these five classes may be defined with more detail, or any one class may be split into finer classes, but the hierarchy to the coarse scale definitions should be retained.

A fire regime condition class is a classification of the amount of departure from the natural regime (Hann and Bunnell 2001). Coarse-scale fire regime condition classes have been defined and mapped by Hardy et al. (2001) and Schmidt et al. (2001). They include three condition classes for each fire regime. The classification is based on a relative measure describing the degree of departure from the historical natural fire regime. This departure results in changes to one (or more) of the following ecological components: vegetation characteristics (species composition, structural stages, stand age, canopy closure, and mosaic pattern); fuel composition; fire frequency, severity, and pattern; and other associated disturbances (e.g., insect and disease mortality, grazing, and drought). There are no wildland vegetation and fuel conditions or wildland fire situations that do not fit within one of the three classes.

The three classes are based on low (fire regime condition class I), moderate (fire regime condition class II), and high (fire regime condition class III) departure from the central tendency of the natural (historical) regime (Hann and Bunnell 2001), Hardy et al. 2001, Schmidt et al. 2002). The central tendency is a composite estimate of vegetation characteristics (species composition, structural stages, stand age, canopy closure, and mosaic pattern); fuel composition; fire frequency, severity, and pattern; and other associated natural

disturbances. Low departure is considered to be within the natural (historical) range of variability, while moderate and high departures are outside.

Characteristic vegetation and fuel conditions are considered to be those that occurred within the natural (historic) fire regime. Uncharacteristic conditions are considered to be those that did not occur within the natural (historical) fire regime, such as invasive species (e.g., weeds, insects, and diseases), "high graded" forest composition and structure (e.g., large trees removed in a frequent surface fire regime), or repeated annual grazing that maintains grassy fuels across relatively large areas at levels that will not carry a surface fire. Determination of amount of departure is based on comparison of a composite measure of fire regime attributes (vegetation characteristics; fuel composition; fire frequency, severity, and pattern) to the central tendency of the natural (historical) fire regime. The amount of departure is then classified to determine the fire regime condition class. A simplified description of the fire regime condition classes and associated potential risks follow.

Fire Regime Condition Class	Description	Potential Risks
Condition Class I	Within the natural (historical) range of variability of vegetation characteristics; fuel composition; fire frequency, severity, and pattern; and other associated disturbances	<p>Fire behavior, effects, and other associated disturbances are similar to those that occurred prior to fire exclusion (suppression) and other types of management that do not mimic the natural fire regime and associated vegetation and fuel characteristics.</p> <p>Composition and structure of vegetation and fuels are similar to the natural (historical) regime.</p> <p>Risk of loss of key ecosystem components (e.g., native species, large trees, and soil) are low.</p>
Condition Class II	Moderate departure from the natural (historical) regime of vegetation characteristics; fuel composition; fire frequency, severity, and pattern; and other associated disturbances.	<p>Fire behavior, effects, and other associated disturbances are moderately departed (more or less severe).</p> <p>Composition and structure of vegetation and fuel are moderately altered.</p> <p>Uncharacteristic conditions range from low to moderate.</p> <p>Risk of loss of key ecosystem components are moderate.</p>
Condition Class III	High departure from the natural (historical) regime of vegetation characteristics; fuel composition; fire frequency, severity, and pattern; and other associated disturbances.	<p>Fire behavior, effects, and other associated disturbances are highly departed (more or less severe).</p> <p>Composition and structure of vegetation and fuel are highly altered.</p> <p>Uncharacteristic conditions range from moderate to high.</p> <p>Risk of loss of key ecosystem components are high.</p>

More detailed descriptions of the fire regime condition classes and associated attributes are provided in the following table.

Condition Class	Fire Regime	Example Management Options	Examples of Key Ecosystem Component Susceptibility to Changing Fire Regime Condition Classes			
			Species Composition and Structure	Invasion by Nonnative Species	Smoke Production Hydrology and Soils	Insects and Disease
Condition Class I	Fire regimes are within the natural (historical) range, and the risk of losing key ecosystem components is low. Vegetation attributes (species composition, structure, and pattern) are intact and functioning within the natural (historical) range.	Where appropriate, these areas can be maintained within the natural (historical) fire regime by treatments such as fire use.	Species composition and structure are functioning within their natural (historical) range at both patch and landscape scales.	Nonnative species are currently not present or present in limited extent. Through time or following disturbance, sites are potentially vulnerable to invasion by nonnative species.	Functioning within their natural (historical) range.	Insect and disease populations functioning within their natural (historical) range.
Condition Class II	Fire regimes have been moderately altered from their natural (historical) range. Risk of losing key ecosystem components is moderate. Fire frequencies have departed from natural frequencies by one or more return intervals (either increased or decreased). This result in moderate changes to one or more of the following: fire size, intensity and severity, and landscape patterns. Vegetation and fuel attributes have been moderately altered from their natural (historical) range.	Where appropriate, these areas may need moderate levels of restoration treatments, such as fire use and hand or mechanical treatments, to be restored to natural fire regime.	Species composition and structure have been moderately altered from their historical range at patch and landscape scales. For example: <u>Grasslands</u> – Moderate encroachment of shrubs and trees and/or invasive exotic species. <u>Shrublands</u> – Moderate encroachment of trees, increased shrubs, or invasive exotic species. <u>Forestland/Woodland</u> – Moderate increases in density, encroachment of shade tolerant tree species, or moderate loss of shade tolerant tree species caused by fire exclusion, logging, or exotic insects or disease. Replacement of surface shrub/grass with woody fuels and litter.	Populations of nonnative invasive species may have increased, thereby increasing the potential risk for these populations to expand following disturbances, such as wildfires.	Have been moderately altered from their natural (historical) range. Water flow typically less. Smoke and soil erosion following fire typically greater.	Insect and disease population have been moderately altered from their natural (historical) range. Typically higher mortality or defoliation.
Condition Class III	Fire regimes have been substantially altered from their natural (historical) range. The risk of losing key ecosystem components is high. Fire frequencies have departed from natural frequencies by multiple return intervals. Dramatic changes occur to one or more of the following: fire size, intensity, severity, and landscape patterns. Vegetation attributes have been substantially altered from their natural (historical) range.	Where appropriate, these areas may need high levels of restoration treatments, such as hand or mechanical treatments, before fire can be used to restore the natural fire regime.	Species composition and structure have been substantially altered from their historical range at patch and landscape scales. For example: <u>Grasslands</u> – High encroachment and establishment of shrubs, trees, or invasive exotic species. <u>Shrublands</u> – High encroachment and establishment of trees, increased shrubs, or invasive exotic species. <u>Forestland/Woodland</u> – High increases in density, encroachment of shade tolerant tree species, or high loss of shade tolerant tree species caused by fire exclusion, logging, or exotic insects or disease.	Invasive species may be common and, in some cases, the dominant species on the landscape. Any disturbance will likely increase both the dominance and geographic extent of these invasive species.	Have been substantially altered from their historical range.	Insect and disease population have been substantially altered from their natural (historical) range. Typically higher mortality or defoliation.

APPENDIX D
AREAS OF CRITICAL ENVIRONMENTAL CONCERN

APPENDIX D AREAS OF CRITICAL ENVIRONMENTAL CONCERN (ACECs)

The ACEC designation is an administrative designation used by the BLM that is accomplished through the land use planning process. It is unique to the BLM in that no other agency uses this form of designation. The Federal Land Policy and Management Act states that the BLM will give priority to the designation and protection of ACECs in the development and revision of land use plans.

BLM regulations (43 Code of Federal Regulations part 1610) define an ACEC as an area "within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards." Private lands and lands administered by other agencies are not included in the boundaries of ACECs. ACECs differ from other special management designations such as wilderness study areas in that designation by itself does not automatically prohibit or restrict other uses in the area (with the exception that wind energy is prohibited and a mining plan of operation is required for any proposed mining activity within a designated ACEC). Specific management direction will be provided in the proposed plan, however, in order to be designated, special management beyond standard provisions established by the plan must be required to protect the relevant and important values.

RELEVANCE AND IMPORTANCE CRITERIA

Relevance

An area meets the relevance criteria if it contains one or more of the following:

- A significant historic, cultural, or scenic value (including but not limited to rare or sensitive archeological resources and religious or cultural resources important to American Indians).
- A fish and wildlife resource (including but not limited to habitat for threatened, endangered, or sensitive species, or habitat essential for maintaining species diversity).
- A natural process or system (including but not limited to threatened, endangered, or sensitive plant species; rare, endemic, or relic plants or plant communities which are terrestrial, aquatic, or riparian; or rare geological features).
- Natural hazards (including but not limited to areas of avalanche, dangerous flooding, landslides, unstable soils, seismic activity, or dangerous cliffs). A hazard caused by human action may meet the relevance criteria if it is determined through the RMP process that it has become part of a natural process.

Importance

The value, resource, system, process, or hazard described in the relevance section must have substantial significance and values to meet the importance criteria. This generally means that the value, resource, system, process, or hazard is characterized by one or more of the following:

- Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource.
- Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change.

APPENDIX D

- Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of Federal Land Policy and Management Act.
- Has qualities that warrant highlighting in order to satisfy public or management concerns about safety and public welfare.
- Poses a substantial threat to human life and safety or to property.

SUMMARY

A total of 128 nominations, including 3 existing ACECs, were considered as part of the Ely land use planning process. Several of these nominations pertained to the same areas and, therefore, were combined for a total of 100 nominated areas. The work of an internal review group is summarized in **Table D-1**. This table displays the nominated areas and explains why 77 of these areas met relevance and importance. **Table D-1** summarizes how relevant and important resources within these areas are protected by the different alternatives and if ACEC designation is needed.

After nomination, the boundaries and acreages for some nominated areas were adjusted to more closely reflect the values of the relevant and important resource. Therefore, the acreage of the final proposed ACEC may not match the acreage presented in **Table D-1**.

The 3 existing and 22 new potential ACECs are described in this appendix and shown on **Maps D-1** through **D-4**. Legal descriptions for the potential ACECs are presented in **Table D-2**.

**Table D-1
Determination of Relevance and Importance of Nominated ACECs**

Nomination	Acres/Miles	Primary Resource Values	Met Relevance	Met Importance	Rationale for not Designating
ACECs should be established to protect the largest old growth of pinyon-juniper forests and their habitats	Unknown	Old growth pinyon-juniper	No	No	N/A
Alamo Pictograph Site (Pahranagat Rock Art)	480 acres	Rock art	Yes	Yes	1,3
All remaining sage grouse and pygmy rabbit habitats	Approximately 5.0 million acres	Sage grouse and pygmy rabbit habitats	Yes	Yes	1
All riparian areas should be inventoried for their potential or historic status as fisheries. They should have special management to achieve and maintain this potential.	Unknown	Riparian habitats	No	No	N/A
Andy's Mine Trilobites	100 acres	Trilobites	Yes	Yes	1
Ash Springs (Pahranagat Rock Art)	160 acres	Rock art	Yes	Yes	1
Baker Archaeological Site	80 acres	Freemont habitation site	Yes	Yes	ACEC
Baking Powder Flat	13,012 acres	<i>Baking Powder Flat Blue butterfly</i>	Yes	Yes	ACEC
Beaver Dam Slope ACEC	36,900 acres	Critical desert tortoise habitat	Yes	Yes	ACEC
Bennett Springs	520 acres	Earliest settlement in district. Lost 49ers Trail passed through the area.	Yes	Yes	1,3
Black Canyon (Pahranagat Rock Art)	400 acres	Rock art	Yes	Yes	1,3
Blue Mass Scenic Area	950 acres	Scenic pastoral setting with rock art	Yes	Yes	ACEC
Bristol Wells	400 acres	Historic mining town, cemetery, and charcoal kilns	Yes	Yes	1
Carbonari sites	21,279 acres	Historic charcoal production sites	Yes	Yes	1,3
Cave Valley Cave Geologic Area	40 acres	Cave resources	Yes	Yes	1
Chisolm Mine Trilobite Area	160 acres	Trilobite area	Yes	Yes	1
Christmas Wash (Snake Range Rock Art)	1,920 acres	Rock art	Yes	Yes	1,2,3
Condor Canyon	6,900 acres	Riparian habitat and scenic canyon	Yes	Yes	ACEC
"The Crack"	5 miles	Earthquake upheaval that snakes over floor of Dry Lake Valley	No	No	N/A
Crystal Wash (Pahranagat Rock Art)	1,440 acres	Rock art	Yes	Yes	1
Currant/Lund Route	35 miles	Historic emigrant and teamster road with remnants	No	No	N/A
Delamar	4,160 acres	Historic mining town and cemetery	Yes	Yes	1
Delamar Mountain Range	90,000 acres	Aid in management of desert bighorn sheep	No	No	N/A
Evergreen Flat (Pahranagat Rock Art)	960 acres	Rock art	Yes	Yes	1
Flat Spring	42 acres	Cold spring system for the <i>Pyrgulopsis cruciglans</i> (snail)	Yes	Yes	1
Frenchy Flat (Pahranagat Rock Art)	220 acres	Rock art	Yes	Yes	1,3
Garnet Hill	1,210 acres	Rock hounding area	Yes	Yes	ACEC
Garrison Archaeological Site	160 acres	Freemont village site	Yes	Yes	1,3
George Keil Memorial Botanical Area	464 acres	Gigantic limestone monolith, ancient and rejuvenated bristlecone pines, Sonoran cactus, virgin Engelmann spruce	No	No	N/A
Gleason Canyon and Panaca Charcoal Kilns	4,000 acres	Region of sandstone shelters, and side canyons, with tall scattered ponderosa pines and pioneer charcoal kilns	Yes	Yes	1
Golden Gate Range	Unknown	Archaeologic and scenic values	No	No	N/A
Goshute Lake	18,360 acres	Paleo-Indian site	Yes	Yes	1,3
Hampton Creek	½ mile on public land	Nomination stated creek was inhabited by the state endangered Utah cutthroat trout (correctly named the Bonneville cutthroat trout)	Yes	Yes	1
Hell's Half Acre (Pahranagat Rock Art)	320 acres	Rock art	Yes	Yes	1,3
Hendry's Creek	0.3 mile on public land	Nomination stated creek was inhabited by the state endangered Utah cutthroat trout (correctly named the Bonneville cutthroat trout)	Yes	Yes	1
Hendry's Creek/Rock Animal Corral	3,300 acres	Archaeological site	Yes	Yes	ACEC
Highland Range, including Highland Peak and Anderson Canyon	11,962 acres	Ancient bristlecone pines, <i>Hypaurotis crysalus intermedia</i> , <i>Satyrium saepium</i> , <i>latilnea</i> , intermountain bristlecone pine woodland, montane	Yes	Yes	ACEC

APPENDIX D

Table D-1 (Continued)

Nomination	Acres/Miles	Primary Resource Values	Met Relevance	Met Importance	Rationale for not Designating
		shrublands, butterfly diversity			
Hiko Canyon (Pahranagat Rock Art)	15 acres	Rock art	Yes	Yes	1,3
Hiko Mountain Range	21,000	Aid in management of desert bighorn sheep	No	No	N/A
Honeymoon Hill/City of Rocks	3,900 to 5,900 acres	Rock art	Yes	Yes	ACEC
Jake's Valley Paleo Shoreline	19,209 acres	Paleo-Indian site	Yes	Yes	1,3
Kane Springs ACEC	57,190 acres	Critical desert tortoise habitat	Yes	Yes	ACEC
Kious Springs Scenic Area	40 acres	Scenic monolith and flora area	No	No	N/A
Kixmiller Ranch	10 acres	Historic charcoal kilns	Kilns are located on private land		N/A
Leviathan Cave Geologic Area	160 acres	"Picture window" cave entrance with huge interior room and wondrous speleothems	Yes	Yes	1,2
Lote's Canyon	Unknown	Scenic cultural values and rock art	No	No	N/A
Lower Meadow Valley Wash	39,000 acres	Biological resources (endangered, threatened, and candidate species)	Yes	Yes	ACEC
Magnolia and Boundary Canyons and North Creek	Unknown	Unique natural arches	Could not determine their location and the nominator did not respond to requests for information.		N/A
Mahoney Canyon Jasperoid Source	200 acres	Tool stone quarry	Yes	Yes	1,3
Meadow Valley Mountain Range	165,000 acres	Aid in management of desert bighorn sheep	No	No	N/A
Meteor Crater	1 acre	Reported meteor impact site	No	No	N/A
Modena Obsidian Source	13,260 acres	Obsidian source	Yes	Yes	1,3
Mojave/Utah Yucca Natural Area	Unknown	Farthest known northern occurrence of yucca cactus	No	No	N/A
Moriah Site (Pahranagat Rock Art)	640 acres	Rock art	Yes	Yes	1,3
Mormon Barrel Cactus	45,772 acres	Scenic quality of barrel cactus	No	No	N/A
Mormon Mesa ACEC	109,700 acres	Critical desert tortoise habitat	Yes	Yes	ACEC
Mormon Mountain Range	90,000 acres	Aid in the management of desert bighorn sheep	No	No	N/A
Mormon Peak Caves, Mormon Mountains and Mormon Peak	123,000 acres	Agave roasting pits, rock shelters and caves	Yes	Yes	1,2,3
Mount Irish	26,200 acres	Rock art	Yes	Yes	ACEC
Negro Creek (Snake Range Rock Art)	560 acres	Rock art	Yes	Yes	1,3
Oak Spring Summit Trilobite Trail	40 acres	Trilobites	Yes	Yes	1
Oak Spring Summit, Delamar Joshua Tree Forest	2,400 acres	Joshua tree forest and fossils	No	No	N/A
Osceola and Osceola Ditch	14,600 acres	Historic townsite and ditch	Yes	Yes	ACEC
Pahroc Rock Art	3,200 acres	Rock art and rock shelters	Yes	Yes	ACEC
Park Range Aboriginal Sites	42,154 acres	High altitude aboriginal sites	Yes	Yes	1,2
Park Range Pristine Meadows	1,280 acres	Pristine meadows	Yes	Yes	1,2
Pennsylvania Canyon	15,000 acres	Geological sight-seeing	No	No	N/A
Pine (Ridge) Creek	2.5 miles	Nomination stated that the creek was inhabited by the state endangered Utah cutthroat trout (correctly named the Bonneville cutthroat trout)	Yes	Yes	1
Pony Springs Open Space Reserve	39,100 acres	Pinyon pine and juniper area	No	No	N/A
Pygmy Sage Research Natural Area	160 acres	Pygmy sage habitat	Yes	Yes	ACEC
Quaking Aspen Spring	40 acres	Recreation	No	No	N/A
Rainbow Canyon	45,827 acres	Scenic volcanic gorge and rock art	Yes	Yes	1,2
Rose Guano Bat Cave	40 acres	Historic guano mine and cave	Yes	Yes	ACEC
Ruin Wash and Klondyke Gap	160 acres	Fossils	Yes	Yes	1
Sawmill Canyon	9,920 acres	Historic timber operations and rock art	Yes	Yes	1,3
Scarlet Buckwheat-White Rock	642 acres	<i>Eriogonum Phoenicium</i>	Yes	Yes	1
Schlesser Pincushion	6,468 acres	Schlesser Pincushion cactus	Yes	Yes	ACEC
Shooting Gallery	20,700 acres	Rock art	Yes	Yes	ACEC
Shoshone Ponds Natural Area	1,240 acres	Rocky Mountain juniper trees living in hostile alkali valley soils. Spring-fed pools containing rare and endangered Pahrump killifish and Relic Steptoe Dace.	Yes	Yes	ACEC

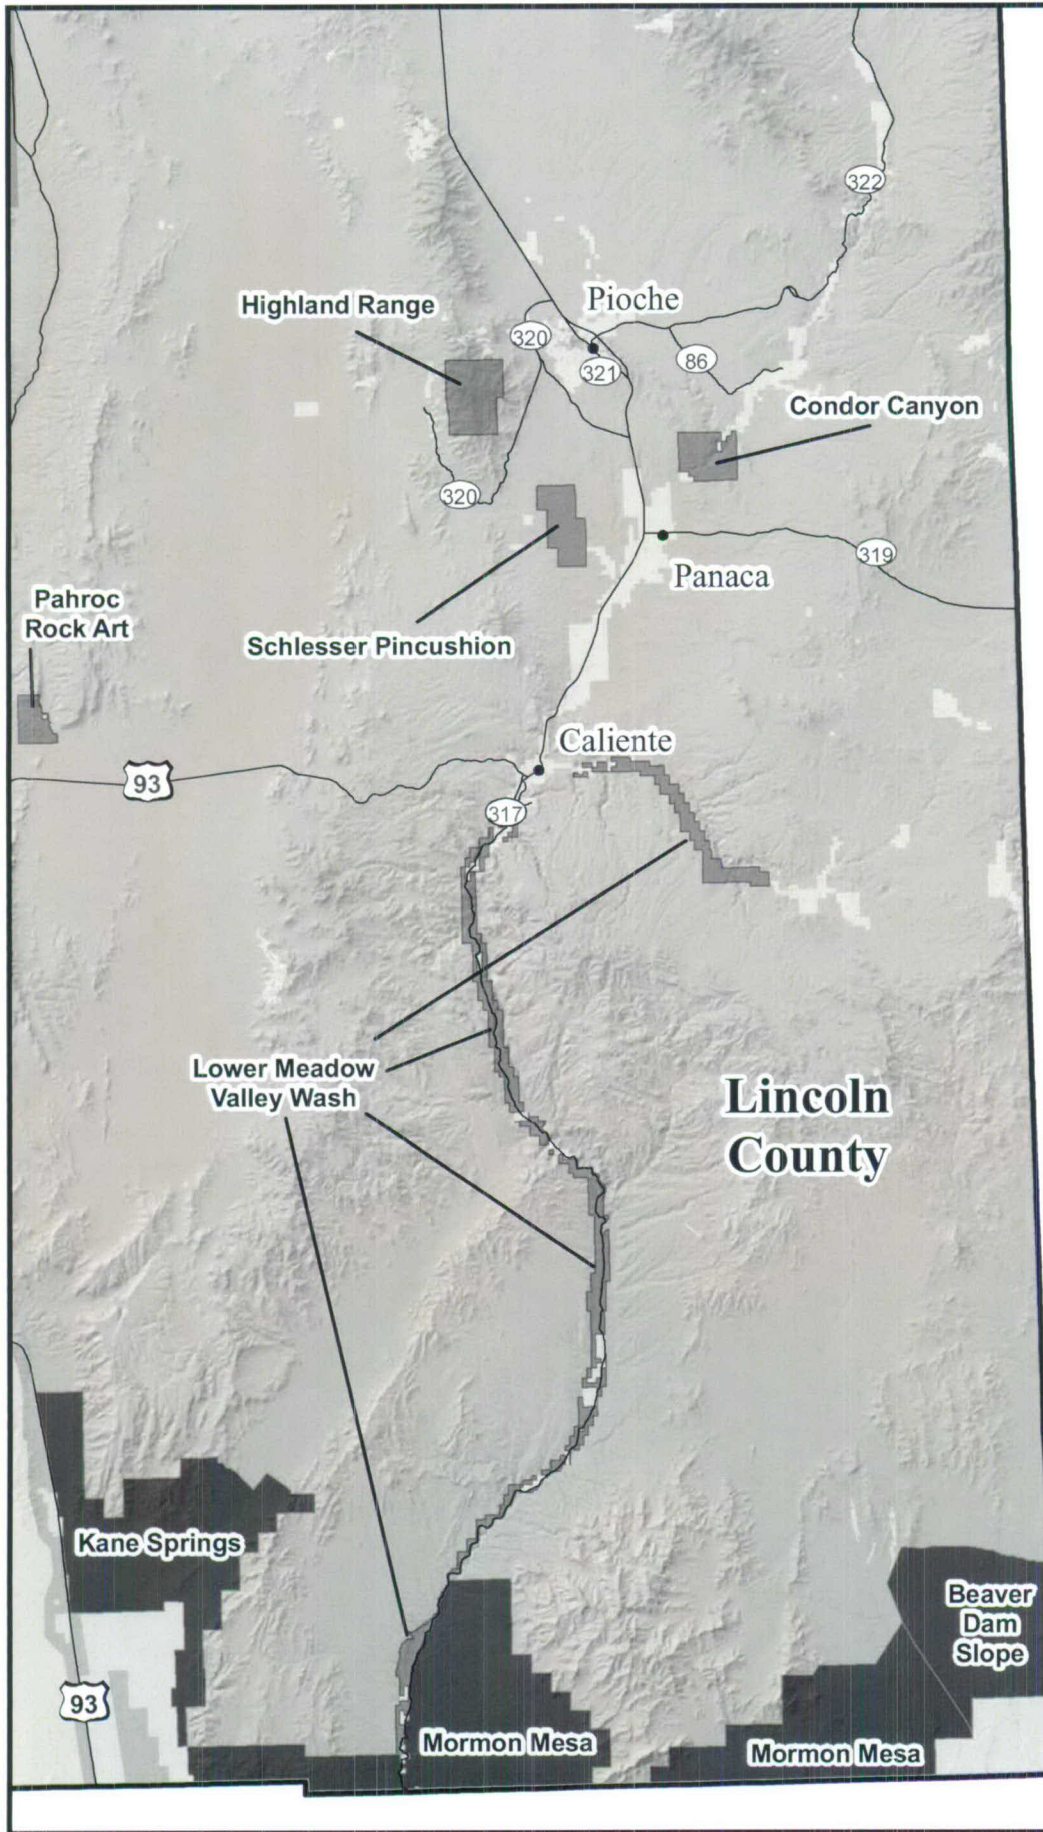

Table D-1 (Continued)

Nomination	Acres/Miles	Primary Resource Values	Met Relevanc e	Met Importanc e	Rationale for not Designati ng
Six Mile Flat (Pahranagat Rock Art)	2,160 acres	Rock art	Yes	Yes	1,3
Snake Creek Indian Burial Cave	40 acres	Archaeological resource and cave	Yes	Yes	ACEC
South Pahroc Range	28,395 acres	Geologic sight-seeing and desert bighorn sheep habitat	No	No	N/A
Spring Valley Waterfowl Area	9,733 acres	Natural wildlife resource system	No	No	N/A
Stateline Canyon Graveyard (Rice Family Cemetery)	10 acres	Historic graveyard	Yes	Yes	1
Step toe Valley Crescent spot	1,937 acres	Sensitive status species of butterfly and its habitat	Yes	Yes	1,3
Sunshine Locality National Register District	34,540 acres	Paleo-Indian site	Yes	Yes	1,3
Swamp Cedar Natural Area	3,200 acres	Rocky Mountain juniper trees living in alkali valley soils. Battlefield of the Goshute War of 1863.	Yes	Yes	ACEC
Tempiute Obsidian Source	29,767 acres	Obsidian source	Yes	Yes	1,3
Tepee Rocks	160 acres	Geologic sight-seeing	No	No	N/A
Tri-county Paleo Site	19,967 acres	Paleo-Indian site	Yes	Yes	1,3
Tunnel Canyon	200 acres	Fremont pictographs	Yes	Yes	1,3
Turnley Spring	41 acres	Cold spring system of the <i>Pyrgulopsis peculiaris</i> (snail)	Yes	Yes	1
Tybo/Duckwater Route	60 miles	Historic emigrant, stage and teamster route	No	No	N/A
Upper Meadow Valley Archaeological Zone	980 acres	Prehistoric campsites and rock art	Yes	Yes	1,3
Ward Mining District	2,500 to 11,000 acres	Historic mining area	Yes	Yes	ACEC
Weaver Creek Scenic Area	½ mile of public land	Nomination stated the creek was inhabited by the state endangered Utah cutthroat trout (correctly named the Bonneville cutthroat trout).	Nevada Department of Wildlife cannot establish a Bonneville cutthroat trout fishery because water levels are not dependable.		N/A
Weepah Spring (Pahranagat Rock Art)	5,120 acres	Rock art	Yes	Yes	1,2,3
Whipple Cave Geologic Area	160 acres	Cave resources	Yes	Yes	1,2
White River Narrows (Pahranagat Rock Art)	8,960 acres	Rock art	Yes	Yes	1
White River Valley	15,556 acres	<i>Frasera gypsicola</i> , <i>Cryptantha welshii</i> , <i>Lepidium nanum</i> , <i>Mentzelia tiehmi</i> , <i>Asclepias Rastwoodiana</i> , <i>Phacelia parishii</i> , <i>Townsendia jonesii</i> var, <i>tumulosa</i> , pygmy sagebrush dwarf shrublands (sensitive plants)	Yes	Yes	ACEC
Worthington Peak, Golden Gates, Mount Wilson and Scottie's Cabin	Unknown	Ponderosa pine groves	No	No	N/A
Yucca Gardens	Unknown	Unique suspect succulent cactus hybrid ecology	Field visit to the area did not reveal the unique suspect succulent cactus hybrid ecology identified in the nomination.		N/A

¹ Special management attention is not required to protect the potential ACEC because standard or routine management prescriptions are sufficient to protect the resource or value from risks or threats of damage/degradation. (That is, the same management prescriptions would have been provided for the area in the absence of the important and relevant values.)

² The area is being proposed for designation under another statutory authority, e.g., designated wilderness, and requires no management attention differing from that afforded the entire designation.

³ The manager has concluded that no special management attention is justified either because exposure to risks of damage or threats to safety is greater if the area is designated or there are not reasonable special management actions which can be taken to protect the resource from irreparable damage or the restore it to a viable condition.

DETAILED DESCRIPTIONS OF EXISTING AND PROPOSED ACECs**Existing ACECs****Beaver Dam Slope, Kane Springs, and Mormon Mesa ACECs**

The Beaver Dam Slope ACEC is located in southeast Lincoln County east of the Mormon Mesa ACEC and west of the Nevada/Arizona/Utah border. The ACEC extends north from the Lincoln/Clark County line and northwest of the city of St. George, Utah. The Kane Springs ACEC is located in southwestern Lincoln County, west of the Mormon Mesa ACEC. The ACEC extends north along U.S. Highway 93 towards Alamo from the Lincoln/Clark County border. The Mormon Mesa ACEC is located in south central Lincoln County west of the Kane Springs ACEC and east of the Beaver Dam Slope ACEC. The ACEC extends north from the Lincoln/Clark County line and the cities of Mesquite and Moapa, Nevada, near the Mormon Mountain Range.

These ACECs offer several relevant and important features and encompass important desert tortoise and hot desert wildlife habitats in Lincoln County. The Mormon Mesa ACEC also includes riparian habitats on BLM-administered land along the Lower Meadow Valley Wash for several other sensitive or listed Mojave species including the federally threatened southwestern willow flycatcher and federal candidate yellow-billed cuckoo.

The current condition and trend of the relevant and important values of these ACECs are byproducts of historic human uses, present human uses, and unnatural and reoccurring fire regimes. The area is composed of a mixture of Mojave vegetative communities, including northern and southern desert shrub and annual grasslands. In some areas native shrubs, cactus, yuccas, and Joshua trees composition has been replaced with non-native red brome and native annual grasses due to increased fire frequency and intensity. Previous grazing use by domestic cattle and sheep and wild horses and burros, have additionally altered the vegetative state and composition of the Mojave habitats within the ACECs. Development in adjoining non-ACEC designated areas is increasing near the communities of Las Vegas, Mesquite, Moapa, and Alamo. The ACECs also are receiving tremendous increases in recreational utilization and off-highway vehicle use due to an ever increasing demand placed on these resources from the growing populations of the greater Las Vegas area. Desert tortoise populations in the northeastern Mojave remain relatively low, but mostly stable.

Threats

The current threats and risks to the wildlife and critical Mojave Desert wildlife habitats of Kane Springs, Mormon Mesa, and Beaver Dam Slope ACECs include: conversion of Mojave shrub habitats to annual grassland from altered fire regimes, habitat fragmentation from past development/actions within ACECs and current development and habitat loss adjacent to ACECs, direct mortality and indirect alteration of habitat from vehicles and off-highway vehicle use, and increased predation rates due to habitat fragmentation and increased predator abundance and distribution resulting from human activity and actions.

APPENDIX D

Proposed ACECs

Baker Archaeological Site

The Baker Archaeological Site is located in White Pine County, Nevada, about 1.5 to 2 miles northwest of Baker, Nevada. This ACEC, in Snake Valley, is located on the eastern edge of the planning area.

This area is a potential ACEC based on the prehistoric values it contains. The Baker Archaeological Site is a Fremont habitation site containing foundations of several structures. The positioning of the structures indicates the inhabitants' use of the sun to aid them in determining seasons. Evidence of agriculture was found during the excavations. To date, this site is the furthest west and north Fremont site in the U.S.

Threats

Threats to the historic resources include livestock grazing, visitor use, weathering, the potential for the designation of rights-of-way, and mineral development. Several lands and realty actions have occurred immediately adjacent to or within the Baker Archaeological Site. The Baker Archaeological Site occurs within the Baker Creek grazing allotment.

Baking Powder Flat

Baking Powder Flat ACEC is located in Spring Valley in White Pine County about 12 miles south of Highway 50 and lies in the valley east of Lake Valley Summit. The valley bottoms in the area have sandy soils and low sand dunes that provide exemplary habitat for the rare, endemic Baking Powder Flat blue butterfly (*Euphilotes bernardino minuta*) a BLM sensitive status species. Six of seven separate occurrences on public lands within the planning area were located in Spring Valley. Baking Powder Flat ACEC harbors four occurrences and is the largest contiguous habitat for the blue butterfly.

This area is a potential ACEC to protect the habitat essential for maintaining the Baking Powder Flat Blue butterfly. Its host plant, Shockley buckwheat (*Eriogonum shockleyi* var. *shockleyi*) is a common mound-forming plant often found on fine-textured substrates. This plant reaches exceptional diameters at this location and is the predominant plant in the valley bottom land.

Threats

Threats to the continued existence of this butterfly include limited habitat and potential damage to Shockley buckwheat by permitted cattle and wild horse grazing. Additional threats include habitat damage from off-highway vehicles, construction of new roads, land sales, and rights-of-way designation.

Blue Mass Scenic Area

Blue Mass Scenic Area is located in northern White Pine County approximately 9 miles from the Utah border in the Kern Mountains. The geology of the area is mostly granitic. The area is made up of a winding canyon and many rock hoodoos (a column, pinnacle, or pillar of rock produced by differential weathering.) with Blue Mass creek flowing through.

This area is a potential ACEC for the preservation of the high scenic values and unusual geology.

Threats

Threats and risks to the scenic qualities of Blue Mass include increased recreation and visitation resulting in an increase in off-highway vehicle use, vehicle route proliferation, and an increase in the number of informal campsites.

Condor Canyon

Condor Canyon is a steeply confined and isolated canyon located within the Meadow Valley Wash of Lincoln County, Nevada, 4 miles north of Panaca. The canyon encompasses 4 miles of perennial stream reach, which is moderately to deeply entrenched by 10-foot sandy high-flow walls and a man-made railroad levee. Condor Canyon is comprised only of BLM-administered lands.

This area is a potential ACEC for the protection of significant historic, cultural, archaeological, and scenic values and critical terrestrial and aquatic wildlife habitats. Features include numerous prehistoric lithic/ceramic scatters, rock shelters and overhangs, and rock art locations encompassing hundreds of panels of both pictograph and petroglyphs. In addition, remnants of mill foundations, dugouts, trails, and artifact scatters exist within the canyon. Both the Pioche-Bullionville Narrow Gauge Railroad (Circa 1870) and Union Pacific Pioche/Caliente Railroad (Circa 1900) remain evident within the canyon. Condor Canyon contains designated critical habitat (50 Federal Register 12298) for Big Spring spinedace (*Lepidomeda mollispinis pratensis*) and harbors the only known population of this federally threatened species. Additionally, the U.S. Fish and Wildlife Service Species of Concern and Nevada State Sensitive, Meadow Valley Wash desert sucker (*Catostomus clarki* ssp.) and Meadow Valley Wash speckled dace (*Rhinichthys osculus* ssp.) occur within Condor Canyon.

Threats

Several threats and risks exist to the critical wildlife habitats and cultural resources of Condor Canyon. Pre-historic pictograph and petroglyph rock art panels are highly susceptible to intense heat and subsequent rock exfoliation from reoccurring wildfires. Additionally, fish species of Condor Canyon are extremely vulnerable to catastrophic events, habitat modification, or loss and associated habitat fragmentation from natural and human induced biotic and abiotic impacts. Increased recreation and visitation to the canyon have brought increased off-highway vehicle and impacts to the terrestrial and aquatic habitats during all periods of the year and has increased the likelihood of the spread or introduction of nonnative species, vandalism or removal of historic artifacts and resources, and toxic or unwanted substance releases into the stream.

Garnet Hill

Garnet Fields rock hound area (Garnet Hill) is located in White Pine County approximately 6 miles west of Ely.

This area is a potential ACEC for the protection of Garnet Hill, a nationally-known rock hound area that is famous for dark red garnets.

APPENDIX D

Threats

Several threats and risks to the resource include the potential for commercial mining activity as well as illegal collecting of garnets for commercial sale. An increase in recreation in the Ely area has led to increased visitation and vandalism at the Garnet Hill site.

Hendry's Creek/Rock Animal Corral Archaeological Site

The proposed Hendry's Creek/Rock Animal Corral ACEC is located in White Pine County, Nevada, about 15 miles north of Baker, Nevada. This proposed ACEC, in the Snake Range, is located along the eastern border of the planning area.

This area is a potential ACEC for the protection of the prehistoric values it contains including several rockshelters, pictographs, lithic scatters, and the rock animal corral itself."

Threats

Several threats and risks exist than may affect the relevant and important values in the proposed Hendry's Creek/Rock Animal Corral ACEC. These threats and risks include decorative stone removal, off-highway vehicle use, and visitor use.

Highland Range

The Highland Range is located in Lincoln County approximately 6 miles west of Pioche.

This area is a potential ACEC for the protection of the habitat for several populations of globally rare butterflies including the intermediate Colorado hairstreak (*Hypaurotis crysalus intermedia*), and broadlined saepium hairstreak (*Satyrium saepium latilinea*) and habitat for basin waxflower (*Jamesia tetrapetala*) a BLM sensitive status species that commonly grows in association with bristlecone pine.

Threats

Threats to this habitat include wildland fire, mineral development, off-highway vehicle use, and rights-of-way designation.

Honeymoon Hill/City of Rocks

The proposed Honeymoon Hill/City of Rocks ACEC is located in White Pine County, Nevada, about 25 to 30 miles southwest of Ely, Nevada. This area, in Jakes Wash, is located in the central portion of the planning area.

This area is a potential ACEC based on the prehistoric values and geologic scenic values it contains. The Honeymoon Hill archaeological site is a part of a much larger archaeological site complex known as the City of Rocks. It includes an extensive prehistoric chert quarry, a large, upland Paleo-Indian site, later Archaic occupation, numerous rock shelters exhibiting red pictographs, and scattered shards of brown ware pottery, presumably of Numic origin. Honeymoon Hill is the only identified petroglyph location within this complex.

Threats

Threats and risks that could affect the relevant and important values in the Honeymoon Hill/City of Rocks area are off-highway vehicle use, visitor use, rights-of-way designation, and mineral exploration and development. Disposal of land within the ACEC also could threaten the resources being protected.

Lower Meadow Valley Wash ACEC

The Lower Meadow Valley Wash is an 80-mile perennial stream stretch of the historic Meadow Valley Wash. The Lower Meadow Valley Wash begins 2 miles east of Barclay, Nevada near the Utah/Nevada State Line, at the Big Springs in the Clover Creek drainage, flows west-by-northwest through Caliente, then south through Elgin, Carp, and Rox Nevada toward the Lincoln Clark County Line. It includes the perennial inflows of Ash and Pine Creek from the Clover Mountains. The Lower Meadow Valley wash feeds into the Muddy River and Virgin River drainage of the Lower Colorado River System.

This area is a potential ACEC for the protection of federally endangered, threatened, and candidate species, as well as Nevada State protected species and BLM Sensitive species. Some of the more prominent terrestrial and aquatic species include southwestern willow flycatcher (endangered), desert tortoise (threatened), yellow-billed cuckoo (candidate), Meadow Valley Wash desert sucker and speckled dace (sensitive), Arizona toad (sensitive), and chuckwalla (sensitive).

Threats

Threats to habitat potential for terrestrial and aquatic wildlife species include poorly managed grazing, railroad and state highway right-of-way alteration of hydrologic regimes, damming and channelization of the stream flow, re-direction/diversions of stream flows, habitat removal/fragmentation, non-native weed (salt cedar, tall whitetop, etc.) monotypic dominance, loss of terrestrial understory, decreased native vegetative resiliency, increased fire and flood frequency, increased fire and flood impacts from sedimentation and down cutting, and degraded water quality.

Mount Irish

The proposed Mount Irish ACEC is located in Lincoln County, Nevada, about 8 miles west of Hiko, Nevada in the southwest portion of the planning area.

This area is a potential ACEC for the protection of the prehistoric and historic values it contains. The area includes the Mount Irish Archaeological District, as well as two historic sites; remnants of the Pahrnagat Mining District, Crescent Mill, and Logan City. Crescent Mill is located on public land in a drainage area on the west side of Mt. Irish. Thousands of petroglyphs have been located on Mount Irish, but the entire archaeological district has not been fully explored. Petroglyph panels are associated with other cultural features including lithic scatters, pottery scatters, rockshelters with deposits, and an occasional pictograph. The Mount Irish rock art is particularly important because of its research potential. Crescent Mill and Logan City are part of Nevada's earliest mining era. They also are part of the Pahrnagat mining district, which was organized in 1865, and Crescent Mill is a remnant of Southern Nevada's first major mining booms. Logan City is located in the hills south of Mount Irish on the east side of the range at the base of a cliff with dramatic horizontal strata of water deposited volcanic ash. The Pahrnagat Mining District is on Mount Irish in the Pahrnagat Range about 10 miles northwest of Hiko.

APPENDIX D

Threats

Threats that could impact the relevant and important values in the proposed Mount Irish ACEC include off-highway vehicle use, visitor use, locatable mineral development, livestock grazing, and land disposals.

Osceola and Osceola Ditch

The proposed Osceola/Osceola Ditch ACEC is located in White Pine County, Nevada, about 35 miles east of Ely, Nevada. This area, in the Snake Range, is located in the eastern central portion of the planning area.

This area is a potential ACEC for the protection of the historic values it contains.

Osceola

The Osceola district was organized in October 1872 after placer gold was discovered the previous summer. Osceola has gained at least three distinctions: its pioneering use of hydraulic hoses in the 1880s, a massive gold nugget (probably Nevada's largest) that was found in 1877 reportedly weighed over 20 pounds and was valued at approximately \$6,000, and most important, it survived longer than any other placer camp in Nevada. (All information about Osceola from Paher 1970 – Nevada Ghost Towns and Mining Camps.)

Osceola Ditch

The Osceola (east) Ditch was constructed in 1889-1890 by the Osceola Gravel Mining Company. It consists of the east ditch, a wooden flume, and a rock dam that was used for transporting water for hydraulic mining operations at Osceola.

Threats

Several threats and risks exist that may affect the relevant and important values in the proposed Osceola/Osceola Ditch ACEC. These threats and risks are locatable mineral development, visitor use, off-highway vehicle use, natural deterioration of the ditch and cemetery, and trespass/unauthorized use.

Pahroc Rock Art

The proposed Pahroc Rock Art ACEC is located in Lincoln County, Nevada, about 35 miles west of Caliente, Nevada. This area, in the North Pahroc Range, is located in the south central portion of the planning area.

This area is a potential ACEC for the protection of the prehistoric values it contains. These prehistoric values include several petroglyphs, rock shelters, and other artifacts indicating ongoing use in this area.

Threats

Threats to the relevant and important values in the proposed Pahroc Rock Art ACEC include recreational bouldering, livestock grazing, unrestricted off-highway vehicle use, and visitor use/vandalism. In addition, land disposals and rights-of-way designations could negatively impact the prehistoric values.

Pygmy Sage Research Natural Area

The Pygmy Sage Research Natural Area is located in White Pine County in Spring Valley, northwest of Wheeler Peak.

This area is a potential ACEC based on its designation as a research natural area to assist in the preservation of an example of a pygmy sage (*Artemesia pygmaea*) ecosystem for comparison with other ecosystems influenced by humans.

Threats

Threats to the unusual vegetation include increased recreation and visitation resulting in increased off-highway vehicle use and vehicle route proliferation. An increase in the spread of noxious and invasive weeds also could impact the area as could the permitted livestock grazing in the area.

Rose Guano Bat Cave

The proposed Rose Guano Bat Cave ACEC is located in White Pine County, Nevada, about 40 miles east of Ely, Nevada, on U.S. Highway 50. This Snake Range area is located in the east central portion of the planning area.

This area is a potential ACEC for the protection of historic values and sensitive species.

Rose Guano Bat Cave was mined for phosphate rock and bat guano and is home to a large roosting summer population of Mexican (or Brazilian) free-tailed bats (*Tadarida brasiliensis*) and winter use by a smaller population of Townsend's big eared bats (*Plecotus townsendii pallenscens*), a Nevada BLM sensitive species.

Threats

Threats and risks that may affect the relevant and important values in the Bat Cave include visitor use/visitor safety and wildlife protection.

Schlesser Pincushion

The proposed Schlesser Pincushion ACEC is located in the Bennett Springs Wash area, 3 miles southwest of Cathedral Gorge State Park in Lincoln County.

This area is a potential ACEC for the protection of populations of the globally-rare Schlesser pincushion (*Sclerocactus schlesseri*). The cactus is a BLM sensitive status species and is a local endemic restricted to the Central Mountains section of the Great Basin ecoregion. It is currently known from seventeen occurrences and the proposed Schlesser Pincushion ACEC harbors ten of them.

Threats

Threats to the Schlesser pincushion include diminished quality of the habitat caused by disturbance of soil crusts and vegetative cover, increased recreation and proliferation of off-highway vehicle use, uncontrolled grazing, wild horse grazing, and mineral development.

APPENDIX D

Shooting Gallery

The proposed Shooting Gallery ACEC is located in Lincoln County, Nevada, about 7 miles west of Alamo, Nevada. This area, between the Pahrnagat Range and the East Pahrnagat Range, is located in the southwest portion of the planning area.

This area is a potential ACEC based on the prehistoric values it contains including the Shooting Gallery Game Drive District—a multi-component cultural landscape consisting of a large complex of scattered rock art sites (seven sites, approximately 200 to 300 panels) in association with several well-developed habitation areas. There also are at least five areas of stacked rocks, upright rock slabs, and small rock circles likely to have functioned as a game-drive complex used for hunting large game (bighorn sheep, deer, or pronghorn antelope).

Threats to relevant and important values in the proposed Shooting Gallery ACEC include off-highway vehicle use, visitor use, and vandalism.

Shoshone Ponds

Shoshone Ponds are located in White Pine County in Spring Valley, just west of the Snake Range.

This area is a potential ACEC for the protection of significant habitat for endangered species, as well as important vegetation communities such as valley bottom Rocky Mountain Junipers. Three ponds designed to hold endangered fish are within the area. The endangered fish include the Pahrump poolfish and the Relic Steptoe dace. The original ponds were built by the Civilian Conservation Corp in the 1930s and remnants of the Civilian Conservation Corp camp are located within the Natural Area. These ponds also represent an important water source for the Brazilian free-tailed bats found in the Rose Guano Bat Cave and Guano Mine Historic Area. The Pahrump poolfish is found nowhere else in the world.

Threats and risks to Shoshone Ponds include drought and a decrease in the natural runoff necessary for the plant communities' health, increasing off-highway vehicle use, the spread of noxious and invasive weeds, and livestock grazing and trampling around the ponds. Drought and increased recreational use also could impact the endangered fish found in the ponds. Active grazing occurs within the Bastian Creek allotment and several roads and fence lines cross the area.

Snake Creek Indian Burial Cave

The proposed Snake Creek Indian Burial Cave ACEC is located in White Pine County, Nevada, about 7 miles southeast of Baker, Nevada. This proposed ACEC, in western Snake Valley, is located on the eastern edge of the planning area.

This area is a potential ACEC for the protection of the prehistoric archaeological, geological, and zooarchaeological values it contains. The prehistoric archaeological values include recovery of an extinct camel (*Camelops* sp) and horse of late Pleistocene age (*Equus* spp.) and identification of eight mustelid species including three species not previously reported from the late Rancholabrean of the Great Basin:

black footed ferret (*Mustela nigripes*), least weasel (*Mustela nivalis*), and wolverine (*Gulo gulo*). Geological values include examples of moonmilk folia and at a lower level, an interesting sedimentation sequence. The form of the cave is unusual because of the sinkhole entrance, the entrance drop, the different levels and rooms, and the opportunity to observe a variety of speleothems. The cave has been severely vandalized over a period of many decades with little or no record of the actual materials recovered. According to the native residents of Baker, Nevada, and Garrison, Utah, artifacts and remains of what were considered Indians have been taken from the cave since early pioneer days. Human remains (portions of a human pelvis and cranium) were reported to be visible on the cave floor in 1980 and more human remains reported in 1987.

Threats

Threats that may affect the relevant and important values in the proposed Snake Creek Indian Burial Cave ACEC include visitor use, public safety, and vandalism.

Swamp Cedar Natural Area

The Swamp Cedar Natural Area is located in central Spring Valley in White Pine County, Nevada.

This natural area is a potential ACEC for the protection of habitat for endangered, sensitive, or threatened species, habitat essential for maintaining species diversity, and rare and endemic plant communities. In addition, the Swamp Cedar Natural Area is a significant historical site containing the battlefield of the Goshute War of 1863.

The Swamp Cedar Natural Area is the largest of three known occurrences of a valley bottom ecotype of Rocky Mountain juniper woodlands. Although they are locally called swamp cedars, they are described by the national vegetation classification system as Rocky Mountain juniper (*Juniperus scopulorum*) temporarily flooded woodland. In addition to the rare plant community, the Spring Valley Swamp Cedars site provides habitat for slender thelypody (*Thelypodium sagittatum* ssp. *ovalifolium*), a rare plant endemic to the Great Basin ecoregion.

Threats

Threats and risks to the Swamp Cedar Natural Area include drought and a decrease in the natural runoff necessary for the plant communities' health, increasing off-highway vehicle use, and the spread of noxious and invasive weeds.

Ward Mining District

The proposed Ward Mining District ACEC is located in the Egan Range in White Pine County, Nevada, about 17 miles south of Ely, Nevada, in the center of the planning area.

This area is a potential ACEC for protection of the historic values it contains. Silver ore was discovered around what is now Ward Gulch. The town site of Ward contained two smelters and a twenty-stamp mill with three furnaces connected to the mines by a tramway. The beehive-shaped charcoal ovens are spectacular examples of stone architecture and masonry craftsmanship.

APPENDIX D

Threats

Threats and risks exist that may affect the relevant and important values in the proposed Ward Mining District ACEC include visitor use, right-of-way access, off-highway vehicle use, locatable mineral development, vandalism, harvest of forestry/woodland products, and wildland fire.

White River Valley

White River Valley ACEC contains four separate polygons located in White River Valley in Nye County. This area is a potential ACEC for protection of the numerous sensitive plant and animal species and unique badland soil types. The predominant plant community in which most of these plant populations occur is pygmy sagebrush (*Artemisia pygmaea*) dwarf shrub lands which are restricted to the Great Basin and adjacent ecoregions. Pygmy sagebrush dwarf shrub lands are plant communities considered rare and local throughout its range by NatureServe.

Sensitive status species in White River ACEC include:

Nevada State Protected (BLM manages as if Federal candidate species)

Sunnyside green gentian, (*Frasera gypsicola*)

BLM Sensitive Status species

Eastwood milkweed (*Asclepias eastwoodiana*)

White River catseye, (*Cryptantha welshii*)

Tiehm blazingstar, (*Mentzelia tiehmii*)

Parish phacelia, (*Phacelia parishii*)

Charleston grounddaisy, (*Townsendia jonesii* var. *tumulosa*)

White River wood nymph (*Cercyonis pegala pluvialis*)

White River Valley skipper (*Hesperia uncas*)

Rare Species tracked by the Nevada Natural Heritage Program

Southwestern peppergrass, (*Lepidium nanum*)

Rayless tansy aster (*Machaeranthera grindelioides* var. *depressa*)

The gypsum soils formed as springmounds also are extremely rare.

Threats

Threats to the important qualities of the White River Valley ACEC include any action which disrupts soil surfaces and vegetation cover such as off-highway vehicle use and road maintenance or construction. The introduction of invasive and nonnative plants to the area, oil and gas exploration, and mineral material removal all constitute a threat to the protected resources.

APPENDIX E
SPECIAL STATUS SPECIES

**Table E-1
Special Status Species Table**

Common Name ^{1,2,3,4,5}	Scientific Name	Habitat Type	Special Status Species		Potential for Occurrence within the Planning Area		
			U.S. Fish and Wildlife Service ⁸	BLM Sensitive Species	Lincoln County	White Pine County	Nye County
MAMMALS							
Pallid bat	<i>Antrozous pallidus</i>	All		X	X	X	X
Pygmy rabbit	<i>Brachylagus idahoensis</i>	SB; MDV		X	X	X	X
Townsend's big-eared bat	<i>Corynorhinus townsendii</i>	All		X	X	X	X
Big brown bat	<i>Eptesicus fuscus</i>	All		X	X	X	X
Spotted bat	<i>Euderma maculatum</i>	All		X	X	X	X
Silver-haired bat	<i>Lasionycteris noctivagans</i>	R-W; PJ; MC/A		X	X	X	X
Hoary bat	<i>Lasiurus cinereus</i>	R-W; PJ; MC/A		X	X	X	X
Desert Valley kangaroo mouse	<i>Microdipodops megacephalus albiventer</i>	SB; MDV		X	X		
Pahranagat Valley montane vole	<i>Microtus montanus fucosus</i>	R-W; MDV		X	X		
California myotis	<i>Myotis californicus</i>	All		X	X	X	X
Small-footed myotis	<i>Myotis ciliolabrum</i>	All		X	X	X	X
Long-eared myotis	<i>Myotis evotis</i>	All		X	X	X	X
Little brown myotis	<i>Myotis lucifugus</i>	All		X	X	X	X
Fringed myotis	<i>Myotis thysanodes</i>	All		X	X	X	X
Long-legged myotis	<i>Myotis volans</i>	PJ; MC/A		X	X	X	X
Yuma myotis	<i>Myotis yumanensis</i>	All		X	X	X	X
Desert bighorn sheep	<i>Ovis canadensis nelsoni</i>	MM		X	X	X	X
Western pipistrelle bat	<i>Pipistrellus hesperus</i>	All		X	X	X	X
Brazilian free-tailed bat	<i>Tadarida brazilliensis</i>	All		X	X	X	X
BIRDS							
Northern goshawk	<i>Accipiter gentiles</i>	MC/A; R-W; SB		X	X	X	X
Golden eagle	<i>Aquila chrysaetos</i>	All		X	X	X	X
Short-eared owl	<i>Asio flammeus</i>	R-W		X	X	X	X
Long-eared owl	<i>Asio otus</i>	R-W; MC; MDV		X	X	X	X
Western burrowing owl	<i>Athene cunicularia hypugea</i>	SB; MDV		X	X	X	X
Juniper titmouse	<i>Baeolophus griseus</i>	MC; SB; MDV		X	X	X	X
Ferruginous hawk	<i>Buteo regalis</i>	PJ; R-W; MDV; SB		X	X	X	X
Swainson's hawk	<i>Buteo swainsoni</i>	PJ; MDV; SB		X	X	X	X
Greater sage grouse	<i>Centrocercus urophasianus</i>	R-W; SB		X	X	X	X
Western snowy plover	<i>Charadrius alexandrinus nivosus</i>	R-W		X	X	X	X
Black tern	<i>Chlidonias niger</i>	R-W		X		X	X
Yellow-billed cuckoo	<i>Coccyzus americanus</i>	R-W; PJ	C		X		
Southwestern willow flycatcher	<i>Epidonax tralii extimus</i>	R-W; PJ	LE		X		
Prairie falcon	<i>Falco mexicanus</i>	MDV		X	X	X	X
Sandhill Crane	<i>Grus canadensis</i>	R-W		X	X	X	X

² Nevada Heritage Program shape files, 2004.

³ U.S. Fish and Wildlife Service species list, 2004. The Ely Field Office is maintaining ongoing coordination with the U.S. Fish and Wildlife Service offices in Reno and Las Vegas to ensure that any additions, deletions, or changes in species status will be updated in the RMP/EIS.

⁴ Nevada Natural Heritage Program Detailed Rare Plant and Animal Species list, March 18, 2004.

⁵ Nevada Natural Heritage Program Rare Plant Atlas, June 2001.

⁶ Because this species is on the U.S. Fish and Wildlife Service species list as a Species of Concern, it is being retained.

⁷ This species does not occur within the planning area boundary, but has been documented along the Virgin River.

⁸ U.S. Fish and Wildlife Service Status:

LE – Federally listed as endangered.

LT – Federally listed as threatened.

C – Federal candidate species.

⁹ No documented occurrences within the planning area.

Habitat Type

PJ – Pinyon-Juniper Woodlands

A – Aspen

C – High-elevation Conifer

R-W – Riparian-Wetlands

MM – Mountain Mahogany

SB – Sagebrush

SDS – Salt Desert Shrub

MDV – Mojave Desert Vegetation

NNS – Non-native Seedings

MC – Mixed Conifer

MG – Mixed Grasses

APPENDIX F
RESOURCE PROGRAM BEST MANAGEMENT PRACTICES

**APPENDIX F
RESOURCE PROGRAM BEST MANAGEMENT PRACTICES**

Best management practices are management actions that have been developed by agency, industry, scientific, and/or working groups as methods for reducing environmental impacts to certain resources associated with certain kinds of activity. Appendix F in the Proposed Resource Management Plan (RMP)/Final Environmental Impact Statement (EIS) presents the best management practices for the Proposed RMP. They have been organized in this appendix by the source of the best management practice. Section 1 and Section 2 have been developed by the Ely Field Office specifically to guide management in the decision area. Section 3 contains the Wind Energy EIS best management practices, which was developed by the BLM Washington Office and is applied nationally.

Best management practices typically are implemented at the discretion of the BLM Authorized Officer (the Field Manager or his/her designee) at the activity plan or project-specific level. The impact analysis in any project-specific National Environmental Policy Act (NEPA) document would be based on the reduction of impacts afforded by the application of those best management practices that are appropriate for the specific project under review. Best management practices may be added, deleted, or modified through plan maintenance as new and better information dictates.

**APPENDIX F, SECTION 1
RESOURCE PROGRAM BEST MANAGEMENT PRACTICES**

**APPENDIX F, SECTION 1
RESOURCE PROGRAM BEST MANAGEMENT PRACTICES**

1.1 Introduction

Section 1 contains best management practices developed by the Ely Field Office. They have been organized by the primary resource the best management practices would benefit or protect. Each best management practice could actually be implemented by a number of resource programs within the Field Office. Between the Draft RMP/EIS and the Proposed RMP/Final EIS, certain best management practices have been incorporated into Chapter 2.0 as management actions, edited for clarity, or deleted because they are no longer appropriate. Best management practices would be implemented at the discretion of the Ely Field Office on a project-specific basis, depending on the specific characteristics of the project area and the types of disturbance being proposed. They may not be appropriate to implement in all cases. It has been assumed for impact analysis that best management practices would be implemented wherever appropriate.

APPENDIX F, SECTION 1

1.2 Air Resources

- 1.2.1 Use dust abatement techniques on unpaved, unvegetated surfaces to minimize airborne dust.
- 1.2.2 Post and enforce speed limits (e.g., 25 miles per hour) to reduce airborne fugitive dust.
- 1.2.3 Cover construction materials and stockpiled soils if they are a source of fugitive dust.
- 1.2.4 Use dust abatement techniques before and during surface clearing, excavation, or blasting activities.

1.3 Water Resources

- 1.3.1 Avoid the application of fire retardant or foam within 300 feet of a stream channel or waterway, when possible, except for the protection of life and property. Aerial application and use of retardants and foams would be consistent with national policy guidelines established by the National Office of Fire and Aviation, as amended.
- 1.3.2 Fire engines that have surfactant foam mixes in tanks must be fitted with an anti-siphon (back flow protection valve) if filled directly from a stream channel.
- 1.3.3 Construct a containment barrier around all pumps and fuel containers utilized within 100 feet (30.5 meters) of a stream channel. The containment barrier would be of sufficient size to contain all fuel being stored or used on site.
- 1.3.4 Prior to use on lands administered by the Ely Field Office, all fire suppression equipment from outside the planning area utilized to extract water from lakes, streams, ponds, or spring sources (e.g., helicopter buckets, draft hoses, and screens) will be thoroughly rinsed to remove mud and debris and then disinfected to prevent the spread of invasive aquatic species. Rinsing equipment with disinfectant solution will not occur within 100 feet of natural water sources (i.e., lakes, streams, or springs). Ely suppression equipment utilized to extract water from water sources known to be contaminated with invasive aquatic species, as identified by the U.S. Fish and Wildlife Service and Nevada Department of Wildlife, also will be disinfected prior to use elsewhere on lands administered by the Ely Field Office.
- 1.3.5 Do not dump surfactant foam mixes from fire engines within 600 feet of a stream channel.
- 1.3.6 Do not conduct fire retardant mixing operations within 600 feet of a stream channel.
- 1.3.7 Remove all modifications made to impound or divert stream flow by mechanical or other means to facilitate extraction of water from a stream for fire suppression efforts when suppression efforts are completed.

- 1.3.8 When drafting or dipping water during fire operations, continuously monitor water levels at the site that water is being removed from. Do not allow water extraction to exceed the ability of the recharge inflow to maintain the water levels that exist at the time initial attack efforts began. If the water level drops below this predetermined level, all water removal would cease immediately until water levels are recharged.
- 1.3.8 When possible, do not cross or terminate fire control lines at the stream channel. Terminate control lines at the edge of the riparian zone at a location determined appropriate to meet fire suppression objectives based on fire behavior, vegetation/fuel types, and fire fighter safety.
- 1.3.10 Construct access roads and fords that cross stream channels to BLM road standards.
- 1.3.11 Do not construct new roads or mechanical fire control lines or improve existing roads within 300 feet of a stream channel unless authorized by the BLM Field Manager or Authorized Officer.
- 1.3.12 Limit stream crossings on travel routes and trails to the minimal number necessary to minimize sedimentation and compaction. The BLM Authorized Officer will determine if any impacts need to be rehabilitated by the permittee.
- 1.3.13 Conduct mixing of herbicides and rinsing of herbicide containers and spray equipment only in areas that are a safe distance from environmentally sensitive areas and points of entry to bodies of water (storm drains, irrigation ditches, streams, lakes, or wells).
- 1.3.14 A water well may be accepted by the BLM Ely Field Office upon completion of operations. The BLM authorized officer will make the determination whether to accept the well based upon the submission of the well completion forms and relevant hydrogeologic data reports. The well must be installed by drillers licensed by the state of Nevada according to specifications in Nevada Revised Statutes Title 48, Chapter 534.

1.4 Soil Resources

- 1.4.1 Require the use of specialized low-surface impact equipment (e.g., balloon tired vehicles) or helicopters, as determined by the BLM Authorized Officer, for activities in off-road areas where it is deemed necessary to protect fragile soils and other resource values.
- 1.4.2 During periods of adverse soil moisture conditions caused by climatic factors such as thawing, heavy rains, snow, flooding, or drought, suspend activities on existing roads that could create excessive surface rutting. When adverse conditions exist, the operator would contact the BLM Authorized Officer for an evaluation and decision based on soil types, soil moisture, slope, vegetation, and cover.
- 1.4.3 When preparing the site for reclamation, include contour furrowing, terracing, reduction of steep cut and fill slopes, and the installation of water bars, as determined appropriate for site-specific conditions.

APPENDIX F, SECTION 1

1.4.4 Upon completion or temporary suspension of mining operations, backfill all holes and trenches and re-contour the pit to the natural slope, if possible, with pit walls greater than 3 feet in height knocked down and sloped at 3 horizontal to 1 vertical or to the original topography, whichever is less.

1.4.5 Restoration requirements include reshaping, re-contouring, and/or resurfacing with topsoil, installation of water bars, and seeding on the contour. Removal of structures such as culverts, concrete pads, cattle guards, and signs would usually be required. Fertilization and/or fencing of the disturbance may be required. Additional erosion control measures (e.g., fiber matting and barriers) to discourage road travel may be required.

1.5 Vegetation Resources

1.5.1 Where seeding is required, use appropriate seed mixture and seeding techniques approved by the BLM Authorized Officer.

1.5.2 The BLM Authorized Officer will specify required special handling and recovery techniques for Joshua trees, yucca, and some cactus in the southern part of the planning area on a site-specific basis.

1.5.3 Keep removal and disturbance of vegetation to a minimum through construction site management (e.g., using previously disturbed areas and existing easements, limiting equipment/materials storage and staging area sites, etc.).

1.5.4 Generally, conduct reclamation with native seeds that are representative of the indigenous species present in the adjacent habitat. Document rationale for potential seeding with selected nonnative species. Possible exceptions would include use of nonnative species for a temporary cover crop to out-complete weeds. In all cases, ensure seed mixes are approved by the BLM Authorized Officer prior to planting.

1.5.5 Certify that all interim and final seed mixes, hay, straw, and hay/straw products are free of plant species listed on the Nevada noxious weed list.

1.5.6 An area is considered to be satisfactorily reclaimed when all disturbed areas have been recontoured to blend with the natural topography, erosion has been stabilized, and an acceptable vegetative cover has been established. Use the Nevada Guidelines for Successful Revegetation prepared by the Nevada Division of Environmental Protection, the BLM, and the U.S. Department of Agriculture Forest Service (or most current revision or replacement of this document) to determine if revegetation is successful.

1.5.7 Reclamation bond release criteria would include the following:

The perennial plant cover of the reclaimed area would equal or exceed perennial cover of selected comparison areas (normally adjacent habitat). If the adjacent habitat is severely disturbed, an ecological site description may be used as a cover standard. Cover is normally crown cover as estimated by the point intercept method. Selected cover can be determined using a method as described in Sampling Vegetation Attributes, Interagency Technical Reference, 1996, BLM/RS/ST-96/002+1730. The reclamation plan for the area project would identify the site-specific release criteria and associated statistical methods in the reclamation plan or permit.

1.5.8 Utility companies will manage vegetation in their rights-of-way for safe and reliable operation while maintaining vegetation and wildlife habitat.

1.5.9 Respread weed-free vegetation removed from the right-of-way to provide protection, nutrient recycling, and seed source.

1.6 Fish and Wildlife

1.6.1 Install wildlife escape ramps in all watering troughs, including temporary water haul facilities, and open storage tanks. Pipe the overflow away from the last water trough on an open system to provide water at ground level.

1.6.2 As appropriate, mark certain trees on BLM-administered lands for protection as wildlife trees.

1.6.3 Consider seasonal distribution of large wildlife species when determining methods used to accomplish weed and insect control objectives.

1.6.4 Protect active raptor nests in undisturbed areas within 0.25 mile of areas proposed for vegetation conversion using species-specific protection measures. Inventory areas containing suitable nesting habitat for active raptor nests prior to the initiation of any project.

1.6.5 When used to pump water from any pond or stream, screen the intake end of the draft hose to prevent fish from being ingested. Screen opening size would be a maximum of 3/16 inch (4.7 millimeters).

1.6.6 Special recreation use permittees will take action to ensure that race participants and spectators do not harass wildlife.

1.7 Special Status Species

1.7.1 Avoid line-of-sight views between the power poles along powerlines and sage grouse leks, whenever feasible.

APPENDIX F, SECTION 1

- 1.7.2 Use current science, guidelines, and methodologies (Avian Power Line Interaction Committee 1994, 1996, 2005) for all new and existing powerlines to minimize raptor and other bird electrocution and collision potential.
- 1.7.3 When managing weeds in areas of special status species, carefully consider the impacts of the treatment on such species. Wherever possible, hand spraying of herbicides is preferred over other methods.
- 1.7.4 Do not conduct noxious and invasive weed control within 0.5 mile of nesting and brood rearing areas for special status species during the nesting and brood rearing season.
- 1.7.5 To the greatest extent possible, survey all mine adits and shafts slated for closure for bat presence and use prior to being closed. Minimize impacts to bat roosts and bat habitat through the use of current science, guidelines, and methodologies when closing and abandoning mine adits.
- 1.7.6 Develop grazing systems to minimize conflicts with special status species habitat.
- 1.7.7 For streams currently occupied by any special status species, do not allow extraction of water from ponds or pools if stream inflow is minimal (i.e., during drought situations) and extraction of water would lower the existing pond or pool level.
- 1.7.8 When new spring developments are constructed on BLM lands and BLM has the authority to design the project, the source and surrounding riparian area will be fenced, the spring will be developed in a manner that leaves surface water at the source and maintains the associated riparian area, water will be provided outside the enclosure in a manner that provides drinking water for large ungulates, wild horses, and/or livestock so they are less likely to break into the enclosure.
- 1.7.9 Salt and mineral supplements:
- Base placement of salt and mineral supplements on site-specific assessment.
 - Normally place salt and mineral supplements at least 0.5 mile away from riparian areas, sensitive sites, populations of special status plant species, cultural resource sites.
 - Place salt at least 0.5 mile from any water source including troughs.
 - Place salt and mineral supplements at least 1 mile from sage grouse leks.

1.7.9 Water hauling:

- Place water haul sites at least 0.5 mile away from riparian areas, cultural sites, and special status species locations.
- Limit water hauling to existing roads when possible.

1.8 Wild Horses

- 1.8.1 To protect wild horses and wildlife flag all new fences every 16 feet with white flagging that is at least 1 inch wide and has at least 12 inches hanging free from the top wire of the fence.
- 1.8.2 If a project involves heavy or sustained traffic, require road signs for safety and protection of wild horses and wildlife.

1.9 Cultural Resources

- 1.9.1 Ensure that all activities associated with the undertaking, within 100 meters of the discovery, are halted and the discovery is appropriately protected, until the BLM authorized officer issues a Notice to Proceed. A Notice to Proceed may be issued by the BLM under any of the following conditions:
- Evaluation of potentially eligible resource(s) results in a determination that the resource(s) are not eligible;
 - The fieldwork phase of the treatment option has been completed; and
 - The BLM has accepted a summary description of the fieldwork performed and a reporting schedule for that work.
- 1.9.2 The operator will inform all persons associated with the project that knowingly disturbing cultural resources (historic or archaeological) or collecting artifacts is illegal.
- 1.9.3 The BLM may approve cross-country operations of seismic trucks and support vehicles on bare frozen ground or over sufficient snow depth (vehicle traffic does not reveal the ground) so as to prevent surface disturbance.
- 1.9.4 Perform viewshed reclamation when the setting of a site contributes to the significance of the property.

APPENDIX F, SECTION 1

1.10 Paleontological Resources

- 1.10.1 When paleontological resources of potential scientific interest are encountered (including all vertebrate fossils and deposits of petrified wood), leave them intact and immediately bring them to the attention of the BLM Authorized Officer.

1.11 Visual Resources

- 1.11.1 On industrial facilities authorized by the Ely Field Office, utilize anti-glare light fixtures to limit light pollution.
- 1.11.2 During the implementation of vegetation treatments, create irregular margins around treatment areas to better maintain the existing scenic character of the landscape.
- 1.11.3 When feasible, bury utility lines on public land when in the viewshed of residential or community development.

1.12 Travel Management and Off-highway Vehicle Use

- 1.12.1 Design access roads requiring construction with cut and fill to minimize surface disturbance and take into account the character of the landform, natural contours, cut material, depth of cut, where the fill material would be deposited, resource concerns, and visual contrast. Avoid construction of access roads on steep hillsides and near watercourses where alternate routes provide adequate access.
- 1.12.2 Where adverse impacts or safety considerations warrant, limit or prohibit public access when authorizing specific routes to areas or sites under permit or lease.

1.13 Recreation

- 1.13.1 Do not allow surface or underground disturbance to occur within 100 yards (horizontally or vertically) of known cave resources.
- 1.13.2 Where appropriate, do not allow ground disturbing activities within 100 yards of cave entrances, drainage areas, subsurface passages, and developed recreation sites. Do not dispose of waste material or chemicals in sinkholes or gates by cave entrances. If during construction activities any sinkholes or cave openings are discovered, cease construction activities and notify the BLM authorized officer.

1.14 Livestock Grazing

1.14.1 Water troughs

- Place troughs connected with spring developments outside of riparian and wetland habitats to reduce livestock trampling damage to wet areas.
- Control trough overflow at springs with float valves or deliver the overflow back into the native channel.

1.14.2 Based on allotment situations and circumstances associated with livestock grazing and multiple use management, implement any or all of the following appropriate management practices on winterfat dominated ecological sites.

- Develop grazing systems to control or rest grazing use on winterfat sites after March 1 or when the critical growing season begins. Allow spring grazing use during the critical growing period if a grazing rotation system that provides rest from grazing during the critical growing period at least every other year for all areas is in place. Utilization during the critical growth period should not exceed 35 percent under any circumstances.
- Place salt and supplements at least 0.5 mile away from winterfat dominated sites. Base placement on site-specific assessment and characteristics such as riparian, topography, cultural, special status species, etc.
- Locate sheep bedding grounds and camps at least 0.5 mile away from winterfat dominated sites. Base placement on site-specific assessment and characteristics such as riparian, topography, cultural, special status species, etc.
- Locate water haul sites at least 0.5 mile away from winterfat dominated sites. Base placement on site-specific assessment and characteristics such as riparian, topography, cultural, special status species, etc.
- Construct livestock reservoirs away from winterfat dominated sites. Base placement on site-specific assessment and characteristics such as riparian, topography, cultural, special status species, etc.
- If water wells are approved to be drilled in winterfat dominated sites, strive to pipe the water at least 0.5 mile away from winterfat dominated sites. Base placement on site-specific assessment and characteristics such as riparian, topography, cultural, special status species, etc.

APPENDIX F, SECTION 1

1.15 Mineral Extraction

- 1.15.1 Applications for permit to drill would follow the best management practices as outlined in the BLM oil and gas Gold Book (http://www.blm.gov/wo/st/en/prog/energy/oil_and_gas/best_management_practices/gold_book.html), as well as on-shore regulations, individual surface use plans, and conditions of approval that may be part of the Record of Decision for EISs or Decision Records for environmental assessments/Findings of No Significant Impacts, Documentation of NEPA Adequacy, and Categorical Exclusions prepared for site-specific projects.
- 1.15.2 Do not permit blasting if it would be detrimental to the significant characteristics of archeological or historical values, recreation areas, known caves, water wells, or springs.
- 1.15.3 Notify the BLM authorized officer within 5 days of completion of reclamation work so that timely compliance inspections can be completed.

1.16 Watershed Management

- 1.16.1 Manage activities, uses, and authorizations on burned areas to best meet resource management objectives established for the area in specific stabilization, restoration, or activity plans. The BLM authorized officer may open areas to livestock grazing based upon those considerations.

1.17 Fire Management

- 1.17.1 Notify valid existing land users (such as mine claimants, holders of rights-of-way, and livestock permittees) prior to implementation of prescribed fires that may affect their investments.
- 1.17.2 Remove vegetation, where appropriate, to protect facilities (e.g., range improvements, communication sites, and recreation sites).
- 1.17.3 Within the area of operation, every effort will be made to prevent, control, or suppress any fire. Fire-fighting equipment may be required to be on site while operations are in progress, depending on hazards inherent in the type of operation and fire hazard levels. Report uncontrolled fires immediately to the BLM Ely Field Office Manager or Authorized Officer. The BLM Fire Dispatch telephone number is (775) 289-1925 or 1-800-633-6092. After working hours, call 911 or the White Pine County Sheriff's Office at (775) 289-8801, the Lincoln County Sheriff's Office at (775) 962-5151, or the Nye County Sheriff's Office at (775) 482-8101.

1.18 Noxious and Invasive Weed Management

- 1.18.1 Control or restrict the timing of livestock movement to minimize the transport of livestock-borne noxious weed seeds, roots, or rhizomes between weed-infested and weed-free areas.
- 1.18.2 When maintaining unpaved roads on BLM-administered lands, avoid the unnecessary disturbance of adjacent native vegetation and the spread of weeds. Grade road shoulders or barrow ditches

only when necessary to provide for adequate drainage. Minimize the width of grading operations. The BLM Authorized Officer will meet with equipment operators to ensure that they understand this objective.

1.19 Health and Safety

- 1.19.1 Consider nozzle type, nozzle size, boom pressure, and adjuvant use and take appropriate measures for each herbicide application project to reduce the chance of chemical drift.
- 1.19.2 All applications of approved pesticides will be conducted only by certified pesticide applicators or by personnel under the direct supervision of a certified applicator.
- 1.19.3 Prior to commencing any chemical control program, and on a daily basis for the duration of the project, the certified applicator will provide a suitable safety briefing to all personnel working with or in the vicinity of the herbicide application. This briefing will include safe handling, spill prevention, cleanup, and first aid procedures.
- 1.19.4 Store all pesticides in areas where access can be controlled to prevent unauthorized/untrained people from gaining access to the chemicals.
- 1.19.5 Do not apply pesticides within 440 yards (0.25 mile) of residences without prior notification of the resident.
- 1.19.6 Areas treated with pesticides will be adequately posted to notify the public of the activity and of safe re-entry dates, if a public notification requirement is specified on the label of the product applied. The public notice signs will be at least 8 1/2" x 11" in size and will contain the date of application and the date of safe re-entry.
- 1.19.7 The recreation permittee will post warning signs at all known mine shafts and other hazardous areas that occur within 100 feet of a race course or pit/spectator area and will verbally inform race participants of all hazards at the pre-race meeting.
- 1.19.8 The recreation permittee will assume liability for and clean up of any and all releases of hazardous substances or oil (more than one quart) disposed on public land as defined in the National Oil and Hazardous Substances Contingency Plan (Title 40 Code of Federal Regulations Subpart 300). The permittee will immediately notify the BLM Authorized Officer of any and all releases of hazardous substances or oil (more than one quart) on public land.
- 1.19.9 Properly dispose of all tailings, dumps, and deleterious materials or substances. Take measures to isolate, control, and properly dispose of toxic and hazardous materials.
- 1.19.10 Remove and properly dispose of all trash, garbage, debris, and foreign matter. Maintain the disposal site and leave it in a clean and safe condition. Do not allow burning at the site.

APPENDIX F, SECTION 1

- 1.19.11 Do not drain oil or lubricants onto the ground surface. Immediately clean up any spills under 25 gallons; clean up spills over 25 gallons as soon as possible and report the incident to the BLM Authorized Officer and Nevada Division of Environmental Protection.
- 1.19.12 The operator will work with the BLM Authorized Officer on the containment of drilling fluids and drill hole cuttings. Adequately fence, post, or cover mud and separation pits, and hazardous material storage areas.
- 1.19.13 Locate powder magazines at least 0.25 mile from traveled roads. Attend loaded shot holes and charges at all times. Use explosives according to applicable federal and state regulations.
- 1.19.14 Containerize petroleum products such as gasoline, diesel fuel, helicopter fuel, and lubricants in approved containers. Properly store hazardous materials in separate containers to prevent mixing, drainage, or accidents.

**APPENDIX F, SECTION 2
FLUID MINERALS LEASE NOTICES AND STIPULATIONS**

APPENDIX F, SECTION 2
FLUID MINERALS LEASE NOTICES AND STIPULATIONS

LEASE NOTICES

Cultural Sites

Lands within this lease contain areas of known high potential for cultural resources. Properties known at the time of lease announcement that are listed on or eligible for the National Register of Historic Places will be avoided, where possible, by means of lease exclusions or by limits on surface use. The preferred avoidance option is to exclude areas containing National Register of Historic Places eligible sites from leasing and all forms of surface disturbance. Cultural sites not avoided may require consultation with State Historic Preservation Officer and treatment plans.

Historic Sites

Lands within this lease are in proximity to or contain portions of the Pony Express National Historic Trail, the Hastings Cutoff, the Lincoln Highway, or the Osceola Ditch. Oil and gas exploration and development activities within 1 mile of these sites must undergo a visual assessment in conjunction with environmental review to determine if the activity will adversely affect the visual integrity. Appropriate mitigation will take place as necessary to maintain the management corridor in as natural a condition as possible.

Desert Tortoise Habitat

Lands within this lease will require Section 7 consultation prior to any surface disturbance in desert tortoise habitat. The BLM must ensure that the impacts from the operation do not jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat. The operator, U.S. Fish and Wildlife Service, and the BLM also must reach concurrence that the proposed actions are below the jeopardy or adverse modification threshold. If it is determined that through the review of the plan of operation and the use of mitigation measures that the operation is not below the jeopardy or adverse modification threshold, the project would not go forward.

LEASE TIMING STIPULATIONS

Resource: Desert Tortoise Habitat

Stipulation: Timing Limitation. No surface activity would be allowed within desert tortoise habitat from March 1 through October 31.

Objective: To protect desert tortoise during the most active period to maintain desert tortoise populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with U.S. Fish and Wildlife Service, if the operator submits a plan that demonstrates that impacts from the proposed action would not adversely affect desert tortoise habitat.

APPENDIX F, SECTION 2

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with U.S. Fish and Wildlife Service, determines that portions of the area can be occupied without adversely affecting desert tortoise. The dates for the timing restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with U.S. Fish and Wildlife Service, determines that the entire leasehold is no longer occupied by desert tortoise.

Resource: **Sage Grouse Nesting Habitat Associated with Leks**

Stipulation: Timing Limitation. No surface activity would be allowed within two miles of a sage grouse lek from March 1 through May 15 (June 15).

Objective: To protect sage grouse nesting activities associated with leks to maintain sage grouse populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated.

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area can be occupied without adversely affecting sage grouse nesting activity. The dates for the timing restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the entire leasehold no longer contains nesting habitat for sage grouse.

Resource: **Sage Grouse Winter Range**

Stipulation: Timing Limitation. No surface activity would be allowed within winter range for sage grouse from November 1 through March 31.

Objective: To protect sage grouse from disturbance during the crucial winter period to maintain sage grouse populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated.

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area no longer contain sage grouse winter habitat. The dates for the timing restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the entire leasehold no longer contains winter range for sage grouse.

Resource: **Raptor Nest Sites**

Stipulation: Timing Limitation. No surface activity would be allowed from May 1 through July 15 within 0.5 mile of a raptor nest site which has been active within the past five years.

Objective: To protect raptor nesting activities to maintain existing populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated.

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area can be occupied without adversely affecting raptor nesting activity. The dates for the timing restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the entire leasehold no longer contains raptor nest sites.

Resource: **Big Game Calving/Fawning/Kidding/Lambing Grounds**

Stipulation: Timing Limitation. No surface activity would be allowed within big game calving/fawning/kidding/lambing grounds from April 15 through June 30.

Objective: To protect elk, mule deer, pronghorn antelope, and Rocky Mountain bighorn sheep from disturbance during calving, fawning, kidding, and lambing to maintain wildlife populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated.

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area can be

APPENDIX F, SECTION 2

occupied without adversely affecting big game calving, fawning, kidding, and lambing. The dates for the timing restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the entire leasehold no longer contains big game calving/fawning/kidding/lambing grounds.

Resource: **Big Game Crucial Winter Range**

Stipulation: Timing Limitation. No surface activity would be allowed within big game crucial winter range from November 1 through March 31.

Objective: To protect elk, mule deer, and pronghorn antelope from disturbance during the crucial winter period to maintain wildlife populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated.

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area no longer contain winter habitat. The dates for the timing restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the entire leasehold no longer contains crucial winter range for big game.

Resource: **Desert Bighorn Sheep Habitat**

Stipulation: Timing Limitation. No surface activity would be allowed within occupied desert bighorn sheep habitat from March 1 through May 31 and from July 1 through August 31.

Objective: To protect desert bighorn sheep from disturbance during lambing and the crucial hot summer months to maintain existing populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated.

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area can be occupied without adversely affecting desert bighorn sheep. The dates for the timing

restriction may be modified if new information indicates the dates are not valid for the leasehold.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the entire leasehold is no longer occupied by desert bighorn sheep.

LEASE – NO SURFACE OCCUPANCY STIPULATIONS

Resource: Desert Tortoise ACEC

Stipulation: No surface occupancy would be allowed within the Beaver Dam Slope ACEC or the Mormon Mesa ACEC.

Purpose: These areas encompass the habitat which has been determined to be critical to the survival of the desert tortoise population. The desert tortoise is a listed species under the Endangered Species Act.

Exception: The authorized officer may grant an exception (allow surface occupancy) upon completion of formal consultation with the U.S. Fish and Wildlife Service that yields a no-jeopardy opinion if a plan of development is submitted that does not significantly impact tortoise habitats or populations. The plan of development must demonstrate no significant impact will occur through mitigation of impacts, compensation (in accordance with BLM policy), and restoration of the land to pre-disturbance condition.

Modification: None

Waiver: None

Resource: Sage Grouse Leks

Stipulation: No surface occupancy. No surface use would be allowed within 0.25 mile of a sage grouse lek.

Objective: To protect sage grouse breeding activities and the integrity of the habitat associated with sage grouse leks to maintain sage grouse populations.

Exception: An exception to this stipulation may be granted by the authorized officer, in consultation with Nevada Department of Wildlife, if the operator submits a plan that demonstrates that impacts from the proposed action would not affect breeding activity nor degrade the integrity of the habitat associated with the sage grouse lek.

APPENDIX F, SECTION 2

Modification: The boundaries of the stipulated area may be modified if the authorized officer, in consultation with Nevada Department of Wildlife, determines that portions of the area can be occupied without adversely affecting the sage grouse lek.

Waiver: The stipulation may be waived if the authorized officer, in consultation with Nevada Department of Wildlife, determines that the lek has been inactive for at least five consecutive years or the habitat has changed such that there is no likelihood the lek would become active.

Resource: **Threatened and Endangered and Sensitive Species Sites**

Stipulation: No ground disturbance activities would be allowed within the boundaries of areas known to contain unusually high concentrations of threatened, endangered, or BLM or State sensitive species. No surface occupancy would be allowed within the:

Baking Powder Flat Proposed ACEC
Condor Canyon Proposed ACEC
Highland Range Proposed ACEC
Lower Meadow Valley Wash Proposed ACEC
Schlesser Pincushion Proposed ACEC
Shoshone Ponds Proposed ACEC
Swamp Cedar Proposed ACEC
White River Valley Proposed ACEC

Purpose: To protect threatened and endangered and sensitive species.
Avoid BLM-approved activities that contribute to a need to list a species or its habitat as threatened or endangered.

Exception: None

Modification: None

Waiver: None

Resource: **Cultural Sites**

Stipulation: No ground disturbance activities would be allowed within the boundaries of cultural properties and archaeological/historic districts determined to be eligible or potentially eligible to the National Register of Historic Places. No surface occupancy would be allowed within the:

Baker Archeological Site Proposed ACEC
Hendry's Creek/Rock Animal Corral Proposed ACEC
Honeymoon Hill/City of Rocks Proposed ACEC

Mount Irish Proposed ACEC
Pahroc Rock Art Proposed ACEC
Rose Guano Bat Cave Proposed ACEC
Shooting Gallery Proposed ACEC
Snake Creek Indian Burial Cave Proposed ACEC
Sunshine Locality National Register District
White River Archeological District

Purpose: To protect significant cultural properties and archaeological districts and their settings.

Exception: None.

Modification: None.

Waiver: None.

Resource: **Paleontological Sites**

Stipulation: No ground disturbance activities would be allowed within the boundaries of areas of known paleontological sites/locales. No surface occupancy would be allowed within the:

Andies Mine Trilobite Site

Purpose: To preserve and protect significant vertebrate fossils and paleontological sites.

Exception: None

Modification: None

Waiver: None

Resource: **Natural, Scenic, and Recreation Sites**

Stipulation: No ground disturbance activities would be allowed within the boundaries of areas that exhibit exceptional natural, scenic, or recreational values. No Surface Occupancy would be allowed within the:

Ash Springs Proposed Withdrawal
Blue Mass Scenic Area Proposed ACEC
Cleve Creek Recreation Site
Egan Crest Trailhead
Garnet Hill
Illipah Reservoir
Kirch Wildlife Management Area

APPENDIX F, SECTION 2

Sacramento Pass Recreation Site
Ward Mountain Recreation Site
White Pine County Shooting Range

Purpose: To protect the public's opportunity for quality recreation experiences at those sites developed for those purposes.
To prevent user conflicts and incompatible uses in areas with high recreational values and significant amounts of recreational activity.
To control the visual impacts of activities and facilities within acceptable levels.

Exception: None

Modification: None

Waiver: A waiver may be granted for a site if it is moved or eliminated.

Resource: **BLM Facilities**

Stipulation: No surface occupancy would be allowed within the areas proposed for withdrawal at:

Caliente Field Station
Pony Springs Fire Station

Purpose: To protect the operation and maintenance of the BLM's facilities.

Exception: None

Modification: None

Waiver: None

**APPENDIX F, SECTION 3
BLM WIND ENERGY DEVELOPMENT PROGRAM POLICIES AND
BEST MANAGEMENT PRACTICES**

BLM WIND ENERGY DEVELOPMENT PROGRAM POLICIES AND BEST MANAGEMENT PRACTICES (BMPS)

The BLM's Wind Energy Development Program will establish a number of policies and BMPs, provided below, regarding the development of wind energy resources on BLM-administered public lands. The policies and BMPs will be applicable to all wind energy development projects on BLM-administered public lands. The policies address the administration of wind energy development activities, and the BMPs identify required mitigation measures that would need to be incorporated into project-specific Plans of Development (PODs) and right-of-way (ROW) authorization stipulations. Additional mitigation measures will be applied to individual projects, in the form of stipulations in the ROW authorization as appropriate, to address site-specific and species-specific issues.

These policies and BMPs were formulated through preparation of the Final Wind Energy PEIS (BLM 2005). The PEIS included detailed, comprehensive analysis of the potential impacts of wind energy development and relevant mitigation measures; reviews of existing, relevant mitigation guidance; and reviews of comments received during scoping and public review of the Draft PEIS.

A.1 Policies

- The BLM will not issue ROW authorizations for wind energy development on lands on which wind energy development is incompatible with specific resource values. Lands that will be excluded from wind energy site monitoring and testing and development include designated areas that are part of the National Landscape Conservation System (NLCS) (e.g., Wilderness Areas, Wilderness Study Areas, National Monuments, NCAs,¹ Wild and Scenic Rivers, and National Historic and Scenic Trails) and Areas of Critical Environmental Concern (ACECs).² Additional areas of land may be excluded from wind energy development on the basis of findings of resource impacts that cannot be mitigated and/or conflict with existing and planned multiple-use activities or land use plans.
- To the extent possible, wind energy projects shall be developed in a manner that will not prevent other land uses, including minerals extraction, livestock grazing, recreational use, and other ROW uses.

¹ Wind energy development is permitted in one NCA, the California Desert Conservation Area (CDCA), in accordance with the provisions of the *California Desert Conservation Area Plan 1980, as Amended* (BLM 1999).

² Although the MPDS developed for this PEIS (Section 2.2.1 and Appendix B) did not exclude all of these lands at the screening level, they will be excluded from wind energy development.

- Entities seeking to develop a wind energy project on BLM-administered lands shall consult with appropriate federal, state, and local agencies regarding specific projects as early in the planning process as appropriate to ensure that all potential construction, operation, and decommissioning issues and concerns are identified and adequately addressed.
- The BLM will initiate government-to-government consultation with Indian Tribal governments whose interests might be directly and substantially affected by activities on BLM-administered lands as early in the planning process as appropriate to ensure that construction, operation, and decommissioning issues and concerns are identified and adequately addressed.
- Entities seeking to develop a wind energy project on BLM-administered lands, in conjunction with BLM Washington Office (WO) and Field Office (FO) staff, shall consult with the U.S. Department of Defense (DoD) regarding the location of wind power projects and turbine siting as early in the planning process as appropriate. This consultation shall occur concurrently at both the installation/field level and the Pentagon/BLM WO level. An interagency protocol agreement is being developed to establish a consultation process and to identify the scope of issues for consultation. Lands withdrawn for military purposes are under the administrative jurisdiction of the DoD or a military service and are not available for issuance of wind energy authorizations by the BLM.
- The BLM will consult with the U.S. Fish and Wildlife Service (USFWS) as required by Section 7 of the Endangered Species Act of 1973 (ESA). The specific consultation requirements will be determined on a project-by-project basis.
- The BLM will consult with the State Historic Preservation Office (SHPO) as required by Section 106 of the National Historic Preservation Act of 1966 (NHPA). The specific consultation requirements will be determined on a project-by-project basis. If programmatic Section 106 consultations have been conducted and are adequate to cover a proposed project, additional consultation may not be needed.
- Existing land use plans will be amended, as appropriate, to (1) adopt provisions of the BLM's Wind Energy Development Program, (2) identify land considered to be available for wind energy development, and (3) identify land that will not be available for wind energy development.
- The level of environmental analysis to be required under NEPA for individual wind power projects will be determined at the FO level. For many projects, it may be determined that a tiered environmental assessment (EA) is appropriate in lieu of an EIS. To the extent that the PEIS addresses anticipated issues and

concerns associated with an individual project, including potential cumulative impacts, the BLM will tier off of the decisions embedded in the PEIS and limit the scope of additional project-specific NEPA analyses. The site-specific NEPA analyses will include analyses of project site configuration and micro-siting considerations, monitoring program requirements, and appropriate mitigation measures. In particular, the mitigation measures discussed in Chapter 5 of the PEIS may be consulted in determining site-specific requirements. Public involvement will be incorporated into all wind energy development projects to ensure that all concerns and issues are identified and adequately addressed. In general, the scope of the NEPA analyses will be limited to the proposed action on BLM-administered public lands; however, if access to proposed development on adjacent non-BLM-administered lands is entirely dependent on obtaining ROW access across BLM-administered public lands and there are no alternatives to that access, the NEPA analysis for the proposed ROW may need to assess the environmental effects from that proposed development. The BLM's analyses of ROW access projects may tier off of the PEIS to the extent that the proposed project falls within the scope of the PEIS analyses.

- Site-specific environmental analyses will tier from the PEIS and identify and assess any cumulative impacts that are beyond the scope of the cumulative impacts addressed in the PEIS.
- The Categorical Exclusion (CX) applicable to the issuance of short-term ROWs or land use authorizations may be applicable to some site monitoring and testing activities. The relevant CX, established for the BLM in the DOI Departmental Manual 516, Chapter 11, Sec. 11.5, E(19) (DOI 2004), encompasses "issuance of short-term (3 years or less) rights-of-way or land use authorizations for such uses as storage sites, apiary sites, and construction sites where the proposal includes rehabilitation to restore the land to its natural or original condition."
- The BLM will require financial bonds for all wind energy development projects on BLM-administered public lands to ensure compliance with the terms and conditions of the rights-of-way authorization and the requirements of applicable regulatory requirements, including reclamation costs. The amount of the required bond will be determined during the rights-of-way authorization process on the basis of site-specific and project-specific factors. The BLM may also require financial bonds for site monitoring and testing authorizations.
- Entities seeking to develop a wind energy project on BLM-administered public lands shall develop a project-specific Plan of Development (POD) that incorporates all BMPs and, as appropriate, the requirements of other existing and relevant BLM mitigation guidance, including the BLM's interim off-site mitigation guidance (BLM 2005a). Additional mitigation measures will be

incorporated into the POD and into the ROW authorization as project stipulations, as needed, to address site-specific and species-specific issues. The POD will include a site plan showing the locations of turbines, roads, power lines, other infrastructure, and other areas of short- and long-term disturbance.

- The BLM will incorporate management goals and objectives specific to habitat conservation for species of concern (e.g., sage-grouse), as appropriate, into the POD for proposed wind energy projects.
- The BLM will consider the visual resource values of the public lands involved in proposed wind energy development projects, consistent with BLM Visual Resource Management (VRM) policies and guidance. The BLM will work with the ROW applicant to incorporate visual design considerations into the planning and design of the project to minimize potential visual impacts of the proposal and to meet the VRM objectives of the area.
- Operators of wind power facilities on BLM-administered public lands shall consult with the BLM and other appropriate federal, state, and local agencies regarding any planned upgrades or changes to the wind facility design or operation. Proposed changes of this nature may require additional environmental analysis and/or revision of the POD.
- The BLM's Wind Energy Development Program will incorporate adaptive management strategies to ensure that potential adverse impacts of wind energy development are avoided (if possible), minimized, or mitigated to acceptable levels. The programmatic policies and BMPs will be updated and revised as new data regarding the impacts of wind power projects become available. At the project-level, operators will be required to develop monitoring programs to evaluate the environmental conditions at the site through all phases of development, to establish metrics against which monitoring observations can be measured, to identify potential mitigation measures, and to establish protocols for incorporating monitoring observations and additional mitigation measures into standard operating procedures and project-specific stipulations.

A.2 Best Management Practices (BMPs)

The BMPs will be adopted as required elements of project-specific PODs and/or as ROW authorization stipulations. They are categorized by development activity: site monitoring and testing, development of the POD, construction, operation, and decommissioning. The BMPs for development of the POD identify required elements of the POD needed to address potential impacts associated with subsequent phases of development.

A.2.1 Site Monitoring and Testing

- The area disturbed by installation of meteorological towers (i.e., footprint) shall be kept to a minimum.
- Existing roads shall be used to the maximum extent feasible. If new roads are necessary, they shall be designed and constructed to the appropriate standard.
- Meteorological towers shall not be located in sensitive habitats or in areas where ecological resources known to be sensitive to human activities (e.g., prairie grouse) are present. Installation of towers shall be scheduled to avoid disruption of wildlife reproductive activities or other important behaviors.
- Meteorological towers installed for site monitoring and testing shall be inspected periodically for structural integrity.

A.2.2 Plan of Development Preparation

General

- The BLM and operators shall contact appropriate agencies, property owners, and other stakeholders early in the planning process to identify potentially sensitive land uses and issues, rules that govern wind energy development locally, and land use concerns specific to the region.
- Available information describing the environmental and sociocultural conditions in the vicinity of the proposed project shall be collected and reviewed as needed to predict potential impacts of the project.
- The Federal Aviation Administration (FAA)-required notice of proposed construction shall be made as early as possible to identify any air safety measures that would be required.
- To plan for efficient use of the land, necessary infrastructure requirements shall be consolidated wherever possible, and current transmission and market access shall be evaluated carefully.
- The project shall be planned to utilize existing roads and utility corridors to the maximum extent feasible, and to minimize the number and length/size of new roads, lay-down areas, and borrow areas.
- A monitoring program shall be developed to ensure that environmental conditions are monitored during the construction, operation, and

decommissioning phases. The monitoring program requirements, including adaptive management strategies, shall be established at the project level to ensure that potential adverse impacts of wind energy development are mitigated. The monitoring program shall identify the monitoring requirements for each environmental resource present at the site, establish metrics against which monitoring observations can be measured, identify potential mitigation measures, and establish protocols for incorporating monitoring observations and additional mitigation measures into standard operating procedures and BMPs.

- “Good housekeeping” procedures shall be developed to ensure that during operation the site will be kept clean of debris, garbage, fugitive trash or waste, and graffiti; to prohibit scrap heaps and dumps; and to minimize storage yards.

Wildlife and Other Ecological Resources

- Operators shall review existing information on species and habitats in the vicinity of the project area to identify potential concerns.
- Operators shall conduct surveys for federal and/or state-protected species and other species of concern (including special status plant and animal species) within the project area and design the project to avoid (if possible), minimize, or mitigate impacts to these resources.
- Operators shall identify important, sensitive, or unique habitats in the vicinity of the project and design the project to avoid (if possible), minimize, or mitigate impacts to these habitats (e.g., locate the turbines, roads, and ancillary facilities in the least environmentally sensitive areas; i.e., away from riparian habitats, streams, wetlands, drainages, or critical wildlife habitats).
- The BLM will prohibit the disturbance of any population of federal listed plant species.
- Operators shall evaluate avian and bat use of the project area and design the project to minimize or mitigate the potential for bird and bat strikes (e.g., development shall not occur in riparian habitats and wetlands). Scientifically rigorous avian and bat use surveys shall be conducted; the amount and extent of ecological baseline data required shall be determined on a project basis.
- Turbines shall be configured to avoid landscape features known to attract raptors, if site studies show that placing turbines there would pose a significant risk to raptors.

- Operators shall determine the presence of bat colonies and avoid placing turbines near known bat hibernation, breeding, and maternity/nursery colonies; in known migration corridors; or in known flight paths between colonies and feeding areas.
- Operators shall determine the presence of active raptor nests (i.e., raptor nests used during the breeding season). Measures to reduce raptor use at a project site (e.g., minimize road cuts, maintain either no vegetation or nonattractive plant species around the turbines) shall be considered.
- A habitat restoration plan shall be developed to avoid (if possible), minimize, or mitigate negative impacts on vulnerable wildlife while maintaining or enhancing habitat values for other species. The plan shall identify revegetation, soil stabilization, and erosion reduction measures that shall be implemented to ensure that all temporary use areas are restored. The plan shall require that restoration occur as soon as possible after completion of activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats.
- Procedures shall be developed to mitigate potential impacts to special status species. Such measures could include avoidance, relocation of project facilities or lay-down areas, and/or relocation of biota.
- Facilities shall be designed to discourage their use as perching or nesting substrates by birds. For example, power lines and poles shall be configured to minimize raptor electrocutions and discourage raptor and raven nesting and perching.

Visual Resources

- The public shall be involved and informed about the visual site design elements of the proposed wind energy facilities. Possible approaches include conducting public forums for disseminating information, offering organized tours of operating wind developments, and using computer simulation and visualization techniques in public presentations.
- Turbine arrays and turbine design shall be integrated with the surrounding landscape. Design elements to be addressed include visual uniformity, use of tubular towers, proportion and color of turbines, nonreflective paints, and prohibition of commercial messages on turbines.
- Other site design elements shall be integrated with the surrounding landscape. Elements to address include minimizing the profile of the ancillary structures, burial of cables, prohibition of commercial symbols, and lighting. Regarding

lighting, efforts shall be made to minimize the need for and amount of lighting on ancillary structures.

Roads

- An access road siting and management plan shall be prepared incorporating existing BLM standards regarding road design, construction, and maintenance such as those described in the BLM 9113 Manual (BLM 1985) and the *Surface Operating Standards for Oil and Gas Exploration and Development* (RMRCC 1989) (i.e., the Gold Book).

Ground Transportation

- A transportation plan shall be developed, particularly for the transport of turbine components, main assembly cranes, and other large pieces of equipment. The plan shall consider specific object sizes, weights, origin, destination, and unique handling requirements and shall evaluate alternative transportation approaches. In addition, the process to be used to comply with unique state requirements and to obtain all necessary permits shall be clearly identified.
- A traffic management plan shall be prepared for the site access roads to ensure that no hazards would result from the increased truck traffic and that traffic flow would not be adversely impacted. This plan shall incorporate measures such as informational signs, flaggers when equipment may result in blocked throughways, and traffic cones to identify any necessary changes in temporary lane configuration.

Noise

- Proponents of a wind energy development project shall take measurements to assess the existing background noise levels at a given site and compare them with the anticipated noise levels associated with the proposed project.

Noxious Weeds and Pesticides

- Operators shall develop a plan for control of noxious weeds and invasive species, which could occur as a result of new surface disturbance activities at the site. The plan shall address monitoring, education of personnel on weed identification, the manner in which weeds spread, and methods for treating infestations. The use of certified weed-free mulching shall be required. If trucks and construction equipment are arriving from locations with known

invasive vegetation problems, a controlled inspection and cleaning area shall be established to visually inspect construction equipment arriving at the project area and to remove and collect seeds that may be adhering to tires and other equipment surfaces.

- If pesticides are used on the site, an integrated pest management plan shall be developed to ensure that applications would be conducted within the framework of BLM and DOI policies and entail only the use of EPA-registered pesticides. Pesticide use shall be limited to nonpersistent, immobile pesticides and shall only be applied in accordance with label and application permit directions and stipulations for terrestrial and aquatic applications.

Cultural/Historic Resources

- The BLM will consult with Indian Tribal governments early in the planning process to identify issues regarding the proposed wind energy development, including issues related to the presence of cultural properties, access rights, disruption to traditional cultural practices, and impacts to visual resources important to the Tribe(s).
- The presence of archaeological sites and historic properties in the area of potential effect shall be determined on the basis of a records search of recorded sites and properties in the area and/or, depending on the extent and reliability of existing information, an archaeological survey. Archaeological sites and historic properties present in the area of potential effect shall be reviewed to determine whether they meet the criteria of eligibility for listing on the *National Register of Historic Places* (NRHP).
- When any rights-of-way application includes remnants of a National Historic Trail, is located within the viewshed of a National Historic Trail's designated centerline, or includes or is within the viewshed of a trail eligible for listing on the NRHP, the operator shall evaluate the potential visual impacts to the trail associated with the proposed project and identify appropriate mitigation measures for inclusion as stipulations in the POD.
- If cultural resources are present at the site, or if areas with a high potential to contain cultural material have been identified, a cultural resources management plan (CRMP) shall be developed. This plan shall address mitigation activities to be taken for cultural resources found at the site. Avoidance of the area is always the preferred mitigation option. Other mitigation options include archaeological survey and excavation (as warranted) and monitoring. If an area exhibits a high potential, but no artifacts were observed during an archaeological survey, monitoring by a qualified archaeologist could be required during all excavation and

earthmoving in the high-potential area. A report shall be prepared documenting these activities. The CRMP also shall (1) establish a monitoring program, (2) identify measures to prevent potential looting/vandalism or erosion impacts, and (3) address the education of workers and the public to make them aware of the consequences of unauthorized collection of artifacts and destruction of property on public land.

Paleontological Resources

- Operators shall determine whether paleontological resources exist in a project area on the basis of the sedimentary context of the area, a records search for past paleontological finds in the area, and/or, depending on the extent of existing information, a paleontological survey.
- If paleontological resources are present at the site, or if areas with a high potential to contain paleontological material have been identified, a paleontological resources management plan shall be developed. This plan shall include a mitigation plan for collection of the fossils; mitigation could include avoidance, removal of fossils, or monitoring. If an area exhibits a high potential but no fossils were observed during survey, monitoring by a qualified paleontologist could be required during all excavation and earthmoving in the sensitive area. A report shall be prepared documenting these activities. The paleontological resources management plan also shall (1) establish a monitoring program, (2) identify measures to prevent potential looting/vandalism or erosion impacts, and (3) address the education of workers and the public to make them aware of the consequences of unauthorized collection of fossils on public land.

Hazardous Materials and Waste Management

- Operators shall develop a hazardous materials management plan addressing storage, use, transportation, and disposal of each hazardous material anticipated to be used at the site. The plan shall identify all hazardous materials that would be used, stored, or transported at the site. It shall establish inspection procedures, storage requirements, storage quantity limits, inventory control, nonhazardous product substitutes, and disposition of excess materials. The plan shall also identify requirements for notices to federal and local emergency response authorities and include emergency response plans.
- Operators shall develop a waste management plan identifying the waste streams that are expected to be generated at the site and addressing hazardous waste determination procedures, waste storage locations, waste-specific management and disposal requirements, inspection procedures, and waste

minimization procedures. This plan shall address all solid and liquid wastes that may be generated at the site.

- Operators shall develop a spill prevention and response plan identifying where hazardous materials and wastes are stored on site, spill prevention measures to be implemented, training requirements, appropriate spill response actions for each material or waste, the locations of spill response kits on site, a procedure for ensuring that the spill response kits are adequately stocked at all times, and procedures for making timely notifications to authorities.

Storm Water

- Operators shall develop a storm water management plan for the site to ensure compliance with applicable regulations and prevent off-site migration of contaminated storm water or increased soil erosion.

Human Health and Safety

- A safety assessment shall be conducted to describe potential safety issues and the means that would be taken to mitigate them, including issues such as site access, construction, safe work practices, security, heavy equipment transportation, traffic management, emergency procedures, and fire control.
- A health and safety program shall be developed to protect both workers and the general public during construction, operation, and decommissioning of a wind energy project. Regarding occupational health and safety, the program shall identify all applicable federal and state occupational safety standards; establish safe work practices for each task (e.g., requirements for personal protective equipment and safety harnesses; Occupational Safety and Health Administration [OSHA] standard practices for safe use of explosives and blasting agents; and measures for reducing occupational electric and magnetic fields [EMF] exposures); establish fire safety evacuation procedures; and define safety performance standards (e.g., electrical system standards and lightning protection standards). The program shall include a training program to identify hazard training requirements for workers for each task and establish procedures for providing required training to all workers. Documentation of training and a mechanism for reporting serious accidents to appropriate agencies shall be established.
- Regarding public health and safety, the health and safety program shall establish a safety zone or setback for wind turbine generators from residences and occupied buildings, roads, rights-of-ways, and other public access areas that is sufficient to prevent accidents resulting from the operation of wind turbine generators. It shall identify requirements for temporary fencing

around staging areas, storage yards, and excavations during construction or decommissioning activities. It shall also identify measures to be taken during the operation phase to limit public access to hazardous facilities (e.g., permanent fencing would be installed only around electrical substations, and turbine tower access doors would be locked).

- Operators shall consult with local planning authorities regarding increased traffic during the construction phase, including an assessment of the number of vehicles per day, their size, and type. Specific issues of concern (e.g., location of school bus routes and stops) shall be identified and addressed in the traffic management plan.
- If operation of the wind turbines is expected to cause significant adverse impacts to nearby residences and occupied buildings from shadow flicker, low-frequency sound, or EMF, site-specific recommendations for addressing these concerns shall be incorporated into the project design (e.g., establishing a sufficient setback from turbines).
- The project shall be planned to minimize electromagnetic interference (EMI) (e.g., impacts to radar, microwave, television, and radio transmissions) and comply with Federal Communications Commission [FCC] regulations. Signal strength studies shall be conducted when proposed locations have the potential to impact transmissions. Potential interference with public safety communication systems (e.g., radio traffic related to emergency activities) shall be avoided.
- The project shall be planned to comply with FAA regulations, including lighting regulations, and to avoid potential safety issues associated with proximity to airports, military bases or training areas, or landing strips.
- Operators shall develop a fire management strategy to implement measures to minimize the potential for a human-caused fire.

A.2.3 Construction

General

- All control and mitigation measures established for the project in the POD and the resource-specific management plans that are part of the POD shall be maintained and implemented throughout the construction phase, as appropriate.
- The area disturbed by construction and operation of a wind energy development project (i.e., footprint) shall be kept to a minimum.

- The number and size/length of roads, temporary fences, lay-down areas, and borrow areas shall be minimized.
- Topsoil from all excavations and construction activities shall be salvaged and reapplied during reclamation.
- All areas of disturbed soil shall be reclaimed using weed-free native grasses, forbs, and shrubs. Reclamation activities shall be undertaken as early as possible on disturbed areas.
- All electrical collector lines shall be buried in a manner that minimizes additional surface disturbance (e.g., along roads or other paths of surface disturbance). Overhead lines may be used in cases where burial of lines would result in further habitat disturbance.
- Operators shall identify unstable slopes and local factors that can induce slope instability (such as groundwater conditions, precipitation, earthquake activities, slope angles, and the dip angles of geologic strata). Operators also shall avoid creating excessive slopes during excavation and blasting operations. Special construction techniques shall be used where applicable in areas of steep slopes, erodible soil, and stream channel crossings.
- Erosion controls that comply with county, state, and federal standards shall be applied. Practices such as jute netting, silt fences, and check dams shall be applied near disturbed areas.

Wildlife

- Guy wires on permanent meteorological towers shall be avoided, however, may be necessary on temporary meteorological towers installed during site monitoring and testing.
- In accordance with the habitat restoration plan, restoration shall be undertaken as soon as possible after completion of construction activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats.
- All construction employees shall be instructed to avoid harassment and disturbance of wildlife, especially during reproductive (e.g., courtship and nesting) seasons. In addition, pets shall not be permitted on site during construction.

Visual Resources

- Operators shall reduce visual impacts during construction by minimizing areas of surface disturbance, controlling erosion, using dust suppression techniques, and restoring exposed soils as closely as possible to their original contour and vegetation.

Roads

- Existing roads shall be used, but only if in safe and environmentally sound locations. If new roads are necessary, they shall be designed and constructed to the appropriate standard and be no higher than necessary to accommodate their intended functions (e.g., traffic volume and weight of vehicles). Excessive grades on roads, road embankments, ditches, and drainages shall be avoided, especially in areas with erodible soils. Special construction techniques shall be used, where applicable. Abandoned roads and roads that are no longer needed shall be recontoured and revegetated.
- Access roads and on-site roads shall be surfaced with aggregate materials, wherever appropriate.
- Access roads shall be located to follow natural contours and minimize side hill cuts.
- Roads shall be located away from drainage bottoms and avoid wetlands, if practicable.
- Roads shall be designed so that changes to surface water runoff are avoided and erosion is not initiated.
- Access roads shall be located to minimize stream crossings. All structures crossing streams shall be located and constructed so that they do not decrease channel stability or increase water velocity. Operators shall obtain all applicable federal and state permits.
- Existing drainage systems shall not be altered, especially in sensitive areas such as erodible soils or steep slopes. Potential soil erosion shall be controlled at culvert outlets with appropriate structures. Catch basins, roadway ditches, and culverts shall be cleaned and maintained regularly.

Ground Transportation

- Project personnel and contractors shall be instructed and required to adhere to speed limits commensurate with road types, traffic volumes, vehicle types,

and site-specific conditions, to ensure safe and efficient traffic flow and to reduce wildlife collisions and disturbance and airborne dust.

- Traffic shall be restricted to the roads developed for the project. Use of other unimproved roads shall be restricted to emergency situations.
- Signs shall be placed along construction roads to identify speed limits, travel restrictions, and other standard traffic control information. To minimize impacts on local commuters, consideration shall be given to limiting construction vehicles traveling on public roadways during the morning and late afternoon commute time.

Air Emissions

- Dust abatement techniques shall be used on unpaved, unvegetated surfaces to minimize airborne dust.
- Speed limits (e.g., 25 mph [40 km/h]) shall be posted and enforced to reduce airborne fugitive dust.
- Construction materials and stockpiled soils shall be covered if they are a source of fugitive dust.
- Dust abatement techniques shall be used before and during surface clearing, excavation, or blasting activities.

Excavation and Blasting Activities

- Operators shall gain a clear understanding of the local hydrogeology. Areas of groundwater discharge and recharge and their potential relationships with surface water bodies shall be identified.
- Operators shall avoid creating hydrologic conduits between two aquifers during foundation excavation and other activities.
- Foundations and trenches shall be backfilled with originally excavated material as much as possible. Excess excavation materials shall be disposed of only in approved areas or, if suitable, stockpiled for use in reclamation activities.
- Borrow material shall be obtained only from authorized and permitted sites. Existing sites shall be used in preference to new sites.

- Explosives shall be used only within specified times and at specified distances from sensitive wildlife or streams and lakes, as established by the BLM or other federal and state agencies.

Noise

- Noisy construction activities (including blasting) shall be limited to the least noise-sensitive times of day (i.e., daytime only between 7 a.m. and 10 p.m.) and weekdays.
- All equipment shall have sound-control devices no less effective than those provided on the original equipment. All construction equipment used shall be adequately muffled and maintained.
- All stationary construction equipment (i.e., compressors and generators) shall be located as far as practicable from nearby residences.
- If blasting or other noisy activities are required during the construction period, nearby residents shall be notified in advance.

Cultural and Paleontological Resources

- Unexpected discovery of cultural or paleontological resources during construction shall be brought to the attention of the responsible BLM authorized officer immediately. Work shall be halted in the vicinity of the find to avoid further disturbance to the resources while they are being evaluated and appropriate mitigation measures are being developed.

Hazardous Materials and Waste Management

- Secondary containment shall be provided for all on-site hazardous materials and waste storage, including fuel. In particular, fuel storage (for construction vehicles and equipment) shall be a temporary activity occurring only for as long as is needed to support construction activities.
- Wastes shall be properly containerized and removed periodically for disposal at appropriate off-site permitted disposal facilities.
- In the event of an accidental release to the environment, the operator shall document the event, including a root cause analysis, appropriate corrective actions taken, and a characterization of the resulting environmental or health and safety impacts. Documentation of the event shall be provided to the BLM authorized officer and other federal and state agencies, as required.

- Any wastewater generated in association with temporary, portable sanitary facilities shall be periodically removed by a licensed hauler and introduced into an existing municipal sewage treatment facility. Temporary, portable sanitary facilities provided for construction crews shall be adequate to support expected on-site personnel and shall be removed at completion of construction activities.

Public Health and Safety

- Temporary fencing shall be installed around staging areas, storage yards, and excavations during construction to limit public access.

A.2.4 Operation

General

- All control and mitigation measures established for the project in the POD and the resource-specific management plans that are part of the POD shall be maintained and implemented throughout the operational phase, as appropriate. These control and mitigation measures shall be reviewed and revised, as needed, to address changing conditions or requirements at the site, throughout the operational phase. This adaptive management approach would help ensure that impacts from operations are kept to a minimum.
- Inoperative turbines shall be repaired, replaced, or removed in a timely manner. Requirements to do so shall be incorporated into the due diligence provisions of the rights-of-way authorization. Operators will be required to demonstrate due diligence in the repair, replacement, or removal of turbines; failure to do so could result in termination of the rights-of-way authorization.

Wildlife

- Employees, contractors, and site visitors shall be instructed to avoid harassment and disturbance of wildlife, especially during reproductive (e.g., courtship and nesting) seasons. In addition, any pets shall be controlled to avoid harassment and disturbance of wildlife.
- Observations of potential wildlife problems, including wildlife mortality, shall be reported to the BLM authorized officer immediately.

Ground Transportation

- Ongoing ground transportation planning shall be conducted to evaluate road use, minimize traffic volume, and ensure that roads are maintained adequately to minimize associated impacts.

Monitoring Program

- Site monitoring protocols defined in the POD shall be implemented. These will incorporate monitoring program observations and additional mitigation measures into standard operating procedures and BMPs to minimize future environmental impacts.
- Results of monitoring program efforts shall be provided to the BLM authorized officer.

Public Health and Safety

- Permanent fencing shall be installed and maintained around electrical substations, and turbine tower access doors shall be locked to limit public access.
- In the event an installed wind energy development project results in EMI, the operator shall work with the owner of the impacted communications system to resolve the problem. Additional warning information may also need to be conveyed to aircraft with onboard radar systems so that echoes from wind turbines can be quickly recognized.

A.2.5 Decommissioning

General

- Prior to the termination of the rights-of-way authorization, a decommissioning plan shall be developed and approved by the BLM. The decommissioning plan shall include a site reclamation plan and monitoring program.
- All management plans, BMPs, and stipulations developed for the construction phase shall be applied to similar activities during the decommissioning phase.
- All turbines and ancillary structures shall be removed from the site.

- Topsoil from all decommissioning activities shall be salvaged and reapplied during final reclamation.
- All areas of disturbed soil shall be reclaimed using weed-free native shrubs, grasses, and forbs.
- The vegetation cover, composition, and diversity shall be restored to values commensurate with the ecological setting.

APPENDIX G
TOOLS AND TECHNIQUES AND PROGRAMMATIC
EMERGENCY STABILIZATION AND REHABILITATION PLAN

**APPENDIX G
TOOLS AND TECHNIQUES AND PROGRAMMATIC
EMERGENCY STABILIZATION AND REHABILITATION PLAN**

Introduction

Typical tools and techniques that may be used to manage resources, watersheds, and ecological systems within the planning area are described in this appendix. For discussion and general evaluations, these management aids have been grouped into several categories based on similarity in the types of effects they would have. Vegetation treatment for the restoration of watersheds is a primary management action outlined in the Proposed RMP. Therefore, the first step has been to group similar tools and techniques used for vegetation treatment into categories. These are presented below. Obviously many of the typical tools and techniques listed in this appendix overlap into two or more of these broad categories. Professional judgment was used to identify the best fit with the inherent nature of the tool or technique itself.

For any particular resource or resource use, potential impacts may be driven by only a few primary tools and techniques within a category. Where substantial impacts may occur on other resources from a typical tool or technique, these are described in Chapter 4.0. Potential impact assessments generally focus on vegetation, soils, water resources, wildlife resources, and other resources as appropriate. Typical tools and techniques do not vary by alternative, so their potential impacts are discussed at the beginning of each resource program under consideration.

Typical Tools and Techniques

Vegetation Treatment Tools and Techniques

Fire Treatments

- Wildland fire use – Natural fires started by lightning or other natural causes would be managed to achieve restoration goals.
- Prescribed fire – Management fires ignited by available devices.
- Heavy equipment – Heavy equipment such as bulldozers is used to clear fire lines.
- Hand tools – Typically, crews dig hand lines around small fires with chainsaws, pulaskis, and shovels to provide a fuel break for containing them. Fire fighting also includes "mop-up" methods to extinguish embers. Methods include turning over soil and logs and spraying water on the hottest spots.
- Aircraft – Helicopters and slurry bombers (single-engine and multi-engine) are primarily used for fire detection, management, and suppression. Smoke jumpers and helitack crews often are deployed from helicopters and other aircraft to perform initial attack on wildfires.
- Fire retardant – Aerial applications of slurry to suppress or influence wildfire behavior. In some areas, retardant in the form of foam is used to protect sensitive resources.
- Pile burning – Woody debris is piled together and subsequently burned on site.

APPENDIX G

- Burn out – Setting fire inside a control line to widen it or to consume fuel between the edge of the fire and the control line.
- Fire rehabilitation – Procedures for stabilizing and rehabilitating burned areas are included in the Normal Year Fire Rehabilitation Plan.

Mechanical Treatments

- Chaining/brush rolling – Steel chain (60 to 120 pound links totaling 200 to 300 feet in length), with or without rails welded to each link, spanned between two bulldozers to uproot trees. Rails are 18 to 24 inches in length and made from 70- to 90-pound rail. Two passes of the chain in opposite directions is required.
- Mowing/brush beating – Mowing is sometimes used for noxious weed management.
- Machine cutting and piling – Heavy machinery is used to cut and push woody vegetation into piles.
- Disc plowing – A farming disc or brush-land plow is pulled by a tractor to turn over the soil for several types of vegetation treatment, including reseeding.
- Green-stripping – Remove flammable fuels by brush beating, mowing, or other methods in strategic locations and replace with less flammable species, such as forage kochia or crested wheatgrass in order to influence fire behavior.
- Hand cutting – Woody vegetation is cut using chainsaws, hydraulic axes, or other hand tools.
- Pulling – Where noxious weed infestations are small and conditions are conducive, manual pulling of weeds can be an effective non-invasive method of weed management. May also be used where other methods are prohibited.
- Lopping and scattering – Woody biomass that results from vegetation clearing is cut into specified dimensions and scattered.
- Chipping – Residual biomass created as a result of tree removal is turned into small wood chips. Wood chippers are typically small mobile machines transported to and used on site. Chips are distributed by mechanical spreading.
- Pitting and scalping – The ground surface is mechanically pitted or scalped to increase water retention.
- Biomass use – Biomass in the form of trees and shrubs may be generated through vegetation clearing for watershed restoration and for fuel reduction in wildland urban interface areas. Such biomass could be utilized in a number of ways depending on the proposed project size and location and the economic conditions at the time the project is implemented. Biomass uses could include fuel for small electric generating plants (green energy) and raw material for consumer products. BLM would approve such uses of biomass on a case-by-case basis.

Chemical Treatments

- Selective and non-selective herbicides

As of 2004, the following herbicides were approved for use on BLM lands. It is anticipated that this list will be modified over time. As herbicides gain or lose BLM approval, their use on Ely Field Office lands will reflect BLM approval. All herbicide use will be according to label directions. The

Ely Field Office will use the least toxic or lowest amount of herbicide that will achieve the desired result.

Atrazine	Dicamba	Imazapyr + Diuron	Tebuthiuron
Bromacil	Dicamba + 2,4-D Diuron	Mefluidide	Tebuthiuron + Diuron
Bromacil + Diuron	Glyphosate	Metsulfuron	Triclopyr
Chlorsulfuron	Glyphosate + 2,4-D	Picloram	Triclopyr + 2,4-D
Clopyralid	Glyphosate + Dicamba	Picloram + 2,4-D	Triclopyr + Clopyralid
Clopyralid + 2,4-D	Hexazinone	Simazine	
2,4-D	Imazapyr	Sulfometuron	

¹ BLM Information Bulletin No. 2004-030.

Biological Treatments – Grazing Management

- Type of livestock – Use livestock including sheep and goats to remove unwanted vegetation or to facilitate changes in vegetative composition.
- Season of use – Livestock authorizations include season of use by allotment and/or pasture. Allotments are either yearlong or seasonal in permitted use. Rest-rotation, deferred rotation provide rest from grazing under different types of schedules.
- Stocking rate – Permitted stocking levels (animal numbers) can be adjusted to achieve vegetation objectives.
- Allowable use – Identified for allotments, pastures or other specified areas based on the physiology, phenology, density, vigor and condition of key forage species. Monitoring is required on a periodic basis to determine if allowable use is exceeded and what actions should be taken.
- Water haul facilities – Moveable water tanks may be used to control livestock distribution. Avoid tank locations on or adjacent to steep erodible soils or near other sensitive resources.
- Salt/mineral/supplement blocks – Salt/mineral/supplement block placement locations can be used to control livestock distribution. Avoid salt placement on or adjacent to transportation routes, on steep erodible soils, or near other sensitive resources.

Biological Treatments – Other Management

- Seeding/interseeding – Aerial- or terrestrial-based seeding of grasses, forbs, and shrubs to revegetate disturbed areas. Range drills. Plows. Seed spreaders. Seed rollers and drums.
- Planting – Plant seedlings or cuttings of woody species such as willows or cottonwoods to accelerate the recovery of riparian areas and attain proper functioning condition.
- Biological control – Where appropriate, agents (such as insects, bacteria, or pheromones) that feed, infect, disrupt, or compete with noxious or invasive species to their detriment may be released for management purposes.

APPENDIX G

Other Tools and Techniques

Structural Tools

- Heavy equipment – Bulldozers, road graders, and other equipment are used to maintain roads, mine minerals, construct campgrounds, etc.
- Light and medium duty equipment – Cars and trucks used to access sites for all types of administrative work or permitted activities.
- Water bars – Constructed mounds typically on closed roads designed to slow overland flow and soil erosion on steep slopes.
- Straw bales – Straw bales are strategically placed and anchored to minimize soil loss on recently disturbed or revegetated sites especially on slopes.
- Stream structures – Logs, gabions, and other stream structures may be used to catch sediment or create fish pools.
- Bat gates – Metal gates are installed at the entrances of caves or abandoned mines to protect important bat habitats, such as maternity roosts, and to protect cave resources from human use.
- Big game crossing passes – Used to facilitate big game crossing at highways and other high traffic zones.
- Water development – Water developments increase the density and availability of water for wildlife and livestock. Developments vary from piped springs to trickle tanks and gallinaceous guzzlers that capture rainwater and store it in cisterns while allowing controlled use. Water pipelines traversing little watered areas are sometimes used to provide water at intervals along their length.
- Water escape ramps – Provide escape ladders or other devices to allow small mammals and herptiles to escape man made waterbodies that may trap them.
- Livestock fencing – Primarily used to control livestock distribution. Protect vulnerable areas such as riparian zones by excluding grazing animals.
- Gates – Gates are installed to control access on a seasonal or permanent basis.

Administrative or Regulatory Tools

- Permits – Permits are provided for personal and commercial use of materials such as gravel, fuelwood, and pinyon pine nuts. Other activities requiring a permit include some special recreation events and collecting materials for research of caves in the planning area.
- Fees – Fees are collected to aid in the tracking and management of various uses of federal lands and resources.
- Visitor signs – Signs are used to instruct or inform visitors to the public lands regarding health and safety issues, unique vistas or resources, land use restrictions, or general interest items. They may be used to direct activities away from sensitive areas and to concentrate impacts in other areas. Signs also may be used for visitor outreach to make visitors aware of recreation opportunities such as trails, roads, and recreation sites.
- Temporary or permanent closure – Close sensitive areas to recreational, development, treatment, and other permitted activities during sensitive periods.

- Road closures – Temporary or permanent road closures in order to facilitate achievement of land health standards.
- Law enforcement – Law enforcement is a tool to monitor public uses on public lands from assistance during hunting season to fuelwood collection.
- Stewardship contracting – In February 2004, the BLM approved guidelines for developing and entering stewardship agreements as part of the Healthy Forests Initiative. Stewardship contracts allow private entities to retain forest products in exchange for services such as thinning trees and cutting brush. Stewardship projects are primarily focused on restoration and expected to benefit fuels, wildlife and fish, forest, rangeland, and riparian resources. As defined in IM 2004-081 (1/16/04), stewardship opportunities are those that would achieve land management goals as well as meet local and rural community needs. Stewardship contracts and agreements are by definition long-term, giving contractors the ability to invest in equipment and infrastructure.
- Wild horse gathers – Gathers may be conducted by horseback or with helicopter. Temporary traps and pens may be constructed for holding animals.
- Wild horse fertility control - Artificial fertility control measures (e.g., implanted or oral contraceptives) may be applied to control population birth rate and recruitment rate.

Research Tools

- Stream gauges – Used to measure stream flows at permanent sites.
- Flow meters – Used to take spot measurements of stream flow.
- Monitoring of wildlife or vegetation species populations – Monitoring is conducted to establish trends in population locations and numbers.
- Telemetry – Telemetry involves the use of radio transmitters and receivers primarily to monitor animal movements.
- Wild horse fertility control measures – Used to reduce the number of new foals born in existing herds.
- Vegetation exclosures – As appropriate for monitoring, existing vegetation exclosures would be maintained and new exclosures would be constructed. Vegetation exclosures exclude livestock, wild horses, and wildlife from reference areas to assess the effects of grazing on vegetation.

APPENDIX G (Continued)
PROGRAMMATIC EMERGENCY STABILIZATION AND REHABILITATION PLAN

Introduction

The purpose and need for the Normal Year Fire Rehabilitation Plan is to create a framework for the Ely Emergency Stabilization and Rehabilitation program that will streamline Emergency Stabilization and Rehabilitation procedures and allow for the completion of on-the-ground treatments within a timeframe consistent with the urgent nature of fire rehabilitation. In addition, this document will enable the Ely Field Office to initiate Emergency Stabilization and Rehabilitation proposals that reduce the adverse effects of wildfire on soil, vegetation, crucial wildlife habitat, property, water quality, and other resources.

Emergency Stabilization and Rehabilitation activities are funded separately. Thus, depending on the conditions of the burned area, an Emergency Stabilization and/or a Rehabilitation Plan may be written following a wildfire. In some instances, neither plan may be written.

Currently, emergency stabilization plans address:

- Minimizing threats to life, property, and critical cultural and natural resources resulting from the effects of a fire;
- Promptly stabilizing and preventing further degradation to affected resources on lands within the fire perimeter or areas affected directly by wind or water erosion from burned areas; and
- Repairing damages caused by fire suppression operations.

Currently, rehabilitation plans address:

- Mitigating actual and potential long-term post-fire impacts to critical cultural and natural resources and treating those areas unlikely to recover naturally from severe wildland fire damage by emulating historic or pre-fire ecosystem structure, function, diversity, and dynamics;
- Restoring or establishing healthy, stable ecosystems in the burned area, even if these ecosystems cannot fully emulate historic or pre-fire conditions; and
- Repairing or replacing fire damage of minor operating facilities.

In the future, Emergency Stabilization and Rehabilitation plans may address different objectives as determined and stated in future department manuals or documents.

As stated in the Department of the Interior 620 Department Manual 3, funding for Emergency Stabilization treatments and activities is provided for no more than one year following containment of a wildland fire, except that Emergency Stabilization funding may be used to repair or replace Emergency Stabilization

structures or treatments for up to three years following containment of a wildland fire where failure to do so would imperil watershed functionality or result in serious loss of downstream values and for monitoring. Funding for rehabilitation treatments is provided in 1-year increments for no more than 3 years following containment of a wildland fire.

Emergency Stabilization and Rehabilitation funds may not be used for prescribed fire projects in which fire behavior was within prescription. Rehabilitation actions may be planned and funded only for projects that were declared wildfires or where fire behavior exceeded prescription. Wildland fires for resource benefits are not eligible for rehabilitation funds. Furthermore, Emergency Stabilization and Rehabilitation funds are not to be used for rehabilitation caused by wildland fire suppression actions. Costs for rehabilitating wildland fire suppression actions will be funded by the appropriate fire suppression subactivity. Nonetheless, in the future, what is allowed under Emergency Stabilization and Rehabilitation funding may change, and the Emergency Stabilization and Rehabilitation program will assign funding dollars accordingly.

The process for implementing emergency fire rehabilitation activities through a site-specific plan development process is described in the following paragraphs. However, the implementation process may be revised as the needs and regulations of the Emergency Stabilization and Rehabilitation program evolve.

1. Prior to fire containment, an interdisciplinary team will determine if Emergency Stabilization and/or Rehabilitation will be needed in a burned area. If Emergency Stabilization and/or Rehabilitation will be needed, an interdisciplinary team assesses the Emergency Stabilization and Rehabilitation needs of the burn and selects the necessary Emergency Stabilization or Rehabilitation prescription from the Normal Year Fire Rehabilitation Plan. (If the necessary prescription does not fall under the scope of this plan, refer to the Department of the Interior 620 Department Manual 3 for guidance.) Generally, rehabilitation efforts not covered in this plan would require an environmental assessment and approval by the State Director unless the action falls under a categorical exclusion.
2. An interdisciplinary team will then proceed to write both an Emergency Stabilization and a Rehabilitation plan that tier to the Normal Year Fire Rehabilitation Plan. As needed and determined appropriate by the interdisciplinary team, the plans may incorporate any or all of the following prescriptions: seed mixture (unless the prescribed seed mixture does not meet unique needs of the burned area), application rates, planting/seeding methods, costs, erosion control structures, protection fencing, and grazing adjustments beyond the normally prescribed minimum two growing seasons rest period.
3. In determining the Emergency Stabilization and/or Rehabilitation needs of a burn, the interdisciplinary team will keep in mind that natural recovery by native plant species is preferable to planting or seeding, either of natives or non-natives. If planting or seeding is necessary, the use of native species is preferable. To the extent permitted by law and Executive Order 13112, Invasive Species, dated February 3, 1999, introduction of exotic species into natural ecosystems will be restricted unless the Secretary of the Interior finds that such introduction will not have an adverse effect on natural ecosystems.

APPENDIX G

4. Once appropriate treatments are determined, a budget is created that summarizes the Emergency Stabilization and Rehabilitation costs by fiscal year. This budget is sent to the State Director for funding approval, or the Washington Office if the budget is over \$100,000.
5. Cultural and threatened and endangered species clearances will be completed prior to project implementation. Known populations of threatened and endangered plants will be marked and that area restricted from heavy equipment use. Emergency Stabilization and/or Rehabilitation activities that involve mechanized surface disturbance greater than 10 centimeters in depth will require a cultural survey. Any archaeological resources discovered will be marked and avoided by ground disturbing equipment or will be relocated.

Rehabilitation actions outlined in the rehabilitation plan may fall under the categorical exclusion for rehabilitation activities for lands and infrastructure impacted by fires or fire suppression. The rehabilitation categorical exclusion does not cover Emergency Stabilization. In order to ensure that public concerns/interests are addressed, "the responsible officials will consider, on a project-by-project basis whether or not any of the Department of the Interior's exceptions apply. [Furthermore], the responsible official will prepare a decision memo that will be available for public review."

The rehabilitation activities eligible for categorical exclusion and the conditions they must be performed under are listed in the following paragraphs as stated in the Notice for the National Environmental Protection Act (NEPA) Determination Needed for Fire Management Activities; Categorical Exclusions:

- Post-fire rehabilitation activities not exceeding 4,200 acres (such as tree planting, fence replacement, habitat restoration, heritage site restoration, repair of roads and trails, and repair of damage to minor facilities such as campgrounds) to repair or improve lands unlikely to recover to a management approved condition from wildland fire damage, or to repair or replace minor facilities damaged by fire.
- Activities (such as reseeding or planting, fence construction, culvert repair, installation of erosion control device and repair of roads and trails) necessary for rehabilitation of habitat, watersheds, historical, archeological, and cultural sites and infrastructure impacted by wildfire and/ wildfire suppression.

The preceding activities shall be conducted consistent with agency and departmental procedures and applicable land and resource management plans; shall not include the use of herbicides or pesticides or the construction of new permanent roads or other new permanent infrastructure; and shall be completed within 3 years following a wildland fire. Categorical exclusions that apply to the Emergency Stabilization and Rehabilitation program may be revised or added to the department manual and/or other government document(s); consequently, the NEPA process for Emergency Stabilization and Rehabilitation plans may change.

In order to facilitate effective Emergency Stabilization and Rehabilitation treatments, one or more of the following treatments should be considered following a wildfire.

Site Protection

1. Grazing Closure

All revegetated areas as well as areas that have been burned but not revegetated may be closed to grazing until resource objectives are achieved or another course of action is determined if objectives are not met. The grazing closure must be initiated the growing season following the season in which the wildfire burned. Monitoring data will determine when a closed area is reopened for grazing. Grazing closures following a wildfire may be necessary in order to allow for vegetation recovery of both seeded and non-seeded species as well as to protect soil, water and other range resources. However, grazing may be allowed and not closed if it is determined that grazing would have beneficial impacts in reducing annual grasses, etc. A site-specific plan would be developed to guide these actions. See Early Livestock Grazing, page G-11. Recovery objectives should be established for each Emergency Stabilization and Rehabilitation Plan. Annual assessments of the burn area should be established when the grazing closure is initiated and an interdisciplinary team should evaluate the burn area at the end of each growing season to determine if recovery objectives have been met. If objectives have not been met, it may be necessary to extend the grazing closure and continue annual evaluations to determine when recovery objectives have been met, at which point normal grazing may resume. The following methods of grazing closures should be evaluated on a case-by-case basis to determine which method, or combination of methods, is/are suitable for an Emergency Stabilization or Rehabilitation Plan.

- a. Repair of existing fence(s) for resource protection. Repair to fences damaged in the wildfire may be necessary in order to protect resources from grazing following a wildfire. Fences that may require repair in order to meet recovery objectives include, but are not limited to, exclosures for riparian area protection, designated study sites, wilderness study areas, allotment boundary, and pasture fences.
- b. Construction of new fence(s) for resource protection. A new protective fence may be constructed to protect a burned area and its resources from grazing. Protective fences may be either permanent management fences or temporary. Temporary fences should be constructed in rangeland areas that require rest from grazing during the vegetation establishment period following the wildfire, but will not require further grazing management to maintain and protect resources following the rehabilitation process. It should be stated in the Emergency Stabilization or Rehabilitation Plan whether the constructed fence is intended to be permanent or temporary.
- c. Grazing deferment without repair or construction of fence(s). In certain cases fencing may not be necessary in order to achieve grazing closure. A grazing deferment may be achieved in some locations by changing water supply for wildlife or changing grazing rotations for livestock. This method should be evaluated on a case-by-case to determine whether or not it will achieve an effective grazing closure and allow for vegetation recovery.

APPENDIX G

2. Wild Horse Haze

Where grazing by wild horses may affect seedling growth, it is desirable to remove horses from the burn area. Horse hazing may be sufficient to relocate horses on areas that are not fenced. Hazing may also be necessary prior to fencing the burn area so that no horses remain within the fenced area.

3. Wild Horse Gather

A wild horse gather may be required if it is determined that wild horse removal from the burn area is necessary and hazing is not a suitable option. Wild horse removal may be necessary not only by the need to protect establishing seedlings, but also to relieve grazing pressures outside the burn area where there is inadequate forage to support horses and big game wildlife.

Site Stabilization

1. Natural Revegetation

In some cases, natural revegetation may allow for successful establishment of native or previously seeded rangeland species. Natural revegetation may be used following wildfires that do not completely destroy the existing perennial vegetation, where there is a desirable and viable post-fire seedbank, or where there is a desirable root mass present. Natural revegetation may also be used where seeding is not possible due to topography, precipitation, or soil type. To determine if natural revegetation is a feasible treatment, an Emergency Stabilization and Rehabilitation team will assess the burned area and determine whether or not natural revegetation will allow for enough vegetation establishment within the first two post-fire growing seasons to prevent watershed degradation.

2. Seeding

Seeding may be necessary in order to stabilize soils or reestablish a desirable perennial plant community within a reasonable time frame. Seeding may also be used to prevent spread of non-native invasive weeds within the fire area by providing competing vegetation. If seeding is determined as a suitable treatment, the following steps should be evaluated and initiated as needed

a. Site preparation.

- Herbicide use prior to seeding

Where invasive, non-native plant species become established prior to seeding, herbicides may be used to reduce their cover and density. Reducing invasive species allows for better establishment of seeded species by reducing competition. Direct treatment of invasive species is allowable as part of emergency stabilization plans when action is determined necessary and when standard, validated, treatments are used.

- Disking

Disking may be used prior to seeding to create a suitable seedbed where vegetation and topography allows. Disking breaks up surface debris by lifting and turning over the top layer of soil. This creates germination microclimates for applied seed and also creates small soil pockets that can trap moisture. Disking may also reduce competition from invasive species such as *Bromus tectorum* that may have rapid establishment following a wildfire.

- Early livestock grazing

Early (spring) livestock grazing may be used to reduce the establishment of invasive species such as *Bromus tectorum* that exhibit growth early in the spring. Early grazing can reduce the number of seed heads that reach maturity later in the season as well as allowing for higher levels of establishment of seeded and native perennial species by reducing competition.

b. Seed Mixes.

- Native and introduced species

Seed mixes should be created on a site-specific basis taking into account the pre-fire vegetation community, probability of success, wildlife needs, the presence or absence of invasive species, and site characteristics on a watershed scale. A mixture of native and introduced species may be used for site stabilization or rehabilitation. This mixture is most useful when rapid establishment is necessary for site (soil) stabilization as it is often the perennial grasses that will become established first. For emergency stabilization seed mixes, only species that will be effective within three years should be used.

c. Seeding Techniques.

- Drill

Drill seeding uses a rangeland drill to seed selected species at a desired depth. This method of seeding is successful in both seed application and incorporation and is a preferred method for establishing a post-fire perennial plant community. Rangeland drills cannot be used at sites that are too steep, do not have suitable soil, or have dense, burned, tree stands. Under these circumstances aerial seeding should be considered for seed application.

- Aerial

Aerial seeding involves the spread of seed from a helicopter or fixed-wing aircraft. This method of seeding is most effective for large areas where a rangeland drill cannot be used. Aerial seeding may be more effective if followed by a seed incorporation treatment such as chaining.

APPENDIX G

- On ground broadcast

For small burn areas requiring seeding, seed mixes may be spread by hand or from an all-terrain vehicle, tractor, or truck-mounted spreader. With the exception of hand spreading, this method can only be used in areas that are easily accessible, with low topographical gradients, and where the presence of rock and trees is minimal to non-existent.

d. Seed incorporation.

- Chain

An Ely chain can be used following an aerial seed application to help incorporate the seed into the soil and create favorable microclimates for germination/establishment. By disturbing the soil surface, chaining also helps create small pockets in which water is trapping, increasing surface soil moisture and further creating favorable conditions for seed germination and establishment. Chaining disturbs the soil surface by direct contact as well as by uprooting and dragging trees for a minimal distance. Both one-way and two-way chaining may be used.

- Roller chop

A roller chopper may also be used for seed incorporation in areas where tree stands are too dense for a rangeland drill. A roller chopper incorporates seed and cuts up organic debris to create a favorable environment for seed germination and reduce erosion on mild slopes or where soil is highly susceptible to erosion. Seeding can be done behind the tractor (in front of the chopper), or can be applied aerially prior to the roller chopper treatment.

- Livestock

Livestock such as cows or goats may be used in smaller treatment areas for seed incorporation. If livestock are kept moving, their hoof action breaks up the soil surface and incorporates seed into the soil. The livestock also add organic matter to the site while they are working the soil.

- Harrow

A harrow device can be used to cover seed at some sites, allowing for better seed germination and establishment. A harrow can only be used where machinery such as a tractor can access a site, where there is minimal slope, acceptable soil, and no dense stands of trees. Harrowing is primarily useable in previously cultivated rangelands, perennial grass communities, or perennial grass-sagebrush communities. A harrow can be used when disking by dragging the harrow behind the disk and using an on-ground-broadcast for the seed mix where the seed is applied between the disk and the harrow. This method allows for site preparation, seed application, and seed incorporation with one pass of a tractor.

- Hand rake

Hand raking may be used for seed incorporation for small areas where it is more cost effective than bringing in machinery or in areas that are inaccessible to machinery due to terrain, soil, or tree density. Hand raking may also be considered in desert scrub communities where the use of machinery might potentially create an unacceptable amount of fugitive dust.

3. Planting

Shrub and tree seedlings can be planted separately or in combination with a seeding treatment. Seedlings are used to reestablish native tree species lost in a wildfire, prevent the establishment of invasive plant species, and restore habitat in crucial wildlife habitat, fish habitat, riparian areas, or wilderness study areas. The planting of seedlings would help mitigate changes in forest, shrub land, or riparian ecosystems and restore them to the natural, pre-fire conditions. The planting of native seedlings is preferred.

4. Initial Overland Flow Erosion Control

Erosion control and sediment trapping features may be necessary on burned areas where there is high risk of erosion, sediment run-off, or flood waters. Erosion control structures are suggested, but not limited to areas requiring immediate short term stabilization. Primary areas of concern are where there is the possibility of damage to property and critical resources. This may include areas where ephemeral or perennial streambeds cannot adequately transport increases in water run-off and bedloads, steep slopes, and areas with hydrophobic or highly erosive soils. If erosion or sediment control structures are determined to be necessary, the following options should be considered.

- a. Contour felled logs. Where there is anticipated water and sediment runoff following a wildfire, contour felled logs may be used. The primary function of contour felled logs is to divert and break up high volume water flows, reduce water velocity, and create a rough terrain, thereby reducing the ease of water runoff. Secondly, contour felled logs retain sediment.
- b. Mulch. Organic matter (mulch) may be spread over a burned area in order to reduce rain impact and reduce soil erosion. Mulch also retains moisture creating favorable conditions in hot dry areas for seed germination. However, if mulch is spread too thick, it can inhibit the establishment of seeded as well as non-seeded species. Mulch should primarily be used in areas where high levels of erosion are anticipated. Use of mulch is not recommended in areas with sensitive or rare plants. All mulch should be certified weed free prior to use. The following mulch treatments should be evaluated if mulch is desired following a wildfire.

- Mulch blankets

Mulch blankets are made with materials such as straw or wood fibers and are usually stitched together with photodegradable plastic netting. Mulch blankets provide a uniform cover for vegetation establishment while preventing erosion on moderate to steep slopes. Areas where mulch blankets

APPENDIX G

should be considered include, but are not limited to, along roads and where erosion from burned slopes may harm critical habitat or physical structures.

- Weed-free straw

Certified weed-free straw can be purchased and spread by hand, mechanically, or in remote areas, by helicopter or fixed-wing aircraft. Straw mulch provides soil stabilization and retains soil moisture, increasing seed germination and establishment.

- Hydromulch

Hydromulch may be applied mechanically on the ground along road sides or at accessible sites, or aerially in more remote areas. Hydromulch aids in site stabilization by reducing soil erosion through providing ground cover. Hydromulch also provides and retains soil moisture, enhancing seedling germination and establishment. Hydromulch may be applied after a burned area is seeded or seed may be incorporated into the hydromulch slurry allowing seed and mulch to be applied in one treatment.

- c. Silt fences. Silt fences are primarily useful in swales, small seasonal streambeds, and on hillsides where other sediment traps cannot be used. Silt fences are most effective on shallower slopes where they will not experience high sediment loads. Silt fences must be well anchored and monitored to prevent failure, which could cause a high volume sediment release.
- d. Straw bale check dams/other gabions. Dams made out of materials such as straw or rock can be used to reduce sediment in perennial streams following wildfires. The dams detain water long enough for coarse sediment to be deposited on the up-stream side of the dam. Dams also reduce water velocity and can be used to replace woody debris that may have been burned during the wildfire.
- e. Sand, soil, and gravel bags. Sand, soil, and gravel bags can be used on slopes and in channels to interrupt overland water flow and reduce soil erosion by trapping sediment runoff. Bags can be placed in rows similar to contour felled logs in order to promote surface water infiltration.

Cultural Resources Site Stabilization and Protection

Under emergency stabilization and rehabilitation funding, assessments of significant heritage and cultural sites in areas affected by treatments may be conducted. Critical heritage resources affected by wildfire may also be stabilized and looting may be prevented by patrolling, camouflaging, or burying significant heritage sites.

Hazardous Waste Stabilization

Hazardous wastes should be assessed on a case-by-case basis when located within a burned area. Proper actions should be taken to treat or remove hazardous wastes in a timely manner.

Invasive and Non-native Weed Control

Seeding may be used to prevent the establishment of invasive species. Direct treatment such as the use of herbicides may also be used to reduce the spread of invasive species. This may be done under emergency stabilization funding when immediate action is required and validated techniques are used. In addition, chemical, manual, and mechanical treatments of invasive species as well as planting of native and non-native species may be accomplished under rehabilitation funding in order to re-establish a functioning ecosystem even where pre-fire conditions cannot be immediately restored.

Road/Facility Repair

Emergency Stabilization treatments include increasing road drainage for post-fire runoff and replacing or repairing minor facilities where they are essential to public health and safety. In addition, treatments allowable under rehabilitation funding include the replacement or repair of minor operating facilities. These facilities could include, but are not limited to, campgrounds, shade shelters, fences, wildlife guzzlers, and interpretive signs. When repair or reconstruction of roads is necessary for Emergency Stabilization purposes, one or more of the following treatments may be implemented.

1. Out Sloping

In some cases surface water control on roads may be accomplished by shaping the road surface to deflect water runoff perpendicular to the direction of travel on the road. This may prevent rilling and gullyng caused by concentrated water flow.

2. Culvert Upgrades

Following a wildfire, there is often an increased level of surface water runoff. Existing culverts may be replaced with larger diameter culverts to prevent damage to a road. Upgraded culverts should be installed before the first major rains following a wildfire. Armoring of culvert inlets and outlets should be considered to prevent culvert and road damage.

3. Rolling Dips/Water Bars/Cross Drains/Culvert Overflows/Bypasses

Road repair and upgrade may be necessary following a fire to control high levels of surface water runoff. Most road water control treatments can be completed with a road grader, dozer, rocks, or logs. These treatments are a combination of ditches and berms that run perpendicular or at an angle to a road or trail. They may be used to control and drain surface water on the road or the ditch on the downhill side of the road when culverts are not expected to handle predicted levels of surface water. Depending on site specific purpose, and water control method chosen, some treatments may prevent use of a road.

APPENDIX G

Wilderness Study Area Guidelines for Emergency Stabilization and Rehabilitation

Emergency Stabilization and Rehabilitation actions following a wildfire in a wilderness study area will be in conformance with the guidelines described in the Interim Management Plan for Lands Under Wilderness Review (H-8550-1). If a fire occurs within both wilderness study area and non-wilderness study area lands the Emergency Stabilization and Rehabilitation actions will follow the Interim Management Plan for the area within the wilderness study area and follow the Normal Year Fire Rehabilitation Plan for lands burned outside the wilderness study area. If the conditions of the fire permit i.e., no mechanical treatments or non-native species seeding, etc., are deemed crucial, the non-wilderness study area land may be treated the same as the wilderness study area land.

Interested parties will be allowed a 30-day comment period on the proposed treatment in wilderness study areas unless it is not possible to do so because of emergency conditions (i.e., the 30-day comment period would result in missing the optimum period for treatment). If a full 30-day period is not allowed due to time constraints, the necessary parties would be contacted for immediate comment, and a follow-up copy of the proposed action would be forwarded.

Any fire suppression activities that are determined to have negatively affected the wilderness values of the wilderness study area will be rehabilitated prior to the release of fire crew support. These suppression rehabilitation activities will be funded by the appropriate suppression subactivity.

All Emergency Stabilization and Rehabilitation actions must maintain or enhance the wilderness values of the area. Thus, the minimum tool concept will be applied to all emergency and rehabilitation activities to ensure the proposed action is necessary and does not damage the area. Hand or aerial seeding and planting of native species may be done to restore natural vegetation. Generally, seed will be aurally applied unless the fire is small and hand application will not harm the area's wilderness suitability. Seedings and plantings will be staggered or irregular so as to avoid a straight-line plantation appearance. Cross-country use of motorized equipment will be minimal. Each wildfire will be evaluated on a case-by-case basis to ensure that species seeded and the methods for seeding are in compliance with the guidelines set forth in the Interim Management Plan.

**APPENDIX I
COMMENTS AND RESPONSES ON THE DRAFT RMP/EIS**

Introduction to Appendix I

As discussed in Section 5.1.6 of the Proposed RMP/Final EIS, 650 comment letters and emails were received on the Draft RMP/EIS. Six public meetings on the Draft also were held (see Section 5.1.7), and members of the public chose to speak on the record at four of the six. Appendix I includes verbatim copies of the comment letters and emails, as well as transcripts from the four public meetings during which comments were provided. The comments on the Draft RMP/EIS contained within each document have been identified, numbered, and highlighted with brackets. BLM's response is presented opposite each comment.

Comment letters have been organized based on the entity that submitted the letter. For example, letters from federal, state, local, and tribal agencies have been separated into four groups. Each letter has been given a unique identifier that is based on the group prefix and the individual letter number. Letter F6 is the sixth letter from a federal agency, in this case the National Park Service. Within each letter, comments also have been assigned unique numbers. Comment F6-1 would be the first comment from the National Park Service. All comment letters and public meetings are identified on the index that follows. In order to access a specific comment letter, please find it on the following list and then "click" on the letter you wish to review. Hyperlinks from individual entries in the list to the appropriate file will open the letter you have selected.

Letter B1

November 22, 2005

Bureau of Land Management
Attention Gene Drais
Ely Field Office
HC 33 Box 33500
Ely, Nevada 89301

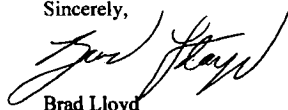

Dear Mr. Drais:

B1-1 [In regards to the Resource Management Plan, I have concerns pertaining to the special recreation permit 2.5.15.2. Of the four alternatives proposed, I'm in favor of a revised version of Alternative E. I would like the wording to read as follows: "For the first three years following plan implementation, outfitter and guide permits for hunting would be limited to parties who have had a permit for the past 3 years. This permit would then remain with the outfitter until it is not renewed or until it is forfeited. The present number of outfitters who have had a permit for the past 3 years would serve as the cap. For any open permit that occurs, non-permitted outfitters would then be placed into a draw procedure to fill the position. Permits would limit the number of sub-guides that could operate. Any one outfitter would be eligible to obtain only one permit at a time."

B1-2 [I am currently a small local outfitter who holds a permit. I definitely feel that we need to put a cap on the number of outfitters. Most importantly, however, I feel that it would be unfair to place the permits on a competitive bid process. It would make it very difficult for a small local business to compete against the huge nation-wide outfitters who currently guide or may desire to guide in the area.

Thank you very much for your consideration of this matter.

Sincerely,

Brad Lloyd
7L Outfitters

Responses to Letter B1

- NOV 23 2005
- B1-1 In response to this and similar comments, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised regarding the issuance of outfitter and guide permits. Monitoring of outfitter and guide use would still occur for three years; however, outfitter and guide permits would not be limited during that three year study. Should the study show resource impacts, including user conflicts as a result of outfitter and guide actions, the Ely Field Office may address those problems by issuing outfitter and guide permits with special stipulations and conditions. No allocation system, including a competitive bid process, is included in the Proposed RMP and Final EIS.
- B1-2 Please refer to Response to Comment B1-1.

Re: Public Comments on Ely BLM EIS RMP

To Whom It May Concern:

B2-1

On behalf of Best In The Desert Racing Association, I have enclosed two (2) maps with yellow highlighting in the N Pahroe Range up to the Schell Creek Range. Best In The Desert is proposing that the yellow area remain open to Non-Competitive SRP's only. In 1990 and 1991 this particular area was permitted for two consecutive race events promoted by Best In The Desert. Taking a more conservative approach in this area will help maintain OHV access but yet provide a low impact effect.

I appreciate your consideration to the very important matter.

Sincerely,

Casey Folks, Director
Best In The Desert

Responses to Letter B2

B2-1 In response to your comment, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised to clarify special recreation permits for non-competitive off-highway vehicle events. Those events would be permitted on a case-by-case basis outside of desert tortoise ACECs.

Re: Public Comments on Ely BLM EIS RMP

To Whom It May Concern:

On behalf of Best In The Desert Racing Association we would like to offer our comments on the new RMP within the Ely Bureau of Land Management Field Office. Best In The Desert Racing Association represents over 4,000 individuals on the mailing list, we reach a great deal of off-road enthusiasts.

B3-1

Regarding the Ely RMP, Best In The Desert's position and choice would be Alternative A. We recognize that Alternative A would better suit the OHV community. Further more, Alternative A follows the philosophy of other Nevada BLM field offices. That philosophy is not net land loss to OHV opportunities. All other alternatives show net land loss in upwards to two-thirds of current available land for OHV use. Best In The Desert also has the opinion that with the population growth in the Las Vegas area available land for OHV opportunities in the Ely District will become more viable in the future.

I appreciate the opportunity to write an opinion on this very important decision.

Sincerely,

Casey Folks, Director
Best In The Desert

Responses to Letter B3

B3-1

The Ely Field Office recognizes that off-highway vehicle use is an acceptable use of public land wherever it is compatible with resource management objectives. Areas are designated as "open" for cross country vehicle use where there are no compelling resource protection needs, user conflicts, or public safety issues. No areas managed by the Ely Field Office were determined to meet those criteria. The Ely Field Office is designating a majority of the planning area as "limited" in the Proposed RMP. The "limited" designation would still provide for off-highway vehicle opportunities, including potential new off-highway vehicle trails, while managing for public safety and resource protection needs. The only areas designated as "closed" to off-highway vehicle travel correspond to currently designated wilderness and wilderness study areas. Please note that the Nevada BLM has no policy regarding "no net land loss to off-highway vehicle opportunities".

RE:1 Comments on Draft RMP/EIS Ely District

To Gene Drais,

- B4-1 [I do realize the need to make changes to facilitate the Great Basin initiative of improving and restoring range lands but I do have some very real concerns which I shall list below.
- B4-2 [1. It is almost impossible to comment on the entire plan because of the multiple alternatives. What is most disturbing is that many of the alternatives do not even allow for 'Public' use. Grazing on these lands is historic. The very idea that such a profoundly useful, sustainable and productive activity be removed from 'Public' lands would be outrageous! Thus, those alternatives are absolutely not acceptable to us.
- B4-3 [2. We are very much in favor of performance based grazing, or grazing that is based upon the livestock operator's past, present and future willingness to commit to the extra effort required to practice performance-based grazing. This should include the capability to manage the livestock, haul water, monitor the resources and to make necessary adjustments needed to change any negative results and to sustain the resources. Livestock management would require flexibility in numbers, use and timing, depending on information acquired from monitoring. Such practices are imperative in achieving the desired ecological conditions.
- B4-4 [3. We would like very much to be able to continue to practice Holistic Management with the team approach. We have been trying to manage holistically since 1993. We have been successful in maintaining a healthy resource and to remain in the cattle business. Our allotments continue to improve, even with the strain of a six-year drought.
- B4-5 [4. We object strongly to the act of creating special-use-only areas which can ultimately exclude and impede management of the land and resources. These would include those areas such as wilderness areas, ACEC's, ect.
- B4-6 [5. Eloquent and lengthy-written documents can easily be used as a detriment to proper management of natural resources. Such monstrosities can often cater to special interests groups which have a very narrow, one sided view of the real picture. Mother

Responses to Letter B4

- B4-1 Comment noted.
- B4-2 A range of alternatives was presented and analyzed in the Draft RMP and EIS and Proposed RMP and Final EIS. Each alternative had a different management emphasis, based on comments received during scoping and the needs/desires of various public land users. While not all management actions would be acceptable to all users, the alternatives do contain a range of approaches for analysis purposes.
- B4-3 Reference to Performance Based Grazing has been removed as a Parameter or a management action in the Proposed RMP. Flexibility associated with livestock grazing is allowed in the current grazing regulations at 43 CFR Part 4100 and is specifically addressed under allotment management plans.
- B4-4 Holistic management is a grazing management practice that can be authorized and could be associated with allotment management plans, as cited in the current grazing regulations at 43 CFR 4120.1. The management direction contained in the Proposed RMP does not preclude the use of Holistic management for grazing.
- B4-5 The Federal Land Policy and Management Act, Section 202 (c) (3) mandates that the BLM give priority to the designation and protection of areas of critical environmental concern in the development of land use plans. The Ely Field Office is proposing to designate 17 new areas of critical environmental concern to protect and prevent irreparable damage to the significant values present in those 17 areas. The BLM does not designate Wilderness or Wilderness Study Areas as a part of the land use planning process.
- B4-6 The goals that you express are the same that the Ely Field Office holds for the Proposed RMP.

Letter B4 Continued

- B4-6 Nature has her own way of sustaining herself. We must simply work with her to keep nature healthy. It is done by carefully watching and managing those activities that have been present on the land since the beginning of time. We cannot simply make decisions to fit others whims or selfish desires, for we may find that we might have to spend the rest of our lives just trying to get back to what we now have and need to appreciate - a healthy, viable and sustainable, multiuse resource.
- B4-7 6. Livestock operations have been on these public lands years before they were called "Public Lands". It would only make sense that livestock operators should be allowed to have more of an influence or say in the management of the land. What we find however, with the formulation of such documents as this resource plan, is that such valuable, productive, long standing, proud, nation building institutions like that of ranching and the running of livestock, are almost eradicated for less productive and actually more resource-threatening institutions. It should be mentioned here that in this day and age, when there are such frightening threats from other nations that would bring this country to its knees, that we would allow in such documents the process of decreasing the nation's ability to produce a very vital food source.
- B4-8 7. Speaking in a legal sense, grazing rights in this country have been purchased or handed down from generation to generation from those who have paid their dues and earned their right to be on these lands. We strongly oppose anything in this said document that would diminish, hinder, obstruct, weaken or eliminate those given rights, without the due process of law.
- B4-9 8. We are concerned about the quality of information in this document. We refer to a chart in the document that shows that the population of White Pine County is decreasing over the next 10-15 years. However, there are other entities in the county, such as the local power company, that has like wise produced a projection which shows an increase of population in this county. There are direct conflicts here. It is frightening that something like this one-sided document can have so much control and impact on an area and its people when its information is apparently tainted or at least unqualified.
- B4-10 9. We are totally, against the further purchase of Nevada lands by the Bureau of Land Management or any other government agencies. Private ownership of land is what has made this country greater than any country on earth. Private ownership of land is directly connected with the sustaining of our national freedoms.
- B4-11 10. We do not prefer land sales for large American developers but we consider those most favorable sales to be those land sales for small business expansion, primarily those which are agricultural and ranch based entities.
- B4-12 11. We see no problem with the designation of addition forage for livestock. This would be most helpful to our operation as we have experienced a 70% reduction in AUM's since the 1960's. Actually, we have previously received from the BLM a promise that any such increased forage would be returned to us.

Responses to Letter B4

- B4-7 Management actions as presented for the Proposed RMP include and address lands available and not available for livestock grazing. Management actions recognize the current amount of existing forage available for livestock grazing. Coordination and consultation associated with the evaluation of livestock grazing use will continue with the affected permittee and interested publics as required under current regulation and BLM policy.
- B4-8 The Proposed RMP recognizes livestock grazing as a privilege and as a multiple use on the public lands. Comments and input to site-specific actions or plans for grazing management will be provided for through the coordination and consultation process.
- B4-9 The population projections presented in Table 4.23-1 were prepared by the State of Nevada Demographer and generally reflect continuation of long-term demographic trends, absent any major new developments. Reference to those projections was appropriate given that insufficient information was available regarding the timing, level of development, likelihood, and other characteristics about other new projects to develop an independent set of long-term population projections. More current projections are now available, and Table 4.23-1 has been modified. However, the new projections do not alter the fundamental conclusions associated with the RMP alternatives.
- B4-10 Please refer to Section 2.4.12.3 in the Proposed RMP and Final EIS for a discussion of land acquisition.
- B4-11 Please refer to Section 2.4.12.2 in the Proposed RMP and Final EIS for a discussion of land disposal. A certain amount of land disposal within the Ely RMP decision area has been mandated by Acts of Congress. Refer to Chapter 1 of the Proposed RMP and Final EIS for a discussion of these legislative mandates.
- B4-12 Please refer to Section 2.4.16 in the Proposed RMP and Final EIS for a discussion of allocation of additional forage, which varies by alternative. Allocation will be based on a multiple use decision process.

Letter B4 Continued

B4-13

12. It is interesting to see how agencies and other groups will bend over backwards to deter a useful tool such as livestock grazing and do it in the name of protection for the public lands and roads. This desire for protection fades quickly when the fun of a motor-cross race is presented. It is very hard to maintain mountain roads to keep the dust down and to keep them travelable. We are warned time after time to be careful with these public dirt roads. We object to the use of main, highly traveled roads to be used as a race track. Such activities beat the roads terribly! It is costly and difficult to maintain such roads after a race. We do not object to the races, we do object to races upon main, vital roads which support the maintenance of livestock grazing and hunting.

B4-14

We hope that our comments will be seriously taken into consideration because such documents and decisions can affect so many in either a positive or seriously, negative way. We take a great deal of pride in the way in which we conduct our operation on the public lands. The sustainability of the resources is our main concern and we face this concern on a daily basis. We look to the federal agencies to listen to those of us who depend on public lands for our quality of life, especially those of us who care so deeply and work so hard to maintain them as lands of multiple-use for all.

Thank You,

Steven Carter
Carter Cattle Co.

cc: Gene Drais Email and hardcopy enroute

Responses to Letter B4

B4-13

Thank you for expressing your concern. Special Recreation Permits for off-highway vehicle events are issued following site-specific environmental analysis and may contain special stipulations, such as a requirement to notify other permittees or a requirement to rehabilitate damaged roads in a timely manner.

B4-14

All comments on the Draft RMP and EIS have been taken seriously. The Ely Field Office appreciates your concern with the public lands. While statements of opinion (including agreement or opposition) do not require specific responses or text revisions under the NEPA regulations, they have been considered by the Ely Field Office and Nevada State Office and documented in the administrative record associated with the Ely RMP.

Letter B5

Dear Sirs:

I have only had 30 days from the public hearings to just barely look at the mass of papers and the CD that I received at the Mesquite, NV Public hearing. The extremely poor turnout at the hearings (about 10 people at the one in Mesquite) is a testament to the poor outreach that is attained with publication in the Federal Register. Although published in the Register July, 29, the Newsletter from the Ely Field Office notifying the public of Meeting is dated October, 2005 and your closure for comments is today Nov. 28, 2005. I know that this is your procedure, but it is our public lands and the first real outreach was the public meetings only 1 (one month) ago (Mesquite, NV on October 19, 2005). You state that there is a 120 day public comment period, but many people never knew that you had an RMP Draft until you announced public hearings. The BLM should extend the comment period to 120 days from the public comments so that people have adequate opportunity to have knowledgeable comment on something as important as your proposed shift to an eco-system type of management with 18 new Areas of Environmental Concern that can be withdrawn from any use (de-facto Wilderness) with a stroke of the Congressional pen. Alternatives to managing lands with Fire and its extremely high atmospheric pollution and animal mortalities should be considered. Better biological approaches to range and forest land management should include grazing with sheep and or goats as well as cattle. This type of management increases biodiversity. The fire tool invariably decreases biodiversity. The BLM proposed approach and preferred alternative should be assessed thoroughly by the public and by Congressional representatives that may be concerned with and involved in tackling economic issues presented by the present energy crisis. The restrictive management of the public lands is not only becoming dangerous to our country in an economic sense, it is also destructive to our lands in an environmental sense. The BLM's proposed alternative does not seem balanced and needs careful review from people outside of the Bureaucratic "preserve a job" loop. Considering the late public meetings, more time for comment is needed.

I am a self employed Professional Geologist, and NO, I have not had time to peruse the massive draft documentation like your team of experts have. I will make sensible, direct, and hopefully relative comments to the plan if given time to study the issue. I have over 30 years experience in the Industrial Minerals field and have input on RMP's and Plans since working on the California Desert Plan from 1976 through the 1980's.

For all of the above reasons and many more, I am copying this letter to several honorable public officials and some friends who may be concerned.

I will continue to review the data and will input, but I respectfully request that my comments be considered due to the unreasonable time constraints put upon such an important document that covers over 11 million public land acres.

Sincerely,

Frederic C. Johnson

Responses to Letter B5

- B5-1 In addition to the Federal Register notice and the Newsletter that was sent to approximately 3,000 recipients on the mailing list, press releases were sent to local media outlets and advertisements were placed in local newspapers to inform the public for all the public meetings on the Draft RMP and EIS.
- B5-2 The required comment period on a Draft RMP and EIS is 90 days. BLM elected to set a 120-day comment period for the Ely Draft RMP and EIS and did not formally extend this period. Although the BLM did not elect to extend the official comment period for this document, comments received after the end of the comment period were considered as late as practicable within the overall document revision and publication process. Comments that were received after the close of the comment period have been accepted and considered in the preparation of the Proposed RMP and Final EIS. Please note that ACECs are not withdrawn from multiple use and that ACECs are not designated by Congress.
- B5-3 In the development of projects, several techniques and alternatives are analyzed to determine which one will achieve the goals and objectives of the project. These include, but are not limited to, fire, mechanical treatment, and biological treatment (e.g. grazing). Please refer to Appendix H, which outlines examples of tools and techniques that could be used. When fire is determined to be the appropriate tool needed to achieve the projects objectives, a Smoke Variance permit is obtained from the Nevada Division of Environmental Protection to ensure that smoke levels are appropriate. In the long term, the use of fire as a tool is expected to increase biological diversity.
- B5-4 Please refer to Section 4.36 in the Draft RMP and EIS and Proposed RMP and Final EIS for a discussion of adverse energy impact from the management direction contained in the Proposed RMP. Also see Section 4.23 for a discussion of the overall economic impacts associated with the alternatives analyzed in the Proposed RMP and Final EIS. The management actions presented in the Proposed RMP are balanced and benefit a wide range of users of the Ely RMP decision area.
- B5-5 Your comments on the Draft RMP and EIS have been considered.

Mr. Gene Drais, Project Manager
U.S. Department of the Interior
Bureau of Land Management
Ely Field Office
HC 33 Box 33500
Ely, Nevada 89301

RE: Draft Resource Management Plan and Environmental Impact Statement ("Draft RMP/EIS")

Dear Mr. Drais:

As you are aware, LS Power Development, LLC ("LS Power"), through its affiliates, is developing a number of energy projects in the Ely BLM District which include:

- A 500 kV transmission line and associated facilities commonly known as the Southwest Intertie Project ("SWIP");
- An up to 1,600 MW coal-fired electric generation facility and associated facilities commonly known as the White Pine Energy Station ("WPES"); and
- In partnership with Nevada Wind, LLC, wind generation facilities and associated facilities located in the Egan Range ("Egan Wind Project").

Upon review of the Draft RMP/EIS, LS Power is pleased to submit the following comments:

Section 2.5.12.5 Parameters – Corridors:

Item #1: Item 3 under *Management Common to All Alternatives* on page 2.5-124 states that "A corridor 2,640 feet wide extending northerly from the north end of the Aerojet designated corridor following the centerline of the approved Southwest Intertie Power Project right-of-way alignment would be maintained."

Comment #1: As a point of clarification the SWIP right-of-way alignment was modified pursuant to the Lincoln County Conservation, Recreation, and Development Act ("LCCRDA") such that SWIP alignment from the north end of the Aerojet property has been relocated to the new designated corridor on the west side

B6-1

Responses to Letter B6

B6-1

The modified SWIP corridor to which this comment refers was shown on the maps in the Draft RMP and EIS and is also shown on the maps in the Proposed RMP and Final EIS.

Letter B6 Continued

Mr. Gene Drais
November 28, 2005

Page 2 of 6

B6-1 of Highway 93 and west of private property for a distance of approximately seven miles and then transitions back to the original SWIP alignment. Given the scale of the maps and the text in Draft RMP/EIS it is unclear if this change to the alignment is reflected in the Draft RMP/EIS.

B6-2 **Item #2:** Under Alternative B, on page 2.5-125, it is stated that "All linear rights-of-way for electrical transmission lines greater than 69 kilovolts, all mainline fiber optics facilities, and all pipelines greater than 10 inches in diameter would (emphasis added) be located within designated corridors."

B6-2 **Comment #2:** While it is understood the Alternative B is not the agency preferred alternative, if selected we believe that the language should include "...would be encouraged to be located within the designated corridors." The basis for this comment is that in many circumstances the origination and termination of such infrastructure facilities will be outside the designated corridors and requiring these facilities to be located entirely within the designated corridors would be too restrictive and impractical. As a real example, the WPES will have transmission line(s) greater than 69 kV that will be approximately 2.5 miles in length outside the designated corridor if the proponent's preferred site is selected or 6 miles in length if the alternative site is selected. While the lines from the WPES will utilize the designated corridors to the greatest extent practical the site location for the WPES is not directly adjacent to designated corridor due to other infrastructure requirements and environmental considerations. Similar issues could arise for other energy and infrastructure projects in the Ely District.

B6-3 **Item #3:** Alternative D on page 2.5-125 states "No additional corridors would be designated. All rights-of-way would be located within designated corridors."

B6-3 **Comment #3:** LS Power does not support Alternative D approach to rights-of-way management. This is far too restrictive as it appears to prohibit any type or size of right-of-way to be located outside a designated corridor. This could effectively prohibit or unreasonably limit economic growth in the Ely District. Also see comments made in Comment #2.

B6-4 **Item #4:** Pipelines greater than 10" in diameter are encouraged to be in designated corridors.

B6-4 **Comment #4:** LS Power proposes that (i) the size of pipeline be increased to be greater than 20" in diameter, (ii) intra-basin underground water pipelines be excluded from the designated corridor limitation or (iii) the RMP acknowledges that the water system for the WPES will not be within the designated corridors. The purpose of a clarification or exemption is to acknowledge that it is not practical for the water system for the WPES to be located in one of the designated corridors given that the points of diversions are spread over a large distance in Steptoe

Responses to Letter B6

B6-2 Thank you for expressing your concerns. Alternative B is included so that a range of alternatives could be analyzed. Your expressed concern is specifically addressed in the Proposed RMP in Section 2.4.12.5, where use of designated corridors is not a requirement.

B6-3 Thank you for expressing your concerns. Alternative D is included so that a range of alternatives could be analyzed. The Ely Field Office has not selected Alternative D for incorporation into the Proposed RMP.

B6-4 Pipelines greater than 10 inches in diameter are not required to be located within the designated corridors. Section 2.7.12.5 in the Proposed RMP and Final EIS states that water pipelines are encouraged to be within designated corridors. Alignments outside of the corridors could be authorized through the right-of-way process.

Letter B6 Continued

Mr. Gene Drais
November 28, 2005

Page 3 of 6

B6-4 Valley. Any attempt to locate all WPES water pipelines over 10" in diameter in a designated corridor would result in increased environmental impacts and an unreasonable increase in costs. Alternatively, the RMP should designate corridors for such facilities.

B6-5 **Item #5:** Add designated corridors to the selected alternative to account for transmission lines from the WPES to the SWIP Corridor. Refer to Section 2.5.12.5 and Maps 2.4-22 and 2.4-23.

B6-5 **Comment #5:** As stated in Comment #2, transmission line(s) greater than 69 kilovolts will need to be constructed from the WPES site location to the designated SWIP corridor. Depending on the alternative selected, the length of these lines from the SWIP corridor would be approximately 2.5 miles or 6 miles. LS Power requests that these potential line segments be expressly accommodated in the RMP/EIS, either by corridor designation or other means.

Item #6: Location of SWIP corridor on Map 2.4-22 and Map 2.4-23.

B6-6 **Comment #6:** LS Power is actively developing the SWIP transmission line. As such we have performed reviews of the SWIP right-of-way grant and other documentation and have prepared a centerline of the SWIP corridor based on the review of this information and the changes enacted through LCCRDA. It appears that the maps included in the Draft RMP/EIS are using GIS information from the early 1990's for the SWIP corridor which do not match precisely with the information we have gathered. While the discrepancies for the most part are minor, we would be happy to provide GIS data for the corridor based on our review of the available information. In addition, we suggest that the RMP/EIS recognize in advance the possibility of minor deviations from the corridor maps due to updated GIS information, field adjustments etc., that may occur during permitting and construction of the SWIP transmission line, to avoid the potential need to amend the RMP to reflect such minor changes should they occur.

Section 2.5.11 Visual Resources:

B6-7 **Item #7:** Alternatives B, C, D, and E designate the land area on top of the Egan Range to be managed as a Class II Objective (see Maps 2.4-5, 2.4-6 and 2.4-7). Portions of this area are also designated as Potential Wind Development Areas (see Maps 2.4-24 and 2.4-25).

Comment #7a: LS Power requests that BLM evaluate whether a Class II Objective can be met while maintaining the potential for wind development in this area. If not LS Power requests that an appropriate Visual Resources class be assigned to maintain compatibility with the potential wind development.

Responses to Letter B6

B6-5 Rights-of-way for electrical transmission lines greater than 69 kilovolts are encouraged to be located within designated corridors. WPES lines would be authorized through the right-of-way process. They would not be required to be within designated corridors.

B6-6 In response to your comments, Map 2.4.12-5 in the Proposed RMP and Final EIS have been revised to more accurately present the SWIP corridor. Alignments outside of the designated corridor could be authorized through the right-of-way process.

B6-7 The section of the Egan Range that your letter refers to was designated as Visual Resource Management Class II, because it lies within the view shed of the Pony Express National Historic Trail. And while the Proposed RMP identifies areas with high wind energy resources, it does not designate potential wind development areas. The Visual Resource Management Class II objective is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. It may be difficult for a wind energy project to meet these objectives, and a higher level of mitigation may be required by the Ely Field Manager. However, these decisions would be project-specific and are not made at the land use planning level.

Letter B6 Continued

Mr. Gene Drais
November 28, 2005

Page 4 of 6

- B6-8 **Comment #7b:** In support of Comment #7a, LS Power believes that a number of locations in the Egan Range have a high potential for wind development based on wind speeds, terrain, access and ability to minimize impacts to environmental resources in this area. Further, the Egan Range location is in close proximity to the SWIP designated corridor and the WPES preferred site which should help to minimize infrastructure impacts by utilizing common infrastructure facilities (to the extent practicable) and utilizing designated corridors to the maximum extent possible.
- B6-9 **Comment #7c:** Maintaining the ability and promoting wind development is consistent with the President's Executive Order 13212, "Actions to Expedite Energy-Related Projects" issued May 2001, establishing policy that federal agencies should take appropriate actions to expedite projects to increase the production, transmission, or conservation of energy.
- B6-10 **Item #8:** Alternatives B, C, and E appear to designate the land area for the preferred and alternative WPES site as primarily Class III with the northern portion of the preferred site potentially being Class II (see Maps 2.4-5, and 2.4-6). Alternative D designates entire area as Class II (see Map 2.4-7).
Comment #8a: LS Power does not support Alternative D for Visual Resources.
- B6-11 **Comment #8b:** LS Power requests that BLM confirm that the classifications selected would be compatible with the proposed WPES, including analyzing if the Class II area overlaps with any portion of the preferred power plant site and make appropriate changes to these classifications, if necessary. LS Power intends to minimize visual impacts to the extent practical, however, the WPES will include structures of notable heights.
- B6-12 **Comment #8c:** In support of Comment #8b, LS Power believes the sites being evaluated for the WPES are the best locations for the facility and will result in the least environmental impact on a cumulative basis when evaluating all resources. Further, the completion of energy projects on federal lands, such as the WPES, is consistent with the President's Executive Order 13212.
- Section 2.5.15.1 Special Recreation Management Areas:
- B6-13 **Item #9:** Table 2.5-11 on page 2.5-137 identifies a Special Recreation Management Area ("SRMA") as "Telegraph". This area is shown on Maps 2.4-33 & 2.4-35 as "Telegraph Peak". This area's primary values for recreation are stated to include non-motorized recreation, equestrian, hiking and mountain biking. Portions of the Telegraph SRMA are also identified for potential wind development areas.

Responses to Letter B6

- B6-8 The Proposed RMP does not designate areas for wind and solar energy development, and the text and map titles in the Proposed RMP and Final EIS have been changed to clarify this. Changes in technology may change the potential for renewable energy development and which areas are suitable. All applications will be subject to NEPA analysis and the Wind Energy Development Program Policies and Best Management Practices published in conjunction with the Record of Decision for BLM's Final Wind Energy Development Programmatic EIS (Appendix F, Section 3 of the Ely Proposed RMP and Final EIS).
- B6-9 Thank you for your comment. The Proposed RMP is consistent with the Executive Order, and the Ely Field Office recognized the value of developing wind energy.
- B6-10 A range of alternatives was presented and analyzed in the Draft RMP and EIS and Proposed RMP and Final EIS. Each alternative had a different management emphasis, based on comments received during scoping and the needs/desires of various public land users. While not all management actions would be acceptable to all users, the alternatives do contain a range of approaches for analysis purposes.
- B6-11 The LS Power preferred power plant site lies within a proposed Visual Resource Management Class III area. The Class III objective is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Actions may attract the attention but should not dominate the view of the casual observer. It may be difficult for a power plant to meet these objectives, and a higher level of mitigation may be required by the Authorized Officer. However, these decisions would be project-specific and are not made at the land use planning level.
- B6-12 Thank you for your comment.
- B6-13 In response to this and similar comments, the text in Section 2.4.15.1 of the Proposed RMP and Final EIS has been revised regarding special recreation management areas. The Telegraph special recreation management area proposal is not being carried forward in the Proposed RMP.

Letter B6 Continued

Mr. Gene Drais
November 28, 2005

Page 5 of 6

B6-13

Comment #9: The Final Programmatic EIS on Wind Energy Development (June 2005) acknowledges that recreation and wind energy development can co-exist, with both positive and negative impacts to recreation. BLM should note that, as stated in the various portions of Comment #7 above, there is a high potential for wind energy development in the Egan Range. LS Power believes that the impacts to recreation will be minor due to the small land area required by wind development as compared to the large area proposed to be designated as the Telegraph SRMA, and due to the fact that impacts from the wind development can also be positive (e.g. improved access to the Telegraph Area). LS Power requests that if the Telegraph area is designated as an SRMA, the RMP/EIS expressly acknowledges that that designation is not inconsistent with and does not preclude wind energy development.

Section 4.28 Cumulative Impacts:

B6-14

Item #10: Page 4.28-1 discusses assumptions for the White Pine Energy Station.

Comment #10: The assumptions for the new surface disturbance associated with the White Pine Energy Station, while on the right order of magnitude, appear to be understated. To connect all of the 22 wells anticipated for the WPES water system, it would require approximately 55 miles of right-of-way having a permanent width of 30 feet and a temporary construction disturbance of an additional 30 foot versus the stated assumption of 12 miles at 75 feet in width. The requested right-of-way for the transmission line is approximately 34 miles long and 200 feet in width versus the stated assumption of 20 miles at 160 feet in width. There is the potential for additional disturbance due to the need for permanent access roads, electric distribution lines to wells, construction staging areas and construction access, which should also be recognized.

B6-15

Item #11: Table 4.28-1, pages 4.28-5 and 4.28-6, states assumptions for the White Pine Energy Station.

Comment #11: See comment #10. The maximum water usage is limited by White Pine County permits of 25,000 acre-feet/year versus the stated assumption of 26,000 acre-feet/year.

Thank you for the opportunity to provide these comments. Combined, the LS Power projects proposed in Nevada represent a capital investment of approximately \$3.0 billion dollars, would result in the creation of hundreds of construction jobs over five years and would create approximately 150 full-time, permanent jobs. In addition, these projects will become vital resources to the electric grid in Nevada and the Western US.

Please do not hesitate to contact me with any questions or data needs.

Responses to Letter B6

B6-14

In response to your comment, the text in Section 4.28.1.1 of the Proposed RMP and Final EIS has been revised to clarify the amount of surface disturbance associated with the White Pine Energy Station. The basic impact conclusions presented in the Draft RMP and EIS have not changed.

B6-15

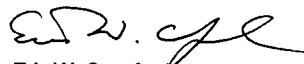

In response to your comment, data for water usage for the White Pine Energy Station on Table 4.28-1 in the Proposed RMP and Final EIS has been updated. The basic impact conclusions presented in the Draft RMP and EIS have not changed.

RE: Draft Resource Management Plan

To Whom it May Concern

I am writing today on the behalf of the Off-Road Business Association (ORBA) in regards to the Draft Resource Management Plan for the Ely Field office. ORBA is a national, non-profit trade association representing all aspects of the Off-Highway Vehicle industry, including vehicle manufacturers, aftermarket manufacturers and distributors and local retail dealers. Our interests are to preserve and enhance motorized recreation opportunities and access while simultaneously protecting our valuable natural and cultural resources.

B7-1

After reviewing the Draft RMP, we feel that overall you have done an excellent job, and we are generally supportive of the Preferred Alternative E. We do have some specific concerns though related specifically to how vehicle travel is restricted in Limited areas. We strongly recommend that rather than restricting travel to DESIGNATED routes, travel should generally be restricted to EXISTING routes. It has been our experience that when agencies mandate vehicle use on designated routes, they are setting themselves up for a huge allocation of resources to do the through analysis required to designate a route. We have watched many offices spend a decade or more and still not be able to complete the process. This exposes the agency to litigation and almost always the agency loses these lawsuits. We have watched other offices short cut the process to get the job done quickly, at the expense of the recreating public, as this usually results in significant, if not massive, loss of opportunities.

B7-2

The alternative of restricting travel to existing roads, trails and washes is much more achievable and would not result in a massive loss of currently open routes. Of course, the BLM always has the ability to close any routes that have documented significant adverse impacts attributable to vehicle travel and where there are no feasible mitigation measures. We strongly feel that the very limited resources available to the BLM in Nevada are better spent in addressing problem areas rather than spending vast amounts of money to analyze all routes. Areas with specific resource concerns are already identified, and currently mandated monitoring processes should have already identified any routes with specific concerns.

B7-3

While it is our understanding that the Ely Field Office has inventoried many of the existing routes, it is also our understanding that this inventory was done with either 4 wheel ATV's or full size vehicles. There are also many, many single track routes in the Ely District that are not passable on an ATV. These single track routes are highly desirable to the motorcycle and mountain bike communities, and we feel they must be

B7-1

The Ely Field Office recognizes the massive undertaking necessary to designate routes in such a large planning area. Please refer to Section 2.4.14.1 in the Proposed RMP and Final EIS for clarification of comprehensive travel management planning.

B7-2

Please refer to Response to Comment B7-1.

B7-3

In addition to four-wheel all-terrain vehicles and four-wheel-drive trucks, the Ely Field Office has also utilized motorcycles in accomplishing the inventory of existing routes and ways. During site-specific transportation planning, the Ely Field Office will hold public scoping meetings to address completeness of the route inventory and public issues, concerns, and access needs, such as single-track route management.

Letter B7 Continued

B7-3

analyzed and designated unless there are compelling reasons to support not designating them. Any resource concerns that can be mitigated should be mitigated whenever feasible. We understand that there are many single track routes especially in areas that have historic motorcycle race routes. These areas include, but are not limited to, the area south of Mail Summit, the area west of Caliente towards Chief Mountain, the area around Alamo, the area between Panaca and Caliente, the area between Robinson Summit and Squaw Peak, and the area in the vicinity of Jakes Wash.

The management strategy of restricting vehicle use to existing roads and trails is not new or untested. As a good example, a few years ago the BLM and US Forest Service prepared a joint Environmental Impact Statement for the states of Montana, North Dakota and South Dakota (Tri State EIS) that restricted travel to existing roads and trails. The public information materials for the implementation of this EIS included photo and descriptive narratives of what an existing route looked like and how the vehicle type should not be any larger than the existing route, such as restricting full size vehicle to two track roads, ATV's to ATV width and wider routes, and motorcycles to single track width and wider routes. Some have raised the concern that allowing use on existing routes allows new routes to be created. Our response to that concern is that besides already existing inventories, aerial photo data is available to document what exists today and determine if a route is newly created.

B7-4

We also strongly urge the BLM to use the Tri State EIS model for restricting vehicle use to routes no wider than the vehicle. As an example, ATV's should not be allowed to convert single track trails into ATV's and full size vehicle should not be allowed to convert ATV trails into full-size vehicle routes.

B7-5

We do have a concern about cross country vehicle travel for hunting purposes. It has been our experience that the explosion of the use of ATV's for hunting has created the biggest problem regarding creation of new routes, at least outside of urban interface areas where route proliferation can be a localized issue. If vehicle use is restricted to existing or designated routes, we feel that this should also include any hunting uses, including game retrieval. One new track often encourages more tracks and can result in the creation of a new route.

B7-6

We do feel that restricting use to Designated routes may be appropriate in heavily used areas and urban interface areas. Limiting use of the Designated route strategy to specific local areas is much more manageable and feasible than using the strategy district-wide.

B7-7

Regarding Special Recreation Permits, and specifically permits for competitive events, we feel that these types of events should be somewhat restricted in where they are allowed. These competitive events do have a higher impact on routes than causal use and even non-competitive events. However, these competitive events should not be restricted to just small areas either, and they should have areas available to them that would allow rotation/rest cycles to allow the routes to heal themselves with time.

Responses to Letter B7

B7-4

In response to your comment, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to ensure that route designations may incorporate vehicle width limitations to prevent expansion of single-track and ATV-width trails.

B7-5

The Proposed RMP and Final EIS (Section 2.4.14.1) retains a management action to allow cross country travel for retrieval of downed big game. The Ely Field Office considers the use of motorized vehicles off of designated roads and trails specifically for retrieving downed game (as opposed to general hunting access or activities) to be an allowable one-time use that would only occur during hunting season.

B7-6

Please refer to Response to Comment B7-1.

B7-7

The Proposed RMP includes four geographic areas where motorcycle special recreation permit events have historically been held. These areas would allow for continuing opportunities for motorized special recreation permit events and race course rest and rotation to occur.

Letter B7 Continued

11/28/2005 17:30 FAX 2082331162

ORBA

003/003

Page 3

B7-8

In closing, our remarks are intended to be in the direction of making the RMP feasible and implementable. We are VERY concerned that the Designated route strategy used on a broad scale would set the Ely Field Office up to fail as well as possibly causing the loss of significant amounts of currently used routes of travel. We want the RMP to succeed in meeting your legal mandates as well as preserve our existing opportunities. Demand for motorized recreation opportunities on public land is growing everyday, while those opportunities are being diminished on much of our public lands across the west, particularly the closer you get to population centers. Much of the lost opportunities has been the result of litigation, and often that litigation was successful because the agency plan made commitments that could not be delivered with available resources.

Thank You for the opportunity to comment. Please include ORBA on your mailing list for the Final RMP EIS and Record of Decision, as well as any other planning processes dealing with access and motorized recreation.

Respectfully,

Bill Dart,
Director of Land Use
Off_Road Business Association
Western States Office
7703 West Buckskin Road
Pocatello, Idaho 83201

ENGINEERING • SURVEYING • RESOURCES & ENVIRONMENTAL SERVICES

RESOURCE CONCEPTS, INC.

November 22, 2005

Mr. Gene Drais, Project Manager
BUREAU OF LAND MANAGEMENT
Ely Field Office
HC 33 Box 33500
Ely, Nevada 89301

NOV 2005
RECEIVED
BUREAU OF LAND
MANAGEMENT
ELY, NEVADA

Dear Mr. Drais:

Resource Concepts, Inc. (RCI) is submitting the enclosed comments regarding the DRAFT Resource Management Plan/Environmental Impact Statement for the Ely District on behalf of the N-4 State Grazing Board. It is our hope that the Ely BLM EIS preparation team will consider these comments when revising the RMP/EIS for final publication.

The N-4 State Grazing Board has interest in the RMP/EIS and the subsequent results of the Record of Decision on public land livestock grazing programs and procedures for the Ely BLM District. The following is a list of comments regarding the DRAFT RMP/EIS for the Ely District. Page numbers are included with each comment for ease of reference to specific points in the document. In general, Resource Concepts Inc. supports the preferred alternative and we commend the BLM Ely Field Office for planning and proceeding with a document that allows for the long-term stability of vegetation communities throughout the Ely District.

Comments:

B8-1

B8-1 Thank you for your comment.

B8-2

B8-2 Thank you for expressing your concerns. As stated in Section 2.8.1 of the Proposed RMP and Final EIS, "Some components of Alternative D could be implemented through the discretionary authority of the Ely Field Manager or the Nevada State Director, while others would require action by the Secretary of the Interior or new legislation by Congress. Thus, the alternative has been included to be responsive to scoping comments and to allow the analysis of a range of management actions in the EIS." Further, Question 2b of the Council on Environmental Quality's "Forty Questions" states that "An alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable"

B8-3

B8-3 Please refer to Section 2.4.3 in the Proposed RMP and Final EIS for a list of water resources management actions that specifically address water quality considerations. The Memorandum of Understanding between Nevada Department of Environmental Protection and BLM is mentioned in Management Action WR-1. Further mention of this MOU is made in the water resources sections of Chapters 3 and 4, clarifying the relationship between BLM water quality considerations and state and federal regulatory authorities. BLM monitoring activities for water resources are described in Section 2.4.23.

- (1) Pg. 2.2-2 Alternative D excludes the permitted discretionary uses that are central to the multiple use and sustained yield principles referred to on page 1.5-3 that the RMP/EIS will adhere to. Therefore, Alternative D should not have been included in the analysis as an alternative. None of the livestock grazing actions specific to Alternative D should be incorporated in the final decision. Additionally as stated in the Carico Lake Allotment Rangeland Health Assessment EA NV-062-EA05-61 "...FLPMA and the Taylor Grazing Act recognize grazing as a valid use of the public lands and require BLM to manage livestock grazing in the context of multiple use."
- (2) Pg 2.5-3 The goal for managing water resources on BLM-administered lands in the Ely District does not state the level or standard which the BLM will use to determine if the chemical, physical, and biological integrity of waters within the district are being maintained. The Nevada Department of Environmental Protection (NDEP) is the regulatory authority for Nevada water quality, and only the State Environmental Commission has authority to establish water quality standards.

Mr. Gene Drails, Project Manager
November 22, 2005
Page 2

B8-3

NDEP also determines the association between water quality and quantity affecting the regulatory status of each stream. Water quality standards enacted through the Nevada Administrative Code (NAC) should be the basis for determining maintenance of chemical and physical integrity associated with water quality.

(3) Pg 2.5-9

The first paragraph of the parameter description for pinyon-juniper woodlands indicates that the Ely District would use the Natural Resources Conservation Service (NRCS) key to classify pinyon-juniper sites from rangeland ecological sites. Then in the second paragraph, an acreage is provided for pinyon-juniper woodlands in the District. It is assumed that inventories and classification have not yet occurred within the District according to the NRCS 2003 publication referred to in this section. Section 3 of the RMP states that the acreages for each vegetation type are projected using three watersheds. Due to the scaling up of the information to the entire district, there should be a statement added reflecting that a portion of the total acreage is likely to be classified as rangeland instead of woodland throughout the watershed assessment process. Greater emphasis needs to be placed on defining pinyon-juniper woodlands in this section, as it will help the reader understand the percentages explained in Table 2.5-1. It should be made clear that rangeland ecological sites with minor components of pinyon or in most cases juniper (often 5 to 10% cover of juniper allowed) are not pinyon-juniper woodlands. In some cases areas with very high cover (>25%) of pinyon-juniper are classified as rangeland within the Ely District.

B8-4

B8-5

(4) Pg 2.5-19

As a side note, the 2003 NRCS publication referred to in this section of the document is listed in the references as the MLRA 28B Nevada Ecological Site Descriptions. See the USDA-NRCS 1997a reference below for an actual key to dividing pinyon-juniper woodlands from rangeland ecological sites.

Alternatives B and C briefly cover protection of aspen regeneration from grazing. Alternative C mentions protecting aspen by limiting grazing to periods outside the grazing season. Alternative B only mentions protection methods with no examples given. For both alternatives, protection from grazing should be limited to areas where site potential allows for regeneration to occur, and should be considered on a site-by-site basis. Fencing, water development, or other allotment improvements may be necessary for protection from grazing. AUM reductions and allotment closures should not be utilized as protection measures unless other measures have been tried unsuccessfully, and it is clearly a problem with overstocking. Also, limiting grazing to periods outside the growing season (Alternative C) may completely eliminate grazing in more alpine areas where the growing season begins once the snow melts, and ends when the snow flies again. During winters with heavy snow packs, grazing would be completely eliminated. This elimination of grazing may not be necessary for protecting or managing for aspen regeneration. Site by site (not District wide) analysis of grazing prescriptions and any protection measures should occur and be written into the individual allotment management plans. In addition, the overall economic impacts to the local economy and ranching viability must be considered.

B8-6

Responses to Letter B8

B8-4

The vegetation sections in Chapter 2 are separate and distinct in reference to each vegetation type. The pinyon /juniper type refers to true woodlands as described by NRCS Order III soil surveys and associated Ecological Site Descriptions, 2003 Edition, and can be identified on a watershed or site-specific basis. In referring to the NRCS Order III inventories in each vegetation section, reference was made to the latest Ecological Site Descriptions. To further update the vegetation section, LANDFIRE biophysical setting models were referenced to the desired range of conditions. Refer to revised Chapter 2 vegetation sections. The text in the Proposed RMP and Final EIS has been revised to emphasize that the acreages presented in the various vegetation tables are based on extrapolation from a few watersheds rather than on inventory data from the entire planning area. During the watershed analysis process, rangeland sites occupied by pinyons and/or junipers will be distinguished from pinyon/juniper woodland sites.

B8-5

The reference citation to NRCS 2003 is correct for the determinations made by the Ely Field Office with regard to identification of woodland sites. The key for dividing woodland from rangeland ecological sites was updated in 2003.

B8-6

In response to your comment, the text in Section 2.4.5.3 of the Proposed RMP and Final EIS has been revised to clarify that the protection methods for encouraging aspen regeneration would be applied on a site-specific basis. Please note that given the extremely limited distribution of aspen in the decision area (about 7,000 acres total), any changes in grazing management to encourage aspen regeneration would have a very limited effect on livestock grazing operations and economics.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 3

- B8-7 (5) Pg 2.5-28 Alternative B describes using changing season of use or type of livestock as passive management actions for treating the salt desert shrub vegetation type. It should be noted that in some circumstances (certain phases or states) changes in livestock grazing will not and are not appropriate management choices for causing a transition from the shrub state to the herbaceous state (i.e. elimination of cattle grazing will not cause a transition to the herbaceous state when there is no seed source, or insignificant seed source present from perennial grass species).
- B8-8 (6) Pg 2.5-31 Similar comment to (3). There are no footnotes describing how acreage estimates were obtained for any of the vegetation types, nor the states present for each one. Add footnotes referring to section 3 assumptions or explain how the data was derived and source as it is presented.
- B8-9 (7) Pg 2.5-33 Under the description of the Shrub State in Table 2.5-6, the verbiage describes the "herbaceous perennial understory [as] lost or has become weak....". Consider changing verbiage about a weak understory to rather reflect a reduction in perennial understory vigor and decreased capacity to produce seed.
- B8-10 (8) Pg 2.5-35 In the second paragraph of the description under Alternative B the document states that 45% of the sagebrush acreage in the District would be "maintained to achieve the desired range of conditions identified for Alternative B." This maintenance would occur on the untreated areas (areas not mechanically treated or prescribed burned), however no description of how maintenance would occur is included in this section. Does maintenance consist of following status quo management or will maintenance consist of other management techniques to reduce the likelihood of a site currently in the herbaceous state (17% of the sagebrush type) from crossing a threshold into the shrub state? This comment pertains to all of the vegetation communities described in Section 2.5.
- B8-11 (9) Pg 2.5-38 In the sections of each vegetation community one of the factors listed as an indicator that a community is no longer resistant and resilient to disturbance is the presence of noxious weeds or "highly competitive unknown invasive weed." If the weed is unknown, how is it known that it is invasive, or how to adequately treat the invasion? It is suggested that the word unknown be stricken.
- B8-12 (10) Pg. 2.5-45 In the preferred alternative, management actions are to be focused on uses and activities that allow for protection, maintenance, and restoration of riparian habitat. Does protection of riparian habitat affect current livestock grazing management plans? Discuss appropriate management actions in greater detail in this section. Alternative A discusses constructing, maintaining, or improving exclosures. Would this also occur in Alternative B? If so, additional offsite waters sources may need to be developed for livestock grazing. In fact, providing additional offsite water sources can increase grazing distribution and reduce grazing use in riparian areas (Clawson 1993, Howery et al. 1996, and Sheffield et al. 1997). Proper livestock grazing use can be an effective

Responses to Letter B8

- B8-7 In response to your comment, the text in Section 2.4.5.4 in the Proposed RMP and Final EIS has been revised to emphasize that changes in livestock management would be used where sufficient native understory species exist to provide an effective seed source.
- B8-8 Please refer to Section 4.1.4.1 in the Proposed RMP and Final EIS for an explanation of how the acreage estimates for vegetation types and treatment areas were derived.
- B8-9 In response to your comment, the text in Table 2.5-6 of the Proposed RMP and Final EIS has been revised.
- B8-10 In response to your comment, the text in Section 2.4.5.1 has been revised to discuss the application of tools described in Appendix H for achieving the maintenance of the desired range of conditions. Integrated treatment actions are further described for each parameter.
- B8-11 In response to your comment, the text in Sections 2.4.5, 2.4.21 and 2.4.23 of the Proposed RMP and Final EIS has been revised to clarify the discussion of invasive species.
- B8-12 As you have indicated in your comment, a wide variety of management options exist for promoting vegetation health, structure, and diversity in the riparian communities. Selection of such approaches is appropriate on a site-specific basis as watershed analyses are conducted and treatment plans are implemented. The management actions in Section 2.4.5.9 of the Proposed RMP and Final EIS (for the Proposed RMP and by extension to Alternative B) have been worded to provide the necessary latitude for selecting treatment methods appropriate to the individual riparian situation.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 4

B8-12 management strategy in riparian areas. It is suggested that livestock grazing not be excluded from riparian areas including those areas not yet meeting proper functioning condition. Rather, altering the grazing system, changing season of use, and changing duration in the pasture should be considered as management alternatives for riparian area grazing. The description of Alternatives B and E are too general and do not adequately address the actions, management, and treatments. If the point of this alternative is to be extremely general so that each riparian system can be treated on a site-by-site basis, then this type of management style should be described. Adaptive management of resource uses should also be incorporated into the decision making process with regard to actions and treatments.

B8-13 (11) Pg. 2.5-49 There is concern that very often Resource Management Plan actions are not adequately monitored nor are the monitoring results adequately reported to the public. It is recommended that an in-depth monitoring plan be developed for these purposes, including the use of an open science team review approach. Quantitative baseline information should be collected before treatment and should include photo monitoring of landscapes and individual plots. Installation and utilization of small exclosures (generally between 0.5 and 5 acres) are recommended as monitoring tools and aids for determining not only changes from upland restoration treatments (with and without grazing), but also for determining stream potential in riparian areas to support desired plant communities and channel bank conditions.

B8-14 (12) Section 2.5.5 This section provides a great deal of detail about each vegetation community and the number of acres estimated for treatment in the next 20 to 50 years. In fact, under the preferred alternative 6,230,270 acres are proposed for treatment. Over the last 13 years the Ely District has treated 164,966 acres. At current rates of treatment (approx 12,689 acres/year) and funding, it would take approximately 490 years to complete the proposed projects. The District would have to increase the rate of treatment to 124,605 acres/year to implement treatments in the next 50 years. It is very likely in some years funding and staff time will limit the District from treating the minimum acreage each year. The DEIS is missing criteria for prioritizing which vegetation types and which of the 61 watersheds will be treated first. A description of how treatments will be prioritized over the short and long terms should be included.

B8-15 (13) Pg. 2.5-52 There is a statement in Alternative E about using Rangeland Health Standards Assessments to determine if livestock grazing is a causal factor for nonattainment of objectives. Completion of the Rangeland Health Standard Assessments worksheets does not in itself allow for determination of livestock grazing as a causal factor for nonattainment of objectives. Also, stratified random sampling of major vegetation types (Ely BLM watershed analysis procedure) does not provide an adequate measure of the most typical areas where grazing use is managed and consistently similar across the landscape. Key areas are areas of one ecological site with similar topography and landscape features that represent a larger area in an allotment from which impacts of

Responses to Letter B8

B8-13 In response to your comment and similar comments, the discussion of adaptive management and monitoring incorporating these aspects has been revised and expanded in the Proposed RMP and Final EIS (see Section 1.7.1 and 2.4.23). A detailed monitoring plan will be developed subsequent to issuance of the Record of Decision. The details you suggest would be more appropriate within that document.

B8-14 The Ely RMP makes the assumption that funding would be available for implementation of the plan. Funding could come through the BLM's budget or from other partners. Criteria for emphasizing treatment is provided in Section 2.4.5.1 Parameter - General Vegetation Management. "Treatments would be emphasized in areas that have the best potential to respond and return to the desired range of conditions". Priorities within individual vegetative types are identified in sections 2.4.5.2 through 2.4.5.10. Criteria for prioritizing watershed analyses are identified in Section 2.4.19, Watershed Management.

B8-15 The information sources presented in this comment are indeed the appropriate kinds and sources of information for assessing livestock grazing relative to the achievement of the standards for rangeland health. These would be reviewed and assessed during the evaluation process.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 5

- B8-15 grazing should be monitored. For additional info on key areas refer to the NRCS Pasture and Range Handbook. Key area monitoring, paired with watershed assessments, quantitative data from monitoring and inventories, qualitative information, professional knowledge, and information provided by State agencies, public land users and others (BLM Manual H4180-1) are the appropriate monitoring locations for assessing the impacts of livestock grazing on attainment of Rangeland Health Standards.
- B8-16 (14) Pg. 2.5-58 Alternative B indicates that through watershed analysis livestock grazing will be assessed to determine if the action is a causal factor for nonattainment of standards. What standards have been developed and approved in the Ely District for meeting migratory bird habitat needs? If they haven't been developed, who will develop them? The Alternative mentions the BLM Nevada Migratory Bird Best Management Practices. Will these be the standards?
- B8-17 Secondly, why is livestock grazing listed as the only parameter that will be assessed as a potential causal factor? There are several other activities that may be causal factors in not meeting habitat needs, including ORV disturbances, right-of-way and road construction, weed invasions, human-caused fires, wildfires, and other activities that may fragment habitat. Cumulative affects of all habitat impacts should be assessed for all potential causative factors.
- B8-18 (15) Pg. 2.5-62 Alternative E states that "big game species habitats would be managed to meet the public demand for increased game species distribution, density, and increased recreational opportunity, beyond what natural habitats and water sources would support." The way the statement is written it seems impossible to sustainably support game species numbers at this increased level. It should be stated that under the preferred alternative, big game species habitats will be altered according to the vegetation management section. Alteration of the habitats will potentially allow for sustainable increases in big game species distribution and density.
- B8-19 (16) Pg. 2.5-62 Similar to comment #13. What standards are approved for crucial mule deer, pronghorn, and bighorn sheep habitats? If none are yet approved, who is responsible for determining crucial habitat standards? Why is livestock grazing the only resource use listed as a potential causal factor for nonattainment of standards? Please list all other potential causal factors for not meeting standards, and how they will be evaluated.
- B8-20 (17) Pg. 2.5-63 Alternative E refers the reader to Alternative B for a description of how wildfire emergency stabilization projects would indirectly restore high and low elevation bighorn sheep habitat, however no description exists in Alternative B. Please describe further.
- B8-21 (18) Pg. 2.5-64 When monitoring fish and game and conducting watershed assessments, conflicts between livestock, wild horses, and wildlife are to be resolved during the watershed assessments and grazing permit renewals. Revisions to AMLs may

Responses to Letter B8

- B8-16 In response to your comment, the text in Section 2.6.6.4 of the Proposed RMP and Final EIS has been revised to note management actions are the same for Alternative B as the Proposed Plan (see 2.4.6.4).
- B8-17 The BLM is required by regulation (Title 43 § 4180) to conduct local-level assessments for ascertaining rangeland health standards. These assessments determine if areas are meeting the Resource Advisory Council standards, and determine specifically whether livestock grazing is a significant factor in failing to achieve the standards. BLM has worked with the Resource Advisory Councils to expand these rangeland health standards so that there are public land health standards relevant to all ecosystems, not just rangelands, and that they apply to all actions, not just livestock grazing. In response to your comment, the Proposed RMP and Final EIS has been modified to more clearly present the 4180 rangeland health standards assessments as they relate to wildlife.
- B8-18 In response to your comment, the text in Section 2.5.6.6 of the Proposed RMP and Final EIS has been revised to clarify the discussion of big game habitat management for increased game species distribution and densities.
- B8-19 In response to your comment, the text in Section 2.4.6 of the Proposed RMP and Final EIS has been revised to clarify grazing standards for big game species.
- B8-20 Emergency stabilization and rehabilitation would establish vegetation to meet ecological site guides. Refer to text in Section 3.6.2 of the Proposed RMP and Final EIS.
- B8-21 In response to your comment, the wording in this portion of Section 2.4.23 (wildlife) of the Proposed RMP and Final EIS has been revised to clarify that conflict resolution would involve potential adjustments to wildlife habitat management and AML as well as livestock permits.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 6

B8-21

also be necessary. Also, these conflicts should be resolved using a consensus type approach working closely with the permittee, wildlife groups, and other stakeholders.

(19) Pg. 2.5-66

B8-22

#12 - Caution should be exercised in implementation of the guidelines in Connelly et al. 2000, especially the grass and forb heights included in Appendix M Tables M-1 and M-4. The scientific literature summarized in (Connelly et al. 2000) indicates that sagebrush canopy cover and composition, as well as the cover and diversity of perennial herbaceous species in the understory are significantly important to sage grouse nesting success (NDOW 2002). Furthermore, in a recent review of the 13 studies that were cited in the Western Association of Fish and Wildlife Agencies (WAFWA) guidelines (Connelly et al. 2000) for sage grouse habitat, there were no statistically significant relationships found between nest success and grass height alone. There was, in fact, a slight negative correlation that should not be over interpreted. Results from simple linear and multiple regressions performed on grass height and nest success suggest that grass height as a single parameter is a poor indicator and should not be used individually or exclusively to assess or monitor sage grouse habitat quality (Schultz 2004).

B8-23

The Sage Grouse BMPs in Appendix K state that changes in livestock management (including the possibility of permanent exclusion) shall occur at the start of the next grazing season where grazing results in a level of forage uses determined detrimental to habitat quality. Using Connelly et al. guidelines as standards may be spatially or temporally inappropriate. Ecological site potentials vary considerably in eastern Nevada sagebrush communities, and it must be considered that understory (excluding seed stalks) height characteristics of seven-inches or more may not be possible or practicable in all ecological sites or habitat areas. Broad application of understory height objectives is not recommended across all sites and areas where sagebrush once grew (NDOW 2002). Due to the findings of Schultz 2004, it is recommended that the height parameters in Tables M-1 and M-4 *not* be used to determine whether or not forage use (utilization levels) has detrimentally affected habitat quality.

B8-24

(20) Pg. 2.5-71

Approximately 9.8 miles of vegetation along lower Meadow Valley Wash burned during the Meadow Valley Fire in 2005. The affected area occurs in the Henrie Complex Allotment. Approximately 52 percent (or 89,000 acres) of the allotment burned in 2005 between the Meadow Valley and the Duzack fires. A considerable amount of the burned acreage occurred in desert tortoise habitat. Removing livestock grazing as a vegetation management tool in desert tortoise habitat limits the ability of land managers to quickly break up the continuity or reduce fuel loads in years of excessive or high production of annual grasses (e.g. cheatgrass, red brome) and weeds (e.g. mustards). Failing to remove fuel loads creates conditions susceptible to large-scale fires and removal of the native vegetation species. Instead of exclusion of all grazing, change management of affected allotments to allow for annually assessed Temporary Non-Renewable Resource (TNR) grazing permits.

Responses to Letter B8

B8-22

In response to your comment, the text in item 12 of Section 2.4.7.6 in the Proposed RMP and Final EIS has been revised to clarify that the management of greater sage-grouse habitat will be in accordance with current guidelines and that such guidelines are subject to periodic revision based on additional scientific information. The Ely Field Office will continue to manage sage-grouse habitat based on the latest BLM policy and scientific evidence.

B8-23

Please refer to Response to Comment B8-22. Also, please refer to Appendix F in the Proposed RMP and Final EIS where a similar text revision has been made.

B8-24

As outlined for the Proposed RMP in the Proposed RMP and Final EIS, the Ely Field Office proposes to implement short-term closures or restrictions for the 598,071 acres recovering from wildfires within the Mojave Desert. In the short-term, Mojave grazing allotments or portions of allotments affected by the South Desert Complex Fires will remain closed and/or operating under the management strategies established through the South Desert Complex Emergency Stabilization Plan. These closures and restrictions would remain in place until short-term Emergency Stabilization objectives were achieved.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 7

- B8-25 (21) Pg. 2.5-71 Alternative E- Grazing should not be excluded from southwestern willow flycatcher potential habitat that is classified as either type A or C. Type A is very limited in distribution and is most affected by lack of surface water. Type C habitat does not have the canopy or interior vegetation density necessary for suitable habitat and may not have the land capability or potential to meet suitable habitat criterion even if all threats/stressors are removed and restoration is attempted (Bio-West 2005). Fencing to exclude grazing from occupied suitable habitat or potential habitat stressed by grazing should also be paired with development of offsite water sources. Failure to do so may in some cases limit livestock grazing distribution throughout affected allotments.
- B8-26 (22) Pg. 2.5-72 Alternatives B and E. See comment #20.
- B8-27 (23) Pg. 2.5-81 Alternative B should also manage horses in a similar fashion to Alternative A, such that the "population range would ensure that a thriving natural ecological balance is obtained...."
- B8-28 (24) Pg. 2.5-140 No mention of what other resource uses would continue or be excluded following the establishment of four special recreation permit areas totaling 1.36 million acres. Please describe the compatibility of these special recreation permit areas with other resource uses. Secondly, ORV use can significantly damage soil resources, especially when concentrated. Are soil surveys completed for all of the proposed areas? If not, adequate knowledge of soil capability to withstand such a use is not available. Where soil survey information is not available, no special recreation permit areas should be designated. Where soil survey data is available, designated routes should avoid highly erodible soils or soils that will rapidly erode once the surface soils have been lost. No increase in PM₁₀ or decrease in air quality is listed as a potential cumulative impact from concentrated ORV recreation.
- B8-29 (25) Pg. 2.5-141 Appendix C describes the phases of the watershed analysis process, however it does not list or describe which vegetation, structural, or functional attributes will be monitored during the process. Management common to all alternatives includes adjusting stocking rates based on watershed analysis. The NRCS Pasture and Rangeland Handbook provides a method for adjusting current stocking rates, involving studies of trend, plant community health, and utilization of key species. Appendix C does not indicate the type of measurements and quantitative (or qualitative) data that will be collected during the watershed analysis. The watershed analysis process should include monitoring of all of the recommended attributes before adjustments of stocking rates are made. More information on the watershed analysis process needs to be included in Appendix C. An appropriate stocking rate is fine tuned in cooperation with the BLM and permittee by adaptive management through the year and from year to year (USDA-NRCS 1997b).

Responses to Letter B8

- B8-25 In response to your comment, the text in Section 2.4.7.3 and 4.7 of the Proposed RMP and Final EIS has been expanded to address interactions between livestock grazing and the southwestern willow flycatcher.
- B8-26 Please refer to Response to Comment B8-24 for a discussion of changes in livestock grazing management in lower Meadow Valley Wash as a result of the fires in 2005.
- B8-27 In response to your comment, the text in Section 2.5.8.2 of the Proposed RMP and Final EIS has been revised to clarify that a similar thriving natural ecological balance would be achieved in Alternative B.
- B8-28 In response to your comment, the analysis for several resource programs in Chapter 4 of the Proposed RMP and Final EIS has been expanded to discuss the impacts of special recreation permit areas. Soils survey data is more detailed than necessary to prepare a largely programmatic RMP/EIS for the Ely planning area. Dust generated from off-road racing events is very localized and temporary and does not contribute to regional air quality degradation.
- B8-29 Appendix A in the Proposed RMP and Final EIS discusses the process found in BLM Handbook H-4180-1 Rangeland Health Standards. The commenter is directed to that handbook for the detail requested in this comment. The watershed analysis process is not used to adjust stocking rates. The Pasture and Rangeland Handbook provides a method for adjusting stocking rates.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 8

- B8-30 (26) Pg. 2.5-142 The Haypress allotment should not be identified for potential disposal if there is little to no indication that the horse preserve will be managed to maintain the health and functionality of both the upland and any riparian vegetation and soils on the preserve. A public process should be endorsed to develop a management plan with monitoring objectives that ensures ecological sustainability prior to disposal.
- B8-31 (27) Pg. 2.5-142 In Alternative E, it is stated that there would only be closure of 3,300 acres within new ACECs, however several of the proposed ACECs would also limit livestock management. Please include the number of acres and allotments which grazing would become limited. Secondly, refer to comment #20. Removing livestock grazing as a management tool (or severely limiting the use) may perpetuate conditions with higher than normal fine fuel loads and subsequently result in larger and more frequent wildfires, especially for allotments in the Mojave Desert.
- B8-32 Secondly, limiting or reducing livestock grazing in the proposed ACECs could have not only short-term but also long-term effects on the economic stability of affected ranches. Long-term limitations may fiscally limit the viability of ranching operations in the area. This issue was not addressed in Alternative E of the Environmental Consequences section.
- B8-33 (28) Pg. 2.5-144 Performance-based grazing authorizations proposed in Alternative E are an excellent way to promote proper, if not exemplary, livestock grazing management. Flexibility to use pastures at appropriate times during the plant growth cycles between seasons and between years should promote accelerated ability to meet reasonable resource objectives and improve overall rangeland health.
- B8-34 (29) Pg. 2.5-147 Allowing grazing permits to be relinquished and converted to forage reserves has the potential to drastically change the economic and social structure of the counties in the District. As land and water purveyors with no agricultural interests (e.g. Southern Nevada Water Authority) buy base property in the counties, more permits are likely to be relinquished. By not allowing application for these permits to other ranchers, the number of livestock producers within the District will continue to decrease. As fewer and fewer producers operate in the area, key infrastructure and economic opportunities will likely be lost, impacting the industry throughout the area. No economic impacts associated with implementing this policy have been analyzed in section 4.23 Economic Conditions - Environmental Consequences of the DRAFT RMP/EIS.
- B8-35 It is easy to appreciate the need to provide additional forage opportunities for those permittees that are displaced for any reason, however each permittee has and continues to manage their own allotments with areas of reserve in the event of drought or other circumstances. This is especially true for permittees using rotation grazing systems. In instances where fire or planned restoration treatments affect allotments on such scales that the active use for that allotment would be significantly reduced, then alternative forage sources outside the

Responses to Letter B8

- B8-30 Aliquot parts of the Haypress Allotment have been identified in the Proposed RMP for potential disposal but not specifically for a wild horse preserve. Any disposal would be in accordance with the Lincoln County Conservation, Recreation, and Development Act, would be a public process, and would be analyzed in accordance with the National Environmental Policy Act.
- B8-31 Please refer to Section 2.4.16.1 in the Proposed RMP and Final EIS for a change in acres associated with new ACECs. Livestock grazing is proposed to be closed in the 40-acre Snake Creek Indian Burial Cave ACEC. Refer to Table 2.4-26 in the Proposed RMP and Final EIS for identification of additional ACECs where grazing is limited. As discussed in Section 2.5.16 of the Proposed RMP and Final EIS, grazing would also be excluded on a temporary basis for areas in the Mojave Desert that are recovering from the South Desert Complex Fires of 2005.
- B8-32 In response to your comment, the text for the Proposed RMP and Alternatives B in Section 4.16 of the Proposed RMP and Final EIS has been revised to clarify the impact of these potential closures on the economic viability of numerous ranching operations. The basic impact conclusions presented in the Draft RMP and EIS have not changed.
- B8-33 Thank you for your comment.
- B8-34 In response to your comment, the text in Section 4.23 of the Proposed RMP and Final EIS has been expanded to clarify the effects of relinquishing grazing permits. Whether grazing permits are relinquished and converted to forage reserves or opened to application from other ranchers would not appear to have dramatically different implications for the economic and social structure of communities in the Ely RMP planning area. In either case, the available forage produced on the affected allotments would likely be used by other ranching operations and the number of continuing ranching operations would logically be similar in either case. In fact, the availability of a forage reserve may help sustain the income of operations temporarily displaced for any reason. Moreover, the major causal factor between local ranching operations and the economic and social structure of local communities would appear to be the retention or selling off of base properties, the value of which is largely independent of current or future livestock operations, not the management of relinquished permits.
- B8-35 The Proposed RMP specifies management policies and actions and provides programmatic and implementable direction for management of the public lands. The desert tortoise ACECs have been closed to livestock grazing in response to the fires that occurred in 2005. Temporary nonrenewable is an action that is regulatory and can be considered, and if appropriate approved, on an annual basis. In the event that grazing permits are relinquished, managing the areas as forage reserves would be considered. This would be reviewed through the scoping process. Both of these actions would be considered in consultation with the Fish and Wildlife Service to promote the recovery of the desert tortoise.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 9

B8-35

allotment should be considered. One alternative could be to issue temporary nonrenewable permits for ACECs or other areas of nonuse during seasons of use that do not conflict with critical times for special status (e.g. livestock grazing could occur in desert tortoise ACECs while tortoises are in hibernation). Currently this option is not included in any of the alternatives in the DRAFT RMP/EIS. A second alternative would be to change relinquished allotments or other areas of nonuse to forage reserves or reserve common allotments.

B8-36

Using the Four C's concepts to grazing administration, forage reserves could be managed as Reserve Common Allotments (RCA). It is recommended that if RCAs are formed from relinquished permits; only the first two types of RCA formation should be utilized:

- 1) **Permittee Association Voluntary RCA** – RCAs voluntarily established by associations of permittees in areas specified in land use plans as suitable for RCA use.
- 2) **Individual Permittee Voluntary RCA** – RCAs voluntarily established by individual permittees in areas specified in land use plans as suitable for RCA use.
- 3) **BLM Administered RCA** – RCAs established from vacant allotments and/or donated or exchanged lands, and administered by the BLM for the same purposes as permittee association and individual permittee voluntary RCAs (BLM 2003).

B8-37

In the event that the Tamberlaine allotment permit, or any other allotment permits are relinquished, it is preferable that the permits remain available by application process to other ranchers according to current regulations (Alternative A). In the event that other ranchers do not apply for relinquished permits, then it is recommended the permits be held as forage reserves by grazing associations or individuals. It is least preferable that the BLM administer allotments as forage reserves, as this type of management should come from the grassroots level, not as a top-down approach for successful implementation.

B8-38

If forage reserves are created, it is imperative that annual or biennial grazing continues to occur on these allotments to prevent herbaceous species such as crested wheatgrass from becoming decadent. Annual or biennial grazing would also reduce the continuity and height of fine fuel loads frequently enough to prevent excessive fuel load build up which could increase susceptibility for large, high-intensity wildfires. Other planning concerns include development of a management plan for forage reserve allotments, which addresses objectives for how these forage reserve allotments will be managed, maintained, and monitored. The plan should also address who will get to use the allotment(s) and how priorities will be determined.

B8-39

Research use (and grazing nonuse) as proposed in Alternatives C and E are not a valid use for grazing permits under the current CFR's. Designated research sites not compatible with livestock grazing should be addressed in the RMP

Responses to Letter B8

B8-36

The types of reserve common allotment formation categories presented in this comment would all be considered when allotments are relinquished.

B8-37

In the event that an allotment grazing permit is relinquished, the actions presented in this comment would be considered.

B8-38

In the event that forage reserves are created, the actions, practices, and recommendations presented in this comment would be considered. Grazing plans would be developed addressing all aspects of grazing management on forage reserves.

B8-39

Research on allotments for which a grazing permit has been relinquished is not included as part of the Proposed RMP. Research Natural Area is not a designation that is allowed under the new BLM Land Use Planning Handbook. If grazing permits are relinquished, authorized uses, which could include research, would be considered. Any uses would be consistent with the regulations and policies in force at that time.

Letter B8 Continued

Mr. Gene Drais, Project Manager
November 22, 2005
Page 10

B8-39 | planning process as a change in land use to Research Natural Areas and included for analysis in section 2.522.5.

B8-40 | The DRAFT RMP/EIS allows for any permits and specifically the Tamberlaine allotment to be relinquished and converted from grazing use to use as forage reserves. Additional planning issues should be considered in designating areas of the district for these changes in land use, including but not limited to economic viability of certain ranching communities/centers, proximity to towns and cities, and ease of transport of cattle from one allotment to another.

B8-41 | As an example of the complex issues associated with forage reserves, the Tamberlaine allotment is located adjacent to the Ward Mountain (Blue Diamond) community, approximately six miles south of Ely. Removal of annual (or at least biennial) livestock grazing on this allotment could result in increased fuel loads and more intense fires. The allotment boundary falls within 0.5 miles of the Ward Mountain (Blue Diamond) development and management on this allotment could affect fire suppression efforts within the wildland-urban interface (WUI). Wildfires could spread more rapidly and at higher intensities into the Ward Mountain WUI. If any additional allotments were converted to forage reserves near other WUI areas, the same affects could be realized. Because of this concern, if allotments were to be managed as forage reserves they should either be grazed using TNR permits annual or biennially or be prohibited on allotments within one to two miles of WUI areas in the District.

B8-42 | (30) Pg. 2.5-180 The description of Watershed Management - Management to maintain resiliency includes the management option of modifying livestock grazing or completely eliminating grazing on existing resilient vegetation communities. All of the options in this section should only be implemented when rangeland health standards are not being met currently. If the plant community only requires maintenance of resilient qualities, and livestock grazing was part of the system that reached a desired level of resiliency, then why should livestock grazing be modified or excluded for the purpose of maintaining resiliency? If the communities are currently functioning in a resistant and resilient manner to disturbance, then why change the current management (if the system is not broke, why fix it)? Also, point-in-time studies such as the watershed assessment method should not be used to determine changes in livestock grazing management. Rather they should only be used to determine areas where additional monitoring should occur, before management changes/adjustments are made.

B8-43 | (31) Pg. 2.5-185 Alternative E proposes to only allocate additional forage to livestock grazing through restoration treatments after all rangeland health standards have been met on a watershed scale. In most cases, more than one allotment and more than one permittee manage grazing within one watershed. Alternative E also calls for granting performance-based grazing on case-by-case basis. This section greatly reduces the incentive for one performance-based permittee to manage his resources to meet all rangeland health standards. This is because a

Responses to Letter B8

B8-40 Current grazing management policy addresses authorized uses (including forage reserves) that could be included or considered if grazing permits are relinquished. If the grazing permit for any allotment were to be relinquished, the planning issues presented in this comment would be considered. In the Proposed RMP, the Tamberlaine Allotment has not been specifically identified for a forage reserve.

B8-41 In the Proposed RMP, the Tamberlaine Allotment has not been specifically identified for a forage reserve. In the event that forage reserves are created, the issues raised in this comment would be considered.

B8-42 A variety of factors besides grazing (e.g., fire and drought) may adversely affect vegetation communities and push them toward transitions into undesired states. In such situations where rangeland health is at risk, adjustments in various resource uses such as grazing may be required for the maintenance of resiliency. As indicated in the comment, if conditions are stable, health standards are being met, and vegetation communities are resilient, such adjustments in grazing management would not be appropriate or required.

B8-43 Reference to Performance Based Grazing has been removed as a Parameter or a management action in the Proposed RMP. Flexibility associated with livestock grazing is allowed in the current grazing regulations at 43 CFR Part 4100 and is specifically addressed under allotment management plans.

Letter B8 Continued

Mr. Gene Drals, Project Manager
November 22, 2005
Page 11

- B8-43 neighboring permittee may not be able to reach standards in the same time frame. Each grazing system is different, and different issues could be present on each allotment in a watershed that will cause each allotment to meet standards at different times. If all standards are met on one allotment (but not the others) in a watershed, the allotment meeting standards should be eligible for additional forage allocations.
- B8-44 (32) Pg. 2.5-194 Alternative E calls for the designation of 18 additional ACECs totaling 138,900 acres. Livestock grazing is to remain closed on 212,500 acres (existing ACECs), 3,300 acres are proposed for closure to grazing (new ACECs), and livestock grazing will be limited through changes to grazing permits on approximately 62,440 acres (new ACECs). In reviewing the description of the proposed Condor Canyon ACEC, no explanation or rationale is provided regarding livestock grazing being a threat to the Big Spring spinedace. Why are any additional grazing restrictions being proposed? Similar comments apply for Mount Irish and Shooting Gallery, as no evidence of threat from grazing is given or reasons for limiting or restricting livestock grazing on these two proposed ACECs, totaling more than 46,900 acres. Also, no description of the economic impacts of these proposed limitations of grazing are analyzed in section 4 – Environmental consequences. Refer to comment #20 regarding fuels management.
- B8-45 (33) Pg. 2.5-266 Alternative E for Wilderness Study Areas proposes to emphasize other multiple uses within WSAs but also restrict management on all other areas with wilderness characteristics. This alternative doesn't list the types of management restrictions that would be put in place, nor does it list the estimated acreage within the District that has wilderness characteristics (other than WSA and designated wilderness). Managing to protect wilderness characteristics could limit the degree and extent of restoration treatments proposed in this document. Further analysis would be necessary to determine the potential impacts of this alternative, and as such it should not be included in the FEIS as the preferred alternative.
- B8-46 (34) Pg. 3.5-4 Table 3.5-2 lists the source for the table as BLM unpublished data. These data need to have a better citation when listing unpublished data as the primary source of information. Are the data created from remote sensing technologies? If so, what is the date of the satellite imagery used for the classification? If not, how were these estimates made?
- B8-47 (35) Pg. 3.5-5 Similar comment to #3 and #34. More information is needed regarding how these categories and estimated percentages were derived. Section 4.1.4 explains that the characteristics of three watersheds were extrapolated to the entire District using GAP data, however this still fails to explain how the watershed analysis was completed and what types of data were used and collected.

Responses to Letter B8

- B8-44 In response to your comment, the text in Section 2.4.22 and Table 2.4-29 of the Proposed RMP and Final EIS has been revised to clarify grazing restrictions relative to various ACECs.
- B8-45 In response to your comment, the text in Section 2.4.22.4 of the Proposed RMP and Final EIS has been revised to clarify the discussion of lands with wilderness characteristics. No lands with wilderness characteristics outside of currently designated wilderness and wilderness study areas have been identified in the Proposed RMP.
- B8-46 In response to your comment, Table 3.5-2 in the Proposed RMP and Final EIS has been revised. The table footnote has been revised to indicate that the acreage estimates contained in the table were derived from extrapolation of Ecological Status Inventory and Southwest ReGAP data. Please also refer to Section 4.1.4.1 for additional discussion of the data extrapolation.
- B8-47 In response to your comment, Section 4.1.4.1 has been revised to clarify that extrapolations within the Great Basin were made from data available for approximately 1.1 million acres in three watersheds, but not through the use of GAP data. Watershed analysis is not complete at this time.

Letter B8 Continued

Mr. Gene Drafs, Project Manager
November 22, 2005
Page 12

- B8-48 (36) Pg. 4.1-9 This section explains how the characteristics of three watersheds were extrapolated to the entire district, excluding the Mojave Desert areas. How was data derived for the Mojave Desert areas?
- B8-49 (37) Pg. 4.16-5 Both Alternatives B and E indicate that changes to stocking levels and grazing management could occur "to meet objectives within pastures where riparian objectives or water quality standards are not being achieved." Changes to grazing management in riparian areas should only occur where livestock grazing is determined to be a causal factor in the failure to meet objectives.
- B8-50 (38) Pg. 4.16.6 It is commendable the Ely District realizes the importance additional management actions, including rangeland projects (e.g. water developments, fencing, etc.), have on progress toward meeting rangeland health and riparian PFC objectives. Changes in season of use, time, duration, and fencing often require rangeland improvements to make them feasible management tools. Water hauls for protection of fishery habitat is not as desirable as permanent developments of offsite water troughs fed by creeks or springs. Increasing labor significantly through water hauls will reduce the capability of livestock producers to focus on improved cattle distribution through herding or other methods.
- B8-51 (39) Pg. 4.16-8 Recreation- There is not enough information on how the proposed 2,680,000 acres of special recreation management areas might be managed for the BLM to assess the potential affects on livestock grazing. This portion of Alternatives B and E needs to be developed in more detail. It is not adequate to say "while management of these areas *may not* preclude grazing...". Instead, the RMP needs to explain how these areas are to be managed to adequately describe and receive comments on impacts of this action.

Dear Mr. Kolkman:

SUBJECT: LINCOLN COUNTY CONSERVATION, RECREATION AND
DEVELOPMENT ACT UTILITY CORRIDORS

The Southern Nevada Water Authority (SNWA) appreciates the opportunity to work with the U.S. Bureau of Land Management (BLM) in the identification of utility corridors authorized under the Lincoln County Conservation, Recreation, and Development Act of 2004 (LCCRDA). As you are aware, SNWA has been developing the alignments for pipelines, power lines, and associated facilities of the Clark, Lincoln, and White Pine Counties Groundwater Development Project (Case File No. N-78803), and is attempting to locate these facilities within the LCCRDA utility corridor as feasible.

However, as we plotted the initial, general delineation of the utility corridor alignment developed by BLM on maps of greater resolution, some conflicts with existing lands and deviations from existing roads were noted. BLM's initial delineation was only of the alignment of the corridor and did not depict the 2,640-foot width of the corridor. In addition, SNWA's proposed pipeline deviates slightly from BLM's initial corridor delineation for engineering and constructability reasons. These adjustments keep the pipeline at lower elevations, minimizing changes in the hydraulic grade and avoiding the need for additional pumping stations.

Therefore, SNWA is proposing minor adjustments in BLM's initial delineation of the utility corridor, as shown on the enclosed maps. These maps display BLM's initial alignment, the proposed corridor location, and SNWA's proposed pipeline and power line alignments on maps of 1:24,000 scale. For your reference, we have also depicted the Southwest Intertie Project alignment on these maps, as provided to us by BLM. We have also enclosed a disk with the GIS shapefile of this proposed corridor.

B9-1

B9-2

B9-1

The SWIP corridor has been expanded to 0.75 miles wide to connect with portions of the corridor designated in the Lincoln County Conservation, Recreation, and Development Act. This will allow Southern Nevada Water Authority to adjust the location of the proposed pipeline. Any other deviations could be authorized as part of the right-of-way process.

B9-2

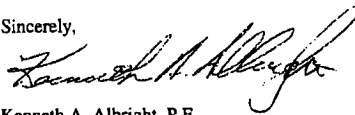

Please refer to Response to Comment B9-1 for a discussion of corridors.

November 16, 2005

Gene Drais, Project Manager
U.S. Department of the Interior
Bureau of Land Management
Ely Field Office
HC33 Box 33500
Ely, Nevada 89301

Dear Mr. Drais:

SUBJECT: DRAFT RESOURCE MANAGEMENT PLAN AND ENVIRONMENTAL IMPACT STATEMENT FOR THE ELY DISTRICT

The Southern Nevada Water Authority (Authority) appreciates the opportunity to provide comments on the draft Resource Management Plan and Environmental Impact Statement (RMP/EIS) for the Ely District. The Authority is a political subdivision of the State of Nevada, created in 1991 under Nevada State law pursuant to a Cooperative Agreement among its seven member agencies. The Authority's member agencies, which are water and wastewater agencies in southern Nevada, include: Big Bend Water District, City of Boulder City, City of Henderson, City of Las Vegas, City of North Las Vegas, Clark County Water Reclamation District, and Las Vegas Valley Water District. The Authority's mission is to manage the water resources of southern Nevada and develop solutions that will ensure adequate future water supplies for the Las Vegas Valley.

I. Introduction

As stated in the document, the purpose of the RMP/EIS is to provide "direction and guidance for management of approximately 11.4 million acres of public land located in Lincoln, Nye, and White Pine counties in eastern Nevada that is administered by the U. S. Bureau of Land Management (BLM), Ely Field Office". The RMP/EIS will "provide direction for management of renewable and nonrenewable resources found within the Ely District" and will "guide decision-making for future site-specific actions". The preferred alternative (Alternative E) supports implementation of the Eastern Nevada Landscape Restoration Project while still providing for resource uses, therefore, the Authority supports adoption of the preferred alternative with the changes described in this letter.

The Authority has applied to the BLM for rights-of-way to develop and convey groundwater within the Ely District, as part of its Clark, Lincoln, and White Pine Counties Groundwater Development Project. The BLM is currently preparing an

B10-1 Thank you for your comment.

Letter B10 Continued

Gene Drais, Project Manager
November 16, 2005
Page 2

EIS for this project. The Ely District RMP/EIS and the final decision made by the BLM will be directly relevant to the Authority's groundwater project.

II. Utility Corridors

The Lincoln County Conservation, Recreation, and Development Act of 2004 (LCCRDA) became law on November 30, 2004 (Public Law 108-424). As part of the LCCRDA, Congress directed the BLM, through the Secretary of the Interior, to establish a 2,640-foot wide utility corridor in Lincoln County and Clark County, Nevada as generally depicted on a map included in the congressional record. Although the BLM does not have discretion on the designation of the utility corridors, the BLM does have discretion on final alignment and location of the utility corridor. On October 27, 2005, the Authority submitted to the BLM a recommended detailed delineation of the utility corridor alignment, which corresponds with the location of the Authority's proposed groundwater project, which was the objective of the LCCRDA utility corridor. A copy of that submittal, including maps and a disk containing the GIS shapefiles, is enclosed. The Authority requests that the BLM consider and adopt this detailed alignment delineation of the utility corridor in the RMP/EIS.

B10-2

Furthermore, although the RMP/EIS describes and depicts the LCCRDA utility corridors, it does not appear to actually designate them. The Authority believes the RMP/EIS should be revised to make it clear that the BLM is establishing the LCCRDA-mandated utility corridor, following the alignment identified in the Authority's October 27, 2005, submittal, and should address the environmental impacts of such establishment in the supporting National Environmental Policy Act (NEPA) document.

B10-3

The Authority recommends selection of the Alternative C proposed Spring Valley Utility Corridor alignment, identified in the RMP/EIS, at a width of 0.5 mile. This alignment follows the existing Highway 893, and is compatible with the Authority's proposed groundwater project alignment.

B10-4

The Authority also recommends the establishment of a utility corridor into Snake Valley consistent with Authority's current proposed action to develop and convey groundwater within the Ely District. Establishing alignments within the RMP/EIS consistent with the Authority's right-of-way applications will help avoid amendments to the RMP/EIS in the future.

B10-5

III. Water Resources

Groundwater

The perennial yield and committed resources data used in Section 3.3 are over 30 and 13 years old, respectively. The cited reference for perennial yield given in Table 3.3-1 (Nevada Division of Water Resources 2003) is Appendix A-2 of the Nevada State Water Plan. Appendix A-2 does not provide perennial yield information. The perennial yield numbers given in the table correspond to Scott et al. (1971) and, therefore, are at least 30 to 40 years old. Page 3.3-1 cites

B10-6

Responses to Letter B10

- B10-2 The SWIP corridor has been expanded to 0.75 miles wide to connect with portions of the corridor designated in the Lincoln County Conservation, Recreation, and Development Act. This will allow Southern Nevada Water Authority to adjust the location of the proposed pipeline. Any other deviations could be authorized as part of the right-of-way process.
- B10-3 The Lincoln County Conservation, Recreation, and Development Act designated this corridor. The Ely Field Office is including the corridor in the Proposed RMP. The impacts of facility construction within the corridor will be analyzed on a project-specific basis.
- B10-4 The text in Section 2.4.12.5 of the Proposed RMP and Final EIS has been revised to clarify the discussion of corridors.
- B10-5 The Ely Field Office is required to designate corridors through the land use planning process. The Draft RMP and EIS did not analyze a corridor in Snake Valley in any of the alternatives. The Proposed RMP states that water pipelines are encouraged to be located within designated corridors. Water pipelines outside of the designated corridors could be authorized through the right-of-way process and would not require a land use plan amendment.
- B10-6 In response to your comment, the text in Section 3.3.1 and the footnote to Table 3.3-1, have been modified to address groundwater data.

Letter B10 Continued

Gene Drais, Project Manager
November 16, 2005
Page 3

- B10-6 Nevada Division of Water Planning 1992 as the source for the committed resources data. Therefore, that data is at least 13 years old. The accurate age of the data needs to be cited in the text and noted on tables along with an explanation of whether the totals include or exclude supplemental duties to help clarify what the totals actually represent. A list of references that contain more recent hydrological data is enclosed.
- B10-7 Table 3.3-1 is subdivided by county. This leads to redundancies, because hydrographic areas cross county lines. Nevada Division of Water Resources (NDWR) does not identify hydrographic areas by county, and therefore, they should not be represented in this manner in the table. In addition, NDWR uses the term "hydrographic areas" not "basins", and that should be corrected in the second column of this table.
- B10-8 Perennial yield and committed resources, described in the third paragraph on page 3.3-1 and Table 3.3-1, are two separate issues that do not directly correlate, and should be discussed separately. Perennial yield is the amount of usable water in a groundwater aquifer and is determined by a variety of factors, including artificial recharge, natural discharge, and natural recharge. Committed resources are the total volume of permitted, certificated and vested groundwater rights which are recognized by the State Engineer and can be withdrawn in a groundwater basin in any given year. By combining the discussion of these distinctly separate topics into one paragraph, it confuses a hydrological process with a regulatory one.
- B10-9 The perennial yield information listed in Table 3.3-1 exclusively uses Scott et al. (1971), which summarizes water availability in the shallow aquifers of the Ely District based on various U.S. Geological Survey Nevada Reconnaissance Reports or Nevada Water Resources Bulletins from the 1960s and 1970s. Numerous studies have been made since then that also focus on perennial yield or recharge estimates for hydrographic areas in the Ely District. These reports include Nichols (2000) and various reports by the Authority and the Las Vegas Valley Water District. These reports often provide perennial yield values or recharge estimates that differ from the values provided by Scott et al. (1971).
- B10-10 The perennial yield values in Table 3.3-1 should be listed as a range that incorporates both older and newer sources of data.
- B10-11 Listing the perennial yield values as ranges avoids misleading the reader to believe they are absolute values. For example, in Snake Valley, the perennial yield value cited in Table 3.3-1 originates from the report titled "Water for Nevada - Report 3" from the State of Nevada Department of Conservation and Natural Resources. In that report, perennial yield for Snake Valley is listed as > 25,000 afy not 25,000 afy. The report also cites Reconnaissance Report No. 34 as the source of the data for Snake Valley. Reconnaissance Report No. 34, however, states that the perennial yield of Snake Valley is approximately 80,000 afy for both Utah and Nevada portions of Snake Valley. The RMP/EIS defines perennial yield as "generally about equal to the estimated net annual recharge". Reconnaissance Report No. 34 states that of the estimated 105,000 afy of total recharge to Snake Valley about 65,000 afy originates from precipitation in Nevada. Based on the three reports discussed above, the perennial yield of Snake Valley could

Responses to Letter B10

- B10-7 Comment noted. No changes were made to the Proposed RMP and Final EIS with regard to the county organization of the table. County residents and governments are part of the public audience, and the existing table organization enhances readability and orientation to a locale for the purposes of this particular EIS. There is no intended implication that hydrographic boundaries follow county lines. NDWR mixes its use of terms for hydrographic areas in published maps, tables, and other documents; usage has been modified to be consistent in the Proposed RMP and Final EIS text and tables.
- B10-8 Please refer to Response to Comment B10-6.
- B10-9 In response to your comment, changes have been made in the text to address the central issue behind this comment. Additional discussion and table entries are not being made, since to do so would involve substantially more text without contributing to the purpose of this RMP and EIS. Other studies and NEPA documents, involving numerous agencies and organizations, will address these issues in a manner appropriate to their scope and the roles and responsibilities of the cooperating participants, including the BLM. Also refer to Response to Comment B10-6.
- B10-10 Please refer to Response to Comment B10-9.

Letter B10 Continued

Gene Drais, Project Manager
November 16, 2005
Page 4

B10-11 | vary from >25,000 to 105,000 afy. Table 3.3-1 should be modified to more accurately show the range of perennial yield projected to be available from each hydrographic area.

B10-12 | The committed resources listed in Table 3.3-1 represent the total volume of permitted, certificated, and vested groundwater rights recognized by the NDWR in each hydrographic area in 1992. As a result, the committed resources are 13 years out-of-date and could vary substantially from the reported value. A footnote should be added to identify this issue. The NDWR source for this information actually specifies the month and year that the data apply to. In addition, the table needs to be footnoted stating whether these totals include or exclude supplemental duties, to help clarify what the total actually represents. It might also help for clarification to state that the 'Committed Resources' are actually 'Committed Groundwater Resources'.

Surface Water

B10-13 | The second paragraph on page 3.3-5 states that Lower Meadow Valley Wash and the White River are tributaries to the Virgin River. Historically, the Lower Meadow Valley Wash and the White River were tributaries to the Virgin River. Today, the Lower Meadow Valley Wash and White River flow into the Muddy River and then into the Colorado River by way of Lake Mead. Please correct the language on page 3.3-5.

B10-14 | The last paragraph on page 3.3-5 describes trends towards transfers of water from agricultural areas to municipal uses in Nevada. It should be noted that transfers of water from agricultural areas to municipal uses are not unique to Nevada and is occurring throughout the western part of the country.

B10-15 | Table 3.3-2 is not an exhaustive list of streams within specific hydrographic areas. For example, Kalamazoo Creek in hydrographic area 184 could be classified as a Class A Water. In addition, some of the assignments seem debatable. For instance, Duck Creek in hydrographic area 179 and Hendry's Creek in hydrographic area 195 have numerous diversions on them that imply they have been affected by industrial or agricultural activities. A better explanation of the data sources used and conclusions made for this table is needed.

B10-16 | As noted above, the NDWR usage is "hydrographic area" not "hydrographic basin". It is suggested that the title of the third column be changed to this usage.

Trends

B10-17 | The discussion in the first paragraph on page 3.3-8 focuses on Authority projects, but neglects to mention the many other groundwater development projects proposed in the Ely District, including those by White Pine County, Lincoln County, and other private parties. The exclusive focus on Las Vegas is misleading. The discussion needs to be expanded to include other water use trends in the Ely District area. In addition, the description of the Authority's Virgin and Muddy Rivers surface water project is misplaced, in that it is solely a surface water project and

Responses to Letter B10

B10-12 | Please refer to the Responses to Comment B10-6 and B10-9.

B10-13 | In response to your comment, the text in Section 3.3.1 of the Proposed RMP and Final EIS has been corrected to clarify the discussion of these tributaries to the Muddy River.

B10-14 | In response to your comment, the text in Section 3.3.2 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of water transfers to municipalities.

B10-15 | In response to your comment, the footnote to Table 3.3-2 in the Proposed RMP and Final EIS has been expanded to more clearly present the state water classification process.

B10-16 | In response to your comment, the text in Table 3.3-2 in the Proposed RMP and Final EIS has been modified to correct the column heading.

B10-17 | In response to your comment, the text in Sections 3.3.1 and 3.3.2 has been modified to largely address your comment. However, the discussion centers on regional water resources and related projects within hydrologic proximity to the planning area, so the discussion of the proposed Virgin and Muddy Rivers surface water project has been retained.

Letter B10 Continued

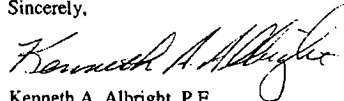

Gene Drais, Project Manager
November 16, 2005
Page 5

B10-17 | shouldn't be described under groundwater trends. Furthermore, it is not located within the Ely District, so its inclusion in the Ely RMP/EIS is confusing.

B10-18 | As described above, the discussion on page 3.3-8 on over-committed basins and estimated perennial yields is only applicable to the year in which the data was obtained. Most of the data cited in this plan is from the 1970s for perennial yield data and from the early 1990s for the committed resources. The discussion needs to state that the data are dated and may not clearly represent current conditions.

If you have any questions regarding these comments, please contact Holly Cheong at (702) 862-3755.

Sincerely,

Kenneth A. Albright, P.E.

November 25, 2005

Mr. Gene Drais

COMMENTS ON: RECREATION PLAN

- B11-1 [1. For BLM to monitor or upgrade recreation in any area is hard for me to believe. Out by Eagle Valley, you have one recreation area that I know for more than ten years while I was a Commissioner in Lincoln County, there was not much up-keep or upgrade ever done at that site.
- B11-2 [2. Any control of the Outfitter and Sub-Guide business should be out of your control. You receive a fee from them on a yearly basis. As for impact to the public lands, I see less from them than the regular hunter. This is their business and they take care of the area in which they hunt. I believe that the only reason you are looking into changing this, is for the monies. Please leave that control with the State of Nevada and NDOW.
- B11-3 [3. Any competitive bid will cause problems - First with small businesses and outfitters, then with the local economy and the businesses that are supported by this industry. Go ahead and enhance recreation, but don't cut anybody out of the business. Create new businesses who will control and manage the tourism and recreation experiences.

COMMENTS ON: MANAGEMENT COMMON TO ALL ALTERNATIVES

- B11-4 [1. Development or construction of recreation trails and routes are acknowledged as a future need and would be considered in site-specific planning: **YES, but work with local areas of government, county and city to also create new businesses for local entrepreneurs.**
- B11-5 [2. Outfitter guide permits would not be limited until resource condition warranted setting limitation. **I would hope never.**
- B11-6 [3. **Appropriate protection of cave resources in the planning area would be established. Turn over to the mining industry to control and educate people or a group.**

Responses to Letter B11

- B11-1 Comment noted. While statements of opinion (including agreement or opposition) do not require specific responses or text revisions under the NEPA regulations, they have been considered by the Ely Field Office and Nevada State Office and documented in the administrative record associated with the Ely RMP.
- B11-2 In response to this and similar comments, the management action in Section 2.4.15.2 of the Proposed RMP and Final EIS regarding outfitter and guide permits has been revised.
- B11-3 Please refer to Response to Comment B11-2.
- B11-4 Thank you for your comment. The Ely Field Office will continue to work with local governments.
- B11-5 Please refer to Response to Comment B11-2.
- B11-6 Caves within the Ely RMP decision area are managed as required by federal law and according to the management direction contained in the Ely Cave Management Plan.

Letter B11 Continued

- B11-7 [4. A comprehensive climbing management plan to promote responsible and ethical climbing practices would be developed. The Ely Field Office staff would work with appropriate entities to protect all resources and preserve access for climbing and bouldering opportunities.: **Turn over to responsible climb clubs or businesses.**
- B11-8 [5. Specific recreation activities would be managed in accordance with the goals and emphasis for recreation management areas. **What specific recreational activities would be managed???**
- B11-9 [6. Most of the planning area would be managed for dispersed, backcountry, unregulated, and undeveloped use. **Concerns me for the area of back country and unregulated and undeveloped use. Need a listing of your management approaches.**
- B11-10 [Alternative A - is the one you should stay with.
- B11-11 [Alternative B - there is that competitive bid again. Keep this out please.
- B11-12 [Alternative C - No limitations on outfitters and guide permits for hunting is where it should be. To large for the motorcycle and truck events - that will be a real impact to the public lands - review the races now held.
- B11-13 [Alternative D - This will not work for any small business or industry.
- B11-14 [Alternative E - Stay away from this monitoring of recreation. Should be a time period of 5-10 years with the data collected for feed back to the public and industry users. Any surveillance at developed recreation sites greatly concerns me, it takes away our freedom..
- B11-15 [Most small businesses in rural Nevada, like us, have invested great amounts of monies to stay alive and to cater to those who come for any reason to our area. Four months out of each year is the hardest part of maintaining business.
- B11-16 [All hunting in Nevada is great for the locals, but needs to be controlled again by the State of Nevada - NDOW.
- B11-17 [Any changes to the racing industry helps but needs to be watched for they have a greater impact than the sportsman.
- B11-18 [Watch any changes to control roads or access to the public lands RS2077

Edward E Wright

On behalf of: Tillie's Inc, Wright's Country Cabins, TKO Outfitters

Responses to Letter B11

- B11-7 Thank you for your comment. The Ely Field Office will continue to work with climbing clubs and other interested parties.
- B11-8 Please refer to Sections 2.4.15.1, 2.5.15.1, 2.6.15.1, 2.7.15.1, and 2.8.15.1 in the Proposed RMP and Final EIS for discussions of management actions by alternative for each proposed Special Recreation Management Area.
- B11-9 Please refer to Section 2.4.15 in the Proposed RMP and Final EIS for a discussion of management actions for recreation.
- B11-10 Comment noted.
- B11-11 Please refer to Response to Comment B11-2.
- B11-12 Please refer to Response to Comment B11-2. The special recreation permit areas are being designated for motorcycle events only. Those areas presented in the Proposed RMP are based on existing courses that have been analyzed and raced on in the past.
- B11-13 Thank you for expressing your concerns. While statements of opinion (including agreement or opposition) do not require specific responses or text revisions under the NEPA regulations, they have been considered by the Ely Field Office and Nevada State Office and documented in the administrative record associated with the Ely RMP.
- B11-14 Thank you for expressing your concerns. While statements of opinion (including agreement or opposition) do not require specific responses or text revisions under the NEPA regulations, they have been considered by the Ely Field Office and Nevada State Office and documented in the administrative record associated with the Ely RMP. The monitoring of recreation use is consistent with BLM policy.
- B11-15 Thank you for your comment. The general topic of local business economics and community sustainability has been considered in Section 4.23 of the Draft and Proposed RMP. The Ely Field Office will continue to consider local concerns when project-specific plans are prepared.
- B11-16 Hunting in the Ely RMP planning area will continue to be managed by the Nevada Department of Wildlife.
- B11-17 Race permitting and monitoring of impacts will be important to the Ely Field Office. While statements of opinion (including agreement or opposition) do not require specific responses or text revisions under the NEPA regulations, they have been considered by the Ely Field Office and Nevada State Office and documented in the administrative record associated with the Ely RMP.

Responses to Letter B11

B11-18 The Ely Field Office assumes the comment addresses Revised Statute (RS) 2477. As was discussed in Section 1.6.2.3 of the Proposed RMP and Final EIS, RS 2477 issues are beyond the scope of the Ely RMP.

Letter B12

Ely Draft RMP/EIS Comment Form

Informed decisions are better decisions: BLM believes that extensive public involvement will serve to improve communication, develop enhanced understanding of different perspectives, and identify solutions to issues and problems. We look forward to hearing from you!

Where to provide comments: You can hand this form in at The Ely BLM Field Office (702 N. Industrial Way) or mail it in using the address on reverse

Tips on providing effective comments: The BLM land use planning process is based on agency policy, science, and social value. Specific comments that deal with important management methods and decisions are extremely helpful to the BLM. Overy general statements of support or opposition are less effective. Also remember that this RMP will deal with broad management decisions, not site-specific actions.

Name Thomas Brunson County White Pine
Title Outfitter Affiliation Timberline Outfitters Guide Service
Mailing Address PO Box 667
City McGill State NV Zip 89318
Date 09/05/05 Meeting Location (if applicable) _____

Please check box if you do not want your name released when comments are made public.

COMMENT (use back side if you need additional space or attach additional sheets)

B12-1

I have read all info provided and I am strongly
In favor of Alternative C. to me its seems the fairest of
all options. I think that if you put it out to competitive bid
you will kill the little guy.

Responses to Letter B12

B12-1

In response to this and similar comments, the management action in Section 2.4.15.2 of the Proposed RMP and Final EIS regarding outfitter and guide permits has been revised.

Letter B13

November 25, 2005

Subject: Public Comments on Ely BLM EIS RMP.

On behalf of Eugene Entertainment Inc. and its Non-Competitive Trail Ride Series TRAC-ON, (Trail Ride Adventure Circuit Of Nevada) we are commenting on the new RMP within the BLM Ely field office. At the end of TRAC-ON's second year 2005 we represent over 300 individual persons on its mailing list. TRAC-ON's mailing list grows 25-50 individual persons per ride. By the end of 2006 TRAC-ON estimates 450 people on its mailing list.

B13-1 [Regarding the Ely RMP TRAC-ON's position and choice would be Alternative A. We recognize that Alternative A would better suit the OHV community. Further more Alternative A follows the philosophy of other Nevada BLM field offices. That philosophy is no net land loss to OHV opportunities. All other alternatives show net land losses in upwards of two-thirds of current available land for OHV use. TRAC-ON also has the opinion that with the population growth in the Las Vegas area; available land for OHV opportunities in the Ely District will become more viable in the future.

B13-2 [In closing I would also like to mention that OHV Education should be implemented to further assist in the Management of the Ely District. I am always available for suggestions on education. Thank You for taking the time to read these comments.

Sincerely,

Daryl Folks
President, E.E.I
Owner, TRAC-ON

Responses to Letter B13

B13-1 The Ely Field Office recognizes that off-highway vehicle use is an acceptable use of public land wherever it is compatible with resource management objectives. Areas are designated as "open" for cross country vehicle use where there are no compelling resource protection needs, user conflicts, or public safety issues. No areas managed by the Ely Field Office were determined to meet those criteria. The Ely Field Office is designating a majority of the planning area as "limited" in the Proposed RMP. The "limited" designation would still provide for off-highway vehicle opportunities, including potential new off-highway vehicle trails, while managing for public safety and resource protection needs. The only areas designated as "closed" to off-highway vehicle travel correspond to currently designated wilderness and wilderness study areas. Please note that the Nevada BLM has no policy regarding "no net land loss to OHV opportunities".

B13-2 The Ely Field Office currently presents several off-highway vehicle education safety and responsible use courses in the White Pine County and Lincoln County school districts. This program is expanding in Lincoln County under a grant including provisions for off-highway vehicle education.

3475 Boulder Highway • Las Vegas, Nevada 89121 • Phone: (702) 641-6401 • Fax: (702) 431-6001

Letter B14

November 25, 2005

Subject: Public Comments on Ely BLM EIS RMP.

B14-1

On behalf of Eugene Entertainment Inc. and TRAC-ON, I have enclosed two maps with yellow highlighting in the N. Pahroc Range up to the Schell Creek Range. TRAC-ON is proposing that the yellow area remain open to Non-Competitive SRP's only. In 1990 and 1991 this particular area was permitted for two consecutive race events put on by the BITD. TRAC-ON has an application currently in process to re-approve this area for a Non-Competitive trail ride in June of 2006. In order for the area to be re-approved a new EA will need to be performed which will be time consuming and costly. Taking a more conservative approach in this area will help maintain OHV access but yet provide a low impact affect.

For the new RMP I hope that the Ely District will take serious consideration to TRAC-ON's proposal of this area. Thank You for taking the time to read these comments and letting TRAC-ON express its opinion.

Sincerely,

Daryl Folks
President, EEI
Owner, TRAC-ON

NOV 2005

Responses to Letter B14

B14-1

In response to your comment, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised to clarify special recreation permits for non-competitive off-highway vehicle events. Those events would be permitted on a case-by-case basis outside of desert tortoise ACECs.

3475 Boulder Highway • Las Vegas, Nevada 89121 • Phone: (702) 641-6401 • Fax: (702) 431-6001

Letter B15

Dear Mr. Draais;

John Uhalde & Company has attempted to review the Draft RMP/EIS for BLM's Ely district and offers the following comments:

--Note that any topic not addressed here is not necessarily agreed with nor endorsed in any way by John Uhalde & Co., but most likely was not commented on due to the extremely confusing and cumbersome way this document was put together.

B15-1 --The comment period needs to be extended. BLM had over 2 years to put this project together, with the hiring of a contractor. The public had just days, how do you think it rationally possible for people not employed to specifically comment on this, to do so in that time frame?

B15-2 --The EXTREME difference in the document itself and the errata sheet lends grave concerns regarding the potential outcome of this RMP revision for multiple-use of the Ely District. This issue needs to be re-addressed on a case by case basis, so there is NO confusion regarding the intention and direction of the BLM on any of the errata sheet issues. Also, ALL discrepancies with the original documentation given to the contractor needs to be made available to the public before ANY final decision is made.

B15-3 --2.5.3 Water resources: Introduction; While BLM would like to have "the right to be involved in the subsequent state permitting process's" following an application for a change in an existing water right or an application for a new permit, it merely has the opportunity to comment on the application on the same level as any person.

B15-4 --The manner in which BLM has dealt with its proposed changes in grazing is totally inadequate. Any proposal to re-allocate adjudicated AUMs will be a question of taxable property, as recognizes by the IRS.

B15-5 --4.1.4.4 Bighorn Sheep and Domestic Sheep Interactions : Your cavalier treatment of closing domestic sheep allotments to accommodate Bighorn at some time in the future is completely unacceptable. Your information presented is, by your own account "incomplete information", using "unknown" effects and "conjecture". From this you conclude "the preponderance of evidence indicates negative interaction" between the two species. How completely absurd is that? The preponderance of incomplete, unknown conjecture is just incomplete unknown conjecture. Your stated

B15-6 conclusion: "THE COST TO IDENTIFY AND CHARACTERIZE DISEASE VECTORS WITHIN BIGHORN SHEEP POPULATIONS ON THE ELY DISTRICT DURING THE RMP/EIS PREPARATION WOULD BE EXORBITANT" If BLM can't do or find the proper research to reach a conclusion that is neither incomplete and unknown or conjecture then the conclusion is just that: incomplete, inconclusive, conjectural and stated as "unknown".

B15-7 --BLM has not addressed any issues of Elk summer and winter forage that "pioneering" elk, as lack of responsible elk management is preferred to be called, which will happen and is indeed happening now, on the east side of the Grant and Quinn ranges.

Responses to Letter B15

B15-1 The required comment period on a Draft RMP and EIS is 90 days. BLM elected to set a 120-day comment period for the Ely Draft RMP and EIS and did not formally extend this period. Although the BLM did not elect to extend the official comment period for this document, comments received after the end of the comment period were considered as late as practicable within the overall document revision and publication process. Comments that were received after the close of the comment period have been accepted and considered in the preparation of the Proposed RMP and Final EIS.

B15-2 Modifications identified in the Errata Sheet have been tracked through the Proposed RMP and Final EIS. Consistency concerns were raised by a number of commenters. Chapters 2 and 4 in particular have been revised to correct inconsistencies among resource programs.

B15-3 In response to your comment, the text in Section 2.4.3 of the Proposed RMP and Final EIS has been modified to clarify the BLM's involvement in water permitting.

B15-4 Livestock grazing use will continue to be monitored and evaluated and coordination and consultation with the affected permittees, other agencies, and public interests would continue as allowed under regulation. Changes in allocated AUMs could affect ranch values, but such implementation-level impacts to taxable property are outside the scope of the RMP.

B15-5 Thank you for your comment. The text in Section 4.1.4.4 of the Proposed RMP and Final EIS has been revised to clarify the discussion of bighorn sheep and domestic sheep and goat interactions. The basic impact conclusions presented in the Draft RMP and EIS have not changed.

B15-6 Please refer to Response to Comment B15-5.

B15-7 In response to this and similar comments, the text in Chapters 2 and 4 related to elk management has been revised to clarify that habitat management for this species (under the Proposed RMP and Alternatives B and C) would conform to the county elk management plans.

Letter B15 Continued

B15-8 --The addressing of the proposed rail spur for the D.O.E.'s Yucca Mountain Project is completely inadequate. This major project, which bi-sects our southern allotments, has been given little or no analysis of the potential impacts that would occur if this is built. It is essential the BLM address the impacts to Air Quality; water; Soil; vegetation; noxious weeds; fish and wildlife; wild horses; soils; visual; cultural; lands and reality;; grazing; special designations and economic impacts among others.

B15-9 --Map 2.4.-38 It would appear from this map that the private property in the Gleason creek watershed would be come a "Motorcycle Special Recreation Permit Area". BLM, of any agency, should be aware of the years of conservation and repair work that we have done in the Gleason creek area, as it was done in conjunction with BLM. While it is unknown to John Uhalde and Company what BLM recreation plans are, any special use permit in this area needs to be done with a great deal of consultation and coordination with private property owners.

B15-10 --Your Impacts of Interrelated projects is inaccurate as well as incomplete. A glaring example is the statement that DOE's rail line withdrawal has no effect on Surface Disturbance other than the 200 foot wide right of way. The current 10 to 20 fold increase of truck and ATV traffic doing just EIS work has disturbed the surface of all roads and trails and then some in this areas.

B15-11 These comments reflect a grave concern with the Draft RMP/EIS for the Ely District in its entirety. It appears that there are many proposals and policies being put forth in this document that are attempting to reverse many years of cooperative work between Private Property owners and the BLM.

B15-12 Many parts of the document are in need of revision to seemingly match the original documentation which was given to the contractor and a new comment period needs to be issued after the corrections have been made. This is to important of a document to be left in this unprofessional and questionable manner.

Sincerely;
John Uhalde & Company
P.O. Box 151088
Ely, Nevada 89315

Responses to Letter B15

B15-8 Thank you for your comment. The subject of this comment is beyond the scope of the Ely RMP. Analysis of the impacts of the construction and operation of the Yucca Mountain rail spur will be conducted by the Department of Energy and presented in an EIS prepared by that agency.

B15-9 Thank you for your comment. Ely Field Office management actions of the Proposed RMP and Final EIS would apply only to public lands and not private lands. In response to your comment, Maps 2.4-42, 2.4-43 and 2.4-44 in the Proposed RMP and Final EIS have been modified to more clearly present that non-BLM administered land is not part of the Motorcycle Special Recreation Permit Areas. Permitting for motorcycle events will continue to involve potentially affected private property owners.

B15-10 Please refer to Response to Comment B15-8 for a discussion of impacts of the Yucca Mountain rail spur. Also see Table 4.28-2 in the Proposed RMP and Final EIS for a listing of those resource programs that could be affected by the rail spur project.

B15-11 The Ely Field Office intends to continue operating in a cooperative manner with all agencies, organizations, and individuals that have an interest in the management of the public lands in the Ely RMP planning area.

B15-12 The Ely Field Office is uncertain what "original documentation" the comment is referring to. The purpose of the Draft RMP and EIS was to solicit comments so that the Proposed RMP and Final EIS could be corrected, clarified, or expanded as appropriate. Comments that were received on the Draft have been incorporated into the Proposed RMP and Final EIS as reflected in the responses to comments contained in this Appendix. A new comment period is not needed.

Letter B16

Page 1 of 1

This letter is written in regard to the Ely District BLM resource management plan EIS draft, chapters 1,2,3. July 2005.

My name is Shawn Lytle. I own and operate White Rock Outfitters in Eagle Valley Nv. I have been a resident of Lincoln Co. a hunter, sportsman and rancher for 34 years. It was brought to my attention that I missed the open meeting where I could have voiced my comments regarding the proposed alternatives in the resource management plan/EIS that affect my business.

I have read the proposed alternatives and I understand that the BLM is leaning toward alternative E.

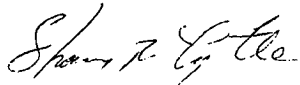

B16-1 First of all, I don't completely agree with any of the alternatives. I as an outfitter have nothing in common with off highway vehicle recreation. I don't understand why the outfitters are being lumped in with that group of people.
B16-2 I am very much against the idea of an open bid process. I already pay the BLM for a land use permit that allows me to guide and operate my business on public land even though I don't impact the land any more than an average hunter does. An open bid process would force me to compete with outfitters who have far deeper pockets than I do. It would force me, and other outfitters like me, out of business.

B16-3 I think the idea of limiting the number of outfitters has merit, however, I think consideration should be given to the outfitters who have aquired land use permits and maintained them. I also think that outfitters that live in the geographical areas where they hunt should be given preference over non-resident outfitters.

B16-4 Another alternative may be to give the existing permittees special consideration and instead of open bid, a draw process with no fee or bid involved. I also think that in the event an outfitter recieves a permit to hunt in an area, he retains that permit for as long as he wants it. The permit may also be renewed every three years with the option to give up the permit.

B16-5 These are just a few ideas that might be considered and all would be better than any bid process. I hope that our local BLM District cares more about the local citizens that use their public land than an increase in revenue. In closing, I would ask that you consider my thoughts on this matter, as they are the thoughts of many of my peers.

Sincerely, Shawn Lytle
White Rock Outfitters

Responses to Letter B16

- B16-1 In response to this and similar comments, the management action in Section 2.4.15.2 of the Proposed RMP and Final EIS regarding outfitter and guide permits has been revised.
- B16-2 In response to this and similar comments, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised regarding the issuance of outfitter and guide permits. Monitoring of outfitter and guide use would still occur for three years; however, outfitter and guide permits would not be limited during that three year study. Should the study show resource impacts, including user conflicts as a result of outfitter and guide actions, the Ely Field Office may address those problems by issuing outfitter and guide permits with special stipulations and conditions. No allocation system, including a competitive bid process, is included in the Proposed RMP and Final EIS.
- B16-3 Please refer to Response to Comment B16-2.
- B16-4 Please refer to Response to Comment B16-2.
- B16-5 Please refer to Response to Comment B16-2.

Letter F1

Comments on the BLM Resource Management Plan/Environmental Impact Statement for the Ely District

By James Potts, Natural Resource Conservation Service
Holly Rask, University of Nevada Cooperative Extension

- F1-1 [Comments on the BLM RMP/EIS will follow table 2.4-1 in section 2.4 Summary of Management Direction by Alternative. As a whole, the majority of actions for resource management are agreed with. There are some areas for suggested changes and in need of clarity which are listed below:
- F1-2 [Under the VEGETATION:
Parameter – Pinyon-juniper Woodland
Alternative C or a combination between B and C would be preferred.
In the first row alternative B could use rewording to "...achieve a variety of phases capable of recuperating after disturbance and provide essential wildlife". This avoids saying resistant which is not achievable and simplifies the statement to the goal outcome. The terms resilient and resistant need to be defined in the glossary and then used appropriately.
- F1-3 [Second row – Where are we going with 77% of the woodland – what is the treatment and how can this much be treated? Commercial uses (mentioned in Alt C) could help drive treatment of 77% of the woodland.
- F1-4 [Parameter – Aspen
We agree with the choice of alternative B. It is recommended to add 'more' in front of "resistant to disturbance" because it will never be totally resistant. The terms resilient and resistant need to be defined in the glossary.
- F1-5 [Parameter – High Elevation Conifer Species
We agree with alternative C but wonder why the same didn't apply for pinyon-juniper woodland.
- F1-6 [Parameter – Salt Desert Shrub
We agree with proposed action.
- F1-7 [Parameter – Sagebrush
We agree with the choice of alternative B. Two questions come up: "How can such a large area be treated? And what kind of impact will the treatment activity have on current livestock operations. Flexibility for management of livestock and grazing allotments will be required.
- F1-8 [Parameter – Mountain Mahogany
We agree with proposed action.
- F1-9 [Parameter – Mojave Desert Vegetation
More work will be required on fire prevention and rehabilitation.

Responses to Letter F1

- F1-1 [Comment noted.
- F1-2 [In response to your comment, in Table 2.9-1 has been revised to incorporate the wording you suggest. Please refer to the Glossary in the Draft RMP and EIS and Proposed RMP and Final EIS for definitions of resilient and resistant.
- F1-3 [The 77 percent of existing woodland would be treated to achieve the desired future conditions presented in the Proposed RMP for pinyon and / or juniper. Treatments would utilize all tools available, individually or in combination. Please see Appendix H in the Proposed RMP and Final EIS for a listing of Tools and Techniques.
- F1-4 [In response to your comment, the text related to Alternative B in Section 2.6.5.3 of the Proposed RMP and Final EIS has been revised to incorporate the wording you suggest. Please refer to the Glossary in the Draft RMP and EIS and Proposed RMP and Final EIS for definitions of resilient and resistant.
- F1-5 [The management direction in Alternative C has been incorporated into the Proposed RMP. Pinyon and /or juniper communities as a whole are generally more accessible, whereas most of the High Elevation Conifer areas are not.
- F1-6 [The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-7 [The management direction in Alternative B has been incorporated into the Proposed RMP. The vegetation treatment would be implemented over a long period of time, as determined appropriate through watershed analyses. Areas of treatment would require exclusion of livestock per BLM policy; however, there would be a balance of treatment acres among watersheds and allotments to lessen the effect on current livestock operations.
- F1-8 [The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-9 [Fire prevention and rehabilitation are important components of the Proposed RMP.

Letter F1 Continued

- F1-10 [Parameter – Riparian/Wetlands
Hydrologic function should be first consideration and then plant community structure and composition.
- F1-11 [Parameter – Nonnative Seedlings
We agree with proposed action.
- F1-12 [FISH and WILDLIFE
We agree with proposed action.
- F1-13 [TERRESTRIAL WILDLIFE
We agree with proposed action.
- F1-14 [SPECIAL STATUS SPECIES
We agree with proposed action. Under Parameter – Great Basin, sage grouse row 4, what is the definition of occupied source habitat and occupied isolated habitats?
- F1-15 [WILD HORSES
We agree with proposed action.
- F1-16 [CULTURAL RESOURCES
We agree with proposed action.
- F1-17 [VISUAL RESOURCES
We agree with proposed action.
- F1-18 [LANDS AND REALTY
Parameter – Disposal of public lands
What was the basis on how the locations were decided? Did it consider impact on economics, lifestyle, etc.? Is the land meant for farming, residential, industry? More thought and effort needs to go into the selection of lands for disposal.
Other parameters - We agree with proposed action.
- F1-19 [RENEWABLE ENERGY
We agree with proposed action.
- F1-20 [TRAVEL MANAGEMENT AND OFF-HIGHWAY VEHICLE USE
Parameter – Off highway Vehicles
The “0 acres – open to cross county off-highway vehicle use” is too restrictive and does not appear to allow access for emergency, research, and ranchers to service needs or retrieve cattle.
- F1-21 [RECREATION
The question of who will mitigate damages to roads caused by events and under what conditions will events be cancelled (e.g. drought) is left unanswered.

Responses to Letter F1

- F1-10 Hydrologic function is tied to plant community structure and composition, and the two are not separable and would be considered together on a watershed basis. Riparian/wetlands are part of a watershed system and would exhibit ecological site integrity.
- F1-11 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-12 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-13 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-14 In response to your comment, the Glossary in the Proposed RMP and Final EIS has been updated to include clarification of the terms identified in Table 2.9-1.
- F1-15 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-16 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-17 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-18 The lands proposed for disposal were selected in coordination with county officials. The counties held public meetings to get input on where the Ely Field Office should dispose of public lands and then provided their choice of lands to be available for disposal that would best meet the county's future needs. The proposed lands are concentrated around the communities in the planning area to provide for community expansion for residential, commercial, and public purpose uses.
- F1-19 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-20 In response to your comment, the text in Section 2.4.14.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion of Off Highway Vehicle Designations. Please refer to Section 2.4.14.1, transportation plan, in the Proposed RMP and Final EIS for a discussion of emergency motorized vehicle access.
- F1-21 Thank you for expressing your concern. Special Recreation Permits for off-highway vehicle events are issued following site-specific environmental analysis and may contain special stipulations, such as a requirement to notify other permittees or a requirement to rehabilitate damaged roads in a timely manner.

Letter F1 Continued

- F1-22 [LIVESTOCK GRAZING
Parameter – Lands Available for Livestock Grazing
We agree with proposed action.
- F1-23 [Parameter – Permit administration
We support alternative E in achieving greater flexibility from administration on adjusting grazing according to the plant population response to grazing and the year's climate.
- F1-24 [Parameter – Kind of Livestock
We agree with proposed action.
- F1-25 [Parameter – Livestock Management in Bighorn Sheep Ranges
We agree with proposed action.
- F1-26 [Parameter – Non-use Relinquished Permits
We agree with proposed action.
- F1-27 [Parameter – Temporary Nonrenewable
What is "temporary non-renewable grazing"?
- F1-28 [Parameter – Water Hauling
We agree with proposed action.
- F1-29 [WOODLAND AND NATIVE PLANT PRODUCTS
Parameter – Fuelwood collection
It is not clear whether this is live or dead trees. This section should be linked to vegetation management plan and treatment of woodlands.
- F1-30 [Parameter – Pinyon Pine Nut Harvesting
We agree with proposed action.
- F1-31 [Parameter - Christmas Tree Harvest
We agree with proposed action.
- F1-32 [Parameter – Post and Pole Harvesting
We agree with proposed action.
- F1-33 [Parameter – Seed Collection
Collection permission should remain on a case-by-case basis. It is important to prevent over-harvesting.
- F1-34 [Parameter – Cactus and Yucca Collection
We agree with proposed action.
- F1-35 [Parameter – Other Vegetation Product Collection

Responses to Letter F1

- F1-22 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-23 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-24 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-25 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-26 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-27 Please refer to Section 2.5.16.2 in the Proposed RMP Final EIS for an explanation of "temporary non-renewable" grazing.
- F1-28 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-29 In response to your comment, the text in Section 2.4.17.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion that fuelwood collection would include both live and dead trees.
- F1-30 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-31 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-32 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-33 In response to your comment, the Proposed RMP in Section 2.4.17.6 of the Proposed RMP and Final EIS has been changed to allow commercial use on a case-by-case basis. Please refer to Section 2.4.17.6 in the Draft RMP and EIS and Proposed RMP and Final EIS for a discussion of how BLM would prevent over-harvesting.
- F1-34 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-35 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.

Letter F1 Continued

- F1-35 [We agree with proposed action.
- F1-36 [GEOLOGY AND MINERAL EXTRACTION
We agree with proposed action.
- F1-37 [WATERSHED MANAGEMENT
We agree with proposed action.
- F1-38 [FIRE MANAGEMENT
We agree with proposed action.
- F1-39 [INVASIVE AND NONNATIVE PLANT SPECIES, INCLUDING NOXIOUS WEEDS
We agree with proposed action.
- F1-40 [SPECIAL DESIGNATIONS
Parameter - Areas of Critical Environmental Concern
How do these affect livestock grazing?
- F1-41 [Parameter - Back Country Byways
We agree with proposed action.
- F1-42 [Parameter - Designated Wilderness (Section 2.5.22.3) is missing from table 2.4-1
We agree with proposed action.
- F1-43 [Parameters - Wilderness Study Areas
Table 2.4-1 references the wrong Section (2.5.22.3 instead of 2.5.22.4)
It is unclear what management will happen in Wilderness Study Areas. What are wilderness characteristics?
- F1-44 [Parameters - Other special designations
Table 2.4-1 references the wrong Section (2.5.22.4 instead of 2.5.22.5)
We agree with proposed action.

Responses to Letter F1

- F1-36 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-37 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-38 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-39 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-40 Please refer to Section 4.16 in the Proposed RMP and Final EIS for a discussion of the acreage that would be lost to livestock grazing with the designation of ACECs under each alternative.
- F1-41 The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-42 Since the management related to wilderness is common to all alternatives, a parameter related to this topic is not needed in Table 2.9-1. The table heading has been corrected in the Proposed RMP and Final EIS to eliminate this erroneous reference to Section 2.4.22. The management direction in Alternative E has been incorporated into the Proposed RMP presented in this document.
- F1-43 Section references have been eliminated from Table 2.9-1. Please see Section 2.5.22.4 for discussion of the management for Wilderness Study Areas and to Section 2.5.22.5 for the management of Other Special Designations. Wilderness characteristics are defined by wilderness regulations. (Please also see Section 1.6.2.1 for further discussion of these areas).
- F1-44 Please refer to Response to Comment F1-43.

Letter F2

DEPARTMENT OF THE AIR FORCE
99TH CIVIL ENGINEER SQUADRON (ACC)
NELLIS AIR FORCE BASE, NEVADA

18 November 2005

Gene Drais, Project Manager
Bureau of Land Management
Ely Field Office
HC 33 Box 33500
Ely NV 89301

Ms Eloisa V. Hopper
99 CES/CEV
4349 Duffer Drive Suite 1601
Nellis AFB NV 89191-7007

Dear Mr. Drais,

On behalf of the United States Air Force, Nellis AFB greatly appreciates being invited to participate as a Cooperating Agency for this document.

Attached are our comments to the draft Resource Management Plan/Environmental Impact Statement for the Ely District. While we consider all of our comments important, of key interest to Nellis AFB and the DoD are land disposals, which bring the potential for residential development underneath military airspace and Wind Energy development, which can have serious flight safety and mission impacts. If you have any questions, my point of contact in this manner is Mr. Jim Campe, (702) 652-5813.

Sincerely,

ELOISA V HOPPER, CMC
Environmental Flight

Ely RMP/EIS	Comment Form for Draft RMP dated July 2005	Author			
Instructions:					
e) The Excel file automatically wraps the text in a cell. Although you may not be able to see all of your comment at one time, it is there. Please do not extend comments to the next row. This makes it impossible to pull the comment into our Access database.					
b) Please do not reference other comments using the row number on your comment form. When pulled into Access, this context disappears.					
Page Number (e.g., 1.5-9 (bottom of printed page))	Section Number (e.g., 1.3.4)	Paragraph Number (counting from the first full paragraph on the page)	Line Number (counting from the first line of the paragraph)	Comment	Author
2.4-23	Table 2.4-1	1		Alternative B and E show our Mt. Irish NACTS site in the middle of a VPM Class II area. While the map appears to have cut our ROW out of the affected lands, we are totally surrounded. Will BLM levy rulings that require monies to connect? i.e. re-paint facilities? We need the detailed map that shows the area.	schofield
2.4-25	Table 2.4-1	4		Table references map 2.4-25. Some of the areas shown as compatible for wind energy development conflict with our R/EMI mission. Development in the areas as shown on the BLM map could impact our mission. To evaluate this, we need a better map of the BLM wind areas. Request GIS coverage from BLM so that we can overlay our R/EMI areas with the BLM compatible wind use areas map.	schofield
2.4-37	Table 2.4-1	1		Alternative B and E show our Mt. Irish NACTS site in the middle of a ACEC area. While the map appears to have cut our ROW out of the affected lands, we are totally surrounded. Will BLM levy rulings that require monies to connect? Will they limit our activities? Will they not renew our ROW. This is a key node in our battle space. Limiting our activities or refusing to renew our ROW will have a significant impact to our mission.	schofield
2.5-111	2.5.11	2	all	Alternative B and E show our Mt. Irish NACTS site in the middle of a VPM Class II area. While the map appears to have cut our ROW out of the affected lands, we are totally surrounded. Will BLM levy rulings that require monies to connect? i.e. re-paint facilities? We need the detailed map that shows the area.	schofield
2.5-113	2.5.12	3	1	"The Ely Field Office would be responsive to the public's needs... Does 'public' also include Federal agencies (DOD or Air Force)? If not, recommend adding Federal Agencies to this paragraph."	schofield
2.5.114	2.5.12	1	3	"need public needs..." Does "public" also include Federal agencies (DOD or Air Force)? If not, recommend adding Federal Agencies to this paragraph.	schofield
2.5.115	2.5.12.1	2	16	Reference to Appendix O. Request a GIS coverage of the lands mentioned here so we can compare our mission use areas to lands recommended for sale to the public for development.	schofield
2.5-126	2.5.12.6	3	6	Recommend changing sentence to read, "Coordinate with Department of Defense on all communication towers over 100 foot above ground level."	schofield
2.5-127	2.5.12.7	2	2	Recommend changing sentence to read, "Coordinate with Department of Defense on all communication towers over 100 foot above ground level."	schofield
2.5-128	2.5.13.1	1	5	Recommend changing sentence to reflect the wording in the Final Programmatic EIS on Wind Energy Development on BLM Administered Lands in the Western United States, June 2005-Section 5.10.3. "... constraints to military testing and training operations could be the basis for denial of a ROW authorization should there be no available mitigation measures. Therefore, developers should conduct pre-application consultations with the BLM and the appropriate military representatives."	schofield/camp
2.5-132	2.5.14.1	2	1	This sentence references a "review team". Request that Nellis Air Force Base be invited to become part of the review team.	schofield/camp

Responses to Letter F2

- F2-1 Rights-of-way are subject to valid existing rights. Visual resource management would not require the Air Force to modify or remove existing facilities.
- F2-2 The Proposed RMP does not designate areas for wind and solar energy development, and the text and map titles in the Proposed RMP and Final EIS have been changed to clarify this. Changes in technology may change the potential for renewable energy development and which areas are suitable. Applications received for wind energy development would be subject to NEPA analysis in coordination with local, state, and other federal agencies. The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans for wind energy development are received and evaluated.
- F2-3 Please refer to Sections 2.4.12.7 and 2.4.22.1, management common to all alternatives, for a discussion of valid existing rights. Rights-of-way are subject to valid existing rights. ACEC management would not require the Air Force to modify or remove existing facilities.
- F2-4 Please refer to Response to Comment F2-1.
- F2-5 In response to your comment, the text in Section 2.4.12 of the Proposed RMP and Final EIS has been revised to include the needs of Federal Agencies in land use authorizations by the Ely Field Office.
- F2-6 Please refer to Response to Comment F2-5.
- F2-7 The requested GIS coverage will be provided.
- F2-8 In response to your comment, the text in Section 2.4.12.6 of the Proposed RMP and Final EIS has been revised to clarify coordination with the Department of Defense on communication towers.
- F2-9 In response to your comment, the text in Section 2.4.12.6 of the Proposed RMP and Final EIS has been revised to clarify coordination with the Department of Defense on rights-of-way equipment.
- F2-10 In response to your comment, the text in Section 2.4.13 of the Proposed RMP and Final EIS has been expanded to clarify coordination with the Department of Defense on wind energy proposals.
- F2-11 The Ely Field Office will continue to involve Nellis Air Force Base in decisions that affect its operations.

Responses to Letter F2

- F2-24 Please refer to Response to Comment F2-2.
- F2-25 Please refer to the text in Section 2.4.14.2 in the Proposed RMP and Final EIS for discussion related to management of off-highway vehicle use on roads and trails in the Ely RMP decision area and to Section 2.4.15.1 for discussion regarding Special Recreation Management Areas. Map 2.4.14-1 in the Proposed RMP and Final EIS is related to planning area-wide travel management, not SRMA management. This map and others have been revised in the Proposed RMP and Final EIS to improve clarity of the information being presented.

Letter F3

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

November 22, 2005

Gene Drais, Project Manager
Bureau of Land Management
Ely Field Office
HC33 Box 33500
Ely, Nevada 89301

Subject: Draft Environmental Impact Statement (DEIS) for the Ely District Resource Management Plan, White Pine, Lincoln and Nye Counties, Nevada (CEQ #20050308)

Dear Mr. Drais:

The U.S. Environmental Protection Agency (EPA) has reviewed the above-referenced document pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508) and Section 309 of the Clean Air Act.

F3-1 [The DEIS analyzes five alternatives and identifies Alternative E as the Preferred Alternative. Our review found that the DEIS sufficiently addresses the environmental impacts of this alternative. Accordingly, we have rated the Preferred Alternative as Lack of Objections (LO). Please see the enclosed Rating Factors for a description of EPA's rating system.

F3-2 [EPA supports the approach of the Preferred Alternative which shifts management of resources from an individual resource allocation basis to an ecological systems basis. We also commend the Bureau for a highly collaborative process that included 14 cooperating agencies, including four Indian tribes.

EPA appreciates the opportunity to review this DEIS. When the Final EIS is released for public review, please send one copy to the address above (mail code: CED-2). If you have any questions, please contact me or David P. Schmidt, the lead reviewer for this project. David can be reached at 415-972-3792 or schmidt.davidp@epa.gov.

Sincerely,

Sr Duane James, Manager
Environmental Review Office
Communities and Ecosystems Division

Letter F4

Responses to Letter F4

Department of Energy
Washington, DC 20585
NOV 3 0 2005

Mr. Gene Drais, Project Manager
U.S. Department of the Interior
Bureau of Land Management
Ely Field Office
HC33 Box 33500
Ely, Nevada 89301

Dear Mr. Drais:

The U.S. Department of Energy, Office of National Transportation (Department) appreciates the opportunity to provide comments on the Draft Resource Management Plan/Environmental Impact Statement (DRMP/EIS) for the Ely District. The Department acknowledges the effort that has gone into preparing this draft document, as well as the attention given to the principles of multiple use and sustained yield found in Section 202 of the Federal Land Policy and Management Act of 1976.

The Bureau of Land Management (BLM) is participating in the Department's preparation of a Rail Alignment Environmental Impact Statement for the Caliente rail corridor as a cooperating agency. Our comments focus on the potential for impacting the development of the proposed rail line along this corridor and focus on:

- F4-1 [1. Uncertainties regarding possible restrictions on granting the Right of Way (ROW) that could be required for this proposed rail line.
- F4-2 [2. The potential for certain alternatives in the DRMP/EIS creating the need for future amendments to the final RMP that could significantly impact the Department's schedule for building the proposed rail line. The time needed for creating an amendment could significantly delay the development of the proposed rail line and it would be unfortunate if this issue was not resolved with the finalization of the RMP.
- F4-3 [3. Uncertainties regarding references to the need for mitigation measures for the proposed rail line.

- F4-4 [Proposed actions of concern to the Department in the alternatives include:
 - Changes to the Visual Resource Management (VRM) Classes
 - The proposed creation of the Garden Valley SRMA
 - Limitations to Lands and Realty actions (particularly not allowing new ROW applications)

- F4-5 [Additionally, other proposed actions in the DRMP/EIS, specifically actions in Alternatives B, D, and E, are very restrictive with regard to surface disturbing activities. If implemented, these actions could require a future amendment to the final RMP, if DOE does decide to construct a rail line.

- F4-1 Please refer to responses to Comments F4-14 and F4-15 for a discussion regarding granting a right-of-way for the rail line.
- F4-2 Please see response to Comment F4-5 for a discussion of alternatives. A project-specific EIS is being prepared for the rail line. Conformance with the appropriate approved RMP will be analyzed as part of that NEPA process. The concerns alluded to are addressed in the responses to a number of subsequent comments.
- F4-3 Please refer to response to Comment F4-18.
- F4-4 Please refer to responses to Comments F4-14 and F4-15 for a discussion regarding granting a right-of-way for the rail line.
- F4-5 A range of alternatives was presented and analyzed in the Draft RMP and EIS and Proposed RMP and Final EIS. Each alternative had a different management emphasis, based on comments received during scoping and the needs/desires of various public land users. While not all management actions would be acceptable to all users, the alternatives do contain a range of approaches for analysis purposes.

Letter F4 Continued

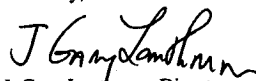

2

- F4-6 [The Department requests that the RMP be finalized, in sections such as those proposing the Garden Valley SRMA, with the necessary recognition and inclusion of the proposed rail line (as presented to BLM in the Department's application for a Public Land Order dated December 19, 2003, and as discussed with BLM in our lead agency/cooperating agency interactions in developing the Rail Alignment EIS). Further, we request that
- F4-7 [BLM not change the VRM classifications for areas under consideration for the rail line from Class IV and III to Class II. This is necessary to avoid potential future conflicts that could adversely impact the development of the rail line.

For ease of identifying the Department's comments on the DRMP/EIS, we have organized our comments to match the sections and resource categories in the draft document. Resource areas of concern to the Department include Visual Resources, Special Recreation Management Areas, Geology and Minerals Extraction, and Lands and Realty.

We appreciate this opportunity to provide comment and look forward to working closely with BLM, and the Ely Field Office, as we proceed with this important program.

Sincerely,

J. Gary Langrum, Director
Office of National Transportation
Office of Civilian Radioactive
Waste Management

Enclosure

Responses to Letter F4

- F4-6 Please refer to responses to Comments F4-19 and F4-21.
- F4-7 Please refer to responses to Comments F4-8, F4-9, F4-10, and F4-11.

Letter F4 Continued

Comments to the US Department of the Interior, Bureau of Land Management
Ely Nevada District, Regarding the Draft Resource Management Plan / Environmental
Impact Statement for the Ely District

Section 2.5, Management Direction for Resource Programs

Section 2.5.11 Visual Resources

Proposals in the alternatives to change Visual Resource Management (VRM) Class IV areas to VRM Class II could significantly impact efforts to construct the rail line through the Ely planning area. To avoid any possible need for a future amendment to the Resource Management Plan (RMP), the U.S. Department of Energy, Office of National Transportation (Department) suggests:

F4-8

1. Retaining the VRM Classes in Alternative A in the final RMP, specifically in locations along the Caliente Corridor (the location of the Department's current application for a Public Land Order) so that they remain VRM Class III and IV. The objective of VRM Class II, as described in the Draft Resource Management Plan / Environmental Impact Statement (DRMP/EIS) on page 2.5-109,

"is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape."

With such language, the proposed VRM changes in the DRMP/EIS could greatly restrict the development of the rail line by requiring an amendment to the final RMP. In the case of Southern Utah Wilderness Alliance, et al., (144 IBLA 70, May 20, 1998), the class II designation was held to prevent BLM from permitting activities they had deemed appropriate. VRM changes of concern in the DRMP/EIS include:

F4-9

- The Garden Valley Area (changing from a Class IV to a Class II)
 - The description of the Garden Valley area on page 2.5-111 does not clearly explain the proposed change

F4-10

- The Timber Mountain Area (changing from a Class IV to a Class II)
 - No explanation is given in the DRMP/EIS for this change

F4-11

- The area around the town of Caliente (changing from Classes IV and III to a Class II)
 - No explanation is given in the DRMP/EIS for this change

Responses to Letter F4

F4-8

In response to this and similar comments, the management actions in Section 2.4.15.1 of the Proposed RMP and Final EIS regarding special recreation management areas have been revised.

F4-9

Please refer to response to Comment F4-8.

F4-10

Please refer to response to Comment F4-8.

F4-11

New technology in the form of geographic information systems, as well as changing public perceptions about visual resources, led to the development of a new inventory for the Ely RMP planning area, and subsequent changes to visual resource management classes.

Letter F4 Continued

- F4-12 [Explanations in this section of the basis for these proposed changes for these areas would have enabled us to better comment on this issue.
- F4-13 [2. Including references to a separate inventory report or documentation of the inventory process in order to better support the proposed changes in VRM classes. Although section 2.5.11 includes general Bureau of Land Management (BLM) guidelines and methodologies used in the VRM inventory, it does not describe with any specificity the process for VRM classifications in the Ely planning area. Contrast rating worksheets (Form 8400-4-Visual Rating Worksheet) completed during the inventory could be referenced in this section, as well as all other visual resource inventory rating forms, overlays, slides and written material (BLM Manual Handbook 8410, section I. General Guidance, paragraph C), (BLM Instruction Memorandum No. 98-164) and (BLM Manual Handbook 8431-1, at 2).
- F4-14 [3. Addressing the uncertainty of the need for future amendments if the Department decides to build the proposed rail line and applies for the necessary ROW. Although the preceding suggestions request additional explanation be provided in this section for the proposed changes in VRM classifications, the Department's main concern with the Visual Resources Section is less with the lack of explanation for the proposed changes in classification, and more with the uncertainty that these proposed changes create for the possibility that a future amendment will be needed to permit the issuance of a Right of Way (ROW) for the rail line. The final RMP needs to deal directly with this uncertainty.

Section 2.5.12, Lands and Realty

The Department's comments on this section focus on the alternatives presented in the draft:

- F4-15 [1. There is a potential conflict between the Department's future rail line ROW application and lands available for disposal under Alternatives B, C, and E. Under these alternatives, lands where the rail line corridor may be located have been identified as available for disposal (as shown in maps 2.4-13, -16, and -21). A portion of those lands would not be available for disposal if the Department were to obtain a ROW to construct and operate a rail line in these areas. The lands identified for disposal in this section are those lands that are also referenced by the Lincoln County Conservation, Recreation and Development Act of 2004.
- F4-16 [2. Alternatives A and C are the least restrictive of the alternatives and are favored by the Department (not withstanding the conflict in Alternative C mentioned previously in point number one) since actions in these alternatives would not restrict the development of the rail line.
- F4-17 [3. Alternative D would place very strict limitations on development of the rail line in that no new ROW will be issued. Because of this, Alternative D would not be favored by the Department as it may not allow the development of the rail line without a future amendment to the final RMP.

Responses to Letter F4

- F4-12 Please refer to responses to Comments F4-9, F4-10, and F4-11.
- F4-13 Please refer to Section 3.11.3 in the Proposed RMP and Final EIS for a discussion of the visual resource inventory process. The detailed methodologies requested are discussed in the referenced BLM guidelines. Overall, the difference in visual resource management between alternatives is consistent with the differing resource management approaches and philosophies among the alternatives.
- F4-14 The VRM classifications shown on Map 2.4.11-1 have been incorporated into the Proposed RMP and will be used during the life of the plan to manage visual resources. VRM management class objectives would be considered when evaluating BLM projects or private party proposals. Mitigation for potential visual resource impacts would be evaluated on a project-specific basis. VRM class objectives do not prohibit other multiple uses.
- F4-15 The Caliente to Yucca Mountain Rail Line corridor was withdrawn on December 28, 2005, for 10 years. If a right-of-way is issued, the withdrawal will be relinquished and the lands will be available for disposal subject to the rail line right-of-way.
- F4-16 Comment noted.
- F4-17 Comment noted.

Letter F4 Continued

F4-18 4. Alternative E does not appear to preclude development of the rail line without an amendment (notwithstanding the conflict in Alternative E, mentioned previously in point number 1), however the requirement to mitigate surface disturbing activities could have unspecified and uncertain impacts on the development of the rail line. The DRMP/EIS is not clear on requirements for mitigation, so the Department is unsure of the limitations placed on the construction of the rail line in this alternative. This should be made clear in the final RMP.

Section 2.5.15.1, Parameter – Special Recreation Management Areas

In this section, the Department suggests adding text in the final RMP to describe the purpose and need for the proposed Garden Valley Special Recreation Management Area (SRMA) under alternatives B and E. The additional text should:

- F4-19
1. Provide a description of activities that would occur in this area.
 2. Address the need for the Garden Valley SRMA
 3. Describe the rationale for restrictions that would be placed on surface disturbing activities as a result of the SRMA.
 - Discussing potential restrictions from this designation can provide a better understanding of the management and purpose of the SRMA. Without this understanding, it is difficult for the Department to determine how the SRMA would affect development and operation of the rail line. Again, it is the uncertainty regarding the need for future amendments that is at issue here.

Section 2.5.18, Geology and Mineral Extraction

F4-20 The action described in the alternatives in this section should include development of rock quarries for ballast, in addition to sand and gravel. Several quarries for ballast may be proposed for the rail alignment.

Section 4.12, Lands and Realty

Alternative E, Impacts from Other Programs, Recreation

F4-21 Additional analysis should be added to this section to clarify the impacts from the proposed SRMA on the lands and realty program. The Department finds that the analysis in this section (page 4.12-7), lacks a discussion of impacts on Lands and Realty from the designation of the Garden Valley SRMA. It is not clear if designation of the SRMA suggests that the area is of high recreational value, thus excluding it from potential proposals such as the rail alignment.

Section 4.28, Cumulative Impacts

Section 4.28.1.3, Present, and Reasonably Foreseeable Future Actions

In this section, the Department suggests:

Responses to Letter F4

F4-18 Thank you for your comment. Required mitigation for the rail line would be a location-specific decision made by the BLM as part of the NEPA analysis for the final right-of-way. The Best Management Practices presented in Appendix F, Section 1, of the Proposed RMP and Final EIS would provide guidance as to what types of mitigation might be required.

F4-19 Please refer to response to Comment F4-8.

F4-20 The Introduction to Section 2.5.18 in the Proposed RMP and Final EIS indicated that "stone" is a saleable mineral. Definitions for leasable, locatable, and saleable minerals have been added to this section. Section 4.28.18 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of rock quarries associated with the interrelated projects. The basic impact conclusions presented in the Draft RMP and EIS have not been changed.

F4-21 Please refer to response to Comment F4-8.

Letter F4 Continued

Responses to Letter F4

F4-22 [1. Changing Table 4.28-1, under the heading "Ongoing Water Demand within the Ely District", from "No Effect" to either "Unknown" or replacing it with an approximate figure. The ongoing water demand would be lower than the construction water demand for the rail alignment. However, describing the impact as "No Effect" may be an understatement of the ongoing water needs of the rail project.

F4-23 [2. Changing Table 4.28-2 to indicate that the rail alignment project could also have an impact on air quality, renewable energy, woodland and native plant products, mineral extraction, and special designations. Currently, the text in this table indicates that there would be no interaction with these resources.

Section 4.28.11, Visual Resources

On page 4.28-47, section 4.28.11, under "Impacts of Interrelated Projects", the text reads, "potential impacts to visual resources could occur from...the development of the Department of Energy rail line. Those projects could potentially require mitigation actions to reduce visual impacts within areas having more restrictive visual resource management classes (i.e., Class I and Class II areas)." It is the Department's understanding that visual resource inventory classes "...do not establish management direction and should not be used as a basis for constraining or limiting surface disturbing activities." (BLM Manual Handbook 8410-1, Visual Resource Inventory, dated 1/17/86, section V-1). The text in this section implies that impacts from VRM classes could limit surface disturbing activities. The Department suggests:

F4-24 [1. Clarifying the text in order to understand if this is the intent.

F4-25 [2. Identifying the types and extent of mitigation anticipated as being required to address potential impacts to visual resources from the rail line, or including a reference to a document containing the BLM standard operating procedures for mitigation. Part of the VRM system is, "to provide timely inputs into proposed surface disturbing projects...", (BLM Manual Handbook 8400, Visual Resource Management, dated 11/14/86, section 07, Overview of Visual Resource Management Systems) (BLM IB No. 98-135).

Section 4.28.12, Lands and Realty

The Department suggests including the BLM proposed action for the withdrawal of public lands within and surrounding the Caliente Rail Corridor in the discussion of trends for future uses of BLM lands in this section.

F4-26 [

Section 4.28.18, Geology and Mineral Extraction

For this section, the Department suggests that a description of the potential development of rock quarries, in addition to sand and gravel, be included in the text. Several quarries for ballast may be proposed for the rail alignment, and their inclusion is needed for an adequate cumulative impact analysis in this section..

F4-27 [

F4-22 In response to your comment, the text on Table 4.28-1 in the Proposed RMP and Final EIS has been modified to more clearly present the water usage associated with the proposed rail line.

F4-23 In response to your comment, the text on Table 4.28-2 in the Proposed RMP and Final EIS has been modified to more clearly present the potential cumulative impacts associated with the proposed rail line.

F4-24 in response to your comment, the text in Section 4.28.11 of the Proposed RMP and Final EIS has been revised to clarify the discussion of cumulative impacts to visual resources. The basic impact conclusions presented in the Draft RMP and EIS have not changed.

F4-25 Please refer to response to Comment F4-18.

F4-26 Please refer to response to Comment F4-15.

F4-27 In response to your comment, the text in Section 4.28.18 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of rock quarries associated with the proposed rail line. Also see Response to Comment F4-20 for further discussion on saleable minerals. In response to your comment, the text in Section 4.28.18 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of rock quarries associated with the proposed rail line. Also see Response to Comment F4-20 for further discussion on saleable minerals.

RECEIVED
Bureau of Land
Management
Ely, Nevada

Memorandum

To: Mr. Gene Drais, Project Manager, U.S. Department of the Interior, Bureau of Land Management, Ely Field Office, Ely, Nevada

From: Field Supervisor, Nevada Fish and Wildlife Office, Reno, Nevada

Subject: Service comments on July 2005 Draft Resource Management Plan and Environmental Impact Statement for the Ely District

Attached are the U.S. Fish and Wildlife Service, Nevada Fish and Wildlife Office's comments and suggested edits on the Draft Resource Management Plan (RMP)/Environmental Impact Statement (EIS) for the Ely District. These comments include input from staff in both our Reno and Las Vegas Offices. We appreciate the opportunity to review and provide comments and edits on the Draft RMP/EIS.

Please reference File No. 1-5-06-TA-024 in future correspondence concerning this input. If you have any questions on our comments, or require additional information, please contact me or Kevin Kritz at (775) 861-6300.

Sincerely,

Robert D. Williams
Field Supervisor

TAKE PRIDE

Letter F5 Continued

U.S. Fish and Wildlife Service, Nevada Fish and Wildlife Office
Comments on the July 2005 Draft Resource Management Plan and
Environmental Impact Statement for the Ely District

General Comments

F5-1 The Preferred Alternative for management of desert tortoise in the draft RMP incorporates existing management actions as described in the Record of Decision for the Caliente Management Framework Plan Amendment. As you may know, the 1994 Desert Tortoise Recovery Plan is under review, and updates to the plan are expected to be completed in 2006. We recommend that BLM incorporate language in the RMP that will allow management flexibility for implementing new recovery guidance that may be included in the updated Recovery Plan. This language should be incorporated into the description of alternatives under "Management Common to All Alternatives", as it will be important for BLM to consider new management guidance for the tortoise, regardless of the management alternative ultimately accepted in the Record of Decision for the RMP EIS.

F5-2 We recommend that BLM include provisions for development of plans to monitor public use in the desert tortoise ACECs. As development progresses within the Coyote Spring Valley and the Lincoln County Land Act lands, we anticipate that public use of the adjacent ACECs will increase, as well as potential impacts to the tortoise. Coordinating and cooperating with local landowners and governmental agencies in these monitoring efforts will ensure that meeting recovery goals for the tortoise remains a high priority for management in the Mojave Desert region of the Ely District.

F5-3 We have recently learned from the Nevada Department of Wildlife (NDOW) that the California condor has been documented in the Condor Canyon area in Nevada. The California condor sighting was probably a member of the nonessential experimental population of California condors in northern Arizona as designated by the Service in the Federal Register (FR Vol. 61, No. 201, pp 54043-54058). Since this population was designated as nonessential, any members of it should be treated as a species proposed for listing as threatened. We suggest BLM consider the needs of this species with regard to the management of any BLM lands administered by Ely BLM Field Office in the Condor Canyon area. There may also be a need for BLM to consider this species in regard to management outside of this area.

Watershed Analysis Process- We reviewed Appendix C and noted the approach Ely BLM District intends to use with regard to watershed analysis for the watersheds within the Ely BLM Field Office administrative boundaries. Further, we understand the utility of this approach and the value this process has for addressing many resource concerns. However, we also note that the RMP EIS indicates that this process will take 10 years to complete, and furthermore that with the current funding levels provided to the Ely BLM

Responses to Letter F5

F5-1 Text in Section 2.4.7 of the Proposed RMP and Final EIS states management would follow U.S. Fish and Wildlife Service Recovery Plans. No text revisions are deemed necessary in response to this comment.

F5-2 In response to your comment, the text in Section 2.4.7 of the Proposed RMP and Final EIS has been expanded to clarify management of the desert tortoise ACECs.

F5-3 In preparation for the Biological Assessment associated with the Ely RMP, the USFWS has made the decision to treat the California condor as a transient to the area. As such, no changes have been made in the Proposed RMP and Final EIS other than to acknowledge the sighting in Chapter 3.

Letter F5 Continued

Field Office, it will take an estimated 20 years to complete to this process (Ch. 4, page 4.1-9). We also note that livestock grazing decisions and adjustments will be made after the watershed analysis is complete and there is some basis for making the change on the ground. Another concern is that watershed analysis has limited utility for most wildlife species (i.e. sage grouse, golden eagle, elk, pronghorn antelope, etc.) that use landscapes on a much broader geographic scale than individual watersheds. A recent policy statement of The Wildlife Society states that "Caution should be exercised, however, when using watersheds to integrate wildlife management objectives into large-scale management plans. Because watersheds are defined by patterns of water drainage, their use as a management and planning tool for terrestrial species represents an artificial human constraint that may not be applicable when addressing wildlife populations that range beyond the boundaries of a planning unit delimited by water runoff."

F5-4 In summary, while we see the benefits of watershed analysis, especially for aquatic species, and recognize the soundness of the approach you outline in Appendix C, we are concerned that waiting to complete watershed analyses for all the Ely Field Office watersheds before management actions are taken to restore and improve existing degraded habitat conditions will unnecessarily delay management actions/decisions that are badly needed now. Also, because of our concerns about the utility of the watershed analysis approach for many terrestrial wildlife species, we suggest the limitations and shortcomings of this approach be acknowledged in the RMP. Finally, we recommend moving forward and implementing those restoration activities within watersheds that have already been identified, without waiting for the watershed analysis process to be complete.

F5-5 Nevada Comprehensive Wildlife Conservation Strategy (CWCS). In 2005, the Nevada Department of Wildlife (NDOW), working with other state, federal, non-governmental organizations, and private interests, developed a Comprehensive Wildlife Conservation Strategy for the state of Nevada. This comprehensive plan is designed to assess current populations, conservation status, and management and monitoring needs for all species of fish and wildlife under NDOW's management authority (mammals, birds, reptiles, amphibians, fish, and some aquatic invertebrates). We did not see any reference to the Nevada CWCS in the Draft Ely BLM RMP, or any indication that Ely BLM will embrace all or parts of the CWCS, in terms of management actions that are within the authority of the Ely BLM Field Office. We recommend that the Ely BLM RMP EIS at least reference the CWCS and that BLM agree to support it at some level. Finally, we recommend that BLM document the level of support that will be provided towards implementation of the CWCS and include this in the RMP EIS.

F5-6 Cumulative Effects analysis for projects that may occur within the foreseeable future. We understand the challenges that the Ely BLM Field Office faces in regard to analyzing all of the cumulative effects of actions proposed in the RMP EIS, as well as other actions like groundwater development, community growth, power plant construction, that may occur in the future. However, we remain concerned that a comprehensive analysis of all the cumulative effects of various types of development and resource extraction activities

Responses to Letter F5

F5-4 Management actions to restore and improve habitat conditions are not dependent on completion of watershed analyses for individual watersheds or until completion of all watershed analyses as inferred in this comment.

F5-5 In response to your comment, the text in Section 2.4.6 for both the Aquatic Habitat and Fisheries, and in Section 2.4.7 for Terrestrial Wildlife has been modified to address the Nevada Comprehensive Wildlife Conservation Strategy.

F5-6 The EISs prepared for the Draft and Proposed RMPs identified those projects within the Ely RMP planning area that could interact with landscape-scale resource management actions. The information that is available on many of these interrelated projects is very limited, but they were included for full disclosure. As development plans for specific proposals are advanced and applications are submitted to the Ely Field Office, the appropriate level of NEPA analysis, including interaction with other projects that could result in cumulative impacts, would be conducted.

Letter F5 Continued

F5-6 | within the area of the Ely BLM Field Office land base needs to be completed in a NEPA format document.

Specific Comments

F5-7 | **Section 1.7, Resource Management Plan Implementation**
Page 1.8-1, section 1.8.1, paragraph 2. In the second sentence we suggest some slight modifications to the wording regarding consultation to state "BLM consults with the U.S. Fish and Wildlife Service whenever a federal project or action that it funds, authorizes, or carries out may affect a listed species, or may adversely modify its designated critical habitat (see Section 3.7 for details on listed species)."

F5-8 | Page 1.8-1, section 1.8.1, paragraph 3. This part of the document indicates BLM will coordinate with the U.S. Fish and Wildlife Service (Service) on decisions that may affect the National Wildlife Refuge System. It also identifies the three National Wildlife Refuges that lie adjacent to Ely BLM administered lands. We suggest a consistency evaluation for any proposed management actions in the Draft Ely RMP that could impact fish and wildlife habitat on adjacent National Wildlife Refuge lands. We recommend coordinating directly with Service personnel responsible for managing these Refuges to complete this consistency evaluation. Finally, we request that BLM not include any proposed actions in the Ely Draft RMP for lands that lie directly adjacent to Service NWR lands that would compromise the intent for which these National Wildlife Refuges were designated.

F5-9 | Page 1.9-5, section 1.9.1, Regional Organizations.
To the bulleted list of plans provided at the top of page 1.9-5 consider adding the following to this list:

- North American Waterfowl Management Plan
- United States Shorebird Conservation Plan
- North American Waterbird Conservation Plan

Section 2.5, Alternatives – Management Direction for Resource Programs

F5-10 | Page 2.4-10, Table 2.4-1, Great Basin Rocky Mountain Bighorn Sheep.
For Alternative E we encourage BLM to add a stipulation that "No domestic sheep or goat grazing would be allowed within 9 miles of rocky mountain bighorn sheep habitat, except where topographic features or other barriers prevent physical contact." This is the same stipulation provided for desert bighorn sheep on Page 2.4-13 for Desert Bighorn Sheep. We believe that rocky mountain bighorn sheep should be managed the same as desert bighorn sheep with regard to this issue. Similarly, under the Livestock Management in Bighorn Sheep Ranges parameter on Page 2.4-30 we recommend that this same language be added for the rocky mountain bighorn sheep under Alternative E that you have below it for the desert bighorn sheep.

Responses to Letter F5

F5-7 | In response to your comment, the text in Section 1.8.1 of the Proposed RMP and Final EIS has been revised to incorporate your recommended wording.

F5-8 | In response to your comment, the text in Section 4.6 of the Proposed RMP and Final EIS has been expanded to clarify impacts to and compatibility of USFWS National Wildlife Refuges with BLM management actions. The basic impact conclusions presented in the Draft RMP and EIS have not changed.

F5-9 | Please note that Section 1.9.1 in the Draft RMP/EIS is now Section 1.8.1. In response to your comment the text of Section 1.8.1 of the Proposed RMP and Final EIS has been revised to incorporate your suggested additions to the list.

F5-10 | Thank you for your comment. Sections 2.4.6.2, 2.4.6.3 and 2.4.16 have been modified to clarify that within occupied habitat for both desert bighorn and Rocky Mountain bighorn sheep, domestic sheep and goats would be managed in accordance with current BLM guidelines when changes to BLM grazing permits are being considered. At the present time, BLM guidelines regarding buffer zones are different for Rocky Mountain bighorn sheep and desert bighorn sheep, because in most states desert bighorn sheep are considered a sensitive species and Rocky Mountain bighorn sheep are not.

Letter F5 Continued

- F5-11 Page 2.4-23, Table 2.4-1, Disposal of Public Lands.
We suggest that Alternative E text be modified to include a stipulation that lands with habitat for federally listed, proposed, and candidate species, or proposed or critical habitat not be exchanged or disposed of.
- F5-12 Pages 2.4-25 and 26, Table 2.4-1, Wind and Solar Energy parameter.
The wording for Alternative C, and by default Alternative E, for wind energy in Table 2.4-1 needs clarification. The text in this Table suggests that despite the fact that about 202,000 acres have been designated as potential wind energy development areas (Map Volume-Map 2.4-25), this type of development could also occur outside these areas. Are all potential wind areas in the District open to development? This seems overly broad and we advise against this approach. We note that some of the areas designated on Map 2.4-25 as "Potential Wind Energy Development Areas" occur in the Butte/Buck/White Pine sage-grouse Population Management Unit (PMU). This PMU is one of five sage grouse PMU's in Nevada that have the highest known population levels of sage grouse in the state. We further note that some of the potential wind energy development areas occur in areas with: elk migration corridors and crucial summer range; pronghorn migration corridors and crucial winter range; mule deer migration corridors and crucial winter range; and desert bighorn sheep migration corridors. We recommend BLM consider reducing some of the acres identified in the RMP EIS as potential wind energy development areas that occur within the Butte/Buck/White Pine sage-grouse PMU and in areas of key habitat for elk, mule deer, desert bighorn sheep, and pronghorn.
- F5-13 Table 2.4-1 also indicates that about 59 percent of the Ely District land base would be open to solar energy development. Although we acknowledge the value of developing more renewable energy sources, we recommend that the approach of allowing this much of the Ely District land base to be open for this type of development should be revisited, and that BLM consider placing additional constraints on this type of development. Some additional considerations for closures to solar energy development would include: 1) areas designated or proposed as critical habitat for a federally listed or proposed species; 2) areas that provide habitat for federally listed species, proposed species, and candidate species; 3) ACEC's established to benefit biological resources (wildlife, fish, plants) or that contribute significantly to the conservation of these biological resources; 4) Riparian and wetland habitat in general; 5) significant portions of the Butte/Buck/White Pine and Schell/Antelope sage-grouse PMU's, and to further consider a full closure for one of these PMU's; 6) crucial elk summer range; 7) crucial winter pronghorn range; and 8) crucial winter and summer range for mule deer.
- F5-14 Page 2.4-30, Table 2.4-1, Non-use Relinquished Permits.
We do not agree with the direction provided in Table 2.4-1 with regard to this parameter. We suggest that the Table be edited for Alternative E. This practice should not be allowed for all grazing allotments in the Mojave Ecosystem part of the Ely BLM land base. We are comfortable with this approach for grazing allotments in the Great Basin Ecosystem section of the Ely BLM land base except in instances where an allotment is closed to protect resource values where this practice should not be allowed.

Responses to Letter F5

- F5-11 In response to your comment, the text in Section 2.4.12.1 Retention of the Proposed RMP and Final EIS has been revised to clarify the discussion of what lands will be retained for federally listed species (i.e., designated critical habitat). Habitat for proposed and/or candidate species will be managed under current policy, which means actions requiring authorization or approval will not contribute to the need to list these species. This means the BLM may or may not be able to dispose of non-critical habitat for these species in the future.
- F5-12 The Proposed RMP does not designate areas for wind and solar energy development, and the text and map titles in the Proposed RMP and Final EIS have been changed to clarify this. Changes in technology may change the potential for renewable energy development and which areas are suitable. All applications will be subject to NEPA analysis and the Wind Energy Development Program Policies and Best Management Practices published in conjunction with the Record of Decision for BLM's Final Wind Energy Development Programmatic EIS (Appendix F, Section 3, of the Ely Proposed RMP and Final EIS). The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans for wind energy development are received and evaluated.
- F5-13 Please refer to Response to Comment F5-13. Applications received for solar power development would be subject to NEPA analysis in coordination with local, state, and other federal agencies. Impacts to biological resources (wildlife, fish, plants), ACECs, and endangered and special status species would be considered.
- F5-14 Please refer to Section 2.4.16 and 2.5.16.2 in the Proposed RMP Final EIS for a discussion of non-use relinquished permits.

Letter F5 Continued

- F5-15 Pages 2.4-34, Table 2.4-1, Salable Mineral parameter.
Alternative E indicates that up to about 84 percent of the Ely District land base would be open to development for salable minerals such as sand and rock. We understand that in all likelihood only a limited part of the District land base will actually be developed to provide these commercial resources. However, allocating 84 percent of the Ely BLM land base to this type of development is inconsistent with the general description of Alternative E and the RMP Management Focus that is repeated throughout the RMP EIS. We suggest BLM reconsider this approach for Alternative E and consider reductions in acreage open to this type of development.
- F5-16 Page 2.5-24 and 25, section 2.5.5.3 High Elevation Conifer Species.
The document indicates that there are approximately 56,000 acres of this habitat type on District (about 0.5 percent of the Ely BLM land base). Given that such a small proportion of the District consists of this type of habitat we do not agree with the management direction described for this under Alternative E. This section indicates that accessible sites would be managed for commodity products. We suggest you reconsider this approach and instead recommend revising Alternative E to indicate that habitat values for wildlife would be driving force for all management actions in these areas. All treatments within these areas should be designed to accomplish a habitat objective. This is not a concern if as a result of implementing treatments to address a habitat need there are products left over that can be utilized by the forest products industry. Again, the dominant driver in decisions about what treatments would be implemented, and how they would be implemented, should be habitat objectives not commodity products objectives.
- F5-17 Page 2.5-49, section 2.5.5.10, paragraph 1, Monitoring of Vegetation. We recommend adding citations for references on vegetation monitoring plans that identify goals, objectives, success criteria, protocols, monitoring intervals, and data management and analysis needs. If these plans do not exist, we recommend that a statement be added that proposes development of such plans.
- F5-18 Page 2.5-58, section 2.5.6.4, Migratory Bird Habitat, Alternative B, paragraph three.
This section states that migratory bird habitat needs will be assessed to determine if livestock grazing is a causal factor for nonattainment of standards. If these standards have not yet been developed, a monitoring plan should be prepared that establishes the standards by which effects of livestock grazing will be determined. These standards should be based on the needs of migratory birds, and should include factors such as understory cover, canopy cover, patch size, density, vertical diversity, and other such factors important in describing migratory bird habitat.
- F5-19 Page 2.5-50, section 2.5.6, Fish and Wildlife.
This section focuses disproportionately on game fish and game animals. We recommend that this approach be reconsidered and that more discussion of those non-game fish and wildlife species, that are not Special Status Species, be included in this section.

Responses to Letter F5

- F5-15 Specific rationale would be required to close an area to the sale of mineral materials. None has been provided in this comment.
- F5-16 As indicated in the errata sheet accompanying the Draft RMP and EIS, Alternative E for this parameter has already been designated the same as Alternative B rather than Alternative C. This correction has been carried forward into the Proposed RMP and Final EIS.
- F5-17 In response to your comment, the text in Section 1.7.2 and 2.4.23 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of monitoring.
- F5-18 In response to your comment, the text in Section 2.4.6.4 of the Proposed RMP and Final EIS has been revised to clarify how the Ely Field Office will manage migratory bird habitat.
- F5-19 The Ely Field Office disagrees that the emphasis is disproportionate. Please refer to Sections 2.4.6.2 and 2.4.6.4 in the Draft RMP and EIS and Proposed RMP and Final EIS for management actions for non-game wildlife.

Letter F5 Continued

F5-20 Page 2.5-62, section 2.5.6, Fish and Wildlife, Alternative E.
At the top of page 2.5-62, the RMP EIS indicates big game species habitats would be managed to meet public demands beyond what natural habitats and water sources would support. We are unclear as to why the Preferred Alternative should have such a goal. We suggest revisiting this objective for Alternative E and that a more appropriate management direction would be to manage big game habitat to support population levels consistent with what habitats and waters sources can support.

F5-21 Page 2.5-65, section 2.5.7, Special Status Species, Management Common to All Alternatives, item # 2. Priority for the application of management actions would be given respectively to Federal endangered and threatened species, Federal proposed species, Federal candidate species, and BLM sensitive species. Although these categories most likely include most of the rare species that may occur within the Ely District, some rare species may not be captured within these categories. The Nevada Natural Heritage Program's lists of rare species include several that do not fall within any of the aforementioned categories, and may be overlooked. We recommend that the BLM also consider these species while implementing management actions on District lands.

F5-22 Page 2.5-65, section 2.5.7, Special Status Species, Management Common to All Alternatives, item # 7. Restate this item as follows: "Most of the conservation measures developed under section 10 of the Endangered Species Act to mitigate effects on non-Federal lands within the Ely District to species covered under future habitat conservation plans would be implemented on Federal lands administered by the BLM Ely District. Development of mitigation measures to be implemented on BLM-administered lands under future habitat conservation plans would be coordinated with and approved by the U.S. Fish and Wildlife Service."

F5-23 Page 2.5-66, section 2.5.7, Special Status Species, Management Common to All Alternatives, item # 11. This paragraph describes the general management proposed at Ash Springs. We recommend BLM also consider adding the option of developing cooperative agreements with the adjacent private landowner, to enhance conservation efforts for the White River springfish at Ash Springs.

F5-24 Page 2.5-69, section 2.5.7.3, Special Status Species, Alternative B, first paragraph. We support the construction of a new fence around Shoshone Ponds, but request that access for fish surveys is included in the design. Additionally, we recommend including management actions that would divert stormflow from this site.

F5-25 Page 2.5-71, section 2.5.7.4, Special Status Species, Mojave and Great Basin Riparian Habitats, Alternative E, first paragraph. This paragraph states that the habitat needs of the Meadow Valley Wash speckled dace and desert sucker would be evaluated in conjunction with the Southwestern Willow Flycatcher Recovery Plan. While protection of riparian areas for the flycatcher will generally provide benefits for the rare fishes, there are conservation actions that should probably be implemented for the fishes that are not included in the flycatcher Recovery Plan. We recommend that development of a management plan for the fishes from Eagle Valley downstream through Meadow Valley

Responses to Letter F5

F5-20 In response to your comment, the text in Section 2.4.6.4 of the Proposed RMP and Final EIS has been revised to clarify the discussion of big game habitat management for increased game species distribution and densities.

F5-21 The Ely RMP focuses on federally listed, proposed, or candidates species; BLM sensitive species; and species that are state protected that could occur within the Ely RMP planning area. (See Planning Criteria #4 in Section 1.5.3.) This approach is consistent with the BLM Land Use Planning Handbook. The Nevada Natural Heritage Program database was consulted during preparation of the Proposed RMP and will be consulted when implementing management actions in the future.

F5-22 In response to your comment, the text in Section 1.8, Section 2.4.6 and Section 3.7 of the Proposed RMP and Final EIS has been revised to address the involvement of the USFWS in developing habitat conservation measures.

F5-23 In response to your comment, a new sentence was added in Section 2.4.7.4 of the Proposed RMP and Final EIS stating that activities could include an option to consider developing cooperative agreements with the adjacent private landowner for the purpose of enhancing conservation efforts for the White River springfish.

F5-24 In response to your comment, the text in Section 2.4.7.2 of the Proposed RMP and Final EIS has been revised to include evaluation and potential implementation of additional protection measures such as diversion of streamflow around the pond.

F5-25 In response to your comment, the text in Section 2.4.7.3 and 4.7 of the Proposed RMP and Final EIS has been revised to clarify the discussion of effects to special status species in Meadow Valley Wash. The basic impact conclusions presented in the Draft RMP and EIS have not changed.

Letter F5 Continued

F5-25 Wash would be a more efficient process for establishing evaluation criteria for the Meadow Valley fishes. This effort could be coordinated with the Nevada Department of Wildlife and members of the Big Springs Spinedace Recovery Implementation Team.

F5-26 Page 2.5-71, section 2.5.7.4, Special Status Species, Mojave and Great Basin Riparian Habitats, Alternative E, paragraph 2. The last sentence in this paragraph states that livestock grazing would be excluded from the desert tortoise habitat areas of the Lower Meadow Valley Wash (Elgin south to Clark County). This statement should clarify if livestock grazing would be excluded from all tortoise habitat or all tortoise ACECs.

F5-27 Page 2.5-71, section 2.5.7.4, Special Status Species, Mojave and Great Basin Riparian Habitats, Alternative E, paragraph 3. Please either describe, or include a reference for, the appropriate stipulations that would be considered to determine if livestock grazing would be appropriate in unoccupied suitable habitats between October 15 and March 15.

F5-28 Page 2.5-71, section 2.5.7.4, Special Status Species, Mojave and Great Basin Riparian Habitats, Alternative E, paragraph 4. This section states that a Southwestern Willow Flycatcher Implementation Plan for Meadow Valley Wash would outline the schedule and procedures to determine if livestock are a causal factor for nonattainment of standards and guidelines. These standards and guidelines should be based on the ecological needs of the flycatcher, and should include factors such as understory cover, canopy cover, patch size, density, vertical diversity, and other such factors important in describing flycatcher habitat. If these standards and guidelines have not yet been developed, we recommend coordinating with the Service and knowledgeable flycatcher scientists to determine the appropriate factors that should be considered as part of this assessment.

F5-29 Pages 2.5-78 to 81, section 2.5.8.1, Wild Horses, Herd Management Area Establishment. We support Alternative E (same as Alternative B), which would eliminate herd management area status and remove herds from those areas that do not provide adequate and suitable habitat, including the Mojave Desert region of southern Lincoln County.

F5-30 Page 2.5-124, section 2.5.12.5, Lands and Realty, Corridors, item # 2. This item designates a corridor along existing telephone fiber-optic lines beginning at Township 11 South, Range 71 East, Section 30, and running easterly to the Arizona state line. This corridor appears to occur within the Beaver Dam Slope ACEC. We recommend identifying alternative routes for all new utility corridors that avoid desert tortoise ACECs.

F5-31 Page 2.5-124, section 2.5.12.5, Management Common to All Alternatives. We recommend that another item be added to the list here. The addition would be "All future electric utility line developments would follow the guidance provided by the Avian Protection Plan (APP) Guidelines released in 2005." This guidance was developed jointly by the Service and the electric utility industry working through the Avian Power Line Interaction Committee. It is available online at <http://www.aplic.org>.

Responses to Letter F5

F5-26 Under section 2.4.16 Livestock Grazing, management actions specify that the 208,160 acres within the Mormon Mesa, Kane Springs, and Beaver Dam Slope ACECs would remain unavailable for grazing. Grazing on allotments or portions of allotments within desert tortoise habitat, but outside of ACECs, would continue at current stocking levels (see Table 2.4-15).

F5-27 The text in Section 2.4.7.3 has been changed from the Draft RMP. The issue raised in your comment (i.e., livestock grazing in the proposed Lower Meadow Valley Wash ACEC) will be considered by the Ely Field Office when an ACEC management plan is prepared. The BLM will coordinate with the Service regarding livestock grazing in southwestern willow flycatcher habitat when the management plan is being developed.

F5-28 Please refer to Response to Comment F5-27.

F5-29 Comment noted.

F5-30 This corridor was designated in the Approved Caliente Management Framework Plan Amendment and Record of Decision for the Management of Desert Tortoise Habitat in September 2000. This amendment and decision were developed in coordination with the Service and incorporated terms and conditions from the Biological Opinion. The text in Section 2.4.12.5 of the Proposed RMP and Final EIS has been changed to state that this designated corridor will be retained.

F5-31 The text in Section 2.5.12.7 of the Proposed RMP and Final EIS has been revised to add coordination with the USFWS policy on utility line development and Avian Protection Plan guidelines.

Letter F5 Continued

- F5-32 { Page 2.5-126, section 2.5.12.6, Lands and Realty, Communications Sites, Management Common to All Alternatives. We recommend that BLM adopt the Service's *Guidance on the Siting, Construction, Operation and Decommissioning of Communications Towers* to minimize effects to migratory birds. We further request that you include this among the numbered items on page 2.5-126 under the "Management Common to All Alternatives."
- F5-33 { Page 2.5-130, section 2.5.13.1, Renewable Energy, Wind and Solar Energy, Alternative E (and Map 2.4-25). According to Map 2.4-25, it appears that several areas along the Meadow Valley Wash would be designated as potential wind energy development areas. Meadow Valley Wash is one of the most biologically diverse ecosystems in southern Nevada for birds. The potential of impacts to birds from wind energy projects established along or adjacent to the Meadow Valley Wash may be much greater than if these projects were located outside of this drainage. We recommend no designation of wind energy development areas within the vicinity of the Meadow Valley Wash.
- F5-34 { Pages 2.5-131 to 133, section 2.5.14.1, Travel Management, Transportation Plan, Management Common to All Alternatives. We recommend identifying desert tortoise habitat outside ACECs, as well as desert tortoise ACECs, as highest priority areas for the designation of roads and trails.
- F5-35 { Pages 2.5-134 and 135, section 2.5.14.2, Parameter- Off-highway vehicles. We are encouraged that under Alternative E none of the landbase would be categorized as "open" to cross-country off-highway vehicle use, that about 10.3 million acres of the Ely FO would have OHV use limited to existing roads and trails, and that about 1.1 million acres would be closed to off-highway vehicle use. However, we are concerned that too much of the District land base (approximately 90%) would still be open to OHV's. We understand OHV's would be limited to existing roads and trails, however, given BLM's limited budget to monitor and provide law enforcement patrols over this large area this approach will likely result in many areas where OHV's continue to travel cross-country. We recommend BLM reconsider the approach taken under Alternative E and consider closing more of the District land base to OHV travel. We suggest that the following areas should receive additional consideration for OHV closures: 1) areas designated or proposed as critical habitat for a federally listed or proposed species; 2) areas that provide habitat for federally listed species, proposed species, and candidate species; 3) ACEC's established to benefit biological resources (wildlife, fish, plants) or that contribute significantly to the conservation of these biological resources; 4) significant portions of the Butte/Buc/White Pine and Schell/Antelope sage-grouse PMU's; 5) crucial elk summer range; 6) crucial winter pronghorn range; and 7) crucial winter and summer range for mule deer. This list is not intended to be all inclusive but rather provided as an indication of the types of concerns we have with regard to off-highway vehicle use.
- F5-36 { Page 2.5-141, section 2.5.16, Livestock Grazing. On page 2.5-141 under the Management Common to All Alternatives header the RMP EIS indicates that "adjustments to stocking rates would be based on watershed analysis." If this means that stocking rates would not be adjusted until watershed analysis was completed in a watershed, then we are concerned about this approach (see our comments

Responses to Letter F5

- F5-32 The text in Section 2.5.12.6 of the Proposed RMP and Final EIS has been revised to add coordination with the USFWS policy on communication sites.
- F5-33 The Proposed RMP does not designate areas for wind and solar energy development, and the text and map titles in the Proposed RMP and Final EIS have been changed to clarify this. Changes in technology may change the potential for renewable energy development and which areas are suitable. All applications will be subject to NEPA analysis and the Wind Energy Development Program Policies and Best Management Practices published in conjunction with the Record of Decision for BLM's Final Wind Energy Development Programmatic EIS (Appendix F, Section 3, of the Ely Proposed RMP and Final EIS).
- F5-34 The designation of roads and trails as part of a transportation plan would not be limited to ACECs. The Ely Field Office will develop logical units for transportation planning. The sequence for developing transportation plans will be based on existing or anticipated travel use and the associated resource conflicts.
- F5-35 Thank you for your suggestion. The BLM designates areas as "closed" if a closure to all vehicular use is necessary to protect resources, ensure visitor safety, or reduce use conflicts. The BLM designates areas as "limited" where it must restrict off-highway vehicle use in order to meet specific resource management objectives. These limitations may include: restricting the number or types of vehicles; limiting the time or season of use; permitted or licensed use only; limiting use to existing roads and trails; and limiting use to designated roads and trails. The BLM may place other limitations, as necessary, to protect resources, particularly in areas that motorized off-highway vehicle use enthusiasts use intensely or where they participate in competitive events. The limited designation across 90% of the Ely RMP decision area is consistent with BLM policy.
- F5-36 Management actions to restore and improve habitat conditions will commence with completion of the initial watershed analyses for individual watershed rather than being delayed until completion of all watershed analyses as inferred in this comment. It is expected that the limiting factor for rate of treatment to restore and improve watershed health will be funding availability rather than the watershed analysis process. Term permits will be fully processed in compliance with NEPA procedures, applicable public laws, and BLM regulations and policies. The Ely Field Office intends to process term permits based on watershed assessment and priorities. However, term permits may be fully processed apart from the watershed process when necessary. The terms and conditions would be modified if information indicates that revision is necessary to achieve or make progress toward the Northeastern Great Basin Resource Advisory Council standards or the Mojave-Southern Great Basin standards.

Letter F5 Continued

F5-36

above under Watershed Analysis Process). Specifically, we are concerned that given the time BLM projects it will take to complete watershed analysis for the Ely District, stocking rate adjustments which are needed in the short term to address resource issues will not occur. This could result in further, and potentially serious, deterioration in watershed health and condition.

F5-37

Page 2.5-142, section 2.5.16.1, Alternative E. We note under the Preferred Alternative that 11,170,000 acres of the Ely District would be available for livestock grazing. We also recognize that livestock grazing is a historic and legal use of public lands. However, the RMP EIS states repeatedly "the restoration and maintenance of healthy ecological systems within watersheds is a primary focus for the future management of the Ely District" and "resources and resource uses will be managed to restore or maintain ecological health." Additionally, the RMP EIS characterizes Alternative E as "a shift from a commodity or individual resource allocation approach to a holistic or ecological systems approach to management." What is not clear is how allowing 11,171,000 acres (approx. 98% of Ely BLM landbase) of the District land base to be open to grazing is consistent with these focus statements, and the RMP characterization of Alternative E. In Chapter 3 on page 3.16-4, the RMP EIS indicates 61 of the grazing allotments in the District are in the "improve" category which, according to IM No. 82-292, means that the "present range condition is unsatisfactory." We do not support this level of grazing utilization on the Ely District land base and ask that BLM seriously reconsider this approach.

We request these type of reductions, or eliminations of livestock grazing, so that the needs of grazing permittees are better balanced with the need to conserve biological resources. Allowing 98 percent of the Ely BLM land base to be open to grazing could have numerous negative consequences to biological resources including federally listed species, federal candidate species, and sensitive species. In terms of areas to focus on in reducing lands open to livestock grazing we suggest the following : 1) areas designated or proposed as critical habitat for a federally listed or proposed species; 2) areas that provide habitat for federally listed species, proposed species, and candidate species; 3) ACEC's established to benefit biological resources (wildlife, fish, plants) or that contribute significantly to the conservation of these biological resources; 4) Riparian and wetland habitat in general; 5) significant portions of the Butte/Buc/White Pine and Schell/Antelope sage-grouse PMU's, and to further consider a full closure for one of these PMU's; 6) crucial elk summer range; 7) crucial winter pronghorn range; and 8) crucial winter and summer range for mule deer.

F5-38

Page 2.5-144, section 2.5.16.2, Alternative E for Permit Administration Parameter. The RMP EIS indicates on page 2.5-144 that Alternative E would implement a performance-based grazing system on the Ely District. We are open to this approach and recognize advantages it may provide. However, we have some reservations and concerns about how this will work in practice. We suspect some permittees will do a great job and others will not. We are also concerned about BLM's ability to administer and monitor this system given limited staffing and funding available to Ely BLM Field Office for this purpose.

Responses to Letter F5

F5-37

The areas presented in points 1 through 7 regarding lands open to livestock grazing currently are considered and addressed during annual grazing authorizations, the term permit renewal process, and the watershed analysis process.

F5-38

The term Performance Based Grazing has been removed as a Parameter. Performance Based Grazing emphasized flexibility. Flexibility will continue to be addressed on a site-specific basis. Allotment compliance will continue and will be prioritized based on criteria to include resource issues and operator performance capabilities.

Letter F5 Continued

F5-39 Pages 2.5-158 to 165, section 2.5.18.1, Descriptions for Alternatives B and E. The Draft Ely BLM RMP indicates that about 1.2 million acres would be open to leasing with some stipulations (standard lease terms and conditions and migratory bird restriction) and that another 8.6 million acres would be open to leasing with some programmatic stipulations. Additionally, another 446,000 acres would be open to leasing with only minor constraints. This means that about 90 percent of the Ely BLM land base would be open to leasing for fluid minerals with either some stipulations, or major stipulations. It also means only about 1.2 million acres would be closed to fluid mineral leasing (about 10 percent of the Ely BLM land base). We are not comfortable with this approach and the large proportion of the District land base that would potentially be open to leasing for fluid minerals like oil and gas. As with livestock grazing, we find that the approach proposed in the Draft RMP EIS is not consistent with the general description of Alternative E which characterizes BLM's Preferred Alternative as "a shift from a commodity or individual resource allocation approach to a holistic or ecological systems approach to management." Nor do we find it consistent with BLM's stated RMP Management Focus.

F5-40 We do note that many of the stipulations for fluid mineral development were specifically designed to benefit biological resources such as migratory birds, desert tortoise, sage grouse, and ferruginous hawks. However, most of these "wildlife" stipulations only relate to timing restrictions on fluid mineral activities. As long as the lessee adheres to seasonal timing restrictions, they can still have surface occupancy and develop the site for oil and gas, etc. Hence fluid mineral development is not prevented, but only shifted to avoid key time periods in the life cycle of certain species. This certainly has benefits for wildlife species but does not negate the negative consequences to wildlife of developing the site.

F5-40 Having 90 percent of Ely District lands open to fluid mineral leasing, and preventing surface occupancy for this purpose on about 10 percent of the land base, conflicts with conserving biological resources. We suggest BLM seriously reconsider allowing this many acres to be open to fluid minerals leasing. Additional considerations for closures to fluid mineral leasing include: 1) areas designated or proposed as critical habitat for a federally listed or proposed species; 2) areas that provide habitat for federally listed species, proposed species, and candidate species; 3) ACEC's established to benefit biological resources (wildlife, fish, plants) or that contribute significantly to the conservation of these biological resources; 4) Riparian and wetland habitat in general; 5) significant portions of the Butte/Buc/White Pine and Schell/Antelope sage-grouse PMU's, and to further consider a full closure for one of these PMU's; 6) crucial elk summer range; 7) crucial winter pronghorn range; and 8) crucial winter and summer range for mule deer.

F5-41 Pages 2.5-158 to 176, Geology and Mineral Extraction, Fluid Leasables, Solid Leasables, Locatables, and Saleables, Alternative E (same as Alternative B). We support BLM's recommendation to close Condor Canyon, Kane Springs, Lower Meadow Valley Wash,

Responses to Letter F5

F5-39 The President's Energy Policy directs the BLM to keep open as much land as possible for energy development and to utilize specific management plans and mitigations to protect resources. The current and specific plans in place such as Class I visual areas, threatened and endangered species, ACECs, ISAs, and WSAs have such strict standards for non-impairment that most mineral operations would be precluded. Leasing stipulations, standard lease terms and conditions, and the Best Management Practices listed in Appendix F would help minimize adverse impacts to resources of concern for those operations that are permitted.

F5-40 Please refer to Response to Comment F5-39 for a discussion of closing areas to fluid mineral leasing.

F5-41 Particular consideration was given to the Desert Tortoise Amendment to the Caliente MFP (1999), its specific Standard Operating Procedures based on the Biological Opinion, current minerals activities and leasing, consistency with neighboring BLM Field Offices, and the BLM's mineral and national energy policy. As a result of this analysis, the management actions for the Mormon Mesa and Beaver Dam Slope ACECs have been retained in Section 2.4.18 of the Proposed RMP and Final EIS.

Letter F5 Continued

F5-41 and Shoshone Ponds ACECs to mineral extraction. We also recommend closing Mormon Mesa and Beaver Dam Wash ACECs to all mineral extraction.

Pages 2.5-168 to 171, section 2.5.18.3, Descriptions for Alternatives B and E.

F5-42 This section indicates that about 10.1 million acres are open to locatable minerals development (about 88 percent of the Ely BLM District land base). In contrast, only about 1.3 million acres would be proposed for withdrawal from mineral entry (about 12 percent of the Ely BLM land base). We do not support this approach and the large proportion of the District land base that would potentially be open to leasing for development of locatable minerals like gold and silver. As with our previous comments pertaining to leasable minerals, we find that the approach proposed in the Draft RMP is not consistent with the general description of Alternative E which characterizes BLM's Preferred Alternative as "a shift from a commodity or individual resource allocation approach to a holistic or ecological systems approach to management." Nor do we find it to be consistent with the RMP Management Focus stated in the RMP. Allowing this many acres of land to be open to potential leasing for locatable mineral development conflicts with conserving biological resources. We suggest that Ely BLM seriously reconsider allowing this many acres to be open to locatable minerals leasing. Additional considerations for closures to this type of mineral leasing include: 1) areas designated or proposed as critical habitat for a federally listed or proposed species; 2) areas that provide habitat for federally listed species, proposed species, and candidate species; 3) ACEC's established to benefit biological resources (wildlife, fish, plants) or that contribute significantly to the conservation of these biological resources; 4) Riparian and wetland habitat in general; 5) significant portions of the Butte/Buc/White Pine and Schell/Antelope sage-grouse PMU's, and to further consider a full closure for one of these PMU's; 6) crucial elk summer range; 7) crucial winter pronghorn range; and 8) crucial winter and summer range for mule deer.

F5-43 Page 2.5-191, section 2.5.21, Noxious and Invasive Weed Management, Management Common to All Alternatives, item # 1. The Nevada Administrative Code (NAC) list of noxious weeds may not include invasive weed species, such as red brome and Sahara mustard, that are of concern to federally-listed, rare, and sensitive species. We recommend adding language to this section that identifies the potential need to manage invasive weeds other than those found on the NAC list of noxious weeds, to reduce threats to federally-listed, rare, and sensitive species and their habitats.

F5-44 Page 2.5-192, section 2.5.21.2, Monitoring of Noxious and Invasive Weeds. This paragraph states that burned areas, both natural and prescribed, would be surveyed for noxious weeds *as funding becomes available*. For prescribed burns, we suggest that weed surveys should be a part of the prescribed burn project, and the funding required for weed surveys should be included in the cost estimate for the project plan or grant proposal. Therefore, if the cost of weed surveys is built into the total cost of the prescribed burn project, conducting weed surveys in conjunction with prescribed burns would not be dependent on the availability of funds.

Responses to Letter F5

F5-42 As a point of clarification, locatable minerals are not subject to leasing. Nevertheless, the current and specific plans in place such as Class I visual areas, threatened and endangered species, ACECs, ISAs, and WSAs have such strict standards for non-impairment, that most mineral operations would not be permitted. This precluded the need for blanket closures and enables more site-specific decisions regarding the resource use. For those operations that are permitted, the Best Management Practices listed in Appendix F would help to minimize adverse impacts to resources of concern.

F5-43 In response to your comment, the text in Section 3.21.3 of the Proposed RMP and Final EIS has been revised to clarify that invasive species of concern include both red brome and Sahara mustard as well as cheatgrass and halogeton.

F5-44 Please refer to Appendix A in the Proposed RMP and Final EIS for a revised discussion of Watershed Analysis and Section 2.4.23 for Monitoring.

Letter F5 Continued

- F5-45 Pages 2.5-194 and 225, section 2.5.22.1, Special Designations, Areas of Critical Environmental Concern, Existing ACECs: Kane Springs, Beaver Dam Slope, and Mormon Mesa. This section proposes to close Kane Springs ACEC to minerals extraction, but leaves Mormon Mesa and Beaver Dam Slope ACECs open to minerals extraction. We recommend all existing ACECs, as well as proposed ACECs (Condor Canyon, Lower Meadow Valley Wash, and Shoshone Ponds) established for the protection of federally-listed species be closed to all mineral extraction.
- F5-46 Page 2.5-225, section 2.5.22.1, Special Designations, Areas of Critical Environmental Concern, Existing ACECs, Transportation. This section should state that roads and trails would be designated open or closed, rather than making a statement that transportation would be limited to existing roads.
- F5-47 Page 2.5-234, section 2.5.22.1, Special Designations, Areas of Critical Environmental Concern, Condor Canyon, Alternative B, Fire Management. Fire management for full suppression should include proactive elements into the strategy, such as incorporating fuel breaks and conducting prescribed fire in a manner that would diminish burn intensity and minimize probability of catastrophic wildfire. Fire management should focus on minimizing potential of erosion and other effects from fire to the Big Springs spinedace.
- F5-48 Page 2.5-234, section 2.5.22.1, Special Designations, Areas of Critical Environmental Concern, Condor Canyon, Alternative B, Livestock Management. We support the recommendation for limited grazing within the ACEC, provided that guidelines are developed to provide options for livestock grazing management that include eliminating or restricting grazing if monitoring shows that goals for riparian management are not being met. These guidelines should be developed with assistance from the Big Springs Spinedace Recovery Implementation Team.
- F5-49 Page 2.5-241, section 2.5.22.1, Special Designations, Areas of Critical Environmental Concern, Lower Meadow Valley Wash ACEC, Alternative B. We support the establishment of an ACEC for the protection of riparian habitat along the Meadow Valley Wash. This ACEC proposes to protect 3,240 acres of riparian habitat within three separate segments along the Meadow Valley Wash south of Caliente down to the Lincoln/Clark County line. These areas were identified based on the best information available a couple years ago on the occurrence of suitable or potentially suitable southwestern willow flycatcher habitat on BLM-administered land along the Meadow Valley Wash. Since that time, additional information has become available regarding disturbance to riparian habitat resulting from flooding events during the winter and spring of 2005 and other ground-disturbing activities conducted in response to damage caused by flooding. This information should be used to verify that the ACEC boundaries as proposed, would encompass the most appropriate locations for protective management of riparian habitat. We recommend that the proposed ACEC boundaries be overlaid with data on the distribution of southwestern willow flycatcher habitat, and with post-flood data on areas that were subject to ground-disturbing activities, to validate the appropriateness and/or feasibility of managing these areas for purposes of riparian habitat

Responses to Letter F5

- F5-45 In response to your comment, the Kane Springs, Beaver Dam Slope, and Mormon Mesa ACECs have been closed to mineral development. Proposals for other ACECs intended to protect federally listed species also contain stipulations on mineral development. Please refer to Section 2.4.18 of the Proposed RMP and Final EIS for specifics on mineral stipulations for individual ACECs.
- F5-46 The BLM proposes to follow the decisions previously negotiated and approved in the Caliente Management Framework Plan Amendment and Record of Decision for the Management of Desert Tortoise Habitat dated September 2000, since these decisions are still valid. As a point of clarification, travel would be limited to designated (not existing) roads and trails. Thus, existing roads and trails would be either designated open or designated closed. The text in Section 2.4.22.1 of the Proposed RMP and Final EIS has been revised to be more consistent with the wording contained in the Amendment and ROD.
- F5-47 The topic of detailed fire management plans for individual ACECs will be considered by the Ely Field Office when individual management plans are prepared for these special designation areas.
- F5-48 The topic of detailed livestock grazing plans for individual ACECs will be considered by the Ely Field Office on a case-by-case basis for these special designation areas. Livestock grazing will be controlled through terms and conditions on the grazing permit.
- F5-49 In response to your comment, the text and maps related to the proposed Lower Meadow Valley Wash area of critical environmental concern in Section 2.5.22 of the Proposed RMP and Final EIS have been revised.

Letter F5 Continued

F5-49 [conservation. We are available to assist BLM with any additional efforts you may undertake to re-evaluate the location of this ACEC.

F5-50 [In addition, since the two southerly segments are subject to a much more stressful desert environment, and are in much poorer condition than the northerly Rainbow segment, we recommend Alternative B for livestock management of the Lower Meadow Valley Wash ACEC, provided that the locations of the three segments of this ACEC are not substantially altered by subsequent evaluations. Alternative B would close the Carp and Rox units to livestock grazing, while limiting grazing in the more northerly Rainbow unit.

Section 3.0, Affected Environment

F5-51 [Page 3.3-8, section 3.3.2, Trends- Groundwater.
We do not agree completely with the first complete sentence on this page. This sentence indicates how areas like Reno, Carson City, and Las Vegas are growing and the ways that water demands related to the growth of these areas can be met. There are other alternatives that could be considered which you do not list here. One example is constructing water desalinization plants in California in exchange for Colorado River water (this would be appropriate for southern Nevada only).

F5-52 [Page 3.6-1, section 3.6 Fish and Wildlife, general comments on this section.
We note the RMP EIS included a list of game fish that occur on the District. We understand that detailed accounts of all the fish and wildlife species that occur on the Ely BLM District cannot be provided. However, we suggest considering the addition of a table to the Appendices that at least provides a list of mammals, birds, reptiles, amphibians, and fishes that are known or suspected to occur on the District.

F5-53 [The RMP EIS wildlife discussion under section 3.6.2 is heavily weighted towards a few big game species. We suggest that expanding coverage of non-game wildlife species that are not Special Status Species. We also suggest adding in a specific section under Wildlife to address migratory birds. There is information available from the Great Basin Bird Observatory's Nevada Bird Count Program and their Breeding Bird Atlas project for Nevada on bird numbers and distribution within the Ely BLM District. Since BLM was a partner in these efforts this data is available to BLM upon request. Trend information for birds is available from the Breeding Bird Survey. We note that within the area covered by the Ely BLM District boundary there are 10 Breeding Bird Survey transects that have been surveyed for birds. Additionally, NDOW likely has information on both non-game wildlife and small game numbers that could be integrated into this part of the document.

F5-54 [Page 3.6-13, section 3.6.2 Wildlife, Current Management.
On the top of Page 3.6-13 the Ely BLM RMP indicates the number of birds from the Service's Birds of Conservation Concern that could occur in the Great Basin and Mojave ecosystem parts of the Ely District. Consider adding an Appendix Table that summarizes this information for interested persons.

Responses to Letter F5

F5-50 Please refer to Response to Comment F5-27.

F5-51 In response to your comment, the text in Section 3.3.2 of the Proposed RMP and Final EIS has been modified to clarify groundwater development trends.

F5-52 Several sources of direction were consulted in determining the information to include in the Proposed RMP and Final EIS. The BLM Land Use Planning Handbook instructs the Ely Field Office to designate priority species of wildlife and habitats for management emphasis. Priority species are identified in Section 2.4.6 of the Proposed RMP and Final EIS. Habitat management that would benefit priority species would also benefit other wildlife species. With regards to the affected environment chapter of the EIS, the Council on Environmental Quality directs that "The descriptions shall be no longer than is necessary to understand the effects of the alternatives" (40 Code of Federal Regulations 1502.15). Therefore, the Ely Field Office did not consider an expansive species list as being necessary for developing management actions or analyzing the impacts of the alternatives.

F5-53 In response to your comment, the text in Section 3.6.2 of the Proposed RMP and Final EIS has been revised to expand the discussion of migratory birds. The BLM Land Use Planning Handbook directs the Ely Field Office to develop management actions for "game, non-game, and migratory bird species". The priority species listed in Section 2.4.6.2 of the Proposed RMP and Final EIS includes game species and migratory birds. Also, please refer to Response to Comment F5-52.

F5-54 In response to your comment, a table has been added to Section 3.6.2 of the Proposed RMP and Final EIS to present the 28 species of birds that are of concern.

Letter F5 Continued

- F5-55 Page 3.7-1, section Special Status Species.
Most of the discussion of plant, fish, and wildlife species is for federally listed and candidate species. Consider adding more discussion for species that are not federally listed or federal candidate species. Some information is available about these species from the Nevada Natural Heritage Program, the Great Basin Bird Observatory's Breeding Bird Atlas project and their Nevada Bird Count program, the Breeding Bird Survey program administered by U.S. Geological Survey- Biological Resources Division, the Nevada Department of Wildlife (especially the Wildlife Diversity Bureau), and other sources.
- F5-56 Page 3.7-2, section 3.7.1, Federal Species of Concern and Sunnyside green gentian.
First we are not certain as to the intended meaning of the term "Federal Species of Concern." If it is intended to be a reference to the "Species of Concern" list that the Nevada Fish and Wildlife Office, U.S. Fish and Wildlife Service, formerly kept for the state of Nevada then we suggest that the RMP refer to these species in a different manner. In October 2003, the Nevada Fish and Wildlife Office discontinued the practice of maintaining a list of species of concern for the state of Nevada. We remain concerned about the conservation status of the species on that former list, however, most were already on the sensitive species list for Nevada maintained by the Nevada Natural Heritage Program (NNHP). So rather than maintain our own list we have adopted NNHP's sensitive species list. We informed partner agencies of this change in a letter sent out in the fall of 2003.
- F5-57 While the sunnyside green gentian it is not a Federal Species of Concern, it is on a list maintained by NNHP of rare plants. Also, it is on a list maintained by the Nevada Division of Forestry of Nevada plants that are "fully protected" under state law.
- F5-58 Page 3.7-2, section 3.7.2 Aquatic Species, Aquatic Invertebrates and Amphibians header.
In the first sentence under the Aquatic Invertebrates and Amphibians header the RMP EIS has the term "proposed species of concern". We are unclear what this is referring to. Is this referring to a species proposed for federal listing, or does it refer to a BLM sensitive species, or is it a reference to the former species of concern maintained by the Service?
- F5-59 Page 3.7-10, section 3.7.3 Wildlife.
We suggest that a discussion for pygmy rabbit in the Special Status Species wildlife section be added to the RMP EIS. Wording regarding management of sagebrush habitat should include qualifiers to allow for possibility that what is good for sage grouse may not be the right approach for other sagebrush obligate species (ie. pygmy rabbit, sage sparrow, sage thrasher, etc.) and may need to be adjusted on a site-specific scale or local project scale.
- F5-60 The Bald Eagle Protection Act should be cited as the Bald and Golden Eagle Protection Act. Since golden eagles are protected under this federal act we suggest that a specific section concerning the management of golden eagles be added to the RMP EIS. One of the appendices includes management stipulations for golden eagles but this approach should be present throughout the document.

Responses to Letter F5

- F5-55 The species presented in Section 3.7 of the Proposed RMP and Final EIS include federally listed species, federal candidate species, and selected BLM sensitive species. The bird species emphasized in Section 3.7.3 (southwestern willow flycatcher, Yuma clapper rail, bald eagle, yellow-billed cuckoo, greater sage-grouse, and western burrowing owl) were selected through discussions between the Ely Field Office and the Fish and Wildlife Service as those most appropriate planning-area-wide impact analysis.
- F5-56 In response to your comment, the text in Section 3.7.1 of the Proposed RMP and Final EIS has been revised to clarify the discussion of the Sunnyside green gentian. The Federal Species of Concern heading has been deleted.
- F5-57 Changes have been made in the text (Table 2.9-1 and text sections 2.4.7.6, 3.7.1, and 4.7) to correctly identify the status of the sunnyside green gentian and to discuss related impacts in an appropriate manner.
- F5-58 In response to your comment, the text in Section 3.7.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion of BLM sensitive species.
- F5-59 In response to your comment, the text in Section 3.7.3 of the Proposed RMP and Final EIS has been modified to discuss additional sagebrush obligate species.
- F5-60 In response to your comment, the text in Section 3.7.3 of the Proposed RMP and Final EIS has been revised to reference the Bald and Golden Eagle Protection Act. In addition, a decision has been added in Section 2.4.7.1 that states, where appropriate, permitted activities will be restricted from May 1 through July 15 within 1/2 mile of a raptor nest site unless the nest site has been determined to be inactive for at least the previous five years. This pertains to all raptors including golden eagles.

Letter F5 Continued

- F5-61 The recovery plan for bald eagles in Nevada is the Pacific States Bald Eagle Recovery Plan which was published in 1986. We suggest you properly cite this document in the EIS and list it with your list of recovery plans that apply to the Ely BLM District on page 1.9-1. You should also be aware in 2005, bald eagles nested in the Ruby Valley in Elko County. This means that bald eagle nesting in the Ely District is possible, although admittedly nesting habitat is rather limited and it is likely that the District will not support very many nesting pairs over time.
- F5-62 Page 3.7-13 Current Management. Although bald eagle presence and use in the Ely District BLM area is rather limited management direction for bald eagles here are covered under the Pacific States Bald Eagle Recovery Plan (1986). This Recovery Plan should be cited on Page 3.7-13 under this header.
- F5-63 Page 3.7-1, section 3.7.1 Plant Species. The "Existing Conditions" section indicates that there are two federally listed plant species on the Ely District. The Utes ladies'-tresses is the only federally listed plant species that occurs on Ely District. The sunnyside green gentian is not a federally listed species so the text should be corrected to reflect this. In 2005 there was a rediscovery of Utes ladies'-tresses in the vicinity of where it was formerly documented. We suggest adding some discussion to incorporate this new information.
- F5-64 Page 3.7-5, section 3.7.2. Affected Environment, Aquatic Species, Pahrnagat Roundtail Chub. Add additional language to this section regarding the new refugium recently developed for this species at the Key Pittman Wildlife Management Area. This refugium is a former irrigation reservoir fed by well water. It was lined with a pond liner during 2004, and 2,400 individuals were stocked. During surveys in the fall of 2005, young of year chub were detected, suggesting reproduction was occurring.
- F5-65 Page 3.7-8, table 3.7-1, Affected Environment, Summary of Population Sampling for Federally Listed Fish Species. More recent data is available for all of the fish species listed in this table. Surveys for each of these species were conducted either in 2004 or 2005. We recommend coordinating with NDOW to update this table so that it reflects the most current data.
- F5-66 Page 3.7-10, section 3.7.3, Wildlife, Federally Listed Species, Southwestern Willow Flycatcher, second paragraph. More recent survey data is available for the Pahrnagat National Wildlife Refuge. One of Nevada's largest flycatcher populations occurs on the Refuge, and surveys have been conducted annually since 1998. Please contact our office to obtain a list of references for these surveys.
- F5-67 Page 3.7-11, section 3.7.3, Wildlife, Federally Listed Species, Bald Eagle, first paragraph. Please add to this paragraph that bald eagles are known to roost in the large cottonwoods and willows at the Pahrnagat National Wildlife Refuge during winter months.

Responses to Letter F5

- F5-61 In response to your comment, the text in Chapter 1 and Section 3.7.3 of the Proposed RMP and Final EIS has been revised to reference the Pacific States Bald Eagle Recovery Plan. In addition, Section 3.7.3 has been modified to acknowledge the nest site in Ruby Valley.
- F5-62 In response to your comment, the text in Section 3.7.3 of the Proposed RMP and Final EIS has been revised to include the reference to the Pacific States Bald Eagle Recovery Plan (1986).
- F5-63 In response to your comment, the text in Section 3.7.1 of the Proposed RMP and Final EIS has been revised to indicate the recent observations of the Ute ladies'-tresses. Changes have been made in the text (Sections 2.4.7, 3.7.1, and 4.7.1) to correctly identify the status of the sunnyside green gentian and to discuss related impacts in an appropriate manner.
- F5-64 In response to your comment, the text in Section 3.7.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion of the new refugium in the Key Pittman Wildlife Management Area.
- F5-65 In response to your comment, Table 3.7-1 in the Proposed RMP and Final EIS has been updated to include more recent survey information.
- F5-66 In response to your comment, the text in Section 3.7.3 of the Proposed RMP and Final EIS has been updated to include the more recent survey data for the southwestern willow flycatcher.
- F5-67 In response to your comment, the text of Section 3.7.3 in the Proposed RMP and Final EIS has been revised to incorporate the additional information on bald eagle roosting.

Letter F5 Continued

Section 4.0, Environmental Consequences

F5-68 Page 4.1-6, section 4.1.3, Assumptions for Analysis. The first bullet statement indicates existing state and federal environmental legislation and regulatory programs would remain relatively unchanged. Our concern with this statement relates to BLM Environmental Impact Statement DES 03-62 regarding Proposed Revisions to Grazing Regulations for the Public Lands. Our understanding is that BLM is in the process of finalizing these proposed revisions to grazing regulations. If this is the case then there are some fundamental changes that will be made to the way BLM administers its grazing program. Many of the proposed changes give greater ownership and benefits to permittees grazing on federal lands, and change the time interval between when a resource problem is identified on an allotment and when livestock numbers are adjusted to address the problem. If these revisions are imminent they would change much of the discussion about livestock grazing and its effects on biological resources of the Ely District. Hence there may be a need for BLM to revise livestock grazing discussions in all appropriate sections of the Ely BLM RMP EIS to account for these changes.

F5-69 Page 4.1-12, section 4.1.4.5 Special Status Species, Summary of Existing Information. This bulleted item indicates that the Nevada Natural Heritage Program only has information about special status plants and not animals. The Nevada Natural Heritage Program tracks information about all rare species in Nevada including animals (includes all taxa). This bullet should be revised accordingly. If the Ely BLM District has not already done queries with the Nevada Natural Heritage Program to acquire information on animal species, consider doing this. Similarly, NDOW, through its Wildlife Diversity Bureau, collects data on animal species and maintains databases and GIS themes with this information. For bird species the Great Basin Bird Observatory has a Nevada Bird Count program focused on monitoring trends of bird populations throughout the state of Nevada. For White Pine and Lincoln Counties this monitoring work has been ongoing for the last four years.

F5-70 Page 4.3-3, section 4.3, Environmental Consequences, Water Resources, Impacts from Other Programs, Lands and Realty. This sentence states that impacts to water resources from lands and realty actions could contribute to increased erosion. This sentence greatly understates the potential impacts to water resources that would result from lands and realty actions. The sale of Federal land for development purposes promotes a greater demand for water resources to support the resulting development. The BLM should disclose all impacts, including indirect impacts related to water resource development, which would result from the sale of disposal lands.

F5-71 Page 4.6-30, section Alternative E- Wildlife Conclusion. We assume that the conclusion statement is a summation of the indirect and direct impacts on wildlife resources from all program areas under the management authority of the Ely BLM Field Office. Most of the discussion about impacts in Chapter 4 is overly generalized and not very specific. Nor is much provided in the way of quantitative information to back up the conclusions that you reached. The discussions in Chapter 4 also seem to focus disproportionately on the positive outcome for biological resources that will accompany actions like range and

Responses to Letter F5

F5-68 Thank you for expressing your concerns regarding consistency between the Proposed RMP and the Proposed Revisions to Grazing Regulations for the Public Lands (BLM EIS DES 03 62). The Record of Decision for revisions to grazing regulations was issued in July of 2006, and the Proposed RMP was evaluated for consistency. In addition, a summary of the grazing EIS has been added to the Proposed RMP and Final EIS in Section 1.9.3.4 on Recent Programmatic EISs.

F5-69 In response to your comment, the text in Section 3.7 of the Proposed RMP and Final EIS has been changed to clarify the discussion regarding the Natural Heritage Program.

F5-70 Without further specifics regarding individual lands and realty actions, it would be speculative to identify site-specific impacts from these actions or try to quantify them. In general, land disposals leading to development would result in increased demands on water resources. In response to this and similar comments, the text in Section 4.3 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of the effects of land disposal on water resources. The basic impact conclusions presented in the Draft RMP and EIS have not changed. In addition, each disposal action would undergo a NEPA process wherein its specific impacts would be assessed, and cumulative impacts from past, present, and reasonably foreseeable future actions would be addressed at that point in time.

F5-71 The conclusion statement is meant to be a brief summary statement about effects of management actions on wildlife in general, not an itemization by individual species or even species groups. Impact discussions that provide effects on particular groups of wildlife species are described earlier in the text for the Proposed RMP.

Letter F5 Continued

Responses to Letter F5

- F5-71 watershed improvement projects, habitat restoration, etc. This is also the case for the conclusion statement. We acknowledge that much of the restoration and habitat enhancement actions you discuss in the EIS will benefit wildlife species. However, the statement lumps many different types of wildlife species together when impacts are likely to affect different wildlife species in very different ways. We are unclear as to why a summary statement about whether the combined indirect and direct impacts would negatively impact wildlife populations, positively affect them, or that they would remain stable was not provided in the RMP EIS. In short, a conclusion about the indirect and direct impacts on wildlife was not provided. We recommend expanding the analysis, splitting out statements of impacts based on different types of wildlife, and providing both conclusory statements and more context as to how these conclusions were reached. We note similar deficiencies in the conclusion statements for Aquatic Habitat and Fisheries on page 4.6-10. The conclusion provided in the RMP EIS for these biological resources is not accurate and lacks justification.
- F5-72 Page 4.7-19, section 4.7.2, Environmental Consequences, Aquatic Species, Alternative B, Fish and Wildlife, Big Spring Spinedace. This sentence states that management actions would have no effect on the spinedace because trout distribution in the Meadow Valley Wash does not overlap with that of the spinedace. However, the Recovery Implementation Team has been discussing the potential for establishing a refugium for the spinedace in Clover Creek, which is within the historic range of the spinedace, and this may create an overlap with trout management in this area. We recommend adding language that would address the potential need for coordinated fish management efforts in Clover Creek at some point in the future.
- F5-73 Page 4.7-19, section 4.7.2, Environmental Consequences, Aquatic Species, Alternative B, Livestock Grazing, Other Sensitive Species on BLM-administered Land. This section mentions reducing impacts to the White River desert sucker and relict dace from livestock grazing. However, there is no mention of these two species elsewhere within the document. Management alternatives and affected environment for these species should be added to chapters 2 and 3.
- F5-74 Page 4.7-20, section 4.7.2, Environmental Consequences, Aquatic Species, Alternative B, Mineral Extraction, Big Spring Spinedace and Other Sensitive Species on BLM-administered Land. This section should be expanded to describe more specifically what the anticipated effects may be to aquatic listed, rare, and sensitive species from mineral extraction. Since most of the Meadow Valley Wash and Clover Creek are located within areas proposed to be open to minerals extraction, and the upper Meadow Valley Wash is located within a high potential oil and gas development area, we are particularly interested in understanding the specific impacts that may occur to listed, rare, and sensitive aquatic species, and the measures that will be taken to ensure that impacts from mineral extraction are minimized to avoid adverse effects to the species.
- F5-75 Pages 4.7-25 and 4.7-46, section 4.7 Special Status Species, Conclusion statements for Aquatic Species and Wildlife Species. Similar to our previous comments above regarding the "Conclusion" statements about impacts (indirect and direct) on Wildlife
- F5-72 In response to your comment, the text in Section 4.7 of the Proposed RMP and Final EIS has been revised to include a discussion of the potential for establishing a refugium for the spinedace in Clover Creek. If the refugium is established, coordinated management between the USFWS and NDOW would be required.
- F5-73 In response to your comment, the text in Section 2.4.7, Section 3.7.2, and Section 4.7 of the Proposed RMP and Final EIS have been revised to clarify the discussion regarding management of special status species and impacts to those species. Specific management direction is provided for those species that the BLM and the USFWS agreed to address during the consultation process for the Ely RMP. All other special status species (see Appendix E) have been addressed in a general way in the Proposed RMP and Final EIS.
- F5-74 The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans for mineral extraction are prepared and evaluated. NEPA analysis and Section 7 compliance will be required and impacts and mitigation will be described for the specific development areas. Best Management Practices would be implemented to minimize impacts to sensitive species. Please refer to Section 2.4.18 in the Proposed RMP and Final EIS for a discussion of specific restrictions to mineral development in ACECs that provide habitat for sensitive species.
- F5-75 The conclusion provides summary statements about effects of management actions on sensitive species as an overall group. Impact discussions that provide effects on particular sensitive species are described under each program.

Letter F5 Continued

F5-75 and Aquatic Habitat and Fisheries we do not think the "Conclusion" statements in this section are accurate or appropriate given the limited discussion provided about indirect and direct impacts. The RMP EIS analysis is overly general and does not provide a context that allows for the conclusion that is provided. The RMP EIS "Conclusion" statement lumps together a wide variety of species and concludes the same outcome for all when the outcomes will actually vary by species. We suggest BLM revisit these sections of the EIS. There is a need to provide more background and context for the conclusions. Rather than lumping together a wide variety of taxa we suggest that they be split into separate discussions. Some type of summary statements about whether you expect populations to remain the same, decrease, or increase should be provided.

F5-76 Page 4.28-32 and 34, section 4.28.6 Fish and Wildlife, Cumulative Impacts Conclusion. After reviewing the summary statements provided on pages 4.28-32 and 4.28-34 for "Fisheries" and "Wildlife", we do not understand how the conclusions that are provided in the RMP EIS were reached. Most of the discussion about impacts in Chapter 4 is overly generalized and not very specific. Nor is much provided in the way of quantitative information to back up the conclusions that are provided. The RMP EIS discussions also seem to focus disproportionately on the positive outcome for biological resources that will accompany actions like range and watershed improvement projects, habitat restoration, etc. We acknowledge that much of the restoration and habitat enhancement actions discussed in the EIS will benefit wildlife species. However, under Alternative E 98 percent of the Ely BLM land base will be open to livestock grazing, the area open to locatable minerals would be 89 percent of the District, the total acreage open to salable minerals would be 84 percent of the District, the acreage open to leasing of fluid minerals would be 89 percent of the District, the acreage open to leasing of solid minerals would be 89 percent of the District, about 60 percent of the District would be open to solar energy development, there does not appear to be any general stipulation preventing lands with known occurrences of federally listed species from being disposed of, about 11 percent of the land base would be open to maximize opportunities for motorcycle special recreation permit events, and only about 7 percent of the District would be closed to off-highway vehicles. Even considering that a variety of best management practices, contract stipulations, and management adjustments will be applied to programs that negatively impact fish and wildlife resources, we do not agree with the conclusions that are provided. Within the context of cumulative impacts analysis the RMP EIS should consider the worst case scenario from the combined impact of all the extractive type activities that BLM could potentially allow and then project an outcome for fisheries and wildlife based on this. BLM may also want to project the best case scenario for resource development in the RMP EIS and then project a range of possible outcomes that may result. In reviewing Chapter 4 we have to assess the greatest potential impact that may result for fish and wildlife resources from the alternative BLM proposes to implement. In doing this we conclude that the overall impact to fish and wildlife resources from the BLM preferred alternative is likely to have negative consequences for fish and wildlife populations on the Ely BLM District land base.

We suggest that BLM revisit the analysis of cumulative effects for fish and wildlife resources, split out the analysis into more categories or groupings of fish and wildlife,

Responses to Letter F5

F5-76 In response to this and other comments, the impact analysis in Section 4.6 of the Proposed RMP and Final EIS has been clarified and expanded as appropriate. However, the Council on Environmental Quality has eliminated the requirement for a "worst case analysis" in EISs. In accordance with applicable statutes and policies, the Ely Field Office would continue to manage the majority of lands within the Ely RMP decision area for multiple uses. The widespread closure of lands to other uses for the sole purpose of protecting and enhancing fish and wildlife values is not consistent with BLM's multiple use mandate. The Ely Field Office's management actions for the decision area are based on projected resource demands, sustainable use levels, and site-specific management applied at the watershed level. The fact that the majority of the decision area would remain open for mineral development or for renewable energy development is essentially irrelevant to the reasonably foreseeable development projections for these resource uses, which serve as the logical basis for assessing environmental impacts from the Proposed RMP. In support of the impact conclusions presented, it should be noted that while the management actions in the Proposed RMP would retain multiple use throughout most of the decision area, almost all disturbance-generating uses would be subject to substantially greater constraints and environmental protection measures than are applied under current management. For example, where current management identifies almost the entire decision area as being "open" to off-highway vehicle use, the Proposed RMP would "limit" such use to designated roads and trails or "close" some areas entirely. Similarly, Section 2.4.12 stipulates that lands designated as "critical habitat" for listed species would not be disposed. The Cumulative Impacts Conclusion statements are intended to be very brief summary statements, not a repeat of the more detailed discussions presented throughout Chapter 4.

Letter F5 Continued

F5-76 | and provide more of a context for how the conclusions provided in the RMP EIS were reached.

Appendix B, The Bureau of Land Management's Proposed Wind Energy Development Program

F5-77 | Will the Ely BLM Field Office be adopting all the best management practices from the BLM Final Programmatic EIS on Wind Energy Development? More specifically, would the Ely Field Office be adopting the best management practice that would prohibit the disturbance of listed plant species?

Pages B-1 to B-6, Under the Proposed Policies and Proposed Best Management Practices header.

F5-78 | We recommend that the Ely BLM Field Office fully adopt both the Service's *Interim Guidelines to Avoid and Minimize Wildlife Impacts from Wind Turbines* and guidance contained in the Service's *Prairie Grouse Leaks and Wind Turbines: U.S. Fish and Wildlife Service Justification for a 5-Mile Buffer from Leaks; Additional Grassland Songbird Recommendations* briefing paper. We also suggest these guidance documents be referenced in this Appendix and that all appropriate guidelines and best management practices from these Service guidance documents be integrated into all future wind energy developments on the Ely BLM District.

Page B-16, under References.

F5-79 | The "Conservation Assessment of Greater Sage-grouse and Sagebrush Habitats, 2004" was not written by the State of Nevada. This was a product of the Western Association of Fish and Wildlife Agencies and authored by John Connelly, Steven Knick, Michael Schroeder, and San Stiver. This publication should be cited as it is given on the front page of that Assessment.

Appendix E, Tools and Techniques

F5-80 | A section is needed to describe monitoring plans for determining the effects or success of management tools and techniques for use in managing natural resources, watersheds, and ecological systems. Although the RMP describes monitoring in general for each of the programs in Chapter 2, more specific guidelines should be developed to test the efficacy of management tools and techniques, to ensure that results are successful in reaching management goals while reducing or avoiding impacts to listed, rare, or sensitive species.

F5-81 | **Appendix F, Special Status Species.** In Table 1, in the column labeled "U.S. Fish and Wildlife Service", the Greater sage grouse is coded as "PT." We assume that this is intended to indicate that the species has been proposed for listing as threatened. Since sage-grouse have not been proposed by the Service for listing, this space should be blank.

Responses to Letter F5

F5-77 | The Proposed RMP/Final EIS has incorporated the best management practices from the BLM Final Programmatic EIS on Wind Energy Development found in Appendix F, Section 3. Any disturbance of listed plant species that might be identified in the future would be addressed during the NEPA process and consultation with the US Fish and Wildlife Service.

F5-78 | Please refer to Appendix F, Section 3 in the Proposed RMP and Final EIS for the BLM Wind Energy Development Program Policies and Best Management Practices published in conjunction with the Record of Decision for BLM's Final Wind Energy Development Programmatic EIS. These are the best management practices that will be adopted by the Ely Field Office. Please note that the Fish and Wildlife Service consulted on the preparation of the Wind Energy EIS and is expected to issue a programmatic biological opinion on the development of wind energy on public lands. If the Service determines that best management practices beyond those published in conjunction with the Record of Decision are necessary and appropriate, it is expected that these would be included in the biological opinion.

F5-79 | In response to your comment, the referenced citation has been corrected.

F5-80 | In response to your comment, the text in Section 2.4.23 of the Proposed RMP and Final EIS has been expanded to clarify the discussion of monitoring.

F5-81 | In response to your comment, Appendix E in the Proposed RMP and Final EIS has been modified by removing the code "PT" from the referenced table.

Letter F5 Continued

- F5-82 [**Appendix H, Standard Operating Procedures.**
We recommend an addition to "WL3" on page H-1 to add another sentence to this SOP stating that "To the greatest extent possible all mind adits and shafts that are slated for closure will be surveyed for bat presence and use prior to being closed."
- F5-83 [For Standard Operation Procedure "SS4" on page H-2 we suggest that BLM add in a reference for the most recent joint guidance produced by APLIC, the 2005 Avian Protection Plan, for minimizing wildlife impacts from powerline/utility line construction.
- F5-84 [We suggest the addition of a stipulation to the "Minerals" part of the Standard Operating Procedures (pages H-6 to H-8). The stipulation should state that for circular, hollow mining claim markers the tops are required to be capped, in accordance with Nevada state law, to prevent mortality to migratory birds, bats, and insects.
- F5-85 [**Appendix L, Standard Terms and Conditions for Mineral Development Within the Ely District.** On Page L-4 under Standard Operating Procedures for Mineral Materials we suggest adjusting the time period with regard to nesting migratory birds so that it reads "Any disturbance commencing between April 1 and July 15." Similarly, on page L-5 under "13" and on page L-23 under "1.2.4.4" we suggest the same change be made.
- F5-86 [On page L-7 under "20" the Appendix indicates that a 0.5 mile buffer zone will be imposed on activities around various raptor use sites. For what length of time would this buffer zone against disturbance be in effect?
- F5-87 [On page L-7 under "21" we suggest changing the language to read "Consultation with the U.S. Fish and Wildlife Service is required under Section 7 of the Endangered Species Act if a BLM project (any project funded, authorized, or carried out by BLM) may affect a listed species or adversely modify designated critical habitat for the species. If a BLM project may affect a species proposed for listing or adversely modify proposed critical habitat for a species, BLM 6840 policy requires conferencing with the U.S. Fish and Wildlife Service." The last sentence provided under item "21" is fine as is. Similarly, we suggest changing this language elsewhere in this Appendix where it occurs (ie. item 25 page L-12, etc.).
- F5-88 [For the desert tortoise on page L-38 under item 1.4.7.1 we suggest some modifications to the existing text to account for the fact that desert tortoise has designated critical habitat. The suggested revision would be "Consultation with the U.S. Fish and Wildlife Service is required under Section 7 of the Endangered Species Act before a project can be approved if BLM determines that the proposed action may affect the desert tortoise, or adversely modify designated critical habitat for the species. If a determination is made that a BLM project may affect the desert tortoise, or adversely modify designated critical habitat for the species, the proposal must be modified or denied per appropriate regulations."
- F5-89 [Page L-25 under section 1.2.4.15, Pygmy Rabbit Standard Operating Procedure. We suggest some changes and revision to the measures that you include here. Our recommendation is that there be three measures as follows:

Responses to Letter F5

- F5-82 In response to your comment, the text of Standard Operating Procedure WL3 from the Draft RMP and EIS has been revised to incorporate the wording suggested in the comment. It now appears in Appendix F, Section 1, as best management practice #1.7.5.
- F5-83 In response to your comment, the text of Standard Operating Procedure SS4 from the Draft RMP and EIS has been revised to incorporate the reference suggested in the comment. It now appears in Appendix F, Section 1, as best management practice #1.7.2.
- F5-84 A best management practice as described in this comment is not needed in the Proposed RMP, because mining claim markers are regulated by the State of Nevada.
- F5-85 The Standard Terms and Conditions for Mineral Development listed in Appendix L of the Draft RMP/EIS are for Alternative A, which is continuation of present management. Thus, the dates referenced in this comment cannot be changed. A specific time period for the nesting of migratory birds in the planning area is not included as a management action in the Proposed RMP, because it would vary substantially between the Great Basin and the Mojave Desert regions. However, please note that the Ely Field Office Policy for Management Actions for the Conservation of Migratory Birds allows for revising the dates of the "no activity" period as new information on avian species or specific characteristics of a proposed project indicate a need to do so.
- F5-86 In response to your comment, the wording of item 20 under Geophysical Operations has been revised to clarify that the referenced buffer zone would apply throughout the period of active use of these sites. Please note that Appendix L has been combined into Appendix K in the Proposed RMP and Final EIS.
- F5-87 In response to your comment, your suggested text changes have been incorporated. Please note that Appendix L has been combined into Appendix K in the Proposed RMP and Final EIS.
- F5-88 In response to your comment, your suggested text changes have been incorporated. Please note that Appendix L has been combined into Appendix K in the Proposed RMP and Final EIS.
- F5-89 In response to your comment, your suggested text changes have been incorporated. Please note that Appendix L has been combined into Appendix K in the Proposed RMP and Final EIS.

Letter F5 Continued

- F5-89
- a. Avoid areas pygmy rabbits occupy
 - b. Restriction of activities near burrows during the months of April through early August
 - c. Avoid fragmentation of populations

Appendix M, Wildlife Desired Future Conditions

F5-90

We note that desired future conditions for sagebrush habitat, and those species associated with this habitat type, are provided in this Appendix. This is key given that about 49 percent of the Ely BLM land base is sagebrush habitat. However, we are concerned that desired future condition sections for any of the other wildlife habitats that Ely BLM District is responsible for managing were not developed and provided in this Appendix. We strongly encourage BLM to develop desired future conditions for all the wildlife habitats managed by the Ely BLM Field Office.

Appendix N, Standard Requirements for Lands and Realty Actions Within the Ely District

F5-91

We are concerned that this Appendix has no stipulations or standards that relate directly to fish, wildlife or plants. More specifically there are no standards provided relative to federally listed species, designated critical habitat, and species that are proposed for listing or those that are federal candidates for listing. We suggest adding a stipulation to this Appendix that specifically indicates that BLM lands with habitat for federally listed species, species proposed for listing, species that are candidates for listing, or with designated or proposed critical habitat for a federally listed species, will not be exchanged or disposed of by BLM.

Responses to Letter F5

F5-90

Please refer to Section 2.4.5 in the Proposed RMP and Final EIS for a discussion of the desired future condition of vegetation by all habitat types. Please note that this Appendix has been deleted from the Proposed RMP and Final EIS.

F5-91

Please refer to Section 2.4.12 in the Proposed RMP and Final EIS for a discussion of lands and realty management actions. Please note that Appendix N has been combined into Appendix K in the Proposed RMP and Final EIS.

Letter F6

United States Department of the Interior

NATIONAL PARK SERVICE
Great Basin National Park
Baker, Nevada 89311-9701

NI6(GRBA)

November 30, 2005

Gene Draiss, Project Manager
U.S. Department of the Interior
Bureau of Land Management
Ely Field Office
HC33 Box 33500
Ely, Nevada 89301

Mr. Draiss,

Great Basin National Park has reviewed the Draft Resource Management Plan/Environmental Impact Statement for the Ely District and would like to provide additional information on issues concerning wildlife. Although Humboldt National Forest and Great Basin National Park predominately administer the south Snake Range, the proposed alternatives could weaken the ability to carry out management for Rocky Mountain Bighorn sheep on the south Snake Range and sage grouse in Snake Valley. Listed below are our comments to include in the document.

F6-1

- Include the Windy Peak and Sacramento Pass area of the south Snake Range for management of Rocky Mountain bighorn sheep. Great Basin National Park is currently preparing a restoration plan for bighorn sheep that will encourage metapopulation dynamics with the Mt. Moriah population and cooperative domestic sheep management. The Windy Peak/Sacramento Pass area provides existing bighorn sheep habitat based on GIS habitat models developed by the park and provides a corridor for movement between Mt. Moriah on the north Snake Range and alpine habitats on the south Snake Range. This corridor allows for metapopulation dynamics that would maintain the genetic viability of both populations. Movements between Mt. Moriah and the south Snake Range do occur. Bighorn sheep released on Mt. Moriah in 1991 and fitted with ear tags were seen as far south as Lincoln Peak on the south Snake Range, 30 miles from Mt. Moriah. In addition, private landowners on Sacramento Pass have reported bighorn sheep movement both north and south in that area.

F6-2

- Include the document titled Instruction Memorandum No. 98-140 Revised Guidelines for Management of Domestic Sheep and Goats in Native Wild Sheep Habitats as an appendix. This document is referred to multiple times, yet without knowledge of it's contents, a reviewer cannot determine the adequacy of the guidelines to protect

Responses to Letter F6

F6-1

In response to your comment, the text in Table 2.9-1 and in Section 2.4.6.4 of the Proposed RMP and Final EIS has been revised to include the entire Snake Range.

F6-2

Thank you for your comment. Any reference to Instruction Memorandum No. 98-140 has been removed from the Proposed RMP and Final EIS because this IM could be replaced during the life of the RMP. The most current BLM guidelines for management of domestic sheep and goats in bighorn sheep habitat will be applied. At the present time, BLM guidelines regarding buffer zones are different for Rocky Mountain bighorn sheep and desert bighorn sheep because in most states desert bighorn sheep are considered a sensitive species and Rocky Mountain bighorn sheep are not.

Letter F6 Continued

F6-2 [bighorn sheep. Mention that these guidelines would be addressed when revising grazing plans on allotments adjacent to bighorn sheep habitats that occur primarily on lands administered by the Humboldt National Forest and National Park Service, which largely occurs on the south Snake Range. Implementing these guidelines around the south Snake Range would reduce risks for disease transfer between domestic and bighorn sheep as buffers would largely be non-bighorn sheep habitats.

F6-3 [

- New information concerning sage grouse in Snake Valley is now available. In October 2004, members of your staff and the Nevada Division of Wildlife captured four male sage grouse on the Baker Ranch and fitted them with radio telemetry transmitters. They requested Great Basin National Park Resource Management staff monitor the movement of these grouse to determine seasonal distribution, lek locations and relative abundance. We are still monitoring several birds today. Range distribution of these birds included the eastern extent of the Baker Ranch between May and October. In November, the birds shifted their range west of Baker onto the bench below Kiou Springs and remained there until mid-May. We discovered new lek locations on the bench below Kiou Springs. Unfortunately, the population is small with only nine birds counted at once. A full report including GIS shapefiles will be sent under a separate letter.

F6-4 [

- Details are not sufficient in the Draft Resource Management Plan/Environmental Impact Statement for the Ely District to determine how proposed land disposals would affect the habitats used by this small population of sage grouse, but we feel it necessary to reevaluate proposed land disposals in Snake Valley in light of the small and isolated nature of this population.

F6-5 [

- Lands within one mile north and south of State Highway 488 and lands within one mile west of State Highway 487 from the junction of U.S Highway 6 & 50 to Baker, NV should not be considered for disposal and should be closed to entry for fluid leasable minerals, solid leasable and locatable minerals and saleable minerals to preserve scenic viewsheds and consolidate urban growth in the townsite of Baker.

This concludes our comments on the Draft Resource Management Plan/Environmental Impact Statement for the Ely District. If you have any questions, do not hesitate to contact Tod Williams at (775) 234-7331 ext. 223 or tod_williams@nps.gov.

Sincerely,

Cindy Nielsen
Superintendent

cc Paul Podbourny, BLM Ely District
Curt Baughman, NDOW

Responses to Letter F6

F6-3 Thank you for this wildlife resource information. Effects on specific leks will be considered by the Ely Field Office when project-specific plans are prepared or evaluated.

F6-4 In response to your comments, the land disposal maps (Maps 2.4.12-1 through 2.4.12-4) in the Proposed RMP and Final EIS have been revised to retain the sage grouse habitat you have identified.

F6-5 This land has not been identified for disposal, and it has not been closed to fluid leasable minerals, solid leasable and locatable minerals, and saleable minerals. The type of issues raised in your comment will be considered by the Ely Field Office when project-project plans are prepared or evaluated.

Form Letter 1

November 29, 2005

BLM Ely Field Office
Attn: Ely RMP Team
HC 33, Box 33500
Ely, Nevada 89301

Dear Ely RMP Team;

Please accept my comments on the draft resource management plan for BLM lands in eastern Nevada.

Form1-1 [Protecting wilderness quality public lands is my primary concern in the draft plan. I urge the BLM to continue to protect and restore the eight areas currently identified as Wilderness Study Areas from damage from illegal off-highway vehicle use and other illegal activities.

Form1-2 [In addition, I ask the BLM to include provisions in the final management plan to protect the wilderness qualities of all of the areas carefully reviewed and recommended by the Nevada Wilderness Coalition for wilderness protection.
These

Form1-3 [special places like Becky Peak, with its high meadows and rich habitat for elk, pronghorn, and other wildlife, are favorites of outdoors enthusiasts. The Antelope Range with its outstanding vistas, wildlife, and opportunities for solitude is equally deserving of protection. In the case of the spectacularly scenic Blue Mass/Kern Mountains, I would like to see the Area of Critical Environmental Concern proposal for this area expanded to include the entire area proposed by the Nevada Wilderness Coalition.

Form1-4 [The Government Peak area, adjacent to the Mt. Moriah Wilderness, should also be protected as wilderness to protect wildlife viewing and hunting opportunities for visitors, as well as habitat for wildlife. The expanded Heusser Mountain Bristlecone Pine area just outside of Ely also needs to be protected.

Form1-5 [All of these wilderness quality areas should be protected in the plan by prohibiting oil and gas leasing and the placement of wind power facilities within their boundaries.

Form1-6 [These potential wilderness areas should be designated as Class 1 Visual Resource Management Units. Off road vehicles should be limited to only designated roads and trails and all unnecessary vehicle routes should be restored.

Form1-7 [In summary, I want to see all of the wilderness quality land managed by the BLM's Ely Field Office protected in the long term for the life of this resource management plan.

Thank you for your consideration.

Sincerely,

Responses to Form Letter 1

Form 1-1 The Lincoln County and White Pine County Conservation, Recreation, and Development Acts have either designated wilderness or released wilderness study areas in these two counties. Designated wilderness and the remaining wilderness study areas in the Nye County portion of the decision area are closed to OHV use. OHV use in other parts of the decision area will be "limited" to designated roads and trails in order to protect a range of resource values.

Form 1-2 When the Ely RMP planning process was initiated, there was no requirement in the Land Use Planning Handbook to identify lands with wilderness characteristics. Under the new Planning Handbook (2005), the BLM no longer designates wilderness study areas as part of the land use planning process. While the new Handbook allows the Ely Field Office to consider information on wilderness characteristics as part of travel management and visual resources management, no lands with wilderness characteristics were identified during the Ely RMP planning process.

Form 1-3 As part of the ACEC regulations, the Ely Field Office may not use an ACEC designation as a substitute for wilderness suitability recommendation.

Form 1-4 Please refer to Response to Comment Form 1-2.

Form 1-5 Please refer to Response to Comment Form 1-2.

Form 1-6 Please refer to Response to Comment Form 1-2.

Form 1-7 Please refer to Response to Comment Form1-2.

Re: BLM Ely RMP/EIS

Dear Sirs:

You have solicited comments from the public; I have the following questions and concerns regarding the proposed RMP/EIS for portions of eastern and central Nevada. As you know, the stated main premise for this effort is an attempt to "restore the Basin's native plant species and halt the spread of invasive species". As that is the main stated premise for the program, I have the following comments and questions:

- | | | |
|----------|---|--|
| Form 2-1 | } | 1. Please see exhibit A attached. Are any of the BLM staff responsible for the development and implementation of this RMP currently or in the past members of, employees of, or affiliated with any of these organizations in any way? |
| Form 2-2 | | 2. Have any of these organizations or individuals from these organizations been hired, contracted with or allowed to work as volunteers in any capacity that would allow them to influence the RMP/EIS development or implementation? |
| Form 2-3 | | 3. Has any information provided by them in the way of statistics, studies either published or unpublished, surveys, or opinions been included in the formulation of this RMP/EIS, in any of the potential implementation formats? |
| Form 2-4 | | 4. Have any of the BLM personnel involved in the RMP/EIS met with any person or persons from any of these organizations in a private or non-public meeting concerning the aspects of this program? |
| Form 2-5 | | 5. Have any of these organizations been contracted with or in any other way paid to provide any information, surveys, studies or statistics that have been utilized by the BLM staff for this particular RMP/EIS? |
| Form 2-6 | | 6. Has the BLM staff complied with the letter and spirit of SB 247 concerning the closure of existing roads, and what is being done to ensure no closures of public access roads and routes currently open? |
| Form 2-7 | | 7. It appears that under the auspices of restoration of native plant and animal species, an attempt is being made by the composers of the plan to include other non-related activities. For example, why does this RMP/EIS even consider road closure and cessation of so called off-road activities? Please explain in detail how the above stated purpose of the RMP/EIS will be met by road closure, cessation of off-road activities, and closure of large areas of the land in question. Please be specific and please be sure to include specific studies and surveys that support that point of view, and where they can be reviewed. |
| Form 2-8 | | 8. What measures have been taken to ensure continued Americans with Disabilities Act access to currently accessible areas? It appears that all of the potential choices will negatively impact this situation. While we understand that you are not required to make provision for the handicapped for wilderness areas, which |

Responses to Form Letter 2

- | | |
|----------|---|
| Form 2-1 | Thank you for your comment. The subject of this comment is beyond the scope of the Ely RMP and does not require further agency response. |
| Form 2-2 | Please refer to Response to Comment Form 2-1. |
| Form 2-3 | Please refer to Response to Comment Form 2-1. |
| Form 2-4 | Please refer to Section 5.1.4 in the Draft RMP and EIS and Proposed RMP and Final EIS for a discussion of informal presentations that were made to organizations during the preparation of the Ely RMP. |
| Form 2-5 | Please refer to Response to Comment Form 2-1. |
| Form 2-6 | Please refer to Section 2.4.14.1 in the Proposed RMP and Final EIS for a discussion of how the BLM develops transportation plans and how the process gives the public the opportunity to participate. |
| Form 2-7 | The Proposed RMP and Final EIS outline the BLM's proposed activities for managing all of the resources and uses for which it has responsibility within the Ely RMP decision area. These responsibilities extend far beyond protection or restoration of plant and animal communities, although those goals are a major part of the proposed program. Management of transportation routes and off-highway vehicle use on the public lands is just one of the factors considered in meeting the goals and objectives identified in the Ely RMP. |
| Form 2-8 | Thank you for your comment. The subject of this comment is beyond the scope of the Ely RMP. As stated in Section 1.5.1, General Criteria No.1 of the Proposed RMP and Final EIS, the Ely Field Office will comply with all applicable Federal laws, including the Americans with Disabilities Act. |

Form Letter 2 Continued

Form 2-8

we believe is basically wrong, the philosophy of the BLM has always been to make provision when possible for handicapped. How specifically will this issue be addressed?

Form 2-9

All of the potential implementation plans have significant problems. The concerns that we have will be significantly alleviated if truthful and complete answers are given.

Thank you,

Dr. Mike Moore Dr. Dave Moore, Dr Gary Moore, Dr. Kevin Moore, Dr. Fred Knight, Dr. S. Chan, Dr. Jeff Henkes, Mr. Mark Moore, Mr. Ryan Moore, Mr. Adam Moore, Mr. Jake Knight, Mr. Derek Knight, Mr. Curtis Knight, Mr. Josh Moore, Mr. Kyle Moore, Mr. Lukas Moore, Mr. Frank Chan, Mr. Vince Lee, Mr. Mark Chan, Mr. Doug West. Form 3-1
Form 3-2
Form 3-3

The proposed draft of the eiy rmp has left out the biggest user, off hwy vehicles .It is amazing that there is no ohv park in this emp draft, with the growth of Nevada and the government land sales ohv areas are lost forever. Now is a great time to get the ohv park going so ohvs can enjoy eastern Nevada for many years to come. In the draft there is a plan to reduce or do away with ooff road racing, limiting or eliminating ohv racing will hurt the local economy's of Lincoln and white pine counties, the largest economic impact to Lincoln County is off road racing. There also needs to be ohv trail connecting Las Vegas to the silver state trail and to the Utah trail system with the Nevada department of parks estimating Nevadan's owning 340,000 ohvs and many out of state users in Nevada it make little sense to reduce the areas that many Nevadan's use their ohvs.

KEN FREEMAN , NATIVE NEVADAN

Responses to Form Letter 3

- Form 3-1 Please refer to Section 2.4.15.1 in the Proposed RMP and Final EIS for a discussion of Special Recreation Management Areas, which include areas where the recreational use of off-highway vehicles would be emphasized. No OHV parks have been included in the Proposed RMP
- Form 3-2 The Proposed RMP and Final EIS identify management actions for off-road racing (see Section 2-4.15.2), but it would not be eliminated.
- Form 3-3 In response to your comment, the text in Section 2.4.15.1 of the Proposed RMP and Final EIS has been revised to clarify the discussion of how future recreational trails would be addressed.

Form Letter 4

November 23, 2005

NOV 23 2005

Re: Comments on BLM's Draft Resource Management Plan/Environmental Impact Statement for the Ely District

Dear Mr. Drais:

As a resident of White Pine County and an avid sportsman I have reviewed the Draft RMP/EIS for the BLM's Ely District and provides the following comments:

General Comment

Form 4-1

The proposed management of elk addressed in the draft contains contradictions and inaccurate information. The draft addresses elk in several sections, some as a non-indigenous species, and some where elk are included as an indigenous species. However, in at least one section of the draft, elk would be granted the same status as other indigenous wildlife. The fact is that very little, or no, research was done to determine if elk were in fact an indigenous wildlife species in the area encompassed by the Ely District. Attached documentation in exhibit form provides evidence that elk are in fact indigenous to Nevada, as well as White Pine County; therefore making it necessary to include elk as an indigenous wildlife species consistently throughout the draft.

Specific Comment

Form 4-2

2.5.6.6 Parameter - Great Basin Big Game Habitat (Mule Deer, Pronghorn, and Elk): The information in paragraph four on Page 2.5.60 under Alternative A, contradicts the information in paragraph two on Page 2.5.61 under Alternative B and in paragraph five on page 2.5-62 under Alternative E. Should either Alternative A or Alternative E be adopted elk would not be granted status as indigenous wildlife; however, in Alternative B elk are more appropriately included as indigenous wildlife.

Form 4-3

Despite the contradiction we maintain that elk are very much indigenous wildlife by definition. There is supporting documentation that elk were very much a part of the native wildlife species in White Pine County. Written documentation in 1859 by Captain J.H. Simpson, Engineer Department of the U. S. Army titled "Explorations" "Great Basin of the Territory of Utah". Captain J. H. Simpson wrote, "An elk was seen yesterday in Stevenson's Canon and one to-day in Red Canon". These sightings were on the northern end of the Snake Range east of Ely. Despite the fact that Capt. Simpson was developing

Responses to Form Letter 4

Form 4-1 In response to your comment, corrections have been made in the Proposed RMP and Final EIS to recognize elk as a native species to the area throughout all alternatives.

Form 4-2 Please refer to Response to Comment Form 4-1 for a discussion of elk as a native species to the area. Text in Chapters 2 and 4 of the Proposed RMP and Final EIS has been revised to indicate that management of habitat for elk under the Proposed RMP would conform to the county elk plans.

Form 4-3 Please refer to Response to Comment Form 4-1 for a discussion of elk as a native species to the area.

Form Letter 4 Continued

Form 4-3 [a direct wagon route from Camp Floyd to Genoa in the Carson Valley in 1859 his observation of elk in White Pine County is documented in the Snake Range. We submit that elk were present in other ranges of White Pine County as early as 1859, if not before. This documentation is proof that elk were indigenous species to White Pine County and therefore granted indigenous species status accordingly. Additional testimony continues to demonstrate that elk are indigenous to Nevada.

Form 4-4 [Statements made referring to the introduction of elk in White Pine County in 1932 are erroneous, when in fact it was a reintroduction of elk in an area in which elk where an indigenous species (native), as documented, almost a century earlier

Form 4-5 [*4.6.1 Aquatic Habitat and Fisheries*
The information contained in paragraph 6 on page 4.6-28 under Alternative E referring to the "reduction in population growth of elk on the District in the long-term" is not consistent with inclusion of elk as an indigenous species as it so deserves based upon above information and attached exhibits which document elk as indigenous wildlife in White Pine County.

Summary

Form 4-6 [We feel that the RMP/EIS should properly address elk as an indigenous (native) species for the purpose of future planning of habitat enhancement projects and just maintain a status equal to that of the mule deer, pronghorn, and big horn sheep. Documentation has been provided to demonstrate that elk were present in White Pine County over a century ago, and due to their reintroduction in 1932 continue to flourish through proper management. I agree that the elk numbers must be managed in relationship to available habitat through harvest, transplant, etc. I personally feel that of the alternatives provide in the draft the only one we could support is Alternative B.

Form 4-7 [Recreation which includes hunting and wildlife viewing contribute a sizable portion to the economy of White Pine County. Not including elk as an indigenous wildlife species and enhancing habitat to maintain or expand heard growth in order to provide recreational opportunities for present and future generations as a part of the BLM's Mission.

Should you have question, please feel free to contact me at (775) 289-4363

Sincerely,

Brandon Jackson

Responses to Form Letter 4

Form 4-4 Please refer to Response to Comment Form 4-1 for a discussion of elk as a native species to the area.

Form 4-5 The current population growth rate of elk in the Ely RMP planning area will logically decrease over time as the population reaches the carrying capacity of available habitat. Text in Chapters 2 and 4 of the Proposed RMP and Final EIS has been revised to indicate that management of habitat for elk under the Proposed RMP would conform to the county elk plans.

Form 4-6 Please refer to Response to Comment Form 4-1 for a discussion of elk as a native species to the area. Your comment regarding a proposed alternative is noted.

Form 4-7 In response to your comment, the text in Section 2.4.6.4 of the Proposed RMP and Final EIS has been revised to clarify the discussion of big game habitat management for increased game species distribution and densities.

Letter I1

Dear sirs:

I would like to add my opinion to the plan regarding the Sloan Canyon Conservation Area. I have been a hunter, fisherman, camper, hiker, target shooter, plinker, etc. for almost 50 years. Most of that activity has occurred on public land. I have raised five children and now have seven grandchildren that have shared my love of the outdoors.

I1-1 [We all love our public lands and the fact that they are open to allow us to pursue our outdoor interests. Please consider that when you develop your resource management plan. I especially want to address:
I1-2 [hunting, target shooting, and plinking. They are honest, wholesome endeavors, even if there are those that disagree with that point of view. I believe our public grounds should be managed to support
I1-3 [hunting, target shooting and plinking. I could go on and on about the times that I have been in the outdoors with folks hunting, target shooting and plinking, and the positive results those outings had on all of us. It's sad to see areas closed to those interests because some don't like them. To those folks I would say, fine, if you don't like to hunt, shoot or plink, then don't, but it's not their place to restrict the rest of us.

I1-4 [I am a retired police officer and was one for over 34 years. I can tell you first hand, that the application of the interests I mention and sharing them with others, especially children, only improve public health.

I1-5 [Please do not consider reducing the availability of our lands when you develop the resource management plan and environmental impact statement for the Sloan Canyon Conservation area.

Thank you for your consideration.

Respectfully submitted,

Paul Anderson

Paul Anderson<paulindarcy@sbcglobal.net>

Responses to Letter I1

- I1-1 Comment noted. Outdoor recreation is an important consideration for the management of public lands by the Ely Field Office.
- I1-2 The outdoor activities identified in your comment are recognized by the Ely Field Office as valid uses of the public lands.
- I1-3 Please refer to Response to Comment I1-2.
- I1-4 Comment noted.
- I1-5 This comment is not relevant to the Ely RMP. The Sloan Canyon Conservation Area is not within the Ely planning area. It was a planning effort undertaken by the BLM Las Vegas Field Office and was completed in June 2006.

Subject: Draft management plan

I2-1 [

Hi: In regards to your management plan I feel that BLM lands in the Ely district should be managed as multiple use and all activities that were allowed in the past, especially recreation (hunting, fishing) be allowed to continue. Sincerely, Fred

Responses to Letter I2

I2-1

Please refer to Sections 2.4.15, 3.15, and 4.15 in the Proposed RMP and Final EIS for discussions of Recreation Resources within the Ely RMP decision area. The management actions contained in the Proposed RMP continue to focus on multiple use of resources.

Letter I3

Dear Ely BLM,

Thank you for the opportunity to comment. We commend the BLM for its forward-thinking plan. We support most of the resource management plan, in particular the restoration activities. Nevertheless, there are some areas of the plan that we feel require further attention, addressed below.

2.5.12.2 Lands and Realty - Disposal of Public Lands

The public lands listed for disposal in the Baker area should be located in different areas than those shown in Alternative E. The areas shown are for the most part away from utility corridors and access. In addition, the land disposal area furthest to the south may be in an area that a group of sage grouse recently have been found to use. In 2004 NDOW put radio collars on some of the sage grouse, finding that they use fields on Baker Ranch for part of the year, then cross the sagebrush land to the northeast to their lekking area. If this land is disposed, potential development could impede the success of this population. Land disposal should take place in areas where disposal would serve important public objectives including community expansion or economic development.

We recommend that the lands for disposal in the Baker area be located around the town of Baker and along Highway 6 & 50. (will send map if comment time extended)

2.5.12.5 Lands and Realty - Corridors

Alternative E should not include designating a new corridor that runs from Lincoln to Elko counties through Spring Valley. If a party desires a right-of-way in the future, it should be decided at that time. Designating a corridor at this time is speculative and would put additional resources at risk.

2.5.13.1 Parameter- Wind and Solar Energy

Limiting locations for renewable energy before they are definitively known will stifle future opportunities. Further studies using anemometers should be conducted before land is designated as wind energy development areas. Locations should be managed on a case-by-case basis.

2.5.5.4 Parameter- Salt Desert Shrub The effect of rodent and ant communities (e.g. ground squirrel burrows and harvester ant mounds) on spreading invasive exotic plants should be discussed.

2.5.6.1 Aquatic Habitat and Fisheries

We congratulate the BLM for moving towards more emphasis on enhancing native fisheries in Alternative E and think that even stronger language supporting native fish and their habitats would be appropriate.

2.5.5.6 Big Game Habitat

We believe that the BLM should make Alternative B its preferred alternative. Alternative E, which provides for managing big game species habitats beyond what natural habitats and water sources would

Responses to Letter I3

- 13-1 In response to this and other similar comments, the lands available for disposal in the Baker area have been revised for the Proposed RMP and Final EIS. Please refer to the revised disposal maps introduced in Section 2.4.12.2 and the revised legal descriptions in Appendix I.
- 13-2 In response to your comment, the text in Section 2.4.6 (Goal) and text in Section 2.4.6.3 of the Proposed RMP and Final EIS have been revised to clarify the discussion of how the BLM would manage big game species habitats.
- 13-3 The Proposed RMP does not designate areas for wind and solar energy development, and the text and map titles in the Proposed RMP and Final EIS have been changed to clarify this. Changes in technology may change the potential for renewable energy development and which areas are suitable. Applications received for wind energy development would be subject to NEPA analysis in coordination with local, state, and other federal agencies.
- 13-4 While the effects of rodents and insects contribute to the spread of plant seeds, these are relatively minor and localized factors in the widespread dispersal of invasive weeds.
- 13-5 Thank you for your comment. The Proposed RMP states that the Ely Field Office would work with the U.S. Fish and Wildlife Service and Nevada Department of Wildlife to enhance native fisheries habitat whenever possible and balance native and nonnative fishery management strategies.
- 13-6 In response to your comment, the text at the beginning of Section 2.4.6 under "Goal" and the text in Section 2.4.6.3 of the Proposed RMP and Final EIS have been revised to clarify the discussion of how the BLM would manage big game species habitats.

Letter I3 Continued

13-6 |

support, unbalances the ecosystem and puts added stress on nongame species and forage species.

Please include us on your mailing list for any further correspondence regarding this EIS.

Sincerely,
Craig and Gretchen Baker

Letter I4

November 29, 2005

Bruce Flynn
BLM, Ely Field Office
HC33 Box 33500
Ely, NV 89301

Nov. 27, 2005
Karen Boeger
5055 Wilcox Ranch Road
Reno, NV 89510

Comments: Ely Draft RMP EIS

Thank you for this opportunity to submit comments on your draft RMP. I'm only sorry that I haven't taken more time study this huge document and give you more detailed comments. Please assume that any issue I haven't commented on, I either agree with your proposed alternative or I just don't have the knowledge/expertise to make an informed comment.

1) Vegetation:

*Aspen (2.5.5.2):

14-1

The preferred alternative says aspen communities would be managed ("using disturbance") ... this sounds dubious at best, unless that means prescribed fire?

14-2

The preferred alternative also is unclear on what is meant by using grazing management as a "common treatment tool" for restoration or rehabilitation. Can it be presumed to mean a restriction of grazing in those areas??? One would hope so.

2) Fish and Wildlife:

*Wildlife Water Developments (2.5.6.3)/ *Great Basin Big Game Habitat (2.5.6.6):

14-3

Alt. B should be the preferred alternative because it emphasizes habitat health, which in turn will provide an appropriately healthy game population. Management that is a response to "public demand" is not always the best for the long-term public good.

14-4

Control of ATVs would do far more in the long run for healthy game populations and improved hunting opportunities than more and more water developments.

14-5

*Great Basin - Big horn sheep:

Responses to Letter I4

14-1

In response to your comment, various disturbance factors (e.g., fire and thinning) are among the common approaches for stimulating additional regeneration in aspen stands. The text in Section 2.4.5.3 of the Proposed RMP and Final EIS has been revised to clarify the propose management of aspen communities.

14-2

The use of grazing management as a tool in treatment and rehabilitation of vegetation communities may involve changes in intensity, duration, and periods of grazing or total elimination, if necessary. In most cases, the specific changes in grazing management for a given area would be defined following watershed analysis rather than being addressed specifically in the RMP/EIS.

14-3

Wildlife habitat health is an overriding theme of all the alternatives analyzed in the Draft RMP and EIS and Proposed RMP and Final EIS. Although the BLM may install artificial wildlife water developments to "Meet the public demands for increased recreational opportunities ..." as stated in Section 2.4.6.7 of the Proposed RMP and Final EIS, that decision must still meet the goal of wildlife habitat management, which is listed at the beginning of Section 2.4.6.

14-4

Please refer to Section 2.4.14.2 in the Proposed RMP and Final EIS for a discussion of how the BLM plans to manage OHVs.

14-5

In response to your comment, the text in Table 2.9-1 and in Section 2.4.6.4 of the Proposed RMP and Final EIS has been revised to include the entire Snake Range.

Letter I4 Continued

- 14-5 [The preferred alternative artificially limits big horns to 2 areas. Further, it does not take into account the affect of management on BLM lands adjacent to big horn areas of the NPS.
- 14-6 [3) Special Status Species
- Mohave Desert Scrub Habitat (2.5.7.6): Alt. B is preferred to E. There must be adequate review and justification for grazing any Mohave Desert lands or lands elsewhere receiving 8" or less of rain per year. Eliminate grazing where grazing cannot be sustained without ecological disruption.
 -
- 4) Cultural Resources
- * (2.5.9.1 through 2.5.9.8:
Historic roads, trails, etc. / Rock Art Sites / Historic town sites, etc./ Historic cemeteries/
Ethnic arboreal narratives / Formative Puebloan sites / Rock shelter and caves
- 14-7 ["Public use" emphasis for these resources will be fraught with problems and leans toward a "build it and they will come" attitude. While existing developed sites should be maintained, in no case should public access be "promoted". Most vandalism and negative impacts can be controlled by limiting public access and/or closing existing motorized routes a significant distance from the resource.
- 14-8 [I oppose any fee sites on general principle. Fees insert a profit motive into public lands decision-making. Dependence on user fees for recreation and/or cultural resource management will damage the BLMs' ability to make objective decisions.
- 5) Lands and realty
- 14-9 [*Disposal of public lands (2.5.12.2): Alt. B is the best for this issue. Not disposing of critical habitat for T&E species or sensitive species is the right thing to do for highest public benefit.
- 14-10 [*Corridor designations (2.5.12.5): Alt. A is best. Additional corridors must not be designated. This is the responsible choice as the majority of White Pine residents have grave concerns about water deportation. It would be irresponsible to make any decision until an expanded water study is complete.
- 14-11 [*Communication sites (2.5.12.6): Alt. B is best. It provides an adaptive management approach by not creating new sites until existing ones are at capacity.
- 14-12 [*Land use authorizations (2.5.12.7): Alt. B again is the best approach. by utilizing authorizations next to existing ones, so as to minimize impacts and not further fragment habitat.
- 6) Travel Management and ORV Use:

Responses to Letter I4

- 14-6 Livestock grazing suitability and the evaluation of grazing use relative to grazing any Mohave Desert lands and the achievement of the standards for rangeland health will be conducted during the term permit renewal process, during watershed analysis, and during grazing use monitoring. Authorizing grazing may be appropriate in certain situations. These are issues that would be considered associated with authorizing any grazing use.
- 14-7 Cultural sites with evidence of public use will be considered for allocation to Public Use. Use of such sites will be limited if monitoring of a site shows a need to protect the resource.
- 14-8 Thank you for expressing your concerns. Fees are an allowable method to maintain facilities for public use. Fee areas are allowed under BLM policy where special management, such as maintenance of facilities for public use, incurs costs that cannot reasonably be funded through the normal budget process.
- 14-9 Please refer to Section 2.4.12.2 in the Proposed RMP and Final EIS for a discussion of disposal of designated critical habitat for threatened or endangered species. Please note that under the Proposed RMP, no such disposal would be allowed.
- 14-10 The Ely Field Office is required to designate corridors through the land use planning process. It is BLM policy to encourage prospective applicants to locate their proposals within corridors. The Proposed RMP states that water pipelines are encouraged to be within designated corridors. Water pipelines could be authorized through the right-of-way process and would not require a designated corridor.
- 14-11 The Proposed RMP encourages co-location of communication sites before rights-of-way for new sites are issued. The Proposed RMP is responsive to the needs of communication for public safety and to accommodate changes in technology.
- 14-12 Please refer to management actions in Section 2.4.12.7 in the Proposed RMP and Final EIS for a discussion of land use authorizations.

Letter I4 Continued

- 14-13 [*Transportation plan (2.5.14.1): Alternative B should be preferred. Recreation and tourism promotion must not be the emphasis for road and trail designations.
- 14-14 [Management capabilities, sustainability, minimizing impact to other resources (wildlife, cultural, historical, etc.), minimizing impact to other users (quiet use, traditional hunting, permittees, etc.) should be the guiding principles of any transportation plan as directed in the Executive Orders and CFRs. Statewide BLM ORV Guidelines should be followed when designating routes.
- 7) Recreation:
- 14-15 [• Special Recreation Management areas (2.5.15.1):
Motorized recreation is not benign. It has more potential to damage land and disrupt traditional uses more than about any other use of public land. Thousands and thousands of miles of roads suitable for ORV use already exist **If** use can be kept to designated routes.
- 14-16 [While the concept of designating areas for emphasis of certain types of recreation can help to reduce conflicts, BLM needs to more clearly define just how these areas will be managed. Proposed areas encompass huge acreages. The impacts on wildlife will be significant, especially over time as use increases. What input has there been from NDOW on this alternative? There must be EAs on each proposed area?
- 14-17 [Existing management capabilities are inadequate to manage existing problem areas. Currently there are absurd administrative limits on BLMs capability to enforce regulations. BLM must resist a "build it and they will come" mentality. Build only as needed and as you have the funds, personnel, and administrative ability to properly manage the use.
- 14-18 [One of the proposed motorized areas, the Eagan Crest, contains a high density of springs, which makes it unique and a highly important wildlife habitat, vulnerable to ORV impacts and disturbance. This area must not be designated an ORV area. Recreation must never be emphasized or "promoted" by a public lands agency without established ability to manage for sustainability and non-degradation of the land and resources while minimizing user conflict
- 14-19 [• Special Recreation Permits (2.5.15.2):
a. The EIS does not make clear just how these ORV recreation management areas differ from the ones proposed in 2.5.15.1. I assume you mean that these will be areas of INTENSIVE (racing, machine challenge, etc.) ORV use??

Responses to Letter I4

- 14-13 In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify criteria that may be used when designating routes in a project-specific transportation plan.
- 14-14 Thank you for your comment. The Proposed RMP has been developed as directed in the BLM Land Use Planning Handbook, current federal regulations, and applicable Executive Orders. Nevada BLM off-highway vehicle guidelines will be utilized by the Ely Field Office.
- 14-15 In response to this and similar comments, the management action in Section 2.4.15.1 of the Proposed RMP and Final EIS regarding special recreation management areas has been revised to reduce the number and size of proposed special recreation management areas. In addition, no special recreation management areas emphasizing off-highway vehicle use have been identified in the Proposed RMP.
- 14-16 In response to this and similar comments, the management action in Section 2.4.15.1 of the Proposed RMP and Final EIS regarding special recreation management areas has been revised to reduce the number and size of proposed special recreation management areas. In addition, no special recreation management areas emphasizing off-highway vehicle use have been identified in the Proposed RMP. The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans are prepared or evaluated.
- 14-17 Please refer to Response to Comment I4-16.
- 14-18 Please refer to Response to Comment I4-16.
- 14-19 In response to your comment, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion of special recreation permit areas for motorcycle events.

Letter I4 Continued

- 14-20 [b. NO recreation management areas with an intensive ORV emphasis should be in the selected alternative. Competitive ORV recreation use, beyond touring:
 Is destructive by nature
 Breeds disrespect for wild country
 Is contrary to the "tread lightly" philosophy
 Encourages/ promotes/ legitimizes unethical motorized behavior
- Fosters irresponsible use that gets carried beyond these areas into the wider public lands.
- 14-21 [c. Motorcycle events must be prohibited (Alt. D) for the same reasons as above.
- 14-22 [d. Truck events must be prohibited (Alt. D) for the same reasons as above.
- 14-23 [e. "Go fast" ORV competitive events encourage machine thrill sport and a demand for speed and machine challenge elsewhere. Such events displace all other users for the duration of the event and in any areas where "go fast" activity is taking place, event or not.
- 14-24 [f. Outfitter and guide permits should be limited by social capacity as well as by resource conditions. Crowding damages wild land experience. Quality recreation experience is in direct proportion to the lowest numbers of others encountered.

9) Special Designations

- 14-25 [• **Backcountry byways (2.5.22.2):**
- Please do not consider extending the Silver State Trail beyond what is legislated in the Lincoln Co. Public Lands Bill. It remains to be seen if management capabilities can minimize potential impacts. No further designations should be made until it is clear that there is capacity for management.
- **WSAs (2.5.22.3):**
- 14-26 [a) It is outrageous that BLM will not be considering new WSAs! The original WSA process is now 20 years old and out-dated. Values and situations have changed dramatically. An onslaught of ATV use, and consequent proliferation of unauthorized renegade routes, has drastically affected previously unroaded lands. White Pine Co. community support for Wilderness indicates that there is an increasing demand for protection of these endangered areas.
- 14-27 [b) The preferred alternative language, which declares, "other multiple uses would be emphasized", is totally unacceptable! WSAs by law must retain their Wilderness character; Alt. E language makes adhering to the law impossible.

Responses to Letter I4

- 14-20 Please refer to Response to Comment 14-16.
- 14-21 Please refer to Response to Comment 14-16.
- 14-22 Please refer to Response to Comment 14-16.
- 14-23 Please refer to Response to Comment 14-16.
- 14-24 In response to this and similar comments, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised regarding the issuance of outfitter and guide permits. Monitoring of outfitter and guide use would still occur for three years; however, outfitter and guide permits would not be limited during that three year study. Should the study show resource impacts, including user conflicts as a result of outfitter and guide actions, the Ely Field Office may address those problems by issuing outfitter and guide permits with special stipulations and conditions. No allocation system, including a competitive bid process, is included in the Proposed RMP and Final EIS.
- 14-25 Please refer to Response to Comment 14-16. The location of the Silver State Trail was designated in the Lincoln County Conservation, Recreation, and Development Act of 2004. The Ely Field Office is currently developing an implementation management plan for that trail. During site-specific transportation planning, the Ely Field Office will hold public scoping meetings to address completeness of the route inventory and public issues, concerns, and access needs. Neither the management plan for the Silver State Trail nor any possible extensions of the trail are addressed in the Proposed RMP.
- 14-26 When the Ely RMP planning process was initiated, there was no requirement in the Land Use Planning Handbook to identify lands with wilderness characteristics. Under the new Planning Handbook (2005), the BLM no longer designates wilderness study areas as part of the land use planning process. While the new Handbook allows the Ely Field Office to consider information on wilderness characteristics as part of travel management and visual resources management, no lands with wilderness characteristics were identified during the Ely RMP planning process.
- 14-27 To clarify, Section 2.4.22.4 in the Draft RMP and EIS and Proposed RMP and Final EIS states that other multiple uses would be emphasized outside of Wilderness Study Areas.

Letter I5

Ely Draft RMP/EIS Comment Form

Informed decisions are better decisions: BLM believes that extensive public involvement will serve to improve communication, develop enhanced understanding of different perspectives, and identify solutions to issues and problems. We look forward to hearing from you!

Where to provide comments: You can hand this form in at The Ely BLM Field Office (702 N. Industrial Way) or mail it in using the address on reverse

Tips on providing effective comments: The BLM land use planning process is based on agency policy, science, and social value. Specific comments that deal with important management methods and decisions are extremely helpful to the BLM. Overly general statements of support or opposition are less effective. Also remember that this RMP will deal with broad management decisions, not site-specific actions.

(See attached file: These comments pertain to the Draft.doc)

Letter I6 Continued

Attachment to e-mail from Sue Gilbert

16-1 [These comments pertain to the Draft-Executive Summary, Resource Management Plan/Environmental Impact Statement for the Ely District. Page 3.3-8 states, "all surface water in Nevada is fully appropriated and no new applications for permits to appropriate surface water rights may be approved." Please note that there are numerous springs and small streams throughout the state for which no determination of water quantity has been made by the State Engineer's office. One must make application on a particular source before this determination of water quantity is made. The State Engineer may approve an application if he determines that there is sufficient water for the proposed use. You should also be aware that there may be vested claims on a various sources. Vested claims are those in which a beneficial use of the water can be established before the establishment of Nevada water law. It is not necessary for vested claims to be filed until such a time as so order by the State Engineer.

16-2 [Please be advised that Table 3.3-1, Water Availability in Shallow Alluvial Aquifers, which shows the perennial yield for various groundwater basins throughout White Pine and Lincoln counties, may be subject to change as more studies and tests are conducted in these areas. Additionally, the committed resource, as enumerate in the table, is subject to change as existing permits and applications are approved, denied, forfeited, cancelled, etc.

Responses to Letter I6

16-1 In response to your comment, the text in Section 3.3.3 of the Proposed RMP and Final EIS has been revised to clarify the discussion of water rights and permit applications.

16-2 In response to your comment, the text in Section 3.3.1, and the footnote to Table 3.3-1, of the Proposed RMP and Final EIS have been modified to clarify the discussion of water availability.

Letter I7

November 29, 2005

Bruce Flynn
Bureau of Land Management, Ely field office
HC33 Box 33500
Ely, NV 89301

Dan Heinz
5055 Wilcox Ranch Road
Reno, NV 89510

Following are my comments on the Draft RMP.
General:

The current staff of the Ely field office can be trusted to do the right thing but this plan is not for you, it is for the long view when current personnel will not be in place. You owe the public a document that will lay out clear, objective, criteria that will help assure future management will not slip, allowing regression of costly restored lands back to their current degraded condition.

17-1 [There have been several major campaigns to restore watersheds and deteriorated rangelands over the years. These have succeeded only in the few situations where the causative factors for the poor conditions were corrected for the long term. So very much public money has been wasted trying to correct symptoms rather than dealing with the basic management problems. I do not find any clear direction to analyze causative factors or to correct management over the long term. Yes, the draft contains some vaguely implied direction but such direction must be strong and clear.

17-2 [I am particularly concerned that the role of past poor grazing practices have played in the massive encroachment of PJ is not highlighted. Highlighted in a manner, which can direct corrective management for all post treatment programs. Poor grazing practice greatly reduces vegetative competition for PJ seedling establishment while reducing wildfire. The Draft does not even provide a comprehensive bibliography laying out the science available on this subject.

Grazing:

17-3 [Performance based grazing is ready for trial only if very specific, objective, and measurable performance criteria are established which protect the multiple resources which depend on healthy, productive range lands. For example only: 4" stubble ht. must remain after grazing on ABC creek, and/or use of riparian willows by cattle will not exceed 30%.

17-4 [Subjective criteria like iterated in the Standards and Guidelines make permit administration difficult indeed.

17-5 [Grazing practices that purport to improve rangelands most often only improve forage for livestock, if they accomplish even that, and are not multiple use orientated.

Responses to Letter I7

- 17-1 The Proposed RMP and Final EIS includes text revisions from the Draft RMP and EIS in several locations to provide clarification of the Ely Field Office's proposed approach to identifying causative factors (see Section 2.4.19 regarding watershed analyses) and monitoring of rangeland health.
- 17-2 Expansion of pinyon-juniper communities is related to a variety of factors with changes in fire regime being one of the foremost. The change in fire regime, in turn, is partially related to grazing management (i.e., fuels manipulation) and partially to levels of local fire suppression. The variety of factors affecting pinyon-juniper expansion will be considered in the proposed management of these areas during and following watershed analysis.
- 17-3 The term Performance Based Grazing has been removed as a Parameter. Performance Based Grazing emphasized flexibility. Flexibility is allowed under current regulation and specifically through allotment management plans. Current policy and regulation are not decisions in the Proposed RMP. Flexibility will continue to be addressed on a site-specific basis. Allotment compliance will continue and will be prioritized based on criteria to include resource issues and operator performance capabilities. Management objectives are established during the term permit renewal process or the watershed analysis process.
- 17-4 Monitoring objectives are developed in association with the Standards and Guidelines, which may be somewhat subjective. However, the objectives are measurable and achievable and consider resources and resource uses. Progress toward meeting the standards is then based on the objectives. These will continue to be developed.
- 17-5 Livestock grazing is a multiple use activity and other resource uses are considered in association with authorizing grazing use. Multiple use objectives are established associated with the standards for rangeland health. Conformance with established guidelines to include effective management practices is essential to maintaining or achieving the standards for rangeland health.

Letter I7 Continued

- 17-6 [The RMP must give direction that objective and measurable criteria be established, and amended to the grazing permit, as a part of the allotment planning process for performance based grazing.
- 17-7 [A new RMP is an opportunity to review old grazing policies such as basic rangeland suitability for domestic livestock grazing in the first place.
- 17-8 [The draft implies grazing policies for the Mojave will be revisited. This is worrisome, that land has been severely degraded by past grazing and may never recover. There are large areas administered by this field office outside of the Mojave, which receive very low precipitation and need to be reviewed for ability to sustain grazing at modern standards for acceptable impacts.
- 17-9 [The selected alternative must direct review of all lands receiving 8" or less annual precipitation for capability to support domestic livestock grazing at economic levels within acceptable impact parameters.
- 17-10 [Recreation:
The Draft proposes to establish special recreation management areas for ORVs.
Touring public lands via motor vehicle is a long established use that can well be allowed within acceptable impact criteria. There are thousands and thousands of routes now available and capable of supporting touring via ORV.
- 17-11 [The Draft is totally unclear exactly what is proposed within these special areas, why there is a need for them in the first place. One must suspect such an area would allow "challenging" machine use, and other activities which have little to do with enjoying the wildness of Nevada's back Country.
- 17-12 [Promoting ORV recreation at this time seems like very bad policy. The BLM cannot even begin to regulate or manage existing opportunities.
- 17-13 [The Draft needs to present a great deal more explanation and justification for the concept of special recreation areas for ORVs and it must direct site specific EAs for all such proposed development.
- 17-14 [ORV Racing by any type is destructive by its very nature. It encourages inappropriate use of other areas. It flies in the face of "tread lightly" policy. It promotes disrespect for wild land. It is in severe conflict with most any other use of the public lands.
- 17-15 [A major, albeit sometimes very tough, roll for public land managers is to just say no to uses, which cannot happen without long term land damage.
Public "demand" must never override good land ethics.
- 17-16 [The long-term public good is going to best be served by phasing out all high land impact competitive sports. Do not advance or encourage racing or any other destructive or competitive use of our lands.

Responses to Letter I7

- 17-6 Please refer to section 2.4.16 and 2.7.16 in the Proposed RMP and Final EIS for a discussion of objective and measurable criteria relative to performance-based grazing.
- 17-7 The Proposed RMP specifies management policies and action and provides programmatic and implementable direction for management of the public lands. Policies such as rangeland suitability will be reviewed on an allotment-specific basis.
- 17-8 The Proposed RMP specifies management policies and actions and provides programmatic and implementable direction for management of the public lands. Evaluation of livestock grazing use relative to achievement of the Mojave-Southern Great Basin Standards is a continual and on-going process. Grazing use will be evaluated during the term permit renewal process, during watershed analysis, and during grazing use monitoring.
- 17-9 Livestock grazing suitability and the evaluation of grazing use relative to grazing any Mohave Desert lands and the achievement of the standards for rangeland health will be conducted during the term permit renewal process, during watershed analysis, and during grazing use monitoring. Authorizing grazing may be appropriate in certain situations. These are issues that would be considered associated with authorizing any grazing use.
- 17-10 Comment noted. The Ely Field Office recognizes that off-highway vehicle use is an acceptable use of public land wherever it is compatible with resource management objectives. However, no single-focus OHV emphasis areas have been identified as a recreation designation.
- 17-11 In response to this and similar comments, the management action in Section 2.4.15.1 of the Proposed RMP and Final EIS regarding special recreation management areas has been revised to reduce the number and size of proposed special recreation management areas. In addition, no special recreation management areas emphasizing off-highway vehicle use have been identified in the Proposed RMP.
- 17-12 Please refer to Response to Comment I7-11.
- 17-13 The BLM deems the recreational use of OHVs to be a valid multiple use of public lands. Management actions are included in Section 2.4.14 and 2.4.15 of the Proposed RMP and Final EIS to ensure that OHV use would have acceptable effects on other uses and resources. As required by existing regulations, an EA or EIS would be prepared for specific developments or events, as appropriate.
- 17-14 The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans are prepared or evaluated.
- 17-15 Please refer to Response to Comment I7-14.
- 17-16 Please refer to Response to Comment I7-14.

Letter I7 Continued

17-17 [In addition I endorse all points raised by the Red Rock Audubon Society.

Sincerely:

Dan Heinz

Re: Draft Resource Management Plan/Environmental Impact Statement for the Ely District

Dear Mr. Drais:

We wish to submit our comments to the Bureau of Land Management (BLM) during the public review period of the *Draft Resource Management Plan/Environmental Impact Statement* (Draft RMP/EIS) for the Ely District. As residents of Garden Valley with property in both Lincoln and Nye Counties, we hope our comments will be seriously considered and that they will contribute to decisions which minimize environmental impacts in this area. Our specific concerns and comments regard the management of "Visual Resources," "Travel Management and Off-Highway Vehicle Use," "Recreation" and "Areas of Critical Environmental Concern."

"2.5.11 Visual Resources"

Our primary interest is to protect a 1-1/2 mile long, 260 acre massive sculpture project know as *City*, located in Garden Valley and mentioned on page 2.5-111 of the Ely RMP.

"Garden Valley is one of the few pristine, scenic valleys remaining in Nevada. It is surrounded by the Quinn Canyon, Grant, Worthington, and Golden Gate ranges and combined with those ranges, provides an excellent example of Nevada's Basin and Range ecological system. In addition, there is an internationally significant sculpture being completed within Garden Valley. The visual and sensory elements of the sculpture depend in large part on the pristine scenic quality of the land surrounding it. On completion, the sculpture is likely to attract many visitors annually to the area. The Visual Resource Management Class II for this special recreation management area would serve to preserve the existing character of the landscape."

18-1

Responses to Letter I8

18-1

Thank you for expressing your concerns. The Proposed RMP does not propose the Garden Valley special recreation management area for scenic qualities. However, the Garden Valley area continues to be identified for visual resource management Class II and Class III objectives. The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans are prepared or evaluated.

Letter I8 Continued

18-1 We highly support "Map 2.4-5/Visual Resource Management Classes Alternatives B and E," designating Garden Valley and part of Coal Valley as a "Class II Objective." If this area is designated as such, we hope to work with the BLM to further protect the sculpture and these valleys from any physical developments to the surrounding landscape from man-made structures, utility corridors, water pipelines and rail lines.

18-2 Within this "Class II Objective," we also recommend the BLM continue to allow livestock grazing (it was suggested in Volume 2 of the Ely RMP Draft [page 4.11-4] that livestock grazing will be prohibited). It is our opinion that livestock and wild horse populations in no way impair the visual character of the land. We support these traditional uses of the land and hope to see them continue into the future.

"2.5.14 Travel Management and Off-Highway Vehicle Use"

18-3 The issue of managing off-highway vehicles within 11.4 million acres is necessary due to increased pressures from recreational off-highway vehicles. Managing invasive weed populations on terrain that has been abused by off-highway vehicles and motorcycles is impossible in this delicate, high desert environment. Off road vehicles and uncontrolled county road grading destroy vegetation, disturb topsoil and promote the spread of noxious weeds. Every year we see weed invasion increase upon these disturbed areas. As residents of Garden Valley who practice a comprehensive weed control program, we are disturbed by these influences around our property, the desert floor and the mountain terrain above.

18-4 Considering the damage off-road vehicles impose upon the environment, we recommend that all vehicles be prohibited from traveling anywhere except maintained roads and trails, adhering to "Map 2.4-32 District Transportation Map/Alternative D." Although restrictive, we find the number of maintained roads and trails within the Ely District to be adequate, especially if there are areas designated for off highway vehicle use, such as "2.5.15.1 Parameter-Special Recreation Management Areas."

"2.5.15 Recreation"

18-5 It is our desire to protect the City sculpture and its surrounding environment within Garden Valley. Therefore, we support "Map 2.4-33/Special Recreational Management Areas Alternatives B and E." With the proposed 'Garden Valley Special Recreation Management Area,' we hope to work with the BLM to further protect this unique American sculpture and the surrounding landscape from avoidable degradation.

18-6 We also support, "Map 2.4-34/Off-highway Vehicle Use Emphasis Areas Alternative B," and "Map 2.4-37 Motorcycle Special Recreation Permit Areas Alternative B." However, we strongly object to "Map 2.4-38 Motorcycle Special Recreation Permit Areas Alternatives C and E" (also associated with "Map 2.4-33/Special Recreational Management Areas Alternatives B and E"). The introduction of the Alamo Motorcycle Special Recreational Permit Area within Coal Valley would be detrimental to the sculpture, the surrounding environment and the local ranching industry. We feel the

Responses to Letter I8

18-2 Please refer to Section 2.6.16 of the Proposed RMP and Final EIS for a discussion of the subject livestock closures. As indicated in the text, these closures are included under Alternative B as protective measures related to desert tortoise and bighorn sheep. The anticipated effects to visual resources are strictly coincidental and are not the reason for the suggested closures.

18-3 In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify criteria that may be used when designating routes in a project-specific transportation plan.

18-4 Please refer to Response to Comment I8-3.

18-5 Please refer to Response to Comment I8-1.

18-6 Thank you for expressing your concern. The special recreation permit area in the Coal Valley area is based on historic motorized event courses. The type of issues raised in your comment will be considered by the Ely Field Office when the project-specific plan is prepared.

Letter I8 Continued

18-6 [territory designated around Caliente ("Map 2.4-37 Motorcycle Special Recreation Permit Areas Alternative B") will be sufficient for motorcycle enthusiasts. Additionally, "The Silver State Off-Highway Vehicle Trail" (*Lincoln County Conservation, Recreation and Development Act of 2004*) will provide all off-highway vehicle enthusiasts with an enormous length of trails within the Ely District.

"2.5.22.1 Parameter - Areas of Critical Environmental Concern"

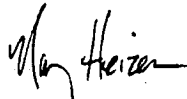

18-7 [Additionally, we would like to see further protection of the Mount Irish Archeological Site ("Map 2.4-55 Areas of Critical Environmental Concern Locations") and support "Alternative B" within the "Mount Irish ACEC Management Actions/Alternatives." This area has one of the greatest densities of ancient petroglyphs in the United States. The protection of prehistoric remains and artifacts is vital to the cultural legacy of this nation.

18-8 [It is our primary goal to protect the sculpture, Garden Valley and Coal Valley. Designating Garden Valley and part of Coal Valley as a "Class II Objective" within the "Visual Resource Management Class" and as a "Special Recreation Management Area" will begin the process of protecting City within a rapidly shrinking natural environment. We hope to work with the BLM in the future to further protect this unique American artwork, and the significant natural resources and traditional land uses that today occupy the lands surrounding the project.

Sincerely,

Michael Heizer

Mary Heizer

Responses to Letter I8

18-7 Please refer to Section 2.4.22.1 of the Proposed RMP and Final EIS for a description of special management prescriptions for the Mount Irish Area of Critical Environmental Concern.

18-8 Please refer to Response to Comment I8-1.

Letter I9

November 28, 2005

BLM Ely Field Office
Attn: Ely RMP Team
HC 33, Box 33500
Ely, Nevada 89301

Dear Ely RMP Team;

I have lived in Nevada for fourteen years now. I spend a great deal of time traveling the state and exploring its many wonderful natural areas, much of it on BLM lands, especially newly designated wilderness areas and wilderness study areas. I have a huge stake in how the BLM manages wild Nevada, and I am asking that you please accept my comments on the draft resource management plan for BLM lands in eastern Nevada.

- 19-1 [My primary concern in the draft plan is the protection of wilderness quality public lands. There is a lot of potential for wilderness designation in eastern Nevada. I believe the BLM should continue to restore eight WSAs, and manage them to keep them from damage from illegal off-highway vehicle use and other illegal activities, at least until Congress has a chance to decide their fate.
- 19-2 [I have been to Ely three times this year already, and may make a fourth trip before winter closes in completely. I am fully aware of the areas that could become designated wilderness and have visited a couple of them. These special places like Becky Peak, with its high meadows and rich habitat for elk, pronghorn, and other wildlife, are favorites of outdoors enthusiasts. The Antelope Range with its outstanding vistas, wildlife, and opportunities for solitude is equally deserving of protection. In the case of the spectacularly scenic Blue Mass/Kern Mountains, I would like to see the Area of Critical Environmental Concern proposal for this area expanded to include the entire area proposed by the Nevada Wilderness Coalition. I would urge the BLM to fully consider potential wilderness areas and put that in its plan.
- The Ely area is hugely popular with hunters and anglers, and for good reason. Hunting is a tradition here, as you can see in the many photographs in Ely's restaurants.
- 19-3 [Wilderness designation would only strengthen this tradition, like in the Government Peak area, adjacent to the Mt. Moriah Wilderness. Expansion of wilderness here would protect as wilderness to protect wildlife viewing and hunting opportunities, as well as habitat for wildlife. The expanded Heusser Mountain Bristlecone Pine area just outside of Ely also needs to be protected.
- 19-4 [Finally, there should be no oil and gas leasing or the placement of wind power facilities within their boundaries until the wilderness status of these lands has been determined. I further believe that these areas should be designated as Class 1 Visual Resource Management Units, which would enhance their wilderness resource value for visitors, whether they be hunters, hikers, or simply the curious.
- 19-5 [

Responses to Letter I9

- 19-1 Please refer to Section 2.4.22.4 of the Proposed RMP and Final EIS for a description of the continuing management of existing wilderness study areas in the Ely RMP decision area. Existing wilderness study areas will continue to be managed under the BLM's Interim Management Policy. In addition, the Proposed RMP closes existing wilderness study areas to motorized and mechanized travel. No new wilderness study areas have been designated in the Proposed RMP.
- 19-2 In response to your comment, the Ely Field Office considered the size of the Blue Mass Scenic Area ACEC but did not change the area proposed for designation. Please refer to Section 2.4.22.1 of the Proposed RMP and Final EIS for a description of the Blue Mass Scenic Area ACEC. As part of the ACEC regulations, the Ely Field Office may not use an ACEC designation as a substitute for wilderness suitability recommendation.
- 19-3 The subject of this comment is beyond the scope of the Ely RMP. Only Congress can designate wilderness.
- 19-4 No oil, gas, or wind energy projects will be allowed within existing wilderness study areas until Congress has made a determination on the wilderness designation of such areas.
- 19-5 A combination of visual resource management classes have been assigned over these areas. Please refer to Section 2.4.11 in the Proposed RMP and Final EIS for clarification of visual resource management class designations.

Letter I9 Continued

19-6 [Designated roads and trails and all unnecessary vehicle routes should be restored, and off-road vehicles kept to strictly enforced corridors so the "untrameled" qualities of these spectacular areas remains marred only by nature.

19-7 [I plan to live out the rest of my days here in Nevada, and in our spectacular backcountry as much as possible. So it stands to reason that I would ask that all the wilderness quality land managed by the BLM's Ely Field Office be protected in the long term for the life of this resource management plan.

Thank you for your consideration.

Sincerely,

William Huggins
430 Salzburg Ave
Las Vegas, NV 89123-7223
USA
feerlessw@earthlink.net

Responses to Letter I9

19-6 The Ely Field Office recognizes that off-highway vehicle use is an acceptable use of public land wherever it is compatible with resource management objectives. During site-specific transportation planning, the Ely Field Office will hold public scoping meetings to address completeness of the route inventory and public issues, concerns, and access needs.

19-7 Comment noted. Congress has designated wilderness through the Lincoln County and White Pine County Conservation, Recreation, and Development Acts, 2004 and 2006 respectively.

Letter I10

Mr. Flinn

- I10-1 [It appears form the Maps provided with your draft plan you have either neglected roads that should remain open for public access or someone may be trying to pull a fast one on the public. one road that does not appear on your map (2.4-32) the road from Rolling Hills pond to Mud Springs needs to remain open. I am also opposed to any action in the RMP that will deny any right currently healed be it mining, grazing, hunting, or any access to the public for recreation.
- I10-2 [

Thank You

Arlin Hughes

175 west 500 north
Veyo Utah
84782

Responses to Letter I10

- I10-1 Map 2.4.14-1 and Map 2.4.14-2 is based on roads currently known to be maintained by federal, state, and county agencies. To the extent that the road map files used were accurate and up-to-date, this map is inclusive of such roads. However, no warranty is implied regarding the completeness or data accuracy of those data sources, particularly at the small scale necessary for this document. The type of issues raised in your comment will be considered by the Ely Field Office when transportation plans are developed through coordination with local agencies, residents, and interest groups.
- I10-2 Please refer to Section 1.5.1, Planning Criterion #12, in the Draft RMP and EIS and Proposed RMP and Final EIS for a discussion of valid existing rights.

Letter I11

November 21, 2005

Mr. Gene Drais
RMP Project Manager
Bureau of Land Management
Ely Office
Re: Ely RMP/EIS

Dear Mr. Drais,

In reference to the RMP for Ely District (#1610 NV-910), we would like to make some comments about the land usage that falls under BLM jurisdiction.

- I11-1 [Section 2.5.14.1 Parameter - Transportation Plan Alternative B states that "All Wilderness Study Areas would be closed to motorized travel." We feel that this is inappropriate as Congress has not yet ruled on Wilderness Study Areas in White Pine County. It would be pre-mature to close access to roads that are still open and reasonable to use.
- I11-2 [Furthermore Alternative B states that, "Greater emphasis on ecological system restoration would be placed on road and trail designations." We would prefer to see the statement read, "Equal emphasis on ecological system restoration and responsible recreation would be placed on road and trail designations."
- I11-3 [The Alternative E contains the statement that "All Wilderness Study Areas would be closed to motorized travel.", again we think that this phrase should be removed, as Congress has not yet ruled on this area, and it would
be pre-mature to close access to roads that are still open and reasonable to use.
- I11-4 [Section 2.5.14.2 Parameter - Off-highway Vehicles Alternative B has several areas that we disagree with. "0 acres available to cross-country off-highway vehicle use", is drastic and unreasonable. At
the very least travel across dry lake beds and dry washes should remain open.
- I11-5 [Please change the second bullet point from "Off-highway vehicle use limited

Responses to Letter I11

- I11-1 Vehicle routes that are excluded from wilderness study area boundaries by cherry-stemmed boundaries would remain open, providing motorized access routes to these areas.
- I11-2 A range of alternatives was presented and analyzed in the Draft RMP and EIS and Proposed RMP and Final EIS. Each alternative had a different management emphasis, based on comments received during scoping and the needs/desires of various public land users. While not all management actions would be acceptable to all users, the alternatives do contain a range of approaches for analysis purposes.
- I11-3 Please refer to Response to Comment I11-1.
- I11-4 The designation of dry lake beds as open was considered in the Draft RMP and EIS and Proposed RMP and Final EIS as part of Alternative C. However, it was not incorporated into the Proposed RMP. Not all dry washes would be suitable for OHV use; however, some may be designated as trails when transportation plans are prepared for a watershed or group of watersheds. The public will be invited to participate in the transportation planning process.
- I11-5 In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify how comprehensive travel management planning will occur in the Ely RMP planning area.

Letter I11 Continued

- I11-5 [to designated roads and trails: 10,338,000 acres.", to Off-highway vehicle use limited to existing roads and trails: 10,338,000 acres.
- I11-6 [Also the final point concerning Wilderness Study Areas, should reflect our position on this matter. We feel that this is inappropriate as Congress has not yet ruled on Wilderness Study Areas in White Pine County. It would be pre-mature to close access to roads that are still open and reasonable to use.
- I11-7 [Alternative C states; "Open to cross-country off-highway vehicle use: 32,000 acres in dry lake beds". We do not wish to limit the scope of cross-country off-highway travel in dry lake bed areas.
- I11-8 [Alternative E: We would like to re-iterate the same comments as in Alternative B.
- I11-9 [Section 2.5.15.1 Parameter - Special Recreation Management Areas
Table 2.5-11, (page 2.5-137, line three), should be revised to read "Heritage tourism and motorized recreation" in the "Primary Values" column.
- I11-10 [Alternative D recommends no special recreation areas, existing or future. We strongly disagree with this, as this is not in the public interest and completely unreasonable.
- I11-11 [Alternative E should include Pahrnanagat along with the other five areas listed for motorized vehicle recreation. We are currently working in partnership with the Ely BLM office on a responsible recreation project that includes motorized recreation. To develop the proposed action, we ask that
you add the Pahrnanagat area to the list of five, (making a list of six).
- I11-12 [Section 2.5.15.2 Parameter - Special Recreation Permits
Alternative B states that "A maximum of two truck events would be permitted

Responses to Letter I11

- I11-6 Please refer to Response to Comment I11-1.
- I11-7 Comment noted. The Proposed RMP does not designate any areas as "Open" to off-highway vehicle travel.
- I11-8 Please refer to responses to comments I11-1 through I11-7.
- I11-9 In response to your comment, the text in Table 2.5-11 and Section 2.5.15.1 of the Proposed RMP and Final EIS has been revised to clarify the discussion of Special Recreation Management Areas. No special recreation management areas emphasizing off-highway vehicle use have been identified in the Proposed RMP.
- I11-10 Comment noted. Please refer to Response to Comment I11-2.
- I11-11 Please refer to Response to Comment I11-9.
- I11-12 In response to your comment, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion of competitive vs. non-competitive events.

Letter I11 Continued

I11-12

each year on race routes subject to NEPA analysis". This is unclear to us.
Are these competitive or non-competitive events?

I11-13

Alternative E recommends that "Four special recreation permit areas totaling approximately 1.38 million acres would be established to maximize opportunities for motorcycle recreation permit events. A maximum of two truck events would be permitted each year. Four routes would be established for all truck events." This sounds like competitive professional or amateur racing. Our usage is vastly different from any type of competitive event. We are committed to slow speeds, and high traction travel, and as such, wish to be considered separately in any consideration for organized events. We would like to see low speed non-competitive events be added for consideration.

Please include me on your email list for any actions, requests or results concerning these parameters.

Finally please allow me to express our sincerest wishes that we will continue to have a long lasting and mutually beneficial relationship with the BLM, and the other users of our great lands. We have and will continue

to help in desert clean-up projects, tread lightly awareness, and of course

respect and manage the trails we enjoy.

Sincerely,

Don Larrick

5824 Kane Holly Street

Las Vegas, NV 89130

For the members of the Total Karnage Four Wheel Drive Club

Las Vegas, Nevada

Responses to Letter I11

I11-13

In response to your comment, the management action in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised to clarify non-competitive off-highway vehicle events. Such events will be evaluated on a case-by case basis and allowed if appropriate.

Letter I12

To Whom It May Concern:

I12-1 I would like to submit the following comments for public record: All existing roads, trails, racecourses and washes need to remain open for OHV use in the 11.4 million acres that this RMP will manage. These roads and trails are a necessity for quality OHV recreation. The closing of these trails would severely impact the OHV community in a negative way. The closures would create fewer opportunities to recreate and explore new areas; forces more people into 1 concentrated area and create an unsafe situation by having to many OHVs riding together. Given the fact that no new roads or trails are being established for use in these areas, the implementation of the Silver State Trail System invading existing racecourses, it would be detrimental to the off-road racing community to lose anymore trails in these areas. There needs to be an equal designation of OHV open use land that equals the other uses

on wlatt lemNa se,a idn Lincoln County.

I12-2 It saddens me that my children and grand children will not be permitted to explore areas of Lincoln county anymore on OHVs like when I was a child. Having been an OHV user for almost 30 years, I can honestly say that none of these new wilderness areas were ever damaged by an OHV. I have ridden in all areas of Lincoln County and everything is fine.

I12-3 The only damage I can remember seeing is damage caused by fires, springs trampled by wild horses and cattle and over grazing of areas due to poor management. I have revisited many of these areas over and over and there is no damage. I can only hope that the BLM will respect the rights of people and taxpayers to recreate and not create policy based on inconclusive scientific discovery or cater to environmental groups that want nothing more than to eliminate OHV use all together.

I12-4 Here are my suggestions of how this land should be managed. The BLM needs to designate 3 or 4 million acres that will be classified as open use much like the Wilderness designation to preserve and protect the OHV communities' recreation areas from environmental groups. You also need have a trail replacement program so that for every mile of trail

Responses to Letter I12

I12-1 In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify how comprehensive travel management planning will occur in the Ely RMP planning area. Not all dry washes would be suitable for OHV use; however, some may be designated as trails when transportation plans are prepared for a watershed or group of watersheds. The public will be invited to participate in the transportation planning process.

I12-2 Comment noted. All existing roads and trails will remain open until site-specific travel management plans have been completed with public input.

I12-3 Comment noted. The intention of the Ely Field Office is to manage not eliminate off-highway vehicle use.

I12-4 Please refer to Response to Comment I12-1.

Letter I12 Continued

I12-4

or racecourse you close there will be a new mile re-established to replace it and the word "designated" needs to be removed from the RMP and replaced with the word "existing", for example all existing trails, roads, race courses and washes will remain open for OHV use in the 11.4 million acres. This statement needs to be added to the RMP.

Thank you,

Anthony Z. Livreri

Letter I13 Continued

Attachment to e-mail from Robert Martinez

I13-1

These comments pertain to the Draft-Executive Summary, Resource Management Plan/Environmental Impact Statement for the Ely District. Page 3.3-8 states, "all surface water in Nevada is fully appropriated and no new applications for permits to appropriate surface water rights may be approved." Please note that there are numerous springs and small streams throughout the state for which no determination of water quantity or issuance of a water right has been made by the State Engineer's office. One must first make application on a particular source before this determination of a water appropriation of a specific quantity is made. The State Engineer may approve an application if he determines that there is sufficient water at the source for the proposed use, does not conflict with existing rights, and that given under NRS 533.370. You should also be aware that there might be vested claims on a various sources. Vested claims are those in which a beneficial use of the water can be established before the enactment of Nevada water law. It is not necessary for vested claims to be filed until such a time as so ordered by the State Engineer.

I13-2

Please be advised that Table 3.3-1, Water Availability in Shallow Alluvial Aquifers, which shows the perennial yield for various groundwater basins throughout White Pine and Lincoln counties, may be subject to change as more studies and tests are conducted in these areas. Additionally, the committed resource, as enumerated in the table, is subject to change for applications, permits and certificates due to actions by this office such as approval, denial, cancellation and forfeiture, etc. See NRS Chapters 533 and 534.

Responses to Letter I13

I13-1

In response to your comment, the text in Section 3.3.3 of the Proposed RMP and Final EIS has been revised to clarify the discussion of water rights and permit applications.

I13-2

In response to your comment, the text in Section 3.3.1, and the footnote to Table 3.3-1, of the Proposed RMP and Final EIS have been modified to clarify the discussion of water availability.

Ely Draft RMP/EIS Comment Form

Nov 28th 2.5-133
Travel Plan
Support

Informed decisions are better decisions: BLM believes that extensive public involvement will serve to improve communication, develop enhanced understanding of different perspectives, and identify solutions to issues and problems. We look forward to hearing from you!

Where to provide comments: You can hand this form in at The Ely BLM Field Office (702 N. Industrial Way) or mail it in using the address on reverse

Tips on providing effective comments: The BLM land use planning process is based on agency policy, science, and social value. Specific comments that deal with important management methods and decisions are extremely helpful to the BLM. Overly general statements of support or opposition are less effective. Also remember that this RMP will deal with broad management decisions, not site-specific actions.

Name Karen Mullen County Washoe
Title N/A Affiliation N/A
Mailing Address 16919 Mt Rose Hwy
City Ream State NV Zip 89511
Date 11/26/05 Meeting Location (if applicable) N/A

Sorry hope you can get it red in the Wild Area

Please check box if you do not want your name released when comments are made public.

COMMENT (use back side if you need additional space or attach additional sheets)

- I14-1 Support Travel Plan restricting OHV use to existing roads & jeep trails and closure of roads that have been created that don't go anywhere or are steep w/ lots of erosion.
- I14-2 Support Access to public land with increased trailheads for all types of use.
- I14-3 I am tired of ATVs destroying wildlife habitat. Please enforce that they stay on roads - confiscate these ATVs and maybe they will stop.
- I14-4 I do not support more than 200-300 acres going to the Wild for housing purposes or business that is non farming. I do not

- I14-1 Comment noted. For clarification, travel will be restricted to designated, not existing, roads and trails.
- I14-2 The type of issues raised in your comment will be considered by the Ely Field Office when project-specific plans are prepared or evaluated.
- I14-3 The Ely Field Office recognizes that off-highway vehicle use is an acceptable use of public land wherever it is compatible with resource management objectives. In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify criteria that may be used when designating routes in a project-specific transportation plan.
- I14-4 Thank you for your comment. The subject of this comment is beyond the scope of the Ely RMP and does not require further agency response.
- I14-5 Thank you for your comment. The Ely Field Office is not aware of any Wilderness Study Areas in the vicinity of Basque Canyon south of Ely.

stage, tape bottom of fold, and mail.
prefer it to kept in BLM holding make it an area of environmental concern instead. Then it is for all to enjoy.

Letter I15

Gene,

The weight of the Ely DRAFT RMP has weighed heavily on my mind while I prepared for a three week trip of a lifetime. The Ely RMP lost out. But my reflections on the RMP include the extensive preparation that you and your staff, with the backing of Bob Abby and State Office staff, implemented in preparation for this process. And I believe that the process is finally as important as the document because documents are a step in time but an include process sets the tone. Gene, I want to thank you again and Bob Abby as well for developing this system.

The Ely District is a largely rural district but being hit with urbanization at the edges of Lincoln County with the demands for water to feed that urbanization now encompassing the entire district. Utility corridor rights of way, power plants with potential for air and water pollution, and unregulated recreation demands are some of the external issues impacting the district. Protection of natural, cultural, and historic resources is a challenge because everything going on appears to be against protecting these resources. In addition you are faced with the issue of range changes including expansion of the p-j forest, areas of dense stands of fire prone sagebrush, areas of declining aspen groves, invasion of cheat grass, and the threat of fire rapidly changing, mostly for the worst, the native ecosystems.

You contracted with The Nature Conservancy to provide a process to discuss and describe many of the basic natural systems occurring. The invitation to participate went out to a broad representation base. You helped to found the Easter Nevada Landscape Coalition, which also was an effort to include diverse interests, which through its annual meetings, membership, and executive group, maintained a diverse group and provide a forum for looking at the natural system. Finally, I recollect being invited to participate in the development of a public participation process which addressed some of the framing of discussion issues as well as the public process itself. In the long run the process of inclusiveness, if it can be continued into the future, holds the best hope for minimizing the damage to the land itself.

I15-1

What is the definition of a natural system? Natural systems change with the advent of a warmer climate, fire, uses such as livestock grazing and corridors, and development roads or transmission lines. I don't know whether in this EIS, because I have not read it that closely, whether you arrived at a definition of "natural". I do know that the word "natural" no longer means leaving the land alone. Restoration is a key component; in effect we are managing for a stage in succession.

This is what I would like to see:

I15-2

* Aspen Groves - Once aspen groves are lost, we are unlikely to invest the resources to rebuild them. Management of livestock, wildlife, plant invaders, wild horses and recreation need to be managed to protect them,

I15-3

* Range - we must protect those lands where a native understory of grasslands and forbs exist and try to restore areas of where we have lost them. Management of livestock, ungulates, wild horses, recreation, manmade corridors must be limited to ensure this future

Responses to Letter I15

I15-1

In response to your comment, the term "natural system" has been added to the Glossary in the Proposed RMP and Final EIS.

I15-2

Maintenance and management of healthy aspen is one of the Ely Field Office's stated priorities in the Proposed RMP and final EIS. BLM's proposed management described in Section 2.4.5.3 is designed to maintain or improve the health of these sites.

I15-3

The Federal Land Policy and Management Act stipulates that the BLM manage public lands for multiple uses and sustained yield. Although the cost for projects such as fire rehabilitation and weed treatments are high in the short term, implementing projects of this nature in the long term would improve vegetation communities and lessen the cost of future maintenance. An objective of the Proposed RMP is restoration of a more natural burn cycle with smaller, cooler fires.

Letter I15 Continued

- I15-3 health. The cost of fires and subsequent weed replacement is too expensive. As I recollect grasslands ensure cooler fires and provide habitat for insects, reptiles, small mammals, and birds, as well as livestock and ungulates,
- I15-4 * Restore white sage and other plants damaged by livestock and other uses,
- I15-5 * Costs of management - With BLM and other federal agencies being so severely in terms of funding, increased emphasis must be placed on work by NDOW and livestock operators. I would suggest that NDOW fund some studies, for instance, on elk impact. However, those studies would only have value if a science based institution was involved.
- I15-6 * Continuation of organization like ENLC with increased emphasis on recreation and utility corridor impacts,
- I15-7 * Protection of all threatened and endangered species. Since so many of them are dependent on vulnerable water sources, I would suggest that ENLC also take up the issue of inventorying existing surface and subsurface water sources and find out whether they are protected under state water law and if not how they can be protected. We did not dwell on the issue of water source loss during our meetings several years ago, but currently, it seems to me, that a good portion of the White Pine and Lincoln county springs, seeps, streams, and subsurface ecosystems like the pinyon pines groves near Great Basin Park are threatened with extinction, and
- I15-8 * Encourage NDOW to update its inventory of water sources and needs for wildlife on all water systems and to file for rights on behalf of wildlife.
NDOW can impact the State Engineer and it should be speaking up for all Nevada's wildlife.

These are a few of my early morning thoughts and hopes for the Ely District

"Tina Nappe"
<tnappe@nvbell.ne

Responses to Letter I15

- I15-4 BLM's proposed vegetation treatments and watershed management will be designed to encourage the regeneration and increase of numerous native species. The term "white sage" is commonly used to refer to both *Ceratoides lanata* or winterfat and *Artemisia ludoviciana*, also known as western mugwort, sagewort, or silver wormwood. The former species, which often forms almost pure stands in the Great Basin, is included under the discussion of Salt Desert Shrub communities (see Section 2.4.5.5). The latter species is a widespread understory species occurring in association with sagebrush, pinyon-juniper, and other communities.
- I15-5 The Ely Field Office agrees that there needs to be more participation from state agencies and livestock operators and understands that they suffer from budget issues as well. The Ely Field Office has established and will continue sound working partnerships with state agencies, collaborative partnerships, and others to accomplish the mission of the managing public lands.
- I15-6 The existing assistance agreements with ENLC allow for collaborative work on all landscapes managed by the Nevada BLM.
- I15-7 A priority for BLM management is protection of riparian systems. Through the assistance agreement with the ENLC, data has been provided and volunteers have assisted with wetland development and management. The Ely Field Office will continue in this effort as budget and workforce allow.
- I15-8 The Ely Field Office will maintain a collaborative working relationship with NDOW on all vegetation systems. The Ely Field Office is updating its inventories of water resources, and this information is shared with NDOW. The Ely Field Office suggests that the commenter contact NDOW directly with your concerns.

Letter I16

November 23, 2005

BLM Ely Field Office
Attn: Ely RMP Team
HC 33, Box 33500
Ely, Nevada 89301

Dear Ely RMP Team;

These are my comments on the draft resource management plan for eastern Nevada.

I16-1

Protecting wilderness quality public lands is critical, especially Becky Peak, with its high meadows and rich habitat for elk; Antelope Range with its outstanding vistas; Blue Mass/Kern Mountains; Government Peak area, to protect hunting opportunities; and Heusser Mountain. These wilderness quality areas should be protected in the plan by strictly limiting the visibility and footprint of oil and gas and wind power facilities within their boundaries. Motor travel should be limited to only designated roads and trails.

I want to see some wilderness quality land protected. Thank you.

Sincerely,

Marc Roddin

Responses to Letter I16

I16-1

When the Ely RMP planning process was initiated, there was no requirement in the Land Use Planning Handbook to identify lands with wilderness characteristics. Under the new Planning Handbook (2005), the BLM no longer designates wilderness study areas as part of the land use planning process. While the new Handbook allows the Ely Field Office to consider information on wilderness characteristics as part of travel management and visual resources management, no lands with wilderness characteristics were identified during the Ely RMP planning process. In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify criteria that may be used when designating routes in a project-specific transportation plan.

Letter I17

To whom it may concern:

My name is Luke Rollins. I am representing myself in this letter. I was born in Ely, NV and was raised in Lincoln County. I spent many years in my youth riding on long time established trails all over the county. In all of my riding, I have noticed a few things that are consistent. One is that most of the people that I ride and race with, use trails that have been already established. There are the exceptions, as there are in any "unwritten" code. One other thing is that I have seen more lands ruined by cattle grazing than by any amount of off highway use. The proof is in the calculation. Consider the average width of an OHV trail and its length. The square miles in a versus calculation proves that more square miles are attributed to cattle dissemination than off highway use. The only thing is OHV use is not profitable. At least not to the BLM. Maybe a OHV registration would help any costs incurred for the management. I do know this, when you take the places away that can be ridden, you make criminals out of locals looking for positive fun. So much for helping the massive increase in rural drug abuse and crime.

I can be contacted @
spankie033@hotmail.com.

My address is 7th and Earnest Panaca, NV 89042.

Thanks for the consideration,
Luke Rollins

Responses to Letter I17

I17-1 Comment noted.

I17-2 The Ely Field Office recognizes that off-highway vehicle use is an acceptable use of public land wherever it is compatible with resource management objectives. In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify how comprehensive travel management planning will occur in the Ely RMP planning area.

Letter I18

Received via email 7-30-05

7/30/05

- I18-1 [I would like the time to comment extended. I would like a hard copy of this plan sent to me for further investigation since I have no access to this on computer.
- I18-2 [I think the following should be totally banned in this entire area:
1. hunting
2. trapping
3. new roads
4. all two stroke vehicles
5. all mining, drilling, grazing and logging
6. all prescribed burning, in which fine particulates are carried by wind thousands of miles ending up in human lungs and causing lung cancer, heart attacks, strokes, pneumonia and asthma.
- I18-3 [I also think this is the taxpayers land, not the politicians and friends land and the taxpayers have paid to save it for cons. they want it saved. only profiteers want to destroy it for their own bank account enrichment.
- I18-4 [I want the wild horses to live on it. I note that there are only 35,000 wild horses left and 4,000,000 cattle to enrich cattle barons have been put on blm lands - and that is atrocious and disgusting.
- I18-5 [I do not want wild horses sent to slaughterhouses to be killed at all ever in any place. They must be allowed to live on these blm lands.

B. Sachau

Florham Park, NJ 07932

Responses to Letter I18

- I18-1 Copies of the Draft RMP and EIS were sent to those persons, organizations, and agencies that indicated they would like to receive one; and copies were also placed in local and regional libraries. The availability of the Draft RMP and EIS was also noticed in the Federal Register and the Newsletter distributed to approximately 3,000 recipients on the RMP/EIS mailing list. The required comment period on a Draft RMP and EIS is 90 days. BLM elected to set a 120-day comment period for the Ely Draft RMP and EIS and did not formally extend this period. Although the BLM did not elect to extend the official comment period for this document, comments received after the end of the comment period were considered as late as practicable within the overall document revision and publication process. Comments that were received after the close of the comment period have been accepted and considered in the preparation of the Proposed RMP and Final EIS.
- I18-2 Comment noted. Please refer to Alternative D in the Draft RMP and EIS and Proposed RMP and Final EIS, which excludes many of the discretionary management actions you mention in this comment.
- I18-3 Comment noted.
- I18-4 Thank you for expressing your concerns. Please refer to Sections 3.8 and 3.16 in the Draft RMP and EIS and Proposed RMP and Final EIS for discussion of the actual numbers of wild horses and animal unit months of livestock use within the Ely RMP decision area.
- I18-5 Law and policy prohibit the BLM from disposing of excess wild horses through slaughter. Nowhere in the Proposed RMP is slaughter identified, discussed, or analyzed. During the planning process, the Ely Field Office identified where to manage wild horses and an overall view of how to manage wild horses on the public lands. The management of wild horses is limited to Herd Areas identified after the Wild and Free Roaming Horse and Burro Act (PL-195) was passed in 1971. From these Herd Areas, designation of Herd Management Areas (HMA) occurs, which identifies areas that are suitable for the long-term maintenance of wild horses. Within these HMAs, wild horses are free to roam as one multiple-use of many under a specified appropriate management level, so as not to exceed the capacity of the rangeland to support a thriving natural ecological balance.

Letter I19

Received via email 9-16-05

09/05/05

- I19-1 [Peaceful uses of this land should prevail. wildlife "watchers" spend ten to one what wildlife killers spend - and it is time that they get priority at these nationally supported areas. tax dollars are used for these lands, and they should benefit the primary groups instead of people who still practice habits of 1860.
- I19-2 [these "advisory councils" are all local and this is a nationally supported area. i believe local profiteers may be populating these councils and coming up with biased decisions that will benefit only the local nevada area. when this is a national area, the decisions emanating MUST benefit the entire country. catering to local profiteers is not appreciated by national taxpayers who have been supported this land for eons and paying for it.
- I19-3 [i note a very very small number of horses being provided for in this plan. i note that wild horses seem to be only good for the slaughterhouse according to blm and urge blm to stop this practice. wild horses should get that land. throw out the grazers, the grazers are in fact destroying the land. the intensive use of this land by grazing has in fact destroyed it a great deal. wild horses are more dispersed and do not do as much damage. i note a real attempt by blm to put inaccurate information in this report to try to blame wild horses.
- I19-4 [d is the best of many bad alternatives. i also do not think any govt agency should be offering the american public only "choices" of their choice. i think the american public should be able to make its own complete choices without being told what to do by this agency, which has an extremely bad environmental record.
- I19-5 [i note game species being favored by this agency - WHY cater to gun nuts? i note killing of coyotes - which is abusive. there are so few there that they should be left alone.
- I19-6 [i note a "wind section" being proposed. how many migratory birds will be killed by those wind turbines every year - i note no number put in thiss plan to let the public know what the damage will be to the bird population.
- I19-7 [i also note that "cheatgrass" is an issue and know that cheatgrass problem is a problem because of the intensive grazing the intensive grazing that blm itself has allowed. So blm gets to make a problem and then say it is a problem and needs taxpayer money to fix it?
- I19-8 [also cheat grass was allowed into this country by the USDA - perhaps you should apply to the usda budget for money from their budget to cover this invasion of what they allowed to be imported into the u.s.

B. Sachau

Florham Park, NJ 07932

Responses to Letter I19

- I19-1 The Ely Field Office recognizes that hunting is an acceptable use of public land wherever it is compatible with resource management objectives. The Ely Field Office has not prioritized multiple uses in the Proposed RMP.
- I19-2 The Resource Advisory Councils (RACs) are nationally chartered by the Secretary of the Interior and are not populated by profiteers. The RACs consider a wide range of resource issues within the Ely RMP decision area.
- I19-3 Law and policy prohibit the BLM from disposing of excess wild horses through slaughter. Nowhere in the Proposed RMP is slaughter identified, discussed, or analyzed. During the planning process, the Ely Field Office identified where to manage wild horses and an overall view of how to manage wild horses on the public lands. The management of wild horses is limited to Herd Areas identified after the Wild and Free Roaming Horse and Burro Act (PL-195) was passed in 1971. From these Herd Areas, designation of Herd Management Areas (HMA) occurs, which identifies areas that are suitable for the long-term maintenance of wild horses. Within these HMAs, wild horses are free to roam as one multiple-use of many under a specified appropriate management level, so as not to exceed the capacity of the rangeland to support a thriving natural ecological balance.
- The Ely Field Office disagrees that a small number of wild horses are being provided for in the Proposed RMP. The plan identifies 1,695 wild horses that initially are to be managed within the Ely RMP planning area. This will still make Ely Field Office the third largest wild horse manager within the Federal Government.
- The Ely Field Office disagrees that wild horses are not a grazer. All past and current scientific information states that wild horses are indeed a grazer. Further, the Ely Field Office has presented accurate information in the Proposed RMP and Final EIS based upon scientific data, current rangeland management principles, and professional field experience. The Ely Field Office disagrees that a small number of wild horses are being provided for in the Proposed RMP. The plan identifies 1,695 wild horses that initially are to be managed within the Ely RMP planning area. This will still make Ely Field Office the third largest wild horse manager within the Federal Government.
- I19-4 Comment noted.
- I19-5 The priority species listed in Section 2.4.6.2 of the Proposed RMP and Final EIS does include game species, but also includes migratory birds. In addition, Section 2.4.7 of the Proposed RMP and Final EIS addresses special status species most of which are not game species. The text of the Proposed RMP and Final EIS has been revised to take out any discussion regarding the killing of coyotes. The killing of coyotes is not the responsibility of the BLM, and therefore, not part of the Proposed RMP and Final EIS.

Responses to Letter I19

- I19-6 In response to your comment, the text in Section 4.6 of the Proposed RMP and Final EIS has been revised to specifically include the potential for migratory bird mortality on wind turbines. While the potential impact is acknowledged, it is impossible to quantify anticipated impacts in the absence of specific development plans. That impact assessment would occur in the NEPA analysis associated with specific project reviews.
- I19-7 Cheatgrass is an invasive species that has spread across both public and private lands throughout the Intermountain West. Although improper grazing management has contributed to its spread in some situations, fire has probably been a substantially greater factor in its distribution and dominance across large areas of the Great Basin.
- I19-8 Comment noted.

Responses to Letter I20

I20-1 Vehicle routes that are excluded from wilderness study area boundaries by cherry-stemmed boundaries would remain open, providing motorized access routes to these areas.

I20-2 Please refer to Response to Comment I20-1.

I20-3 In response to this and similar comments, the text in Section 2.4.14.1 of the Proposed RMP and Final EIS has been revised to clarify criteria that may be used when designating routes in a project-specific transportation plan. Not all dry washes would be suitable for OHV use; however, some may be designated as trails when transportation plans are prepared for a watershed or group of watersheds. The public will be invited to participate in the transportation planning process. Wilderness study areas will be managed under the BLM's interim management policy until Congress makes a decision on the designation of wilderness.

I20-4 Please refer to Response to Comment I20-3.

I20-5 Your comments will also be applied to Alternative E.

Responses to Letter I20

- I20-6 Please refer to management actions REC-2 and REC-4 in Section 2.4.15.1 of the Proposed RMP and Final EIS for a discussion of recreation values/opportunities in Special Recreation Management Areas. Of particular note (in part) is the following component of management action REC-4: *"Using information from the interdisciplinary team and through public scoping, identify different recreation niches to be served in the special recreation management area. Write specific objectives for the recreation opportunities that would be provided and managed."* Thus, the appropriateness of motorized recreation in the proposed Pahrnagat SRMA would be determined through the interdisciplinary and public process described.
- I20-7 Please refer to Response to Comment I20-6.
- I20-8 Please refer to Response to Comment I20-9.
- I20-9 In response to your comment, the text in Section 2.4.15.2 of the Proposed RMP and Final EIS has been revised to clarify the discussion of competitive vs. non-competitive events.

Subject DRMP/EIS

- I21-1 [I am against any management plan that would limit our already limited hunting access or our ability to enjoy one of greatest heritages ever left to us. The right to bare arms and the right to hunt any were on public lands. It is after all our lands also. If some people do not wish in enjoy these rights, that's there right but that does not give them the right to take it from us. Or does it give the government that right. I am under the impression that the government works for all of us not just a select few. After all the government is all of us not just a select few . We not only enjoy hunting but also enjoy just being out to be able to see many things that most people will never see because they don't spend the time out in the outdoors that we do. And we belong to many organizations that promote the environment and also the management of our animals. So that they will be around for our grand kids and there grand kids and so forth and for you too. I personal belong to SCI, NRA, WITO, And the Wild Turkey Federation. So as you see I am very serious about our hunting lands & our public lands for everyone to be able to enjoy weather they hunt or just camp, hike , fish,ski, take pictures or maybe just sight see., that is there right there is allot for everyone to enjoy don't take that from us. Julie Spear Ely, Nv.

- I21-3 [
- I21-4 [

Responses to Letter I21

- I21-1 The Ely Field Office recognizes that hunting is an acceptable use of public land wherever it is compatible with resource management objectives and public safety. The Proposed RMP will only limit motorized access off of designated roads and trails. Access by foot or horse will be allowed in all areas.
- I21-2 Comment noted.
- I21-3 Please refer to Sections 2.4.15, 3.15 and 4.15 in the Proposed RMP and Final EIS for a discussion of proposed recreation management actions, existing recreation conditions, and impacts to recreation resources.
- I21-4 Comment noted. Outdoor recreation is an important consideration for the management of public lands by the Ely Field Office.

Letter I22

Craig Stevenson
3001 Nutwood St.
Las Vegas, NV 89108
(702) 645-2353

28 November 2005

Gene Drais
Project Manager
Bureau of Land Management
Ely Field Office
HC 33 Box 33500
Ely, NV 89301

Dear Mr. Drais:

I have reviewed most of your *Draft Resource Management Plan/Environmental Impact Statement for the Ely District*. I believe it is the better EISs I have seen. I am concerned about the allowances of OHV use, but the document should be sufficiently flexible to corral that use when it reaches its usual excess. My primary concern is the proposed management for paleontological resources.

1) Invertebrate Fossil Collecting Permits

I22-1 I have been involved in trilobite/invertebrate collecting for only a short time, but I have found the Ely District to contain significant trilobite and other paleontological resources. I am concerned that the regulations proposed in the preferred alternative of the *Ely RMP/EIS for the Ely District* will negatively affect amateur or hobby collecting on federal lands.

I22-2 The stated concern behind the proposal to require permits is misdirected. If commercial collection is a threat, I recommend that the Bureau and other federal agencies pursue it at market level. This can be easily done by targeting the sale of species which can be tied solely to federal lands. A quick search on the internet using "trilobite" and "Nevada" presents dozens of sites selling trilobites. Some collectors even list the sites, such as Ruin Wash or the Groom Range, on eBay or commercial sites.

I22-3 Without some enforcement effort, there would be no substantive resolution of resource misuse. These regulations also stands to affect paleontological research.

I22-4 One thing I have noticed, is that paleontologists rarely have great amounts of time to collect an adequate number of specimens. As a result, species classifications and faunal descriptions sometimes prove inadequate. Amateur collectors working with paleontologists often-times have the advantages of proximity to study areas and ample time to better sample the areas.

Responses to Letter I22

I22-1 Comment noted. A registration system should not affect amateur or hobby collectors.

I22-2 In response to your comment, the text in Section 2.4.10.1 of the Proposed RMP and Final EIS has been revised to remove any link between permits and commercial collecting. In the Proposed RMP, the Ely Field Office is not proposing a permit system, but an on-site no-fee based registration system in order for the Field Office to better track use and inform the public of proper use and etiquette in collection of invertebrate fossils.

I22-3 The Proposed RMP contains management actions that set direction/standards for land use management; it does not impose regulations. The management actions contained in the Paleontology section allocate these resources to scientific and public use. Enforcement activities will be ongoing to ensure proper use.

I22-4 Comment noted. Amateur collecting will continue to be allowed under the Proposed RMP.

Letter I22 Continued

I22-4 Additionally, many localities which prove to be of paleontological value are discovered by amateurs. In just the past year, I have been involved in the discovery of a trilobite fauna in Nevada previously found only in northern Utah. At least two new species of *Olenoides* trilobites appear to exist only in this section. With some direction from Dr. Pete Palmer of the Institute for Cambrian Studies, I am helping to confirm and correlate a second locality of this fauna.

In another area, I have collected specimens from what appears to be several undescribed species of *Albertella* trilobites. One of these may correlate with *Albertella highlandensis* (Eddy and McCollum, 1998), extending the known range of this species.

I22-5 I agree that commercial (and amateur) collectors can tear up some areas. Even controlled collecting can result in the appearance of small mining excavations dotting the landscape. More often these locations are off of the beaten path and go unobserved by the general public.

I think you will find that most sites are not significantly disturbed until paleontologists have done some work, (Ruin Wash, Andies Mine, Telegraph Canyon, etc.) The publishing of theses and professional papers leads to the popularity of many sites. It is the follow up or secondary work at sites that stands to be negatively affected.

I22-6 Yet, there is little chance of resources at any one site being eliminated. I have heard other collectors complain that Ruin Wash is played out. The truth is that the "easy" collections are being eliminated. It is often difficult work to uncover fossils locked in rock. Remote locations, limited muscle and age, all affect enthusiasm, which limits the threat to the resource. Depending on numerous factors, several hundred pounds of rock can be moved for little or no reward.

I22-7 Economic factors relating to fossil collecting are also overlooked in the Draft RMP. Trilobite and other fossil collectors contribute to the local economies. Many collectors camp out, but some stay in motels in Alamo, Caliente, Pioche and Ely. Most buy gasoline and supplies in these areas. I usually purchase gasoline and food in Lincoln or White Pine Counties when I travel to the Ely District to collect.

Returning to the permit issue, if the Bureau is not willing to aggressively pursue illegal sales of invertebrate fossils, it should be hesitant to impose regulations which it will be unable to enforce. Before the Ely District suggests any restrictions on the collection of invertebrate paleontological resources I recommend the following:

- I22-8
- 1) *The Ely District should establish a working group to examine the situation.*
 - 2) *Any regulations should be reasonably compatible with adjacent states, agencies and BLM districts.*
 - 3) *The Ely District should have the time and resources to reasonably enforce any rules. The preferred alternative does not articulate reasonable goals and objectives that are attainable under current staffing.*

Responses to Letter I22

I22-5 Comment noted.

I22-6 Comment noted.

I22-7 Thank you for comment. The text in Section 3.23 of the Proposed RMP and Final EIS has been revised to expand the list of recreation and tourism activities that occur in the Ely RMP planning area. The economic contributions of all such activities is recognized collectively in both Sections 3.23 and 4.23. However, individual assessments are beyond the scope of the analysis. The revisions do not affect the basic impact conclusions presented in the Draft RMP and EIS.
