**Comments relative to the TVA Interconnection of Consumer Generation:**

I would like this option for my Farm.

This meeting with consumers relative to Interconnection to the GRID for home Solar Power generation is very timely. I have been trying to contact individuals within TVA and Huntsville Utilities to open a dialog relative to connecting to the GRID for my farm in Gurley, Alabama.

I am in the process of reviewing several Solar Power options for my farm and would like to have a list of knowledgeable people to talk to at TVA and Huntsville Utilities.

I plan on gathering technical documentation on a Concentrating Solar Array system and need to know if TVA or Huntsville Utilities have a preference in the type of inverters and equipment that is required to tie to the GRID.

**Comments relative to the TVA Net Metering:**

I would like this option for my Farm.

I want to know if I build a system large enough to produce more power than I require each month will I receive a cash payment in addition to subtracting from my utility bill.

I would like to build a small solar farm and produce more power than I consume.

After doing the research on the available existing systems, building a system to produce what I consume or more than I consume, may be cost prohibitive.

I guess this option would be classified as a commercial producer.  
I would like to know if Grant money is available to build a small solar farm.
