- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.

- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-A24+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 2/3 group 2, and 0/0 group 3.

**Keywords** HAART, ART, supervised treatment interruptions (STI)

**References** Altfield *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

**References** Altfield *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.

- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

**References** Frahm *et al.* 2007

- 100 HIV-infected subjects were tested for response to optimally-defined CTL epitopes regardless of the subject's HLA type. Half of all detected responses were seen in the absence of the originally reported restricting HLA class I allele, and only 3% of epitopes were recognized exclusively in the presence of their original allele. Statistical and experimental methods were used to define additional HLA alleles associated with the epitopes.
- Based on a prediction of the minimum number of HLA alleles needed to cover the HLA representation in all responders to this epitope, a minimum set of 6 alleles was found: 1 allele previously known to be associated (A24) and 5 additional alleles (A01, A02, A23, Cw04, Cw07).

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting

to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.

- The response to the peptide that carried this epitope, RYPLTFGWCF, was present before superinfection but waned afterward. The epitope from the second strain had a mutation, rypICfgwcf. A second overlapping epitope in the reactive peptide might be involved, the B\*35 epitope YPLTFGWCF.

**HXB2 Location** Nef (134–143)**Author Location** Nef (138–147 SF2)**Epitope** RYPLTFGWCF**Immunogen** HIV-1 infection**Species (MHC)** human (A\*2402)**References** Ikeda-Moore *et al.* 1997

- Defined using reverse immunogenetics – 59 HLA-A\*2402 binding peptides were predicted by searching for A\*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A\*2402.
- This peptide induced CTL in 3/4 HIV-1 + people tested.
- RYPLTFGWCF bound to A\*2402 strongly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.

**HXB2 Location** Nef (134–143)**Author Location** Nef (138–147)**Epitope** RYPLTFGWCF**Epitope name** Nef138-10**Subtype** B**Immunogen** vaccine*Vector/Type:* Sendai virus vector system (SeV)**Species (MHC)** human (A\*2402)**References** Kawana-Tachikawa *et al.* 2002

- A Sendai virus vector system (SeV) was developed that expressed HLA-A\*2402-restricted class I/peptide complexes; this system could be used to detect responses and has the potential to elicit immune responses.
- MHC class I/peptide tetramers could be made using this system that bound to epitope-specific CTLs in PBMCs.
- Cells transfection with SeV modified to express A\*2402-HIV epitope complexes induced CTL mediated specific cell lysis.

**HXB2 Location** Nef (134–143)**Author Location** Nef**Epitope** RYPLTFGWCF**Epitope name** Nef138-10**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A\*2402)**Donor MHC** A\*2402**Country** Japan**Assay type** CD8 T-cell Elispot - IFN $\gamma$ , Chromium-release assay**Keywords** binding affinity, epitope processing, immunodominance, escape**References** Furutsuki *et al.* 2004

- 70% of Japanese people carry HLA A\*2402, and the rFpIftg-wcf (2F) escape variant of this A\*2402 epitope was found to be positively selected in Japan; reversion to wild-type in HLA-A24 negative individuals occurred very slowly over years. The 2F escape variant appears to be common in Japan due to escape and then transmission of this form in the population. The mechanism of escape appeared to be in processing of Nef and antigen presentation rather than HLA binding since both wild-type and 2F variant bound to HLA-A\*2402 with almost same efficiency; the authors suggest the epitope may be cleaved at position 5 with a higher frequency when the 2F mutation is present.

**Epitope** RYPLTFGWCY

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human (A24)

**Keywords** binding affinity, epitope processing

**References** Choppen *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- RYPLTFGWCY was recognized in 5/12 (42%) of individuals with HLA A24. It was a moderate affinity HLA-A24 binder.

**References** Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- Variant rFpIftg-wcf was detected in increasing frequencies in clones from an A24+ infant, but was absent in all sequences from the A24- mother at delivery, revealing selective pressure as early as 3 months of age.

**References** Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimates of reversion rates for this epitope, RYPLTFGWCY/F, in 2 subjects were found to be -0.014 and 0.005/day with SEs of 0.
- A Y135F substitution was shown to confer escape from an A24-restricted response by prevention of epitope processing. In an HLA A24- individual, the mutation rapidly reverted to wild type. Reversion of the Y135F escape mutant was observed in a second A24- individual. The model fitted the data well, giving a rate of 0.005/day. In this subject, the 135F-138C variant was out-competed by a 135Y-138C variant rather than by the wild type (135Y-138T). The rate of reversion with respect to the wild type is zero.

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors influencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly; but the virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim *et al.* J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.

- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, RYPLTFGWCFKLVVPV, had an overall frequency of recognition of 32% - 35.6% AA, 26.9% C, 31.8% H, 33.3% WI. This peptide is included in a 54 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region II', QKRQDILDWVYHTQGYPDWQNYTPGPGIRYPLTFGWCFKLVPEPEKVEEAN, a 54 aa region recognized by >90% of subjects across ethnic groups.

- The ability of T cells from early infected subjects to recognize Nef clade B HIV-1 epitope variants was tested using both a consensus peptide panel and a standardized potential T-cell epitope panel (PTE-B). The magnitude and breadth of PTE-optimized peptide panels was significantly higher than CON peptides'. 29 potential epitopic domains were detected in Nef using the PTE peptide set.
- 5 additional variants of this epitope, YPLTFGWCF, were found using the PTE-B set - fPLTFGWCF, YPLcFGWCF, fPLcFGWCF, YPLTFGW<sub>Cy</sub> and YPLTIGWCF. Only the last variant was not recognized when restricted by HLA-B\*35, though the first variant alone, fPLTFGWCF, was present as a patient autologous sequence. While no epitope variants were seen in the T-cell HLA-B\*18 restricted response, these T cells

did react with 3 out of 6 possible epitopic variants viz. YPLTFGWCF, fPLTFGWCF and YPLTFGW<sub>Cy</sub>. Each of the 6 possible variants was associated predominantly with certain HIV-1 clades: YPLTFGWCF with clades B, C, A; fPLTFGWCF with clades A, B, C; YPLTFGW<sub>Cy</sub> with clades A, C; YPLTIGWCF with clade F; fPLcFGWCF with circulating recombinant forms and YPLcFGWCF with clade B.

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- Subject 00RCH33 was on HAART had a viral load of 2900 and CD4 count of 727 and also recognized the epitopes HIGP-GRIFY, gp160(310-318), HLA A\*3002; AETFYVDGA, RT(437-445), HLA B\*4501; and RSLYNTVATLY, p17(76-86), HLA A\*3002.
- Among HIV+ individuals who carried HLA B53, 8/15 (53%) recognized this epitope – one subject also carried B7, previously shown to restrict this epitope.
- Among HIV+ individuals who carried HLA B35, 13/19 (68%) recognized this epitope.

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B18+ individuals that had a CTL response to this epitope broken down by group: 0/3 group 1, 1/2 group 2, and 0/0 group 3.

**HXB2 Location** Nef (135–143)**Author Location** Nef**Epitope** YPLTFGWCF**Immunogen** HIV-1 infection**Species (MHC)** human (B18)**Keywords** HIV exposed persistently seronegative (HEPS)**References** Kaul *et al.* 2002

- Neisseria gonorrhoea cervicitis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs.
- Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.

**HXB2 Location** Nef (135–143)**Author Location** Nef**Epitope** YPLTFGWCY**Epitope name** B18-YY9(Nef)**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B18)**Donor MHC** A30, A32, B18, B27**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.

- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure

imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- Variants YPLTFGWC(Y/F) are specific for the B/D clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B18 women, 1/4 HEPS and 8/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, *p* value 0.04, and HEPS women tended to respond to FRDYV-DRF(Y/F)K, while infected women tended to respond to YPLTFGWC(Y/F)
- The dominant response to this HLA allele was to this epitope for the one reactive HEPS case and in all 8/9 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A\*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.

- The response to this peptide was initially low, but increased over time.

- CD8+ T-cells from HIV-1 CRF02\_AG-infected Ivoirians could recognize clade B epitopes. No difference was observed in the number of recognized peptide pools between nine French subtype B infected study subjects, and nine CRF02\_AG infected Ivoirian subjects.
- This epitope was recognized by 3/9 CRF02\_AG-infected Ivoirians, and 0/9 B-infected French subjects.
- The three Ivoirians that recognized this peptide carried three different variants of the epitope: identical to LAI: YPLTFGWCY, YPLTFGWcf, and fPLTFGWcf. 6/8 Ivoirians carried a variant, 5/5 B clade infections were not identical.

**HXB2 Location** Nef (135–143)**Author Location** Nef (134–)**Epitope** YPLTFGWCF**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (Cw\*0401)**Country** India**Assay type** Other**Keywords** subtype comparisons**References** Kumar *et al.* 2006a

- Comparative sequencing and phylogenetic analyses of nef genes from 43 Indian AIDS patients showed a majority of HIV-1 subtype C viruses, forming a distinct Indian sub-clade. Potential epitopes were computationally predicted within these Nef proteins.
- Of the most common HLA in India tested, this epitope YPLTFGWCF, is predicted to bind HLA-Cw\*0401 with a binding affinity score of 40.

**HXB2 Location** Nef (136–144)**Author Location** Nef (136–144 BRU)**Epitope** PLTFGWCYK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A3)**Keywords** binding affinity, epitope processing**References** Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- PLTFGWCYK was recognized in 3/12 (25%) of individuals with HLA A3. It was a low affinity HLA-A3 binder.

**Immunogen** HIV-1 infection

**Species (MHC)** human (A2)

**Keywords** subtype comparisons

**References** Durali *et al.* 1998

- Cross-clade CTL response was studied by determining the CTL activity in seven patients from Bangui, (6 A subtype, and 1 AG recombinant infections) and one A subtype infection from a person living in France originally from Togo, to different antigens expressed in vaccinia.
- Pol reactivity: 8/8 had CTL to A subtype, and 7/8 to B subtype, and HIV-2 Pol was not tested.
- Gag reactivity: 7/8 reacted with A or B subtype gag, 3/8 with HIV-2 Gag.
- Nef reactivity: 7/8 reacted with A subtype, and 5/8 with B subtype, none with HIV-2 Nef.
- Env reactivity: 3/8 reacted with A subtype, 1/8 with B subtype, none with HIV-2 Env.
- Patient B18 had the greatest breadth and diversity of response, and recognized Gag SLYNTVATL and Nef PLTFGWCFKL.

**HXB2 Location** Nef (136–145)

**Author Location** Nef (157–166)

**Epitope** PLTFGWCFKL

**Immunogen** vaccine

*Vector/Type:* DNA prime with vaccinia boost

**Species (MHC)** human (A2)

**References** Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D<sup>d</sup> – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCFKL), Pol 346-354 (VIYQYMDLL), and Nef 180-189 (VLEWRFD-SRL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- PLTFGWCFKL was recognized by 1 of the HLA-A2 patients.

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This was one of the most highly recognized of the 31 peptides that were shown to elicit a response.

**HXB2 Location** Nef (136–145)**Author Location** Nef (136–145)**Epitope** PLTFGWCYKL**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** United States**Assay type** CD8 T-cell Elispot - IFN $\gamma$ , Chromium-release assay, HLA binding**Keywords** acute/early infection, optimal epitope**References** Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized in chronic infection.

**HXB2 Location** Nef (136–145)**Author Location** Nef (136–145 HXB2)**Epitope** PLTFGWCYKL**Subtype** B, CRF01\_AE**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** Viet Nam**Assay type** HLA binding**Keywords** subtype comparisons, computational epitope prediction, variant cross-recognition or cross-neutralization, vaccine antigen design**References** Lazaro *et al.* 2005

- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01\_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
- CRF01\_AE variant pICfgwcfkl had a higher HLA-binding score than the HXB2 epitope.

**HXB2 Location** Nef (136–145)**Author Location** Nef**Epitope** PLTFGWCYKL**Epitope name** A2-PL11(Nef)**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Assay type** CD8 T-cell Elispot - IFN $\gamma$ **Keywords** rate of progression, immunodominance, early-expressed proteins**References** Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

**HXB2 Location** Nef (136–146)**Author Location** Nef (136–146 LAI)**Epitope** PLTFGWCYKLV**Subtype** B**Immunogen** in vitro stimulation or selection**Species (MHC)** human (A\*0201)**Keywords** epitope processing**References** Lucchiari-Hartz *et al.* 2000

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.

**HXB2 Location** Nef (137–145)

**Epitope** LTFGWCFKL

**Immunogen** vaccine

*Vector/Type:* DNA, peptide *Strain:* B clade HXB3 *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA)

**Species (MHC)** mouse (A\*0201)

**Keywords** binding affinity, computational epitope prediction

**References** Sandberg *et al.* 2000

- Ten Nef 9-mer peptides were predicted to have a strong binding affinity with HLA-A\*0201 – of these, four did bind strongly by a T2 class I stabilization assay, several others bound weakly.
- A CTL immune response to only 3/10 peptides was detected by a 51Cr-release assay after immunization of HLA-A201 transgenic mice with either nef DNA under the control of a CMV promoter, coated on gold particles delivered to abdominal skin by gene gun – LTFGWCFKL did not elicit a CTL response.
- LTFGWCFKL was also tested by subcutaneous injection of Nef peptides in Freund's adjuvant, because it bound strongly to HLA-A\*0201, and the peptide vaccination did elicit a response.
- The lack of response to the nef DNA vaccine and the response to the peptide suggests LTFGWCFKL may not be processed.

**HXB2 Location** Nef (137–145)

**References** Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A\*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A\*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- This epitope, LTFGWCFKL, was predicted to be restricted by HLA A\*0201.

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa.
- 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef.
- 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.
- Epitope LTFGWICYKLV showed some conservation to subtypes A and non-Indian C.

**HXB2 Location** Nef (137–146)

**Author Location** Nef

**Epitope** LTFGWCFKL

**Immunogen** HIV-1 infection

**Species (MHC)** human (A02)

**Assay type** CD8 T-cell Elispot - IFN $\gamma$ , HLA binding

**Keywords** binding affinity, immunodominance, optimal epitope

**References** Bihl *et al.* 2006

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.

- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope LTFGWCFKL elicited a magnitude of response of 60 SFC with a functional avidity of 0.05nM.

**HXB2 Location** Nef (137–146)

**Author Location** Nef (221A)

**Epitope** LTFGWCFKL

**Epitope name** Nef-221a

**Immunogen** HIV-1 infection

**Species (MHC)** human (A2)

**Keywords** binding affinity, subtype comparisons, super-type, computational epitope prediction

**References** Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A\*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- 1/22 individuals with chronic HIV-1 infection recognized this epitope in ELISPOT.
- 2/12 acutely infected individuals recognized this epitope.
- LTFGWCFKL binds to five HLA-A2 supertype alleles: A\*0203, A\*0201 (highest affinity), A\*0206, A\*6802 and A\*0202.

**Keywords** acute/early infection, optimal epitope

**References** Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized during chronic infection.

**HXB2 Location** Nef (137–146)

**Author Location** Nef (158–167)

**Epitope** LTFGWCFKLV

**Immunogen** HIV-1 infection

**Species (MHC)** human (A2 supertype)

**Keywords** supertype, rate of progression

**References** Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind all five HLA-A2 supertypes alleles (A\*0201, A\*0202, A\*0203, A\*0206 and A\*6802)
- Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific cells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

**Keywords** binding affinity, immunodominance  
**References** Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors influencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly; but the virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim *et al.* *J. Virol.* 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, PEKEVLVWKFDSRLAFHH, had an overall frequency of recognition of 15.3% - 22% AA, 11.5% C, 18.2% H, 9.5% WI.

**HXB2 Location** Nef (177–185)

**Assay type** CD8 T-cell Elispot - IFN $\gamma$

**Keywords** computational epitope prediction, vaccine-induced epitopes

**References** Li *et al.* 2006b

- To assess the efficiency of vaccine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- The peptide EVLqWKFDSSLAlrH is a variant at positions 4, 13 and 14 from the consensus peptide EREVLEWKFDSSLAF.

**References** Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol.

Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.

- This epitope, VLEWRFDSSL, was primarily recognized as wild type. Other variants seen were VLEWRFDSSsL, VLEWRFDgSRL and the 184K emerging variant VLEWkFDSSL. Position 184 fell under 2 overlapping CTL responses restricted by HLAs A2 and B15.
- In Table 2, epitope VLvWRFDSSL is printed as the epitope studied. We chose to record the epitope as VLEWRFDSSL seen twice elsewhere in this paper, as it is more commonly annotated as such in the literature.

**Epitope** VLEWRFDSSL

**Immunogen** in vitro stimulation or selection

**Species (MHC)** human (A2)

**Keywords** binding affinity, dendritic cells, Th1

**References** Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.
- B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSSL which was much greater than AFHHVAREL.

**HXB2 Location** Nef (180–189)

**Author Location** Nef (180–189)

**Epitope** VLEWRFDSSL

**Immunogen** vaccine

*Vector/Type:* DNA prime with vaccinia boost

**Species (MHC)** human (A2)

**References** Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D<sup>d</sup> – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSSL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- VLEWRFDSSL was recognized by 2 of the HLA-A2 patients.

**HXB2 Location** Nef (180–189)

**Author Location** Nef (180–189 LAI)

**Epitope** VLEWRFDSSL

**Epitope name** N3

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human (A2)

**Keywords** HAART, ART

**References** Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFN $\gamma$  production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

**HXB2 Location** Nef (180–189)

**Author Location** Nef (179–188 93TH253 subtype CRF01)

**Epitope** VLEWRFDSSL

**Subtype** CRF01\_AE

**Immunogen** HIV-1 infection

**Species (MHC)** human (A2)

**Keywords** subtype comparisons

**References** Bond *et al.* 2001

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 0/4 tested FSWs recognized the E clade version of this epitope VLIWKFDSSAL, which differs from the previously defined B clade version by three amino acids, VLEWRFDSSL.

**HXB2 Location** Nef (180–189)

**Keywords** HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism

**References** Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than inter-person sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, LEWKFDSSLAFHHMA was mutated in the daughter D2 isolate to LEWKFDSSLAFHHIA.

**Assay type** CD8 T-cell Elispot - IFN $\gamma$

**Keywords** computational epitope prediction, vaccine-induced epitopes

**References** Li *et al.* 2006b

- To assess the efficiency of vaccine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- This peptide, VWrFDSLAFrHMAR, varies at positions 3, 7 and 11 from the consensus peptide LEWKFDLSRLAFHHMA.

**References** Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naïve subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- No CTL responses were detected against the WF9 epitope, WRFDSRLAF. A 184K variant, WkFDSRLAF was found, that did elicit a potent HLA-B15 restricted immune response. Sporadic changes were seen in WF9 to WkFDSRLA (R185K).

**Assay type** CD8 T-cell Elispot - IFN $\gamma$

**Keywords** binding affinity, acute/early infection, early-expressed proteins

**References** Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

**Keywords** HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism

**References** Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNP by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than inter-person sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, FDSRLAFHHMARELH was mutated in the daughter D2 isolate to FDSRLAFHHiAkELH.

- Only 20% of CD8+ T-cells produce IFN-gamma and granzyme B simultaneously (Tc1a). Two additional subpopulations of HIV specific CD8 cells are found, each one constituting 30-40% of the CD8 cell pool. One of these (Tc1b) secretes IFN-gamma only, and the other one (Tc1c) secretes GzB only.
- Two of seven patients responded to this peptide with GzB producing cells, while none of the patients responded with IFN-gamma producing cells.

**HXB2 Location** Nef (186–194)**Author Location** Nef (186–194)**Epitope** DSRLAFHHM**Epitope name** DM9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A24)**Donor MHC** A\*24, A\*31, B\*15, B\*47, Cw\*04, Cw\*07; A\*24, A\*30, B\*39, B\*47, Cw\*12, Cw\*17; A\*23, A\*24, B\*07, B\*39, Cw\*12, Cw\*17**Country** United Kingdom**Assay type** CD8 T-cell Elispot - IFN $\gamma$ **Keywords** responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion**References** Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.

- DSRLAFHHM is a known A24 epitope. A known escape variant, DSRLAFqHM, was transmitted from an A24- mother to her A24+ infant, where it was gradually lost over time, present in 6/10 clones at 2 months, 7/10 at 4 months, and 0/10 at 15 months.

- Another escape variant was present in an A24+ mother, DStLAFqHk and this form was transmitted to her A24+ infant where it persisted in 30/30 sequences sampled over 12 months.
- DSRLAFHHM had higher responder cell frequencies in the A24+ mother than DStLAFqHk. Her A24+ infant did not recognize either form. The variant DSRLAFqHM also stimulated lower responder cell frequencies.

**Assay type** CD8 T-cell Elispot - IFN $\gamma$

**Keywords** computational epitope prediction, vaccine-induced epitopes

**References** Li *et al.* 2006b

- To assess the efficiency of vaccine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- SLAFHHRARELHPEY is a previously unpublished epitope that varies from the consensus at position 7.

**HXB2 Location** Nef (188–202)

**Author Location** Nef (188–202)

**Epitope** SLAFHHRARELHPEY

**Subtype** C  
**Immunogen** HIV-1 infection  
**Species (MHC)** human (A\*6901)  
**Country** India  
**Assay type** CD8 T-cell Elispot - IFN $\gamma$   
**Keywords** subtype comparisons, computational epitope prediction, immunodominance  
**References** Thakar *et al.* 2005

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa. 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef. 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.

**Keywords** HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism  
**References** Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNP by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains.

Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than inter-person sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.

- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, LAFHHMARELHPEYY was mutated in the daughter D2 isolate to LAFHHMAKELHPEYY.

**HXB2 Location** Nef (190–198)  
**Author Location** Nef  
**Epitope** AFHHVAREL  
**Epitope name** Nef AL9  
**Immunogen** HIV-1 infection  
**Species (MHC)** human (A\*0201)  
**Keywords** subtype comparisons, supertype, computational epitope prediction  
**References** Altfield *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A\*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, including Nef AL9, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- RT VL9 was not recognized by any of the 22 HLA-A2 patients with chronic HIV-1 infection or the 13 HLA-A2 patients with acute HIV-1 infection included in this study.

**HXB2 Location** Nef (190–198)  
**Author Location** Nef  
**Epitope** ALKHRAYEL  
**Subtype** A  
**Immunogen** HIV-1 infection, vaccine  
*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag  
**Species (MHC)** human, macaque (A\*0201)  
**Keywords** subtype comparisons, epitope processing, immunodominance  
**References** Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polypeptide string of conserved, often immunodominant epitopes that were selected to

have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].

- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN $\gamma$  ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A\*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A\*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

**HXB2 Location** Nef (190–198)

**Author Location** Nef (190–198 LAI)

**Epitope** AFHHVAREL

**Subtype** B

**Immunogen** HIV-1 exposed seronegative

**Species (MHC)** human (A2)

**Keywords** subtype comparisons, HIV exposed persistently seronegative (HEPS)

**References** Rowland-Jones *et al.* 1998a

- CTL recognition reported in the context of HLA-B52 and A2.1, A2.2 and A2.4.
- A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating.
- The A subtype consensus is ALKHRAYEL.
- The D subtype consensus is AfEHKAREM.
- Hunziker *et al.* [1998] suggests that HLA-A2 does not in fact present this epitope, and notes that it does not promote A2 assembly Connan *et al.* [1994] – also see Brander *et al.* [1998b]
- Hunziker *et al.* [1998] maintains that HLA-A2 does not present this epitope contrary to an earlier report Hadida *et al.* [1995], (also see Brander *et al.* [1998a])—despite the position of Hunziker *et al.*, Rowland-Jones and colleagues are confident that this epitope in its A clade form is presented by HLA-A\*0201 and A\*0202, and it is one of the most common responses seen in both seropositive and exposed-uninfected donors from Nairobi (Rupert Kaul, pers. comm.)

**HXB2 Location** Nef (190–198)

**Author Location** Nef (190–198)

**Epitope** AFHHVAREL

**Immunogen** *in vitro* stimulation or selection

**Species (MHC)** human (A2)

**Keywords** binding affinity, dendritic cells, Th1

**References** Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.

- B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSSL which was much greater than AFHHVAREL.

**HXB2 Location** Nef (190–198)

**Author Location** Nef (190–198)

**Epitope** AFHHVAREL

**Immunogen** vaccine

*Vector/Type:* vaccinia

**Species (MHC)** human (A2)

**References** Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D<sup>d</sup> – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSSL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- AFHHVAREL was recognized by 2 of the patients.

**HXB2 Location** Nef (190–198)

**Country** United Kingdom

**Assay type** CD8 T-cell Elispot - IFN $\gamma$

**Keywords** responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, viral fitness and reversion

**References** Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in

the infant over time was determined by infant HLA haplotype and viral fitness.

- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- AFHHVAREK is an A3 epitope, and a mixture of variants was present in the mother and in her A3- (A31+) infant at 2 months. One of the variants was AFqHmAREL, and this form was not found in 10 clones at the 15 month time point.

**Immunogen** computer prediction, HIV-1 and GBV-C co-infection  
**Species (MHC)** human  
**Country** United States  
**Assay type** CD8 T-cell Elispot - IFN $\gamma$   
**Keywords** computational epitope prediction, vaccine-induced epitopes  
**References** Li *et al.* 2006b
  - To assess the efficiency of vaccine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
  - This peptide FHHKARELHPEYYKD, varies from the consensus at the fourth position, lysine.

- Comparative sequencing and phylogenetic analyses of nef genes from 43 Indian AIDS patients showed a majority of HIV-1 subtype C viruses, forming a distinct Indian sub-clade. Potential epitopes were computationally predicted within these Nef proteins.
- Of the most common HLA in India tested, this epitope ARELHPEFY, is predicted to bind HLAs - B\*2702 and B\*2705 with binding affinity scores of 200 and 1000.

**HXB2 Location** Nef**Author Location** Nef**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human (A\*0201, Cw\*08)**References** Shacklett *et al.* 2000

- HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.

**HXB2 Location** Nef**Author Location** Nef**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B\*35)**Keywords** rate of progression**References** Jin *et al.* 2002

- Patients with HLA-B\*35 variants B\*3502, B\*3503, B\*3504, and B\*5301 tend to proceed to AIDS more quickly than those with B\*3501.
- Of 32 patients with HLA-B\*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B\*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B\*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B\*3501 individuals, but not in B\*3502, B\*3503, B\*3504, and B\*5301 individuals.

**Epitope**

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Keywords** epitope processing, escape

**References** Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.

**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, dendritic cells**References** Larsson *et al.* 2002b

- Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.

**HXB2 Location** Nef**Author Location** (SF2)**Epitope****Subtype** B**Immunogen** HIV-1 and HCV co-infection**Species (MHC)** human**Keywords** rate of progression**References** Lauer *et al.* 2002

- HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFN $\gamma$  production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins.
- All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load.
- Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted.
- HIV-specific CD4 proliferative responses were detected in 9/17 coinfecting patients, but no HCV responses were detected.

**HXB2 Location** Nef**Author Location****Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, responses in children**References** Scott *et al.* 2001

- CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.
- Before ART 2/13 infants <6 months of age showed IFN $\gamma$  Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy— 3 infants were coinfecting with CMV and all 3 had CMV-specific CD8+ T-cell responses.
- One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.

- Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.

**HXB2 Location** Nef**Author Location** (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Ortiz *et al.* 2001

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebounded to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.

**HXB2 Location** Nef**Author Location****Epitope****Immunogen** vaccine*Vector/Type:* adenovirus *HIV component:* Gag-Pol, Nef, Vpr**Species (MHC)** mouse**References** Muthumani *et al.* 2002

- Vpr can cause cells to go into G2 arrest, and it suppresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens.
- Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol.
- In vitro, Vpr reduced T-cell cytokine production of IL-12 and TNF $\alpha$ , indicative of Vpr-mediated immune suppression.

**HXB2 Location** Nef**Author Location** Nef**Epitope****Subtype** multiple**Immunogen****Species (MHC)** human**Assay type** Flow cytometric T-cell cytokine assay**Keywords** subtype comparisons**References** Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.

- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

**Keywords** assay standardization/improvement  
**References** Draenert *et al.* 2003
- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses.
  - Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays.
  - Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivities were observed using the B.AU.AF064676 peptides but not the consensus.
  - Using an overlap of 10 or 11 amino acids did not make a difference.

**References** Masemola *et al.* 2004a

- Anti-HIV T-cell responses in subtype C HIV-1 infected individuals in the beginning of the infection target multiple protein regions, but the responses are dominated by Nef, making up almost one-third of the total responses. 97.5% of the Nef epitopes targeted were within a short stretch of 119 amino acids.
- Neither breadth nor magnitude of CD8+ T-cell responses were correlated with control of virus, however hierarchical preferential targeting of Gag was significantly associated with lower viral loads.

**Keywords** HAART, ART, immunodominance, acute/early infection, vaccine antigen design

**References** Lichterfeld *et al.* 2004b

- HIV-1 specific CD8 T-cell responses in individuals with acute and early HIV-1 infection are preferentially directed against epitopes in the central region of Nef, with 94% of the magnitude of the response in acute infection directed at Nef, and 46% during early infection. In chronic infection, CD8 T-cell immune responses are broadly diversified towards Gag, Env and Pol, and Nef accounts for only 17% of the response.
- The region of Nef that is targeted is the central most conserved region, but relative to other HIV proteins it is still quite variable. However, responses are cross-reactive enough to detect strong acute responses using consensus based peptides, and is an early expressed gene so may have advantages in the context of a vaccine.
- Nef immunodominance was retained in patients that were treated during acute infection, but no treatment and so continuous antigen exposure resulted in rapid diversification of the immune response.

**References** Ariyoshi *et al.* 2002

- This review summarizes a meeting held to discuss options for determining CTL responses to vaccines. Problems are noted: costs for some assays are prohibitive for a Phase III study, Elispot shows interlaboratory variation but could be extended to many samples. HLA-A11 is very common in Thailand – over 30% carry the HLA-A11 allele. Predominant strains may be evolving to evade recognition of A11 restricted epitopes. Few full length CRF01 sequences are available. Epitopes may differ in vaccinees and infected individuals.

**Keywords** HAART, ART, acute/early infection, early treatment

**References** Alter *et al.* 2003

- Longitudinal study (24 mo) monitoring T-cell immune responses in 4 patient groups: Group 1 (n=6) consists of subjects who underwent HAART preseroconversion, group 2 (n=11) were HAART treated during early postseroconversion, group 3 (n=5) contained patients who started HAART during late postseroconversion, and group 4 (n= 6) commenced with HAART during chronic HIV-1 infection.
- The experimental strategy was to test for reactivity levels with sets of peptides that each contain epitopes with known HLA-restricting elements, making the peptide selection based on the optimal epitope list in this database. The HLA alleles found in the patients were balanced so that the frequency in the groups were comparable. Peptides spanning parts of Gag, Env, Nef, and RT were used for Elispot, and Gag peptides were used for ICS.
- All group 1 patients, and 5/11 group 2 patients, maintained the breadth and the magnitude of the immune response throughout the study; those in group 2 that maintained response started therapy earlier. The hierarchy of intensity of responses to different peptides was preserved. Individuals in groups 3 and 4 all showed a decline, and after treatment lost responses. Groups 1 and 2 showed HAART-induced suppression of viremia but maintained responses. Groups 3 and 4 both

showed viral suppression in association with a decreased immune response in breadth and magnitude after HAART. The authors suggest that preservation of HIV CD4+ responses can be maintained even if HAART is first given beyond the acute phase of infection, and a delay may allow a full CD8 response to develop while still allowing CD4 function to be preserved.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** vaccine**Species (MHC)** human (B27, B8)**Keywords** binding affinity, review, subtype comparisons, epitope processing, escape**References** McMichael & Hanke 2002

- CTL response-eliciting vaccines are reviewed. The natural epitope interactions with the HLA class I presenting molecules and T-cell receptors are described, and the impact of breadth of CTL responses and diversity considered in a vaccine context.
- Interesting specific examples are given concerning anchor chain residues. For B27, the B pocket fits Arg (R) but not Lys (K), so even this conservative change is not tolerated. In B8 either R or K can fit in the B pocket, but the substitution will cause conformational shifts in other parts of the epitope.

- Non-cytotoxic anti-HIV responses of CD8+ T cells cultured with CD4 infected HIV cells are mediated by blocking expression of viral RNA, and do not influence viral replication steps through integration of provirus.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** vaccine**Species (MHC)****Keywords** dynamics**References** Altes *et al.* 2002

- This study employs a mathematical model to study the consequences of increasing the T-helper response through a vaccine, which would have counter-balancing effects in a new infection: a more intense response provides more help but also more target cells. The model indicates that if the infecting virus had a low replication rate, then CTLp and CD4 helper cells could control an infection. Only a vaccine that could increase CTL responsiveness could reduce viral set point with observed replication rates.
- A CD4+ T-cell response without maintained CTL response was deleterious in this model.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** assay standardization/improvement**References** Carrier *et al.* 2002b

- Elispot standardization was sought using a reference peptide pool of 23, 8-11 mer epitopes from Influenza, cytomegalovirus (CMV), and Epstein Bar Virus (EBV) presented by 11 common HLA class I molecules.
- 15/17 (88%) HIV- and 14/20 (70%) HIV+ individuals reacted with this test set and *in vitro* simulation of the PBMC from these individuals were capable of killing cells expressing the target antigen.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human, macaque**Keywords** review, class I down-regulation by Nef, escape**References** Johnson & Desrosiers 2002

- Reviews evidence for CTL escape in HIV epitopes in natural human infections, and in SIV infections of macaque where viral clones with a known time of infection and multiple animals with the same HLA molecules can be tracked.
- Vigorous CTL responses are made despite class I down-regulation by the Nef protein, but it may delay cytolysis of infected cells. Too great a loss of MHC proteins may enhance NK cell killing so the fitness advantage of this function of Nef may be in balance.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection, vaccine**Species (MHC)** human**Keywords** review, epitope processing, supertype, computational epitope prediction, HIV exposed persistently seronegative (HEPS), supervised treatment interruptions (STI), immunodominance**References** Newman *et al.* 2002

- This extensive review covers many aspects of T-cell immunity and natural HIV infections, and considers how this knowledge might be applied to a polyepitope vaccine approach. Strategies concerning ways to avoid the creation of junctional epitopes and use of linkers to enhance processing of such constructs are discussed.
- The C-terminal flanking residue (C1) was found to be associated with immunodominance of epitopes, such that R or K (positive charge) > N or Q (amide) > C, G, A, T, S (small) > F, W, Y (aromatic) > I, L, M, V (aliphatic) > D (negative). As this position is outside and proximal to the epitope, processing and cleavage is the likely reason for this observation.
- Changing the C1 residue from F to K for an HLA-A2 presented epitope from HBV resulted in a change from the epitope being non-immunogenic to strongly immunogenic.

- The frequency of HIV-1 specific T-cell responses was characterized in an Elispot IFN-gamma assay, using 507 overlapping peptides based on the B clade consensus sequence spanning all HIV-1 clade B proteins against PBMC from 57 HIV-1 infected patients at various disease and treatment stages. 63% of the peptides were recognized (range of 1-42 per subject, median=14). More variable peptides were targeted less frequently.
- Autologous virus sequences from six patients in acute infection spanning of HIV-1 p24, Tat and Vpr were used to scan for missed responses due to viral variation when using the consensus for peptides. 12/42 (29%) responses to these peptides were detected only with autologous peptides, and often these autologous responses were immunodominant. Responses were also generally higher using autologous peptides.
- A longitudinal analysis (5 yrs) of the T-cell responses in 5 patients showed that the autologous sequence detected stronger T-cell recognition than the HIV-1 clade B consensus sequence.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** chimpanzee**Keywords** review**References** Balla-Jhagjhoorsingh *et al.* 2003

- This paper reviews HIV-1-specific cell-mediated immune responses in chimpanzees and discusses mechanisms that might control HIV-1 pathogenesis in chimpanzees. During the first decade of the HIV epidemic, more than 200 chimpanzees were experimentally infected with HIV. Among these only one case of declining CD4+ cells has been reported, all others have remained asymptomatic with no loss of immune function, some after 20 years of infection. In contrast to infected humans which have a skewed Th2 response, chimpanzees maintain balanced Th responses and are likely to support a fully mature CD8+ T-cell response.

- Specific HIV epitopes recognized by chimpanzees have been mapped and CTL detected, but overall the responses are at much lower levels than in humans, as viral loads are so low. Gag epitope responses are estimated to be 0.0095 to 0.0025% of the CD8+ T cell population in chimpanzee, and 1-2% in humans.
- The authors argue that the chimpanzee immune response may be effective at controlling virus because it focuses on conserved epitopes, and further speculate that long contact with lentiviruses may have put strong selection pressures on the chimpanzee MHC class I, narrowing the population's ability to respond to only the most conserved, and so useful, epitopes.

**Keywords** responses in children

**References** Feeny *et al.* 2003

- The magnitude and breadth of CD8+ T-cell responses in 18 pediatric (6-17 years) perinatally HIV-1 infected patients was determined using 1) overlapping peptides spanning all HIV-1 proteins and 2) peptides from all predefined appropriately class I HLA-restricted HIV-1 epitopes.
- Perinatally infected children's CD8+ T-cell responses were comparable in magnitude and breadth to adult responses. Many reactive peptides did not overlap with a previously characterized optimal epitope.

- On average 20% of all known pre-defined optimal epitopes presented by appropriate HLAs were recognized in these children. In two patients, autologous sequences spanning unrecognized potential epitopes usually corresponded to the reactive form of the epitope, so epitope variation alone did not account for unrecognized epitopes.

- Children with detectable viremia showed a broader and greater CTL responses than HAART responsive children with undetectable viremia.

- CD4+ and CD8+ T cell responses were analyzed in this longitudinal study (19 mo) of 53 patients with chronic HIV-1 infection receiving continuous ART therapy. Three subgroups were compared: one with suppressed viremia and increasing CD4+ T cell counts, one with detectable viral load and declining CD4, and one with detectable viral load with a positive CD4+ T cell slope.
- IFN- $\gamma$  ELISPOT analysis was performed with peptides spanning RT, Env, Gag (p24), Gag(p17), Nef, Tat and Rev. The IFN- $\gamma$  analysis showed the greatest CD4+ as well as CD8+ T-cell responses in the group with stable CD4+ T cell responses despite detectable virus over a median time course of 9 months.

**References** Collins 2004

- There are a number of factors that combined make HIV-infected cells resistant to CTLs. HLA-associations with disease progression are reviewed. Nef down-regulation of HLA class I A and B molecules is one important mechanism of HIV immune evasion. Rev allows late viral proteins to be expressed, enabling CTL specific for epitopes in these proteins to recognize infected cells. It is suggested that blocking the activity of Nef and Rev would reduce production of viral variants and enhance the ability of CTLs to combat HIV.

- IFN- $\gamma$  Elispot assay is shown to be a good initial screening method for measurement of CD8+ T-cell responses in both vaccination and natural HIV-1 infection. Responses were detected using peptides at low concentrations (1-2  $\mu$ g/mL) and an increase in detection of HIV-1 specific CD8+T-cells by using 15-mers rather than 20-mer peptides for cell activation was observed. More responses were detected using smaller pools (10 or 2 peptides) than larger pools (25 or 50 peptides), so smaller pools may be needed to detect low frequency responses. Responses to natural infection were more than a log higher than to the vaccine.

**References** Gamberg *et al.* 2004b

- A relationship was found between the proportion of HIV-specific CTLs expressing CD28 and CD4+ T-cell counts, viral load and disease progression. This association cannot be linked to disease related degeneration of CD8+CD28- T-cells in terms of their TCRbetaV family repertoire diversity or ability to produce cytokines. This suggests that effective immune responses contain CD8+CD28+ T-cell populations that shift to CD8+CD28- in ineffective responses.

**References** Goulder & Watkins 2004

- CTLs have a central role in the control of HIV infection. Emergence of escape variants to CTLs is one of the major obstacles to vaccine development. Factors that should be considered for the development of an HIV vaccine are CTLs that are specific for epitopes recognized during the acute phase of infection, CTLs that are able to efficiently control viral replication, and epitopes from regions of the viral genome that are highly conserved or where variation results in loss of viral fitness.

**Author Location**

**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Country** France**Keywords** HAART, ART, characterizing CD8+ T cells, immune dysfunction**References** Kryworuchko *et al.* 2004

- A subset of HIV-1 infected untreated patients had CD8+ T-cells that were unable to respond to IL-2 by activating STAT5a and b proteins. This was correlated with an impaired activation of the upstream kinase Jak-3. 6 months of HAART was shown to restore Jak/STAT signalling in those patients and their CD8+ T-cell response to IL-2. This suggests another mechanism for immune dysfunction in HIV infected patients.

**HXB2 Location** HIV-1**Author Location****Epitope****Subtype** A, B, C, D, F, G, U**Immunogen** computer prediction**Species (MHC)** human**Keywords** vaccine antigen design**References** Maksyutov *et al.* 2004

- Every HIV protein was shown to have some regions that were highly similar to the regions of human proteins. Most of those regions contained T-cell or/and B-cell epitopes. The epitopes shared by HIV and its host may have immunopathogenic potential through stimulating autoimmunity and should possibly be excluded from HIV vaccines. All HIV proteins from the sequence of BH10 were compared to human proteins, as well as many HIV-1 V3 variants.

**HXB2 Location** HIV-1**Author Location** (ELI)**Epitope****Immunogen** in vitro stimulation or selection**Species (MHC)** human**Assay type** Cytokine production, proliferation, Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** class I down-regulation by Nef, rate of progression, dendritic cells, immune dysfunction**References** Quaranta *et al.* 2004

- Exogenous Nef protein activates immature DCs and inhibits the capacity of DCs to prime CD8+ T-cell responses by down-regulating their proliferation and function capacities. Nef induces CD8+ T-cell apoptosis by up-regulating TNF-alpha and FasL production by DCs, while DCs are protected from apoptosis themselves. These mechanisms, as well as by down regulation of the HLA class I proteins, can contribute to HIV-triggered immune dysfunction.

- In untreated, HIV-1 chronically infected patients, CD4+ T-cell responses and, to a lesser extent, CD8+ T-cell responses, were found to inversely correlate with disease progression rate. Polymorphisms in CCR genes, HLA genotype and GB virus C coinfection were not found to be related to slower disease progression.

**HXB2 Location** HIV-1**Author Location** (B clade)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Country** Canada**Assay type** CD8 T-cell Elispot - IFN $\gamma$ , Flow cytometric T-cell cytokine assay**Keywords** genital and mucosal immunity, characterizing CD8+ T cells**References** Sheth *et al.* 2004

- HIV viral load in semen is found to be 10-fold lower than in blood. No correlation was found between viral load in either semen or blood and systemic HIV-specific CD8 T-cell responses, in 20 samples.

**HXB2 Location** HIV-1**Author Location****Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* DNA with CMV promotor, virus-like particle (VLP), modified vaccinia Ankara (MVA) *Strain:* B clade *HIV component:* Env, Gag, Pol, Protease, RT**Species (MHC)** macaque**Assay type** T-cell Elispot, Intracellular cytokine staining**Keywords** vaccine antigen design**References** Smith *et al.* 2004

- Macaques were immunized with codon-optimized Gag DNA and non-codon-optimized Gag-Pol-Env DNA vaccines, expressed as VLPs as aggregates, followed by an MVA boost. There was no significant difference in anti-Gag T-cell responses and anti-Env Ab responses between the different vaccines. A second MVA boost did not increase T-cell responses but it increased anti-Env Ab titers by 40- to 90-fold.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen****Species (MHC)** human**Keywords** review, epitope processing, rate of progression, escape, early-expressed proteins, vaccine antigen design**References** Yang 2004

- This review considers CTL biology in HIV infection in the context of vaccine design principles. Since HIV-1 infection damages immunity through depletion of CD4+ T-cells, which in turn results in diminished capacity of the immune system to produce new and functional CTL responses, maximizing the breadth of CTL responses might not be enough for an HIV-1 vaccine. CTLs recognizing early proteins might be more prone to epitope escape mutation, while those recognizing more conserved structural proteins might be more likely to persist, so focusing on more conserved proteins those might be a good strategy to produce an attenuating vaccine.
- Original antigenic sin is discussed, the initial responses to an antigen that persist even after escape occurs, blunting the later immune response. If the goal is to prevent disease, focusing on conserved late expressed proteins might be the best target, where the fitness cost is greatest for escape; if the goal is to prevent infection, focusing the vaccine on the more variable early expressed proteins that elicit the first responses, Tat and Nef, might be best.

**HXB2 Location** HIV-1**Author Location** p24 (HIV-2 ROD, HIV-1 IIIB)**Epitope****Subtype** B, HIV-2**Immunogen** HIV-1 or HIV-2 infection**Species (MHC)** human**Country** Gambia**Assay type** Cytokine production, proliferation, CD8 T-cell Elispot - IFN $\gamma$ , Chromium-release assay**Keywords** rate of progression, HIV-2**References** Jaye *et al.* 2004

- A comparison of T cell responses in HIV-1 and HIV-2 infected asymptomatic patients with CD4+ cell counts 20% showed no significant difference between groups. Viral loads were roughly 20 times greater in HIV-1 positive patients than HIV-2 positive patients.
- 10/20 (50%) of HIV-1 infected patients demonstrated proliferative responses with SI greater than 1.4 to gp120, and 11/20 to p24. 8/29 (29%) of HIV-2 infected patients recognized gp105, and 8/29 (29%) p26. Cytokine responses in both groups did not differ.
- 9/21 (43%) of HIV-1 + and 15/30 (50%) of HIV-2 + patients had cytotoxic T cell responses to Gag, and 3/21 (14%) HIV-1 + and 8/30 (27%) HIV-2 + responded to Pol.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Country** Spain**Assay type** proliferation, Intracellular cytokine staining**Keywords** HAART, ART**References** López *et al.* 2004

- A clinical trial compared chronically HIV-1 infected patients who had replaced HAART with didanosine (ddI) and hyroxurea (HU) were followed for 12 months to an untreated HIV+ group and a group that continued on HAART.

- Approximately 20% of the patients treated with ddI-HU had detectable CD4+ T-cell proliferative responses to Gag and Env in contrast to drug-naive and HAART treated HIV-infected patients, who had few or no responses.
- HIV-specific CD8+ T-cell responses were higher in ddI-HU treated patients than HAART treated patients, even in individuals that maintained undetectable viral loads.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen****Species (MHC)****Keywords** review, adjuvant comparison**References** Mitchison & Sattentau 2005

- Review summarizes mechanisms of immunoregulation relevant for new vaccine development, with a brief summary of adjuvant triggering innate immunity through Toll-like receptors (TLRs), Nod molecules, and other activators. DNA encoded adjuvants that have been tested in DNA vaccines are summarized. The balance between Th1 (CTL activating) and Th2 (B cell activating) responses is discussed, and it is noted that BALB/c mice are predominately Th2 responders, C57BL Th1.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** escape**References** Piontkivska & Hughes 2006

- Greatest amino acid diversity is found in sites in the HIV genome that are spanned by antibody epitopes. Sites spanned by CTL epitopes, but not by antibody epitopes, showed reduced amino acid diversity, even in comparison to non-epitope sites. However, mutations within CTL epitopes were more likely to be convergent than mutations within antibody epitopes. These patterns were consistent both in Gag and in Env.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** CD8 T-cell Elispot - IFN $\gamma$ , CD8 T-cell RecycleSpot - IFN $\gamma$ **Keywords** assay standardization/improvement, optimal epitope**References** Bihl *et al.* 2005

- This study describes a novel approach to achieve maximal information from an extensive set of antigens (HIV, EBV, CMV, HCV, and HBV) to determine the magnitude of T-cell responses while requiring minimal cell numbers. Large sets of peptides based on optimally defined epitopes from each pathogen are used. It is shown that, when compared to ex vivo cell preparations, antigen-unspecific in vitro T-cell expansion maintains the breadth of detectable T-cell responses. Also, harvesting cells from negative ELISpot wells for re-use (RecycleSpot) maximizes the use of available cells.

- HXB2 Location** HIV-1  
**Author Location**  
**Epitope**  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**Assay type** CD8 T-cell Elispot - IFN $\gamma$   
**Keywords** genital and mucosal immunity, characterizing CD8+ T cells  
**References** Ibarrondo *et al.* 2005
- The breadth and magnitude of HIV-1-specific CTL responses in blood and sigmoid colon mucosa were assessed in 16 patients. The magnitude of pool-specific CTL responses in blood and mucosa was correlated within each individual and across all individuals. CTL targeting was also found to correlate between these 2 compartments, with Nef being the most highly targeted region, followed by Gag. No correlation between the magnitude and breadth of CTL responses and viremia and blood CD4 levels was found in any of the compartments. Concordant peptide pool responses were found in the blood and mucosa 85%; pools that differed were near the threshold of detection.
  - This study suggests that HIV-1-specific CTL responses in the blood mirror those in the mucosa during chronic infection.

- HIV-specific T-cell responses to peptide from A, B, and C clade spanning the entire HIV proteome were assessed in clade B infected individuals. Many cross-reactive responses were observed against clade A, B, and C consensus sequences, preferentially recognized in conserved regions with low intra-clade diversity and high inter-clade homology.
- At the individual peptide level, within clade responses to B clade peptides were more frequent. 194 responses were detected with only one peptide, of these 105 recognized B clade, 55 C clade, and 34 A clade. 125 responses recognized peptides from two clades, and 110 of these were with B plus either A or C. 166 responses were cross-reactive with all three clades.

**References** Gansov & De Boer 2006

- A simple mathematical model is used to estimate costs of CTL escape mutations and killing rate of CTLs. Using in vivo data, it is shown that minimal estimates of the fitness cost of the escape mutations and minimal estimates of the average killing rate can be obtained. This general model may be used for both acute and chronic phases of SIV/HIV infection.
- Fitness cost is found to be proportional to the rate of replacement of the mutant by wild-type rather than the time taken for this to happen. Exponential growth of the virus is assumed during such reversion experiments. However, no virus growth is assumed during escape experiments to gauge the minimum average rate at which the CTL response clears one viral epitope.

**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** review, escape**References** Frahm & Brander 2007

- This report characterizes HIV epitope variants with a view to guiding vaccine design. It discusses immune correlates of controlled HIV infection, HIV escape from cellular immunity and the effects of sequence diversity on T-cell recognition.
- In controlled infections it is noted that diversity of HIV-specific cells is associated with better control of infection than magnitude of HIV-specific response. The specific epitopic region targeted by host immune cells is a determinant in controlling infection too. However, high avidity responses are effective in virus control and epitope recognition despite a limited T-cell receptor repertoire. While HLA-B alleles mediate most CTL cellular immunity, subdominant responses are key in effective immune control. On the other hand, uncontrolled virus replication is linked to high expression of PD-1, low IL-7R, fewer early and intermediate differentiated cells, absence of CD4 T-cell help and reduced proliferation.
- HIV escape can occur on several fronts - viruses may develop compensatory changes to restore fitness; transmission between individuals with different HLA types allows virus reversion; certain epitopes may disappear from circulating viral populations if there is a high population frequency of specific HLA and specific epitope variants can even act as antagonists or partial agonists either silencing total epitopic T-cell responses or inducing immune responses even with only partial functionality.
- Sequence diversity is greatly increased by the spread of unique recombinant forms of HIV in individuals. The authors advise the use of detailed single-peptide-based analyses in addition to using peptide pools. They also suggest 3 approaches to incorporating sequence diversity in vaccine studies.

- To address the role of reversions in early HIV-1 evolution, the authors studied 7 acute infected AIDS patients longitudinally. Their findings show that most forward mutations in HIV-1 were significantly likely to occur within and including "neighboring" CTL epitope residues restricted by the host's HLA type. 62% of early/fast mutations arising within 6 months of infection were reversions to consensus sequences while 73% of forward mutations occurred as late/slow mutations. Almost 30% of reversions were found in CTL epitopes not restricted by the current host. Reversions themselves occurred faster in conserved residues as well as more conserved proteins like

Gag and Pol; however slow reversions were seen more frequently in Env and non-structural proteins like Vif, Tat and Nef. The authors suggest that fitness cost and structural constraints may be the underlying cause for high and early reversion rates.

**HXB2 Location** HIV-1**Author Location****Epitope****Subtype** B, C**Immunogen** vaccine*Strain:* A clade, B clade *HIV component:* Env, Gag, gp120, Nef, Pol, Rev, Tat, Vif, Vpr, Vpu**Species (MHC)** human**Assay type** Other**Keywords** vaccine antigen design**References** Fischer *et al.* 2007

- In order to work towards a global vaccine covering multiple variable and conserved epitopes, the authors have designed a method for generating polyvalent vaccines optimized against HIV-1 M group viruses. 4 mosaic proteins were produced by in silico recombination natural sequences, including common, and excluding rare potential 9-mer epitopes. Total coverage was assessed by tracking exact and partial 9-mer matches. Such mosaic, polyvalent multi-antigens that resemble a native protein would also allow more natural delivery and epitope processing in vivo.

- By using a method developed recently [Asquith *et al.*, PLOS Biology. Vol:4, Issue: 4. pp. 583-592 (2006)] for estimating the in vivo rate at which CTLs kill HIV-1-productively infected cells, the authors compare previously determined human CTL control of HIV-1 infection with macaque CTL control of SHIV/SIV infection. Quantitatively, it was shown that macaque CTLs kill infected cells significantly faster than human. Also, in most cases for both species, the outgrowth of escape variants was too rapid to put anything but a lower bound on the escape rate. There was also no significant difference in virus escape rate between macaque chronic or acute infection.
- In spite of the fact that CTL response in macaques is faster than in humans, CTL-induced viral escape variants appeared more rapidly in macaques than in humans. However, macaque escape variants also had a higher fitness cost, as evidenced by their higher rate of reversion upon transfer of viral variant to macaques that did not present the HLA restricting the epitope under study. Taken together, it was determined that immunodeficient virus-infected cells were killed almost 10 times more rapidly in macaques than in humans.

- To evaluate the immunogenicity of various vaccine modalities the IFN-gamma ELISpot assay is optimized and validated here across vaccine recipients and regimens, using 9-, 15- or 20-mer peptide pools. An empirical method to establish positivity criteria with a <1% false-positive rate was established at  $\geq 55$  spots/ $10^6$  PBMCs and  $\geq 4$ -fold over mock negative control. Moreover, 15-mer peptides had greater sensitivity than 20-mers as well as a greater specificity; i.e. ability to stimulate CD4 and CD8 T cells with fewer false-positives and cross-reactive responses, than 9-mers.

**References** Fu *et al.* 2007

- Using IFN-gamma ELISpot analyses and peptide pools, the authors studied a cohort of 54 chronically infected HIV-positive individuals to evaluate CTL responses against HIV-1. 2 criteria were established to score an ELISpot as positive - a reading of  $> 55$  SFC/ $10^6$  PBMC and an antigen response at least 4-fold higher than that of mock antigen. By performing T subset depletion the contribution of CTL responses to cellular immunity was proven. These CTL immune responses were mounted mostly against Gag, Pol and Nef peptide pools, and to a lower extent versus Rev and Tat peptides. Without antiviral therapy, host CTL responses correlate directly with plasma viral loads during chronic infection.

- This correspondence is in response to an article by Arien *et al.* (2007) Nature Reviews Microbiology 5(2):141-51. Here the authors claim that in silico studies demonstrate HIV follows "survival of the flattest" effects. They propose that HIV-1 shifts to robust population characters that protect it from niche perturbations and increase its survival at the expense of replicative fitness. The balance between intra-host replication and inter-host transmission is suggested to be held by circulating viruses going from high fitness and low mutational support to lower fitness and high mutations. They maintain that lower fitness does not equal virus attenuation as discussed by Arien *et al.*

- To sidestep the issue that in vaccine design against AIDS, providing protection against global diversity may be an insurmountable problem, a prototype conserved elements (CE) vaccine comprising 45 8-residue long HIV segments is described. Therefore the authors seek to cope with HIV-1 diversity by avoiding it altogether. Stringent conservation criteria are followed to find CEs devoid of mutable segments across M group viral proteomes. Most CE were identified in Pol, Gag, Env, Vif and Rev. Even though most CE peptides were identified in Pol, these are rarely targeted in natural infections probably because of the much lower ratio of Pol proteins produced compared to Gag. Therefore Pol CE were used here in contrast to most other vaccines. Similarly, Nef was not used and fewer Env CE peptides were used in this vaccine, even though they are usually found in other vaccines. Many CE segments contained known CTL epitopes and are implicated with LTNPs. One crucial advantage of this strategy is that a single global CE vaccine should work against all circulating HIV-1 M strains.

- To develop vaccines that include antigens versus circulating variation in consensus sequences as well as versus mutations, a computational method was developed to reconstruct ancestral sequence at the center of phylogenetic tree using 169 subjects' sequences. Also, to compass sufficient antigenicity, more antigenic sequences would be required, but to avoid large, full-length antigens, short protein sequences present at high frequencies in HIV-1 populations were used in constructs. In this study, 3 constructs were directed against highly variable Nef and immunologically important but conserved Gag. 82% 9-mer coverage for Gag and 62% for Nef were achieved.

**Part III**

# **HIV Helper/CD4+ T-Cell Epitopes**

T-Helper CD4+

## III-A

# Summary

This part includes tables, maps, and associated references of HIV-specific helper T-cell (Th) epitopes from the literature arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, as each entry represents a single publication in this part of the database. HLA specificity is usually not determined for Th epitopes. For more recent updates, epitope sequence alignments, and useful search capabilities, please see our web site: <http://www.hiv.lanl.gov/content/immunology>. Helper T-cell responses to proteins with no defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T cells and helper T cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

### III-A-1 Epitope tables

Each T-helper epitope has a multi-part basic entry:

**HXB2 location:** The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our

web site: <http://www.hiv.lanl.gov/content/sequence/LOCATE/locate.html>.

**Author location:** The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

**Epitope:** The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

**Epitope name:** If the epitope has a name attributed by the publication, it is recorded here, e.g. "SL9".

**Subtype:** The subtype under study, if specified in the primary publication; this is generally not specified for B subtype.

**Immunogen:** The antigenic stimulus of the Th response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted separately, and additional information about the vaccine antigen is provided as available.

**Species (MHC):** The species responding and MHC or HLA specificity of the epitope.

**Donor MHC:** The HLA genotype of the individual that responded to the epitope.

**Country:** The country where the samples were obtained; this is generally not specified if the study was conducted in the United States.

**Assay type:** Assay used to characterize the response.

**Keywords:** Keywords are a searchable field for the web interface that is included in the T-cell sections of the

printed version to help identify entries of particular interest.

**Reference:** The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Following the entry for a given Th epitope brief comments explain the context in which the epitope was studied and what was learned about the epitope in a given study.

### III-A-2 HIV protein epitope maps

All HIV Th epitopes mapped to within a region of 18 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of Th epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A\*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

### III-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the Th epitope search tool at <http://www.hiv.lanl.gov/content/immunology>. The master alignment files from which the epitope alignments were created are available at our web site at <http://www.hiv.lanl.gov/content/sequence/NEWALIGN/align.html>.

## III-B

# HIV Helper/CD4+ T-Cell Epitope Tables

All HIV Helper/CD4+ T-Cell epitopes are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location within the protein, and finally by HLA presenting molecule. Epitopes for which the HXB2 location is unknown appear at the end of the listing of the protein in which they are located.

### III-B-1 Gag p17 Helper/CD4+ T-cell epitopes

**Keywords** subtype comparisons, memory cells  
**References** Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. VLSGGELDRWE was not reported for human infections.
- The response elicited to the B clade epitope VLSGGELDRWE does not cross-react with the CRF02\_AG form VLtGGELDsWE. The forms VLSGG[e/k]LD[r/ak]WE are prevalent among M group clades.

**Author Location** Gag (13–23)

**Epitope** LDRWEKIRLRP

**Epitope name** Gag 1.3

**Immunogen** vaccine

*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu

**Species (MHC)** macaque

**Assay type** T-cell Elispot, Intracellular cytokine staining

**Keywords** subtype comparisons, memory cells

**References** Amara *et al.* 2005

• Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.

• 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.

• LDRWEKIRLRP was not reported for human infections.

• The response elicited to the B clade epitope LDRWEKIRLRP does not cross-react with the CRF02\_AG form LDsWEKIRLRP. Other clades most commonly carry an A in this position, and C clade consensus carries K (LD[r/ak]WEKIRLRP).

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Donor MHC** DQB1\*0301, DQB1\*0601, DRB1\*1303, DRB1\*1502, DRB3\*0101, DRB5\*0102

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$

**References** Koeppel *et al.* 2006

- The study measured CD4+ T-cell responses against epitopes in Gag p17 and p24 and concurrent endogenous plasma HIV-1 RNA epitope sequence variation. No intrapatient protein sequence variation was found in identified epitopes, indicating that escape from CD4-positive T-cell responses is not a common process *in vivo*.
- 1/22 patients responded to this peptide.

**HXB2 Location** p17 (17–34)

**Author Location** p17 (17–34 B consensus)

**Epitope** EKIRLRPGGKKKYKIKHI

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining, HLA binding

**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 14% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.

- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

**HXB2 Location** p17 (17–34)  
**Author Location** p17 (17–34)  
**Epitope** EKIRLRPGGKKKYKLHKI  
**Subtype** B  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**Country** Netherlands  
**Assay type** Cytokine production  
**References** Geels *et al.* 2006

- The relationship between CTL escape and the subsequent increase in viral load and CD4 Th responses was studied in 2 patients. In both patients T-cell reactivity and recognition were lost after CTL escape, and in 1 patient only the loss of CTL responses was paralleled by a decrease in IL-2 CD4 Th responses.
- Autologous sequences corresponding to known and predicted Th epitopes were analyzed. EKIRLRPGGKKKYKLHKI had fixation of 1 mutation (EKIRLRPGGKK[k/r]YKLHKI) in 1 of the patients.

**HXB2 Location** p17 (18–42)

**Keywords** HAART, ART, Th1, Th2  
**References** Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V $\beta$  usage, and some clones had a Th1 cytokine secretion profile (high IFN $\gamma$  production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 6 recognized this peptide sequence restricted by DRB1\*13. This clone had a high SI (27.1 to p55, 90.6 to peptide) secreted IFN $\gamma$ , indicative of a Th1 response, as well as TNF $\alpha$ . Clone 6 was highly cytotoxic, through a perforin-mediated pathway.

**Keywords** escape  
**References** Harcourt *et al.* 1998

- 43 asymptomatic HIV+ individuals were screened for proliferative responses to HIV – 12 showed a response, and dominant epitopes were mapped for two individuals, one in p24 and one in p17.
- Patient 024's naturally occurring variant LRPGGKKKYQLKHIV also elicited a strong proliferative response.
- Naturally occurring variants of this epitope were found within the individual who made this response – several did not stimulate the CD4+ T-cell line that recognized the index peptide, suggestive of immune escape.

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- EELRSLYNTVA was not reported for human infections.
- The response elicited to the B clade epitope EELRSLYNTVA does not cross-react with the CRF02\_AG form EEFK-SLYNIVA. The epitope is however conserved across clades A,B,C,D,F.

**Country** Brazil

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , HLA binding

**Keywords** binding affinity, computational epitope prediction, cross-presentation by different HLA

**References** Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 Brazilian HIV-1 chronically infected individuals.
- While the reacting peptide is EELRSLYNTVATLYCVH, shorter LRSLYNTVATLYC is the predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- This peptide was recognized by 25% of the study group.
- The peptides that were recognized by the most people were able to bind broadly to multiple HLA-DR molecules. This peptide showed high cross-reactive binding capacity and bound to 6/8 common HLA-DR molecules.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

**References** Pajot *et al.* 2007

- HLA class I/II-transgenic, H-2 class I/II knockout mice, previously used to characterize responses to Hepatitis B vaccine, were used in this study to analyze the HLA-DR1-restricted HIV-1 Gag epitopes.
- Peptides were selected with the TEPITOPE algorithm. Of 9 selected peptides 7 were previously reported epitopes and 2 (LLVQNANPDCKTILKALGPA, KTILKALGPAATLEEMMTAC) were novel.
- Human relevance of the 2 novel epitopes was established by assaying PBMC from HIV-1-infected long term asymptomatic subjects. KTILKALGPAATLEEMMTA primed CD4+ cells from 2 HLA-DR1 seronegative donors in vitro.
- Th1 helper potential was demonstrated for 7 structurally conserved epitopes and was particularly strong with YKTLRAEQASQEVKNWMTET, LLVQNANPDCKTILKALGPA, NKIVRMYSPSILDIRQGP.

**HXB2 Location** p17-p24 (131–18)

**Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining  
**Keywords** HAART, ART  
**References** Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells  $\mu$ l was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.
- The TCR that recognized this epitope used V $\beta$ 5.1.

**HXB2 Location** p24 (1–11)  
**Author Location** p24 (1–11 SF2)  
**Epitope** PIVQNLQGQMV  
**Immunogen** HIV-1 infection  
**Species (MHC)** human (DR1)  
**Keywords** escape  
**References** Harcourt *et al.* 1998

- 43 asymptomatic HIV+ individuals were screened for proliferative responses to HIV – 12 showed a response, and dominant epitopes were mapped for two individuals, one in p24 and one in p17.
- Out of five truncated versions of peptide PIVQNLQGQMVHQAI SPRTL, only p24(1-11) elicited a proliferative response.
- Nine naturally occurring variants of this epitope were found within the individual who made this response – all bound to HLA-DR1, but three did not stimulate the CD4+ T-cell line that recognized the index peptide, suggestive of immune escape.

**HXB2 Location** p24 (1–15)  
**Author Location** p24 (133–147 III B, B10)

**Immunogen** HIV-1 infection  
**Species (MHC)** human

- References** Wahren *et al.* 1989b; Wahren *et al.* 1989a
- Peptides were identified that commonly evoke T-cell responses – 62% of 90 HIV+ people had a T-cell response to this peptide.

**HXB2 Location** p24 (1–22)  
**Author Location** p24 (133–154 SF2)  
**Epitope** PIVQNIQGQMVHQAI SPRTLNA  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**References** Rosenberg *et al.* 1997

- While anti-HIV CD4 Th responses are characteristically undetectable in chronic infections, strong p24-specific proliferative responses were inversely correlated with low viral load in 10 chronically infected people.
- The dominant proliferative response in one of two long term survivors was to this peptide.

**HXB2 Location** p24 (7–21)

**Author Location** Gag (171–185)

**Epitope** QGQMVHQAI SPRTL N

**Epitope name** Gag 171

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR supermotif)

**Keywords** subtype comparisons

**References** Wilson *et al.* 2001

- Eleven peptides were identified that had the HLA-DR supermotif, all were found to bind to MHC class II DR molecules and all elicited proliferative responses from multiple HIV-infected donors.
- This epitope binds to nine HLA-DR alleles: DRB1\*0101, DRB1\*1501, DRB1\*0401, DRB1\*0405, DRB1\*1302, DRB1\*0701, DRB1\*0901, DRB5\*0101 and DRB4\*0101 with an IC<sub>50</sub> threshold below 1,000 nM.
- This epitope sequence is conserved in 52% of clade B isolates.
- 7/22 HIV infected individuals responded to this epitope (13/22 responded to some of the DR supermotif epitopes, the 9 non-responder peptides tended to also not have recall responses to rec HIV-1 whole proteins)

**HXB2 Location** p24 (7–21)

**Author Location** p24 (171–185)

**Epitope** QGQMVHQAI SPRTL N

**Epitope name** Gag1

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR supermotif)

**Country** United Kingdom

**Assay type** proliferation, intracellular cytokine staining

**Keywords** supertype, rate of progression

**References** Boaz *et al.* 2003

- Proliferative and cytokine (IFN $\gamma$  and IL-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNPs (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+ T cell declined to <500 after 15 years. Patients were treatment-naive.
- Gag-specific CD4+ T cells in LTNPs showed increased numbers of IFN $\gamma$  and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFN $\gamma$ , levels were correlated with proliferation.
- Gag1 was 1 of 3 peptides that had a negative correlation between absolute number of responding cells and viral load.

**HXB2 Location** p24 (7–21)

**Epitope name** Gag 171

**Immunogen** vaccine

**Vector/Type:** DNA with CMV promoter, peptide **Adjuvant:** Complete Freund's Adjuvant (CFA)

**Species (MHC)** mouse (I-Ab and HLA-DR)

**Donor MHC** H-2b

**Keywords** vaccine-specific epitope characteristics, immunodominance

**References** Livingston *et al.* 2002

- 4 Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented by murine class II molecule I-Ab, enabling testing of vaccine strategies in H-2b mice.
- Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promoter were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all 4 peptides, using either DNA or protein for the vaccination.

**Assay type** proliferation, CD4 T-cell Elispot - IFN $\gamma$ , Chromium-release assay

**Keywords** subtype comparisons, rate of progression, acute/early infection, early treatment, variant cross-recognition or cross-neutralization

**References** Norris *et al.* 2004

- 5 CD4+ T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T cell proliferation. Cross-clade recognition was found to be impaired in 17/32 variants tested.
- Patient AC-01, who was infected with HIV-1 in 1997, recognized this epitope and epitope EPRGSDIAGT during acute infection, and 19 months post-initiation of ART therapy started during primary infection.

- The epitope EEKAFSPEVIP is highly conserved in B clade. Common variants from other clades were tested and all had markedly diminished responses, including eeRafspevip, eekaLspevip, and eDKafspevip (all found in clade A); eekGf-spevip, eekGfNpevip (clades A and CRF01\_AE); eekafspeIip (clade C); eekafNpevip (clade D).
- Minimum length peptides for the epitopes studied were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T-cell responses.

**HXB2 Location** p24 (29–48)

**Author Location** Gag (161–180 HXB2)

**Epitope** EKAFSPEVIPMFSALSEGAT

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Donor MHC** DRB1\*0701, DRB1\*1601

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$

**References** Boritz *et al.* 2007

- CD4+ targeted P24 HXB2 peptides were compared with autologous sequences in 9 chronic untreated patients. 10 of 26 peptides in 5 responding patients exactly matched autologous sequences, indicating that CD4+ T cell responses can persist in chronic HIV-1 infection despite recognition of epitopes present in vivo.
- Responding patient had autologous sequence exactly matching this peptide.

**HXB2 Location** p24 (31–41)

**Species (MHC)** human

**Country** India

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Flow cytometric T-cell cytokine assay

**Keywords** subtype comparisons

**References** Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN $\gamma$  response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN $\gamma$  CD4+ response). IL-2 response was detectable.

**HXB2 Location** p24 (31–46)

**Author Location** p24 (163–177)

**Epitope** AFSPEVIPMFSALSEC

**Immunogen** in vitro stimulation or selection

**Species (MHC)** human (A\*0201)

**References** Bedford *et al.* 1997

- Epitope elicits a primary proliferative response in PBMC from uninfected donors.
- Peptide contains a CTL epitope identified in HIV-positive patients.

- Peptide binds to HLA A\*0201 and causes regulation of class I expression on T2 cells.
- Matches 3/3 anchor residues for HLA DR: VIPMFSALS

**HXB2 Location** p24 (31–47)

**Author Location** p24 (31–47 B Consensus)

**Epitope** AFSPEVIPMFSALSEGA

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining, HLA binding

**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

**Epitope** AFSPEVIPMFSALSEGAT

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Country** Netherlands

**Assay type** Cytokine production

**References** Geels *et al.* 2006

- The relationship between CTL escape and the subsequent increase in viral load and CD4 Th responses was studied in 2 patients. In both patients T-cell reactivity and recognition were lost after CTL escape, and in 1 patient only the loss of CTL responses was paralleled by a decrease in IL-2 CD4 Th responses.
- Autologous sequences corresponding to known and predicted Th epitopes were analyzed. AFSPEVIPMFSALSEGAT had fixation of 2 mutations (AF[s/n]PEVIPMF[s/t]ALSEGAT) in 1 of the patients.

**Keywords** binding affinity, escape, optimal epitope, antagonism

**References** Norris *et al.* 2006

- This study demonstrates a mechanism of antagonism by a peptide shorter than the minimum length epitope for an HIV p24-specific CD4+ T-cell clone.
- Truncation of the peptide from PEVIPMFSALSEGATP (PP16) to PEVIPMFSALSEG (PG13) rendered the peptide unable to elicit proliferation, IFN- $\gamma$  release, or serine esterase release, even though it retained strong binding to MHC.

- Although both the original and truncated peptide-MHC complexes bound TCR clone, PEVIPMFSALSEGATP-DR1 tetramer bound with higher avidity than PEVIPMFSALSEG-DR1 tetramer, suggesting that tighter association of the peptide-MHC complex with the TCR is associated with the extent of T-cell activation.
- G/P substitution in the original full-length peptide (PEVIPMFSALSE[g/p]ATP) led to complete loss of agonist activity, and PEVIPMFSALSEpATP became antagonistic.

**HXB2 Location** p24 (35–44)

**References** Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- CD4 T-cell epitope previously reported for human is ETINEEAAEWDRVHPC. HLA restriction: DRB1\*03, DRB1\*0101.
- The response elicited to the B clade epitope INEEAAEWDRV does not cross-react with the CRF02\_AG form INdEAAEWDRV. The epitope is however conserved in CRF01\_AE and CRF02\_AG consensus sequences. Other clades tend to have L in the last position (INEEAAEWDR[v/l]).

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V $\beta$  usage, and some clones had a Th1 cytokine secretion profile (high IFN $\gamma$  production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 12 recognized this peptide sequence restricted by DRB1\*03 using TCR V $\beta$  22. This clone had a SI of 12.4 to p55, 49.6 to peptide, secreted low levels of IFN $\gamma$ , indicative of a Th1 response. Clone 12 had cytotoxic activity, mediated through both a perforin and a Fas-based pathway.

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells  $\mu$ l was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. Two clones recognized this epitope.

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- $\gamma$ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- $\gamma$  only-producing cells are short lived.

- Gag-specific CD4+ helper T-cell clones were derived from 1 LTNP (CTS-01) and 3 individuals given therapy during acute infection, 2 before (AC-01 and AC-36) and 1 after (AC-25) STI. Gag peptide recognition induced proliferation, IFN- $\gamma$  production, and perforin-mediated cytotoxicity in all CD4+ T-cell clones isolated.

- 3/23 p24-derived peptides tested induced proliferative p24-specific Th cell responses in the LTNP CTS-01. The immunodominant response was to the peptide DRVHPVHAGPI-APGQMREPRGS (81-102), and 9/10 CD4+ T-cell clones reacted with it. One was characterized in detail and used a B $\beta$ 4 TCR.

- The minimum peptide recognized by the clones from CTS-01 was VHAGPIAPG and it was restricted by HLA-DQ7.

- 5 CD4-T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T-cell proliferation. Cross-clade recognition was studied and found to be impaired in 17/32 variants tested.
- Patient CTS01, who was infected with HIV-1 in 1998, was an LTNP, and recognized this epitope.
- This epitope VHAGPIAPG was the most variable of the 5 epitopes studied. Only the C variant Ihagpiapg did not diminish the response. All other variations had impaired responses: vhagpVapg, found in clades A, B, C, and D; vQagpVapg, clades B, C, D; AQagpFPpg, IhagpVapg, AhagpVapg, and vQagpiP, all found in clade A; AQagpiapg, clade B; and vPagpiapg, clade C.
- Minimum length peptides for the epitopes studies were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T-cell responses.

- 5 CD4-T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T-cell proliferation. Cross-clade recognition was found to be impaired in 17/32 variants tested.
- Patient AC-01, who was infected with HIV-1 in 1997, recognized this epitope and epitope EPRGSDIAGT during acute infection, and 19 months post-initiation of ART therapy started during primary infection.
- This was the most variable of the 5 epitopes studied. REPRGSDIAGT natural variants were tested and did not usually diminish the response by much (rDprgsdiagt, clades B and C; and rDprgsdiagA and rGprgsdiagt, both clade C), although the CRF01\_AE variant reprgAdiagt abrogated the response.
- Minimum length peptides for the epitopes studies were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T cell responses. This peptide was the exception, as REPRGSDIAGTT, which is elongated by 2 amino acids compared to the minimum epitope, elicited a stronger proliferative immune response as well as IFN- $\gamma$  secretion and cytolysis.

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.

- Clone 6 recognized three peptides including this one with a Th1 response using TCR V $\beta$  6 (6s5A1N1). Sequencing TCR V $\beta$  regions of colonies from clone 6 suggested this was a clonal population. Assays using different peptide concentrations suggest that this peptide does not carry the main epitope of this clone.

**Species (MHC)** human  
**Country** United Kingdom  
**Assay type** proliferation, CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining  
**Keywords** HAART, ART, vaccine-induced epitopes, therapeutic vaccine  
**References** Ondondo *et al.* 2006
- A vaccinia-gag vaccine stimulated broad functional T helper responses in 16 chronically infected HAART patients. Gag-specific CD4+ T cell responses targeted known and new epitopes, several of which were also recognized by HIV-uninfected subjects.
  - TLQEQIGWMTSNPPIPVGD contains three possible HLA-DR4 binding sequences: LQEQIGWMT, IGWMTSNPP and MTSNPPIPV. Peptides that included these sequences and were at least 10 aa in length stimulated responses.
- HXB2 Location** p24 (111–132)  
**Author Location** p24 (243–264 SF2)  
**Epitope** LQEQIGWMTNPPIPVGEIYKR  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**References** Rosenberg *et al.* 1997
- Low viral load correlated with strong HIV-1-specific proliferative response.
  - A proliferative response to this epitope was detected in two long term survivors.
- HXB2 Location** p24 (113–127)  
**Author Location** Gag (248–262)  
**Epitope** EQIAWMTSNPPVPVG  
**Subtype** C  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**Country** India  
**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Flow cytometric T-cell cytokine assay  
**Keywords** subtype comparisons  
**References** Kaushik *et al.* 2005
- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN- $\gamma$  response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
  - 1/25 patients responded to this peptide (IFN- $\gamma$  CD4+ response). IL-2 response was not detectable.
- HXB2 Location** p24 (117–127)  
**Author Location** Gag (251–261)  
**Epitope** WMTSNPPVPVG  
**Subtype** C  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**Country** India

**Author Location** p24 (251–265)

**Epitope** TNNPPIPBGEIYKRW

**Immunogen** HIV-1 infection

**Species (MHC)** human (DRB1\*1301)

**Keywords** binding affinity, HAART, ART

**References** Blankson & Siliciano 2001; Malhotra *et al.* 2001

- The DRB1\*13-DQB1\*06 haplotype is associated with maintained viral suppression after HAART – 7/7 early-treated DRB1\*13-DQB1\*06 positive people, but only 3/14 (21%) of those who did not have DRB1\*13-DQB1\*06, maintained viral suppression for 18 months.
- PBMC from individuals with the haplotype DRB1\*13-DQB1\*06 displayed increased IFN- $\gamma$  secretion and stronger proliferative responses against p24 80 weeks post treatment.
- DRB1\*13-DQB1\*06 was also found to be enriched among long-term non-progressors (LTNPs) (it was in 9/18 versus, versus 21% of the general population)
- This epitope was mapped with truncated peptides using the Elispot assay.
- Two distinct DRB1\*13 epitopes were defined in the peptide region spanning 251 to 270, and this 20-mer bound with very high affinity to DRB1\*1302 – DRB1\*1301 and DRB1\*1302 would be expected to have very similar binding properties.

**HXB2 Location** p24 (119–133)

**Assay type** proliferation, Flow cytometric T-cell cytokine assay  
**Keywords** memory cells  
**References** Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- $\gamma$ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- $\gamma$  only-producing cells are short lived.

**References** Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 74 recognized two peptides including this one with a Th1 response using TCR V $\beta$  13 (13s1); it required 200 ng/ml (100 nM) and 1  $\mu$ g/ml (0.5  $\mu$ M) for stimulation by peptides 480-500 and 261-280, respectively. Sequencing TCR V $\beta$  regions of colonies from clone 74 suggested this was a clonal population.

- Low viral load correlated with strong HIV-1-specific proliferative response.
- A proliferative response to this epitope was detected in two long term survivors.

**HXB2 Location** p24 (133–143)

**Author Location** Gag (265–275)

**Epitope** WIILGLNKIVR

**Epitope name** Gag 14.2

**Immunogen** vaccine

*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade  
*HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu

**Species (MHC)** macaque

**Assay type** T-cell Elispot, Intracellular cytokine staining

**Keywords** subtype comparisons, variant cross-recognition or cross-neutralization, memory cells

**References** Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- The similar reported human epitope in this case is KRWIILGLNKIVRMYSPTSI, which is presented by 13 HLA-DR alleles.
- The response elicited to the B clade epitope WIILGLNKIVR cross-reacts with the CRF02\_AG form WIvLGLNKIVR. WIILGLNKIVR is mostly conserved across other clades.

**Epitope** NKIVRMYSPTSILDIRQGP

**Epitope name** P28

**Immunogen** *in vitro* stimulation or selection

**Species (MHC)** human (DR4)

**Donor MHC** DQ2, DQ3, DR4, DR7

**Keywords** immunodominance, Th1, Th2, TCR usage

**References** Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 6 recognized three peptides including this one with a Th1 response using TCR V $\beta$  6 (6s5A1N1). Sequencing TCR V $\beta$  regions of colonies from clone 6 suggested this was a clonal population. Assays using different peptide concentrations suggest that this peptide, 271-290, contains the main epitope of this clone. Upon activation, clone 6 was observed to induce a cytopathic effect in the adherent layer of fibroblasts expressing HLA DR4W14 and -W15. Clone 6 was activated in response to vaccinia virus Gag-infected B-LCL, so it could recognize naturally processed epitopes.
- Clone 37 recognized this peptide sequence with a Th2 response using TCR V $\beta$  3, and was a homogeneous T-cell population. This clone was only activated by peptide, not by processed protein from vaccinia virus Gag-infected B-LCL.
- Clone 97 recognized this peptide sequence with a using TCR V $\beta$  9 and 14; the two TCR receptors used indicates this limiting dilution represents a mixed population. This clone was only activated by peptide, not by processed protein from vaccinia virus Gag-infected B-LCL.

- HLA class I/II-transgenic, H-2 class I/II knockout mice, previously used to characterize responses to Hepatitis B vaccine, were used in this study to analyze the HLA-DR1-restricted HIV-1 Gag epitopes.
- Peptides were selected with the TEPITOPE algorithm. Of 9 selected peptides 7 were previously reported epitopes and 2 (LLVQANPDCKTILKALGPA, KTLKALGPAATLEEMMTAC) were novel.
- Human relevance of the 2 novel epitopes was established by assaying PBMC from HIV-1-infected long term asymptomatic subjects. KTLKALGPAATLEEMMTA primed CD4+ cells from 2 HLA-DR1 seronegative donors in vitro.
- Th1 helper potential was demonstrated for 7 structurally conserved epitopes and was particularly strong with YKTLRAEQASQEVKNWMTET, LLVQANPDCKTILKALGPA, NKIVRMYSPTSILDIRQGPK.

**References** Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN- $\gamma$  response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN- $\gamma$  CD4+ response). IL-2 response was not detectable.

**References** Iyasere *et al.* 2003

- Fifteen patients receiving HAART with strong CD4+ proliferative responses to HIV antigens while on therapy were examined, to see the effects of viremia on these responses during treatment interruptions. Increased viremia occurred in 12/15 patients during at least one treatment interruption. Anti-HIV proliferative responses were inhibited during viremia, but IFN $\gamma$  production to Gag, Pol, and Nef peptide pools were maintained.
- IL-2 production diminished during viremia, and exogenous IL-2 revived *in vitro* proliferation of HIV-specific T-cells to Gag or Pol DR0101 epitopes in a tetramer, as well as Gag-specific total CD4 T-cell responses.

**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The peptides that were recognized by the most people were able to bind broadly to multiple HLA-DR molecules. This peptide showed very high cross-reactive binding capacity, and bound to 8/8 tested common HLA-DR molecules.
- This peptide was the most often recognized, with a responses by 58% of the study group.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

**References** Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.

- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- $\gamma$ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- $\gamma$  only-producing cells are short lived.

**Keywords** HAART, ART, Th1, Th2, TCR usage

**References** Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V $\beta$  usage, and some clones had a Th1 cytokine secretion profile (high IFN $\gamma$  production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 26 recognized this peptide sequence restricted by DRB1\*03. This clone had a SI of 4.1 to p55, 5.3 to peptide, secreted high levels of IFN- $\gamma$ , indicative of a Th1 response, but also IL-4 and IL-5. Clone 26 had no cytotoxic activity.

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.

- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for HLA driven HIV diversity as has been claimed in Moore *et al.* (Science 2002).
- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell responses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B\*1410, B15; Patient B: A\*3101, A68, B\*4403, B51.

**References** Palmer *et al.* 2004

- The cytokine and maturation profiles as well as the proliferative capacity of HIV-1 Gag-specific CD4+ T cells was analyzed in 4 groups of HIV-1 infected patients: HAART treated, HAART suppressed, treatment naive and untreated, slowly progressing. Measurements of Gag-specific CD4+ T cell maturation, proliferation and plasma viremia indicate that virologic control is impaired due to HIV-1 effects on the maturation profiles of CD4+ T cells.

**Keywords** HIV exposed persistently seronegative (HEPS)

**References** Alimonti *et al.* 2005

- CD4+ T cell responses were studied in high-risk HIV-seronegative (Kenya) women, HIV-positive women (Kenya) and low-risk HIV-seronegative women (Canada), using 15mer peptides (overlapping by 11 amino acids) spanning p24 HXB2 sequence.
- Compared to HIV-positive women, high-risk HIV-seronegative women had significantly lower level of CD4+ specific immune activation and apoptosis. Lower proportion of HIV-seronegative women showed responses by the short-term CD4+ specific intracellular cytokine staining assay, while the proportions showing responses by the long-term CD8+-depleted T cell proliferation assay were similar. HIV-seronegative responders had 4.5-fold stronger response than the HIV+ group.

**Keywords** HAART, ART

**References** Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells/ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.
- The two Th clones that recognized this epitope utilized TCR V $\beta$ 2 and B $\beta$ 8.1.

**Species (MHC)** macaque**Assay type** T-cell Elispot, Intracellular cytokine staining**Keywords** subtype comparisons, memory cells**References** Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- The similar reported human epitope in this case is GNFRN-QRKIVKCFNCGKEGH. HLA restriction: DR15/51.
- The response elicited to the B clade epitope NQRKIVKCFNC does not cross-react with the CRF02\_AG form gQR-IKCFNC. The epitope is highly variable across other clades.

- Stimulates T-cell proliferation in HIV-infected donors.
- Schrier lists this peptide as p24(466-473), but it is in p2p7p1p6.

**HXB2 Location** p2p7p1p6 (93–112)**Author Location** p15 (93–112 B Consensus)**Epitope** TAPPEESFRFGREETTPSQK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Country** United States**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining, HLA binding**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 14% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

**HXB2 Location** p2p7p1p6 (98–112)**Author Location** p15 (473–487 IIIB, B10)**Epitope** ESFRSGVETTPPQK**Immunogen** HIV-1 infection**Species (MHC)** human**References** Wahren *et al.* 1989b; Wahren *et al.* 1989a

- Peptides were identified that commonly evoke T-cell responses – 50% of 90 HIV+ people had a T-cell response to this peptide.

**HXB2 Location** p2p7p1p6 (103–120)**Author Location** (clade B consensus)**Epitope** GEETTPSQKQEPIDKEL**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Donor MHC** A\*2402, A\*680301, B\*3502, B\*3905, Cw\*0401, Cw\*0702, DRB1\*0407, DRB1\*1104**Country** United States**Assay type** CD4 T-cell Elispot - IFN $\gamma$ **Keywords** escape**References** Rychert *et al.* 2007

- Sequence mutations were studied during acute infection in 7 subjects. Mutations within CD4 epitopes were coincident with changes in the peptide-specific CD4 response.
- GEEITTPSQKQEtIDKEL variant was present at first time point and coincided with a positive CD4+ response. GEEITTPSQKQEtIDKEL variant was present 4 weeks later and response was lost.

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN- $\gamma$  response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN- $\gamma$  CD4+ response). IL-2 response was detectable.

**HXB2 Location** p2p7p1p6 (106–116)**Author Location** Gag (469–479)**Epitope** TTTTPPQKQEPI**Epitope name** Gag 24.3**Immunogen** vaccine**Vector/Type:** DNA prime with modified vaccinia Ankara (MVA) boost **Strain:** B clade **HIV component:** Env, Gag, Protease, Rev, RT, Tat, Vpu**Species (MHC)** macaque**Assay type** T-cell Elispot, Intracellular cytokine staining**Keywords** subtype comparisons, memory cells**References** Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02\_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. TTTTPQKQEPI was not reported for human infections.
- The response elicited to the B clade epitope TTTTPQKQEPI does not cross-react with the CRF02\_AG form ipssP-KQEPr. The epitope is highly variable across other clades.

**References** Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 74 recognized two peptides, including this one, with a Th1 response using TCR V $\beta$  13 (13s1); it required 200 ng/ml (100 nM) and 1  $\mu$ g/ml (0.5  $\mu$ M) for stimulation by peptides 480-500 and 261-280, respectively. Sequencing TCR V $\beta$  regions of colonies from clone 74 suggested this was a clonal population. Clone 74 was activated in response to vaccinia virus Gag-infected B-LCL, so it could recognize naturally processed epitopes.

- Recombinant canarypox virus vector containing HIV-1 sequences, upon infection of mature dendritic cells, can trigger specific lysis *in vitro* by T-cells from HIV-1 infected individuals at levels comparable to the response seen to HIV carried in vaccinia vectors.
- Recombinant canarypox virus vector containing HIV-1 sequences can also stimulate HIV-specific IFN- $\gamma$  CD4+ helper T cell responses to Gag from bulk or purified CD4+ T cells.

**HXB2 Location** Gag**Author Location** p55**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human (DRB1\*03, DRB1\*13)**Donor MHC** A29, A30, B35, B8, DRB1\*03, DRB1\*13**Keywords** HAART, ART, Th1, Th2, TCR usage**References** Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V $\beta$  usage. Two clones were DRB1\*13 restricted and used TCR V $\beta$  17+19 or 5.1. Three clones were DRB1\*03 restricted and used TCR V $\beta$  22. Some clones had a Th1 cytokine secretion profile (high IFN $\gamma$  production) while some had a Th2 profile (high IL-4 and IL-5 production).

**HXB2 Location** Gag**Author Location** p24**Epitope****Immunogen** vaccine*Vector/Type:* DNA *HIV component:* Gag**Species (MHC)** mouse (H-2<sup>d</sup>)**References** Qiu *et al.* 2000

- Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein.
- Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors.
- IFN- $\gamma$  levels were increased compared to an undetectable IL-4 response.
- CTL levels were also increased in secreted Gag expression vaccination studies.

**HXB2 Location** Gag**Author Location** Gag**Epitope****Immunogen** vaccine*Vector/Type:* DNA, DNA with protein boost*Strain:* B clade LAI *HIV component:* Gag,Nef, Tat *Adjuvant:* IL-18**Species (MHC)** mouse (H-2<sup>d</sup>)**Keywords** Th1, Th2**References** Billaut-Mulot *et al.* 2001

- DNA vaccinated BALB/c mice primed and boosted with a multiepitopic vaccine with IL18 showed lymphoproliferative responses 7 weeks post immunization.
- Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime + DNA boost was more effective than DNA prime + protein boost.
- Immunization with either the multiepitopic DNA or with the mixed DNA vaccine resulted in Th1 cytokines production (IL-2 and IFN- $\gamma$ ) in spleen cell cultures stimulated by Tat and Gag, while Th2 cytokines IL-4 and IL-10 production was not detectable.
- Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.

**HXB2 Location** Gag**Author Location** p24**Epitope****Immunogen** vaccine*Vector/Type:* coxsackievirus *HIV component:* p24 Gag**Species (MHC)** mouse (H-2<sup>d</sup>)**References** Halim *et al.* 2000

- An avirulent rec coxsackievirus (CB4-P) construct was generated that can express p24 Gag sequences – CB4-P is attenuated even in immunodeficient mice and T help responses can be elicited from peptides embedded in a surface loop of the VP1 capsid.
- This paper describes the vaccine strategy and generation of constructs, and employs amino-terminal fusion of Gag sequences to the viral polyprotein with subsequent cleavage to elicit CTL responses via MHC class I presentation in BALB/c mice.

- Env and gag Th epitopes were pooled and used to test Th proliferative responses after IL2 therapy – while IL2 therapy causes an increase in CD4+ lymphocyte count, it does not increase HIV-1 specific proliferative responses.

**HXB2 Location** Gag**Author Location** Gag (LAI)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* DNA prime with vaccinia boost*Strain:* B clade LAI *HIV component:* Env, Gag**Species (MHC)** macaque**Keywords** Th1, Th2**References** Kent *et al.* 1998

- Priming with an HIV-DNA vaccine and boosting with a vaccinia construct induced greater levels of HIV T-cell immunity than either vaccine alone.
- The proliferative response to Env and Gag after the DNA vaccination had a mean SI of 1.5-4, but after boosting with rHIV-fowlpox virus, there was a 6-17 fold increase in the mean SI for HIV Gag and Env – The Th response happened despite a fall in Ab titers, suggesting that the Th response was primarily Th1, not Th2. The CTL response was also enhanced.

**HXB2 Location** Gag**Author Location****Epitope****Immunogen** vaccine*Vector/Type:* DNA, protein, virus-like particle (VLP), ISCOM**Species (MHC)** macaque**Keywords** Th1, Th2**References** Heeney *et al.* 1999

- Ten different vaccine strategies were evaluated for their ability to protect from infection in a rhesus macaque model using a non-pathogenic SHIV challenge.
- Protection correlated with the magnitude of NAb responses, beta-chemokines, and a balanced Th response.
- DNA, protein+adjuvant, VLP and ISCOM vaccines were tested.
- HIV-1/ISCOMS gave the highest NAb titers, Th1 and Th2 responses, was the only vaccine formulation tested with a detectable CTL response, and gave enhanced beta-chemokine production.

**HXB2 Location** Gag**Author Location** Gag/Pol (MN)

**Epitope****Immunogen** vaccine*Vector/Type:* DNA *Strain:* B clade MN*HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86**Species (MHC)** chimpanzee**References** Kim *et al.* 1998

- Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.

**HXB2 Location** Gag**Author Location** Gag/Pol (LAI, MN)**Epitope****Immunogen** vaccine*Vector/Type:* canarypox *Strain:* B cladeLAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease**Species (MHC)** human**References** Salmon-Ceron *et al.* 1999

- A live attenuated canarypox vector expressing MN gp120 and LAI gp41/gag/protease could induce CTL and a lymphoproliferative response in healthy uninfected volunteers.

**HXB2 Location** Gag**Author Location** p55 (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Zhang *et al.* 2001b

- T-helper cell proliferative responses to HIV p24, p55 and gp120 were tested in 27 patients with HIV infection – vigorous responses directed at Gag were detected in ten patients, but an Env specific response was detected in only one patient.
- Untreated patients showed a negative correlation between plasma viral load and HIV p24-specific T-cell responses, and the responses could be detected after extended HAART therapy with viremia below the detection limit.

**HXB2 Location** Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI), kinetics, Th1**References** Carcelain *et al.* 2001

- Repeated structured HAART therapy interruptions (STI) in 3 chronically HIV infected patients induced rapid but transient (< 3 weeks) HIV-1 specific CD4+ Th1 responses concurrently with viral rebound, as measured by proliferation assays and by IFN- $\gamma$  production by CD8-depleted PBMC.
- Kinetics suggest that viral replication leads to rapid destruction of the HIV-specific Th1 cell response.
- HIV-specific CD8+ T-cell responses were delayed relative to the Th1 responses and were not sustained.

**HXB2 Location** Gag**Author Location** Gag**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Blankson *et al.* 2001

- 5/10 chronically HIV infected patients with low CD4+ counts who received HAART therapy and experienced immune reconstitution displayed p24, p17 and p66 T-helper CD4 proliferative responses, in contrast to 0/8 chronically HIV infected patients with high CD4+ counts at the initiation of antiretroviral treatment.
- This surprising result could be due to the low CD4 nadir patients being more likely to have thymic regeneration or a peripheral expansion of T cells.

**HXB2 Location** Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Angel *et al.* 2001

- Prolonged viral suppression resulting from potent antiretroviral therapy allowed a T helper response to Gag p24 and PHA to develop in many HIV+ patients.
- At baseline, 2/41 (4.9%) subjects had a proliferative response to Gag p24, and 7/41 (17.1%) had a response to PHA, but by week 72 of therapy, 53% had a detectable response to p24 and 94% to PHA.

**HXB2 Location** Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Blazevic *et al.* 2000

- Prolonged viral suppression resulting from potent antiretroviral therapy did not allow an HIV T helper response to p24 or gp160, but Th proliferative responses to influenza, alloantigen, and PHA did develop in many HIV+ patients, and asymptomatic patients had stronger and more frequent Th response recovery than AIDS patients.

**HXB2 Location** Gag**Author Location** Gag (SF2)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, acute/early infection**References** Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.

- The breadth and specificity of the CTL response was determined using Elispot by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Individuals who were given HAART during acute or early in infection had significantly stronger proliferative responses than individuals who were chronically infected.

- 37/45 patients with primary HIV infection underwent a short course of antiretroviral therapy (SCART). 29/37 patients received triple ART therapy and eight patients received four ART drugs. Initiation of SCART was effective in controlling HIV replication by ten weeks in all patients and preserving CD4+ T cell responses for up to 64 weeks after therapy.
- No induction of drug escape mutations was observed, although two individuals had escape mutations in their infecting virus at baseline.
- 34 UK infected patients were clade B infected. 11/45 subjects had non-UK acquired HIV infection, 2 were clade A, 1 was A/E, 1 was C, 1 was "untypable", the rest were B.
- Recombinant HIV-1 derived gp120, p24, p66 and overlapping peptide pools spanning Tat and Nef were employed to measure CD4 T-cell frequencies in ELISPOT assays. The strongest preservation of T helper responses 12 weeks off SCART was seen for p24-specific CD4+ T-cell responses.
- 6/8 of the untreated individuals were tested for CD4+ T-cell responses. 1 had no detectable response. 1 had detectable responses to all HIV-1 proteins tested at baseline, but this narrowed to p24 and gp120, then became undetectable by 52

weeks. 3 had detectable and persistent responses, but only to p24.

- Post-therapy, the average spot forming cells for all proteins tested in 17/37 with 24 weeks of follow up had not declined, although the plasma viral RNA was increasing. SFU using p24 were measurable following SCART and preserved at levels comparable to baseline.

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile.
- SF2 p24 20mer peptides overlapping by 10 were used to assess the response in the different groups. At least 1/10 and up to 7/10 nonprogressors had a proliferative response with every one of the 22 p24 overlapping peptides. All peptides produced an IL-2 (Th1) response in at least one of the 10 non-progressors. IL-4 (Th2) responses were strong, but somewhat less comprehensive as 6/22 peptides elicited no IL-4 production, and fewer IL-4 responses were seen per peptide. In contrast, only 1/10 progressors had a clear proliferative and IL-2 response to 2/22 peptides, and neither one made an IL-4 response.
- The results taken together suggest that a balanced Th1/Th2 response to HIV is important for viral control in long-term non-progression.
- One immunologically discordant progressor became symptomatic while on the study. He showed a rapid decline in proliferative activity at that point, and a shift from a Th1 to a Th2 IL-4 producing response.

- A 51 year old male, infected presumably in 1988, diagnosed seropositive in 1993, has remained asymptomatic and is a long term non-progressor. He had very low proviral copy number in his PBMCs with high levels of G-A hypermutation, resulting in multiple stop codons, and viral replication was not evident. He was heterozygous for the CCR5 delta 32 allele, and has undergone a variety of treatments through the years. T cell responses in this patient and in two additional LTNP were described, and this patient had particularly intense CD4+ Th responses.
- PBMC from this patient resisted infection from CCR5, CXCR4 and dual-tropic HIV-1 strains. Purified CD4+ T cells became infected, however, without detectable cytopathic effect. CD8+ T cells were shown to protect PBMCs from infection, and this protection was not mediated by IFN $\gamma$ . Undefined CD8 T-cell secreted factors were stimulated by Gag, Pol and Nef genes introduced into target cells with vaccinia and processed through a class I pathway were responsible for the protective effect. This factor resembled CAF, the CD8+ cell antiviral factor described in Mackewicz and Levy (ARHR 8:1039, 1992)
- The CD4+ and CD8+ T-cell populations were both strongly skewed toward the CD45RO+ phenotype, many of which were terminally differentiated, CD28-, and expressed the activation markers CD38+ and HLA-DR+. Cell turnover, however, wasn't much elevated as measured by apoptosis or Ki-67+ and Bcl-2 dim expression.
- Vigorous p24-specific Th proliferative responses were observed, and 50% of CD4+ T-cells proliferated in response to p24 Gag, an extraordinary percentage. Responses were also detected against other regions in Gag, gp120 and Nef. It remains unclear how such vigorous Th responses are maintained with undetectable ongoing viral replication.
- Strong CD4+ T-cell IFN $\gamma$  Elispot responses were mapped to many peptides in Gag for this patient. T-cells from two other LTNP were tested here, and they did not react with as many Gag peptides as the main study subject of the paper. NIH reference Gag peptide set was used, but the sequences of the reactive peptides and the precise strain was not indicated in the paper, so we could not record them in the database.
- CD8+ T cell Elispot responses to Gag, Env, Nef, and Pol were detected as well, although CTL were not prominent, consistent with undetectable viremia.
- This subject had strong NAb responses when tested using the X4 primary isolate 228 200.

- p55 Gag cellular trafficking of two chimeras (DNA plasmid with either lysosomal-associated membrane protein LAMP/gag or human dendritic cell CD-LAMP/gag) was studied in mice. Both produces potent T and B cell immune responses, but DC-LAMP produces stronger Th1 response. The chimeras produces also significant responses to cryptic epitopes that were not recognized after immunization with native gag DNA.

**HXB2 Location** Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Country** South Africa**Assay type** proliferation, Intracellular cytokine staining**References** Day *et al.* 2006

- PD-1 (inhibitory receptor programmed death) expression on CD8 and CD4 cells was studied. There was a positive correlation with viral load and inverse correlation with CD4 T cell count, and blockage of PD-1 pathway augmented CD4 and CD8 T cell function.

**HXB2 Location** Gag**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Country** Kenya**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining**Keywords** responses in children, rate of progression**References** Chakraborty *et al.* 2005

- A study of long-term surviving children in Kenya revealed CD8 T-cell responses in all progression groups. The most striking attribute of long term surviving children was strong CD4 T-cell responses, which may be significant in delaying disease progression.
- Preservation of Gag-specific CD4+ Th responses have been described for adult non-progressors, and this study described similar responses for slow and non-progressing children.

**HXB2 Location** Gag**Author Location****Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade**Species (MHC)** macaque**Assay type** Intracellular cytokine staining**Keywords** subtype comparisons, vaccine antigen design**References** Smith *et al.* 2005

- Macaques were immunized with a clade B HIV vaccine and tested for responses to pools of clade B and A/G Env and Gag peptides. While CD4 responses were more frequent than CD8 responses, higher cross-clade responses were found for CD8

responses. The authors suggest that the better cross-clade reactivity of the CD8 responses reflects the size difference between CD8 and CD4 epitopes; the smaller CD8 epitopes provide a smaller target for mutation.

- All 5 pools of B Env and Gag peptides stimulated CD4 responses, while only 2 pools of A/G peptides stimulated responses, suggesting that 1 or 2 out of 5 CD4 epitopes were cross-reactive.

**HXB2 Location** Gag

**Author Location**

**Epitope**

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Assay type** Intracellular cytokine staining

**Keywords** acute/early infection

**References** Zaunders *et al.* 2005

- In 6/7 patients with very early HIV infection, CD4+ T cells producing IFN-g in response to Gag peptides were readily detected, and most CD4+ T cells were CCR5+CD38+++. In PHI subjects with later presentation, antigen specific CD4+ T cells could not be readily detected, coinciding with a lower level of CCR5+CD38+++ CD4+ T cells.

### III-B-6 Protease Helper/CD4+ T-cell epitopes

**HXB2 Location** Protease (7–21)

**Author Location** Protease (7–21 clade B consensus)

**Epitope** QRPLVTIKIGGQLKE

**Subtype** B

**Immunogen** HIV-1 infection, computer prediction

**Species (MHC)** human (DRB1\*0101, DRB1\*1101, DRB1\*1501, DRB5\*0101)

**Country** Brazil

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , HLA binding

**Keywords** binding affinity, computational epitope prediction, cross-presentation by different HLA

**References** Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 Brazilian HIV-1 chronically infected individuals.
- While the reacting peptide is QRPLVTIKIGGQLKE, shorter LVTIKIGGQ peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

**HXB2 Location** Protease (49–72)

**Author Location**

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR1, DR2 or DR3, DR4 and DR7)

**Keywords** Th1

**References** van der Burg *et al.* 1999

- T-cells specific for this epitope from the three donors were stimulated when presented with target cells pulsed with whole RT, indicating that the peptide is naturally processed for multiple HLA-DR molecules.
- Epitope binds to HLA-DR1, -DR2, -DR3, -DR4, and DR7, and can elicit Th1 cells that recognize peptide, protein, and HIV pulsed stimulator cells in the context of DR1, 2 or 3, 4 and 7 – these HLA types cover more than half of the general population.

**HXB2 Location** RT (171–190)

**Author Location** RT (171–190 HXB2)

**Epitope** FRKQNPDIYQYMDLTVG

**Subtype** B

**Immunogen** HIV-1 infection, *in vitro* stimulation or selection

**Species (MHC)** human (DR1, DR2, DR3, DR4, DR7)

**Keywords** binding affinity, cross-presentation by different HLA, Th1

**References** van der Burg *et al.* 1999

- The goal of this study was to identify Th epitopes that could be cross-presented by multiple class II HLA molecules. 5 RT peptides were identified that could bind to more than one HLA class II protein, and but only 2/5 could stimulate strong proliferation responses in PBMC derived from multiple healthy donors.
- This highly conserved epitope binds with high affinity to HLA-DR1, -DR2, -DR3, -DR4, and -DR7 but not HLA-DR5, and stimulated proliferation in 3/3 PBMC individuals with the appropriate HLA alleles.
- This epitope was able to be naturally processed in protein pulsed stimulator cells, and responding clones had a Th1 cytokine profile.
- This epitope is highly conserved and spans the highly conserved YMDD motif, and showing only minor variability in clades A, B, and D.

**Epitope** KDSWTVNDIQKLVGK

**Immunogen** *in vitro* stimulation or selection

**Species (MHC)** human (DR5-11.01)

**Donor MHC** DR5, DR6

**Assay type** proliferation

**Keywords** binding affinity, epitope processing, vaccine-specific epitope characteristics, escape

**References** Moschella *et al.* 2003

- Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. They have different T cell receptor usage. Residue 11 (kdswtvndiqKlvGk) is a natural variant, and K11A, K11G, K11I, and K11L variants were synthesized and studied in two presentation contexts, one as simple peptides, the other embedded in a recombinant protein, GST.
- The two Th clones and the two presentation contexts gave different outcomes with the peptides. K11I was not stimulatory, and was an antagonist in GST, an agonist as a peptide. K11L retained reactivity when presented in the fusion antigen, and had no activity as a peptide. K11G stimulated in both contexts, but the concentrations required for half maximal reactivity were different. K11A could not bind to the MHC in the processed form and could only stimulate when given as a peptide.
- In conclusion, substitutions in epitopes have different effects on Th stimulation depending on the mode of processing, and this should be considered when interpreting Th escape studies and vaccine development.

**HXB2 Location** RT (249–263)

**Author Location** RT (248–262)

**Epitope** KDSWTVNDIQKLVGK

**Immunogen** *in vitro* stimulation or selection

**Species (MHC)** human (DR5-11.01)

**Donor MHC** DR5, DR6

**Assay type** proliferation

**Keywords** binding affinity, epitope processing, vaccine-specific epitope characteristics, escape, TCR usage

**References** Bonomi *et al.* 2000

- Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. One of them used TCR V $\beta$ 15, the other used V $\beta$ 2. The substitutions D2A, W4A, D8A, I9A, and K15A were generated and only D8A, I9A failed to react with one clone, while W4A, D8A, I9A were all critical for a reaction with the other clone, showing the TCRs focused on different but overlapping residues.
- Moving the epitope to different contexts in recombinant proteins for presentation by APCs, as well as adding polyanalalanine and polyserine strings to either side of the epitope, influenced reactivity, suggesting processing context can influence the structure of the presentation complex.

**References** De Berardinis *et al.* 2003

- An RT T-helper (KDSWTVNDIQKLVGK) that can be promiscuously presented by multiple HLA-DR molecules, and an RT CTL epitope (ILKEPVHGV) presented by HLA-A2, were displayed using two different antigen presentation systems, bacteriophage virions or E2 protein scaffolds. Both systems enabled display of the epitopes in a mouse model system to the immune system. CTL responses were detected in immunized mice, and were processed correctly for both class I and class II presentation.

**HXB2 Location** RT (249–263)

**References** Manca *et al.* 1995b

- Peptide stimulation of PBMC from non-infected individuals *in vitro*.
- Peptide priming did not induce T-cells that recognize whole protein.

**HXB2 Location** RT (249–263)  
**Author Location** RT (248–262)  
**Epitope** KDSWTVNDIQKLVGK  
**Immunogen** in vitro stimulation or selection  
**Species (MHC)** human  
**References** De Berardinis *et al.* 1999

- PBMC from donors GD (HLA DR 11; DRB52) and LD (HLA DR 11, 13; DRB52) recognized this epitope (pep23)
- A subset of T-cell lines generated from these donors were capable of recognizing pep23 expressed on the surface of filamentous phage fd, fused to the major coat protein gVIIIp.
- This peptide was selected to study phage presentation of peptide sequences because it was known to serve as a T-cell helper determinant which could induce proliferation from a naive repertoire Manca *et al.* [1995a]

**HXB2 Location** RT (251–261)  
**Author Location** RT (250–260)  
**Epitope** SSTVNDIQKLV  
**Immunogen** in vitro stimulation or selection  
**Species (MHC)** human (DR5(11.01))  
**References** Manca *et al.* 1996

- This peptide was the minimal stimulatory sequence.
- One Th line was stimulated by p66, one by a Glutathione-S-transferase (GST)-peptide fusion protein.

- Constructs linking GST to the KDSSTVNDIQKLVGK peptide at the N-term end of GST stimulated Th cells, but not constructs linking at the C-term end.
- The C and N termini of GST are not intrinsically permissive or non-permissive, presentation is epitope specific (see FAILKC-NNK for contrast)

**Species (MHC)** human (DP4)

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , HLA binding

**Keywords** binding affinity, epitope processing, computational epitope prediction, dendritic cells

**References** Cohen *et al.* 2006

- Motif-based quantitative matrices binding predictions, binding assays and cellular assays were used to identify 4 HLA-DP4 epitopes by scanning the whole HIV-1 genome.
- 21 peptides were predicted to bind HLA-DP4, 17 of them did bind in binding assays, 6 of them were good binders. Of the 6 good binders, 4 peptides primed peptide-specific CD4+ T cell lines restricted to HLA-DP4 molecules.
- TYQIYQEPFKNLKTG primed CD4+ T cells that recognized epitopes of the native proteins processed by immature dendritic cells.
- TYQIYQEPFKNLKTG variant had a lower binding capacity to HLA-DP4 molecules, resulting from the unfavorable accommodation of H in the P6 binding pocket.

**Species (MHC)** human (DR supermotif)

**Keywords** subtype comparisons

**References** Wilson *et al.* 2001

- Eleven peptides were identified that had the HLA-DR supermotif, all were found to bind to MHC class II DR molecules and all elicited proliferative responses from multiple HIV-infected donors.
- This epitope binds eleven HLA-DR alleles: DRB1\*0101, DRB1\*1501, DRB1\*0401, DRB1\*0405, DRB1\*1101, DRB1\*1302, DRB1\*0701, DRB1\*0802, DRB1\*0901, DRB5\*0101 and DRB4\*0101, with an IC<sub>50</sub> threshold below 1,000 nM.
- This epitope sequence is conserved in 84% of clade B isolates.
- 6/22 HIV infected individuals responded to this epitope (13/22 responded to some of the DR supermotif epitopes, the 9 non-responder peptides tended to also not have recall responses to rec HIV-1 whole proteins)

**HXB2 Location** RT (414–428)

**Author Location** RT (596–610)

**Epitope** WEFVNTPLVKLWYQ

**Epitope name** Pol3

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR(supermotif))

**Country** United Kingdom

**Assay type** Cytokine production, proliferation

**Keywords** supertype, rate of progression

**References** Boaz *et al.* 2003

- Proliferative and cytokine (IFN $\gamma$  and IL-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNP (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+ T cell declined to <500 after 15 years. Patients were treatment-naïve).
- Gag-specific CD4+ T cells in LTNP showed increased numbers of IFN  $\gamma$  and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFN $\gamma$ , levels were correlated with proliferation.
- Pol3 was 1 of 2 peptides that had a positive correlation between absolute number and percentage of responding cells and viral load. Pol3 responses were also negatively correlated with CD4 counts. In contrast, the absolute number of 3/11 peptides studied were negatively correlated with viral load.

**Donor MHC** H-2b

**Keywords** vaccine-specific epitope characteristics, immunodominance

**References** Livingston *et al.* 2002

- 4 Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented by murine class II molecule I-Ab, enabling testing of vaccine strategies in H-2b mice.

- Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promoter were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all 4 peptides, using either DNA or protein for the vaccination.
- Although responses to this peptide indicated it was immunodominant, responses to all 4 peptides were made upon vaccination with linear constructs when GPGPG spacers were used.

**Country** United Kingdom  
**Assay type** proliferation, intracellular cytokine staining  
**Keywords** supertype, rate of progression, immunoprophylaxis  
**References** Boaz *et al.* 2003  
 • Proliferative and cytokine (IFN $\gamma$  and IL-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNPs (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+ T cell declined to <500 after 15 years. Patients were treatment-naive.  
 • Gag-specific CD4+ T cells in LTNPs showed increased numbers of IFN  $\gamma$  and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFN $\gamma$ , levels were correlated with proliferation.

**HXB2 Location** Integrase (187–204)  
**Author Location** (clade B consensus)  
**Epitope** RKGIGGYSAGERIVDII

**Subtype** B  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**Donor MHC** A\*0101, A\*0201, B\*4001, C\*0304, DRB1\*0801, DRB1\*1301  
**Country** United States  
**Assay type** CD4 T-cell Elispot - IFN $\gamma$   
**Keywords** escape  
**References** Rychert *et al.* 2007

- Sequence mutations were studied during acute infection in 7 subjects. Mutations within CD4 epitopes were coincident with changes in the peptide-specific CD4 response.
- RKGIGGYSAGERIVDII variant coincided with a positive response. RKGIGGYSAGkRIVDII variant 4 weeks later coincided with no response.

**References** Wilson *et al.* 2001  
 • Eleven peptides were identified that had the HLA-DR supermotif, all were found to bind to MHC class II DR molecules and all elicited proliferative responses from multiple HIV-infected donors.

- This epitope binds twelve HLA-DR alleles: DRB4\*0101, DRB5\*0101, DRB1\*0901, DRB1\*0802, DRB1\*0701, DRB1\*1302, DRB1\*1201, DRB1\*1101, DRB1\*0405, DRB1\*0401, DRB1\*1501 and DRB1\*0101, with an IC<sub>50</sub> threshold below 1,000 nM.
- This epitope sequence is conserved in 95% of clade B isolates.
- 8/22 HIV infected individuals responded to this epitope (13/22 responded to some of the DR supermotif epitopes, the 9 non-responder peptides tended to also not have recall responses to rec HIV-1 whole proteins)

**HXB2 Location** Integrase (214–228)

**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP responded to many peptides, comparable to acute STI.

**HXB2 Location** Integrase (250–267)

**References** Kim *et al.* 1998
- Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.

**HXB2 Location** Pol**Author Location** Pol**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Blankson *et al.* 2001

- 5/10 chronically HIV infected patients with low CD4+ counts who received HAART therapy and experienced immune reconstitution displayed p24, p17 and p66 T-helper CD4 proliferative responses, in contrast to 0/8 chronically HIV infected patients with high CD4+ counts at the initiation of antiretroviral treatment.
- This surprising result could be due to the low CD4 nadir patients being more likely to have thymic regeneration or a peripheral expansion of T cells.

**HXB2 Location** Pol**Author Location** p66**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Oxenius *et al.* 2000

- Patients who started therapy at acute HIV infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.

**HXB2 Location** Pol**Author Location** p66**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Palmer *et al.* 2002

- CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses.
- No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.

**HXB2 Location** Pol**Author Location** (BRU)**Epitope****Subtype** B**Immunogen** vaccine**Vector/Type:** inactivated HIV **Strain:** B**clade** BRU **HIV component:** RT, virus**Adjuvant:** Complete Freund's Adjuvant (CFA)**Species (MHC)** mouse**References** Haas *et al.* 1991

- Of 5 mouse inbred lines tested DBA/2 (H-2d, Ad, Ed), B10.A(4R) (H-2h4, Ak) and B10.A(5R) (H-2i5) showed particularly good CD4+ T cell proliferative responses to HIV proteins (gp160, gp120, p17, p24, Nef and RT), after vaccination with inactivated virus.
- B10.BR (H-2k, Ak, Ek) and C57BL/6 (H-2b and Ab) had weaker responses.

### III-B-11 Vif Helper/CD4+ T-cell epitopes

**HXB2 Location** Vif (4–26)**Author Location****Epitope** RWQVMIVWQVDRMRIRTWNSLVK**Epitope name** HIV-VAX-1052**Immunogen** HIV-1 infection**Species (MHC)** human (DRB\*0101)**Country** United States**Assay type** CD4 T-cell Elispot - IFN $\gamma$ **Keywords** subtype comparisons, computational epitope prediction, vaccine antigen design**References** De Groot *et al.* 2005

**HXB2 Location** Vif (144–158)**Author Location** Vif (144–158 clade B consensus)**Epitope** SLQYLALVALVAPKK**Subtype** B**Immunogen** HIV-1 infection, computer prediction**Species (MHC)** human (DRB1\*0101, DRB1\*0401, DRB1\*0405, DRB1\*0701, DRB1\*1101, DRB1\*1501, DRB5\*0101)

**Country** Brazil

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , HLA binding

**Keywords** binding affinity, computational epitope prediction, cross-presentation by different HLA

**References** Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 Brazilian HIV-1 chronically infected individuals.
- While the reacting peptide was SLQYLALVALVAPKK, shorter LQYLALVALVAPKK peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

**HXB2 Location** Vif

**Author Location** Vif

**Epitope**

**Immunogen** vaccine

*Vector/Type:* DNA *HIV component:* Nef, Vif, Vpu

**Species (MHC)** mouse (H-2<sup>d</sup>)

**Keywords** subtype comparisons, Th1

**References** Ayyavoo *et al.* 2000

- Splenocytes from BALB/c mice immunized with pVVN-P DNA were incubated with Vif, Vpu or Nef antigens for 3 days and assayed for IL-4 and IFN- $\gamma$  levels.
- Antigen stimulation increased IFN- $\gamma$  production in pVVN-P immunized mice, indicating a Th1 response.
- IL-4 production was not significantly changed after antigen stimulation compared to control levels.
- Cross-clade CTL activity was also observed: A, B clade, CRF01(AE) clade antigens could serve as targets for the B clade immunization stimulated CTL – an HIV-1 AC recombinant, however, did not stimulate a CTL response, but was expressed at lower levels on the target cell.

### III-B-12 Vpr Helper/CD4+ T-cell epitopes

**HXB2 Location** Vpr (58–72)

**Author Location** Vpr (58–72 clade B consensus)

**Epitope** EAIRILQQLLFIHF

**References** Hinkula *et al.* 1997

- Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein.
- Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.

**HXB2 Location** Tat (17–32)

**Author Location** Tat (17–32 HXB2)

**Epitope** QPKTACTNCYCKKCCF

**Epitope name** D26

**Subtype** B

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR5? plus others)

**Keywords** immunodominance

**References** Blazevic *et al.* 1993

- 9/14 (64%) of HIV-1 positive patients had proliferative T-cell responses associated with IL-2 production against at least one Tat-derived synthetic peptides of twelve overlapping 15-16 mer peptides spanning Tat. T cell proliferation was associated with IL-2 production.
- 3/12 peptides were recognized.

- This immunodominant, highly conserved and most frequently recognized peptide was recognized by 57% of the HIV-1 infected patients. A beta-sheet secondary structure was predicted at aa residues 21–28, but no amphipathic helix structure, suggested to be most favorable for T-cell epitopes, was indicated.

- This peptide contained epitopes restricted by several HLA DR alleles, although the frequency of DR5 was enriched (3/6) among the patients that recognized the peptide.

**HXB2 Location** Tat (17–32)

**Author Location** Tat (17–32)

**Epitope** QPKTACTNCYCKRCCF

**Epitope** HCQVCFITKALGISYG

**Epitope name** D28

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR5? plus others)

**References** Blazevic *et al.* 1993

- 9/14 (64%) of HIV-1 positive patients had proliferative T-cell responses associated with IL-2 production against at least one Tat-derived synthetic peptides of twelve overlapping 15-16 mer peptides spanning Tat. T cell proliferation was associated with IL-2 production.
- 3/12 peptides were recognized.
- 4/14 HIV+ people recognized this peptide.
- An alpha-helix structure was predicted at residues 39-44, but charge patterns did not indicate it was an amphipathic helix, suggested to be most favorable for T-cell epitopes.
- This peptide contained epitopes restricted by several HLA DR alleles, although the frequency of DR5 was enriched (2/4) among the patients that recognized the peptide.

**Keywords** Th1, vaccine antigen design

**References** Ramakrishna *et al.* 2004

- BALB/c and C57BL/6 mice were intramuscularly immunized with a codon optimized HIV-1 C-consensus Tat DNA vaccine that was linked to ubiquitin to facilitate rapid processing. Ubiquitin and codon optimization enhanced Th1 T cell responses, with increased proliferative responses, cytotoxic responses, and Th1 responses measured by IFN $\gamma$  EliSpot, but not the Th2 responses, measured by IL-4 EliSpot.
- Several immunogenic regions in HIV-1 Tat were identified in BALB/c mice using EliSpot. The strongest immune response was within the core region of Tat; the peptides based on the C subtype consensus positions 30-50 and 40-60 gave the strongest EliSpot responses in BALB/c mice, suggesting a putative helper T-cell epitope spanning the region of overlap, residues 40-50.

**Epitope****Immunogen** in vitro stimulation or selection**Species (MHC)** human**Keywords** dendritic cells, Th1, Th2**References** Corinti *et al.* 2002

- In vitro delivery of recombinant Tat protein conjugated to red blood cells (RBCs) via avidin-biotin bridges (RBC-Tat) to human dendritic cells was compared to dendritic cells pulsed with rec Tat.
- Dendritic cells pulsed with RBC-Tat elicited specific and significantly stronger CD4+ and CD8+ T-cell responses and required 1250-fold less antigen than DCs stimulated with soluble Tat.
- Dendritic cells which were matured in the presence of IFN $\gamma$  induced elevated IL-12 and TNF- $\alpha$  secretion. IFN $\gamma$  upregulated IP-10 and down regulated TARC, chemokines which attract Th1 and Th2 cells, respectively.

**HXB2 Location** Tat**Author Location** Tat (IIIB, BH10)**Epitope****Subtype** B**Immunogen** in vitro stimulation or selection**Species (MHC)** human**Keywords** epitope processing, vaccine-specific epitope characteristics, dendritic cells, Th1**References** Fanales-Belasio *et al.* 2002b

- Biologically active HIV-1 Tat is readily taken up by monocyte-derived dendritic cells (MDDC) (and activated endothelial cells), but not other APCs. Tat must be in a native, non-oxidized conformation for efficient uptake. Tat upregulates MHC molecules, IL-12, TNF $\alpha$ , RANTES and MIP-1- $\alpha$  and MIP-1- $\beta$  production which drives Th1 immune responses and enhances antigen presentation.
- Native Tat enhanced the antigen presentation of MDDC and boosted proliferative recall and allogeneic antigen responses, and the authors propose it could be used as an adjuvant to drive the immune response as well as an antigen.

**HXB2 Location** Tat**Author Location** Tat**Epitope****Immunogen** vaccine*Vector/Type:* DNA, protein *HIV component:* Tat *Adjuvant:* aluminum hydroxide, Ribi adjuvant (MPL+TDM) (RIBI)**Species (MHC)** macaque**Assay type** Cytokine production, Delayed-type hypersensitivity (DTH)**Keywords** review, early-expressed proteins, Th1**References** Fanales-Belasio *et al.* 2002a

- HIV-1 Tat protein has several virtues vaccine component. It is an early expressed protein, and though variable, contains conserved T-cell and B-cell epitopes that allow cross-clade recognition. It is efficiently taken up by monocyte-derived dendritic cells (MDDCs) and in this context can stimulate Th1 immune responses. A Tat based vaccine can elicit an immune response that can control primary infection in monkeys that are in early stage of infection with SHIV89.6P.

**HXB2 Location** Tat**Author Location** Tat (1-72)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* protein, nanoparticle *Strain:* B clade BRU *HIV component:* Tat *Adjuvant:* aluminum hydroxide, lipid A**Species (MHC)** mouse**Donor MHC** H-2d**Assay type** Cytokine production, proliferation**Keywords** Th1, Th2, adjuvant comparison, vaccine antigen design**References** Cui *et al.* 2004

- Mice were subcutaneously injected on day 0 and 14 with either Alum and Tat (Th2 control) or Lipid A-adjuvanted Tat (Th1 control), or Tat coated anionic nanoparticles. Analysis of Ab and cytokine release in splenocytes (day 28) showed both IgG and IgM Ab responses; immunization with Tat-coated nanoparticles induced a Th1-biased immune response.
- IFN  $\gamma$  responses were 3.3-fold stronger with Tat and either Lipid-A or coated nanoparticles than with Tat and Alum.

**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection  
**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

**References** Cohen *et al.* 2006

- Motif-based quantitative matrices binding predictions, binding assays and cellular assays were used to identify 4 HLA-DP4 epitopes by scanning the whole HIV-1 genome.
- 21 peptides were predicted to bind HLA-DP4, 17 of them did bind in binding assays, 6 of them were good binders. Of the 6 good binders, 4 peptides primed peptide-specific CD4+ T cell lines restricted to HLA-DP4 molecules.

**References** Nehete *et al.* 1993

- Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice.
- Proliferative response to this peptide was observed in 3/3 immunized rhesus monkeys.

**HXB2 Location** gp160 (38–48)

**Author Location** Env (45–55)

**Epitope** VYYGVPVWKEA

**Immunogen** HIV-1 infection

**Species (MHC)** human, chimpanzee

**References** Nehete *et al.* 1998b

- Seven out of nine HIV-infected chimpanzees and eight out of seventeen HIV-positive humans exhibited positive proliferative responses to this conserved peptide (peptide 104) – no HIV negative individuals showed a response.
- This peptide, along with 4 other peptides from conserved regions of envelope, can induce proliferative responses to HIV and may be useful for vaccines.
- Peptide 104 elicited proliferative responses in inbred mouse strains and outbred rhesus monkeys in previous study by same group.

**Keywords** HAART, ART, acute/early infection, cross-presentation by different HLA

- References** Malhotra *et al.* 2003
- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
  - This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
  - This peptide showed bound to HLA-DRB1\*0101.

**Keywords** subtype comparisons, responses in children, mother-to-infant transmission

**References** Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breastfeeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

**HXB2 Location** gp160 (105–117)

- Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activated were infected.

- PBL from 10/21 of the mothers showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.

**HXB2 Location** gp160 (105–117)

**Assay type** proliferation

**Keywords** responses in children, mother-to-infant transmission

**References** Kuhn *et al.* 2001b

- T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistence of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retroviral exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but

were at no greater risk of infection due to subsequent breast feeding (Ditrane *et al.*, Lancet 354:2050 (1999)).

- Species (MHC)** mouse (H-2 IA<sup>b</sup>)  
**Keywords** subtype comparisons, epitope processing, TCR usage  
**References** Surman *et al.* 2001
- This epitope is located in the V2 region of UG92005 (UG, clade D) and the hybridoma that recognized it used Vβ5.
  - C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
  - The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
  - Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and Vβ usage was determined.
  - Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
  - 80 unique clonotypes were characterized from six mice.
  - H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
  - Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- Five peptides were recognized most frequently: C2 (aa 142–161), C3 (aa 152–171), C5 (aa 172–191), E5 (aa 272–291) and G4 (aa 380–393). The first three were in or near V2, the other two were proximal to the V3 and V4 loops.
- 4/15 responders recognized this immunodominant peptide, average SI = 7.4.

**HXB2 Location** gp160 (174–185)**Author Location** gp160 (174–185 clade B consensus)**Epitope** ALFYKLDVVPID**Subtype** B**Immunogen** HIV-1 infection, computer prediction**Species (MHC)** human (DRB1\*0101, DRB1\*0401, DRB1\*0405, DRB1\*0701, DRB1\*1101, DRB1\*1302)**Country** Brazil**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , HLA binding**Keywords** binding affinity, computational epitope prediction, cross-presentation by different HLA**References** Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 Brazilian HIV-1 chronically infected individuals.
- While the reacting peptide was ALFYKLDVVPID, shorter FYKLDVVPID peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

**HXB2 Location** gp160 (175–189)**Author Location** Env (UG92005)**Epitope** LFYKLDVVQIDNSTN**Immunogen** vaccine*Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)**Species (MHC)** mouse (H-2 IA<sup>b</sup>)**Keywords** subtype comparisons, epitope processing, TCR usage**References** Surman *et al.* 2001

- This epitope is located in the V2 region of UG92005 (UG, clade D) and the V $\beta$  usage of the TCR was not determined.

- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

  - The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (PKITFEPIPIHYCAP and ITFEPIPIHYCAPAG)
  - C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
  - The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
  - Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and V $\beta$  usage was determined.
  - Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
  - 80 unique clonotypes were characterized from six mice.
  - H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
  - Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

**Keywords** HAART, ART, vaccine-specific epitope characteristics, acute/early infection, cross-presentation by different HLA

**References** Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
- Seven out of 12 clones recognized this conserved C3 region of gp120. Clone one was mapped to the optimal epitope and was found to be presented by HLA-DR. The peptide showed promiscuous binding to DRB1\*0101, DRB1\*0401, DRB1\*1302, DRB1\*0701, DRB1\*0901, DRB4\*0101, DRB5\*0101.

**Keywords** epitope processing, vaccine-induced epitopes, escape, TCR usage

**References** Zhan *et al.* 2003

- A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035.

Five of seven different Th hybridomas isolated from five immunized mice immunized reacted with the peptide PKVS-FEPIPIHYCAP, located in the C2 region of gp120. TCR V $\beta$  usage indicated each of the clones was unique. Splenic populations from other C57BL/6 mice immunized with 1035 env confirmed that the gp120 specific T-helper response was focused on the PKVSFEPIPIHYCAP peptide. The authors suggest the protein structural context may contribute to the immunodominance of this peptide.

- The minimal epitope was mapped for one of the hybridomas, and was FEPIPIHYC.
- The natural variant, fDpipihyc, did not stimulate a response in three of the hybridomas.

**Keywords** acute/early infection

**References** Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

**References** Oscherwitz *et al.* 1999b

- Epitope presented as a tandem repeat (eight copies) elicits stronger B-cell and T-cell responses than the epitope presented as a single copy.
- This study indicates that the increased response was not due to neodeterminants created at the junction of the peptides, but rather due to an epitope density effect, increased immunogenicity through a high ratio of epitope to protein.

**HXB2 Location** gp160 (297–330)

**Author Location** Env (303–335 BX08)

**Epitope** TRPNNNTRKSIHIGPGRAFYATGEIIGDIRQAH

**Immunogen** vaccine

**Vector/Type:** lipopeptide

**Species (MHC)** human

**References** Gahery-Segard *et al.* 2000

- Anti-HIV lipopeptide vaccine consisting of six long peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial.
- A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 6/10 reacted to this peptide.
- 9/12 tested mounted a CTL responses to at least one of the six peptides, each of the six peptides elicited a CTL response in at least one individual – this peptide was particularly immunogenic, eliciting a CTL response in five vaccinees.
- None of the 12 tested had an IgG response to gp120 or gp160 and vaccinees could be differentiated from HIV-1 seropositive individuals with a commercial HIV detection kit – no neutralizing antibodies were observed.

**HXB2 Location** gp160 (298–307)

**Author Location** Env (UG92005)

**Immunogen** vaccine

**Vector/Type:** DNA, protein, vaccinia

**Strain:** B clade 1007, D clade UG92005

**HIV component:** gp140 **Adjuvant:** Complete Freund's Adjuvant (CFA)

**Species (MHC)** mouse (H-2 IA<sup>b</sup>)

**Keywords** subtype comparisons, epitope processing, TCR usage

**References** Surman *et al.* 2001

- This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by a hybridoma with V $\beta$  usage not determined.

- The epitope described here is the region of overlap of two 15mers that were both able to stimulate IL-2 production from the hybridoma (TINCTRPYNNTRKGI and RPYNNTRKGI-HIGPG)
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

**Keywords** Th1  
**References** Lu *et al.* 1999
- MIP-1α expression plasmid co-inoculated with a DNA vaccine consisting of HIV-1 pCMV160IIIB and pcREV enhanced the HIV-specific T-cell immune response as measured by a CTL test against using V3 peptide pulsed targets, and a DTH test to V3 peptide.
  - The IgG1/IgG2a response was lowered with co-inoculation of MIP-1 alpha, suggesting it preferentially elicits a Th1 response.

- Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice.
- Despite the proliferative response to this peptide in mice and humans, no response was observed in 3 rhesus monkeys.

**HXB2 Location** gp160 (308–322)**Author Location** gp120 (315–329 IIIB)**Epitope** RIQRGPGRAFVTIGK**Epitope name** P18**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** responses in children, Th1, Th2**References** Wasik *et al.* 1997

- The breadth and intensity of the CTL response and the type of Th response was studied in seven rapidly progressing HIV-1 + infants.
- IL-2 and  $\gamma$  IFN production from Th1 cells correlated with the CTLp frequency against HIV-1 Gag, Env, Nef and Pol.
- IL-4 production from Th2 cells was inversely correlated with the CTLp frequency.
- The HIV-1 + children with strong CTL responses had levels of anti-CD3 MAb induction of Th1 cells comparable to uninfected children.
- The children that did not mount a good CTL response had dramatically decreased numbers of Th1 relative to Th2 cells.

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before

delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.

- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

- This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by two hybridomas with V $\beta$  usage not determined, but one used V $\alpha$  8.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and V $\beta$  usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

**References** Berzofsky *et al.* 1991b; Berzofsky *et al.* 1991a

- FVTIGKIGNMRQAHCNISRAKWNNTLKQIDSKL encompasses several murine Th epitopes and is referred to as a "multideterminant region" or cluster peptide.
- Six multideterminant region cluster peptides were evaluated Th responses in different MHC/HLA backgrounds after vaccination of mice with gp160, or in infected people.

- This cluster peptide elicited proliferative responses in cells from B10.BR mice (H-2A<sup>k</sup>, E<sup>k</sup>) and B10.D2 mice (H-2A<sup>d</sup>, E<sup>d</sup>), but shorter peptides from within this region stimulated H-2<sup>k</sup>, H-2<sup>d</sup>, H-2<sup>b</sup> and H-2<sup>s</sup> responses.
- IL-2 production in response to this peptide was observed in 58% (21/36) of asymptomatic HIV-infected individuals.

**Donor MHC** H-2k, H2-d  
**Keywords** epitope processing, immunodominance  
**References** Dai *et al.* 2001
- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
  - This peptide was highly reactive in 7/10 BALB/c mice tested, and in 7/10 CBA/J mice and was considered one of the 3 immunodominant peptides identified that were shared in both mouse strains: RRNIIGDIRQAHCNISRAKW, NNTLQQIVIKLREKFRNKTI, GTNGTEGNDIITLQCRIKQI.

CFA did not augment responses in animals vaccinated with plasmid.

- A total of 7 gp120 peptides elicited a delayed type hypersensitivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 3/5 animals vaccinated with rec gp120 responded by DTH to this peptide, and 2/6 responded that were vaccinated with plasmid gp120 DNA.

**Keywords** subtype comparisons, epitope processing, TCR usage

**References** Surman *et al.* 2001

- This epitope is located in the V4C4 region of 1007 (US, clade B) and was recognized by 13 hybridomas with V $\beta$  usage V $\beta$  4, 7, 8.1, 8.2, 10, 12 and not determined – one of the V $\beta$  8.2 was shown to utilize V $\alpha$  2.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.

- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and V $\beta$  usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

**Assay type** Cytokine production, CD4 T-cell Elispot - IFN $\gamma$

**Keywords** vaccine-induced epitopes, variant cross-recognition or cross-neutralization, vaccine antigen design

**References** Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- T-cell hybridoma 1007P3-23 was isolated from mice immunized with 1007, and it recognized the peptide SNNTVGNPIILPCRI of the V4/C4 region. The minimal, core peptide recognized by 1007P3-23 was NPIIL, a sequence not found in UG92005, which has a deletion in the core, so that the equivalent region in the D isolate is NNET—ITLQCRI
- Priming mixtures of 1007 and UG92005 induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHC-NVSKAKW, V3-C3) Th responses in murine spleen cells.

**HXB2 Location** gp160 (421–436)**Author Location****Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** vaccine*Vector/Type:* canarypox prime with recombinant protein boost *HIV component:* gp120**Species (MHC)** human (DRB1\*13)**Donor MHC** DRB1\*01, DRB1\*13**Assay type** proliferation**Keywords** enhancing activity, optimal epitope**References** Okazaki *et al.* 2006

- KQIINMWQEVGKAMYA-specific human CD4+ T-cell line from a healthy Caucasian American volunteer immunized with a canarypox virus vector expressing gp120 and boosted with recombinant gp120 was developed and found to be restricted to DRβ1\*13. Epitope enhancement with different amino acid substitutions was studied.
- Likely binding core for KQIINMWQEVGKAMYA was determined as WQEVGKAMY, based on single A or S substitutions that diminished recognition, and proliferation assay data using truncated peptides.
- HLA binding motif was studied using substituted peptides in anchor positions 1,4,6,9 from the N-terminus of WQEVGKAMY. In position 1, CD4+ response was reduced by kqiinm[w/ai]QEVGKAMYa substitutions, but not by kqiinm[w/f]QEVGKAMYa substitution suggesting a requirement of aromatic amino acid. In position 4, CD4 response was reduced by kqiinmMWQE[v/af]GKAMYa substitutions, but enhanced by kqiinmWQE[v/i]GKAMYa substitution, suggesting a requirement of aliphatic amino acid. In position 6, response was reduced by kqiinmWQEVG[k/ae]AMYa substitutions, but was enhanced by positively charged R substitution (kqiinmWQEVG[k/r]AMYa). In position 9, all peptides substituted with small, aromatic, or aliphatic amino acids (kqiinmWQEVGKAM[y/afi]a) induced enhanced response.
- The altered KQIINMWQE[v/i]GKAMYA peptide produced higher IFN-γ production than the original peptide, suggesting greater CD4 T-cell activation in a Th1 functional response.
- Triple substituted peptide KQIINMWQE[v/i]G[k/r]AM[y/a]A shifted the peak proliferative response to lower concentrations.

**HXB2 Location** gp160 (421–436)**Author Location** Env (421–436 IIIB)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** vaccine*Vector/Type:* peptide *Strain:* modified B clade IIIB *HIV component:* Env**Species (MHC)** mouse (Ek)**Assay type** Cytokine production, Th support of CTL response**Keywords** binding affinity, Th1**References** Ahlers *et al.* 2001

- BALB/c and A.AL were immunized with an Env-peptide vaccine construct containing the CTL epitope P18IIIB and a T helper epitope.
- Substitution of Glu (wt) to Ala, kqiinmwqAvgkamy, caused increased affinity for MHC class II Ek. This resulted in the upregulation of CD40L in the responding Th cells, and shifted the response towards Th1. Increased Th responses stimulated DCs to produce higher levels of IL-12, and B7-1 and B7-2, thus enhance CTL responses.
- The modified epitope, T1A, elicited stronger protection against increasing doses of viral challenge with vaccinia expressing HIV-1 IIIB gp120 compared to the wildtype epitope T1.

- KQIINMWQEVGKAMYAPPISGQIR encompasses several murine Th epitopes including KQIINMWQEVGKAMYA and is referred to as a "multideterminant region" or cluster peptide.

**HXB2 Location** gp160 (421–436)**Author Location** gp120 (428–443 IIIB)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** vaccine*Vector/Type:* peptide *Strain:* B clade IIIB**Species (MHC)** mouse (H-2E $\alpha$  E $\beta$ <sup>k</sup>)**References** Boehncke *et al.* 1993

- C3H H2<sup>k</sup> mice were used for immunization in the study because H-2<sup>k</sup> mice are particularly good T1 responders – T1 can be presented by E $\alpha$  E $\beta$ <sup>k</sup> but not E $\alpha$  E $\beta$ <sup>b</sup> – the nature of the T1 class II molecular interaction was thoroughly explored.
- Alanine substitutions across peptide did not negatively affect MHC binding or effective presentation of epitope, except at three critical residues (432N, 435Q, 439K), however substitutions with larger side chains often diminished activity – only a few amino acids were found to be critical for class II interaction and for maintaining T-cell receptor specificity.
- A gain in potency was observed when 436E was replaced with A, suggesting that substitutions in positions that interfere with binding might allow the design of a more potent vaccine.

**HXB2 Location** gp160 (421–436)**Author Location** gp120 (426–441 IIIB)**Epitope** KQFINMWQEWGKAMYA**Immunogen****Species (MHC)** human**References** Furci *et al.* 1997

- Epitope T1 variant: 9/11 exposed-uninfected individuals in this study had a proliferative response to a C5 peptide, but none reacted with this previously defined epitope.
- IIIB position 435 listed as W in this epitope as opposed to V in the sequence.

**HXB2 Location** gp160 (421–436)**Author Location** gp120 (428–433 IIIB)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** responses in children, kinetics, Th1**References** Wasik *et al.* 2000

- Th responses measured by IL-2 responses to P18 and T1 in HIV-1 infected infants were undetectable at less than 1 month of age, and remained low in children with AIDS symptoms, but increased with age in children with slowly progressive disease.
- The kinetics and intensity of the CTL activity during the first year of life was related to the child's ability to make Th1 responses.

**HXB2 Location** gp160 (421–436)**Author Location** gp120 (428–433 IIIB)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** responses in children, Th1, Th2**References** Wasik *et al.* 1997

- The breadth and intensity of the CTL response and the type of Th response was studied in seven rapidly progressing HIV-1 + infants.
- IL-2 and  $\gamma$  IFN production from Th1 cells correlated with the CTLp frequency against HIV-1 Gag, Env, Nef and Pol.
- IL-4 production from Th2 cells was inversely correlated with the CTLp frequency.
- The HIV-1 + children with strong CTL responses had levels of anti-CD3 MAb induction of Th1 cells comparable to those of uninfected children.

- C4-V3 PV (polyvalent HIV envelope synthetic peptide immunogen) consisted of T1 helper epitope presented in tandem with a V3 loop CTL epitope from one of four different North American strains.
- This was a pilot phase I study involving vaccination of ten HIV-infected subjects who were HLA-B7-positive.
- Enhanced lymphoproliferative response to peptide was observed in 5/8 vaccinees – increase in neutralizing antibody responses in 4/8 vaccinees.

**HXB2 Location** gp160 (421–436)**Author Location** gp120**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)** human**Keywords** subtype comparisons, responses in children, mother-to-infant transmission**References** Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

**HXB2 Location** gp160 (421–436)**Author Location** gp120 (428–443 RF)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** HIV-1 infection**Species (MHC)****Keywords** epitope processing**References** de Lorimier *et al.* 1994

- Proton NMR spectroscopy was employed to analyze the solution conformation of a hybrid peptide, T1-SP10RF, in order to better understand the immunogenicity of its' T helper (KQI-INMWQEVGKAMYA, CTRPNNTRKSI), CTL (SITKGP-GRVIYATG) and B-cell epitopes (RKSITKGPGRVIYATG).

- As a free peptide, the T1 segment, a T-helper epitope is in an extended conformation with nascent helical conformation. It may form a beta strand in native gp120, and a nonnative conformation may account for the inability of free T1 peptide to elicit antibody responses, in contrast to the T1 segment in native gp120. It lacks random-coil conformations, and it is suggested that this may make the peptide less susceptible to complete proteolytic degradation, and be favored within epitopes.

**HXB2 Location** gp160 (421–436)**Author Location** Env (428–443 IIIB)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)****Assay type** Cytokine production**Keywords** mother-to-infant transmission**References** Clerici *et al.* 1993a

- Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activated were infected.
- PBL from 10/21 of the mothers showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.

**HXB2 Location** gp160 (421–436)**Author Location** Env (IIIB)**Epitope** KQIINMWQEVGKAMYA**Epitope name** T1**Subtype** B**Immunogen** HIV-1 exposed seronegative**Species (MHC)****Assay type** Cytokine production**References** Clerici *et al.* 1994a

- Six of eight HIV-exposed health care workers had transient HIV-specific T-helper responses after percutaneous exposure to HIV, responding to two or more Env peptides among the set T1, T2, Th4.1, P18IIIB and P18MN. Responses were lost after 12–56 weeks. The HIV-specific Th responses occurred without seroconversion or PCR evidence for infection.
- Six of the eight HIV-exposed individuals responded to two or more peptides, whereas, only one individual exposed to HIV-negative blood responded to one peptide.

**References** Kuhn *et al.* 2001b

- T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistence of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retroviral exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrane *et al.*, Lancet 354:2050 (1999)).

- This epitope is located in the C4 region of UG92005 (UG, clade D) and was recognized by ten hybridomas with V $\beta$  usage V $\beta$  6, 8.1, 8.2, 13, 14 and not determined – among the ND V $\beta$  set, three V $\alpha$ s were identified, V $\alpha$  2, 8, and 11.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and V $\beta$  usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

**HXB2 Location** gp160 (433–447)

**Author Location** Env (gp160) (UG92005)

**Epitope** AMYAPPIAGLIQCSS

**Subtype** D

**Immunogen** vaccine

## HIV Helper/CD4+ T-Cell Epitope Tables

*Vector/Type:* DNA, protein, vaccinia

*Strain:* B clade 1007, D clade UG92005

*HIV component:* Env *Adjuvant:* Complete Freund's Adjuvant (CFA)

**Species (MHC)** mouse (H2b)

**Assay type** Cytokine production, CD4 T-cell Elispot - IFN $\gamma$

**Keywords** vaccine-induced epitopes, variant cross-recognition or cross-neutralization, vaccine antigen design

**References** Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- T-cell hybridoma UGP2-17 was isolated from mice immunized with env sequence UG92005 (clade D), and it recognized the C4/V4 region peptide AMYAPPIAGLIQCSS. The minimal peptide recognized by 10007P3-23 was PPIAGLIQ, which matched only 5/8 residues in the B clade isolate, ppiRgQiK.
- Priming with 1007 and UG env's induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPPIHYCAP, C2, GNIRQAHC-NVSKAKW, V3-C3) Th responses in murine spleen cells.

**HXB2 Location** gp160 (436–451)

**Species (MHC)** guinea pig  
**Keywords** vaccine-specific epitope characteristics, Th1  
**References** Chattergoon *et al.* 2002

- Hartley guinea pigs were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensitivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
- A total of 7 gp120 peptides elicited a delayed type hypersensitivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 0/5 animals vaccinated with rec gp120 responded by DTH to this peptide, while 6/6 vaccinated with plasmid gp120 DNA responded.

**Keywords** HAART, ART, acute/early infection

**References** Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

**Immunogen** HIV-1 infection

**Species (MHC)** human (DR)

**Assay type** Cytokine production, proliferation, CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining

**References** Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
- This peptide showed promiscuous binding to DRB1\*0101, DRB1\*1101, DRB1\*1302, DRB1\*0701, DRB1\*0801 DRB4\*0101 DRB5\*01.

- A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035, to the peptide PKVSFEPPIHYCAP, located in the C2 region of gp120. The only other peptide recognized using Elispot on Env overlapping peptides to test vaccine responses in the mice was this one: TNVPWNASWSNKSLE, located in gp41.

**HXB2 Location** gp160 (606–620)**Author Location** gp41 (UG92005)**Epitope** TNVPWNASWSNKSLE**Immunogen** vaccine*Vector/Type:* DNA, protein, vaccinia*Strain:* B clade 1007, D clade UG92005*HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)**Species (MHC)** mouse (H-2 IA<sup>b</sup>)**Keywords** subtype comparisons, epitope processing, TCR usage**References** Surman *et al.* 2001

- This gp140 epitope of UG92005 (UG, clade D) was recognized by five hybridomas with V $\beta$  usage V $\beta$  8.1, 14 and not determined – one of the V $\beta$  8.1 was shown to utilize V $\alpha$  8.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA<sup>b</sup> transfected L cells as targets and V $\beta$  usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA<sup>b</sup> restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

**Keywords** subtype comparisons, epitope processing, TCR usage

**References** Surman *et al.* 2001

- This gp41 epitope is conserved in 1007 (US, clade B) and UG92005 (UG, clade D) and was recognized by two hybridomas from two different mice that were vaccinated with different clades – the V $\beta$  usage was V $\beta$  4 and 14.
- The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (T[*TN*]VPWNASWSNKSLE and NASWSNKSLEQIWN) – the only difference between 1007 and UG92005 for these two proteins is that 1007 has a T and UG92005 has an N in the second position of the first peptide.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given *i.m.*, 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.

**Keywords** subtype comparisons, responses in children, mother-to-infant transmission  
**References** Kuhn *et al.* 2001a
- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
  - The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
  - 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.

- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

**References** Clerici *et al.* 1993a

- Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activated were infected.
- PBL from 10/21 of the mother showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.

**HXB2 Location** gp160 (827–841)

**Keywords** responses in children, mother-to-infant transmission

**References** Kuhn *et al.* 2001b

- Th proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistence of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retroviral exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrane *et al.*, Lancet 354:2050 (1999)).

- Rabbits were immunized with fowlpox recombinant vectors or expression plasmids, which express either SIVmac239 gag/pol or HIV-1 env 89.6P genes, and then boosted with virus-like particles (VLPs)(gag/pol SIV with HIV env 89.6).
- A lymphoproliferative Th0 profile response and homologous neutralizing Ab were seen in all three groups. The pcDNA3gag/pol SIV construct was more efficient at producing Abs than the fowlpox construct, although the fowlpox env89.6 construct elicited good humoral and cellular responses. VLP boosting was shown to be efficacious; the pseudoviral structure of the VLP providing a more natural protein conformational was considered helpful for eliciting long term memory cells.

**HXB2 Location** Env**Author Location** gp160**Epitope****Subtype** B**Immunogen** HIV-1 infection, vaccine

*Vector/Type:* canarypox prime with gp160 boost *Strain:* B clade MN/LAI-2 *HIV component:* gp160

**Species (MHC)** human**Assay type** proliferation**Keywords** vaccine-specific epitope characteristics, vaccine-induced epitopes**References** Ratto-Kim *et al.* 2003

- The CD4+ T-helper response to vaccinees given ALVAC-HIV(vCP205) alone, rgp160 MN/LAI-2 alone, or the two combined in a prime-boost was investigated by establishing T cell lines and comparing proliferative responses to a series of peptides (15 mers overlapping by 10) spanning autologous gp160 MN/LAI-2. Th responses against Env during natural HIV-1 infection were also studied.

- Broad, strong T-helper responses scattered across the Env were obtained from volunteers who received a prime boost vCP205 + rgp160MN/LAI-2, while those receiving rgp160 responded to fewer peptides, and vCP205 to very few peptides.
- HIV-1 + volunteers had less breadth and amplitude of Th responses than vaccinees that got the prime-boost vaccine, although T-cell lines were readily generated from HIV+ individuals. Some vaccinees targeted C1 and C5, while infected individuals did not, and some infected individuals targeted V3, while vaccinees did not.
- The authors note that the differences in response may be contributed to by the fact the peptides used to screen the responses were the same as the vaccine strain, and different than the strains in the natural infection, but that there also may be real immunological differences in the two scenarios of vaccine versus natural infection.

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Keywords** review, Th1, Th2, immune dysfunction

**References** Becker 2004b

- The review suggests HIV-1 shed gp120 virions can act as an allergen, inducing Th2 cytokine production, in particular IL-4, by Fc epsilon RI+ hematopoietic cells. This could inhibit IgG production and CTL responses, and inactivate Th1 cells. New vaccination strategies employing IL-4 inhibitors and anti-allergen drugs are discussed.

**HXB2 Location** Env

**Epitope**

**Immunogen** HIV-1 infection

**Species (MHC)** human

**Keywords** review, Th1, Th2, immune dysfunction

**References** Becker 2004a

- Review raises the possibility that the switch from Th1 to Th2 activity along with an increase in IL-4 and IgE production in HIV-1 infected patients are an allergic response to HIV-1 protein gp120. Alternative treatments to block Th2 cytokine production, e.g. with IL-4 receptor inhibitors, are discussed.

**Assay type** proliferation, CD8 T-cell Elispot - IFN $\gamma$

**Keywords** HAART, ART, subtype comparisons, supervised treatment interruptions (STI), immunotherapy

**References** Boström *et al.* 2004

- In this study, HIV-infected patients who had previously been immunized with DNA plasmid (nef, tat and rev) or recombinant gp160 were followed longitudinally to determine the impact of HAART on specific T-cell responses. While therapeutic immunizations had transient effects on CD4 cell counts, there was increased survival at 2 years.

- After gp160 vaccination, gp160-specific proliferative CD4+ T cell responses to both baculovirus (MGS HIV-1 rgp 160) and to IMMUNO AG derived gp160 were increased, as well as to p24. Long term HAART treatment was associated with increased IFN- $\gamma$  producing T-cells.
- T-cell proliferative responses to gp160 vaccination were maintained for up to 7 years.

**References** Smith *et al.* 2005

- Macaques were immunized with a clade B HIV vaccine and tested for responses to pools of clade B and A/G Env and Gag peptides. While CD4 responses were more frequent than CD8 responses, higher cross-clade responses were found for CD8 responses. The authors suggest that the better cross-clade reactivity of the CD8 responses reflects the size difference between CD8 and CD4 epitopes; the smaller CD8 epitopes provide a smaller target for mutation.
- All 5 pools of B Env and Gag peptides stimulated CD4 responses, while only 2 pools of A/G peptides stimulated responses, suggesting that 1 or 2 out of 5 CD4 epitopes were cross-reactive.

**References** Sadagopal *et al.* 2005

- 22/23 macaques that were immunized with a DNA prime SHIV-89.6 and boosted with rMVA showed successful control of viremia, with low or undetectable viral loads and normal CD4 counts 200 weeks postchallenge. IFN-gamma producing T cells were found in unexpectedly low breadths and frequencies. T-cell responses were stable over time and maintained their production of IFN-gamma and IL-2. Long-term control was found in macaques of diverse histocompatibility types. The CD8 T cells seemed to have the most impact on well-contained chronic infections in the vaccinated and challenged animals.
- After challenge, vaccinated animals maintained normal levels of CD4 cells, while unvaccinated animals quickly lost CD4 cells. Both CD4 and CD8 responses were found to the SIV Gag and HIV Env proteins; 60% of CD8+ epitopes and 80% of CD4+ epitopes were in p27.

### III-B-18 Nef Helper/CD4+ T-cell epitopes

**HXB2 Location** Nef (1–20)

**Donor MHC** DP4, DQw1, DR1, DRw15(2)  
**Assay type** proliferation  
**Keywords** epitope processing  
**References** Wentworth & Steimer 1994

- Seven CD4+ T-cell clones that proliferated in responses to SF2 Nef were generated *in vitro* by stimulation of PBMC from uninfected donors. These CD4+ clones also had cytotoxic activity.
- These seven clones were capable as of presenting their epitopes to themselves, if Nef peptides were provided.

**HXB2 Location** Nef (65–79)  
**Author Location**  
**Epitope** EVGFVPIQVPLRPM  
**Epitope name** N017  
**Immunogen** HIV-1 infection  
**Species (MHC)** human  
**Country** Canada  
**Assay type** proliferation, Flow cytometric T-cell cytokine assay  
**Keywords** memory cells  
**References** Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- $\gamma$ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- $\gamma$  only-producing cells are short lived.

**Epitope** VGFPVPRQVPLRPMTYKAAVDLS

**Epitope name** HIV-VAX-1062

**Immunogen** HIV-1 infection

**Species (MHC)** human (DRB\*0101)

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$

**Keywords** subtype comparisons, computational epitope prediction, vaccine antigen design

**References** De Groot *et al.* 2005

- 9-mers conserved across clades were analyzed by computer for affinity to DRB\*0101. 23-mers were synthesized based on these predicted epitopes. 19/20 of these 23-mers were confirmed to be immunogenic in US HIV-infected subjects.
- 5/13 US test subjects responded to this 23-mer by CD4 Elispot assay. The core computer-predicted peptide was QVPLRPMTY.

**HXB2 Location** Nef (66–97)

**Author Location** Nef (66–97)

**Epitope** VGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGGL

**Epitope name** Nef-2

**Immunogen** HIV-1 infection

**Species (MHC)** human (DQ)

**Country** France

**Assay type** proliferation

**Keywords** computational epitope prediction, cross-presentation by different HLA

**References** Pancré *et al.* 2007

- Responses to 4 Nef epitopes (3 HLA-DR epitopes selected with TEPITOPE software and 1 HLA-DQ epitope) were evaluated in treatment naïve asymptomatic patients and long term non-progressors. 2 years later, more than half medium- and non-responders followed bi-therapy, while high responders to Nef peptides still were without antiretroviral treatment and conserved stable CD4 counts, indicating that Nef specific CD4+ response is associated with non-progression.
- Proliferative response to Nef epitopes was always associated with high IFN- $\gamma$  secretion.
- VGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGGL was predicted by TEPITOPE to bind HLA DR1, DR3, DR4, DR7, DR11, DR15, DRB5.

**HXB2 Location** Nef (66–97)

**Author Location** Nef (66–97 LAI)

**Epitope** VGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGGL

**Subtype** B

**Immunogen** vaccine

*Vector/Type:* lipopeptide

**Species (MHC)** human

**References** Gahery-Segard *et al.* 2000

- Anti-HIV lipopeptide vaccine consisting of six long peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial.

- A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 5/10 reacted to this Nef peptide.

- 9/12 tested mounted a CTL responses to at least one of the six peptides, each of the six peptides elicited a CTL response in at least one individual.

- 5/12 tested had an IgG response to this peptide.

**HXB2 Location** Nef (73–90)

**Species (MHC)** human

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$ , Intracellular cytokine staining, HLA binding

**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

**Country** United States

**Assay type** CD4 T-cell Elispot - IFN $\gamma$

**Keywords** supervised treatment interruptions (STI), immunodominance

**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN- $\gamma$  EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 25% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The peptides that were recognized by the most people were able to bind broadly to multiple HLA-DR molecules. This peptide showed high cross-reactive binding capacity and bound to 5/8 tested HLA-DR molecules.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

**Assay type** proliferation, Flow cytometric T-cell cytokine assay

**Keywords** memory cells

**References** Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- $\gamma$ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- $\gamma$  only-producing cells are short lived.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)****Keywords** dynamics, rate of progression, escape**References** Bernaschi & Castiglione 2002

- A cellular automata model was used to model the dynamics of HIV-1 infection and progression to disease. The model suggests the long asymptomatic period is due to immune escape mutants with lower viral fitness, and with AIDS resulting from a drastic reduction of the T-helper cell reservoir.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** vaccine**Species (MHC)****Keywords** dynamics, kinetics**References** Altes *et al.* 2002

- This study employs a mathematical model to study the consequences of increasing the T-helper response through a vaccine, which would have counter-balancing effects in a new infection: a more intense response provides more help but also more target cells. The model indicates that if the infecting virus had a low replication rate, then CTLp and CD4 helper cells could control an infection. Only a vaccine that could increase CTL responsiveness could reduce viral set point with observed replication rates.
- A CD4+ T-cell response without maintained CTL response was deleterious in this model.

**HXB2 Location** HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)****Keywords** dynamics, HAART, ART, rate of progression**References** Bajaria *et al.* 2002

- This paper presents a dynamical model of HIV infection and progression that includes CD4 T-cell naive and memory populations distributed between the peripheral blood and the lymph nodes, as well as the effects of HAART. Increasing viral replication and infectivity and decreasing T-cell immunity had impact on the rate of disease progression in this model.

- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses.
- Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays.
- Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivities were observed using the B.AU.AF064676 peptides but not the consensus.

- Using an overlap of 10 or 11 amino acids did not make a difference.

**Species (MHC)** human

**Assay type** Cytokine production

**Keywords** HAART, ART, rate of progression, Th1, Th2

**References** Nunnari *et al.* 2003

- HIV-1 positive patients co-infected the GBV-C, the hepatitis G virus, have a longer survival time to AIDs and higher CD4+ T cell counts than patients that were not infected with GBV-C. GBV-C co-infected patients showed an intact Th-1 profile over time, with high serum levels of IL-2 and IL-12, and diminishing Th-2 responses reflected by lower levels of IL-4 and IL-10. The opposite was true for HIV-1 + patients that were not co-infected with GBV-C.
- AIDs progression is slower in patients infected with both HIV-1 and hepatitis G virus. It is unclear whether Th-2 and Th-1 cytokines in co-infected patients show cause or consequence of slower AIDs progression. CD4+ cells may support hepatitis G replication.

- This study compared vaccinating with Tat alone to vaccinating with Tat+Gag+Env. Rhesus macaques (*Macaca mulatta*) were intramuscularly immunized with a combination of DNA plasmids (HIV-1 IIIB expressing Tat, SHIV-1 89.6P expressing gp120 and SIV mac239 expressing Gag, followed by three boosts with HIV-1 Tat (IIIB) and Env (89.6, gp140) SIV Gag protein. Animals with multi-antigen vaccination had reduced viremia increased CD4+ T-cell counts.

- Tat-Env-Gag immunized animals had weaker Tat-specific Th responses in comparison to animals immunized with Tat alone; but the response to Tat alone was a Th2 response that did not protect from challenge.
- Immunization with Tat-Env-Gag boosted proliferation of Gag-specific IFN- $\gamma$  and IL-2 producing cells in 3/4 animals (Th1 and Th2 responses) and induced a Th2-immune response (IL-2, IL-4) to Env.
- CD4+ T helper responses to Tat-Env-Gag immunization were correlated with control and reduction of viremia, suggesting a combination of Th1 and Th2 vaccine responses to multiple HIV antigens is advantageous.

**Part IV**

# **HIV Antibody Binding Sites**

**B Cell**

## IV-A

# Summary

This part summarizes HIV-specific antibodies (Abs) from the literature arranged sequentially according to the location of their binding domain, organized by protein. We attempted to make this part as comprehensive as possible. For the monoclonal antibodies (MAbs) capable of binding to linear peptides, we require that the binding site be contained within a region of 30 or so amino acids to define the epitope, but not that the precise boundaries be defined. MAbs that do not bind to defined linear peptides are grouped by category at the end of each protein. Antibody categories, for example CD4 binding site (CD4BS) antibodies, are also noted in the index at the beginning of this part. Studies of polyclonal Ab responses are also included. Responses that are just characterized by binding to a protein, with no known specific binding site, are listed at the end of each protein. For more recent updates, epitope sequence alignments, and search capabilities, please see our web site: <http://www.hiv.lanl.gov/content/immunology>.

### IV-A-1 Indices

Three indices are provided. The first provides a concise list of anti-HIV-1 MAbs by cross-competition category, with both discontinuous epitopes (for example, CD4BS) and some well known linear epitopes (for example, cluster I) summarized. The second lists the MAbs' IDs in alphabetical order so one can find their location in the table. The third is a listing by order of appearance in the tables.

### IV-A-2 Tables

Each MAb has a twelve-part basic entry:

**Number:** Order of appearance in this table.

**MAb ID:** The name of the monoclonal antibody with synonyms in parentheses. MAbs often have several names. For example, punctuation can be lost and names are often shortened (M-70 in one paper can be M70 in another). Polyclonal responses are listed as "polyclonal" in this field.

**HXB2 location:** Position of the antibody binding site relative to the viral strain HXB2 (GenBank Accession Number K03455), which is used as a reference strain throughout this publication. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation, the epitope may not actually be

present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: <http://www.hiv.lanl.gov/content/sequence/LOCATE/locate.html>.

**Author location:** The amino acid positions of the epitope boundaries and the reference sequence used to define the epitope are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases, position numbers were provided but the reference sequence identification was not. Because of HIV-1's variability, position numbers require a reference strain to be meaningful. Binding sites that cannot be defined through peptide binding or interference studies are labeled as discontinuous. The approximate location on the protein, sequence number, and reference sequence are listed.

**Sequence:** The amino acid sequence of the binding region of interest, based on the reference strain used in the study defining the binding site. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

**Subtype:** The subtype under study, generally not specified for B subtype.

**Neutralizing:** **L:** neutralizes lab strains. **P:** neutralizes at least some primary isolates. **no:** does not neutralize. No information in this field means that neutralization was either not discussed or unresolved in the primary publications referring to the MAb.

**Immunogen:** The antigenic stimulus of the original B cell response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted, and additional information about the vaccine antigen is provided as available.

**Species (Isotype):** The host in which the antibody was generated, and the isotype of the antibody.

**Research Contact:** Information about who produced an antibody, how to obtain it, or who should receive credit.

**Country:** The country where the samples were obtained; this is generally not specified if the study was conducted in the United States.

**References:** All publications that we could find that refer to the use of a specific monoclonal antibody. First is a list of all references. Additional details for some of the older references can be found in Part V, although we have tried to keep the entries self-contained since 1997.

**Keywords:** Keywords for antibody entries were initiated in 2004. The keywords are listed when available as part of the main entry, and also follow the note in bold type so references pertaining to particular types of studies can be found quickly.

**Notes:** Describe the context of each study, and what was learned about the antibody in the study.

### IV-A-3 HIV protein binding site maps

The names of MAbs and the location of well characterized linear binding sites of 21 amino acids or less are indicated relative to the protein sequences of the HXB2 clone. This map is meant to provide the relative location of epitopes on a given protein, but the HXB2 sequence may not actually bind to the MAb of interest, as it may vary relative to the sequence for which the epitope was defined. Above each linear binding site, the MAb name is given followed by the species in parentheses. Human is represented by 'h', non-human primate by 'p', mouse by 'm', and others by 'o'. More precise species designations for any given MAb can be found using the web search interface or in the tables in this part.

### IV-A-4 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the Ab search tool at <http://www.hiv.lanl.gov/content/immunology>. The master alignment files from which the epitope alignments were created are available at our web site at <http://www.hiv.lanl.gov/content/sequence/NEWALIGN/align.html>.

## IV-C

# HIV Antibodies Tables

All HIV MAbs and polyclonal Abs that bind to linear epitopes 30 amino acids or less in length are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location, then by antibody type, and finally by antibody name. Abs that bind to conformational epitopes or with unknown epitopes are listed at the end of each protein section.

### IV-C-1 Gag p17 Antibodies

#### No. 1

**MAb ID** L14.17

**HXB2 Location** p17 (11–25)

**Author Location** p17 (11–25 BRU)

**Epitope** GELDRWEKIRLRPGG

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* viral lysate *Strain:* B clade BRU *HIV component:* HIV-1

**Species (Isotype)** mouse (IgG)

**References** Robert-Hebmann *et al.* 1992a; Robert-Hebmann *et al.* 1992b; Tatsumi *et al.* 1990

#### No. 2

**MAb ID** polyclonal

**HXB2 Location** p17 (11–25)

**Author Location** p17 (11–25 LAI)

**Epitope** GELDRWEKIRLRPGG

**Subtype** B

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* protein, virus-like particle (VLP) *Strain:* B clade LAI *HIV component:* Gag, p17 Gag, p24 Gag *Adjuvant:* Complete Freund's Adjuvant (CFA)

**Species (Isotype)** mouse

**References** Truong *et al.* 1997

- An ELISA assay was used to study a panel of Gag peptides – mature p24 CA epitopes mapped to residues 176–192, 201–218, 233–253, 285–304, and were recognized by antibodies elicited by rp24CA – one p17MA epitope, residues 11–25, and one p24CA epitope, residues 176–192, were recognized by antibodies raised against anti-p55 virus-like particles, suggesting a different antigenic properties for p24CA and p17MA antibodies depending on whether they are produced against the mature soluble protein or the immature assembled form of the gag proteins. Truong *et al.* [1997]

#### No. 3

**MAb ID** 32/5.8.42

**HXB2 Location** p17 (12–19)

**Author Location** p17 (12–19 IIIB)

**Epitope** ELDRWEKI+ALDKIE

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* viral lysate

**Species (Isotype)** mouse (IgG)

**References** Papsidero *et al.* 1989

- 32/5.8.42: Binds to two discontinuous regions, positions 12–19 and 100–105, peptides ELDRWEKI and ALDKIE – inhibited infectivity of cell free virus. Papsidero *et al.* [1989]

#### No. 4

**MAb ID** 32/5.8.42

**HXB2 Location** p17 (12–19)

**Author Location** p17 (IIIB)

**Epitope** ELDRWEKI+ALDKIE

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* viral lysate *HIV component:* HIV-1

**Species (Isotype)** mouse (IgG)

**References** Papsidero *et al.* 1989

- 32/5.8.42: Inhibited infectivity of cell free virus – bound to two peptides, ELDRWEKI and ALDKIE, at positions 12–19 + 100–105. Papsidero *et al.* [1989]

#### No. 5

**MAb ID** HyHIV-1

**HXB2 Location** p17 (12–29)

**Author Location** p17 (12–29 JMH1)

**Epitope** ELDKWEKIRLRPGGKTLTLY

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* protein *HIV component:* p17 Gag

**Species (Isotype)** mouse (IgG1)

**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-1: This paper compares the results of affinity constant ( $K_a$ ) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

#### No. 6

**MAb ID** HyHIV-2

**HXB2 Location** p17 (12–29)

**Author Location** p17 (12–29 JMH1)

**Epitope** ELDKWEKIRLRPGGKTLTLY

**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17  
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-2: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 7

**MAb ID** HyHIV-3**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLTY**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17  
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-3: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 8

**MAb ID** HyHIV-4**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLTY?**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17  
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-4: epitope uncertain, based on the best estimate from JMH1 sequence– Ka is  $1.8 \times 10^7$  M<sup>-1</sup> for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface. Ota *et al.* [1998]
- HyHIV-4: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 9

**MAb ID** HyHIV-5**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLTY**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17  
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-5: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 10

**MAb ID** HyHIV-6**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLTY**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17  
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-6: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 11

**MAb ID** 32/1.24.89**HXB2 Location** p17 (17–22)**Author Location** p17 (17–22 IIIB)**Epitope** EKIRLR**Neutralizing** L**Immunogen** vaccine*Vector/Type:* viral lysate**Species (Isotype)** mouse (IgG)**References** Papsidero *et al.* 1989

- 32/1.24.89: Inhibited infectivity of cell free virus. Papsidero *et al.* [1989]

No. 12

**MAb ID** 3B10**HXB2 Location** p17 (19–38)**Author Location** p17 (19–38 SIVmac)**Epitope** IRLPGGKKKYM LKHVVWAA**Neutralizing** no**Immunogen** vaccine*Vector/Type:* inactivated *HIV Strain:*  
B clade AGM TYO-7 *HIV component:*  
HIV-1**Species (Isotype)** mouse (IgG1)**References** Otteken *et al.* 1992

- 3B10: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H), SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one conserved immunogenic epitope recognized serologically. Otteken *et al.* [1992]

No. 13

**MAb ID** 3E11

**HXB2 Location** p17 (19–38)

**Author Location** p17 (19–38 SIVmac)

**Epitope** IRLPGGKKKYMLKHVVAA

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* inactivated HIV *Strain:* B clade AGM TYO-7 *HIV component:* HIV-1

**Species (Isotype)** mouse (IgG1)

**References** Nilsen *et al.* 1996; Otteken *et al.* 1992

- 3E11: There is another MAb with this ID that recognizes integrase. Nilsen *et al.* [1996]
- 3E11: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H), SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one highly conserved immunogenic epitope. Otteken *et al.* [1992]

No. 14

**MAb ID** polyclonal

**HXB2 Location** p17 (25–34)

**Author Location** Gag

**Epitope** GKTHYMINPL

**Neutralizing**

**Immunogen** vaccine

*Vector/Type:* peptide *HIV component:* Env, Gag, Nef, Pol

**Species (Isotype)** rabbit

**References** Li *et al.* 2005

**Keywords** mimics

- In early HIV-1 infection, patients develop autoimmune thrombocytopenia, with Ab directed against beta3 integrin, GPIIIa49-66. Panning with a 7-mer phage display library using rabbit anti-GPIIIa49-66 (CAPESIEFPVSEARVLED), the immunodominant epitope of the identified potential molecular mimicry epitopes with HIV-1 Env (sklFDeGLFn, elfnk-TIIFP), Pol (geAPEFPskq), Gag (gktHyMINPI) and Nef (qeeeeVgFPVt, qeeeeVgFPVt, edeGigFPVr, fklVPVSEae, ssnTPTTNa) proteins. Pools of these peptides elicited Ab in rabbits that induce platelet oxidation in vitro and thrombocytopenia in vivo upon passive transfer. Nef (qeeeeVgFPVt), Gag (gktHyMINPI), and Nef (fklVPVSEae) all overlap with known HIV-1 epitopes. Li *et al.* [2005] (**mimics**)

No. 15

**MAb ID** 8H10

**HXB2 Location** p17 (30–52)

**Author Location** p17 (30–52 JMH1)

**Epitope** KLKHIVWASRELERFAVNPGLLE

**Neutralizing**

**Immunogen** vaccine

*Vector/Type:* peptide *Strain:* B clade JMH-1 *HIV component:* p17 Gag *Adjuvant:* BSA

**Species (Isotype)** mouse (IgM)

**References** Ota & Ueda 1999; Ota *et al.* 1999

- 8H10: The p17 MAb also can bind to the V3 loop. Ota *et al.* [1999]
- 8H10: Inhibits viral replication of the HIV-1 infected MT-4 cells by decreasing p17 DNA levels in the infected cells, and the effect of growing the 8H10 hybridoma in co-culture with HIV-1 infected MT-4 cells was studied. Ota & Ueda [1999]

No. 16

**MAb ID** HyHIV-21

**HXB2 Location** p17 (30–52)

**Author Location** p17 (30–52 JMH1)

**Epitope** KLKHIIWASRELERFAVNPGLLE

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* protein *HIV component:* p17 Gag

**Species (Isotype)** mouse (IgG2a)

**References** Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-21: epitope uncertain, based on the best estimate from JMH1 sequence – Ka is  $3.6 \times 10^6$  M<sup>-1</sup> for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface –inhibited growth of HIV-1 JMH1 in MT-4 cells when added 24 hours after the initial culture. Ota *et al.* [1998]

No. 17

**MAb ID** B4f8

**HXB2 Location** p17 (51–65)

**Author Location** p17 (51–65)

**Epitope** LETSEGCRQILGQLQ

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1

**Species (Isotype)** rat (IgG2a)

**References** Shang *et al.* 1991

- -B4f8: Did not bind live infected cells, only cells that had been made permeable with acetone. Shang *et al.* [1991]

No. 18

**MAb ID** HyHIV-22

**HXB2 Location** p17 (52–83)

**Author Location** p17 (53–87 JMH1)

**Epitope** ETSEGCRQILGQRQPSLQGTGSEELRSYNTIH

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* protein *HIV component:* p17 Gag

**Species (Isotype)** mouse (IgG1)

**References** Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-22: epitope uncertain, based on the best estimate from JMH1 sequence – stains the surface of infected cells indicating the antigen is exposed at the cell surface – Ka is  $2.3 \times 10^5$  M<sup>-1</sup> for rec p17. Ota *et al.* [1998]

**No. 19**  
**MAb ID** 12H-D3b3  
**HXB2 Location** p17 (62–78)  
**Author Location** p17 (62–78)  
**Epitope** GQLQPSLQTGSEELRSL  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* HIV infected-cell lysate  
*Strain:* B clade IIIB *HIV component:* HIV-1

## IV-C-4 Gag p24-p2p7p1p6 Antibodies

**No.** 120  
**MAb ID** LH-104-G  
**HXB2 Location** p24-p2p7p1p6 (231–5)  
**Author Location** p24 (363–368 BRU)  
**Epitope** LAEAMS  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* peptide *Strain:* B clade BRU  
**Species (Isotype)** mouse (IgG1κ)  
**References** Haaheim *et al.* 1991  
 • LH-104-G database comment: This epitope overlaps the p24-p2 cleavage site.  
 • LH-104-G: UK Medical Research Council AIDS reagent: ARP320.  
 • LH-104-G: Reacts with both p24 and p55, in contrast to LH-104-I. Haaheim *et al.* [1991]

## IV-C-5 Gag p2p7p1p6 Antibodies

**No.** 121  
**MAb ID** i5B11  
**HXB2 Location** p2p7p1p6 (19–28)  
**Author Location** p7 (5–14)  
**Epitope** NFRNQRKIVK  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* protein *HIV component:* p7 Gag  
**Species (Isotype)** rat (IgG2a)  
**References** Tanchou *et al.* 1995; Tanchou *et al.* 1994; Otake *et al.* 1994  
 • i5B11 database comment: i5B11 and 15B11 may be two names for the same MAb.  
 • i5B11: MAb reacts with NCp7, NCp15, and partially inhibits NCp7-tRNA interaction. Tanchou *et al.* [1995]  
 • i5B11: Epitope mapped by ELISA and BIAcore – inhibits NCp7 primer tRNA binding. Tanchou *et al.* [1994]

**No.** 122  
**MAb ID** EC6  
**HXB2 Location** p2p7p1p6 (45–54)  
**Author Location** p15 (408–417 HXB2)  
**Epitope** PRKKGCKWCKG  
**Subtype** B  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* protein *HIV component:* p24-p15 Gag  
**Species (Isotype)** mouse (IgG2aκ)  
**References** Hinkula *et al.* 1990  
 • EC6: Epitope defined by peptide blocking of binding to native protein – WB reactive with p53. Hinkula *et al.* [1990]

**No.** 123  
**MAb ID** M12  
**HXB2 Location** p2p7p1p6 (45–54)  
**Author Location** p15 (408–417 HXB2)

**Epitope** PRKKGCKWCKG  
**Subtype** B  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* protein *HIV component:* p24-p15 Gag  
**Species (Isotype)** mouse (IgG1κ)  
**References** Hinkula *et al.* 1990  
 • M12 database comment: There is a p15 and a gp120 mouse MAb both called M12 and a human gp41 Fab M12.  
 • M12: Epitope defined by peptide blocking of binding to native protein – WB reactive with p53. Hinkula *et al.* [1990]

**No.** 124  
**MAb ID** DG8  
**HXB2 Location** p2p7p1p6 (66–81)  
**Author Location** p7 (52–67)  
**Epitope** RQANFLGKIWPSYKGR  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* protein *HIV component:* p7 Gag  
**Species (Isotype)** mouse  
**References** Tanchou *et al.* 1995  
 • DG8: Binds proximal to the second zinc-finger, inhibits NCp7-tRNA interaction. Tanchou *et al.* [1995]

**No.** 125  
**MAb ID** EB5  
**HXB2 Location** p2p7p1p6 (66–81)  
**Author Location** p7 (52–67)  
**Epitope** RQANFLGKIWPSYKGR  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* protein *HIV component:* p7 Gag  
**Species (Isotype)** mouse  
**References** Tanchou *et al.* 1995  
 • EB5: Binds proximal to the second zinc-finger – mutation at position 59 (Lys to Ser) results in 10-fold reduction in reactivity. Tanchou *et al.* [1995]

**No.** 126  
**MAb ID** HH3  
**HXB2 Location** p2p7p1p6 (66–81)  
**Author Location** p7 (52–67)  
**Epitope** RQANFLGKIWPSYKGR  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* protein *HIV component:* p7 Gag  
**Species (Isotype)** mouse (IgG2b)  
**References** Tanchou *et al.* 1995; Tanchou *et al.* 1994  
 • HH3: Binds proximal to the second zinc-finger. Tanchou *et al.* [1995]  
 • HH3: Epitopes mapped by ELISA and BIAcore – does not inhibit NCp7 primer tRNA binding. Tanchou *et al.* [1994]

**No.** 127  
**MAb ID** AD2

**HXB2 Location** p2p7p1p6 (78–86)  
**Author Location** p7 (64–72)  
**Epitope** YKGRPGNFL  
**Neutralizing** no

#### IV-C-6 Gag Antibodies

**No.** 135  
**MAb ID** 16/4/2  
**HXB2 Location** Gag  
**Author Location** p24  
**Epitope**  
**Neutralizing** no  
**Immunogen** vaccine  
*Vector/Type:* DNA with CMV promotor,  
 DNA with CMV/MCK hybrid promotor,  
 DNA with MCK promotor  
**Species (Isotype)**  
**References** Bojak *et al.* 2002a

- 16/4/2: The ability of three different promoters to induce Gag specific immune responses was compared. The cytomegalovirus (CMV) early gene promoter, which allows constitutive expression in different cells of host tissue, the tissue specific muscle creatine kinase (MCK) promoter, which may be restricted to differentiated, multinucleated myofibers and so safer, and a hybrid MCK/CMV promoter – intramuscular immunization of BALB/c mice utilizing the MCK promoter in combination with a codon optimized gag gene generated humoral (IgG1 (Th1) and IgG2a (Th2)) and CTL immune responses against HIV-1 Gag, however, the quantified immune parameters were clearly reduced as compared to CMV promoter-driven Gag expression. Immunogen HIV-1 infection

Species (Isotype) human

References Montefiori *et al.* 2001

- In 7/9 patients in whom HAART was initiated during early seroconversion, NAbs to autologous strains were not found immediately following treatment interruption after 1-3 years, and Env and Gag Abs were low or undetected by ELISA indicating, that early HAART suppresses the normal antibody response to HIV-1, presumably by limiting the concentration of viral antigens needed to drive B-cell maturation – in 3 patients with a viral rebound autologous NAbs rapidly appeared and correlated with spontaneous down-regulation of viremia – prolonged control of viremia after stopping treatment persisted in the absence of detectable NAbs, suggesting that cellular immune responses alone can control viremia under certain circumstances – these results support the notion that virus-specific B-cell priming, combined with CD8+ CTL induction, may be beneficial for HIV-1 vaccines that aim to suppress viremia in the absence of complete protection to prevent disease and reduce the rate of virus transmission. **References** Otten *et al.* 2003

- This study evaluates different vaccine technologies that avoid live vectors including plasmid DNA, recombinant p55Gag protein or gag-pol administered by polylactide coglycolide (PLG) microparticles, LTK63 as adjuvant, VLP, and plasmid DNA. 4/4 macaques primed with Gag-PLG and LTK63 showed strong antibody responses after the fourth immunization at week six. The best CTL responses were found for gag DNA, the best Th and Ab were obtained using Gag protein on PLG microparticles; Gag DNA priming with a PLG-protein boost gave high level CTL, Th and Ab responses. Otten *et al.* [2003]

**Species (Isotype)** human

**References** Barin *et al.* 2005

**Keywords** acute/early infection, assay development

- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLGIWGCSGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. This assay can be

used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development, acute/early infection**)

- Addition of non-immunogenic side chains (AAAC and CAAA) to both N- and C-termini of synthetic alpha helical peptide sequences of HIV-1 p24 and p17 proteins improved Ab reactivity. As diminishing response to these antigens is a harbinger of progression these peptides may be useful in diagnostic assays. Lottersberger *et al.* [2004]

**Keywords** genital and mucosal immunity, mucosal immunity

- BALB/c mice were immunized with DNA plasmid and PEI/DNA complexes and boosted with recombinant TianTan vaccinia virus (rTTV) expressing HIV-1 Gag. PEI is polyethylenimine, a polymer with the high cationic charge density. HIV-specific IgG Abs in sera were comparable between DNA and PEI/DNA immunized mice. However, PEI/DNA stimulated significantly higher IgA responses than DNA alone in different mucosal secretions, both with or without rTTV boosting. Intramuscular rTTV boosting enhanced Ab immune responses raised by intranasal priming. Huang *et al.* [2007b] (**genital and mucosal immunity, mucosal immunity**)

- DNA antigen encoding Gag as a chimera with the mouse and human lysosome-associated membrane protein (mLAMP/gag and hLAMP/gag) was used in immunization studies in mice and macaques. IgG responses in mice immunized with hLAMP/gag were considerably greater than the response to the mLAMP/gag. Strong HIV-specific IgG response was also observed in hLAMP/gag immunized macaques, which increased after each DNA immunization. Significant Gag-specific IgA levels were detected in 3 of 5 immunized macaques. Serum samples from the macaques recognized 13 of 49 20-aa Gag peptides covering Gag sequence indicating broad B-cell response. Chikhlikar *et al.* [2006] (**vaccine antigen design**)

- 1E8: Inhibits RT activity, binding site overlaps with two AZT resistance mutations. Wu *et al.* [1993]

**No.** 186

**MAb ID** polyclonal

**HXB2 Location** RT (249–263)

**Author Location** RT (249–263)

**Epitope** KDSWTVNDIQKLVGK

**Neutralizing**

**Immunogen** vaccine, *in vitro* stimulation or selection

*Vector/Type:* peptide presented on icosahedral protein scaffold *HIV component:* RT  
*Adjuvant:* Incomplete Freund's Adjuvant (IFA)

**Species (Isotype)** human (IgG)

**Ab Type** gp120 C2

**References** Domingo *et al.* 2003

**Keywords** vaccine antigen design

- A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from *Bacillus stearothermophilus* has been engineered to display 60 copies of one or more epitopes on a single molecule. An E2DISP scaffold which displayed pep23, a 15-residue B and T helper HIV-1 RT epitope elicited a pep23-specific T-helper response *in vitro*. The E2DISP scaffold displaying peptide RT2, which is a CTL HIV-1 RT epitope, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to both the class I and class II processing pathways. The Th response in vaccinated mice supported Pep23-specific IgG responses. - 4D6: This MAb inhibits end processing and DNA joining, and reduces reintegration activity. Nilsen *et al.* [1996]
- 4D6: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

**No.** 215

**MAb ID** 7-16 (7-19)

**HXB2 Location** Integrase (50–159)

**Author Location** Integrase (50–159 HXB2)

**Epitope**

**Subtype** B

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* chimeric maltose binding protein (MBP) *Strain:* B clade IIIB *HIV component:* Int

**Species (Isotype)** mouse (IgG2b)

**Ab Type** Integrase catalytic core

**Research Contact** Yoshihiro Kitamura, Div of Mol Genetics, Nat Inst of Infectious Diseases, Musashimurayama, Japan

**References** Ishikawa *et al.* 1999

- 7-16: Binds to the central catalytic domain – the paper seems to sometimes call this antibody 7-16, sometimes 7-19, a possible typo. Ishikawa *et al.* [1999]

**No.** 216

**MAb ID** 4F6

**HXB2 Location** Integrase (56–102)

**Author Location** Integrase (56–102 HXB2)

**Epitope** CSPGIWQLDCTHLEGGKLVILVAVHVASGYIEAE-VIPAETGQETAYFLL

**Subtype** B

**Neutralizing** no

**Immunogen** vaccine

*Vector/Type:* protein *Strain:* B clade HXB2  
*HIV component:* Int

**Species (Isotype)** mouse (IgG1κ)

**Ab Type** Integrase catalytic core

**References** Nilsen *et al.* 1996; Haugan *et al.* 1995

- 4F6: MAb binding had minimal effects on IN *in vitro* activities. Nilsen *et al.* [1996]
- 4F6: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

**No.** 217

**MAb ID** anti-K159

**HXB2 Location** Integrase (151–163)

**Author Location** Integrase (163–175)

**Epitope** VESMNKELKKIIG

**Neutralizing**

**Immunogen** vaccine

*Vector/Type:* peptide *HIV component:* Int

**Species (Isotype)** rabbit (IgG)

**References** Maksutov *et al.* 2002; Maroun *et al.* 1999

- anti-K159: This epitope is similar to a fragment of the human protein Apoptosis regulator BCL-W (KIAA0271), ESNVKE-MEPLVGQV. Maksutov *et al.* [2002]
- anti-K159: Both the peptide K159, SQGVVESMNKELKKI-IGQVRDQAEHLKTA, and the Abs raised against this peptide inhibit Integrase activity – K159 was found to fulfill condition of minimal number of helical heptads to achieve the formation of a stable coiled-coil structure – Integrase is proposed to function as a dimer interacting in this region. Maroun *et al.* [1999]

**No.** 218

**Keywords** acute/early infection, assay development

- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLGIWGC-SGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. Integrase antibodies are among the last to appear after infection. This assay can be used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development, acute/early infection**)

**Keywords** antibody binding site definition and exposure, computational epitope prediction, mimotopes, structure

- 33: Called Fab33. A new computer program designed to recognize conformational epitopes in 3D structures that correspond to linear peptide mimotopes (3DEX) was tested using the known conformational epitope of this Fab. 223F, 224R, 226Y, 244K, 267I, and 268I, previously defined as the epitope from NMR structural studies (Yi2002) were confirmed, along with two additional amino acids, (A265 and K266). Schreiber *et al.* [2005] (**antibody binding site definition and exposure, mimotopes, computational epitope prediction, structure**)
- 33: Called mAb33 – mAb33 and mAb32 compete for binding to the C-term domain of Integrase – while mAb32 only weakly inhibits IN activity, mAb33 inhibits strongly, mAb32 has a lower affinity than mAb33, and Fab32 does not inhibit at all while Fab33 inhibits catalytic activity and DNA binding – heteronuclear NMR indicated eight residues of Integrase are immobilized upon Fab33 binding, two in the core of the protein, and 6 on the outer face that form a contiguous patch likely to contain the epitope – 223F, 224R, 226Y, 244K, 267I, and 268I, which may be a useful target for drug design – the Fab33-IN complex is far more soluble than IN alone and may be useful for crystallization. Yi *et al.* [2002] (**antibody binding site definition and exposure**)
- 33: Limited proteolysis combined with mass spectrometric analysis were used to define the binding site for Fab32, but Fab33 binding to the Integrase C-term domain left it resistant to proteolytic digestion. Yi & Skalka [2000]

- 33: Used for the creation of single chain variable antibody fragments (SFVs) for internal cellular expression – neutralization of IN activity prior to integration, whether the Ab is expressed in the nucleolus or the cytoplasm – relative binding affinity to IN: 12 > 17 = 33 > 21 > 4. Levy-Mintz *et al.* [1996]
- 33: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – MAbs 32 and 33 form a competition group. Bizub-Bender *et al.* [1994]

#### IV-C-12 Vpr Antibodies

- No.** 264  
**MAb ID** polyclonal  
**HXB2 Location** Vpr  
**Author Location** Vpr (89.6)  
**Epitope**  
**Subtype** B  
**Neutralizing**  
**Immunogen** HIV-1 infection  
**Species (Isotype)** human (IgG)  
**References** Richardson *et al.* 2003  
**Keywords** rate of progression
- Serum samples were obtained from the French GRIV (genetic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses, as both may contribute as extracellular proteins to pathogenesis. Serum anti-Vpr IgG responses were significantly higher in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) and unstable non-progressors (declined during a 20 month follow up), than fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). Serum anti-Tat IgG was found to be significantly higher in stable non-progressors compared to unstable non-progressors and fast progressors indicating that higher levels of serum anti-Tat IgG are associated with maintenance of non-progression status. Richardson *et al.* [2003] (**rate of progression**)

#### IV-C-13 Tat Antibodies

- No.** 265  
**MAb ID** polyclonal  
**HXB2 Location** Tat (1–15)  
**Author Location** Tat (1–15 89.6)  
**Epitope** MEPVDRPLEPWKHPG  
**Subtype** B  
**Neutralizing**  
**Immunogen** vaccine

*Vector/Type:* protein *Strain:* B clade 89.6, B clade HXBc2 *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

**Species (Isotype)** macaque (IgG)

**Ab Type** C-term, N-term, Tat basic region

**References** Silvera *et al.* 2002

**Keywords** antibody binding site definition and exposure, vaccine antigen design

- Anti-Tat and Tat toxoid responses were raised in rhesus macaques using HxBc2 and 89.6P Tat, and Tat toxoids. High anti-Tat IgG responses were observed in all animals, and helper responses were detected in 8/16, and IFN gamma CTL in 11/16. Ab and proliferative responses were observed, and the truncated 86 amino acid IIIIB Tat was more immunogenic than the full 102 amino acid Tat. Tat vaccinated animals when challenged with SHIV89.6 were infected despite a robust immune response. The most consistent reactions to the vaccinations were to peptides in regions: N-term, 1-15 (MEPVDPRLEPWKHPG), basic domain 46-60 (SYGRKKRRQR-RRAHQ), and 61-91, particularly C-term 76-90 (QPRGDPT-GPKQKKK). **Immunogen** vaccine

*Vector/Type:* protein *Strain:* B clade IIIIB *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), macrophage activating lipopeptide-2 (MALP-2)

**Species (Isotype)** mouse (IgA, IgG)

**References** Borsutzky *et al.* 2003

**Keywords** adjuvant comparison, genital and mucosal immunity, immunodominance, mucosal immunity, Th1, Th2, vaccine-induced epitopes

- Intranasal immunization of BALB/c mice Tat with MALP-2 induced stronger immune responses than i.p. vaccination of Tat with IFA. Also i.n. MALP-2 vaccination favored Th1 responses, while i.p. IFA favored Th2. Ab, T help and CTL responses were observed. MALP-2 enhanced Tat-specific IgA responses in the lung and in the genital tract. Three linear Ab epitopes were recognized. The most frequent response (80% of vaginal lavage, 100% of sera and lung lavage) was to Tat peptide 1-20. The second strongest to Tat 46-60 (20% of vaginal lavage, 50% of lung lavage, 50% of sera). Finally, 50% of the sera of Tat+ IFA i.p. immunized mice recognized Tat 73-86. - Intramuscular injection of Tat-toxoid induced high titers of anti-Tat reactivity in serum samples of six HIV-1 positive and of four HIV negative study subjects. Anti-Tat antibodies successfully blocked extracellular Tat from transactivating HIV Tat-sensitive promoters. The anti-Tat IgG response in sera from two healthy and HIV infected patients inhibited cell entry of synthetic Tat, thus blocking its functional activity. Additionally, the anti-Tat antibodies inhibited intercellular Tat transfer as demonstrated by a co-culture cell system. All HIV-1 infected patients had Ab responses to the N-term region of Tat, and 4/4 HIV-1 + and 5/6 HIV-1 negative patients responded to the basic domain. Several additional peptides were recognized either exclusively or more commonly in the HIV+ people. The N-terminus region of Tat mediates binding to CD26, that may be involved in modulation of chemokine function, and may also mediate T-cell apoptosis. - Intranasal immunization of BALB/c mice with Tat and e.coli heat-labile enterotoxin (LT) and non-toxic LT-R72 LT induced strong antigen-specific IgG Abs which remained stable for one year. Tat-specific IgA responses were measured in vaginal and intestinal secretions. Immunization of BALB/c mice with native Tat (aa1-86) induced serum IgG directed against an immunodominant epitope (aa1-20) and against a second epitope (aa 46-60). CTL responses were also observed. Anti-Tat serum Abs neutralized Tat activity in a dose-independent manner. C57BL/6 remained unresponsive to Tat immunizations when Tat was co-administered with LT or cholera toxin (CT) as adjuvant; BALB/c mice are H-2d, C57BL/6 are H-2b. Congenic BALB.C mice that express H-2b rather than H-2d also could not respond to Tat, suggesting the response to Tat is constrained by the haplotype. **Keywords** immunotherapy, rate of progression

- Comparing 67 fast progressors with 182 non-progressors in the GRIV cohort, only anti-Tat Ab levels, not Abs to Env, Gag, or Nef, were correlated as a serological indicator of rate of progression. This suggests that raising Tat Abs may be beneficial as immunotherapy or in a vaccine. Zagury *et al.* [1998] (**immunotherapy, rate of progression**)

- Serum samples were obtained from the French GRIV (genetic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses as both may contribute as extracellular proteins to pathogenesis. Serum anti-Tat IgG responses were significantly higher and maintained for up to 20 months in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) compared to unstable non-progressors and fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). Anti-Tat IgG from GRIV stable non-progressors recognized linear epitopes located within the N-terminal, basic and the C-terminal domains of Tat. Humoral responses of fast-progressors and of one unstable non-progressor were restricted to the basic region of Tat. Tat toxoid vaccinees from Milan tended to recognize N-terminal and C-terminal domains. Sera from some GRIV and Tat toxoid vaccinees cross-reacted in an ELISA assay with a truncated 89.6 S/HIV 89.6P Tat, 89.6P Tat, HIV-1 subtype E (CMU08) and with SIV-mac251 Tat (one sample). - Anti-Tat responses were raised in rhesus macaques using IIIB Tat, SHIV89.6P Tat, carboxymethylated Tat and 89.6P Tat toxoids. Tat IgG responses to the vaccine were cross-reactive with subtype E and MAC 251. Ab and proliferative responses were observed, and the truncated 86 amino acid IIIB Tat was more immunogenic than the full 102 amino acid Tat. Tat vaccinated animals when challenged with SHIV89.6 were infected despite a robust immune response and were not distinguishable from controls. - Vaccinia p14 can elicit NABs and p39 tends to be immunodominant, so these two proteins were fused to regions of HIV-1 Env – reduced glycosylation was noted when p14 or p39 was placed in the N-term region of the fusion protein – chimeric proteins shifted the Env Ab response from V3 to either a C1 or C4 domain, depending on the construct – all chimeric Env proteins: 14kEnv, 39kEnv, and Env39k elicited a strong Ab response to the C1 region of gp120 (LFCASDAKAYDTEVHNVWAT), and Env39k mounted a strong response to the C4 region (KAMYAPPISGQIRCSSNITG) Collado *et al.* [2000]

- 133/237: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 133/237. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 133/237: The relative affinity, denatured/native gp120 is 1.4 – mutation of position 69 W/L impairs binding. Moore *et al.* [1994c]
- 133/237: Region of overlap for reactive peptides is WATHA – weak neutralization of lab strains. Niedrig *et al.* [1992b]

**Keywords** vaccine antigen design

- 133/290: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)

- 133/290: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 133/290: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 133/290: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. Wyatt *et al.* [1997]
- 133/290: Reciprocal binding inhibition with the antibody 522-149, that binds to a discontinuous epitope – binding is enhanced by some C5 and C1 binding site antibodies. Moore & Sodroski [1996]
- 133/290: Used for antigen capture assay, either to bind gp120 to the ELISA plate, or to quantify bound gp120. Wyatt *et al.* [1995]
- 133/290: The relative affinity for denatured/native gp120 is 2.2 – mutation in position 69 W/L impairs binding. Moore *et al.* [1994c]
- 133/290: Region of overlap for reactive peptides is WATHA – weak neutralization of lab strains. Niedrig *et al.* [1992b]

- C6: NIH AIDS Research and Reference Reagent Program: 810.
- C6: Called Ch6 – binds to gp120 but not to infected cells – when linked to ricin A, the immunotoxin did not mediate cell killing – sCD4 has no effect. Pincus & McClure [1993]; Pincus *et al.* [1996]
- C6: C1 region – epitope boundaries mapped by peptide scanning, FNMW core. Abacioglu *et al.* [1994]
- C6: The relative affinity for denatured/native gp120 is 0.9. Moore *et al.* [1994c]

- CA13: MRC Centralized Facility for AIDS Reagents, NIBSC, UK, ARP3119.
- CA13: The MAb CA13 binds to the conserved C1 epitope EDIISLW and was used in conjunction with MAb 221, a MAb that binds to the gp120 C-terminal end, to explore the composition and stability of a highly stable trimeric rgp140 derived from a HIV-1 subtype D isolate containing intermonomer V3-derived disulfide bonds and lacking gp120/gp41 proteolytic processing. The stability of the trimer indicates it may be a good candidate for structural studies. Billington *et al.* [2007]

- CA13: This Ab did not inhibit HIV-1 BaL replication in macrophages. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- CA13: HIV-1 fusion complexes were prepared from cell lines expressing R5 HIV-1 gp120/gp41 and CD4-CCR5. Neutralizing Abs were raised against both R5 (strain BaL) and X4 (strain 213) viruses. CA13 was used to detect gp120/gp41. Zipeto *et al.* [2005] (**vaccine antigen design**)
- CA13: A set of oligomeric envelope proteins were made from six primary isolates for potential use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. CA13 is a MAb that binds to a linear epitope in the C13 region of gp120 that was raised against clade A variant 92/UG/029. C13 bound to antigens from all clades A-F, as well as group O. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. Jeffs *et al.* [2004] (**vaccine antigen design, subtype comparisons**)

References Yang *et al.* 2000; Kropelin *et al.* 1998; Binley*et al.* 1998; Binley *et al.* 1997a; Trkola *et al.*1996a; Moore & Sodroski 1996; Moore *et al.*1994d; Moore *et al.* 1994c; Niedrig *et al.*

1992b

- 135/9: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 135/9: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 135/9: Noted to bind to C1 peptide HEDIISLWDQSLK – blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) Kropelin *et al.* [1998]
- 135/9: Binding is enhanced by some anti-C1 and anti-C5 antibodies – enhances binding of some anti-V3, anti-C4 and anti-V2 MAbs – 135/9 binds to predicted alpha-helix in C1. Moore & Sodroski [1996]
- 135/9: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 135/9: The relative affinity for denatured/native gp120 is 15 – mutation 113 D/R impairs binding to native and denatured, 113 D/A only to denatured. Moore *et al.* [1994c]
- 135/9: Substitutions 106 E/A, 113 D/A or R, and 117 K/W impair binding, some substitutions enhance binding. Moore *et al.* [1994d]
- 135/9: Defines the epitope as gp120(114-123) MHEDIISLWD (core LWD?) – weak neutralization of lab strain. Niedrig *et al.* [1992b]

**Keywords** antibody binding site definition and exposure, antibody generation, review, variant cross-recognition or cross-neutralization

- 82D3/C3: In an extensive review of gp120 binding MAbs in this database, V1-specific MAbs are noted to be unusual, but in one study transgenic mouse immunization with SF162 yielded ten V1 MAbs with highly strain-specific autologous NAb responses, and V1 was immunodominant. Human MAbs to V1 may be difficult to isolate due to selection with heterologous strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
- 82D3/C3: Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2kappa MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with HIV SF162 gp120 – several of the MAbs obtained were effective at neutralizing the autologous strain – C-term-V1- region was immunodominant in these mice and the ten V1-specific MAbs could potentially neutralize autologous strain SF162 but were highly type specific. He *et al.* [2002] (**antibody binding site definition and exposure, antibody generation**)

**Keywords** ADCC, antibody binding site definition and exposure, co-receptor, dendritic cells, enhancing activity, neutralization, review, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 697D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 697-D: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V2 MAb 697-D did not bind to mCHO and had diminished binding to GDMR, while V2 MAb 8.22.2 bound to GDMR but not mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design, vaccine-specific epitope characteristics**)
- 697-D: In a review of Envelope binding MAbs in this database, V2-specific MAbs are noted to have some ability to neutralize HIV-1, but generally weak with limited cross-reactivity; it weakly neutralizes some primary but not TCLA strains. 697-D is the best characterized of the anti-V2 MAbs, and binds weakly and sporadically to isolates from clades A-D. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review, subtype comparisons**)
- 697-D: Called 697D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels

of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)

- 697-D: Called 697D – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A, 4117C and 697D were used as controls. He *et al.* [2002]
- 697-D: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIR-LKVQK. Maksiutov *et al.* [2002]
- 697-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V2 MAbs 697-D, 1357 and 1361 favored the monomer by approximately 2 fold. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 697-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V2 MAb 697-D did not effect proliferation. Hioe *et al.* [2000]
- 697-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 anti-V2 MAbs, which showed weak and sporadic binding, with the most frequent binding to C and D clades. Nyambi *et al.* [2000] (**subtype comparisons**)
- 697-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – V2 Abs 697-D, 1361, and 1357 tended to bind weakly with a similar pattern of specificity to virions, and bound well to soluble gp120: weak binding to 1/4 B clade viruses (CA5), and weak binding to viruses from subtype A and D. Nyambi *et al.* [1998] (**subtype comparisons**)
- 697-D: Called 697-30D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998] (**variant cross-recognition or cross-neutralization**)
- 697-D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 697-D bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 697-D: Does not neutralize TCLA strains but neutralizes some primary isolates weakly. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 697-D: Partial inhibition of gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor**)
- 697-D: Not neutralizing, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC, enhancing activity**)

- 697-D: Review: called 697/30D – neutralizes some primary, but not lab adapted strains. Moore & Ho [1995] (**variant cross-recognition or cross-neutralization, review**)
- 697-D: Conformational with weak reactivity to V2 peptide ISTSIRGKVQKEYAFFYKLD – neutralized 3/4 primary isolates, but none of 4 lab strains – V2 substitutions 176/177 FY/AT, 179/180 LD/DL, 183/184 PI/SG, and 192-194 YSL/GSS abrogate binding – anti-C4 MAb G3-536 and G45-60 enhance binding – mild oxidation of carbohydrate moieties inhibits binding. Gorny *et al.* [1994] (**antibody binding site definition and exposure**)

- C108G: Position 167 in V2 dictates the specificities of three type-specific neutralizing MAbs that bind to an otherwise relatively conserved epitope in involving V2: 2909, C108g, and 10/76b. Introduction of D167G mutation in YU2 Env resulted in significant neutralization by C108G. Removing of glycan at position N131 and V1 glycosylation site 140 resulted in increase in sensitivity to C108G. On the other hand, eliminating the glycan at position 160 in V2 in conjunction with V1 glycan and D167G mutations resulted in large decrease in sensitivity to C108, indicating that the glycan in this position is an important component of the C108G epitope. Honnen *et al.*

[2007] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)

- C108G: This MAb is type-specific and neutralizes BaL and HXB2. It is the most potent anti-V2 MAb, is glycan dependent, and contrary to earlier reports requires disulfide bonds. Neutralization by C108g is not mediated by CD4 or CCR5 receptor blockage on the cell surface. Binding to CD4 was inhibited by b12, but not by C108g. Binding to CCR5 was completely inhibited by two V3 MAbs, 4117C and 2219, and was substantially inhibited by 2G12, but was not inhibited by C108g. JR-FL is a neutralization resistant strain; modification of JRFL at positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potentially neutralize the modified JR-FL. The MAb 10/76b, that binds to a linear V2 epitope that is unaffected by deglycosylation or reduction eliminating disulfide bonds, could only weakly neutralize this modified JR-FL. Similarly SF162 substitutions in the neutralization sensitive virus SF162 GVK->NMK (167-169) plus the glycosylation site at 160, created a G108g neutralization sensitive virus. In contrast, 10/76b binds to the NMK substituted variant, but addition of the glycosylation site inhibited binding. Pinter *et al.* [2005] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- C108G: This MAb is unusual among V2-directed MAbs. It is glycan dependent and can neutralize both a primary isolate (BaL and a TCLA (IIIB) strain. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure, review**)
- C108G: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – C108G bound and directed lysis against only IIIB – this is first demonstration of ADCC directed by a V2 specific MAb. Alsmadi & Tilley [1998] (**ADCC, variant cross-recognition or cross-neutralization**)
- C108G: Inhibits HX10 binding to both CD4 positive and negative HeLa cells. Mondor *et al.* [1998]
- C108G: Viral binding inhibition by C108G was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- C108G: Synergistic neutralization of HIV-1 when combined with anti-V3 MAbs 0.5beta and C311E, or anti-CD4BS MAbs, 1125H and 5145A – neutralization further enhanced by presence of both 1125H and 0.5beta. Warrier *et al.* [1996] (**antibody interactions**)
- C108G: Characterization of MAb variable region. Warrier *et al.* [1995] (**antibody sequence variable domain**)
- C108G: Strain specificity: LAI, BaL, HXB2 – conformational character – glycosylation site at 160 critical – mutation of conserved glycosylation site at 156 increased epitope exposure. Wu *et al.* [1995] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- C108G: Chimps were infected with HIV-1 IIIB, and this high affinity MAb was obtained from an Epstein-Barr virus transformed B-cell line. It gave potent neutralization of HIV-1 IIIB. Binding was not affected by reduction of disulfide bonds. Binding was disrupted by removal of N-linked glycans. The peptide binds with lower affinity than glycosylated Env. Warrier *et al.* [1994] (**antibody binding site definition and exposure, antibody generation**)

**Keywords** antibody binding site definition and exposure, antibody generation, neutralization, review, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 8.22.2: This Ab was used to help define the antigenic profile of envelopes used in serum depletion experiments to attempt to define the neutralizing specificities of broadly cross-reactive neutralizing serum. This Ab bound to JR-FL and JR-CSF gp120 monomers but not to core JR-CSF gp120 monomer used in the same experiments. V1, V2, and V3 specificities did not contribute to the broadly neutralizing capability of sera from 3 (2 B clade, 1 A clade) HIV infected individuals. Dhillon *et al.* [2007] (**antibody binding site definition and exposure, neutralization**)
- 8.22.2: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V2 MAb 697-D did not bind to mCHO and had diminished binding to GDMR, while V2 MAb 8.22.2 bound to GDMR but not mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design, vaccine-specific epitope characteristics**)
- 8.22.2: This broad review of anti-Envelope MAbs notes that V2 MAbs are generally weakly neutralizing at best, and somewhat strain specific. 8.22.2 weakly neutralizes SF162. Gorny & Zolla-Pazner [2004] (**review**)
- 8.22.2: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 8.22.2. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 8.22.2: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neutralization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three anti-V2 MAb were tested – 8.22.2 weakly neutralized SF162, and did not neutralize JRFL at all. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 8.22.2 : Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2κ MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with

- HIV SF162 gp120 – several of the MAbs obtained were effective at neutralizing the autologous strain – 8.22.2 was the only V2-specific MAb created and it could cross-compete with MAb 697D – 8.22.2 could cross-react with BaL and JR-FL, two B clade R5 strains, but not B clade X4 or E clade viruses, and it could weakly neutralize autologous strain SF162. He *et al.* [2002] (**antibody binding site definition and exposure, antibody generation, variant cross-recognition or cross-neutralization, subtype comparisons**)
- 8.22.2: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIR-LKVQK. Maksutov *et al.* [2002]

**Keywords** antibody interactions, vaccine antigen design

- G3-136: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- G3-136: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V2 MAb used. Zwick *et al.* [2003] (**antibody interactions**)
- G3-136: Called G3.136 – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000]
- G3-136: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- G3-136: Called G3.136 – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998]
- G3-136: Called G3.136 – does not mediate gp120 virion dissociation in contrast to anti-V2 MAb G3-4 – not neutralizing for SF162 or SF128A in either primary macrophages or PBMC. Stamatatos *et al.* [1997]
- G3-136: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997]
- G3-136: Described epitope as STSIRGKVQKEYAFFYKLDI – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT123 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. Poignard *et al.* [1996a]
- G3-136: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes cell free Hx10. Sattentau & Moore [1995]

- G3-136: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V2 loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a – anti-V2 MAbs G3-4 and G3.136 don't bind to T-cell tropic SF2. Stamatatos & Cheng-Mayer [1995]
- G3-136: HIV-1 RF V2 substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity. Yoshiyama *et al.* [1994]
- G3-136: Conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
- G3-136: Marginal binding to peptide, binding inhibited by 183/184 PI/SG substitution. Moore *et al.* [1993a]
- G3-136: Binding enhanced by selected antibodies to C1, C4, C5, V3 and anti-CD4 binding site MAbs – enhances binding of selected V3, C4 and anti-CD4 binding site MAbs. Moore *et al.* [1993a]
- G3-136: V2 region – binds and neutralizes IIIB and RF in CEM-SS cells, but not MN – neutralization activity against a few primary isolates in PBMC – sCD4 binding inhibits binding (contrast with BAT085) – deglycosylation or reduction of gp120 by DTT diminishes reactivity. Fung *et al.* [1992]

Keywords antibody binding site definition and exposure, antibody interactions, vaccine antigen design

- G3-4: 2909 is a human anti-Env NAb that was selected by neutralization assay and binds to the quaternary structure on the intact virion. G3-4 was used as a positive control for defining the binding properties of 2909. Gorny *et al.* [2005]
- G3-4: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The SF2 and all five glycan mutants were resistant to G3-4. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure, vaccine antigen design**)
- G3-4: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including G3-4. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- G3-4: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- G3-4: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V2 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- G3-4: Called G3.4 – Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – G3.4 recognized o-gp140. Srivastava *et al.* [2002]
- G3-4: Called G3.4 – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutral-

- ization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000]
- G3-4: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
  - G3-4: Called G3.4 – Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998]
  - G3-4: Called G3.4 – mediates gp120 virion dissociation in contrast to anti-V2 MAb G3-136 – not neutralizing for SF162 or SF128A in either primary macrophages or PBMC. Stamatatos *et al.* [1997]
  - G3-4: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997]
  - G3-4: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – deletion of the V3 loop from gp120 results in more potent G3-4 binding inhibition by CRDS – G3-4 epitope described as 176-184 FYKLDIPI and 191-193 YSL. Jagodzinski *et al.* [1996]
  - G3-4: Binding enhanced by selected antibodies to C1, C4, C5, V3 and anti-CD4 binding site MAbs – enhances binding of selected V3, C4 and anti-CD4 binding site MAbs. Moore & Sodroski [1996]
  - G3-4: Described epitope as STSIRGKVKEYAFFYKLDI – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT085 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. Pognard *et al.* [1996a]
  - G3-4: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes Hx10 cell-free virus. Sattentau & Moore [1995]
  - G3-4: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V2 loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a – anti-V2 MAbs G3-4 and G3.136 don't bind to T-cell tropic SF2. Stamatatos & Cheng-Mayer [1995]
  - G3-4: Reactive with BH10, RF, and MN – binds native, but not denatured or deglycosylated gp120, binds to deglycosylated V1V2 fusion protein, suggesting importance of glycans outside the V1V2 region. Wu *et al.* [1995]
  - G3-4: Weakly neutralizing, IC 50 = 53 mug/ml. Gorny *et al.* [1994]
  - G3-4: Conformationally sensitive – sporadic cross-reactivity among, and outside, B clade gp120s. Moore *et al.* [1994b]
  - G3-4: gp41 mutation (582 A/T) that reduces neutralization of anti-CD4 binding site MAbs does not alter G3-4s ability to neutralize. Thali *et al.* [1994]
  - G3-4: Neutralizes RF – substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity and result in neutralization escape. Yoshiyama *et al.* [1994]
  - G3-4: Conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
  - G3-4: V2 region, marginal binding to peptide, binding inhibited by 183/184 PI/SG substitution. Moore *et al.* [1993a]
  - G3-4: Increased binding in the presence of sCD4. Sattentau *et al.* [1993]
  - G3-4: Substitutions in residues 176 to 184 affect MAb recognition – substitutions in V2 can result in gp120-gp41 dissociation. Sullivan *et al.* [1993]
  - G3-4: Neutralizes IIIB and RF, not MN – blocks sCD4-gp120, not as potent as MAb 15e – V2 binding MAbs BAT085 and G3-136 block G3-4 gp120 binding – sensitive to reduction of gp120 by DTT. Ho *et al.* [1992]
  - G3-4: Binding is sensitive to removal of glycans by endo H – 50% neutralization of 4/9 primary isolates – has conformational features. Ho *et al.* [1991a]

- BAT085: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
  - BAT085: Binding is blocked by other V2 region antibodies, enhanced by several anti-C1 MAbs, and anti-V3 MAb G511 – reciprocal enhancement of CD4i MAb 48d binding. Moore & Sodroski [1996]
  - BAT085: Epitope suggested to be QKEYAFFYKLD – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT123 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. Pognard *et al.* [1996a]

- BAT085: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes cell free Hx10. Sattentau & Moore [1995]
- BAT085: HXB10 strain specificity – binds native, deglycosylated, or denatured gp120. Wu *et al.* [1995]
- BAT085: Multi-lab study for antibody characterization and assay comparison – did not bind MN or SF2. D'Souza *et al.* [1994]
- BAT085: Interacts with two overlapping peptides with region of overlap KEYAFFYKLD. Gorny *et al.* [1994]
- BAT085: Neutralizes RF – substitution 177 Y/H in the V2 loop of RF does not inhibit neutralization, in contrast to MAbs G3-4 and SC258. Yoshizawa *et al.* [1994]
- BAT085: Called BAT-85 – conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
- BAT085: 7/8 V2 murine MAbs required gp120 native structure to bind, but BAT085 was the exception – type-specific. Moore *et al.* [1993a]
- BAT085: Peptide affinities of G3-136 and G3-4 are 100-fold less than BAT085, but BAT085 has lower affinity for BH10 gp120 and is weaker at neutralization. Moore *et al.* [1993a]
- BAT085: V2 region – sCD4 does not block – neutralizes IIIB and some primary isolates, but not MN or RF – binds MN – deglycosylation or DDT reduction of gp120 does not diminish reactivity. Fung *et al.* [1992]

No. 418

MAB ID 1006-30-D

HXB2 Location gp160 (236–245)

Author Location gp120 (241–251)

Epitope KGSKKNVSTV

Neutralizing

Immunogen

Species (Isotype) human (IgG1 $\lambda$ )

Ab Type gp120 C2

References Nyambi *et al.* 2000; Hioe *et al.* 2000

- 1006-30-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – C2 MAbs 1006-30-D and 847-D did not effect proliferation. Hioe *et al.* [2000]
- 847-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including two C2 MAbs – the binding of anti-C2 MAbs was weak to isolates from clades B, C, D, E, F, G, and they did not bind to isolates from subtypes A and H – epitope is suggested to be in a 20 amino acid peptide KGSKKNVSTVQCTHGIRPVV. Nyambi *et al.* [2000]

**Keywords** antibody binding site definition and exposure

- IIIB-V3-21: UK Medical Research Council AIDS reagent: ARP3048.
- IIIB-V3-21: NIH AIDS Research and Reference Reagent Program: 1725.
- IIIB-V3-21: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin, but anti-V3 MAb IIIB-V3-21 was not decreased in either case. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- IIIB-V3-21: This epitope is similar to a fragment of the FasI receptor precursor (Apptosis-mediating surface antigen fas) (APO- 1 antigen) (CD95 antigen), VEINCTRQN. Maksutov *et al.* [2002]
- IIIB-V3-21: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- IIIB-V3-21: Does not block HIV-1 LAI binding or entry into CEM cells. Valenzuela *et al.* [1998]
- IIIB-V3-21: Binds to NP40 treated gp120, and epitope is probably obscured by local glycosylation. Laman *et al.* [1993]
- IIIB-V3-21: Binds to the base of the V3 loop on denatured gp120. Laman *et al.* [1992]

**References** He *et al.* 2003

**Keywords** antibody binding site definition and exposure, vaccine antigen design

- 168B8: Vaccination of a gp120-CD4 fusion complex in six transgenic XMG2 XenoMouse mice that produce human IgG2 with K light chain did not produce any neutralizing antibodies. 36/39 MAbs derived from one of these mice were in one of two competition groups that were conformational and specific for the complex, suggesting this chimeric vaccine may be of little value, as immunodominant responses are to epitopes unique to the complex, not present in native Env. This MAb is one of the 3/36 non-neutralizing MAbs that bound to linear epitopes on gp120. He *et al.* [2003] (**antibody binding site definition and exposure, vaccine antigen design**)

- 1334-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1334-D: Called 1334. V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using HIV451 gp120. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 1334-D: Called 1334 – binds to V3 peptides from MN, SF2, NY5, RF, and CDC4 strains as well as x-reactivity with peptides from A, C, D, F, G, and H subtypes – was suggested to be IgG1λ here – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and

C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization, subtype comparisons**)

- 1334-D: Called 1334D – A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1334D showed intermediate cross-reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1334-D: This MAb was selected using oligomeric gp160 from HIV451. Zolla-Pazner *et al.* [1999a] (**antibody generation**)
- 1334-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)

- 1324-E: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1324-E: Called 1324E – A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1324E showed poor cross-reactivity, and was the only MAb tested that was derived from a non-B clade infected patient, an E clade infection was the source of 1324E. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1324-E: E clade stimulated MAb did not cross-react with B clade peptides nor did B clade derived peptides with an E clade V3 loop, but both E and B clade stimulated Abs can cross-react with some peptides from other clades – this Ab showed strong binding to several E, A and F peptides, one C peptide, and no reactivity with B peptides and most D peptides. Zolla-Pazner *et al.* [1999a] (**subtype comparisons**)

- 1324-E: MAb reacted with peptides from E clade, while B clade derived MAbs could not. Zolla-Pazner *et al.* [1999b] (**subtype comparisons**)
- 1324-E: A human MAb was derived from an HIV-1 E clade infection from a US service man who had served in Thailand, selected with the consensus V3 peptide from clade E – cross-reactive with V3 peptides, and gp120 from E, C and A clades, as well as cells infected with a C-clade primary isolate, but not with B and D clade V3 peptides or rgp120 – neutralizes E clade virus adapted for growth in H9 cells, but not 5 primary E clade isolates, including the autologous isolate – kinetic parameters were measured, 1324E was comparable to 447-52D. Gorny *et al.* [1998] (**antibody generation, variant cross-recognition or cross-neutralization, subtype comparisons**)

Keywords antibody binding site definition and exposure, antibody generation, subtype comparisons, variant cross-recognition or cross-neutralization

- D19: The epitope for D19 is conserved and embedded in V3. D19 is unique because for R5 viruses, it was cryptic and did not bind without exposure to sCD4, but for X4 and R5X4 isolates it was constitutively exposed. It had a similar overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity; D19 binding to monomeric gp120 was independent of sCD4, the dependence was only seen in the context of native oligomeric Env. D19 reacted with 23/29 B clade Envs, but to only 2/14 viruses from other clades: one A and one F, but no C, D or E clade strains. D19 can neutralize X4 and R5X4 isolates, but could only neutralize R5 isolates in the presence of sCD4. The authors suggest that a more exposed V3 loop may facilitate CXCR4 coreceptor usage, but that this phenotype is limited *in vivo* by neutralizing antibodies until the onset of progressive disease. - 412-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 412-D: Called 412: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)

- 412-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 412-D showed limited reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 412-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
- 412-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 412-D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 412-D has a relatively fast dissociation, thus low affinity among V3 MAbs. Gorny *et al.* [1998] (**kinetics**)
- 412-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 412-D was bound only to B clade virions and to D clade MAL. Nyambi *et al.* [1998] (**subtype comparisons**)
- 412-D: Called 412 – The tip of the V3 loop was presented in a mucin backbone – higher valency correlates with higher affinity constant. Fontenot *et al.* [1995] (**vaccine antigen design, binding affinity**)
- 412-D: Called 412-10D – relatively rapid dissociation and weak homologous neutralization. VanCott *et al.* [1994] (**binding affinity**)
- 412-D: Neutralizes MN, does not bind SF2 or HXB2 – not reactive with hexa or heptapeptides by Pepsan. Gorny *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- 412-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. Spear *et al.* [1993] (**complement**)

  - 257-D IV: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
  - 257-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
  - 257-D: Called 257: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not show as much ability to neutralize as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 257 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
  - 257-D: Called ARP3023: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. Vella *et al.* [2002] (**assay development**)
  - 257-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
  - 257-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001]
  - 257-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 257-D showed intermediate reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
  - 257-D: Called 257D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
  - 257-D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 257-D bound rgp120 W61D but could only neutralize the W61D isolate following T-cell line adaptation. Beddows *et al.* [1999] (**vaccine antigen design, variant cross-recognition or cross-neutralization, vaccine-specific epitope characteristics**)
  - 257-D: Study of a live-vector mucosal vaccine that expresses HIV-1 V3 domains using the bacterium *Streptococcus gordonii* which can express heterologous Ag and can colonize the oral cavity and vagina of mice – 268-D and 257-D recognized *S. gordonii* expressing the V3 domain of MN – the vaccine stimulated V3-specific IgG2a in mice. Oggioni *et al.* [1999] (**vaccine antigen design**)
  - 257-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
  - 257-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
  - 257-D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 257-D has a slow dissociation, thus the highest affinity among V3 MAbs. Gorny *et al.* [1998] (**kinetics, binding affinity**)
  - 257-D: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. LaCasse *et al.* [1998] (**co-receptor, variant cross-recognition or cross-neutralization**)
  - 257-D: Called 257D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V3 MAbs 391-95D or 257D. Stamatatos & Cheng-Mayer [1998] (**vaccine antigen design, subtype comparisons**)

- 257-D: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. Yang *et al.* [1998] (**assay development**)
  - 257-D: Called 257 – gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. Hill *et al.* [1997] (**antibody binding site definition and exposure, co-receptor**)
  - 257-D: Neutralized (>90%) an SI-env chimeric virus and enhanced (>200%) an NSI-env chimeric virus. Schutten *et al.* [1997] (**enhancing activity, variant cross-recognition or cross-neutralization**)
  - 257-D: Binds less extensively than MAb 391-95D on the surface of HIV-1 isolates SF162 and SF128A – neutralizes less potently than 391-95D – stronger neutralization of primary macrophage targets than PBMC. Stamatatos *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
  - 257-D: IIIB neutralizing MAbs *in vitro* fail to neutralize in a mouse model *in vivo*. Schutten *et al.* [1996]
  - 257-D: 257-D is V H5 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisniewski *et al.* [1996] (**antibody sequence variable domain**)
  - 257-D: Called 257-D-IV – could neutralize MN and closely related JRCSF, but not 2 B subtype and 1 D subtype primary isolates in a multi-laboratory study involving 11 labs. D'Souza *et al.* [1995] (**variant cross-recognition or cross-neutralization, subtype comparisons**)
  - 257-D: Only inhibition of SI phenotype virus, and strong enhancement of NSI phenotype chimeric viruses, that incorporated different envs from the same donor. Schutten *et al.* [1995a] (**enhancing activity, variant cross-recognition or cross-neutralization**)
  - 257-D: Comparable affinity for SI and NSI viruses, in contrast to MAb MN215. Schutten *et al.* [1995b] (**variant cross-recognition or cross-neutralization**)
  - 257-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 better revealed this V3 epitope on TCLA SF2 and dual tropic (MU3) viruses than on macrophage tropic isolates. Stamatatos & Cheng-Mayer [1995] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
  - 257-D: In serotyping study using flow-cytometry, bound only to virus with KRIHI. Zolla-Pazner *et al.* [1995] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
  - 257-D: Included a multi-lab study for antibody characterization and assay comparison – best NAb against MN, but not IIIB. D'Souza *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
  - 257-D: Potent MN neutralization, slow dissociation constant. VanCott *et al.* [1994] (**binding affinity**)
  - 257-D: Additive MN or SF2 neutralization when combined with CD4 binding site MAb F105 – does not neutralize RF. Cavacini *et al.* [1993a] (**antibody interactions, variant cross-recognition or cross-neutralization**)
  - 257-D: Neutralizes MN – binds SF2: epitope KSIYI – specificity: MN, SF2, NY5, RF. Gorny *et al.* [1993] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
  - 257-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG – complement mediated virolysis of MN, but not in the presence of sCD4. Spear *et al.* [1993] (**complement**)
  - 257-D: Reacts with MN, NY5, CDC4 and SF2, does not cross-react with RF, WM52, or HXB2. Karwowska *et al.* [1992b] (**variant cross-recognition or cross-neutralization**)
  - 257-D: Called 257-2-D-IV – potent neutralizing MAb. D'Souza *et al.* [1991]

- 311-11-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
  - 311-11-D: Called 311: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not neutralize as well as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 311 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
  - 311-11-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most

cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 311-11-D showed weak reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)

**Keywords** acute/early infection, antibody binding site definition and exposure, co-receptor, dendritic cells, enhancing activity, neutralization, review, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- 391-D: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 391/95-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MABs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 391/95-D: Called 391/95: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MABs selected using V3 peptides do not show as much ability to neutralize as V3 MABs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 391/95 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 391/95-D: Sera from two HIV+ people and a panel of MABs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of any of the five glycans, within the V3 loop (GM299 V3), C2 (GM292 C2), C3 (GM329 C3), C4 (GM438 C4), or V5 (GM454 V5) made SF162 become sensitive to 391/95-D; SF162 is resistant to 391/95-D neutralization. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure, vaccine antigen design**)
- 391/95-D: The affect of Ab binding on infectivity was studied by pseudotyping three related envs with different phenotypes – R5 viruses were preferentially enhanced, not X4 – the V3 region was the main determinant of Ab-mediated enhancement and modulation of the interaction between CCR5 and gp120 is critical – tests with MABs anti-V3 391/95-D and CD4BS-specific GP68 indicate that Ab specificity did not determine whether or not infectivity was enhanced or neutralized, rather the phenotype was determined by Env conformation. Guillon *et al.* [2002b] (**co-receptor, enhancing activity**)
- 391/95-D: The phenotype and genotype of viral env sequences were studied over a period of seroconversion in one individual – Env trans-complementation demonstrated infectivity

ity of clones derived pre-seroconversion were not influenced by MAb 391/95-D, but post-seroconversion clones were enhanced in the presence of 391/95-D, although the V3 binding region was unchanged – a change in the CD4-binding site was observed (NL43 427 Glu→Lys) to be present in the post-seroconversion 391/95-D enhanced clone (see Guillon *et al.* [2002b]) Lawson *et al.* [2002]. Guillon *et al.* [2002b]; Lawson *et al.* [2002] (**enhancing activity, acute/early infection**)

- 391/95-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- 391/95-D: Called 391-95D – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and Ig-GCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000] (**antibody binding site definition and exposure**)
- 391/95-D: Called 391/95D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000] (**antibody binding site definition and exposure**)
- 391/95-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
- 391/95-D: Called 391.5 – MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 391/95-D: Called 391-95D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V3 MAbs 391-95D or 257D. Stamatatos &

Cheng-Mayer [1998] (**antibody binding site definition and exposure, subtype comparisons**)

- 391/95-D: Called 391-95D – binds more extensively than MAb 257-D on the surface of HIV-1 isolates SF162 and SF128A – neutralizes more potently than 257-D – stronger neutralization of primary macrophage targets than PBMC – binding post-gp120-sCD4 association related to anti-V3 Abs neutralizing capacity. Stamatatos *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 391/95-D: Competition ELISAs with serial deletions estimated the epitope to be KRIHIGPGRAFY – unconstrained peptide had higher affinity than cyclic. Seligman *et al.* [1996] (**antibody binding site definition and exposure**)
- 391/95-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 better revealed this V3 epitope on macrophage tropic and dual tropic (MU3) viruses, but not in TCLA SF2. Stamatatos & Cheng-Mayer [1995] (**antibody binding site definition and exposure**)
- 391/95-D: Neutralizes MN – binds to SF2, not IIIB. Gorny *et al.* [1993]

**Keywords** antibody binding site definition and exposure, antibody generation, binding affinity, enhancing activity, review, variant cross-recognition or cross-neutralization

- DO124-10: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. DO124-10 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
- D0124-10: Called D0124. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- DO142-10: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different that Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs

and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**variant cross-recognition or cross-neutralization, binding affinity**)

- DO124-10: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab Ab fragment DO124-10 also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism – while DO124-10 enhances YU2 entry 6-fold, it neutralizes HXBc2 under identical conditions. Sullivan *et al.* [1998a] (**enhancing activity, variant cross-recognition or cross-neutralization**)
- DO142-10: Phage expression libraries panned against MN peptide were used to select Fab DO142-10 – Fab binds MN gp120, but not a primary isolate rec gp120. Ditzel *et al.* [1997] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- DO142-10: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- DO142-10: Binds to gp120 MN and an MN V3 peptide with equal affinity, but binds a consensus B peptide and JRCSF less well, and to IIB gp120 not at all. Parren & Burton [1997] (**variant cross-recognition or cross-neutralization, binding affinity**)
- DO142-10: Fab fragment – competition ELISAs with serial deletions defined the epitope KRIHIGPGRAFYTT. Seligman *et al.* [1996] (**antibody binding site definition and exposure, antibody generation**)

- SF162ΔV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization – when incorporated into a codon-optimized DNA vaccine with a CMV promoter, delivered by gene gun, SF162Δ2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162ΔV2, but not intactSF162, was used as the immunogen – NAb titers specific for SF162 increased with multiple immunizations, while titers for non-homologous isolates decreased, but anti-V3 peptide binding Abs were not likely the source of this distinction because anti-V3 titers were much lower than those against the entire envelope, and the second booster immunization did not increase the titer of anti-V3 loop Abs. Barnett *et al.* [2001]

- 50.1: NIH AIDS Research and Reference Reagent Program: 1289.
- 50.1: Called R/V3-50.1 – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 50.1: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make

- them more susceptible to NAbs alters some step after binding – the dissociation constant,  $K_d$  of 50.1 for the cell associated primary and TCLA Envs was equal, 7nM. York *et al.* [2001]
- 50.1: Called R/V3-50.1 – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MABs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MABs against gp120 by causing conformational changes – 50.1 could only neutralize the sensitive form. Park *et al.* [2000]
  - 50.1: The crystal structure of V3 loop peptides bound to Fabs was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different Fabs were bound. Stanfield *et al.* [1999]
  - 50.1: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MABs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. LaCasse *et al.* [1998]
  - 50.1: Binds to 6/7 isolates from breakthrough cases from a MN gp120 vaccine trial. Berman *et al.* [1997]
  - 50.1: Competition ELISAs with serial deletions produced comparable estimate of epitope length to crystal structure and alanine substitution – KRIHIGP. Seligman *et al.* [1996]
  - 50.1: Used to monitor HIV-1 Env expression in infected H9 cells. VanCott *et al.* [1995]
  - 50.1: No neutralization of primary isolate JR-CSF – greater affinity for and neutralization of T cell tropic strain T-CSF, derived from JR-CSF. Bou-Habib *et al.* [1994]
  - 50.1: Shows modest cross-reactivity among B clade gp120s, little outside B clade. Moore *et al.* [1994b]
  - 50.1: Chimeric MN V3 loop in an HXB2 background allows increased FACS signal, Ab affinity, and viral neutralization. Robert-Guroff *et al.* [1994]
  - 50.1: Potent MN neutralization, slow dissociation rate. VanCott *et al.* [1994]
  - 50.1: Crystal structure of a 24 amino acid peptide from the V3 loop bound to 59.1 and 50.1 Fab fragments – epitope KRIHIGP. Ghiara *et al.* [1993]
  - 50.1: No synergistic neutralization of MN when combined with CD4BS MAB F105 – isotype stated to be IgG2a. Potts *et al.* [1993]
  - 50.1: Crystal structure of V3 loop bound to 50.1 – light chain binds just to the left of GPG, heavy chain binds further to the left. Rini *et al.* [1993]
  - 50.1: Epitope defined by peptide reactivity and changes affinity with amino acid substitutions – epitope RIHIGP. White-Scharf *et al.* [1993]
  - 50.1: Called R/V3-50.1 – potent neutralizing of lab strains. D'Souza *et al.* [1991]

References Gauduin *et al.* 1998; Parren *et al.* 1998a; Andrus *et al.* 1998; Poignard *et al.* 1996a; Sattentau & Moore 1995; Gauduin *et al.* 1995; Pirofski *et al.* 1993; Thali *et al.* 1993; Safrit *et al.* 1993; Moore & Ho 1993; Fung *et al.* 1990; Liou *et al.* 1989; Fung *et al.* 1987

- BAT123: Post-exposure prophylaxis was effective when MAB 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAB BAT123 that could protect delivered 4 hours post infection. Andrus *et al.* [1998]
- BAT123: Post-exposure passive transfer of murine BAT123 can confer protection to hu-PBL-SCID mice challenged with HIV-1 LAI – this protection is not elicited by CGP 47 439, a BAT123 chimera that has a human IgG1 Fc domain, suggesting that the protection is mediated by complement – the protective ability of BAT123 is lost when mice were treated with cobra venom factor, which inactivates serum complement – IgG1 does not fix complement efficiently so an IgG2 MAB might perform better. Gauduin *et al.* [1998]
- BAT123: The MAB and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]

- BAT123: Epitope described as RGPGRAFVTIGK – V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus (BAT123 less so than the others), mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. Poignard *et al.* [1996a]
  - BAT123: Passive transfer of BAT123 to hu-PBL-SCID mice 1 hour prior to inoculation with HIV-1 LAI, or up to four hours post-exposure, could protect mice from infection – the protection, like the MAb, was specific for the viral strain LAI. Gauduin *et al.* [1995]
  - BAT123: Binds with high affinity to monomer and oligomer, rapid association and potent neutralization of lab strain. Sattentau & Moore [1995]
  - BAT123: Called BAT-123 – conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120 – does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
  - BAT123: Variable region sequenced – heavy chain: V 3660-SB32, D unknown, J H3 – light chain: V kappa21, J kappa2. Pirofski *et al.* [1993]
  - BAT123: Passive transfer to Hu-PBS-SCID mice confers protection against challenge with homologous cell-free virus. Safrit *et al.* [1993]
  - BAT123: Anti-idiotypic MAb, AB19-4i, stimulates anti-anti-ID which neutralizes MN and IIIB. Fung *et al.* [1990]
  - BAT123: CGP 47 439 is a BAT123 chimera that has a human IgG1 Fc domain. Liou *et al.* [1989]

- Keywords** antibody binding site definition and exposure, antibody generation, review, subtype comparisons, variant cross-recognition or cross-neutralization
- 838-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
  - 838-D: Called 838: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
  - 838-D: Called 838 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS), 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
  - 838-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
  - 838-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
  - 838-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 838-D showed intermediate reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
  - 838-D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed strong binding to many A, B, C and F peptides, poor binding to D and E. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
  - 838-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
  - 838-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 838-D bound B clade virions but had limited cross-reactivity with other clades, with low levels of binding to A and D virions. Nyambi *et al.* [1998] (**subtype comparisons**)

- 838-D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 838-D was cross-reactive with V3 peptides from clade A and C, and could bind to 5/8 B clade V3 peptides – 50% neutralization of RF was obtained. Gorny *et al.* [1997] (**antibody generation, variant cross-recognition or cross-neutralization, subtype comparisons**)
- 838-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. **Keywords** antibody binding site definition and exposure, antibody generation, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 1006-15D: The neutralization potency of this Ab against 7 HIV-1 primary isolates was compared to the neutralization potency of the Ab KD-247. Same Ab concentrations were needed for neutralization of the N-NIID and 92TH022 isolates, while higher concentrations of 1006-15D were needed for the neutralization of the rest of the HIV-1 isolates suggesting 1006-15D has lower neutralization potency. Eda *et al.* [2006b] (**variant cross-recognition or cross-neutralization**)
- 1006-15D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1006-15D: Called 1006-15: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and

affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)

- 1006-15D: Called 1006 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 1006-15D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1006-15D showed strong cross-reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1006-15D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed strong binding to several B and F peptides, one C peptide, and some reactivity with A peptides – no binding was observed with D and E peptides. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
- 1006-15D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 1006-15D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – was somewhat cross-reactive with V3 peptides from clade A, C and other B clade V3 peptides, but not E clade. Gorny *et al.* [1997] (**antibody generation, subtype comparisons**)

**Keywords** antibody binding site definition and exposure, antibody generation, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 782-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
- 782-D: Called 782: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 782-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 782-D showed intermediate reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 782-D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed strong binding to several B and F peptides, one C peptide, and some reactivity with A and D peptides. Zolla-Pazner *et al.* [1999a] (**variant cross-recognition or cross-neutralization, review, subtype comparisons**)
- 782-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 782-D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 782-D was not cross-reactive with V3 peptides from clade A or E, but could bind to 3/8 B clade V3 peptides, and 1/2 C clade V3 peptides – 50% neutralization of RF was obtained. Gorny *et al.* [1997] (**antibody generation, variant cross-recognition or cross-neutralization, subtype comparisons**)
- 782-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)

**Keywords** antibody binding site definition and exposure, antibody generation, review, subtype comparisons

- 1027-15D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1027-15S: Called 1027-15: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 1027-15D: Called 1027-D – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**)
- 1027-15D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1027-15D showed strong cross-reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1027-15D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed moderate binding to several B and F peptides, one C peptide, and was not reactivity with A, D and E peptides. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
- 1027-15D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 1027-15D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 1027-15D was not cross-reactive with V3 peptides from clade A or E, but could bind to 3/8 B clade V3 peptides,

and 1/2 C clade V3 peptides. Gorny *et al.* [1997] (**antibody binding site definition and exposure, antibody generation, subtype comparisons**)

- 13105100: This MAb was raised against the peptide IRIQRGPGRAFVTI, located within the V3 loop flanking the GPGR apical motif. Two MAbs were used to determine the photodamage location in HIV-1 Env induced by sulfonated anionic porphyrins. The negatively charged porphyrins interact with positive charge in the V3 loop. When light activated, they damage amino acid side chains in the C5 region of Env, as evidenced by inhibition of binding of C5 MAb 9201, but not V3 MAb 13105100. Anionic porphyrins could be used in targeted photodynamic decontamination of biological fluids, such as blood, killing HIV without disabling the function of desirable transfusion products. **Keywords** antibody binding site definition and exposure, escape, review, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- M77: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. M77 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**review**)
- M77: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells,

but not the CXCR4 co-receptor, binding to a fusion intermediate. Cluster I and II MAbs bound to gp120/gp41 complexes at the cell-to-cell contact interface, in contrast to M77 which bound to gp120 that was evenly dispersed over the target cell surface. Finnegan *et al.* [2002]

- M77: M77 is highly strain specific for IIIB, but anti-idiotypic Abs directed against M77 can in turn elicit an Ab response with expanded HIV cross-reactivity – this mechanism may serve to prolong the primary response and to counter-balance viral immune evasion by mutation. Denisova *et al.* [2000] (**variant cross-recognition or cross-neutralization**)
- M77: Used M77 bound to gp120 as an immunogen – analysis of polyclonal and monoclonal (62 MAbs were generated) response suggests the M77-gp120 immunogen generated MAbs to more linear epitopes than gp120 alone or gp120 bound to CD4. Denisova *et al.* [1996] (**vaccine-specific epitope characteristics**)
- M77: Native M77 is highly strain specific, and V3 binding is primarily dependent on its heavy chain – a light chain switched Fab version of M77 could recognize HIV-1 strains that had substitutions on the left side of the V3 loop – R in GPGR is likely to be critical for binding. Watkins *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- M77: Reacted with both reduced and non-reduced covalently cross-linked gp120-CD4 complex. DeVico *et al.* [1995] (**antibody binding site definition and exposure**)
- M77: Conformational rearrangements upon binding of M77 to gp120 generates novel epitopes called metatopes. Denisova *et al.* [1995]
- M77: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. Cook *et al.* [1994]
- M77: Stated to be a murine MAb – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – M77 neutralization was only slightly reduced by this mutation. Watkins *et al.* [1993] (**escape**)
- M77: Antibody binding to viral isolates from IIIB infected lab worker followed through time – A to T substitution resulted in the loss of neutralization and native gp120 binding, but not peptide binding. di Marzo Veronese *et al.* [1993] (**escape**)
- M77: IIIB-specific MAb, immunoprecipitates deglycosylated form. di Marzo Veronese *et al.* [1992] (**variant cross-recognition or cross-neutralization**)

**Keywords** antibody binding site definition and exposure, antibody interactions, neutralization, review, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 19b: This Ab was shown to infrequently neutralize cloned Envs (clades A, B, C, D, F1, CRF01\_AE, CRF02\_AG, CRF06\_cpx and CRF11\_cpx) derived from donors with and without broadly cross-reactive neutralizing antibodies. Cham *et al.* [2006] (**neutralization, variant cross-recognition or cross-neutralization, subtype comparisons**)
- 19b: The gp140 $\delta$ CFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. 19b was shown to bind specifically to all the recombinant proteins as well as to the gp120 from two subtype B isolates. The specific binding of his Ab to CON-S indicated that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure, vaccine antigen design, subtype comparisons**)
- 19b: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design, vaccine-specific epitope characteristics**)
- 19b: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some

- TCLA strains, and a subset also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 19b: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
  - 19b: Virion capture assays are not a good predictor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, A DA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. Poignard *et al.* [2003]
  - 19b: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
  - 19b: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
  - 19b: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAb 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. Schulke *et al.* [2002]
  - 19b: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
  - 19b: Mutations in two glycosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINC-NTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 19b. Kolchinsky *et al.* [2001]
  - 19b: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form but 19b was an exception and required around 950 ng/ml to neutralize either form. Park *et al.* [2000]
  - 19b: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAb IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]
  - 19b: Used as a control in this Hx10 binding and neutralizing MAb study because 19b does not bind to Hx10. Mondor *et al.* [1998]
  - 19b: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
  - 19b: No detectable neutralizing activity among primary isolates with different co-receptor usage – some neutralization of TCLA strains. Trkola *et al.* [1998]
  - 19b: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 19b has an epitope involving the tip of the V3 loop, with 5 or 6 essential amino acids distributed within a 12 amino acid stretch – the previously determined binding site was confirmed -I—G—FY—T and some tolerated variants described, the I can be I, V, or

L, the Y can be Y, F, or W – probably a beta-turn is required for FY or FF binding, but WY in can bind with out the context of the turn. Boots *et al.* [1997]

- 19b: In a multilaboratory blinded study, failed to consistently neutralize any of nine B clade primary isolates – there were four sequences with variations in the defined epitope among the 9 isolates tested. D'Souza *et al.* [1997]
- 19b: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 19b bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997]
- 19b: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b]
- 19b: Viral binding inhibition by 19b was weakly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997]
- 19b: Not as effective as IgG1b12 at neutralization *ex vivo* of virus direct from plasma of HIV-1 infected individuals. Gauduin *et al.* [1996]
- 19b: Inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 19b: MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 – binding of 19b blocks this inhibition. Wu *et al.* [1996]
- 19b: Binds to some gp120s from clades A,B,C,E, and F – weakly neutralized some B and one C clade virus. Moore *et al.* [1995b]
- 19b: Despite broad gp120 binding reactivity, not broadly neutralizing. Moore *et al.* [1995a]
- 19b: Review: more broadly cross-reactive than anti-V3 tip MAb 447-D. Moore & Ho [1995]
- 19b: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. Sattentau *et al.* [1995]
- 19b: V3 loop binding MAb that is more broadly clade cross-reactive than most (binds to 19/29 clade B and 10/12 clade E gp120s) Moore *et al.* [1994b]
- 19b: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. Moore *et al.* [1994a]

- loop 2 database comment: Also known as Loop 2, IgG1 Loop 2 was a obtained by engineering Fab loop2 into an IgG1 molecule. (**antibody generation**)
- loop 2: Called loop2. This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. loop 2 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
- loop 2: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- loop 2: Called loop2. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- loop 2: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope – binding affinity of divalent IgG1 loop 2 is only 2-fold greater than monovalent Fab loop 2, suggesting the IgG1 form may bind with only one arm. Parren *et al.* [1998a] (**binding affinity**)
- loop 2: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – loop 2 enhances YU2 at concentrations up to 20 ug/ml. Sullivan *et al.* [1998a]
- loop 2: Binds to gp120 from MN and SF2 but not LAI. Ditzel *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- loop 2: Epitope is suggested to be GPGRAF – binds to 10/17 US clade B monomeric gp120s – IgG1 form can neutralize MN and 2 primary isolates tested. Parren & Burton [1997]

- loop 2: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- loop 2: Viral binding inhibition by loop 2 MAb or Fab was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997]
- loop 2: MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 – binding of loop 2 blocks this inhibition. Wu *et al.* [1996] (**co-receptor**)
- loop 2: Called Loop 2 – shows modest cross-reactivity among B clade gp120s, little outside B clade. Moore *et al.* [1994b] (**variant cross-recognition or cross-neutralization, subtype comparisons**)
- loop 2: Sequences of the heavy and light chain Fab variable regions were generated. Barbas III *et al.* [1993] (**antibody sequence variable domain**)

**Keywords** ADCC, antibody binding site definition and exposure, antibody interactions, review, subtype comparisons, variant cross-recognition or cross-neutralization
- 4117c: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from subtype B infected individuals reacted only with subtype B. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by anti-V3 B clade specific MAbs 447-52D and 4117C was fully blocked by a clade V3 loop fusion protein, but not an A clade fusion protein, while Cameroonian sera neutralization was fully blocked by both A and B clade fusion proteins. Krachmarov *et al.* [2005] (**variant cross-recognition or cross-neutralization, subtype comparisons**)
  - 4117c: This study is about the MAb C108g, and 4117C was a control. 4117C is a linear V3 epitope unaffected by reduction, whereas C108g, contrary to earlier reports, requires disulfide bonds. C108G is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potentially neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MAbs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Binding to CCR5 was completely inhibited by two V3 MAbs, 4117C and 2219, and was substantially inhibited by

2G12, but was not inhibited by C108g. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)

- 4117c: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. 4117C and 4118D are anti-V3 MAbs that neutralize TCLA strains. Gorny & Zolla-Pazner [2004] (**review**)
- 4117c: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neutralization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12 which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs, including 4117c, had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigppgrafyTtgE for JR-FL and TigppgrafyAtgD for SF162). Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 4117c: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS), 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 4117C: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – bound and directed lysis against MN and SF2, but not IIIB and RF. Alsmadi & Tilley [1998] (**ADCC, variant cross-recognition or cross-neutralization**)
- 4117C: Neutralizes SF2 and MN synergistically combined with anti-CD4 binding site discontinuous Mab. Pinter *et al.* [1993a]; Tilley *et al.* [1992] (**antibody interactions, variant cross-recognition or cross-neutralization**)
- 4117C: Binds V3 loop – does not immunoprecipitate soluble gp120, does react with gp120 on intact virions. Pinter *et al.* [1993b] (**antibody binding site definition and exposure**)
- 4117C: Potent neutralizing activity against MN, SF-2, and NY-5 – synergy with CD4BS MAb 1125H. Tilley *et al.* [1991a] (**antibody binding site definition and exposure, antibody interactions, variant cross-recognition or cross-neutralization**)

**Keywords** antibody binding site definition and exposure, complement, mimotopes, review, subtype comparisons, superinfection, variant cross-recognition or cross-neutralization

- 419-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 419-D: Called 419: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**mimotopes, superinfection**)
- 419-D: Called 419 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS), 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 419-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 419-D showed intermediate reactivity, and no neutralization when tested against five strains – discrepancy between the epitope as described in earlier papers and as described here, KRIHIGP. Nyambi *et al.* [2000] (**subtype comparisons**)
- 419-D: Review of clade specificity and anti-V3 HIV-1-Abs – epitope is described as KRIHIGP. Zolla-Pazner *et al.* [1999a] (**antibody binding site definition and exposure, review**)
- 419-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 419-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 419-D bound to 3/4 B clade virions, and to D clade MAL. Nyambi *et al.* [1998] (**subtype comparisons**)
- 419-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of

gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)

- 419-D: Neutralizes MN – binds SF2: IYIGPGR. Gorny *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- 419-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. Spear *et al.* [1993] (**complement**)
- 419-D: MN, NY5 and SF2 strain specific, does not cross-react with RF, CDC4, WM52 or HXB2. Karwowska *et al.* [1992b] (**variant cross-recognition or cross-neutralization**)

**References** Gorny *et al.* 2004; Gorny & Zolla-Pazner 2004; Nyambi *et al.* 2000; Zolla-Pazner *et al.* 1999b; Zolla-Pazner *et al.* 1999a; Fontenot *et al.* 1995; VanCott *et al.* 1994; Gorny *et al.* 1993; Gorny *et al.* 1991

**Keywords** antibody binding site definition and exposure, binding affinity, review, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- 453-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**)
- 453-D: Called 453: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 453-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 453-D showed intermediate reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)

- 453-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
- 453-D : MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group – MAb 268, with a previously defined core epitope identical to 453 (HIGPGR), was not part of this reactivity group, illustrating that context can be critical. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 453-D : Called 453, epitope described as KRIHIGPGR – the tip of the V3 loop was presented in a mucin backbone – higher valency correlates with stronger affinity constant. Fontenot *et al.* [1995] (**antibody binding site definition and exposure, vaccine antigen design**)
- 453-D: Moderate homologous neutralization, moderately slow dissociation rate. VanCott *et al.* [1994] (**binding affinity**)
- 453-D: Neutralizes MN – binds SF2: IYIGPGR – specificity: MN, SF2, NY5, RF. Gorny *et al.* [1993] (**antibody binding site definition and exposure**)

- 83.1: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]
- 83.1: Maternally transferred anti-V3 loop MAb selectively inhibits the anti-V3 loop Ab component of the IgG response to rgp120 SF2 in 21 day old BALBc mice. Jelonek *et al.* [1999]
- 83.1: 19 day old mice injected with 83.1 have a shift in IgG1 response away from the V3 loop upon vaccination, without decreasing the total IgG anti-gp120 response, suggesting that prior treatment with a MAb can mask immunogenic sites and shift the immune response to vaccination. Keller & Arora [1999]
- 83.1: Study of synergism of neutralization and binding comparing F105 and sCD4 with the V3 MAbs: 50.1, 59.1, 83.1, and 58.2 – synergy was observed, and the data suggest that binding of one ligand (F105) can increase the binding of the second (e. g. V3 loop MAbs) due to conformational changes. Potts *et al.* [1993]
- 83.1: Neutralizes SF2. White-Scharf *et al.* [1993]

**Keywords** antibody binding site definition and exposure, antibody sequence variable domain, structure

- F58/D1: Called F58. A 17 amino acid peptide from the CDR-H3 region of F58 retained specificity for gp120 and could neutralize IIIB, although less efficiently than the intact antibody. The F58 MicroAb has a 3-fold faster association rate and a 37.5-fold more rapid dissociation rate than the intact antibody. Such Ab binding site fragments, that retain binding specificity, are called microantibodies. Alanine-substitutions in F58 MicroAb at three positions significantly compromised neutralization but did not reduce binding to soluble gp120, while substitutions at three other positions abrogated both binding and neutralization. The microAb forms a conformationally constrained beta sheet. Heap *et al.* [2005b] (**antibody binding site definition and exposure, antibody sequence variable domain, structure**)
- F58/D1: A 17 amino acid MicroAB was made from the third complementarity-determining region of the heavy chain of MAb – F58 neutralized 5x's more efficiently in terms of mass than the original MAb, 32-fold less on a molar basis – neutralization does not involve initial attachment, but fusion and events in early infection. Jackson *et al.* [1999]
- F58/D1: The interaction of a 17-amino-acid neutralizing microantibody (MicroAB) based on F58 and HIV-1 env was studied by electrospray ionization mass spectrometry. Millar *et al.* [1998]

- F58/D1: Called F58. The complementarity-determining region of F58 was used to create a miniantibody that could neutralize both HIV-1 IIIB and SF2 in vitro. Levi *et al.* [1993] (**antibody binding site definition and exposure, antibody sequence variable domain**)
- F58/D1: Binding to native gp120 1-3 fold greater than to denatured – 314G/W substitution abolishes binding, changes outside the loop have little effect. Moore *et al.* [1993b]

Immunogen vaccine

Vector/Type: peptide Strain: B clade IIIB

Species (Isotype) mouse (IgG1)

Ab Type gp120 V3

References Holl *et al.* 2006a; Zhang *et al.* 2002; Chakrabarti *et al.* 2002; Watkins *et al.* 1993; D'Souza *et al.* 1994; Laman *et al.* 1993; Laman *et al.* 1992

Keywords dendritic cells, neutralization

- IIIB-13 V3: Also known as 1044-13 and as IIIB-V3-13 (J. P. Moore, per. comm.)
- IIIB-13 V3: UK Medical Research Council AIDS reagent: ARP3046.
- IIIB-13 V3: NIH AIDS Research and Reference Reagent Program: 1727.
- IIIB-V3 13: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- IIIB-13 V3: Called 1727: Used as a standard for comparing immune responses to modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation – experiment showed enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. Chakrabarti *et al.* [2002]
- IIIB-13 V3: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]

- IIIB-13 V3: Included in a panel of antibodies used in a multi-lab study for antibody characterization and assay comparison, some neutralization of strains other than IIIB. D'Souza *et al.* [1994]
- IIIB-13 V3: Called IIIB-V3-13 – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – IIIB-V3-13 neutralization was only slightly reduced by this mutation. Watkins *et al.* [1993]
- IIIB-13 V3: Neutralizes IIIB but not MN. Laman *et al.* [1992]

**Keywords** antibody binding site definition and exposure, dendritic cells, neutralization, review

- 268-D: UK Medical Research Council AIDS reagent: ARP3024.

- 268-D: NIH AIDS Research and Reference Reagent Program: 1511.
- 268-D IV: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 268-D: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. It had an overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity. Lusso *et al.* [2005]
- 268-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 268-D: Called 268: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4 induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not show as much ability to neutralize as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 268 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 268-D: Called ARP3024: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. Vella *et al.* [2002]
- 268-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera—2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5—thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 268-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAb alters some step after binding – one of the TCLA V3 viruses 320SI-C3.3 shows reduced binding with this MAb, the sequence of the epitope in 320SI is HIGPGR and in 320SI-C3.3 is RIGPGR. York *et al.* [2001]
- 268-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V3 MAbs 447-52-D and 268-10-D did not effect proliferation. Hioe *et al.* [2000]
- 268-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 268-D showed weak reactivity. Nyambi *et al.* [2000]
- 268-D: Called 268D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- 268-D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 268-D bound rgp120 W61D but could only neutralize the W61D isolate following T-cell line adaptation. Beddows *et al.* [1999]
- 268-D: Called MAb 268 – To identify potential mimotopes of V3, a hexapeptide phage library was screened with MAb 268 – two hexamers were identified, HLGPGR or KAIHRI that bind to 268 with the same binding site as the V3 loop and inhibit 268 MN gp120 – KLH conjugated hexamer KAIHRI stimulates Abs in rabbits that cross-react with ML gp120. Laisney & Strosberg [1999]
- 268-D: Called 268-11D – Study of a live-vector mucosal vaccine that expresses HIV-1 V3 domains using the bacterium *Streptococcus gordonii* which can express heterologous Ag and can colonize the oral cavity and vagina of mice – 268-D and 257-D recognized *S. gordonii* expressing the V3 domain of MN – the vaccine stimulated V3-specific IgG2a in mice. Oggioni *et al.* [1999]
- 268-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a]
- 268-D: Peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group – MAb 453, with an identical core epitope to 268 based on prior experiments (HIGPGR), was not part of this reactivity group, illustrating that context can be critical. Zolla-Pazner *et al.* [1999b]
- 268-D: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. LaCasse *et al.* [1998]
- 268-D: Poor reactivity against HIV-1 isolates SF162 and SF128A and no neutralization, in contrast to MAbs 391/95-D and 257-D. Stamatatos *et al.* [1997]

- 268-D: Failed to neutralize HXB2 and chimeric virus with gp120 from primary isolates in an HXB2 background. McKee *et al.* [1996]
- 268-D: 268-D is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisniewski *et al.* [1996]
- 268-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 did not influence the binding of 268-D to virion-associated gp120, although sCD4 binding did alter epitope exposure for other anti-V3 MAbs. Stamatos & Cheng-Mayer [1995]
- 268-D: Serotyping study using flow-cytometry, if H of HIGPGR was substituted in virus, 268-D did not bind. Zolla-Pazner *et al.* [1995]
- 268-D: Moderate dissociation rate and homologous neutralization titer. VanCott *et al.* [1994]
- 268-D: Neutralizes MN – binds SF2: YIGPGR – specificity: MN, SF2, NY5, RF, CDC4. Gorny *et al.* [1993]
- 268-D: Mediated deposition of complement component C3 on HIV infected cells, but not in the presence of sCD4. Spear *et al.* [1993]
- 268-D: Reacts with MN, NY5, CDC4, RF and SF2, does not cross-react with WM52 or HXB2. Karwowska *et al.* [1992b]
- 268-D: Called 268-11-D-IV – strain specific weakly neutralizing. D'Souza *et al.* [1991]

- 418-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 418-D: Called 418: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 418 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 418-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 418-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 418-D showed intermediate reactivity. • 110.5: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]

• 110.5: Viral binding inhibition by 110.5 was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997]

• 110.5: Deletion of the V1V2 regions did not affect anti-V3 Abs ability to bind when compared to intact rec gp120. Jeffs *et al.* [1996]

• 110.5: Neutralizes HIV-1 LAI. McDougal *et al.* [1996]

• 110.5: Reciprocal binding inhibition with other anti-V3 MAbs – enhances binding of some anti-V2 MAbs – binding enhanced by some CD4 binding site MAbs. Moore & Sodroski [1996]

- 110.5: Did not induce dissociation of gp120, as sCD4 did – discrepancy with Poignard *et al.* [1996a], that was suggested to be due to MAb interference with detection, as the gp120-MAB complex was denatured in the Poignard study Moore *et al.* [1990]. Moore *et al.* [1990]; Poignard *et al.* [1996a]
- 110.5: V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus, mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. Poignard *et al.* [1996a]
- 110.5: Pretreatment of HX10-infected H9 cells with sCD4 decreases signal from 110.5 at 37 degrees due to dissociation of gp120-gp41. Sattentau *et al.* [1995]
- 110.5: Binds with high affinity to monomer and oligomer, rapid association and potent neutralization of lab strains – neutralizes cell-free Hx10. Sattentau & Moore [1995]
- 110.5: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to conformationally sensitive neutralizing MAbs – neutralization efficiency of 110.5 is not affected. Klasse *et al.* [1993a]; Reitz *et al.* [1988]
- 110.5: Thrombin cleavage of V3 loop between R-315 and A-316 abrogates binding – can inhibit C4 region antibody which has conformational requirements (G3-299) – binding to native gp120 100-300 fold greater than to denatured. Moore *et al.* [1993b]
- 110.5: Variable region sequenced – heavy chain: V 3660-SB32, D closest to DSP2.3, 2.4 and .6, J H2 – light chain: V kappa21, J kappa2. Pirofski *et al.* [1993]
- 110.5: Binding insensitive to gp120 reduction. Cordell *et al.* [1991]
- 110.5: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991]

References Binley *et al.* 2004; York *et al.* 2001; Stanfield *et al.* 1999; Seligman *et al.* 1996; Moore *et al.* 1994b; Potts *et al.* 1993; White-Scharf *et al.* 1993

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

- 58.2: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. 58.2 could only neutralize B subtype viruses, and seemed to have a minimal epitope of (H/T)IGPGR(A/T)(F/L). Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization, subtype comparisons**)

- 58.2: 58.2's epitope was noted to be IGPGRAF – Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NABs alters some step after binding. York *et al.* [2001]
- 58.2: The crystal structure of Fab 58.2 bound to V3 loop peptides was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different MAbs were bound – 58.2's epitope was defined as KRKRIHIGPGRFY. Stanfield *et al.* [1999]
- 58.2: Competition ELISAs with serial deletions produced longer estimates of epitope length, RIHIGPGRFY, than Alanine substitution, suggesting significance of non-contact residues. Seligman *et al.* [1996]
- 58.2: Modest cross-reactivity among B clade gp120s, little outside B clade – core epitope as I-IHIG. Moore *et al.* [1994b]
- 58.2: Did not synergistically neutralize MN in combination with MAb F105 – there was synergistic neutralization when combined with sCD4. Potts *et al.* [1993]
- 58.2: Epitope defined by peptide reactivity and changes in affinity with amino acid substitutions – 4/7 primarily isolates were neutralized. White-Scharf *et al.* [1993]

Vector/Type: peptide keyhole limpet hemo-cyanin (KLH) conjugate, peptide Brucella abortus (Ba) conjugate, peptide lipopolysaccharide (LPS) conjugate Strain: B clade MN HIV component: V3

Species (Isotype) mouse (IgA, IgG1, IgG2a)

References Golding *et al.* 2002a

- Intranasal (i.n.) immunization with V3-Ba induced mucosal anti-V3 NABs and IFN-gamma secreting T cells – V3-Ba, V3-KLH and V3-LPS could each induce serum and mucosal IgA and IgG in BALB/c mice – i.n. plus i.p. immunizations gave higher titers than i.n. alone – the response to V3-KLH was mainly restricted to IgG1, and to V3-Ba, IgG2a – class II KO mice (CD4+ deficient) did not respond to V3-KLH, but did respond to V3-Ba, suggesting that V3-Ba may be effective in eliciting Ab responses in HIV-1 infected individuals that have impaired CD4+ T cell function. **Keywords** antibody binding site definition and exposure, antibody generation, antibody sequence variable domain, binding affinity, escape, immunoprophylaxis, variant cross-recognition or cross-neutralization

- KD-247: Escape variants were induced by exposing the HIV-1 strain MOKW to different concentrations of KD-247 in vitro. In the presence of relatively low concentrations of the Ab, viral variants with V2 mutations R166K and D167N were found with partial resistance against KD-247. In the presence of high concentrations of KD-247, in addition to the V2 mutations, a V3 tip mutation (P313L) expanded inducing complete resistance to KD-247. V2 P175L substitution conferred high resistance to KD-247, however, additional KN substitutions in positions 166 and 167 resulted in a less resistant virus with a replication advantage. Shibata *et al.* [2007] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization, escape, binding affinity**)
- KD-247: A new humanize MAb recognizing the V3 tip sequence was generated by transferring the genes of the complementary determining region of the mouse NAb C25 into genes of a human V region. C25 was raised by serial vaccinations of a mouse with distinctive six B clade V3 loop peptides. KD-247 was shown to neutralize laboratory and primary isolates of CXCR4 and CCR5 viruses that possess a GPGR sequence in the Env V3 tip region more effectively than any of the reference Abs used in the study. KD-247 was shown to recognize the narrow V3 tip sequence with high affinity. Eda *et al.* [2006b] (**antibody binding site definition and exposure, antibody generation, variant cross-recognition or cross-neutralization, binding affinity, antibody sequence variable domain**)
- KD-247: This Ab was shown to efficiently neutralize clade B and B' CXCR4 and CCR5 HIV-1 primary isolates with matching V3 sequence motifs while it did not neutralize sequence-mismatched clade B and E isolates. It was also shown to provide sterile protection against SHIV challenge when passively transferred to monkeys in a single high dose. Lower doses provided partial protection. Eda *et al.* [2006a] (**immunoprophylaxis, variant cross-recognition or cross-neutralization**)

**Keywords** antibody binding site definition and exposure

- 537-D: Called 537: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 537-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 537-D showed weak reactivity. Nyambi *et al.* [2000]
- 537-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a]
- 537-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b]
- 537-D: Moderate homologous neutralization, relatively rapid dissociation constant. VanCott *et al.* [1994]
- 537-D: MN type specific neutralization observed – binds SF2, also IGPGR. Gorny *et al.* [1992, 1993]
- 537-D: Reacts with MN, NY5, CDC4, RF, WM52 and SF2, but does not cross-react with HXB2. Karwowska *et al.* [1992b]

**Keywords** co-receptor, HAART, ART

- RC25: MD14 is a R5X4 SHIV with a B clade Env; the V3 loop of an E-clade Env was inserted into MD14 to create SHIV-TH09V3, an R5 virus. SHIV-TH09V3 could infect both cynomolgous and pig-tailed macaques, and the R5 co-receptor usage was maintained after passage through macaques. The MAb RC25 recognized B clade V3 loops, and reacted with SHIV-MD14. Rabbit anti-sera raised against a NSI Clade E consensus preferentially recognized SHIV-TH09V3. Kaizu *et al.* [2003] (**co-receptor**)
- RC25: RC25 is a humanized MAb that recognizes the epitope IGPGRA – it has strong neutralizing activity against JRFL (R5 virus) and weak against NL4-3 (X4 virus) and is used as a control in a study of NAb activity in patients undergoing HAART. Kimura *et al.* [2002] (**HAART, ART**)

- 0.5beta: UK Medical Research Council AIDS reagent: ARP3025.
- 0.5beta: NIH AIDS Research and Reference Reagent Program: 1591.
- 0.5beta: The affinity of this Ab was measured for three peptides, one representing the sequence of the V3 loop of HIV-1 IIIB strain and the other two having thiazolidine derivatives replacing the proline within the GPGR. None of the replacements had a large effect on binding of the Ab but the replacement with 2,2 dimethylthiazolidine behaved more like the wildtype. This and the structural and conformational studies by NMR and modeling indicate that it can successfully be used to mimic the native peptide. Garcia *et al.* [2006] (**antibody binding site definition and exposure, mimics, binding affinity, structure**)
- 0.5beta: Studies on the temperature dependence of infectious virus (increased temperatures up to 37 degrees increases infectivity) showed that X4 pseudoviruses that were infectious at room temperature were also more resistant to anti-V3 0.5beta and anti-CXCR4 blocking peptide T140. This implies that virus more heavily populated with functional envelopes are more infectious. Harada *et al.* [2004] (**co-receptor**)

- 0.5beta: 0.5beta was used as a control for gp120 expression relative to Nef expression soon after infection of cultures. The goal of this study was to elicit anti-Nef IgM human Abs in trans-chromosome mice that carry human chromosomes responsible for Ig production. These mice were immunized with recombinant Nef protein. Human heavy chain, mouse light chain anti-Nef IgM were obtained. The hope was that these human IgM anti-Nef chimeric Abs would activate complement mediated cytolysis; C3 deposition was induced but not at high enough levels to induce lysis. Kawai *et al.* [2003] (**complement**)
- 0.5beta: Host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. Fortin *et al.* [2000] (**antibody interactions**)
- 0.5beta: MAbs 0.5beta and G3-42 were used to study synthesis of oligomeric and monomeric forms of Env – inhibition of glycosylation by tunicamycin results in reduction of oligomeric gp120 at the cell surface and of monomer in the cytoplasm – neither MAb recognized non-glycosylated Env precursor. Jagodzinski & Trzeciak [2000]
- 0.5beta: 14/18 residues of peptide P1053, RKSIRIQRGP-GRFVTIG, were shown to be involved in the Ab recognition site using NMR – QRGPGR forms a beta-hairpin turn at the center of the binding pocket. Tugarinov *et al.* [2000] (**antibody binding site definition and exposure**)
- 0.5beta: NMR and mutation cycles were employed to generate a model of the peptide-antibody complex, showing aa residues that interact or do not contribute to the binding of MAb 0.5beta Fv with the peptide – F96(L) of 0.5beta binds to Pro13, H52(H) interacts with Ile7, Ile9, Gln10, and D56(H) interacts with Arg11 of the V3 loop peptide – RGPG retains hairpin conformation binds in the center of a groove. Zvi *et al.* [2000] (**structure**)
- 0.5beta: NMR structure reveals that Ab bound IIIB-V3 peptide adopts an unexpected type VI cis proline beta-turn. Tugarinov *et al.* [1999] (**structure**)
- 0.5beta: The Fv fragment was purified and the temperature dependence and effect of mutations was studied. Faiman & Horovitz [1997]
- 0.5beta: Relative to the native peptide, an O-linked alpha-galactosamine modified V3 peptide enhanced binding to 0.5beta, while an N-linked beta-glucosamine modified peptide showed reduced binding. Huang *et al.* [1997] (**antibody binding site definition and exposure**)
- 0.5beta: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- 0.5beta: The structure of a 17 amino acid V3 peptide bound to the Fab was studied using NMR. Zvi *et al.* [1997] (**structure**)
- 0.5beta: For Fv fragment of 0.5beta, the combined variable regions of the heavy and light chain residues, were purified. Binding of the V3 peptide epitope TRKSIRIQRGP-GRFVTIGK was studied through mutagenesis of arginines and the free energy of binding in various salt concentrations. R4A, R8A, and R11A all reduce the free energy; R8 is embedded in the peptide-Fv fragment, while R11 is more solvent exposed. Faiman *et al.* [1996] (**antibody binding site definition and exposure**)
- 0.5beta: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS inhibits 0.5beta binding – 0.5beta epitope described as GPGRFVTIG. Jagodzinski *et al.* [1996]
- 0.5beta: Deletion of the V1V2 regions did not affect anti-V3 Abs ability to bind when compared to intact rec gp120. Jeffs *et al.* [1996] (**antibody binding site definition and exposure**)
- 0.5beta: Synergistic neutralization of HIV-1 when combined with anti-V2 MAb C108G. Warrier *et al.* [1996] (**antibody interactions**)
- 0.5beta: The interactions of the peptide RKSIRIQRGP-GRFVT 0.5beta were studied by NMR, and hydrophobic interactions between the two Is and the V form the base of a 12 amino acid loop with GPGR at the apex. Zvi *et al.* [1995b] (**antibody binding site definition and exposure**)
- 0.5beta: NMR of 0.5beta bound NNTRKSIRIQRGP-GRFVTIGKIG suggests that the bound amino acids are in the region SIRIQRGPGRFVT. Zvi *et al.* [1995a] (**antibody binding site definition and exposure**)
- 0.5beta: Type-specific neutralization of IIIB – does not neutralize SF2. Broder *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 0.5beta: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. Cook *et al.* [1994] (**brain/CSF**)
- 0.5beta: Binding domain aa 310-319: RGPGRFVTIGKIG – mutations in the V3 loop from basic residues can destroy virus infectivity and syncytium formation: R306T, R309T and R313G can also reduce binding of V3 MAbs with two different binding sites: 9284 and 0.5beta. Okada *et al.* [1994] (**antibody binding site definition and exposure**)
- 0.5beta: gp41 mutation that confers resistance to neutralization by anti-CD4 binding site antibodies does not reduce neutralizing efficiency of this V3 region MAb. Thali *et al.* [1994]
- 0.5beta: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to some antiserum and conformationally sensitive neutralizing MAbs – neutralization efficiency of 0.5beta is not affected. Klasse *et al.* [1993a]; Reitz *et al.* [1988] (**antibody binding site definition and exposure**)
- 0.5beta: Binding to native gp120 100-300 fold greater than to denatured. Moore *et al.* [1993b] (**antibody binding site definition and exposure**)
- 0.5beta: Monoclonal anti-idiotypic antibodies that mimic the 0.5beta epitope were generated. Sperlagh *et al.* [1993] (**anti-idiotypic**)
- 0.5beta: A neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – of the MAbs tested, 0.5beta neutralization was the most profoundly affected by this mutation. Watkins *et al.* [1993] (**escape**)
- 0.5beta: Neutralization of virus carrying an A to T substitution (contrast with MAb M77) di Marzo Veronese *et al.* [1993]

- 0.5beta: sCD4 causes loss of IIIB type-specificity, allowing binding and neutralization of MN, in contrast to MAb mu5.5. Maeda *et al.* [1992]
- 0.5beta: Chimeric mouse-human MAb Cbeta1 was constructed by combining the human Cgamma1 and Ckappa constant regions with the 0.5beta murine MAb – ADCC and neutralizing activity. Matsushita *et al.* [1992] (**complement**)
- 0.5beta: Potent neutralizing activity. D'Souza *et al.* [1991]
- 0.5beta: Emergence of virus resistant to MAb 0.5beta and autologous sera neutralization in IIIB infected chimps. Nara *et al.* [1990] (**escape**)
- 0.5beta: Type-specific neutralization of IIIB – does not neutralize MN or RF. Matsushita *et al.* [1988]; Skinner *et al.* [1988b] (**antibody generation**)

- C25: A new humanize MAb recognizing the V3 tip sequence was generated by transferring the genes of the complementary determining region of the mouse NAb C25 into genes of a human V region. C25 was raised by serial vaccinations of a C3H/HeN mouse with distinctive six B clade V3 loop peptides. KD-247 was shown to neutralize laboratory and primary isolates of CXCR4 and CCR5 viruses that possess a GPGR sequence in the Env V3 tip region more effectively than any of the reference Abs used in the study. **Keywords** acute/early infection, ADCC, antibody binding site definition and exposure, antibody interactions, antibody sequence variable domain, assay development, assay standardization/improvement, binding affinity, co-receptor, complement, dendritic cells, enhancing activity, escape, kinetics, mimotopes, neutralization, review, structure, subtype comparisons, Th2, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization, viral fitness and reversion

- 447-52D: This Ab was used to help define the antigenic profile of envelopes used in serum depletion experiments to attempt to define the neutralizing specificities of the broadly cross-reactive neutralizing serum. Peptides containing epitopes for 447-52D did not inhibit neutralization by broadly neutralizing sera from two clade B and one clade A infected asymptomatic individuals, indicating that the V3 epitope for this MAb did not account for the broad neutralizing activity observed. 447-52D bound to JR-FL and JR-CSF gp120 monomers but not to core JR-CSF gp120 monomer. Dhillon *et al.* [2007] (**antibody binding site definition and exposure, neutralization**)
- 447-52D: Viruses from early and late infection of a macaque with SHIV SF162P4 were resistant to contemporaneous serum that had broadly reactive NAbS. SF162 was highly susceptible to neutralization by anti-V3 MAbs 447D and P3E1, as well as anti-V1 MAb P3C8, while envelopes cloned from this animal at 304 days and at 643 days (time of death) post infection had developed resistance to all three of these antibodies. Kraft *et al.* [2007] (**neutralization, escape**)
- 447-52D: G1 and G2 recombinant gp120 proteins, consisting of 2F5 and 4E10, and 4E10 epitopes, respectively, engrafted

into the V1/V2 region of gp120, were tested as an immunogen to see if they could elicit MPER antibody responses. Deletion of V1/V2 from gp120, or its replacement with G1 and G2 grafts, did not greatly affect binding of 447-52D to gp120. Shortening of the N and C termini of the V3 loop enhanced the binding of 447-52D. Law *et al.* [2007] (**vaccine antigen design**)

- 447-52D: Z13e1, a high affinity variant of Fab Z13, was identified through targeted mutagenesis and affinity selection against gp41 and an MPER peptide. Z13e1 showed 100-fold improvement in binding affinity for MPER antigens over Z13. 447-52D was used as a control in this study. 447-52D was shown to clearly bind to monomers of gp120-gp41 while trimer binding was negligible, in accordance with its modest neutralization potency against HIV-1 JR-FL. Nelson *et al.* [2007] (**vaccine antigen design**)
- 447-52D: In this study the neutralization breadth of F425 B4e8 was assessed using a panel of 40 primary HIV-1 isolates, and 447-52D was found to have a similar profile, and was used as a control to gauge the effects of the amino acid substitutions in the V3 region. As expected, replacing Arg 315 with Ala or Gln and Pro 313 with Ala reduced binding affinity of this 447-52D substantially. Ala substitutions of residues in positions 304-309 and 319-320 also unexpectedly resulted in diminished binding affinity of the Ab. Pantophlet *et al.* [2007] (**antibody binding site definition and exposure, subtype comparisons**)
- 447-52D: Guinea-pigs were immunized with 447-52D epitope inserted at three different surface V3 loop locations in the small Escherichia coli Trx protein in order to generate a competent immunogen. Only one complex was shown to successfully generate anti-V3 Abs capable of out-competing 447-52D binding to gp120 and recognizing the same epitope as this Ab. However, these 447-52D-like Abs were not able to affect neutralization of JRFL and BAL. Chakraborty *et al.* [2006] (**neutralization, vaccine antigen design, variant cross-recognition or cross-neutralization, binding affinity**)
- 447-52D: Cloned Envs (clades A, B, C, D, F1, CRF01\_AE, CRF02\_AG, CRF06\_cpx and CRF11\_cpx) derived from donors either with or without broadly cross-reactive neutralizing antibodies were shown to be of comparable susceptibility to neutralization by 447-52D. Cham *et al.* [2006] (**neutralization, variant cross-recognition or cross-neutralization, subtype comparisons**)
- 447-52D: The neutralization potency of this Ab against 7 HIV-1 primary isolates was compared to the neutralization potency of the anti-V3 MAb KD-247. Same Ab concentrations were needed for neutralization of the MN, N-NIID, and 92TH022 isolates, while higher concentrations of 447-52D were needed for the neutralization of the rest of the HIV-1 isolates suggesting KD-247 is more potent. Eda *et al.* [2006b]
- 447-52D: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design

strategies are also discussed. Haynes & Montefiori [2006] (**neutralization**)

- 447-52D: 29 subtype B V3 peptides were designed and used for immunization of guinea pigs. Peptides that induced Abs that neutralized more than 3 HIV isolates were shown to bind to this Ab better than peptides unable to induce neutralization of any of the HIV-1 primary isolates. Haynes *et al.* [2006] (**neutralization, binding affinity**)
- 447-52D: Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in iMDDCs was evaluated. The neutralizing activity of 447-52D was observed to be higher in iMDDCs than in PBLs and PHA-stimulated PBMCs. A 90% reduction of HIV infection was observed without induction of MDDC maturation by this mAb. It was also demonstrated that binding of this mAb to HIV-1 was necessary for inhibition of iMDDC infection. Increased expression of FcγRI on iMDDCs increased inhibition of HIV by 447-52D, suggesting the involvement of this receptor in the HIV-inhibitory activity of this mAb. Holl *et al.* [2006b] (**neutralization, dendritic cells**)
- 447-52D: The ability of this Ab to inhibit viral growth was increased when macrophages and immature dendritic cells (iDCs) were used as target cells instead of PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**dendritic cells**)
- 447-52d: 2909 is a human anti-Env NAb that was selected by a neutralization assay and binds to the quaternary structure on the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12. Gorny *et al.* [2005]
- 447-52D: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. 447-52D has no indication of polyspecific autoreactivity. Haynes *et al.* [2005] (**antibody binding site definition and exposure**)
- 447-52D: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by anti-V3 B clade specific MAbs 447-52D and 4117C was fully blocked by a clade V3 loop fusion protein, but not an A clade fusion protein, while Cameroonian sera neutralization was fully blocked by both A and B clade fusion proteins. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization, subtype comparisons**)
- 447-52D: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. It had an overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity. While B4e8 and 447-52D could bind to the R5 virus BaL in the absence of sCD4, treatment with sCD4 did increase the binding of both B4e8 and 447-52D, but did not impact their ability to neutralize BaL. Lusso *et al.* [2005] (**antibody binding site definition and exposure**)
- 447-52D: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication in microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglial-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using CD4BS MAbs F105 and IgG1b12, glycan-specific 2G12, and V3-specific 447-52D, and were unchanged. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Martín-García *et al.* [2005] (**antibody binding site definition and exposure**)
- 447-52D: This study is about the V2 MAb C108g, which is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potentially neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MAbs 4117c, 2219, 2191, and 447-52D (447-52D was the only one of the 4 V3 MAbs that could neutralize the unmodified JRFL); but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 447-52D: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. Selvarajah *et al.* [2005] (**vaccine-specific epitope characteristics, Th2**)
- 447-52D: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. Neutralization outside of the B clade was very rare, and seemed to depend on the presence of a GPGR V3 tip, which is rare outside of the B clade. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization, subtype comparisons**)

- 447-52D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally sensitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Although 447-52D was selected using a peptide, it has conformational characteristics. Inter-clade cross-neutralization by anti-V3 conformation-dependent MAbs is reduced. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure, review**)
- 447-52D: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides, but was an exception in that it is cross-neutralizing. 447-52D neutralized 12/13 clade B viruses. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 447-52D: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 447-52D: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of any of three glycans within or adjacent to the V3 loop (GM299 V3), C2 (GM292 C2), C3 (GM329 C3) increased neutralization susceptibility to 447-52D, but C4 (GM438 C4) or V5 (GM454 V5) removal did not make SF162 more sensitive. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure, vaccine antigen design**)
- 447-52D: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 447-52D. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 447-52D: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neutralization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs, including 447-52D, had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigppgrafyTtgE for JR-FL and TigppgrafyAtgD for SF162). Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 447-52D: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. 447-52D did not neutralize the primary or passaged variant. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization, viral fitness and reversion**)
- 447-52D: Analysis of the conformation of 447-52D in complex with the V3MN18 peptide (gp12 aa 310-329, KRKRI-HIGPGRAFYTTKN) was undertaken using solid state NMR. The bound peptide had a well defined constrained structure that was in good agreement with solution NMR and crystallographic studies. Sharpe *et al.* [2004] (**structure**)
- 447-52D: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. 447-52D was able to neutralize the SOS protein better than the wildtype, but did not neutralize SOS well when added post-attachment, as the V3 loop is involved in co-receptor engagement. Binley *et al.* [2003] (**vaccine antigen design**)
- 447-52D: The Fv fragment (composed of just the light and heavy variable regions, and the smallest intact binding unit of an Ab) of 447-52 D was expressed and purified. Preliminary NMR with the peptide epitope indicates that an NMR structure determination is feasible. Kessler *et al.* [2003] (**antibody sequence variable domain, structure**)
- 447-52D: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 447-52D: Virion capture assays are not a good predictor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently

block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – Ab 447-52D was able to potently neutralize 89.6 and to neutralize JR-CSF at a high concentration but poorly neutralized ADA – b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, but anti-V3 Abs 447-52D and 19b, which did not neutralize JR-CSF and ADA, captured amounts of p24 equal to or higher than the amounts captured by the neutralizing Ab b12. Poignard *et al.* [2003] (**antibody binding site definition and exposure, assay development, variant cross-recognition or cross-neutralization**)

- 447-52D: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 447-52D: Review of NAb. Ferrantelli & Ruprecht [2002]
- 447-52D: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 447-52D bound to primary isolates from all clades except CRF01 (E), was conformationally sensitive and showed the some of the most potent neutralizing activity. Gorny *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS), 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 447-52D: The feasibility of determining the NMR structure of the V3(MN) peptide bound to the 447-52D Fab fragment was tested and a general strategy for obtaining NMR structures of V3 peptide-Fab fragments developed – preliminary NMR spectra for 447-52D complexed to a 23 amino acid V3 peptide was obtained. Sharon *et al.* [2002] (**structure**)
- 447-52D: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent—antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs—447-D recognized the gp120 monomer much more readily than o-gp140, suggesting the V3 loop is less exposed on o-gp140 and on intact virions. Srivastava *et al.* [2002] (**antibody binding site definition and exposure, vaccine antigen design**)
- 447-52D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions, variant cross-recognition or cross-neutralization**)
- 447-52D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAb alters some step after binding – the dissociation constant, Kd of 447-52D for the cell associated primary and TCLA Envs was equal, 3nM. York *et al.* [2001] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization, binding affinity**)
- 447-52D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 447-52D: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**vaccine antigen design**)
- 447-52D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V3 MAbs 447-52-D and 268-10-D did not effect proliferation. Hioe *et al.* [2000]
- 447-52D: Called 447D – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral en-

- try. Ly & Stamatatos [2000] (**antibody binding site definition and exposure**)
- 447-52D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 447-52D showed the highest cross-reactivity, bound to 24/26 viruses tested, but achieved 90% neutralization only against MN, 50% against CA5, and no neutralization was observed for 3 other isolates tested. Nyambi *et al.* [2000] (**subtype comparisons**)
  - 447-52D: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000] (**antibody binding site definition and exposure**)
  - 447-52D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – TCLA strains showed enhanced 447-52D neutralization sensitivity relative to PBMC-adapted lines (32X increase between HIV-1 (M2424/PBMC(p0)) and HIV-1 (M2424/H9(p9)) and a >128X increase between HIV-1 (W61D/PBMC) and HIV-1 (W61D/SupT1) isolates) Beddows *et al.* [1999] (**variant cross-recognition or cross-neutralization**)
  - 447-52D: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. Hioe *et al.* [1999]
  - 447-52D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review, subtype comparisons**)
  - 447-52D: MAb peptide-reactivity pattern clustered with the immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group – 447 reacted with peptides containing GPGR, but also with many lacking this sequence (GPGQ, for example), and it failed to react with 2/14 peptides containing GPGR, illustrating the importance of context. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
  - 447-52D: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. Connor *et al.* [1998]
  - 447-52D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 1324E was comparable to 447-52D. Gorny *et al.* [1998] (**kinetics**)
  - 447-52D: Called 447-D – 447-D resistance took longer to acquire in virus with the M184V substituted RT, and had the form (AAC N to TAC Y) at position 5 of the V3 loop, rather than the GPGR to GPGR resistance found with wildtype RT. Inouye *et al.* [1998]
  - 447-52D: Inhibits binding of Hx10 to both CD4 positive and negative HeLa cells. Mondor *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
  - 447-52D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 447-52D was the most potent and cross-reactive of 18 human MAbs tested and was the only MAb which bound to virions from isolates CA20 (subtype F), CA13 (subtype H), and VI526 (subtype G) Nyambi *et al.* [1998] (**subtype comparisons**)
  - 447-52D: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
  - 447-52D: Called 447-52-D – The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 447-52D was among the Abs used – chimeric viruses elicited potent NAb in guinea pigs against ALA-1 and MN. Smith *et al.* [1998] (**vaccine antigen design**)
  - 447-52D: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 447-52D has an epitope involving the tip of the V3 loop, that was previously studied with this method Keller *et al.* [1993] – in Keller *et al.*, with no competition, LxGPxR was the most common six-mer, 38% of the peptides – after competition with a gp120 IIIB ligand (QRGPGR)<sub>i</sub>, RGPxR was the most common and one peptide had the sequence QRGPGR, showing type specific mimotopes can be enriched by strain specific ligand and competition protocols Boots *et al.* [1997]. Boots *et al.* [1997]; Keller *et al.* [1993] (**antibody binding site definition and exposure, mimotopes**)
  - 447-52D: In a multilaboratory blinded study, failed to consistently neutralize any of nine B clade primary isolates – many of these isolates had the GPGR motif at the apex of the V3 loop. D'Souza *et al.* [1997] (**variant cross-recognition or cross-neutralization, assay standardization/improvement**)
  - 447-52D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 447-52D bound monomer, oligomer, and neutralized JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
  - 447-52D: Used as a control for comparison to five V3 RF selected antibodies – 447-52D was reactive with A, B, and C clade peptides, but not E. Gorny *et al.* [1997] (**subtype comparisons**)
  - 447-52D: Called 447 – gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. Hill *et al.* [1997] (**co-receptor**)

- 447-52D: Tested using a resting cell neutralization assay. Hioe *et al.* [1997a] (**assay standardization/improvement**)
- 447-52D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Viral binding inhibition by 447-D was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- 447-52D: Called 447-52-D – The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS inhibits 447-52D binding. Jagodzinski *et al.* [1996] (**antibody binding site definition and exposure**)
- 447-52D: Review: called 447-52-D – only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. Sattentau [1996] (**variant cross-recognition or cross-neutralization, review**)
- 447-52D: Neutralizes JR-FL – strongly inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor, variant cross-recognition or cross-neutralization**)
- 447-52D: Called 447 – The tip of the V3 loop was presented in a mucin backbone – higher valency correlates with stronger affinity constant. Fontenot *et al.* [1995] (**vaccine antigen design**)
- 447-52D: Neutralizing (- complement), no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC, complement, enhancing activity**)
- 447-52D: Binding affected by identity of amino acids flanking GPGR core – poor breadth of primary virus neutralization. Moore *et al.* [1995a] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Review: the V3 loop motif GPGR is not common outside subtype B isolates, MAb 19b is more cross-reactive than 447-52D. Moore & Ho [1995] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Ab-mediated activation of complement on HIV+ cells is higher than Ab independent activation—what has been termed “Ab independent” in fact results in part from IgM in normal human serum that is HIV-cross-reactive. Saarloos *et al.* [1995] (**complement**)
- 447-52D: Called 447d – Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. Sattentau *et al.* [1995] (**vaccine antigen design**)
- 447-52D: Serotyping study using flow-cytometry – bound only to GPGR V3 loop tips. Zolla-Pazner *et al.* [1995] (**antibody binding site definition and exposure**)
- 447-52D: Neutralization of primary and prototype laboratory HIV-1 isolates using a resting cell assay enhances sensitivity. Zolla-Pazner & Sharpe [1995] (**assay development, variant cross-recognition or cross-neutralization**)
- 447-52D: Requires GPxR at the tip of the V3 loop, common in B clade – neutralized primary isolates. Conley *et al.* [1994a] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- 447-52D: Mild oxidation of carbohydrate moieties does not alter binding. Gorny *et al.* [1994] (**antibody binding site definition and exposure**)
- 447-52D: Neutralization synergy in combination with CD4 binding domain MAbs. Laal *et al.* [1994] (**antibody interactions**)
- 447-52D: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. Moore *et al.* [1994a] (**acute/early infection**)
- 447-52D: GPGQ in MAL resulted in enhanced dissociation – GPGQ in CM234 or K14T did not bind – binding affected by identity of amino acids flanking GPGR core. VanCott *et al.* [1994] (**antibody binding site definition and exposure**)
- 447-52D: Additive neutralization of MN and SF2 when combined with CD4 binding site MAb F105 – supra-additive neutralization of RF. Cavacini *et al.* [1993a] (**antibody interactions**)
- 447-52D: Neutralizes MN and IIIB: GPGR, and binds SF2: GPGR. Gorny *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Peptide phage library showed that any of the residues ADGLMNQRS in the X position tolerated in peptides that react well with the antibody. Keller *et al.* [1993] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- 447-52D: Complement mediated virolysis of IIIB, but not in the presence of sCD4. Spear *et al.* [1993] (**complement**)
- 447-52D: 60-fold increase in neutralization potency when combined 1:1 with human MAb 588-D. Buchbinder *et al.* [1992] (**antibody interactions**)
- 447-52D: Requires GPXR at the tip of the V3 loop – neutralizes a broad array of B clade lab isolates. Gorny *et al.* [1992] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- 447-52D: Reacts with MN, NY5, CDC4, SF2, RF, WM52, and HXB2. Karwowska *et al.* [1992b] (**variant cross-recognition or cross-neutralization**)

- NM-01: Called hNM01. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. The humanized version of this MAb was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- NM-01: Called hNM01. The CDR region of the murine MAb NM-01 was put into a human IgG frame. The epitope recognition was preserved, but the neutralizing potency of the humanized form was enhanced. It could activate complement. Nakamura *et al.* [2000] (**complement, immunotherapy**)
- NM-01: The tip of the MN V3 loop was inserted into cold-causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and NM-01 was among the Abs used – chimeric viruses elicited potent NAb in guinea pigs against ALA-1 and MN. Smith *et al.* [1998]

**Research Contact** Mary White-Scharf and A. Profy, Repligen Corporation

**References** York *et al.* 2001; Stanfield *et al.* 1999; Smith *et al.* 1998; Ghiara *et al.* 1997; Seligman *et al.* 1996; D'Souza *et al.* 1994; Bou-Habib *et al.* 1994; Ghiara *et al.* 1993; Potts *et al.* 1993; White-Scharf *et al.* 1993; D'Souza *et al.* 1991

- 59.1: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAb alters some step after binding. York *et al.* [2001]
- 59.1: The crystal structure of V3 loop peptides bound to Fabs was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different MAbs were bound. Stanfield *et al.* [1999]
- 59.1: The tip of the MN V3 loop was inserted into cold-causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 59.1 was among the Abs used – chimeric viruses elicited potent NAb in guinea pigs against ALA-1 and MN. Smith *et al.* [1998]
- 59.1: A conformationally restricted analog of the tip of the V3 loop was constructed and bound with Fab 59.1 – crystal structure shows interactions between 59.1 and an MN peptide and 59.1 and the modified peptide are similar, but NMR studies reveal that the modified peptide is more ordered in solution, retaining the Fab bound form. Ghiara *et al.* [1997]

- 59.1: Competition ELISAs with serial deletions produced longer estimate of epitope length than x-ray crystallography or Alanine substitution, RIHIGPGRAFYTT, suggesting significance of non-contact residues. Seligman *et al.* [1996]
- 59.1: Greater affinity for T-cell tropic strain T-CSF than the primary isolate JR-CSF, from which T-CSF was derived. Bou-Habib *et al.* [1994]
- 59.1: Multi-lab study for antibody characterization and assay comparison – neutralizes MN and IIIB. D'Souza *et al.* [1994]
- 59.1: Crystal structure of a 24 amino acid peptide from the V3 loop bound to 59.1 Fab fragment – contact residues IGP-GRAF. Ghiara *et al.* [1993]
- 59.1: Synergistic neutralization of MN when combined with sCD4 or the CD4BS MAb F105. Potts *et al.* [1993]
- 59.1: Epitope defined by peptide reactivity and binding affinity with amino acid substitutions – GPGRAF. White-Scharf *et al.* [1993]
- 59.1: Called R/V3-59.1 – potent neutralizing MAb. D'Souza *et al.* [1991]

- 902: NIH AIDS Research and Reference Reagent Program: 522.
- 902: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin, 932 binding was only decreased by trypsin. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 902: V3-BH10 peptide with loop-structure inhibits IL-2 induced T-cell proliferation, thought to be due to altering intracellular signaling, and MAb 908 can block the peptide inhibition. Sakaida *et al.* [1997]

**Keywords** antibody binding site definition and exposure, antibody interactions, review, variant cross-recognition or cross-neutralization

- 694/98D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
- 694/98-D: Called 694/98. V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using IIIB gp120. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 694-98D: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 694/98D: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region,

- CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 694/98-D: Called 694/98D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002]
  - 694/98-D: Called 694 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS), 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
  - 694/98-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 694/98-D showed intermediate reactivity. Nyambi *et al.* [2000]
  - 694/98-D: Called 694/98D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
  - 694/98-D: A Semliki Forest virus (SFV) expression system carrying BX08 env was used to study the conformation of gp120 – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not linear V3 MAbs – expression in rat brain also showed that surface-expressed Env was recognized only by the conformation-dependent antibodies and not by anti-V3 antibodies. Altmeyer *et al.* [1999]
  - 694/98-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a]
  - 694/98-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b]
  - 694/98-D: Used to study pre- and post-exposure prophylaxis Hu-PBL-SCID mice infected by an intraperitoneal injection of HIV-1 LAI – MAb half-life in plasma in mice is 9 days – 2 hours post-694/98-D mice were challenged with LAI, and at an Ab concentration of 1.32 mg/Kg, 50% of the mice were infected – one of the infected mice carried the resistant form GRTF rather than GRAF (critical amino acids for binding are GRA) – post-exposure prophylaxis was effective if delivered 15 min post-exposure, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. Andrus *et al.* [1998]
  - 694/98-D: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS) Li *et al.* [1998]
  - 694/98-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 694/98-D bound only to B and D clade virions and had limited cross reactivity. Nyambi *et al.* [1998]
  - 694/98-D: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, anti-V3 MAbs were found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan more efficiently than HIV-BRU. Schonning *et al.* [1998]
  - 694/98-D: The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 694/98-D was among the Abs used – chimeric viruses elicited potent NAb in guinea pigs against ALA-1 and MN. Smith *et al.* [1998]
  - 694/98-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – could only achieve 50% neutralization alone – all Ab combinations tested showed synergistic neutralization – 694/98-D has synergistic response with MAbs F105, 15e, b12, 2F5, 17b, 2G12, and 48d, and with HIVIG. Li *et al.* [1997]
  - 694/98-D: ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995]
  - 694/98-D: Human HIV-1 infected sera and MAb 694/98 have high reactivity to MN and RF infected H9 cells, but Genentech rec gp120 IIIB vaccine recipients do not. VanCott *et al.* [1995]
  - 694/98-D: Serotyping study using flow-cytometry – bound GRAX bearing virus in 10/11 cases – somewhat conformation dependent. Zolla-Pazner *et al.* [1995]
  - 694/98-D: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – V3 MAbs can inhibit gp120 binding to GalCer *in vitro* – binding of GalCer to gp120 inhibited but did not completely block MAb binding. Cook *et al.* [1994]
  - 694/98-D: 50% neutralization of HIV-IIIB at a concentration of 0.15µg/ml. Gorny *et al.* [1994]
  - 694/98-D: Potent neutralization of IIIB – no neutralization synergy in combination with CD4 binding domain MAbs. Laal *et al.* [1994]
  - 694/98-D: GRVY did not alter peptide binding – GRVI and GQAW enhanced dissociation – GQVF and GQAL did not bind. VanCott *et al.* [1994]
  - 694/98-D: Neutralizes MN and IIIB (GRAF) – binds SF2 (GRAF) – binding reactivity: MN, IIIB, SF2, NY5, RF, CDC4, WM52. Gorny *et al.* [1993]

- 694/98-D: Called 694-D – complement mediated virolysis of IIIB, but not in the presence of sCD4. Spear *et al.* [1993]
- 694/98-D: Type-specific lab isolate neutralization was observed – binds with 1-3 fold greater affinity to gp120 than to peptides. Gorny *et al.* [1992]
- 694/98-D: This MAb was first described here. Skinner *et al.* [1988b]

**Neutralizing L****Immunogen** vaccine*Vector/Type:* peptide *Strain:* B clade IIIB*HIV component:* V3**Species (Isotype)** mouse (IgG1)**Ab Type** gp120 V3**Research Contact** NEN, Boston MA, commercial**References** Huskens *et al.* 2007; Gram *et al.* 2002; Schonning *et al.* 1999; Schonning *et al.* 1998; Fontenot *et al.* 1995; VanCott *et al.* 1994; Allaway *et al.* 1993; Trujillo *et al.* 1993; Durda *et al.* 1990**Keywords** variant cross-recognition or cross-neutralization

- 9205 database comment: Also see MAb called 5023A.
- 9205: 2G12 cross-neutralization and escape was the emphasis of this study. The Mab 9205 was used as a control. 9205 did not bind to nor inhibit the strains NDK or HE, while it did neutralize NL43 and MN. Huskens *et al.* [2007] (**variant cross-recognition or cross-neutralization**)
- 9205: Called NEA9205 – gp120 capture ELISAs with MAbs D7324 (anti-C-term) or 9205 (anti-V3) were compared in a study of orientation of glycosylation sites – CD4 binding could only inhibit deglycosylation when gp120 was bound to the plate by D7324, not by 9205, while Abs from HIV-1 infected people inhibited deglycosylation most effectively when gp120 was caught by 9205. Gram *et al.* [2002]
- 9205: Called NEA-9205 – the stoichiometry of MAb neutralization was tested and the data indicated that binding for neutralization was incremental not all or none, i.e., each envelope oligomer binds a single MAb and each Env oligomer bound reduces the chances of infection – 9205 binds only to Env with a glycosylation site mutation in the V3 loop, A308T. Schonning *et al.* [1999]
- 9205: Called NEA-9205 – The N306 glycan of the V3 loop makes the tip of the V3 loop inaccessible to this MAb in oligomeric Env, loss of this glycan enhances neutralization sensitivity. Schonning *et al.* [1998]
- 9205: Neutralizes IIIB but not MN – significantly slower dissociation constant for IIIB than MN. VanCott *et al.* [1994]
- 9205: Synergy with combinations of CD4-based molecules in inhibition of HIV-1 Env mediated cell fusion. Allaway *et al.* [1993]
- 9205: Called NEA-9205, epitope RIQRGPGRAFVTIGK – reacts with three human brain proteins of 35, 55, 110 kd molecular weight – similar to 9284 – RAF is the core reactivity. Trujillo *et al.* [1993]

• C12: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. Dorfman *et al.* [2006] (**co-receptor**)  
 • C12: C12 was obtained from an HIV-1 infected individual with a potent and broadly neutralizing activity of his serum. It was shown that scFv C12 was sulfate-modified and it is implied that the sulfates are localized exclusively within the heavy chain CDR3 region of this MAb. Binding efficiency of scFv C12 to ADA gp120 was doubled in the presence of CD4, showing that this MAb is a CD4-induced. Association of scFv

C12 with ADA gp120-CD4-Ig complex was partially inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that C12 binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. scFv C12 was shown to efficiently bind to gp120 of three R5 isolates but not to the HXBc2 X4 isolate. Choe *et al.* [2003] (**antibody binding site definition and exposure, co-receptor**)

**Keywords**

antibody binding site definition and exposure, antibody generation, co-receptor, neutralization, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- E51: Four consensus B Env constructs: full length gp160, un-cleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective un-cleaved version mediated infection using the CCR5 co-receptor. CD4 inducible MAbs 17b and E51 were tested for the ability to neutralize the various forms of Con B; as anticipated gp160 and gp145 were not neutralized by these two MAbs, but the gp160-201N/S mutant was neutralized with IC50 values of 10 ug/ml, suggesting increased formation and/or exposure of the co-receptor binding site. The poorly infectious clone WITO4160.27 was also somewhat susceptible to neutralization by these clones. Kothe *et al.* [2007] (**vaccine antigen design, variant cross-recognition or cross-neutralization**)
- E51: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. The sulfated peptide from E51 (pE51) efficiently bound gp120, was enhanced by CD4, and could neutralize HIV-1 more effectively than peptides based

on CCR5. pE51 was able to block infection by a range of subtype B isolates. Dorfman *et al.* [2006] (**co-receptor**)

- E51: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. E51 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005] (**antibody binding site definition and exposure**)
- E51: E51 was obtained from an HIV-1 infected individual with a potent ELISA response to the gp120. It was shown that this MAb could be sulfate-modified. The results indicated that the sulfates present on E51 are localized on tyrosines within its heavy chain CDR3 region and that they contribute to E51's ability to associate with gp120 of the ADA isolate. Binding efficiency of E51 to ADA gp120 was increased by 25% in the presence of CD4, showing that E51 is a CD4i Ab. Association of E51 with ADA gp120-CD4-Ig complex was inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that E51 binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. Neutralization assays showed that E51 neutralizes primary R5 and R5X4 isolates more efficiently, and X4 isolates less efficiently, than CD4i Abs 17b and 48d. scFv E51 was shown to efficiently bind to gp120 of three R5 isolates and to the HXBc2 X4 isolate. Choe *et al.* [2003] (**antibody binding site definition and exposure, co-receptor, neutralization**)
- E51: E51 recognizes a highly conserved epitope localized in the basic  $\beta$ 19-strand (gp120 aa420-423), a region involved in CCR5 binding. The MAb was isolated from an EBV transformed B-cell line established from an HIV+ individual undergoing early STI. Fab fragments were also produced. E51, like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. The presence of sCD4 induces a conformational change in gp120, which enhances ligand recognition. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and CD4BS MAb F105 binding, and K421D inhibits F105 binding, but not sCD4. E51 has more cross-neutralizing potency than other prototype CD4i MAbs (17b) for B and C clade isolates. E51 and 17b both neutralized HIV-1 clade B strains HXBc2 and ADA, while JR-FL and 89.6 were only neutralized by E51, not 17b. Clade C strains MCGP1.3 and SA32 were both inhibited by 17b and E51, but E51 was more potent against SA32. Xiang *et al.* [2003] (**antibody binding site definition and exposure, antibody generation, co-receptor, variant cross-recognition or cross-neutralization, subtype comparisons**)

- JL413: Phage display was used to create a library of gp120-binding single-chain fragments containing V domain (scFv) constructs derived from PBMC of lupus patients. Lupus patients rarely get HIV/AIDS and can make antibodies that bind to a conserved gp120 determinant. The scFv clone JL413 was able to induce dose-dependent, cross-clade neutralization of primary HIV-1 isolates ZA009 (R5, clade C); BR004 (R5, clade C); Ug046 (X4, clade D); SF162 (R5, clade B), and 231135 (clade B). The scFv clone JL413 recognizes a linear region that overlaps the CD4 T-cell binding site, in contrast to HIV-induced MAbs that bind to this region and are conformation dependent. - G3-211: Note – it is not clear if 211/C and G3-211 are the same antibodies. By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only

three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 211/C Pantophlet *et al.* [2004] (**vaccine antigen design**)

**Keywords** antibody interactions

- G3-537: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

**Keywords** dendritic cells, neutralization

- ICR38.1a: UK Medical Research Council AIDS reagent: ARP388/ARP389.
- ICR38: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- ICR38.1a: Called ARP388/ARP389: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs – lists epitope as WQEVGKAMYA. Vella *et al.* [2002]
- ICR38.1a: Called 388/389 – anti-C1 region MAb 87-135/9 blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) Kropelin *et al.* [1998]
- ICR38.1a: The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind – ICR38.1a was not affected by V3 serine substitutions – mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. Peet *et al.* [1998]

- ICR38.1a: Called 38.1a – 10 to 20 fold increased binding when V1/V2 or V1/V2 and V3 were deleted from gp120. Jeffs *et al.* [1996]
- ICR38.1a: Studied in the context of a neutralization escape mutant. McKeating *et al.* [1993a]
- ICR38.1a: Unreactive with solid-phase decapeptide, competed in solution phase assay – ICR 38.1a and ICR 38.8f were initially reported to be independent MABs, but are actually subclones of the same MAB. Moore *et al.* [1993b]
- ICR38.1a: Weakly neutralizing – binds linear determinant in the CD4 binding domain – cross-competition with MABs G3-536, 5C2E5, and ICR38.8f. Cordell *et al.* [1991]; McKeating *et al.* [1992b]
- ICR38.1a: Unable to exert a synergistic effect in combination with V3 directed MABs, in contrast to MAB 39.13g, that binds to a conformational epitope involved in CD4 binding. McKeating *et al.* [1992a]

**Keywords** antibody binding site definition and exposure, antibody interactions

- G3-299: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MABs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MABs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MABs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4-V3 MABs used. Zwick *et al.* [2003] (**antibody interactions**)
- G3-299: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAB ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MABs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of

binding to the gp120 monomer, except the potent CD4BS neutralizing MAB b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MABs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MABs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the G3-299 epitope as V3 loop/outer domain. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- G3-299: The MAB and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- G3-299: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997]
- G3-299: Discontinuous V3-C4 epitope, binding enhanced by a few anti-C1, anti-CD4 binding site, and V2 MABs – binding reciprocally inhibited by anti-V3 MABs – G3-229 enhances the binding of some anti-V2 MABs. Moore & Sodroski [1996]
- G3-299: Epitope described as KQIINMWQKVGKAMYAPPIS – binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAB 50-69. Poignard *et al.* [1996a]
- G3-299: Binds with higher affinity to monomer than to oligomer, slow association rate, although faster than other C4 MABs tested, with more potent neutralization of lab strain. Sattentau & Moore [1995]
- G3-299: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – G3-42, G3-299 lower affinity than G3-508, G3-519, and G3-536 – bound native gp120, not denatured – poor peptide binding, epitope spans V3-C4 regions – 433A/L, 435Y/H and 430V/S substitutions impaired binding, V3 loop cleavage or insertion abolished binding. Moore *et al.* [1993b]
- G3-299: Best neutralization of IIIB in panel of 7 MABs that bind overlapping epitope. Sun *et al.* [1989]

**Keywords** antibody binding site definition and exposure, antibody interactions

- G3-42: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. G3-42 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, representing a MAb with a linear C4/V3 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- G3-42: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4-V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 0.5beta: MAbs 0.5beta and G3-42 were used to study synthesis of oligomeric and monomeric forms of Env – inhibition of glycosylation by tunicamycin results in reduction of oligomeric gp120 at the cell surface and of monomer in the cytoplasm – neither MAb recognized non-glycosylated Env precursor. Jagodzinski & Trzeciak [2000]
- G3-42: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAb IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]
- G3-42: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS potentially inhibits G3-42 binding – G3-42 epitope described as KVGKAMYAPP. Jagodzinski *et al.* [1996]
- G3-42: Inhibits binding of many anti-V3, -CD4 binding site, and -C4 region MAbs – enhances binding of some anti-V2 region MAbs. Moore & Sodroski [1996]
- G3-42: Epitope described as KQIINMWQKVGKAMYAPPIS – binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAb 50-69. Poignard *et al.* [1996a]
- G3-42: Called G3 42 – Does not inhibit gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study – described as V3-C4 discontinuous epitope. Trkola *et al.* [1996a]
- G3-42: Binds with higher affinity to monomer than to oligomer, slow association rate. Sattentau & Moore [1995]
- G3-42: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – G3-42, G3-299 have lower affinity than G3-508, G3-519, and G3-536 – bound native gp120, not denatured – poor peptide binding, epitope spans V3-C4 regions – 433A/L, 435Y/H and 430V/S substitutions impaired binding, V3 loop insertion abolished binding. Moore *et al.* [1993b]
- G3-42: Inhibits binding of CD4 inducible MAb 48d. Thali *et al.* [1993]
- G3-42: Neutralization of IIIB but not RF. Sun *et al.* [1989]

Immunogen vaccine

Vector/Type: vaccinia HIV component: Env

Species (Isotype) mouse

Ab Type gp120 C4

References Collado *et al.* 2000

- Vaccinia p14 can elicit NAb and p39 tends to be immunodominant, so these two proteins were fused to regions of HIV-1 Env – reduced glycosylation was noted when p14 or p39 was placed in the N-term region of the fusion protein – chimeric proteins shifted the Env Ab response from V3 to either a C1 or C4 domain, depending on the construct – all chimeric Env proteins: 14kEnv, 39kEnv, and Env39k elicited a strong Ab response to the C1 region of gp120 (LFCAS-DAKAYDTEVHNVWAT), and Env39k mounted a strong response to the C4 region (KAMYAPPISGQIRCSSNITG) Colorado *et al.* [2000]

- CRA1: UK Medical Research Council AIDS reagent: ARP323.
- CRA1: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. CRA1 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MABs, representing a MAb with a linear C5 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- CRA1: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MABs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MABs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MABs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- CRA1: C5 region linear epitope, binds weakly to nondenatured monomeric gp120 – reciprocal binding inhibition with anti-C5 antibodies IC1 and M91 – non-reciprocal binding enhancement some C1 and V2 antibodies – non-reciprocal binding inhibition of some CD4 binding site antibodies. Moore & Sodroski [1996]
- CRA1: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- CRA1: Some C5 mutations abrogate binding 470 P/L or G, 475 M/S, some C2 mutations enhance binding. Moore *et al.* [1994d]
- CRA1: The relative affinity for denatured/native gp120 is 24 – C5 mutations 470 P/L or G, 475 M/S impairs binding to the native gp120 – only mutation 470 P/L impairs binding to denatured. Moore *et al.* [1994c]
- CRA1: Bound preferentially to denatured IIIB and SF2 gp120. Moore & Ho [1993]

**Keywords** antibody interactions
- M91: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
  - M91: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
  - M91: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
  - M91: C5 region linear epitope, binds weakly to nondenatured monomeric gp120 – M91 binding was enhanced by 1C1, but 1C1 binding was inhibited by M91 – non-reciprocal binding enhancement of C1 and V2 antibodies – non-reciprocal binding inhibition of CD4 binding site antibodies. Moore & Sodroski [1996]
  - M91: The relative affinity for denatured/native gp120 is 24 – mutation in position 470 P/L impairs binding. Moore *et al.* [1994c]
  - M91: 470 P/L impairs binding, but not 475 D/V, in contrast to CRA1 – some C2 mutations can enhance binding. Moore *et al.* [1994d]
  - M91: Immunoblot reactive, RIP negative, but precipitates deglycosylated gp120 – reacts with strains IIIB, 451, MN, RF, and RUTZ. di Marzo Veronese *et al.* [1992]

Keywords antibody binding site definition and exposure

- 9201: This paper describes a slightly different epitope, stating 9201 was raised against the peptide MRDNWRSELIKY, located within the alpha 5 helix in the C5 terminal region of gp120. Two MAbs were used to determine the photodamage location in HIV-1 Env induced by sulfonated anionic porphyrins. The negatively charged porphyrins interact with positive charge in the V3 loop. When light activated, they damage amino acid side chains in the C5 region of Env, as evidenced by inhibition of binding of C5 MAb 9201, but not V3 MAb 13105100. Anionic porphyrins could be used in targeted photodynamic decontamination of biological fluids, such as blood, killing HIV without disabling the function of desirable transfusion products. Dairou *et al.* [2004] (**antibody binding site definition and exposure**)
- 9201: Does not neutralize LAI. This paper notes the peptide binding region is GGGDMRDNRWSE. McDougal *et al.* [1996] (**antibody binding site definition and exposure**)

**Keywords** antibody binding site definition and exposure, immunotoxin

- 110.1 database comment: There is another antibody with this ID that binds to gp120, but at aa 200-217.
- 110.1: This epitope is similar to a fragment of the human protein mast/stem cell growth factor receptor precursor, VVP-TKADKRRSV. Maksiutov *et al.* [2002]
- 110.1: Does not effect LAI viral binding or entry into CEM cells. Valenzuela *et al.* [1998]
- 110.1: Does not neutralize HIV-1 LAI. McDougal *et al.* [1996]
- 110.1: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – MAbs against the carboxy-terminus of gp120 inhibit gp120 binding to GalCer but not as potently as anti-V3 MAbs – binding of GalCer to gp120 does not inhibit MAb binding. Cook *et al.* [1994]
- 110.1: The relative affinity for denatured/native gp120 is 0.7. Moore *et al.* [1994c] (**antibody binding site definition and exposure**)
- 110.1: Polyanionic polysaccharides were proposed to inhibit viral functions such as binding and syncytia formation through interactions mediated through the local high positive charge density in the V3 loop. The binding of this antibody is not inhibited by dextran sulfate, in contrast to anti-V3 antibodies. Callahan *et al.* [1991]
- 110.1: Difference was noted in the epitope: mapped to aa 421-429 (KQIINMWQE), the T1 sequence – poor efficacy as an immunotoxin when linked to RAC. Pincus *et al.* [1991] (**antibody binding site definition and exposure, immunotoxin**)
- 110.1: Referred to as 110-1 – does not inhibit CD4-gp120 binding or neutralize HIV-1 strains. Linsley *et al.* [1988]

**No.** 636**MAb ID** 42F**HXB2 Location** gp160 (491–500)**Author Location** gp120 (491–500 HXB2)**Epitope** IEPLGVAPTK**Subtype** B**Neutralizing** no**Immunogen** HIV-1 infection**Species (Isotype)** human (IgG1λ)**Ab Type** gp120 C5

**Keywords** dendritic cells, neutralization

- 450-D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 450-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFN gamma production – 450-D does not have this effect and was used as a control in this study. Hioe *et al.* [2001]
- 450-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001]
- 450-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – C5 MAbs 450-D and 750-D did not effect proliferation. Hioe *et al.* [2000]
- 450-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b]
- 450-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 6 mug/ml. Li *et al.* [1997]
- 450-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995]
- 450-D: Virions complexed to gp120 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 450-D: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – MAbs against the carboxy-terminus of gp120 do not inhibit gp120 binding to GalCer –

binding of GalCer to gp120 does not inhibit MAb binding. Cook *et al.* [1994]

- 450-D: Epitope is defined as PTKAKRR. Gorny *et al.* [1994]
- 450-D: Not neutralizing alone, could synergize anti-CD4 binding site antibody neutralization. Laal *et al.* [1994]
- 450-D: Did not mediate deposition of complement component C3 on HIV infected cells. Spear *et al.* [1993]
- 450-D: Bound to MN, SF-2 and IIIB, but was not neutralizing. Karwowska *et al.* [1992a]

**No.** 643

**MAb ID** 670-D (670, 670D)

**HXB2 Location** gp160 (498–504)

**Author Location** gp120 (503–509)

**Epitope** PTKAKRR

**Neutralizing** no

**Immunogen** HIV-1 infection

**Species (Isotype)** human (IgG1 $\lambda$ )

**Ab Type** gp120 C5

**Research Contact** Susan Zolla-Pazner (Zollas01@mccr6.med.nyu), NYU, NY

**References** Holl *et al.* 2006a; Gorny *et al.* 2005; Zwick *et al.* 2003; Verrier *et al.* 2001; Nyambi *et al.* 2000; Gorny & Zolla-Pazner 2000; Altmeyer *et al.* 1999; Nyambi *et al.* 1998; Gorny *et al.* 1998; Hioe *et al.* 1997b; Gorny *et al.* 1997; Hill *et al.* 1997; Forthal *et al.* 1995; Zolla-Pazner *et al.* 1995

**Keywords** antibody interactions, dendritic cells, neutralization

- 670D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 670: 2909 is a human anti-Env NAb that was selected by neutralization assay and binds to the quaternary structure on the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12. Gorny *et al.* [2005]
- 670-D: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- 670-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001]

- 670-D: A gp120 C5 MAb used as a negative control in a study of anti-gp41 MAbs. Gorny & Zolla-Pazner [2000]
- 670-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 670-D bound 21/26, and was the most cross-reactive C5 MAb. Nyambi *et al.* [2000]
- 670-D: A Semliki Forest virus (SFV) expression system carrying BX08 env was used to study the conformation of gp120 – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not V3 MAbs – expression in rat brain also showed that surface-expressed Env was recognized only by the conformation-dependent antibodies and not by anti-V3 antibodies. Altmeyer *et al.* [1999]
- 670-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-C5 Abs 670-D and 1331A bound to 3/4 B clade viruses (they didn't bind to IIIB), and to subtype D MAL – 670-D also reacted with subtype A. Nyambi *et al.* [1998]
- 670-D: gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. Hill *et al.* [1997]
- 670-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b]
- 670-D: Not neutralizing, positive ADCC activity, and no viral enhancing activity, numbering provided suggests epitope is RRVVQRE. Forthal *et al.* [1995]
- 670-D: Group specific cross-clade binding in serotyping study using flow-cytometry. Zolla-Pazner *et al.* [1995]

**Epitope** RRVVQRE

**Neutralizing** no

**Immunogen** HIV-1 infection

**Species (Isotype)** human (IgG1κ)

**Ab Type** C-term

**References** Holl *et al.* 2006a; Forthal *et al.* 1995; Laal *et al.* 1994

**Keywords** dendritic cells, neutralization

- 722-D: This Ab did not inhibit HIV-1 BaL replication in macrophages. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 722-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995]
- 722-D: Not neutralizing alone, could synergize anti-CD4 binding site antibody neutralization. Laal *et al.* [1994]

**No.** 648

**MAb ID** polyclonal

**HXB2 Location** gp160 (503–511)

**Author Location** gp120 (508–516)

**Epitope** RRVVQREKR

**Neutralizing**

**Immunogen** HIV-1 infection

**Species (Isotype)** human

**Ab Type** C-term

**References** Loomis-Price *et al.* 1997; Palker *et al.* 1987

- Most HIV-1 + individuals have an antibody response to this epitope – in this study, reactivity to RRVVQREKR was used as a positive control for HIV-1 + gp160 vaccine recipients. Loomis-Price *et al.* [1997]

**No.** 649

**MAb ID** 1331A

**HXB2 Location** gp160 (503–511)

**Author Location** gp120 (510–516)

**Epitope** dwVVQREKR

**Neutralizing**

**Immunogen** HIV-1 infection

**Species (Isotype)** human (IgG3λ)

**Ab Type** gp120 C5

**Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center)

**References** Holl *et al.* 2006a; Zwick *et al.* 2003; Edwards *et al.* 2002; Gorny *et al.* 2002; Nyambi *et al.* 2000; Hochleitner *et al.* 2000b; Gorny *et al.* 2000; Nyambi *et al.* 1998

**Keywords** neutralization

- 1331A: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**)

- 1331A: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003]
- 1331A: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002]
- 1331A: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control as binding was not diminished by treating gp120 with DTT or sodium metaperiodate to reduce disulfide bonds), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades). Gorny *et al.* [2002]
- 1331A: Core epitope dwVVQREKR maps to gp120(510-516) – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – C5 MAbs 858-D, 989-D and 1331A bound with a 5-10 fold preference for the monomer. Gorny *et al.* [2000]
- 1331A: The Ab binding site was studied with epitope excision (protein is bound in native conformation to immobilized MAb, then digested with proteolytic enzymes) and extraction (protein is digested then allowed to react with Ab), followed by mass spectroscopy – two non-contiguous aa in C5 were protected, E-507 and I-487, which are thought to be located on opposite sides of hydrophobic pocket involved in gp120/gp41 interaction. Hochleitner *et al.* [2000b]
- 1331A: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 858-D bound only 4/26, the worst of all anti-C5 MAbs tested, while MAb 1331A, which shares the same core epitope (positions 495-516), bound to 18/26. Nyambi *et al.* [2000]

- 1331A: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-C5 Abs 670-D and 1331A bound to 3/4 B clade viruses (they don't bind to IIB), and to subtype D MAL. Nyambi *et al.* [1998]

- 4D4: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 4D4: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. - 50-69: NIH AIDS Research and Reference Reagent Program: 531.
- 50-69: Increased binding of 50-69 Ab to gp41 in the presence of CD4 was abrogated by the small molecule HIV-1 entry inhibitor IC9564, suggesting that IC9564 arrests gp120 into a fusion-incompetent conformation unable to expose 50-69 epitope. Huang *et al.* [2007a] (**antibody binding site definition and exposure**)
- 50-69: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 50-69: This is one of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 50-69: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAb 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 50-69: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. SF162 and each of the five glycosylation mutants studied were all neutralization resistant to 50-69. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure, vaccine antigen design**)
- 50-69: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D, 3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure, kinetics**)
- 50-69: Called 50-69D. Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 sensitivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- 50-69: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**)
- 50-69: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – MAb 50-69 binding to infected cells is enhanced by sCD4, while 4E10 and Z13 binding is essentially unaltered. Zwick *et al.* [2001b] (**antibody binding site definition and exposure**)
- 50-69: A cluster I epitope that binds to rgp41 567-647, recognizes a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41 – this MAb doesn't react with either of the peptides N51 or C43 individually – MAbs 50-69 and 1367 had similar properties –

- MAb 50-69 bound the fusogenic form of the protein in liquid phase. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 50-69: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
  - 50-69: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 50-69 bound the majority of isolates although binding was moderate to weak – specifies discontinuous binding site range as aa 579-613. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization, subtype comparisons**)
  - 50-69: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GC-SGKLICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613 – identifies non-contiguous W596-G597-C598 and C604-T605 as minimal epitope. Mitchell *et al.* [1998] (**antibody binding site definition and exposure**)
  - 50-69: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 50-69 maps to an immunodominant domain in gp41 – three groups of peptides were selected, one which seems most closely related to gp41 sequence peptide consensus is WGCxx(RK)(x n)LxC – the analogous gp41 sequence WCGSGKLIK is present in most M group clades, except D with a common L to H substitution. Boots *et al.* [1997] (**mimotopes**)
  - 50-69: Binding of anti-gp120 MAbs IgG1b12 or 654-30D does not mediate significant exposure of the gp41 epitopes for MAbs 2F5 and 50-69. Stamatatos *et al.* [1997] (**antibody interactions**)
  - 50-69: Binds to a linear epitope located in the cluster I region – binding of 50-69 and 240-D inhibited by Fabs A1, A4, M8B, M26B, M12B and T2. Binley *et al.* [1996] (**antibody binding site definition and exposure**)
  - 50-69: Used to test exposure of gp41 upon sCD4 binding. Klasse & Sattentau [1996]
  - 50-69: Does not neutralize HIV-1 LAI. McDougal *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
  - 50-69: Prebinding of anti-V3, and CD4i MAbs 48d and 17b, but not anti-V2 neutralizing MAbs, expose the 50-69 epitope. Pognard *et al.* [1996a] (**antibody interactions**)
  - 50-69: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. Chen *et al.* [1995] (**antibody binding site definition and exposure**)
  - 50-69: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
  - 50-69: Preferentially binds oligomer – binding increased after pretreatment of infected cells with sCD4 – binding domain overlaps site that is critical for gp120-gp41 association. Sattentau *et al.* [1995] (**antibody binding site definition and exposure**)
  - 50-69: Epitope described as cluster I, 601-604, conformational – does not neutralize IIIB or synergize neutralization by anti-V3 MAb 447-52D or by CD4 BS MAbs. Laal *et al.* [1994] (**antibody binding site definition and exposure, antibody interactions**)
  - 50-69: Called SZ-50.69 – binds to an epitope within aa 579-613. Eddleston *et al.* [1993] (**antibody binding site definition and exposure**)
  - 50-69: Did not mediate deposition of complement component C3 on HIV infected cells unless cells were pre-incubated with sCD4 – complement mediated virolysis of MN and IIIB in the presence of sCD4. Spear *et al.* [1993] (**complement**)
  - 50-69: Enhances HIV-1 infection *in vitro* – synergizes with huMAb 120-16 *in vitro* to enhance HIV-1 infection to level approaching that found in polyclonal anti-HIV serum. Robinson *et al.* [1991] (**antibody interactions, enhancing activity**)
  - 50-69: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991] (**antibody binding site definition and exposure**)
  - 50-69: The epitope is affected by the conformation conferred by the two cysteines at amino acids 598 and 604. Xu *et al.* [1991] (**antibody binding site definition and exposure**)
  - 50-69: Kills HIV-infected cells when coupled to deglycosylated ricin A chain. Gorny *et al.* [1989] (**immunotoxin**)
  - 50-69: Reacts preferentially with gp160 oligomer, compared to gp41 monomer. Pinter *et al.* [1989] (**antibody binding site definition and exposure**)
  - 50-69: Combined with deglycosylated A chain of ricin is toxic to lines of HIV-infected T cells (H9) and monocytes (U937). Till *et al.* [1989] (**immunotoxin**)

**Keywords** acute/early infection, assay development

- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLLGIWGCSGKLICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. This assay can be used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development, acute/early infection**)

- 246-D: NIH AIDS Research and Reference Reagent Program: 1245.
- 246-D: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. It is also suggested that this Ab is directed against epitopes distinct from those recognized by NABs and that it will not impair virus entry into PBMCs but that it could participate in the protection of mucosal HIV transmission by preventing the infection of macrophages and iDCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 246-D: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 246-D: Called 246D. The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAB 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 246-D: Called 246D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels

- of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)
- 246-D: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D, 3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure, kinetics**)
  - 246-D: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 sensitivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
  - 246-D: Called 246 – Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades tested, A, B, C, D, F and CRF01 (clade E). Gorny *et al.* [2002] (**variant cross-recognition or cross-neutralization, subtype comparisons**)
  - 246-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**)
  - 246-D: Core epitope aa 591 to 597, a cluster I epitope that does not bind to either a peptide complex that approximates the core of the fusogenic form of gp41 or the individual peptides N51 and C43 that form this structure – MAbs 181-D and 246-D had similar properties. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
  - 246-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 246-D bound strongly or moderately to all 26 HIV-1 group M clades viruses tested and showed the strongest binding of all anti-Env MAbs tested, including the V3 and C5 region MAbs – notes core epitope as LLGI – no neutralizing activity was observed when 246-D was tested with five isolates. Nyambi *et al.* [2000] (**subtype comparisons**)
  - 246-D: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGK-LICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613. Mitchell *et al.* [1998] (**antibody binding site definition and exposure**)
  - 246-D: This antibody, along with murine MAb D61, can be blocked by any of a group of 8 conformational MAbs (M10, D41, D54, T4, T6, T9, T10 and T35). Earl *et al.* [1997] (**antibody interactions**)
  - 246-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations and 246-D neutralized 91US056 – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
  - 246-D: No neutralizing activity, both ADCC and viral enhancing activity. Forthal *et al.* [1995] (**complement, enhancing activity**)
  - 246-D: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
  - 246-D: Ab-mediated activation of complement on HIV+ cells is higher than Ab independent activation—what has been termed “Ab independent” in fact results in part from IgM in normal human serum that is HIV-cross-reactive. Saarloos *et al.* [1995] (**complement**)
  - 246-D: Called SZ-246.D. Eddleston *et al.* [1993]
  - 246-D: Did not mediate deposition of complement component C3 on HIV infected cells unless cells were pre-incubated with sCD4. Spear *et al.* [1993] (**complement**)

- 246-D: No neutralizing activity, some enhancing activity. Robinson *et al.* [1991] (**enhancing activity**)
- 246-D: Fine mapping indicates core is LLGI. Xu *et al.* [1991] (**antibody binding site definition and exposure**)

- 240-D: NIH AIDS Research and Reference Reagent Program: 1242.
- 240-D: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. It is also suggested that this Ab is directed against epitopes distinct from those recognized by NABs and that it will

not impair virus entry into PBMCs but that it could participate in the protection of mucosal HIV transmission by preventing the infection of macrophages and iDCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)

- 240-D: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 240-D: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D, 3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure, kinetics**)
- 240-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 246-D bound strongly or moderately to 24/26 HIV-1 group M clades viruses tested. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization, subtype comparisons**)
- 240-D: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGK-LICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613. Mitchell *et al.* [1998] (**enhancing activity**)
- 240-D: Binds to a linear epitope located in the cluster I region – binding of 50-69 and 240-D inhibited by Fabs A1, A4, M8B, M26B, M12B and T2. Binley *et al.* [1996] (**antibody binding site definition and exposure**)
- 240-D: V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisniewski *et al.* [1996] (**antibody sequence variable domain**)
- 240-D: Did not mediate deposition of complement component C3 on HIV infected cells. Spear *et al.* [1993] (**complement**)
- 240-D: No neutralizing activity, some enhancing activity. Robinson *et al.* [1991] (**enhancing activity**)
- 240-D: Fine mapping indicates core is IWG. Xu *et al.* [1991] (**antibody binding site definition and exposure**)

**Keywords** antibody binding site definition and exposure, antibody interactions, antibody sequence variable domain, co-receptor, dendritic cells, enhancing activity, neutralization, review, variant cross-recognition or cross-neutralization

- F240: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. It is also suggested that this Ab is directed against epitopes distinct from those recognized by NAb and that it will not impair virus entry into PBMCs but that it could participate in the protection of mucosal HIV transmission by preventing the infection of macrophages and iDCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- F240: Transduction of human CD4+ H9 T cells with both the intracellularly expressed and secreted forms of the single-chain F240 Ab inhibited MN virus production. The secreted form was more potent. Viral replication of HIV-1 primary isolates was not reduced. Liu *et al.* [2005a]
- F240: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- F240: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. Anti-gp41 MAb F240 could inhibit B4e8 neutralization. Cavacini *et al.* [2003] (**antibody interactions**)
- F240: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate, with the exception of F240 which bound both equally well, which captured more virus than any other human MAb tested, and didn't neutralize either isolate. F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 and the gp41 MAb 2F5 for both R5X4 and R5 isolates. F240 binding to gp41 was not affected by the binding of the V3 loop MAb B4a1, but preincubation with F240 could enhance B4a1 binding of the R5 isolate. Synergistic neutralization between F240 and CD4i MAbs 17b and 48d was noted for the R5X4 but not the R5 isolate, and F240 also enhanced neutralization of the R5X4 isolate by 2F5, but had

no effect on R5 virus. In contrast, F240 combined with 2G12 demonstrated enhanced neutralization of R5 virus at low Ab concentrations. Cavacini *et al.* [2002] (**antibody interactions, co-receptor**)

- F240: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D, 3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**)
- F240: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 sensitivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- F240: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAb alters some step after binding. York *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- F240: Distinct from MAb 240-D, an antibody with a similar epitope in the immunodominant region of gp41 – dose-dependent reactivity with HIV isolates RF, SF2, IIIB, and MN was observed – F240 had no neutralizing activity and enhances infection in the presence of complement – reactivity of F240 is enhanced by preincubation of cells with sCD4 or anti-CD4BS MAb F105 – heavy and light chain variable domains were sequenced, and a strong homology to hu MAb 3D6 was observed, as 3D6 binds to the same epitope, these MAbs may define a human Ab clonotype. Cavacini *et al.*

**Keywords** antibody binding site definition and exposure, antibody generation

- D61: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b – nor did it alter two gp41 MAbs, T9 and D61, inability to inhibit fusion. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)

- D61: Binding maps to region 597-613: WGCSGKLICT-TAVPWNA – immunodominant region containing two Cys residues – this antibody, along with human MAb 246-D, can be blocked by any of a group of 8 conformational MAbs (M10, D41, D54, T4, T6, T9, T10 and T35) – members of this competition group are blocked by sera from HIV-1 + individuals. Earl *et al.* [1997] (**antibody binding site definition and exposure**)
- D61: Linear gp41 epitope in the cluster I region – human sera blocked binding in oligomeric ELISA assay to a similar extent for gp41 MAbs D20, D43, D61, and T4. Richardson *et al.* [1996] (**antibody binding site definition and exposure**)
- D61: Does not precipitate gp41(21-166), but due to a structural difference in the disulfide bonding region near the two cysteines – the authors propose that this region may change conformation during the activation of the membrane fusion state of the HIV-1 glycoprotein. Weissenhorn *et al.* [1996] (**antibody binding site definition and exposure**)
- D61: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

**HXB2 Location** gp160 (595–607)  
**Author Location** gp41 (600–612)  
**Epitope** IWGCSGKLICTTA  
**Subtype** B  
**Neutralizing**  
**Immunogen** HIV-1 infection  
**Species (Isotype)** human (IgG)  
**References** Belliard *et al.* 2003  
**Keywords** rate of progression  
 • Sera from 101 slow progressors and 42 fast progressors were tested for responses to Tat peptides, and compared to responses to gp41 peptide 600-612, as anti-Tat antibodies had been shown by others to be elevated in slow progressors. Most patient sera react with this peptide, it is used in diagnostics. In this study, overall levels of Tat antibodies were not different in the two groups, however relative levels of antibodies to different Tat peptides and to this gp41 peptide were observed. Belliard *et al.* [2003] (**rate of progression**)

**No.** 721  
**MAb ID** clone 3 (CL3)  
**HXB2 Location** gp160 (597–606)  
**Author Location** gp41 (597–606)  
**Epitope** GCSGKLICTT  
**Subtype** B  
**Neutralizing** L P  
**Immunogen** HIV-1 infection

**Keywords** antibody binding site definition and exposure, rate of progression, responses in children, review, subtype comparisons, variant cross-recognition or cross-neutralization  
 • clone 3: Called CL3 here. Nabs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. Clone 3 could neutralize some O group strains. CL3 is specific for a linear epitope containing 2 cysteines that generate a loop that could be important during the fusion of the virus with the target cell. This epitope is represented as GCxGxxxCxT HIV-1 group O isolates. Ferrantelli *et al.* [2004a] (**variant cross-recognition or cross-neutralization**)  
 • clone 3: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. clone 3 neutralized 3 diverse B clade TCLA strains and 3 primary O group strains. Gorny & Zolla-Pazner [2004] (**variant**)

**cross-recognition or cross-neutralization, review, subtype comparisons)**

- clone 3: Monoclonal antibodies to this epitope have distinct phenotypes—41-7 and 1B8.env were found to be not neutralizing, 2F11 possibly enhancing, and clone 3 beneficial. Enshell-Seijffers *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- clone 3: Inhibits replication of three diverse HIV-1 laboratory strains, as well as an AZT-resistant isolate. Cotropia *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- clone 3: Core binding domain gcskLIC – lack of serological activity to this region correlates with rapid progression in infants (Broliden *et al.* [1989]) Cotropia *et al.* [1992]. Broliden *et al.* [1989]; Cotropia *et al.* [1992] (**antibody binding site definition and exposure, responses in children, rate of progression**)

- 3D6: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 3D6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D, 3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure, kinetics**)
- 3D6: Cavacini *et al.* note that both MAbs F223 and 3D6 are anti-HIV-1 Env MAbs that have an autoimmune response and that both use uses VH3 germline genes. Cavacini *et al.* [1999]
- 3D6: Binds to the immunodominant region of gp41 – a strong homology between heavy variable domains of hu MAb 3D6 and MAb F20 was observed, these MAbs may define a human Ab clonotype. Cavacini *et al.* [1998a] (**antibody sequence variable domain**)
- 3D6: The complete V, J and D(H) domain was sequenced – in contrast the sequences of five neutralizing MAbs, 3D6 had very little somatic mutation, with homologies of 97-98% relative to germline genes. Kunert *et al.* [1998] (**antibody sequence variable domain**)
- 3D6: 3D6 is V H3 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- 3D6: Called IAM 41-3D6: binding increased after pretreatment of infected cells with sCD4 – binding domain overlaps site that is critical for gp120-gp41 association. Sattentau *et al.* [1995] (**antibody binding site definition and exposure**)
- 3D6: Optimum peptide for binding 3D6 Fab was CSGKLICTTAVPW. Stigler *et al.* [1995] (**antibody binding site definition and exposure**)
- 3D6: This MAb binds to HIV gp41, and to a 43 kd protein found in human T, B and monocyte cell lines, proposed molecular mimicry. Chen *et al.* [1994b]
- 3D6: Fab fragment crystal structure. He *et al.* [1992] (**structure**)

- D50: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**)
- D50: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. D50 prefers the triggered form after receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. D50 binds equally to the fusion-intermediate and six-helix bundle. 2F5 neutralization seems to block a later step of the fusion process. de Rosny *et al.* [2004b] (**antibody binding site definition and exposure**)
- D50: The mechanism of 2F5 neutralization was explored, and experiments suggest it is due to interference with a late step in viral entry. sCD4 binding to gp120 triggers conformational changes in gp41 allowing formation of the six helix bundle.

The NAb 2F5 preferentially bound native gp41, prior to receptor triggering, while the antibody D50 that also binds to the heptad region, near 2F5, is not neutralizing, and preferentially bound the CD4 triggered gp41. The C and N peptides that can be used to block the formation of the six helix bundle and lock gp41 in the fusion intermediate state after sCD4 triggering enabled 2F5 to bind after sCD4 triggering, while D50 was able to bind to both the peptide-trapped and sCD4 induced six helix bundle equally well, suggesting the D50 epitope is linear and more exposed after sCD4 binding. de Rosny *et al.* [2004a] (**antibody binding site definition and exposure**)

- D50: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – D50 was used to capture the o-gp140 for ELISA to test the antigenicity of o-gp140 using a panel of well characterized MAbs. Srivastava *et al.* [2002]
- D50: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 trimer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-). Yang *et al.* [2000] (**antibody binding site definition and exposure**)
- D50: Found to bind to a linear peptide, between Env amino acids 642-655 – can be blocked by the conformation dependent MAbs D16, D17, D31, D36, D37, D40, D44, D55, D59, T37, and T45 – the region is in the immunogenic cluster two region – reactive with 9/10 HIV-1 strains tested, all except HIV-1 ADA, in which the change E659D and E662A may result in the loss of binding (ELLE to DLLA). Earl *et al.* [1997] (**antibody binding site definition and exposure**)
- D50: Thought to be a discontinuous epitope recognizing residues between 649-668 – designated cluster II – Fabs D5, D11, G1, T3, M12, M15, S6, S8, S9, S10 block binding. Binley *et al.* [1996] (**antibody binding site definition and exposure**)
- D50: Richardson suggests this is a linear gp41 epitope. Richardson *et al.* [1996] (**antibody binding site definition and exposure**)
- D50: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

- 98-6: NIH AIDS Research and Reference Reagent Program: 1240.
- 98-6D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 98-6: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644–663); none have any neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 98-6: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAb 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 98-6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D, 3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure, kinetics**)
- 98-6: Called 98-6D. Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 sensitivity is in-

- creased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- 98-6: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
  - 98-6: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6—six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D, while six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions, variant cross-recognition or cross-neutralization**)
  - 98-6: 98-6 and 2F5 both bind to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, and to C43 alone but not to N51 alone – 98-6 and 2F5 have comparable affinities for C43, but 98-6 has a higher affinity for the complex and the binding of 98-6 is not inhibited by N51. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure, binding affinity**)
  - 98-6: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
  - 98-6: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs – no neutralizing activity was observed when tested against 5 isolates, but 98-6 did not bind to these isolates. Nyambi *et al.* [2000] (**subtype comparisons**)
  - 98-6: The fusogenic form of gp41 is recognized by 98-6, and the epitope is a conformational epitope formed by the interaction of two regions of gp41 which form an alpha-helical bundle. Taniguchi *et al.* [2000] (**antibody binding site definition and exposure**)
  - 98-6: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-gp41 Abs 98-6, 1367 and 1342 were not able to bind detectably with any of the viruses from any clade. Nyambi *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
  - 98-6: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D) and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
  - 98-6: 98-6 is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
  - 98-6: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. Chen *et al.* [1995] (**antibody binding site definition and exposure**)
  - 98-6: No neutralizing activity, positive ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC, enhancing activity**)
  - 98-6: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
  - 98-6: Preferentially recognizes oligomeric form of gp41 – enhanced binding to HIV-1 infected cells at 37 degrees relative to 4 degrees – addition of sCD4 enhances binding. Sattentau *et al.* [1995] (**antibody binding site definition and exposure**)
  - 98-6: Epitope described as cluster II, 644-663, conformational – does not neutralize IIIB or synergize neutralization by anti-V3 MAb 447-52D or by CD4 BS MAbs. Laal *et al.* [1994] (**antibody binding site definition and exposure, antibody interactions, variant cross-recognition or cross-neutralization**)
  - 98-6: This MAb was expressed as a surface anti-gp41 monoclonal antibody receptor for gp41 on a CD4-negative B-cell line. Transfected cells could bind HIV Envelope, but could not be infected by HIV-1. When CD4 delivered by retroviral constructs was expressed on these cells, they acquired the ability to replicate HIV-1, and sIg/gp41 specifically enhanced viral replication. Tani *et al.* [1994]
  - 98-6: Called SZ-98.6 – binds to a conformational domain within aa 644-663 of gp41, and reacts with astrocytes, as do 167-7 and ND-15G1. Eddleston *et al.* [1993] (**antibody binding site definition and exposure**)
  - 98-6: Did not mediate deposition of complement component C3 on HIV infected cells, binding enhanced by sCD4. Spear *et al.* [1993] (**complement**)
  - 98-6: No neutralizing or enhancing activity. Robinson *et al.* [1991] (**enhancing activity**)
  - 98-6: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991] (**antibody binding site definition and exposure**)

- 98-6: Appeared to be specific for a conformational or discontinuous epitope. Xu *et al.* [1991] (**antibody binding site definition and exposure**)
- 98-6: No neutralizing or enhancing activity for HIV-1 IIIB. Robinson *et al.* [1990b] (**enhancing activity**)
- 98-6: Serves as target for antibody-dependent cellular cytotoxicity, ADCC. Tyler *et al.* [1990] (**ADCC**)
- 98-6: Kills HIV-infected cells when coupled to deglycosylated ricin A chain. Gorny *et al.* [1989] (**immunotoxin**)
- 98-6: Reacts preferentially with gp160 oligomer, compared to gp41 monomer. Pinter *et al.* [1989] (**antibody binding site definition and exposure**)
- 98-6: Toxic to HIV-infected T cells (H9) and monocytes (U937) when coupled to deglycosylated A chain of ricin. Till *et al.* [1989] (**immunotoxin**)

**Keywords** ADCC, antibody binding site definition and exposure, complement, dendritic cells, enhancing activity, neutralization, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 167-D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization, dendritic cells**)
- 167-D: Called 167. One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644–663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 167-D: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- 167-D: This cluster II MAb binds to a conformational epitope in the region 644–663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 167-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 167-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs. Nyambi *et al.* [2000] (**subtype comparisons**)
- 167-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC, enhancing activity, variant cross-recognition or cross-neutralization**)

- 167-D: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 167-D: Did not mediate deposition of complement component C3 on HIV infected cells – complement mediated virolysis of MN and IIIB in the presence of sCD4. Spear *et al.* [1993] (**complement**)

**Keywords** antibody binding site definition and exposure, binding affinity, vaccine antigen design

- 2F5: Cyclic peptides ELLELDKWASLW that adopt constrained beta-turn conformation of the 2F5 epitope beta-turn in the complexed crystal structure were synthesized and optimized 2F5 binding affinity. This peptide elicits high titer peptide-specific immune responses in guinea pigs that do not neutralize; the authors propose this may be the result of a short CDR3 loop in guinea pigs and additional recessed contact points between 2F5 and gp41. - 2F5: DP178 is a peptide derived from the C-term heptad repeat of gp41 that is a potent inhibitor of viral-mediated fusion – it contains ELDKWA but fails to stimulate 2F5-like NAb upon immunization – the peptide was extended to force an increase in helicity, and the modified peptide had a increase in affinity for 2F5, but upon guinea pig immunization although high peptide-specific Ab titers were achieved the sera were incapable of viral neutralization – the authors propose that 2F5 may be a low affinity maturation intermediate, which may account for its breadth and why it is hard to recreate the NAb response, but also suggests that the high concentrations required for neutralization are not relevant *in vivo*. **Keywords** antibody binding site definition and exposure, antibody generation, subtype comparisons, variant cross-recognition or cross-neutralization

- 14D9: This mouse MAb was raised against a variant of EL-DKWA core epitope of the NAb 2F5, eldEwa, derived from the 2F5 neutralization resistance variant MVP5180. The eldEwa peptide was conjugated to the carrier protein keyhole limpet hemocyanin (KLH) and administered to BALB/c mice and 14D9 was prepared using standard hybridoma methods. 2F5 does not bind to the variants eldEwa, elNkwa (B.TH.TH936705) or elEkwa, while 14D9 binds only to eldEwa and not ELDKWA. The eldEwa variant is common in the HIV-1 O group. Huang *et al.* [2002] (**antibody binding site definition and exposure, antibody generation, variant cross-recognition or cross-neutralization, subtype comparisons**)
