

It's Not Organic Waste,
It's a Resource

Beyond the Garden

Organic waste is a valuable resource that can be used to create compost, which is a natural fertilizer for plants. Composting is a simple process that can be done in your own backyard. It involves collecting organic waste, such as food scraps, yard waste, and paper, and allowing it to decompose over time. The resulting compost is rich in nutrients and can be used to improve the soil in your garden. Composting is a sustainable practice that can help reduce the amount of organic waste that ends up in a landfill. It is also a great way to save money on fertilizer.
