

Veterinary Cases: Cumulative Report

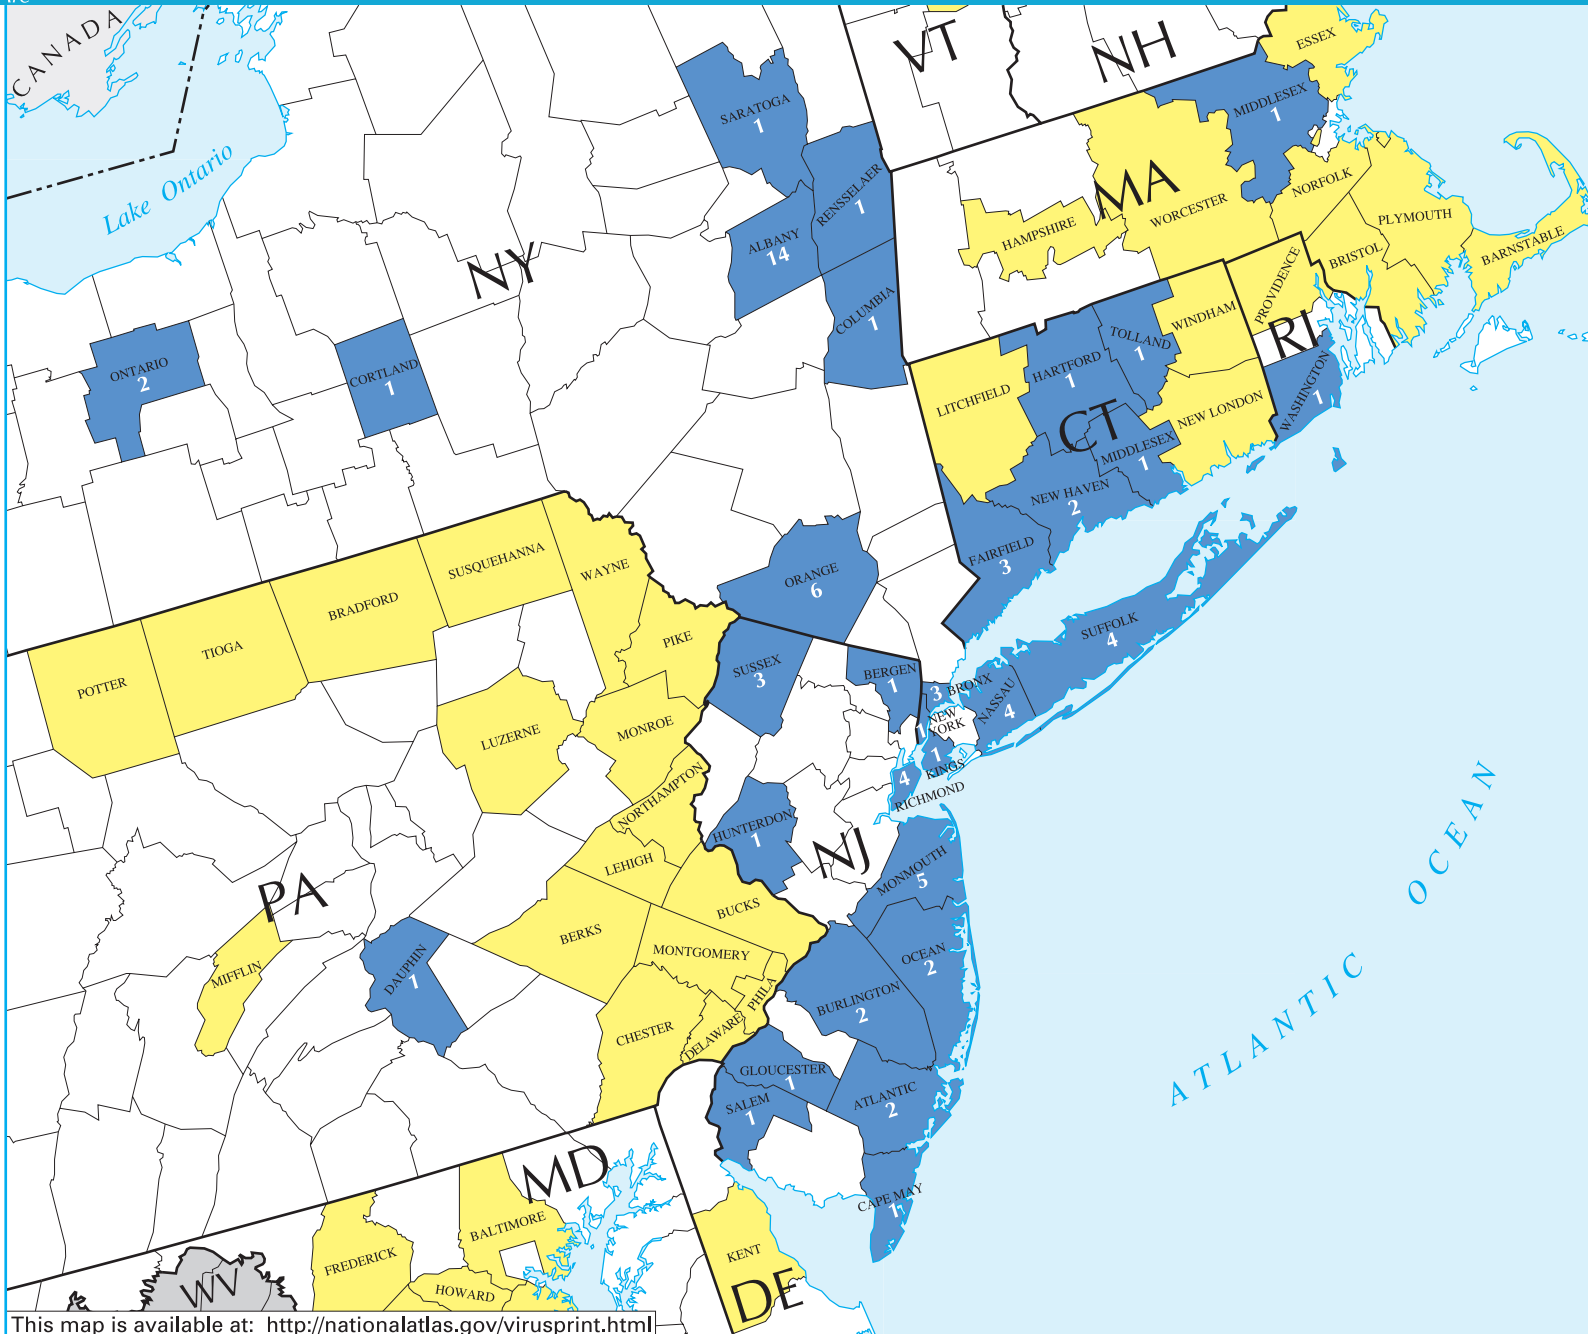

Data from reports made
between 1 JAN 00 and 8 DEC 00.

- 1 Number of Positives
- Test Samples Submitted
- No Reports
- Not Participating

These county and county equivalent data are based on information reported voluntarily to CDC by state and federal agencies. West Nile virus (WNV) infection was determined by laboratory testing on animals other than wild birds (such as pets, livestock, and wildlife) with symptoms of WNV infection. Note that the map includes all areas of positive (confirmed or probable) WNV results, but not necessarily all areas with submitted samples or areas with no reports.

Disclaimer: These data are provisional and may be revised or adjusted in the future.
