by George A. Plesko

ncome measurement for tax reporting follows a separate set of rules than that used for financial reporting. The goal of financial reporting, as outlined by the Financial Accounting Standards Board (FASB) in its 1978 Statement of Financial Accounting Concepts No. 1, is to provide external users with "information that is useful in investment and credit decisions [1]." In contrast, tax reporting is intended to facilitate the collection of revenues in an equitable and efficient manner, and tax authorities, while identified by the FASB as potential users, have the authority to require companies to supply the information necessary to administer the tax code. Further, while companies can exercise substantial discretion in applying the financial accounting rules to their businesses, the tax code generally proscribes a fixed set of rules with little room for managerial judgment.

Schedule M-1 of the Form 1120 series of corporation income tax returns requires corporations to reconcile financial reporting of book net income with tax net income. While the sources and magnitudes of the differences between financial and tax measures of income may be useful as part of the Internal Revenue Service (IRS) audit process, the differences between the two measures has also been of interest to those making tax policy. The corporate "alternative minimum tax," enacted as part of the Tax Reform Act of 1986, included as a "tax preference" item subject to that tax one-half of the difference between the amounts of income reported under each system [2]. Recently, increases in the difference between the amount of income reported under each system have raised concern that the corporate tax base may be eroding, and that corporations may have become more aggressive in reducing their tax liabilities [3]. Further, the extent and sources of differences between tax and financial reporting measures of income have been the focus of numerous academic studies evaluating the corporate tax system and corporations' responses to changes in tax rules [4].

George Plesko is the Class of 1922 Assistant Professor of Management at the Sloan School of Management, Massachusetts Institute of Technology. This article was prepared under the direction of Karen Cys, Chief, Corporation Statistics Branch. Madeline Boerner helped in the preparation of the tables. Rebecca Zarutskie and Jonathan Zinman assisted in preparing the tables and figures. This article presents a summary of information tabulated from Schedule M-1 and provides information on the magnitude of the various components of the differences by industrial division. These data, for active corporations other than those filing Forms 1120S, 1120-REIT, and 1120-RIC, supplement annual return data published in the *Statistics of Income Bulletin* and the *Source Book of Statistics of Income--Corporation Income Tax Returns*. Specifically, the tabulations presented here match the same group of returns published annually in *Statistics of Income--Corporation Income Tax Returns*. Tables are provided for 3 return years, 1996 to 1998 [5].

### Sources of Book-TaxDifferences

The sources of book-tax differences in the amount of income reported as earned by a corporation are based on the differences in the concepts and rules underlying each reporting system. The target audience of financial statements are investors and others who need information in order to make decisions about a company, including whether to invest in the company's equity or debt. Companies that issue publicly-traded equity or debt securities are required by the Securities and Exchange Commission to file audited financial statements. Such statements must follow Generally Accepted Accounting Principles (GAAP), which include an adherence to pronouncements of the Financial Accounting Standards Board (FASB) and other accounting standards.

Tax accounting is designed to administer the U.S. tax laws, with the IRS as the primary audience for tax filings. In contrast to GAAP in a particular area, tax rules can change frequently, depending on legislative initiatives. Further, tax rules are not necessarily designed to present as consistent a definition of income over time as financial accounting rules are, as periodic changes in the tax rules are intended to both change the level of taxes collected and encourage or discourage certain types of activities.

An important element of financial accounting is the amount of discretion left to the corporation in implementing GAAP within its business. For example, in determining the useful life and depreciation pattern of a capital asset, depreciation schedules of the same asset can vary by company, and by usage, and usually follow a straight-line pattern. Tax depreciation is dictated by the Internal Revenue Code and leaves less discretion to the company. The lack of

discretion in the tax code is intended to lead to more uniform application of the tax system.

Figure A provides a copy of the Schedule M-1 reconciliation table, the specific sources of differences that are reported, and the steps needed to calculate tax net income from book net income. Differences between tax and financial measures of income can arise from two types of measurement differences in the accounting systems: temporary and permanent [6]. Temporary (timing) differences occur when tax and financial reporting each recognize the same total amount of income or expense, but do so either over different time periods or in different patterns over the same period. These timing differences can arise from the different reporting rules under each system, but also because GAAP allows managers greater discretion in determining the

amounts of income and expense in each period than does the tax system.

The second source of differences in the measures of income is permanent, and arises when a particular item of income or expense is recognized under one system but not the other. An example is tax-exempt interest on municipal bonds, which is included in book income but not in the determination of tax net income.

Both temporary and permanent differences are reported in corporations' financial statements. Under FASB's *Statement of Financial Accounting Standards Number 109*, corporations report a total amount of tax liability based on current year financial reporting income, delineating the portion currently owed to the Government from that which is deferred due to differences in income and expense recognition

### Figure A

# Schedule M-1 Reconciliation of Income (Loss) per Books With Income per Return, Tax Years 1996-1998

- 1 Net income (loss) per books (after-tax) Additions:
- 2 Federal income tax
- 3 Excess of capital losses over capital gains
- 4 Income subject to tax not recorded on books this year
- 5 Expenses recorded on books this year not deducted on this return:

Depreciation

Travel and entertainment

Contributions carryover

6 Equals: Book income after additions

#### **Subtractions:**

7 Income recorded on books this year not included on this return:

Tax- exempt interest

8 Deductions on this return not charged against book income this year:

Depreciation

Contributions carryover

- 9 Equals: Total subtractions
- 10 Book income after additions and subtractions, equal to tax net income before net operating loss deduction and special deductions (line 6 less line 9)

NOTE: The schedule M-1 line numbers are included for reference.

between the two methods. If the deferred portion is positive a deferred tax liability is created, representing the amount of taxes not paid on financial statement income this period because of temporary differences reducing tax net income below book income. Such is usually the case in the short term with depreciation, as more deductions are taken for tax purposes during the early years of an asset's life than are recognized as expenses for book purposes. The deferred tax liability associated with the asset on a corporation's financial statements represents the amount of tax to be paid in the future relative to future book earnings when the tax depreciation deductions fall below the book depreciation expense. In contrast to deferred tax liabilities, deferred tax assets are created when more taxes are paid than would be paid if financial reporting income were used to base tax liability, and

represent a financial claim on the Government for taxes paid ahead of time relative to financial reporting.

Permanent differences, such as the effect of taxexempt interest, never reverse and therefore do not create deferred tax assets or liabilities. Corporations account for permanent differences in a separate financial disclosure in the tax footnote of their financial statements. Figure B provides some examples of the types of transactions with different accounting treatments under each system.

#### ScheduleM-1Reconciliation

Schedule M-1 begins with a company's "net income (loss) per books," which represents the after-tax amount of income reported to shareholders, and the company's Federal income tax, which must be added back to the company's book net income to obtain the

### Figure B

### **Examples of Book-Tax Accounting Differences**

### Income subject to tax not recorded on books in the current year

Prepaid rent received

Prepaid interest received

Prepaid subscriptions

Realized capital gains on previously accrued trading security gains

#### Expenses recorded on books not deducted on the return

Travel and entertainment expenses in excess of deductible amounts

Reserves for warranty expenses

Book depreciation in excess of tax depreciation

Bad debt expense when tax reporting uses specific charge-off method

Allowances for returns not recognized for tax purposes until occurrance

Differences in amortization of intangible assets

#### Income recorded on books not included on the return

Unrepatriated income from foreign subsidiaries

Rent prepaid in a prior period

Tax -exempt interest (permanent difference)

Accrued capital gains on trading securities not yet realized

### Deductions not charged against book income in the current year

Tax depreciation in excess of book depreciation

Compensation related to the exercise of non-qualified stock options

Realized capital losses on previously accrued trading security losses

amount of pre-tax book income. Additions are then made for items included in tax net income but not included in book net income, and for book expenses that do not reduce tax net income. The first of these income items is the "excess of capital losses over capital gains," and represents losses on the sale of capital assets (such as securities) that are not permitted to be deducted in the current year for tax purposes, but which are fully reflected as a loss in a company's book income.

For "income subject to tax not recorded on books this year," corporations report income which is currently recognized for tax purposes but not for financial accounting. For tax purposes, income is usually recognized by a corporation when payment is received, while financial reporting will require payments made in advance to be recognized as income during the future periods when the service or goods are provided by the company. An example of this type of transaction is rental payments received in advance by a company. Financial accounting rules require such payments to be recognized as income pro-rata over the time period of the lease, while tax rules would classify the entire amount as income in the current period. If the rental period spanned more than one accounting period, a temporary difference would arise and reverse in a later year, leading to a difference that would be reported elsewhere in Schedule M-1 as "income recorded on books this year not included on this return," at that time.

As part of "expenses recorded on books not deducted on the return," corporations report differences in the accounting treatment of expenses that increase tax net income relative to financial reporting income by being recognized for book, but not tax, reporting. An example of such a transaction would be any expense for travel and entertainment in excess of deductible limits. Also reported here, and separately identified, are any differences in depreciation to the extent book depreciation exceeds tax depreciation. Such differences in depreciation are usually due to the reversal of previous excess tax depreciation, and will be discussed in more detail below.

While the first set of items of Schedule M-1 capture accounting differences that lead to higher levels of tax net income than book income, at least in the near term, other aspects of tax and financial reporting will decrease tax net income. "Income

recorded on books this year not included on this return" records items of book income that are not recognized as tax net income in the current year. Examples of such income include tax-exempt interest (which by definition is excluded from the calculation of tax net income, though fully recognized as income for financial accounting purposes) and income recognized as taxable in a prior period that was not considered income under GAAP, such as prepaid rent.

The final set of accounting differences reported on Schedule M-1 is the amount by which tax deductions exceed their respective charges against book income. An important element of these types of expenses is depreciation, which is itemized on Schedule M-1. For financial reporting purposes, property, plant, and equipment are generally depreciated using the straight-line method over an estimate of each asset's expected useful life, to some residual value. In calculating tax net income, corporations can use accelerated methods of depreciation following procedures given by the tax code, typically over a shorter life, and to no residual value [7]. In the near term, other things equal, such differences will lead to taxable income being less than financial accounting income as the tax deduction for depreciation will be greater than the depreciation expense charged against earnings. However, at some point, the amount of depreciation allowed for tax purposes on these assets will fall below that reported for financial accounting purposes, reversing the relation between the two measures of income. Such reversals will be reported as an "expense recorded on books this year not deducted on this return," and included in the itemization for depreciation.

Also included as a deduction not charged as an expense are the effects of the differential treatment of stock-based compensation [8]. When employees exercise non-qualified stock options, the difference between the exercise price and the market price is treated as compensation and is deductible for tax purposes. However, under GAAP, such compensation is treated as a contribution of capital to the corporation, and is not recognized as an expense.

Schedule M-1 reconciliation does not include the net operating loss deduction or other special deductions such as the deduction for dividends received as these two items are subtracted from tax net income in order to determine "income subject to tax," the

actual tax base. Unlike pre-tax book income or tax net income, income subject to tax cannot be negative. The effect of these deductions will be to create a larger difference between book income and income subject to tax for companies with positive tax net income. A company's ultimate tax liability is calculated by applying the rate schedule to income subject to tax, with additional taxes potentially levied (for example by the alternative minimum tax) and offset by the use of credits (such as the foreign tax credit).

The Magnitude of Book Tax Adjustments, 1996-1998

Figure C provides annual totals for each line item in Schedule M-1 for all active corporation returns (other than Forms 1120S, 1120-REIT, and 1120-RIC) and for the subset of returns with net income, as well as additional information on total assets, net operating loss deductions, special deductions, and income tax before and after credits [9]. Figure D provides a plot of two data series of interest: pre-tax book income and tax net income.

Figure D

Returns of Active Corporations, Other than Forms 1120S, 1120-REIT, and 1120-RIC: Book and Tax Measures of Income, Tax Years 1996-1998

- <sup>1</sup> Net income (loss) per books plus Schedule M-1 Federal income tax
- <sup>2</sup> Schedule M-1 tax net income (after additions and subtractions to pre-tax book income)

In Figure E, the amount of tax reported for book purposes is compared to total income tax after credits from the tax return. Consistent with Figure D, book measures of tax liability exceed income tax after credits in each year. For 1996, financial measures of tax liability exceeded tax after credits by \$28.8 billion, increasing to more than \$35.0 billion in both 1997 and 1998.

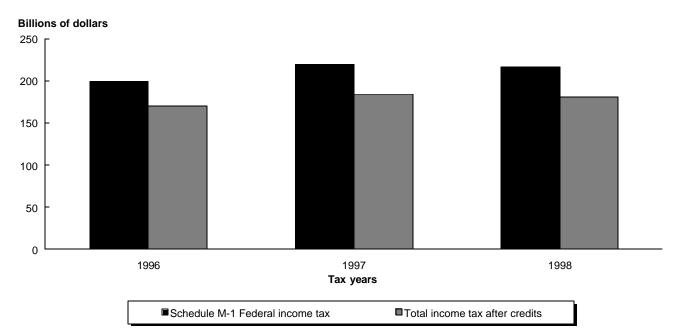

Pre-tax book income of active corporations (the sum of net income (loss) per books and Federal income tax) grew from \$752.7 billion for 1996 to \$819.6 billion for 1997, and fell slightly for 1998 to \$816.7 billion. Similarly, tax net income grew from \$660.2 billion for 1996 to \$693.6 billion for 1997, and also fell for 1998 to \$657.7 billion. Over these 3 years, these figures represent an 8.5-percent growth in pre-tax book income, while tax net income remained essentially flat (falling less than one-half of 1 percent). The net effect of these differential growth patterns was to increase the difference between pre-tax book income and tax net income from \$92.5 billion for 1996 to more than \$159.0 billion for 1998.

an increase of 71.9 percent. This book-tax difference represented 24.2 percent of the total amount of net income reported for tax purposes for 1998.

The sources of these differences in the levels of income can be examined in two ways: first, by the changes in income by the income status of company, and second, by the components of the reconciling items. For returns with net income (the bottom panel of Figure C), pre-tax book income rose 9.2 percent from 1996 to 1998, and tax net income rose 7.1 percent. Among these companies, the difference between book net income and tax net income rose from \$69.1 billion for 1996 to \$92.0 billion for 1998, or by 10.8 percent of the 1998 level of tax net income. In contrast, the book-tax differences of loss corporations, which in the aggregate reported both negative pre-tax book income and negative tax net income, nearly tripled, from \$23.4 billion for 1996 to \$67.0 billion for 1998. Thus, of the \$66.5-billion increase in book-tax income differences, \$43.6 billion, or 65.6 percent, was attributable to corporations without net income for tax purposes.

Figure E

As for the components of Schedule M-1, the "excess of capital losses over capital gains," grew by the greatest percentage over the period (78.2 percent) from \$8.6 billion to \$15.4 billion. Of the differences in the amount of income reported under each system, the net difference in "income recorded on books not included on this return" and "income subject to tax not recorded on books" increased from \$21.6 billion in 1996 to \$99.4 billion for 1998. Most of this increase was due to loss companies. Companies with net income in each year reported \$68.6 million more income for tax than book purposes (net) for 1996, reversing to an excess of income reported for book purposes of \$31.1 billion. However, loss companies reported \$21.7 billion more in pre-tax book income than tax net income in 1996, rising to \$68.3 billion in 1998.

The amount of tax deductions in excess of book expenses rose from \$48.7 billion for 1996 to \$65.8 billion for 1997, falling to \$46.4 billion for 1998. Of those totals, net excess depreciation for tax purposes rose from \$56.8 billion for 1996 to \$65.5 billion for 1997, and \$80.0 billion for 1998.

Book-TaxDifferencesbySize, 1996-1998 Figure F provides totals for Schedule M-1 items for active corporations by the size of assets for 1996. Although firms in the largest asset category of \$250 million or more represented only two-tenths of 1 percent of the returns filed for 1996, they held 88.1 percent of total assets and reported 96.0 percent of net income (loss) per books and 92.0 percent of tax net income. Of the total amount of book-tax differences for 1996, about 98.6 percent was reported by these companies. Although not reported in tabular form, the concentration of assets, income, and booktax adjustments was similar for 1997 and 1998, with corporations with assets of \$250 million or more reporting 96.6 percent of the total book-tax difference for 1997, and 96.9 percent for 1998.

Differences in Income Status, 1996–1998 Apart from the magnitude of the differences in the amount of income reported under each accounting system is the question of whether firms report the same "sign" of income under each system. Figure G provides a cross-tabulation of the number of returns

<sup>&</sup>lt;sup>1</sup> Net income (loss) per books plus Schedule M-1 Federal income tax.

for each year based on whether they reported positive or negative pre-tax book income and whether net income (loss) was positive or negative and income subject to tax was positive or zero [10]. For these tabulations, net income refers to the amount of income reported by corporations before the net operating loss deduction and special deductions, as reported on the first page of Form 1120, and not the amount reported in Schedule M-1 (referred to as "tax net income"). Differences in these amounts will be due to omissions in Schedule M-1, and not due to errors in the calculation of the company's income subject to tax. For further details, see the *Data Sources and Limitations* section at the end of this article.

The first panel of Figure G provides tabulations of the returns based on the signs of their pre-tax book income and net income (loss). For 1996, there were 995,163 returns showing zero or negative pre-tax

book income and zero net income or loss, with 1,080,800 returns showing positive amounts of each. While these two amounts represent nearly 90 percent of the total number of returns, it is important to note that the other two table cells show that 10.4 percent of companies report income with opposite signs under the two accounting systems, with the bulk of those reporting positive tax net income but zero or negative pre-tax book income. This pattern remains constant throughout 1997 and 1998, with 10.2 percent and 10.3 percent of the returns, respectively, showing differences in the signs of income reported for tax and book purposes.

The second set of tabulations in the top panel compares pre-tax book income to income subject to tax. Income subject to tax cannot be negative, and will be less than net income (loss) if the corporation has a dividends-received deduction or certain other

 $<sup>^{\</sup>rm 2}\,\text{Taxable}$  income before net operating loss deduction and special deductions.

statutory special deductions, such as a net operating loss carryforward. Predictably, the share of returns with differing signs increases to approximately 20 percent for each of the 3 years, with the largest increase occurring in the combination of companies reporting positive pretax book income, but zero income subject to tax. That this combination increases is not surprising, as the dividends received deduction and statutory special deductions will only reduce tax accounting measures of income, without affecting the amount of pre-tax book income reported to shareholders.

The second panel of Figure G repeats the tabulation of the first, but is limited to companies in the largest size category, those with assets of \$250 million or more. For the 3 years, the overall percentage of returns showing different signs is only slightly higher, at 10.9 percent for 1996, 11.1 percent for 1997, and 11.5 percent for

1998. Strikingly different, however, is that for each of these years, the majority of returns reporting different "signs" of income are those with positive pre-tax book income and zero or negative net income.

For the largest corporations, the percentage reporting different signs of income is somewhat smaller than for the population as a whole: 16.2 percent for 1996, about 16.0 percent for 1997, and 15.1 percent for 1998. What is different in this panel, however, is that of those returns with different "signs" of income, the relative number reporting positive pre-tax book income but zero income subject to tax is more than four times the number reporting positive income subject to tax but zero or negative pre-tax book income for 1996 and 1997, and more than 3 times for 1998.

In Figure H, the tabulations of Figure G are repeated, but with the amount of book-tax difference

<sup>&</sup>lt;sup>1</sup> Net income (loss) per books plus Schedule M-1 Federal income tax.

<sup>&</sup>lt;sup>2</sup> Taxable income before net operating loss deduction and special deductions.

for each combination of income reported rather than the number of returns. For active corporations, based on the sign of pre-tax book income and net income (loss) for all corporations in the sample, more than 100 percent of the total book-tax income difference for 1996 and 1997 is due to corporations with positive amounts of both, with the other three combinations largely offsetting each other. For companies reporting positive pre-tax book income but zero net income or loss, the amount of the book-tax difference will always be positive, just as corporations reporting positive net income and negative pre-tax book income will always show a negative book-tax income difference. For companies with negative or zero amounts of both pre-tax book and net loss, the aggregate value of the book-tax difference is negative, suggesting these companies, on average, report higher net income (loss) than book income.

For 1998, the amount of book-tax difference due to companies with positive pre-tax book income and positive net income was 94.3 percent of the total, with the amount of book-tax differences reported by companies with positive pre-tax book income and zero net income or loss increasing 87.4 percent, from \$65.4 billion for 1997 to \$122.5 billion for 1998, an increase of \$57.1 billion.

The next two lines of data provide information on the magnitude of the difference between pre-tax book income and income subject to tax. Between 1997 and 1998, the amount of book-tax income differences reported by companies with positive pre-tax book income and zero income subject to tax increased significantly, from \$76.4 billion to \$132.6 billion, a 73.6-percent difference.

The bottom half of Figure H provides the magnitudes of book-tax differences for the largest corporations. Examining the dollar amounts of the book-tax difference for corporations with assets of \$250 million or more shows a similar pattern for 1996 and 1997 as in the entire sample. Most notable, however, is that the sharp increase in the book-tax difference for 1998 seems to have been driven by the increase in the book-tax difference of these large corporations. For 1996 and 1997, the book-tax differences of corporations reporting positive pre-tax book income and positive net income were approximately equal to the entire amount of the book-tax difference for all returns included in the statistics.

From 1997 to 1998, corporations with assets in excess of \$250 million, and reporting positive pre-tax book income and zero or negative net income, reported twice the amount of book-tax income differences, from \$41.3 billion to \$98.8 billion. This increase in the book-tax difference for these corporations is also found in the bottom panel for corporations with assets of at least \$250 million. For this subset of companies, the book-tax difference of returns showing positive pre-tax book income and zero income subject to tax more than doubled, from \$50.4 billion for 1997 to \$106.4 billion for 1998.

# Book-TaxDifferencesbyIndustrialDivision, 1996-1997

While aggregate differences are informative in helping to understand the importance of accounting differences in the measurement of income, they are not indicative of every industry. In this section, the extent of book-tax accounting differences are described by industrial division. Tables 1 through 6 present tabulations from Schedule M-1 for active corporations and of corporations with net income for the years 1996 to 1998. Because of changes in classifications as a result of the adoption of the North American Industrial Classification System (NAICS), industrial "sectors" for 1998 are not readily comparable to the industrial "divisions" of earlier years. As a result, 1998 is discussed separately.

Agriculture, forestry, and fishing.--With approximately one-half of the division's assets held by companies with less than \$5 million in assets, these smaller, privately-held corporations are more likely to use tax accounting rules as the basis of their financial accounting, and therefore have fewer adjustments to make between book and tax net income. Pre-tax book income exceeded tax net income by \$90.8 million for 1996 and \$22.1 million for 1997, representing 5.1 and 1.4 percent of tax net income in those years, respectively. Excess depreciation deducted for tax purposes was \$95.9 million for 1996 and \$116.2 million for 1997. Each of these amounts exceeded the total amount of book-tax differences for each year. After including nondepreciation expenses, net charges against pre-tax book income were \$17.6 million more than those against tax net income for 1996, and \$8.3 million less for 1997. Income recognition differences were the

largest source of book-tax differences, with \$124.7 million more income recorded as pre-tax book income than tax net income for 1996 and \$69.4 million for 1997.

Mining.--Pre-tax book income exceeded tax net income by \$3.8 billion for 1996, or 35.4 percent, but reversed for 1997, leaving tax net income \$0.3 billion (or 2.4 percent) higher than pre-tax book income for 1997. The net amount of additional income reported on these companies' financial books over income reported on their tax returns was \$498.0 million for 1996 and \$417.6 million for 1997, while tax deductions, which exceeded book expenses by \$3.6 billion for 1996, reversed and were smaller than book expenses by \$520.1 million for 1997. Depreciation differences were small for both years, amounting to only \$58.2 million for 1996 and \$8.2 million for 1997.

Construction.--As in agriculture, assets are less concentrated in large corporations; more than onehalf are owned by companies with assets less than \$10 million. Pre-tax book income exceeded tax net income by 1.4 percent for this group, or \$108.9 million for 1996 (with corporations in the largest asset category (\$250 million or more) reporting tax net income \$364.0 million *greater* than pre-tax book income). For 1997, this relationship reversed, with the division reporting \$385.1 million more in tax net income than pre-tax book income, or 4.9 percent of the total amount of tax net income. Corporations reported a net \$1.0 billion more in pre-tax book income than tax net income for 1996 and \$0.5 billion more for 1997. Net deductions for tax were \$846.0 million less than net book expenses in 1996 and \$813.3 million less in 1997. Of these expenses, net tax depreciation exceeded book depreciation by \$488.4 million in 1996 and \$595.8 million in 1997.

Manufacturing.--For 1996, about 89 percent of manufacturing's assets and nearly 92 percent of pretax book income were reported by corporations with \$250 million or more in assets. For 1996, tax net income for this division exceeded book pre-tax income by \$10.7 billion (3.3 percent of tax net income) but this reversed for 1997, with pre-tax book income exceeding tax net income by \$20.1 billion, or 6.1 percent of tax net income. Excess capital losses were \$3.7 billion for 1996 and \$6.7 billion for 1997. This division was responsible for approximately 32 percent of the total amount of book depreciation expenses "not deducted for the current year" for

1996 and 1997. Although excess tax depreciation exceeded book depreciation by nearly \$20 billion for 1996 and approximately \$24 billion for 1997, the difference between deductions and expenses was much smaller in 1996 at \$14.5 billion and increased to \$34.8 billion for 1997. The net amount of tax net income not included in pre-tax book income exceeded book income not included in tax net income by \$21.8 billion for 1996, but only \$8.2 billion for 1997.

*Transportation and public utilities.--*Even more concentrated than manufacturing, this division's largest group of companies (those with total assets of \$250 million or more) held 94 percent of the division's assets and reported almost 98 percent of its tax net income for 1996. Reported book pre-tax income exceeded tax net income by \$30.1 billion for 1996 and \$18.9 billion for 1997, 32.5 percent and 15.0 percent of the total amount of book tax differences in each year. These differences amounted to 37.0 percent of tax net income in 1996 and 23.3 percent in 1997. The amount of income recorded for financial accounting purposes exceeded that reported as tax net income by \$13.9 billion for 1996 and \$7.2 billion for 1997. Tax deductions exceeded book expenses by \$17.2 billion and \$14.5 billion, respectively, for 1996 and 1997, with depreciation accounting for \$11.9 billion and \$8.8 billion of that total.

Wholesale and retail trade.--For 1996, tax net income exceeded pre-tax book income by \$3.2 billion, amounting to 5.7 percent of total tax net income of \$56.1 billion. Income included in pre-tax book income was \$6.2 billion less than for tax net income, partially offset by \$3.5 billion more in tax deductions than expenses taken for book purposes. Depreciation deductions reduced tax net income by \$9.3 billion more than taken against pre-tax book income.

For 1997, nearly the entire amount of book-tax difference was eliminated, with tax net income exceeding pre-tax book income by only \$546 million, less than 1 percent of the total amount of tax net income for that year. The amount of income included in pre-tax book income but not included in tax net income increased only slightly (from \$6.2 billion to \$6.8 billion), while the amount of deductions taken for tax but not book purposes more than doubled, from \$3.5 billion to \$7.2 billion.

Finance, insurance, and real estate.--By far the largest source of aggregate book-tax differences, this industrial division showed 45.7 percent more

income for book purposes than for tax purposes for 1996 and 53.4 percent for 1997, representing \$72.4 billion and \$93.7 billion, respectively. Only slightly less concentrated than the Transportation division, corporations in the largest asset category reported 92 percent of the assets, 94 percent of the book pre-tax income, 96 percent of tax net income, and 89 percent (\$64.7 billion) of pre-tax book income in excess of tax net income for 1996.

For 1996, the single largest factor explaining the book-tax difference was the \$38.7-billion net income included in pre-tax book income but not included in tax net income, including \$17 billion in tax-exempt interest, 83 percent of the total reported by all companies. An additional \$5.4 billion of tax deductions in excess of book expenses were recorded, along with \$2.1 billion in excess capital losses.

For 1997, additional income reported for book, but not tax purposes, was \$50.5 billion, including \$16.3 billion in tax-exempt interest. Deductions against tax net income in excess of expenses for book purposes were \$7.6 billion, with an additional \$14.8 billion in depreciation deductions.

Services.--The amount of tax net income reported by the services division (\$22.2 billion) exceeded pre-tax book income by \$26.8 million for 1996, but increased dramatically to \$5.5 billion for 1997. The amount of income included in tax net income but not in pre-tax book income was \$4.8 million for 1996 and \$7.7 billion for 1997. This additional income for tax purposes was partially offset by \$5.3 billion of tax deductions in excess of book expenses for 1996, falling to \$3.0 billion for 1997. Deductions for depreciation exceeded those reported as a book expense by \$5.5 billion and \$6.3 billion for both 1996 and 1997. Excess capital losses accounted for the remaining \$0.7-billion and \$0.8-billion differences.

Book-TaxDifferencesby Industry Sector, 1998 Schedule M-1 data for 1998 are presented in Tables 5 and 6. Because 1998 is the first year using the North American Industry Classification System (NAICS), industry classifications are not directly comparable to classifications used in prior years. Further information on NAICS sectors, and the effects of NAICS on the comparability of corporate tax return data, can be found in Treubert and Jauquet (2001) [11].

Raw materials.--Companies in the raw materials industries reported \$3.1 billion more tax net income

than pre-tax book income for 1998. While these companies reported \$2.9 billion more in income for financial accounting purposes than for tax purposes, this was more than offset by \$4.2 billion less in tax deductions than book expenses. Depreciation for book purposes exceeded depreciation for tax by nearly \$900 million. Of these totals, loss companies reported nearly all of the additional book pre-tax income, with companies with positive net income claiming \$5.6 billion less in tax deductions than book expenses.

Goods production.--Companies classified in this sector had an excess of pre-tax book income over tax net income of \$11.6 billion, representing 3.7 percent of the amount they reported as tax net income. Even though depreciation deductions were nearly \$31.0 billion more for tax purposes than for book purposes, total deductions for tax purposes were \$4.5 billion less than expenses for book purposes. Income reported for book but not tax purposes exceeded \$22.7 billion, representing 23 percent of the total for all companies, and excess capital losses were \$6.7 billion--the largest amount for any industry sector and 43 percent of the total for all corporations.

Distribution and transportation of goods.-These corporations reported pre-tax book income \$9.2 billion higher than tax net income, a difference of 11.6 percent. The excess of income included in tax net income over income recorded for book purposes was \$9.0 billion, but this was offset by more than \$19.0 billion in additional deductions for tax than for book purposes.

Information.--Corporations classified in this sector showed the second largest source of book-tax income differences for 1998, reporting \$58.5 billion more in pre-tax book income than tax net income, a difference equal to 95.4 percent of the \$61.3 billion reported as tax net income. Within this sector, the excess of income reported for book but not tax purposes was \$38.5 billion, of which loss corporations' share was more than 100 percent (\$39.1 billion). Tax deductions exceeded book expenses by \$22.2 billion, of which \$20.8 billion were due to corporations with positive tax net income.

Finance, insurance, and real estate.--As with prior years, corporations classified as finance-related were responsible for the largest amount of book-tax income differences, \$81.4 billion, 51.2 percent of the grand total for the year. The amount of the book-tax difference was equal to 94.5 percent of tax net

income reported by finance-related companies. Both returns with net income, as well as returns without net income, reported large amounts of pre-tax book income in excess of income included in tax returns, \$47.8 billion and \$35.0 billion, respectively, and smaller amounts of expenses for book purposes than those deducted for tax purposes, \$2.9 billion less for returns with net income and \$4.6 billion for returns without net income. Tax-exempt interest reported for the finance sector totaled \$14.1 billion, 63 percent of the total amount of tax-exempt interest reported by all corporations.

Professional and business services.--Tax net income exceeded pre-tax book income for service corporations by \$4.9 billion for 1998. While these corporations reported \$5.8 billion less income for tax than for book purposes, tax deductions exceeded book expenses by more than \$11.3 billion, almost all of which could be attributed to depreciation differences of \$11.2 billion. Corporations in this sector also reported nearly \$5.0 billion in tax-exempt interest, second only to finance, and 22 percent of the U.S. total.

Education, health, and social services.-Aggregate net income for this sector was negative on both a book and tax basis for 1998. The reported pre-tax book loss of \$6.1 billion was \$5.4 billion more than the \$0.7 billion for tax net income. The companies in this sector reported both \$974.0 million less in income for tax purposes than book purposes, and \$4.2 billion more in expenses for book purposes. Companies with and without net income both show this same pattern of greater tax than book income reported, and greater expenses charged against book income than deducted for tax purposes.

Leisure.--Pre-tax book income exceeded tax income by \$2.2 billion, an amount equal to 32.3 percent of tax net income. Leisure companies reported \$2.0 billion more in pre-tax book income than income reported under tax accounting rules, while reporting \$0.5 billion more in expenses for tax reporting purposes. Approximately one-half of the book-tax difference was due to depreciation differences, with depreciation expenses for tax reporting exceeding book depreciation by \$1.1 billion.

Firms with zero or negative tax net income represented 56 percent of all returns filed in this sector and were the source of \$1.4 billion of the total book-tax difference, or nearly 62 percent.

### Summary

Accounting differences for tax and financial reporting purposes can lead to large differences in the amount of income reported under each system. This article provides data on the magnitudes of these differences for Tax Years 1996-1998 based on data compiled from Schedule M-1 of the 1120 series of corporation income tax returns. The extent of the difference in income was estimated to be more than \$159.0 billion in 1998, representing 24.2 percent of the total amount of tax net income reported for that year.

The release of these data should help to provide more insight into the operation of the corporate income tax system, and its interaction with other accounting methods. It should also be useful in helping to better understand the relation between the corporate tax system and the economy as a whole, as corporate Income Subject to Tax is influenced by factors other than current economic performance.

Data Sources and Limitations, Form 1120, Tax Years 1996-1998

Estimates for Tax Years 1996-1998 are based on samples of corporation income tax returns with accounting periods ending July of one year through June of the following year (Tax Year 1996, for example, includes accounting periods of July 1996 to June 1997) posted to the Internal Revenue Service Business Master File from the beginning of July through the end of the following June. These returns represent domestic corporations filing Form 1120 or 1120-A; foreign corporations with income "effectively connected" with a U.S. business filing Form 1120-F: life insurance companies filing Form 1120-L: and property and casualty insurance companies filing Form 1120-PC. While life insurance companies are included in the tabulations, Form 1120-L does not include a Schedule M-1, and book-tax differences of these companies will not be reflected in the tables. Form 1120S (S corporation returns), regulated investment companies filing Form 1120-RIC, and real estate investment trusts filing Form 1120-REIT were excluded from the tabulations.

A stratified probability sample was used to produce the statistics. Sample sizes vary by year with stratifications based on combinations of total assets and a measure of income at rates ranging from 0.25 percent to 100 percent. More detail for individual

years can be found in *Statistics of Income--Corpo*ration Income Tax Returns.

Information is obtained from the returns as filed. Within this article, "tax net income" refers to the amount of income reported on the last line of Schedule M-1 as reconciled with pre-tax book income. This "tax net income" should equal the amount reported as "taxable income before net operating loss deduction and special deductions," as reported on the first page of Form 1120 (referred to as "net income (loss)"). However, companies that do not complete the schedule or leave it blank will not be recorded as having a book-tax difference, and the amount of "tax net income" tabulated from Schedule M-1 may not equal the amount of net income reported elsewhere. As a result, income subject to tax derived from Schedule M-1 tax net income can differ from income subject to tax reported on the first page of Form 1120.

<sup>&</sup>lt;sup>1</sup> Schedule M-1 tax net income (after additions and subtractions to pre-tax book income).

<sup>\*</sup>Estimate should be used with caution because of the small number of sample returns on which it is based.

NOTES: Detail may not add to totals because of rounding. The industrial divisions shown in this table are based on the Standard Industrial Classification system.

Table 2.--Returns with Net Income, Other than Forms 1120S, 1120-REIT, and 1120-RIC: Selected Schedule M-1 and Tax Return Items, by Industrial Division, Tax Year 1996

<sup>&</sup>lt;sup>1</sup> Schedule M-1 tax net income (after additions and subtractions to pre-tax book income).

<sup>\*</sup>Estimate should be used with caution because of the small number of sample returns on which it is based.

NOTES: Detail may not add to totals because of rounding. The industrial divisions shown in this table are based on the Standard Industrial Classification system.

Table 3.--Returns of Active Corporations, Other than Forms 1120S, 1120-REIT, and 1120-RIC: Selected Schedule M-1 and Tax Return Items, by Industrial Division, Tax Year 1997

<sup>&</sup>lt;sup>1</sup> Schedule M-1 tax net income (after additions and subtractions to pre-tax book income).

<sup>\*</sup>Estimate should be used with caution because of the small number of sample returns on which it is based.

NOTES: Detail may not add to totals because of rounding. The industrial divisions shown in this table are based on the Standard Industrial Classification system.

Table 4.--Returns with Net Income, Other than Forms 1120S, 1120-REIT, and 1120-RIC: Selected Schedule M-1 and Tax Return Items, by Industrial Division, Tax Year 1997
