EXECUTIVE SUMMARY

Natural resources of the Hudson River have been contaminated through past and ongoing discharges of polychlorinated biphenyls (PCBs). The Hudson River Natural Resource Trustees—New York State, the U.S. Department of Commerce, and the U.S. Department of the Interior—are conducting a natural resource damage assessment (NRDA) to assess and restore those natural resources injured by PCBs.

In August-September 2003, the Trustees collected near-shore sediment samples and bullfrog (*Rana catesbeiana*) tadpoles from the Hudson River for contaminant analysis. This work was undertaken by the Trustees to assist in determining the extent to which bullfrog tadpoles and near-shore sediments in the Hudson River are currently contaminated with PCBs, and to determine if additional pathway and injury assessment studies focused on bullfrog or other amphibian species should be conducted as part of the Hudson River NRDA. Bullfrog tadpole composites and co-located sediment composites were collected from six study sites of known PCB contamination on the Hudson River between Bakers Falls and Schodack Island, and two reference sites.

The tadpole and sediment samples were analyzed for select PCB congeners, PCB homologue groups, total PCBs, percent lipids (tadpoles only), and percent organic carbon (sediments only). The total PCB concentrations (as sum of homologues) of tadpoles and sediments from the study sites ranged from 354 parts per billion (ppb) to 9,280 ppb and 2,640 ppb to 57,600 ppb, respectively. Tadpole and sediment PCB concentrations from reference sites were statistically different ($p < 0.05$) than study sites and ranged from 15 ppb to 108 ppb and 508 ppb to 834 ppb, respectively. Tadpole and sediment PCB concentrations were well correlated among the sites ($R^2 = 0.89$).

The PCB congener composition of sediments from the study sites are dominated by lower chlorinated biphenyls and differ markedly from congener distributions in the reference sediments where the heavier molecular weight congeners are more prevalent. A similar trend was evident in tadpoles, with lower chlorinated compounds comprising the majority of the tissue residue in tadpoles from the six study sites.

1.0 INTRODUCTION

Past and continuing discharges of polychlorinated biphenyls (PCBs) have contaminated natural resources of the Hudson River. The Hudson River Natural Resource Trustees — New York State, the U.S. Department of Commerce, and the U.S. Department of the Interior — are conducting a natural resource damage assessment (NRDA) to assess and restore those natural resources injured by PCBs (Hudson River Natural Resource Trustees 2002a). This Data Report provides the results of a preliminary investigation of PCB contamination of a select Hudson River amphibian species conducted pursuant to the NRDA.

The Hudson River and its habitat support many species of amphibians. These animals spend a large part of their lives in contact with potentially contaminated substances – water, sediment and soil – and consume potentially contaminated prey. Bullfrogs (*Rana catesbeiana*) are an important part of the Hudson River food web. Bullfrogs are carnivorous and eat a variety of foods including insects, snakes, other frogs, birds and mammals. Frogs are an important link between trophic levels because they are important food sources for many other organisms such as herons, raccoons, snakes and other large predatory organisms. Frogs, however, play a unique role in connecting aquatic and terrestrial food webs. Bullfrogs start life as aquatic tadpoles, feeding on potentially contaminated plant and animal material in water. They subsequently metamorphose into air-breathing adults with an expanded habitat range and a more varied diet. During both life stages, bullfrogs provide a mechanism for transfer of PCBs to organisms within the aquatic ecosystem and terrestrial food web.

In August-September 2003, the Trustees collected near-shore sediment samples and bullfrog tadpoles from the Hudson River for contaminant analysis. This work was undertaken by the Trustees to assist in determining the extent to which bullfrog tadpoles and near-shore sediments in the Hudson River are currently contaminated with PCBs, and to determine if additional pathway and injury assessment studies focused on bullfrog or other amphibian species should be conducted as part of the Hudson River NRDA. This work may potentially be used to design future studies to assess the health of these animals in the Hudson River.

2.0 SAMPLING

2.1 SAMPLE COLLECTION AND PROCESSING

Collection and processing of tadpole and sediment samples were conducted in accordance with the Trustees' Sampling and Analysis Plan for the Collection of Bullfrog (*Rana catesbeiana*) Tadpoles and Near-Shore Sediment Samples from the Hudson River, New York (Appendix A) (Hudson River Natural Resource Trustees 2003a).

2.1.1 SAMPLING SITES

This preliminary investigation focused on four regions of the Hudson River between Hudson Falls, New York and Schodack Island, New York. Sediments and tadpoles were collected from these four geographic regions to provide samples from various portions of the river known to be contaminated by PCBs at various levels. These four regions are described below, and depicted on Figure 1. Figure 2a identifies the nine sampling sites and Figure 2b is a close up of the five sampling sites in Region 1.

Region 1: the area from Bakers Falls (at River Mile (RM) 196.9) downstream to the Fort Miller Dam (Lock 6) at RM 186.2. Sediments were collected from five sites in this region while tadpoles were collected from four of these five sites. One of the sites in Region 1 (Site 1) was a reference site located adjacent to the Hudson River (Figure 2)

Region 2: the area from the Fort Miller Dam (Lock 6) at RM 186.2 downstream to the Stillwater Dam (Lock 4) at RM 168.2. Sediments and tadpoles were collected from two sites in this region.

Region 3: the area below the Stillwater Dam (Lock 4) at RM 168.2 downstream to the Federal Dam at Troy (RM 153.9), excluding Troy and its urban vicinity (approximately from Peebles Island State Park downstream to the Federal Dam). Sediments and tadpoles were collected from one site in this region.

Region 4: the area below the Federal Dam at Troy (RM 153.9) extending south to Lower Schodack Island (RM 132), excluding Albany and its urban vicinity. Sediments and tadpoles were collected from one reference site away from the Hudson River.

Sample sites were identified using aerial photos and other maps, site-specific knowledge regarding the Hudson River, and existing contaminant data from the Hudson River. Areas with bullfrog tadpole habitat — identified as areas containing several acres of emergent marsh and aquatic vegetation located adjacent to open water — were identified, and then assessed for ease of access. Region 1 provided the most suitable habitat for bullfrog tadpoles, hence more sampling sites were located in this Region than in Regions 2 or 3. The Trustees looked extensively for bullfrog tadpoles within the Hudson River in Region 4 but did not locate any suitable sites.

Tadpole and sediment samples were also collected from two reference areas, one adjacent to the Hudson River and the other away from the Hudson River (Sites 1 and 9, respectively). Site 1, located in sampling Region 1, is a small marsh adjacent to the Hudson River and separated from the Hudson River by West River Road. The marsh is no more than ten meters from the Hudson River. Site 9 is located west of the Region 4 boundary, at Five Rivers Environmental Education Center in Delmar, New York.

Sampling Sites used in this preliminary investigation are as follows:

Site No.	Description
1	Reference Site – backwater off West River Road, west site of road, just north of Thompson Island Dam
2	Southern tip of Griffin Island
3	Backwater bay just south of Lock 6 at Fort Miller
4	East side of island; $\frac{1}{4}$ mile south of Lock 6 at Fort Miller
5	Wetland pond west/northwest of Lock 4 at Stillwater
6	$\frac{1}{2}$ mile north of Lock 4 at Stillwater
7	$\frac{1}{2}$ mile south of Thompson Island
8	Northeast of Quack Island, north of Lock 2
9	Reference Site – Goose Point at Five Rivers Environmental Education Center

2.1.2 HABITAT EVALUATION

For each site from which tadpoles or sediments were to be collected, a habitat evaluation was performed. The focus of this was to evaluate areas along the Hudson River for their suitability for amphibians and identify areas where sufficient numbers of amphibians live and/or breed for the purpose of identifying the location of potential future sites for amphibian injury studies. The habitat evaluation was accomplished in accordance with the Trustees' Standard Operating Procedure (SOP) for Habitat Evaluation (Appendix 1 to Appendix A).

2.1.3 TADPOLE COLLECTION, PROCESSING AND COMPOSITING

Collection of bullfrog tadpoles was attempted at each sample site where a habitat evaluation was conducted and tadpoles were found. Bullfrog tadpole collection was conducted as specified in the Trustees' Standard Operating Procedure for Tadpole Collection and Processing (Appendix 2 to Appendix A).

A total of 155 bullfrog tadpoles were collected from eight of the nine sites included in this preliminary investigation (no tadpoles were collected from Site 2). Tadpole samples were collected between August 20, 2003 and September 4, 2003.

Tadpole samples were subsequently processed and composited for chemical analysis as specified in that SOP and in the Trustees' Sampling and Analysis Plan for this preliminary investigation.

2.1.4 SEDIMENT COLLECTION AND COMPOSITING

Sediment collection and compositing was conducted as specified in the Trustees' Standard Operating Procedure for Sediment Collection (Appendix 3 to Appendix A).

One composite sediment sample was collected from each of the nine study sites. Sediment samples were collected between August 19, 2003 and September 4, 2003.

2.2 SAMPLE ANALYSIS

Chemical analyses were conducted pursuant to the Trustees' Analytical Quality Assurance Plan (Hudson River Natural Resource Trustees 2002b).

A total of 42 tadpole composites and nine sediment composites were submitted for analysis. The tadpole composites were analyzed in three laboratory analytical batches (0312035, 0312036, and 0312044), and the sediment composites were in a separate batch (0312034). One equipment rinsate blank was collected during the tadpole tissue homogenization process at the laboratory, and reported in analytical batch 0312088.

Tadpole samples were analyzed for 47 select PCB congeners (see Table 3), PCB homologues, total PCBs (as sum of homologues) and percent lipid. Sediment samples were analyzed for 47 select PCB congeners (see Table 3), PCB homologues, total PCBs (as sum of homologues), organic carbon content (%) and water content (%). The samples were prepared, extracted, and analyzed using laboratory SOPs approved by the Trustees prior to sample receipt.

Sample analysis began on December 12, 2003, and concluded on January 29, 2004.

2.3 QUALITY ASSURANCE/QUALITY CONTROL

Data validation was based on the quality assurance/quality control (QA/QC) criteria documented in the Trustees' Analytical Quality Assurance Plan (Hudson River Natural Resource Trustees 2002b), U.S. Environmental Protection Agency (USEPA) (1999), and the following laboratory SOPs:

- SOP # HR NRDA Project Tissue Prep: Tissue Preparation and Homogenization, Revision #1.0, 9/25/02
- SOP # OP-004: Extraction of Soil, Tissue, Vegetation, and Sediment by Pressurized Fluid Extraction, Revision #2.0, 8/15/02
- SOP # O-010: Determination of PCB Homologues and Individual Congeners by GC/MS - SIM, Revision # 2.2, 10/24/02
- SOP # HR NRDA % Lipids: Percent Lipids Determination, Revision # 0.0, 9/9/02
- SOP # W-001: Percent Solids Determination, Revision # 2.1, 9/25/02
- SOP # W-028: Total Organic Carbon in Soil, Sediment and Water, Revision # 2.0, 1/22/03
- SOP # W-029: Particle Size Analysis of Soils - with and without Hydrometer, and Liquid Limit, Plastic Limit and Plasticity Index, Draft, 1/16/04
- Additional cleanup, sample handling, storage, custody SOPs as necessary.

A SRM was extracted and analyzed with each analytical batch. The SRM selected for the tadpole tissue composites was 1974b - Organics in Mussel Tissue. This SRM has certified values for 27 PCB congeners. One SRM analysis was submitted with each laboratory batch, so a total of three SRM analyses (with 27 certified values each, for a total of 81 data points) were performed. The SRM selected for the sediment analyses was 1944 - New York/New Jersey Waterway Sediment. This SRM has certified values for 28 of the target PCB congeners. One SRM analysis was submitted, for a total of 28 data points.

Sample results and related QC data were received in both an electronic and hard copy format. Electronic data were verified against the hard copy data package. One tadpole composite package and the sediment data package received full validation; the other packages received summary validation.

The following QC elements were reviewed for data packages undergoing summary validation:

- Analytical holding times
- Chain of custody and sample handling
- GC/MS tune verification (from summary forms)
- Method blank contamination (from summary forms)
- Initial and continuing calibration (from summary forms)
- Rinsate blank contamination (from sample result summaries)
- Analytical accuracy: surrogates, matrix spike samples, laboratory control samples, and standard reference material results (from summary forms)
- Analytical precision: laboratory duplicate samples (from summary forms)
- Internal standard areas (from summary forms)
- Reported detection limits (from sample result summaries)

Full validation included review of all the items listed above for summary validation, plus the following QC elements:

- Compound identification (from raw data)
- Compound quantitation, transcription and calculation checks performed at a frequency of 10% from raw data. If an error was noted, 100% of the calculations and transcriptions for that data set were verified.

The data package submitted by the laboratory was reviewed to determine whether the analytical data quality objectives (ADQO) specified in Tables 6.1a - 6.1c in the Analytical Quality Assurance Plan (Hudson River Natural Resource Trustees 2002b) were met.

Table 1.1 of the Trustees' Analytical Quality Assurance Plan (Hudson River Natural Resource Trustees, 2002b) specifies the target Method Detection Limits (MDLs) for PCB congeners, homologues and total PCBs. For tissue, such as bullfrog tissue composites, the target MDLs are 0.1 ng/g wet weight (equivalent to 0.1 ppb wet weight) for individual congeners, and 10 ng/g (equivalent to 10 ppb) for PCB homologues and total PCBs. Actual MDLs for each PCB analyte were established by the analytical laboratory as specified in the Analytical Quality Assurance Plan. Actual MDLs are reported on the Data Sheets (Appendices C and D) in the "Detection Limit" column.

Appendix B contains the Data Quality Assessment Report (Hudson River Natural Resource Trustees 2004a) for the samples. Tables 1A, 1B, and 1C of Appendix B summarize the SRM results for this preliminary investigation.

Out of 3027 results reported by the laboratory (51 samples each with 47 congeners, 10 homologue groups, and total PCBs; percent lipids for the tadpole composites; percent moisture, grain size, and total organic carbon for the sediments), a total of 86 (2.8%) data points were estimated (J). No data were rejected. The completeness level attained for the analysis of the field samples is 100%.

3.0 RESULTS

The Tadpole Data Sheets (Appendix C) and Sediment Data Sheets (Appendix D) provide the results of the analyses.

These Data Sheets contain information that has been extracted from the Trustees' Tadpole and Sediment Database (Hudson River Natural Resource Trustees 2003b). That complete database and the accompanying Database User Manual (Hudson River Natural Resource Trustees 2004b) are not included in this report due to the size of the database, but will be made available upon request.

The Tadpole Data Sheets and Sediment Data Sheets contain the following fields:

Sampling Date – Sampling Date (mm/dd/yy format).

Field ID –

For the Tadpole Data Sheets, the field IDs were created using the following format:

BTC-001-001

where “BTC” refers to bullfrog tadpole composite. The first set of three digits refers to the unique site number from which the tadpole was collected, and the second set of three digits refers to the unique composite number. For example, BTC-001-001 indicates a bullfrog tadpole composite sample from Site 1 and that it is the first composite sample from that site.

For the Sediment Data Sheets, the field IDs were created using the following format:

SED-001

where “SED” refers to sediment. The set of three digits refers to the unique site number from which the sediments were collected. For example, SED-001 indicates a sediment sample (composite) from Site 1.

Easting – NAD83 Universal Transverse Mercator easting coordinates (meters) Zone 18N.

Northing – NAD83 Universal Transverse Mercator northing coordinates (meters) Zone 18N.

Site Number – as noted on Figure 2.

Laboratory ID – Laboratory IDs were created using the following format:

Sample delivery group – run sequence number (e.g., 0208031-01).

Analyte – For the PCB congeners, the analyte names are reported using the following format:

Clx-BZ#NNN

where Clx refers to the chlorination level, BZ# refers to the Ballschmiter and Zell (1994) number, and NNN is the congener number. For example, PCB 110 (a pentachlorinated biphenyl) is reported as Cl5-BZ#110.

Value, Interpretive Qualifier and Units –

Value – Analytical result (3 significant figures).

Interpretive Qualifier - This field contains qualifiers applied to each data point by the laboratory and after the data validation process. The qualifiers are defined as follows:

U Analyte was not detected. The associated value represents the detection limit.

J Estimated: The associated numerical value is an estimated quantity. The analyte was detected, but the reported value may not be accurate or precise. The “J” qualification indicates the data fell outside the QC limits, but the exceedance was not sufficient to cause rejection of the data.

UJ Estimated/Not detected: An analysis was performed for the compound or analyte, but it was not detected and the sample quantitation or detection limit may be inaccurate or imprecise. The associated numerical result is the detection limit.

J Estimated: The associated numerical value is an estimated quantity. The analyte was detected, but the reported value may not be accurate or precise. The "J" qualification indicates the data fell outside the QC limits, but the exceedance was not sufficient to cause rejection of the data.

UJ Estimated/Not detected: An analysis was performed for the compound or analyte, but it was not detected and the sample quantitation or detection limit may be inaccurate or imprecise. The associated numerical result is the detection limit.

NJ Tentatively Identified/Estimated: The analyte was tentatively identified and the associated numerical value is an estimated quantity.

Reasons for qualification are explained further in the Data Quality Assessment Report (Appendix B).

Units - The unit of measurement of the analytical result is provided (for example, $\mu\text{g}/\text{kg}$).

Detection Limit – self-explanatory; this column includes units.

A brief description of some of the features of these data follows in sections 3.1 and 3.2 of this Data Report. Please note that the unit " $\mu\text{g}/\text{kg}$ " used in the Data Sheets is equivalent to parts per billion (ppb) used in the discussion of these data in this Data Report.

Data fields, and data collected by the Trustees, that are not reported in this Data Report but that are contained within the Trustees' Tadpole and Sediment Database consist of the following: Analytical Batch, Laboratory Flag, Data Validation Qualifier, Data Validation Qualifier Reason Code, Analysis Group, Analytical Method, Matrix, Extraction Date, Analysis Date, Dilution Factor, Sample Size and Units, Sampling Interval for sediment samples, Sample Description for sediment samples, Biota Type, and Number of Tadpoles in a composite sample.

For the purpose of reporting PCB results below and in the figures attached to this report, all values flagged with either a U or UJ qualifier (that is, not detected; see Appendix B) were considered to be zero. Using zero, rather than the value reported by the laboratory for the analyte, which represents the detection limit for the analysis, potentially underreports the true value, but avoids overreporting the true value. This is thus a conservative result; the actual PCB concentration could be higher.

3.1 TOTAL PCB CONCENTRATIONS

Total PCB concentrations in tadpole samples from the Hudson River sites range from 354 ppb to 9,280 ppb (wet weight basis) (Table 1; Figure 4). Total PCB concentrations in sediment samples from the Hudson River sites range from 2,640 ppb to 57,600 ppb (wet weight basis) (Table 2; Figure 3).

Table 1. Summary of Total PCBs (as sum of homologues, wet weight basis) in Tadpole Composite Samples

Sampling Site	Number of composited samples	PCB Conc. Range (ppb)	Conc. Average \pm 1 Std. Dev. (ppb)
Site 1 (Reference Site)	7	48 - 108	80 \pm 22
Site 2	None collected	--	--
Site 3	4	501 - 4,000	1,710 \pm 1,600
Site 4	5	2,500 - 9,280	4,810 \pm 2,620
Site 5	5	354 - 1,070	607 \pm 289
Site 6	6	559 - 1,730	1,017 \pm 404
Site 7	4	2,190 - 7,680	3,940 \pm 2,540
Site 8	6	823 - 1,570	1,060 \pm 319
Site 9 (Reference Site)	5	15 - 97	40 \pm 33

Table 2. Summary of Total PCBs (as sum of homologues, dry weight basis) in Sediment Composite Samples

Sampling Site	PCB Concentration (ppb)
Site 1 (Reference Site)	834
Site 2	7,880
Site 3	6,880
Site 4	48,900
Site 5	5,820
Site 6	2,640
Site 7	57,600
Site 8	4,550
Site 9 (Reference Site)	508

PCB concentrations in tadpoles display a generally decreasing, downstream concentration gradient with PCB concentrations decreasing downstream from Site 7 near Schuylerville to Site 8 near Mechanicville (Figure 4). Tadpoles from the reference sites (Sites 1 and 9) possess PCB body burdens, on average, an order of magnitude or more lower than tadpoles collected from the study sites (Figure 4). While there is no obvious relationship between tadpole PCB concentrations and lipid content or sediment PCB concentrations and organic carbon content (Figure 5), tadpole PCB body burdens were well correlated with their respective sediment concentrations (Figure 6).

3.2 PCB HOMOLOGUES AND CONGENERS

PCBs are synthetic (man-made) chemicals that form a group of 209 individual compounds that have similar chemical structures based on a biphenyl core with 1 to 10 chlorine atoms attached. PCBs have the generic formula $C_{12}H_{(10-x)}Cl_x$, where x is an integer from 1 to 10. Each individual PCB compound, called a congener, is identified by the unique number and location of chlorine atoms that attach to the compound's base structure. Congeners differ both in their physical properties and in their effects on fish and wildlife (Safe 1994; Van den Berg et al. 1998).

For this investigation, the tadpoles and sediments were analyzed for 47 specific target PCB congeners listed in Table 3. In addition, a total concentration for each homologue group was determined by summing all target and non-target congener concentrations within each homologue group. For any congener reported as non-detected, zero was used in the summation.

Table 3. PCB Congener Analytes

Current Ballschmiter and Zell (1994) and IUPAC Number	IUPAC Name
8	2,4'-Dichlorobiphenyl
18	2,2',5-Trichlorobiphenyl
28/31	2,4,4'-Trichlorobiphenyl/2,4',5-Trichlorobiphenyl
44	2,2',3,5'-Tetrachlorobiphenyl
45	2,2',3,6-Tetrachlorobiphenyl
47	2,2',4,4'-Tetrachlorobiphenyl
49	2,2',4,5'-Tetrachlorobiphenyl
52	2,2',5,5'-Tetrachlorobiphenyl
56	2,3,3',4'-Tetrachlorobiphenyl
66	2,3',4,4'-Tetrachlorobiphenyl
70	2,3',4',5-Tetrachlorobiphenyl
74	2,4,4',5-Tetrachlorobiphenyl
77	3,3',4,4'-Tetrachlorobiphenyl
81	3,4,4',5-Tetrachlorobiphenyl
87	2,2',3,4,5'-Pentachlorobiphenyl
95	2,2',3,5',6-Pentachlorobiphenyl
99	2,2',4,4',5-Pentachlorobiphenyl
101	2,2',4,5,5'-Pentachlorobiphenyl
105	2,3,3',4,4'-Pentachlorobiphenyl
110	2,3,3',4',6-Pentachlorobiphenyl
114	2,3,4,4',5-Pentachlorobiphenyl
118	2,3',4,4',5-Pentachlorobiphenyl
123	2,3',4,4',5'-Pentachlorobiphenyl
126	3,3',4,4',5-Pentachlorobiphenyl
128	2,2',3,3',4,4'-Hexachlorobiphenyl
138	2,2',3,4,4',5'-Hexachlorobiphenyl
146	2,2',3,4',5,5'-Hexachlorobiphenyl
149	2,2',3,4',5',6-Hexachlorobiphenyl
151	2,2',3,5,5',6-Hexachlorobiphenyl
153	2,2',4,4',5,5'-Hexachlorobiphenyl
156	2,3,3',4,4',5-Hexachlorobiphenyl
157	2,3,3',4,4',5'-Hexachlorobiphenyl
158	2,3,3',4,4',6-Hexachlorobiphenyl
167	2,3',4,4',5,5'-Hexachlorobiphenyl
169	3,3',4,4',5,5'-Hexachlorobiphenyl
170	2,2',3,3',4,4',5-Heptachlorobiphenyl
174	2,2',3,3',4,5,6'-Heptachlorobiphenyl
177	2,2',3,3',4,5',6'-Heptachlorobiphenyl
180	2,2',3,4,4',5,5'-Heptachlorobiphenyl
183	2,2',3,4,4',5',6-Heptachlorobiphenyl
187	2,2',3,4',5,5',6-Heptachlorobiphenyl
189	2,3,3',4,4',5,5'-Heptachlorobiphenyl
194	2,2',3,3',4,4',5,5'-Octachlorobiphenyl
195	2,2',3,3',4,4',5,6-Octachlorobiphenyl
201	2,2',3,3',4,5',6,6'-Octachlorobiphenyl
206	2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl
209	Decachlorobiphenyl

Figures 7 and 8 graphically display the sediment PCB homologue distributions at study and reference sites, respectively.

The PCB congener composition of sediments from the study sites (Figure 7) are dominated by lower chlorinated biphenyls and differ markedly from congener distributions in the reference sediments (Figure 8) where the heavier molecular weight congeners are more prevalent. A similar trend was evident in tadpoles, with lower chlorinated compounds comprising the majority of the tissue residue in tadpoles from the six study sites (Figure 9).

1.0 INTRODUCTION

The General Electric Company discharged from its capacitor manufacturing operations at its Hudson Falls and Ford Edward, New York facilities as much as 1.33 million pounds of polychlorinated biphenyls (PCBs) into the Hudson River from the 1940s through 1977 (USEPA 2002). These PCBs have been detected in the sediment, water, and biota of the Hudson River at levels of potential ecological concern (TAMS Consultants, Inc. and Menzie-Cura & Associates, Inc. 2000). Elevated PCB levels in Hudson River floodplain soils have also been documented (SEA Consultants, Inc. 2002).

As a result of the contamination of the Hudson River ecosystem with PCBs, the Hudson River Natural Resource Trustees (Trustees) are conducting a natural resource damage assessment (NRDA) of the Hudson River. The Trustees are the State of New York, acting through the New York State Department of Environmental Conservation (NYSDEC), the U.S. Department of the Interior (DOI), acting through the Fish and Wildlife Service and the National Park Service, and the U.S. Department of Commerce acting through the National Oceanic and Atmospheric Administration (NOAA).

This Sampling and Analysis Plan (SAP) is for collection and contaminants analysis of tadpoles of the bullfrog (*Rana catesbeiana*) and near-shore sediment samples from the Hudson River, and characterization of amphibian habitats along the Hudson River. This work will be undertaken by the Trustees to assist the Trustees in determining the extent to which bullfrog tadpoles and near-shore sediments in the Hudson River are currently contaminated with PCBs, and to determine if additional pathway and injury assessment studies focused on bullfrog tadpoles or other amphibian species should be conducted as part of the Hudson River NRDA.

This preliminary investigation will provide information that is key to the design of potential future amphibian injury studies. It will facilitate the selection of appropriate study sites for such an injury study, if appropriate. It will provide us knowledge of breeding areas for species of interest, and qualitative information regarding presence and abundance of such species, at different areas of the Hudson River. Information collected in this investigation will also have utility in pathway work, determination of ecological losses, and restoration planning.

Bullfrog tadpoles are connected to other Hudson River species through the food web. Tadpoles are food for migratory birds, including kingfishers. They are also consumed by other Hudson River species, such as fish and other amphibians, which are prey for other biota, including larger migratory birds. This work will assist the Trustees in determining the extent to which amphibians are a pathway of exposure and injury to other biological resources.

The bullfrog is a species which is common in the Hudson River. Tadpoles can be collected with relative ease, and are expected to be relatively abundant. It is a species which is expected to be exposed to PCBs from the Hudson River. Exposure of bullfrog tadpoles to PCBs could be high because it has a tadpole stage extending over two summers, and the feeding habits of tadpoles (*i.e.*, grazing on algae and detritus at the sediment-water interface) may contribute to high sediment exposure.

The objectives of this investigation are to:

- characterize amphibian habitat in the Hudson River between Bakers Falls and Lower Schodack Island;
- collect bullfrog tadpole samples and near-shore sediment samples from about 40 sites on the Hudson River (main stem and/or adjacent areas anticipated to be potentially impacted by Hudson River contamination) and from about 10 additional reference sites;
- and, process the tadpoles for subsequent chemical analyses. Sediment samples will also be analyzed.

The goal of this investigation is to collect paired tadpole and sediment samples from each of four geographic regions within the study area (the Upper Hudson River and the upper portion of the Lower Hudson River) to provide a balanced sample amongst various portions of the river, and from a fifth region that will be a reference area. The goal of this investigation is to collect about 10 paired tadpole and sediment samples from within each of these five areas, thus collection of a maximum of about 50 tadpole samples and 50 sediment samples is planned. However, it may not be possible to collect paired tadpole and sediment samples from all sites, nor to collect samples in this proposed geographic distribution.

The four areas of known contamination that are the subject of this preliminary investigation can be approximately described as follows:

Region 1: the area from Bakers Falls (at River Mile (RM) 196.9) downstream to the Fort Miller Dam (Lock 6) at RM 186.2 (Champlain Canal); this includes the Thompson Island Pool.

Region 2: the area from the Fort Miller Dam (Lock 6) at RM 186.2 downstream to the Stillwater Dam (Lock 4) at RM 168.2; this includes the Stillwater Pool.

Region 3: the area below the Stillwater Dam (Lock 4) at RM 168.2 downstream to the Federal Dam at Troy (RM 153.9), excluding Troy and its urban vicinity (approximately from Peebles Island State Park downstream to the Federal Dam).

Region 4: the area below the Federal Dam at Troy (RM 153.9) extending south to Lower Schodack Island (RM 132), excluding Albany and its urban vicinity.

Additionally, there will be a reference area (Region 5). The reference area will be located in the Hudson River upstream of Region 1 or in another appropriate location.

2.0 METHODS

In this section of the SAP, the methods that will be used to identify potential sample sites, conduct the habitat evaluation, and collect tadpole and sediment samples to be submitted for chemical analysis are discussed.

Identification of Potential Sample Sites

Prior to mobilizing for field survey, potential sample sites will be identified using aerial photos and other maps, site-specific knowledge of case team members and other knowledgeable individuals regarding the Hudson River, and existing contaminant data from the Hudson River. Areas with several acres of emergent marsh and aquatic vegetation located adjacent to open water will be identified. These areas will then be screened for ease of access. Sites with suitable habitat and easy access will be identified as potential sample sites. If more than the specified number of potential sample sites are pre-identified, then those sites will be prioritized for survey work based upon factors such as ease of access, likelihood of meeting project goals, and geographic relationship to other potential sample sites.

The focus of this effort will be on publicly owned land or on private property where landowner permission for access has already been obtained, or where the sample site can be accessed via boat. Where access over private property is needed, the landowner will be contacted by the Investigation Lead or his designee for permission to access the property. Such contacts will include a combination of methods, including phone calls, letters, and personal contact.

Figure 1 (page 4) notes potential sites for collection of tadpole and sediment samples identified to date. More sites may be added as the work progresses, particularly to address geographic areas not shown on Figure 1.

Habitat Evaluation

For each potential sample site from which tadpoles or sediments may be collected, a habitat evaluation will be performed. The focus of this is to evaluate areas along the Hudson River for their suitability for amphibians and identify areas where sufficient numbers of amphibians live and/or breed for the purpose of identifying the location of potential future sites for amphibian injury studies. The habitat evaluation will be accomplished in accordance with the Standard Operating Procedure (SOP) for Habitat Evaluation (Appendix 1). This includes documentation of habitat characterizations on a Habitat Evaluation Data Sheet and documentation of opportunistic visual or auditory observations of amphibians. Habitat evaluation will be conducted on sites along the main stem of the Hudson River which are anticipated to provide habitat for amphibians (but at which bullfrog tadpoles may not necessarily be found), as well as more protected areas that may not be on the main stem of the Hudson where it is anticipated that bullfrog tadpoles may be found. Identification of species of interest will be accomplished with the use of appropriate field guides, other documents, and sound recordings, including Hunter et al. (1999).

Sampling and Analysis Plan – Bullfrog Tadpoles & Near-Shore Sediment Sample Collection
August 11, 2003

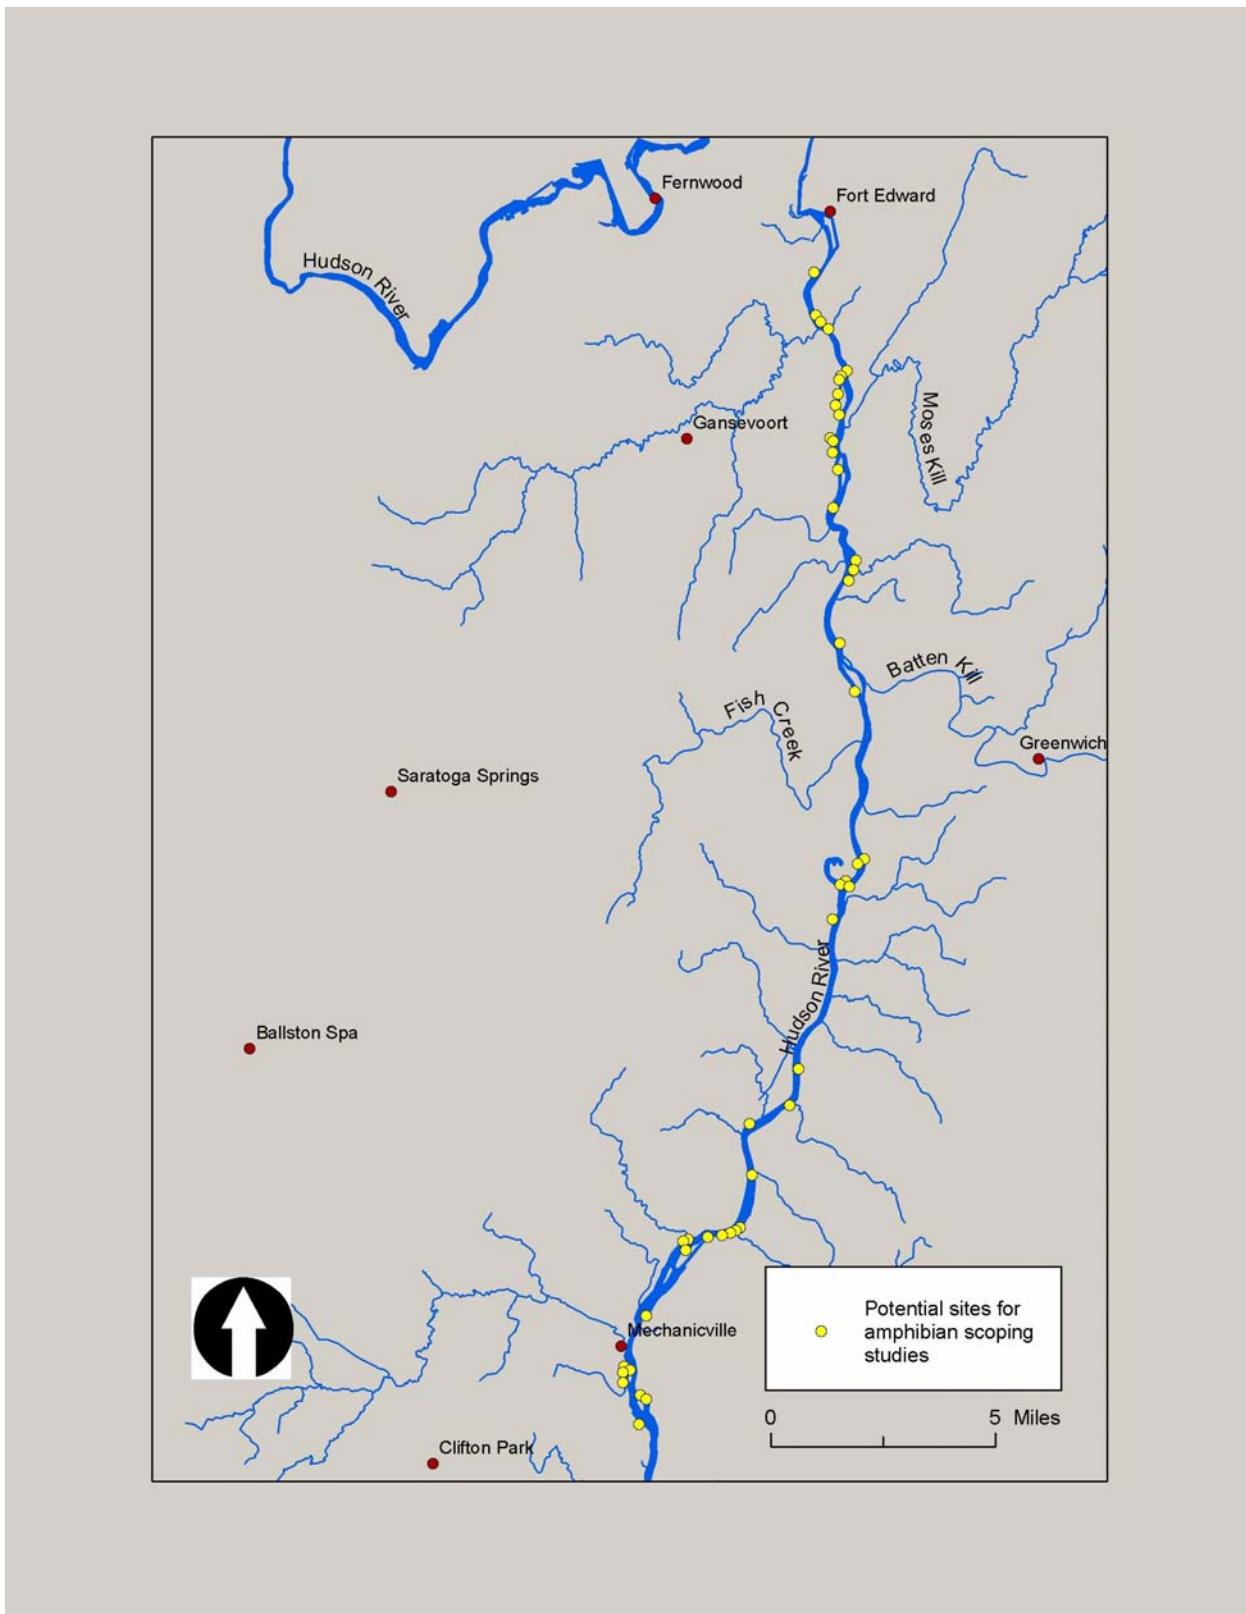

Figure 1. Potential sites for collection of tadpole and sediment samples identified to date.

Tadpole Collection

Tadpoles of bullfrogs will be collected from each sample site where a habitat evaluation is conducted and such tadpoles are found. Together with the sediment data from these same sites, these data will provide information regarding exposure of these organisms to PCBs and the bioaccumulation of PCBs by tadpoles. Each tadpole sample will consist of multiple individual tadpoles from the same sample site which will be composited. Sufficient tadpole numbers and sample sizes will be collected to allow a portion of the tadpoles to be archived for future further analysis should such later be determined to be warranted.

Identification of bullfrog tadpoles will be accomplished with the use of appropriate field guides and other documents, including Altig et al. (1998) and Berrill (2002).

Tadpole collection and processing will be accomplished in accordance with the SOP for Tadpole Collection and Processing (Appendix 2). Photographs will be taken during tadpole collection when and where determined appropriate by the Field Crew Leader. During tadpole collection, scientists will wear nitrile gloves to reduce exposure to any parasites and diseases that may be present and minimize potential contamination. Gloves will be changed between handling tadpoles from different sites to avoid cross-contamination. Appropriate Chain of Custody (COC) (see Section 3.3.2 and Appendix 4) will be followed.

Prior to analysis, tadpoles will be dissected to remove their gut coils, according to the SOP for Tadpole Collection and Processing. The intent of this is to avoid over-reporting the PCB levels in tadpoles tissues that would result from analyzing them with their sediment-laden gut tracks intact, although this potentially under-reports the PCB levels these tadpoles would constitute as a food source to other biota, such as wading birds or carnivorous fish. The gut samples will be archived for potential future analysis, if such is warranted relative to pathway/food web studies; taking into account the PCBs in the gut coils, as well as in the tadpole tissues, would establish the level of PCBs to which tadpole-eating biota are exposed to from that food source.

Sediment Collection

Sediments will be collected from each sample site where bullfrog tadpoles are collected. Sediment may also be collected from habitats identified during the habitat evaluation which would be anticipated to provide habitat for substantial numbers of amphibians but at which bullfrog tadpoles may not necessarily be found during this investigation.

The focus will be on collection of shallow near-shore sediment data from habitats that likely support amphibian populations (as demonstrated by either the presence of bullfrog tadpoles or adults or tadpoles or adults of other amphibian species) and potentially represent a pathway of exposure of such resources to PCBs. These data will allow the Trustees to identify sites with various degrees of PCB contamination, for potential use in designing future injury studies or other investigations, including potential development of a regression between sediment PCB levels and bullfrog tissue PCB levels.

Sediments will be collected from the top 3 centimeters of the river bottom, as these surficial sediments are those to which the organisms are most likely exposed. Each sediment sample will consist of twenty-five sediment sub-samples from within each sample site that will be composited in the field. Sufficient sediment will be collected to allow a portion of the samples to be archived for possible future further analysis should the need for such be identified at a later date.

Sediment collection will be accomplished in accordance with the SOP for Sediment Collection (Appendix 3). Photographs will be taken during sediment collection when and where determined appropriate by the Field Crew Leader. Appropriate Chain of Custody (COC) (see Section 3.3.2 and Appendix 4) will be followed.

3.0 QUALITY ASSURANCE/QUALITY CONTROL

Overview and Project Management

This study is being conducted in accordance with the Quality Assurance Management Plan for the Trustees' Hudson River NRDA (Hudson River Natural Resource Trustees 2002a). As described in that document, four general elements of quality assurance/quality control (QA/QC) must be addressed for each data collection effort: project management, data generation and acquisition, assessment and oversight, and data validation and usability.

This section describes the Quality Assurance Plan (QAP) for the bullfrog tadpole and near-shore sediment preliminary investigation, based on these four general elements. The objectives of the study are outlined in Section 1.0. To achieve these objectives, the following types of data will be required:

- Tadpole collection: Accurate species identification is required to locate the targeted species in the study area. Tadpole collection and processing will require following set procedures to insure proper sample collection and processing.
- Tadpole and sediment contamination levels: The laboratory chosen for tissue and sediment analysis will follow the requirements of the current version of the Hudson River NRDA Analytical QA Plan (Hudson River Natural Resource Trustees 2002b).

The study is organized based on tasks and levels of responsibility to ensure good communication between all personnel. The NYSDEC Assessment Manager (Larry Gumaer) has overall project oversight and responsibility for design and implementation of the study. Responsibility for design and implementation of the study is vested with the Amphibian and Reptile Technical Working Group (TWG), subject to the approval of the Hudson River NRDA Case Management Team (CMT) to conduct and fund this project. Quality assurance (QA) will be coordinated with the Hudson River NRDA QA Coordinator. The Investigation Lead is responsible for sample collection and handling.

The Investigation Lead provides instructions to the Investigation Team on all aspects of the project, including quality assurance management. For safety reasons, the Investigation Team will consist of a minimum of two persons -- a Field Crew Leader and a Field Data Recorder. The Investigation Lead is responsible for resolving any issues raised by the Investigation Team, in coordination with the TWG, QA Coordinator and CMT, as warranted. The Investigation Lead will work with the CMT, TWG, and QA Coordinator to ensure that the study is consistent with the overall QA objectives of the NRDA.

The SAP for this study was developed to provide detailed and explicit instructions for the Investigation Team to follow in collecting the study data. The SAP has been reviewed, commented on, and approved by key parties to the study before the beginning of sample collection. Reliance on a detailed, explicit, and fully reviewed SAP ensures that:

- Study objectives, methods, procedures, and details are completely thought out before sampling.
- Data will be collected in a systematic and consistent way throughout the study.
- Every member of the Investigation Team adheres to the requirements of the SAP. Each Investigation Team member is required to sign the "Investigation Team Acknowledgment of Sampling and Analysis Plan Review," affirming that he or she has read this SAP, understands it, and will comply with it. In particular, each Field Crew Leader must make sure that his or her team adheres to the SAP.

The procedures specified in this SAP must be considered somewhat flexible. Events can arise during field sample and data collection that require changes to the procedures being used. In these circumstances, deviations from the SAP will be conducted only after consultation between the Assessment Managers and Investigation Lead. Deviations from the SAP will be carefully documented, as will a detailed explanation as to why the deviations were necessary; this information will be incorporated into an Addendum to the SAP to be prepared at a later date.

Project Managers Contact Information

Contact information for the persons noted in section 3.1 of this SAP is as follows:

NYSDEC Assessment Manager:

Larry Gumaer, New York State Department of Environmental Conservation, 625 Broadway,
5th Floor, Albany, NY 12233; Phone: 518-402-8971; Fax: 518-402-9027;
e-mail: lwgumaer@gw.dec.state.ny.us

Amphibian and Reptile TWG Chair:

Kathryn Jahn, U.S. Fish and Wildlife Service, 3817 Luker Road, Cortland, NY 13045;
Phone: 607-753-9334; Fax: 607-753-9699; e-mail: kathryn_jahn@fws.gov

For work on National Park Service lands:

Bill Fuchs, National Park Service, Northeast Regional Office, 222 Union Street, #411,
New Bedford, MA 02740; Phone: 508-999-4458; Fax: 508-999-4459;
e-mail: bill_fuchs@nps.gov

Data Generation and Acquisition

Data developed in this study must meet standards of precision, accuracy, completeness, representativeness, comparability, and sensitivity, and be consistent with sound scientific methodology appropriate to the data quality objectives. Table 1 notes the types of data checks that will be used and their frequency.

Precision is defined as the level of agreement of repeated independent measurements of the same characteristic. For this study, agreement between Investigation Team members regarding species identification must be obtained for verification. This will occur in the field on a daily basis as surveys are conducted. Precision may also be evaluated by assessing the degree to which surveys are consistent among sites. The frequency and type of field checks are listed in Table 1 on the following page.

Accuracy is defined as the agreement of a measurement with its true value. For the parameters unique to the field portion of this study, accuracy means that the target animal is correctly identified.

Field crews will receive explicit instructions in the execution of this SAP. The field crews will be instructed in the field before beginning any sampling, and the instructions will be repeated or refreshed during the sampling as necessary (Table 1). The Investigation Lead will direct the fieldwork. Field crew members will be provided photographs, slides, and/or video images of bullfrog tadpoles and adults amphibian species of interest (bullfrog, northern leopard frog, and green frog). Before a field crew begins work, the Investigation Lead will confirm that the field crew members can accurately identify bullfrog tadpoles and adult bullfrogs, northern leopard frogs and green frogs.

Table 1. Data Checks and Frequency

Type of Activity	Measurement	Minimum Frequency of Check by Investigation Lead	Acceptance Criteria
Habitat evaluation	Habitat Evaluation Data Sheets are filled out correctly and completely.	Preferably daily, but with no more than a 3 day interval between preparation of a sheet by a Field Data Recorder and checking of the sheet by the Investigation Lead.	Data sheets are complete, legible and accurate.
Opportunistic visual or auditory observations of amphibians	Portion of Habitat Evaluation Data Sheet that pertains to opportunistic visual or auditory observations of amphibians is filled out correctly and completely.	Preferably daily, but with no more than a 3 day interval between preparation of a sheet by a Field Data Recorder and checking of the sheet by the Investigation Lead.	Data sheets are complete, legible and accurate.
Identification of amphibian species of interest during opportunistic observations	Adult bullfrog, green frog and northern leopard frogs can be identified by sight using a field guide and/or other information for confirmation, and sound	Once before beginning of investigation. Regular discussions between field crew members are expected. Descriptive keys, photographs, slides, and/or video images of adults of amphibian species of interest will be used to check identification.	One hundred percent accuracy on identification.
Bullfrog tadpole identification by sight	Bullfrog tadpoles can be identified by sight using a field guide and/or other information for confirmation.	Once before beginning of investigation. Regular discussions between field crew members are expected. Descriptive keys, photographs, slides, and/or video images of bullfrog tadpoles will be used to check identification.	One hundred percent accuracy on identification.
GPS data collection and data downloading	Field personnel can operate GPS equipment and transfer data to computers.	Once before beginning of investigation, and then as data is downloaded and verified.	GPS data collected in the field matches up to correct locations on georeferenced aerial photos of the study area.

Sampling and Analysis Plan – Bullfrog Tadpoles & Near-Shore Sediment Sample Collection
 August 11, 2003

Type of Activity	Measurement	Minimum Frequency of Check by Investigation Lead	Acceptance Criteria
Tadpole collection	Individual tadpole samples are properly labeled when collected	Each day tadpole samples are collected and/or composited.	Each individual sample is correctly assigned a Tadpole Identification Number
Completion of Tadpole Collection Data Sheets	Tadpole Collection Data Sheets are filled out correctly and completely.	Preferably daily, but with no more than a 3 day interval between preparation of a sheet by a Field Data Recorder and checking of the sheet by the Investigation Lead.	Data sheets are complete, legible and accurate.
Completion of Tadpole Processing Data Sheets	Tadpole Processing Data Sheets are filled out correctly and completely.	Preferably daily, but with no more than a 3 day interval between preparation of a sheet by a Processor and checking of the sheet by the Investigation Lead.	Data sheets are complete, legible and accurate; each composite sample is correctly assigned a Tadpole Carcass Composite ID and a Tadpole Gut Coil Composite ID.
Sediment sample collection	Sediment samples are properly labeled when collected and then transferred to the lab for homogenization and analysis.	Each day sediment samples are collected.	Each sample is correctly assigned a Sediment Sample Number.
Completion of Sediment Collection Data Sheets	Sediment Collection Data Sheets are filled out correctly and completely.	Preferably daily, but with no more than a 3 day interval between preparation of a sheet by a Field Data Recorder and checking of the sheet by the Investigation Lead.	Data sheets are complete, legible and accurate.

Completeness is defined as the percentage of the planned samples actually collected and processed. Although sample sizes cannot be predetermined, observations must be conducted in habitat that the species could use where access is granted. The full distribution of study efforts within those parameters is a measure of the completeness of this study.

Representativeness is defined as the degree to which the data accurately reflect the characteristics present at the sampling location at the time of sampling. Obtaining representative data for this study will be ensured through the establishment of a thorough literature review to identify life history characteristics, nursery habitat, and by completing field studies in a manner to determine if bullfrog tadpoles are present, and determining if adults of the amphibian species of interest are present.

Comparability is defined as the measure of confidence with which results from this study may be compared to another similar data set. Because of the nature of the study, there cannot be a duplication of effort in the same area at the same time. Comparability will be attained through use of techniques that are commonly used in amphibian studies in different parts of North America.

Sensitivity is defined as the ability of a measurement technique or instrument to operate at a level sufficient to measure the parameter of interest. For data specific to this study, sensitivity will pertain to the ability to locate and identify bullfrog tadpoles and adults of the amphibian species of interest. This process is a stepwise approach that requires expertise. Work will focus on potentially suitable habitats along the Hudson River. Then those specific habitats will be checked for the presence of bullfrog tadpoles, or adults of the amphibian species of interest. Surveys involve using visual searches and/or listening to locate the species of interest.

3.1.1 Study Documentation

All study activities will be documented through use of the sequentially numbered Data Sheets contained with the SOPs (Appendices 1, 2, and 3). Data sheets will be placed into a ring-binder. All information will be recorded on these pre-formatted data sheets. The use of pre-formatted data sheets is a QA/QC measure designed to:

- ensure that all necessary and relevant information is recorded for each sample and each sampling activity,
- serve as a checklist for the field crews to help ensure completeness of the data collection effort,
- assist the field crews by making data recording more efficient, and
- minimize the problem of illegible field notebook entries.

Each Investigation Team will have a designated Field Data Recorder responsible for recording information on the Data Sheets. Assigning this responsibility to a designated person will help ensure that documentation is complete and consistent; Field Data Recorders will be retained throughout the study to the extent feasible. The Field Data Recorder is also responsible for the care, custody, and disposition of the binder containing the Data Sheets.

Data Sheet entries will be made in waterproof ink and corrections made with a single line through the error accompanied by the correction date, and the corrector's initials.

Each completed Data Sheet will be reviewed, corrected (if necessary), and initialed by the Field Data Recorder (or Processor in the case of the Tadpole Processing Data Sheet), and the Field Crew Leader. Data Sheets will then be reviewed by the Investigation Lead. This review by the

Investigation Lead will occur preferably daily, but with no more than a 3 day interval between preparation of a Data Sheet by a field crew or processor and checking of the data sheet by the Investigation Lead.

Following completion of the study, the original data sheets will be retained at NYSDEC.

3.1.2 Chain of Custody

Strict Chain of Custody (COC) procedures will be used throughout the study. The COC procedure will begin when a tadpole or sediment sample is collected. A COC form is shown in Appendix 4. These forms will be used to maintain records of sample collection, sample transfer between personnel, sample shipment, and sample receipt for storage in a freezer, or receipt by the analytical lab. Each sample collected will be listed on the COC forms. A separate form will be used for each cooler that is shipped. The original COC will accompany the samples. The Investigation Lead will maintain a copy of the COC. The signatures of the persons shipping and receiving the samples, and the date and time of transfer, will be documented on the COC forms. An air-bill can be used to document the transfer of a sample from the Investigation Team to the shipper, and from the shipper to the analytical lab.

All sections of the COC form will be completed with information pertaining to the sample collection. All samples included in the sample catalog will be clearly listed. The time, date, location, identifier (i.e., sample ID code), type of sample, and number and size of containers will also be listed on the form. If more than one cooler is required to ship the samples, a separate form will be used listing the samples actually held in each cooler. An indication of the number of coolers per shipment (e.g., 1 of 3) will be listed on the form. Once the form is completely filled out, it will be placed in a clear plastic shipping window and securely attached to the inside of the cooler. Each cooler will be sturdy, well sealed with filament tape, and have an unbroken signed custody seal. All materials, samples, and coolers will be kept in locked locations all the time until shipped.

3.1.3 Personnel Experience and Training

The Investigation Team will receive explicit instructions in the execution of this SAP from the Investigation Lead. The Investigation Team will be instructed in the field by the Investigation Lead before beginning any sampling, and the instructions will be repeated or refreshed during the sampling period as necessary (Table 1). The work will be directed by an Investigation Lead. Investigation Team members will be trained to identify bullfrog tadpoles by their sight and their habitat, and other identifying characteristics, and will be trained to identify adult bullfrogs, northern leopard frogs and green frogs by sight and sound; the ability of Investigation Team members to do so will be confirmed by the Investigation Lead before beginning work.

Assessment and Oversight

Several mechanisms for internal audits of the data generation process will be used for the study.

These mechanisms include:

- A project management structure that defines clear lines of responsibility and ensures communication between field crews and with the Investigation Lead. Clear responsibilities and communication can serve as a means of providing internal audits of the sample collection process as it proceeds.
- A requirement that Data Sheets be completed daily and be reviewed by the Investigation Lead. Data Sheets will be reviewed by the Investigation Lead preferably daily, but with no more than a 3 day interval between preparation of a Data Sheet and checking of the Data Sheet by the Investigation Lead.
- The use of pre-formatted Data Sheets that serve as a checklist for sampling procedures, thereby helping to ensure that sampling is complete.
- The work will not begin until approval is received from the QA Coordinator or their delegate. The QA Coordinator or their designee will conduct a field audit of procedures and documentation of the study to ensure that the project-specific SOPs, this SAP and other procedures are being properly implemented.

Data Validation and Usability

This study employs standard techniques for amphibian collection. The SAP for this study has been reviewed for the adequacy of the sampling design and methods. The original Data Sheets will be maintained by the NYSDEC and archived for a minimum of fifteen years. Disposal of the Data Sheets will be coordinated with the DOI and NOAA after this timeframe unless a longer archive period is requested. Any final reports generated from the data can then be reviewed against the sampling records to ensure that the data presented in the reports represent complete and accurate information. Analytical data will be validated as specified in the Analytical QA Plan (Hudson River Natural Resource Trustees, 2002b).

The Investigation Lead performing oversight of habitat characterization, tadpole and sediment collection and tadpole processing will validate that Investigation Team members are correctly identifying bullfrog tadpoles and adult amphibian species of interest, and correctly completing Data Sheets by performing periodic checks during the study as specified in Table 1.

4.0 DATA ENDPOINTS

Data endpoints for this project will include habitat evaluation parameters, numbers of various frogs observed during the visual encounter surveys, and contamination levels in near-shore sediments and bullfrog tadpoles. The exact contaminant analyses and preparation procedures will be determined by the Trustees upon finalization of the collection, and will follow those specified in the Hudson River NRDA Analytical Chemistry QA Plan (Hudson River Natural Resource Trustees 2002b).

5.0 SCHEDULE

Several tasks need to be sequentially performed while others can run parallel courses. The Hudson River bullfrog tadpole collection effort will begin in late summer 2003, and last several weeks. Before collection begins, any necessary State and/or Federal permits will be obtained. A "Scientific Research and Collecting Permit" will be required from the National Park Service (NPS) for any collection activities conducted on NPS lands.

Standard Operating Procedure

Habitat Evaluation

HABITAT EVALUATION

STANDARD OPERATING PROCEDURE

Introduction

This standard operating procedure (SOP) was developed as part of the Hudson River natural resource damage Trustees' data collection effort for the summer of 2003. The Sampling and Analysis plan for this effort contains details on issues such as site selection, quality assurance and control, and other topics of broad relevance to this field effort. This SOP focuses on the mechanics to be followed with respect to habitat evaluation, including the documentation of any opportunistic visual or auditory encounters with amphibians. This SOP is based on SOPs developed for similar habitat evaluation activities elsewhere (*e.g.*, Kendall 2002, Coeur d'Alene 1995).

Habitat Characterization

Upon reaching the site, one or more photographs will be taken to provide an overview of the site, and the film and frame number(s) will be recorded on the Habitat Evaluation Data Sheet. In addition, for each site, the observer will record the following information on the site's Habitat Evaluation Data Sheet:

1. Date and time;
2. Site number and description;
3. GPS location;
4. Air temperature (°C), taken approximately 1 meter above ground;
5. Water temperature (°C), taken a few inches below the surface in an area that is or that may be frequented by amphibians;
6. Cloud cover (clear, 0%, 25%, 50%, 75%, 100%);
7. Precipitation (none, light, moderate, heavy);
8. Wind (calm, light, strong);
9. Water flow (none, slow, moderate, fast);
10. Approximate water depth where the tadpoles are observed (may be a range);
11. Aquatic vegetation (none, sparse, moderate, dense); and species, if known.

12. Primary aquatic substrate (silt/mud, sand/gravel, cobble, bedrock, other);
13. Shoreline vegetation (describe type(s), density);
14. Opportunistic visual or auditory observations of amphibians;
15. Brief directions to site (optional);
16. Any other comments (special site features, evidence of human impacts to the site, logistical or other difficulties that may impact the site's usability in future studies, anecdotal observations, etc.).

Opportunistic Visual or Auditory Encounters

The frog species of primary interest include the bullfrog (*Rana catesbeiana*), northern leopard frog (*Rana pipiens*), and green frog (*Rana clamitans*). These species occur in shallow emergent marsh habitat found adjacent to open water in the littoral zone of the river. Vegetation in these areas is overtopped during high flow events, which provides an opportunity for potentially contaminated sediment to settle out and become substrate. All three species of frogs use these areas for breeding and would be expected to be found breeding in the Upper Hudson River between about April and July, depending on the species. In Maine, northern leopard frogs breed in late April and early May; green frogs breed in early to mid June; and bullfrogs breed in late June and early July when air temperatures reach 20-22 °C (68-72 °F) (Hunter *et al.* 1999).

All three species of frogs breed in permanent water bodies with abundant emergent and aquatic vegetation. Chorusing adults are indicative of breeding activity. Northern leopard frogs usually mate at night when territorial males can be heard calling from groups in shallow water. Green frogs and bullfrogs also call more frequently at night, usually from a territory. Each frog has several different calls, which are used to attract females, defend a territory, or to distract a predator.

Although the field effort will not include formal visual or calling surveys of frogs, to the degree that frogs are seen or are heard calling during the course of this field effort, the estimated numbers of individuals seen or heard calling and their species (preliminarily determined) will be recorded.

Materials and Equipment

- GPS unit
- Habitat Evaluation Datasheets (write-in-the-rain paper)
- Writing instruments with waterproof ink
- Bulb-based or other thermometer calibrated in °C suitable for air temperature measurements
- Bulb-based or other thermometer calibrated in °C suitable for water temperature measurements
- Long-handled nets for capturing frogs

- Camera with film (or a digital camera) with extra batteries
- Binoculars

Standard Operating Procedure

Tadpole Collection and Processing

TADPOLE COLLECTION AND PROCESSING

STANDARD OPERATING PROCEDURE

Introduction

This standard operating procedure (SOP) was developed as part of the Hudson River natural resource damage Trustees' data collection effort for the summer of 2003. The Sampling and Analysis plan for this effort contains details on issues such as site selection, quality assurance and control, and other topics of broad relevance to this field effort. This SOP focuses on the mechanics to be followed with respect to bullfrog (*Rana catesbeiana*) tadpole collection, shipment, and preparation for chemical analysis.

Collection Methodology

Bullfrog tadpoles will be collected using seines, dip nets, minnow traps or other sampling equipment, as appropriate based on habitat and site-specific logistical considerations. To the degree that tadpoles of other species are inadvertently caught, the species and approximate numbers of these tadpoles will be determined and recorded on a Tadpole Collection Data Sheet for the site. Non-bullfrog tadpoles will be re-released. For each site, as many bullfrog tadpoles as possible will be collected, up to a total of 25 per site.

When collected, bullfrog tadpoles will be transferred to a chemically-clean glass jar containing a few millimeters of site water. All tadpoles from a single site will be put into a single jar, and the jar will be labeled with the date, time, collectors' initials, and the site number. This glass jar will be put into a cooler containing blue ice, where the tadpoles will be kept until removed to another facility (*e.g.*, the Hale Creek lab facility) at the end of the collection day.

Equipment Care

Prior to sampling at a new site, sampling equipment (seine, dip nets, traps, etc.) will be well-rinsed in site water at a point somewhat removed from the anticipated specific sampling location. Care will be taken to ensure that no visible sediment, particulates, vegetation or biota from prior sites remains on the apparatus when it is used at the new site.

Tadpole Handling: Euthanization, Labeling, Documentation, and Storage

At the end of each collection day, all collected tadpoles will be documented, labeled, and euthanized in the lab as described below. In particular:

1. Each tadpole will be removed from the site collection jar. Tadpoles will be handled by field personnel using nitrile gloves. Care will be taken to not damage the tadpole. Each tadpole will be assigned a unique identification number. The tadpole identification numbers will have the following format:

BT-001-001

“BT” stands for bullfrog tadpole. The first set of three digits refers to the unique site number from which the tadpole was collected, and the second set of three digits refers to the unique tadpole number. For instance, if three tadpoles are caught at Site 1, their numbers would be BT-001-001, BT-001-002, and BT-001-003. The next tadpole, caught at Site 2, would have the number BT-002-004.

2. Tadpoles will be examined for gross external deformities, erosion, lesions, and tumors (DELTs). All tadpoles with DELTs will be photographed, and the relevant data recorded on the Tadpole Collection Data Sheet.
3. Assuming that no abnormalities are observed in tadpoles collected from a particular site, pictures will be taken of at least three apparently normal tadpoles from each site; these tadpoles may be photographed on the same frame provided they can be identified individually, such as by placement of labels with ID numbers next to the individuals or appropriate notation on the data sheets. (If DELTs are observed, more pictures may be taken and those tadpoles will be photographed individually.) If tadpoles in different stages of development are found at a given site, the team will try to take one photograph of an example of each stage, up to a total of three photographs.
4. After examination for DELTs and/or being photographed, each tadpole will be wrapped in aluminum foil, and the foil will be labeled with the tadpole’s unique identification number using a permanent marker.
5. To euthanize the tadpole, labeled foil packages will immediately be put on dry ice for a minimum of 15 minutes.
6. After euthanization, the foil package will be double-bagged in Zip-loc type bags. A notecard will be inserted between the inner and outer bag, facing out, and will contain the following information: Hudson River, the tadpole identification number, the sampling date, and the investigator’s initials.
7. Bagged tadpoles will be stored at -20°C until they are shipped to a lab for dissection and chemical analysis.

Shipping

Tadpoles are to be shipped as per the United States Geological Service's protocol for the Collection, Preservation & Mailing of Amphibians.¹ Specifically, the double-bagged tadpoles will be put into plastic or hard cardboard boxes (to prevent crushing), and packed in a cooler or in a styrofoam-lined cardboard box containing dry ice.

Nylon-reinforced or 2-inch wide clear tape will be wrapped completely across the lid, sides and bottom of each cooler in at least two places to prevent accidental opening of the container. An overnight courier service may be used to ship containers to the new location; if used, all procedures required by the carrier for the safe shipping of dry ice will be followed. Alternately, the samples may be hand-delivered to the laboratory (with a total transportation time of not more than 12 hours). Strict Chain of Custody procedures will be followed, as described in Section 3.3.2 of the Sampling and Analysis plan.

Gut Coil Removal and Compositing

Tadpoles will be swiftly measured and dissected, to avoid deterioration of the tadpole gut coil and body as it defrosts. In particular, tadpoles will be processed and their gut coils removed according to the following steps:

1. After removing from the freezer and unwrapping, weigh the tadpole to the nearest milligram (0.001 g), handling the tadpole with chemically-clean forceps. Record the measurement on the Tadpole Processing Data Sheet.
2. Measure both snout-to-vent length and total length to the nearest millimeter with the electronic vernier calipers, and record the measurements on the Tadpole Processing Data Sheet.
3. Determine the Gosner stage of the tadpole using Gosner (1960), and record the measurement on the Tadpole Processing Data Sheet.
4. While the tadpole is still partially to mostly frozen (the optimal degree of 'frozenness' is best determined with experience), make a slit along the ventral surface from the throat to the vent, using a chemically-clean scalpel.
5. With a forceps, carefully remove the gut coil. Inspect the coil carefully for any other tissues. The gut coil is a uniform gray or olive drab color, and other tissues such as liver, heart, or other organs are typically indicated by a red, orange, or pink color. These other tissues are to be returned to the carcass.
6. Weigh the gut coil to the nearest 0.001 g, and record the measurement on the Tadpole Processing Data Sheet.

¹ See http://www.nwhc.usgs.gov/research/amph_dc/sop_mailing.html, visited on 7/1/2003.

7. Weigh the carcass without the gut coil to the nearest 0.001 g, and record the measurement on the Tadpole Processing Data Sheet.
8. Tadpoles from a single site in similar developmental stages, as defined by Gosner (1960), will be composited into a single sample of approximately 10 g as follows:
 - Prelimb (21-26);
 - Visible limb bud (27-35);
 - Hindlimb (36-39);
 - Metamorph (40-45).

Tadpole carcasses (without gut coils) will be combined into a single, chemically-clean glass jar with a Teflon lid. *Depending on the numbers and stages of tadpoles collected, the above compositing scheme may need to be revisited.*

9. Tadpole carcass composite jars will be labeled with the following information: Hudson River, the tadpole collection date, the collector's initials, and a composite identification number with the following format:

BTC-001-001

“BTC” refers to bullfrog tadpole composite. The first set of three digits refers to the unique site number from which the tadpole was collected, and the second set of three digits refers to the unique composite number.

10. Gut coils from each tadpole composite will be combined a single chemically-clean glass jar for purposes of chemical analysis.
11. Gut coil composite jars will be labeled with the following information: Hudson River, the tadpole collection date, collector's initials, and a composite identification number with the following format:

BGCC-001-001

“BGCC” refers to bullfrog gut coil composite. The first set of three digits refers to the unique site number from which the tadpole was collected, and the second set of three digits refers to the unique composite number at the site. The six numeric digits should be identical to those used for the corresponding tadpole carcass composite.

12. If the samples will not be immediately subject to chemical analysis, all samples will be re-frozen and stored at a temperature of -20°C or colder. If refrozen, the composite containers will be put into a labeled box prior to being stored.

As noted above, data from the above measurements will be recorded into a Tadpole Processing Data Sheet. Notes of any potential problems that arise during the dissection and compositing process will be made.

For each tadpole, either a fresh scalpel and pair of forceps will be used or the equipment will be cleaned between dissections. Equipment will be cleaned between tadpoles by washing in tap water, rinsing in distilled water, rinsing in HP-grade acetone, and allowing to dry.

Materials and Equipment

FIELD COLLECTIONS

- GPS unit
- Seine for collecting tadpoles, ¼ -inch mesh
- Dip net (D-scap) for collecting tadpoles, ¼ -inch mesh
- Minnow traps
- Chemically-clean glass jar with Teflon lid (1 per tadpole collection site), with pre-adhered labels
- Tadpole Collection Data Sheets in ring-binder (write-in-the-rain paper)
- Writing instruments with waterproof ink
- Labeled cooler containing blue ice
- Chain of Custody forms
- Nitrile gloves

INITIAL LABORATORY PROCESSING

- Square pieces aluminum foil – 1 per tadpole
- Zip-loc type bags – 2 per tadpole
- Notecards – 1 per tadpole
- Permanent marker
- Dry ice in suitably-sized container
- Nitrile gloves
- Camera with film (or a digital camera) with extra batteries
- Tadpole Collection Data Sheets in ring-binder (write-in-the-rain paper)
- Chain of Custody forms

SHIPPING

- Hard plastic or cardboard boxes for protecting bagged tadpoles
- Shipping container (cooler or cardboard box lined with styrofoam)
- Dry ice
- Nylon-reinforced tape or 2-inch wide clear tape
- Chain of Custody seals
- Chain of Custody forms
- Paperwork for overnight courier service
- Writing instruments

LAB DISSECTION AND COMPOSITING

- Balance that weights to the nearest 0.001 gram
- Electronic vernier calipers
- Paper or other towels

- Chemically-clean scalpel
- Chemically-clean forceps
- Chemically-clean glass jars, 2 per composite (1 for gut coils; 1 for rest of bodies) with Teflon lids
- Labels for the sample jars
- Nitrile gloves
- Labeled storage boxes (in the event that composited samples are not immediately subject to chemical analysis)
- Tadpole Processing Data Sheets in ring-binder
- Chain of Custody forms
- Writing instruments

APPENDIX 3

Standard Operating Procedure

Sediment Collection

SEDIMENT COLLECTION

STANDARD OPERATING PROCEDURE

Introduction

This standard operating procedure (SOP) was developed as part of the Hudson River natural resource damage Trustees' data collection effort for the summer of 2003. The Sampling and Analysis plan for this effort contains details on issues such as site selection, quality assurance and control, and other topics of broad relevance to this field effort. This SOP focuses on the mechanics to be followed with respect to nearshore sediment collection, shipment, and preparation for chemical analysis. This SOP is based on SOPs developed for similar sediment collection activities elsewhere (*e.g.*, EPA (1994a and 1994b), EPA (2001), Coeur d' Alene (1995), PTI Environmental Services (1995), Radtke (1997), and Portland Harbor Sediment Management Plan (1999)).

Collection and Compositing

To avoid disturbing the sediments prior to collection, at each site sediments will be collected prior to the collection of tadpoles, to the extent feasible. For purposes of this SOP, a sampling site is defined as an area of contiguous habitat with similar structural characteristics not more than 100 meters in diameter. In practice, the Field Crew Leader will define the specific area that constitutes a single site for sampling purposes.

A composite of approximately 500 g of sediments will be collected from each site. The composite will consist of 25 samples of approximately 10 ml each, taken from 25 separate locations within each defined site.

Sediment samples from a specific site will be collected using an interval approach and will be collected from nearshore locations that are at least five feet apart, in an area that spans the site of bullfrog tadpole collection. A rope, marked in 1- and 5-foot intervals, will be used to help delineate the sampling area. To the degree that a site is too small for 25 samples to be collected at 5-foot intervals, smaller, regular intervals will be used at the discretion of the Field Crew Leader. The approximate sampling interval used will be recorded on the Sediment Collection Data Sheet. Overall, when collecting samples, care will be taken to maintain the integrity of the site and minimize disturbance of sediments during the site evaluation and collecting process.

For sampling in slow-moving water that is less than 24 inches deep, the use of a chemically-clean aluminum trowel or scoop is appropriate. Following the guidance of EPA (1994b), the following procedure will be used to collect sediment with the trowel or scoop:

1. Before walking through the sample site, identify the approximate areas for sediment collection. Space them out, as described above, to sample the entire tadpole

- collection area. Identify the route of access to each sample point and avoid and minimize sediment disruption from trampling between sample points.
2. Carefully remove approximately 10 ml of sediment from the selected location, to a depth of up to 3 cm.

3. Transfer the sample into a pre-labeled, 16-ounce chemically clean glass jar with a Teflon lid. Fill out the relevant portions of the Sediment Collection Data Sheet.
4. Move to the next subsite and repeat the process until a total of twenty-five sediment samples have been collected in the jar.
5. Care will be taken to minimize loss of sediments from the scoop during the collection process. This may mean restricting sample collection to areas of shallower water.

Approximately equal portions of about 10 ml of sediment from each of 25 subsites will be deposited into a chemically-clean glass jar with a Teflon-lined cap, leaving at least a 1/3 of the jar empty to allow for expansion if the sample is frozen. Excess water will be carefully decanted.

A fresh, chemically-clean aluminum scoop (wrapped in aluminum foil after cleaning) will be used for each site.

Storage, Labeling and Shipping

Self-adhesive labels will be attached to the composite containers. When a composite is put into a container as described above, the container's label will be marked with the following information: Hudson River, sediment composite number, sampling date, and the investigator's initials. Sediment composite numbers will have the following format:

SED-001

“SED” stands for sediment. The set of three digits refers to the unique site number from which the sediments were collected.

After putting the composite into the labeled container, each container will be wrapped in protective material (*e.g.*, bubble wrap) and placed in a plastic bag. Bags will be placed into a cooler containing blue ice, where they will be kept until removed to another facility (*e.g.*, the Hale Creek lab facility) at the end of the collection day. Sediment samples will be kept at -20°C until transferred to the analytical laboratory.

For purposes of shipping, the bags containing the sample containers should be placed into an ice chest or cooler. Blue ice should also be placed in the cooler in sufficient quantities to ensure that the samples are kept cold until arrival at the laboratory.

Nylon-reinforced or 2-inch wide clear tape will be wrapped completely across the lid, sides and bottom of each cooler in at least two places to prevent accidental opening of the

container. An overnight courier service may be used to ship containers to the chemical analysis lab; if used, all procedures required by the carrier for the safe shipping of dry ice will be followed. Alternately, the samples may be hand-delivered to the laboratory (with a total transportation time of not more than 12 hours. Strict Chain of Custody procedures will be followed, as described in Section 3.3.2 of the Sampling and Analysis plan. Upon arrival at the lab, the samples will be maintained at -20°C until thawed for chemical analysis.

Materials and Equipment

FIELD COLLECTIONS

- GPS unit
- Chemically-clean aluminum scoops or trowels, wrapped in aluminum foil
- Chemically-clean, wide-mouth 16-ounce glass jars with Teflon-coated lids and with self-adhesive labels attached
- Rope, marked off in 1- and 5-foot intervals
- Bubble wrap or other protective packing material
- Plastic bags for storing sampling containers protected with bubble-wrap
- Labeled coolers containing blue ice
- Chain of Custody forms
- Sediment Collection Datasheets in ring binder (write-in-the-rain paper)
- Writing instruments with waterproof ink
- Nitrile gloves

SHIPPING

DATA QUALITY ASSESSMENT

Hudson River Natural Resource Damage Assessment

Tadpole Tissue and Associated Sediments

1.0 INTRODUCTION

This report documents the results of a quality assurance review of data from tadpole tissues and the associated sediment samples collected in support of the Hudson River Natural Resource Damage Assessment. All samples were analyzed for PCB congeners, PCB homologue groups, and total PCBs. The tadpole composites were also analyzed for percent lipids. The sediment samples were analyzed for percent moisture, total organic carbon, and grain size.

A total of 155 bullfrog (*Rana catesbeiana*) tadpoles were collected from eight of the nine sites included in this sampling event (no tadpoles were collected from Site 2). One composite sediment sample was also collected from each study site. Field methods are described in *Sampling and Analysis Plan for the Collection of Bullfrog (Rana catesbeiana) Tadpoles and Near-Shore Sediment Samples from the Hudson River, New York*, Final, August 11, 2003.

The tadpoles were transported under chain-of-custody to the US Geological Survey (USGS) Patuxent Wildlife Research Center, where the tadpoles were dissected to remove the gut coils, and then composited. The tadpole composites were shipped to Woods Hole Group Environmental Laboratories for analysis.

A total of 42 tadpole composites and nine sediment composites were submitted for analysis. The tadpole composites were analyzed in three laboratory analytical batches (0312035, 0312036, and 0312044), and the sediment composites were in a separate batch (0312034). One equipment rinsate blank was collected during the tadpole tissue homogenization process at the laboratory, and reported in analytical batch 0312088.

The samples were prepped, extracted, and analyzed by the Woods Hole Group Environmental Laboratories (Raynham, Massachusetts) using laboratory Standard Operating Procedures (SOPs) that were submitted and reviewed prior to sample receipt.

2.0 DATA VALIDATION PROCEDURES

Data validation was based on the quality assurance/quality control (QA/QC) criteria documented in the *Analytical Quality Assurance Plan for the Hudson River Natural Resource Damage Assessment*, Version 1.0, July 9, 2002, and USEPA *National Functional Guidelines for Organic Data Review*, 1999, and the following laboratory SOPs:

- SOP # HR NRDA Project Tissue Prep: Tissue Preparation and Homogenization, Revision #1.0, 9/25/02

- SOP # OP-004: Extraction of Soil, Tissue, Vegetation, and Sediment by Pressurized Fluid Extraction, Revision #2.0, 8/15/02
- SOP # O-010: Determination of PCB Homologues and Individual Congeners by GC/MS - SIM, Revision # 2.2, 10/24/02
- SOP # HR NRDA % Lipids: Percent Lipids Determination, Revision # 0.0, 9/9/02
- SOP # W-001: Percent Solids Determination, Revision # 2.1, 9/25/02
- SOP # W-028: Total Organic Carbon in Soil, Sediment and Water, Revision # 2.0, 1/22/03
- SOP # W-029: Particle Size Analysis of Soils - with and without Hydrometer, and Liquid Limit, Plastic Limit and Plasticity Index, Draft, 1/16/04
- Additional cleanup, sample handling, storage, custody SOPs as necessary.

Sample results and related QC data were received in both an electronic and hard copy format. Electronic data were verified against the hard copy data package. One tadpole composite package and the sediment data package received full validation; the other packages received summary validation.

The following QC elements were reviewed for data packages undergoing summary validation:

- Analytical holding times
- Chain of custody and sample handling
- GC/MS tune verification (from summary forms)
- Method blank contamination (from summary forms)
- Initial and continuing calibration (from summary forms)
- Rinsate blank contamination (from sample result summaries)
- Analytical accuracy: surrogates, matrix spike samples, laboratory control samples, and standard reference material results (from summary forms)
- Analytical precision: laboratory duplicate samples (from summary forms)
- Internal standard areas (from summary forms)
- Reported detection limits (from sample result summaries)

Full validation included review of all the items listed above for summary validation, plus the following QC elements:

- Compound identification (from raw data)
- Compound quantitation, transcription and calculation checks performed at a frequency of 10% from raw data. If an error was noted, 100% of the calculations and transcriptions for that data set were verified.

This report summarizes the results of data validation relative to the analytical data quality objectives (ADQO) for precision, accuracy, and completeness. The report also provides a quantitative and

qualitative assessment of the data and identifies potential sources of error, uncertainty, and bias that may affect the overall usability.

Laboratory QC samples were used to assess the effectiveness of homogenization procedures and to evaluate laboratory-derived contamination, laboratory performance, and sample matrix effects. Quality control samples included: method blanks, laboratory control samples (LCS), matrix spike (MS) samples, laboratory duplicate samples, and standard reference material (SRM) analyses. Surrogates were added to each sample analyzed for PCB congeners to further assess the effects of sample matrix on accuracy.

Data were qualified when associated QC sample results were outside the QC limits. The following definitions provide brief explanations of the qualifiers assigned to results in the data validation process:

- J Estimated:** The associated numerical value is an estimated quantity. The analyte was detected, but the reported value may not be accurate or precise. The "J" qualification indicates the data fell outside the QC limits, but the exceedance was not sufficient to cause rejection of the data.
- UJ Estimated/Not detected:** An analysis was performed for the compound or analyte, but it was not detected and the sample quantitation or detection limit may be inaccurate or imprecise. The associated numerical result is the detection limit.
- NJ Tentatively Identified/Estimated:** The analyte was tentatively identified and the associated numerical value is an estimated quantity.
- DNR Do Not Report:** Data should not be used. A more appropriate result has been reported.

3.0 DATA QUALITY ASSESSMENT

The data package submitted by the laboratory was reviewed to determine whether the analytical data quality objectives (ADQO) specified in Tables 6.1a - 6.1c in the *Analytical Quality Assurance Plan* were met. Each quality control element is discussed briefly below. More details are available in the individual data validation reports presented in **Attachment A**.

3.1 Holding Times and Sample Preservation

The primary analytes of concern for this study are persistent compounds, which have been found to remain stable in tissue after several years of storage. Due to this, no maximum holding time criterion was established. The samples were extracted approximately 4 months after collection. All extracts were analyzed within 30 days from sample extraction. Samples were kept frozen by the laboratory at the required temperature of $-20^{\circ}\text{C} \pm 2^{\circ}$.

3.2 Instrument Calibration

3.2.1 Initial Calibration (ICAL)

The ADQO specification for the initial calibration is that a minimum of a five point calibration would be performed for all analytes, and that the percent relative standard deviation (%RSD) values for all analytes are less than 20%.

All submitted ICAL data met the specified ADQO.

3.2.2 Continuing Calibration (CCAL)

The ADQO specified for the continuing (or daily) calibrations is that a CCAL must be analyzed at the beginning and end of each analytical sequence (or every 12 hours, whichever is more frequent), and that all percent difference (%D) values must be less than 20%. Up to three %D values can be greater than 20%, provided that all %D values are less than 30%.

All CCAL met the ADQO requirements. The %D value for PCB31/28 was greater than 20% (but less than 30%) in two CCALs. The PCB31/28 results were estimated (J or UJ) in the associated samples. Nine results (two detection limits and seven positive results) were qualified based on the CCAL %D outliers.

3.3 GC/MS Tune

GC/MS instrument tuning verifications were performed at the proper frequency, prior to each analytical sequence. All GC/MS tunes met the acceptance criteria specified in the laboratory standard operating procedures.

3.4 Blank Analyses

The method blanks and equipment rinsate blank were acceptable, in that no target analytes were detected in any blank.

3.5 Accuracy

Accuracy is evaluated by comparison of an analytical concentration to a known (true) value. Accuracy was monitored through the use of surrogate compounds in each sample, and SRM, MS, and laboratory control sample (blank spike) analyses. Each QC element is discussed below. Overall, accuracy was acceptable.

3.5.1 Surrogate Compounds

Two surrogate compounds, ^{13}C -BZ#19 and ^{13}C -BZ#202, were added to each sample prior to extraction.

The ADQO specified for surrogate compounds is that all percent recovery (%R) values would be within the 50% - 125% acceptance window. The recovery value from the late eluting surrogate (¹³C-BZ#202) is used for the quantitation of the reported target analyte concentrations.

All of the surrogate %R values were within the 50% - 125% control limits.

3.5.2 Standard Reference Material Analyses

An SRM was extracted and analyzed with each analytical batch. The SRM selected for the tadpole tissue composites was 1974b - Organics in Mussel Tissue. This SRM has certified values for 27 PCB congeners. One SRM analysis was submitted with each laboratory batch, so a total of three SRM analyses (with 27 certified values each, for a total of 81 data points) were performed.

The ADQO for the SRM is that the reported value must be within $\pm 20\%$ of the 95% confidence interval of the true value, for analytes with values greater than five times the method detection limit (MDL). This ADQO was used by the laboratory to evaluate the reported results. However, during data validation, no data were qualified unless the reported value was greater than $\pm 25\%$ of the 95% confidence interval.

Overall, the SRM accuracy results were acceptable. Two SRM results (2.5% of the total) were greater than the upper control limit (125% of the 95% confidence interval for an individual congener). The outliers were for the following congeners: PCB18 and PCB31/28. The positive results associated with these SRM outliers were estimated (J) to indicate a potential high bias. Twenty-two results (0.9% of the tadpole results) were estimated based on these SRM outliers.

The SRM selected for the sediment analyses was 1944 - New York/New Jersey Waterway Sediment. This SRM has certified values for 28 of the target PCB congeners. One SRM analysis was submitted, for a total of 28 data points. Two SRM results (7.1% of the total) were greater than the upper control limit (125% of the 95% confidence interval for an individual congener). The outliers were for the following congeners: PCB138 and PCB170. The positive results associated with these SRM outliers were estimated (J) to indicate a potential high bias. Sixteen results (2.8 % of the sediment results) were estimated based on these SRM outliers.

Tables 1A, 1B, and 1C summarize the SRM results for this study.

3.5.3 Laboratory Control Samples

The laboratory performed laboratory control sample (LCS) analyses at the required frequency of one for every 15 samples or analytical batch, whichever was more frequent. The ADQO for the LCS analyses is that all %R values must be within the acceptance limits of 75% to 125%.

Five LCS analyses were submitted with the samples. Each LCS included 47 target analytes, for a total of 235 data points (%R values). Eleven LCS %R values were greater than the 125% upper control limit, indicating a potential high bias. Associated positive results were estimated (J);

reporting limits were judged as unaffected and no action was taken. Forty-five data points (1.5% of the sample results) were estimated based on the LCS %R outliers.

3.5.4 Matrix Spike Samples

Matrix spike analyses were not performed for the tadpole composite samples due to limited sample volume.

For the sediments, the laboratory analyzed an MS and a duplicate. Each MS sample included 47 spiked analytes, for a total of 94 data points. The ADQO for MS analyses is that all %R values should be within the 50% to 125% control limits. The ADQO does not apply if the concentration in the parent sample is greater than five times the concentration in the spiking solution.

A potential low bias was indicated by two of the MS %R values (one in the MS and one in the duplicate), as the %R values were less than 50% (at 43% and 44%). One data point (the result for PCB110 in Sample SED-009) was estimated (J) based on the MS %R outliers.

3.5.5 Internal Standards

Internal standards were added to each field and QC sample prior to injection onto the analytical instrument. The ADQO for internal standards is that the area of the internal standards in each analysis must be within $\pm 50\%$ of the area of the internal standard in the associated CCAL.

All internal standard areas met the ADQO.

3.6 Precision

Precision is evaluated through replicate analyses of a sample. For this study, laboratory duplicate samples could not be analyzed due to the limited sample volume. An SRM was analyzed with each batch. Overall, precision was judged as acceptable.

3.6.1 Standard Reference Material Analyses

Section 3.5.2 describes the frequency and criteria for the SRM analyses performed with each analytical batch. The results for the SRM analyses associated with the tadpoles and sediments are summarized in **Tables 1A, 1B, and 1C**.

SRM accuracy outliers are discussed in **Section 3.5.2**. For congeners with elevated recovery values, the precision %D results (compared to the certified values) were also elevated. For the other congeners, the average %D from the certified values for the 1974b SRM results ranged from 0.43% to 22.8% for each of the congeners with values greater than five times the MDL. Most %D values (18) are less than 10%, indicating good overall precision among the analytical batches.

3.7 Reporting Limits and Sample Results

Method detection limits (MDLs) were determined using low level spikes in tissue from laboratory mice following procedures outlined in the *US Code of Federal Regulations* (40 CFR Part 136, Appendix B). The detection limits for target congeners were generally in the range of 0.02 µg/Kg to 0.22 µg/Kg, with a co-elution of PCB31/28 at 1.38 g/Kg. There were 14 target congeners with MDL values greater than the 0.1 µg/Kg target MDL. The PCB31/28 co-elution MDL value was elevated due to interferences which could not be resolved using the selected method.

The separation and spectral fit for any positive result for the coplanar congeners (PCB77, PCB81, PCB126, and PCB169) were evaluated. PCB77 was the only coplanar congener detected in these samples. PCB110 was found to interfere with PCB77.

For PCB77, the spectral match met general identification criteria, so the laboratory correctly reported the results as positive results. However, due to the interference, the results may be false positives or may be biased high. The potential interferences cannot be resolved without further extract cleanup (e.g., carbon column cleanup). Thus, all positive results for PCB77 were qualified as tentatively identified at an estimated concentration (NJ-21). PCB congener PCB77 was reported as detected in all sediment samples except SED-009, and the results were qualified NJ. A total of eight results for PCB77 were qualified.

Chromatography and mass spectral identification were reviewed for a minimum of 10% of the other reported congeners. No other instances of potential interference were noted. All reported positive results met the identification criteria and chromatographic peak shapes were acceptable. All other reported results were judged to be accurate unless qualified for some other reason.

3.8 Completeness

Out of 3054 results reported by the laboratory (51 samples each with 47 congeners, 10 homologue groups, and total PCBs; percent lipids for the tadpole composites; percent moisture, grain size, and total organic carbon for the sediments), a total of 86 (2.8%) data points were estimated (J). No data were rejected. The completeness level attained for the analysis of the field samples is 100%.

3.9 Summary of Data Usability

A total of 86 out of 3054 results were estimated because of laboratory accuracy outliers. In general, the overall quality of the data is acceptable and the results, as qualified, are considered usable.

I. DATA PACKAGE COMPLETENESS

All required deliverables were submitted by the laboratory. The laboratory followed adequate corrective action processes, and all anomalies were discussed in the case narrative.

II. TECHNICAL DATA VALIDATION

The quality control (QC) requirements that were reviewed are listed below.

- | | | |
|------------------------------------|---|-------------------------------------|
| GC/MS Instrument Performance Check | 2 | Standard Reference Material (SRM) |
| Initial Calibration (ICAL) | 1 | Laboratory Duplicate |
| Continuing Calibration (CCAL) | | Internal Standards |
| Blanks | 2 | Compound Identification |
| 1 Surrogate Compounds | | Calculation Verification |
| 2 Matrix Spike (MS) | 2 | Reporting Limits and Sample Results |
| 2 Laboratory Control Samples (LCS) | | EDD Transcription Check |

¹ Quality control results are discussed below, but no data were qualified.

² Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Surrogate Compounds

The percent recovery (%R) value for the C₁₃-PCB19 surrogate was less than the 50% lower control limit at 48%, in the standard reference material analysis. No action was taken.

Matrix Spike/Matrix Spike Duplicate (MS/MSD)

Matrix spike analysis was performed using Sample SED-009. The %R values for PCB110 were less than the 50% lower control limit in both the matrix spike (at 43%) and the matrix spike duplicate (at 44%). As the recovery in the laboratory control sample (LCS) was acceptable, the value for PCB110 was estimated (J-8) in Sample SED-009 only.

Laboratory Control Sample (LCS)

The percent recovery (%R) values for PCB87, PCB118, PCB156, PCB167, PCB170, and PCB189 were greater than the upper control limit of 125%. Positive values for these analytes were estimated (J-10) in the samples. As the outliers indicate a potential high bias, reporting limits were judged unaffected.

Standard Reference Material (SRM)

The laboratory analyzed SRM1944 - New York/New Jersey Waterway Sediment. This SRM has certified values for 28 of the target PCB congeners. The reported concentrations for PCB138 and PCB170 were greater than the upper control limit of the acceptance window [$\pm 20\%$ of the 95% confidence interval]. Since the recoveries of these compounds were acceptable in the MS/MSD and/or LCS analyses, no action was taken unless the reported concentrations were also outside a wider control limit of $\pm 25\%$ of the 95% confidence interval.

Since the reported values for both PCB138 and PCB170 were also greater than the +25% upper control limit, positive values for these congeners were estimated (J-12) in all samples. As the SRM results indicate a potential high bias, no action was taken if the congeners were not detected.

Laboratory Duplicate

No laboratory duplicate was performed for the grain size or the PCB congener analysis. Precision for the PCB congener analysis was assessed from the MS/MSD results. Precision was not evaluated for the grain size analysis.

Compound Identification

The separation and spectral fit for any positive result for the coplanar congeners (PCB77, PCB81, PCB126, and PCB169) were evaluated. PCB77 was the only coplanar congener detected in these samples. PCB110 was found to interfere with PCB77.

For PCB77, the spectral match met general identification criteria, so the laboratory correctly reported the results as positive results. However, due to the interference, the results may be false positives or may be biased high. The potential interferences cannot be resolved without further extract cleanup (e.g., carbon column cleanup). Thus, all positive results for PCB77 were qualified as tentatively identified at an estimated concentration (NJ-21). PCB congener PCB77 was reported as detected in all samples except SED-009, and the results were qualified NJ.

Although not a coplanar congener, an interference was also noted for PCB157. For PCB157, the peak co-elutes with the non-target PCB200. However, the quantitation ions for PCB157 (a hexachlorobiphenyl) and PCB200 (an octachlorobiphenyl) are sufficiently different that each congener can be resolved despite the co-elution. No action was taken for the PCB157 results.

Chromatography and mass spectral identification were reviewed for a minimum of 10% of all other reported congeners. No other instances of potential interference were noted. All reported positive results met the identification criteria and chromatographic peak shapes were acceptable.

Reporting Limits and Sample Results

Samples SED-002, SED-004, and SED-007 required dilution due to values that exceeded the linear range of the instrument. Both sets of data were reported by the laboratory. In order that only one set of data be reported, values that exceeded the linear range of the instrument were qualified as do-not-report (DNR-20) in the initial analyses and should be reported from the dilutions. The values for all analytes except those that exceeded the linear range in the initial analyses were qualified as do-not-report (DNR-14) in the dilution analyses.

For GCMS-SIM analysis, response factors are generated for each congener during the calibration process. The relative area of a peak is divided by the appropriate response factor to calculate the concentration of the congener. For the homologue groups (monochlorobiphenyl, dichlorobiphenyl, etc.), a representative response factor is used. For example, the response factor for PCB29 is used as the representative response factor for all trichlorobiphenyls.

In several samples, the reported trichlorobiphenyl and/or heptachlorobiphenyl homologue group total values were less than the sum of the individual congeners. This occurs because the representative response factor is sufficiently different from the target congener response factors generated during the calibration. For example, the response factor for the PCB31/28 co-elution (detected in most samples) is lower than the trichlorobiphenyl representative response factor. Since the areas are divided by the response factors, this results in a lower concentration for the total trichlorobiphenyls, even if PCB31/28 is the only detected congener in the chlorination level.

Unless all 209 congeners are calibrated, any reported total for a chlorination level will have some inherent variability. The differences for the Total Homologue values are all less than 1.0%. This is within the variability of the method, thus no action was taken.

III. Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical methods. Accuracy was acceptable, as demonstrated by the surrogate, laboratory control sample (LCS), standard reference material (SRM), and matrix spike/matrix spike duplicate (MS/MSD) percent recovery values, with the exceptions noted above. Precision was acceptable as demonstrated by the relative percent difference values for the MS/MSD and laboratory duplicate analyses.

Data were estimated due to MS, LCS, and SRM recovery outliers. Data were qualified as tentatively identified due to potential interference. Data were qualified as do-not-report due to concentrations greater than the linear range of the instrument and the existence of duplicate data.

Data that have been qualified as do-not-report should not be used for any purpose. All other data, as qualified, are acceptable for use.

I. DATA PACKAGE COMPLETENESS

All required deliverables were submitted by the laboratory. The laboratory followed adequate corrective action processes, and all anomalies were discussed in the case narrative.

II. TECHNICAL DATA VALIDATION

The quality control (QC) requirements that were reviewed are listed below.

- | | |
|------------------------------------|---------------------------------------|
| GC/MS Instrument Performance Check | 1 Standard Reference Material (SRM) |
| Initial Calibration (ICAL) | 1 Laboratory Duplicate |
| Continuing Calibration (CCAL) | Internal Standards |
| Blanks | 1 Compound Identification |
| 1 Surrogate Compounds | Calculation Verification |
| 1 Matrix Spike (MS) | 1 Reporting Limits and Sample Results |
| Laboratory Control Samples (LCS) | EDD Transcription Check |

¹ Quality control results are discussed below, but no data were qualified.

² Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Surrogate Compounds

The percent recovery (%R) value for the C₁₃-PCB19 surrogate was less than the lower control limit of 50, at 46%, in Sample BTC-009-001. This surrogate is not used for recovery correction, and the %R value for the surrogate used for recovery correction (C₁₃-PCB202 at 58%) was acceptable. No action was taken.

Matrix Spike (MS)

Matrix spike analysis was not performed due to insufficient sample volume.

Standard Reference Material (SRM)

The laboratory analyzed an aliquot of SRM 1974b - Organics in Mussel Tissue. This SRM has certified values for 27 of the target PCB congeners. The reported concentration for PCB170 was greater than the upper control limit of the acceptance window [$\pm 20\%$ of the 95% confidence interval]. However, the certified concentration for PCB170 is less than five times the established method detection limit (MDL) for this analyte, and therefore the criteria do not apply. No qualifiers were assigned.

Laboratory Duplicate

No laboratory duplicate was performed due to insufficient sample volume.

Compound Identification

Chromatography and mass spectral identification were reviewed for a minimum of 10% of all reported congeners. No instances of potential interference were noted. All reported positive results met the identification criteria and chromatographic peak shapes were acceptable.

Reporting Limits and Sample Results

Sample BTC-004-001 was analyzed at a dilution (2.18X) based on screening values. Reporting limits were elevated accordingly. No action was taken.

In Samples BTC-001-001, BTC-001-002, BTC-001-003, BTC-006-001, BTC-009-001, and BTC-009-002, the value reported for the trichlorobiphenyl homologue group is less than the sum of the individual target trichlorobiphenyl congeners reported in these samples. In Sample BTC-005-002 the value reported for the heptachlorobiphenyl homologue group is less than the sum of the individual target heptachlorobiphenyl congeners reported in this sample.

PCB congener response factors are generated for each target congener during the calibration process. The relative area of a peak is divided by the appropriate response factor to calculate the

concentration of the congener. For the homologue groups (monochlorobiphenyl, dichlorobiphenyl, etc.), a representative response factor is used. For example, the response factor for PCB29 is used as the representative response factor for all trichlorobiphenyls.

In the cases above, where the reported trichlorobiphenyl or heptachlorobiphenyl homologue group total values are less than the sum of the individual congeners, the representative response factor selected for homologue calculation is sufficiently different from the target congener response factors generated during the calibration. For example, the response factor for the PCB31/28 co-elution (detected in most samples) is lower than the trichlorobiphenyl representative response factor. Since the areas are divided by the response factors, this results in a lower concentration for the total trichlorobiphenyls, even if PCB31/28 is the only detected congener in the chlorination level.

Unless all 209 congeners are calibrated, any reported total for a chlorination level will have some inherent variability. For example, for the trichlorobiphenyl and heptachlorobiphenyl results, the greatest difference between the calculated (by summing the congeners) and reported result is 2.1% (for values with concentrations greater than the reporting limit). The differences noted for the Total Homologue values are all less than 1.0%. This is within the variability of the method, thus no action was taken.

III. Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical methods. Accuracy was acceptable, as demonstrated by the surrogate, LCS, and SRM recovery values.

All data, as reported, are acceptable for use.

| 1 Matrix Spike (MS) | | EDD Transcription Check |
| Laboratory Control Samples (LCS) | | |

¹ Quality control results are discussed below, but no data were qualified.

² Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Matrix Spike (MS)

Matrix spike analysis was not performed due to insufficient sample volume.

Standard Reference Material (SRM)

The laboratory analyzed an aliquot of SRM 1974b - Organics in Mussel Tissue. This SRM has certified values for 27 of the target PCB congeners. The reported concentrations for PCB18, PCB31/28, and PCB170 were greater than the upper control limit of the acceptance window ($\pm 20\%$ of the 95% confidence interval). However, the certified concentration for PCB170 is less than five times the established method detection limit (MDL) for this analyte, and therefore the criteria do not apply. Since the recoveries of the other compounds were acceptable in the laboratory control sample (LCS) analyses, no action was taken unless the reported concentrations were also outside a wider control limit of $\pm 25\%$ of the 95% confidence interval.

The reported value for PCB31/28 was within a wider window of $\pm 25\%$ of the 95% confidence interval, and no qualifiers were assigned to PCB31/28. The reported value for PCB18 was greater than the upper limit of the wider window of $\pm 25\%$ of the 95% confidence interval. PCB18 was detected in all samples, and these values were estimated (J-12).

Laboratory Duplicate

No laboratory duplicate was performed due to insufficient sample volume.

Reporting Limits and Sample Results

In Samples BTC-001-004, BTC-001-005, BTC-001-006, and BTC-006-007 the value reported for the trichlorobiphenyl homologue group is less than the sum of the individual target trichlorobiphenyl congeners reported in these samples.

PCB congener response factors are generated for each target congener during the calibration process. The relative area of a peak is divided by the appropriate response factor to calculate the concentration of the congener. For the homologue groups (monochlorobiphenyl, dichlorobiphenyl, etc.), a representative response factor is used. For example, the response factor for PCB29 is used as the representative response factor for all trichlorobiphenyls.

In the cases above, where the reported trichlorobiphenyl homologue group total values are less than the sum of the individual congeners, the representative response factor selected for homologue calculation is sufficiently different from the target congener response factors generated during the calibration. For example, the response factor for the PCB31/28 co-elution (detected in most samples) is lower than the trichlorobiphenyl representative response factor. Since the areas are divided by the response factors, this results in a lower concentration for the total trichlorobiphenyls, even if PCB31/28 is the only detected congener in the chlorination level.

Unless all 209 congeners are calibrated, any reported total for a chlorination level will have some inherent variability. The differences noted for the Total Homologue values are within the variability of the method, thus no action was taken.

III. Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical methods. Accuracy was acceptable, as demonstrated by the surrogate, LCS, and SRM recovery values, with the exceptions noted above.

Data were qualified as estimated due to an SRM recovery outlier.

All data, as qualified, are acceptable for use.

DATA VALIDATION REPORT - SUMMARY REVIEW
Hudson River
Polychlorinated Biphenyl Congeners
SDG: 0312088
Woods Hole Group

This report documents the review of analytical data from the analysis of one equipment rinsate blank and the associated laboratory quality control samples. Samples were analyzed by Woods Hole Group Environmental Laboratories, Raynham, Massachusetts.

I. DATA PACKAGE COMPLETENESS

All required deliverables were submitted by the laboratory. The laboratory followed adequate corrective action processes, and all anomalies were discussed in the case narrative.

II. TECHNICAL DATA VALIDATION

The quality control (QC) requirements that were reviewed are listed below.

GC/MS Instrument Performance Check	1	Standard Reference Material (SRM)
Initial Calibration (ICAL)	1	Laboratory Duplicate
2 Continuing Calibration (CCAL)		Internal Standards
Blanks		Compound Identification
Surrogate Compounds		Reporting Limits and Sample Results
1 Matrix Spike (MS)		EDD Transcription Check
1 Laboratory Control Samples (LCS)		

¹ Quality control results are discussed below, but no data were qualified.

² Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Continuing Calibration (CCAL)

The percent difference (%D) value of PCB31/28 (at 21.7%) was greater than the control limit of $\pm 20\%$ in the CCAL performed December 29, 2003 at 14:50. The reporting limit for this analyte was estimated (UJ-5B) in the sample.

Matrix Spike (MS)

No matrix spikes (MS) were performed with this SDG.

Laboratory Control Sample (LCS)

The percent recovery (%R) values for PCB189, PCB194, PCB195, PCB206, and PCB209 were greater than the upper control limit of 125% in the LCS submitted with this SDG. As these analytes were not detected in the sample, and the outliers indicate a potential high bias, no action was taken.

Standard Reference Material (SRM)

A standard reference material (SRM) was not analyzed with this SDG.

Laboratory Duplicate

A laboratory duplicate was not performed.

III. Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical methods. Accuracy was acceptable, as demonstrated by the surrogate and LCS %R values, with the exceptions noted above. Laboratory precision was not evaluated.

One data point was estimated due to a continuing calibration percent difference outlier.

All data, as qualified, are acceptable for use.

I. DATA PACKAGE COMPLETENESS

All required deliverables were submitted by the laboratory. The laboratory followed adequate corrective action processes, and all anomalies were discussed in the case narrative.

II. TECHNICAL DATA VALIDATION

The quality control (QC) requirements that were reviewed are listed below.

- | | |
|------------------------------------|---------------------------------------|
| GC/MS Instrument Performance Check | 1 Standard Reference Material (SRM) |
| Initial Calibration (ICAL) | 1 Laboratory Duplicate |
| 2 Continuing Calibration (CCAL) | Internal Standards |
| Blanks | Compound Identification |
| Surrogate Compounds | 1 Reporting Limits and Sample Results |
| 1 Matrix Spike (MS) | EDD Transcription Check |
| Laboratory Control Samples (LCS) | |

¹ Quality control results are discussed below, but no data were qualified.

² Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Continuing Calibration (CCAL)

The percent difference (%D) value of PCB31/28 (at 20.9%) was greater than the control limit of $\pm 20\%$ in the CCAL performed January 28, 2004 at 16:17. Positive values and/or reporting limits for this analyte were estimated (J/UJ-5B) in the samples.

Matrix Spike (MS)

Matrix spike analysis was not performed due to insufficient sample volume.

Standard Reference Material (SRM)

The laboratory analyzed an aliquot of SRM 1974b - Organics in Mussel Tissue. This SRM has certified values for 27 of the target PCB congeners. The reported concentrations for PCB31/28, PCB49, and PCB170 were greater than the upper control limit of the acceptance window ($\pm 20\%$ of the 95% confidence interval). However, the certified concentration for PCB170 is less than five times the established method detection limit (MDL) for this analyte, and therefore the criteria do not apply. Since the recoveries of the other compounds were acceptable in the laboratory control sample (LCS) analyses, no action was taken unless the reported concentrations were also outside a wider control limit of $\pm 25\%$ of the 95% confidence interval.

The reported value for PCB49 was within a wider window of $\pm 25\%$ of the 95% confidence interval, and no qualifiers were assigned to PCB49. The reported value for PCB31/28 was greater than the upper limit of the wider window of $\pm 25\%$ of the 95% confidence interval. PCB31/28 was detected in all samples except BTC-009-005. The positive results were estimated (J-12). As the outlier indicated a potential high bias, the detection limit in BTC-009-005 was not affected, and no further action was taken.

Laboratory Duplicate

No laboratory duplicate was performed due to insufficient sample volume.

Reporting Limits and Sample Results

In Samples BTC-009-003 and BTC-009-004 the value reported for the trichlorobiphenyl homologue group is less than the sum of the individual target trichlorobiphenyl congeners reported in these samples.

PCB congener response factors are generated for each target congener during the calibration process. The relative area of a peak is divided by the appropriate response factor to calculate the concentration of the congener. For the homologue groups (monochlorobiphenyl, dichlorobiphenyl, etc.), a representative response factor is used. For example, the response factor for PCB29 is used as the representative response factor for all trichlorobiphenyls.

In the cases above, where the reported trichlorobiphenyl homologue group total values are less than the sum of the individual congeners, the representative response factor selected for homologue calculation is sufficiently different from the target congener response factors generated during the calibration. For example, the response factor for the PCB31/28 co-elution (detected in most samples) is lower than the trichlorobiphenyl representative response factor. Since the areas are divided by the response factors, this results in a lower concentration for the total trichlorobiphenyls, even if PCB31/28 is the only detected congener in the chlorination level.

Unless all 209 congeners are calibrated, any reported total for a chlorination level will have some inherent variability. The differences noted for the Total Homologue values are within the variability of the method, thus no action was taken.

III. Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical methods. Accuracy was acceptable, as demonstrated by the surrogate, LCS, and SRM recovery values, with the exceptions noted above.

Data were qualified due to a continuing calibration percent difference outlier and a SRM outlier.

All data, as qualified, are acceptable for use.
