**Subject:** Bisphenol A comment (rhetorical question)

Hi,

Sorry to intrude on your busy schedule, but I just had to propose this question to somebody that is involved in the BPA controversy/study.

First let me say that I am NOT quick to jump to any conclusions nor jump onto any scare tactic crusades.

I am just wondering, not accusing: could there be any correlation between the widespread use of BPA and the increase of *reported* cases of autism? (Which may or may not be an *actual* increase according to what I've read recently.)

I was wondering if any studies are looking at this.

You need not take time to reply to this, I just wanted to propose the idea to somebody "in the loop" of the current controversy.

Thank you,

John J. Roos [redacted](#)
