# CURRENT POPULATION SURVEY, FEBRUARY, JUNE, AND NOVEMBER 2003: TOBACCO USE SUPPLEMENT FILE 

TECHNICAL DOCUMENTATION<br>CPS—03

This file documentation consists of the following materials:

| Attachment 1 | Abstract |
| :---: | :---: |
| Attachment 2 | Overview - Current Population Survey |
| Attachment 3 | Overview - February, June, and November 2003 Tobacco Use Supplement |
| Attachment 4 | Glossary |
| Attachment 5 | How to Use the Record Layout |
| Attachment 6 | Basic CPS Record Layout |
| Attachment 7 | Current Population Survey, February, June, and November 2003 Tobacco Use Supplement Record Layout |
| Attachment 8 | Current Population Survey, February, June, and November 2003 Tobacco Use Supplement Questionnaire |
| Attachment 9 | Industry Classification Codes |
| Attachment 10 | Occupation Classification Codes |
| Attachment 11 | Specific Metropolitan Identifiers |
| Attachment 12 | Topcoding of Usual Hourly Earnings |
| Attachment 13 | Tallies of Unweighted Counts |
| Attachment 14 | Countries and Areas of the World |
| Attachment 15 | Allocation Flags |
| Attachment 16 | Source and Accuracy of the February, June and November 2003 Tobacco Use Supplement Data |
| Attachment 17 | User Notes |

NOTE

Questions about accompanying documentation should be directed to Administrative and Customer Services Division, Electronic Products Development Branch, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 763-8004

Questions about the CD-ROM should be directed to, Customer Services Center, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 763-INFO (4636)

Questions about the subject matter should be directed to Dennis Clark, Demographic Surveys Division, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 763-3806.

## ATTACHMENT 1

ABSTRACT<br>Current Population Survey, February, June, and November 2003: Tobacco Use Supplement [machine-readable data file] conducted by the U.S. Census Bureau for the Bureau of Labor Statistics. - Washington: U.S. Census Bureau [producer and distributor], 2006.

## Type of File:

Microdata; unit of observation is households.

## Universe Description:

The universe consists of all persons aged 15 and above in the civilian noninstitutional population of the United States. The probability sample selected to represent the universe consists of 153,851 households. These include February 42,151, June 55,892, and November 55,808.

The Tobacco Use Supplement universe is person level for all persons age 15 and above who completed the labor force interview. February differed from June and November because February used 6 Months In Sample (MIS) but June and November used all 8 MIS. February used Months In Sample (MIS) 1, 2, 3, 5, 6, or 7 .

Questionnaire Structure: The supplement is structured in Sections A through K (except I)

- Section A screened for prior cigarette usage and current usage status of everyday smoker, some days smoker or not at all.
- Section B questions were asked if they had smoked 100 cigarettes, is a self-respondent and currently smoking everyday
- Section C questions were asked if the person had smoked 100 cigarettes, is a self-respondent and currently smoking some days.
- Section D asked questions about quit smoking attempts of the past 12 months.
- Section E asked about use of telephone help lines or quit lines during the past 12 months.
- Section F asked about Doctor and Dentist advice to stop smoking.
- Section G asked about the persons likelihood to quit within the next 6 months.
- Section H questions were asked if the person had smoked 100 cigarettes, is a self-respondent and currently not smoking at all.
- Section J asked all respondents about use of other tobacco products.
- Section JJ asked about use of those tobacco products with claims of fewer harmful chemicals.
- Section K asked about banning of smoking at home and in the workplace.
- The Supplement Universe was :
(HRINTSTA = 1 AND
PRTAGE greater than or equal to 15 AND
HRMIS in $1,2,3,4,5,6,7,8$ )
except as noted above that February did not use MIS 4 or 8.

## Subject-Matter Description:

Data are provided on labor force activity for the week prior to the survey. Comprehensive data are available on the employment status, occupation, and industry of persons 15 years old and over. Also shown are personal characteristics such as age, sex, race, marital status, veteran status, household relationship, educational background, and Hispanic origin.

The Tobacco Use questions were asked of any person age 15 years or older in the household.

## Geographic Coverage:

Geography data is provided to the State level.

## Technical Description:

File Structure: Rectangular.
File Size: 473,087 logical person level records; 909 character logical record length. These records consist of February 158,633; June 157,585; and November 156,869. There are 301,608 total supplement eligible records derived from February 82,528; June 109,941; and November 109,139.

File Sort Sequence: The file is sorted by State (GESTFIPS) by household identification number by line number.

## Reference Materials:

Current Population Survey, February, June, and November 2003: Tobacco Use Supplement Technical Documentation. Documentation contains this abstract, questionnaire facsimiles, and record layouts of the file. One copy accompanies each file order. Additional copies are available from Marketing Services Office, Customer Services Center, U.S. Bureau of the Census, Washington, DC 20233.

Bureau of the Census. The Current Population Survey Design and Methodology (Technical Paper 63RV) describes in detail the sample design and survey procedures used as well as accuracy of estimates and sampling errors. Reference copies should be available from most public libraries or Federal Depository Libraries.

For information about the Current Population Survey and other Census Bureau data products, be sure to visit our online Question \& Answer Center on the Census Bureau's home page at http://www.census.gov/ where you can search our knowledge base and submit questions.

## File Availability:

You can order the file on disc from the Customer Services Center at (301) 763-INFO (4636) or through our online sales catalog (click "Catalog" on the Census Bureau's home page).

## ATTACHMENT 2

## OVERVIEW

## Current Population Survey

## Introduction

The Current Population Survey (CPS) is the source of the official government statistics on employment and unemployment. The CPS has been conducted monthly for over 50 years. Currently, we obtain interviews from about 57,000 households monthly, scientifically selected on the basis of area of residence to represent the nation as a whole, individual states, and other specified areas. Each household is interviewed once a month for four consecutive months one year, and again for the corresponding time period a year later. This technique enables us to obtain reliable month-to-month and year-to-year comparisons at a reasonable cost while minimizing the inconvenience to any one household.

Although the main purpose of the survey is to collect information on the employment situation, a very important secondary purpose is to collect information on demographic characteristics such as age, sex, race, marital status, educational attainment, family relationship, occupation, and industry. From time to time, additional questions are included on health, education, income, and previous work experience. The statistics resulting from these questions serve to update similar information collected once every 10 years through the decennial census, and are used by government policymakers and legislators as important indicators of our nation's economic situation and for planning and evaluating many government programs.

The CPS provides current estimates of the economic status and activities of the population of the United States. Because it is not possible to develop one or two overall figures (such as the number of unemployed) that would adequately describe the whole complex of labor market phenomena, the CPS is designed to provide a large amount of detailed and supplementary data. Such data are made available to meet a wide variety of needs on the part of users of labor market information.

Thus, the CPS is the only source of monthly estimates of total employment (both farm and nonfarm); nonfarm selfemployed persons, domestics, and unpaid helpers in nonfarm family enterprises; wage and salaried employees; and, finally, estimates of total unemployment.

It provides the only available distribution of workers by the number of hours worked (as distinguished from aggregate or average hours for an industry), permitting separate analyses of part-time workers, workers on overtime, etc. The survey is also the only comprehensive current source of information on the occupation of workers and the industries in which they work. Information is available from the survey not only for persons currently in the labor force but also for those who are outside the labor force. The characteristics of such persons whether married women with or without young children, disabled persons, students, older retired workers, etc., can be determined. Information on their current desire for work, their past work experience, and their intentions as to job seeking are also available.

For a more detailed discussion about the basic labor force data gathered on a monthly basis in the CPS survey, see "Revisions in the Current Population Survey Effective January 1994" in the February 1994 issue of Employment and Earnings published by the Bureau of Labor Statistics.

## CPS Sample Design

The current CPS sample is selected based on 1990 census information. The first stage of the 1990 sample design created 2,007 geographic areas called primary sampling units (PSUs) in the entire United States. These PSUs were grouped into strata within each state. Some of these PSUs formed strata by themselves and were in sample with certainty, which is referred to as self-representing. Of the remaining nonself-representing PSUs, one PSU was selected from each stratum with the probability of selection proportional to the population of the PSU. A total of 754 PSUs were selected for sample containing 2,121 counties, minor civil divisions, and independent cities. The second stage of the sample design selected housing units within these PSUs.

Approximately 72,000 housing units are assigned for interview each month, of which about 60,000 are occupied and thus eligible for interview. The remainder are units found to be destroyed, vacant, converted to nonresidential use, containing persons whose usual place of residence is elsewhere, or ineligible for other reasons. Of the 60,000 occupied housing units, approximately 5 percent are not interviewed in a given month due to temporary absence (vacation, etc.), the residents are not found at home after repeated attempts, inability of persons contacted to respond, unavailability for other reasons, and refusals to cooperate. The interviewed households contain approximately 112,000 persons 15 years old and over, approximately 31,000 children $0-14$ years old, and about 450 Armed Forces members living with civilians either on or off base within these households. A more precise explanation regarding the CPS sample design is provided in "Explanatory Notes and Estimates of Error: Household Data - Sampling" in any issue of Employment and Earnings.

## Relationship of Current Population Survey Files to Publications

Each month, a significant amount of information about the labor force is published by the Bureau of Labor Statistics in the Employment and Earnings and Monthly Labor Review reports.

As mentioned previously, the CPS also serves as a vehicle for supplemental inquiries on subjects other than employment, which are periodically added to the questionnaire. From the basic and supplemental data, the Bureau of the Census issues three series of publications under the general title Current Population Reports:

```
P-20 Population Characteristics
P-23 Special Studies
P-60 Consumer Income
```

All Current Population Reports, including the other series for population estimates and projections and special censuses, may be obtained by subscription from the U.S. Government Printing Office at 202-783-3238. Subscriptions are available as follows: Population Characteristics, Special Studies, and Consumer Income series (P-20, P-23, P-60) combined, \$101 per year (sold as a package only); Population Estimates and Projections, (P-25), $\$ 27$ per year. Single issues may be ordered separately; ordering information and prices are provided in the Bureau of the Census Catalog and Guide, the Monthly Product Announcement (MPA), and in Census and You. Selected reports also may be accessed on the INTERNET at http://www.census.gov/prod/www/subject.html\#pop

## Geographic Limitations

The CPS sample was selected so that specific reliability criteria were met nationally, for each of the 50 States and for the District of Columbia. Since 1985, these reliability criteria have been maintained through periodic additions and deletions in the State samples. Estimates formed for geographic areas identified on the microdata file which are smaller than states are not as reliable.

## Weights

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns for the entire panel of respondents. The CPS estimation procedure involves weighting the data from each sample person. The base weight, which is the inverse of the probability of the person being in the sample, is a rough measure of the number of actual persons that the sample person represents. Almost all sample persons in the same state have the same base weight, but the weights across states are different. Selection probabilities may also differ for some sample areas due to field subsampling, which is done when areas selected for the sample contain many more households than expected. The base weights are then adjusted for noninterview, and the ratio estimation procedure is applied.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability of the respondent for other reasons. This noninterview adjustment is made separately for clusters of similar sample areas that are usually, but not necessarily, contained within a state. Similarity of sample areas is based on Metropolitan Statistical Area (MSA) status and size. Within each cluster, there is a further breakdown by residence. Each MSA cluster is split by "central city" and "balance of the MSA". Each non-MSA cluster is split by "urban" and "rural" residence categories. The proportion of occupied sample households not interviewed fluctuates around 5 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole in such characteristics as age, race, sex, and state of residence. Because these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the survey estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio adjustment as follows:
a. First-stage ratio estimate. The purpose of the first-stage ratio adjustment is to reduce the contribution to variance that results from selecting a sample of PSUs rather than drawing sample households from every PSU in the nation. This adjustment is made to the CPS weights in two race cells: black and nonblack; it is applied only to PSUs that are nonself-representing and for those states that have a substantial number of black households. The procedure corrects for differences that existed in each state cell at the time of the 1990 census between 1) the race distribution of the population in sample PSUs and 2) the race distribution of all PSUs (both 1 and 2 exclude selfrepresenting PSUs).
b. Second-stage ratio estimate. This procedure substantially reduces the variability of estimates and corrects, to some extent, for CPS undercoverage. The CPS sample weights are adjusted to ensure that sample-based estimates of population match independent population controls. Three sets of controls are used:
1) 51 state controls of the civilian noninstitutional population 16 years of age and older
2) national civilian noninstitutional population controls for 14 hispanic and 5 nonhispanic agesex categories
3) national civilian noninstitutional population controls for 66 white, 42 black, and 10 "other" age-sex categories

The independent population controls are prepared by projecting forward the resident population as enumerated on April 1, 1990. The projections are derived by updating demographic census data with information from a variety of other data sources that account for births, deaths, and net migration. Estimated numbers of resident Armed Forces personnel and institutionalized persons reduce the resident population to the civilian noninstitutional population. Estimates of net census undercount, determined from the Post Enumeration Survey, are added to the population projections. Prior to January 1994, the projections were based on earlier censuses, and there was no correction for census undercount. A summary of the current procedures used to make population projections is given in "Revisions in the Current Population Survey Effective January 1994" in the February 1994 issue of Employment and Earnings.

## Comparability of CPS From Microdata Files With Published Sources

Although total estimates of the population will equal published estimates, labor force estimates produced from a microdata file will not be directly comparable or identical with the published nonseasonally adjusted labor force data. The major reason for this is due to a final estimation procedure incorporated into the production of the published nonseasonally adjusted data. This procedure, known as a composite estimator, is a weighted average of two estimates for the current month for any particular item. The first estimate is the two-stage ratio estimate that includes all the estimation steps given above. The second estimate consists of the composite estimate for the preceding month to which has been added an estimate of the change from the preceding month, based on that part of the sample which is common to the two months (about 75 percent). This procedure is primarily used to increase the reliability of estimates of month-to-month change, although other reliability gains are also realized. As noted above, the composite estimation procedure does not affect estimates of the total population.

Another factor also inhibits microdata comparison with published labor force data. This is the seasonal adjustment that is applied to many published statistics. This adjustment is used to adjust for normal seasonal variations to help distinguish the underlying economic situation in month-to-month changes.

Shown below are data from January and July 1993 which demonstrate how estimates compiled using the final weights from the microdata file may differ from the published composited estimates, with and without seasonal adjustment. Note that the composite estimation procedure was not used for estimates published from January 1994 to May 1994. For a further description of both the composite estimator and seasonal adjustment, see "Explanatory Notes and Estimates of Error: Household Data - Estimating Methods (Composite Estimation Procedure)" and "Seasonal Adjustment" in any issue of Employment and Earnings.

Comparison of CPS Estimates from Microdata Files with Published Sources

| Noni | Civilian titutional opulation | Civilian Labor Force | Employed | Unemployed | Not in Labor Force |

## ATTACHMENT 3

## OVERVIEW

February, June, and November 2003: Tobacco Use Supplement

## General

Census Bureau staff conducted a Tobacco Use Special Cessation Supplement (TUSCS) to the Current Population Survey (CPS) in conjunction with the February, June and November 2003 CPS. The National Cancer Institute (NCI) and the Centers for Disease Control and Prevention (CDC) cosponsored the supplement. The CPS is a monthly labor force survey conducted in approximately 55,000 interviewed households across the country. Attachment 8 contains a facsimile of the February, June and November 2003 TUSCS questions. Attachment 2 comprises a description of the CPS entitled "Overview--Current Population Survey."

Census Bureau staff collected the series of NCI sponsored Tobacco Use Supplements to the CPS in September 1992, January 1993, and May 1993, in September 1995, January 1996, and May 1996, and again in September 1998, January 1999, and May 1999. We conducted an abbreviated Tobacco Use Supplement in January 2000 and May 2000 at the request of the NCI in order to assess the usage of cigars, snuff, pipes and chewing tobacco, as well as cigarettes by the U.S. population. Prior to this 2003 cycle, the most recent series of Tobacco Use Supplements was conducted in June 2001, November 2001 and February 2002. State data will be most reliable when using data from all three months of data collection. For this reason, we recommend that all three files be purchased when analyzing state level data. This is especially important when trying to replicate analysis done by the NCI. Much of their analysis is based on a statistical average of all three months for any series of collection periods. Each file contains only Tobacco Use Special Cessation Supplement data collected for the specific month of February, June or November of 2003.

For the 2003 wave of Tobacco Use Supplements, the Tobacco Use Special Cessation Supplements THE CITATION IS: US Department of Commerce, Census Bureau 2006, National Cancer Institute and Centers for Disease Control and Prevention co-sponsored Tobacco Use Special Cessation Supplement to the Current Population Survey 2003. [http://riskfactor.cancer.gov/studies/tus-cps].

For more information about past, current and future NCI Tobacco Use Supplements and data reports and publications utilizing supplement data see the NCI website: http://riskfactor.cancer.gov/studies/tuscps/. A description of the February, June, and November 2003 TUSCS follows.

## Race/Ethnicity 2003 Changes and Subsequent Trend Analyses

This section is relevant for those wishing to make smoking estimates by race and/or ethnicity. Due to a directive from the Office of Management and Budget (OMB), the Current Population Survey (CPS) changed its race/ethnicity questions in January 2003. CPS respondents may now select more than one race when answering the survey. The change in wording does not impact smoking estimates and trends made for the Nation from the TUSCS-CPS, but it potentially impacts smoking estimates and trends made by race/ethnicity.

When a change is made in question wording on a continuing survey, it is standard to ask the two different forms of the question to a random sample of survey respondents -- the "overlap sample". Using this sample of responses, a model can be constructed that allows the prediction of responses from one set of questions given a particular response to the other question. This model can be used to obtain estimates of what would have been obtained using the old question when the new question is used exclusively. The overlap sample and modeling process provides a bridge from the new estimates to the old estimates.

In May 2002, the Bureau of Labor Statistics (BLS) sponsored a CPS supplement that asked the new race/ethnicity questions of all sample people. The Census Bureau provided cross-tabular information on race/ethnicity responses from the old (pre-2003) and new (post-2003) questions. Using this information, NCI analysts developed a method to make valid TUSCS-CPS smoking estimates by race/ethnicity using multiple imputations. For information about this method, see the NCI website: http://riskfactor.cancer.gov/studies/tus-cps/.

The multiple imputation approach has the potential to make the greatest difference in the estimates for races where a high proportion of the respondents report multiple races. In the May 2002 CPS supplement, less than $2 \%$ of the respondents reported multiple races. However, over $50 \%$ of the American Indian and Alaskan Native (AIAN) respondents reported multiple races. The NCI, as part of the Department of Health and Human Services (DHHS), is committed to reducing health disparities for the underserved populations -- such as the AIAN. Thus, it was important to the NCI to develop this race bridging methodology to allow comparison of smoking estimates by race/ethnicity.

## Data Collection

## Partial Overlap Sample for TUS-CPS February 2002 and TUSCS-CPS February 2003

TUSCS-CPS Unique Analysis Opportunity. A unique feature of the CPS is its panel design where each household in the sample is surveyed for four consecutive months (panels \# 1-4) and then for four more consecutive months (panels \# 5-8) nine months later [see Attachment \# 2- Overview of the Current Population Survey, and U.S. Department of Commerce. 2000. Current Population Survey. Design and methodology (Technical paper 63RV). Washington, D.C.:U.S. Census Bureau. http://www.census.gov/prod/2000pubs/tp63.pdf ]. Due to this sampling strategy persons who were in their $1^{\text {st }}, 2^{\text {nd }}$, or $3^{\text {rd }}$ month in sample in February 2002 when the TUS data was collected were potentially also in the February 2003 sample for panel months \#5, 6 and 7 when the TUSCS-CPS was fielded. Thus a unique opportunity exists for analyzing data from this short longitudinal study of a one-year duration. If the retrospective assessment of smoking status 12 months ago asked in February 2002 is considered, then this cohort can be extended to two years (February 2001 - February 2003).

Matching February 2002 and February 2003 Files. The data from the February 2002 and 2003 overlap can be matched using the following matching variables on the CPS files:

HRHHID: Household identifier
HRMIS: Month in sample [1 in Feb $2002=5$ in Feb 2003; 2 in Feb $2002=6$ in Feb 2003; and 3 in Feb $2002=7$ in Feb 2003. If interested in CPS items only, then can also match 4 in Feb $2002=8$ in Feb 2003. There are no data for TUS items for panels 4 and 8 in both February 2002 and February 2003 since the TUS was not asked of those panels due to fielding of the March supplement items also in February among those panels.]

HRSAMPLE: Sample identifier
HRSERSUF: Serial suffix
HUHHNUM: Household number
PULINENO: Person's line number
PESEX: Sex
PEAGE: Person's age (Match if 2003 age is within plus or minus 1 of 2002)
Since the CPS is a household based sample, the mismatches for the corresponding months in sample (using the matching variables described above) are due to migration where entire households and individuals within households move to another location as well as non-response (individual or household non-response)

Adjustment Weights for Partial Overlap Sample for February 2002 and 2003. NCI in collaboration with the Census Bureau has developed a strategy to create new weights appropriate for analyzing only the overlap sample. NCI is working on creating them for public use and further information about their development, proper use and availability from NCI can be found on NCI's Risk Factor Monitoring \& Methods Branch website - http://riskfactor.cancer.gov/studies/tus-cps

Briefly, the strategy is based on a two-step procedure. First, the number of matched individuals is adjusted up to the total sample size for the TUSCS-CPS in February 2003. This is done because the overlap only accounts for half the February sample even if there were neither non-response nor any migration. Next, using the same post-stratification variables that were used to weight the 2003 February data, adjustments for non-response and self-response are made sensitive to state controls by age and sex, national ethnicity controls (Hispanic/non-Hispanic) based on sex/age categories, and national race controls for White Only, Black Only, and "Other " race grouped according to age/sex subcategories.

## Linkages with Other CPS or Other Supplements to the CPS

Another unique aspect of the TUSCS-CPS is that the data for subsets of the sample can be linked with other CPS Basic and other CPS Supplement data in the same manner as it can be linked to the February 2002 data. This allows the opportunity to include other topics in analysis such as Internet Use, Time Use, Veterans info, Food Security info, etc. The 2003 American Time Use Supplement to the CPS would be especially useful for exploring how smokers identified in the 2003 TUSCS-CPS utilize their time as determinants of smoking cessation and tobacco use.

## The Tobacco use Special Cessation Supplement Items

The Supplement consisted of Items PEA1 through PEK5. All CPS household members age 15 years and older who had completed CPS Core items were eligible for these items.

Items for Both Proxy and Self-Respondents. Self-respondents were eligible for the entire supplement, whereas proxy respondents were only eligible for certain items. We only collected information from proxies on topics, such as smoking status (Items PEA1 - PEA3) and the use of other tobacco products, for example, pipes, cigars, chewing tobacco, and snuff (Items PEJ1a -PEJ2a).

Items for Self-Respondents Only. In addition to the smoking status and other tobacco use questions, we asked self-respondents various questions depending on their smoking status.

- We asked everyday, some days and former smokers a set of detailed smoking history questions tailored to their status (Items PEB1 - PEB11, PEC1 - PEC11, PEJ2b - PEJ3d_3 and PEH1NUM - PEH13d). This included special questions not asked before in earlier TUS-CPS series such as types of cigarettes smoked- menthol, lights, and the nature of addiction as well as attempts to quit smoking (latter Items PEDa - PED8, and PEJ4 - PEJ6bV).
- Questions which hadn't ever appeared before in previous TUS-CPS series regarding products, resources, and methods used to try to quit for current smokers (PEE1a - PEE2bSPC, and PEJ7a -PEJ7d@SPC) and for former smokers ( PEH10a - PEH11bSPC) were included in the 2003 supplements.
- In addition, we asked current smokers questions, such as whether the medical and dental community had advised them to quit smoking (PEF1 - PEF5, and PEJ7a - PEJ7d@SPC) or if they were planning to quit in the near future (PEG1 - PEG4).. Similar questions (H6a-H6b) on health professional advice to quit smoking were asked of former smokers, a novel approach for national surveys.
- New questions were included to examine use of new tobacco products that are claimed to have fewer harmful chemicals (PEJJ1@1 - PEJJ1@7).
- We also asked all self-respondents detailed questions on smoking policies in their work place (Items PEK1 - PEK3b), smoking rules in the home (Item PEK4) and we asked for their opinion about smoking in bars and cocktail lounges (Item PEK5).

NOTE: In the 2003 TUSCS-CPS both every day and some day current smokers who smoked at least 12 days in the last 30 days were asked about attempts to try to quit smoking lasting at least one day, including characteristics of the attempt(s). We did ask those some days smokers smoking less than 12 days during the past 30 days whether during the past 12 months, they had TRIED to QUIT smoking COMPLETELY (Da). Previous to 2001-02, only every day smokers were asked these questions on the TUS-CPS, and in 2001-02 all current cigarette smokers (both every day and some day smokers) were asked these questions.

Another generally unique feature of the 2003 TUSCS-CPS is asking former smokers questions on their previous level of addiction, products/resources/methods used to quit smoking, and advice from health professionals. This unique feature is not typical of other national surveys. This will enable elegant comparisons between characteristics of former smokers-"successful quitters" and current smokers attempting to quit.

Special Administrative Items. We also collected some special questions, such as who the proxy respondents were, the language in which the interview was conducted, the survey method (telephone vs. personal-visit interviews), Computer Assisted Telephone Interviewing (CATI) vs. Computer Assisted Personal Interviewing (CAPI), and the date of the interview.

## Data Processing

The data processing involved editing the February, June and November 2003 supplement data. This process is described on the next page.

## Edits, Allocations, and Recodes

Regular Edits. Data processing involved a consistency edit of all supplement items. The consistency edit ensured that the entries within an individual record followed the correct skip pattern. Items with missing entries were assigned values (allocations), if appropriate. The remaining items were not allocated.

Other Edits. We also edited the supplement data based on patterns of response, such as:
(1) making check items consistent with entries; (2) making the various records of proxy/self consistent with each other; and (3) assigning a code "88" in the variable PES78 (located in positions 1341-1342) when we knew that the interview was done by a proxy, but we did not know by whom.

Recodes. We also created an interview status recode and a smoking status recode. The interview status recode is identified by the variable "INTRVIEW" (located in positions 1347-1348), where Code 1 is an interview and Code 2 is a noninterview. The smoking status recode is identified by the variable "SMOKSTAT" (located in positions 1351-1352) where Code 1 is a "never smoker," Code 2 is an "everyday smoker," Code 3 is a "some days smoker," Code 4 is a "former smoker," and Code -9 is "indeterminate (unknown) smoking status."

The values and universes for each variable are defined in the supplement record layout (Attachment 7).

## Weighting

PWSSWGT for Labor Force Data. All adult records retain the "basic CPS weight," which reflects controlling for age, race, sex, and Hispanic origin estimates and individual state 16+ estimates. Use the basic CPS final weight PWSSWGT (located in positions 613:622) for tallying the labor force items. For a description of this weight, see Attachment 2, "Overview of the Current Population Survey."

Special Supplement Weights. This file contains two special supplement weights: a supplement nonresponse adjustment weight and a supplement self-response adjustment weight. In addition to maintaining national demographic totals (for age, sex, race, and origin), these weights were designed to maintain each state's population total.

Supplement Non-Response and Self-Response Weights. Use the supplement nonresponse adjustment weight PWNRWGT (located in positions 1363:1372) for tallying the supplement items. When you are interested in self-response analysis (especially for those items requiring self-response only), use the supplement self-response adjustment weight PWSRWGT (in positions 1373-1382) for tallying the supplement items.

Use of Weights When Using All Three Files. The best analysis of the Tobacco Use Supplement Special Cessation to the CPS data, especially for states, will come from combining the data in all three collection periods (February, June and November 2003). To use the weights when combining the three files, divide each weight by three. The Source and Accuracy Statement found in Attachment 16 contains a detailed description on how to use the Tobacco Use Special Cessation Supplement special parameters to make standard error estimates for single and combined files.

## February, June, and November 2003 NCI and CDC Co-Sponsored Tobacco use Special Cessation Supplement to the CPS File

## CPS Labor Force Data

The February 2003 CPS file contains 158,633 records. The June CPS file contains 157,585 records and the November CPS file contains 156,869 records. The first 856 characters contain the labor force data for each record. Attachment 6 contains the CPS Basic Items Record Layout, which includes the variable name, character size, location on the record, universe, and the possible values of each basic CPS variable included on the file.

The variable PRPERTYP (located in positions 161:162 on the CPS Basic Items Record Layout) determines the type of record as follows:

## PRPERTYP

$$
1 \text { = Child household member (0-14 years old) }
$$

2 = Adult civilian household member (15+ years old)
3 = Adult Armed Forces household member (15+ years old)
The variable HRINTSTA (located in positions 57:58 on the CPS Basic Items Record Layout) determines the interview status of the household.

HRINTSTA
1 = Interviewed
2 = Type A Noninterview (These records represent households that were eligible for CPS interview but were not interviewed because no one was home, household members were temporarily absent, etc.)

3 = Type B Noninterview (These records represent sample addresses determined to be ineligible for the CPS by virtue of a temporary situation, such as being vacant, nonresidential, etc. These households could become eligible for a CPS interview.)

4 = Type C Noninterview (These records represent sample addresses determined to be ineligible for CPS by virtue of a permanent change such as demolished, condemned, etc. These addresses will not be visited again for CPS interviews.)

The total number of records is determined by combining the values of PRPERTYP (1-3) and HRINTSTA (2-4).

The values of PRPERTYP are:

## Unweighted Counts

February 2003 June 2003 November 2003

| 1 = Child | 30,585 | 30,071 | 29,974 |
| :--- | ---: | ---: | ---: |
| 2 = Adult Civilian, 15 + | 110,711 | 110,160 | 109,363 |
| 3 = Adult, Armed Forces | $\underline{409}$ | $\underline{451}$ | $\frac{444}{139,781}$ |

The values of HRINTSTA are:

| 1 = Interview | 56,500 | 55,926 | 55,845 |
| :--- | ---: | ---: | ---: |
| 2 = Type A Noninterview | 4,622 | 4,244 | 4,396 |
| 3 = Type B Noninterview | 11,706 | 12,004 | 12,004 |
| 4 = Type C Noninterview | 600 | 655 | 688 |
|  | Total | 73,428 | 72,829 |

For Supplement non-response and Supplement self response rates, see Attachment 16, Source \& Accuracy Statement.

The total number of TUSCS-CPS interviewed adults 15+ (INTRVIEW = 1) are:

February 2003
68,954

June 2003
89,864

November 2003
90,802

## ATTACHMENT 4

## GLOSSARY

## Current Population Survey

Age-Age classification is based on the age of the person at his/her last birthday. The adult universe (i.e., population of marriageable age) is comprised of persons 15 years and over for CPS labor force data.

## Allocation Flag-Each edited item has a corresponding allocation flag indicating the nature of the edit. See the

 attachment on allocation flags for more information. The second character of the item name is always "X".Armed Forces-Demographic information for Armed Forces members (enumerated in off-base housing or on-base with their families) is included on the CPS data files. No labor force information is collected of Armed Forces members in any month. In March, supplemental data on income are included for Armed Forces members. This is the only month that non-demographic information is included for Armed Forces members.

## Civilian Labor Force-(See Labor Force.)

Class of Worker-This refers to the broad classification of the person's employer. These broad classifications for current jobs are:

1) Federal government
2) State government
3) Local government
4) Private industry (including self-employed, incorporated)
5) Self-employed (not incorporated)
6) Working without pay

Domain-The domain for an item is a list or range of its possible values. Note that all unedited items have possible values of -1 (blank), -2 (don't know), and -3 (refused). Since all items have these possible values, they are not shown as valid entries for each item.

Duration of Unemployment-Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed are continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of two weeks or more during which a person is employed or ceased looking for work is considered to break the continuity of the present period of seeking work.

Earners, Number of-The file includes all persons 15 years old and over in the household with $\$ 1$ or more in wages and salaries, or $\$ 1$ or more of a loss in net income from farm or nonfarm self-employment during the preceding year.

Edited item-An edited item is allocated or imputed by the processing system. In most cases this means allocating a value where the unedited item contains a value of blank, "don't know", or "refused". The second character of the item name is always " E ".

An edited version of an item exists only if that item is processed through the edits. If the edits never deal with a particular item, then that item only has an unedited version.

Since the instrument enforces skip patterns and consistency between many items, the edits are left mainly with the job of allocating missing values. Also, since an interviewer is allowed to "back up" in the interview, there may be "off-path" items filled in the unedited data. The edits also blank these off-path items if an edited version of the items exists.

## Education-(See Level of School Completed.)

## Employed-(See Labor Force.)

Family-A family is a group of two persons or more (one of whom is the householder) residing together and related by birth, marriage, or adoption. All such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family Household-A family household is a household maintained by a family (as defined above), and may include among the household members any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of Family).

Family Weight-This weight is used only for tallying family characteristics. In March, the weight on the family record is the March supplement weight of the householder or reference person.

Final Weight-Used in tabulating labor force items in all months, including March. The final weight is controlled to independent estimates for:

1) States
2) Origin, Sex, and Age
3) Age, Race, and Sex

This weight should not be used when tabulating March supplement data.
Full-Time Worker-Persons on full-time schedules include persons working 35 hours or more, persons who worked 1-34 hours for noneconomic reasons (e.g., illness) and usually work full-time, and persons "with a job but not at work" who usually work full-time.

Group Quarters-Group quarters are noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing nine or more persons unrelated to the person in charge.

Head Versus Householder-Beginning with the March 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used.

## Highest Grade of School Attended-(See Level of School Completed.)

Hispanic/Non-Hispanic Origin-A person's Hispanic/Non-Hispanic status in this file is determined on the basis of a question that simply ask "(Is/Are) (Name/you) Hispanic?"

Hours of Work-Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who is off on the Veterans Day holiday is reported as working 32 hours even though he is paid for the holiday.

For persons working in more than one job, the figures related to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Household-A household consists of all the persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live and eat with any other person in the structure, and when there is direct access from the outside or through a common hall. The count of households excludes persons living in group quarters, such as rooming houses, military barracks, and institutions. Inmates of institutions (mental hospitals, rest homes, correctional institutions, etc.) are not included in the survey.

Household Weight-The household weight is used for tallying household characteristics. In March, the household weight is the March Supplement weight of the householder.

Householder-The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Householder With No Other Relatives in Household-A householder who has no relatives living in the household. This is the entry for a person living alone. Another example is the designated householder of an apartment shared by two or more unrelated individuals.

Householder With Other Relatives (Including Spouse) in Household-The person designated as householder if he/she has one or more relatives (including spouse) living in the household.

Industry, Occupation, and Class of Worker (I\&O)-Current Job (basic data)-For the employed, current job is the job held in the reference week (the week before the survey). Persons with two or more jobs are classified in the job at which they worked the most hours during the reference week. The unemployed are classified according to their latest full-time job lasting two or more weeks or by the job (either full-time or part-time). The I \& O questions are also asked of persons not in the labor force who are in the fourth and eighth months in sample and who have worked in the last five years.

Job Seekers-All unemployed persons who made specific efforts to find a job sometime during the 4-week period preceding the survey week.

Longitudinal Weight-Used for gross flows analysis. Only found on adult records matched from month to month.
PEMLR-(Major Labor Force Recode)-This classification is available for each civilian 15 years old and over according to his/her responses to the monthly (basic) labor force items.

Labor Force-Persons are classified as in the labor force if they are employed, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" includes all civilians classified as employed or unemployed.

The file includes labor force data for civilians age 15 and over. However, the official definition of the civilian labor force is age 16 and over.

## 1. Employed

Employed persons comprise (1) all civilians who, during the survey week, do any work at all as paid employees or in their own business or profession, or on their own farm, or who work 15 hours or more as unpaid workers on a farm in a business operated by a member of the family; and (2) all those who have jobs but who are not working because of illness, bad weather, vacation, or labor-management dispute, or because they are taking time off for personal reasons, whether or not they are seeking other jobs. These persons would have a Monthly Labor Force Recode (MLR) of 1 or 2 respectively in characters 180-181 of the person record which designates "at work" and "with a job, but not at work." Each employed person is counted only once. Those persons who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week. If they worked an equal number of hours at more than one job, they are counted at the job they held the longest.

## 2. Unemployed

Unemployed persons are those civilians who, during the survey week, have no employment but are available for work, and (1) have engaged in any specific job seeking activity within the past 4 weeks such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) are waiting to be called back to a job from which they had been laid off; or (3) are waiting to report to a new wage or salary job within 30 days. These persons would have an MLR code of 3 or 4 in characters 180-181 of the person record. The unemployed includes job leavers, job losers, new job entrants, and job reentrants.
a. Job Leavers

Persons who quit or otherwise terminate their employment voluntarily and immediately begin looking for work.
b. Job Losers

Persons whose employment ends involuntarily, who immediately begin looking for work, and those persons who are already on layoff.
c. New Job Entrants

Persons who never worked at a full-time job lasting two weeks or longer.

## d. Job Reentrants

Persons who previously worked at a full-time job lasting two weeks or longer but are out of the labor force prior to beginning to look for work.

Finally, it should be noted that the unemployment rate represents the number of persons unemployed as a percent of the civilian labor force 16 years old and over. This measure can also be computed for groups within the labor force classified by sex, age, marital status, race, etc. The job loser, job
leaver, reentrant, and new entrant rates are each calculated as a percent of the civilian labor force 16 years old and over; the sum of the rates for the four groups thus equals the total unemployment rate.

## 3. Not in Labor Force

All civilians 15 years old and over who are not classified as employed or unemployed. These persons are further classified by major activity: retired, unable to work because of long-term physical or mental illness, and other. The "other" group includes, for the most part, students and persons keeping house. Persons who report doing unpaid work in a family farm or business for less than 15 hours are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are asked only in those households that are in the fourth and eighth months of the sample, i.e., the "outgoing" groups, those which had been in the sample for three previous months and would not be in for the subsequent month.

Persons classified as NILF have an MLR code of 5-7 in characters 180-181 of the person record.
Layoff-A person who is unemployed but expects to be called back to a specific job. If he/she expects to be called back within 30 days, it is considered a temporary layoff; otherwise, it is an indefinite layoff.

Level of School Completed/Degree Received-These data changed beginning with the January 1992 file. A new question, "What is the highest level of school ... has completed or the highest degree ... has received?" replaced the old "Highest grade attended" and "Year completed" questions. The new question provides more accurate data on the degree status of college students. Educational attainment applies only to progress in "regular" school. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to a school in the regular school system.

Looking for Work-A person who is trying to get work or trying to establish a business or profession.
Marital Status-The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of enumeration.

The category "married" is further divided into "married, civilian spouse present," "married, Armed Force spouse present," "married, spouse absent," "married, Armed Force spouse absent," and "separated." A person is classified as "married, spouse present" if the husband or wife is reported as a member of the household even though he or she may be temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as "separated" included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily estranged from their spouses because of marital discord.

For the purpose of this file, the group "other marital status" includes "widowed and divorced," "separated," and "other married, spouse absent."

Month-In-Sample-The term is defined as the number of times a unit is interviewed. Each unit is interviewed eight times during the life of the sample.

Never Worked-A person who has never held a full-time civilian job lasting two consecutive weeks or more.
Nonfamily Householder-A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Nonworker-A person who does not do any work in the calendar year preceding the survey.
Nonrelative of Householder With No Own Relatives in Household-A nonrelative of the householder who has no relative(s) of his own in the household. This category includes such nonrelatives as a foster child, a ward, a lodger, a servant, or a hired hand, who has no relatives of his own living with him in the household.

Nonrelative of Householder With Own Relatives (Including Spouse)in Household-Any household member who is not related to the householder but has relatives of his own in the household; for example, a lodger, his spouse, and their son.

Other Relative of Householder-Any relative of the householder other than his spouse or child; for example, father, mother, grandson, daughter-in-law, etc.

Out Variable-An instrument-created item that stores the results of another item.
Own Child-A child related by birth, marriage, or adoption to the family householder.
Part-Time, Economic Reasons-The item includes slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. (See also Full-Time Worker.)

Part-Time, Other Reasons-The item includes labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season.

Part-Time Work-Persons who work between 1 and 34 hours are designated as working "part-time" in the current job held during the reference week. For the March supplement, a person is classified as having worked part-time during the preceding calendar year if he worked less than 35 hours per week in a majority of the weeks in which he worked during the year. Conversely, he is classified as having worked full-time if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Part-Year Work-Part-year work is classified as less than 50 weeks' work.
Population Coverage-Population coverage includes the civilian population of the United States plus approximately 820,000 members of the Armed Forces in the United States living off post or with their families on post but excludes all other members of the Armed Forces. This file excludes inmates of institutions. The labor force and work experience data are not collected for Armed Forces members.

Processing Recode-An item calculated by the processing system from a combination of other items in the database. The second character of the item name is always " R ".

Race-The population is divided into three groups on the basis of race: White, Black, and Other races. The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In most of the published tables, "Other Races" are shown in total population.

Reentrants-Persons who previously worked at a full-time job lasting two weeks or longer but who are out of the labor force prior to beginning to look for work.

Related Children-Related children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25 " and "own children of any age," include all children regardless of marital status. The totals include nevermarried children living away from home in college dormitories.

Related Subfamily-A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the householder or spouse. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the number of families.

School-A person who spent most of his time during the survey week attending any kind of public or private school, including trade or vocational schools in which students receive no compensation in money or kind.

Secondary Individual-A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily households and inmates of institutions) who is not related to any other person in the household or group quarters.

Self-Employed-Self-employed persons are those who work for profit or fees in their own business, profession or trade, or operate a farm.

Stretches of Unemployment-A continuous stretch is one that is not interrupted by the person getting a job or leaving the labor market to go to school, to keep house, etc. A period of two weeks or more during which a person is employed or ceased looking for work is considered to break the continuity of the period of seeking work.

Unable to Work-A person is classified as unable to work because of long-term physical or mental illness, lasting six months or longer.

Unedited item-An item that is produced by the CAPI instrument, either collected during the interview or created by the CAPI instrument. The second character of the item name is always "U".

## Unemployed-(See Labor Force.)

Unpaid Family Workers-Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by birth or marriage.

Unrelated Individuals-Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a nonfamily householder living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Unrelated Subfamily-An unrelated subfamily is a family that does not include among its members the householder and relatives of the householder. Members of unrelated subfamilies may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of families. However, the number of such unrelated subfamilies became so small ( 37,000 in 1967) that beginning with the data for 1968 (and beginning with the census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Veteran Status-If a male served at any time during the four major wars of this century, the code for the most recent wartime service is entered. The following codes are used:

0 Children under 15
1 Vietnam era
2 Korean
3 WWI
4 WWII
5 Other Service
6 Nonveteran
Wage and Salary Workers-Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Also included are persons who are self-employed in an incorporated business.

Workers-(See Labor Force--Employed.)
Work Experience-Includes those persons who during the preceding calendar year did any work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Year-Round Full-Time Worker-A year-round full-time worker is one who usually worked 35 hours or more per week for 50 weeks or more during the preceding calendar year.

## ATTACHMENT 5

## HOW TO USE THE RECORD LAYOUT

Data users familiar with the CPS data files in prior years will see many similarities between the format of this file and those files released before January 1994. As in the past, there are numeric locations on the file which correspond to each variable. There is only one record layout which contains the variables for children, adults, and armed forces members. In prior years, each type of person had a separate record layout.

## Item Naming Conventions

- The first character of each variable name is one of the following:

H - Household item
G - Geography item

* P - Person item (includes adult items, child items, and armed forces items)
* There is no need to distinguish adult, child, and armed forces items in the variable names in the new system. The recode PRPERTYP (located in positions 161-162) tells you what category the person is in.
- The second character of each variable name is one of the following:

E - Edited item
U - Unedited item
X - Allocation flag (see Attachment 16 for more information)
W - Weight
R - Recode

- The remaining characters describe the variable.
- For multiple entry items, the file contains a separate variable for each possible response. Each item has the same descriptive name but a number is added as the last digit. For example, Question 22A allows separate entries for up to 6 job search methods. The item names are PELKM1 (this item is edited), PULKM2, (this item is unedited), PULKM3, etc. These items are located in positions 296-307 of the record layout.

## SUPPLEMENT QUESTIONNAIRE

February 2003, June 2003, and November 2003
Tobacco Use Supplement

PRESUP This month we would also like to ask about your thoughts and experiences concerning tobacco use. I need to ask each individual, age 15 years old and older, these questions.

## ENTER (P) TO PROCEED

## ENTER (I) FOR IMPORTANCE OF RESPONDING

H_SUPP_I The information you give is important. Answers to the tobacco use questions will be used by the National Cancer Institute, the Centers for Disease Control and Prevention, other researchers, national, state, and local public health officials, and others to measure changes in America's use of tobacco products, work place policies, medical doctor and dentist advice, and opinions towards tobacco use.

NXTPR ENTER LINE NO: $|\ldots|$ _ $\mid$ FOR [fill name]
I (also) need to talk with [fill name/READ LIST OF NEEDED PERSONS]. Is he/she at home now/Are either of them at home now/Are any of them at home now)?

NO ONE ELIGIBLE, SKIP TO FIN (F10) IF ANSWERED, JUMP FORWARD (F3)

GET SELF RESPONSE ONLY. WHEN DONE, F10 FOR CALLBACKS CALLBACK \#: [fill number]

## INDUSTRY CLASSIFICATION

Industry Classification Codes for Detailed Industry (4 digit) (Changes from 2000 Census classification noted)

These categories are aggregated into 52 detailed groups and 14 major groups (see page A-11). The codes in the right hand column are the 2002 NAICS equivalent. Changes from the Census 2000 classification are noted by asterisks (*).

These codes correspond to Items PEIO1ICD and PEIO2ICD, in positions 856-859 and 864-867 of the Basic CPS record layout in all months, except March. In the March, these codes correspond to PEIOIND, in positions $87-90$ of the Person record.

## ATTACHMENT 10

## OCCUPATION CLASSIFICATION

(Beginning January 2003)

These categories are aggregated into 23 detailed groups and 11 major groups (see page B-15). The codes in the right hand column are the 2002 NAICS equivalent. Changes from the Census 2000 classification are noted by an asterisk (*).

These codes correspond to Items PEIO1OCD and PEIO2OCD in positions 860-863 and 868-871 of the Basic CPS record layout in all months except March. In March, these codes correspond to Item PEIOOCC, and are located in positions 91-94 of the Persons Record.

## ATTACHMENT 11

Specific Metropolitan Identifiers

The specific metropolitan identifiers on this file are based on the Office of Management and Budget's June 30, 1993 definitions. MSA's and PMSA's can be identified by using the FIPS MSA/PMSA code (List 3).
Identification of individual central cities is based on acombination of codes (List 2). Individual central cities are identified by the appropriate central city code and the FIPS MSA/PMSA code. Some examples of the proper coding of specific metropolitan areas are given below:

| AREA | INDIVIDUAL <br> CENTRAL <br> CITY CODE <br> (GEINDVCC) | FIPS <br> MSA/PMSA <br> CODE <br> (GEMSA) | FIPS <br> CMSA <br> CODE <br> (GECMSA) |
| :---: | :---: | :---: | :---: |
|  | List 4 | List 2 or 3 | List 1 or 2 |
| Dallas-Fort Worth, TX CMSA | N/C | 1920 and 2800 | 31 |
| Fort Worth-Arlington, TX PMSA | N/C | 2800 | N/C |
| Fort Worth, TX Central City | 1 | 2800 | N/C |
| Phoenix, AZ MSA | N/C | 6200 | N/C |
| Mesa, AZ Central City | 2 | 6200 | N/C |
| Burlington, VT MSA | N/C | 1305 | N/C |
|  | N/C = No Code |  |  |

## NOTE:

Many of the smaller metropolitan areas in sample do not contain central city/balance breakdowns and hence, are coded "not identifiable" in the household metropolitan statistical area residence status code (GEMSAST). It is recommended that this code in conjunction with the modified household metropolitan statistical area residence status code (GEMETSTA) be used for tallying metropolitan residence status for national and other grouped data. The GE in each variable name refers to Household Geographic.

## Topcoding of Usual Hourly Earnings

This variable will be topcoded based on an individual's usual hours worked variable, if the individual's edited usual weekly earnings variable is $\$ 999$. The topcode is computed such that the product of usual hours times usual hourly wage does not exceed an annualized wage of $\$ 150,000$ ( $\$ 2885.00$ per week). Below is a list of the appropriate topcode

| Hours | Topcode | Hours | Topcode | Hours | Topcode |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |
| 1 | None | 34 | $\$ 84.85$ | 67 | $\$ 43.06$ |
| 2 | None | 35 | $\$ 82.43$ | 68 | $\$ 42.43$ |
| 3 | None | 36 | $\$ 80.14$ | 69 | $\$ 41.81$ |
| 4 | None | 37 | $\$ 77.97$ | 70 | $\$ 41.21$ |
| 5 | None | 38 | $\$ 75.92$ | 71 | $\$ 40.63$ |
| 6 | None | 39 | $\$ 73.97$ | 72 | $\$ 40.07$ |
| 7 | None | 40 | $\$ 72.13$ | 73 | $\$ 39.52$ |
| 8 | None | 41 | $\$ 70.37$ | 74 | $\$ 38.99$ |
| 9 | None | 42 | $\$ 68.69$ | 75 | $\$ 38.47$ |
| 10 | None | 43 | $\$ 67.09$ | 76 | $\$ 37.96$ |
| 11 | None | 44 | $\$ 65.57$ | 77 | $\$ 37.47$ |
| 12 | None | 45 | $\$ 64.11$ | 78 | $\$ 36.99$ |
| 13 | None | 46 | $\$ 62.72$ | 79 | $\$ 36.52$ |
| 14 | None | 47 | $\$ 61.38$ | 80 | $\$ 36.06$ |
| 15 | None | 48 | $\$ 60.10$ | 81 | $\$ 35.62$ |
| 16 | None | 49 | $\$ 58.88$ | 82 | $\$ 35.18$ |
| 17 | None | 50 | $\$ 57.70$ | 83 | $\$ 34.76$ |
| 18 | None | 51 | $\$ 56.57$ | 84 | $\$ 34.35$ |
| 19 | None | 52 | $\$ 55.48$ | 85 | $\$ 33.94$ |

## CURRENT POPULATION SURVEY

Selected Unweighted Tallies from the February, June, and November 2003 Tobacco Use Supplement

## ITEM VALUE

PEA1 Have you smoked at least 100 cigarettes in your entire life?

| -9 | $=$ No response | 0 | 1 | 0 |
| ---: | :--- | ---: | ---: | ---: |
| -3 | $=$ Refused | 66 | 158 | 122 |
| $-2=$ Don't know | 203 | 310 | 310 |  |
| $-1=$ Not in universe | 13,574 | 20,077 | 18,337 |  |
| $1=$ Yes | 26,014 | 33,179 | 33,553 |  |
| 2 | $=$ No | 42,671 | 56,216 | 56,817 |

PEA3 Do you now smoke cigarettes every day, some days, or not at all?

| -9 = No response | 35 | 60 | 46 |
| :---: | :---: | :---: | :---: |
| -3 = Refused | 56 | 112 | 84 |
| -2 = Don't know | 32 | 35 | 46 |
| -1 $=$ Not in universe | 56,514 | 76,762 | 75,586 |
| 1 = Every day | 10,162 | 13,129 | 13,096 |
| 2 = Some days | 2,294 | 2,919 | 2,829 |
| 3 = Not at all | 13,534 | 16,924 | 17,452 |

PEB1a Would you say that, on average, you now smoke more or less than 20 cigarettes each day?

| -9 | $=$ No response | 9 | 17 | 24 |
| ---: | :--- | ---: | ---: | ---: |
| -3 | Refused | 40 | 83 | 60 |
| -2 | Don't know | 14 | 26 | 29 |
| -1 | Not in universe | 82,407 | 109,725 | 108,937 |
| 1 | More | 11 | 14 | 27 |
| 2 | Less | 30 | 49 | 40 |
| 3 | $=$ About 20 (one pack) | 17 | 27 | 22 |

## ITEM VALUE

PEB2 Is your usual cigarette brand menthol or non-menthol?

| -9 = No response | 15 | 34 | 37 |
| :---: | :---: | :---: | :---: |
| -3 $=$ Refused | 60 | 115 | 107 |
| -2 = Don't know | 24 | 32 | 31 |
| -1 = Not in universe | 74,354 | 99,509 | 99,168 |
| 1 = Menthol | 2,044 | 2,542 | 2,485 |
| 2 = Non-menthol | 5,828 | 7,463 | 7,050 |
| 3 = No usual type | 203 | 246 | 261 |

PEC2 Is your usual cigarette brand menthol or non-menthol?

| -9 | $=$ No response |
| :--- | :--- |
| -3 | $=$ Refused |
| -2 | $=$ Don't Know |
| -1 | $=$ Not in universe |
| 1 | $=$ Yes |
| 2 | $=$ No |
| During the past 12 months, have you tried to quit |  |
| smoking completely? |  |

| -9 | $=$ No response | 15 | 26 | 22 |
| ---: | :--- | ---: | ---: | ---: |

## ALLOCATION FLAGS

## Current Population Survey

For every edited item, there is a corresponding allocation flag with the prefix "PX". The last six characters of the names are the same. For example, PXMLR is the allocation flag for PEMLR. All allocation flags have the following list of possible values.

| 00 | VALUE - NO CHANGE |
| :--- | :--- |
| 01 | BLANK - NO CHANGE |
| 02 | DON'T KNOW - NO CHANGE |
| 03 | REFUSED - NO CHANGE |
| 10 | VALUE TO VALUE |
| 11 | BLANK TO VALUE |
| 12 | DON'T KNOW TO VALUE |
| 13 | REFUSED TO VALUE |
| 20 | VALUE TO LONGITUDINAL VALUE |
| 21 | BLANK TO LONGITUDINAL VALUE |
| 22 | DON'T KNOW TO LONGITUDINAL VALUE |
| 23 | REFUSED TO LONGITUDINAL VALUE |
| 30 | VALUE TO ALLOCATED VALUE LONG. |
| 31 | BLANK TO ALLOCATED VALUE LONG. |
| 32 | DON'T KNOW TO ALLOCATED VALUE LONG. |
| 33 | REFUSED TO ALLOCATED VALUE LONG. |
| 40 | VALUE TO ALLOCATED VALUE |
| 41 | BLANK TO ALLOCATED VALUE |
| 42 | DON'T KNOW TO ALLOCATED VALUE |
| 43 | REFUSED TO ALLOCATED VALUE |
| 50 | VALUE TO BLANK |

## CURRENT POPULATION SURVEY

Source and Accuracy Statement for the February 2003, June 2003, and November 2003 Microdata Files on Tobacco Use

## SOURCE OF DATA

The data for these microdata files are from the February 2003, June 2003, and November 2003 Current Population Survey (CPS). The Census Bureau conducts the CPS every month, although these files have only February 2003, June 2003, and November 2003 data. The survey uses two sets of questions, the basic CPS and a set of supplemental questions. The basic CPS, sponsored jointly by the U.S. Census Bureau and the U.S. Bureau of Labor Statistics, is the country's primary source of labor force statistics for the entire population. The National Cancer Institute (NCI) and the Centers for Disease Control and Prevention (CDC), both of the Department of Health and Human Services, have jointly sponsored the supplemental questions for the Tobacco Use Supplement since 2001, while NCI has sponsored it since 1992.

Basic CPS. The monthly CPS collects primarily labor force data about the civilian noninstitutional population living in the United States. The institutionalized population, which is excluded from the population universe, is composed primarily of the population in correctional institutions and nursing homes ( 91 percent of the 4.1 million institutionalized people in Census 2000). Interviewers ask questions concerning labor force participation about each member 15 years old and over in sample households. Typically, the week containing the nineteenth of the month is the interview week. The week containing the twelfth is the reference week (i.e., the week about which the labor force questions are asked).

The CPS uses a multistage probability sample based on the results of the decennial census, with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. When files from the most recent decennial census become available, the Census Bureau gradually introduces a new sample design for the CPS. ${ }^{1}$ This sample was selected from 1990 Decennial Census files.

In the first stage of the sampling process, primary sampling units (PSUs) ${ }^{2}$ are selected for sample. In the 1990 design, the United States was divided into 2,007 PSUs, and these were grouped into 754 strata. Within each stratum, a single PSU is chosen for the sample, with its probability of selection proportional to its population as of the most recent decennial census. This PSU represents the entire stratum from which it was selected. In the case of strata consisting of only one PSU, the PSU is chosen with certainty.

[^0]Approximately 73,000 housing units were selected for sample from the sampling frame in February, June, and November. Based on eligibility criteria, 11 percent of these housing units were sent directly to computer-assisted telephone interviewing (CATI). The remaining units were assigned to interviewers for computer-assisted personal interviewing (CAPI). ${ }^{3}$ Of all housing units in sample, about 61,000, 60,000, and 60,000 were determined to be eligible for interview in February, June, and November, respectively. Interviewers obtained interviews at about 57,000, 56,000, and 56,000 of these units in February, June, and November, respectively. Noninterviews occur when the occupants are not found at home after repeated calls or are unavailable for some other reason.

The number of households that are eligible for interview in the basic CPS increased from 50,000 to 60,000 in July of 2001. This increase in the number of eligible households was due to the implementation of the State Children's Health Insurance Program (SCHIP) sample expansion. The SCHIP sample expansion increases the monthly CPS sample in states with high sampling errors for low-income uninsured children. With the increase in eligible households, the number of units where interviewers were unable to obtain an interview increased from 3,200 to 4,500.

February, June, and November 2003 Supplements. In addition to the basic CPS questions, interviewers asked supplementary questions on tobacco use in these months. The tobacco use supplement is a large, nationally representative survey, which enables it to produce national, state, and some substate estimates. The tobacco use supplement collected information from about 250,000 respondents in the 2003 survey period. Approximately 75 percent of supplement respondents are interviewed by CATI and 25 percent by CAPI. For some measures of use, approximately 20 percent of responses are proxy responses, with the rest of the data collected through self-response. See reference [3] for more information.

Basic CPS Estimation Procedure. This survey's estimation procedure adjusts weighted sample results to agree with independently derived population estimates of the civilian noninstitutional population of the United States and each state (including the District of Columbia). These population estimates, used as controls for the CPS, are prepared monthly to agree with the most current set of population estimates that are released as part of the Census Bureau's population estimates and projections program.

The population controls for the nation are distributed by demographic characteristics in two ways:

- Age, sex, and race (White alone, Black alone, and all other race groups combined).
- Age, sex, and Hispanic origin.

The projections for the states are distributed by race (Black alone and all other race groups combined), age ( $0-15,16-44$, and 45 and over), and sex.

The independent estimates by age, sex, race, and Hispanic origin, and for states by selected age groups and broad race categories, are developed using the basic demographic accounting formula whereby the population from the latest decennial data is updated using data on the components of

[^1]population change (births, deaths, and net international migration) with net internal migration as an additional component in the state population estimates.

The net international migration component in the population estimates includes a combination of the following:

- Legal migration to the United States.
- Emigration of foreign born and native people from the United States.
- Net movement between the United States and Puerto Rico.
- Estimates of temporary migration.
- Estimates of net residual foreign-born population, which include unauthorized migration.

Because the latest available information on these components lags the survey date, it is necessary to make short-term projections of these components to develop the estimate for the survey date.

Supplement Estimation Procedure. In addition to the CPS estimation procedure, the tobacco use supplement uses a supplement noninterview adjustment and a supplement self-response adjustment. The supplement noninterview adjustment accounts for occupied sample households that responded to and completed the CPS, but not the supplement questionnaire. The selfresponse adjustment accounts for the elimination of interviews which were completed by proxy.

NOTE: The CPS household weight (HWHHWGT) adjusts for household nonresponse. Additional calculations are needed to create a supplement household weight. There are two sets of supplement weights on this microdata file. The nonresponse weight (PWNRWGT) includes only the noninterview adjustment. The self-response weight (PWSRWGT) includes both the noninterview adjustment and the self-response adjustment.

## ACCURACY OF THE ESTIMATES

A sample survey estimate has two types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of error. The nature of the sampling error is known given the survey design; the full extent of the nonsampling error is unknown.

Sampling Error. Since the CPS estimates come from a sample, they may differ from figures from an enumeration of the entire population using the same questionnaires, instructions, and enumerators. For a given estimator, the difference between an estimate based on a sample and the estimate that would result if the sample were to include the entire population is known as sampling error. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of the magnitude of sampling error. However, they may include some nonsampling error.

Nonsampling Error. For a given estimator, the difference between the estimate that would result if the sample were to include the entire population and the true population value being estimated is known as nonsampling error. There are several sources of nonsampling error, which may occur during the development, or execution of the survey. It can occur because of circumstances
created by the interviewer, the respondent, the survey instrument, or the way the data are collected and processed. For example, errors could occur because:

- The interviewer records the wrong answer, the respondent provides incorrect information, the respondent estimates the requested information, or an unclear survey question is misunderstood by the respondent (measurement error).
- Some individuals or businesses, which should have been included in the survey frame, were missed (coverage error).
- Responses are not collected from all those in the sample or the respondent is unwilling to provide information (nonresponse error).
- Values are estimated imprecisely for missing data (imputation error).
- Forms may be lost; data may be incorrectly keyed, coded, or recoded, etc. (processing error).

The Census Bureau employs quality control procedures throughout the production process, including the overall design of surveys, the wording of questions, the review of the work of interviewers and coders, and the statistical review of reports to minimize these errors.

Two types of nonsampling error that can be examined to a limited extent are nonresponse and undercoverage.

Nonresponse. The effect of nonresponse cannot be measured directly, but one indication of its potential effect is the nonresponse rate. Table 1 shows nonresponse rates for the basic CPS and its February, June, and November 2003 supplements.

| Month | Basic CPS (household nonresponse rate) | Supplement (person nonresponse rates) |  |
| :---: | :---: | :---: | :---: |
|  |  | Total (self and proxy) | Self response only |
| February 2003 | 7.6\% | 16.4\% | 34.2\% |
| June 2003 | 7.1\% | 18.3\% | 36.4\% |
| November 2003 | 7.3\% | 16.8\% | 38.6\% |

The basic CPS nonresponse rates are for households; nonresponse rates for the supplement are for people. In order for an individual to be eligible for the supplement, the individual's basic CPS questionnaire must have been completed. The "Total (self and proxy)" column allows proxy interviews. The "Self response only" column counts proxy responses as noninterviews.

Coverage. The concept of coverage in the survey sampling process is the extent to which the total population that could be selected for sample "covers" the survey's target population. Missed housing units and missed people within sample households create undercoverage in the CPS. Overall CPS undercoverage for February, June, and November 2003 is estimated to be about 11 percent. CPS coverage varies with age, sex, and race. Generally, coverage is larger for females than for males and larger for non-Blacks than for Blacks. This differential coverage is a general problem for most household-based surveys.

The CPS weighting procedure partially corrects for bias due to undercoverage, but biases may still be present when people who are missed by the survey differ from those interviewed in ways other than age, race, sex, Hispanic origin, and state of residence. How this weighting procedure affects other variables in the survey is not precisely known. All of these considerations affect comparisons across different surveys or data sources.

A common measure of survey coverage is the coverage ratio, calculated as the estimated population before post-stratification divided by the independent population control. Table 2 shows November 2003 CPS coverage ratios by age and sex for certain race and Hispanic groups. The CPS coverage ratios can exhibit some variability from month to month.

| Age Group | Total |  |  | White Only |  | Black Only |  | Residual Race |  | Hispanic |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | All People | Male | Female | Male | Female | Male | Female | Male | Female | Male | Female |
| 0-15 | 0.91 | 0.90 | 0.92 | 0.93 | 0.95 | 0.79 | 0.81 | 0.90 | 0.92 | 0.92 | 0.99 |
| 16-19 | 0.84 | 0.84 | 0.85 | 0.86 | 0.87 | 0.77 | 0.78 | 0.77 | 0.73 | 0.91 | 0.88 |
| 20-24 | 0.79 | 0.75 | 0.82 | 0.77 | 0.84 | 0.65 | 0.71 | 0.78 | 0.81 | 0.84 | 0.92 |
| 25-34 | 0.85 | 0.82 | 0.87 | 0.85 | 0.89 | 0.70 | 0.78 | 0.78 | 0.83 | 0.76 | 0.87 |
| 35-44 | 0.89 | 0.86 | 0.93 | 0.88 | 0.95 | 0.73 | 0.85 | 0.81 | 0.85 | 0.82 | 0.91 |
| 45-54 | 0.91 | 0.89 | 0.93 | 0.91 | 0.93 | 0.83 | 0.94 | 0.84 | 0.86 | 0.84 | 0.82 |
| 55-64 | 0.91 | 0.92 | 0.91 | 0.92 | 0.90 | 0.93 | 0.94 | 0.91 | 0.86 | 0.85 | 0.85 |
| 65+ | 0.90 | 0.92 | 0.89 | 0.93 | 0.89 | 0.93 | 0.92 | 0.82 | 0.79 | 0.85 | 0.78 |
| 15+ | 0.88 | 0.87 | 0.89 | 0.88 | 0.91 | 0.78 | 0.85 | 0.82 | 0.83 | 0.82 | 0.87 |
| 0+ | 0.89 | 0.87 | 0.90 | 0.89 | 0.91 | 0.78 | 0.84 | 0.84 | 0.85 | 0.85 | 0.91 |

Notes: (1) The Residual race group includes cases indicating a single race other than White or Black, and cases indicating two or more races.
(2) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Therefore, caution should be used when comparing results from different sources.

Data users should be careful when comparing the data from these microdata files, which reflect Census 2000-based controls, with microdata files from March 1994 through December 2002, which reflect 1990 census-based controls. Ideally, the same population controls should be used when comparing any estimates. In reality, the use of same population controls is not practical when comparing trend data over a period of 10 to 20 years. Thus, when it is necessary to combine or compare data based on different controls or different designs, data users should be aware that changes in weighting controls or weighting procedures can create small differences between estimates. See the discussion following for information on comparing estimates derived from different controls or different sample designs.

Microdata files from previous years reflect the latest available census-based controls. Although this change in population controls had relatively little impact on summary measures such as
averages, medians, and percentage distributions, it did have a significant impact on levels. For example, use of Census 2000-based controls results in about a one percent increase from the 1990 census-based controls in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 2003 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain population subgroups than for the total population.

Note that certain microdata files from 2002, namely June, October, and November, and the 2002 ASEC, contain both Census-2000 based estimates and 1990 census-based estimates and are subject to the comparability issues discussed above. All other microdata files from 2002 reflect the 1990 census-based controls.

Based on the results of each decennial census, the Census Bureau gradually introduces a new sample design for the CPS. During this phase-in period, CPS data are collected from sample designs based on different censuses. While most CPS estimates were unaffected by this mixed sample, geographic estimates are subject to greater error and variability. Users should exercise caution when comparing metropolitan and nonmetropolitan estimates across years with a design change, especially at the state level.

Caution should also be used when comparing Hispanic estimates over time. No independent population control totals for people of Hispanic origin were used before 1985.

A Nonsampling Error Warning. Since the full extent of the nonsampling error is unknown, one should be particularly careful when interpreting results based on small differences between estimates. The Census Bureau recommends that data users incorporate information about nonsampling errors into their analyses, as nonsampling error could impact the conclusions drawn from the results. Caution should also be used when interpreting results based on a relatively small number of cases. Summary measures (such as medians and percentage distributions) probably do not reveal useful information when computed on a subpopulation smaller than 75,000.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to references [2] and [4].

Standard Errors and Their Use. The sample estimate and its standard error enable one to construct a confidence interval. A confidence interval is a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis is that the population parameters are different. An example of this would be comparing the proportion of male every-day smokers to the proportion of female every-day smokers.

Tests may be performed at various levels of significance. A significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. For example, to conclude that two characteristics are different at the 0.10 level of significance, the absolute value of the estimated difference between characteristics must be greater than or equal to 1.645 times the standard error of the difference.

The Census Bureau uses 90-percent confidence intervals and 0.10 levels of significance to determine statistical validity. Consult standard statistical textbooks for alternative criteria.

Estimating Standard Errors. The Census Bureau uses replication methods to estimate the standard errors of CPS estimates. These methods primarily measure the magnitude of sampling error. However, they do measure some effects of nonsampling error as well. They do not measure systematic biases in the data associated with nonsampling error. Bias is the average over all possible samples of the differences between the sample estimates and the true value.

Estimates of the 15 to 17 year old age groups and estimates of other similarly small subgroups are likely to yield imprecise standard errors that may be too low.

Generalized Variance Parameters. While it is possible to compute and present an estimate of the standard error based on the survey data for each estimate in a report, there are a number of reasons why this is not done. A presentation of the individual standard errors would be of limited use, since one could not possibly predict all of the combinations of results that may be of interest to data users. Additionally, data users have access to the CPS microdata files, and it is impossible to compute in advance the standard error for every estimate one might obtain from those data sets. Moreover, variance estimates are based on sample data and have variances of their own. Therefore, some methods of stabilizing these estimates of variance, for example, by generalizing or averaging over time, may be used to improve their reliability.

Experience has shown that certain groups of estimates have similar relationships between their variances and expected values. Modeling or generalizing may provide more stable variance estimates by taking advantage of these similarities. The generalized variance function is a simple model that expresses the variance as a function of the expected value of the survey estimate. The parameters of the generalized variance function are estimated using direct replicate variances. These generalized variance parameters provide a relatively easy method to obtain approximate standard errors for numerous characteristics. In this source and accuracy statement, Table 4 provides the generalized variance parameters for labor force estimates,

Tables 5 and 6 provide generalized variance parameters for tobacco use nonresponse data and tobacco use self-response data. Tables 7 and 8 provide factors and population controls to derive U.S. state and regional parameters.

These parameters are designed to estimate the standard error of the number of people with a certain characteristic, not the number of tobacco products. For example, use Formula (1) below to estimate the standard error of the number of people who have ever smoked, and use Formula (2) to estimate the standard error of the percentage of people reporting a smoke-free environment. To estimate the standard error of a number of tobacco products, such as the average number of cigarettes smoked per day, use Formula (8). This formula is based on the distribution of the number of people using different amounts of tobacco products.

NOTE: The generalized variance parameters given in this document cannot be used when estimating variances for complex analysis research such as linear regression. Variances must be estimated using replicate weights for those types of analyses from the tobacco use supplement data. Replicate weights can be obtained from NCI upon request.

The basic CPS questionnaire records the race and ethnicity of each respondent. With respect to race, a respondent can be White, Black, Asian, American Indian and Alaskan Native (AIAN), Native Hawaiian and Other Pacific Islander (NHOPI), or combinations of two or more of the preceding. A respondent’s ethnicity can be Hispanic or non-Hispanic, regardless of race.

The generalized variance parameters to use in computing standard errors are dependent upon the race/ethnicity group of interest. The following table summarizes the relationship between the race/ethnicity group of interest and the generalized variance parameters to use in standard error calculations.

Table 3. Estimation Groups of Interest and Generalized Variance Parameters

| Race/ethnicity group of interest | Generalized variance parameters to <br> use in standard error calculations |
| :--- | :---: |
| Total population | Total or White |
| Total White, White AOIC, or White non-Hispanic population | Total or White |
| Total Black, Black AOIC, or Black non-Hispanic population | Black |
| Total API, AIAN, NHOPI; <br> API, AIAN, NHOPI AOIC; <br> or API, AIAN, NHOPI non-Hispanic population | API, AIAN, NHOPI |
| Populations from other race groups | API, AIAN, NHOPI |
| Hispanic population | Hispanic |
| Two or more races - employment/unemployment and <br> educational attainment characteristics | Black |
| Two or more races - all other characteristics | API, AIAN, NHOPI |

Notes: (1) API, AIAN, NHOPI are Asian and Pacific Islander, American Indian and Alaska Native, Native Hawaiian and Other Pacific Islander, respectively.
(2) AOIC is an abbreviation for alone or in combination. The AOIC population for a race group of interest includes people reporting only the race group of interest (alone) and people reporting multiple race categories including the race group of interest (in combination).
(3) Hispanics may be any race.
(4) Two or more races refers to the group of cases self-classified as having two or more races.

Standard Errors of Estimated Numbers. The approximate standard error, $s_{x}$, of an estimated number from this microdata file can be obtained by using the formula:

$$
\begin{equation*}
s_{x}=\sqrt{a x^{2}+b x} \tag{1}
\end{equation*}
$$

Here $x$ is the size of the estimate and $a$ and $b$ are the parameters in Tables 4, 5, and 6 associated with the particular type of characteristic. When calculating standard errors from cross-tabulations involving different characteristics, use the set of parameters for the characteristic that will give the largest standard error.

## Illustration 1

Suppose there were 5,626,000 unemployed men (ages 16 and up) in the civilian labor force. Use the appropriate parameters from Table 4 and Formula (1) to get

| Illustration 1 |  |
| :--- | ---: |
| Number of unemployed males in the civilian | $5,626,000$ |
| $\quad$ labor force $(x)$ | -0.000035 |
| a parameter $(a)$ | 2,927 |
| b parameter $(b)$ | 124,000 |
| Standard error | $5,422,000$ to $5,830,000$ |
| 90-percent confidence interval |  |

The standard error is calculated as

$$
s_{x}=\sqrt{\left(-0.000035 \times 5,626,000^{2}\right)+(2,927 \times 5,626,000)}=124,000
$$

The 90 -percent confidence interval is calculated as $5,626,000 \pm 1.645 \times 124,000$. A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the parameter from Table 4, 5, or 6 as indicated by the numerator.

The approximate standard error, $s_{x, p}$, of an estimated percentage can be obtained by using the formula:

$$
\begin{equation*}
s_{x, p}=\sqrt{\frac{b}{x} p(100-p)} \tag{2}
\end{equation*}
$$

Here $x$ is the total number of people, families, households, or unrelated individuals in the base of the percentage, $p$ is the percentage ( $0 \leq p \leq 100$ ), and $b$ is the parameter in Table 4, 5 , or 6 associated with the characteristic in the numerator of the percentage.

## Illustration 2

Suppose there are $39,715,000$ people aged 15 to 24 , of which 11.8 percent are every-day smokers. Use the appropriate parameter from Table 5 and Formula (2) to get

| Illustration 2 |  |
| :--- | ---: |
| Percentage of people aged 15-24 who are | 11.8 |
| $\quad$ every-day smokers $(p)$ | $39,715,000$ |
| Base $(x)$ | 4,323 |
| b parameter $(b)$ | 0.34 |
| Standard error | 11.2 to 12.4 |
| 90-percent confidence interval |  |

The standard error is calculated as

$$
s_{x, p}=\sqrt{\frac{4,323}{39,715,000} \times 11.8 \times(100.0-11.8)}=0.34
$$

The 90-percent confidence interval for the estimated percentage of people aged 15 to 24 who are every-day smokers is calculated as $11.8 \pm 1.645 \times 0.34$.

Standard Errors of Estimated Differences. The standard error of the difference between two sample estimates is approximately equal to

$$
\begin{equation*}
s_{x-y}=\sqrt{s_{x}^{2}+s_{y}^{2}} \tag{3}
\end{equation*}
$$

where $s_{x}$ and $s_{y}$ are the standard errors of the estimates, $x$ and $y$. The estimates can be numbers, percentages, ratios, etc. This will result in accurate estimates of the standard error of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

## Illustration 3

Suppose that of the 5,738,000 Blacks 15 to 24 years of age, 9.0 percent were every-day smokers, and of the $24,887,000$ non-Hispanic Whites 15 to 24 years of age, 14.4 percent were every-day smokers. Use the appropriate parameters from Table 5 and Formulas (2) and (3) to get

| Illustration 3 |  |  |  |
| :--- | ---: | ---: | ---: |
|  | Black ( $x$ ) | Non-Hispanic <br> White (y) | Difference |
| Percentage every-day <br> smokers $(p)$ | 9.0 | 14.4 | 5.4 |
| Base $(x)$ | $5,738,000$ | $24,887,000$ | - |
| b parameter $(b)$ | 4,636 | 4,323 | - |
| Standard error | 0.81 | 0.46 | 0.93 |
| 90-percent confidence | 7.7 to 10.3 | 13.6 to 15.2 | 3.9 to 6.9 |

The standard error of the difference is calculated as

$$
s_{x-y}=\sqrt{0.81^{2}+0.46^{2}}=0.93
$$

The 90-percent confidence interval around the difference is calculated as $5.4 \pm 1.645 \times 0.93$. Since this interval does not include zero, we can conclude with 90 percent confidence that the percentage of Black every-day smokers between 15 and 24 years of age is less than the percentage of non-Hispanic White every-day smokers between 15 and 24 years of age.

Standard Errors of Estimated Ratios. Certain estimates may be calculated as the ratio of two numbers. Compute the standard error of a ratio, $x / y$, using

$$
\begin{equation*}
s_{x / y}=\frac{x}{y} \sqrt{\left(\frac{s_{x}}{x}\right)^{2}+\left(\frac{s_{y}}{y}\right)^{2}-2 r \frac{s_{x} s_{y}}{x y}} \tag{4}
\end{equation*}
$$

The standard error of the numerator, $s_{x}$, and that of the denominator, $s_{y}$, may be calculated using formulas described earlier. In Formula (4), $r$ represents the correlation between the numerator and the denominator of the estimate.

For one type of ratio, the denominator is a count of families or households and the numerator is a count of people in those families or households with a certain characteristic. If there is at least one person with the characteristic in every family or household, use 0.7 as an estimate of $r$. An example of this type is the average number of children per family with children.

For another type of ratio, the population estimated by the numerator $(x)$ is a subset of the population estimated by the denominator ( $y$ ). In that case,

$$
\begin{equation*}
\mathrm{r}=\frac{\mathrm{x} \cdot \mathrm{~s}_{\mathrm{y}}}{\mathrm{y} \cdot \mathrm{~s}_{\mathrm{x}}} \tag{5}
\end{equation*}
$$

For all other types of ratios, $r$ is assumed to be zero. Examples are the average number of children per family and the family poverty rate. If $r$ is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio. NOTE: For estimates expressed as the ratio of $x$ per $100 y$ or $x$ per $1,000 y$, multiply Formula (4) by 100 or 1,000 , respectively, to obtain the standard error.

## Illustration 4

Suppose the number of former smokers is $41,142,000$ and the number of ever (current and former) smokers is $81,110,000$. The ratio of former to ever smokers (known as the "quit ratio") would be 0.51 . Use Formulas (1), (4), and (5), and the appropriate parameters from Table 5 to get

| Illustration 4 |  |  |  |
| :--- | ---: | ---: | ---: |
|  | Former $(x)$ | Ever $(y)$ | Ratio |
| Number of smokers | $41,142,000$ | $81,110,000$ | 0.51 |
| a parameter $(a)$ | -0.000017 | -0.000017 | - |
| b parameter $(b)$ | 4,323 | 4,323 | - |
| correlation $(r)$ | - | - | 0.64 |
| Standard error | 386,000 | 489,000 | 0.004 |
| 90-percent confidence | $40,507,000$ to $41,777,000$ | $80,306,000$ to $81,914,000$ | 0.50 to 0.52 |
| interval |  |  |  |

The correlation is calculated as

$$
r=\frac{41,142,000 \times 489,000}{81,110,000 \times 386,000}=0.64
$$

and the standard error of the quit ratio is calculated as
$S_{x / y}=\frac{41,142,000}{81,110,000} \sqrt{\left(\frac{386,000}{41,142,000}\right)^{2}+\left(\frac{489,000}{81,110,000}\right)^{2}-\left(2 \times 0.64 \times \frac{386,000 \times 489,000}{41,142,000 \times 81,110,000}\right)}=0.004$
and the 90 -percent confidence interval is calculated as $0.51 \pm 1.645 \times 0.004$.
Accuracy of State Estimates. The redesign of the CPS following the 1980 census provided an opportunity to increase efficiency and accuracy of state data. All strata are now defined within state boundaries. The sample is allocated among the states to produce state and national estimates with the required accuracy while keeping total sample size to a minimum. Improved accuracy of state data was achieved with about the same sample size as in the 1970 design.

Since the CPS is designed to produce both state and national estimates, the proportion of the total population sampled and the sampling rates differ among the states. In general, the smaller the population of the state the larger the sampling proportion. For example, in Vermont approximately 1 in every 250 households is sampled each month. In New York the sample is about 1 in every 2,000 households. Nevertheless, the size of the sample in New York is four times larger than in Vermont because New York has a larger population.

Standard Errors of State Estimates. The standard error for a state may be obtained by determining new state-level $a$ and $b$ parameters and then using these adjusted parameters in the standard error formulas mentioned previously. To determine a new state-level $b$ parameter $\left(b_{\text {state }}\right)$, multiply the $b$ parameter from Table 4,5 , or 6 by the state factor from Table 7. To determine a new state-level $a$ parameter ( $a_{\text {state }}$ ), use the following:
(1) If the $a$ parameter from Table 4, 5, or 6 is positive, multiply the $a$ parameter by the state factor from Table 7.
(2) If the $a$ parameter in Table 4, 5, or 6 is negative, calculate the new state-level $a$ parameter as follows:

$$
\begin{equation*}
\mathrm{a}_{\text {state }}=\frac{-\mathrm{b}_{\text {state }}}{\mathrm{POP}_{\text {state }}} \tag{6}
\end{equation*}
$$

where $P O P_{\text {state }}$ is the state population found in Table 7.

## Illustration 5

Suppose there were 1,735,000 people living in Florida who were every-day smokers. Use the appropriate parameters, factor, and population from Tables 5 and 7 and Formulas (1) and (6) to get

| Illustration 5 |  |
| :--- | ---: |
| Number of every-day smokers in Florida $(x)$ | $1,735,000$ |
| b parameter $(b)$ | 4,323 |
| Florida state factor | 1.14 |
| State population | $16,349,543$ |
| State a parameter $\left(a_{\text {state }}\right)$ | -0.000301 |
| State b parameter $\left(b_{\text {state }}\right)$ | 4,928 |
| Standard error | 87,000 |

Obtain the state-level $b$ parameter by multiplying the $b$ parameter, 4,323, by the state factor, 1.14. This gives $b_{\text {state }}=4,323 \times 1.14=4,928$. Obtain the needed state-level $a$ parameter by

$$
a_{\text {state }}=\frac{-4,928}{16,349,543}=-0.000301
$$

The standard error of the estimate of the number of people in Florida who were every-day smokers can then be found by using Formula (1) and the new state-level $a$ and $b$ parameters, -0.000301 and 4,928 , respectively. The standard error is given by

$$
s_{x}=\sqrt{\left(-0.000301 \times 1,735,000^{2}\right)+(4,928 \times 1,735,000)}=87,000
$$

Standard Errors of Regional Estimates. To compute standard errors for regional estimates, follow the steps for computing standard errors for state estimates found in "Standard Errors of State Estimates" using the regional factors and populations found in Table 8.

Standard Errors of Groups of States. The standard error calculation for a group of states is similar to the standard error calculation for a single state. First, calculate a new state group factor for the group of states. Then, determine new state group $a$ and $b$ parameters. Finally, use these adjusted parameters in the standard error formulas mentioned previously.

Use the following formula to determine a new state group factor:

$$
\begin{equation*}
\text { state group factor }=\frac{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}} \times \text { factor }_{\mathrm{i}}}{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}}} \tag{7}
\end{equation*}
$$

where $P O P_{i}$ and factor $_{i}$ are the population and factor for state $i$ from Table 7.

To obtain a new state group $b$ parameter ( $b_{\text {state }}$ group $)$, multiply the $b$ parameter from Table 4 , 5 , or 6 by the state group factor obtained by Formula (7). To determine a new state group a parameter ( $a_{\text {state group }}$ ), use the following:
(1) If the $a$ parameter from Table 4, 5 , or 6 is positive, multiply the $a$ parameter by the state group factor determined by Formula (7).
(2) If the $a$ parameter in Table 4, 5, or 6 is negative, calculate the new state group $a$ parameter as follows:

$$
\begin{equation*}
\mathrm{a}_{\text {state group }}=\frac{-\mathrm{b}_{\text {state group }}}{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}}} \tag{8}
\end{equation*}
$$

## Illustration 6

Suppose the state group factor for the state group Illinois-Indiana-Michigan was required. Use Formula (7) and the appropriate factors and populations from Table 7 to get

$$
\text { state group factor }=\frac{(12,717,075 \times 1.08)+(6,140,133 \times 0.92)+(10,055,731 \times 1.05)}{12,717,075+6,140,133+10,055,731}=1.04
$$

Standard Errors of Averages for Grouped Data. The formula used to estimate the standard error of an average for grouped data is

$$
\begin{equation*}
s_{\bar{x}}=\sqrt{\frac{b}{y}\left(S^{2}\right)} \tag{9}
\end{equation*}
$$

In this formula, $y$ is the size of the base of the distribution and $b$ is the parameter from Table 4, 5, or 6 . The variance, $S^{2}$, is given by the following formula:

$$
\begin{equation*}
\mathrm{S}^{2}=\sum_{\mathrm{i}=1}^{\mathrm{c}} \mathrm{p}_{\mathrm{i}} \overline{\mathrm{X}}_{\mathrm{i}}^{2}-\overline{\mathrm{x}}^{2} \tag{10}
\end{equation*}
$$

where $\bar{x}$, the average of the distribution, is estimated by

$$
\begin{equation*}
\overline{\mathrm{x}}=\sum_{\mathrm{i}=1}^{\mathrm{c}} \mathrm{p}_{\mathrm{i}} \overline{\mathrm{x}}_{\mathrm{i}} \tag{11}
\end{equation*}
$$

where
$c=$ the number of groups; $i$ indicates a specific group, thus taking on values 1
through $c$.
$p_{i}=$ estimated proportion of households, families, or people whose values, for the characteristic ( $x$-values) being considered, fall in group i.
$\bar{x}_{i}=\left(Z_{i-1}+Z_{i}+1\right) / 2$ where $Z_{i}$ is the upper interval boundary for group $i$ (where $i=1$, $Z_{i-1}=0$ ). $\bar{X}_{i}$ is assumed to be the most representative value for the characteristic for households, families, and unrelated individuals or people in group $i$. If group $c$ is open-ended, i.e., no upper interval boundary exists, use a group approximate average value of

$$
\begin{equation*}
\overline{\mathrm{x}}_{\mathrm{c}}=\frac{3}{2} \mathrm{Z}_{\mathrm{c}-1} \tag{12}
\end{equation*}
$$

NOTE: Estimates for number of cigarettes smoked 'per some day' (as in Illustration 7b) must first be converted into estimates for number of cigarettes smoked 'per day' by multiplying by the average number of days smoked in the last 30 days, and dividing by 30 for each group $i$.

## Illustration 7a

Suppose there were $32,167,000$ every-day smokers among self-respondents and the distribution of the average number of cigarettes consumed per every-day smoker per day was

| Cigarettes per day | Percent of smokers | $\bar{x}_{i}$ |
| :---: | :---: | :---: |
| $1-10$ | 34.6 | $(0+10+1) / 2=5.5$ |
| $11-20$ | 49.8 | $(10+20+1) / 2=15.5$ |
| $21-30$ | 9.1 | $(20+30+1) / 2=25.5$ |
| $31-40$ | 5.3 | $(30+40+1) / 2=35.5$ |
| $41+$ | 1.1 | $3 / 2(40)=60.0$ |

Using Formula (11),

$$
\bar{x}=(0.346 \times 5.5)+(0.498 \times 15.5)+(0.091 \times 25.5)+(0.053 \times 35.5)+(0.011 \times 60.0)=14.48
$$

and Formula (10),

$$
S^{2}=\left(0.346 \times 5.5^{2}\right)+\left(0.498 \times 15.5^{2}\right)+\left(0.091 \times 25.5^{2}\right)+\left(0.053 \times 35.5^{2}\right)+\left(0.011 \times 60.0^{2}\right)-14.48^{2}=86.01
$$

Because this data is from self-respondents, use the appropriate parameter from Table 6 and Formula (9) to get

| Illustration 7a |  |
| :--- | ---: |
| Average amount of cigarettes smoked per day for | 14.48 |
| $\quad$ every-day smokers $(\bar{x})$ | 86.01 |
| Variance $\left(S^{2}\right)$ | $32,167,000$ |
| Base $(y)$ | 5,745 |
| b parameter $(b)$ | 0.124 |
| Standard error | 14.28 to 14.68 |
| 90 -percent confidence interval |  |

The standard error is calculated as

$$
s_{\bar{x}}=\sqrt{\frac{5,745}{32,167,000}(86.01)}=0.124
$$

and the 90 -percent confidence interval is calculated as $14.48 \pm 1.645 \times 0.124$. A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

## Illustration 7b

Suppose there were $7,189,000$ some day smokers among self respondents and the distribution of the average number of cigarettes consumed per some day smoker per some day and per every day was

| Cigarettes per <br> some day | Percent of <br> smokers | $\bar{x}_{i}$ | Avg \# of days <br> smoked in the last <br> 30 days $\left(d_{i}\right)$ | Cigarettes per day <br> $\left(\bar{x}_{i} \times d_{i} / 30\right)$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 13.6 | $(0+1+1) / 2=1.0$ | 10.0 | $1.0 * 10.0 / 30=0.33$ |
| 2 | 22.0 | $(1+2+1) / 2=2.0$ | 12.9 | $2.0 * 12.9 / 30=0.86$ |
| 3 | 15.6 | $(3+2+1) / 2=3.0$ | 14.3 | $3.0 * 14.3 / 30=1.43$ |
| 4 | 8.5 | $(4+3+1) / 2=4.0$ | 14.7 | $4.0 * 14.7 / 30=1.96$ |
| $5+$ | 40.2 | $3 / 2(4)=6.0$ | 16.3 | $6.0 * 16.3 / 30=3.26$ |

Using Formula (11),

$$
\overline{\mathrm{x}}=(0.136 \times 0.33)+(0.220 \times 0.86)+(0.156 \times 1.43)+(0.085 \times 1.96)+(0.402 \times 3.26)=1.93
$$

and Formula (10),

$$
S^{2}=\left(0.136 \times 0.33^{2}\right)+\left(0.220 \times 0.86^{2}\right)+\left(0.156 \times 1.43^{2}\right)+\left(0.085 \times 1.96^{2}\right)+\left(0.402 \times 3.26^{2}\right)-1.93^{2}=1.37
$$

Because this data is from self-respondents, use the appropriate parameter from Table 6 and Formula (9) to get

| Illustration 7b |  |
| :--- | ---: |
| Average amount of cigarettes smoked per day for | 1.93 |
| $\quad$ some day smokers $(\bar{x})$ | 1.37 |
| Variance $\left(S^{2}\right)$ | $7,189,000$ |
| Base $(y)$ | 5,745 |
| b parameter $(b)$ | 0.033 |
| Standard error | 1.88 to 1.98 |
| 90-percent confidence interval |  |

The standard error is calculated as

$$
s_{\bar{x}}=\sqrt{\frac{5,745}{7,189,000}(1.37)}=0.033
$$

and the 90 -percent confidence interval is calculated as $1.93 \pm 1.645 \times 0.033$. A conclusion that the average estimate derived from all possible sample lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Aggregates. Aggregates, such as the total number of cigarettes consumed, are computed by multiplying the average number of cigarettes consumed per smoker, $\bar{x}$, by the total number of smokers, $y$, in the formula

$$
\begin{equation*}
T=\bar{x} y \tag{13}
\end{equation*}
$$

where $T$ is the aggregate to be computed.
Both $\bar{x}$ and $y$ have a standard error, so the standard error of a product must be computed. Approximate the standard error of an aggregate with the formula

$$
\begin{equation*}
s_{T}=\sqrt{\bar{x}^{2} s_{y}^{2}+y^{2} s_{\bar{x}}^{2}} \tag{14}
\end{equation*}
$$

where $s_{\bar{x}}$ is computed using Formula (9) and $s_{y}$ is computed using Formula (1). In the above formula, the correlation between $\bar{x}$ and $y$ is assumed to be zero. If it is actually positive (negative), then this formula will underestimate (overestimate) the standard error of the product.

## Illustration 8

Continuing with Illustration 7a, suppose that the estimate for the total number of every-day smokers was $32,167,000$ people and that these people smoked an average of 14.48 cigarettes per day. These people then would consume approximately 465,778,000 cigarettes per day. Use the appropriate parameters from Table 6, since the data is self-reported, and Formula (1) to get $s_{y}$ (get $s_{\bar{x}}$ from Illustration 7a) with Formula (14) to get

| Illustration 8 |  |
| :--- | ---: |
| Average amount of cigarettes smoked per day $(\bar{x})$ | 14.48 |
| Standard error $\left(s_{\bar{x}}\right)$ | 0.124 |
| Number of every-day smokers $(y)$ | $32,167,000$ |
| a parameter $(a)$ | -0.000023 |
| b parameter $(b)$ | 5,745 |
| Standard error $\left(s_{y}\right)$ | 401,000 |
| Number of cigarettes consumed $(T)$ | $465,778,000$ |
| Standard error $\left(s_{T}\right)$ | $7,045,000$ |
| 90-percent confidence interval | $454,189,000$ to |

The standard error for $y$ is calculated as

$$
s_{y}=\sqrt{\left(-0.000023 \times 32,167,000^{2}\right)+(5,745 \times 32,167,000)}=401,000
$$

where $T$ is

$$
T=14.48 \times 32,167,000=465,778,000
$$

and the standard error for $T$ calculated as

$$
s_{\mathrm{T}}=\sqrt{\left(14.48^{2} \times 401,000^{2}\right)+\left(32,167,000^{2} \times 0.124^{2}\right)}=7,045,000
$$

The 90-percent confidence interval is calculated as $465,778,000 \pm 1.645 \times 7,045,000$. A conclusion that the average estimate derived from all possible sample lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Averages for Daily Amount Smoked by Current Smokers. The formula used to estimate the standard error of the average daily amount smoked by current smokers is

$$
\begin{equation*}
s_{\bar{x}}=\sqrt{\left[\frac{P\left(C_{1}-C_{2}\right)}{(E+P)^{2}}\right]^{2} s_{E}^{2}+\left[\frac{E\left(C_{1}-C_{2}\right)}{(E+P)^{2}}\right]^{2} s_{P}^{2}+\left(\frac{E}{E+P}\right)^{2} s_{C_{1}}^{2}+\left(\frac{P}{E+P}\right)^{2} s_{C_{2}}^{2}} \tag{15}
\end{equation*}
$$

where
$E=$ the estimated population of every-day smokers.
$s_{E}=$ the standard error of the estimated population of every-day smokers.
$P=$ the estimated population of some day smokers.
$s_{P}=$ the standard error of the estimated population of some day smokers.
$C_{1}=$ the average amount an every-day smoker smokes per day.
$s_{C_{1}}=\quad$ the standard error of the average amount an every-day smoker smokes per day.
$C_{2}=$ the average amount a some day smoker smokes per day.
$s_{C_{2}}=\quad$ the standard error of the average amount a some day smoker smokes per day.

## Illustration 9

Continuing with Illustrations 7 and 8 , suppose there were $32,167,000$ every-day smokers that smoked an average of 14.48 cigarettes per day. In addition, suppose $7,189,000$ some day smokers smoked an average of 1.93 cigarettes per day. Then, the distribution of the average number of cigarettes consumed per day by all current smokers would be

| Cigarettes per day | Percent of smokers |
| :---: | :---: |
| 0.33 | 2.5 |
| 0.86 | 4.0 |
| 1.43 | 2.9 |
| 1.96 | 1.6 |
| 3.26 | 7.3 |
| 5.5 | 28.3 |
| 15.5 | 40.7 |
| 25.5 | 7.5 |
| 35.5 | 4.4 |
| 60.0 | 0.9 |

where $\bar{x}$, the average amount smoked by all current smokers, is found using Formula (11) as

$$
\begin{aligned}
\overline{\mathrm{x}}= & (0.025 \times 0.33)+(0.040 \times 0.86)+(0.029 \times 1.43)+(0.016 \times 1.96)+(0.073 \times 3.26) \\
& +(0.283 \times 5.5)+(0.407 \times 15.5)+(0.075 \times 25.5)+(0.044 \times 35.5)+(0.009 \times 60.0) \\
= & 12.23
\end{aligned}
$$

Use the appropriate parameters from Table 6, since this is self respondent data, and Formula (1) to get $s_{P}$ (get $s_{E}$ from Illustration 8 and $s_{C_{1}}$ and $\mathrm{s}_{\mathrm{C}_{2}}$ from Illustration 7) and Formula (15) to get

| Illustration 9 |  |
| :--- | ---: |
| Average amount of cigarettes smoked per day $(\bar{x})$ | 12.23 |
| Estimated population of every-day smokers $(E)$ | $32,167,000$ |
| Standard error $\left(s_{E}\right)$ | 401,000 |
| Estimated population of some day smokers $(P)$ | $7,189,000$ |
| a parameter $(a)$ | -0.000023 |
| b parameter $(b)$ | 5,745 |
| Standard error $\left(s_{P}\right)$ | 200,000 |
| Average amount of cigarettes smoked per every-day $\left(C_{1}\right)$ | 14.48 |
| Standard error $\left(s_{C_{1}}\right)$ | 0.124 |
| Average amount of cigarettes smoked per some day $\left(C_{2}\right)$ | 1.93 |
| Standard error $\left(s_{C_{2}}\right)$ | 0.033 |
| Standard error | 0.116 |
| 90-percent confidence interval | 12.04 to 12.42 |

The standard error for $s_{P}$ is calculated as

$$
s_{P}=\sqrt{\left(-0.000023 \times 7,189,000^{2}\right)+(5,745 \times 7,189,000)}=200,000
$$

and the standard error for $\bar{x}$ is calculated as

$$
\begin{aligned}
s_{\bar{x}}= & {\left[\left(\frac{7,189,000(14.48-1.93)}{(32,167,000+7,189,000)^{2}}\right)^{2} \times 401,000^{2}+\left(\frac{32,167,000(14.48-1.93)}{(32,167,000+7,189,000)^{2}}\right)^{2} \times 200,000^{2}\right.} \\
& \left.+\left(\frac{32,167,000}{32,167,000+7,189,000}\right)^{2} \times 0.124^{2}+\left(\frac{7,189,000}{32,167,000+7,189,000}\right)^{2} \times 0.033^{2}\right]^{1 / 2} \\
& =0.116
\end{aligned}
$$

The 90-percent confidence interval is calculated as $12.23 \pm 1.645 \times 0.116$. A conclusion that the average estimate derived from all possible sample lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Quarterly or Yearly Averages. For information on calculating standard errors for labor force data from the CPS which involve quarterly or yearly averages, please see the "Explanatory Notes and Estimates of Error: Household Data" section in Employment and Earnings, a monthly report published by the U.S. Bureau of Labor Statistics.

Technical Assistance. If you require assistance or additional information, please contact the Demographic Statistical Methods Division via email at dsmd.source.and.accuracy@census.gov.

## Table 4. Parameters for Computation of Standard Errors for Labor Force Characteristics: February, June, and November 2003

| Characteristic | a | b |
| :--- | :--- | :--- |
| Labor Force and Not in Labor Force Data Other than Agricultural Employment and Unemployment |  |  |
| Total or White | -0.000008 | 1,586 |
| Men | -0.000035 | 2,927 |
| Women | -0.000033 | 2,693 |
| Both sexes, 16 to 19 years | -0.000244 | 3,005 |
| Black | -0.000154 | 3,296 |
| Men | -0.000336 | 3,332 |
| Women | -0.000282 | 2,944 |
| Both sexes, 16 to 19 years | -0.001531 | 3,296 |
| Hispanic | -0.000187 | 3,296 |
| Men | -0.000363 | 3,332 |
| Women | -0.000380 | 2,944 |
| Both sexes, 16 to 19 years | -0.001822 | 3,296 |
| Other | -0.000272 | 2,749 |
| Men | -0.000569 | 2,749 |
| Women | -0.000521 | 2,749 |
| Unemployment |  |  |
| Total or White | -0.000017 | 3,005 |
| Men | -0.000035 | 2,927 |
| Women | -0.000033 | 2,693 |
| Both sexes, 16 to 19 years | -0.000244 | 3,005 |
| Black | -0.000154 | 3,296 |
| Men | -0.000336 | 3,332 |
| Women | -0.000282 | 2,944 |
| Both sexes, 16 to 19 years | -0.001531 | 3,296 |
| Hispanic | -0.000187 | 3,296 |
| Men | -0.000363 | 3,332 |
| Women | -0.000380 | 2,944 |
| Both sexes, 16 to 19 years | -0.001822 | 3,296 |
| Men | -0.000272 | 2,749 |

Notes: (1) These parameters are to be applied to basic CPS monthly labor force estimates.
(2) For foreign-born and noncitizen characteristics for Total and White, the $a$ and $b$ parameters should be multiplied by 1.3. No adjustment is necessary for foreign-born and noncitizen characteristics for Blacks, Hispanics, and Others.
(3) For nonmetropolitan characteristics, multiply the $a$ and $b$ parameters by 1.5 . If the characteristic of interest is total state population, not subtotaled by race or ethnicity, the $a$ and $b$ parameters are zero.
(4) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameter" section.

Table 5. Parameters for Computation of Standard Errors for Tobacco Use Characteristics Using Non-response Weights: February, June, and November 2003

|  | Total or White |  | Black |  | Hispanic |  | Other |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Characteristic | a | b | a | b | a | b | a | b |
|  |  |  |  |  |  |  |  |  |
| One month |  |  |  |  |  |  |  |  |
| Both sexes | -0.000017 | 4,323 | -0.000100 | 4,636 | -0.000122 | 3,964 | -0.000284 | 4,636 |
| Male or female | -0.000035 | 4,323 | -0.000201 | 4,636 | -0.000245 | 3,964 | -0.000569 | 4,636 |
|  |  |  |  |  |  |  |  |  |
| Two combined months | -0.000009 | 2,262 | -0.000052 | 2,426 | -0.000064 | 2,074 | -0.000149 | 2,426 |
| Both sexes | -0.000018 | 2,262 | -0.000105 | 2,426 | -0.000128 | 2,074 | -0.000298 | 2,426 |
| $\quad$ Male or female |  |  |  |  |  |  |  |  |
| Three combined months | -0.000006 | 1,575 | -0.000037 | 1,689 | -0.000045 | 1,444 | -0.000104 | 1,689 |
| Both sexes | -0.000013 | 1,575 | -0.000073 | 1,689 | -0.000089 | 1,444 | -0.000207 | 1,689 |
| Male or female |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |

Notes: (1) These parameters are to be applied to the February, June, and November 2003 Tobacco Use Supplement data.
(2) For foreign-born and noncitizen characteristics for Total and White, the $a$ and $b$ parameters should be multiplied by 1.3. No adjustment is necessary for foreign-born and noncitizen characteristics for Blacks, Hispanics, and Others.
(3) For nonmetropolitan residence categories, the $a$ and $b$ parameters should be multiplied by 1.5. If the characteristic of interest is total state population, not subtotaled by race or ethnicity, the $a$ and $b$ parameters are zero.
(4) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section.

Table 6. Parameters for Computation of Standard Errors for Tobacco Use Characteristics Using Self-response Weights: February, June, and November 2003

|  | Total or White |  | Black |  | Hispanic |  | Other |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Characteristic | a | b | a | b | a | b | a | b |
|  |  |  |  |  |  |  |  |  |
| One month |  |  |  |  |  |  |  |  |
| Both sexes | -0.000023 | 5,745 | -0.000132 | 6,080 | -0.000181 | 5,858 | -0.000373 | 6,080 |
| Male or female | -0.000046 | 5,745 | -0.000263 | 6,080 | -0.000361 | 5,858 | -0.000746 | 6,080 |
|  |  |  |  |  |  |  |  |  |
| Two combined months | -0.000012 | 3,006 | -0.000069 | 3,181 | -0.000095 | 3,065 | -0.000195 | 3,181 |
| Both sexes | -0.000024 | 3,006 | -0.000138 | 3,181 | -0.000189 | 3,065 | -0.000390 | 3,181 |
| Male or female |  |  |  |  |  |  |  |  |
| Three combined months | -0.000008 | 2,093 | -0.000048 | 2,215 | -0.000066 | 2,134 | -0.000136 | 2,215 |
| Both sexes | -0.000017 | 2,093 | -0.000096 | 2,215 | -0.000132 | 2,134 | -0.000272 | 2,215 |
| Male or female |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |

Notes: (1) These parameters are to be applied to the February, June, and November 2003 Tobacco Use Supplement data.
(2) For foreign-born and noncitizen characteristics for Total and White, the $a$ and $b$ parameters should be multiplied by 1.3. No adjustment is necessary for foreign-born and noncitizen characteristics for Blacks, Hispanics, and Others.
(3) For nonmetropolitan residence categories, the $a$ and $b$ parameters should be multiplied by 1.5. If the characteristic of interest is total state population, not subtotaled by race or ethnicity, the $a$ and $b$ parameters are zero.
(4) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section.

Table 7. State Populations and Factors for Monthly, 2-Month, and 3-Month State Parameters and Standard Errors: February, June, and November 2003

| State | One month factor | Two combined months factor | Three combined months factor | November 2003 population |
| :---: | :---: | :---: | :---: | :---: |
| Alabama | 0.94 | 0.93 | 0.90 | 4,437,446 |
| Alaska | 0.12 | 0.12 | 0.12 | 635,105 |
| Arizona | 1.15 | 1.11 | 1.09 | 5,383,165 |
| Arkansas | 0.64 | 0.62 | 0.61 | 2,670,949 |
| California | 1.49 | 1.45 | 1.40 | 35,554,286 |
| Colorado | 0.67 | 0.65 | 0.64 | 4,493,928 |
| Connecticut | 0.55 | 0.53 | 0.50 | 3,444,790 |
| Delaware | 0.18 | 0.17 | 0.16 | 793,838 |
| District of Columbia | 0.14 | 0.14 | 0.13 | 577,355 |
| Florida | 1.14 | 1.09 | 1.05 | 16,349,543 |
| Georgia | 1.70 | 1.65 | 1.60 | 8,440,760 |
| Hawaii | 0.26 | 0.25 | 0.25 | 1,217,608 |
| Idaho | 0.30 | 0.29 | 0.29 | 1,328,016 |
| Illinois | 1.08 | 1.05 | 1.02 | 12,717,075 |
| Indiana | 0.92 | 0.90 | 0.88 | 6,140,133 |
| Iowa | 0.51 | 0.51 | 0.50 | 2,925,836 |
| Kansas | 0.48 | 0.48 | 0.48 | 2,699,333 |
| Kentucky | 0.83 | 0.80 | 0.78 | 4,028,766 |
| Louisiana | 1.05 | 1.01 | 0.97 | 4,428,104 |
| Maine | 0.21 | 0.20 | 0.20 | 1,269,650 |
| Maryland | 0.93 | 0.90 | 0.88 | 5,412,655 |
| Massachusetts | 0.93 | 0.89 | 0.85 | 6,462,600 |
| Michigan | 1.05 | 1.01 | 0.97 | 10,055,731 |
| Minnesota | 0.81 | 0.82 | 0.83 | 5,022,063 |
| Mississippi | 0.73 | 0.71 | 0.68 | 2,827,556 |
| Missouri | 1.00 | 0.96 | 0.93 | 5,594,458 |
| Montana | 0.23 | 0.23 | 0.23 | 896,415 |
| Nebraska | 0.34 | 0.34 | 0.33 | 1,727,067 |
| Nevada | 0.35 | 0.34 | 0.33 | 2,125,297 |
| New Hampshire | 0.22 | 0.21 | 0.20 | 1,261,676 |
| New Jersey | 0.92 | 0.88 | 0.84 | 8,658,228 |
| New Mexico | 0.46 | 0.44 | 0.43 | 1,849,736 |
| New York | 1.00 | 0.97 | 0.93 | 19,413,210 |
| North Carolina | 1.09 | 1.10 | 1.10 | 8,167,137 |
| North Dakota | 0.13 | 0.13 | 0.12 | 629,019 |
| Ohio | 1.13 | 1.09 | 1.05 | 11,381,519 |
| Oklahoma | 0.72 | 0.70 | 0.68 | 3,428,684 |
| Oregon | 0.68 | 0.67 | 0.66 | 3,492,412 |
| Pennsylvania | 1.04 | 1.00 | 0.97 | 12,179,129 |
| Rhode Island | 0.16 | 0.16 | 0.15 | 1,055,458 |
| South Carolina | 0.83 | 0.80 | 0.78 | 4,023,189 |
| South Dakota | 0.13 | 0.13 | 0.13 | 753,441 |
| Tennessee | 1.35 | 1.30 | 1.25 | 5,717,343 |
| Texas | 1.37 | 1.33 | 1.29 | 21,726,542 |
| Utah | 0.46 | 0.46 | 0.45 | 2,365,319 |
| Vermont | 0.11 | 0.11 | 0.10 | 611,727 |
| Virginia | 1.32 | 1.28 | 1.25 | 7,116,129 |
| Washington | 1.11 | 1.16 | 1.21 | 6,035,636 |
| West Virginia | 0.34 | 0.32 | 0.31 | 1,768,584 |
| Wisconsin | 0.82 | 0.84 | 0.86 | 5,404,346 |
| Wyoming | 0.10 | 0.10 | 0.10 | 490,742 |

Note: The state population counts in this table are for the $0+$ population.

Table 8. Regional Populations and Factors for Monthly, 2-Month, and 3-Month Regional Parameters and Standard Errors: February, June, and November 2003

| Region | One month <br> factor | Two combined <br> months factor | Three combined <br> months factor | November 2003 <br> population |
| :--- | :---: | :---: | :---: | :---: |
| Midwest | 0.93 | 0.91 | 0.89 | $65,050,021$ |
| Northeast | 0.90 | 0.86 | 0.83 | $54,356,468$ |
| South | 1.14 | 1.10 | 1.07 | $101,914,580$ |
| West | 1.14 | 1.12 | 1.09 | $65,867,665$ |

Note: The regional population counts in this table are for the $0+$ population.

## ATTACHMENT 17

## USER NOTES

This section will contain information relevant to the Current Population Survey, February, June, and November 2003: Tobacco Use Supplement File that becomes available after the file is released. The cover letter to the updated information should be filed behind this page.

## CURRENT POPULATION SURVEY

FEBRUARY, JUNE, AND NOVEMBER 2003:
TOBACCO USE SUPPLEMENT FILE

## User Note 1

This is a change to the record layout storage position order for response categories in PEH10b. Response options " $D$ " and " $F$ " were stored in reverse order of the format in which they were asked.

The response options were presented to the respondent in the following order.
H10b When you quit smoking completely did you use ANY of the following?
(1) Yes
(2) No

(A) A telephone help line or quit line
(B) A stop smoking clinic, class, or support group
(C) One-on-one counseling
(D) Help or support from friends or family
(E) The Internet or World Wide Web
(F) Books, pamphlets, videos, or other materials
(G) Acupuncture or hypnosis

The data was stored in this order:

| Name | Length | Description | Position |
| :---: | :---: | :---: | :---: |
| PEH10b1 | 2 | (A) A telephone help line or quit line | 1169-1170 |
| PEH10b2 | 2 | (B) A stop smoking clinic, class, or support group | 1171-1172 |
| PEH10b3 | 2 | (C) One-on-one counseling | 1173-1174 |
| PEH10b4 | 2 | (D) Books, pamphlets, videos, or other materials | 1175-1176 |
| PEH10b5 | 2 | (E) The Internet or World Wide Web | 1177-1178 |
| PEH10b6 | 2 | (F) Help or support from friends or family | 1179-1180 |
| PEH10b7 | 2 | (G) Acupuncture or hypnosis | 1181-1182 |

## CURRENT POPULATION SURVEY

FEBRUARY, JUNE, AND NOVEMBER 2003:
TOBACCO USE SUPPLEMENT FILE

## User Note 2

This is a change to the record layout edited universes for PEF4 and PEF5. This is also a change for the questionnaire skip pattern for $F 4$.

- Originally the edited universe for PEF4 was stated as F31 AND F32 AND F33 AND F34 AND F35 all equal 2 which excluded don't know and refusal responses.

It has now been revised to say:
F31 AND F32 AND F33 AND F34 AND F35 all equal 2, OR all equal DK/RF, OR all equal some combination of DK OR RF OR 2.

- Originally the edited universe for PEF5 was stated as F31 AND F32 AND F33 AND F34 AND F35 all equal 1 which excluded the universe for F 4 .

It has now been revised to say:
F31 AND F32 AND F33 AND F34 AND F35 all equal 1; OR if in universe for F4.

- Originally the skip pattern for F4 stated IF F3@ (1) through F3@ (5) = $2 \rightarrow$ GO TO F4.

It has now been revised to say:
IF F3 @ (1) through F3 @ (5) = 2, DK, RF $\rightarrow$ GO TO F4

## CURRENT POPULATION SURVEY

## FEBRUARY, JUNE, AND NOVEMBER 2003: <br> TOBACCO USE SUPPLEMENT FILE

## User Note 3

The Tobacco Source and Accuracy (S\&A) was modified to bring it in line with the current S\&A template. Most of the changes were cosmetic - rearranging wording slightly, and formatting. This user note is a list of the most substantive changes.

1) A new Table 3 Estimation Groups of Interest and Generalized Variance Parameters was inserted so former tables 3,4 , and 5 became 4,5 , and 6 .
2) 'A' Parameters in Tables 5 and 6 (old Tables 4 and 5) were changed slightly to account for 15 year olds.
3) Basic CPS: addition of the sentence "Typically, the week containing the nineteenth of the month is the interview week. The week containing the twelfth is the reference week (i.e., the week about which the labor force questions are asked)." to the first paragraph of the Basic CPS section.
4) Nonsampling Error: This section is re-written.

## Old:

For a given estimator, the difference between the estimate that would result if the sample were to include the entire population and the true population value being estimated is known as nonsampling error. Sources of nonsampling errors include the following:
? Inability to get information about all sample cases (nonresponse)
? Definitional difficulties
? Differences in the interpretation of questions
? Respondent inability or unwillingness to provide correct information
? Respondent inability to recall information
? Errors made in data collection such as recording and coding data
? Errors made in processing the data
? Errors made in estimating values for missing data
? Failure to represent all units with the sample (undercoverage).
To minimize these errors, the Census Bureau employs quality control procedures in sample selection, wording of questions, interviewing, coding, data processing, and data analysis.

New:
For a given estimator, the difference between the estimate that would result if the sample were to include the entire population and the true population value being estimated is known as nonsampling error. There
are several sources of nonsampling error which may occur during the development or execution of the survey. It can occur because of circumstances created by the interviewer, the respondent, the survey instrument, or the way the data are collected and processed. For example, errors could occur because:

- The interviewer records the wrong answer, the respondent provides incorrect information, the respondent estimates the requested information, or an unclear survey question is misunderstood by the respondent (measurement error).
- Some individuals or businesses which should have been included in the survey frame were missed (coverage error).
- Responses are not collected from all those in the sample or the respondent is unwilling to provide information (nonresponse error).
- Values are estimated imprecisely for missing data (imputation error).
- Forms may be lost, data may be incorrectly keyed, coded, or recoded, etc. (processing error).

The Census Bureau employs quality control procedures throughout the production process, including the overall design of surveys, the wording of questions, the review of the work of interviewers and coders, and the statistical review of reports to minimize these errors.
5) Coverage: the sentence "For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section." has been added to Note 2 to Table 2.
6) Estimating Standard Errors. The sentence "Estimates of the 15 to 17 year old age groups and estimates of other similarly small subgroups are likely to yield imprecise standard errors that may be too low." is placed as a paragraph of its own at the end of this section.
7) Generalized Variance Parameters: the phrase "data users have access to the CPS microdata files, and it is impossible to compute in advance the standard error for every estimate one might obtain from those data sets." has been added to the first paragraph.
8) Same section: The following Note has been added between the original third and fourth paragraphs:

NOTE: The generalized variance parameters given in this document cannot be used when estimating variances for complex analysis research such as linear regression. Variances must be estimated using replicate weights for those types of analyses from the tobacco use supplement data. Replicate weights can be obtained from NCI upon request.
8) Same section: the (old) penultimate paragraph has been replaced by new Table 3 .

[^0]:    1 For detailed information on the 1990 sample redesign, please see reference [1].
    2 The PSUs correspond to substate areas (i.e., counties or groups of counties) that are geographically contiguous.

[^1]:    3 For further information on the CATI and CAPI and the eligibility criteria, please see reference [2].
