Combat Methamphetamine Act of 2005 (CMEA)

10 Years of Meth Use

Preventing the Retail Diversion of Pseudoephedrine

2008

Background

Methamphetamine (“meth”) is an addictive stimulant drug that strongly activates certain areas in the brain. It is chemically related to amphetamine, but the central nervous system effects of methamphetamine are greater, resulting in a high potential for abuse and addiction.

Street Names

- Meth
- Ice
- Crystal
- Fire
- Speed
- Chalk
- Crank
- Ice

Methamphetamine has become a tremendous challenge for the entire nation. A clandestine meth lab has been found in every state across the country.

Labs have been found in homes, cars, hotel rooms, storage facilities – these are generally referred to as “small toxic labs.”

Background Continued

Ephedrine (EPH), pseudoephedrine (PSE), and phenylpropanolamine (PPA) are precursor chemicals used in the illicit manufacture of methamphetamine or amphetamine.

The Combat Methamphetamine Epidemic Act (CMEA) of 2005 was signed into law on March 9, 2006 to regulate, among other things, retail over-the-counter sales of EPH, PSE, and PPA products which are common ingredients found in cold and allergy products.

Small Toxic Lab

DEA's Goal

DEA is committed to working with state and local law enforcement partners to ensure that our streets and neighborhoods are safe and the methamphetamine problem is brought to an end. DEA's focus is to dismantle clandestine methamphetamine labs and trafficking organizations and to monitor the products that are illegally used to produce methamphetamine.

Preventing Diversion

Per the CMEA, retailers must store products containing EPH, PSE, or PPA where customers do not have direct access to the product: either behind the counter or in a locked cabinet. Preventing diversion involves the coordination and cooperation of law enforcement officials, retailers and individual consumers.
