Subject: Bisphenol A

As we are getting ready for summer, I put my list of “to do things” together. While thinking about sunscreen, I realized that our sunscreen comes in plastic bottles, the bottles often sit in the sun and then we apply the sunscreen to our skin, which absorbs the chemicals to protect our skin from cancer.

[redacted]

If Bisphenol A is leaching into our water bottles, what else is it leaching into?
What is happening if we have a world where we have to take extra Vitamin D to stay healthy because of sunscreen?

It is all kind of overwhelming and frightening to think through, now isn't it?

Thanks

Marge McCarthy
