## Soil Survey of Carroll County, Illinois

## How To Use This Soil Survey

This publication consists of a manuscript and a set of soil maps. The information provided can be useful in planning the use and management of small areas.

To find information about your area of interest, locate that area on the Index to Map Sheets. Note the number of the map sheet and turn to that sheet.

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the Contents, which lists the map units by symbol and name and shows the page where each map unit is described.

The Contents shows which table has data on a specific land use for each detailed soil map unit. Also see the Contents for sections of this publication that may address your specific needs.

## National Cooperative Soil Survey

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (formerly the Soil Conservation Service) has leadership for the Federal part of the National Cooperative Soil Survey. This survey was made cooperatively by the Natural Resources Conservation Service and the Illinois Agricultural Experiment Station. It is part of the technical assistance furnished to the Carroll County Soil and Water Conservation District. Additional funding was provided by the Illinois Department of Agriculture and Carroll County.

Major fieldwork for this soil survey was completed in 2004. Soil names and descriptions were approved in 2004. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 2004. The most current official data are available on the Internet.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

## Nondiscrimination Statement

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 7206382 (TDD). USDA is an equal opportunity provider and employer.

## Cover Photo Caption

A limestone outcrop in a very steep area of NewGlarus and Lamoille soils overlooking the Mississippi River.

Additional information about the Nation's natural resources is available online from the Natural Resources Conservation Service at http://www.nrcs.usda.gov.

61A—Atterberry silt loam, 0 to 2 percent slopes ..... 22
61B—Atterberry silt loam, 2 to 5 percent slopes ..... 23
Beavercreek Series ..... 24
3579A—Beavercreek silt loam, 0 to 2 percent slopes, frequently flooded ..... 25
Camden Series ..... 26
134A-Camden silt loam, 0 to 2 percent slopes ..... 28
134B-Camden silt loam, 2 to 5 percent slopes ..... 28
134C2-Camden silt loam, 5 to 10 percent slopes, eroded ..... 29
Casco Series ..... 30
735D2-Casco-Rodman-Fox complex, 6 to 12 percent slopes, eroded ..... 31
735E2-Casco-Rodman-Fox complex, 12 to 20 percent slopes, eroded ..... 32
Coatsburg Series ..... 34
660D2-Coatsburg silt loam, 10 to 18 percent slopes, eroded ..... 36
660D3-Coatsburg silty clay loam, 10 to 18 percent slopes, severely eroded ..... 36
Coloma Series ..... 37
689B-Coloma sand, 2 to 7 percent slopes ..... 38
689D—Coloma sand, 7 to 15 percent slopes ..... 39
689F-Coloma sand, 20 to 30 percent slopes ..... 40
Coyne Series ..... 40
764B—Coyne fine sandy loam, 2 to 5 percent slopes ..... 42
Derinda Series ..... 42
417D3—Derinda silty clay loam, 10 to 18 percent slopes, severely eroded ..... 44
417E2—Derinda silt loam, 18 to 25 percent slopes, eroded ..... 44
Dickinson Series ..... 45
87A—Dickinson sandy loam, 0 to 2 percent slopes ..... 47
87B—Dickinson sandy loam, 2 to 5 percent slopes ..... 48
87C2—Dickinson sandy loam, 5 to 10 percent slopes, eroded ..... 49
Dorchester Series ..... 49
1239A—Dorchester silt loam, undrained, 0 to 2 percent slopes, frequently flooded ..... 50
8239A—Dorchester silt loam, 0 to 2 percent slopes, occasionally flooded ..... 51
8239B—Dorchester silt loam, 2 to 5 percent slopes, occasionally flooded ..... 52
Drummer Series ..... 52
152A—Drummer silty clay loam, 0 to 2 percent slopes ..... 54
Dubuque Series ..... 55
29D3—Dubuque clay loam, 10 to 18 percent slopes, severely eroded ..... 56
Dunbarton Series ..... 56
505D2—Dunbarton silt loam, 6 to 12 percent slopes, eroded ..... 57
505D3—Dunbarton silty clay loam, 6 to 12 percent slopes, severely eroded ..... 58
505E2—Dunbarton silt loam, 12 to 20 percent slopes, eroded ..... 59
505E3—Dunbarton silty clay loam, 12 to 20 percent slopes, severely eroded ..... 60
505F2—Dunbarton silt loam, 20 to 35 percent slopes, eroded ..... 61
505G—Dunbarton silt loam, 35 to 60 percent slopes ..... 61
Durand Series ..... 62
416C2—Durand silt loam, 5 to 10 percent slopes, eroded ..... 64
416C3—Durand silty clay loam, 5 to 10 percent slopes, severely eroded ..... 64
835G—Earthen dam ..... 65
Edgington Series ..... 65
272A—Edgington silt loam, 0 to 2 percent slopes ..... 67
Eleroy Series ..... 67
547C2—Eleroy silt loam, 5 to 10 percent slopes, eroded ..... 69
547D2—Eleroy silt loam, 10 to 18 percent slopes, eroded ..... 69
Elizabeth Series ..... 70
403E2—Elizabeth silt loam, 12 to 35 percent slopes, eroded ..... 71
Fayette Series ..... 71
280B—Fayette silt loam, 2 to 5 percent slopes ..... 73
280C—Fayette silt loam, 5 to 10 percent slopes ..... 74
280C2—Fayette silt loam, 5 to 10 percent slopes, eroded ..... 75
280C3—Fayette silty clay loam, 5 to 10 percent slopes, severely eroded ..... 75
280D2—Fayette silt loam, 10 to 18 percent slopes, eroded ..... 76
280D3—Fayette silty clay loam, 10 to 18 percent slopes, severely eroded ..... 77
280F2—Fayette silt loam, 18 to 35 percent slopes, eroded ..... 78
280G2—Fayette silt loam, 35 to 60 percent slopes, eroded ..... 78
798C2—Fayette-Gale silt loams, 5 to 10 percent slopes, eroded ..... 79
Flagg Series ..... 80
419B—Flagg silt loam, 2 to 5 percent slopes ..... 81
419C2—Flagg silt loam, 5 to 10 percent slopes, eroded ..... 82
419D2—Flagg silt loam, 10 to 18 percent slopes, eroded ..... 83
419D3—Flagg silty clay loam, 10 to 18 percent slopes, severely eroded ..... 83
3646L—Fluvaquents, loamy, 0 to 2 percent slopes, frequently flooded, long duration ..... 84
Fox Series ..... 85
735D2-Casco-Rodman-Fox complex, 6 to 12 percent slopes, eroded ..... 86
735E2—Casco-Rodman-Fox complex, 12 to 20 percent slopes, eroded ..... 87
Gale Series ..... 89
798C2—Fayette-Gale silt loams, 5 to 10 percent slopes, eroded ..... 90
Gilford Series ..... 91
201A-Gilford fine sandy loam, 0 to 2 percent slopes ..... 92
Greenbush Series ..... 93
675A—Greenbush silt loam, 0 to 2 percent slopes ..... 94
675B—Greenbush silt loam, 2 to 5 percent slopes ..... 95
675C-Greenbush silt loam, 5 to 10 percent slopes ..... 96
675C2—Greenbush silt loam, 5 to 10 percent slopes, eroded ..... 96
Hitt Series ..... 97
506C2—Hitt silt loam, 5 to 10 percent slopes, eroded ..... 99
506C3—Hitt silty clay loam, 5 to 10 percent slopes, severely eroded ..... 100
Hoopeston Series ..... 100
172A—Hoopeston sandy loam, 0 to 2 percent slopes ..... 101
Huntsville Series ..... 102
8077A—Huntsville silt loam, 0 to 2 percent slopes, occasionally flooded ..... 103
Joy Series ..... 104
275A—Joy silt loam, 0 to 2 percent slopes ..... 105
275B—Joy silt loam, 2 to 5 percent slopes ..... 106
Keltner Series ..... 107
546C2—Keltner silt loam, 5 to 10 percent slopes, eroded ..... 108
Lacrescent Series ..... 109
785G—Lacrescent cobbly loam, 25 to 60 percent slopes ..... 110
Lamoille Series ..... 110
905F—NewGlarus-Lamoille silt loams, 18 to 35 percent slopes ..... 112
905G—NewGlarus-Lamoille silt loams, 35 to 60 percent slopes ..... 113
Lamont Series ..... 114
175B—Lamont fine sandy loam, 2 to 5 percent slopes ..... 115
175C2—Lamont fine sandy loam, 5 to 10 percent slopes, eroded ..... 115
175D2—Lamont fine sandy loam, 10 to 18 percent slopes, eroded ..... 116
175D3—Lamont fine sandy loam, 10 to 18 percent slopes, severely eroded ..... 117
175F2—Lamont fine sandy loam, 18 to 35 percent slopes, eroded ..... 118
952C2—Tell-Lamont complex, 5 to 10 percent slopes, eroded ..... 119
952D2-Tell-Lamont complex, 10 to 18 percent slopes, eroded ..... 120
952D3-Tell-Lamont complex, 10 to 18 percent slopes, severely eroded ..... 121
952F2—Tell-Lamont complex, 18 to 35 percent slopes, eroded ..... 122
Lawson Series ..... 123
1451A—Lawson silt loam, undrained, 0 to 2 percent slopes, frequently flooded ..... 124
3451A—Lawson silt loam, 0 to 2 percent slopes, frequently flooded ..... 125
7451A—Lawson silt loam, 0 to 2 percent slopes, rarely flooded ..... 126
Littleton Series ..... 127
81A—Littleton silt loam, 0 to 2 percent slopes ..... 128
81B—Littleton silt loam, 2 to 5 percent slopes ..... 129
Loran Series. ..... 129
572C2—Loran silt loam, 5 to 10 percent slopes, eroded ..... 131
Medary Series ..... 132
569F2—Medary silty clay loam, 15 to 45 percent slopes, eroded ..... 133
Millington Series ..... 134
1082A-Millington silt loam, undrained, 0 to 2 percent slopes, frequently flooded ..... 135
3082A—Millington silt loam, 0 to 2 percent slopes, frequently flooded ..... 135
7082A—Millington clay loam, 0 to 2 percent slopes, rarely flooded ..... 136
Mt. Carroll Series ..... 137
268B—Mt. Carroll silt loam, 2 to 5 percent slopes ..... 138
268C2—Mt. Carroll silt loam, 5 to 10 percent slopes, eroded ..... 139
M-W-Miscellaneous water ..... 140
Muscatune Series ..... 140
51A—Muscatune silt loam, 0 to 2 percent slopes ..... 142
51B—Muscatune silt loam, 2 to 5 percent slopes ..... 142
Myrtle Series ..... 143
414B—Myrtle silt loam, 2 to 5 percent slopes ..... 145
414C2—Myrtle silt loam, 5 to 10 percent slopes, eroded ..... 145
NewGlarus Series ..... 146
905F—NewGlarus-Lamoille silt loams, 18 to 35 percent slopes ..... 148
905G—NewGlarus-Lamoille silt loams, 35 to 60 percent slopes ..... 149
928C2—NewGlarus-Palsgrove silt loams, 5 to 10 percent slopes, eroded ..... 150
928D2—NewGlarus-Palsgrove silt loams, 10 to 18 percent slopes, eroded ..... 151
Niota Series ..... 152
261A—Niota silt loam, 0 to 2 percent slopes ..... 153
Ogle Series ..... 154
412B—Ogle silt loam, 2 to 5 percent slopes ..... 155
412C2—Ogle silt loam, 5 to 10 percent slopes, eroded ..... 156
412C3—Ogle silty clay loam, 5 to 10 percent slopes, severely eroded ..... 157
Orion Series ..... 158
3415A—Orion silt loam, 0 to 2 percent slopes, frequently flooded ..... 159
7415A—Orion silt loam, 0 to 2 percent slopes, rarely flooded ..... 159
802B—Orthents, loamy, undulating ..... 160
Osco Series ..... 161
86A—Osco silt loam, 0 to 2 percent slopes ..... 163
86B—Osco silt loam, 2 to 5 percent slopes ..... 164
86C—Osco silt loam, 5 to 10 percent slopes ..... 164
86C2—Osco silt loam, 5 to 10 percent slopes, eroded ..... 166
86C3—Osco silty clay loam, 5 to 10 percent slopes, severely eroded ..... 167
Otter Series ..... 167
1076A—Otter silt loam, undrained, 0 to 2 percent slopes, frequently flooded ..... 169
3076A—Otter silt loam, 0 to 2 percent slopes, frequently flooded ..... 169
7076A—Otter silt loam, 0 to 2 percent slopes, rarely flooded ..... 170
Palms Series ..... 171
7100A—Palms muck, 0 to 2 percent slopes, rarely flooded ..... 172
Palsgrove Series ..... 173
429C2—Palsgrove silt loam, 5 to 10 percent slopes, eroded ..... 174
928C2—NewGlarus-Palsgrove silt loams, 5 to 10 percent slopes, eroded ..... 175
928D2—NewGlarus-Palsgrove silt loams, 10 to 18 percent slopes, eroded ..... 176
Pecatonica Series ..... 177
21B—Pecatonica silt loam, 2 to 5 percent slopes ..... 178
21C2—Pecatonica silt loam, 5 to 10 percent slopes, eroded ..... 179
21C3—Pecatonica silty clay loam, 5 to 10 percent slopes, severely eroded ..... 180
21D2—Pecatonica silt loam, 10 to 18 percent slopes, eroded ..... 180
21D3—Pecatonica silty clay loam, 10 to 18 percent slopes, severely eroded ..... 181
21F2—Pecatonica silt loam, 18 to 35 percent slopes, eroded ..... 182
862—Pits, sand ..... 183
864—Pits, quarries ..... 183
865-Pits, gravel ..... 183
Port Byron Series ..... 183
277B—Port Byron silt loam, 2 to 5 percent slopes ..... 185
277C—Port Byron silt loam, 5 to 10 percent slopes ..... 186
277C2—Port Byron silt loam, 5 to 10 percent slopes, eroded ..... 186
Riley Series ..... 187
7452A-Riley loam, 0 to 2 percent slopes, rarely flooded ..... 188
Rodman Series ..... 189
735D2-Casco-Rodman-Fox complex, 6 to 12 percent slopes, eroded ..... 190
735E2-Casco-Rodman-Fox complex, 12 to 20 percent slopes, eroded ..... 192
Rozetta Series ..... 193
279A-Rozetta silt loam, 0 to 2 percent slopes ..... 194
279B-Rozetta silt loam, 2 to 5 percent slopes ..... 195
Sable Series ..... 196
68A-Sable silty clay loam, 0 to 2 percent slopes ..... 197
68A+-Sable silt loam, 0 to 2 percent slopes, overwash ..... 198
Sawmill Series ..... 199
1107A—Sawmill silty clay loam, undrained, 0 to 2 percent slopes, frequently flooded ..... 200
3107+—Sawmill silt loam, 0 to 2 percent slopes, frequently flooded, overwash ..... 201
3107A—Sawmill silty clay loam, 0 to 2 percent slopes, frequently flooded ..... 202
7107+-Sawmill silt loam, 0 to 2 percent slopes, rarely flooded, overwash ..... 203
7107A-Sawmill silty clay loam, 0 to 2 percent slopes, rarely flooded ..... 203
Seaton Series ..... 204
274B-Seaton silt loam, 2 to 5 percent slopes ..... 206
274C-Seaton silt loam, 5 to 10 percent slopes ..... 206
274C2—Seaton silt loam, 5 to 10 percent slopes, eroded ..... 207
274D2-Seaton silt loam, 10 to 18 percent slopes, eroded ..... 208
274D3-Seaton silt loam, 10 to 18 percent slopes, severely eroded ..... 208
274E2-Seaton silt loam, 18 to 25 percent slopes, eroded ..... 209
274 F -Seaton silt loam, 18 to 35 percent slopes ..... 210
943F2-Seaton-Timula silt loams, 18 to 35 percent slopes, eroded ..... 211
943G2-Seaton-Timula silt loams, 35 to 60 percent slopes, eroded ..... 212
Selma Series ..... 213
125A-Selma loam, 0 to 2 percent slopes ..... 214
Sparta Series ..... 215
88A-Sparta loamy sand, 0 to 2 percent slopes ..... 216
88B-Sparta loamy sand, 1 to 6 percent slopes ..... 217
88C-Sparta loamy sand, 6 to 12 percent slopes ..... 218
88 E -Sparta loamy sand, 12 to 20 percent slopes ..... 219
Strawn Series ..... 219
224C2—Strawn silt loam, 5 to 10 percent slopes, eroded ..... 220
224D2-Strawn silt loam, 10 to 18 percent slopes, eroded ..... 221
224D3-Strawn clay loam, 10 to 18 percent slopes, severely eroded ..... 222
224F2-Strawn silt loam, 18 to 35 percent slopes, eroded ..... 222
Tell Series ..... 223
565B-Tell silt loam, 2 to 5 percent slopes ..... 224
565 C 2 -Tell silt loam, 5 to 10 percent slopes, eroded ..... 225
565D2-Tell silt loam, 10 to 18 percent slopes, eroded ..... 226
565D3-Tell silt loam, 10 to 18 percent slopes, severely eroded ..... 227
565F2-Tell silt loam, 18 to 35 percent slopes, eroded ..... 228
952C2-Tell-Lamont complex, 5 to 10 percent slopes, eroded ..... 228
952D2-Tell-Lamont complex, 10 to 18 percent slopes, eroded ..... 230
952D3-Tell-Lamont complex, 10 to 18 percent slopes, severely eroded ..... 231
952F2—Tell-Lamont complex, 18 to 35 percent slopes, eroded ..... 232
Timula Series ..... 233
943F2—Seaton-Timula silt loams, 18 to 35 percent slopes, eroded ..... 234
943G2—Seaton-Timula silt loams, 35 to 60 percent slopes, eroded ..... 235
Wakeland Series ..... 236
3333A—Wakeland silt loam, 0 to 2 percent slopes, frequently flooded ..... 237
W-Water ..... 238
Waukegan Series ..... 238
564B—Waukegan silt loam, 2 to 5 percent slopes ..... 239
564C2—Waukegan silt loam, 5 to 10 percent slopes, eroded ..... 240
Woodbine Series ..... 241
410C2—Woodbine silt loam, 5 to 10 percent slopes, eroded ..... 242
410D2—Woodbine silt loam, 10 to 18 percent slopes, eroded ..... 243
410D3-Woodbine silty clay loam, 10 to 18 percent slopes, severely eroded ..... 244
410F2—Woodbine silt loam, 18 to 35 percent slopes, eroded ..... 245
410G2—Woodbine silt loam, 35 to 60 percent slopes, eroded ..... 246
Worthen Series ..... 247
37A—Worthen silt loam, 0 to 2 percent slopes ..... 248
37B-Worthen silt loam, 2 to 5 percent slopes ..... 249
37 C -Worthen silt loam, 5 to 10 percent slopes ..... 249
Zwingle Series ..... 250
576A—Zwingle silt loam, 0 to 2 percent slopes ..... 251
576B—Zwingle silt loam, 2 to 5 percent slopes ..... 252
576C—Zwingle silt loam, 5 to 10 percent slopes ..... 253

## Numerical Index to Map Units

21B—Pecatonica silt loam, 2 to 5 percent slopes ..... 178
21C2—Pecatonica silt loam, 5 to 10 percent slopes, eroded ..... 179
21C3—Pecatonica silty clay loam, 5 to 10 percent slopes, severely eroded ..... 180
21D2—Pecatonica silt loam, 10 to 18 percent slopes, eroded ..... 180
21D3—Pecatonica silty clay loam, 10 to 18 percent slopes, severely eroded ..... 181
21F2—Pecatonica silt loam, 18 to 35 percent slopes, eroded ..... 182
29D3—Dubuque silty clay loam, 10 to 18 percent slopes, severely eroded ..... 56
37A-Worthen silt loam, 0 to 2 percent slopes ..... 248
37B—Worthen silt loam, 2 to 5 percent slopes ..... 249
37C-Worthen silt loam, 5 to 10 percent slopes ..... 249
51A—Muscatune silt loam, 0 to 2 percent slopes ..... 142
51B—Muscatune silt loam, 2 to 5 percent slopes ..... 142
61A—Atterberry silt loam, 0 to 2 percent slopes ..... 22
61B—Atterberry silt loam, 2 to 5 percent slopes ..... 23
68A-Sable silty clay loam, 0 to 2 percent slopes ..... 197
68A+—Sable silt loam, 0 to 2 percent slopes, overwash ..... 198
81A—Littleton silt loam, 0 to 2 percent slopes ..... 128

## Foreword

Soil surveys contain information that affects land use planning in survey areas. They include predictions of soil behavior for selected land uses. The surveys highlight soil limitations, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

Soil surveys are designed for many different users. Farmers, foresters, and agronomists can use the surveys to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the surveys to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the surveys to help them understand, protect, and enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. The information in this report is intended to identify soil properties that are used in making various land use or land treatment decisions. Statements made in this report are intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. The location of each soil is shown on the detailed soil maps. Each soil in the survey area is described, and information on specific uses is given. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

## Soil Survey of Carroll County, Illinois

By Steven L. Elmer and Steven K. Higgins, Natural Resources Conservation Service<br>Original fieldwork by B.W. Ray, R.L. Allison, F.F. Hall, and A.H. Reimer, University of Illinois Agricultural Experiment Station; and L.L. Benson, F.N. Gebeck, G.W. Gook, D.C. Hallbick, J.F. Steinkamp, and P.S. Watters, Soil Conservation Service<br>Others contributing to the original fieldwork include J.D. Alexander, D.B. Freeman, and L.H. Wagner, University of Illinois Agricultural Experiment Station; and L.J. Bushue, L.W. Hacker, V.G. Link, L.M. Reinebach, R.E. Windy, and J.H. Young, Soil Conservation Service<br>Updated fieldwork by Brad Boggess, Steven L. Elmer, Erik Gerhard, and Frank E. Heisner, Natural Resources Conservation Service<br>Major assistance provided by Amy Kuhel and Gary Hankins, Natural Resources Conservation Service<br>United States Department of Agriculture, Natural Resources Conservation Service, in cooperation with the Illinois Department of Agriculture and the Illinois Agricultural Experiment Station

Carroll County is in northwestern Illinois (fig. 1). It has an area of 298,535 acres, or about 466 square miles. In 2000, the county had a population of 16,674 . Mt. Carroll, the county seat, had a population of 1,832 (U.S. Department of Commerce, 2002). The county is bounded on the west by the Mississippi River, on the north by Jo Daviess and Stephenson Counties, on the east by Ogle County, and on the south by Whiteside County.

## General Nature of the County

This section provides some general information about Carroll County. It describes history and settlement, agriculture, physiography and drainage, and climate.

## History and Settlement

Carroll County was established by law on February 22, 1839, after having been part of Jo Daviess County since 1827. The first settlement in what is now Carroll County was at the present site of Savanna in 1828. Early trails, fords, and bridges in the county resulted primarily from travel across the area to the lead-mining activities near Galena in Jo Daviess County.

The county was named after Charles Carroll of Carrollton by early settlers from Maryland. Charles Carroll was a well known statesman of the Revolutionary period, a signer of the Declaration of Independence, and United States Senator from Maryland.

> 131A—Southern Mississippi River Alluvium
> 134—Southern Mississippi Valley Loess

Figure 1.-Location of Carroll County and major land resource areas (MLRAs) in Illinois.

## Agriculture

Agriculture has always been the major industry in Carroll County. The county has a high percentage of productive soils, good transportation facilities, nearby markets, and a favorable climate.

Although cash grain farming has increased, most of Carroll County is well adapted to combination grain and livestock farming because of its sloping topography, and a high percentage of farm income is derived from livestock and livestock products.

In 2002, the county had 656 farms that made up 247,536 acres (Illinois Agricultural Statistics Service, 2004). The average farm size was 377 acres. Corn, soybeans, and hay are the major crops. In 2003, about 133,000 acres was used for corn, about 56,000 acres was used for soybeans, and about 9,900 acres was used for hay (Illinois Agricultural Statistics Service, 2004).

Hogs, beef and dairy cattle, sheep, and chickens are important animal industries. In 2003, the number of hogs and pigs in the county was 38,800 and there were about 45,100 cattle and calves (Illinois Agricultural Statistics Service, 2004).

## Physiography and Drainage

Most of Carroll County is in the Rock River Hill Country of the Till Plains Section of the Central Lowland Province. The northwestern one-fourth of the county, generally north of the village of Wacker and west of Illinois State Route 78, is included in the Wisconsin Driftless Section of the Central Lowland Province (Leighton and others, 1948).

The Wisconsin Driftless Section, which was unglaciated, is maturely to submaturely dissected by numerous dendritic drainage systems tributary to the Mississippi River. The Mississippi Valley has precipitous walls breaking into broad terraces and bottom land. Thick loess mantles the bluffs, except on bluff faces. The loess is thinner toward the east.

The glaciated part of the county, part of the Rock River Hill Country, has more subdued rolling hills in the stage of late youth to early maturity. The Illinoian drift thins in the area, and the uplands and valleys are determined primarily by the bedrock surface. In the southwestern part of the county, in the uplands, deposits of loess and fine sand occur on ridges and as low dunes on the eroded Illinoian till plain.

The highest point in the county, about 2 miles southeast of Shannon, has an elevation of approximately 1,070 feet. Some lowlands and islands in the Mississippi Valley are at an elevation of less than 590 feet. The normal pool level of the Mississippi River near the southwest corner of Carroll County is 583 feet (fig. 2).

The county is drained by several major streams. The Apple River, the Plum River, Rush Creek, Johnson Creek, Camp Creek, and Carroll Creek drain into the Mississippi River.

In the southeastern part of the county, Elkhorn Creek, Eagle Creek, Middle Creeks, Rock Creek, and Otter Creek drain southwestward into Whiteside County and the Rock River.

The extreme northeastern part of the county is drained by Lost Creek, which flows north through Stephenson County into Yellow Creek and eventually empties into the Pecatonica River. This water eventually reaches the Mississippi River in a circuitous route by way of the Pecatonica and Rock Rivers.

## Climate

Carroll County is cold in winter. In summer it generally is hot but has occasional cool spells. Precipitation falls as snow during frequent snowstorms in winter and chiefly as rain showers, which often are heavy, during the warmer periods, when warm moist air moves in from the south. The amount of annual rainfall usually is adequate for corn, soybeans, and small grain.
Table 1 gives data on temperature and precipitation for the survey area as recorded at Mt. Carroll during the period 1971 to 2000 . Table 2 shows probable dates of the first

Figure 2.-A generalized relief map of Carroll County showing the highest elevation (orange dot) and lowest elevation (blue dot).
freeze in fall and the last freeze in spring. Table 3 provides data on length of the growing season.

In winter, the average temperature is about 22 degrees $F$ and the average daily minimum temperature is about 12 degrees. The lowest temperature on record, which occurred at Mt. Carroll on January 7, 1910, is -31 degrees. In summer, the average temperature is about 69.5 degrees and the average daily maximum temperature is about 82.5 degrees. The highest recorded temperature, which occurred at Mt. Carroll on July 12, 1936, is 108 degrees.

Growing degree days are shown in table 1. They are equivalent to "heat units." During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature ( 50 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

Total annual precipitation is 37.48 inches. Of this total, 24.33 inches, or about 65 percent, usually falls in April through September. The growing season for most crops falls within this period. In 2 years out of 10, the rainfall in April through September is less than 13.1 inches. The heaviest 1 -day rainfall on record, 5 inches, occurred at Mt. Carroll on September 14, 1961. Thunderstorms occur on about 50 days each year, and most occur in summer.

The average seasonal snowfall is 33.4 inches. On average, 58 days of the year have at least 1 inch of snow on the ground. The number of such days, however, varies greatly from year to year.

Tornadoes and severe thunderstorms strike occasionally. They are of local extent and of short duration and cause only sparse damage in narrow belts. Hailstorms sometimes occur during the warmer periods. The hail falls in scattered small areas.

## How This Survey Was Made

This survey was made to provide updated information about the soils and miscellaneous areas in the survey area, which is Major Land Resource Areas 105, 108B, and 115C (fig. 1). Major land resource areas (MLRAs) are geographically
associated land resource units that share a common land use, elevation, topography, climate, water, soils, and vegetation (USDA, 2006). Map unit design and the detailed soil descriptions are based on the occurrence of each soil throughout the MLRA. This soil survey updates a survey of Carroll County published in 1975 (Ray and others, 1975) and provides the soil information on USGS 7.5-minute Digital Ortho Quad sheets for use in future geographic information systems.

The information in this survey includes a description of the soils and miscellaneous areas and their location and a discussion of their properties and the subsequent effects on suitability, limitations, and management for specified uses.

Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; and the kinds of crops and native plants. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area are in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, soil scientists develop a concept, or model, of how the soils were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landform.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, soil reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop
yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a water table within certain depths in most years, but they cannot predict that a water table will always be at a specific level in the soil on a specific date.

The descriptions, names, and delineations of the soils in this survey area may not fully agree with those of the soils in adjacent survey areas. Differences are the result of an improved knowledge of soils, modifications in series concepts, or variations in the intensity of mapping or in the extent of the soils in the survey areas.

## Formation and Classification of the Soils

This section relates the soils in the survey area to the major factors of soil formation and describes the system of soil classification.

## Formation of the Soils

Soil-forming processes act on deposited or accumulated geologic material. The characteristics of the soil at any given point are determined by the parent material, living organisms both on and in the soil, the climate, the topography, and the length of time that the forces of soil formation have acted on the soil material (Jenny, 1941).

Climate and living organisms are active factors of soil formation. As they act on the parent material that has accumulated through the weathering of rocks and that may have been relocated by water, glaciers, or wind, they slowly change the material into a natural body that has genetically related horizons. The effects of climate and living organisms are conditioned by topography. The parent material affects the kind of soil profile that forms. Finally, time is needed for changing the parent material into a soil. Usually, a long time is needed for the formation of distinct horizons. The importance of each factor differs from place to place, and each modifies the effect of the other four. In some areas one factor dominates the formation of a soil. Human activities, such as clearing forests, cultivating, and applying fertilizer, also affect soil formation.

## Parent Material

Parent material is the unconsolidated mass in which a soil forms. It determines the limits of chemical and mineralogical composition of the soil. The properties of the parent material vary greatly, sometimes within small areas, depending on how the material was deposited. The major parent materials in Carroll County were deposited during the glacial period, but some soils formed partially in the sedimentary bedrock, which is many thousands of years older than the glacial material.

Loess is the dominant parent material in upland areas and on some of the terraces. This silty material, deposited by wind, was blown from the flood plain along the Mississippi River. The thickness of the loess ranges from more than 30 feet on ridgetops near the Mississippi River to slightly less than 10 feet on ridgetops in the northeastern and eastern parts of the county (Reimer, 1957). The loess is less than 5 feet thick, regardless of the slope, in an upland area in the southwestern part of the county, including parts of York, Mt. Carroll, and Fairhaven Townships (Ray and Watters, 1961). Loess is an excellent parent material because of its silty texture, moderate bulk density and permeability, and well balanced mineral content (Fehrenbacher and others, 1968). Fifteen of the soil series in the county formed entirely in loess, including the Osco series, which is the most extensive soil series in Carroll County. Many of the other soils formed partly in loess that overlies other materials.

Loess is typically thin on the steeper slopes in the uplands, and in places it does not occur at all. In these steeper areas, some of the soils formed partly in loess and also in till, sand, or gravel, also of glacial origin. Where loess and other glacial deposits in upland areas are thin, the sedimentary bedrock is an important parent material. The bedrock is dominantly dolomitic limestone, but shale is important in some places and
sandstone occurs at shallow depths in a few places in the extreme eastern part of the county.

Sandy soils in the upland occur mainly in the southwestern part of the county, except for an area in northern Washington Township (T. 25 N., R. 3 E.). In some places the sandy parent material was probably blown onto the upland, but it may be the result of glacial action and melting, especially in the southwestern part of the county.

Soils that formed in stream terrace or bluff-wash parent materials occur mainly along the major streams and vary greatly in texture. Extremely sandy soils occur on much of the Mississippi River terrace along with loamy and silty soils. Lacustrine deposits, which are dominantly silty clay to clay in the upper few feet, are the parent material for a small but significant group of soils that occur mainly on the Plum River terraces north and east of Savanna.

The flood plains of the major streams contain recently deposited sediments derived from upland slopes. The soils that formed in these materials are primarily silt loams, but textures range from silty clay loam to sandy loam.

## Living Organisms

Plants are the principal living organisms affecting the soils in Carroll County. Bacteria, fungi, and earthworms, however, also have affected soil formation. The chief contribution of plant and animal life is the addition of organic matter and nitrogen to the soil. The kind of organic material on and in the soil depends on the kind of plants that grew on the soil. The remains of these plants accumulate in the surface layer, decay, and eventually become organic matter. The roots of the plants provide channels for the downward movement of water through the soil and add organic material as they decay. Bacteria in the soil help to break down the organic material and thus help to provide plant nutrients.

The native vegetation in the county was trees and prairie grasses. The sloping soils formed mainly under forests of oak, hickory, and similar trees. The nearly level soils formed under prairie grasses. They have a darker and thicker surface layer than that of the soils that formed under forest vegetation. Also, they have a higher content of organic matter. Fayette soils are examples of soils that formed under forest vegetation. Muscatune soils are examples of soils that formed under prairie vegetation.

## Climate

Climate is an important factor in the formation of soils. It influences the kinds of plant and animal life on and in the soil. Precipitation affects the weathering of minerals and the transporting of soil material. Temperature determines the rate of chemical reaction that occurs in the soil. The general climate has had an important overall influence on the characteristics of the soils, but it does not cause major differences among soils in a relatively small area, such as a county.

The climate in Carroll County is temperate and humid. It is probably similar to the climate under which the soils formed.

## Topography

Topography, or relief, has a marked influence on the soils through its effect on natural drainage, erosion, plant cover, and soil temperature. In Carroll County, the slopes dominantly range from 0 to 60 percent. Natural soil drainage classes range from well drained on upland ridgetops to very poorly drained in depressions.

Topography influences the formation of soils by affecting runoff and drainage. Drainage in turn, through its effect on aeration of the soils, determines the color of the soil. Runoff is most rapid on the steeper slopes, but in low areas, water is temporarily
ponded. Water and air move freely through well drained soils but slowly through poorly drained soils. In well aerated soils, the iron compounds that give most soils their color are brightly colored. In poorly aerated soils, the colors are gleyed and mottled. Seaton soils are examples of well drained, well aerated soils. Sable soils are examples of poorly drained, poorly aerated soils.

## Time

The length of time needed for the formation of a soil depends on the other factors of soil formation. Differences in the length of time that the parent materials have been in place are commonly reflected in the degree of profile development. Soils form more rapidly and are more acid if the parent material has a low content of calcium (lime). The more rapidly permeable soils form more readily than slowly permeable soils because calcium and other soluble minerals are leached more quickly. Soils form more quickly under forest vegetation than under prairie vegetation because grasses are more efficient in recycling calcium and other bases from the subsoil to the surface layer. Soils generally form more quickly in a humid climate than a dry climate.

The soils in Carroll County range from young to mature. Most of the soils on uplands are moderately developed.

## Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories (Soil Survey Staff, 1999 and 2003). Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements Table 4 shows the classification of the soils in the survey area. The categories are defined in the following paragraphs.

ORDER. Twelve soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in sol. An example is Mollisol.

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Aquoll (Aqu, meaning water, plus oll, from Mollisol).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Endoaquolls (Endo, meaning within, plus aquoll, the suborder of the Mollisols that has an aquic moisture regime).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other known kind of soil. Each subgroup is identified by one or more adjectives preceding the name of the great group. An example is Typic Endoaquolls.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineral content, cation-exchange capacity, temperature regime, thickness of the root
zone, consistence, moisture equivalent, slope, and permanent cracks. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is fine-silty, mixed, superactive, mesic Typic Endoaquolls.

SERIES. The series consists of soils that have similar horizons in their profile. The horizons are similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile. The texture of the surface layer or of the substratum can differ within a series.

## Soil Series and Detailed Soil Map Units

In this section, arranged in alphabetical order, each soil series recognized in the survey area is described. Each series description is followed by descriptions of the associated detailed soil map units.

Characteristics of the soil and the material in which it formed are identified for each soil series. A pedon, a small three-dimensional area of soil, that is typical of the series in the survey area is described. The detailed description of each soil horizon follows standards in the "Soil Survey Manual" (Soil Survey Division Staff, 1993). Many of the technical terms used in the descriptions are defined in "Soil Taxonomy" (Soil Survey Staff, 1999) and in "Keys to Soil Taxonomy" (Soil Survey Staff, 2003). Unless otherwise stated, colors in the descriptions are for moist soil. Following the pedon description is the range of important characteristics of the soils in the series.

The map units on the detailed soil maps in this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses. More information about each map unit is given under the headings "Use and Management of the Soils" and "Soil Properties."

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The contrasting components are mentioned in the map unit descriptions. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of
such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives the principal hazards and limitations to be considered in planning for specific uses.

Soils that have profiles that are almost alike make up a soil series. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into soil phases. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Fayette silt loam, 5 to 10 percent slopes, eroded, is a phase of the Fayette series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are called complexes. A complex consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. NewGlarus-Palsgrove silt loams, 10 to 18 percent slopes, eroded, is an example.

This survey includes miscellaneous areas. Such areas have little or no soil material and support little or no vegetation. Pits, gravel, is an example.

Table 5 gives the acreage and proportionate extent of each map unit. Other tables give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

## Ade Series

Taxonomic classification: Coarse-loamy, mixed, superactive, mesic Lamellic Argiudolls

## Typical Pedon

Ade loamy fine sand, 2 to 7 percent slopes; 1,820 feet east and 105 feet north of the southwest corner of sec. 15, T. 20 N., R. 4 E.; Whiteside County, Illinois; USGS Erie topographic quadrangle; lat. 41 degrees 42 minutes 52 seconds $N$. and long. 90 degrees 01 minute 43 seconds W., NAD 27:

Ap-0 to 10 inches; very dark grayish brown (10YR 3/2) loamy fine sand, grayish brown (10YR 5/2) dry; moderate medium granular structure; friable; moderately acid; abrupt smooth boundary.
BA-10 to 16 inches; brown (10YR 4/3) loamy fine sand; weak medium subangular blocky structure; friable; many faint very dark grayish brown (10YR 3/2) organic films on faces of peds; slightly acid; clear smooth boundary.
Bw-16 to 27 inches; dark yellowish brown (10YR 4/4) loamy fine sand; weak medium subangular blocky structure; friable; slightly acid; abrupt smooth boundary.
E and Bt1-27 to 41 inches; dark yellowish brown (10YR 4/4) fine sand (E); single grain; loose; lamellae of brown (7.5YR 4/4) loam (Bt) about 6 inches apart and 4 to 5 inches thick; moderate medium subangular blocky structure; friable; slightly acid; clear smooth boundary.
E and Bt2—41 to 60 inches; yellowish brown (10YR 5/4) fine sand (E); single grain; loose; lamellae of brown (7.5YR 4/4) sandy loam and loamy sand (Bt) about 5 inches apart and 1 to 3 inches thick; weak medium subangular blocky structure; friable; slightly acid.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 20 inches
Depth to lamellae: 30 to 45 inches
Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture—loamy fine sand, loamy sand, or fine sand
Bw horizon:
Hue-7.5YR or 10YR
Value-4 or 5
Chroma-3 to 6
Texture-loamy fine sand or fine sand
E part of the E and Bt horizon:
Hue-10YR
Value-4 to 6
Chroma-3 to 6
Texture-sand or fine sand
Bt part of the E and Bt horizon:
Hue-7.5YR or 10YR
Value-3 or 4
Chroma-3 or 4
Texture-loamy sand, sandy loam, or loam

## 98A—Ade loamy fine sand, 0 to 2 percent slopes

Setting
Landform: Stream terraces
Position on the landform: Shoulders

## Map Unit Composition

Ade and similar soils: 96 percent
Dissimilar soils: 4 percent

## Minor Components

Similar soils:

- Soils that have a lighter colored surface layer
- Soils that have silt loam in the lower part of the subsoil
- Soils that are mostly fine sand throughout

Dissimilar soils:

- The somewhat poorly drained Watseka soils in low areas

Properties and Qualities of the Ade Soil
Parent material: Eolian sands
Drainage class: Somewhat excessively drained
Slowest permeability within a depth of 40 inches: Rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 4.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent

# Shrink-swell potential: Low <br> Flooding: None <br> Potential for frost action: Low <br> Hazard of corrosion: Low for steel and moderate for concrete <br> Surface runoff class: Very low <br> Susceptibility to water erosion: Low <br> Susceptibility to wind erosion: High <br> Interpretive Groups <br> Land capability classification: 3s <br> Prime farmland category: Not prime farmland <br> Hydric soil status: Not hydric <br> <br> 98B—Ade loamy fine sand, 2 to 7 percent slopes <br> <br> 98B—Ade loamy fine sand, 2 to 7 percent slopes <br> <br> Setting <br> <br> Setting <br> Landform: Stream terraces <br> Position on the landform: Shoulders 

## Map Unit Composition

Ade and similar soils: 96 percent
Dissimilar soils: 4 percent

## Minor Components

Similar soils:

- Soils that have a lighter colored surface layer
- Soils that have silt loam in the lower part of the subsoil
- Soils that are mostly fine sand throughout

Dissimilar soils:

- Soils that have a seasonal high water table at a depth of 1 to 2 feet; in low areas
- The somewhat poorly drained Watseka soils in low areas

## Properties and Qualities of the Ade Soil

Parent material: Eolian sands
Drainage class: Somewhat excessively drained
Slowest permeability within a depth of 40 inches: Rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 4.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: Low
Hazard of corrosion: Low for steel and moderate for concrete Surface runoff class: Very low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: High

## Interpretive Groups

Land capability classification: 3s
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 98D—Ade loamy fine sand, 7 to 15 percent slopes

## Setting

Landform: Dunes
Position on the landform: Shoulders
Map Unit Composition
Ade and similar soils: 96 percent
Dissimilar soils: 4 percent

## Minor Components

Similar soils:

- Soils that have a lighter colored surface layer
- Soils that have silt loam in the lower part of the subsoil
- Soils that are mostly fine sand throughout

Dissimilar soils:

- The somewhat poorly drained Watseka soils in low areas

Properties and Qualities of the Ade Soil
Parent material: Eolian sands
Drainage class: Somewhat excessively drained
Slowest permeability within a depth of 40 inches: Rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 4.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: Low
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: High

## Interpretive Groups

Land capability classification: 3s
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Argyle Series

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Mollic Hapludalfs
Typical Pedon
Argyle silt loam, 5 to 10 percent slopes, eroded; 2,200 feet south and 1,300 feet east of the northwest corner of sec. 4, T. 25 N., R. 7 E.; Carroll County, Illinois; USGS Shannon topographic quadrangle; lat. 42 degrees 11 minutes 34 seconds N. and long. 89 degrees 42 minutes 11 seconds W., NAD 27:
Ap-0 to 7 inches; black (10YR 2/1) silt loam; moderate fine and medium granular structure; friable; many fine and medium roots; moderately acid; clear smooth boundary.
BE—7 to 12 inches; yellowish brown (10YR 5/4) silty clay loam; moderate fine and medium subangular blocky structure; firm; common fine and medium roots; very
dark gray (10YR 3/1) worm channels; light gray (10YR 7/1) silt coatings on faces of peds; moderately acid; clear smooth boundary.
Bt1-12 to 22 inches; yellowish brown (10YR 5/4) silty clay loam; strong fine and medium subangular blocky structure; firm; common fine roots; common distinct dark yellowish brown (10YR 4/4) clay films on faces of peds; strongly acid; abrupt smooth boundary.
2Bt2—22 to 38 inches; red (2.5YR 4/6) gravelly clay loam; moderate medium and coarse angular blocky structure; firm; few fine roots; common faint yellowish red (5YR 4/6) clay films, especially on pebbles; common fine black (N 2/) masses of iron and manganese oxides or organic coatings; stone line in the upper part of the horizon; 25 percent gravel; strongly acid; clear smooth boundary.
2Bt3-38 to 70 inches; red (2.5YR 4/6) gravelly sandy clay loam; moderate coarse angular blocky structure; firm; few fine roots; common distinct dark reddish brown (2.5YR 3/4) clay films on faces of peds; 20 percent gravel; strongly acid; clear smooth boundary.
2BC—70 to 84 inches; dark red (2.5YR 3/6) sandy loam; weak coarse angular blocky structure; friable; 5 percent gravel; slightly acid.

## Range in Characteristics

Thickness of the loess: 15 to 25 inches
Thickness of the solum: 48 to more than 96 inches
A or Ap horizon:
Hue-10YR
Value-2 or 3
Chroma-1 or 2
Texture-silt loam
E horizon:
Hue-10YR
Value-4 to 6
Chroma-2 or 3
Texture—silt loam
BE or Bt horizon:
Hue-7.5YR or 10YR
Value-4 or 5
Chroma-4 to 6
Texture—silty clay loam
2Bt horizon:
Hue-7.5YR or 2.5YR
Value-3 to 5
Chroma-4 to 6
Texture—clay loam to gravelly sandy clay loam or sandy loam

## 227B—Argyle silt loam, 2 to 5 percent slopes

## Setting

## Landform: Ground moraines

Position on the landform: Summits and shoulders
Map Unit Composition
Argyle and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have less than 20 inches or more than 40 inches of loess over the underlying till
- Soils that have a lighter colored surface layer

## Properties and Qualities of the Argyle Soil

Parent material: Thin layer of loess over a paleosol that formed in till Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 4.0 percent
Shrink-swell potential: Moderate
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2 e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 227C2—Argyle silt loam, 5 to 10 percent slopes, eroded Setting

Landform: Ground moraines
Position on the landform: Shoulders and backslopes

## Map Unit Composition

Argyle and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have less than 20 inches or more than 40 inches of loess over the underlying till
- Soils that have a lighter colored surface layer

Properties and Qualities of the Argyle Soil
Parent material: Thin layer of loess over a paleosol that formed in till Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.2 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None

Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Ashdale Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Argiudolls
Taxadjunct features: The Ashdale soil in map unit 411C2 has a thinner dark surface layer than is defined as the range for the series. This soil is classified as a finesilty, mixed, superactive, mesic Mollic Hapludalf.

## Typical Pedon

Ashdale silt loam, 2 to 5 percent slopes; 18 feet east and 660 feet south of the center of sec. 36, T. 22 N., R. 11 E.; Lee County, Illinois; USGS Ashton topographic quadrangle; lat. 41 degrees 51 minutes 04 seconds $N$. and long. 89 degrees 10 minutes 43 seconds W., NAD 27:

Ap-0 to 9 inches; very dark gray (10YR 3/1) silt loam, grayish brown (10YR 5/2) dry; moderate fine granular structure; friable; few fine roots throughout; slightly acid; abrupt smooth boundary.
AB—9 to 13 inches; dark brown (10YR 3/3) silt loam, brown (10YR 5/3) dry; weak fine subangular blocky structure parting to moderate fine granular; friable; few fine roots throughout; common distinct very dark gray (10YR 3/1) organic coatings on faces of peds; moderately acid; clear smooth boundary.
Bt1—13 to 19 inches; dark yellowish brown (10YR 4/4) silty clay loam; weak medium prismatic structure parting to moderate fine granular; friable; few fine roots between peds; common faint very dark grayish brown (10YR 3/2) clay films on faces of peds; moderately acid; clear smooth boundary.
Bt2-19 to 26 inches; dark yellowish brown (10YR 4/4) silty clay loam; weak fine prismatic structure parting to moderate medium subangular blocky; firm; few fine roots between peds; common faint brown (10YR 4/3) clay films on faces of peds; moderately acid; clear smooth boundary.
Bt3-26 to 35 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate fine prismatic structure parting to moderate fine subangular blocky; firm; few fine roots between peds; few faint brown (10YR 4/3) clay films on faces of peds; few distinct light brownish gray (10YR 6/2) (dry) silt coatings on faces of peds; slightly acid; clear smooth boundary.
Bt4-35 to 44 inches; dark yellowish brown (10YR 4/4) silt loam; moderate medium prismatic structure parting to moderate medium subangular blocky; firm; few fine roots between peds; few faint brown (10YR 4/3) clay films on faces of peds; few distinct light brownish gray (10YR 6/2) (dry) silt coatings on faces of peds; slightly acid; clear smooth boundary.
Bt5—44 to 48 inches; dark yellowish brown (10YR 4/4) silt loam; moderate medium subangular blocky structure; firm; few fine roots between peds; few faint brown
(10YR 4/3) clay films on faces of peds; 1 percent pebbles about 1 to 5 mm in size; neutral; clear smooth boundary.
2BC-48 to 52 inches; mixed yellowish red (5YR 4/6) and dark yellowish brown (10YR 4/4) silty clay; moderate fine subangular blocky structure; firm; few fine roots between peds; neutral; clear smooth boundary.
$2 R-52$ inches; mixed brownish yellow (10YR 6/6) and reddish brown (5YR 4/4), fractured limestone bedrock.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 20 inches
Thickness of the loess: 36 to 50 inches
Thickness of the residuum: 2 to 20 inches
Thickness of the solum: 40 to 60 inches
$A p$ or $A B$ horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture-silt loam
Bt horizon:
Hue-10YR
Value-4 or 5
Chroma- 3 to 5
Texture-silty clay loam or silt loam
2BC horizon:
Hue-5YR to 10YR
Value-3 to 5
Chroma- 3 to 6
Texture-silty clay or clay

## 411B—Ashdale silt loam, 2 to 5 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Shoulders and summits
Map Unit Composition
Ashdale and similar soils: 85 percent
Dissimilar soils: 15 percent

## Minor Components

Similar soils:

- Soils that have a thinner dark surface layer
- Soils that contain more sand in the surface layer and the upper part of the subsoil
- Soils that have fractured limestone bedrock within a depth of 40 inches
- Soils that have thin sandy subhorizons in the lower part of the subsoil

Dissimilar soils:

- The well drained Ogle soils in landform positions similar to those of the Ashdale soil

Properties and Qualities of the Ashdale Soil
Parent material: Loess over residuum weathered from limestone Drainage class: Well drained

Slowest permeability within a depth of 40 inches: Moderate Permeability below a depth of 60 inches: Very slow or slow Depth to restrictive feature: 40 to 60 inches to bedrock (lithic) Available water capacity: About 10.5 inches to a depth of 60 inches Content of organic matter in the surface layer: 3.0 to 5.0 percent Shrink-swell potential: Moderate<br>Flooding: None<br>Potential for frost action: High<br>Hazard of corrosion: Moderate for steel and concrete<br>Surface runoff class: Low<br>Susceptibility to water erosion: Low<br>Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2 e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

# 411C2—Ashdale silt loam, 5 to 10 percent slopes, eroded Setting 

Landform: Ground moraines
Position on the landform: Backslopes and shoulders
Map Unit Composition
Ashdale and similar soils: 85 percent
Dissimilar soils: 15 percent

## Minor Components

Similar soils:

- Soils that have a thinner dark surface layer
- Soils that contain more sand in the surface layer and the upper part of the subsoil
- Soils that have fractured limestone bedrock within a depth of 40 inches
- Soils that have thin sandy subhorizons in the lower part of the subsoil

Dissimilar soils:

- The well drained Ogle soils in landform positions similar to those of the Ashdale soil

Properties and Qualities of the Ashdale Soil
Parent material: Loess over residuum weathered from limestone Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very slow or slow Depth to restrictive feature: 40 to 60 inches to bedrock (lithic)
Available water capacity: About 11.1 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 5.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium

Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Atterberry Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Udollic Endoaqualfs

## Typical Pedon

Atterberry silt loam, 0 to 2 percent slopes; 1,650 feet north and 1,120 feet east of the southwest corner of sec. 34, T. 16 N., R. 9 E.; Bureau County, Illinois; USGS Princeton South topographic quadrangle; lat. 41 degrees 19 minutes 30 seconds N. and long. 89 degrees 26 minutes 47 seconds W., NAD 27:
Ap-0 to 9 inches; very dark grayish brown (10YR 3/2) silt loam, brown (10YR 5/3) dry; moderate fine granular structure; friable; few fine roots; neutral; abrupt smooth boundary.
E-9 to 13 inches; light brownish gray (10YR 6/2) silt loam, light brownish gray (10YR 7/2) dry; moderate thin platy structure; friable; few fine roots; common fine faint grayish brown (10YR 5/2) silt coatings; slightly acid; clear smooth boundary.
BE-13 to 17 inches; brown (10YR 5/3) silt loam; moderate medium platy structure parting to moderate very fine subangular blocky; friable; few fine roots; common faint brown (10YR 4/3) clay films on faces of peds and common distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; few fine prominent dark brown (7.5YR 3/2) concretions of iron and manganese oxide; few fine distinct grayish brown (10YR 5/2) iron depletions in the matrix; slightly acid; clear smooth boundary.
Bt-17 to 24 inches; brown (10YR 5/3) silty clay loam; moderate fine subangular blocky structure; firm; few fine roots; many faint dark grayish brown (10YR 4/2) clay films and common faint light gray (10YR 7/2) (dry) silt coatings on faces of peds; common fine prominent rounded dark brown (7.5YR 3/2) concretions of iron and manganese oxide; common fine faint grayish brown (10YR $5 / 2$ ) iron depletions and common fine distinct yellowish brown (10YR $5 / 6$ ) iron concentrations in the matrix; strongly acid; clear smooth boundary.
Btg1-24 to 33 inches; grayish brown (2.5Y 5/2) silty clay loam; moderate medium subangular blocky structure; friable; few fine roots; many distinct grayish brown (10YR 5/2) clay films and few distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; common fine prominent rounded dark brown (7.5YR 3/2) concretions of iron and manganese oxide; common fine faint light brownish gray ( $2.5 \mathrm{Y} 6 / 2$ ) iron depletions and common fine distinct yellowish brown (10YR 5/6) iron concentrations in the matrix; strongly acid; clear smooth boundary.
Btg2-33 to 40 inches; light brownish gray ( $2.5 \mathrm{Y} 6 / 2$ ) silty clay loam; moderate medium prismatic structure parting to moderate medium subangular blocky; friable; few fine roots; common distinct grayish brown (10YR 5/2) clay films and few distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; many prominent very dark grayish brown (10YR $3 / 2$ ) clay films lining pores; common fine prominent rounded dark brown (7.5YR 3/2) concretions of iron and manganese oxide; many fine prominent yellowish brown (10YR $5 / 6$ ) iron concentrations in the matrix; strongly acid; clear smooth boundary.

Btg3—40 to 48 inches; light brownish gray (2.5Y 6/2) silty clay loam; moderate coarse prismatic structure; friable; few fine roots; common distinct grayish brown (10YR $5 / 2$ ) clay films on faces of peds; many prominent very dark grayish brown (10YR $3 / 2$ ) clay films lining pores; many fine prominent yellowish brown (10YR 5/6) iron concentrations in the matrix; strongly acid; clear smooth boundary.
$B C g — 48$ to 55 inches; light brownish gray (2.5Y 6/2) silt loam; weak coarse prismatic structure; friable; common distinct grayish brown (10YR $5 / 2$ ) clay films on faces of peds; many prominent very dark grayish brown (10YR 3/2) clay films lining pores; many medium prominent yellowish brown (10YR 5/6) iron concentrations in the matrix; moderately acid; clear wavy boundary.
Cg—55 to 60 inches; light brownish gray (2.5Y 6/2) silt loam; massive; friable; many medium prominent yellowish brown (10YR 5/6) iron concentrations in the matrix; slightly acid.

## Range in Characteristics

Thickness of the solum: 42 to 72 inches
Ap or A horizon:
Value-2 or 3
Chroma-1 or 2
Reaction-moderately acid to neutral
E horizon:
Value-4 to 6
Chroma-1 or 2
Reaction-strongly acid to neutral
Bt or Btg horizon:
Hue-10YR, 2.5Y, or 5Y
Value-4 to 6
Chroma-2 to 4
Texture—silty clay loam or silt loam
Reaction-strongly acid to neutral
C or Cg horizon:
Hue-10YR, 2.5Y, or 5 Y
Value-4 to 6
Chroma-1 to 4
Reaction-moderately acid to slightly alkaline

## 61A—Atterberry silt loam, 0 to 2 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Summits
Map Unit Composition
Atterberry and similar soils: 98 percent
Dissimilar soils: 2 percent

## Minor Components

Similar soils:

- Soils that have less clay in the subsoil
- Soils that have a lighter colored surface horizon
- Soils that have a dark surface layer more than 10 inches thick
- Soils that do not have a seasonal high water table within a depth of 3 feet

Dissimilar soils:

- The poorly drained Sable soils in low areas that are subject to ponding

Properties and Qualities of the Atterberry Soil
Parent material: Loess
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.7 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.5 to 3.5 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: 0.5 foot, January
through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 1
Prime farmland category: Prime farmland where drained
Hydric soil status: Not hydric

## 61B—Atterberry silt loam, 2 to 5 percent slopes Setting

Landform: Ground moraines
Position on the landform: Summits
Map Unit Composition
Atterberry and similar soils: 98 percent
Dissimilar soils: 2 percent

## Minor Components

Similar soils:

- Soils that have less clay in the subsoil
- Soils that have a lighter colored surface horizon

Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Beavercreek Series

Taxonomic classification: Loamy-skeletal, mixed, active, calcareous, mesic Typic Udifluvents
Taxadjunct features: The Beavercreek soils in this survey area have a water table higher in the profile than is defined as the range for the series. Also, they are calcareous throughout.

## Typical Pedon

Beavercreek silt loam, 0 to 2 percent slopes, frequently flooded, 1,500 feet west and 370 feet south of the northeast corner of sec. 7, T. 26 N., R. 5 E.; Jo Daviess County, Illinois; USGS Kent topographic quadrangle; lat. 42 degrees 16 minutes 05 seconds N . and long. 89 degrees 57 minutes 54 seconds W., NAD 27:
A—0 to 4 inches; very dark grayish brown (10YR 3/2) silt loam, grayish brown (10YR $5 / 2$ ) dry; moderate fine granular structure; friable; many very fine roots; many distinct very dark gray (10YR 3/1) organic coatings on faces of peds; less than 1 percent chert fragments of gravel size; slightly effervescent; slightly alkaline; abrupt smooth boundary.
C1-4 to 7 inches; very dark grayish brown (10YR 3/2) silt loam, grayish brown (10YR 5/2) dry; massive; friable; many very fine roots; common distinct brown (10YR 4/3 and $5 / 3$ ) depositional strata; many distinct very dark gray (10YR $3 / 1$ ) organic coatings on faces of peds; less than 1 percent chert fragments of gravel size; slightly effervescent; slightly alkaline; abrupt smooth boundary.
C2—7 to 18 inches; brown (10YR 5/3) silt loam; massive; friable; few very fine roots; very dark gray (10YR 3/1) loam depositional strata; 20 percent chert and dolomite fragments of gravel size; slightly effervescent; slightly alkaline; abrupt smooth boundary.
2C3-18 to 32 inches; dark grayish brown (10YR 4/2) extremely gravelly loam; massive; friable; few very fine roots; common distinct very dark gray (10YR 3/1) organic films; 70 percent chert and dolomite fragments of gravel size; strongly effervescent; slightly alkaline; abrupt smooth boundary.
2C4-32 to 52 inches; dark grayish brown (10YR 4/2) very gravelly loam with depositional strata of coarse sand; massive; friable; common distinct very dark grayish brown (10YR 3/2) and very dark gray (10YR 3/1) organic coatings on
faces of peds; 50 percent chert fragments of gravel size; violently effervescent; moderately alkaline; clear smooth boundary.
$2 \mathrm{Ab}-52$ to 57 inches; very dark gray ( $2.5 \mathrm{Y} 3 / 1$ ) gravelly silt loam; few fine prominent light olive brown ( $2.5 \mathrm{Y} 5 / 6$ ) mottles; weak medium and fine subangular blocky structure; friable; 30 percent chert and dolomite fragments of gravel size; light olive brown ( $2.5 \mathrm{Y} 5 / 6$ ) and olive yellow ( $2.5 \mathrm{Y} 6 / 6$ ) weathered rock fragments; slightly effervescent; neutral; abrupt smooth boundary.
$2 \mathrm{Bg}-57$ to 60 inches; dark grayish brown ( $2.5 \mathrm{Y} 4 / 2$ ) very gravelly loam; common medium prominent yellowish brown (10YR 5/6) mottles; weak medium subangular blocky structure; friable; 70 percent chert and dolomite fragments of gravel size; common distinct very dark gray ( $2.5 \mathrm{Y} 3 / 1$ ) organic coatings on faces of peds; strongly effervescent; slightly alkaline.

## Range in Characteristics

Depth to carbonates: 0 to 10 inches
$A$ and $C$ horizons:
Hue-10YR
Value-3 to 6
Chroma-2 or 3
Texture-fine sandy loam, very fine sandy loam, loam, or silt loam
2C horizon:
Hue-10YR or 2.5 Y
Value-3 to 6
Chroma-2 to 4
Texture-sand, loamy sand, sandy loam, loam, or silt loam or the gravelly or very gravelly analogs of these textures

2Ab horizon:
Hue-5Y, 2.5Y, or N
Value-2 or 3
Chroma-0 or 1
Texture-silty clay loam, loam, or silt loam or the gravelly or very gravelly analogs of these textures
2Bb horizon:
Hue-10YR or 2.5 Y
Value-3 to 6
Chroma-2 to 4
Texture-silty clay loam, loam, or silt loam or the gravelly or very gravelly analogs of these textures

## 3579A—Beavercreek silt loam, 0 to 2 percent slopes, frequently flooded

Setting

## Landform: Flood plains <br> Map Unit Composition

Beavercreek and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have more clay in the surface layer and subsoil
- Soils that have a surface layer more than 24 inches thick

Dissimilar soils:

- Somewhat poorly drained soils in the slightly lower positions

## Properties and Qualities of the Beavercreek Soil

Parent material: Gravelly and cobbly loamy recent alluvial and colluvial sediments Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Moderately rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 5.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 3.0 percent
Shrink-swell potential: Low
Frequency and most likely period of flooding: Frequent (January, February, March, April, May, June, November, December)
Potential for frost action: Low
Hazard of corrosion: Low for steel and concrete
Surface runoff class: Very low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 6s
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Camden Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Camden silt loam, 0 to 2 percent slopes; 1,280 feet west and 1,740 feet south of the northeast corner of sec. 12, T. 15 N., R. 8 E.; Bureau County, Illinois; USGS Wyanet topographic quadrangle; lat. 41 degrees 18 minutes 05 seconds N . and long. 89 degrees 30 minutes 52 seconds W., NAD 27:

Ap-0 to 7 inches; brown (10YR 4/3) silt loam, pale brown (10YR 6/3) dry; moderate fine granular structure; friable; few fine roots; slightly acid; abrupt smooth boundary.
E-7 to 12 inches; yellowish brown (10YR 5/4) silt loam; weak medium platy structure parting to weak very fine subangular blocky; friable; few fine roots; neutral; clear smooth boundary.
Bt1-12 to 18 inches; yellowish brown (10YR 5/6) silty clay loam; moderate fine subangular blocky structure; friable; few fine roots; common distinct yellowish brown (10YR 5/4) clay films on faces of peds; neutral; clear smooth boundary.
Bt2-18 to 26 inches; yellowish brown (10YR 5/6) silty clay loam; moderate medium prismatic structure parting to moderate medium subangular blocky; friable; few fine
roots; many distinct dark yellowish brown (10YR 4/4) clay films on faces of peds; moderately acid; clear smooth boundary.
2Bt3-26 to 34 inches; yellowish brown (10YR 5/6) clay loam; weak medium prismatic structure parting to moderate medium subangular blocky; friable; few fine roots; many distinct dark yellowish brown (10YR 4/4) clay films on faces of peds; moderately acid; clear smooth boundary.
2Bt4—34 to 37 inches; strong brown (7.5YR 5/6) clay loam; weak medium subangular blocky structure; friable; few fine roots; many distinct brown (7.5YR 4/4) clay films on faces of peds; about 7 percent gravel; slightly acid; clear smooth boundary.
2Bt5-37 to 48 inches; strong brown (7.5YR 5/6) sandy clay loam; 1-inch strata of yellowish brown (10YR 5/6) sandy loam; weak medium subangular blocky structure; friable; common distinct brown (7.5YR 4/4) clay films on faces of peds; about 5 percent gravel; slightly acid; clear smooth boundary.
2Bt6-48 to 53 inches; strong brown (7.5YR 5/6) sandy loam; weak medium subangular blocky structure; friable; common distinct brown (7.5YR 4/4) clay films bridging sand grains; about 2 percent gravel; neutral; clear wavy boundary.
2C-53 to 60 inches; brown (7.5YR 4/4) sandy loam that has thin strata of loamy sand; massive; friable; about 5 percent gravel; neutral.

## Range in Characteristics

## Depth to the base of the argillic horizon: 35 to 60 inches

## Minor Components

Similar soils:

- Soils that have less gravel and more sand or silt in the lower layers

Dissimilar soils:

- Soils underlain by till or limestone bedrock

Properties and Qualities of the Casco Soil
Parent material: Loamy alluvium over calcareous, stratified sandy outwash Drainage class: Well drained

Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 3.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Low
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Properties and Qualities of the Rodman Soil

Parent material: Sandy and gravelly glaciofluvial deposits
Drainage class: Excessively drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 2.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Low
Ponding: None
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: Low
Hazard of corrosion: Low for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Properties and Qualities of the Fox Soil

Parent material: Loamy alluvium and/or thin layer of loess over calcareous, stratified sandy outwash
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: Casco—6e; Rodman—6s; Fox—4e
Prime farmland category: Not prime farmland
Hydric soil status: Casco—not hydric; Rodman—not hydric; Fox—not hydric

## Coatsburg Series

Taxonomic classification: Fine, smectitic, mesic Vertic Argiaquolls
Taxadjunct features: The Coatsburg soil in map unit 660D3 has a thinner dark surface layer than is defined as the range for the series. This soil is classified as a fine, smectitic, mesic Vertic Epiaqualf.

## Typical Pedon

Coatsburg silt loam, 5 to 10 percent slopes, eroded; 2,550 feet east and 2,400 feet north of the southwest corner of sec. 20, T. 2 N., R. 5 W.; Adams County, Illinois; USGS Augusta topographic quadrangle; lat. 40 degrees 08 minutes 31 seconds N. and long. 90 degrees 59 minutes 59 seconds W., NAD 27:

Ap-0 to 6 inches; very dark gray (10YR 3/1) silt loam, dark grayish brown (10YR 4/2) dry; moderate fine granular structure; friable; many fine and medium roots; moderately acid; abrupt smooth boundary.
AB-6 to 10 inches; very dark gray (10YR 3/1) silty clay loam, gray (10YR 5/1) dry; weak medium subangular blocky structure parting to moderate fine subangular blocky; firm; common fine roots; few prominent light gray (10YR 7/1) (dry) silt coatings on faces of peds; common fine prominent irregular strong brown (7.5YR $5 / 6$ ) masses of iron oxide throughout; many fine prominent irregular light olive brown (2.5Y 5/4) masses of iron oxide throughout; moderately acid; clear wavy boundary.
2Btg1-10 to 14 inches; dark grayish brown (10YR 4/2) silty clay loam; weak medium subangular blocky structure; firm; few fine roots; common distinct very dark gray (10YR 3/1) organo-clay films on faces of peds; common distinct dark gray (10YR $4 / 1$ ) clay films on faces of peds; common fine prominent irregular strong brown (7.5YR 5/6) and many fine prominent irregular light olive brown (2.5Y 5/4) masses of iron oxide throughout; moderately acid; clear wavy boundary.
2Btg2—14 to 19 inches; grayish brown (10YR 5/2) silty clay; weak coarse prismatic structure parting to weak medium subangular blocky; firm; few fine and medium roots; common distinct very dark gray (10YR 3/1) organo-clay films on faces of peds; many fine prominent irregular strong brown (7.5YR 5/6) masses of iron oxide throughout; common fine faint irregular light brownish gray (10YR 6/2) iron depletions throughout; moderately acid; clear wavy boundary.
2Btg3-19 to 26 inches; grayish brown (10YR 5/2) silty clay loam; weak very coarse prismatic structure; firm; few fine roots; few distinct very dark gray (10YR 3/1) organo-clay films on faces of peds; common distinct gray (10YR $5 / 1$ ) clay films on faces of peds; common fine and medium prominent irregular strong brown (7.5YR $5 / 6$ ) masses of iron oxide throughout; many fine faint irregular light brownish gray (10YR 6/2) iron depletions throughout; moderately acid; clear wavy boundary.
2Btg4-26 to 38 inches; grayish brown (10YR 5/2) silty clay loam; weak very coarse prismatic structure; firm; few very fine roots; few distinct gray (10YR 5/1) clay films on faces of peds and in pores; common fine and medium prominent irregular black (2.5Y 2.5/1) masses of iron and manganese oxide throughout; common fine and medium prominent irregular strong brown (7.5YR $5 / 6$ ) masses of iron oxide
throughout; many fine and medium faint light brownish gray (10YR 6/2) iron depletions throughout; moderately acid; clear wavy boundary.
2Btg5-38 to 45 inches; light brownish gray (10YR 6/2) silty clay loam; moderate very coarse prismatic structure; firm; few distinct dark gray (10YR 4/1) clay films lining root channels and pores; common distinct grayish brown (10YR 5/2) clay films on faces of peds; common prominent light gray (10YR 7/2) (dry) silt coatings on faces of peds; common medium prominent brownish yellow (10YR 6/8) masses of iron oxide throughout; slightly acid; clear wavy boundary.
2Btg6-45 to 62 inches; gray (10YR 6/1) silty clay loam; moderate very coarse prismatic structure; firm; many prominent light gray (10YR 7/2) (dry) silt coatings on faces of peds; common distinct gray (10YR $5 / 1$ ) clay films on faces of peds; few medium prominent black ( $2.5 \mathrm{Y} 2.5 / 1$ ) masses of iron and manganese oxide throughout; common medium and coarse prominent brownish yellow (10YR 6/6) masses of iron oxide throughout; slightly acid; clear wavy boundary.
2Btg7-62 to 70 inches; light brownish gray (10YR 6/2) silty clay; weak very coarse prismatic structure parting to moderate medium subangular blocky; very firm; few distinct gray (10YR 6/1) clay films on faces of peds and in pores; common fine prominent black ( $2.5 \mathrm{Y} 2.5 / 1$ ) masses of iron and manganese oxide throughout; many medium prominent strong brown (7.5YR $5 / 6$ ) masses of iron oxide throughout; 2 percent pressure faces throughout; slightly acid; gradual wavy boundary.
$2 B C g-70$ to 80 inches; gray (10YR 6/1) silty clay; weak very coarse prismatic structure; firm; common fine prominent black ( $2.5 \mathrm{Y} 2.5 / 1$ ) masses of iron and manganese oxide throughout; many coarse prominent irregular brownish yellow (10YR 6/6) masses of iron throughout; slightly acid.

## Range in Characteristics

Thickness of the loess: Less than 20 inches
Thickness of the mollic epipedon: 10 to 20 inches
Depth to the base of the argillic horizon: 50 to 80 inches
$A p, A$, or $A B$ horizon:
Value-2 or 3
Chroma-1 or 2
Texture-silt loam, silty clay loam, or clay loam
Reaction-strongly acid to slightly alkaline (where limed)
$B t, B t g, 2 B t$, or $2 B t g$ horizon:
Hue-10YR, 2.5Y, 5Y, or N
Value-3 to 6
Chroma-0 to 2
Texture-clay, clay loam, silty clay, or silty clay loam
Reaction-strongly acid to slightly acid
$2 B C g$ or 2Cg horizon (where present):
Hue-10YR, 7.5YR, 2.5Y, 5Y, or N
Value-4 to 6
Chroma-0 to 8
Texture-clay, clay loam, silty clay, silty clay loam, or loam
Reaction-moderately acid to slightly alkaline

# 660D2—Coatsburg silt loam, 10 to 18 percent slopes, eroded 

## Setting

Landform: Ground moraines
Position on the landform: Backslopes

## Map Unit Composition

Coatsburg and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a lighter colored surface layer
- Soils that have as much as 3 feet of loess over the underlying till
- Soils that do not have a seasonal high water table within a depth of 1 foot

## Properties and Qualities of the Coatsburg Soil

Parent material: Paleosol that formed in till
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Very slow
Permeability below a depth of 60 inches: Slow
Depth to restrictive feature: More than 80 inches
Available water capacity: About 8.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 4.0 percent
Shrink-swell potential: High
Depth and months of the highest perched seasonal high water table: At the surface, January through May
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 4 e
Prime farmland category: Not prime farmland
Hydric soil status: Hydric

# 660D3—Coatsburg silty clay loam, 10 to 18 percent slopes, severely eroded 

Setting

Landform: Hills

Hue-7.5YR or 10YR
Value-4 or 5
Chroma-3 to 5
Texture-loam or fine sandy loam
Reaction-moderately acid to neutral

## 2Bt horizon:

Hue-5YR or 2.5YR
Value-4 to 6
Chroma- 3 to 6
Texture-loam, silt loam, silty clay loam, or silty clay
Reaction-moderately acid to neutral

## 3C horizon:

Hue-7.5YR or 10YR
Value-3 to 6

Chroma-3 to 8
Texture-sand or sand and gravel with strata of clay loam, loam, silty clay loam, or silt loam
Reaction—moderately acid to moderately alkaline

## 764B-Coyne fine sandy loam, 2 to 5 percent slopes

## Setting

Landform: Lake plains
Position on the landform: Summits and shoulders
Map Unit Composition
Coyne and similar soils 100 percent

## Minor Components

Similar soils:

- Soils that contain more sand throughout
- Soils that have a seasonal high water table within a depth of 60 inches

## Properties and Qualities of the Coyne Soil

Parent material: Lacustrine deposits
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Moderate
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Very low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Derinda Series

Taxonomic classification: Fine, mixed, active, mesic Oxyaquic Hapludalfs
Typical Pedon
Derinda silt loam; 480 feet east and 2,060 feet north of the southwest corner of sec. 32, T. 26 N., R. 6 E.; Stephenson County, Illinois; USGS Boone Branch topographic quadrangle; lat. 42 degrees 12 minutes 14 seconds N. and long. 89 degrees 50 minutes 35 seconds W., NAD 27:

Ap-0 to 7 inches; dark grayish brown (10YR 4/2) silt loam, light brownish gray (10YR
$6 / 2$ ) dry; weak medium granular structure; friable; many fine and medium roots;
few light gray (10YR 7/1 and 7/2) silt coatings; few distinct black (10YR 2/1) iron and manganese oxide concretions; slightly acid; abrupt smooth boundary.
$B E-7$ to 12 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate fine and medium subangular blocky structure; firm; common fine and medium roots; very dark grayish brown (10YR $3 / 2$ to 4/2) worm channel fillings; slightly acid; clear smooth boundary.
Bt1-12 to 18 inches; brown (10YR 4/3) silty clay loam; moderate very fine and fine subangular blocky structure; firm; common distinct brown (10YR 4/3) clay films; few fine distinct yellowish brown (10YR 5/6) and strong brown (7.5YR 5/6) masses of iron and manganese; few fine distinct black (10YR 2/1) iron and manganese concretions; common fine and medium roots; 2 percent small chert fragments; slightly acid; clear smooth boundary.
2Bt2-18 to 23 inches; variegated grayish brown (10YR 5/2) and yellowish brown (10YR 5/4) silty clay; moderate fine and medium prismatic structure parting to strong fine and medium angular blocky; firm; common distinct dark gray (10YR 4/1) clay films; common fine distinct yellowish brown (10YR 5/6) and strong brown (7.5YR 5/6) masses of iron and manganese; many fine distinct black (10YR 2/1) iron and manganese concretions; common fine and medium roots; 3 percent small chert fragments; neutral; clear smooth boundary.
2BCt-23 to 25 inches; variegated brownish yellow (10YR 6/6), yellow (10YR 7/8), and strong brown (7.5YR $5 / 6$ and $5 / 8$ ) loam; material appears to be mainly disintegrated soft limestone; weak medium angular blocky structure; very friable; many distinct dark grayish brown (10YR 4/2) coatings in root channels; many fine distinct black (10YR 2/1) iron and manganese specks; few fine and medium roots; slightly alkaline; clear smooth boundary.
2 Cr -25 to 60 inches; gray ( $5 \mathrm{Y} 6 / 1$ ), pale olive ( $5 \mathrm{Y} 6 / 3$ ), dark gray (10R $4 / 1$ ), gray (10R 5/1), and grayish brown (10R 5/2) clay shale; spots of white (10YR 8/1) lime in the pale olive ( $5 \mathrm{Y} 6 / 3$ ) zones; a few brownish yellow (10YR 6/6) to yellow (10YR 7/8) limestone slabs 2 to 3 inches thick are within the upper 12 inches in a discontinuous pattern; within the shale, limestone chunks 1 to 3 inches in diameter occupy about 5 percent of the volume; weak coarse angular blocky inherited rock structure; extremely firm; few fine and medium roots in the upper part; slightly alkaline.

## Range in Characteristics

```
Depth to paralithic or lithic contact: 20 to 40 inches
Depth to residuum from shale: 15 to 30 inches

```

2Cr horizon:
Kind of material—residuum weathered from shale

## 417D3—Derinda silty clay loam, 10 to 18 percent slopes, severely eroded

Setting<br>Landform: Hillslopes<br>Position on the landform: Backslopes<br>Map Unit Composition

Derinda and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have less than 15 inches or more than 30 inches of loess on the surface
- Soils that have till above the bedrock

## Properties and Qualities of the Derinda Soil

Parent material: Thin layer of loess over residuum weathered from calcareous shale Drainage class: Moderately well drained Slowest permeability within a depth of 40 inches: Impermeable Permeability below a depth of 60 inches: Impermeable to very slow Depth to restrictive feature: 20 to 40 inches to bedrock (paralithic)
Available water capacity: About 5.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 1.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest perched seasonal high water table: 2.5 feet,
February through April
Flooding: None
Accelerated erosion: This soil has lost more than 75 percent of the original surface
layer. The plow layer consists largely of subsoil material.
Potential for frost action: Moderate
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 6e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric
417E2—Derinda silt loam, 18 to 25 percent slopes, eroded
Setting

## Typical Pedon

Dickinson sandy loam (fig. 3), 0 to 2 percent slopes; 360 feet north and 1,720 feet west of the center of sec. 17, T. 17 N., R. 6 E.; Bureau County, Illinois; USGS Mineral topographic quadrangle; lat. 41 degrees 27 minutes 37 seconds N . and long. 89 degrees 50 minutes 09 seconds W., NAD 27:
Ap-0 to 8 inches; very dark brown (10YR 2/2) sandy loam, dark grayish brown (10YR 4/2) dry; weak fine granular structure; very friable; few fine roots; moderately acid; abrupt smooth boundary.
A1-8 to 15 inches; very dark brown (10YR 2/2) sandy loam, dark grayish brown (10YR 4/2) dry; weak medium subangular blocky structure; very friable; few fine roots; moderately acid; clear smooth boundary.
A2-15 to 20 inches; very dark grayish brown (10YR 3/2) sandy loam, grayish brown (10YR 5/2) dry; weak medium subangular blocky structure; very friable; few fine roots; common very dark brown (10YR $2 / 2$ ) organic coatings on faces of peds; slightly acid; clear smooth boundary.
Bw-20 to 31 inches; brown (10YR 4/3) sandy loam; weak medium prismatic structure parting to weak medium subangular blocky; very friable; few fine roots; many distinct dark brown (10YR $3 / 3$ ) organic coatings on faces of peds; slightly acid; clear smooth boundary.

Figure 3.-A profile of a Dickinson soil. Depth is marked in centimeters.

Bt-31 to 36 inches; yellowish brown (10YR 5/6) loamy sand; weak medium prismatic structure parting to weak medium subangular blocky; very friable; common distinct brown (10YR 4/3) clay films bridging sand grains; slightly acid; clear smooth boundary.
BC-36 to 47 inches; yellowish brown (10YR 5/6) sand; weak coarse prismatic structure; very friable; moderately acid; clear smooth boundary.
C-47 to 60 inches; yellowish brown (10YR 5/6) sand; single grain; loose; strong brown (7.5YR $5 / 6$ ) bands $1 / 2$ inch to 2 inches thick at depths of 52,56 , and 58 inches; moderately acid.

## Range in Characteristics

Thickness of the mollic epipedon: 12 to 20 inches

Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture-fine sandy loam, sandy loam, or loam
Bw horizon:
Hue-10YR
Value-3 to 5
Chroma-2 to 4
Texture—sandy loam or fine sandy loam
$B C$ and/or $C$ horizon:
Hue-7.5YR or 10YR
Value-4 or 5
Chroma-3 to 6
Texture—loamy sand, sand, loamy fine sand, or fine sand

## 87A—Dickinson sandy loam, 0 to 2 percent slopes <br> Setting

Landform: Stream terraces and outwash plains
Position on the landform: Summits
Map Unit Composition
Dickinson and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a dark surface soil more than 24 inches thick
- Soils that have more sand and gravel
- Soils that have more clay
- Soils that have a dark surface layer less than 10 inches thick
- Soils that have thin clayey subhorizons in the subsoil
- Soils that are calcareous in the lower part of the subsoil and in the substratum

Dissimilar soils:

- The somewhat poorly drained Hoopeston and poorly drained Gilford soils on footslopes

## Properties and Qualities of the Dickinson Soil

Parent material: Eolian sands over outwash
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 5.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete

Surface runoff class: Very low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 2 s
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 87B—Dickinson sandy loam, 2 to 5 percent slopes

## Setting

Landform: Stream terraces and outwash plains
Position on the landform: Shoulders and summits

## Map Unit Composition

Dickinson and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a dark surface soil more than 24 inches thick
- Soils that have more sand and gravel
- Soils that have more clay
- Soils that have a dark surface soil less than 10 inches thick
- Soils that have thin clayey subhorizons in the subsoil
- Soils that are calcareous in the lower part of the subsoil and in the substratum

Dissimilar soils:

- The somewhat poorly drained Hoopeston and poorly drained Gilford soils on footslopes

## Properties and Qualities of the Dickinson Soil

Parent material: Loamy and/or sandy alluvium and/or eolian sands Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 5.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete Surface runoff class: Very low Susceptibility to water erosion: Low
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: $2 e$
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

# 87C2—Dickinson sandy loam, 5 to 10 percent slopes, eroded 

Setting

Landform: Dunes
Position on the landform: Backslopes

## Map Unit Composition

Dickinson and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a dark surface soil more than 24 inches thick
- Soils that have more sand and gravel
- Soils that have more clay
- Soils that have a dark surface soil less than 10 inches thick
- Soils that have thin clayey subhorizons in the subsoil
- Soils that are calcareous in the lower part of the subsoil and in the substratum

Dissimilar soils:

- The somewhat poorly drained Hoopeston and poorly drained Gilford soils on footslopes

# Properties and Qualities of the Dickinson Soil 

Parent material: Eolian sands
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 5.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Low
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Dorchester Series

Taxonomic classification: Fine-silty, mixed, superactive, calcareous, mesic Typic Udifluvents

## Typical Pedon

Dorchester silt loam, 0 to 2 percent slopes; 1,600 feet east and 1,650 feet south of the northwest corner of sec. 36, T. 10 N., R. 6 E.; Peoria County, Illinois; USGS Oak Hill
topographic quadrangle; lat. 40 degrees 48 minutes 31 seconds N. and long. 89 degrees 46 minutes 11 seconds W., NAD 27:
Ap-0 to 9 inches; dark grayish brown (10YR 4/2) silt loam, gray (10YR 6/1) dry; weak medium platy structure parting to weak very fine subangular blocky; friable; few very fine roots; few faint very dark grayish brown (10YR $3 / 2$ ) organic stains on faces of peds; slightly effervescent; slightly alkaline; abrupt smooth boundary.
C-9 to 32 inches; stratified dark grayish brown (10YR 4/2), grayish brown (10YR 5/2), brown (10YR $5 / 3$ ), very dark gray (10YR $3 / 1$ ), and very dark grayish brown (10YR $3 / 2$ ) silt loam; few thin strata of loam; massive with moderate thin bedding planes resulting from stratification; friable; few very fine roots; slightly effervescent; slightly alkaline; abrupt smooth boundary.
2Ab1-32 to 43 inches; black (10YR 2/1) silt loam; weak fine subangular blocky structure parting to weak very fine granular; friable; slightly alkaline; gradual smooth boundary.
2Ab2-43 to 60 inches; very dark gray (10YR 3/1) silt loam; moderate fine subangular blocky structure; friable; many faint black (10YR 2/1) organic stains on faces of peds; few fine distinct brown (10YR 4/3) masses of iron in the matrix below a depth of 48 inches; slightly alkaline.

Range in Characteristics
Thickness of the solum: Less than 10 inches
Depth to the 2Ab horizon: 20 to 45 inches

```
Ap or A horizon:
Hue-10YR
Value-3 or 4
Chroma-2 or 3
Texture-silt loam, loam, or silty clay loam
C horizon:
Hue-10YR
Value-3 to 5
Chroma-2 or 3
Texture-silt loam; thin strata of loam in some pedons
```

2Ab horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture-clay loam, silt loam, or silty clay loam

## 1239A—Dorchester silt loam, undrained, 0 to 2 percent slopes, frequently flooded

## Setting

Landform: Flood plains

## Map Unit Composition

Dorchester and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a seasonal high water table at a depth as shallow as 2 feet
- Soils that are not calcareous

## Properties and Qualities of the Dorchester Soil

Parent material: Alluvium
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 13.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 2.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface,
November through June
Frequency and most likely period of flooding: Frequent, November through June
Potential for frost action: High
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 5w
Prime farmland category: Not prime farmland

## Drummer Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Endoaquolls

## Typical Pedon

Drummer silty clay loam; on the University of Illinois south farm 1 mile south of Urbana; 1,600 feet east and 300 feet north of the southwest corner of sec. 19, T. 19 N., R. 9 E.; Champaign County, Illinois; USGS Urbana topographic quadrangle; lat. 40 degrees 05 minutes 04 seconds N . and long. 88 degrees 13 minutes 58 seconds W.; UTM Zone 16T 0394896E 4437648N, NAD 27:

Ap—0 to 7 inches; black (10YR 2/1) silty clay loam, dark gray (10YR 4/1) dry; weak fine granular structure; firm; many fine roots; moderately acid; clear smooth boundary.
A-7 to 14 inches; black (10YR 2/1) silty clay loam, dark gray (10YR 4/1) dry; moderate fine subangular blocky structure parting to weak fine granular; firm; many fine and medium roots; slightly acid; clear smooth boundary.
BA—14 to 19 inches; very dark gray (10YR 3/1) silty clay loam, gray (10YR $5 / 1$ ) dry; moderate fine and medium subangular blocky structure; firm; many fine and medium roots; few fine faint very dark grayish brown (2.5Y 3/2) masses of iron and manganese accumulation in the matrix; slightly acid; gradual smooth boundary.
Bg—19 to 25 inches; dark gray (10YR 4/1) silty clay loam; moderate fine prismatic structure parting to moderate fine angular blocky; firm; many fine roots; common fine distinct and prominent yellowish brown (10YR 5/6) masses of iron accumulation in the matrix; many worm holes; neutral; gradual smooth boundary.
Btg1-25 to 32 inches; grayish brown (2.5Y 5/2) silty clay loam; weak fine and medium prismatic structure parting to moderate fine angular blocky; firm; many fine roots; common distinct dark gray ( $\mathrm{N} 4 / 0$ ) clay films on faces of peds; many medium distinct yellowish brown (10YR 5/4) masses of iron and manganese accumulation in the matrix; neutral; gradual wavy boundary.
Btg2—32 to 41 inches; gray (N 5/0) silty clay loam; weak medium prismatic structure parting to weak medium angular blocky; firm; few fine roots; few distinct dark gray ( $\mathrm{N} 4 / 0$ ) clay films on faces of peds; many medium prominent yellowish brown (10YR 5/4) masses of iron and manganese accumulation in the matrix; neutral; clear wavy boundary.
2Btg3-41 to 47 inches; gray (N 5/0) loam; weak coarse subangular blocky structure; friable; few fine roots; few distinct dark gray (10YR 4/1) clay films on faces of peds; common medium prominent yellowish brown (10YR 5/6) masses of iron accumulation in the matrix; 4 percent fine gravel; neutral; abrupt wavy boundary.
2Cg-47 to 60 inches; dark gray (10YR 4/1), stratified loam and sandy loam; massive; friable; many medium prominent olive brown (2.5Y 4/4) masses of iron and manganese accumulation in the matrix; many medium distinct gray ( $\mathrm{N} 5 / 0$ ) iron depletions in the matrix; slightly alkaline.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 22 inches
Thickness of the loess: 40 to 60 inches
Depth to free carbonates: 40 to 65 inches
Thickness of the solum: 42 to 65 inches
Ap or A horizon:
Hue-10YR, 2.5Y, 5Y, or N
Value-2 or 3
Chroma-0 to 2
Texture—silty clay loam

## Bg or Btg horizon:

Chroma-0 to 2

Texture-loam or silt loam with strata of sandy loam, clay loam, sandy clay loam, or silty clay loam
2C or 2Cg horizon:
Hue-7.5YR to 5 Y or N
Value-4 to 7
Chroma-0 to 8
Texture-stratified loam, silt loam, clay loam, sandy clay loam, silty clay loam, or sandy loam

## 152A—Drummer silty clay loam, 0 to 2 percent slopes

## Setting

## Landform: Outwash plains

Position on the landform: Toeslopes

## Map Unit Composition

Drummer and similar soils: 92 percent
Dissimilar soils: 8 percent

## Minor Components

Similar soils:

- Soils that have unstratified silt loam in the substratum
- Soils that contain more sand throughout
- Soils that do not have a seasonal high water table within a depth of 2 feet
- Soils that have a dark surface layer more than 24 inches thick
- Soils that contain less clay in the subsurface layer and the upper part of the subsoil

Dissimilar soils:

- Soils along drainage ditches that are subject to rare flooding

## Properties and Qualities of the Drummer Soil

Parent material: Loess over outwash
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 5.0 to 7.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Deepest ponding: 0.2 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2w
Prime farmland category: Prime farmland where drained
Hydric soil status: Hydric

## Dubuque Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Dubuque silt loam, 10 to 15 percent slopes, eroded; 2,600 feet west and 2,600 feet north of the southeast corner of sec. 28, T. 29 N., R. 2 E.; Jo Daviess County, Illinois; USGS Scales Mound West topographic quadrangle; lat. 42 degrees 28 minutes 56 seconds $N$. and long. 90 degrees 17 minutes 33 seconds W., NAD 27:
Ap-0 to 7 inches; dark grayish brown (10YR 4/2) silt loam, light brownish gray (10YR $6 / 2$ ) dry; moderate medium and fine granular structure; friable; common very fine roots; fragments of yellowish brown (10YR 5/4) subsoil mixed in the lower part; neutral; clear smooth boundary.
Bt1-7 to 13 inches; yellowish brown (10YR 5/4) silty clay loam; moderate fine and very fine subangular blocky structure; friable; common very fine roots; common fragments of dark grayish brown (10YR 4/2) mixed in the upper part; common distinct brown (10YR 4/3) clay films on faces of peds; slightly acid; gradual smooth boundary.
Bt2—13 to 20 inches; yellowish brown (10YR 5/4) silty clay loam; moderate fine subangular blocky structure; friable; common very fine roots; common distinct brown (10YR 4/3) clay films on faces of peds; moderately acid; gradual smooth boundary.
Bt3-20 to 29 inches; yellowish brown (10YR 5/4) silty clay loam; moderate medium subangular blocky structure; friable; common very fine roots; common distinct brown (10YR 4/3) clay films on faces of peds; neutral; gradual smooth boundary.
$2 \mathrm{Bt} 4-29$ to 33 inches; brown (7.5YR 5/4) and strong brown (7.5YR $5 / 6$ ) silty clay; moderate medium and fine angular blocky structure; firm; many distinct brown (7.5YR 4/2) clay films on faces of peds; neutral; abrupt smooth boundary.

2R-33 to 60 inches; hard dolomitic limestone with an inch of soft yellow (10YR 8/6) fragmented limestone in the upper part.

Range in Characteristics
Depth to dolomitic limestone: 20 to 40 inches
A or Ap horizon:
Hue-10YR
Value-3 to 5
Chroma-1 to 3
Texture—silt loam or silty clay loam
E horizon (where present):
Hue-10YR
Value-4 or 5
Chroma-2 or 3
Texture—silt loam or silty clay loam
Bt horizon:
Hue-10YR

Chroma-3 to 6
Texture—silt loam or silty clay loam

## 2Bt horizon:

Hue-5YR, 7.5YR, or 10YR
Value-4 to 6

Chroma-3 to 8
Texture-silty clay or clay

# 29D3—Dubuque clay loam, 10 to 18 percent slopes, severely eroded 

Setting<br>Landform: Hillslopes<br>Position on the landform: Backslopes<br>Map Unit Composition

Dubuque and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have more sand and less silt in the upper part
- Soils that are either less than 20 inches or more than 40 inches deep to the underlying bedrock

## Properties and Qualities of the Dubuque Soil

Parent material: Loess over a thin layer of residuum weathered from limestone Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow or very slow
Depth to restrictive feature: 20 to 30 inches to bedrock (lithic)
Available water capacity: About 4.8 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 3.0 percent
Shrink-swell potential: High
Flooding: None
Accelerated erosion: This soil has lost more than 75 percent of the original surface
layer. The plow layer consists largely of subsoil material.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Very low

## Interpretive Groups

Land capability classification: 4 e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Dunbarton Series

Taxonomic classification: Clayey, smectitic, mesic Lithic Hapludalfs

## Typical Pedon

Dunbarton silt loam, 18 to 60 percent slopes; at an elevation of 690 feet; 500 feet east and 2,600 feet north of the southwest corner of sec. 4, T. 11 N., R. 3 W.; Warren County, Illinois; USGS Monmouth topographic quadrangle; lat. 40 degrees 58 minutes 25 seconds $N$. and long. 90 degrees 44 minutes 42 seconds W., NAD 27:

A-0 to 2 inches; very dark grayish brown (10YR 3/2) silt loam, pale brown (10YR 6/3) dry; weak and moderate medium granular structure; friable; common fine and medium roots; neutral; abrupt smooth boundary.
E-2 to 4 inches; brown (10YR 5/3) silt loam; weak thin platy structure; friable; about 1 percent gravel; moderately acid; abrupt smooth boundary.
BE-4 to 10 inches; yellowish brown (10YR 5/4) silt loam; weak fine subangular blocky structure; friable; many distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; about 5 percent gravel; moderately acid; clear wavy boundary.
2Bt-10 to 16 inches; reddish brown (5YR 4/4) silty clay; strong medium subangular blocky structure; firm; common faint reddish brown (5YR 4/3) clay films on faces of peds; about 10 percent gravel; slightly acid; abrupt smooth boundary.
$2 \mathrm{Cr}-16$ to 20 inches; fractured limestone bedrock with reddish brown (5YR 4/4) clay in vertical and horizontal cracks.
2R-20 inches; limestone bedrock.

## Range in Characteristics

Thickness of the loess: 0 to 15 inches Depth to bedrock: 12 to 20 inches

A horizon:
Value-3 or 4

## E horizon:

Value-4 or 5
Chroma-2 or 3
2Bt horizon:
Hue-5YR or 7.5YR
Value-4 or 5
Chroma-3 or 4
Texture-silty clay or clay

## 505D2—Dunbarton silt loam, 6 to 12 percent slopes, eroded

## Setting

## Landform: Hillslopes

Position on the landform: Backslopes
Map Unit Composition
Dunbarton and similar soils: 95 percent
Dissimilar soils: 5 percent
Minor Components
Similar soils:

- Soils that have less clay throughout
- Soils that are underlain by calcareous shale bedrock
- Soils that are more than 20 inches deep to bedrock
- Soils that have a darker surface horizon

Dissimilar soils:

- The well drained Beavercreek soils on flood plains and in drainageways

## Properties and Qualities of the Dunbarton Soil

Parent material: Thin mantle of loess over clayey pedisediment and/or residuum weathered from dolomite
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow to moderate
Depth to restrictive feature: 12 to 20 inches to bedrock (lithic)
Available water capacity: About 3.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: High
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Interpretive Groups

Position on the landform: Backslopes

## Map Unit Composition

Dunbarton and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have less clay throughout
- Soils that are underlain by calcareous shale bedrock
- Soils that are more than 20 inches deep to bedrock

Dissimilar soils:

- The well drained Beavercreek soils on flood plains and in drainageways

## Properties and Qualities of the Dunbarton Soil

Parent material: Thin mantle of loess over clayey pedisediment and/or residuum weathered from dolomite
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow to moderate
Depth to restrictive feature: 12 to 20 inches to bedrock (lithic)
Available water capacity: About 2.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.0 to 0.5 percent
Shrink-swell potential: High
Flooding: None
Accelerated erosion: This soil has lost more than 75 percent of the original surface
layer. The plow layer consists largely of subsoil material.
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 7e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Durand Series

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Typic Argiudolls Taxadjunct features: The Durand soils in map units 416C2 and 416C3 have a thinner dark surface layer than is defined as the range for the series. The Durand soil in map unit 416C2 is classified as a fine-loamy, mixed, superactive, mesic Mollic Hapludalf. The Durand soil in map unit 416C3 is classified as a fine-loamy, mixed, superactive, mesic Typic Hapludalf.

## Typical Pedon

Durand silt loam, 2 to 5 percent slopes; 600 feet south and 405 feet east of the northwest corner of sec. 30, T. 28 N., R. 9 E.; Stephenson County, Illinois; USGS Dakota topographic quadrangle; 42 degrees 24 minutes 08 seconds $N$. and long. 89 degrees 30 minutes 51 seconds W., NAD 27:

Ap-0 to 9 inches; very dark brown (10YR 2/2) silt loam, dark grayish brown (10YR $4 / 2$ ) and grayish brown (10YR 5/2) dry; moderate fine subangular blocky structure
parting to moderate medium granular; friable; many fine and medium roots; layer compacted because of tillage practices; slightly acid; abrupt smooth boundary.
AB-9 to 13 inches; 70 percent dark brown (10YR $3 / 3$ ) and 30 percent very dark grayish brown (10YR 3/2) silt loam; dark brown (10YR 3/3) crushed; brown (10YR $5 / 3$ ) dry; moderate fine and medium granular structure; friable; many fine and medium roots; slightly acid; clear smooth boundary.
Bt1-13 to 21 inches; dark yellowish brown (10YR 4/4) and brown (10YR 4/3) silty clay loam; dark yellowish brown (10YR 4/4) crushed; moderate fine subangular blocky structure; friable; many fine and medium roots; common faint dark brown (10YR $3 / 3$ ) organo-clay films on faces of peds; moderately acid; clear smooth boundary. 2Bt2-21 to 26 inches; brown (7.5YR 4/4) clay loam; moderate fine subangular blocky structure; firm; common fine and medium roots; common faint brown (7.5YR 4/4) clay films on faces of peds; moderately acid; clear smooth boundary.
2Bt3-26 to 35 inches; brown (7.5YR 4/4) clay loam; moderate fine and medium subangular blocky structure; firm; common fine and medium roots; common faint reddish brown (5YR 4/3) clay films on faces of peds; few large pebbles; moderately acid; clear smooth boundary.
2Bt4-35 to 47 inches; reddish brown (5YR 4/4) clay loam; moderate medium and coarse subangular and angular blocky structure; firm; few fine and medium roots; common faint reddish brown (5YR 4/3) clay films on faces of peds; about 5 percent pebbles; moderately acid; clear smooth boundary.
2Bt5-47 to 66 inches; brown (7.5YR 4/4) clay loam; moderate medium and coarse subangular and angular blocky structure; firm; few fine and medium roots; common faint reddish brown (5YR 4/4) clay films on faces of peds; occasional streaks of reddish brown (2.5YR 4/4) clay residuum weathered from dolomitic limestone; about 5 percent pebbles; slightly acid; clear smooth boundary.
2BC-66 to 77 inches; brown (7.5YR 4/4) clay loam; weak medium subangular blocky structure; friable; few fine and medium roots; about 7 percent pebbles; slightly acid; abrupt wavy boundary.
$2 \mathrm{C}-77$ to 86 inches; variegated yellowish brown (10YR 5/4) and light yellowish brown (10YR 6/4) sandy loam; massive; friable; about 10 percent gravel; strongly effervescent; moderately alkaline.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 20 inches

## Interpretive Groups

Land capability classification: None assigned
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Edgington Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Argiaquic Argialbolls

## Typical Pedon

Edgington silt loam, 0 to 2 percent slopes; 222 feet west and 45 feet north of the southeast corner of $\mathrm{NE}^{1 / 1} / 4 \mathrm{sec} .5$, T. 25 N., R. 7 E.; Carroll County, Illinois; USGS Shannon topographic quadrangle; lat. 42 degrees 11 minutes 30.1 seconds N . and long. 89 degrees 42 minutes 31 seconds W., NAD 27:

A1-0 to 16 inches; black (10YR 2/1) silt loam; moderate medium granular structure; friable; many fine and medium roots; slightly acid; gradual smooth boundary.
A2-16 to 20 inches; very dark brown (10YR 2/2) and very dark grayish brown (10YR
$3 / 2$ ) silt loam; moderate medium granular structure; friable; many fine and medium roots; strongly acid; clear smooth boundary.

E-20 to 31 inches; dark grayish brown (10YR 4/2) and grayish brown (10YR 5/2) silt loam; weak medium platy structure parting to weak fine granular; friable; common fine and medium roots; few fine distinct dark yellowish brown (10YR 4/4) redoximorphic concentrations; common black (10YR $2 / 1$ ) nodules and concretions (iron and manganese oxides); strongly acid; clear smooth boundary.
Btg1-31 to 35 inches; dark gray (5Y 4/1) silty clay loam; moderate fine subangular blocky structure; friable; few fine and medium roots; few dark gray (10YR 4/1) clay films on faces of peds: few fine prominent yellowish brown (10YR 5/4) masses of iron; common prominent black (10YR 2/1) nodules and concretions (iron and manganese oxides); strongly acid; gradual smooth boundary.
Btg2—35 to 41 inches; gray (10YR 5/1) silty clay loam; weak medium prismatic structure parting to moderate fine and medium angular blocky; firm; few fine and medium roots; common faint dark gray (10YR 4/1) clay films on faces of peds; few fine distinct dark yellowish brown (10YR 4/4) and few fine prominent yellowish brown (10YR 5/6) masses of iron; common black (10YR 2/1) nodules and concretions (iron and manganese oxides); moderately acid; gradual smooth boundary.
Btg3-41 to 49 inches; gray (10YR 5/1) silty clay loam; weak medium and coarse prismatic structure parting to strong medium angular blocky; firm; few fine and medium roots; common faint dark gray (10YR 4/1) and very dark gray (10YR 3/1) clay films on faces of peds; common fine prominent brown (7.5YR 4/4) and yellowish brown (10YR 5/6) masses of iron; common black (10YR 2/1) nodules and concretions (iron and manganese oxides); moderately acid; clear smooth boundary.
Btg4—49 to 55 inches; gray (10YR 5/1) and light brownish gray (10YR 6/2) silty clay loam; weak medium and coarse angular blocky structure; firm; few fine and medium roots; common faint dark gray (10YR 4/1) clay films on faces of peds; many fine prominent brown (7.5YR 4/4) and strong brown (7.5YR 5/6) masses of iron; common black (10YR 2/1) nodules and concretions (iron and manganese oxides); very dark gray (10YR 3/1) krotovina crosses the horizon; moderately acid; gradual smooth boundary.
Cg-55 to 60 inches; gray (10YR 5/1), yellowish brown (10YR 5/6), and light brownish gray (10YR 6/2) silt loam; massive; friable; few distinct dark brown (7.5YR 3/2) masses of iron and manganese oxides; slightly acid.

## Range in Characteristics

## 272A—Edgington silt loam, 0 to 2 percent slopes <br> Setting

Landform: Ground moraines
Position on the landform: Toeslopes
Map Unit Composition
Edgington and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that are underlain by loamy or sandy drift within a depth of 5 feet; on terraces
- Soils that formed in water-laid deposits instead of in loess

## Properties and Qualities of the Edgington Soil

Parent material: Silty loess Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderately slow
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 4.5 to 6.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Deepest ponding: 0.2 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2w
Prime farmland category: Prime farmland where drained
Hydric soil status: Hydric

## Eleroy Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Oxyaquic Hapludalfs

## Typical Pedon

Eleroy silt loam, 10 to 18 percent slopes, eroded; 825 feet east and 495 feet north of the center of sec. 1, T. 25 N., R. 5 E.; Carroll County, Illinois; USGS Boone Branch topographic quadrangle; lat. 42 degrees 11 minutes 28 seconds $N$. and long. 89 degrees 52 minutes 04 seconds W., NAD 27:

Ap-0 to 7 inches; dark grayish brown (10YR 4/2) silt loam, light brownish gray (10YR 6/2) dry; moderate medium granular structure; friable; slightly acid; abrupt smooth boundary.
E-7 to 12 inches; grayish brown (10YR 5/2) silt loam, light brownish gray (10YR 6/2) dry; weak medium and thick platy structure parting to weak fine and medium granular; friable; slightly acid; clear wavy boundary.
BE-12 to 15 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate medium subangular blocky structure; firm; some light gray (10YR 7/2) (dry) silt coatings on faces of peds; slightly acid; clear smooth boundary.
Bt1-15 to 22 inches; dark yellowish brown (10YR 4/4) silty clay loam; strong medium subangular blocky structure; firm; common faint brown (10YR 4/3) clay films on faces of peds; few very dark brown (10YR 2/2) iron and manganese oxides; moderately acid; gradual smooth boundary.
Bt2-22 to 32 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate medium subangular blocky structure; firm; common faint brown (10YR 4/3) clay films on faces of peds; few medium faint yellowish brown (10YR 5/8) masses of iron and manganese oxides; moderately acid; gradual smooth boundary.
2Bt3—32 to 41 inches; olive brown ( $2.5 \mathrm{Y} 4 / 3$ ) silty clay loam; weak coarse subangular blocky structure; firm; common distinct dark grayish brown (10YR 4/2) clay films; few medium distinct yellowish brown (10YR $5 / 8$ ) masses of iron and manganese oxides; 3 percent pebbles of igneous rock; slightly acid; abrupt smooth boundary.
$2 \mathrm{Cr}-41$ to 50 inches; gray (5Y 6/1) clay shale; common coarse prominent light olive brown (2.5Y5/4) stains of oxidized iron and manganese on fragment surfaces; massive; very firm; calcareous.

## Elizabeth Series

Taxonomic classification: Loamy-skeletal, mixed, superactive, mesic Lithic Hapludolls
Typical Pedon
Elizabeth silt loam, 7 to 15 percent slopes; 1,900 feet west and 560 feet south of the northeast corner of sec. 10, T. 27 N., R. 2 E.; Jo Daviess County, Illinois; USGS Hanover topographic quadrangle; lat. 42 degrees 21 minutes 17 seconds N. and long. 90 degrees 15 minutes 57 seconds $W$.

A1-0 to 6 inches; very dark gray (10YR 3/1) silt loam, gray (10YR 5/1) dry; moderate medium granular structure; friable; many fine and very fine roots; less than 10 percent limestone; slightly alkaline; clear smooth boundary.
A2-6 to 10 inches; very dark grayish brown (10YR 3/2) cobbly silt loam, grayish brown (10YR 5/2) dry; moderate medium subangular blocky structure parting to moderate medium granular; friable; many fine and very fine roots; 25 percent limestone; slightly effervescent; slightly alkaline; clear smooth boundary.
A3-10 to 19 inches; dark brown (10YR 3/3) extremely cobbly loam, brown (10YR 5/3) dry; moderate medium granular structure; friable; few fine and very fine roots; about 90 percent cobbles 3 to 6 inches in the smallest dimension; slightly effervescent; slightly alkaline; diffuse wavy boundary.
2R-19 inches; fractured dolomitic limestone bedrock; some dark silt loam in cracks in the upper few inches.

## Range in Characteristics

Thickness of the solum and depth to dolomitic limestone: 10 to 20 inches
A horizon:
Hue-10YR

Value-2 or 3
Chroma-1 to 3
Texture—silt loam, loam, clay loam, or silty clay loam

## 2R horizon:

Kind of material—fractured dolomitic limestone

## 403E2—Elizabeth silt loam, 12 to 35 percent slopes, eroded

## Setting

Landform: Stream terraces
Position on the landform: Backslopes

## Map Unit Composition

Elizabeth and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have fractured bedrock at the surface
- Soils that are more than 20 inches deep to bedrock
- Soils that have more clay in the subsoil

## Properties and Qualities of the Elizabeth Soil

Parent material: Loamy material over dolostone
Drainage class: Somewhat excessively drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow or moderately slow
Depth to restrictive feature: 7 to 20 inches to bedrock (lithic)
Available water capacity: About 2.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.5 to 5.0 percent
Shrink-swell potential: Moderate
Ponding: None
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 7s
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Fayette Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Fayette silt loam (fig. 4), 10 to 18 percent slopes, eroded; 2,100 feet north and 1,700 feet west of the southeast corner of sec. 31, T. 12 N., R. 3 W.; Warren County, Illinois;

Figure 4.-A profile of a Fayette soil. These soils formed in loess under a cover of forestland vegetation.

USGS Rozetta topographic quadrangle; lat. 40 degrees 59 minutes 13 seconds N . and long. 90 degrees 46 minutes 18 seconds W., NAD 27:

Ap—0 to 5 inches; mixed dark grayish brown (10YR 4/2) and yellowish brown (10YR $5 / 4$ ) silt loam, light brownish gray (10YR 6/2) dry; moderate medium granular structure; friable; common fine roots throughout; moderately acid; clear smooth boundary.
EB—5 to 9 inches; mixed brown (10YR 5/3) and yellowish brown (10YR 5/4) silt loam; weak medium platy structure parting to moderate fine subangular blocky; friable; common fine roots between peds; few faint dark yellowish brown (10YR 4/4) clay films on faces of peds; moderately acid; clear smooth boundary.
Bt1-9 to 13 inches; dark yellowish brown (10YR 4/4) silt loam; moderate fine and medium subangular blocky structure; friable; few fine roots between peds; common faint brown (10YR 4/3) clay films on faces of peds; moderately acid; clear smooth boundary.
Bt2—13 to 27 inches; yellowish brown (10YR 5/4) silty clay loam; moderate medium subangular blocky structure; friable; few fine roots between peds; common faint dark yellowish brown (10YR 4/4) clay films on faces of peds; moderately acid; gradual smooth boundary.
Bt3-27 to 38 inches; yellowish brown (10YR 5/4) silty clay loam; weak coarse prismatic structure parting to moderate medium subangular blocky; friable; common faint dark yellowish brown (10YR 4/4) clay films on faces of peds; common distinct light gray (10YR 7/2) (dry) clay depletions on faces of peds; few
prominent dark brown (7.5YR 3/2) accumulations of iron-manganese on faces of peds; moderately acid; gradual wavy boundary.
BC-38 to 55 inches; yellowish brown (10YR 5/4) silt loam; moderate medium and coarse subangular blocky structure; friable; common faint dark yellowish brown (10YR 4/4) clay films on faces of peds; common distinct light gray (10YR 7/2) (dry) clay depletions on faces of peds; few prominent dark brown (7.5YR 3/2) accumulations of iron-manganese on faces of peds; moderately acid; clear wavy boundary.
C-55 to 60 inches; yellowish brown (10YR 5/4) silt loam; massive; friable; few prominent dark brown (7.5YR 3/2) concretions of iron and manganese throughout the matrix; moderately acid.

Chroma-4 to 6
Texture-silt loam or silty clay loam

## 280B—Fayette silt loam, 2 to 5 percent slopes <br> Setting

Landform: Ground moraines
Position on the landform: Shoulders and summits
Map Unit Composition
Fayette and similar soils: 100 percent
Minor Components
Similar soils:

- Soils that have a darker surface layer
- Soils that have a seasonal high water table within a depth of 6 feet
- Soils that contain less clay in the subsoil

## Properties and Qualities of the Fayette Soil

Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate

Permeability below a depth of 60 inches: Moderate Depth to restrictive feature: More than 80 inches<br>Available water capacity: About 11.6 inches to a depth of 60 inches<br>Content of organic matter in the surface layer: 1.0 to 3.0 percent<br>Shrink-swell potential: Moderate<br>Flooding: None<br>Potential for frost action: High<br>Hazard of corrosion: Moderate for steel and concrete<br>Surface runoff class: Low<br>Susceptibility to water erosion: Moderate<br>Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 280C—Fayette silt loam, 5 to 10 percent slopes <br> Setting

Landform: Ground moraines
Position on the landform: Shoulders and summits
Map Unit Composition
Fayette and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have a seasonal high water table within a depth of 6 feet
- Soils that contain less clay in the subsoil
- Soils that contain loamy glacial till within a depth of 60 inches

## Properties and Qualities of the Fayette Soil

Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

# 280C2—Fayette silt loam, 5 to 10 percent slopes, eroded Setting <br> Landform: Ground moraines <br> Position on the landform: Shoulders and backslopes 

Map Unit Composition
Fayette and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have a seasonal high water table within a depth of 6 feet
- Soils that contain less clay in the subsoil
- Soils that contain loamy glacial till within a depth of 60 inches

Properties and Qualities of the Fayette Soil
Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and high for concrete Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 280C3—Fayette silty clay loam, 5 to 10 percent slopes, severely eroded

Setting<br>Landform: Ground moraines<br>Position on the landform: Backslopes and shoulders<br>Map Unit Composition

Fayette and similar soils: 100 percent
Minor Components
Similar soils:

- Soils that have a darker surface layer
- Soils that have a seasonal high water table within a depth of 6 feet
- Soils that contain less clay in the subsoil
- Soils that contain loamy glacial till within a depth of 60 inches

Properties and Qualities of the Fayette Soil
Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.2 to 1.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost more than 75 percent of the original surface
layer. The plow layer consists largely of subsoil material.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 4 e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 280D2—Fayette silt loam, 10 to 18 percent slopes, eroded Setting

Landform: Loess hills and ground moraines
Position on the landform: Shoulders and backslopes

## Map Unit Composition

Fayette and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have a seasonal high water table within a depth of 6 feet
- Soils that contain less clay in the subsoil
- Soils that contain loamy glacial till within a depth of 60 inches

Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 7e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 798C2—Fayette-Gale silt loams, 5 to 10 percent slopes, eroded

Setting<br>Landform: Ground moraines<br>Position on the landform: Fayette—shoulders and the upper backslopes; Gale—middle and lower backslopes

## Map Unit Composition

Fayette and similar soils: 60 percent
Gale and similar soils: 40 percent

## Minor Components

Similar soils:

- Soils that have slopes of more than 10 percent
- Soils that are underlain by limestone rather than sandstone

## Properties and Qualities of the Fayette Soil

Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.

Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Properties and Qualities of the Gale Soil

Parent material: Loess over residuum weathered from sandstone Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately slow
Permeability below a depth of 60 inches: Moderately slow
Depth to restrictive feature: 20 to 40 inches to bedrock (paralithic)
Available water capacity: About 4.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: Fayette—3e; Gale-3e
Prime farmland category: Not prime farmland
Hydric soil status: Fayette—not hydric; Gale—not hydric

## Flagg Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Flagg silt loam, 2 to 5 percent slopes; 100 feet south and 1,790 feet west of the center of sec. 20, T. 27 N., R. 9 E.; Stephenson County, Illinois; USGS Ridott topographic quadrangle; lat. 42 degrees 19 minutes 25 seconds N. and long. 89 degrees 29 minutes 28 seconds W., NAD 83:

A-0 to 4 inches; very dark grayish brown (10YR 3/2) silt loam; moderate fine granular structure; friable; few wormcasts; moderately acid; clear smooth boundary.
E-4 to 11 inches; brown (10YR 4/3) silt loam; weak thin platy structure parting to moderate fine granular; friable; common wormcasts; strongly acid; clear smooth boundary.
BE—11 to 17 inches; brown (7.5YR 4/4) silty clay loam; moderate fine subangular blocky structure; firm; few clean silt grains on faces of peds; strongly acid; gradual smooth boundary.
Bt1-17 to 30 inches; brown (7.5YR 4/4) silty clay loam; moderate fine and medium subangular blocky structure; firm; common distinct dark brown (7.5YR 3/2) clay films on faces of peds; strongly acid; gradual smooth boundary.
Bt2-30 to 39 inches; brown (7.5YR 4/4) silty clay loam; moderate medium angular blocky structure; firm; common distinct dark brown (7.5YR 3/2) clay films on faces of peds; common small dark concretions of iron and manganese oxides; strongly acid; clear smooth boundary.

2Bt3-39 to 48 inches; brown (7.5YR 5/4) silty clay loam containing a component of sand; common coarse distinct strong brown (7.5YR 5/8) masses of iron oxides; moderate medium and coarse subangular blocky structure; firm; many distinct reddish brown (5YR 4/3) clay films on faces of peds; strongly acid; gradual smooth boundary.
2Bt4-48 to 72 inches; reddish brown (5YR 4/4) clay loam; moderate medium subangular blocky structure; firm; many faint dark reddish brown (5YR 3/4) clay films on faces of peds; strongly acid.

## 3646L—Fluvaquents, loamy, 0 to 2 percent slopes, frequently flooded, long duration

## Setting

Landform: Flood plains

## Map Unit Composition

Fluvaquents and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have more sand
- Soils that have more clay

Dissimilar soils:

- The somewhat poorly drained Hoopeston soils on summits

Properties and Qualities of the Fluvaquents
Parent material: Alluvium
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Moderate

Depth and months of the highest apparent seasonal high water table: At the surface all year
Deepest ponding: 0.2 foot all year
Frequency and most likely period of flooding: Frequent, November through June
Potential for frost action: High
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 5w
Prime farmland category: Not prime farmland
Hydric soil status: Hydric

## Fox Series

Taxonomic classification: Fine-loamy over sandy or sandy-skeletal, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Fox silt loam, 6 to 12 percent slopes, eroded; 258 feet north and 111 feet east of the southwest corner of sec. 24, T. 46 N., R. 4 E.; Winnebago County, Illinois:

Ap-0 to 8 inches; dark grayish brown (10YR 4/2) silt loam; moderate medium granular structure; friable; common distinct very dark brown (10YR 2/2) coatings on faces of peds; neutral; abrupt smooth boundary.
Bt1-8 to 15 inches; dark yellowish brown (10YR 4/4) clay loam; moderate fine subangular blocky structure; friable; few faint dark grayish brown (10YR 4/2) clay films on faces of peds; neutral; clear smooth boundary.
Bt2—15 to 18 inches; brown (10YR 4/3) clay loam; moderate fine and medium subangular blocky structure; friable; few faint dark grayish brown (10YR 4/2) clay films on faces of peds; neutral; clear smooth boundary.
Bt3-18 to 24 inches; brown (10YR 4/3) gravelly loam; moderate medium subangular blocky structure; friable; few faint brown (7.5YR 4/2) clay films on faces of peds; neutral; clear smooth boundary.
Bt4-24 to 28 inches; brown (10YR 4/3) gravelly sandy loam; weak medium subangular blocky structure; friable; few distinct brown (7.5YR 4/2) clay films on faces of peds; neutral; abrupt smooth boundary.
2C-28 to 60 inches; yellowish brown (10YR 5/4) gravelly coarse sand and gravelly sand; single grain; loose; 25 percent gravel; violently effervescent; moderately alkaline.

## Range in Characteristics

Thickness of the loess or other silty material: Less than 24 inches
Depth to sandy and gravelly deposits: 20 to 40 inches
Depth to carbonates: 20 to 40 inches
Thickness of the solum: 20 to 40 inches

Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches

Available water capacity: About 7.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: Casco—6e; Rodman-6s; Fox—4e
Prime farmland category: Not prime farmland
Hydric soil status: Casco—not hydric; Rodman—not hydric; Fox—not hydric

## Gale Series

Taxonomic classification: Fine-silty over sandy or sandy-skeletal, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Gale silt loam, in an area of Fayette-Gale complex, 5 to 10 percent slopes, eroded; 2,310 feet east and 2,490 feet north of the southwest corner of sec. 4, T. 24 N., R. 7 E.; Carroll County Illinois; USGS Brookville topographic quadrangle; lat. 42 degrees 06 minutes 15 seconds N . and long. 89 degrees 41 minutes 51 seconds W., NAD 27:

Ap-0 to 9 inches; dark grayish brown (10YR 4/2) silt loam, light brownish gray (10YR $6 / 2$ ) dry; moderate medium granular structure; friable; slightly acid; abrupt smooth boundary.
BE-9 to 12 inches; brown (10YR 4/3) silt loam; weak fine subangular blocky structure; friable; common faint dark brown (10YR $3 / 3$ ) organic coatings on faces of peds and in pore linings; slightly acid; clear wavy boundary.
Bt1-12 to 18 inches; brown (10YR 4/3) silt loam; moderate medium subangular blocky structure; friable; common faint dark brown (10YR $3 / 3$ ) clay films on faces of peds; strongly acid; clear wavy boundary.
2Bt2-18 to 21 inches; dark yellowish brown (10YR 4/4) loam; weak medium subangular blocky structure; friable; common faint dark brown (10YR 3/3) clay films on faces of peds; strongly acid; clear wavy boundary.
3C-21 to 27 inches; strong brown (7.5YR 5/6) channery sand; about 20 percent sandstone channers; strongly acid.
$3 \mathrm{Cr}-27$ inches; strong brown (7.5YR 4/6) sandstone bedrock.

## Range in Characteristics

Thickness of the loess mantle: 15 to 39 inches
Depth to sandy residuum: 15 to 39 inches
Depth to the paralithic contact with sandstone: 20 to 40 inches

Texture—sandy loam or fine sandy loam; strata of loamy sand, loamy fine sand, loam, sandy clay loam, silt loam, or sand in some pedons
Cg and/or C horizon:
Hue-7.5YR to 5 Y
Value-3 to 6
Chroma-1 to 8
Texture-loamy sand, sand, loamy fine sand, or fine sand; loamy strata in some pedons

## 172A-Hoopeston sandy loam, 0 to 2 percent slopes

Setting

Landform: Outwash plains<br>Position on the landform: Summits

Map Unit Composition
Hoopeston and similar soils: 92 percent
Dissimilar soils: 8 percent

## Minor Components

Similar soils:

- Soils that have more sand or clay in the subsoil
- Soils that have a seasonal high water table at a depth of more than 3 feet

Dissimilar soils:

- The well drained Dickinson soils on summits and shoulders
- The very poorly drained Gilford soils in depressions

## Properties and Qualities of the Hoopeston Soil

Parent material: Loamy and/or sandy outwash
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 3.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Very low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 2s
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Huntsville Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Cumulic Hapludolls

## Typical Pedon

Huntsville silt loam, 0 to 2 percent slopes, occasionally flooded; at an elevation of 623 feet; 2,475 feet east and 495 feet south of the northwest corner of sec. 1, T. 12 N., R. 4 E.; Knox County, Illinois; USGS La Fayette topographic quadrangle; lat. 41 degrees 03 minutes 37 seconds N . and long. 89 degrees 59 minutes 42 seconds W., NAD 27:

Ap-0 to 10 inches; very dark grayish brown (10YR 3/2) silt loam, grayish brown (10YR 5/2) dry; weak fine and medium subangular blocky structure; friable; slightly acid; clear smooth boundary.
A1-10 to 16 inches; very dark grayish brown (10YR $3 / 2$ ) silt loam, grayish brown (10YR $5 / 2$ ) dry; weak fine granular structure; friable; common faint very dark gray (10YR 3/1) organic coatings on faces of peds; neutral; clear smooth boundary.
A2-16 to 27 inches; dark brown (10YR 3/3) silt loam, brown (10YR 5/3) dry; weak fine granular structure; friable; common distinct very dark gray (10YR 3/1) organic coatings on faces of peds; neutral; clear smooth boundary.
AC-27 to 52 inches; brown (10YR 4/3) silt loam, pale brown (10YR 6/3) dry; weak medium subangular blocky structure; friable; common distinct very dark grayish
brown (10YR 3/2) organic coatings on faces of peds; neutral; clear smooth boundary.
C—52 to 60 inches; dark brown (10YR 3/3) silt loam; massive; friable; slightly acid.

## Range in Characteristics

Thickness of the mollic epipedon: 24 to 57 inches
Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture-silt loam
AC horizon:
Hue-10YR
Value-4 or 5
Chroma-3 or 4
Texture—silt loam or loam below a depth of 40 inches
C horizon:
Hue-10YR
Value-3 to 5
Chroma-3 or 4
Texture-silt loam or loam; strata of very fine sandy loam to fine sand below a depth of 40 inches in some pedons

## 8077A—Huntsville silt loam, 0 to 2 percent slopes, occasionally flooded

## Setting

Landform: Flood plains

## Map Unit Composition

Huntsville and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that contain more sand
- Soils that have a dark surface soil less than 24 inches thick
- Soils that have a light-colored deposit of silt loam overwash
- Soils that have slopes of more than 2 percent

Dissimilar soils:

- The somewhat poorly drained Lawson soils in the slightly lower positions
- Soils in the slightly higher positions that are not subject to frequent flooding

## Properties and Qualities of the Huntsville Soil

Parent material: Alluvium
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 13.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 4.0 percent

Shrink-swell potential: Moderate<br>Depth and months of the highest apparent seasonal high water table: 4.0 feet,<br>February through April<br>Frequency and most likely period of flooding: Occasional, November through June<br>Potential for frost action: High<br>Hazard of corrosion: Low for steel and concrete<br>Surface runoff class: Low<br>Susceptibility to water erosion: Low<br>Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 1
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Joy Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Aquic Hapludolls

## Typical Pedon

Joy silt loam, 0 to 2 percent slopes; 1,900 feet east and 2,600 feet north of the southwest corner of sec. 26, T. 18 N., R. 3 E.; Henry County, Illinois; USGS Spring Hill topographic quadrangle; lat. 41 degrees 31 minutes 01 second $N$. and long. 90 degrees 06 minutes 59 seconds W., NAD 27:

Ap-0 to 5 inches; black (10YR 2/1) silt loam, dark grayish brown (10YR 4/2) dry; moderate medium granular structure; friable; moderately acid; abrupt smooth boundary.
A1-5 to 13 inches; very dark gray (10YR 3/1) silt loam, dark grayish brown (10YR $4 / 2$ ) dry; weak fine subangular blocky structure parting to moderate medium granular; friable; slightly acid; clear smooth boundary.
A2-13 to 17 inches; very dark grayish brown (10YR 3/2) silt loam; moderate fine subangular blocky structure parting to moderate medium granular; friable; neutral; clear smooth boundary.
Bt1-17 to 21 inches; brown (10YR 4/3) silt loam; moderate medium and fine subangular blocky structure; friable; common faint dark grayish brown (10YR 4/2) clay films on faces of peds; neutral; clear smooth boundary.
Bt2-21 to 27 inches; mixed grayish brown (10YR 5/2) and brown (10YR 5/3) silty clay loam; moderate medium and fine subangular blocky structure; friable; common faint dark grayish brown (10YR 4/2) clay films on faces of peds; few prominent black (7.5YR 2.5/1) coatings of iron-manganese on faces of peds; common medium distinct yellowish brown (10YR $5 / 6$ ) iron masses in the matrix; neutral; clear smooth boundary.
Bt3-27 to 34 inches; yellowish brown (10YR 5/4) silt loam; moderate fine and medium subangular blocky structure; friable; common faint brown (10YR $5 / 3$ ) clay films on faces of peds; few prominent black (7.5YR 2.5/1) coatings of iron-manganese on faces of peds; common fine distinct light brownish gray (10YR 6/2) iron depletions and yellowish brown (10YR 5/6) iron masses in the matrix; neutral; clear smooth boundary.
Btg-34 to 49 inches; mixed light brownish gray ( $2.5 \mathrm{Y} 6 / 2$ ) and yellowish brown (10YR $5 / 6$ ) silt loam; weak fine prismatic structure parting to weak fine and medium subangular blocky; friable; few faint grayish brown (10YR 5/2) clay films on faces of peds; few prominent black (7.5YR 2.5/1) coatings of iron-manganese on faces of peds; neutral; gradual smooth boundary.

Cg—49 to 60 inches; light brownish gray (2.5Y 6/2) silt loam; massive; friable; common prominent black (7.5YR 2.5/1) coatings of iron-manganese along cleavage planes; many medium prominent yellowish brown (10YR 5/6) iron masses in the matrix; neutral.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 20 inches
Depth to free carbonates: More than 40 inches
Thickness of the solum: 36 to 60 inches
Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture—silt loam
Bw, Bg, or Bt horizon:
Hue-7.5YR, 10YR, or 2.5Y
Value-4 to 6
Chroma-2 to 6
Texture—silt loam or silty clay loam
C or Cg horizon:
Hue-10YR, 2.5Y, or 5Y
Value-4 to 7
Chroma-1 to 4
Texture-silt loam, very fine sandy loam, or loam

## 275A—Joy silt loam, 0 to 2 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Summits

## Map Unit Composition

Joy and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have less silt and more sand in the substratum
- Soils that have a dark surface soil more than 24 inches or less than 10 inches thick
- Soils that do not have a seasonal high water table within a depth of 4 feet

Dissimilar soils:

- The well drained Port Byron soils on summits and shoulders
- The poorly drained Sable soils on toeslopes

## Properties and Qualities of the Joy Soil

Parent material: Loess
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.9 inches to a depth of 60 inches

Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January
through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 1
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 275B—Joy silt loam, 2 to 5 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Summits
Map Unit Composition
Joy and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have less silt and more sand in the substratum
- Soils that have a dark surface soil more than 24 inches or less than 10 inches thick
- Soils that do not have a seasonal high water table within a depth of 4 feet

Dissimilar soils:

- The well drained Port Byron soils on summits and shoulders

Properties and Qualities of the Joy Soil
Parent material: Loess
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Keltner Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Oxyaquic Argiudolls

## Typical Pedon

Keltner silt loam, 2 to 5 percent slopes; 380 feet east and 240 feet north of the center of sec. 32, T. 26 N., R. 7 E.; Stephenson County, Illinois; USGS Shannon topographic quadrangle; lat. 42 degrees 12 minutes 23 seconds $N$. and long. 89 degrees 42 minutes 59 seconds W., NAD 27:

Ap-0 to 8 inches; black (10YR 2/1) silt loam, very dark gray (10YR 3/1) dry; moderate medium granular structure; friable; light gray (10YR 7/2) (dry) silt coatings; neutral; abrupt smooth boundary.
A—8 to 13 inches; very dark grayish brown (10YR 3/2) silt loam, dark grayish brown (10YR 4/2) dry; weak fine granular structure; friable; moderately acid; clear smooth boundary.
Bt1-13 to 20 inches; dark yellowish brown (10YR 4/4) silty clay loam; weak fine subangular blocky structure; firm; common distinct brown (10YR 4/3) clay films on faces of peds; moderately acid; clear smooth boundary.
Bt2—20 to 27 inches; yellowish brown (10YR 5/4) silty clay loam; moderate fine and medium subangular blocky structure; firm; common distinct brown (10YR 4/3) clay films on faces of peds; many medium distinct light olive brown (2.5Y 5/4) and few fine distinct yellowish brown (10YR 5/8) masses of iron in the matrix; moderately acid; clear smooth boundary.
Bt3-27 to 38 inches; dark grayish brown (10YR 4/2) silty clay loam; moderate medium subangular blocky structure; firm; many distinct grayish brown (10YR 5/2) clay films on faces of peds; many dark brown (7.5YR 3/2) concretions of iron and manganese oxides; many medium distinct yellowish brown (10YR $5 / 8$ ) masses of iron and grayish brown ( $2.5 \mathrm{Y} 5 / 2$ ) iron depletions in the matrix; moderately acid; abrupt smooth boundary.
$2 B t 4-38$ to 41 inches; mixed light olive brown (2.5Y 5/4), greenish gray (5G 6/1), and yellowish brown (10YR 5/8) clay; moderate medium and coarse angular blocky structure; very firm; few faint olive gray (5Y5/2) clay films on faces of peds; neutral; gradual smooth boundary.
$2 \mathrm{Cr}-41$ to 60 inches; mixed olive (5Y 5/3), greenish gray (5BG 6/1), and yellowish brown (10YR 5/8), thinly bedded clayey shale containing many fragments of limestone in discontinuous layers ranging from 1 to 3 inches in thickness; horizontal cleavage planes with light greenish gray (5G 7/1) fillings and coatings; slightly effervescent; moderately alkaline.

## Range in Characteristics

Thickness of the loess: 30 to 50 inches
Thickness of the mollic epipedon: 10 to 24 inches
Thickness of the solum: 40 to 50 inches
Depth to clayey, calcareous shale bedrock: 40 to 60 inches
A horizon:
Hue-10YR
Value-2 or 3

Chroma-1 or 2
Texture—silt loam; silty clay loam in pedons in eroded areas

## Bt horizon:

Hue-7.5YR or 10YR
Value-4 or 5
Chroma-2 to 6
2Bt horizon:
Hue-10YR, 2.5Y, or 5 Y
Value-4 to 6
Chroma-2 to 6
Texture—silty clay loam, silty clay, or clay
2Cr horizon:
Hue-10YR, 2.5Y, 5Y, 5GY, 5G, 5BG, or N
Value-4 to 6
Chroma-0 to 4
Texture—clay or silty clay

## 546C2—Keltner silt loam, 5 to 10 percent slopes, eroded <br> Setting

Landform: Valley sides
Position on the landform: Backslopes
Map Unit Composition
Keltner and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that are underlain by shale bedrock within a depth of 40 inches
- Soils that have till above the bedrock

## Properties and Qualities of the Keltner Soil

Parent material: Loess over residuum weathered from shale Drainage class: Moderately well drained Slowest permeability within a depth of 40 inches: Slow Permeability below a depth of 60 inches: Very slow or slow Depth to restrictive feature: 40 to 60 inches to bedrock (paralithic)
Available water capacity: About 7.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 4.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest perched seasonal high water table: 2.0 feet, February through April
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Lacrescent Series

Taxonomic classification: Loamy-skeletal, mixed, superactive, mesic Typic Hapludolls

## Typical Pedon

Lacrescent cobbly loam, 25 to 60 percent slopes; 1,980 feet east and 700 feet north of the southwest corner of sec. 5, T. 22 N., R. 4 E.; Whiteside County, Illinois; USGS Thomson topographic quadrangle; lat. 41 degrees 55 minutes 07 seconds N . and long. 90 degrees 04 minutes 03 seconds W., NAD 27:

A1-0 to 5 inches; very dark grayish brown (10YR 3/2) cobbly loam, dark grayish brown (10YR 4/2) dry; weak fine granular structure; very friable; few fine roots throughout; about 15 percent cobblestones and pebbles; slightly effervescent; slightly alkaline; clear smooth boundary.
A2—5 to 12 inches; dark brown (10YR 3/3) cobbly loam, brown (10YR 5/3) dry; weak medium and fine granular structure; very friable; few fine roots throughout; about 15 percent cobblestones and pebbles; violently effervescent; slightly alkaline; clear smooth boundary.
Bw-12 to 36 inches; brown (10YR 4/3) very cobbly loam; weak fine subangular blocky structure parting to weak fine granular; very friable; few fine roots between peds; few faint very dark grayish brown (10YR 3/2) organic coatings in root channels; about 40 percent cobblestones and pebbles; violently effervescent; slightly alkaline; clear smooth boundary.
C-36 to 60 inches; yellowish brown (10YR 5/4) very cobbly loam; massive; very friable; about 60 percent cobblestones and pebbles; violently effervescent; slightly alkaline.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 18 inches
Depth to free carbonates: 20 to 36 inches
Thickness of the solum: 20 to 36 inches
Depth to limestone bedrock: 3.5 to 10 feet
A horizon:

## Lamont Series

Taxonomic classification: Coarse-loamy, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Lamont fine sandy loam, 2 to 5 percent slopes; 2,180 feet north and 1,460 feet east of the southwest corner of sec. 14, T. 18 N., R. 7 E.; Bureau County, Illinois; USGS New Bedford topographic quadrangle; lat. 41 degrees 32 minutes 48 seconds N . and long. 89 degrees 39 minutes 42 seconds W., NAD 27:

Ap-0 to 9 inches; mixed dark grayish brown (10YR 4/2) and yellowish brown (10YR 5/4) fine sandy loam, yellowish brown (10YR 5/4) dry; moderate fine granular structure; very friable; few very fine roots throughout; slightly acid; abrupt smooth boundary.
Bt1-9 to 13 inches; yellowish brown (10YR 5/4) fine sandy loam; weak medium subangular blocky structure; very friable; few very fine roots between peds; few faint dark yellowish brown (10YR 4/4) clay films on faces of peds; neutral; clear smooth boundary.
Bt2-13 to 20 inches; yellowish brown (10YR 5/4) fine sandy loam; moderate medium subangular blocky structure; very friable; few very fine roots between peds; common faint dark yellowish brown (10YR 4/4) clay films on faces of peds; moderately acid; clear smooth boundary.
Bt3-20 to 29 inches; yellowish brown (10YR 5/4) fine sandy loam; moderate medium subangular blocky structure; very friable; few fine roots between peds; many prominent brown (7.5YR 4/4) clay films on faces of peds; moderately acid; clear smooth boundary.
BC-29 to 39 inches; yellowish brown (10YR 5/4) loamy fine sand with several thin lamellae of brown (7.5YR 4/4) loamy fine sand; weak coarse subangular blocky structure; very friable; strongly acid; clear smooth boundary.
E and $\mathrm{Bt}-39$ to 60 inches; yellowish brown (10YR 5/4) fine sand (E part); single grain; loose; thin brown (7.5YR 4/4) loamy fine sand lamellae about $1 / 2$ to 1 inch thick at depths of 43 and 53 inches and fine sandy loam lamellae at a depth of 59 inches (Bt part); weak fine subangular blocky structure; very friable; slightly acid.

## Range in Characteristics

Thickness of the solum: 30 to more than 60 inches
Ap or A horizon:
Hue-10YR
Value-3 or 4
Chroma-1 or 2
Texture-fine sandy loam, sandy loam, or loam

## Bt horizon:

Hue-10YR
Value-4 or 5
Chroma-3 or 4
Texture—sandy clay loam, loam, or fine sandy loam
$E$ and Bt horizon:
Hue-7.5YR or 10YR
Value-4 to 6
Chroma-3 to 6
Texture-fine sandy loam, loamy sand, sand, loamy fine sand, or fine sand

## 175B—Lamont fine sandy loam, 2 to 5 percent slopes

Setting<br>Landform: Dunes<br>Position on the landform: Summits and shoulders

Map Unit Composition
Lamont and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have less clay and more sand in the subsoil
- Soils that have silt loam in the surface layer and the upper part of the subsoil

Dissimilar soils:

- The somewhat poorly drained Hoopeston soils on footslopes

Properties and Qualities of the Lamont Soil
Parent material: Eolian sands
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 1.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete Surface runoff class: Very low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 175C2—Lamont fine sandy loam, 5 to 10 percent slopes, eroded

Setting<br>Landform: Dunes<br>Position on the landform: Shoulders and backslopes<br>Map Unit Composition

Lamont and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have less clay and more sand in the subsoil
- Soils that have silt loam in the surface layer and the upper part of the subsoil

Dissimilar soils:

- The somewhat poorly drained Hoopeston soils on footslopes

## Properties and Qualities of the Lamont Soil

Parent material: Eolian sands
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 1.0 percent
Shrink-swell potential: Low
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 175D2—Lamont fine sandy loam, 10 to 18 percent slopes, eroded

## Setting

Landform: Dunes
Position on the landform: Backslopes

## Map Unit Composition

Lamont and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have less clay and more sand in the subsoil
- Soils that have silt loam in the surface layer and the upper part of the subsoil

Dissimilar soils:

- The somewhat poorly drained Hoopeston soils on footslopes

## Properties and Qualities of the Lamont Soil

Parent material: Eolian deposits
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 8.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 1.0 percent
Shrink-swell potential: Low
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 4e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

# 175D3—Lamont fine sandy loam, 10 to 18 percent slopes, severely eroded 

Setting<br>Landform: Dunes<br>Position on the landform: Backslopes<br>Map Unit Composition

Lamont and similar soils: 99 percent
Dissimilar soils: 1 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have less clay and more sand in the subsoil
- Soils that have silt loam in the surface layer and the upper part of the subsoil

Dissimilar soils:

- The somewhat poorly drained Hoopeston soils on footslopes

Properties and Qualities of the Lamont Soil
Parent material: Eolian deposits
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 8.2 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.2 to 0.8 percent
Shrink-swell potential: Low

## Flooding: None

Accelerated erosion: This soil has lost more than 75 percent of the original surface
layer. The plow layer consists largely of subsoil material.
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete Surface runoff class: Low
Susceptibility to water erosion: High
Susceptibility to wind erosion: Moderately high

## Interpretive Groups

Land capability classification: 6e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 175F2—Lamont fine sandy loam, 18 to 35 percent slopes, eroded

Setting<br>Landform: Dunes<br>Position on the landform: Backslopes<br>\section*{Map Unit Composition}

Lamont and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a darker surface layer
- Soils that have less clay and more sand in the subsoil
- Soils that have silt loam in the surface layer and the upper part of the subsoil
- Soils that are calcareous

Dissimilar soils:

- The somewhat poorly drained Hoopeston soils on footslopes

## Properties and Qualities of the Lamont Soil

Parent material: Eolian deposits
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches

Texture—silt loam

## 1451A—Lawson silt loam, undrained, 0 to 2 percent slopes, frequently flooded

## Setting

Landform: Flood plains

## Map Unit Composition

Lawson and similar soils: 92 percent
Dissimilar soils: 8 percent

## Minor Components

## Similar soils:

- Soils that have a dark surface soil less than 24 inches thick
- Soils that have a light-colored deposit of silt loam overwash
- Soils that have a buried horizon within a depth of 60 inches
- Soils that contain more sand in the surface layer

Dissimilar soils:

- The poorly drained Otter soils in the slightly lower positions on flood plains
- The well drained Huntsville soils in the slightly higher positions on flood plains

## Properties and Qualities of the Lawson Soil

Parent material: Alluvium
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.1 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: 1.0 foot,
November through May
Ponding: None
Frequency and most likely period of flooding: Frequent, November through June
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 5w
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 3451A—Lawson silt loam, 0 to 2 percent slopes, frequently flooded

Setting

Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 13.1 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 4.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Loran Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Aquollic Hapludalfs Taxadjunct features: The Loran soils in this survey area have a thinner dark surface layer than is defined as the range for the series.

## Typical Pedon

Loran silt loam, 2 to 5 percent slopes; 1,290 feet west and 620 feet south of the center of sec. 34, T. 26 N., R. 8 E.; Stephenson County, Illinois; USGS Forreston North topographic quadrangle; lat. 42 degrees 12 minutes 23 seconds $N$. and long. 89 degrees 33 minutes 58 seconds W., NAD 27:

Ap—0 to 6 inches; black (10YR 2/1) silt loam, very dark gray (10YR 3/1) dry; moderate medium granular structure; friable; neutral; abrupt smooth boundary.
A-6 to 13 inches; black (10YR 2/1) silt loam, very dark gray (10YR 3/1) dry; moderate medium granular structure; friable; neutral; clear smooth boundary.
Bt1-13 to 17 inches; very dark grayish brown (10YR 3/2) silty clay loam, grayish brown (10YR 5/2) dry; moderate fine and medium subangular blocky structure; firm; few distinct very dark gray (10YR $3 / 1$ ) organo-clay films on faces of peds; neutral; clear smooth boundary.
Bt2-17 to 21 inches; dark grayish brown (10YR 4/2) silty clay loam; moderate fine and medium subangular blocky structure; firm; common distinct very dark grayish brown (10YR 3/2) organo-clay films on faces of peds; few fine faint dark yellowish brown (10YR 4/4) masses of iron; many prominent black (10YR 2/1) concretions of iron and manganese throughout; neutral; clear smooth boundary.
Btg1—21 to 29 inches; dark grayish brown (2.5Y 4/2) and grayish brown (2.5Y 5/2) silty clay loam; weak moderate prismatic structure parting to moderate fine and medium subangular blocky; firm; common distinct dark gray (10YR 4/1) clay films on faces of peds; few fine distinct yellowish brown (10YR 5/6) masses of iron; many prominent black (10YR 2/1) concretions of iron and manganese throughout; neutral; clear smooth boundary.
Btg2—29 to 38 inches; grayish brown (2.5Y 5/2) silt loam; weak medium and coarse prismatic structure parting to moderate medium subangular blocky; firm; common distinct dark grayish brown (2.5Y 4/2) clay films on faces of peds; common fine prominent yellowish brown (10YR 5/8) and brownish yellow (10YR 6/8) masses of iron; many prominent black (10YR 2/1) concretions of iron and manganese throughout; neutral; abrupt smooth boundary.
2Bt-38 to 40 inches; mottled yellowish brown (10YR 5/6), brown (7.5YR 5/4), and strong brown (7.5YR 5/6) clay loam; weak coarse angular blocky structure; firm; few distinct dark grayish brown (2.5YR 4/2) clay films on faces of peds; few prominent black (10YR 2/1) stains and concretions of iron and manganese throughout; neutral; abrupt smooth boundary.
$3 B C g-40$ to 45 inches; greenish gray (5GY 6/1) clay; weak medium prismatic structure; extremely firm; strongly effervescent; slightly alkaline; gradual smooth boundary.
$3 C r-45$ to 60 inches; greenish gray (5GY 6/1) clayey shale; spots and streaks of yellow (10YR 7/8 and 8/6); massive; extremely firm; strongly effervescent; slightly alkaline.

## Range in Characteristics

Thickness of the loess: 30 to 50 inches
Thickness of the mollic epipedon: 10 to 17 inches
Depth to paralithic contact: 40 to 60 inches
Thickness of the solum: 40 to 55 inches

## 572C2—Loran silt loam, 5 to 10 percent slopes, eroded

 SettingLandform: Ground moraines
Position on the landform: Shoulders

## Map Unit Composition

Loran and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have less clay in the subsoil
- Soils that have a seasonal high water table within a depth of 1 foot
- Soils that have a lighter colored surface layer
- Soils that have more clay in the surface layer

Properties and Qualities of the Loran Soil
Parent material: Loess over till over residuum weathered from clayey shale
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Slow
Depth to restrictive feature: 40 to 60 inches to bedrock (paralithic)
Available water capacity: About 9.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 4.0 to 5.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest perched seasonal high water table: 1.0 foot,
February through April
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High

Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Medary Series

Taxonomic classification: Fine, mixed, superactive, mesic Oxyaquic Hapludalfs

## Typical Pedon

Medary silty clay loam, 15 to 45 percent slopes, eroded; 1,220 feet north and 700 feet east of the southwest corner of sec. 22, T. 26 N., R. 2 E.; Jo Daviess County, Illinois; USGS Green Island topographic quadrangle; lat. 42 degrees 13 minutes 41 seconds N . and long. 90 degrees 16 minutes 20 seconds W., NAD 27:
A-0 to 5 inches; very dark grayish brown (10YR 3/2) silty clay loam, brown (10YR $5 / 2$ ) dry; moderate fine subangular blocky structure parting to moderate medium granular; friable; slightly acid; abrupt smooth boundary.
2Bt1-5 to 11 inches; reddish brown (5YR 5/4) clay; moderate fine subangular blocky structure; firm; few distinct brown (7.5YR 4/2) organic coatings on faces of peds; common distinct reddish brown (5YR 5/3) clay films on faces of peds; moderately acid; clear smooth boundary.
2Bt2-11 to 20 inches; brown (7.5YR 5/4) silty clay; moderate fine angular blocky structure; firm; few distinct reddish brown (5YR 4/3) clay films on faces of peds; few fine distinct brown (7.5YR 5/2) and few medium distinct reddish brown (5YR $5 / 3$ ) iron depletions; moderately acid; clear smooth boundary.
2Bt3-20 to 32 inches; reddish brown (5YR 5/4), light olive yellow (2.5Y 5/4, and grayish brown (2.5Y5/2), stratified silty clay, silty clay loam, and silt loam; moderate medium subangular blocky structure; firm; common distinct reddish brown (5YR 5/3) and brown (10YR 4/3) clay films on faces of peds; moderately acid; clear smooth boundary.
2Bt4-32 to 40 inches; reddish brown (5YR 5/4), light brownish gray (2.5Y 6/2), and brown (7.5YR 5/4), stratified silt loam and silty clay; moderate fine prismatic structure parting to moderate medium subangular blocky; firm; common distinct reddish brown (5YR 5/3) clay films on faces of peds; common fine distinct strong brown (7.5YR 5/6) iron masses in the matrix; neutral; gradual smooth boundary.
2BC—40 to 46 inches; light brownish gray (2.5Y 6/2), reddish brown (5YR 4/3), and strong brown (7.5YR 5/6), stratified silt loam with silty clay along ped faces; moderate medium and coarse subangular blocky structure; friable; few distinct dark reddish brown (5YR 3/2) and reddish brown (5YR 4/3) clay films on faces of peds; neutral; clear smooth boundary.
2C—46 to 60 inches; strong brown (7.5YR 5/6), light brownish gray (2.5Y 6/2), reddish brown (5YR 4/3), and dark reddish gray (5YR 4/2), stratified silt loam and silty clay; massive; friable; few lime concretions; slightly effervescent; moderately alkaline.

## Range in Characteristics

Thickness of the solum: 36 to 60 inches

Ap or A horizon:

Chroma-4 to 6
Texture—silty clay loam, silty clay, or clay; thin strata of silt loam in some pedons
2C horizon:
Hue-5YR or 7.5YR
Value-4 or 5
Chroma-4 to 6
Texture—silty clay loam, silty clay, or clay; thin strata of silt loam in some pedons

## 569F2—Medary silty clay loam, 15 to 45 percent slopes, eroded

Setting<br>Landform: Stream terraces<br>Position on the landform: Backslopes<br>Map Unit Composition

Medary and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have more clay in the surface layer

Dissimilar soils:

- The somewhat poorly drained Wakeland soils on flood plains and in drainageways
- The well drained Seaton and Lamont soils in landform positions similar to those of the Medary soil

## Properties and Qualities of the Medary Soil

Parent material: Silty alluvium and/or loess over clayey glaciolacustrine deposits
Drainage class: Moderately well drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: High
Depth and months of the highest apparent seasonal high water table: 2.0 feet,
February through April
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.

Potential for frost action: Moderate
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Very high
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 7e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Millington Series

Taxonomic classification: Fine-loamy, mixed, superactive, calcareous, mesic Cumulic Endoaquolls

## Typical Pedon

Millington silt loam, undrained, 0 to 2 percent slopes, frequently flooded; 700 feet south and 940 feet west of the northeast corner of sec. 25, T. 20 N., R. 4 E.; Whiteside County, Illinois; USGS Prophetstown topographic quadrangle; lat. 41 degrees 41 minutes 50 seconds $N$. and long. 89 degrees 58 minutes 54 seconds W., NAD 27 :

A—0 to 19 inches; black (10YR 2/1) silt loam, very dark gray (10YR 3/1) dry; moderate fine subangular blocky structure; friable; few snail-shell fragments; slightly effervescent; slightly alkaline; clear smooth boundary.
Bg-19 to 35 inches; black (10YR 2/1) loam, very dark gray (10YR 3/1) dry; weak medium subangular blocky structure; friable; few snail-shell fragments; strongly effervescent; slightly alkaline; clear smooth boundary.
Cg-35 to 60 inches; olive gray ( $5 \mathrm{Y} 5 / 2$ ) loam that has few thin strata of sandy loam; massive; friable; common medium prominent strong brown (7.5YR $5 / 8$ ) iron masses and common medium faint dark gray (5Y 4/1) iron depletions in the matrix; few snail-shell fragments; strongly effervescent; slightly alkaline.

## Range in Characteristics

Thickness of the mollic epipedon: 24 to 40 inches
Thickness of the solum: 24 to 48 inches

Hue-10YR or N
Value-2 or 3
Chroma-0 to 2
Texture-loam, silt loam, silty clay loam, or clay loam

## Bg horizon:

Hue-10YR, 2.5Y, 5Y, or N
Value-2 to 5
Chroma-0 to 2
Texture-loam, silt loam, silty clay loam, or clay loam; strata of sandy loam and/or gravel in some pedons

Cg horizon:
Chroma-0 to 2
Texture-stratified, calcareous sandy loam to silty clay loam

# 1082A-Millington silt loam, undrained, 0 to 2 percent slopes, frequently flooded 

Setting

Landform: Flood plains

## Map Unit Composition

Millington and similar soils: 100 percent

## Minor Components

## Similar soils:

- Soils that have less sand in the surface layer and subsoil
- Soils that have sandy strata in the subsoil and substratum
- Soils that are not subject to ponding

## Properties and Qualities of the Millington Soil

## Parent material: Calcareous alluvium

Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 4.0 to 6.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Deepest ponding: 0.2 foot, November through June
Frequency and most likely period of flooding: Frequent, November through June
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 5w
Prime farmland category: Not prime farmland
Hydric soil status: Hydric

Landform: Ground moraines
Position on the landform: Summits
Map Unit Composition
Muscatune and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have more sand in the lower part of the subsoil
- Soils that have a seasonal high water table at a depth of 4 to 6 feet
- Soils that have less clay in the subsoil
- Soils that have slopes of more than 2 percent

Dissimilar soils:

- The poorly drained Sable soils on summits and toeslopes
- The well drained Osco soils on shoulders

Properties and Qualities of the Muscatune Soil
Parent material: Loess
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.5 to 5.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January
through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 1
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 51B—Muscatune silt loam, 2 to 5 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Summits and shoulders

## Map Unit Composition

Muscatune and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have more sand in the lower part of the subsoil
- Soils that have a seasonal high water table at a depth of 4 to 6 feet
- Soils that have less clay in the subsoil
- Soils that have slopes of less than 2 percent

Dissimilar soils:

- The well drained Osco soils on shoulders
- The poorly drained Sable soils on summits and toeslopes

Properties and Qualities of the Muscatune Soil
Parent material: Loess
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## Myrtle Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Mollic Hapludalfs

## Typical Pedon

Myrtle silt loam, 2 to 5 percent slopes; 490 feet west and 165 feet north of the southeast corner of sec. 19, T. 29 N., R. 9 E.; Stephenson County, Illinois; USGS Davis quadrangle; lat. 42 degrees 29 minutes 27 seconds $N$. and long. 89 degrees 29 minutes 58 seconds W., NAD 83:

Ap—0 to 8 inches; very dark gray (10YR 3/1) silt loam, gray (10YR 5/1) dry; moderate fine granular structure; friable; neutral; abrupt smooth boundary.
E-8 to 14 inches; dark grayish brown (10YR 4/2) silt loam; weak fine and medium crumb structure; friable; slightly acid; clear smooth boundary.
Bt1-14 to 19 inches; brown (10YR 4/3) silty clay loam; moderate very fine subangular blocky structure; friable; few faint very dark grayish brown (10YR 3/2) organo-clay
films on horizontal faces of peds; common distinct light gray (10YR 7/1) (dry) silt coatings on faces of peds; moderately acid; clear smooth boundary.
Bt2—19 to 27 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate fine subangular blocky structure; firm; common distinct dark brown (10YR 3/3) clay films on faces of peds; light gray (10YR 7/1) (dry) silt coatings on faces of peds; moderately acid; clear smooth boundary.
Bt3-27 to 37 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate medium subangular blocky structure; firm; common distinct dark brown (10YR 3/3) and very dark grayish brown (10YR 3/2) clay films and light gray (10YR 7/1) (dry) silt coatings on faces of peds; moderately acid; gradual smooth boundary.
Bt4-37 to 42 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate medium subangular blocky structure; firm; common distinct dark brown (7.5YR $3 / 3$ ) clay films on faces of peds; few distinct light gray (10YR 7/1) (dry) silt coatings on faces of a few peds; about 12 percent (by volume) sand; moderately acid; clear smooth boundary.
2Bt5-42 to 80 inches; brown (7.5YR 4/4) clay loam; moderate medium and coarse subangular blocky structure; firm; common distinct reddish brown (5YR 4/4) and dark reddish brown (5YR 3/3) clay films on faces of peds; few fine prominent black ( $\mathrm{N} 2.5 /$ ) iron-manganese stains in the matrix; moderately acid.

## Range in Characteristics

Thickness of the loess: 30 to 50 inches

Value-4 to 6
Chroma-4 to 6
Texture—clay loam, silty clay loam, or sandy clay loam
2C horizon:
Hue-10YR or 7.5YR
Value-4 to 6
Chroma-4 to 6
Texture-loam, clay loam, or sandy loam

## 414B—Myrtle silt loam, 2 to 5 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Summits and shoulders
Map Unit Composition
Myrtle and similar soils: 100 percent

## Minor Components

## Similar soils:

- Soils that have a lighter colored surface horizon
- Soils that have less than 30 inches or more than 50 inches of loess over the till

## Properties and Qualities of the Myrtle Soil

Parent material: Loess over a paleosol that formed in till Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 10.1 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 414C2—Myrtle silt loam, 5 to 10 percent slopes, eroded

## Setting

Landform: Ground moraines
Position on the landform: Backslopes
Map Unit Composition
Myrtle and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a lighter colored surface horizon
- Soils that have less than 30 inches or more than 50 inches of loess over the till

Properties and Qualities of the Myrtle Soil
Parent material: Loess over a paleosol that formed in till Drainage class: Well drained

Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## NewGlarus Series

Taxonomic classification: Fine-silty over clayey, mixed, superactive, mesic Typic Hapludalfs
Taxadjunct feature: The NewGlarus soils in this survey area are thinner over limestone bedrock than is defined as the range for the series.

## Typical Pedon

NewGlarus silt loam, in an area of NewGlarus-Lamoille silt loams, 18 to 35 percent slopes (fig. 6); 980 feet south and 2,490 feet west of the northeast corner of sec. 17, T. 26 N., R. 5 E.; Jo Daviess County, Illinois; USGS Kent quadrangle; lat. 42 degrees 15 minutes 07 seconds $N$. and long. 89 degrees 56 minutes 57 seconds W., NAD 83:
A—0 to 5 inches; very dark grayish brown (10YR 3/2) silt loam, grayish brown (10YR $5 / 2$ ) dry; moderate fine granular structure; friable; common fine roots; common distinct very dark gray (10YR 3/1) organic coatings on faces of peds; about 2 percent chert fragments of gravel size; neutral; abrupt smooth boundary.
BE—5 to 14 inches; dark yellowish brown (10YR 4/4) silt loam; moderate medium platy structure parting to moderate medium and fine subangular blocky; friable; few fine roots; many distinct dark brown (10YR 3/3) organic coatings on faces of peds; few distinct very dark grayish brown (10YR 3/2) organic coatings along root channels; about 10 percent chert fragments of gravel size; neutral; clear smooth boundary.
Bt1-14 to 22 inches; yellowish brown (10YR 5/4) silty clay loam; strong medium and fine angular blocky structure; firm; few fine and medium roots; many distinct dark yellowish brown (10YR 4/4) clay films on faces of peds; about 10 percent chert fragments of gravel size; moderately acid; abrupt smooth boundary.
2Bt2—22 to 34 inches; strong brown (7.5YR 5/6) gravelly silty clay; strong medium and fine angular blocky structure; firm; few medium roots; many prominent dark reddish brown (5YR 3/2) clay films on faces of peds; about 20 percent chert fragments of gravel size with dolomite fragments of cobble and stone size in the lower part; neutral; clear wavy boundary.

Figure 6.-Vertical limestone outcrops are common in areas of NewGlarus-Lamoille silt loams, 18 to 35 percent slopes.

2R-34 inches; level bedded dolomite with 6 inches of yellow (10YR 7/6) fragmented dolomite in the upper part and strong brown (7.5YR 5/6) silty clay residuum in fissures.

## Range in Characteristics

Thickness of the loess: 12 to 35 inches
Thickness of the residuum: 6 to 20 inches
Thickness of the solum: 20 to 40 inches
Ap or A horizon:
Hue-10YR
Value-3 or 4
Chroma-2 or 3
Texture-silt loam or silty clay loam
BE horizon:
Hue-10YR
Value-3 to 5

Texture-silt loam or silty clay loam
Bt horizon:
Hue-7.5YR or 10YR
Value-4 or 5

Chroma-3 to 6
Texture—silt loam or silty clay loam

## 2Bt horizon:

Hue-2.5YR, 5YR, or 7.5 YR
Value-3 to 5
Chroma-3 to 6
Texture—silty clay, clay, clay loam, or silty clay loam or the channery or flaggy analogs of these textures

3Bt horizon:
Hue-7.5YR or 10YR
Value-3 or 4
Chroma-2 to 4
Texture—loam or sandy loam or the very channery, very flaggy, extremely channery, or extremely flaggy analogs of these textures

## 905F-NewGlarus-Lamoille silt loams, 18 to 35 percent slopes

## Setting

Landform: Hillslopes
Position on the landform: NewGlarus—middle and lower backslopes; Lamoille—upper backslopes

## Map Unit Composition

NewGlarus and similar soils: 55 percent
Lamoille and similar soils: 45 percent

## Minor Components

Similar soils:

- Soils that have bedrock within a depth of 60 inches

## Properties and Qualities of the NewGlarus Soil

Parent material: Loess over clayey pedisediment over loamy residuum weathered from dolomite
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow to moderate
Depth to restrictive feature: 20 to 40 inches to bedrock (lithic)
Available water capacity: About 5.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: High
Flooding: None
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Properties and Qualities of the Lamoille Soil
Parent material: Thin mantle of loess over clayey residuum over loamy-skeletal colluvium
Drainage class: Well drained

Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Moderately slow
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: NewGlarus-6e; Lamoille—6e
Prime farmland category: Not prime farmland

3Cg horizon:
Texture—silt loam; strata of loam, clay loam, sandy loam, silty clay loam, or loamy fine sand in some pedons

## 261A—Niota silt loam, 0 to 2 percent slopes

## Setting

Landform: Lacustrine plains
Position on the landform: Toeslopes

## Map Unit Composition

Niota and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have more clay in the surface layer
- Soils that have a gray subsoil

## Properties and Qualities of the Niota Soil

Parent material: Glaciolacustrine deposits
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Very slow
Permeability below a depth of 60 inches: Moderately rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 10.1 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: High
Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Deepest ponding: 0.2 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and high for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2 w
Prime farmland category: Prime farmland where drained
Hydric soil status: Hydric

## Ogle Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Argiudolls
Taxadjunct features: The Ogle soils in map units 412C2 and 412C3 have a thinner dark surface layer than is defined as the range for the series. The Ogle soil in map unit 412C2 is classified as a fine-silty, mixed, superactive, mesic Mollic Hapludalf. The Ogle soil in map unit 412C3 is classified as a fine-silty, mixed, superactive, mesic Typic Hapludalf.

## Typical Pedon

Ogle silt loam; 75 feet north and 495 feet east of the southwest corner of $\mathrm{SE}^{1 / 4 \mathrm{sec} .30 \text {, }}$ T. 24 N., R. 7 E.; Carroll County, Illinois; USGS Brookville quadrangle; lat. 42 degrees 02 minutes 21 seconds $N$. and long. 89 degrees 43 minutes 57 seconds W., NAD 83 :
A-0 to 11 inches; very dark brown (10YR $2 / 2$ ) silt loam; moderate fine granular structure; friable; slightly acid; gradual smooth boundary.
$A B-11$ to 15 inches; dark brown (10YR 3/3) silt loam; moderate very fine subangular blocky structure; friable; many very dark brown (10YR $2 / 2$ ) wormcasts; moderately acid; gradual smooth boundary.
Bt1-15 to 22 inches; brown (10YR 4/3) silty clay loam; moderate fine subangular blocky structure; firm; common distinct dark brown (10YR $3 / 3$ organo-clay films on
faces of peds; few very dark grayish brown (10YR 3/2) wormcasts; few fine gray (10YR 5/1) (dry) specks on faces of peds; strongly acid; gradual smooth boundary.
Bt2-22 to 33 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate fine and medium subangular blocky structure; firm; common distinct dark brown (7.5YR 3/4) clay films on faces of peds; moderately acid; gradual smooth boundary.
Bt3-33 to 40 inches; yellowish brown (10YR 5/4) silty clay loam; moderate medium subangular blocky structure; firm; common distinct dark brown (7.5YR 3/4) clay films on faces of peds; few sand grains and angular pebbles in the lower part; moderately acid; clear smooth to wavy boundary.
2Bt4-40 to 60 inches; reddish brown (5YR 4/4) clay loam; strong medium and coarse subangular blocky structure; firm; common distinct dark reddish brown (5YR 3/4) clay films on faces of peds; moderately acid.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 18 inches
Thickness of the loess: 30 to 50 inches
Thickness of the solum: More than 5 feet
Ap or A horizon:
Hue-10YR

# 412C2—Ogle silt loam, 5 to 10 percent slopes, eroded <br> Setting 

Landform: Ground moraines
Position on the landform: Backslopes
Map Unit Composition
Ogle and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a thicker dark surface horizon
- Soils that contain sandy subhorizons in the subsoil
- Soils that have loamy textures within a depth of 30 inches

Dissimilar soils:

- The well drained Ashdale soils in landform positions similar to those of the Ogle soil

## Properties and Qualities of the Ogle Soil

Parent material: Loess over a paleosol that formed in till Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.8 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 5.0 percent
Shrink-swell potential: Moderate
Flooding: None

Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 412C3—Ogle silty clay loam, 5 to 10 percent slopes, severely eroded

Setting<br>Landform: Ground moraines<br>Position on the landform: Backslopes<br>\section*{Map Unit Composition}

Ogle and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a thicker dark surface horizon
- Soils that contain sandy subhorizons in the subsoil

## Orion Series

Taxonomic classification: Coarse-silty, mixed, superactive, nonacid, mesic Aquic Udifluvents

## Typical Pedon

Orion silt loam, 0 to 2 percent slopes, frequently flooded; 270 feet south and 1,000 feet east of the northwest corner of sec. 17, T. 22 N., R. 6 E.; Whiteside County, Illinois; USGS Milledgeville topographic quadrangle; lat. 41 degrees 54 minutes 06 seconds N . and long. 89 degrees 50 minutes 13 seconds W., NAD 27:

A-0 to 5 inches; dark grayish brown (10YR 4/2) silt loam, light brownish gray (10YR $6 / 2$ ) dry; massive; friable; many thin strata of brown (10YR 4/3) and very dark gray (10YR 3/1) silt loam; neutral; abrupt smooth boundary.
C1-5 to 15 inches; dark grayish brown (10YR 4/2) silt loam; massive; friable; many thin strata of pale brown (10YR 6/3) and yellowish brown (10YR $5 / 4$ ) silt loam; few fine prominent brown (7.5YR 4/4) masses of iron in the matrix; neutral; clear wavy boundary.
C2-15 to 29 inches; dark grayish brown (10YR 4/2) silt loam; massive; friable; many thin strata of dark yellowish brown (10YR 4/4), yellowish brown (10YR 5/6), and pale brown (10YR 6/3) silt loam; few very dark gray (10YR 3/1) wormcasts; few fine prominent brown (7.5YR 4/4) masses of iron in the matrix; neutral; abrupt wavy boundary.
Ab1-29 to 39 inches; black (2.5Y 2.5/1) silt loam; weak thick platy structure parting to weak medium and fine subangular blocky; friable; neutral; clear smooth boundary.
Ab2-39 to 51 inches; black ( $2.5 \mathrm{Y} 2.5 / 1$ ) silty clay loam; strong medium and fine angular blocky structure; friable; neutral; clear smooth boundary.
Ab3-51 to 60 inches; very dark gray (10YR 3/1) silty clay loam; moderate medium and fine subangular blocky structure; friable; neutral.

## Range in Characteristics

Depth to dark buried soil: 20 to 40 inches
Thickness of the surface layer: 5 to 10 inches
Ap or A horizon:
Hue-10YR
Value-3 to 6
Chroma-2 or 3
Texture-silt loam; stratified in some pedons
C horizon:

# 3415A—Orion silt loam, 0 to 2 percent slopes, frequently flooded 

Setting<br>Landform: Flood plains<br>Map Unit Composition

Orion and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have more sand in the upper part
- Soils that do not have a buried soil within a depth of 40 inches
- Soils that have a seasonal high water table within a depth of 1 foot
- Soils that do not have a seasonal high water table within a depth of 3 feet

## Properties and Qualities of the Orion Soil

Parent material: Alluvium
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January through May
Frequency and most likely period of flooding: Frequent, November through June
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3w
Prime farmland category: Prime farmland where protected from flooding or not frequently flooded during the growing season
Hydric soil status: Not hydric

## 7415A—Orion silt loam, 0 to 2 percent slopes, rarely flooded

Setting
Landform: Flood plains
Map Unit Composition
Orion and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have more sand in the upper part

## Properties and Qualities of the Orion Soil

Parent material: Alluvium
Drainage class: Somewhat poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.7 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: 1.0 foot, January through May
Frequency and most likely period of flooding: Rare, November through June
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 2w
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 802B-Orthents, loamy, undulating

## Setting

Landform: Ground moraines
Position on the landform: Backslopes

## Map Unit Composition

Orthents and similar soils: 85 percent
Dissimilar soils: 15 percent

## Minor Components

Similar soils:

- Soils that are mostly silt loam or silty clay loam
- Soils that have a seasonal high water table within a depth of 60 inches

Dissimilar soils:

- Well drained till soils on backslopes
- The well drained Pecatonica soils on backslopes
- The somewhat poorly drained Orion soils on flood plains

## Properties and Qualities of the Orthents

Parent material: Mine spoil or earthy fill Drainage class: Well drained Slowest permeability within a depth of 40 inches: Moderately slow Permeability below a depth of 60 inches: Moderately slow Depth to restrictive feature: More than 80 inches Available water capacity: About 10.9 inches to a depth of 60 inches Content of organic matter in the surface layer: 0.5 to 2.0 percent

Shrink-swell potential: Moderate<br>Flooding: None<br>Potential for frost action: Moderate<br>Hazard of corrosion: Moderate for steel and low for concrete<br>Surface runoff class: Low<br>Susceptibility to water erosion: Moderate<br>Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Osco Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Argiudolls
Taxadjunct features: The Osco soils in map units 86C2 and 86C3 have a thinner dark surface layer than is defined as the range for the series. These soils are classified as fine-silty, mixed, superactive, mesic Mollic Hapludalfs.

## Typical Pedon

Osco silt loam (fig. 7), 2 to 5 percent slopes; at an elevation of 858 feet; 316 feet north and 88 feet west of the southeast corner of sec. 23 , T. 24 N., R. 6 E.; Carroll County, Illinois; USGS Lanark topographic quadrangle; lat. 42 degrees 03 minutes 15 seconds N . and long. 89 degrees 45 minutes 52 seconds W., NAD 27:
Ap-0 to 10 inches; very dark brown (10YR $2 / 2$ ) silt loam, very dark grayish brown (10YR $3 / 2$ ) dry; moderate fine granular structure; friable; common fine roots; slightly acid; abrupt smooth boundary.
A-10 to 14 inches; very dark grayish brown (10YR 3/2) silt loam, dark grayish brown (10YR 4/2) dry; moderate medium and coarse granular structure; friable; common fine roots; strongly acid; clear smooth boundary.
BA-14 to 20 inches; dark yellowish brown (10YR $3 / 4$ ) and dark brown (10YR $3 / 3$ ) silt loam, brown (10YR $5 / 3$ ) dry; weak fine subangular blocky structure; friable; common fine roots; few distinct light brownish gray (10YR 6/2) (dry) silt coatings on faces of peds; strongly acid; clear smooth boundary.
Bt1-20 to 26 inches; brown (10YR 4/3) silty clay loam; moderate fine subangular blocky structure; friable; few fine roots; few distinct gray (10YR 6/1) (dry) silt coatings and common faint dark brown (10YR 3/3) clay films on faces of peds; strongly acid; clear smooth boundary.
Bt2-26 to 37 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate medium subangular blocky structure; firm; few fine roots; common distinct light brownish gray (10YR 6/2) (dry) silt coatings and many faint dark yellowish brown (10YR 4/4) clay films on faces of peds; common fine faint brown (10YR 5/3) and common medium prominent strong brown (7.5YR 5/8) masses of iron in the matrix; many prominent very dark gray ( $\mathrm{N} 3 /$ ) and dark brown (7.5YR 3/2) ironmanganese concretions in the matrix; strongly acid; clear smooth boundary.
Bt3-37 to 45 inches; light yellowish brown (10YR 6/4) silty clay loam; moderate coarse subangular blocky structure; friable; few fine roots; many faint dark yellowish brown (10YR 4/4) clay films on faces of peds; common fine distinct light brownish gray (10YR 6/2) iron depletions and few medium prominent strong brown (7.5YR 5/8) masses of iron in the matrix; strongly acid; gradual smooth boundary.

BC-45 to 55 inches; yellowish brown (10YR 5/4) and brown (10YR 4/3) silty clay loam; weak coarse angular blocky structure; friable; few fine distinct light brownish

Figure 7.-A profile of an Osco soil.
gray (10YR 6/2) iron depletions in the matrix; strongly acid; gradual smooth boundary.
C—55 to 60 inches; yellowish brown (10YR 5/4) and brown (10YR 4/3) silt loam; massive; friable; many fine distinct yellowish brown (10YR 5/6) masses of iron and common medium distinct grayish brown (10YR 5/2) iron depletions in the matrix; moderately acid.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 18 inches
Thickness of the solum: 40 to more than 60 inches
Depth to free carbonates: More than 48 inches
Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 or 2
Texture-silt loam

Bt horizon:
Hue-10YR
Value-4 to 6
Chroma-3 or 4
Texture—silty clay loam or silt loam
C or Cg horizon:
Hue-10YR or 2.5Y
Value-4 or 5
Chroma-3 to 6
Texture—silt loam

## 86A—Osco silt loam, 0 to 2 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Summits
Map Unit Composition
Osco and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a seasonal high water table within a depth of 4 feet
- Soils that have a thinner dark surface layer

Dissimilar soils:

- The poorly drained Sable soils in the lower areas that are subject to ponding

Properties and Qualities of the Osco Soil
Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 4.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: 4.0 feet,
February through April
Flooding: None
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 1
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 86B—Osco silt loam, 2 to 5 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Shoulders and summits

## Map Unit Composition

Osco and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have more sand in the lower part of the profile
- Soils that have a seasonal high water table within a depth of 4 feet
- Soils that have less clay in the subsoil
- Soils that have slopes of less than 2 percent

Dissimilar soils:

- The poorly drained Sable soils in depressions and drainageways
- The somewhat poorly drained Ipava soils on summits
- The poorly drained Sable and Virden soils on summits and toeslopes
- The poorly drained Denny soils in depressions

# Properties and Qualities of the Osco Soil 

Parent material: Loess

## 7100A—Palms muck, 0 to 2 percent slopes, rarely flooded

## Setting

Landform: Backswamps

## Map Unit Composition

Palms and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have less than 16 inches or more than 50 inches of organic material over mineral soil

Dissimilar soils:

- Soils that contain more sand in the solum
- Soils that are calcareous

Properties and Qualities of the Palms Soil
Parent material: Herbaceous organic material over loamy alluvium Drainage class: Very poorly drained
Slowest permeability within a depth of 40 inches: Moderately slow
Permeability below a depth of 60 inches: Moderately slow or moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 16.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 75.0 to 99.0 percent
Shrink-swell potential: Low
Depth and months of the highest apparent seasonal high water table: At the surface,
November through June
Deepest ponding: 0.5 foot, November through June
Frequency and most likely period of flooding: Rare, November through June
Potential for frost action: High
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: High

## Interpretive Groups

Land capability classification: 3w
Prime farmland category: Not prime farmland
Hydric soil status: Hydric

## Palsgrove Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Hapludalfs

## Typical Pedon

Palsgrove silt loam, 2 to 5 percent slopes; 2,355 feet south and 275 feet east of the center of sec. 24, T. 23 N., R. 9 E.; Ogle County, Illinois; USGS Grand Detour quadrangle; lat. 41 degrees 57 minutes 38 seconds $N$. and long. 89 degrees 24 minutes 15 seconds W., NAD 27:

Ap-0 to 28 cm (0 to 11 inches); dark grayish brown (10YR 4/2) silt loam, pale brown (10YR 6/2) dry; moderate fine and medium granular structure; friable; common roots; slightly acid; abrupt smooth boundary.
Bt1-28 to 43 cm (11 to 17 inches); dark yellowish brown (10YR 4/4) silty clay loam; weak fine prismatic structure parting to moderate fine and medium subangular blocky; friable; few roots; common distinct brown (10YR 4/3) clay films and few prominent light gray (10YR 7/1) (dry) silt coatings on faces of peds; moderately acid; clear smooth boundary.
Bt2—43 to 71 cm (17 to 28 inches); mixed yellowish brown (10YR 5/4) and dark yellowish brown (10YR 4/4) silty clay loam; weak medium prismatic structure parting to moderate fine and medium subangular blocky; friable; few roots; common distinct brown (10YR 4/3) clay films and few prominent light gray (10YR $7 / 1$ ) (dry) silt coatings on faces of peds; strongly acid; clear smooth boundary.
Bt3-71 to 89 cm ( 28 to 35 inches); mixed yellowish brown (10YR 5/4) and dark yellowish brown (10YR 4/4) silty clay loam; moderate coarse prismatic structure parting to moderate medium and coarse subangular blocky; friable; few roots; common distinct brown (10YR 4/3) clay films and few prominent light gray (10YR $7 / 1$ ) (dry) silt coatings on faces of peds; moderately acid; clear smooth boundary.
Bt4-89 to 122 cm (35 to 48 inches); mixed yellowish brown (10YR 5/4) and dark yellowish brown (10YR 4/4) silty clay loam; moderate coarse prismatic structure; friable; few roots; common distinct brown (10YR 4/3) clay films on faces of peds; few fine black (7.5YR 2.5/1) iron and manganese oxides in the matrix; moderately acid; clear smooth boundary.
2Bt5-122 to 140 cm ( 48 to 55 inches); mixed reddish brown (5YR 4/4) and dark reddish brown (5YR 3/3) clay; moderate coarse prismatic structure; very firm; few fine and very fine roots; 2 percent cherty gravel; common distinct dark brown (7.5YR 4/4) clay films on faces of peds; neutral; clear smooth boundary.

2R-140 cm (55 inches); level bedded dolomitic limestone; partly disintegrated in the upper 3 to 5 inches.

# 928C2—NewGlarus-Palsgrove silt loams, 5 to 10 percent slopes, eroded 

Setting<br>Landform: Hillslopes<br>Position on the landform: NewGlarus-middle and lower backslopes; Palsgroveshoulders and upper backslopes

## Map Unit Composition

NewGlarus and similar soils: 50 percent
Palsgrove and similar soils: 50 percent

## Minor Components

Similar soils:

- Soils that do not have bedrock within a depth of 60 inches
- Soils that have clayey till over the bedrock

Properties and Qualities of the NewGlarus Soil
Parent material: Loess over clayey pedisediment over loamy residuum weathered from dolomite
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Slow
Permeability below a depth of 60 inches: Slow to moderate
Depth to restrictive feature: 20 to 40 inches to bedrock (lithic)
Available water capacity: About 6.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: High
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low

## 862-Pits, sand

- This map unit consists of excavated areas from which sand and gravel have been removed. The remaining floors are nearly level, and sidewalls are very steep or nearly vertical. Areas of this map unit generally do not support vegetation.

## 864-Pits, quarries

- This map unit consists of excavated areas from which limestone bedrock has been removed. The remaining floors are nearly level, and sidewalls are very steep or nearly vertical. Areas of this map unit generally do not support vegetation.

## 865-Pits, gravel

- This map unit consists of excavated areas of gravelly outwash deposits from which gravelly and sandy material has been removed. The remaining floors are nearly level, and sidewalls are very steep or nearly vertical. Areas of this map unit generally do not support vegetation.

## Port Byron Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Typic Hapludolls Taxadjunct features: The Port Byron soil in map unit 277C2 has a thinner dark surface layer than is defined as the range for the series. This soil is classified as a finesilty, mixed, superactive, mesic Mollic Hapludalf.

## Typical Pedon

Port Byron silt loam, 2 to 5 percent slopes; 2,620 feet south and 400 feet east of the northwest corner of sec. 9, T. 20 N., R. 3 E.; Whiteside County, Illinois; USGS Erie Northwest topographic quadrangle; lat. 41 degrees 44 minutes 13 seconds N. and long. 90 degrees 10 minutes 08 seconds W., NAD 27:

Ap-0 to 8 inches; very dark gray (10YR 3/1) silt loam, dark grayish brown (10YR 4/2) dry; weak medium granular structure; friable; many very fine and fine roots throughout; moderately acid; abrupt smooth boundary.

A—8 to 13 inches; very dark grayish brown (10YR 3/2) silt loam, grayish brown (10YR $5 / 2$ ) dry; moderate medium and fine subangular blocky structure; friable; common very fine and fine roots throughout; many faint very dark gray (10YR 3/1) organic coatings on faces of peds; slightly acid; clear smooth boundary.
BA-13 to 20 inches; brown (10YR 4/3) silt loam; moderate medium and fine subangular blocky structure; friable; common fine roots between peds; many faint very dark grayish brown (10YR $3 / 2$ ) organic coatings on faces of peds; few distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; few faint very dark grayish brown (10YR 3/2) wormcasts; slightly acid; clear smooth boundary.
Bw1-20 to 31 inches; dark yellowish brown (10YR 4/4) silt loam; moderate medium and fine subangular blocky structure; friable; common fine and medium roots between peds; common faint brown (10YR 4/3) clay films on faces of peds; few faint dark brown (10YR 3/3) wormcasts; moderately acid; clear smooth boundary.
Bw2-31 to 40 inches; yellowish brown (10YR 5/4) silt loam; moderate coarse and medium subangular blocky structure; friable; few fine roots between peds; common faint brown (10YR 4/3) clay films on faces of peds; few distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; moderately acid; clear smooth boundary.
Bw3-40 to 52 inches; yellowish brown (10YR 5/4) silt loam; weak coarse subangular blocky structure; friable; few fine roots between peds; few faint dark yellowish brown (10YR 4/4) clay films on faces of peds; few distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; few fine faint pale brown (10YR 6/3) masses of iron in the matrix; slightly acid; clear smooth boundary.
BC—52 to 60 inches; yellowish brown (10YR 5/4) silt loam; weak medium and coarse prismatic structure; firm; few fine roots between peds; few distinct light gray (10YR 7/2) (dry) silt coatings on faces of peds; common fine faint yellowish brown (10YR $5 / 6$ ) masses of iron in the matrix; few fine dark brown (7.5YR 3/2) coatings of ironmanganese oxides on faces of peds; slightly acid; clear smooth boundary.
C1-60 to 66 inches; yellowish brown (10YR 5/4) silt loam; massive; friable; common fine faint yellowish brown (10YR 5/6 and 5/8) masses of iron in the matrix; few fine and medium irregular brown (7.5YR 4/4) and few fine prominent rounded black ( N 2.5/) concretions of iron-manganese oxides throughout the matrix; common medium prominent black (5Y 2.5/1) irregular masses of iron-manganese in root channels and pores in the lower 2 inches; neutral; gradual smooth boundary.
C2—66 to 77 inches; 50 percent yellowish brown (10YR 5/4) and 50 percent pale brown (10YR 6/3) silt loam; massive; friable; common fine and medium faint yellowish brown (10YR 5/6) and few medium distinct strong brown (7.5YR 5/6) masses of iron in the matrix; light brownish gray (10YR 6/2) iron depletions; few fine and medium prominent irregular black ( $\mathrm{N} 2.5 /$ ) concretions of iron-manganese throughout the matrix; neutral; gradual smooth boundary.
C3-77 to 89 inches; 70 percent yellowish brown (10YR 5/4) and 30 percent pale brown (10YR 6/3) silt; massive; friable; common fine faint yellowish brown (10YR $5 / 6$ and $5 / 8$ ) masses of iron in the matrix; few fine faint light brownish gray (10YR $6 / 2$ ) and gray (10YR 6/1) iron depletions; few fine prominent rounded black (N 2.5/) concretions of iron-manganese throughout the matrix; neutral.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 24 inches
Thickness of the solum: 42 to more than 60 inches
Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 to 3
Texture-silt loam

BA or Bw horizon:
Hue-7.5YR or 10YR
Value-4 or 5

Texture—silt loam
C horizon:
Hue-10YR or 2.5Y
Value-5 or 6
Chroma-2 to 4
Texture—silt loam

## 277B—Port Byron silt loam, 2 to 5 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Shoulders

## Map Unit Composition

Port Byron and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a seasonal high water table within a depth of 60 inches
- Soils that have more sand in the lower part of the subsoil
- Soils that have a dark surface soil more than 24 inches thick
- Soils that have a dark surface soil less than 10 inches thick

Dissimilar soils:

- The somewhat poorly drained Joy soils on footslopes

Properties and Qualities of the Port Byron Soil
Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.8 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: High
Hazard of corrosion: Low for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 277C—Port Byron silt loam, 5 to 10 percent slopes

## Setting

Landform: Ground moraines
Position on the landform: Shoulders

## Map Unit Composition

Port Byron and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a seasonal high water table within a depth of 60 inches

## 735D2—Casco-Rodman-Fox complex, 6 to 12 percent slopes, eroded

## Setting

Landform: Stream terraces
Position on the landform: Backslopes

## Map Unit Composition

Casco and similar soils: 35 percent
Rodman and similar soils: 31 percent
Fox and similar soils: 29 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have less gravel and more sand or silt in the lower layers

Dissimilar soils:

- Soils underlain by till or limestone bedrock

## Properties and Qualities of the Casco Soil

Parent material: Loamy alluvium over calcareous, stratified sandy outwash Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 3.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate

## Flooding: None

Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Low
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Properties and Qualities of the Rodman Soil

Parent material: Sandy and gravelly glaciofluvial deposits
Drainage class: Excessively drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 2.6 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Low
Ponding: None
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Low
Hazard of corrosion: Low for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion:

## Properties and Qualities of the Fox Soil

Parent material: Loamy alluvium and/or thin layer of loess over calcareous, stratified sandy outwash
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Moderate for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

- Soils that have a seasonal high water table at a depth of more than 1 foot
- Soils that are silt loam throughout
- Soils that have more sand in the lower part of the subsoil and in the substratum
- Soils that have a dark surface soil more than 24 inches thick

Dissimilar soils:

- Soils that have a seasonal high water table at a depth of 2.0 to 3.5 feet; on shoulder slopes
- The well drained Osco soils on summits

## Properties and Qualities of the Sable Soil

Parent material: Loess
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.9 inches to a depth of 60 inches

Content of organic matter in the surface layer: 5.0 to 6.0 percent Shrink-swell potential: Moderate<br>Depth and months of the highest apparent seasonal high water table: At the surface, January through May<br>Deepest ponding: 0.2 foot, January through May<br>Flooding: None<br>Potential for frost action: High<br>Hazard of corrosion: High for steel and low for concrete<br>Surface runoff class: Negligible<br>Susceptibility to water erosion: Low<br>Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2w
Prime farmland category: Prime farmland where drained
Hydric soil status: Hydric

# 68A+—Sable silt loam, 0 to 2 percent slopes, overwash Setting 

Landform: Ground moraines
Position on the landform: Summits
Map Unit Composition
Sable and similar soils: 94 percent
Dissimilar soils: 6 percent

## Minor Components

Similar soils:

- Soils that have a seasonal high water table at a depth of more than 1 foot
- Soils that are silt loam throughout
- Soils that have more sand in the lower part of the subsoil and in the substratum
- Soils that have a dark surface soil more than 24 inches thick

Dissimilar soils:

- The well drained Osco soils on summits

Properties and Qualities of the Sable Soil
Parent material: Loess
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.1 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 4.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Deepest ponding: 0.2 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Negligible

Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2 w
Prime farmland category: Prime farmland where drained
Hydric soil status: Hydric

## Sawmill Series

Taxonomic classification: Fine-silty, mixed, superactive, mesic Cumulic Endoaquolls

## Typical Pedon

Sawmill silty clay loam, 0 to 2 percent slopes, occasionally flooded; 300 feet south and 750 feet east of the northwest corner of sec. 20, T. 15 N., R. 4 W.; Sangamon County, Illinois; USGS New City topographic quadrangle; lat. 39 degrees 44 minutes 34 seconds N. and long. 89 degrees 34 minutes 15 seconds W., NAD 27:
Ap-0 to 10 inches; very dark gray (10YR 3/1) and very dark grayish brown (10YR $3 / 2$ ) silty clay loam, gray (10YR $5 / 1$ ) dry; weak fine subangular blocky structure; firm; few fine roots throughout; few subrounded pebbles 1 to 3 mm in diameter; slightly acid; clear smooth boundary.
A1-10 to 17 inches; black (10YR 2/1) and very dark grayish brown (10YR $3 / 2$ ) silty clay loam, dark gray (10YR 4/1) dry; moderate fine subangular blocky structure; firm; few fine roots between peds; few subrounded pebbles 1 to 3 mm in diameter; few fine prominent yellowish brown (10YR 5/6) masses of iron in the matrix; few fine concretions of manganese lining root channels and pores; neutral; clear smooth boundary.
A2-17 to 25 inches; black (10YR 2/1) silty clay loam, dark gray (10YR 4/1) dry; moderate fine and medium angular blocky structure; firm; few fine roots between peds; few fine concretions of manganese lining root channels and pores; few fine prominent yellowish brown (10YR 5/6) masses of iron in the matrix; neutral; clear smooth boundary.
AB-25 to 32 inches; very dark gray (10YR 3/1) silty clay loam, gray (10YR 5/1) dry; weak medium prismatic structure parting to moderate fine subangular blocky; firm; few fine roots between peds; few fine concretions of manganese lining root channels and pores; few fine prominent yellowish brown (10YR 5/6) masses of iron in the matrix; neutral; clear smooth boundary.
$\mathrm{Bg}-32$ to 40 inches; dark gray (10YR 4/1) silty clay loam; weak medium prismatic structure parting to moderate fine and medium angular blocky; firm; few fine roots between peds; few faint very dark gray (10YR 3/1) organic coatings on faces of peds; few fine concretions of manganese lining root channels and pores; few fine prominent strong brown (7.5YR 5/6) masses of iron in the matrix; slightly alkaline; clear smooth boundary.
Btg1-40 to 49 inches; grayish brown (10YR 5/2) silty clay loam; moderate medium prismatic structure parting to weak medium angular blocky; firm; common distinct dark gray (10YR 4/1) clay films on faces of peds; few fine concretions of manganese lining root channels and pores; few fine prominent strong brown (7.5YR 5/6) and common fine distinct yellowish brown (10YR 5/4) masses of iron in the matrix; slightly alkaline; clear smooth boundary.
Btg2-49 to 58 inches; grayish brown ( $2.5 \mathrm{Y} 5 / 2$ ) silty clay loam; moderate medium prismatic structure; firm; few distinct gray (10YR $5 / 1$ ) clay films on faces of peds; few fine concretions of manganese lining pores; few fine prominent yellowish
brown (10YR 5/6) masses of iron in the matrix; slightly alkaline; gradual smooth boundary.
Cg-58 to 65 inches; grayish brown (2.5Y 5/2) silty clay loam; massive; firm; very dark gray (10YR 3/1) channel linings and fillings; many medium prominent yellowish brown (10YR 5/6) masses of iron in the matrix; slightly alkaline.

Range in Characteristics
Thickness of the mollic epipedon: 24 to 36 inches
Thickness of the solum: 36 to 60 inches
Ap or A horizon:
Hue-10YR, 2.5Y, 5Y, or N
Value-2 or 3
Chroma-0 to 2
Texture-silty clay loam
Bg or Btg horizon:
Hue-10YR, 2.5Y, or 5 Y
Value-3 to 6
Chroma-1 or 2
Texture—silty clay loam; strata in some pedons
Cg horizon:
Hue-10YR, 2.5Y, 5Y, or N
Value-4 to 6
Chroma-0 to 2
Texture-silty clay loam or clay loam; strata in some pedons

## 1107A—Sawmill silty clay loam, undrained, 0 to 2 percent slopes, frequently flooded

## Setting

Landform: Flood plains

## Map Unit Composition

Sawmill and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have less clay in the control section
- Soils that have mucky or sandy textures in the subsoil
- Soils that have a surface soil less than 24 inches thick
- Soils that have more clay

Dissimilar soils:

- The well drained Huntsville soils in the slightly higher positions

Properties and Qualities of the Sawmill Soil
Parent material: Alluvium
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.5 inches to a depth of 60 inches

Content of organic matter in the surface layer: 4.0 to 5.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface,
November through June
Deepest ponding: 0.2 foot, November through June
Frequency and most likely period of flooding: Frequent, November through June
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 5w
Prime farmland category: Not prime farmland
Hydric soil status: Hydric

## 3107+—Sawmill silt loam, 0 to 2 percent slopes, frequently flooded, overwash

## Setting

Landform: Flood plains

## Map Unit Composition

Sawmill and similar soils: 98 percent
Dissimilar soils: 2 percent

Seaton and similar soils: 55 percent
Timula and similar soils: 45 percent

## Minor Components

Similar soils:

- Soils that contain more sand
- Soils that are calcareous within a depth of 20 inches
- Soils that are not calcareous within a depth of 40 inches

Properties and Qualities of the Seaton Soil
Parent material: Loess
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.7 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Low
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: High

Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Properties and Qualities of the Timula Soil

## Parent material: Loess

Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderate
Depth to restrictive feature: More than 80 inches
Available water capacity: About 12.2 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: Low
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Low for steel and concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: Seaton—7e;Timula—7e
Prime farmland category: Not prime farmland
Hydric soil status: Seaton-not hydric; Timula-not hydric

## Selma Series

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Typic Endoaquolls
Typical Pedon
Selma loam, 0 to 2 percent slopes; at an elevation of 656 feet; 52 feet south and 160 feet west of the northeast corner of sec. 18, T. 28 N., R. 10 E.; Iroquois County, Illinois; USGS Piper City Northeast topographic quadrangle; lat. 40 degrees 54 minutes 35 seconds N . and long. 88 degrees 06 minutes 43 seconds W., NAD 27 :
Ap-0 to 6 inches; black (10YR 2/1) loam, dark gray (10YR 4/1) dry; weak fine and medium granular structure; friable; common very fine and fine roots; neutral; gradual smooth boundary.
A-6 to 13 inches; black (10YR 2/1) clay loam, dark gray (10YR 4/1) dry; weak fine subangular blocky structure; friable; common fine roots; neutral; gradual wavy boundary.
Btg1-13 to 19 inches; dark grayish brown (2.5Y 4/2) clay loam; moderate fine and medium subangular blocky structure; friable; common fine roots; many prominent very dark gray ( $2.5 \mathrm{Y} 3 / 1$ ) organo-clay films on faces of peds and in pores; few fine distinct yellowish brown (10YR 5/4) masses of iron in the matrix; neutral; gradual wavy boundary.
Btg2-19 to 28 inches; grayish brown (2.5Y 5/2) loam; moderate medium prismatic structure parting to moderate medium subangular blocky; friable; common fine roots; many prominent dark gray ( $2.5 \mathrm{Y} 4 / 1$ ) clay films on faces of peds; few fine light olive brown ( $2.5 \mathrm{Y} 5 / 4$ ) iron and manganese nodules throughout; common medium distinct olive brown ( $2.5 \mathrm{Y} 4 / 4$ ) masses of iron in the matrix; slightly alkaline; gradual wavy boundary.

Btg3—28 to 39 inches; grayish brown (2.5Y 5/2) loam; weak fine and medium subangular blocky structure; friable; common fine roots; few distinct dark gray (2.5Y 4/1) clay films on faces of peds; black (N 2.5/) krotovina from a depth of 30 inches to a depth of 39 inches; few fine dark yellowish brown (10YR 4/6) iron and manganese nodules throughout; few fine prominent light olive brown (2.5Y 5/6) masses of iron in the matrix; slightly alkaline; gradual wavy boundary.
BCtg—39 to 44 inches; grayish brown (2.5Y 5/2) loam; weak medium subangular blocky structure; friable; few very fine roots; few faint dark gray (2.5Y 4/1) clay films on faces of peds; few fine dark yellowish brown (10YR 4/6) iron and manganese nodules throughout; few fine prominent light olive brown (2.5Y 5/6) masses of iron in the matrix; strongly effervescent; slightly alkaline; gradual wavy boundary.
Cg1-44 to 54 inches; 55 percent dark gray (2.5Y 4/1), 35 percent gray (2.5Y 5/1), and 10 percent light yellowish brown (2.5Y 6/4), stratified sandy loam and loamy sand; massive in the sandy loam and single grain in the loamy sand; friable in the sandy loam and loose in the loamy sand; few very fine roots; very strongly effervescent; moderately alkaline; gradual wavy boundary.
Cg2—54 to 80 inches; 45 percent dark gray (2.5Y 4/1), 45 percent gray (2.5Y5/1), and 10 percent light olive brown (2.5Y5/6), stratified silt loam, sandy loam, and loamy sand; massive in the silt loam and sandy loam and single grain in the loamy sand; friable; few very fine roots; strongly effervescent; moderately alkaline.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 24 inches
Depth to carbonates: More than 30 inches
Thickness of the solum: 35 to 55 inches
Ap or A horizon:
Hue-10YR
Value-2 or 3
Chroma-1 or 2
Texture-loam or clay loam
$B g$, Btg, or BCg horizon:
Hue-10YR, 2.5Y, 5 Y , or N
Value-4 to 6
Chroma-0 to 2
Texture-loam, clay loam, silt loam, or sandy loam
Content of gravel-less than 10 percent
Cg or C horizon:
Hue-10YR, 2.5Y, or 5Y
Value-4 to 6
Chroma-1 to 6
Texture—stratified sandy loam, loam, silt loam, or loamy sand
Content of gravel—less than 15 percent

# 125A-Selma loam, 0 to 2 percent slopes <br> Setting <br> Landform: Outwash plains <br> Position on the landform: Toeslopes 

## Map Unit Composition

Selma and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a lighter colored surface layer
- Soils that have more sand in the upper part

Dissimilar soils:

- Somewhat poorly drained soils on footslopes

# Properties and Qualities of the Selma Soil 

Parent material: Outwash
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Moderately rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 11.0 inches to a depth of 60 inches
Content of organic matter in the surface layer: 3.0 to 5.0 percent
Shrink-swell potential: Moderate
Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Deepest ponding: 0.2 foot, January through May
Flooding: None
Potential for frost action: High
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Negligible
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2 w
Prime farmland category: Prime farmland where drained
Hydric soil status: Hydric

## Sparta Series

Taxonomic classification: Sandy, mixed, mesic Entic Hapludolls

## Typical Pedon

Sparta loamy sand, 0 to 2 percent slopes; 2,150 feet north and 1,939 feet east of the southwest corner of sec. 20, T. 23 N., R. 10 E.; Ogle County, Illinois; USGS Daysville topographic quadrangle; lat. 41 degrees 57 minutes 58 seconds N. and long. 89 degrees 22 minutes 13 seconds W., NAD 27:
A1-0 to 10 inches; very dark gray (10YR 3/1) loamy sand, grayish brown (10YR 5/2) dry; weak medium subangular blocky structure parting to moderate very fine granular; very friable; many fine roots throughout; neutral; clear smooth boundary.
A2-10 to 17 inches; very dark grayish brown (10YR 3/2) loamy sand, grayish brown (10YR $5 / 2$ ) dry; very weak medium and coarse subangular blocky structure parting to moderate very fine granular; very friable; common fine roots throughout; neutral; clear smooth boundary.
Bw1-17 to 24 inches; dark yellowish brown (10YR 4/4) sand; weak medium and coarse subangular blocky structure; very friable; few fine roots throughout; few distinct very dark grayish brown (10YR 3/2) organic coatings and few faint dark brown (10YR 3/3) clay bridging between sand grains; strongly acid; clear smooth boundary.

Bw2—24 to 31 inches; brown (7.5YR 5/4) sand; weak medium and coarse subangular blocky structure; very friable; few fine roots throughout; moderately acid; clear smooth boundary.
C-31 to 60 inches; reddish yellow (7.5YR 6/6) sand; single grain; loose; moderately acid.

## Range in Characteristics

Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 4e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 565D3-Tell silt loam, 10 to 18 percent slopes, severely eroded

Setting<br>Landform: Outwash plains<br>Position on the landform: Backslopes and shoulders<br>\section*{Map Unit Composition}

Tell and similar soils: 99 percent
Dissimilar soils: 1 percent

## Minor Components

Similar soils:

- Soils that have less than 20 inches of loess on the surface
- Soils that contain more sand throughout
- Soils that have more clay in the subsoil
- Soils that have more than 40 inches of loess over the underlying material

Dissimilar soils:

- The somewhat poorly drained Joyce soils on footslopes

Properties and Qualities of the Tell Soil
Parent material: Loess over outwash or eolian sands
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.5 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 2.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost more than 75 percent of the original surface
layer. The plow layer consists largely of subsoil material.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 6e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

# 565F2-Tell silt loam, 18 to 35 percent slopes, eroded 

## Setting

Landform: Outwash plains or ground moraines
Position on the landform: Backslopes and shoulders

## Map Unit Composition

Tell and similar soils: 99 percent
Dissimilar soils: 1 percent

## Minor Components

Similar soils:

- Soils that have less than 20 inches of loess on the surface
- Soils that contain more sand throughout
- Soils that have more clay in the subsoil
- Soils that have more than 40 inches of loess over the underlying material

Dissimilar soils:

- The somewhat poorly drained Joyce soils on footslopes

Properties and Qualities of the Tell Soil
Parent material: Loess over outwash or eolian sands
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.2 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In
most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: High
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 6e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 952C2—Tell-Lamont complex, 5 to 10 percent slopes, eroded

Setting
Landform: Ground moraines
Position on the landform: Summits and shoulders
Map Unit Composition
Tell and similar soils: 46 percent Lamont and similar soils: 44 percent Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have less than 20 inches of loess on the surface
- Soils that have more clay in the subsoil

Dissimilar soils:

- The somewhat poorly drained Joyce soils on footslopes

## Properties and Qualities of the Tell Soil

Parent material: Loess over outwash or eolian sands
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.3 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 3.0 percent
Shrink-swell potential: Moderate
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: High
Hazard of corrosion: Moderate for steel and concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Properties and Qualities of the Lamont Soil

Parent material: Eolian deposits
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderately rapid
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 7.9 inches to a depth of 60 inches
Content of organic matter in the surface layer: 0.5 to 1.0 percent
Shrink-swell potential: Low
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: Low for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Moderately high

Hydric soil status: Tell—not hydric; Lamont—not hydric

## Timula Series

Taxonomic classification: Coarse-silty, mixed, superactive, mesic Typic Eutrudepts
Typical Pedon
Timula silt loam, in an area of Seaton-Timula silt loams, 18 to 30 percent slopes, eroded; 1,080 feet east and 2,000 feet south of the northwest corner of sec. 29, T. 22 N., R. 5 E.; Whiteside County, Illinois; USGS Morrison topographic quadrangle; lat. 41 degrees 52 minutes 03 seconds N . and long. 89 degrees 57 minutes 19 seconds W ., NAD 27:

Ap-0 to 6 inches; brown (10YR 4/3) silt loam, pale brown (10YR 6/3) dry; weak fine subangular blocky structure parting to weak medium granular; friable; few fine roots throughout; few dark yellowish brown (10YR 4/4) fragments of subsoil material; neutral; abrupt smooth boundary.
Bw1-6 to 12 inches; yellowish brown (10YR 5/4) silt loam; moderate medium and fine subangular blocky structure; friable; few fine roots between peds; few faint brown (10YR 4/3) organic coatings and dark yellowish brown (10YR 4/4) clay films on faces of peds; neutral; clear smooth boundary.
Bw2-12 to 23 inches; yellowish brown (10YR 5/4) silt loam; weak coarse and medium subangular blocky structure; friable; few fine roots between peds; common faint dark yellowish brown (10YR 4/4) clay films on faces of peds; neutral; clear smooth boundary.
BC-23 to 28 inches; yellowish brown (10YR 5/4) silt loam; weak coarse angular blocky structure; friable; few fine distinct yellowish brown (10YR 5/6) masses of iron and light brownish gray (10YR 6/2) iron depletions in the matrix; slightly effervescent; slightly alkaline; gradual smooth boundary.

C—28 to 60 inches; light yellowish brown (2.5Y 6/4) silt loam; massive; friable; common fine prominent yellowish brown (10YR 5/6) masses of iron and common fine distinct light gray (10YR 7/2) iron depletions in the matrix; few fine soft dark brown (7.5YR 3/2) masses of iron-manganese oxides in the matrix; strongly effervescent; slightly alkaline.

## 3333A—Wakeland silt loam, 0 to 2 percent slopes, frequently flooded

Setting
Landform: Flood plains

## Map Unit Composition

Wakeland and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a black buried surface layer within a depth of 40 inches
- Soils that are calcareous
- Soils that contain more sand and less silt

## Properties and Qualities of the Wakeland Soil

Parent material: Alluvium<br>Drainage class: Somewhat poorly drained<br>Slowest permeability within a depth of 40 inches: Moderate<br>Permeability below a depth of 60 inches: Moderate<br>Depth to restrictive feature: More than 80 inches<br>Available water capacity: About 13.2 inches to a depth of 60 inches<br>Content of organic matter in the surface layer: 1.0 to 3.0 percent<br>Shrink-swell potential: Low<br>Depth and months of the highest apparent seasonal high water table: 0.5 foot, January through May<br>Frequency and most likely period of flooding: Frequent, November through June<br>Potential for frost action: High<br>Hazard of corrosion: High for steel and low for concrete<br>Surface runoff class: Low<br>Susceptibility to water erosion: Low<br>Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 2w
Prime farmland category: Prime farmland where drained and either protected from flooding or not frequently flooded during the growing season
Hydric soil status: Not hydric

## W-Water

- This map unit consists of natural water bodies and impoundments generally used for livestock water supplies, as wetland wildlife habitat, or for recreational purposes.

## Waukegan Series

Taxonomic classification: Fine-silty over sandy or sandy-skeletal, mixed, superactive, mesic Typic Hapludolls
Taxadjunct features: The Waukegan soil in map unit 564C2 has a thinner dark surface layer than is defined as the range for the series. This soil is classified as a fine-silty over sandy or sandy-skeletal, mixed, superactive, mesic Dystric Eutrudept.

## Typical Pedon

Waukegan silt loam, 0 to 2 percent slopes; 1,744 feet north and 450 feet east of the southwest corner of sec. 31, T. 18 N., R. 7 E.; Bureau County, Illinois; USGS New Bedford topographic quadrangle; lat. 41 degrees 30 minutes 04 seconds N. and long. 89 degrees 44 minutes 29 seconds W., NAD 27:
Ap—0 to 9 inches; very dark brown (10YR 2/2) silt loam, dark grayish brown (10YR $4 / 2$ ) dry; moderate fine granular structure; friable; common very fine roots throughout; moderately acid; abrupt smooth boundary.
A-9 to 17 inches; very dark brown (10YR 2/2) silt loam, dark grayish brown (10YR $4 / 2$ ) dry; moderate fine subangular blocky structure parting to moderate medium granular; friable; common very fine roots throughout; slightly acid; clear smooth boundary.

Bt1-17 to 22 inches; brown (10YR 4/3) silt loam; moderate medium subangular blocky structure; friable; common very fine roots between peds; few faint very dark brown (10YR 2/2) and dark brown (10YR 3/3) organo-clay films on faces of peds; slightly acid; clear smooth boundary.
Bt2—22 to 30 inches; yellowish brown (10YR 5/4) silt loam; moderate medium subangular blocky structure; friable; few very fine roots between peds; many faint dark yellowish brown (10YR 4/4) clay films on faces of peds; slightly acid; abrupt smooth boundary.
2BC-30 to 34 inches; yellowish brown (10YR 5/4) sandy loam; weak medium subangular blocky structure; friable; few very fine roots between peds; common faint dark yellowish brown (10YR 4/4) clay films on faces of peds; moderately acid; abrupt smooth boundary.
2C-34 to 60 inches; yellowish brown (10YR 5/4) gravelly sand; single grain; loose; about 32 percent pebbles and cobblestones; strong brown (7.5YR 5/6) iron bands between depths of 45 and 47 inches; slightly acid.

## Range in Characteristics

Thickness of the mollic epipedon: 10 to 20 inches
Thickness of the loess: 20 to 40 inches
Depth to sand and gravel: 20 to 40 inches
Depth to free carbonates: 40 to 70 inches

Chroma-2 to 6
Texture-sand or coarse sand

## 564B—Waukegan silt loam, 2 to 5 percent slopes

## Setting

## Landform: Outwash plains

Position on the landform: Summits and shoulders

## Map Unit Composition

Waukegan and similar soils: 95 percent
Dissimilar soils: 5 percent

## Minor Components

Similar soils:

- Soils that have a thinner dark surface layer
- Soils that have more than 40 inches of loess over the underlying sandy material
- Soils that have more sand in the surface layer and subsoil

Dissimilar soils:

- The somewhat poorly drained Joyce soils on footslopes

Properties and Qualities of the Waukegan Soil
Parent material: Loess over outwash
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.4 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 5.0 percent
Shrink-swell potential: Low
Flooding: None
Potential for frost action: Low
Hazard of corrosion: Low for steel and concrete
Surface runoff class: Low
Susceptibility to water erosion: Moderate
Susceptibility to wind erosion: Low
Interpretive Groups
Land capability classification: 2e
Prime farmland category: Prime farmland
Hydric soil status: Not hydric

## 564C2-Waukegan silt loam, 5 to 10 percent slopes, eroded

## Setting

Landform: Outwash plains
Position on the landform: Backslopes

## Map Unit Composition

Waukegan and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a thinner dark surface layer
- Soils that have more than 40 inches of loess over the underlying sandy material
- Soils that have more sand in the surface layer and subsoil
- Soils that have a lighter colored surface layer
- Soils that have a dark surface layer more than 10 inches thick

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## Woodbine Series

Taxonomic classification: Fine-loamy, mixed, active, mesic Typic Hapludalfs

## Typical Pedon

Woodbine silt loam, 2 to 5 percent slopes; 273 feet west and 1,410 feet south of the northeast corner of sec. 11, T. 27 N., R. 7 E.; Stephenson County, Illinois; USGS Freeport West topographic quadrangle; lat. 42 degrees 21 minutes 20 seconds N . and long. 89 degrees 39 minutes 02 seconds W., NAD 27:
A-0 to 4 inches; very dark gray (10YR 3/1) silt loam, gray (10YR 5/1) dry; moderate fine granular structure; friable; slightly acid; clear smooth boundary.
E-4 to 9 inches; mixed brown (10YR $5 / 3$ ) and very dark gray (10YR $3 / 1$ ) silt loam; brown (10YR $5 / 3$ ) when kneaded; moderate thin platy structure; friable; slightly acid; gradual smooth boundary.
BE-9 to 15 inches; dark yellowish brown (10YR 4/4) silty clay loam; moderate fine and medium subangular blocky structure; friable; moderately acid; clear smooth boundary.
$2 \mathrm{Bt} 1-15$ to 21 inches; brown (7.5YR 4/4) silty clay loam with about 10 percent sand; weak fine subangular blocky structure; firm; common distinct dark brown (7.5YR $3 / 2$ ) clay films on faces of peds; strongly acid; abrupt smooth boundary.
2Bt2-21 to 37 inches; brown (7.5YR 4/4) clay loam; moderate medium subangular blocky structure; firm; many distinct dark brown (7.5YR 3/2) clay films on the faces of peds; strongly acid; clear smooth boundary.
3Bt3-37 to 41 inches; dark reddish brown (5YR 3/4) gravelly clay; weak coarse angular blocky structure; firm; common distinct dark reddish brown (5YR 3/2) clay films on faces of peds; about 20 percent chert fragments; moderately acid; abrupt wavy boundary.
R-41 inches; level bedded dolomitic limestone.

## Range in Characteristics

Thickness of the loess: 10 to 30 inches
Thickness of the glacial drift: 20 to 35 inches
Thickness of the residuum: 0 to 5 inches
Thickness of the solum: 40 to 60 inches
Ap or A horizon:
Hue-10YR
Value-2 to 5
Chroma-1 to 3
Texture—silt loam or loam
E horizon:
Hue-10YR
Value-4 or 5
Chroma-1 to 3
Texture—silt loam or loam

## 2Bt horizon:

Hue-2.5YR, 5YR, or 7.5YR
Value-3 to 5
Chroma-3 to 5
Texture—clay loam, silty clay loam, loam, sandy clay loam, or sandy loam
3Bt horizon:
Hue-5YR
Value-3 or 4
Chroma-3 to 6
Texture—silty clay, clay, gravelly silty clay, or gravelly clay

## 410C2-Woodbine silt loam, 5 to 10 percent slopes, eroded

## Setting

## Landform: Ground moraines

Position on the landform: Backslopes
Map Unit Composition
Woodbine and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a thicker dark surface layer
- Soils that have 10 to 20 percent chert fragments in the surface layer and the upper part of the subsoil
- Soils that have more sand in the surface layer and subsoil
- Soils that have silt loam throughout the middle part of the subsoil
- Soils that have limestone bedrock within a depth of 40 inches

Dissimilar soils:

- The well drained Pecatonica soils on summits and shoulders
- The well drained Ross soils in drainageways

## Properties and Qualities of the Woodbine Soil

Parent material: Loess over till over residuum weathered from limestone
Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very slow or slow
Depth to restrictive feature: 40 to 60 inches to bedrock (lithic)
Available water capacity: About 8.2 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: High
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 410D2—Woodbine silt loam, 10 to 18 percent slopes, eroded

Setting<br>Landform: Ground moraines<br>Position on the landform: Backslopes<br>Map Unit Composition

Woodbine and similar soils: 85 percent
Dissimilar soils: 15 percent

## Minor Components

Similar soils:

- Soils that have a thicker dark surface layer
- Soils that have 10 to 20 percent chert fragments in the surface layer and the upper part of the subsoil
- Soils that have more sand in the surface layer and subsoil
- Soils that have silt loam throughout the middle part of the subsoil
- Soils that have limestone bedrock within a depth of 40 inches

Dissimilar soils:

- The well drained Pecatonica soils on summits, backslopes, and shoulders
- Well drained, loamy soils that have a thick dark surface layer; in drainageways

## Properties and Qualities of the Woodbine Soil

Parent material: Loess over till over residuum weathered from limestone Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very slow or slow

Depth to restrictive feature: 40 to 60 inches to bedrock (lithic)
Available water capacity: About 8.0 inches to a depth of 60 inches
Content of organic matter in the surface layer: 1.0 to 2.0 percent
Shrink-swell potential: High
Flooding: None
Accelerated erosion: This soil has lost 25 to 75 percent of the original surface layer. In most areas the subsoil is mixed with the surface layer.
Potential for frost action: Moderate
Hazard of corrosion: High for steel and low for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 3e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 410D3—Woodbine silty clay loam, 10 to 18 percent slopes, severely eroded

Setting

Landform: Ground moraines
Position on the landform: Backslopes

## Map Unit Composition

Woodbine and similar soils: 90 percent
Dissimilar soils: 10 percent

## Minor Components

Similar soils:

- Soils that have a thicker dark surface layer
- Soils that have 10 to 20 percent chert fragments in the surface layer and the upper part of the subsoil
- Soils that have more sand in the surface layer and subsoil
- Soils that have silt loam throughout the middle part of the subsoil
- Soils that have limestone bedrock within a depth of 40 inches

Dissimilar soils:

- The well drained Pecatonica soils on summits and shoulders
- Well drained, loamy soils in drainageways

## Properties and Qualities of the Woodbine Soil

Parent material: Loess over till over residuum weathered from limestone Drainage class: Well drained
Slowest permeability within a depth of 40 inches: Moderate
Permeability below a depth of 60 inches: Very slow or slow Depth to restrictive feature: 40 to 60 inches to bedrock (lithic) Available water capacity: About 7.3 inches to a depth of 60 inches Content of organic matter in the surface layer: 0.2 to 1.0 percent Shrink-swell potential: High
Flooding: None

Accelerated erosion: This soil has lost more than 75 percent of the original surface layer. The plow layer consists largely of subsoil material.
Potential for frost action: Moderate
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Medium
Susceptibility to water erosion: High
Susceptibility to wind erosion: Low

## Interpretive Groups

Land capability classification: 4 e
Prime farmland category: Not prime farmland
Hydric soil status: Not hydric

## 576A—Zwingle silt loam, 0 to 2 percent slopes

## Setting

Landform: Terraces
Position on the landform: Summits

## Map Unit Composition

Zwingle and similar soils: 100 percent

## Minor Components

Similar soils:

- Soils that have a gray subsoil
- Soils that have a seasonal high water table at a depth of more than 1 foot

## Properties and Qualities of the Zwingle Soil

Parent material: Clayey lacustrine deposits
Drainage class: Poorly drained
Slowest permeability within a depth of 40 inches: Very slow
Permeability below a depth of 60 inches: Moderately rapid
Depth to restrictive feature: More than 80 inches
Available water capacity: About 9.0 inches to a depth of 60 inches
Content of organic matter in the surface layer: 2.0 to 3.0 percent
Shrink-swell potential: High

Depth and months of the highest apparent seasonal high water table: At the surface, January through May
Flooding: None
Potential for frost action: Moderate
Hazard of corrosion: High for steel and moderate for concrete
Surface runoff class: Low
Susceptibility to water erosion: Low
Susceptibility to wind erosion: Low

## Interpretive Groups

## Use and Management of the Soils

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as forestland; as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities; and as wildlife habitat. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Planners and others using soil survey information can evaluate the effect of specific land uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of sand and gravel, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, and trees and shrubs.

## Interpretive Ratings

The interpretive tables in this survey rate the soils in the survey area for various uses. Many of the tables identify the limitations that affect specified uses and indicate the severity of those limitations. The ratings in these tables are both verbal and numerical.

## Rating Class Terms

Rating classes are expressed in the tables in terms that indicate the extent to which the soils are limited by all of the soil features that affect a specified use or in terms that indicate the suitability of the soils for the use. Thus, the tables may show limitation classes or suitability classes. Terms for the limitation classes are not limited, somewhat limited, and very limited. The suitability ratings are expressed as well suited, moderately suited, poorly suited, and unsuited or as good, fair, and poor.

## Numerical Ratings

Numerical ratings in the tables indicate the relative severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.00 to 1.00 . They indicate
gradations between the point at which a soil feature has the greatest negative impact on the use and the point at which the soil feature is not a limitation. The limitations appear in order from the most limiting to the least limiting. Thus, if more than one limitation is identified, the most severe limitation is listed first and the least severe one is listed last.

## Crops and Pasture

General management needed for crops and pasture is suggested in this section. The estimated yields of the main crops and pasture plants are listed, the system of land capability classification used by the Natural Resources Conservation Service is explained, and prime farmland is described.

Planners of management systems for individual fields or farms should consider the detailed information given in the description of each soil under the heading "Soil Series and Detailed Soil Map Units." Specific information can be obtained from the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

## Yields per Acre

The average yields per acre that can be expected of the principal crops under a high level of management are shown in table 6. In any given year, yields may be higher or lower than those indicated in the table because of variations in rainfall and other climatic factors. The land capability classification of map units in the survey area also is shown in the table.

The yields are based mainly on the experience and records of farmers, conservationists, and extension agents (OIsen and others, 2000). Available yield data from nearby counties and results of field trials and demonstrations also are considered (Fehrenbacher and others, 1978).

The management needed to obtain the indicated yields of the various crops depends on the kind of soil and the crop. Management can include drainage, erosion control (fig. 9), and protection from flooding; the proper planting and seeding rates; suitable high-yielding crop varieties; appropriate and timely tillage; control of weeds, plant diseases, and harmful insects; favorable soil reaction and optimum levels of nitrogen, phosphorus, potassium, and trace elements for each crop; effective use of crop residue, barnyard manure, and green manure crops; and harvesting that ensures the smallest possible loss.

The estimated yields reflect the productive capacity of each soil for each of the principal crops. Yields are likely to increase as new production technology is developed. The productivity of a given soil compared with that of other soils, however, is not likely to change.

Crops other than those shown in table 6 are grown in the survey area, but estimated yields are not listed because the acreage of such crops is small. The local office of the Natural Resources Conservation Service or of the Cooperative Extension Service can provide information about the management and productivity of the soils for those crops.

## Pasture and Hayland Interpretations

Under good management, proper grazing is essential for the production of highquality forage, stand survival, and erosion control. Proper grazing helps plants to maintain sufficient and generally vigorous top growth during the growing season. Brush control is essential in many areas, and weed control generally is needed. Rotation grazing and pasture renovation also are important management practices.

Figure 9.-No-till practices leave crop residue on the surface and help to control erosion.

Yield estimates are often provided in animal unit months (AUM), or the amount of forage or feed required to feed one animal unit (one cow, one horse, one mule, five sheep, or five goats) for 30 days.

The local office of the Natural Resources Conservation Service or the Cooperative Extension Service can provide information about forage yields other than those shown in the yields table.

## Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for forestland or for engineering purposes.

In the capability system, soils are generally grouped at three levels-capability class, subclass, and unit (USDA, 1961). Only class and subclass are used in this survey.

Capability classes, the broadest groups, are designated by the numbers 1 through 8. The numbers indicate progressively greater limitations and narrower choices for practical use. The classes are defined as follows:

Class 1 soils have slight limitations that restrict their use.
Class 2 soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.

Class 3 soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.

Class 4 soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.

Class 5 soils are subject to little or no erosion but have other limitations, impractical to remove, that restrict their use mainly to pasture, forestland, or wildlife habitat.

Class 6 soils have severe limitations that make them generally unsuitable for cultivation and that restrict their use mainly to pasture, forestland, or wildlife habitat.

Class 7 soils have very severe limitations that make them unsuitable for cultivation and that restrict their use mainly to grazing, forestland, or wildlife habitat.

Class 8 soils and miscellaneous areas have limitations that preclude commercial plant production and that restrict their use to recreational purposes, wildlife habitat, watershed, or esthetic purposes.

Capability subclasses are soil groups within one class. They are designated by adding a small letter, $e, w, s$, or $c$, to the class numeral, for example, $2 e$. The letter $e$ shows that the main hazard is the risk of erosion unless close-growing plant cover is maintained; $w$ shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); $s$ shows that the soil is limited mainly because it is shallow, droughty, or stony; and $c$, used in only some parts of the United States, shows that the chief limitation is climate that is very cold or very dry.

In class 1 there are no subclasses because the soils of this class have few limitations. Class 5 contains only the subclasses indicated by $w, s$, or $c$ because the soils in class 5 are subject to little or no erosion. They have other limitations that restrict their use to pasture, forestland, or wildlife habitat.

The capability classification of the soils in this survey area is given in the section "Soil Series and Detailed Soil Map Units" and in the yields table.

## Prime Farmland

Prime farmland is one of several kinds of important farmland defined by the U.S. Department of Agriculture. It is of major importance in meeting the Nation's short- and long-range needs for food and fiber. Because the supply of high-quality farmland is limited, the U.S. Department of Agriculture recognizes that responsible levels of government, as well as individuals, should encourage and facilitate the wise use of our Nation's prime farmland.

Prime farmland, as defined by the U.S. Department of Agriculture, is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and is available for these uses. It could be cultivated land, pastureland, forestland, or other land, but it is not urban or built-up land or water areas. The soil qualities, growing season, and moisture supply are those needed for the soil to economically produce sustained high yields of crops when proper management, including water management, and acceptable farming methods are applied. In general, prime farmland has an adequate and dependable supply of moisture from precipitation or irrigation, a favorable temperature and growing season, acceptable acidity or alkalinity, an acceptable salt and sodium content, and few or no rocks. It is permeable to water and air. It is not excessively erodible or saturated with water for long periods, and it either is not frequently flooded during the growing season or is protected from flooding. Slope ranges mainly from 0 to 6 percent. More detailed information about the criteria for prime farmland is available at the local office of the Natural Resources Conservation Service.

A recent trend in land use in some parts of the survey area has been the loss of some prime farmland to industrial and urban uses. The loss of prime farmland to other
uses puts pressure on marginal lands, which generally are more erodible, droughty, and less productive and cannot be easily cultivated.

About 107,853 acres, or about 36 percent of the survey area, meets the requirements for prime farmland.

The map units in the survey area that are considered prime farmland are listed in table 7. This list does not constitute a recommendation for a particular land use. On some soils included in the list, measures that overcome a hazard or limitation, such as flooding, wetness, and droughtiness, are needed. Onsite evaluation is needed to determine whether or not the hazard or limitation has been overcome by corrective measures. The extent of each listed map unit is shown in table 5. The location is shown on the detailed soil maps. The soil qualities that affect use and management are described under the heading "Soil Series and Detailed Soil Map Units."

## Hydric Soils

The three essential characteristics of wetlands are hydrophytic vegetation, hydric soils, and wetland hydrology (Cowardin and others, 1979; U.S. Army Corps of Engineers, 1987; National Research Council, 1995; Tiner, 1985). Criteria for all of the characteristics must be met for areas to be identified as wetlands. Undrained hydric soils that have natural vegetation should support a dominant population of ecological wetland plant species. Hydric soils that have been converted to other uses should be capable of being restored to wetlands.

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). These soils, under natural conditions, are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation (fig. 10).

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2003) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and others, 2002).

Hydric soils are identified by examining and describing the soil to a depth of about 20 inches. This depth may be greater if determination of an appropriate indicator so requires. It is always recommended that soils be excavated and described to the depth necessary for an understanding of the redoximorphic processes. Then, using the completed soil descriptions, soil scientists can compare the soil features required by each indicator and specify which indicators have been matched with the conditions observed in the soil. The soil can be identified as a hydric soil if at least one of the approved indicators is present.

Map units that are dominantly made up of hydric soils may have small areas, or inclusions, of nonhydric soils in the higher positions on the landform, and map units dominantly made up of nonhydric soils may have inclusions of hydric soils in the lower positions on the landform. Table 8 lists the map units that include hydric soils, either as

Figure 10.-Wetland vegetation in an area of Edgington soils.
major components or as inclusions. The hydric soils listed in the table meet the definition of a hydric soil and have at least one of the hydric soil indicators. This list can help in planning land uses; however, onsite investigation is recommended to determine the hydric soils on a specific site (National Research Council, 1995; Hurt and others, 2002).

The criteria for hydric soils are represented by codes in the table (for example, 2B3). Definitions for the codes are as follows:

1. All Histels except for Folistels, and Histosols except for Folists.
2. Soils in Aquic suborders, great groups, or subgroups, Albolls suborder, Historthels great group, Histoturbels great group, Pachic subgroups, or Cumulic subgroups that:
A. are somewhat poorly drained and have a water table at the surface ( 0.0 feet) during the growing season, or
B. are poorly drained or very poorly drained and have either:
1) a water table at the surface ( 0.0 feet) during the growing season if textures are coarse sand, sand, or fine sand in all layers within a depth of 20 inches, or
2) a water table at a depth of 0.5 foot or less during the growing season if permeability is equal to or greater than $6.0 \mathrm{in} / \mathrm{hr}$ in all layers within a depth of 20 inches, or
3) a water table at a depth of 1.0 foot or less during the growing season if permeability is less than $6.0 \mathrm{in} / \mathrm{hr}$ in any layer within a depth of 20 inches.
3. Soils that are frequently ponded for long or very long duration during the growing season.
4. Soils that are frequently flooded for long or very long duration during the growing season.

## Windbreaks and Environmental Plantings

Windbreaks protect livestock, buildings, yards, fruit trees, gardens, and cropland from wind and snow; help to keep snow on fields; and provide food and cover for wildlife. Field windbreaks are narrow plantings made at right angles to the prevailing
wind and at specific intervals across the field. The interval depends on the erodibility of the soil.

Environmental plantings help to beautify and screen houses and other buildings and to abate noise. The plants, mostly evergreen shrubs and trees, are closely spaced. To ensure plant survival, a healthy planting stock of suitable species should be planted properly on a well prepared site and maintained in good condition.

Table 9 shows the height that locally grown trees and shrubs are expected to reach in 20 years on soils in the survey area. The estimates in the table are based on measurements and observation of established plantings that have been given adequate care. They can be used as a guide in planning windbreaks and screens. Additional information on planning windbreaks and screens and planting and caring for trees and shrubs can be obtained from the local office of the Natural Resources Conservation Service or of the Cooperative Extension Service or from a commercial nursery.

## Forestland Productivity and Management

The tables in this section can help forest owners or managers plan the use of soils for wood crops. They show the potential productivity of the soils for wood crops and rate the soils according to the limitations that affect various aspects of forest management.

## Forestland Productivity

In table 10, the potential productivity of merchantable or common trees on a soil is expressed as a site index and as a volume number. The site index is the average height, in feet, that dominant and codominant trees of a given species attain in a specified number of years. The site index applies to fully stocked, even-aged, unmanaged stands. Commonly grown trees are those that forest managers generally favor in intermediate or improvement cuttings. They are selected on the basis of growth rate, quality, value, and marketability. More detailed information regarding site index is available in the "National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet (http://soils.usda.gov).

The volume of wood fiber, a number, is the yield likely to be produced by the most important tree species. This number, expressed as cubic feet per acre per year and calculated at the age of culmination of the mean annual increment (CMAI), indicates the amount of fiber produced in a fully stocked, even-aged, unmanaged stand.

Suggested trees to plant are those that are preferred for planting, seeding, or natural regeneration and those that remain in the stand after thinning or partial harvest.

## Forestland Management

In tables 11a through 11d, interpretive ratings are given for various aspects of forest management. The ratings are both verbal and numerical.

Some rating class terms indicate the degree to which the soils are suited to a specified forest management practice. Well suited indicates that the soil has features that are favorable for the specified practice and has no limitations. Good performance can be expected, and little or no maintenance is needed. Moderately suited indicates that the soil has features that are moderately favorable for the specified practice. One or more soil properties are less than desirable, and fair performance can be expected. Some maintenance is needed. Poorly suited indicates that the soil has one or more properties that are unfavorable for the specified practice. Overcoming the unfavorable properties requires special design, extra maintenance, and costly alteration. Unsuited indicates that the expected performance of the soil is unacceptable for the specified
practice or that extreme measures are needed to overcome the undesirable soil properties.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the specified forest management practice (1.00) and the point at which the soil feature is not a limitation (0.00).

Rating class terms for seedling mortality are expressed as low, moderate, and high. Where these terms are used, the numerical ratings indicate gradations between the point at which the potential for fire damage or seedling mortality is highest (1.00) and the point at which the potential is lowest (0.00).

The paragraphs that follow indicate the soil properties considered in rating the soils for forest management practices. More detailed information about the criteria used in the ratings is available in the "National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet (http://soils.usda gov).

For limitations affecting construction of haul roads and log landings, the ratings are based on slope, flooding, permafrost, plasticity index, the hazard of soil slippage, content of sand, the Unified classification, rock fragments on or below the surface, depth to a restrictive layer that is indurated, depth to a water table, and ponding. The limitations are described as slight, moderate, or severe. A rating of slight indicates that no significant limitations affect construction activities, moderate indicates that one or more limitations can cause some difficulty in construction, and severe indicates that one or more limitations can make construction very difficult or very costly.

The ratings of suitability for log landings are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, ponding, flooding, and the hazard of soil slippage. The soils are described as well suited, moderately suited, or poorly suited to use as log landings.

Ratings in the column soil rutting hazard are based on depth to a water table, rock fragments on or below the surface, the Unified classification, depth to a restrictive layer, and slope. Ruts form as a result of the operation of forest equipment. The hazard is described as slight, moderate, or severe. A rating of slight indicates that the soil is subject to little or no rutting, moderate indicates that rutting is likely, and severe indicates that ruts form readily.

Ratings in the column hazard of off-road or off-trail erosion are based on slope and on soil erodibility factor K. The soil loss is caused by sheet or rill erosion in off-road or off-trail areas where 50 to 75 percent of the surface has been exposed by logging, grazing, mining, or other kinds of disturbance. The hazard is described as slight, moderate, severe, or very severe. A rating of slight indicates that erosion is unlikely under ordinary climatic conditions; moderate indicates that some erosion is likely and that erosion-control measures may be needed; severe indicates that erosion is very likely and that erosion-control measures, including revegetation of bare areas, are advised; and very severe indicates that significant erosion is expected, loss of soil productivity and off-site damage are likely, and erosion-control measures are costly and generally impractical.

Ratings in the column hazard of erosion on roads and trails are based on the soil erodibility factor K, slope, and content of rock fragments. Ihe ratings apply to unsurfaced roads and trails. The hazard is described as slight, moderate, or severe. A rating of slight indicates that little or no erosion is likely; moderate indicates that some erosion is likely, that the roads or trails may require occasional maintenance, and that simple erosion-control measures are needed; and severe indicates that significant erosion is expected, that the roads or trails require frequent maintenance, and that costly erosion-control measures are needed.

Ratings in the column suitability for roads (natural surface) are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, ponding, flooding, and the hazard of soil slippage. The ratings indicate the suitability for using the natural surface of the soil for roads. The soils are described as well suited, moderately suited, or poorly suited to this use.

Ratings in the column suitability for mechanical site preparation (surface) are based on slope, depth to a restrictive layer, plasticity index, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, poorly suited, or unsuited to this management activity. The part of the soil from the surface to a depth of about 1 foot is considered in the ratings.

Ratings in the column suitability for mechanical site preparation (deep) are based on slope, depth to a restrictive layer, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, poorly suited, or unsuited to this management activity. The part of the soil from the surface to a depth of about 3 feet is considered in the ratings.

Ratings in the column potential for seedling mortality are based on flooding, ponding, depth to a water table, content of lime, reaction, salinity, available water capacity, soil moisture regime, soil temperature regime, aspect, and slope. The soils are described as having a low, moderate, or high potential for seedling mortality.

## Recreation

The soils of the survey area are rated in tables 12 a and 12 b according to limitations that affect their suitability for recreation. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect the recreational uses. Not limited indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. Somewhat limited indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. Very limited indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

The ratings in the tables are based on restrictive soil features, such as wetness, slope, and texture of the surface layer. Susceptibility to flooding is considered. Not considered in the ratings, but important in evaluating a site, are the location and accessibility of the area, the size and shape of the area and its scenic quality, vegetation, access to water, potential water impoundment sites, and access to public sewer lines. The capacity of the soil to absorb septic tank effluent and the ability of the soil to support vegetation also are important. Soils that are subject to flooding are limited for recreational uses by the duration and intensity of flooding and the season when flooding occurs. In planning recreational facilities, onsite assessment of the height, duration, intensity, and frequency of flooding is essential.

The information in tables 12 a and 12 b can be supplemented by other information in this survey, for example, interpretations for building site development, construction materials, sanitary facilities, and water management.

Camp areas require site preparation, such as shaping and leveling the tent and parking areas, stabilizing roads and intensively used areas, and installing sanitary
facilities and utility lines. Camp areas are subject to heavy foot traffic and some vehicular traffic. The ratings are based on the soil properties that affect the ease of developing camp areas and the performance of the areas after development. Slope, stoniness, and depth to bedrock or a cemented pan are the main concerns affecting the development of camp areas. The soil properties that affect the performance of the areas after development are those that influence trafficability and promote the growth of vegetation, especially in heavily used areas. For good trafficability, the surface of camp areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Picnic areas are subject to heavy foot traffic. Most vehicular traffic is confined to access roads and parking areas. The ratings are based on the soil properties that affect the ease of developing picnic areas and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of picnic areas. For good trafficability, the surface of picnic areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Playgrounds require soils that are nearly level, are free of stones, and can withstand intensive foot traffic. The ratings are based on the soil properties that affect the ease of developing playgrounds and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of playgrounds. For good trafficability, the surface of the playgrounds should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Paths and trails for hiking and horseback riding should require little or no slope modification through cutting and filling. The ratings are based on the soil properties that affect trafficability and erodibility. These properties are stoniness, depth to a water table, ponding, flooding, slope, and texture of the surface layer.

Off-road motorcycle trails require little or no site preparation. They are not covered with surfacing material or vegetation. Considerable compaction of the soil material is likely. The ratings are based on the soil properties that influence erodibility, trafficability, dustiness, and the ease of revegetation. These properties are stoniness, slope, depth to a water table, ponding, flooding, and texture of the surface layer.

Golf fairways are subject to heavy foot traffic and some light vehicular traffic. Cutting or filling may be required. Irrigation is not considered in the ratings. The ratings are based on the soil properties that affect plant growth and trafficability after vegetation is established. The properties that affect plant growth are reaction; depth to a water table; ponding; depth to bedrock or a cemented pan; the available water capacity in the upper 40 inches; the content of salts, sodium, or calcium carbonate; and sulfidic materials. The properties that affect trafficability are flooding, depth to a water table, ponding, slope, stoniness, and the amount of sand, clay, or organic matter in the surface layer. The suitability of the soil for traps, tees, roughs, and greens is not considered in the ratings.

## Wildlife Habitat

Soils affect the kind and amount of vegetation that is available to wildlife as food and cover. They also affect the construction of water impoundments. The kind and abundance of wildlife depend largely on the amount and distribution of food, cover, and water. Wildlife habitat can be created or improved by planting appropriate vegetation, by maintaining the existing plant cover, or by promoting the natural establishment of desirable plants.

In table 13, the soils in the survey area are rated according to their potential for providing habitat for various kinds of wildlife. This information can be used in planning parks, wildlife refuges, nature study areas, and other developments for wildlife; in selecting soils that are suitable for establishing, improving, or maintaining specific elements of wildlife habitat; and in determining the intensity of management needed for each element of the habitat.

The potential of the soil is rated good, fair, poor, or very poor. A rating of good indicates that the element or kind of habitat is easily established, improved, or maintained. Few or no limitations affect management, and satisfactory results can be expected. A rating of fair indicates that the element or kind of habitat can be established, improved, or maintained in most places. Moderately intensive management is required for satisfactory results. A rating of poor indicates that limitations are severe for the designated element or kind of habitat. Habitat can be created, improved, or maintained in most places, but management is difficult and must be intensive. A rating of very poor indicates that restrictions for the element or kind of habitat are very severe and that unsatisfactory results can be expected. Creating, improving, or maintaining habitat is impractical or impossible.

The elements of wildlife habitat are described in the following paragraphs.
Grain and seed crops are domestic grains and seed-producing herbaceous plants.
Soil properties and features that affect the growth of grain and seed crops are depth of the root zone, texture of the surface layer, available water capacity, wetness, slope, surface stoniness, and flooding. Soil temperature and soil moisture also are considerations. Examples of grain and seed crops are corn, soybeans, wheat, oats, and barley.

Grasses and legumes are domestic perennial grasses and herbaceous legumes. Soil properties and features that affect the growth of grasses and legumes are depth of the root zone, texture of the surface layer, available water capacity, wetness, surface stoniness, flooding, and slope. Soil temperature and soil moisture also are considerations. Examples of grasses and legumes are bromegrass, timothy, orchardgrass, clover, alfalfa, wheatgrass, and birdsfoot trefoil.

Wild herbaceous plants are native or naturally established grasses and forbs, including weeds. Soil properties and features that affect the growth of these plants are depth of the root zone, texture of the surface layer, available water capacity, wetness, surface stoniness, and flooding. Soil temperature and soil moisture also are considerations. Examples of wild herbaceous plants are bluestem, indiangrass, blueberry, goldenrod, lambsquarters, dandelions, blackberry, ragweed, wheatgrass, and nightshade.

Hardwood trees and woody understory produce nuts or other fruit, buds, catkins, twigs, bark, and foliage. Soil properties and features that affect the growth of hardwood trees and shrubs are depth of the root zone, available water capacity, and wetness. Examples of these plants are oak, poplar, box elder, birch, maple, green ash, willow, and American elm.

Coniferous plants furnish browse and seeds. Soil properties and features that affect the growth of coniferous trees, shrubs, and ground cover are depth of the root zone, available water capacity, and wetness. Examples of coniferous plants are pine, spruce, cedar, and tamarack.

Wetland plants are annual and perennial wild herbaceous plants that grow on moist or wet sites. Submerged or floating aquatic plants are excluded. Soil properties and features affecting wetland plants are texture of the surface layer, wetness, reaction, salinity, slope, and surface stoniness. Examples of wetland plants are smartweed, wild millet, rushes, sedges, bulrushes, wild rice, arrowhead, waterplantain, cattails, prairie cordgrass, bluejoint grass, asters, and beggarticks.

Shallow water areas have an average depth of less than 5 feet. Some are naturally wet areas. Others are created by dams, levees, or other water-control structures. Soil properties and features affecting shallow water areas are depth to bedrock, wetness, surface stoniness, slope, and permeability. Examples of shallow water areas are marshes, waterfowl feeding areas, wildlife watering developments, beaver ponds, and other wildlife ponds.

The habitat for various kinds of wildlife is described in the following paragraphs.
Habitat for openland wildlife consists of cropland, pasture, meadows, and areas that are overgrown with grasses, herbs, shrubs, and vines. These areas produce grain and seed crops, grasses and legumes, and wild herbaceous plants. Wildlife attracted to these areas include Hungarian partridge, ring-necked pheasant, bobwhite quail, sharp-tailed grouse, meadowlark, field sparrow, cottontail rabbit, and red fox.

Habitat for woodland wildlife consists of areas of deciduous and/or coniferous plants and associated grasses, legumes, and wild herbaceous plants. Wildlife attracted to these areas include wild turkey, ruffed grouse, thrushes, woodpeckers, owls, tree squirrels, porcupine, raccoon, and white-tailed deer.

Habitat for wetland wildlife consists of open, marshy or swampy shallow water areas. Some of the wildlife attracted to such areas are ducks, geese, herons, bitterns, rails, kingfishers, muskrat, otter, mink, and beaver.

## Engineering

This section provides information for planning land uses related to urban development and to water management (fig. 11). Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the data in the tables described under the heading "Soil Properties."

Information in this section is intended for land use planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil between the surface and a depth of 5 to 7 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.

The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section. Local ordinances and regulations should be considered in planning, in site selection, and in design.

Figure 11.-Streambank stabilization practices help to control erosion along streambeds.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about particle-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 to 7 feet of the surface, soil wetness, depth to a water table, ponding, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kinds of adsorbed cations. Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, industrial, and recreational uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, and sewage lagoons; plan detailed onsite investigations of soils and geology; locate potential sources of gravel, sand, earthfill, and topsoil; plan drainage systems, irrigation systems, ponds, terraces, and other structures for soil and water conservation; and predict performance of proposed small structures and pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the Glossary.

## Building Site Development

Soil properties influence the development of building sites, including the selection of the site, the design of the structure, construction, performance after construction, and maintenance. Tables 14a and 14b show the degree and kind of soil limitations that affect dwellings with and without basements, small commercial buildings, local roads and streets, shallow excavations, and lawns and landscaping.

The ratings in the tables are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect building site development. Not limited indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. Somewhat limited indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. Very limited indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00 . They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation ( 0.00 ).

Dwellings are single-family houses of three stories or less. For dwellings without basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. For dwellings with basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of about 7 feet. The ratings for dwellings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility. Compressibility is inferred from the Unified classification. The properties that affect the ease and amount of excavation include depth to a water table, ponding, flooding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

Small commercial buildings are structures that are less than three stories high and do not have basements. The foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. The ratings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility (which is inferred from the Unified classification). The properties that affect the ease and amount of excavation include flooding, depth to a water table, ponding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

Local roads and streets have an all-weather surface and carry automobile and light truck traffic all year. They have a subgrade of cut or fill soil material; a base of gravel, crushed rock, or soil material stabilized by lime or cement; and a surface of flexible material (asphalt), rigid material (concrete), or gravel with a binder. The ratings are based on the soil properties that affect the ease of excavation and grading and the traffic-supporting capacity. The properties that affect the ease of excavation and
grading are depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, depth to a water table, ponding, flooding, the amount of large stones, and slope. The properties that affect the traffic-supporting capacity are soil strength (as inferred from the AASHTO group index number), subsidence, linear extensibility (shrink-swell potential), the potential for frost action, depth to a water table, and ponding.

Shallow excavations are trenches or holes dug to a maximum depth of 5 or 6 feet for graves, utility lines, open ditches, or other purposes. The ratings are based on the soil properties that influence the ease of digging and the resistance to sloughing. Depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, the amount of large stones, and dense layers influence the ease of digging, filling, and compacting. Depth to the seasonal high water table, flooding, and ponding may restrict the period when excavations can be made. Slope influences the ease of using machinery. Soil texture, depth to the water table, and linear extensibility (shrink-swell potential) influence the resistance to sloughing.

Lawns and landscaping require soils on which turf and ornamental trees and shrubs can be established and maintained. Irrigation is not considered in the ratings. The ratings are based on the soil properties that affect plant growth and trafficability after vegetation is established. The properties that affect plant growth are reaction; depth to a water table; ponding; depth to bedrock or a cemented pan; the available water capacity in the upper 40 inches; the content of salts, sodium, or calcium carbonate; and sulfidic materials. The properties that affect trafficability are flooding, depth to a water table, ponding, slope, stoniness, and the amount of sand, clay, or organic matter in the surface layer.

## Sanitary Facilities

Tables 15 a and 15 b show the degree and kind of soil limitations that affect septic tank absorption fields, sewage lagoons, sanitary landfills, and daily cover for landfill. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect these uses. Not limited indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. Somewhat limited indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. Very limited indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00 . They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

Septic tank absorption fields are areas in which effluent from a septic tank is distributed into the soil through subsurface tiles or perforated pipe. Only that part of the soil between depths of 24 and 60 inches is evaluated. The ratings are based on the soil properties that affect absorption of the effluent, construction and maintenance of the system, and public health. Permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, and flooding affect absorption of the effluent. Stones and boulders, ice, and bedrock or a cemented pan interfere with installation. Subsidence interferes with installation and maintenance. Excessive slope may cause lateral seepage and surfacing of the effluent in downslope areas.

Some soils are underlain by loose sand and gravel or fractured bedrock at a depth of less than 4 feet below the distribution lines. In these soils the absorption field may
not adequately filter the effluent, particularly when the system is new. As a result, the ground water may become contaminated.

Sewage lagoons are shallow ponds constructed to hold sewage while aerobic bacteria decompose the solid and liquid wastes. Lagoons should have a nearly level floor surrounded by cut slopes or embankments of compacted soil. Nearly impervious soil material for the lagoon floor and sides is required to minimize seepage and contamination of ground water. Considered in the ratings are slope, permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, flooding, large stones, and content of organic matter.

Soil permeability is a critical property affecting the suitability for sewage lagoons. Most porous soils eventually become sealed when they are used as sites for sewage lagoons. Until sealing occurs, however, the hazard of pollution is severe. Soils that have a permeability rate of more than 2 inches per hour are too porous for the proper functioning of sewage lagoons. In these soils, seepage of the effluent can result in contamination of the ground water. Ground-water contamination is also a hazard if fractured bedrock is within a depth of 40 inches, if the water table is high enough to raise the level of sewage in the lagoon, or if floodwater overtops the lagoon.

A high content of organic matter is detrimental to proper functioning of the lagoon because it inhibits aerobic activity. Slope, bedrock, and cemented pans can cause construction problems, and large stones can hinder compaction of the lagoon floor. If the lagoon is to be uniformly deep throughout, the slope must be gentle enough and the soil material must be thick enough over bedrock or a cemented pan to make land smoothing practical.

A trench sanitary landfill is an area where solid waste is placed in successive layers in an excavated trench. The waste is spread, compacted, and covered daily with a thin layer of soil excavated at the site. When the trench is full, a final cover of soil material at least 2 feet thick is placed over the landfill. The ratings in the table are based on the soil properties that affect the risk of pollution, the ease of excavation, trafficability, and revegetation. These properties include permeability, depth to bedrock or a cemented pan, depth to a water table, ponding, slope, flooding, texture, stones and boulders, highly organic layers, soil reaction, and content of salts and sodium. Unless otherwise stated, the ratings apply only to that part of the soil within a depth of about 6 feet. For deeper trenches, onsite investigation may be needed.

Hard, nonrippable bedrock, creviced bedrock, or highly permeable strata in or directly below the proposed trench bottom can affect the ease of excavation and the hazard of ground-water pollution. Slope affects construction of the trenches and the movement of surface water around the landfill. It also affects the construction and performance of roads in areas of the landfill.

Soil texture and consistence affect the ease with which the trench is dug and the ease with which the soil can be used as daily or final cover. They determine the workability of the soil when dry and when wet. Soils that are plastic and sticky when wet are difficult to excavate, grade, or compact and are difficult to place as a uniformly thick cover over a layer of refuse.

The soil material used as the final cover for a trench landfill should be suitable for plants. It should not have excess sodium or salts and should not be too acid. The surface layer generally has the best workability, the highest content of organic matter, and the best potential for plants. Material from the surface layer should be stockpiled for use as the final cover.

In an area sanitary landfill, solid waste is placed in successive layers on the surface of the soil. The waste is spread, compacted, and covered daily with a thin layer of soil from a source away from the site. A final cover of soil material at least 2 feet thick is placed over the completed landfill. The ratings in the table are based on the soil properties that affect trafficability and the risk of pollution. These properties include
flooding, permeability, depth to a water table, ponding, slope, and depth to bedrock or a cemented pan.

Flooding is a serious problem because it can result in pollution in areas downstream from the landfill. If permeability is too rapid or if fractured bedrock, a fractured cemented pan, or the water table is close to the surface, the leachate can contaminate the water supply. Slope is a consideration because of the extra grading required to maintain roads in the steeper areas of the landfill. Also, leachate may flow along the surface of the soils in the steeper areas and cause difficult seepage problems.

Daily cover for landfill is the soil material that is used to cover compacted solid waste in an area sanitary landfill. The soil material is obtained offsite, transported to the landfill, and spread over the waste. The ratings in the table also apply to the final cover for a landfill. They are based on the soil properties that affect workability, the ease of digging, and the ease of moving and spreading the material over the refuse daily during wet and dry periods. These properties include soil texture, depth to a water table, ponding, rock fragments, slope, depth to bedrock or a cemented pan, reaction, and content of salts, sodium, or lime.

Loamy or silty soils that are free of large stones and excess gravel are the best cover for a landfill. Clayey soils may be sticky and difficult to spread; sandy soils are subject to wind erosion.

Slope affects the ease of excavation and of moving the cover material. Also, it can influence runoff, erosion, and reclamation of the borrow area.

After soil material has been removed, the soil material remaining in the borrow area must be thick enough over bedrock, a cemented pan, or the water table to permit revegetation. The soil material used as the final cover for a landfill should be suitable for plants. It should not have excess sodium, salts, or lime and should not be too acid.

## Construction Materials

Tables 16a and 16b give information about the soils as potential sources of gravel, sand, reclamation material, roadfill, and topsoil. Normal compaction, minor processing, and other standard construction practices are assumed.

Gravel and sand are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction. Specifications for each use vary widely. In table 16a, only the likelihood of finding material in suitable quantity is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material. The properties used to evaluate the soil as a source of gravel or sand are gradation of grain sizes (as indicated by the Unified classification of the soil), the thickness of suitable material, and the content of rock fragments. If the bottom layer of the soil contains gravel or sand, the soil is considered a likely source regardless of thickness. The assumption is that the gravel or sand layer below the depth of observation exceeds the minimum thickness.

The soils are rated good, fair, or poor as potential sources of gravel and sand. A rating of good or fair means that the material is likely to be in or below the soil. The bottom layer and the thickest layer of the soils are assigned numerical ratings. These ratings indicate the likelihood that the layer is a source of gravel or sand. The number 0.00 indicates that the layer is a poor source. The number 1.00 indicates that the layer is a good source. A number between 0.00 and 1.00 indicates the degree to which the layer is a likely source.

In table 16b, the soils are rated good, fair, or poor as potential sources of reclamation material, roadfill, and topsoil. The features that limit the soils as sources of these materials are specified in the table. The numerical ratings given after the specified features indicate the degree to which the features limit the soils as sources
of reclamation material, roadfill, or topsoil. The lower the number, the greater the limitation.

Reclamation material is used in areas that have been drastically disturbed by surface mining or similar activities. When these areas are reclaimed, layers of soil material or unconsolidated geological material, or both, are replaced in a vertical sequence. The reconstructed soil favors plant growth. The ratings in the table do not apply to quarries and other mined areas that require an offsite source of reconstruction material. The ratings are based on the soil properties that affect erosion and stability of the surface and the productive potential of the reconstructed soil. These properties include the content of sodium, salts, and calcium carbonate; reaction; available water capacity; erodibility; texture; content of rock fragments; and content of organic matter and other features that affect fertility.

Roadfill is soil material that is excavated in one place and used in road embankments in another place. In this table, the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the whole soil, from the surface to a depth of about 5 feet. It is assumed that soil layers will be mixed when the soil material is excavated and spread.

The ratings are based on the amount of suitable material and on soil properties that affect the ease of excavation and the performance of the material after it is in place. The thickness of the suitable material is a major consideration. The ease of excavation is affected by large stones, depth to a water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the AASHTO classification of the soil) and linear extensibility (shrink-swell potential).

Topsoil is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area. The ratings are based on the soil properties that affect plant growth; the ease of excavating, loading, and spreading the material; and reclamation of the borrow area. Toxic substances, soil reaction, and the properties that are inferred from soil texture, such as available water capacity and fertility, affect plant growth. The ease of excavating, loading, and spreading is affected by rock fragments, slope, depth to a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, depth to a water table, rock fragments, depth to bedrock or a cemented pan, and toxic material.

The surface layer of most soils is generally preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

## Water Management

Tables 17a, 17b, and 17c give information on the soil properties and site features that affect water management. The degree and kind of soil limitations are given for pond reservoir areas; embankments, dikes, and levees; aquifer-fed excavated ponds; constructing grassed waterways and surface drains; constructing terraces and diversions; tile drains and underground outlets; and irrigation. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect these uses. Not limited indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. Somewhat limited indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. Very limited indicates that the soil has one or more features that are unfavorable for the specified use. The limitations
generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00 . They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

## Table 17a

Pond reservoir areas hold water behind a dam or embankment. Soils best suited to this use have low seepage potential in the upper 60 inches. The seepage potential is determined by the permeability of the soil and the depth to fractured bedrock or other permeable material. Excessive slope can affect the storage capacity of the reservoir area.

Embankments, dikes, and levees are raised structures of soil material, generally less than 20 feet high, constructed to impound water or to protect land against overflow. Embankments that have zoned construction (core and shell) are not considered. In this table, the soils are rated as a source of material for embankment fill. The ratings apply to the soil material below the surface layer to a depth of about 5 feet. It is assumed that soil layers will be uniformly mixed and compacted during construction.

The ratings do not indicate the ability of the natural soil to support an embankment. Soil properties to a depth even greater than the height of the embankment can affect performance and safety of the embankment. Generally, deeper onsite investigation is needed to determine these properties.

Soil material in embankments must be resistant to seepage, piping, and erosion and have favorable compaction characteristics. Unfavorable features include less than 5 feet of suitable material and a high content of stones or boulders, organic matter, or salts or sodium. A high water table affects the amount of usable material. It also affects trafficability.

Aquifer-fed excavated ponds are pits or dugouts that extend to a ground-water aquifer or to a depth below a permanent water table. Excluded are ponds that are fed only by surface runoff and embankment ponds that impound water 3 feet or more above the original surface. Excavated ponds are affected by depth to a permanent water table, permeability of the aquifer, and quality of the water as inferred from the salinity of the soil. Depth to bedrock and the content of large stones affect the ease of excavation.

## Table 17b

Grassed waterways and surface drains are natural or constructed channels, generally broad and shallow, that conduct surface water to outlets at a nonerosive velocity. Large stones, wetness, slope, and depth to bedrock affect the construction of grassed waterways and surface drains. A hazard of wind erosion, a low available water capacity, restricted rooting depth, toxic substances such as salts and sodium, and restricted permeability adversely affect the growth and maintenance of the grass after construction.

Terraces and diversions are embankments or a combination of channels and ridges constructed across a slope to control erosion and conserve moisture by intercepting runoff. Slope, wetness, large stones, and depth to bedrock affect the construction of terraces and diversions. A restricted rooting depth, a severe hazard of wind erosion or water erosion, an excessively coarse texture, and restricted permeability adversely affect maintenance.

Tile drains and underground outlets are used in some areas to remove excess subsurface and surface water from the soil. The ratings in the table apply to the soil in
its undisturbed condition and do not include consideration of current land use. Depth to bedrock, a dense layer, or a cemented pan, the content of large stones, and the content of clay influence the ease of digging, filling, and compacting. A seasonal high water table, ponding, and flooding may restrict the period when excavations can be made. The slope influences the use of machinery. Soil texture and depth to the water table influence the resistance to sloughing. Subsidence of organic layers influences grade and stability of tile drains.

## Table 17c

Irrigation is the controlled application of water to supplement rainfall and support plant growth. The design and management of an irrigation system are affected by depth to the water table, the need for drainage, flooding, available water capacity, intake rate, permeability, erosion hazard, and slope. The construction of a system is affected by large stones and depth to bedrock or a cemented pan. The performance of a system is affected by the depth of the root zone, the amount of salts or sodium, and soil reaction.

## Soil Properties

Data relating to soil properties are collected during the course of the soil survey.
Soil properties are ascertained by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine particle-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties are shown in tables. They include engineering index properties, physical and chemical properties, and pertinent soil and water features.

## Engineering Index Properties

Table 18 gives the engineering classifications and the range of index properties for the layers of each soil in the survey area.

Depth to the upper and lower boundaries of each layer is indicated.
Texture is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter(fig. 12). "Loam," for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, "gravelly." Textural terms are defined in the Glossary.

Classification of the soils is determined according to the Unified soil classification system (ASTM, 2005) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2004).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement, the suitability of a soil as subgrade material can be indicated by a group

Figure 12.-Percentages of clay, silt, and sand in the basic USDA soil textural classes.
index number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an ovendry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420 , and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and plasticity index (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

The estimates of particle-size distribution, liquid limit, and plasticity index are generally rounded to the nearest 5 percent. Thus, if the ranges of gradation and Atterberg limits extend a marginal amount (1 or 2 percentage points) across classification boundaries, the classification in the marginal zone is generally omitted in the table.

## Physical Properties

Table 19 shows estimates of some physical characteristics and features that affect soilbehavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.
Particle size is the effective diameter of a soil particle as measured by sedimentation, sieving, or micrometric methods. Particle sizes are expressed as
classes with specific effective diameter class limits. The broad classes are sand, silt, and clay, ranging from the larger to the smaller.

Sand as a soil separate consists of mineral soil particles that are 0.05 millimeter to 2 millimeters in diameter. In the table, the estimated sand content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

Silt as a soil separate consists of mineral soil particles that are 0.002 to 0.05 millimeter in diameter. In the table, the estimated silt content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In the table, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of sand, silt, and clay affects the physical behavior of a soil. Particle size is important for engineering and agronomic interpretations, for determination of soil hydrologic qualities, and for soil classification.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrinkswell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earthmoving operations.

Moist bulk density is the weight of soil (ovendry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at $1 / 3$ - or $1 / 10$-bar ( 33 kPa or 10 kPa ) moisture tension. Weight is determined after the soil is dried at 105 degrees C . In the table, the estimated moist bulk density of each soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter. Bulk density data are used to compute shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. Depending on soil texture, a bulk density of more than 1.4 can restrict water storage and root penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

Permeability ( $K_{\text {sat }}$ ) refers to the ability of a soil to transmit water or air. The term "permeability," as used in soil surveys, indicates saturated hydraulic conductivity ( $\mathrm{K}_{\text {sat }}$ ). The estimates in the table indicate the rate of water movement, in inches per hour, when the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each soil layer. The capacity varies, depending on soil properties that affect retention of water. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Linear extensibility refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. It is an expression of the volume change between the water content of the clod at $1 / 3$ - or $1 / 10-$ bar tension ( 33 kPa or 10 kPa tension) and oven dryness. The volume change is reported in the table as percent change for the whole soil. Volume change is influenced by the amount and type of clay minerals in the soil.

Linear extensibility is used to determine the shrink-swell potential of soils. The shrink-swell potential is low if the soil has a linear extensibility of less than 3 percent; moderate if 3 to 6 percent; high if 6 to 9 percent; and very high if more than 9 percent. If the linear extensibility is more than 3, shrinking and swelling can cause damage to buildings, roads, and other structures and to plant roots. Special design commonly is needed.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In table 19, the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained by returning crop residue to the soil. Organic matter has a positive effect on available water capacity, water infiltration, soilorganism activity, and tilth. It is a source of nitrogen and other nutrients for crops (fig. 13).

Erosion factors are shown in table 19 as the K factor (Kw and Kf) and the T factor. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of K range from 0.02 to 0.69 . Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

Erosion factor Kw indicates the erodibility of the whole soil. The estimates are modified by the presence of rock fragments.

Erosion factor Kf indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

Erosion factor $T$ is an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible. The groups are described in the "National Soil Survey Handbook" (USDA/ NRCS, National Soil Survey Handbook).

Wind erodibility index is a numerical value indicating the susceptibility of soil to wind erosion, or the tons per acre per year that can be expected to be lost to wind erosion. There is a close correlation between wind erosion and the texture of the surface layer, the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence wind erosion.

## Chemical Properties

Table 20 shows estimates of some chemical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.
Cation-exchange capacity is the total amount of extractable bases that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality ( pH 7.0 ) or at some other stated pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. The ability to retain cations reduces the hazard of ground-water pollution.

Figure 13.-Maintaining a cover crop, such as close-seeded alfalfa, in this strongly sloping area of Fayette soils helps to control erosion and improves soil structure and the content of organic matter.

Effective cation-exchange capacity refers to the sum of extractable bases plus aluminum expressed in terms of milliequivalents per 100 grams of soil. It is determined for soils that have pH of less than 5.5.

Soil reaction is a measure of acidity or alkalinity. The pH of each soil horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Calcium carbonate equivalent is the percent of carbonates, by weight, in the fraction of the soil less than 2 millimeters in size. The availability of plant nutrients is influenced by the amount of carbonates in the soil. Incorporating nitrogen fertilizer into calcareous soils helps to prevent nitrite accumulation and ammonium-N volatilization.

## Water Features

Table 21 gives estimates of various water features. The estimates are used in land use planning that involves engineering considerations.

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The four hydrologic soil groups are:
Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group ( $A / D, B / D$, or $C / D$ ), the first letter is for drained areas and the second is for undrained areas.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation. Table 21 indicates surface water depth and the duration and frequency of ponding. Duration is expressed as very brief if less than 2 days, brief if 2 to 7 days, long if 7 to 30 days, and very long if more than 30 days. Frequency is expressed as none, rare, occasional, and frequent. None means that ponding is not probable; rare that it is unlikely but possible under unusual weather conditions (the chance of ponding is nearly 0 percent to 5 percent in any year); occasional that it occurs, on the average, once or less in 2 years (the chance of ponding is 5 to 50 percent in any year); and frequent that it occurs, on the average, more than once in 2 years (the chance of ponding is more than 50 percent in any year).

Flooding is the temporary inundation of an area caused by overflowing streams, by runoff from adjacent slopes, or by tides. Water standing for short periods after rainfall or snowmelt is not considered flooding, and water standing in swamps and marshes is considered ponding rather than flooding.

Duration and frequency of flooding are estimated. Duration is expressed as extremely brief if 0.1 hour to 4 hours, very brief if 4 hours to 2 days, brief if 2 to 7 days, long if 7 to 30 days, and very long if more than 30 days. Frequency is expressed as none, very rare, rare, occasional, frequent, and very frequent. None means that flooding is not probable; very rare that it is very unlikely but possible under extremely unusual weather conditions (the chance of flooding is less than 1 percent in any year); rare that it is unlikely but possible under unusual weather conditions (the chance of flooding is 1 to 5 percent in any year); occasional that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); frequent that it is likely to occur often under normal weather conditions (the chance of flooding is more than 50 percent in any year but is less than 50 percent in all months in any year); and very frequent that it is likely to occur very often under normal weather conditions (the chance of flooding is more than 50 percent in all months of any year). Common is used when the occasional and frequent classes are grouped for certain purposes.

The information is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and levels of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

Water table refers to a saturated zone in the soil. Table 21 indicates the depth to the top (upper limit) and base (lower limit) of the saturated zone for the specified months in most years. Estimates of the upper and lower limits are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors or mottles (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

The table also shows the kind of water table, that is, apparent or perched. An apparent water table is a thick zone of free water in the soil. It is indicated by the level at which water stands in an uncased borehole after adequate time is allowed for adjustment in the surrounding soil. A perched water table is water standing above an unsaturated zone. In places an upper, or perched, water table is separated from a lower one by a dry zone.

## Soil Features

Table 22 gives estimates of various soil features. The estimates are used in land use planning that involves engineering considerations.

A restrictive layer is a nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly impede the movement of water and air through the soil or that restrict roots or otherwise provide an unfavorable root environment. Examples are bedrock, cemented layers, dense layers, and frozen layers. Depth to top is the vertical distance from the soil surface to the upper boundary of the restrictive layer.

Subsidence is the settlement of organic soils or of saturated mineral soils of very low density. Subsidence generally results from either desiccation and shrinkage or oxidation of organic material, or both, following drainage. Subsidence takes place gradually, usually over a period of several years. The table shows the expected initial subsidence, which usually is a result of drainage, and total subsidence, which results from a combination of factors.

Potential for frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage to pavements and other rigid structures.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that corrodes or weakens uncoated steel or concrete. The rate of corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil. Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel or concrete in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than the steel or concrete in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as low, moderate, or high, is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion also is expressed as low, moderate, or high. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

## Glossary

Many of the terms relating to landforms, geology, and geomorphology are defined in more detail in the "National Soil Survey Handbook" (available in local offices of the Natural Resources Conservation Service or on the Internet).

ABC soil. A soil having an A, a B, and a C horizon.
Ablation till. Loose, relatively permeable earthy material deposited during the downwasting of nearly static glacial ice, either contained within or accumulated on the surface of the glacier.
AC soil. A soil having only an A and a C horizon. Commonly, such soil formed in recent alluvium or on steep, rocky slopes.
Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.
Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.
Alluvial fan. A low, outspread mass of loose materials and/or rock material, commonly with gentle slopes. It is shaped like an open fan or a segment of a cone. The material was deposited by a stream at the place where it issues from a narrow mountain valley or upland valley or where a tributary stream is near or at its junction with the main stream. The fan is steepest near its apex, which points upstream, and slopes gently and convexly outward (downstream) with a gradual decrease in gradient.
Alluvium. Unconsolidated material, such as gravel, sand, silt, clay, and various mixtures of these, deposited on land by running water.
Alpha,alpha-dipyridyl. A compound that when dissolved in ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction implies reducing conditions and the likely presence of redoximorphic features.
Animal unit month (AUM). The amount of forage required by one mature cow of approximately 1,000 pounds weight, with or without a calf, for 1 month.
Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.
Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.
Aspect. The direction toward which a slope faces. Also called slope aspect.
Available water capacity (available moisture capacity). The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60 -inch profile or to a limiting layer is expressed as:

Backslope. The position that forms the steepest and generally linear, middle portion of a hillslope. In profile, backslopes are commonly bounded by a convex shoulder above and a concave footslope below.
Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.
Basal till. Compact till deposited beneath the ice.
Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of $\mathrm{Ca}, \mathrm{Mg}, \mathrm{Na}$, and K ), expressed as a percentage of the total cation-exchange capacity.
Base slope (geomorphology). A geomorphic component of hills consisting of the concave to linear (perpendicular to the contour) slope that, regardless of the lateral shape, forms an apron or wedge at the bottom of a hillside dominated by colluvium and slope-wash sediments (for example, slope alluvium).
Bedding plane. A planar or nearly planar bedding surface that visibly separates each successive layer of stratified sediment or rock (of the same or different lithology) from the preceding or following layer; a plane of deposition. It commonly marks a change in the circumstances of deposition and may show a parting, a color difference, a change in particle size, or various combinations of these. The term is commonly applied to any bedding surface, even one that is conspicuously bent or deformed by folding.
Bedding system. A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.
Bedrock. The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.
Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.
Bench terrace. A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.
Bisequum. Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.
Blowout. A saucer-, cup-, or trough-shaped depression formed by wind erosion on a preexisting dune or other sand deposit, especially in an area of shifting sand or loose soil or where protective vegetation is disturbed or destroyed; the adjoining accumulation of sand derived from the depression, where recognizable, is commonly included. Blowouts are commonly small.
Bottom land. An informal term loosely applied to various portions of a flood plain.
Boulders. Rock fragments larger than 2 feet ( 60 centimeters) in diameter.
Breaks. A landscape or tract of steep, rough or broken land dissected by ravines and gullies and marking a sudden change in topography.
Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.
Brush management. Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.
Calcareous soil. A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.
Calcium carbonate. A common mineral in sediments and soils.
Canopy. The leafy crown of trees or shrubs. (See Crown.)

Capillary water. Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.
Cation. An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.
Cation-exchange capacity. The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality ( pH 7.0 ) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.
Catsteps. See Terracettes.
Channery soil material. Soil material that has, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.
Chemical treatment. Control of unwanted vegetation through the use of chemicals.
Chiseling. Tillage with an implement having one or more soil-penetrating points that shatter or loosen hard, compacted layers to a depth below normal plow depth.
Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.
Clay depletions. See Redoximorphic features.
Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.
Claypan. A dense, compact, slowly permeable subsoil layer that contains much more clay than the overlying materials, from which it is separated by a sharply defined boundary. A claypan is commonly hard when dry and plastic and sticky when wet.
Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.
Coarse textured soil. Sand or loamy sand.
Cobble (or cobblestone). A rounded or partly rounded fragment of rock 3 to 10 inches ( 7.6 to 25 centimeters) in diameter.
Cobbly soil material. Material that has 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches ( 7.6 to 25 centimeters) in diameter. Very cobbly soil material has 35 to 60 percent of these rock fragments, and extremely cobbly soil material has more than 60 percent.
COLE (coefficient of linear extensibility). See Linear extensibility.
Colluvium. Unconsolidated, unsorted earth material being transported or deposited on side slopes and/or at the base of slopes by mass movement (e.g., direct gravitational action) and by local, unconcentrated runoff.
Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.
Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.
Concretions. See Redoximorphic features.
Conglomerate. A coarse grained, clastic sedimentary rock composed of rounded or subangular rock fragments more than 2 millimeters in diameter. It commonly has a matrix of sand and finer textured material. Conglomerate is the consolidated equivalent of gravel.
Conservation cropping system. Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soilimproving crops and practices more than offset the effects of the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-
improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.
Conservation tillage. A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.
Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."
Contour stripcropping. Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.
Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but for many it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.
Coprogenous earth (sedimentary peat). A type of limnic layer composed predominantly of fecal material derived from aquatic animals.
Corrosion (geomorphology). A process of erosion whereby rocks and soil are removed or worn away by natural chemical processes, especially by the solvent action of running water, but also by other reactions, such as hydrolysis, hydration, carbonation, and oxidation.
Corrosion (soil survey interpretations). Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.
Cover crop. A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.
Crop residue management. Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.
Cropping system. Growing crops according to a planned system of rotation and management practices.
Cross-slope farming. Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.
Crown. The upper part of a tree or shrub, including the living branches and their foliage.
Culmination of the mean annual increment (CMAI). The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.
Cutbanks cave (in tables). The walls of excavations tend to cave in or slough.
Deferred grazing. Postponing grazing or resting grazing land for a prescribed period.
Delta. A body of alluvium having a surface that is fan shaped and nearly flat; deposited at or near the mouth of a river or stream where it enters a body of relatively quiet water, generally a sea or lake.
Dense layer (in tables). A very firm, massive layer that has a bulk density of more than 1.8 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.

Depression. Any relatively sunken part of the earth's surface; especially a low-lying area surrounded by higher ground. A closed depression has no natural outlet for surface drainage. An open depression has a natural outlet for surface drainage.
Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.
Diversion (or diversion terrace). A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.
Divided-slope farming. A form of field stripcropping in which crops are grown in a systematic arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.
Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized-excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."
Drainage, surface. Runoff, or surface flow of water, from an area.
Drainageway. A general term for a course or channel along which water moves in draining an area. A term restricted to relatively small, linear depressions that at some time move concentrated water and either do not have a defined channel or have only a small defined channel.
Drift. A general term applied to all mineral material (clay, silt, sand, gravel, and boulders) transported by a glacier and deposited directly by or from the ice or transported by running water emanating from a glacier. Drift includes unstratified material (till) that forms moraines and stratified deposits that form outwash plains, eskers, kames, varves, and glaciofluvial sediments. The term is generally applied to Pleistocene glacial deposits in areas that no longer contain glaciers.
Drumlin. A low, smooth, elongated oval hill, mound, or ridge of compact till that has a core of bedrock or drift. It commonly has a blunt nose facing the direction from which the ice approached and a gentler slope tapering in the other direction. The longer axis is parallel to the general direction of glacier flow. Drumlins are products of streamline (laminar) flow of glaciers, which molded the subglacial floor through a combination of erosion and deposition.
Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.
Dune. A low mound, ridge, bank, or hill of loose, windblown granular material (generally sand), either barren and capable of movement from place to place or covered and stabilized with vegetation but retaining its characteristic shape.
Earthy fill. See Mine spoil.
Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.
End moraine. A ridgelike accumulation that is being or was produced at the outer margin of an actively flowing glacier at any given time.
Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian deposit. Sand-, silt-, or clay-sized clastic material transported and deposited primarily by wind, commonly in the form of a dune or a sheet of sand or loess.
Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.
Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.
Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep. Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.
Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.
Erosion surface. A land surface shaped by the action of erosion, especially by running water.
Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. Most commonly applied to cliffs produced by differential erosion. Synonym: scarp.
Esker. A long, narrow, sinuous, steep-sided ridge of stratified sand and gravel deposited as the bed of a stream flowing in an ice tunnel within or below the ice (subglacial) or between ice walls on top of the ice of a wasting glacier and left behind as high ground when the ice melted. Eskers range in length from less than a kilometer to more than 160 kilometers and in height from 3 to 30 meters.
Fertility, soil. The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.
Fibric soil material (peat). The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.
Field moisture capacity. The moisture content of a soil, expressed as a percentage of the ovendry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called normal field capacity, normal moisture capacity, or capillary capacity.
Fill slope. A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.
Fine textured soil. Sandy clay, silty clay, or clay.
Firebreak. An area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of firefighters and equipment. Designated roads also serve as firebreaks.
First bottom. An obsolete, informal term loosely applied to the lowest flood-plain steps that are subject to regular flooding.
Flaggy soil material. Material that has, by volume, 15 to 35 percent flagstones. Very flaggy soil material has 35 to 60 percent flagstones, and extremely flaggy soil material has more than 60 percent flagstones.
Flagstone. A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches ( 15 to 38 centimeters) long.

Flood plain. The nearly level plain that borders a stream and is subject to flooding unless protected artificially.
Flood-plain landforms. A variety of constructional and erosional features produced by stream channel migration and flooding. Examples include backswamps, floodplain splays, meanders, meander belts, meander scrolls, oxbow lakes, and natural levees.
Flood-plain splay. A fan-shaped deposit or other outspread deposit formed where an overloaded stream breaks through a levee (natural or artificial) and deposits its material (commonly coarse grained) on the flood plain.
Flood-plain step. An essentially flat, terrace-like alluvial surface within a valley that is frequently covered by floodwater from the present stream; any approximately horizontal surface still actively modified by fluvial scour and/or deposition. May occur individually or as a series of steps.
Fluvial. Of or pertaining to rivers or streams; produced by stream or river action.
Footslope. The concave surface at the base of a hillslope. A footslope is a transition zone between upslope sites of erosion and transport (shoulders and backslopes) and downslope sites of deposition (toeslopes).
Forb. Any herbaceous plant not a grass or a sedge.
Forest cover. All trees and other woody plants (underbrush) covering the ground in a forest.
Forest type. A stand of trees similar in composition and development because of given physical and biological factors by which it may be differentiated from other stands.
Fragipan. A loamy, brittle subsurface horizon low in porosity and content of organic matter and low or moderate in clay but high in silt or very fine sand. A fragipan appears cemented and restricts roots. When dry, it is hard or very hard and has a higher bulk density than the horizon or horizons above. When moist, it tends to rupture suddenly under pressure rather than to deform slowly.
Genesis, soil. The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.
Geosol. A buried soil that formed on a landscape in the past with distinctive morphological features resulting from a soil-forming environment that no longer exists at the site. The former pedogenic process was interrupted by burial. A geosol is a laterally traceable, mappable, geologic weathering profile that has a consistent stratigraphic position. See Paleosol.
Gilgai. Commonly, a succession of microbasins and microknolls in nearly level areas or of microvalleys and microridges parallel with the slope. Typically, the microrelief of clayey soils that shrink and swell considerably with changes in moisture content.
Glaciofluvial deposits. Material moved by glaciers and subsequently sorted and deposited by streams flowing from the melting ice. The deposits are stratified and occur in the form of outwash plains, valley trains, deltas, kames, eskers, and kame terraces.
Glaciolacustrine deposits. Material ranging from fine clay to sand derived from glaciers and deposited in glacial lakes mainly by glacial meltwater. Many deposits are bedded or laminated.
Gleyed soil. Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.
Graded stripcropping. Growing crops in strips that grade toward a protected waterway.
Grassed waterway. A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.

Gravel. Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.

Gravelly soil material. Material that has 15 to 35 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.
Green manure crop (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.
Ground moraine. An extensive, fairly even layer of till having an uneven or undulating surface.
Ground water. Water filling all the unblocked pores of the material below the water table.
Gully. A small channel with steep sides caused by erosion and cut in unconsolidated materials by concentrated but intermittent flow of water. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.
Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.
Hard to reclaim (in tables). Reclamation is difficult after the removal of soil for construction and other uses. Revegetation and erosion control are extremely difficult.
Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.
Head slope (geomorphology). A geomorphic component of hills consisting of a laterally concave area of a hillside, especially at the head of a drainageway. The overland waterflow is converging.
Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.
High-residue crops. Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.
Hill. A generic term for an elevated area of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline. Slopes are generally more than 15 percent. The distinction between a hill and a mountain is arbitrary and may depend on local usage.
Hillslope. A generic term for the steeper part of a hill between its summit and the drainage line, valley flat, or depression floor at the base of a hill.
Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. An explanation of the subdivisions is given in the "Soil Survey Manual." The major horizons of mineral soil are as follows:
O horizon.-An organic layer of fresh and decaying plant residue. $L$ horizon.-A layer of organic and mineral limnic materials, including coprogenous earth (sedimentary peat), diatomaceous earth, and marl.
A horizon.-The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a $B$ horizon.
$E$ horizon.-The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.
$B$ horizon.-The mineral horizon below an $A$ horizon. The $B$ horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.
C horizon.-The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2 , precedes the letter C.
Cr horizon.-Soft, consolidated bedrock beneath the soil.
$R$ layer.-Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.
Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.
Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.
Igneous rock. Rock that was formed by cooling and solidification of magma and that has not been changed appreciably by weathering since its formation. Major varieties include plutonic and volcanic rock (e.g., andesite, basalt, and granite).
Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.
Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.
Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.
Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.
Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.
Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

| Less than 0.2 | ... very low |
| :---: | :---: |
| 0.2 to 0.4 | low |
| 0.4 to 0.75 | .. moderately low |
| 0.75 to 1.25 | moderate |
| 1.25 to 1.75 | moderately high |
| 1.75 to 2.5 | ............. high |
| More than 2.5 | .. very high |

Interfluve. A landform composed of the relatively undissected upland or ridge between two adjacent valleys containing streams flowing in the same general
direction. An elevated area between two drainageways that sheds water to those drainageways.
Interfluve (geomorphology). A geomorphic component of hills consisting of the uppermost, comparatively level or gently sloping area of a hill; shoulders of backwearing hillslopes can narrow the upland or can merge, resulting in a strongly convex shape.
Intermittent stream. A stream, or reach of a stream, that does not flow year-round but that is commonly dry for 3 or more months out of 12 and whose channel is generally below the local water table. It flows only during wet periods or when it receives ground-water discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.
Iron depletions. See Redoximorphic features.
Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:
Controlled flooding.-Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.
Drip (or trickle).-Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.
Sprinkler.-Water is sprayed over the soil surface through pipes or nozzles from a pressure system.
Kame. A low mound, knob, hummock, or short irregular ridge composed of stratified sand and gravel deposited by a subglacial stream as a fan or delta at the margin of a melting glacier; by a supraglacial stream in a low place or hole on the surface of the glacier; or as a ponded deposit on the surface or at the margin of stagnant ice.
Knoll. A small, low, rounded hill rising above adjacent landforms.
$\mathbf{K}_{\text {sat }}$. Saturated hydraulic conductivity. (See Permeability.)
Lacustrine deposit. Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.
Lake plain. A nearly level surface marking the floor of an extinct lake filled by well sorted, generally fine textured, stratified deposits, commonly containing varves.
Lake terrace. A narrow shelf, partly cut and partly built, produced along a lakeshore in front of a scarp line of low cliffs and later exposed when the water level falls.
Landscape. A collection of related natural landforms; usually the land surface which the eye can comprehend in a single view.
Large stones (in tables). Rock fragments 3 inches ( 7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.
Leaching. The removal of soluble material from soil or other material by percolating water.
Linear extensibility. Refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. Linear extensibility is used to determine the shrink-swell potential of soils. It is an expression of the volume change between the water content of the clod at $1 / 3$ - or $1 / 10$-bar tension ( 33 kPa or 10 kPa tension) and oven dryness. Volume change is influenced by the amount and type of clay minerals in the soil. The volume change is the percent change for the whole soil. If it is expressed as a fraction, the resulting value is COLE, coefficient of linear extensibility.
Liquid limit. The moisture content at which the soil passes from a plastic to a liquid state.
Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loess. Material transported and deposited by wind and consisting dominantly of siltsized particles.
Low strength. The soil is not strong enough to support loads.
Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.
Masses. See Redoximorphic features.
Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.
Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.
Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement at depth in the earth's crust. Nearly all such rocks are crystalline.
Mine spoil. An accumulation of displaced earthy material, rock, or other waste material removed during mining or excavation. Also called earthy fill.
Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.
Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.
Miscellaneous area. A kind of map unit that has little or no natural soil and supports little or no vegetation.
Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.
Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.
Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.
Moraine. In terms of glacial geology, a mound, ridge, or other topographically distinct accumulation of unsorted, unstratified drift, predominantly till, deposited primarily by the direct action of glacial ice in a variety of landforms. Also, a general term for a landform composed mainly of till (except for kame moraines, which are composed mainly of stratified outwash) that has been deposited by a glacier. Some types of moraines are disintegration, end, ground, kame, lateral, recessional, and terminal.
Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.
Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance-few, common, and many; size-fine, medium, and coarse; and contrast-faint, distinct, and prominent. The size measurements are of the diameter along the greatest dimension. Fine indicates less than 5 millimeters (about 0.2 inch); medium, from 5 to 15 millimeters (about 0.2 to 0.6 inch); and coarse, more than 15 millimeters (about 0.6 inch).

Muck. Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)
Munsell notation. A designation of color by degrees of three simple variables-hue, value, and chroma. For example, a notation of $10 \mathrm{YR} 6 / 4$ is a color with hue of 10YR, value of 6 , and chroma of 4 .
Natric horizon. A special kind of argillic horizon that contains enough exchangeable sodium to have an adverse effect on the physical condition of the subsoil.
Neutral soil. A soil having a pH value of 6.6 to 7.3. (See Reaction, soil.)

Nodules. See Redoximorphic features.
Nose slope (geomorphology). A geomorphic component of hills consisting of the projecting end (laterally convex area) of a hillside. The overland waterflow is predominantly divergent. Nose slopes consist dominantly of colluvium and slopewash sediments (for example, slope alluvium).
Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.
Organic matter. Plant and animal residue in the soil in various stages of decomposition. The content of organic matter in the surface layer is described as follows:

Outwash. Stratified and sorted sediments (chiefly sand and gravel) removed or "washed out" from a glacier by meltwater streams and deposited in front of or beyond the end moraine or the margin of a glacier. The coarser material is deposited nearer to the ice.
Outwash plain. An extensive lowland area of coarse textured glaciofluvial material. An outwash plain is commonly smooth; where pitted, it generally is low in relief.
Paleosol. A general term used to describe a soil that formed on a landscape of the past; it may be a buried soil, a relict soil, or an exhumed soil. See Geosol.
Paleoterrace. An erosional remnant of a terrace that retains the surface form and alluvial deposits of its origin but was not emplaced by, and commonly does not grade to, a present-day stream or drainage network.
Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, hardpan, fragipan, claypan, plowpan, and traffic pan.
Parent material. The unconsolidated organic and mineral material in which soil forms.
Peat. Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)
Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.
Pedisediment. A layer of sediment, eroded from the shoulder and backslope of an erosional slope, that lies on and is being (or was) transported across a gently sloping erosional surface at the foot of a receding hill or mountain slope.
Pedon. The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.
Percolation. The movement of water through the soil.
Permafrost. Ground, soil, or rock that remains at or below 0 degrees $C$ for at least 2 years. It is defined on the basis of temperature and is not necessarily frozen.
Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as
"permeability." Terms describing permeability, measured in inches per hour, are as follows:

| Impermeable | less than 0.0015 inch |
| :---: | :---: |
| Very slow | . 0.0015 to 0.06 inch |
| Slow | ..... 0.06 to 0.2 inch |
| Moderately slow | .... 0.2 to 0.6 inch |
| Moderate | 0.6 inch to 2.0 inches |
| Moderately rapi | ..... 2.0 to 6.0 inches |
| Rapid | 6.0 to 20 inches |
| Very rapid.. | more than 20 inches |

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)
Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.
Piping (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.
Pitting (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.
Plastic limit. The moisture content at which a soil changes from semisolid to plastic.
Plasticity index. The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.
Plinthite. The sesquioxide-rich, humus-poor, highly weathered mixture of clay with quartz and other diluents. It commonly appears as red mottles, usually in platy, polygonal, or reticulate patterns. Plinthite changes irreversibly to an ironstone hardpan or to irregular aggregates on repeated wetting and drying, especially if it is exposed also to heat from the sun. In a moist soil, plinthite can be cut with a spade. It is a form of laterite.
Plowpan. A compacted layer formed in the soil directly below the plowed layer.
Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.
Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.
Pore linings. See Redoximorphic features.
Potential native plant community. See Climax plant community.
Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.
Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.
Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.
Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.
Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.
Reaction, soil. A measure of acidity or alkalinity of a soil, expressed as pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is
neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

| Ultra acid | less than 3.5 |
| :---: | :---: |
| Extremely acid | ... 3.5 to 4.4 |
| Very strongly acid | ... 4.5 to 5.0 |
| Strongly acid | ... 5.1 to 5.5 |
| Moderately acid | .... 5.6 to 6.0 |
| Slightly acid | .. 6.1 to 6.5 |
| Neutral | .. 6.6 to 7.3 |
| Slightly alkaline | .... 7.4 to 7.8 |
| Moderately alkaline | ... 7.9 to 8.4 |
| Strongly alkaline. | .... 8.5 to 9.0 |
| Very strongly alkaline | 9.1 and higher |

Redoximorphic concentrations. See Redoximorphic features.
Redoximorphic depletions. See Redoximorphic features.
Redoximorphic features. Redoximorphic features are associated with wetness and result from alternating periods of reduction and oxidation of iron and manganese compounds in the soil. Reduction occurs during saturation with water, and oxidation occurs when the soil is not saturated. Characteristic color patterns are created by these processes. The reduced iron and manganese ions may be removed from a soil if vertical or lateral fluxes of water occur, in which case there is no iron or manganese precipitation in that soil. Wherever the iron and manganese are oxidized and precipitated, they form either soft masses or hard concretions or nodules. Movement of iron and manganese as a result of redoximorphic processes in a soil may result in redoximorphic features that are defined as follows:

1. Redoximorphic concentrations.-These are zones of apparent accumulation of iron-manganese oxides, including:
A. Nodules and concretions, which are cemented bodies that can be removed from the soil intact. Concretions are distinguished from nodules on the basis of internal organization. A concretion typically has concentric layers that are visible to the naked eye. Nodules do not have visible organized internal structure; and
B. Masses, which are noncemented concentrations of substances within the soil matrix; and
C. Pore linings, i.e., zones of accumulation along pores that may be either coatings on pore surfaces or impregnations from the matrix adjacent to the pores.
2. Redoximorphic depletions.-These are zones of low chroma (chromas less than those in the matrix) where either iron-manganese oxides alone or both iron-manganese oxides and clay have been stripped out, including:
A. Iron depletions, i.e., zones that contain low amounts of iron and manganese oxides but have a clay content similar to that of the adjacent matrix; and
B. Clay depletions, i.e., zones that contain low amounts of iron, manganese, and clay (often referred to as silt coatings or skeletans).
3. Reduced matrix.-This is a soil matrix that has low chroma in situ but undergoes a change in hue or chroma within 30 minutes after the soil material has been exposed to air.

Reduced matrix. See Redoximorphic features.

Regolith. All unconsolidated earth materials above the solid bedrock. It includes material weathered in place from all kinds of bedrock and alluvial, glacial, eolian, lacustrine, and pyroclastic deposits.
Relief. The relative difference in elevation between the upland summits and the lowlands or valleys of a given region.
Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as bedrock disintegrated in place.
Rill. A very small, steep-sided channel resulting from erosion and cut in unconsolidated materials by concentrated but intermittent flow of water. A rill generally is not an obstacle to wheeled vehicles and is shallow enough to be smoothed over by ordinary tillage.
Riser. The vertical or steep side slope (e.g., escarpment) of terraces, flood-plain steps, or other stepped landforms; commonly a recurring part of a series of natural, steplike landforms, such as successive stream terraces.
Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.
Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.
Root zone. The part of the soil that can be penetrated by plant roots.
Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called groundwater runoff or seepage flow from ground water.
Saline soil. A soil containing soluble salts in an amount that impairs growth of plants. A saline soil does not contain excess exchangeable sodium.
Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.
Sandstone. Sedimentary rock containing dominantly sand-sized particles.
Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.
Saturated hydraulic conductivity ( $\mathrm{K}_{\text {sat }}$ ). See Permeability.
Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.
Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.
Second bottom. The first terrace above the normal flood plain (or first bottom) of a river.
Sedimentary rock. A consolidated deposit of clastic particles, chemical precipitates, or organic remains accumulated at or near the surface of the earth under normal low temperature and pressure conditions. Sedimentary rocks include consolidated equivalents of alluvium, colluvium, drift, and eolian, lacustrine, and marine deposits. Examples are sandstone, siltstone, mudstone, claystone, shale, conglomerate, limestone, dolomite, and coal.
Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)
Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.
Shale. Sedimentary rock that formed by the hardening of a deposit of clay, silty clay, or silty clay loam and that has a tendency to split into thin layers.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.
Shoulder. The convex, erosional surface near the top of a hillslope. A shoulder is a transition from summit to backslope.
Shrink-swell (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.
Side slope (geomorphology). A geomorphic component of hills consisting of a laterally planar area of a hillside. The overland waterflow is predominantly parallel. Side slopes are dominantly colluvium and slope-wash sediments.
Silica. A combination of silicon and oxygen. The mineral form is called quartz.
Silica-sesquioxide ratio. The ratio of the number of molecules of silica to the number of molecules of alumina and iron oxide. The more highly weathered soils or their clay fractions in warm-temperate, humid regions, and especially those in the tropics, generally have a low ratio.
Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay ( 0.002 millimeter) to the lower limit of very fine sand ( 0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.
Siltstone. An indurated silt having the texture and composition of shale but lacking its fine lamination or fissility; a massive mudstone in which silt predominates over clay.
Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.
Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75 .
Slickensides (pedogenic). Grooved, striated, and/or glossy (shiny) slip faces on structural peds, such as wedges; produced by shrink-swell processes, most commonly in soils that have a high content of expansive clays.
Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance.
Slope alluvium. Sediment gradually transported down the slopes of mountains or hills primarily by nonchannel alluvial processes (i.e., slope-wash processes) and characterized by particle sorting. Lateral particle sorting is evident on long slopes. In a profile sequence, sediments may be distinguished by differences in size and/ or specific gravity of rock fragments and may be separated by stone lines. Burnished peds and sorting of rounded or subrounded pebbles or cobbles distinguish these materials from unsorted colluvial deposits.
Sloughed till. Water-saturated till that has flowed slowly downhill from its original place of deposit by glacial ice. It may rest on other till, on outwash, or on a glaciolacustrine deposit.
Slow refill (in tables). The slow filling of ponds, resulting from restricted permeability in the soil.
Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.
Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief and by the passage of time.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

| Very coarse sand | 2.0 to 1.0 |
| :---: | :---: |
| Coarse sand | 1.0 to 0.5 |
| Medium sand | ...... 0.5 to 0.25 |
| Fine sand | .... 0.25 to 0.10 |
| Very fine sand | .... 0.10 to 0.05 |
| Silt | 0.05 to 0.002 |
| Clay | less than 0.002 |

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the $A, E$, and $B$ horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.
Stone line. In a vertical cross section, a line formed by scattered fragments or a discrete layer of angular and subangular rock fragments (commonly a gravel- or cobble-sized lag concentration) that formerly was draped across a topographic surface and was later buried by additional sediments. A stone line generally caps material that was subject to weathering, soil formation, and erosion before burial. Many stone lines seem to be buried erosion pavements, originally formed by sheet and rill erosion across the land surface.
Stones. Rock fragments 10 to 24 inches ( 25 to 60 centimeters) in diameter if rounded or 15 to 24 inches ( 38 to 60 centimeters) in length if flat.
Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.
Strath terrace. A type of stream terrace; formed as an erosional surface cut on bedrock and thinly mantled with stream deposits (alluvium).
Stream terrace. One of a series of platforms in a stream valley, flanking and more or less parallel to the stream channel, originally formed near the level of the stream; represents the remnants of an abandoned flood plain, stream bed, or valley floor produced during a former state of fluvial erosion or deposition.
Stripcropping. Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to wind erosion and water erosion.
Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are—platy (laminated), prismatic (vertical axis of aggregates longer than horizontal), columnar (prisms with rounded tops), blocky (angular or subangular), and granular. Structureless soils are either single grain (each grain by itself, as in dune sand) or massive (the particles adhering without any regular cleavage, as in many hardpans).
Stubble mulch. Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind erosion and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.
Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.
Subsoiling. Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.
Substratum. The part of the soil below the solum.
Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.
Summer fallow. The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce
a crop every year. Summer fallow is frequently practiced before planting winter grain.
Summit. The topographically highest position of a hillslope. It has a nearly level (planar or only slightly convex) surface.
Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer," or the "Ap horizon."
Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.
Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.
Terminal moraine. An end moraine that marks the farthest advance of a glacier. It typically has the form of a massive arcuate or concentric ridge, or complex of ridges, and is underlain by till and other types of drift.
Terrace (conservation). An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field generally is built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.
Terrace (geomorphology). A steplike surface, bordering a valley floor or shoreline, that represents the former position of a flood plain, lake, or seashore. The term is usually applied both to the relatively flat summit surface (tread) that was cut or built by stream or wave action and to the steeper descending slope (scarp or riser) that has graded to a lower base level of erosion.
Terracettes. Small, irregular steplike forms on steep hillslopes, especially in pasture, formed by creep or erosion of surficial materials that may be induced or enhanced by trampling of livestock, such as sheep or cattle.
Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay, and clay. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."
Thin layer (in tables). Otherwise suitable soil material that is too thin for the specified use.
Till. Dominantly unsorted and nonstratified drift, generally unconsolidated and deposited directly by a glacier without subsequent reworking by meltwater, and consisting of a heterogeneous mixture of clay, silt, sand, gravel, stones, and boulders; rock fragments of various lithologies are embedded within a finer matrix that can range from clay to sandy loam.
Till plain. An extensive area of level to gently undulating soils underlain predominantly by till and bounded at the distal end by subordinate recessional or end moraines.
Tilth, soil. The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.
Toeslope. The gently inclined surface at the base of a hillslope. Toeslopes in profile are commonly gentle and linear and are constructional surfaces forming the lower part of a hillslope continuum that grades to valley or closed-depression floors.
Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.
Tread. The flat to gently sloping, topmost, laterally extensive slope of terraces, floodplain steps, or other stepped landforms; commonly a recurring part of a series of natural steplike landforms, such as successive stream terraces.
Tuff. A generic term for any consolidated or cemented deposit that is 50 percent or more volcanic ash.
Upland. An informal, general term for the higher ground of a region, in contrast with a low-lying adjacent area, such as a valley or plain, or for land at a higher elevation than the flood plain or low stream terrace; land above the footslope zone of the hillslope continuum.
Valley fill. In glaciated regions, material deposited in stream valleys by glacial meltwater. In nonglaciated regions, alluvium deposited by heavily loaded streams.
Variegation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.
Varve. A sedimentary layer or a lamina or sequence of laminae deposited in a body of still water within a year. Specifically, a thin pair of graded glaciolacustrine layers seasonally deposited, usually by meltwater streams, in a glacial lake or other body of still water in front of a glacier.
Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.
Weathering. All physical disintegration, chemical decomposition, and biologically induced changes in rocks or other deposits at or near the earth's surface by atmospheric or biologic agents or by circulating surface waters but involving essentially no transport of the altered material.
Well graded. Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.
Wilting point (or permanent wilting point). The moisture content of soil, on an ovendry basis, at which a plant (specifically a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.
Windthrow. The uprooting and tipping over of trees by the wind.

## Tables

Table 1.--Temperature and Precipitation
(Recorded in the period 1971-2000 at Carroll, Illinois)

* A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2 , and subtracting the temperature below which growth is minimal for the principal crops in the area ( 50 degrees $F$ ).

Table 12a.--Recreational Development
(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00 . The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Table 14b.--Building Site Development
(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Table 15b.--Sanitary Facilities
(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00 . The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Table 16a.--Construction Materials
(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The ratings given for the thickest layer are for the thickest layer above and excluding the bottom layer. The numbers in the value columns range from 0.00 to 0.99. The greater the value, the greater the likelihood that the bottom layer or thickest layer of the soil is a source of sand or gravel. See text for further explanation of ratings in this table.

Table 17a.--Water Management
(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

## NRCS Accessibility Statement

The Natural Resources Conservation Service (NRCS) is committed to making its information accessible to all of its customers and employees. If you are experiencing accessibility issues and need assistance, please contact our Helpdesk by phone at 1-800-457-3642 or by e-mail at ServiceDesk-FTC @ftc.usda.gov. For assistance with publications that include maps, graphs, or similar forms of information, you may also wish to contact our State or local office. You can locate the correct office and phone number at http://offices.sc.egov.usda.gov/locator/app.
