gamma rays

(EMITTED BY NUCLEI)

Quantums of electromagnetic radiation emitted by nuclei, each such photon being emitted as the result of a quantum transition be-tween two energy levels of the nucleus. Gamma rays have energies usually between 10 thou-sand electron volts and 10 million electron volts with correspondingly short wavelengths and high frequencies. Used for gamma radiation.

gas at low pressure that permits the passage of electricity through the gas upon application of sufficient voltage. Note: The tubes are usually provided with metal electrodes, but one form permits an electrodeless discharge with induced voltage. Used for discharge tubes and gas discharge counters. discharge tubes gas discharge counters GS electron tubes . gas discharge tubes ignitrons . thyratrons

RT Faraday dark space ∞ gas tubes microwave equipment microwave oscillators microwave tubes phototubes radiation counters

gels

Liquids containing colloidal structural networks that form continuous matrices and completely pervade the liquid phase. Gels de-

form elastically upon application of shear forces less than the yield stress. At shear forces above the yield stress, the flow properties are principally determined by the gel matrices

satellite altimetry shapes spheroids symmetrical bodies **GEOLE** satellites GS artificial satellites . French satellites ... GEOLE satellites . geodetic satellites ... GEOLE satellites . meteorological satellites . GEOLE satellites **EOLE** satellites French space program geological faults A surface or zone of rock fracture along which there has been displacement, from a few centimeters to a few kilometers in scale. Used for closed faults, cross faults, echelon faults, geofractures, grabens, rifts, splits (geology), step faults, and thrust faults. closed faults cross faults echelon faults geofractures grabens splits (geology) step faults thrust faults geological faults African rift system San Andreas Fault crevasses crustal fractures earthquake damage earthquakes ∞ faults fissures (geology) folds (geology) formations inliers (landforms) landforms massifs mid-ocean ridges plates (tectonics) Rouse belts San Andreas Fault experiment synclines geological surveys GS surveys geological surveys exploration geodetic surveys geology geophysics paleontology petrology photogeology radar geology DEF The study of the planet Earth--the materials of which it is made, the processes that act on these materials, the products formed, and the history of the planet and its life forms since its origin. Geology considers the physical forces that act on the Earth, the chemistry of its constituent materials, and the biology of its past inhabitants as revealed by fossils. Clues on the origin of the planet are sought in a study of the Moon and other extraterrestrial bodies. The knowledge thus obtained is placed in the service of man--to aid in the discovery of minerals and fuels of value in the Earth's crust, to identify geologically stable sites for major structures, and to provide foreknowledge of some of the dangers associated with the mobile forces in a dynamic Earth. geology beds (geology) GS . . salt beds . cones (volcanoes)

# high electron mobility transistors

(added November 1992)

DEF A recently developed field effect transistor based on the technique of modulation doping of GaAs/Al(x)Ga(1-x) as heterojunctions. This technique achieves high mobility in part by introducing carriers into high purity GaAs from donor ions in an adjacent A1GaAs layer, the electrons and ions being separated by the built-in heterojunction potential. Used for HEMT (electronics)

# homosphere

The lower portion of a two part division of the atmosphere according to the general homogeneity of atmospheric composition; opposed to the heterosphere. The region in which there is no gross change in atmospheric composition, that is, all the atmosphere from the Earth's surface to about 90 kilometers. The homosphere is about equivalent to the neutrosphere, and includes the troposphere, stratosphere, and mesosphere; it also includes the ozonosphere and at least part of the chemosphere.

Huygens principle

DEF A very general principle applying to all forms of wave motion which states that every point on the instantaneous position of an advancing phase front (wave front) may be regarded as a source of secondary spherical wavelets. The position of the phase front a moment later is then determined as the envelope of all the secondary wavelets (ad infinitum). RT diffraction

∞ optics point sources refraction scattering Schelkunoff principle spherical waves wave fronts wave propagation

# ill-posed problems (mathematics)

(added March 1994)

Problems corresponding to physical system models whose solutions do not satisfy Hadamard's criteria for 'well posedness,' i.e., existence, uniqueness, and continuous dependence on initial data. Most commonly, such problems stem fundamental physical limitations on the accessibility of information about the object or process being studied. (See also ILL-CONDITIONED PROBLEMS)

uniqueness

#### illuminance

(LIMITED TO DETECTION RATE PER UNIT AREA OF VISIBLE RADIATION-EQUALS LIGHT PRESSURE TIMES SPEED OF LIGHT)

DEF The total luminous flux received on a unit area of a given real or imaginary surface, expressed in such units as the footcandle, lux, or phot. Illuminance is analogous to irradiance, but is to be distinguished from the latter in that illuminance refers only to light and contains the luminous efficiency weighting factor necessitated by the nonlinear wavelength response of the human eye. Used for light pressure.

**IMAGE** satellite

(added November 2000)

DEF A medium class Explorer (MIDEX) mission to study the global response of the Earth's magnetosphere to changes in the solar wind. IMAGE (Imager for Magnetopause-to-Aurora Global Exploration) will use neutral atom, ultraviolet, and radio imaging techniques to: (a) identify the dominant mechanisms for injecting plasma into the magnetosphere on substorm and magnetic storm time scales; (b) determine and magnetic storm time scales; (b) determine the directly driven response of the magnetosphere to solar wind changes; and, (c) discover how and where magnetospheric plasmas are energized, transported, and subsequently lost during substorms and magnetic storms.

#### interfaces

A common boundary between two DEF parts of a system, whether material or non material. Specifically, in a rocket vehicle or other mechanical assembly, a common boundary between two components. Specifically, in fluid dynamics, a surface separating two fluids across which there is a discontinuity of some fluid property such as density or velocity or of some derivative of these properties in a direction normal to the interface. The equations of motion do not apply at the interface but are replaced by the boundary conditions.

### interplanetary shock waves

(added April 2007)

Shock waves in the solar corona and interplanetary space caused by the interaction of fast coronal mass ejections, the solar wind, and the interplanetary magnetic field. Interplanetary shock waves occur when the speed of the coronal mass ejection is faster than the local fast magnetosonic speed.

radio auroras

Charged atoms or molecularly bound groups of atoms; sometimes also free electrons or other charged subatomic particles. In atmospheric electricity, any of several types of electrically charged submicroscopic particles normally found in the atmosphere. Atmospheric ions are of two principal types, small ions and large ions, although a class of intermediate ions has occasionally been reported. In chemistry, atoms or specific groupings of atoms which have gained or lost one or more electrons, as the chloride ion or ammonium ion. Such ions exist in aqueous solutions and in certain crystal structures.

. refractory metals . . iridium ... iridium isotopes

# Iridium network

(added December 1998)

A 66-satellite wireless personal telecommunications network designed to provide worldwide telephone, paging, facsimile and data services to handheld or mobile equipment.

Nova launch vehicles

. RAM B launch vehicle

Pegasus air-launched booster

DEF The postulated openings in the continuum of time or of space, through which a spacecraft or missile must be launched in order

launching pads to achieve a desired encounter, rendezvous, impact or the like. Used for launch time. Specifically, structures or devices, often incorporating tubes, a group of tubes, or a set of tracks, from which self-propelled missiles are sent forth and by means of which the missiles usually are aimed or imparted initial guidance -- distinguished in this specific sense the catapult. Broadly, structures, machines, or devices, including catapults, by means of which airplanes, rockets, or the like are directed, hurled, or sent forth. Used for launching devices. . aircraft launching devices . hypervelocity launchers . missile launchers . mobile missile launchers National Launch Vehicle Program . spacecraft launching National Launch Vehicle Program DEF Areas such as Cape Kennedy or Vandenburg Air Force Base that have several launch sites. Used for launch complexes. Cape Kennedy launch complex ground support equipment DEF The load-bearing base or platform from which a rocket vehicle is launched.

leading edge sweep

GS geometry . Euclidean geometry

. . angles (geometry)

... sweep angle

.... sweepback . . . . leading edge sweep

leading edge thrust The increase in lift produced by highly swept, low-aspect ratio wings which develop a strong separation vortex; however, an even

larger increase in drag is produced.

thrust . leading edge thrust

aerodynamic forces airfoils

leading edges wing loading

leading edges

GS edges

. leading edges . . blunt leading edges

. sharp leading edges airfoils forebodies leading edge thrust thrust distribution

trailing edges vortex flaps wing rock

leaf area index GS ratios

. indexes (ratios)

. . vegetative index

. . leaf area index RT canopies (vegetation)

linear evolution equations
DEF Denotes a large class of differential or integral differential equations which are used to describe the evolution in time of some physical systems from an initial state. The equation is said to be linear if the unknown functions and their derivatives appear linearly.

## linear quadratic Gaussian control

DEF A type of optimal-state feedback control whose design considers noise. It is primarily used to control aircraft and spacecraft systems. Used for LQG control.

SN (DOES NOT INCLUDE THE MAGELLAN ULTRAVIOLET ASTRONOMY SATELLITE)

DEF A Venus probe incorporating Voyager and Galileo hardware designs equipped with a synthetic aperture radar system to acquire surface imagery, altimetric profiles, and surface radiothermal emissivities. Earth-based Doppler radio tracking of the spacecraft will be used to derive gravimetric data. (This term designates the spacecraft intrinsic and support hardware, instrumentation acquired data.) Used for Venus Radar Mapper.

#### magic tees

DEF Compound waveguides or coaxial tees with four arms which exhibit directional characteristics, when properly matched, so that a sig-nal entering one arm will be split between two of the other arms but not the third. A signal entering another arm is likewise split with half the energy entering one of the arms common to the other input but not its second arm and the other half of the energy entering the arm not used by the other input. Magic tees are used in radar as transmitter receiver duplexers.

RT duplexers

#### magnetars

(added January 2000)

Highly magnetized neutron stars believed to emit quasi-steady x-rays along with bursts of soft gamma rays- emissions powered by their magnetic energy. According to the mag-netar theory, these stars form in some fraction of all supernovae. When they are young (with ages less than about 10,000 years) magnetars may be observed as soft gamma repeaters (SGRs) or anomalous X-ray pulsars.

#### magnetic moments

The quantities obtained by multiplying the distances between two magnetic poles by the average strength of the poles. Measures of the magnetic flux set up by the gyration of an electric field in a magnetic field. Moments are negative, indicating they are diagramatic, and equal to the energy of rotation divided by the magnetic field. In atomic and nuclear physics, moments, measured in Bohr magnetrons, are associated with the intrinsic spin of the particle and with the orbital motion of the particle in a system.

# maintainability

DEF A measure of the ease and rapidity with which a system or equipment can be retained in operational status through preventive maintenance or restored to operational status following a failure. It is characteristic of equipment design and installation, personnel availability in the required skill levels, adequacy of maintenance procedures and test equipment, and the physical environment under which main-

tenance is performed. RT design analysis maintenance reliability

#### Mars Climate Orbiter

(added March 1999)

One of two spacecraft comprising the Mars Surveyor 98 program; launched December 1998. After obtaining a polar, nearly circular orbit around Mars, the Orbiter will serve as a radio relay during the Lander surface mission, then begin monitoring the atmosphere, surface, and polar caps for a complete Martian year. The Orbiter carries two science instruments: the Pressure Modulated Infrared Radiometer and the Mars Color Imager.

#### Mars Polar Lander

(added March 1999)

DEF One of two spacecraft comprising the Mars Surveyor 98 program; launched January 1999. After a soft landing near the Martian south pole, the Lander will search for near-surface ice and possible surface records of cyclic climate and possible surface records of cyclic climate change, and characterize physical processes key to the seasonal cycles of water, carbon dioxide and dust on Mars. Prior to landing, the Deep Space 2 microprobes will be released as part of a technology-validation mission related to multiple-lander spacecraft.

# Mars Reconnaissance Orbiter

(added August 2005)

DEF A spacecraft launched on August 12, 2005 to determine how long water existed on Mars by conducting surface and subsurface mapping. The Mars Reconnaissance Orbiter carries instruments for geological and meteorological observations from Martian orbit, and for spacecraft navigation and communication. After completion of its science mission, the spacecraft will provide data relay services between other Mars missions and Earth.
