December 20, 2005

Producer Price Indexes -- November 2005

The Producer Price Index for Finished Goods declined 0.7 percent in November, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This decrease followed a 0.7-percent rise in October and a 1.9-percent gain in September. Prices for finished goods other than foods and energy increased 0.1 percent, after decreasing 0.3 percent in the preceding month. At the earlier stages of processing, the index for intermediate goods fell 1.2 percent, following a 3.0-percent rise in the prior month. Crude goods prices moved down 1.2 percent, after advancing 6.7 percent in October. (See table A.)

Table A. Monthly and annual percent changes in selected stage-of-processing price indexes, seasonally adjusted

			Finished	l goods			
Month	Total	Foods	Energy	Except foods and energy	Change in finished goods from 12 months ago (unadj.)	Inter- mediate goods	Crude goods

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for July 2005 have been revised to reflect the availability of late reports and corrections by respondents.

The downturn in the finished goods index was due to prices for energy goods, which fell 4.0 percent in November after increasing 4.1 percent a month earlier. By contrast, prices for finished consumer goods other than foods and energy turned up 0.2 percent, following a 0.2-percent decline in the previous month. The finished consumer foods index moved up 0.5 percent, after edging down 0.1 percent in October. Capital equipment prices fell 0.1 percent in November, compared with a 0.2-percent decrease in the prior month.

Before seasonal adjustment, the Producer Price Index for Finished Goods dropped 1.6 percent in November to 158.4 (1982 = 100). From November 2004 to November 2005, prices for finished goods increased 4.4 percent. Over the same period, the finished energy goods index jumped 17.8 percent, prices for finished goods other than foods and energy advanced 1.7 percent, and the finished consumer foods index inched up 0.8 percent. For the 12 months ended November 2005, prices received by manufacturers of intermediate goods rose 8.4 percent, and the index for crude goods went up 21.0 percent.

Finished goods

Prices for finished energy goods decreased 4.0 percent in November, following a 4.1-percent gain in the previous month. Leading this downturn, the residential natural gas index fell 0.5 percent, after rising 12.7 percent in October. Prices for home heating oil, liquefied petroleum gas, diesel fuel, and kerosene also moved down in November, following increases in the prior month. The gasoline index declined more than it had in the preceding month, while prices for residential electric power advanced at slower rates than they had in October. (See table 2.)

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for July 2005 have been revised to reflect the availability of late reports and corrections by respondents.

The index for finished consumer goods other than foods and energy rose 0.2 percent in November, following a 0.2-percent decrease in the previous month. Prices for pharmaceutical preparations increased 1.6 percent, following a 0.2-percent gain in the preceding month. The index for sanitary papers and health products also rose more than a month earlier. The rates of decline in the indexes for passenger cars and light motor trucks slowed from October to November. Prices for apparel and floor coverings turned up, after falling in October. The index for household furniture rose, after showing no change in the previous month. By contrast, prices for alcoholic beverages turned down 0.3 percent in November, after increasing 0.3 percent a month earlier. The textile housefurnishings index also declined, following a gain in the preceding month, while prices for book publishing and mobile homes rose less than they had in October.

The finished consumer foods index turned up 0.5 percent in November, compared with a 0.1-percent decline in the previous month. More than half of this upturn was due to prices for eggs for fresh use, which increased 13.4 percent following a 25.2-percent drop in October. The indexes for fresh and dry vegetables, fresh fruits and melons, pork, and soft drinks also rose, after falling in the prior month. Conversely, finfish and shellfish prices declined 7.1 percent in November, following a 9.7-percent increase in the preceding month. The processed turkeys index also turned down, following a gain in October. Prices for beef and veal rose less than they had in the prior month, and the processed young chickens index fell more than it had in October. Prices for dairy products showed no change in November, after moving up a month earlier.

The capital equipment index inched down 0.1 percent in November, compared with a 0.2-percent decline in the prior month. In November, falling prices for light motor trucks, passenger cars, communication and related equipment, metal cutting machine tools, electronic computers, and railroad equipment slightly outweighed rising prices for commercial furniture, transformers and power regulators, agricultural machinery and equipment, civilian aircraft, industrial material handling equipment, and heavy motor trucks.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components decreased 1.2 percent in November, following a 3.0-percent increase in October. This reversal primarily can be attributed to prices for intermediate energy goods, which fell in November after rising in the preceding month. The indexes for materials for nondurable manufacturing and for intermediate foods and feeds also turned down, following gains in October. Prices for materials and components for construction and materials for durable manufacturing advanced at slower rates in November than they had a month earlier. The index for intermediate goods less foods and energy moved up 0.5 percent in November, after climbing 1.2 percent in October. (See table B.)

Prices for intermediate energy goods dropped 6.6 percent, following a 9.3-percent jump in October. The index for industrial natural gas declined 4.4 percent, after surging 16.1 percent in the previous month. Prices for jet fuel, diesel fuel, commercial natural gas, residual fuel, natural gas to electric utilities, and home heating oil also turned down, following increases in October. The gasoline index fell more in November than it had a month earlier. By contrast, prices for industrial electric power advanced 4.4 percent, after rising 1.0 percent in the preceding month. (See table 2.)

The index for materials for nondurable manufacturing decreased 0.9 percent in November, following a 2.8-percent gain in October. Prices for primary basic organic chemicals moved down 10.3 percent, after increasing 7.7 percent in the prior month. The indexes for inedible fats and oils and for processed yarns and threads also fell in November, following advances a month earlier. Prices for plastic resins and materials and for basic inorganic chemicals rose at slower rates than they had in October. Alternatively, the paperboard index climbed 4.0 percent, after edging up 0.2 percent in October. Prices for intermediate basic organic chemicals and fertilizer materials also increased at faster rates than they had in the prior month. The indexes for paper and finished fabrics turned up in November.

The rate of increase in prices for materials and components for construction slowed to 1.0 percent in November, from 1.4 percent in October. The plywood index turned down 15.0 percent in November, compared with a 5.1-percent increase a month earlier. Prices for building paper and board, air conditioning and refrigeration equipment, and treated wood also declined, following advances in October. The softwood lumber index fell more than in the prior month, while prices for fabricated structural metal products increased less in November than they had in the previous month. Conversely, the concrete products index rose 1.2 percent, after moving up 0.6 percent in October. Prices for wiring devices, nonferrous wire and cable, asphalt felts and coatings, and plastic construction products also climbed more in November than they had in the preceding month. The index for mineral wool for structural insulation turned up, following a decrease in October.

The index for materials for durable manufacturing advanced 1.6 percent in November, after rising 2.0 percent in October. Prices for copper cathode and refined copper increased 3.3 percent, compared with a 13.3-percent jump in the previous month. The indexes for building paper and board, plywood, cold finished steel bars, and cement turned down in November, following gains a month earlier. Prices for hot rolled steel bars, plates, and structural shapes, as well as copper and brass mill shapes, rose less than they had in October. Conversely, the index for semifinished steel mill products surged 12.2 percent in November, after moving up 2.5 percent in the prior month. Prices for hot rolled steel sheet and strip, aluminum mill shapes, and prepared paint also increased at quicker rates than they had in October.

The index for intermediate foods and feeds edged down 0.1 percent in November, following a 0.7-percent increase in October. Prices for prepared animal feeds fell 1.3 percent, after rising 0.3 percent in the preceding month. The indexes for beef and veal, fluid milk products, refined sugar and byproducts, and shortening and cooking oils advanced at slower rates in November than they had in October. Prices for processed young chickens decreased more than they had in the previous month. By contrast, the pork index moved up 0.2 percent in November, following a 4.2-percent decline a month earlier. Prices for natural, processed, and imitation cheese also turned up, after falling in October. The indexes for flour and snack chips increased at quicker rates than they had in the prior month.

Crude goods

The Producer Price Index for Crude Materials for Further Processing fell 1.2 percent in November, following a 6.7-percent advance in October. Prices for crude energy materials turned down in November, after rising in the preceding month. Conversely, the index for basic industrial materials increased, following a decline in October. The rate of increase in prices for crude foodstuffs and feedstuffs quickened from October to November. (See table B.)

The crude energy materials index declined 4.2 percent in November, after increasing 12.4 percent in October. The natural gas index fell 1.3 percent, compared with a 20.3-percent jump in the prior month. Crude petroleum prices tumbled 11.4 percent in November, after climbing 0.6 percent a month earlier. By contrast, the coal index edged down 0.1 percent in November, following a 0.2-percent drop in October. (See table 2).

Prices for basic industrial materials increased 5.4 percent in November, after decreasing 1.2 percent in October. The iron and steel scrap index went up 18.8 percent, following a 7.8-percent decline in the preceding month. Prices for aluminum base scrap and for softwood logs, bolts, and timber also turned up in November, after falling in October. The indexes for construction sand, gravel, and crushed stone and for hardwood logs, bolts, and timber rose more in November than they had in the prior month. Alternatively, the raw cotton index fell 6.0 percent, compared with an 8.3-percent gain in October. Prices for gold ores, wastepaper, and pulpwood also turned down in November, following increases a month earlier. The index for copper base scrap rose less in November than it had in October.

Prices for crude foodstuffs and feedstuffs climbed 1.3 percent, following a 0.2-percent gain in October. Subsequent to a 7.7-percent decrease in October, the corn index rose 10.5 percent in November. Prices for soybeans, fresh and dry vegetables, and fresh fruits and melons also turned up in November. The index for slaughter broilers and fryers fell less than it had in the previous month. By contrast, prices for slaughter hogs declined 1.9 percent in November, after advancing 8.6 percent in October. The indexes for wheat and unprocessed finfish also turned down, following gains a month earlier. Prices for fluid milk showed no change in November, after increasing in the preceding month.

Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries fell 3.4 percent in November, following a 9.8-percent rise in October. (Net output price indexes are not seasonally adjusted.) Prices received by the industry for crude petroleum and natural gas extraction declined 6.1 percent, after gaining 12.2 percent a month earlier. The industry indexes for natural gas liquid extraction, oil and gas operations support activities, gold ore mining, and bituminous coal and lignite surface mining also turned down, after rising in October. The industry index for oil and gas well drilling increased less than a month earlier. By contrast, prices received by the industry for bituminous coal underground mining turned up 0.5 percent, after falling 0.4 percent in October. The industry index for potash, soda, and borate mineral mining also increased, after an October decline. In November, the Producer Price Index for Total Mining Industries was 245.2 (December 1984 = 100), 36.9 percent above its year-ago level.

Manufacturing. The Producer Price Index for the Net Output of Total Manufacturing Industries declined 2.4 percent in November, following a 1.6-percent gain in October. Prices paid to manufacturers of petroleum and coal products turned down 19.4 percent, after rising 7.7 percent in the previous month. The industry group indexes for transportation equipment, wood products, and food also decreased, after increasing in October. The industry group index for machinery remained unchanged, after rising in the prior month, while prices received by the computer and electronic products industry group fell at faster rates in November than in October. By contrast, the rate of increase in the industry group index for plastics and rubber products accelerated to 3.3 percent, from 2.0 percent in October. Prices paid to manufacturers of paper turned up in November, after falling in the prior month. In November, the Producer Price Index for Total Manufacturing Industries was 152.7 (December 1984 = 100), 4.5 percent above its year-ago level.

Services. Among services industries in November, prices received by commercial bankers increased 4.4 percent, after declining 3.5 percent in October. The industry indexes for hotels and motels (excluding casinos) and for direct life insurance carriers also turned up, following declines in the preceding month. Alternatively, prices paid to offices of real estate agents and brokers edged down 0.1 percent, following a 4.5-percent gain in October. The industry indexes for long distance trucking of new, specialized freight and for cable networks also turned down in November. Prices received by lessors of nonresidential buildings (excluding miniwarehouses) decreased in November, after remaining unchanged in October. The industry indexes for direct health and medical insurance carriers and for portfolio management advanced at slower rates than in the previous month. Prices received by specialty hospitals (other than psychiatric and substance abuse) were unchanged, after rising in October.

Producer Price Index data for December 2005 are scheduled to be released on Friday, January 13, 2006, at 8:30 a.m. (EST).

Brief Explanation of Producer Prices Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (2-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit). Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digits), products (9-digits), and more detailed subproducts (11-digits); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of unit dollar prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Weights

DDI Datailad

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at (http://www.bls.gov/opub/hom/homch14_itc.htm), and reprints are available on request.

Calculating Index Changes

Each PPI measures price changes from a reference period which equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: Prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy, because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from the BLS.)

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (6-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data Via the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million accesses of PPI series over the Internet during the 12 months ended December 31, 2003.

Retrieving PPI data from the PPI Website

PPI data can be obtained from the WWW address (http://www.bls.gov/ppi). Scrolling down the page to the "Get Detailed Statistics" header reveals the following 5 methods of data retrieval:

- *Most Requested Series* is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- Create Customized Tables is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple screen, nonJava-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.
- *Series Report* is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

There are three basic formats for creating a unique PPI time series identifier. For commodity and stage-of-processing indexes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) in combination with a commodity-based code to create a series identifier.

Commodity code Will provide data for:

wps063 Drugs and pharmaceuticals, seasonally adjusted wpu063803 Pharmaceutical preparations, cardiovascular system

wpusop3000 Finished goods, not seasonally adjusted

For a current industry-based price index organized according to the North American Industry Classification System (NAICS), enter the prefix "pcu" followed by the industry-product code. The series identifier for products primary to an industry include 12 numeric digits, the six-digit industry code is repeated, and up to seven additional digits of product detail. Dashes are used as place holders for higher-level industry group codes.

Industry-product code,
Current NAICS series

pcu325---325--pcu336110336110

pcu621111621111411

Will provide data for:

Chemical manufacturing, not seasonally adjusted
Automobile and light duty motor vehicle manufacturing

Offices of physicians, one and two physician practices and single specialty group practices,
general/family practice

To identify a discontinued industry-product code based on the Standard Industrial Classification (SIC), enter a "pdu" prefix and "#" between the fourth and fifth characters of the product code. A series identifier for the discontinued dataset uses underscores as placeholders to complete a reference to an SIC industry group code of less than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of the NAICS.) *In all cases, no spaces are permitted.*

Industry-product code, Discontinued SIC series pdu28_# Chemicals and allied products, not seasonally adjusted pdu331_# Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted pdu3711#111 Passenger cars

• *Flat Files* and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as, seasonal factor and relative importance tables). The FTP site can be accessed at (ftp://ftp.bls.gov) or directly from the links on the "Get Detailed Statistics" page or the PPI homepage. Data and documentation available for download include:

Directory:

NAICS Current Series

SIC Discontinued Series

Commodity Series

pub/time.series/pd

pub/time.series/wp

pub/time.series/wp

pub/special.requests/ppi

Latest News Release

Directory:

pub/time.series/pd

pub/time.series/wp

pub/special.requests/ppi

pub/news.release/ppi.txt

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, go to the overview.txt file for an overview relating to all BLS data available through the FTP site. For commodity-based PPI data (which appear in tables 1, 2, 3, 6, 7, and 8 of the PPI monthly detailed report and tables 1, 2, 3, and 5 of the monthly news release), the program help file is wp.txt. For current industry-based PPI data based on the NAICS (which appear in tables 4, 5, and 9 of the monthly PPI report and table 4 of the monthly news release), the file is pc.txt. For industry-based SIC time series that have been discontinued, go to pd.txt. (These and other help files are also maintained within each of the five directories listed above.)

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (http://www.bls.gov). After clicking the "Get Detailed Statistics" link at the top of the homepage a chart appears listing all of the available BLS programs. The following four methods are available for PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page including: Economic news releases, series report, and economy at a glance.

Additional information

The PPI homepage (http://www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information directly at (202) 691-7705 or *ppi-info@bls.gov*. Data also can be obtained by calling the national fax-on-demand service at (202) 691-6325. This service enables customers to request faxes of BLS data 24 hours a day, 7 days a week.

^{1/} Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

Note: NAICS 2002 replaced the SIC system beginning with the release of PPI data for January 2004.

^{2/} The indexes for July 2005 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

^{3/} Not available.

Table 5. Producer price indexes by stage of processing, seasonally adjusted (1982=100)

			Index	1/
