

Protecting the Future

Conserving America's Natural Resources
...for America's Children

Three fourths of the people in the United States live on 16% of the land. These areas have major environmental problems which include land disturbances, erosion, land use change, sedimentation, loss of open space, loss of wetlands, soil compaction, increased runoff, flooding, water pollution, and disruption of plant and animal habitat.

In addition, some of our most valuable crops and best farmlands are located in urban and suburban areas and these lands are diminishing as they are converted to nonagricultural uses.
