by Michael Parisi and Dave Campbell

axpayers filed 127.1 million individual income tax returns for Tax Year 1999, of which more than 94.5 million, or 74.4 percent, showed some income tax liability. The average tax rate on all taxable returns increased approximately 0.4 percentage points from 1998 to 15.7 percent in 1999. On these taxable returns, the average adjusted gross income (less deficit) (AGI) rose 6.4 percent to \$59,028, while average total income tax increased to \$9,280, a 9.5-percent increase. Total AGI reported on taxable returns increased 8.2 percent to \$5,581 billion, while total income tax increased 11.3 percent to \$877 billion.

For the sixth consecutive year, the percent of AGI reported by the top 5 percent of taxpayers increased, reaching 34.0 percent for 1999. The top 5 percent of taxpayers also paid 55.5 percent of the total income tax for 1999, an increase of 1.7 percentage points from 1998. To be included in the top 5 percent, a taxpayer had to have an AGI of at least \$120,846. Taxpayers with AGI of at least \$293,415 were in the top 1 percent of taxpayers. The percent of AGI reported by the top 1 percent of taxpayers for 1999 increased for the sixth consecutive year to 19.5 percent, while the same group accounted for 36.2 percent of the total income tax, up from 34.8 percent of the total income tax they accounted for in 1998.

This article discusses the individual income tax rates and tax shares and the computation of "total income tax" for 1999. To put this discussion into perspective, the appendices to the article provide explanations of selected terms used in the article and describe the income tax structure, certain tax law changes, income and tax concepts (the "1979 Income Tax Concept," "modified" taxable income, and marginal tax rates), the computation of "alternative minimum taxable income," and the data sources and limitations.

Income Tax Rates

Discussions of income tax rates generally center on measuring two distinct tax rates: average tax rates and marginal tax rates. Average tax rates are calculated by dividing some measure of tax by some

Michael Parisi and Dave Campbell are economists with the Individual Returns Analysis Section. This article was prepared under the direction of Jeff Hartzok, Chief. measure of income. For the statistics in this article, the average tax rate is "total income tax" (the sum of "income tax after credits" and the "alternative minimum tax") divided by AGI reported on returns showing some income tax liability. Measures of marginal tax rates, on the other hand, focus on determining the tax rate imposed on the last (or next) dollar of income received by a taxpayer. For this article, the marginal tax rate is the statutory rate at which the last dollar of taxable income is taxed. (See Appendix D for a more detailed explanation of marginal tax rates.) The following sections describe the measurement of the average and marginal tax rates in more detail, and discuss the statistics based on these rates for 1999.

Average Tax Rates

Figure A presents statistics for 1986 through 1999 on income (based on each year's definition of AGI and on the common 1979 Income Concept) and taxes reported. (See Appendix D for an explanation of the 1979 Income Concept.) These tax years can be partitioned into six distinct subperiods:

- (1) Tax Year 1986 was the last year under the Economic Recovery Tax Act of 1981 (ERTA81). The tax bracket boundaries, personal exemptions, and standard deductions were indexed for inflation, and the maximum tax rate was 50 percent.
- (2) Tax Year 1987 was the first year under the Tax Reform Act of 1986 (TRA86). For 1987, a 1-year, transitional, five-rate tax bracket structure was established with a partial phase-in of new provisions that broadened the definition of AGI. The maximum tax rate was 38.5 percent.
- (3) During Tax Years 1988 through 1990, there was effectively a three-rate tax bracket structure [1]. The phase-in of the provisions of TRA86 continued with a maximum tax rate of 33 percent.
- (4) Tax Years 1991 and 1992 brought a three-rate tax bracket structure (with a maximum tax rate of 31 percent), a limitation on some itemized deductions, and a phaseout of personal exemptions.
- (5) Tax Years 1993 through 1996 had a five-rate

tax bracket structure (with a maximum statutory tax rate of 39.6 percent), a limitation on some itemized deductions, and a phaseout of personal exemptions.

(6) Tax Years 1997 through 1999 were subject to the Taxpayer Relief Act of 1997 (TRA97). TRA97 added three new capital gain tax rates to the

previous rate structure to form a new eight-rate tax bracket structure (with a maximum statutory tax rate of 39.6 percent). (See Appendix C for a more detailed description of the capital gain rates.)

More than 94.5 million, or 74.4 percent, of the 127.1 million individual returns filed for 1999 were "taxable returns." Total AGI for these returns in-

² Average tax rate is "total income tax" (column 5) as a percentage of adjusted gross income (less deficit) (AGI) (column 4).

³ The average adjusted gross income (less deficit), average total income tax, and average tax rate were calculated from unrounded data.

⁴ Constant dollars were calculated using the U.S. Bureau of Labor Statistics' consumer price index for urban consumers (CPI-U, 1982-84=100). See footnote 2 of this article for further details.

⁵ These statistics are based on adjusted gross income (AGI) recomputed to reflect the 1979 Income Concept, thus enabling more valid comparisons to be made of the average tax rates among years. Changes in the definition of AGI among years render direct comparison of the unadjusted figures misleading. For additional information, see Statistics of Income-Individual Income Tax Returns, for 1986-1999.

creased 8.2 percent to \$5,581 billion. Using the 1979 Income Concept, taxable returns showed total income of \$5,736 billion, an increase of 8.2 percent from 1998. Taxpayers reported \$877 billion in total income tax for 1999, approximately \$88 billion (11.3 percent) more than for 1998. This represents an increase over the 7.8 percent for 1998 and is the highest percentage increase in total income tax since 1996 (11.9 percent).

Average AGI and average total income tax increased from 1998 to 1999, in both current and constant 1982-1984 dollars [2]. Average tax increased 9.5 percent to \$9,280, some 3.1 percentage points more than growth in average AGI, which increased 6.4 percent to \$59,028. After adjusting for inflation as measured in 1982-1984 dollars, average AGI rose to \$35,431, and average total income tax increased to \$5.570.

Because TRA86 reduced statutory tax rates and broadened the definition of AGI (by eliminating or limiting the preferential treatment of various tax

items, such as restricting the use of "passive losses" to offset "non-passive income" and finally including net long-term capital gains), comparisons of average tax rates before and after 1986, based on currentyear definitions of AGI, become less meaningful [3]. The 1979 Income Concept provides a more consistent basis for such comparisons. Based on the 1979 Income Concept, average tax rates declined 0.1 percentage point from 13.6 percent for 1986 to 13.5 percent for 1987, increased to 13.7 percent for 1988, and declined again for the next 3 years, until reaching 13.2 percent for 1991. The average tax rate rose to 13.4 percent for 1992, increased to 13.9 percent for 1993, and continued to increase to 15.1 percent for 1997 before tapering off to 14.9 percent for 1998, the first decline since 1991. In 1999, the average tax rate increased to 15.3 percent.

As shown in Figure B, the average tax rate (as a percentage of AGI) on all taxable returns increased approximately 0.4 percentage points for 1999 to 15.7 percent. Most of this increase was due to higher

¹ Includes returns with adjusted gross deficit. Tax in these returns represents some combination of alternative minimum tax, Form 4972 tax on lump-sum distributions from qualified retirement plans, and Form 8814 tax on a child's interest and dividends not reflected in adjusted gross income or taxable income.

NOTE: Detail may not add to totals because of rounding

² Percentage not computed.

³ Increase not computed.

average tax rates in the top two AGI-size classes of "\$500,000 under \$1,000,000" and "\$1,000,000 or more," where the average tax rate increased 0.2 and 0.4 percent, respectively. The average tax rate for the "\$1 under \$10,000" AGI-size class increased as well, by 0.2 percentage points. However, since total income tax in this bracket was much smaller than the larger AGI-size classes, it did not have a significant effect on the percentage increase in the total average tax rate. Tax rates in all of the AGI-size classes between the top two and bottom one either remained unchanged or declined between 1998 and 1999. These AGI classes contain taxpavers who were most likely to have taken advantage of child and education tax credits that were increased for 1999. The child tax credit increased to \$500 in 1999, up from \$400 in 1998. Specifically, this can be seen in the "\$30,000 under \$50,000" AGI-size class, which had the largest reduction in average tax rate for 1999 (0.2 percentage points), and also had increases of 0.2 and 0.4 percentage points in the number of returns with the child tax credit and education credits, respectively [4].

Marginal TaxRateClassifications

A return's marginal tax rate is the highest statutory tax rate bracket applicable to that tax return. Marginal tax rate statistics are presented in Figures C and D, and in Table 1. These statistics were based on individual income tax returns showing an amount for "tax generated" on taxable income and items of income that were subject to the regular income tax, generally those included in AGI [5]. Tables 2 and 3 contain additional data based on marginal tax rates. These tables present statistics on the income and tax generated at each marginal tax rate by size of AGI (Table 2) and by filing status (Table 3). Appendix D explains the details of the determination of the marginal tax rate bracket into which a return is assumed to fall.

For 1999, the 102.8 million individual returns with modified taxable income totaling \$4,136.3 billion generated \$906.4 billion in income taxes. Figure C presents the amounts and percentages of modified taxable income and income tax generated (before reduction by tax credits, including the earned income credit) by the marginal rate categories (defined in

Returns with Modified Taxable Income: Percentages of Returns, Modified Taxable Income, and Tax Generated by Marginal Tax Rate Classification, Tax Years 1997-1999

Number of Returns

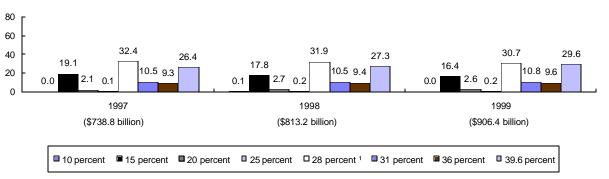

Modified Taxable Income

Percentage

Tax Generated

Percentage

¹ Includes 28 percent for returns with net long-term capital gains in excess of net short-term capital losses. NOTE: Returns in the "Form 8615" and "Form 8814" categories were included in the calculation of the percentages, but are not shown separately. Detail may not add to 100 percent because of rounding.

The percentage share of income tax generated for the "39.6-percent" category increased 3.2 percentage points.

Appendix D). Although 66.2 percent of the returns with modified taxable income were in the "15 percent" and "15 percent (Form 8814)" marginal rate categories, they reported

only 24.1 percent of the modified taxable income and generated only 16.4 percent of the tax. Conversely, the 0.8 percent of the returns in the "39.6-percent" classification reported 19.6 percent of the modified taxable income and generated 29.6 percent of the tax. The 25.3 percent of returns in the "28-percent" and "28-percent (capital gain)" categories reported 35.0 percent of the modified taxable income and 30.6 percent of the tax. Returns in the "31-percent" classification reported 9.9 percent of the modified taxable income and 10.8 percent of the income tax, while returns in the "36-percent" classification showed 7.8 percent of the modified taxable income and 9.6 percent of the income tax. Other than capital gains, the remaining returns--those in the "Form 8615" category--reported 0.1 percent of the modified taxable income and 0.1 percent of the income tax generated.

The three rate classifications that were new for 1997, "10 percent," "20 percent," and "25 percent," reported for 1999 just 3.5 percent of the modified taxable income and 2.8 percent of the income tax. As shown in Table 2, some 10.2 percent of returns had modified taxable income taxed at "20 percent," which accounted for 9.6 percent of the modified taxable income and 8.8 percent of the income tax. Also, 9.1 percent of returns had modified taxable income taxed at the "10-percent" rate, which accounted for only 0.9 percent of modified taxable income and 0.4 percent of income tax. The returns with income taxed at the "25-percent" rate classification accounted for only 0.5 percent of the total, while the modified taxable income and income tax reported at this rate were 0.2 and 0.3 percent of the aggregates, respectively.

Figure D illustrates changes in the distribution of percentages of tax returns, modified taxable income, and income tax generated among various marginal tax rate classifications over Tax Years 1997, 1998,

and 1999. Over the 3-year period, the percentage of returns in the "15-percent" marginal tax rate category decreased 3.0 percentage points, while the remaining seven marginal tax rate categories either increased or remained the same. During this 3-year period, the largest changes in the percentage shares of modified taxable income and income tax generated occurred in the "15-percent," "28-percent," and "39.6-percent" categories. The percentage shares of modified taxable income declined in both the "15percent" and "28-percent" categories by 3.3 and 1.5 percentage points, respectively, and increased by 2.7 percentage points in the "39.6-percent" category. Similar to the changes in the percentage shares of modified taxable income, the percentage shares of income tax generated for the "15-percent" categories decreased by 2.7 percentage points, and the "28percent" categories decreased by 1.9 percentage points. The percentage share of income tax generated for the "39.6-percent" category increased 3.2 percentage points. The three newest marginal tax rate categories, "10 percent," "20 percent," and "25 percent," did not have a significant impact on the distribution of returns, modified taxable income, or tax generated.

Components of Total Income Tax

Regular Tax

Regular tax is generally tax determined from a taxpayer's taxable income based on statutory tax rates less any applicable tax credits. It does not include the "alternative minimum tax" (AMT). Figure E illustrates the derivation of aggregate total income tax for 1999 returns with modified taxable income. Table 1 includes two tax amounts: "tax generated" and "income tax after credits." Tables 5 through 8 and Figures A and B include an additional measure of tax, "total income tax."

As shown (Figure E and column 5 of Table 1), the tax generated by applying statutory income tax rates to modified taxable income was \$906.4 billion. For most taxpayers, tax generated was equal to income tax before credits. However, for others, income tax before credits included special taxes on lump-sum distributions from qualified retirement plans (when a 10-year averaging method was used) [6]. The earned income credit (EIC) is included in this

Figure E

Derivation of 1999 Total Income Tax as Shown in Statistics of Income

| Child tax credit ¹ | 19.4 |
| Education credit | 4.8 |
| Foreign tax credit | 4.9 |
| General business credit | 0.8 |
| Earned income credit (limited to the amount | |
| needed to reduce total income tax to zero) | 1.9 |
| Credit for prior-year minimum tax | 1.0 |
| Other credits 2 | 0.4 |
| EQUALS: | |
| Income tax after credits | 870.9 |
| PLUS: Alternative minimum tax | 6.5 |
| EQUALS: | |
| Total income tax | 877.4 |

- ¹ Does not include the additional child tax credit which for 1999 was \$812.4 million.
- ² Includes the elderly or disabled credit, empowerment zone employment credit, mortgage interest credit, adoption credit, nonconventional source fuel credit, and other credits.

NOTE: Detail may not add to totals because of rounding.

computation to the extent that its application did not reduce income tax before credits below zero. Any portion of the EIC that is refundable to the taxpayer because it exceeds the taxpayer's liability and any portion of the EIC used to reduce taxes other than regular income taxes are excluded from the computation of income tax after credits [7]. Income tax after credits (Figure E) totaled \$870.9 billion. Total income tax of \$877.4 billion (Figure A) is the sum of income tax after credits and the alternative minimum tax [8].

Table 4 provides estimates on the type of tax computation for returns with modified taxable income. For 1999, the number of children under age 14 who had investment income over \$1,400 increased 23.6 percent to almost 575,000. Using Form 8615 to compute their tax (as if their income were treated as the marginal income of their parents or guardians), these children showed \$933.3 million in tax generated (column 7). If these same children had had all their income taxed as ordinary income, income tax before

credits (regular tax computation) would have totaled \$783.2 million (column 6). Thus, the difference resulting from the special tax computation was \$150.2 million (column 8) in additional tax, up 142.1 percent from the \$62.0 million calculated for 1997 (column 4) [9]. This large increase may be related to both the increase in the number of children's returns, as well as to a movement on these returns from long-term capital gains to investment income other than capital gains.

For 1999, the 16.9 million returns using the Schedule D capital gain tax computation generated \$405.8 billion in tax (column 7). However, if longterm capital gains had been taxed the same as ordinary income, the amount of income tax before credits (regular tax computation) for these same taxpayers would have been \$464.7 billion (column 6). Therefore, the reduction in tax generation resulting from use of the Schedule D tax computation was \$58.9 billion (column 8), an increase of 14.5 percent over the \$51.4-billion reduction shown for 1998 (column 4), when almost 16 million taxpayers received some benefit from lower capital gain taxes (column 1). Most of these tax savings (60.2 percent) were reported by taxpayers in the "\$1,000,000 or more" income-size class. For 1999, some 6.3 million taxpayers with an AGI of less than \$50,000 were able to take advantage of lower capital gain tax rates and saved \$961.9 million in taxes, an increase of 5.5 percent over the previous year's tax savings.

Alternative Minimum Tax

The Revenue Act of 1978 established the alternative minimum tax to ensure that a minimum amount of income tax was paid by taxpayers who might otherwise use certain provisions of the tax code meant to stimulate economic activity and generate "economic income" to reduce, or even eliminate, their regular tax liabilities. The AMT provisions may recapture some of these tax reductions by recomputing income to achieve "alternative minimum taxable income," or AMTI, the tax base for AMT. Form 6251, *Alternative Minimum Tax--Individuals*, is used to calculate AMT. (See Appendix E for an explanation of the computation of AMTI.)

Figure F presents statistics, by size of AGI, on AMT reported by taxpayers filing Form 6251 with their returns. For 1999, an AMT liability of \$6.5

¹ See Figures K-1 and K-2 for the calculation of alternative minimum taxable income and the list of alternative minimum tax adjustments and preferences.

NOTE: Detail may not add to totals because of rounding.

billion was reported based on AMTI of \$890.8 billion. Generally, AMTI is only shown on filed tax returns if the taxpayer's liability is affected by the AMT. The AMT amount for 1999 represents a 29.2-percent increase from the \$5.0 billion in AMT for 1998 based on \$815.3 billion of AMTI. Over the past few years, net long-term capital gain (less loss) has shown a significant increase. Since net long-term capital gain (less loss) is taxed at 28 percent (the same as the maximum rate for AMT) or lower rates, this increase is one of the reasons for the large percentage increase in the AMT amount. Another reason for the increase in the AMT amount is that the size of the AMT exemptions and the AMT income level at

which the rate increases from 26 percent to 28 percent are not indexed for inflation, whereas the widths of regular income tax rate brackets and the sizes of personal exemptions are inflation-adjusted annually. Thus, year-to-year inflation may cause more taxpayers to be affected by AMT and increase the amount of AMT liability. Also, even though this inflation may not cause AMT liability, it may increase tentative minimum tax. For certain taxpayers, this would reduce or eliminate their ability to take certain tax credits. These credits include all general business credits, prior-year minimum tax credit, empowerment zone credit, mortgage interest credit, and the nonconventional source fuel credit.

² Includes returns with adjusted gross deficit.

Figure G shows the highest marginal tax rates on ordinary income, capital gains, and AMTI for each of the years 1986 through 1999. The amount of AMT reported for each of the 14 years is also shown. For 1986, after TRA86 was introduced but before it became effective, when the highest marginal tax rate on ordinary income was 50 percent, and the highest capital gain rate and highest AMT rate were both 20 percent, the AMT reported was \$6.7 billion. After 1986, both the highest capital gain rate and the highest AMT rate increased, while the highest marginal ordinary tax rate declined. In addition, capital gains were fully included in AGI. For 1987, AMT decreased dramatically to \$1.7 billion. From 1988 to 1990. AMT revenue continued to decrease to a low of \$830.3 million for 1990. For 1991, when the AMT rate increased to 24 percent, AMT increased 46.1 percent to \$1.2 billion. From 1992 to 1993, when the highest marginal tax rate on ordinary income and the

| 1999 | 39.6 | 28 | 28 | 1,018,063 | 6,477,697 | | |

¹ This tax rate was based on 60 percent of long-term capital gains (in excess of short-term capital losses) being excluded from income. The remaining 40 percent of capital gains were taxed at the maximum rate of 50 percent, creating a top capital gain rate of 20 percent

highest AMT rate increased again (while the highest capital gain rate remained the same), the AMT liability increased 51.3 percent to nearly \$2.1 billion. From 1994 through 1996, the amount of AMT increased gradually every year. But for 1997, AMT spiked 42.4 percent to \$4.0 billion, the highest level reported since 1986. This also coincides with the large increases in long-term capital gains receiving favorable tax rates, cited previously. In 1999, the amount of AMT increased 29.2 percent to \$6.5 billion, following the 25.2 increase in 1998. Of all returns filed, 0.8 percent of taxpayers paid AMT in 1999, the highest percentage since the imposition of AMT.

Income and Tax Shares

Historical statistics on income and tax by cumulative percentiles (based on numbers of returns) are presented in Tables 5 through 8. Distributions of AGI, as defined for each year and tax, by descending and ascending cumulative percentiles of returns, are presented in Tables 5 and 6. These tables can be used to make comparisons across cumulative percentile classes within each year, among years within the ERTA81 period (i.e., Tax Years 1982 through 1986), and among years within the post-TRA86 period (i.e., Tax Years 1987 through 1999). Since TRA86 redefined AGI, Tables 5 and 6 are not as useful for comparisons between pre- and post-TRA86 years. Thus, Tables 7 and 8, which are based on a consistent definition of income (i.e., using the 1979 Income Concept), are included to facilitate such comparisons.

Tables 5 and 7 are based on percentiles of returns cumulated downward from the highest income returns. The data are shown for the top 1, 5, 10, 25, and 50 percent of returns. Tables 6 and 8 are based on returns cumulated upward for the lowest income returns. Data are shown for the bottom 50, 75, 90, 95, and 99 percent of all returns.

For example, consider the data in Table 5 for the 126.0 million returns filed for 1999 with positive AGI [10]. The average tax rate for these returns was 14.9 percent, an increase from the 1998 average tax rate of 14.4 percent. The average tax rate on the top 1, 5, 10, 25 and 50 percentiles increased from 1998 (mostly due to the decrease in capital gains which are taxed at the reduced capital gain rates). For 1999, the returns in the top 1 percentile reported 19.5 percent of total AGI and 36.2 percent of total income

² The tax rate schedule provided only two basic rates: 15 percent and 28 percent. However, taxable income between certain amounts was subject to an additional 5 percent tax, creating an "effective" 33-percent tax rate.

tax. The amount of AGI needed for inclusion in this percentile group (i.e., the AGI floor) was \$293,415. For 1998, the returns in this percentile group (i.e., those with at least \$269,496 in AGI) reported 18.5 percent of total AGI and 34.8 percent of total income tax. For 1999, the returns in the top 5 percentile group (returns reporting AGI of \$120,846 or more) reported 34.0 percent of total AGI and 55.5 percent of total income tax, higher than the 32.9 percent and 53.8 percent, respectively, for 1998 (when the AGI floor was \$114,729). For 1999, returns in the top 10 percentile group (returns with AGI of at least \$87,682) showed 44.9 percent of AGI and 66.5 percent of total income tax. For 1998, the returns in this percentile group (with AGI of \$83,220 or more) reported 43.8 percent of total AGI and 65.0 percent of total income tax.

The statistics by percentile in Tables 5 and 6 (for years prior to 1991) and Tables 7 and 8 (for years prior to 1994) were estimated, using a mathematical technique called "osculatory interpolation," applied to aggregated data tabulated by income-size classes, in order to distribute the tax returns within each class [11]. For 1991 and later years, the statistics by percentiles in Tables 5 and 6 (and Tables 7 and 8 for 1994 through 1999) were computed based on an actual ranking of the returns in the statistical sample that served as the basis for Individual Statistics of Income estimates. The differences under the two methods were judged to be minor enough so that the pre-1991 and post-1990 data are believed to be comparable.

Figure H presents percentage shares of income and total income tax for various percentile groups, using the 1979 Income Concept, for 1986 through 1999. While shares of income for the top 1 percent and bottom 50 percent of taxpayers have been close over the years, 1999 marks the fifth consecutive year that that the income shares of the top 1 percent of taxpayers were higher than the corresponding shares of the bottom 50 percentile. The income share for the top 1 percent of taxpayers grew to the largest it has been in the previous 13 years, reaching 20.3 percent for 1999, while the bottom 50 percent of taxpayers reported the lowest share of income over the corresponding period at 13.0 percent. This constitutes the largest difference in income shares between the two percentile groups over the previous 14 years, 7.3 percentage points. Similar to this recent

trend in shares of income, the shares of total income tax for the top 1 percent and bottom 50 percent of taxpayers have diverged over time. The total income tax shares for the top 1 percent have, despite fluctuations, risen from 25.4 percent for 1986 to a high of 35.0 percent for 1999. Shares of total income tax for the bottom 50 percent of taxpayers have decreased from 6.7 percent for 1986 to just over 4.1 percent for 1999. The difference between shares of income for the top 5 percent and bottom 75 percent of taxpayers, which has converged over time, continued this trend for 1999. Income shares increased from 28.4 percent for 1986 to 35.6 percent for 1999 for the top 5 percent of taxpayers and decreased from 38.2 percent for 1986 to 32.6 percent for 1999 for the bottom 75 percent of taxpayers. Shares of total income tax for the top 5 percent and bottom 75 percent of taxpayers have also diverged over the past 14 years. Percentage shares of total income tax for taxpayers in the top 5 percentile rose from 42.4 percent for 1986 to a high of 54.7 percent for 1999, while shares of total income tax for the bottom 75 percent of taxpayers have decreased from 24.3 percent for 1986 to a low of 16.8 percent for 1999.

Notes and References

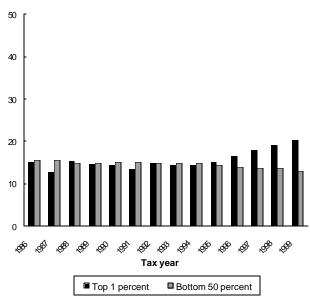

- [1] For Tax Years 1988 through 1990, the tax rate schedules provided only two basic rates: 15 percent and 28 percent. However, taxable income over certain levels was subject to a 33-percent tax rate to phase out the benefit of the 15-percent tax bracket (as compared to the 28-percent rate) and the deduction for personal exemptions. At the taxable income level where these benefits were completely phased out, the tax rate returned to 28 percent.

- [3] For further information about the Tax Reform Act of 1986, see U.S. Congress, Joint Committee on Taxation, General Explanation of the Tax Reform Act of 1986 (H.R. 3838, 99th Congress, Public Law 99-514), May 4, 1987.
- [4] Table 3.3 in *Statistics of Income--1998* and *Statistics of Income--1999* shows the number of returns for the child tax credit and education credit by size of AGI.
- [5] Nontaxable (i.e., tax-exempt) forms of income, such as interest on State and local government obligations, were not included in AGI and generally did not affect the marginal tax rate. However, the receipt of some forms of tax-exempt income, such as Social Security benefits, could have influenced the taxability of other income. When this situation occurred, the income made taxable by the receipt of other forms of nontaxable income was included in AGI.
- [6] The income amounts on which these special computations were based were not reflected in current-year AGI or current-year taxable income.
- [7] For 1999, the total earned income credit was \$31.9 billion. This amount includes the amount used to reduce the regular income tax (\$1.9 billion), the amount used to reduce other taxes reported on individual income tax returns (\$2.4 billion), and the amount refunded to taxpayers (\$27.6 billion). Table 2.5 in Statistics of Income--1999, Individual Income Tax Returns, shows these amounts.
- [8] Total income tax does not include certain other taxes reported on the individual income tax return, such as self-employment tax (the Social Security tax on income from self-employment), the Social Security tax on certain tip income, tax from the recapture of prior-year investment or low-income housing credits, tax applicable to

- early withdrawals from an Individual Retirement Arrangement (IRA) or other qualified retirement plans, tax on trusts, accumulation and distributions, and household employment taxes. The statistics for "total tax liability," shown in *Statistics of Income--1999, Individual Income Tax Returns*, include these taxes. For Tax Year 1999, total tax liability reported on 97.1 million returns was \$912.5 billion.
- [9] The difference resulting from the special tax computation does not reflect the provisions of TRA86, which lowered standard deductions for dependents (compared to other taxpayers) and prevented these children from claiming their own personal exemptions.
- [10] The percentile groupings of tax filers exclude returns with zero or negative AGI.
- [11] For an explanation of the osculatory interpolation technique, see Oh, H. Lock, "Osculatory Interpolation with a Monotonicity Constraint," 1977 Proceedings of the American Statistical Association, Section on Statistical Computing, 1978.

Appendix A: Explanation of Selected Terms This appendix provides brief explanations of the major tax concepts discussed. For more extensive definitions, see Section 4 in *Statistics of Income-1999*, *Individual Income Tax Returns*.

Adjusted Gross Income.--Adjusted gross income is "total income," as defined by the tax code, less "statutory adjustments" (primarily business, investment, or certain other deductions, such as payments to a Keogh self-employed retirement plan, certain deductible contributions to an Individual Retirement Arrangement (IRA), and self-employed health insurance deductions). Total income includes, for example, salaries and wages, taxable interest, dividends, alimony, and net amounts from such sources as business income, rents and royalties, and sales of capital assets.

Difference Due to Special Tax Computation.--For this article, the tax difference is the amount of tax resulting from using provisions of one of the special tax computations (Form 8615 or Schedule D) less the amount of tax that would have resulted from not having used any of these provisions (regular tax computation).

Form 8615 Tax Computation.--Form 8615 was used to compute the tax on investment income of children under age 14 who had investment income of more than \$1,400. Generally, such income was taxed at the marginal tax rate of the parents.

Income Tax Before Credits (Regular Tax Computation).—This amount consisted of the tax liability on ordinary income, computed by using the tax table or applying the rates from one of the four tax rate schedules, plus any additional tax (tax on lump-sum distributions from qualified retirement plans). When Form 8615 tax was payable on investment income of children, for this concept, all the income was taxed at the child's rate rather than at the rate of the parents. When the Schedule D tax was payable on net long-term capital gains, the tax was based on the regular tax rates rather than the 10, 20, 25, or 28-percent tax rate for capital gains.

Marginal Tax Rate.--See Appendix D.

Marginal Taxable Income.--See Appendix D.

Regular Tax Computation.--Depending on marital status and size of taxable income, the tax-payer used one of the four tax rate schedules or used an approximation from the tax table to determine tax. Returns of taxpayers who had taxes computed by the Internal Revenue Service were classified under the regular tax computation method.

Schedule D Tax Computation.--Schedule D was used to compute the 10-percent, 20-percent, 25-percent, and 28-percent tax on net long-term capital gains (in excess of net short-term capital losses), if such a computation was beneficial to the taxpayer. Any investment interest allocated to long-term capital gains (on Form 4952) was excluded from this computation.

Taxable Income.--Taxable income is AGI less the sum of personal exemption amounts and either the standard deduction for non-itemizers or total itemized deductions. The amounts for personal exemptions and total itemized deductions are net of any reductions because of taxpayers' incomes exceeding certain income thresholds.

Taxable Returns.--A return is classified as "taxable" based on the presence of "total income tax" (the sum of income tax after credits and the alternative minimum tax). The following additional

taxes were not taken into account for this purpose: self-employment, household employment, Social Security, Railroad Retirement Tax Act (RRTA) taxes, tax from recomputing prior-year investment or low-income housing credits, penalty taxes on Individual Retirement Arrangements, section 72 penalty taxes, advance earned income credit payments, or "golden parachute" payments (made to key employees as compensation under certain circumstances).

Tax Generated.--This is the amount of tax computed on modified taxable income either from the tax rate schedules or the tax table. Tax generated does not take into account the alternative minimum tax or the effect of tax credits. For most returns (those without the special tax on lump-sum distributions from qualified retirement plans), tax generated equals "income tax before credits."

Total Income Tax.--Total income tax is the sum of income tax after credits and the alternative minimum tax.

AppendixB: Income Tax Structure

Each year, taxpayers must file an income tax return if they meet certain minimum filing requirements. The filing requirements for 1999 were based on the amount of "gross income," filing status, age, and, to a lesser extent, dependency and blindness [B1]. Generally, the minimum level of income for which a return was required to be filed equaled the sum of the standard deduction for the particular filing status and the amount of the personal exemption deduction allowed for the taxpayer or taxpayers (but not for any dependents). In addition to the general filing requirements, individuals were required to file a return for Tax Year 1999 if they had net earnings from selfemployment of at least \$400; liability for Social Security or Medicare tax on unreported tip income; Social Security, Medicare, or Railroad Retirement tax on reported tip income or group-term life insurance; "alternative minimum tax"; tax on qualified retirement plan distributions, including an Individual Retirement Arrangement (IRA) or a Medical Savings Account (MSA); tax on the recapture of investment credit or low-income housing credit; recapture tax on the disposition of a home purchased with a Federallysubsidized mortgage; any advance earned income credit payments; or wages of \$108.28 or more from a church or qualified church-controlled organization that was exempt from Social Security taxes.

Gross income includes all income received as money, goods, property, or services that was not expressly exempt from tax [B2]. Adjusted gross income (AGI) is equal to gross income less deductions for certain expenses [B3]. "Taxable income," the base on which income tax before credits is computed, equals AGI less the amount for personal exemptions and less either total allowable itemized deductions for taxpayers who itemize deductions, or the standard deduction (including the additional amounts for age and blindness) for all other taxpayers.

Income tax before credits is calculated from taxable income using: The tax table or tax rate schedules, both of which vary with taxpayer filing status (single, married filing jointly, surviving spouse, married filing separately, and head of household); Form 8615 or Form 8814 for children's investment income; Schedule D worksheet for net long-term capital gains; or some combination of the above [B4]. For 1999, the tax rates for each filing status were 10, 15, 20, 25, 28, 31, 36, and 39.6 percent. The tax rates of 10, 20, and 25 percent were only for net long-term capital gains (in excess of net short-term capital losses). (See Appendix C for further details on these rates)

To calculate their Federal income tax liability for 1999, taxpayers used either the tax table or the tax rate schedules. Taxpayers with taxable income less than \$100,000 were required to use the tax table, while those with taxable income of \$100,000 or more were required to use the tax rate schedules. The tax table was based on income tax "brackets" up to \$50 wide [B5]. The tax within each bracket was based on the tax calculated at the midpoint of the bracket and then rounded to the nearest whole dollar. As a result, the tax table and the tax rate schedules could produce different amounts of tax for the same amount of taxable income. Use of the tax table could have produced either a slightly higher or lower amount of tax than that produced by the tax rate schedules. For taxpayers using the tax table with taxable income that was subject to the 36-percent marginal rate, the maximum difference in tax between the tax rate schedules and the tax table was \$9.00 [B6]. However, the actual difference in tax was smaller for most taxpayers.

Notes to Appendix B

- [B1] Taxpayers fall into one of five filing statuses: single; married filing jointly; married filing separately; head of household; or surviving spouse. Being age 65 or older or being legally blind affects the amount of the standard deduction and, hence, the filing requirements. Those taxpayers who are (or could be) dependents of other taxpayers have different filing requirements. For more information on the general filing requirements for 1999, see *Statistics of Income--1999*, *Individual Income Tax Returns* or Publication 17, *Your Federal Income Tax*.
- [B2] As defined under section 61 of the Internal Revenue Code, gross income includes amounts from wages and salaries, interest and dividends, alimony, bartering income, canceled debt income, gambling winnings, rents and royalties, and gains from property sales or exchanges, as well as gross profits from sole proprietorships and farming, income from partnerships and S corporations, and distributions from estates and trusts. This definition of gross income is slightly different from the Form 1040, U.S. *Individual Income Tax Return*, concept of "total income," which is a component of the adjusted gross income (AGI) calculation on Form 1040. Total income includes net amounts rather than gross amounts (income prior to deductions) from such items as business income and rents and royalties.
- [B3] As defined under Internal Revenue Code section 62, deductible expenses are those incurred in the course of a trade or business or in connection with rents and royalties; losses from property sales or exchanges; and certain statutory adjustments, such as deductible contributions to an IRA or Keogh plan, moving expenses, or the health insurance deduction for certain self-employed taxpayers.
- [B4] Income tax before credits includes tax on lumpsum distributions from qualified retirement plans.

- [B5] For taxable income between \$0 and \$5 and between \$5 and \$25, the tax brackets were \$5 and \$10 wide, respectively. For taxable income between \$25 and \$3,000, the brackets were \$25 wide. All brackets for taxable income above \$3,000 were \$50 wide.
- [B6] For example, assume a taxpayer filing as "married filing separately" reported taxable income of \$85,000. Using the tax table, the tax would be \$22,286, but using the tax rate schedules, the tax would be \$22,277, a difference of \$9.

Appendix C: Changes in Lawfor 1999

Capital Gain Distributions.--For Tax Year 1999, taxpayers who had capital gains only from capital gain distributions did not have to report these gains on Schedule D. Instead, the capital gain distributions could have been reported directly on Form 1040.

Child Tax Credits.--Modifications were made to the child tax credit for 1999. In 1999, taxpayers were allowed a maximum tax credit of \$500 for each of their qualifying children under the age of 17, whereas for 1998, the maximum credit was \$400 per child.

Earned Income Credit.--The maximum amount of the earned income credit increased, as did the amounts of earned income and investment income an individual could have and still claim the credit. The maximum credit for taxpayers with no qualifying children increased 1.8 percent to \$347. For these taxpayers, earned income and AGI had to be less than \$10,200 (up from \$10,030 for 1998). For taxpavers with one qualifying child, the maximum credit increased 1.8 percent to \$2,312, and, for taxpayers with two or more qualifying children, the maximum credit increased 1.6 percent to \$3,816. To be eligible for the credit, a taxpayer's earned income and AGI had to be less than \$26,928 for one qualifying child, or less than \$30,580 for two or more qualifying children. The maximum amount of investment income (interest, dividends, and capital gain income) a taxpayer could have and still claim the credit increased to \$2,350 from \$2,300.

Exemption Amount.--Indexing for inflation allowed most taxpayers to claim a \$2,750 deduction for each exemption to which he or she was entitled for 1999, a \$50 increase over the amount allowed for 1998. The AGI threshold for the reduction of exemption amounts was also indexed for inflation, from

\$124,500 to \$126,600 for single filers; \$186,800 to \$189,950 for married persons filing jointly and surviving spouses; \$155,650 to \$158,300 for heads of household; and \$93,400 to \$94,975 for married persons filing separately.

Itemized Deductions.--If a taxpayer's AGI was greater than \$126,600 (\$63,300 if married filing separately), some types of his or her itemized deductions were limited; this threshold increased from \$124,500 (\$62,250) for 1998 as a result of indexing for inflation. The limitation did not apply to deductions for medical and dental expenses, investment interest expenses, casualty or theft losses, and gambling losses; all other deductions were subject to the limitation. To arrive at allowable itemized deductions, total itemized deductions were reduced by the smaller of: (1) 80 percent of the "non-limited" deductions or (2) 3 percent of AGI in excess of the limitation threshold.

Self-Employed Health Insurance Deduction.--Included in the Health Insurance and Portability and Accountability Act of 1996 was a provision to increase the maximum percentage of self-employed health insurance premiums that a taxpayer could deduct as an adjustment, from 45 percent in 1998 to 60 percent for 1999.

Self-Employment Tax.--The ceiling on taxable "self-employment income" was increased for 1998. The maximum amount of net earnings applied to the Social Security portion of self-employment tax increased to \$72,600 from \$68,400 for 1998.

Standard Deduction.--The basic standard deduction and additional standard deduction for age or blindness increased for 1999 as a result of inflation indexing. For single filers, the basic standard deduction rose from \$4,250 to \$4,300; for married persons filing jointly or surviving spouses, from \$7,100 to \$7,200; for married persons filing separately, from \$3,550 to \$3,600; and for heads of household, from \$6,250 to \$6,350. The amount of the standard deduction for dependents was the larger of \$700 or the dependent's earned income plus \$250 (but not more than the regular standard deduction amount).

Student Loan Interest Deduction.--The limit on the deduction for interest paid on qualified higher educational loans rose to \$1,500 for 1999, up from \$1,000 for 1998. These loans must have gone toward qualified expenses of either the taxpayer, taxpayer's spouse, or any dependent of the taxpayer at the time the debt was incurred. The phaseout for a taxpayer

claiming the educational interest deduction was over a modified AGI range of \$40,000-\$50,000 (\$60,000-\$75,000, joint returns) These income ranges will be indexed for inflation in 2003.

Tax Brackets.--To counterbalance the effects of inflation, the boundaries for the tax brackets were widened. The 15-percent bracket applied to taxable income equal to or below \$25,750 (\$25,350 for 1998) for single filers; \$43,050 (\$42,350 for 1998) for joint filers or surviving spouses; \$21,525 (\$21,175 for 1998) for married persons filing separately; and \$34,550 (\$33,950 for 1998) for heads of household. The 28-percent tax bracket applied to taxable income in excess of the 15-percent bracket ceiling and equal to or below \$62,450 (\$61,400 for 1998) for single filers; \$104,050 (\$102,300 for 1998) for joint filers or surviving spouses; \$52,025 (\$51,150 for 1998) for married persons filing separately; and \$89.150 (\$87,700 for 1998) for heads of household. The 31percent tax bracket applied to taxable income in excess of the 28-percent bracket ceiling and equal to or below \$130,250 (\$128,100 for 1998) for single filers; \$158,550 (\$155,950 for 1998) for joint filers or surviving spouses; \$79,275 (\$77,975 for 1998) for married persons filing separately; and \$144,400 (\$142,000 for 1998) for heads of households. The 36-percent tax bracket applied to taxable income in excess of the 31-percent bracket ceiling and equal to or below \$283,150 (\$278,450 for 1998) for single filers, joint filers or surviving spouses, and heads of households and \$141,575 (\$139,225 for 1998) for married persons filing separately. The 39.6-percent tax rate applied to taxable income in excess of the upper boundary for the 36-percent tax bracket.

Appendix D: Income and Tax Concepts
As discussed in Appendix B, gross income is all income received that is not exempt from tax. Total income is the net amount of gross income after certain expenses (i.e., business or rent and royalty expenses) have been deducted. Adjusted gross income (AGI) is the result of total income less statutory adjustments to income (i.e., deductible contributions to an IRA or Keogh plan).

1979 Income Concept

To analyze changes in income and taxes over a period of years, a consistent definition of income should be used. Because the components of AGI

may vary from year to year as the law changes, the "1979 Income Concept" was developed to provide a more uniform measure of income across tax years. By including the same income and deduction items in each year's income calculation and using only items available on Federal individual income tax returns, the definition of the 1979 Income Concept is consistent throughout the base years and can be used for future years to compare income by including only income components common to all years. Tax Years 1979 through 1986 were used as base years in identifying the income and deduction items included in this concept. The 1979 Income Concept applied to 1999 includes many income and deduction items that are also components of AGI (Figure I). However, unlike

- ¹ Included in adjusted gross income (less deficit) (AGI) for Tax Year 1999.
- ² Adjustment to add back excess depreciation (accelerated over straight-line depreciation) deducted in the course of a trade or business and included in net income (loss) amounts shown above.
- ³ Includes taxable and tax-exempt pension and retirement distributions, including IRA distributions.
 - ⁴ Not fully included in AGI for Tax Year 1999.
- Includes an adjustment to add back amounts reported for the "foreign-earned income exclusion."
 - ⁶ Not included in AGI for Tax Year 1999.

AGI, the 1979 Income Concept also includes nontaxable (i.e., tax-exempt) amounts of income reported on individual income tax returns and disallowed passive loss deductions. In addition, only straight-line deductions for depreciation are included in the 1979 Income Concept [D1].

ModifiedTaxableIncome

This concept is relevant only for "prior-year returns." For current-year returns, modified taxable income is identical to taxable income.

This is the term used for the statistics to describe "income subject to tax," the actual base on which tax is computed. Each year, a small number of returns for prior tax years are filed during the same calendar year in which the tax returns for the current tax year are being selected for the Statistics of Income sample. Some of these returns are selected for the sample and act as proxies for returns for the current tax year that will be filed during a later calendar year. The tax on these returns is based on a previous year's tax law (which may reflect different tax rates and income concepts). For the statistics in this article, the taxable income reported on these prior-year returns is modified to equal an amount necessary to generate the tax actually shown on these returns using current-year rates.

Marginal TaxRates

Under the progressive U.S. income tax rate structure, different portions of taxable income are taxed at different rates. Figure J illustrates how income tax is

Figure J

Income Tax Calculation for a Single Taxpayer With One Exemption Who Used the Standard Deduction, Tax Year 1999

[Money amounts are in whole dollars]

| Item | 1999 |

| Next \$36,700 taxed at 28 percent | 10,276 |
| Next \$67.800 taxed at 31 percent | 21,018 |
| Next \$152,900 taxed at 36 percent | 55,044 |
| Next \$22,550 taxed at 39.6 percent | 8,930 |
| Total tax from tax rate schedule | 99,131 |

¹ The exemption amount was phased out completely because AGI exceeded \$249,100.

determined for a single taxpayer with AGI of \$310,000 using the standard deduction. As shown in the example, five different tax rates are applied to the taxable income to arrive at total tax. The first \$25,750 of taxable income were taxed at the 15percent rate; the next \$36,700 were taxed at the 28-percent rate; the next \$67,800 were taxed at the 31-percent rate; the next \$152,900 were taxed at the 36-percent rate; and the remaining \$22,550 were taxed at the 39.6-percent rate. For purposes of this article, the tax rate applied to the last dollar of income (given certain assumptions about which source of income provided the last dollar of income subject to tax) is the marginal tax rate for that return. The example shown has a marginal tax rate of 39.6 percent.

Since the individual income tax structure includes various types of income, deductions, exclusions, credits, and taxes which are not subject to the same treatment under tax laws, determining marginal tax rate can be difficult. For instance, investment income of a dependent under age 14 in excess of a specific amount is treated differently than salaries and wages of the same dependent. The investment income in excess of \$1,400 was taxed at the marginal tax rate of the parents, whereas the salaries and wages were taxed at the dependent's own rate.

Calculating marginal tax rates for a specific individual income tax return generally depends on the types and amounts of income reported and the assumptions made about the order in which the income is taxed, in particular, which type of income is assumed to be received "last." This determination is complicated by the presence of such items as the alternative minimum tax and various tax credits.

For this article, it is assumed that the income taxed at the marginal rate was the "last" income received. The alternative minimum tax and income tax credits, such as the earned income credit, are excluded in determining the marginal tax rates. The marginal tax rate is defined as follows:

- (1) If a return showed taxable income, the marginal tax rate of the return was the highest rate at which any amount of taxable income reported on the return was taxed.
- (2) If the return had no taxable income except for net long-term capital gains and that amount was

less than or equal to the 15-percent tax bracket limit, the return was defined as having a "10percent rate" marginal tax rate. If the return had taxable income (from other than net long-term capital gains) to which only the 15-percent tax rate applied, as well as net long-term capital gains to which the 20-percent or 25-percent rate on the net gain applied, the return was defined as having a marginal tax rate equal to the maximum rate at which the net gains were taxed. If the return had taxable income (from other than net long-term capital gains) to which the 28-percent tax rate applied as the highest rate, as well as net long-term capital gains to which the maximum 28-percent rate on net gain applied, the return was defined as having a "28-percent (capital gains)" marginal tax rate. However, if the return had taxable income (from other than net longterm capital gains) above the maximum amount to which the 28-percent applied, as well as net long-term capital gains to which the 28-percent rate on the net gain applied, the return was classified as having the highest rate at which any amount of taxable income reported on the return was taxed.

- (3) For returns of dependents with a Form 8615 attached when the use of this form resulted in the taxation of some of the dependent's income as if it were that of the parents, the return was classified as having a "Form 8615" marginal tax rate (the returns in the Form 8615 classification are not distributed by tax rate).
- (4) For returns of parents choosing to report interest and dividend income of their dependents under age 14 on their own (i.e., the parents') return using Form 8814, when the dependent's income generated the only tax liability on the parent's return, the return was classified with a "Form 8814" marginal tax rate.

The classification of returns into marginal tax rate categories for Statistics of Income purposes was essentially a function of filing status, size of taxable income, presence of net long-term capital gains (in excess of net short-term capital losses), and presence of Form 8615 or Form 8814. Returns were classified into one of the following eleven mutually exclusive

marginal tax rate categories: (1) 10-percent rate; (2) Form 8814 (15-percent rate with no tax liability other than that generated by the dependent's income); (3) 15-percent rate; (4) 20-percent rate; (5) 25-percent rate; (6) 28-percent rate with net long-term capital gains [D2]; (7) 28-percent rate; (8) 31-percent rate; (9) 36-percent rate; (10) 39.6-percent rate; and (11) Form 8615 (with income taxed at any rate) [D3].

Table 1 presents statistics by marginal tax rate classification and filing status for returns with modified taxable income. For each marginal rate classification, modified taxable income and "income tax generated" were computed "at all rates" and "at marginal rate." The "at all rates" computations (columns 3 and 5) show the total amount of modified taxable income or tax generated, tabulated by the marginal tax rate specified; each tax rate classification is mutually exclusive. The "at marginal rate" computations (columns 4 and 6) report the specific amounts of modified taxable income taxed and the tax generated at the marginal tax rate shown, for all returns in each of the marginal rate classifications. For example, consider returns in the "joint returns and returns of surviving spouses" filing status that were included in the "39.6-percent" marginal tax rate classification. The total modified taxable income for the 723.143 returns in this classification "at all rates" was \$678.4 billion (column 3), and the total tax generated was \$224.1 billion (column 5). Approximately \$344.8 billion (column 4) of the modified taxable income for 1999 were subject to tax at the marginal tax rate of 39.6 percent. This modified taxable income generated \$136.5 billion (column 6) in tax at the 39.6-percent tax rate with the remainder generated at the lower seven tax rates. The alternative minimum tax was not included in the statistics by marginal tax rate.

Table 2 provides statistics on the tax generated, in total and at each marginal tax rate bracket, for returns with modified taxable income. Returns in this table are classified by size of AGI rather than by the marginal tax rate classifications used in Table 1. The tax generated at each marginal tax rate was computed based on the modified taxable income for each individual return. For example, the approximately 1.87 million returns included in the "\$200,000 under \$500,000" income-size classification showed total modified taxable income of \$463.5 billion and generated total tax of \$129.5 billion. Of the \$463.6 billion

of modified taxable income, \$1.2 billion were taxed at the 10-percent rate, \$75.1 billion were taxed at 15 percent, \$57.1 billion were taxed at 20 percent, \$2.6 billion were taxed at 25 percent, \$0.1 billion were taxed at the 28-percent rate with net long-term capital gains, \$102.7 billion were taxed at the 28-percent rate (ordinary income), \$90.9 billion were taxed at the 31-percent rate, \$108.1 billion were taxed at the 36percent rate, and \$25.6 billion were taxed at the 39.6percent rate, with the remainder consisting of income related to Forms 8814 and 8615. Approximately \$0.1 billion of the total tax generated were from the 10percent rate, \$11.3 billion of the total tax generated were from the 15-percent rate, \$11.4 billion were from the 20-percent rate, \$0.6 billion were from the 25-percent rate, \$0.03 billion were from the 28percent rate with net long-term capital gains, \$28.8 billion were from the 28-percent rate (ordinary income), \$28.2 billion were from the 31-percent rate, \$38.9 billion were from the 36-percent rate, and \$10.1 billion were generated at the 39.6-percent rate, with the remainder from tax related to Forms 8814 and 8615.

Table 3 presents statistics on the income and tax generated at each marginal tax rate (as in Table 2, columns 5 through 37) by filing status, instead of size of AGI, for returns with modified taxable income. Over 0.7 million of the more than 44.6 million returns with modified taxable income filed jointly had some income taxed at the 39.6-percent tax rate. For these returns, the taxable income subject to this rate was \$344.8 billion, and the tax generated was \$136.5 billion.

Notes to Appendix D

- [D1] For more details on the income computation under the 1979 Income Concept for 1999, see *Statistics of Income--1999, Individual Income Tax Returns*.
- [D2] The "28-percent (capital gains)" marginal tax rate category consists of returns that have a top tax rate of 28 percent, but have net long-term capital gains (in excess of net short-term capital losses), which would have been taxed at a higher rate if they had been some other form of income.

[D3] For some taxpayers, the statutory marginal tax rate may differ from the actual marginal tax rate. For example, extra income received by certain taxpayers may result in the phaseout of their personal exemptions, as well as some of their itemized deductions. Therefore, an extra dollar of income could add more than \$1 of taxable income. While this taxpayer could face a statutory marginal tax rate of 31 percent, the actual marginal rate faced by the taxpayer would be somewhat higher.

Appendix E: Computation of Alternative Minimum Taxable Income (AMTI) AMTI was computed by adding certain "tax preferences" (i.e., deduction or exclusion amounts identified as potential sources of tax savings disallowed for AMT purposes) and "adjustments" (i.e., regular tax deduction amounts recomputed or excluded for AMT purposes) to taxable income before any deductions for personal exemptions (Figures K-1 and K-2). Although itemized deductions for some taxpayers were limited for regular tax purposes, the full amounts of such itemized deductions were included as adjustments. To compensate for this, the overall limitation on itemized deductions was subtracted from taxable income for AMT purposes. The "net operating loss deduction" was recomputed to allow for the exclusion of the "tax preference items" and "adjustments" used to reduce regular tax liability. The recomputed net operating loss deduction, termed the "alternative net operating loss deduction," was

Figure K-1

Calculation of Alternative Minimum Taxable Income (AMTI), Tax Year 1999

Taxable income before deduction for personal exemptions

PLUS: Adjustments and preferences

PLUS: Net operating loss deduction

MINUS: Overall itemized deductions limitation

MINUS: Alternative tax net operating loss deduction¹

EQUALS: Alternative minimum taxable income

¹ Limited to 90 percent of AMTI, except when depletion is present on Form 6251. In this case, AMTI is recalculated, and the alternative tax net operating loss deduction is limited to 90 percent of the recomputed amount.

Figure K-2

Alternative Minimum Tax Adjustments and Preferences, Tax Year 1999

- Standard deduction
- Medical and dental expenses from Schedule A (the lesser of deductible medical and dental expenses or 2.5 percent of AGI)
- Deductions for State and local income, real estate, personal property, and foreign taxes
- Deductions for interest on certain home mortgages not used to buy, build, or improve the taxpayer's main home or second home
- Miscellaneous itemized deductions subject to the 2-percent-of-AGI limitation
- Refunds of State and local income, real estate, personal property, and foreign taxes previously deducted (negative)
- Investment interest expense (the result could be negative)
- Excess of depreciation on property placed in service after 1986 over less liberal methods allowed for alternative minimum tax (AMT) purposes (straight-line or 150-percent declining balance method, depending on the type of property; the result could be negative)
- Adjustment of gain or loss on property, the basis of which was affected by accelerated depreciation or rapid amortization and which was reduced for AMT purposes (the result could be negative)
- Incentive stock options which were exercised after 1987 (the amount by which the value of the option when exercised exceeded the price paid by the taxpayer; the result could be negative)
- Passive activity gains and losses allowed for regular tax purposes for activities acquired before October 23, 1986, taking into account AMT adjustments and preference items and any AMT prior-year unallowed losses (the result could be negative)
- Difference between income distributions to beneficiaries of estates and trusts for regular tax purposes and the amounts refigured for AMT purposes (the result could be negative)
- Tax-exempt interest from private activity bonds issued after August 7, 1986
- Excess of circulation expenditures paid or incurred after 1986 over allowable amortization if the expenditures were capitalized (the result could be negative)
- Excess of percentage depletion deduction for sections 611 and 613 property over the adjusted basis (the result could be negative)
- Excess of accelerated depreciation on property placed in service before 1987 over straight-line depreciation as refigured for AMT purposes
- Adjustment from disallowing the installment sales method of accounting for sales of inventory and stock in trade after March 1, 1986, with certain exceptions (the result could be negative)
- Amount by which excess intangible drilling costs deducted currently over allowable amortization (if these costs were capitalized) was more than 65 percent of the taxpayer's "net income" from oil, gas, and geothermal wells, with exceptions for independent oil producers and royalty owners
- Amount of net section 1231 gain or loss other than due to casualty or theft from large partnerships
- Deferred income from long-term contracts entered into after February 28, 1986, with certain exceptions and limitations (the result could be negative)
- Adjustment for refigured loss from activities in which allowable losses from partnerships or S corporations were limited by "at-risk" and other rules, taking into account AMT adjustments and preference items (the result could be negative)
- Excess of mining exploration and development costs paid or incurred after 1986 over allowable amortization if the expenditures were capitalized (the result could be negative)
- Adjustment for taxable distributions received from a cooperative (total AMT patronage dividend and per-unit retain allocation adjustment)
- Excess of rapid amortization of pollution control facilities placed in service after 1986 over otherwise allowable depreciation (the result could be negative)
- Excess of research and experimental expenditures paid or incurred after 1986 over allowable amortization if the expenditures were capitalized (the result could be negative)
- Excluded gain, under the section 1202 gain on qualified small business stock held more than 5 years, multiplied by 42 percent
- Adjustment for refigured tax shelter farm losses, taking into account AMT adjustments and preference items (the result could be negative)
- Related adjustments, refigured for AMT purposes, including section 179 expense deduction, expenses for business or rental use of the home, conservation expenses, taxable IRA distributions, self-employed health insurance deduction, Keogh retirement plan or self-employed SEP deduction, and IRA deductions (the result could be negative)

limited to 90 percent of AMTI (with certain minor exceptions for 1999).

AMTI was reduced by an exemption amount dependent on the filing status of the individual and subject to phaseout at higher AMTI levels. For 1999, the AMTI exemption for single filers (and heads of households) was \$33,750; for joint filers and surviving spouses, \$45,000; and for married persons filing separately, \$22,500. The exemption was reduced (but not below zero) by 25 percent of the amount by which the AMTI exceeded threshold levels of \$112,500 for single filers (and heads of households), \$150,000 for joint filers, and \$75,000 for married persons filing separately. The exemptions was phased out completely for individuals whose filing status was single (or head of household), married filing jointly, and married filing separately, at \$247,500, \$330,000, and \$165,000, of AMTI, respectively.

After reduction by the exemption, the first \$175,000 (\$87,500 if married filing separately) of the remaining AMTI was subject to tax at a 26-percent rate, with any excess taxed at a 28-percent rate. However, capital gains (recalculated for AMT purposes) that were taxed at lower rates (10, 20, and 25 percent) were taxed at these same rates for AMT. The rest of AMTI was taxed at the rates mentioned above (26 or 28 percent). The resulting tax was reduced by the "alternative minimum tax foreign tax credit," which produced a "tentative minimum tax." Tentative minimum tax was further reduced by the individual's regular tax before credits (excluding tax on lump-sum distributions from qualified retirement plans) less the foreign tax credit (for regular tax purposes) to yield the alternative minimum tax.

Dependents under the age of 14 with investment income over a certain amount who filed their own returns were subject to special rules for AMT purposes. These rules required that the dependents pay the same amount of AMT as their parents would have paid if the parents included the dependents' incomes on their own tax returns. (Dependents filing their own returns were limited to an AMT exemption of \$5,100 plus their "earned incomes." The

dependent's AMT could be reduced if the parents had regular tax greater than the child's own tentative minimum tax, or if any other dependent under age 14 of the same parents had regular tax greater than this dependent's own tentative minimum tax.)

Appendix F: Data Sources and Limitations These statistics are based on a sample of individual income tax returns (Forms 1040, 1040A, 1040EZ, and 1040PC, including electronically-filed returns) filed during Calendar Year 1999. Returns in the sample were stratified based on: (1) the larger of positive income or negative income; (2) the size of business and farm receipts; (3) the presence or absence of specific forms or schedules; and (4) the usefulness of returns for tax policy modeling purposes [F1]. Returns were then selected at rates ranging from 0.05 percent to 100 percent. The 1999 data are based on a sample of 176,966 returns and an estimated final population of 127,321,626 returns. The corresponding sample and population for the 1998 data were 164,340 and 125,037,636 returns, respectively.

Since the data presented here are estimates based on a sample of returns filed, they are subject to sampling error. To properly use the statistical data provided, the magnitude of the potential sampling error must be known; coefficients of variation (CV's) are used to measure that magnitude. Figure L shows estimated CV's for the numbers of returns and money amounts for selected income items. The reliability of estimates based on samples, and the use of coefficients of variation for evaluating the precision of estimates based on samples, are discussed in the appendix to this issue of the *Bulletin*.

Notes to Appendix F

[F1] Returns in the sample were stratified based on the presence or absence of one or more of the following forms or schedules: Form 2555, Foreign Earned Income; Form 1116, Foreign Tax Credit (Individual, Fiduciary, or Nonresident Alien Individual); Schedule C, Profit or Loss from Business (Sole Proprietorship); and Schedule F, Profit or Loss from Farming.

^{*} Estimate should be used with caution due to the small number of sample returns on which it is based.

NOTE: Detail may not add to totals because of rounding.

¹ Form 8814 was filed for a dependent child under age 14 for whom the parents made the election to report the child's investment income (if it was from interest or dividends totaling between \$700 and \$7,000) on the parents' income tax return. This rate classification is comprised of those returns with a tax liability only from the dependents' income.

² Returns with net long-term capital gains in excess of short-term capital losses taxed at the 28-percent rate.
³ Form 8615 was filed for a child under age 14 to report the child's investment income in excess of \$1,400. The returns in this rate classification are not distributed by tax rate. (X) Percentage not computed.

^{*} Estimate should be used with caution because of the small number of sample returns on which it is based.

 $[\]ensuremath{^{**}}$ Data combined to avoid disclosure of information for specific taxpayers.

¹ Form 8814 was filed for a dependent child under age 14 for whom the parents made the election to report the child's investment income (if it was from interest or dividends totaling between \$700 and \$7,000) on the parents' income tax return. This rate classification is comprised of those returns with a tax liability only from the dependents' income.

² Includes returns with adjusted gross deficit.

³ Returns with net long-term capital gains in excess of short-term capital losses taxed at the 28 percent rate.

⁴ Form 8615 was filed for a child under age 14 to report the child's investment income in excess of \$1,400. The returns in this rate classification are not distributed by tax rate. NOTE: Detail may not add to totals because of rounding.

¹ Form 8814 was filed for a dependent child under age 14 for whom the parents made an election to report the child's investment income (if it was from interest or dividends totaling between \$700 and \$7,000) on the parents' income tax return. This rate classification is comprised of those returns with a tax liability only from the dependents' income.

² Returns with net long-term capital gains in excess of short-term capital losses taxed at the 28-percent rate.

³ Form 8615 was filed for a child under age 14 to report the child's investment income in excess of \$1,400. The returns in this rate classification are not distributed by tax rate. NOTE: Detail may not add to totals because of rounding.

 $^{^{\}star}$ Estimate should be used with caution due to the small number of sample returns on which it is based.

¹ Includes special tax not included in tax generated.

² The difference between the amount of tax resulting from using provisions of one of the special tax computations and the amount of tax resulting from the regular tax computation.

³ Includes returns with adjusted gross deficit.

NOTE: Detail may not add to totals because of rounding.

Table 5.--Returns with Positive Adjusted Gross Income (AGI): Number of Returns, Shares of AGI and Total Income Tax, AGI Floor on Percentiles in Current and Constant Dollars, and Average Tax Rates, by Selected Descending Cumulative Percentiles of Returns Based on Income Size Using the Definition of AGI for Each Year, Tax Years 1986-1999 [All figures are estimates based on samples]

N/A-- Not applicable.

^{*} Numbers have been revised.

¹ The number of returns with negative adjusted gross income, i.e., returns with an adjusted gross deficit, and the corresponding amounts for adjusted gross deficit, were excluded from Tables 5 and 6. By excluding deficit returns, alternative minimum tax reported on some of these returns was also excluded. For Tax Year 1999, there were 4,842 returns with no adjusted gross income that reported income tax, mostly alternative minimum tax, totaling \$109.3 million.

² For Table 5, constant dollars were calculated using the U.S. Bureau of Labor Statistics' consumer price index for urban consumers (CPI-U, 1982-84=100). See footnote 2 of this article for further details.

³ Total income tax is the sum of income tax after credits and alternative minimum tax reported on returns that showed a positive amount for adjusted gross income. Therefore, total income tax excludes alternative minimum tax, Form 8814 tax (tax on a child's interest or dividends), and Form 4972 tax (tax on lump-sum distributions from qualified retirement plans) reported on some returns with a negative amount for adjusted gross income. See also footnote 1.

⁴ The average tax rate was computed by dividing total income tax (see footnote 3) by (positive) adjusted gross income.

N/A--Not applicable.

^{*} Numbers have been revised

¹ The number of returns in columns 2 through 6, Tables 7 and 8, was processed in thousands and, therefore, reflects differences due to rounding.

² For Table 7, constant dollars were calculated using the U.S. Bureau of Labor Statistics' consumer price index for urban consumers (CPI-U, 1982-84=100). See footnote 2 of this rticle for further details

 $^{^{\}rm 3}$ Total income tax is the sum of income tax after credits and the alternative minimum tax.

⁴Average tax rate was computed by dividing total income tax (see footnote 3) by income, using the 1979 income concept (see text and Figure I).
