ACKNOWLEDGMENTS

Many people regularly participate in the quarterly production of this report, which is prepared under the general direction of Charles Funk, Assistant Division Chief for Surveys and Programs.

Yolando St. George, Chief, Financial Report Branch, plans and manages the financial data collection effort. Data analysis activities are performed by Rose Antonio, Michael Borsi, Sherri Ewing, Kimberly Hansberry, and Rosemarie Hillmon. Demetria Hanna advises the staff on technical accounting matters and directs the revision work. Telephone follow-up activities are performed by Connie Abner, Lolita Curtis-Hammond, Traci Gillespie-Brown, and Cheryl Nelson. Traci Gillespie-Brown coordinates the various phases of the publication process, including table preparation and Internet posting. Brian Napper provides secretarial support to the branch.

John P. Seabold, Chief, Corporate Analysis Branch, assisted by Theresa Brashears, Justin Keller, James Mercury, Adesegun Oyesanya, Joan Sanders, Lorraine Talley, Angela Walker, Claudia White, and Minnie Whiteside, reviews and analyzes corporate structure and industry classification of companies participating in the program, and controls correspondence.

Laura Gonchar Schmitz, assisted by Bob Peregoy, provides production planning and data processing support.

Carol Caldwell, Assistant Chief for Research and Methodology, provides monitoring of the integrity of the samples. Mark S. Sands, Chief, Statistical Research and Methods Branch, directs sample design and quality control, assisted by Irene L. Evans, Melvin McCullough, and Terry Pennington.

Diane Roebuck, Ed Johnson, Yung Yi, Emily Dao, Charlie Nguyen, Duy Nguyen, and Kruti Parekh, of the Economic Statistical Methods and Programming Division, provide computer software development services.

Corey Beasley of the Administrative and Customer Services Division, Walter C. Odom, Chief, provides publication graphics design for the electronic media.

Special acknowledgments are also due to the many corporations whose cooperation each quarter is essential to the success of this report.

Introduction

SURVEY DESCRIPTION

The Quarterly Financial Report (QFR) Program publishes up-to-date aggregate statistics on the financial results and position of U.S. corporations. Based upon a sample survey, the QFR presents estimated statements of income and retained earnings, balance sheets, and related financial and operating ratios for manufacturing corporations with assets of \$250,000 and over, and mining, wholesale trade and retail trade corporations with assets of \$50 million and over. The statistical data are classified by industry and by asset size.

The Federal Trade Commission (FTC) was responsible for the program from its inception in 1947 until December 1982. That responsibility was shared with the Securities and Exchange Commission until 1971. Authority to conduct the survey was transferred to the U.S. Census Bureau in 1982.

The Commerce Department regularly employs QFR data as an important component in determining corporate profits for the Gross Domestic Product (GDP) and National Income estimates; the Federal Reserve Board uses QFR data to assess industrial debt structure, liquidity, and profitability; the Treasury Department estimates corporate tax liability through use of QFR data; the Council of Economic Advisers and Congressional Committees utilize key indicators derived from QFR data as they design economic policies and draft legislation; the FTC utilizes the series as a basic reference point in analyzing the financial performance of American industries; and banking institutions and financial analysts draw upon the series in making investment evaluations.

Publication schedule. QFR data are scheduled for release approximately 75 days after the end of the first, second, and third-calendar quarters, and approximately 95 days after the end of the fourth-calendar quarter.

The QFR publishes information on the most recently closed quarter for manufacturing, mining, and wholesale trade corporations, and the preceding quarter's data for retail trade corporations, except in the fourth quarter when the 95-day publication lag permits synchronized presentation. The following table shows how a corporation's fiscal quarter relates to QFR quarters:

	Month Corporation's Fiscal Quarter Ends	
QFR Quarter	Manufacturing, Mining, and Wholesale Trade	Retail Trade
First	Jan., Feb., or Mar.	Feb., Mar., or Apr.
Second	Apr., May, or June	May, June, or July
Third	July, Aug., or Sept.	Aug., Sept., or Oct.
Fourth	Oct., Nov., or Dec.	Nov., Dec., or Jan.

Data revisions. Revisions to QFR data are attributable primarily to industry reclassifications of major corporations involved in merger/acquisition activities, restructuring of operations, economic changes, or additional information and/or corrections submitted by respondents subsequent to last quarter's publication. In order to reflect these changes and to provide users with comparable data, revisions are made each quarter to the most recent four quarters of previously published data.

Consolidation rules. Reporting companies have been instructed to fully consolidate the domestic operations of every company, corporate (including 1120S corporations) and noncorporate, which are taxable under the U.S. Internal Revenue Code and are owned more than 50 percent by the reporting company and its majority-owned subsidiaries. This includes every majority-owned domestic company located within the United States that manufactures, mines, or conducts other business activities with the following exceptions: foreign entities (either corporate or noncorporate), foreign branch operations, and domestic companies primarily engaged in foreign operations (plants or work forces are located in foreign countries). Subsidiaries created in foreign countries to manufacture and/or sell primarily in foreign markets are not consolidated. Also excluded from consolidation are domestic companies primarily engaged in banking, finance, or insurance as defined in the North American Industry Classification System (NAICS) Sector 52. Commonwealths such as Puerto Rico and territories such as the Virgin Islands are not considered domestic for this report.

Nonconsolidated subsidiaries are accounted for on either the cost or equity method of accounting, at the option of the reporting company. Manufacturing corporations with assets less than \$50 million report their dividend income or equity income (loss) with other nonoperating income (expense). Corporations with assets of \$50 million and over report their dividend income or equity income (loss) separately.

How corporations are classified and tabulated. The industry combinations used in the QFR are defined in accordance with the descriptions provided in the North American Industry Classification System, United States, 1997 manual. Each corporation in the survey is required to provide a breakdown of gross receipts by source industry. These data are analyzed to determine the classification of each corporation. A reporting corporation is initially classified into the NAICS sector accounting for more gross receipts than any other NAICS sector. To be in scope for the QFR, more gross receipts of the reporting corporation must be accounted for by either (not a combination of) the NAICS Manufacturing sector, Mining sector, Wholesale Trade sector, or Retail Trade sector than by any other NAICS sector. After a corporation is assigned to a sector, it is further classified by the 3-digit NAICS subsector accounting for more gross receipts than any other 3-digit subsector within the sector. In certain cases, corporations are further classified into 4-digit industry groups. QFR data are published for these subsectors and industry groups, except when statistical criteria are not satisfied. In those cases, sectors or subsectors are combined, such as Leather Product Manufacturing and Apparel Manufacturing.

Note that these procedures may lead to a conglomerate corporation being assigned to a major group from which only a small proportion of its receipts are obtained. For example, if a corporation obtains 20 percent of its gross receipts from wholesale, 25 percent each from mining and retail, and 30 percent from manufacturing, it would be classified in the manufacturing sector. Furthermore, if the 30 percent of manufacturing activity was conducted in two subsectors, 10 percent in one and 20 percent in the other, the activities of the corporation as a whole would be classified in the subsector accounting for 20 percent of total receipts.

When a corporation is drawn into the sample, its classification is determined using the most current information available. This classification is reviewed periodically and changed as needed for as long as the corporation remains in the sample. Each manufacturing corporation is tabulated according to its total assets reported for that quarter. Mining and trade corporations are tabulated according to their total assets at the time of sample selection.

DATA ANALYSIS

Financial operating ratios. Many quantitative indicators are used to assess the financial strength of an enterprise and the success of its operations. The simplest method is to assemble related financial items, such as sales and profits, and to express this relationship in the form of a ratio. Using these ratios, various aspects of corporate operations may be compared with the performance of other corporations or groups of corporations of similar size or in a similar industry.

The QFR's ratio formatted income statement and selected balance sheet ratios are expressed as percents of net sales and total assets, respectively. The operating and financial characteristics of the respective industries and asset size groups are thus reduced to a common denominator to facilitate analysis.

The ratio tables include the following additional basic operating ratios:

- **Annual rate of profit on stockholders' equity at end of period.** This ratio is obtained by multiplying income for the quarter before or after domestic taxes (including branch income (loss) and equity in the earnings of nonconsolidated subsidiaries net of foreign taxes) by four, to put it on an annual basis, and then dividing by stockholders' equity at the end of the quarter. This ratio measures the rate of return that accrues to stockholders on their investment.
- **Annual rate of profit on total assets.** This ratio is obtained by multiplying income, as defined in deriving the rate of profit on stockholders' equity, both before and after taxes, by four, and then dividing by total assets at the end of the quarter. This ratio measures the productivity of assets in terms of producing income.
- **Total current assets to total current liabilities.** This ratio is obtained by dividing total current assets by total current liabilities. This ratio measures the ability to discharge current maturing obligations from existing current assets.
- **Total cash and U.S. Government and other securities to total current liabilities.** This ratio is obtained by dividing total cash and U.S. Government and other securities by total current liabilities. This ratio measures the ability to discharge current liabilities from liquid assets.
- **Total stockholders' equity to total debt.** This ratio is obtained by dividing total stockholders' equity by the total of short-term loans, current installments on long-term debt, and long-term debt due in more than one year. This ratio indicates the extent of leverage financing used.

Comparisons with other statistics. QFR estimates will not necessarily agree with other financial and industrial statistics, whether based upon a sample or complete canvass. For example:

- The QFR eliminates multiple counting of interplant and other intracompany transfers included in census establishment statistics. It also eliminates multiple counting of intercorporate transfers included in statistics based upon nonconsolidated, partly consolidated, or combined reports from multicorporate enterprises.
- Each corporation that files one of the U.S. Corporation Income Tax Return Forms 1120, 1120A, or 1120S and is in scope of the QFR is classified in one of 37 QFR subsectors or industry groups and has a known probability of being drawn into the QFR sample. Each corporation in the QFR sample is therefore given its proper weight in computing the QFR estimates. The composition of the sample changes each quarter to reflect the effects of corporate births, deaths, acquisitions, divestitures, mergers, consolidations, and the like. To redistribute the reporting responsibility as equitably as possible among the smallest corporations, one-eighth of the noncertainty sample is replaced each quarter. The QFR estimates may, therefore, differ significantly from estimates based upon reports for identical groups of corporations.

- The conventional accounting concept of profits is used in the QFR estimates. This differs from the concept of profits employed in the national income and product accounts. In measuring profits for national income accounting purposes, capital gains and dividends received by corporations are deducted from profits, capital losses and depletion charges are added to profits, and adjustments are made for international flows affecting profits.
- Corporations' QFR submissions generally embody the accounting conventions adopted for financial reporting purposes. As such, they may differ from those used by corporations for reporting income to the Internal Revenue Service (IRS); for example, in the more frequent application of accelerated depreciation on tax returns. Therefore, annual income and balance sheet information derived from tax returns, which can be found in the IRS report series Statistics of Income: Corporation Income Tax Returns, may not be comparable.
- QFR estimates by corporation size are based upon the total assets of consolidated corporate enterprises. They differ from estimates based upon other criteria such as value of shipments or number of employees. They differ also from estimates based upon other reporting units such as establishments, nonconsolidated corporations, or enterprises consolidated differently than in the QFR.
- QFR estimates are based upon a changing sample of audited, unaudited, and estimated reports required to be submitted within 25 days after the end of each quarterly reporting period by corporations that are not necessarily identical entities from quarter to quarter. Aggregated for any four consecutive quarters, the QFR estimates will differ from similar aggregations of finalized and audited annual reports for accounting years that are not necessarily identical from corporation to corporation.

Time series discontinuities. Because of various changes to the QFR program over the years, discontinuities that affect its use as a time series for tracking economic change have been introduced. The most significant ones follow:

- **Accounting rules changes.** When the QFR series began in 1947, corporations were instructed to consolidate all of their subsidiaries that were taxable under the U.S. Internal Revenue Code and that were fully consolidated in their latest report to stockholders. All other subsidiaries were to be accounted for as investments. Closely held corporations that did not prepare stockholder reports were to report on a basis consistent with their audited or corporation prepared reports.

The income tax liability rule was expected to eliminate most foreign operations. However, as the number of multinational corporations increased between 1947 and 1973, foreign operations gradually became more and more significant in the QFR data. Therefore, an interagency task force composed of user agency representatives was created.

New consolidation rules were put into effect in the fourth quarter of 1973 to maximize coverage and minimize the impact of foreign operations on QFR statistics (see Consolidation rules). As a result of these changes, foreign operations are included on an investment basis. In addition, the breadth of the new consolidation rules was expanded to include certain domestic subsidiaries previously excluded under the old rules. Also, the rules were clarified with respect to the scope of coverage. Domestic subsidiaries engaged in banking, finance, or insurance are not to be consolidated.

The change in consolidation rules and the creation of a line item to reflect equity in earnings from nonconsolidated subsidiaries, significantly lessened the comparability of pre- and post-Q4 1973 reports. QFR internal accounting procedures prior to the rule change required the classification of equity in earnings (losses) as direct credit or charge to retained earnings. Therefore, when a reporting corporation indicated by footnote that its equity in nonconsolidated subsidiary earnings (losses) was included in its current quarter's income (loss), the QFR accounting staff made the appropriate adjustment. With the addition of the separate line on equity, this adjustment is not made. Equity in earnings (losses) is accounted for as an element of the parent corporation's quarterly income (loss) after taxes. The treatment of dividend income received from nonconsolidated subsidiaries accounted for by the cost method has remained consistent under both the new and old format. In these instances, dividends received are included in net income before taxes through the nonoperating income line. A comparison of aggregated totals published under both the old and new consolidation rules indicates the following:

- There was a net decrease in sales, apparently due to the exclusion of foreign activities previously included.
- There was a net decrease in net income before taxes (NIBT) apparently due to two major effects. Equity in earnings (losses) from nonconsolidated subsidiaries is reflected on a designated line below NIBT, whereas prior reports often included this amount in NIBT. If the reporting company did not footnote this inclusion, QFR accountants were unable to make the proper adjustment. If foreign activity was fully consolidated, foreign earnings were also included in NIBT. The new consolidation rules minimize this effect as well.
- The net effect of the rule changes on net income after taxes (NIAT) was small. Under both rules, foreign activity should be included above the NIAT line. The slight degree of difference also suggests that the QFR footnoted equity in earnings (losses) on nonconsolidated subsidiaries were not extensive enough to affect comparative published data materially.

- Noncurrent assets include investments in nonconsolidated subsidiaries under either the cost or equity method. The rule change precluding full consolidation of foreign activity caused a marked increase in this line item. Corporations that consolidated foreign activity fully up to 1973 were required to eliminate their investment in accordance with generally accepted accounting principles. Since foreign activity is not fully consolidated, investments in these subsidiaries are included in the noncurrent asset line.
- **Industry classification system changes.** The fourth quarter of 2001 reflects the conversion of the QFR to the North American Industry Classification System (NAICS) from the Standard Industrial Classification (SIC) system. With NAICS, there were major changes in how industries are defined requiring the movement of many corporations to different industry categories. The most notable changes are: moving publishing activities from manufacturing to the information sector; moving logging to the agriculture, forestry, fishing, and hunting sector; moving eating and drinking places from retail trade to the accommodation and food services sector; redistributing instruments and related products to several new or redefined manufacturing sectors; and creating the NAICS computer and electronic products manufacturing sector. Data for the fourth quarter of 2000 through the third quarter of 2001 were restated on the new NAICS basis.
- **Sample design changes.** The first sample in this survey was drawn from U.S. Corporation Income Tax Returns (Form 1120) filed with IRS for the taxable year 1943 and was used to produce estimates for 1947 to 1951. A second sample was drawn from income tax returns for the taxable year 1949 and used to produce data for 1951 to 1956. Since then, samples are drawn annually from income tax returns to produce data. Each sample through fourth-quarter 1982 was supplemented by quarterly samples of applications for a Federal Social Security Employer's Identification Number filed with the Social Security Administration (SSA). Subsequent to that quarter the QFR lost its authority to obtain the SSA data.

From the third-quarter 1977 through the fourth-quarter 1986, the strata including very small manufacturing firms (those with assets less than \$250,000) and all newly incorporated manufacturers were estimated using multivariate techniques. Beginning in the first-quarter 1987, the QFR universe of corporations was redefined to exclude these strata. Beginning in the fourth quarter of 1988, the asset level for inclusion in published mining, wholesale trade, and retail trade estimates was raised to \$50 million at the time of sample selection. These latter changes to the sample rules were effected to reduce reporting burden on small companies and to meet changing budgeting restraints.

Effective with the fourth-quarter 2001 report, cooperatives were defined out of scope of the QFR program.

These firms, which are primarily in the manufacturing and wholesale trade food sectors, file 990-C Farmers' Cooperative Association tax returns with IRS. Also, even though many are incorporated, they have tax exempt status with IRS.

- **Questionnaire changes.** In 1980, Congress mandated a reduction in both QFR form complexity and sample size. In response, the program adopted an abbreviated form for surveyed corporations with total assets of less than \$50 million. Corporations with higher asset values continued to submit the long form, which has been in use since 1974. To accomplish the sample size reduction, the threshold for sampling on less than a 1:1 ratio was raised from \$10 million to \$25 million in assets. The threshold for sampling was subsequently raised to \$50 million in 1988 and to \$250 million in 1995 (See Survey Methodology). The resulting reduced sample size was optimally allocated with further cuts made in asset sizes below \$10 million. The results of these changes are reflected beginning in the fourth quarter of 1981.

Beginning with the first quarter of 1998, the long and short survey forms were updated to conform with changes in accounting principles and to provide more meaningful data to users. The new format provided for reporting of interest expense, bonds and debentures, and more detailed information on significant economic events, such as asset sales and disposal of business segments. Net income before and after tax were redefined to include minority stockholders' interest. In some instances, old data items were not fully comparable with the new format; however, where possible prior quarter data were restated in the new format.

Copies of the long and short survey forms are shown on pages x and xi to assist in comparing data collection differences. These survey forms also provide the reader a key to the long to short format conversion. Note that data tables presenting total estimates by NAICS sector, subsector, and industry group are published on the short-form basis; therefore, the more detailed long form data submitted by larger corporations (those with assets of \$50 million and over) are collapsed in these tables.

Corporations filing the short form, report equity in earnings (losses) of nonconsolidated subsidiaries and foreign branches as a component of all other nonoperating income (expense). Although this treatment will introduce elements of foreign earnings (losses) into income (or loss) before income taxes, the contribution of foreign earnings (losses) of these smaller asset size corporations to this data item has been historically insignificant. Corporations with assets of \$50 million and over continue to report equity in earnings (losses) as a separate data item. As can be seen in the conversion table, this data item is collapsed for total estimation into all other nonoperating income (expense).

However, since these larger asset size corporations continue to report equity in earnings (losses) separately, as reflected in the tables published for corporations with assets of \$25 million and over, comparability with prior data can be achieved through subtraction.

SURVEY METHODOLOGY

Sampling frame and sample selection. The QFR survey includes manufacturing corporations with total assets of \$250,000 and over, and mining, wholesale trade, and retail trade corporations with total assets of \$50 million and over. Each year, a QFR sampling frame is built from an annual IRS file of corporate entities which are required to file Form 1120, 1120A, or 1120S. This frame is stratified by industry classification and size of total assets and gross receipts prior to sampling.

Nearly all corporations whose operations are within scope of the QFR and have total assets of \$250 million and over are included in the sample with certainty and are canvassed every quarter. Simple random samples are selected from the eligible noncertainty units in the remaining industry-by-size strata. The sample in each cell is divided systematically into four panels that are introduced over the next year. Each noncertainty panel is in the survey for eight successive quarters. Each quarter, one noncertainty panel is rotated out and a new panel is rotated into the sample. This means that the noncertainty sample for adjacent quarters is seven-eighths identical; one half of the sample is the same for quarter sending one year apart.

See Table J (page xxiv) for the number of active corporations in the sample by assets size.

As a result of the Paperwork Reduction Act of 1995, QFR sample units are subject to time in / time out constraints. If a sampled company has less than \$50 million in total assets and has been in the survey for eight quarters, that company is not eligible for selection again for the next 10 years. If a company has total assets between \$50 million and \$250 million and has been in the survey for eight quarters, it is not eligible for selection again for the next 2 years. Because of the time in / time out constraints, it is necessary to evaluate the frame to assure there are enough eligible units for the four panels of the current sample to be selected, and that there will remain enough units on the frame that will be eligible for selection in subsequent years. If there are too few units, the sample size for the current year is reduced to allow enough units for future years' selections. This adjustment to the optimal sample size results in increased variance for these strata.

Sample maintenance. The file received from the IRS to create the QFR frame does not contain all corporate tax returns. This is due to several factors, including but not limited to, corporations filing late tax returns, mergers and acquisitions, spinoffs, corporate restructuring, etc. In an attempt to keep the coverage of certainty corporations as complete as possible, the QFR staff reviews current corporate news releases and public records to identify any potential additions and changes to the

QFR target population. Corporations thus identified and thought to meet the QFR in-scope criteria are mailed classification forms. If their response indicates that the corporation meets the QFR in-scope criteria, they will be included in the survey with certainty for the remainder of the year.

Estimation. The estimates of total are computed as the sum of weighted data for all responding sample units. The weights in the noncertainty portion are adjusted to account for nonresponse by multiplying the weighted estimate by the ratio of the number of active sample cases divided by the number of respondents. Data for all nonrespondent certainty cases are imputed using procedures that ensure the imputed data are consistent with prior reported data and/or with the other responses.

Sampling error. The sample used in this survey is one of many possible samples that could have been selected using the sampling methodology described earlier. Each of these possible samples would likely yield different results. These samples give rise to a distribution of estimates for the unknown population value. A statistical measure of the variability among these estimates is the standard error (SE), which can be estimated from any one sample. The standard error is defined as the square root of the variance. The relative standard error (RSE) of an estimate is the standard error of the estimate divided by the estimate, and is usually expressed as a percent. It provides a measure of the variation of the data relative to the estimate being made. Note that measures of sampling variability, such as the standard error and relative standard error, are estimated from the sample and are also subject to sampling variability. Table K (page xxv) gives the estimates of the relative standard error in percent for the estimates of net sales, depreciation, inventories, and total assets. The estimates of standard errors for income before income taxes are also given in Table K.

Beginning with the third quarter 2006 publication, the methodology for calculating the sample variance has changed. Prior methodology used a design-based approach, whereas the new methodology uses a model-based approach. This new approach provides a better estimate of sample variance in strata with few sample cases, and also accounts for some of the variability due to our methods used to account for non-responding companies.

The relative standard errors presented in Table K can be used to derive the standard error of the estimate. The standard error can be used to derive interval estimates with prescribed levels of confidence that the interval includes the average results of all samples:

- Intervals defined by one standard error above and below the sample estimate will contain the true value approximately 68 percent of the time.
- Intervals defined by 1.6 standard errors above and below the sample estimate will contain the true value approximately 90 percent of the time.

- Intervals defined by two standard errors above and below the sample estimate will contain the true value approximately 95 percent of the time.

To illustrate the computations involved in the above confidence statements as related to dollar volume net sales estimates, assume that an estimate of net sales for all manufacturing published in Table 1.0 is \$525,000 million for a particular quarter and that the relative standard error for this estimate, as given in Table K, is 0.2 percent. Then the SE is calculated as:

$$\begin{aligned} SE(X_j) &= \left[[RSE(X_j)] / 100 \right] * X_j \\ &= (.2 / 100) * \$525,000 \text{ million} \\ &= \$1,050 \text{ million} \end{aligned}$$

Therefore, a 90-percent confidence interval is \$525,000 million \pm 1.6 (\$1,050 million) = \$525,000 \pm \$1,680 million, or \$523,320 million to \$526,680 million.

If corresponding confidence intervals were constructed for all possible samples of the same size and design, approximately 90 percent of the intervals would contain the figure obtained from a complete enumeration.

Nonsampling error. The relative standard error estimates sampling variation, but does not measure all nonsampling error in the data. Nonsampling error consists of both a variance component and a bias component. Bias is the difference, averaged over all possible samples of the same size and design, between the estimate and the true value being estimated.

Nonsampling errors can be attributed to many possible sources:

- Coverage error, such as failure to accurately represent all population units in the sample, or the inability to obtain information about all sample cases;
- Response errors, possibly due to definitional difficulties or misreporting;
- Mistakes in recording or coding the data obtained;
- Other errors of coverage, collection, nonresponse, response, processing, or imputing for missing or inconsistent data.

These nonsampling errors also occur in complete censuses. Although no direct measures of these errors have been obtained, precautionary steps were taken in all phases of the collection, processing, and tabulation of the data to minimize their influence.

Adjustment for seasonal variation. The X-12 ARIMA program is used to derive the factors for adjusting sales and net income after taxes for All Manufacturing, All Durable Manufacturing, and All Nondurable Manufacturing for seasonal variations. Seasonal adjustment of estimates is an approximation based on current and past experiences. Therefore, the adjustment could become less precise because of changes in economic conditions and other elements that introduce significant changes in seasonal patterns.

¹ The Relative Standard Error (RSE) for the item "Income before income taxes" is more volatile than for the other items shown on this table. This is due in part to the fact that "Income before income taxes" can be negative. Aggregation of positive and negative values may result in totals which approach zero and cause the RSE's to rapidly increase. Therefore, the Standard Error (SE) is provided as a measure of precision for this item and should show consistency from quarter to quarter. For information on the meaning and use of the RSE and SE, see the Survey Methodology Section in the Introduction.

² Fourth quarter 2006.

³ Included in subsector above.

⁴ See the Survey Methodology section in the Introduction, page viii, for information on a change in methodology for calculating the sample variance.

¹ The seasonally adjusted estimates provided in this table were derived using a combination of SIC-based and NAICS-based estimates.

NOTE: Seasonally adjusted estimates are the result of removing normal seasonal patterns from an unadjusted data series to bring out underlying trends. The seasonally adjusted estimates are computed using the X-12 ARIMA seasonal adjustment program. Further information on the X-12 ARIMA may be obtained from the Associate Director for Statistical Design, Methodology, and Standards, U.S. Census Bureau, Washington, DC 20233.
