

DATA HEALTH STATISTICS

The Collection and Processing of Drug Information:

National Ambulatory Medical Care Survey United States, 1980

The report describes the method and instruments used to collect and process drug information for the 1980 National Ambulatory Medical Care Survey. It explains in detail the development of the system by which the drug information was classified and coded, and offers a complete set of coding instructions along with an alphabetized list of 7,227 drugs that office-based physicians might prescribe. Finally, it presents the plan for analyzing the drug data and reporting it to potential users.

of Washington at Seattle

Background

This report describes the method and instruments used to collect and process drug information for the 1980 National Ambulatory Medical Care Survey (NAMCS). In this report, the term *drug* is interchangeable with the term *medication* and includes all immunizing and desensitizing agents. The use of the term *prescribing* a drug or of the physician's *prescribing* habits, is used in its broader sense, namely to mean the ordering or provision of any medication—prescription (Rx) or nonprescription (OTC)—in the course of the office visit. The relationship between *prescribing* and *using* drugs is inferential, subject to the patient's compliance with the doctor's decision.

The purpose of NAMCS is to collect and report descriptive data about the medical care provided in the physician's office. Each year beginning with 1973, NAMCS has sampled 3,000 of the Nation's roughly 200,000 doctors of medicine and osteopathy who are principally engaged in office-based, patient-care practice. The sample excludes: physicians who are federally employed; physicians who practice in Alaska and Hawaii; and physicians who, though office-based, specialize in anesthesiology, pathology, or radiology. Among eligible physicians, NAMCS uses a multistage probability design that distributes its sample geographically by primary sampling units (PSU's) and functionally by the specialties of the physicians who practice within the PSU's. Sampled physicians complete records (figure 1) for a systematic random sample of their office visits over a weekly reporting period. In 1978, the year of the Patient Record shown in figure 1, sampled physicians responded at a rate of 72.8 percent. This produced a raw data base of 47,291 patient records, from which an estimated 584,498,000 total visits was projected.

In designing the Patient Record each year, the prime motivating factor has been to spare the physi-

cian time and effort. The approach, typified by the 1978 Record, has been as indicated below.

1. To ensure that the record format does not exceed one side of one page, the overall number of items must be limited.
2. To make sure that the items are as self-explanatory as possible, or place clarifying information on the face of the Record form. If necessary, special instructions or definitions are made readily available to the recording physician by either printing them directly on the jacket in which the Patient Records are filed or on a card which is inserted in the jacket.
3. To hold write-in responses to a minimum, placing relatively more reliance on the checkbox.

Until the 1980 NAMCS, every Patient Record contained checkbox items for nonspecific drug therapy ordered or provided during the visit. In brevity and content, all the items closely resembled the drug question that appeared on the 1978 Record under Item 12. Two subitems, Item 12.2 and 12.3, elicit relevant drug response.

Though this approach to gathering drug information agreed with the NAMCS tradition by requiring a laudable economy of respondent effort, it unfortunately resulted in a regrettable paucity of descriptive detail about the role played by drugs in office-based medical care. For example, statements such as this could be made.

"In 1978 there were an estimated 348,262,000 *drug visits* (visits at which at least one drug was prescribed). *Drug visits* amounted to about 60 percent of all office visits."

It could be shown how the frequency of drug visits varied with such influencing factors as physician specialty, primary diagnosis, age or race of patient, etc. But beyond this limited description, additional information about the drug therapy was not available. For example, specific drug products could not be

ASSURANCE OF CONFIDENTIALITY—All information which would permit identification of an individual, a practice, or an establishment will be held confidential, will be used only by persons engaged in and for the purposes of the survey and will not be disclosed or released to other persons or used for any other purpose.

identified by name and counted. Certain facts that bear critically on a full understanding of drug utilization were left unexplored, such as: the extent of generic prescribing, the relative reliance on combination drugs, and the use of usually-less-costly nonprescription drugs. Except for the immunizing and desensitizing agents, there were only inferential clues to the therapeutic effect that the physician desired in using the drug.

Sensitive to the limited utility of the NAMCS drug data, its panel of advisory experts had for several years urged a more ambitious effort. Two concerns delayed the implementation of their suggestion.

One, it was thought that a more detailed probe into the prescribing habits of respondents might act negatively on their response rate. Drug therapy is currently one of the more controversial facets of health care. Although the confidentiality of data provided in NAMCS is protected by statute, NAMCS planners feared that physicians might assume that their responses would be used to evaluate the quality of their

practice, monitor their Medicare or Medicaid billings, or be otherwise interpreted to their disadvantage.

Two, the problems of classifying and coding the detailed drug data might prove too costly and complex for practical management.

However, realizing that subjective reservations should not by themselves be allowed to debar a potentially useful action, NAMCS planners began in 1978 to pursue a course of action that would objectify the problems implicit in an extended drug inquiry, and to solve as many of these problems as possible, with the tentative aim of incorporating the revised approach in the 1980 survey.

This course of action led to the undertaking of the following specific tasks:

1. A formal study that would evaluate the feasibility of obtaining more specific drug information and indicate the format that such a revised drug item should take.
2. A search for a system by which drug data could

be most efficiently and economically classified and coded.

The first task was undertaken in July 1979 by the NAMCS contractor, The National Opinion Research Center. A small-scale feasibility study was designed to investigate two major questions:

1. Were physicians willing and able to report more specific information about medications prescribed during the patient visit?

2. What were the advantages of open-ended (verbatim) recording of drugs versus a more modest extension of the drug inquiry, expressed as a closed checklist of therapeutic effects desired by the use of the drugs?

To put these questions to empirical test, two experimental forms of the Patient Record were constructed. Version A (figure 2) had a precoded format on which physicians were first asked whether any

Figure 3. Patient Record, Version B, 1980

medication was ordered or provided. If the answer was yes, they were asked to check off the therapeutic effect(s) desired from a list of 33 precoded response categories. Version B (figure 3) employed an open-ended format that required the physician to list verbatim all new or continued medications prescribed during the visit, using either generic or brand names, and recording nonprescription as well as prescription drugs.

The study design called for two matched samples of 20 physicians each, one sample assigned Version A,

the other Version B. The assignment was random. The samples were selected from physicians who had recently participated in NAMCS. Since these physicians were already comfortable with NAMCS procedures and with the content of its Patient Record, it was felt that they could better direct their critical attention to the new medication item without suffering the possibly negative distraction which might—in newly recruited physicians—be evoked by new procedures, by other items on the Patient Record, or both.

The sample was dispersed geographically and included all the major specialties. Each sampled physician was asked to fill out 10 Patient Records a day for 3 days. Following the 3-day period, interviewers visited the doctor's office to pick up the completed forms and to conduct a brief evaluation interview. This interview probed for reactions to the medication items with particular reference to any difficulties experienced in obtaining and recording the data. During the interview, physicians were shown the alternative version of the Patient Record (precoded checkbox or open-ended write-in) and asked to indicate a preference. The findings of the evaluation interviews are tabulated in appendix I. Finally, respondents were asked whether in their judgment any substantial number of physicians might not be willing to provide this kind of drug information.

Patient Records and completed evaluation interviews were received from 35 of the 40 physicians. In the sample that used Version A, 17 physicians participated, producing 407 Patient Records. In the sample that used Version B, 18 physicians participated, producing 384 Patient Records on which a total of 706 drug entries were listed. None of the five nonrespondents demurred because of a negative reaction to the drug item.

Summarizing the results of the evaluation interviews, it may be said that physicians had little or no difficulty using either version of the form, expressed confidence that they had included all prescription drugs ordered or provided (but thought they may have missed some nonprescription drugs), and had no strong preference for either the precoded checklist or the open-ended write-in.

It deserves emphasis that there was absolutely no overt refusal to participate in the study or criticism of the medication items on the grounds that the information would be used to evaluate the quality of the doctor's practice, monitor Medicare or Medicaid billings, or otherwise be used to the physician's disadvantage. However, though they themselves expressed no concerns, 10 of the 35 pretest respondents did raise possible concerns that—they conjectured—other physicians might have, for example:

"Maybe if they're handing out amphetamines."

"Certain drugs are not recognized for the condition on the Patient Record. If they're using those, they might not want to say so."

"Some don't like to admit the number of drugs they are prescribing."

"They might fear it will open the door to the government, but probably not unless they're doing something unethical. There may be abuses they do not want to reveal."

"Some prescribe diet and pain pills in large quantities."

"It could be used by government agencies as a means of review."

"If the doctor has not kept up with current trends he wouldn't want to reveal it."

The contractor for the study put his conclusions and recommendations in these words.

"In our opinion, this pretest has demonstrated the feasibility of obtaining data on medications ordered or provided to ambulatory care in physicians' offices. We encountered no refusal to participate in the survey because this item was included, no specific objections to recording the information, and no immediate visible evidence that responses were distorted. The fact that ten of the participating physicians could think of reasons why other physicians might object to recording the information is not surprising to us; the speculation is a plausible one. But we have no evidence that such attitudes would significantly affect the data.

"Either the checklist type of item or the open-ended write-in seems quite feasible and agreeable to doctors. The open-ended version will be more costly, since it requires office coding in one or more dimensions, but the choice would seem to depend upon which type of information will be most useful to NAMCS users.

"With respect to ease of recording and quality of the data, we would recommend using write-ins rather than the checklist. Although the latter may seem simple at first glance, the checklist has several difficulties. It takes time for the physician to acquaint himself with the numerous categories; many of these categories may be entirely irrelevant to his practice and thus prove confusing and distracting; he must use his judgment to determine in which category to place the particular drugs he prescribes and the judgment may be difficult because the category may be too general or too restrictive. Uncertainty about the coding of the therapeutic effect desired is compounded when a nurse or other assistant completes all or part of the patient record instead of the doctor. Using the open-ended version of the form, the assistant could simply copy the name of the drug from the medical record; using the precoded version, the assistant might not be able to decide correctly the effect desired by the physician.

"We had thought that the write-in method would be more burdensome to the doctor, but as we have seen the majority of those who used this version preferred it as quicker and simpler than coding onto the list of desired effects. We had also thought that the write-in method might produce fewer mentions, since the precoded list could be expected to jog the physician's memory,

and since the task of writing out the name of a drug might be expected to inhibit mention. Instead, we found an average of 1.8 medications written in per patient, compared to an average of only 1.6 categories checked. (It may be, of course, that physicians sometimes ordered two drugs to achieve one type of effect.)

“The more specific and objective nature of the brand or generic name information appears to provide another advantage over the vaguer and more subjective checking of desired effects. The name of the prescribed drug is or should be unambiguous and will normally appear on the physician’s record, where it is accessible to his assistant or to the doctor himself if he fills out the patient record at a later date.

“It is also subject to clarification or checking by the interviewer in the course of her edit of the form. If a drug is unfamiliar or recorded illegibly, she can verify the entry with the physician’s nurse or administrative assistant. The checklist of effects is practically immune to verification or edit.

“The reporting of nonprescription medication caused some problems and the need for this information could well be reviewed. Such medications are not listed on the record in many cases and recommendations for their use may have been given informally on past occasions, as well as in the course of the reported visit. Accuracy and completeness of recall are unknown. Almost half of our pretest physicians were not sure they had

reported all of these, whereas three-quarters were confident they had fully reported all prescription drugs ordered or provided.”

Concurrent with the planning and conduct of the pretest, NAMCS staff contacted 40 health-care authorities, asking which version of the Patient Record they preferred—write-in of drug names or checklist of therapeutic effects—and inviting their comments. Among those contacted were: members of the NAMCS technical advisory panel, representatives of the 18 professional organizations that endorsed NAMCS, interested educators, and officials within the National Center for Health Statistics. Thirty-five of the contacts replied. Of these, 25 favored the write-in version, 5 the checklist, and 5 expressed no preference.

Evidence from this informal elicitation of opinion, along with the recommendation from the Feasibility Study, pointed up the richer potential of useful information implicit in the write-in version, confirming NAMCS planners growing determination to use this approach. (The finished format of the 1980 Patient Record, closely modeled on Version B of the pretest, appears as figure 4.) However, especially among authorities sophisticated in coding problems, the caution was frequently expressed that the larger the number of drug dimensions explored, the more complex and expensive the classification and coding process would certainly become, thus, requiring a very specific forecasting of the uses to which the drug data would be put.

	ASSURANCE OF CONFIDENTIALITY —All information which would permit identification of an individual, a practice, or an establishment will be held confidential, will be used only by persons engaged in and for the purposes of the survey and will not be disclosed or released to other persons or used for any other purpose. Figure 4. Patient Record and Instruction on Patient Record jacket

Drug identification and description

A central issue, then, is how to identify and describe drugs in order to characterize prescribing in office-based practice. The question is a complex one because substantial variability exists in the detail with which drugs are commonly identified. In order to dispense a drug to a patient, there must be an instruction by the physician and a decision by the pharmacist to select a unique drug entity. For example, the medication received by a patient may be described as follows:

AMPICILLIN	250 mg	Capsule	1 QID	100
↓	↓	↓	---	↓
Drug Name	Drug Strength	Dosage Form	Dosage Regimen	Number of Doses
(1)	(2)	(3)	(4)	(5)

These five units of information can be expanded by adding the price (or cost) of the medication, package size used by the pharmacist, manufacturer, or other information. Quite obviously the task of recording drug prescribing activities can become extremely complex if the intent is to reflect all decision-making that occurs in the prescribing process. Another complicating factor is that, as the depth of information increases, so does the breadth of information. In the above example five basic and several supplemental units of information were identified that add information to an AMPICILLIN drug order. At this very explicit level of description there are over 50,000 unique drug entities available in the marketplace. That is, an AMPICILLIN prescription for a capsule would be considered different from an oral suspension, and so forth. If each drug order were to be described in complete detail the resource requirements would be unmanageable. The need to balance cost and utility considerations quickly leads to a parsimonious approach in data collection.

Because complete capture of prescribing information is not feasible, there is a need to establish decision rules for defining minimum essential information. Three guidelines were established:

1. The data base should reflect, insofar as possible,

the prescriber's primary intent in ordering drug therapy.

2. Physical characteristics of the product (e.g., dosage form, strength, package size) are of minimal importance.
3. Identification procedures must be restricted to the information commonly included by physicians in ordering drugs.

These three guidelines dictated that only the "core identifier" (e.g., AMPICILLIN) could be used in data collection. The core identifier is the prescriber's designation of the pharmaceutical agent(s) used for cure, treatment, diagnosis, or prevention of disease. Information concerning dosage form, strength, and other medication characteristics is extraneous to this primary intent. Further, the physician commonly omits physical product and dosage regimen information when recording drug orders. The data collection objective then becomes one of extracting the maximum amount of useful information from the core identifier.

A valuable unit of information available from the core identifier is simply the frequency with which drugs are used in office-based practice. Since drug therapy is the most frequently employed treatment modality in medical care there is a need to understand the rates of drug use. For example, the average number of prescriptions per office visit, and characteristics of drug users (e.g., age, sex, race) versus nonusers are measures that would be useful in planning public or private health services programs. The NAMCS drug data base would be a valuable tool if it captured the number of drug orders for a known and representative population of prescribers and patients.

A second major information need has to do with not only how many, but what general types of drugs are used in office-based practice. Private insurance programs, public funding agencies, hospitals, Health Maintenance Organizations, and other organizations

need to assure that patients have adequate access to comprehensive pharmaceutical care. Only by knowing what drugs are prescribed for what purposes—in general therapeutic categories, not specific diseases—can this need be met. The NAMCS drug data base can assist by documenting the different types of drugs (e.g., antibiotics) as well as different products (e.g., AMPICILLIN) prescribed in office-based practice.

A third need is to assist in the clarification and evaluation of public policy issues in pharmaceutical care. Extensive discussion has occurred during the past decade about costs and merits of brand name prescription drugs versus a (usually) less costly generic drug. If the physician prescribes a drug by its “family” or generic (e.g., AMPICILLIN) name the pharmacist can select any manufacturer’s product approved by the Food and Drug Administration. If the physician provides a specific manufacturer’s product (e.g., AMCILL) the pharmacist may or may not be able to dispense a different manufacturer’s product, depending upon State law, regulation, and professional standards of practice. In order to measure the potential impact of drug substitution, it is necessary to characterize prescribing according to brand or generic designation.

Drugs are subdivided into two major classifications—prescription (legend) and nonprescription (over the counter, or OTC) drugs. Prescription drug use represents the judgment of physicians concerning a person’s medical care needs. Over-the-counter drug use represents a much greater reliance on self-care by the consumer. In many cases there are also significant cost differences between prescription and nonprescription drugs used for the same purpose, e.g., ASPIRIN or DARVON used for analgesic effect. Further, since some over-the-counter drugs are extremely important in medical care (e.g., ASPIRIN for fever and pain, INSULIN for diabetes, antacids for peptic ulcer) this information can be useful in planning health education programs. In order to understand and support the role of self-care in drug therapy, the NAMCS drug data base should distinguish between prescription and nonprescription drugs.

An extremely important issue in health and social policy is the use of medications having significant potential for addiction and/or habituation. Potential for diversion into illicit channels, need for adequate regulatory control, and risk of adverse treatment events all argue for complete documentation of narcotics and related substances. Public policy now places regulatory control of these substances in the Department of Justice, specifically the Drug Enforcement Agency (DEA). The DEA has placed drugs into five categories of control, depending upon therapeutic use and potential for addiction or habituation. Classifications and their criteria are:

Schedule I. The drug or other substance has a high potential for abuse, it has no currently ac-

cepted medical use in treatment in the United States, and there is a lack of accepted safety for use under medical supervision.

Schedule II. The drug or other substance has a high potential for abuse, it has a currently accepted medical use in the United States, and abuse may lead to severe psychological or physical dependence.

Schedule III. The drug or other substance has a potential for abuse less than drugs in Schedules I and II, it has a currently accepted medical use in the United States, and abuse may lead to moderate or low physical or high psychological dependence.

Schedule IV. The drug or other substance has a low potential for abuse relative to drugs or other substances in Schedule III, it has a currently accepted medical use in the United States, and abuse of the drug may lead to limited physical or psychological dependence relative to drugs in Schedule III.

Schedule V. The drug or other substance has a low potential for abuse relative to drugs or other substances in Schedule IV, it has a currently accepted medical use in the United States, and abuse of the drug may lead to limited physical or psychological dependence relative to drugs in Schedule IV.

Any attempt to describe prescribing patterns of office-based physicians must be able to classify drugs according to these properties.

Finally, an issue of longstanding debate in drug policy concerns the use of drugs in fixed combinations, as opposed to single ingredient entities. As an example, a common approach in treating hypertension is to prescribe a diuretic agent (e.g., HYDROCHLOROTHIAZIDE 50 mg tablets) and an antihypertensive agent (e.g., RESERPINE 0.125 mg tablets). The physician can do this by ordering two separate prescriptions, or by ordering a fixed combination of the two products (e.g., HYDROPRES-50). The latter approach is usually more costly and offers less flexibility in dosage adjustment, however, it offers greater potential convenience to the patient. The extent to which fixed combination products are used is an important consideration in planning drug benefits in prepaid health plans. Also, this information is useful in the development of reimbursement policies for publicly sponsored programs. Data collection efforts should therefore be able to infer single or combination ingredient status, and the specific ingredient(s) (e.g., HYDROCHLOROTHIAZIDE and RESERPINE) from core identifiers (e.g., HYDROPRES-50) used by physicians to order drugs.

To summarize, the preceding discussion has indicated that the “core identifiers” employed by physi-

cians in ordering drugs must be used to provide additional data. Essential units of information to be obtained from the core identifier include frequency of separate medication entry, therapeutic category, generic or brand name, prescription or nonprescription

status, Federal control schedule, and single or combination drug entities. The following example may be helpful in interpreting a typical medication entry (see figure 4, item 11):

<p>11 Medication Therapy This Visit</p> <p>[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents.]</p> <p>a. For Principal Diagnosis in Item 9a</p> <p>1. <u>EMPIRIN #3</u></p> <p>2. <u>AMPICILLIN</u></p> <p>3. _____</p> <p>4. _____</p>	<p>None <input type="checkbox"/></p> <p>b. For All Other Reasons</p> <p>1. _____</p> <p>2. _____</p> <p>3. _____</p> <p>4. _____</p>
---	--

This core identifier can be extrapolated to yield the following information:

Number of Separate Medication Entries <u>2</u>	
Detailed Information for Entry 1. (EMPIRIN #3)	
Therapeutic category	<u>Analgesic</u>
Generic or brand Name	<u>Brand name</u>
Prescription or nonprescription status	<u>Prescription</u>
Federal control status	<u>III</u>
Single or combination ingredient	<u>Combination</u>
Specific ingredient(s)	<u>CODEINE PHOSPHATE</u> <u>ASPIRIN</u>
Detailed Information for Entry 2. (AMPICILLIN)	
Therapeutic category	<u>Antibiotic</u>
Generic or brand Name	<u>Generic</u>
Prescription or nonprescription status	<u>Prescription</u>
Federal control status	<u>None</u>
Single or combination ingredient	<u>Single</u>
Specific ingredient(s)	<u>AMPICILLIN</u>

This example shows how two core identifiers (AMPICILLIN and EMPIRIN #3) can be expanded to provide detailed information on drugs used in office-

based physicians' practices. What is needed next is a complete coding system that records and classifies core identifiers into the desired units of information.

Classifying and coding device

The task that now confronted NAMCS planners was that of finding or—in whole or in part—creating a system by which the drugs and their dimensions could be most readily, efficiently, and economically identified, coded, and copied into the machine readable format already in use for the other variables of the NAMCS reporting system.

The problems of creating—manually and from zero base—such a multidimensional coding device were too formidable to consider seriously. No single source book contains all the drug dimensions, let alone appropriate codes for each. At a minimum, two books are needed, for example, the current editions of the American Drug Index^a and the Drug Topics Red Book.^b The information in these sources would—with most dimensions—require the creation of unique coding schemes. Furthermore, coding from multiple sources by manual search and selection requires advanced pharmaceutical expertise, costs dearly in time and effort, and is dogged by the possibility of human error. Consider the sheer volume of drug information to be found and coded for NAMCS 1980. NAMCS planners estimated that sampled physicians would make roughly 54,000 drug entries (the actual figure for 1980 was 51,372). If, along with identifying and coding each specific entry, NAMCS coders were required to code six additional drug dimensions by manual search and find, between 350,000 and 400,000 coding decisions might be involved—a staggering prospect.

Clearly, the best solution to these complex problems lay in finding a computerized source, one that would provide—in machine readable and printable form—an exhaustive inventory of the drugs anticipated to be prescribed in office-based ambulatory care, along with precoded classification formats for

each of the drug dimensions that NAMCS wished to explore.

With these demands in mind, NAMCS planners considered and selected the Drug Product Information File (DPIF), a computer-processable data base of information on more than 30,000 commercially available drug products. Developed and maintained under the auspices of the American Society of Hospital Pharmacists, the DPIF is continually updated to add new products when they are marketed and to withdraw products when they are no longer available. Drug products are described in a fixed-field format in which 68 fields are used to record a broad range of drug information, including information on all the drug dimensions desired for NAMCS needs. The fields applicable to NAMCS usage are shown in table A and they are underlined. (Note: All DPIF materials are reproduced with the permission of the American Society of Hospital Pharmacists.)

NAMCS planners now proceeded to construct their own computerized drug file by adopting or adapting relevant fields from the DPIF. The result was the NAMCS Drug File; its format appears as table B. Its data fields are described as follows.

Field #01—National Drug Code.—The National Drug Code (NDC) is a 10-character identification code for a drug product and package. It is maintained by the U.S. Food and Drug Administration. One of two linkage codes in the NAMCS Drug File, it is borrowed without modification from the DPIF to permit possible linkages with drug classification systems other than the DPIF.

Field #02—Brand Name.—The Brand Name (BRAND NAME) is the name under which the drug product is marketed and may or may not be a trademark. Note that this field also contains generic names if the products are marketed using generic names. The spelling of the brand name is complete in most instances. If the name exceeds 40 characters, abbreviations may be used.

The DPIF for June 1980 (the time of its acquisi-

*AN = Alphanumeric, N = Numeric.

tion by NAMCS) contained nearly 35,000 records in the brand name field. To adapt the field for NAMCS needs, several operations were undertaken. First, a computer run was made that unduplicated the DPIF records by selecting a single record for those drug products with the same name but with multiple labelers. This run reduced the number of brand name records to about 9,700. Second, this time by manual inspection and deletion, certain differentiating information on dosage strength was eliminated as irrelevant to NAMCS needs. Thus for the following three DPIF records:

APAP W/CODEINE
 APAP W/CODEINE 15 MG
 APAP W/CODEINE 30 MG

only the record APAP W/CODEINE was retained, an operation that further reduced the NAMCS brand name field to about 6,800 records. Finally, the remaining brand names were modified in most instances to agree with the nomenclature found in the "Index" of the looseleaf, two-volume publication of the American Hospital Formulary Service.^c The brand names, as modified, then were used to form the core of the 1980 NAMCS Medication Code List (see the discussion of field #06).

Field #3—Brand Drug Product Package Code.—In the DPIF, the Brand Drug Product Package Code (BDPP#) identifies a labeler's package of a brand of a particular drug product. Each record in the DPIF has a unique BDPP#. One of two linkage codes in the NAMCS Drug File, the BDPP# is retained without modification to permit linkages back to the applicable records in the original DPIF.

^cAmerican Hospital Formulary Service; American Society of Hospital Pharmacists, Inc., January 1980.

Field #4—Generic Name.—The generic name (GENERIC NAME) is the (public, scientific, nonproprietary, established) name as assigned by the United States Pharmacopeia or other responsible authorities. The spelling of the generic name is complete in most instances. If the name exceeds 40 characters, abbreviations are used. In the NAMCS Drug File, the records in the DPIF generic name field have been modified to agree in nomenclature with the generic forms used in the current volumes of the American Hospital Formulary Service.^c Thus the DPIF "BROMPHENIRAMINE MALEATE" becomes the NAMCS "BROMPHENIRAMINE."

A further modification—and resultant overall reduction—was then undertaken, which aimed at selectively replacing certain product-specific generics in the DPIF by the more functional, utilization-oriented configurations needed by NAMCS. For example, the following DPIF generics

IODINE (ETHIODIZED OIL)
 IODIDES TINCTURE
 IODINE TINCTURE
 IODINE (POLAXAMER-IODINE)
 IODINE (IODOPHOR)
 SODIUM IODIDE
 IODINE (PROVIDONE-IODINE)

were grouped for NAMCS Needs into a single generic category "IODINE TOPICAL PREPARATIONS."

The final result of these adaptations was the NAMCS Inventory of Generic Names, which appears in appendix II. Selected names from this inventory were added to the 1980 Medication Code List to insure a more complete representation of generic-entry choices. (See the discussion of field #06.)

Note: Drugs containing more than one active ingredient generally have "COMBINATION PRODUCT" as the GENERIC NAME. Some common

combination drugs have been assigned a generic name; e.g., APC/PROPOXYPHENE.

Field #05—Generic Name Code.—A Generic Name Code (GN#), created for and unique to the NAMCS Drug File, is assigned to each generic name in field #04. The following codes are used:

GN#
50005 — 56300 generic names in field #04
50000 generic name undetermined

See also appendix II and the discussion of ingredient codes to follow.

Field #06—Medication Code List Name.—The Medication Code List Name (MCL NAME) is the name of a drug as it appears on the NAMCS Medication Code List, an alphabetized inventory of single-source and multiple-source drugs for use in coding the entries on the NAMCS Patient Records (see appendix III). The core constituents of the list are the brand names in field #02. Selected generic names from field #04 have been added to insure a more complete representation of generic-entry choices. The spelling of the MCL name is complete in most instances. If the name exceeds a fixed field of 40 characters, abbreviations are used.

Field #07—Medication Code List Code.—A Medication Code List Code (MCL#), unique to the NAMCS Drug File, is assigned to each MCL name in field #06. The serial order of the MCL codes parallels the alphabetic order of the MCL names (see appendix V).

Field #08—Entry Status Code.—The Entry Status Code (E#) is unique to NAMCS, denoting the nature of the entry that the physician makes on the Patient Record. Every item on the Medication Code List is assigned an entry status. The following codes are used:

E#	<i>Entry Status</i>
1	Generic name—(About 17 percent of the coding choices on the 1980 MCL are generic (multiple-source) entries.)
2	Brand (nongeneric) name—The use of “brand” to define an entry status is restricted to nongeneric (single-source) entries. (About 82 percent of the coding choices are brand-name entries.)
3	Therapeutic effect—This code is used for the 95 coding choices where the physician did not specify a brand or generic medication, stating only the therapeutic effect desired; e.g., laxative, analgesic, etc.
4	Other—This code applies to entries which, though identifiable as brand or

generic names or as therapeutic effects, are not in the MCL.

5 Illegible

Field #09—Prescription Status Code.—The Prescription Status Code (P#) is derived from the DPIF Legal Status Code (L#), which is used to indicate the Federal legal classification of drug products. The following codes are used by NAMCS:

P#	<i>Prescription Status</i>
1	Prescription (Rx) drug—(About 60 percent of the coding choices on the 1980 MCL are prescription drugs.)
2	Nonprescription (OTC) drug—(These drugs represent about 36 percent of the coding choices.)
3	Undetermined

Field #10—Federal Controlled Substance Status Code.—The Federal Controlled Substance Status Code or Drug Enforcement Administration Code (DEA#) is derived from the DPIF Legal Status Code. It denotes the degree of potential abuse and Federal control of a drug. The following codes are used by NAMCS:

DEA#	<i>Federal Control Schedules</i>
1	Schedule I (LSD, HEROIN, MARIJUANA—research only)
2	Schedule II (MORPHINE, DEMEROL, AMPHETAMINES—most abused)
3	Schedule III (APC/CODEINE, etc.—less abused)
4	Schedule IV (VALIUM, etc.—potential abuse)
5	Schedule V (Controlled sale by pharmacy only—Rx required—or State restricted)
6	No control
7	Undetermined

Controlled drugs comprise about 8 percent of the coding choices on the 1980 MCL.

Field #11—Composition Status Code.—The Composition Status Code (C#) is derived from the DPIF Record Type Code (T#). It is used to distinguish between single- and multiple-entity drugs. The following codes are used by NAMCS:

C#	<i>Composition Status</i>
1	Single-entity drug—The drug contains only one active ingredient. (About 51 percent of the coding choices on the 1980 MCL are single-entity drugs.)
2	Combination drug—The drug contains

more than one active ingredient. (About 48 percent of the MCL coding choices are combination drugs.)

- 3 Undetermined
- 5 Multivitamin—A combination drug given separate identity for purposes of analysis; there are 453 multivitamin coding choices in the MCL.

Field #12—Therapeutic Category Code.—The Therapeutic Category Code (AHFS#) is borrowed without modification from the DPIF. It identifies the pharmacologic-therapeutic category of a drug, according to the classification system of the American Hospital Formulary Service (AHFS). The AHFS classification is reproduced as appendix IV.

Note: An *AHFS* classification number is conventionally printed with a colon between the second and third digits and a period between the fourth and fifth digits (e.g., 20:12.12). The fifth and sixth digits are omitted if they are zeros. On the NAMCS Drug File, the colon and period are not included and all digits are carried (e.g., 8:04 becomes 080400).

The following codes appear on the NAMCS Drug File:

<i>AHFS#</i>	
040000 - 960000	Therapeutic category
970000	Undetermined

For many drugs, especially for combination drugs, more than one therapeutic category is possible. On the NAMCS Drug File, only one AHFS# appears for each drug entry. The selection of this single AHFS# was a judgment of the DPIF staff.

Field #13-17—Ingredients of Combination Drugs.—For combination drugs, the NAMCS Drug File uses ingredient codes adapted from the DPIF to identify the active, generic ingredients of the drugs. The Ingredient Code (I#) is the five-character Generic Name Code (GN#) described for field #05. Fields are available for a maximum of five ingredients; this represents a truncation of the DPIF, in which 12 ingredient code fields are allowed. An estimated 84 percent of all active ingredients are identified in the five fields retained by NAMCS. The following codes are used:

<i>I#</i>	<i>Ingredients</i>
50005 - 56300	Generic names in field #04, NAMCS Drug File
50000	Generic ingredient undetermined

Note: The NAMCS Drug File does not retain the DPIF ingredient codes for generic components that cannot also function as a single-entity drugs. Thus if a generic substance is identified by the DPIF as having "ingredient-status" only, e.g., ALPHA AMYLASE, it is coded by NAMCS as I# "Undetermined."

Coding process

The coding of the NAMCS drug information began in August 1980, 7 months into the 1980 survey year. The coding volume was roughly predictable. NAMCS findings in past years suggested that the sample of office visits—expressed in completed Patient Records—would probably approximate a raw number of 50,000, and that about 60 percent of these visits (30,000) would result in some form of drug therapy. For every visit that entailed drug therapy, pretest findings indicated that about 1.8 drugs would be ordered or provided. This led to a rough prediction of 54,000 drug entries (or “mentions”) to be coded. (The final raw total was 51,372.) The coding task was performed by the National Opinion Research Center (NORC), contractor for all collection and coding operations of NAMCS. The contractor agreed to provide double, independent coding of 100 percent of the first half (27,000) of the raw drug entries; 50 percent of the next 14,000 entries; and 25 percent of the remainder. The balance was to be single-coded by those coders who had proved to be the most proficient in the coding of the drug entries. Coders were supplied with the NAMCS *Medication Code List* (MCL), reproduced as appendix III, along with the *Coding Procedures for Medication Entries*, reproduced as appendix V. In the early weeks of coding, the coauthors gave onsite instruction to the NORC coding staff in the use of these instruments.

At the NORC level, the job of the coder was to apply one of three coding choices to every drug entry on the Patient Record; namely:

1. The entry was legible and on the MCL, in which case it was given the appropriate code.
2. The entry was illegible to the coder and assigned the code #99999.
3. The entry was classifiable as “other”; that is, it was legible to the coder but not found on the MCL, in which case it was assigned the code #99980.

All disagreements between independent coders, as well as all illegibles and all “others” were for-

warded to the NAMCS staff for adjudication.^d See appendix V for a detailed description of the coding and adjudicating functions.

As the coding progressed through 1980 and early 1981, there was a perceptible decline in the overall proportion of adjudicable entries; i.e., disagreements, illegibles, and “others,” from about 8 percent for the first 5,000 entries to about 3.5 percent for the final 5,000. Interestingly, illegibles remained constant at between 1.5 and 2 percent throughout the entire coding operation; it was the diminishing need to resort to the “other” category that contributed most to the overall decline in adjudicables.

In great part, this diminishing recourse to the coding choice “other” was due to an ongoing examination of the “other” entries, leading to continuing additions to the MCL in order to create a more realistic representation of coding choices.

Examples:

NAMCS planners had not anticipated that some physicians would write in only the therapeutic effect (e.g., allergy relief, laxative, analgesic, etc.) instead of the specific drug name. Yet it became evident in the early weeks of coding that this was indeed happening to a minor but disturbing degree (with about 3 percent of entries). Thus a representative battery of therapeutic-effect choices was devised and added to the MCL, care being taken to make the choices compatible with the therapeutic categories in appendix IV.

Every time a hitherto unanticipated generic appeared on the Patient Records, it was added to the MCL in order to insure a better representation of generic choices.

Chief among the “other” entries were the new brand drugs that appeared on the market subsequent to June 1980. Though these new products were known to NAMCS by monthly updates of the Drug Product Information File, they num-

^dThe adjudicating function was performed for NAMCS by Dr. William H. Campbell.

bered in the hundreds and no attempt was made to add all of them in periodic, massive updates of the MCL. After all, NAMCS is primarily utilization oriented and does not require the strict topicality needed in studies of market trends. Thus only those new drugs were added that began to appear with substantial frequency on the Patient Records (examples: ZOMAX, TRANXENE, MECLOMEN).

Whenever a new MCL choice was added, a back search and correction was made of all previously coded Patient Records.

Thus, as has been seen, the need for adjudication was steadily decreased by increasing the range and representation of the MCL. The formal process of adjudication further acted to clarify doubtful areas by reconciling all disagreements between coders, and by reducing the proportion of "others" to 1.1 percent and illegibles to 0.2 percent.

NOTE: Not least among the problems that the adjudicator helped to solve were those that involved variant spellings and nonstandard abbreviations of items that were already on the MCL, problems some-

times complicated by problems of illegibility. The variant spellings probably occurred chiefly at those visits where the physician dictated the drug entries to an assistant, apparently not an uncommon arrangement. For this kind of problem the list of "Look-Alikes or Sound-Alikes," reproduced in appendix V, was especially helpful to coders. The write-in of nonstandard abbreviations created special problems of interpretation. PENICILLIN, for example, appeared in the following variations:

P or p
P-cillin
P cill
PcIn
Pen

Interestingly, the use of many nonstandard abbreviations probably owed its origin to a kind of shorthand communication—an informal system of shared understandings—that had developed over a long period between prescribing physician and dispensing pharmacist. The adjudicator—who was experienced, as a practicing pharmacist—was well fitted to solve this problem.

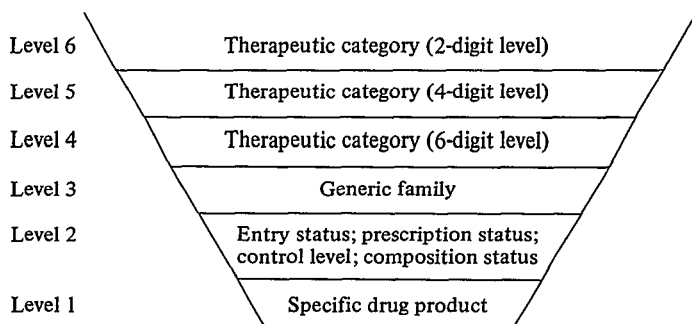

Evaluation and plan for analysis

The final Medication Code List for 1980 contained 7,227 coding choices, of which 2,532 were actually used by the coders. These 2,532 drugs are underlined in the List that appears as appendix V. Table C shows the extent to which key drug dimensions were provided for among the 7,227 coding choices and the extent they were actually used in the coding operation.

In the 1980 NAMCS, it was believed that the addition of a drug item on the questionnaire might negatively affect the physician response rate. However, this proved not to be so because the response rate of about 77 percent was higher than in 1978 and 1979 (72.8 and 71.8 percent, respectively). None of the 530-odd refusals to participate in the 1980 NAMCS could be attributed to the presence of the drug item.

On the contrary, the presence of the drug item seemed to improve the completeness and relevance of the response to other items on the Patient Record; e.g., diagnostic procedures, nonmedication therapy, and both principal and other-listed diagnoses.

In analyzing the drug findings of the 1980 NAMCS, the NAMCS staff will use the degree of specificity that best describes the subject, being always alert to the effect on precision produced by the size of an estimate. To be most flexible, the analyst should be able to operate at successive levels of specificity, each level should be made up of homogeneous groupings that would allow for the cumulation of data from lower levels, and result in estimates of ever-increasing size. The NAMCS drug data provide for this kind of flexibility by permitting grouping and analysis at any of six levels. The inverted ladders, shown below, graphically illustrate these six levels of specificity.

Example: the drug PENBRITIN

In figure 5 the perspective of analysis is broadened beyond the drug dimensions to include the other dimensions of office-based care surveyed by NAMCS. The rich mosaic of potential contrasts is obvious.

These contrasts will be explored and made available to the public in three forms:

1. Response to specific data requests should be possible by early 1982.
2. A series of formal publications should begin to appear in early 1982.
3. A tape of 1980 NAMCS findings should become available in mid-1982.

Appendix I. Response to precoded questions on evaluation interview

Q. 1: Doctor, as you know, we are especially interested on this pretest in your reactions to the medication items—that is, (Item 15-16 on A form, Item 12 on B form).

Was this information very easy for you to fill out, was it occasionally difficult, or did you have real problems in recording the medication therapy you ordered or provided?

	NUMBER OF CASES IN:		
	"A" Sample (Precoded)	"B" Sample (Open-ended)	TOTAL
Very easy	10	15	25
Occasionally difficult	7	2	9
Real problems	—	1	1
TOTALS	17	18	35

Q. 2: Do you think you included all prescription drugs that you ordered or provided for these patients, or might you have missed some?

	NUMBER OF CASES IN:		
	"A" Sample (Precoded)	"B" Sample (Open-ended)	TOTAL
Included all	14	13	27
Might have missed some	3	5	8
TOTALS	17	18	35

Q. 3: How about nonprescription drugs—Are you pretty sure you recorded all of these, or might you not have reported all of them?

	NUMBER OF CASES IN:		
	"A" Sample (Precoded)	"B" Sample (Open-ended)	TOTAL
Reported all	9	10	19
Might not have	6	8	14
Not applicable (Volunteered if no such drugs ordered or provided)	2	—	2
TOTALS	17	18	35

Q. 4: The form asked you to report both "new and continuing" medication. Do you think you always included old medication that you wanted the patient to continue, even though it might not have been related to this visit?

	NUMBER OF CASES IN:		
	"A" Sample (Precoded)	"B" Sample (Open-ended)	TOTAL
Yes	13	15	28
No	2	2	4
Don't know	2	1	3
TOTALS	17	18	35

Q. 5: How confident are you that you included all immunizing or desensitizing agents among the medications that you ordered or provided—Are you fairly sure you always reported, or do you think you might sometimes overlook these?

	NUMBER OF CASES IN:		
	"A" Sample (Precoded)	"B" Sample (Open-ended)	TOTAL
Always reported	15	13	28
Sometimes overlooked	—	2	2
Not applicable (Volunteered if no immunizations ordered or provided)	2	3	5
TOTALS	17	18	35

Q. 7: Would you rather use the write-in version of the medication items, or would you rather use the check-off version?

	NUMBER OF CASES IN:		
	“A” Sample (Precoded)	“B” Sample (Open-ended)	TOTAL
Prefer write-in	4	11	15
Prefer checklist	9	6	15
No preference	4	1	5
TOTALS	17	18	35

Appendix IV. Coding procedures for medication entries, NAMCS 1980

CODING PROCEDURES FOR MEDICATION ENTRIES NAMCS 1980

SOURCE MATERIALS

- Medication Code List 1980 (MCL)
- Attachment 1: “Common Abbreviations Used in Medical Orders”
- Attachment 2: “Caution! 1,000 Drugs Whose Names Look-Alike or Sound-Alike”
- Attachment 3: Drug Form I (Coder A)
- Attachment 4: Drug Form I (Coder B)
- Attachment 5: Drug Form II (Adjudicator)

GENERAL

These instructions apply to the coding of the information contained on the 1980 Patient Record in Item 11: **MEDICATION THERAPY THIS VISIT**. On the lines provided in Item 11, the physician records all medications ordered or provided at the visit. These include new or continued medications which may be prescription or non-prescription (over-the-counter) drugs. Immunizing and desensitizing agents are also included.

For making the entry of a medication, the physician uses one of two names:

EITHER

1. the *generic* name. This is the “official” or “nonproprietary” name. Usually, it is the contraction of a complex, chemical name.

OR

2. the *brand* or *trade* name. This is the commercial or “proprietary” name, the name that is used to advertise a drug to the medical profession. For example, *tetracycline* is the generic name of a widely used antibiotic. A physician may write a prescription for this drug by its generic name, or may prescribe it under the brands names *Achromycin* (made by Lederle), *Sumycin* (made by Squibb), or *Tetracyn* (made by Pfizer).

Item 11 has two parts. Item 11a provides space for listing medications ordered or provided for the principal diagnosis shown in Item 9a. Item 11b provides space for listing medications ordered or provided for all other reasons.

The basic coding document is the Medication Code List 1980 (MCL). It contains 7,081 brand and generic names of medications, alphabetized and coded serially from 00005 to 35405. In addition, there is a code (99999) for

illegible entries and an 'other' code (99980) for entries that are legible but cannot be found on the Medication Code List 1980. *One of three coding choices will be applied to every medication entry: a code from the name list, the illegible code, or the 'other' code.* The name that appears on the Medication Code List 1980 is the *core identifier* of a medication. That is, it usually contains just enough information to set it clearly apart from all other medications. In most cases the core identifier will *not* contain specific information about

- the 'labeler' (manufacturer of a drug)
- the dosage form (tablet, capsule, inhalant, ointment, injection, suppository, etc.)
- the route of administration, that is, the path by which a drug product enters or is applied to the body (intramuscular or I.M., implant, inhalation, intravenous or I.V., nasal, ophthalmic, oral, otic, rectal, topical, etc.)
- the strength of a drug product (milligram or mg, milliliter or ml, percent or %, etc.)
- instructions for use. For example, "Take as needed (p.r.n)." or "Take twice a day (b.i.d)."
- other qualities of the drug such as color or flavor

Though the above descriptors are not usually included as part of the core identifier of a medication in the MCL, they may appear in many of the medication entries that the physician makes on the Patient Records. Mostly, they appear because many physicians will write the same entries on the Patient Records that they wrote on the patient's prescription. Therefore, the coders will have to take them into consideration in their search for a core identifier to be matched against the Medication Code List 1980.

For the specimen entries below, the core identifiers have been circled, matched against the Medication Code List 1980, and the proper code identified.

<u>Specimen entry</u>	<u>Code</u>
Phillip's Milk of Magnesia chocolate	19375
Hiwolfia blue	14620
Prednisone 5 mg tid x 5d ¹	24890
Bicillin i.m. ²	04235

¹Dosage strength 5 milligrams. Take 3 times per day for 5 days.

²Injected intramuscularly.

As an aid in isolating the core identifiers, the coder will find it useful to refer to Attachment 1: "Common Abbreviations Used in Medical Orders."

Once the core identifier has been stripped of all (or as much as possible) of the extraneous material that surrounds it, it will be matched alphabetically against the Medication Code List 1980. A perfect fit will not be possible in every case but the coder will always attempt to

MAKE THE CLOSEST MATCH POSSIBLE

The specimen entries above appear in typed form and have been edited for correct spelling, facilitating the isolation of their core identifiers. This will not be the case in the actual coding operation, where the entries are more likely to look like the following real facsimiles of 1980 Patient Records.

Example A

11. MEDICATION THERAPY THIS VISIT NONE
[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]

a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.

1. Shepharbital

2. Dilantin

3. _____

4. _____

b. FOR ALL OTHER REASONS.

1. Accelax

2. _____

3. _____

4. _____

Example B

11. MEDICATION THERAPY THIS VISIT NONE
[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]

a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.

1. Amupillin 2. Aspirin

2. _____

3. _____

4. _____

b. FOR ALL OTHER REASONS.

1. _____

2. _____

3. _____

4. _____

Example C

11. MEDICATION THERAPY THIS VISIT NONE
[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]

a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.

1. aldoril 2 tid

2. Perantime 6 tid

3. Antonid tid

4. _____

b. FOR ALL OTHER REASONS.

1. _____

2. _____

3. _____

4. _____

a. none

Example D

11. MEDICATION THERAPY THIS VISIT NONE
[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]

a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.

1. Jan-Dialmes 250 BiD

2. _____

3. _____

4. _____

b. FOR ALL OTHER REASONS.

1. Lanix 20- BiD

2. Inuato Dos Spritz

3. _____

4. _____

Example E

11. MEDICATION THERAPY THIS VISIT <input type="checkbox"/> NONE <i>[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]</i>	
a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.	b. FOR ALL OTHER REASONS.
1. <u>Garamycin</u>	1. _____
2. <u>Cycloxy 1/2</u>	2. _____
3. <u>10% Neosynphrine</u>	3. _____
4. <u>5% NaCl ointment</u>	4. _____
<div style="display: flex; justify-content: space-between;"> APY 13. WAS PATIENT 14. DISPOSITION THIS VISIT 15. DURATION </div>	

Example F

11. MEDICATION THERAPY THIS VISIT <input type="checkbox"/> NONE <i>[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]</i>	
a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.	b. FOR ALL OTHER REASONS.
1. <u>Plures</u>	1. _____
2. <u>Cycloxy 1/2</u>	2. _____
3. <u>Neosynphrine 10%</u>	3. _____
4. _____	4. _____

Example G

11. MEDICATION THERAPY THIS VISIT <input type="checkbox"/> NONE <i>[Using brand or generic names, record all new and continued medications ordered, injected, administered, or otherwise provided at this visit. Include immunizing and desensitizing agents]</i>	
a. FOR PRINCIPAL DIAGNOSES IN ITEM 9a.	b. FOR ALL OTHER REASONS.
1. <u>Intra-articular</u>	1. _____
2. <u>1. Aristoart</u>	2. _____
3. <u>2. Hexalol</u>	3. _____
4. _____	4. _____

Here are the correct core identifiers for these examples:

Patient Record	Entry Number	Item 11a	Item 11b
Example A	1	Phenobarbital	Acelax
	2	Dilantin	
Example B	1	Ampicillin	
	2	Aspirin	
Example C	1		Aldoril
	2		Persantine
	3		Atromid
Example D	1	Diabinese	Lasix
	2		Tenuate
Example E	1	Garamycin	
	2	Cyclogyl	
	3	Neosynephrin	
	4	Sodium Chloride	
	5	Alcaine	
Example F	1	Fluress	
	2	Cyclogyl	
	3	Neosynephrin	
Example G	1	Aristocort	
	2	Hexadrol	

It is readily apparent that legibility is going to be a major problem. At least two things will help the coder overcome this problem.

1. Experience: Names and spellings of medications that appear impossible or difficult at the beginning of the coding operation will become more and more familiar as the coder proceeds through an increasing number of Patient Records.

2. Familiarity with the writing peculiarities of a given physician. Patient Records completed by the same physician will be batched together and, in this fashion, presented by the coding supervisor to the coder. Thus, an early entry which cannot be deciphered may later in the batch become legible after the coder has gained a grasp of the physician's writing style.

Another problem (complicated by legibility) lies in the fact that some drugs look or sound like others. To help solve this problem, the coder should consult Attachment 2: "Caution: 1,000 Drugs Whose Names Look-Alike or Sound-Alike."

Entries will be numbered and coded sequentially from top to bottom. If there is more than one entry on a line, each will be included in the sequence, numbering from left to right (See Example B).

No more than four entries will be coded in Item 11a and no more than four in Item 11b. Any additional entries, such as "Alcaine" in Example E, will not be coded.

It is the core identifier of a medication that is numbered, not any extraneous, descriptive material. Thus Aristocort is entry number 1 in Example G, even though it appears in the third space.

THE CODING PROCESS

The specific instructions on coding and reporting that follow are *provisional* instructions, that is, they are subject to alteration as our experience in the coding and reporting process develops over time. NORC staff are invited to suggest any changes that will improve the efficiency and/or economy of the operation.

Rule: There will be 100 percent, independent coding of every medication entry.

Functions	Personnel
Control and flow function.	Coding supervisor Clerical aide
Coding function	Coder A Coder B
Adjudicating function	Adjudicator*

*Specially qualified by education and experience in drug nomenclature and use. Should preferably have on-the-job familiarity with the prescribing practices of physicians.
The responsibility for all three of these functions will rest with NORC.

Steps

1. The coding supervisor will assign Patient Records to the coders, batched so that all the Records from the same physician are kept together.

2. Coders A and B will *independently* code the medication entries, each listing the selected codes on the appropriate DRUG FORM I (see Attachments 3 and 4). The coders will *not* request any assistance from the Adjudicator at the time of coding and will not consult each other regarding specific coding.

3. The coders will deliver completed DRUG FORM I to the clerical aide. For every entry where the code assigned by Coder A agrees with the code assigned by Coder B, the clerical aide will write that code directly on the Patient Record. When the coders disagree on a code and/or for every entry coded illegible or 'other', the clerical aide will put a check mark (✓) opposite these codes on the copies of DRUG FORM I, and deliver the forms to the Adjudicator along with the appropriate Patient Records. Reference to Attachments 3 and 4 will demonstrate the processes described in steps 2 and 3.

4. The Adjudicator rules on any disagreement between Coder A and Coder B, either: (1) choosing A's code or B's code or (2) choosing some other selection from the Medication Code List 1980. Also *every* illegible or 'other' entry will be carefully checked in the adjudication process, even if both coders agree that it is illegible or 'other'. For entries which require adjudication, including all illegibles or 'others', the Adjudicator will use DRUG FORM II to record the codes assigned by Coders A and B and to enter his (her) own coding choice. The process is illustrated in Attachment 5. Finally, the adjudicated coding choice will then be entered directly on the Patient Record (by either the Adjudicator or the clerical aide).

5. A weekly written report will be made to:

Hugo Koch
Ambulatory Care Statistics Branch, NCHS
Rm. 2-28, Federal Center Building
3700 East West Highway
Hyattsville, Maryland 20782

The report will contain the following:

- a. Number of Patient Records processed.
- b. Number of Patient Records with at least one medication entry.
- c. Total number of medication entries.
- d. Number of medication entries in which a difference existed between Coder A and Coder B. Enclose copies of appropriate DRUG FORM II's and Patient Records.
- e. List of all medication entries coded 'other'.

Additional duties of the Adjudicator:

In addition to his (her) contribution to the direct, coding process already discussed, the Adjudicator will further:

1. Conduct a sample check of Patient Records where *no* difference existed between Coder A and Coder B, with the aim of discovering possible areas of consistent bias.
2. Develop list of medications that are most commonly misspelled and supply them to the coders to aid them in the on-going coding of the 1980 medication entries. When the coding of the 1980 medication entries has been completed, the Adjudicator will supply a list of the 100 most commonly misspelled medications to Hugo Koch (address above).
3. Develop lists of the medications most frequently associated with common principal diagnoses and supply them to the coders to aid them in coding entries for Item 11a.
4. Conduct periodic training sessions for the coders to correct specific patterns of error that the adjudicator observes developing, and to share his (her) specialized drug knowledge.
5. Continually evaluate the adequacy of the medication coding instruments and processes, and communicate suggestions for improvement in frequent, informal contact with:

Hugo Koch
Phone: (301) 436-7132

* * * * *

COMMON ABBREVIATIONS USED IN MEDICAL ORDERS

Word	Abbreviation	Meaning
ana	āā, aa	of each
ante cibum	a.c.	before meals or food
ad	ad	to, up to
aurio dextra	a.d.	right ear
ad libitum	ad lib.	at pleasure
aurio laeva	a.l.	left ear
ante meridiem	A.M.	morning
aqua	aq.	water
aqua destillata	aq. dest.	distilled water
aurio sinister	a.s.	left ear
aures utrae	a.u.	each ear
bis in die	b.i.d.	twice daily
bowel movement	b.m.	bowel movement
blood pressure	b.p.	blood pressure
cum	c̄	with
capsula	caps.	capsule
compositus	comp.	compound
dies	d.	day
dilue	dil.	dilute
dispensa	disp.	dispense
divide	div.	divide
dentur tales doses	d.t.d.	give of such a dose
elixir	el.	elixir
et	et	and
fac, fiat, fiant	f., ft.	make, let be made
gramma	Gm., g.	gram
granum	gr.	grain
gutta	gtt.	a drop
hora	h.	hour
hora somni	h.s., hor. som.	at bedtime
liquor	liq.	a liquor, solution
misce	M.	mix
more dictor	m. dict.	as directed
mixtura	mixt.	a mixture
numerus	no.	number
nocturnal	noc.	in the night
non repetatur	non. rep.	do not repeat, no refills
octarius	O, Oct.	a pint
oculus dexter	o.d.	right eye
oculus laevus	o.l.	left eye
oculus sinister	o.s.	left eye
oculo uterque	o.u.	each eye
post cibos	p.c., post. cib.	after meals
post meridiem	P.M.	afternoon or evening
per os	p.o.	by mouth
pro re nata	p.r.n.	as needed
pulvis	pulv.	a powder
quiaque hora	q.h.	every hour
quater in die	q.i.d.	four times a day
quantum sufficiat	q.s.	a sufficient quantity

*The listing of commonly used abbreviations is included as an aid in interpreting medical orders.

Word	Abbreviation	Meaning
quam volueris	q.v.	as much as you wish
recipe	Rx	take, a recipe
repetatur	rep.	let it be repeated
sine	̄s.	without
secundum artem	s.a.	according to art
saturatus	sat.	saturated
signa	Sig.	label, or let it be printed
solutio	sol.	solution
semis	̄ss., ss	one-half
si opus sit	s.o.s.	if there is need
statim	stat.	at once, immediately
suppositorium	supp.	suppository
syrupus	syr.	syrup
tabella	tab.	tablet
ter in die	t.i.d.	three times a day
tincture	tr., tinct.	tincture
tritura	trit.	triturate
unguentum	ung.	ointment
ut dictum	ut. dict.	as directed
while awake	w.a.	while awake

COMMON SYSTEMS OF WEIGHT AND MEASURE*

METRIC SYSTEM

Metric Weight

1 microgram	μg (mcg)	=	0.000,001	g
1 milligram	mg	=	0.001	g
1 centigram	cg	=	0.01	g
1 decigram	dg	=	0.1	g
1 gram	g	=	1.0	g
1 dekagram	Dg	=	10.0	g
1 hectogram	hg	=	100.0	g
1 kilogram	kg	=	1000.0	g

Metric Liquid Measure

1 microliter	μl	=	0.000,001	=	L
1 milliliter	ml	=	0.001	=	L
1 centiliter	cl	=	0.01	=	L
1 deciliter	dl	=	0.1	=	L
1 liter	L	=	1.0	=	L
1 dekaliter	Dl	=	10.0	=	L
1 hectoliter	hl	=	100.0	=	L
1 kiloliter	kl	=	1000.0	=	L

Note—The abbreviation μg or mcg is used for microgram in pharmacy rather than gamma (γ) as in biology.

APOTHECARY SYSTEM

Apothecary Weight

1 grain	gr	=	1 gr
1 scruple	\mathfrak{g}	=	20 gr
1 dram	\mathfrak{ss}	=	60 gr. = 3 \mathfrak{g}
1 ounce	\mathfrak{z}	=	480 gr = 8 \mathfrak{ss}
1 pound	\mathfrak{lb}	=	5760 gr = 12 \mathfrak{z}

Apothecary Liquid Measure

1 minim	\mathfrak{m}	=	1 \mathfrak{m}
1 fluidram	$\mathfrak{f}\mathfrak{ss}$	=	60 \mathfrak{m}
1 fluidounce	$\mathfrak{f}\mathfrak{z}$	=	480 \mathfrak{m} = 8 $\mathfrak{f}\mathfrak{ss}$
1 pint	pt	=	7680 \mathfrak{m} = 16 $\mathfrak{f}\mathfrak{z}$
1 gallon	gal	=	61440 \mathfrak{m} = 8 pt

AVOIRDUPOIS SYSTEM

Avoirdupois Weight

1 ounce	= 1 oz.	=	437.5 grains (gr.)
1 pound	= 1 lb.	=	16 ounces (oz.) = 7000 grains (gr.)

NOTE: The grain in each of the above systems has the same value, and thus serves as a basis for the interconversion of the other units.

*The listing of common systems of weight and measure is included to aid the practitioner in calculating dosages.

APPROXIMATE PRACTICAL EQUIVALENTS*

Weight Equivalents

1 gram	= 1 Gm or g	= 15.432 grains
1 kilogram	= 1 Kg	= 2.20 pounds avoirdupois(lb)
1 ounce avoirdupois	= 1 oz	= 28.35 grams
1 ounce apothecary	= 1 ℥	= 31.1 grams
1 pound avoirdupois	= 1 lb	= 454. grams
1 grain	= 1 gr	= 64.8 milligrams

Measure Equivalents

1 milliliter	= 1 ml	= 16.23 minims (℥)
1 fluidounce	= 1 f℥	= 29.57 ml
1 liter	= 1 L	= 33.8 fluidounces (f℥)
1 tablespoonful	= 1 tbs or tbsp	= 15. ml
1 wineglassful	= 2 f℥	= 60. ml
1 teacupful	= 4 f℥	= 120. ml
1 tumblerful	= 8 f℥	= 240. ml
1 pint	= 1 pt or O or Oct	= 473. ml
1 gallon	= 1 gal or C or Cong	= 3785. ml

*The listing of approximate practical equivalents is included to aid the practitioner in calculating and converting dosages among the various systems.

Updated

CAUTION!

1,000 Drugs Whose Names Look-Alike or Sound-Alike

Ben Teplitsky, Pharmacist
Pharmacy Editor, *Pharmacy Times*

► The accurate reading and interpretation of prescriptions is one of your key responsibilities as a pharmacist. That is why you must be so *very* careful (a) when you take a prescription over the phone or (b) when you attempt to decipher a doctor's scribbling. You take *special* care to avoid dispensing a drug product not intended by the prescriber.

Physicians' Scribbling

Dispensing errors can result from *sound-alike* or *look-alike* drugs. Similarities might be due to *pronunciation*—e.g., Donnatal and Donnagel. These drug names sound alike to the listener. Or, there may be similarities in the way the drug names look when quickly scribbled by a physician or quickly read by a pharmacist; for example, phenobarbital and pentobarbital, Decadron and Decaderm, and Brethine and Banthine.

In some cases, drugs might be *both* look-alikes and sound-alikes. Amoxil & Amcill and digitoxin & digoxin are examples of these similarities. Most drugs on the list were sent to us by pharmacists.

Fortunately, pharmacists contact the pre-

scriber—immediately—when doubts exist.

On the following two pages, PHARMACY TIMES publishes an *updated*, alphabetical list of 1,000 look-alike and/or sound-alike drugs. We suggest that you familiarize yourself with the entire list, because it is published in pairs of drugs. Thus, you may have a prescription for a drug which is the second half of a listing, and you might not see it right away.

For example, if a doctor phones in a prescription for ampicillin and you check to see if it is on the list, you will find nothing listed under the first column of the A's for ampicillin. However, if you are familiar with the list, you will recall that there is a listing under the C's for "Compicillin . . . Ampicillin."

Mail Other 'Alikes' to Pharmacy Times

After you have studied the list carefully, we suggest that you post it in the prescription department as a handy reference.

Pharmacists are urged to mail us the names of drugs they have encountered which are sound-alikes and/or look-alikes. An additional list of such problem drugs will be published in a future issue. Just mail your "alikes" to Ben Teplitsky, Pharmacy Editor of PHARMACY TIMES, 80 Shore Road, Port Washington, New York 11050. More ►

Appendix V. American Hospital Formulary Service classification system and therapeutic category codes

AMERICAN HOSPITAL FORMULARY SERVICE CLASSIFICATION SYSTEM AND THERAPEUTIC CATEGORY CODES (AHFS#)

(Classifications in parentheses are provisional but may be used in DPIF)

AMERICAN HOSPITAL FORMULARY SERVICE CLASSIFICATION SYSTEM	36:00 DIAGNOSTIC AGENTS	60:00 GOLD COMPOUNDS
	36:04 Adrenocortical Insufficiency	
	36:08 Amyloidosis	64:00 HEAVY METAL ANTAGONISTS
	36:12 Blood Volume	
	36:16 Brucellosis	68:00 HORMONES AND SYNTHETIC SUBSTITUTES
	36:18 Cardiac Function	68:04 Adrenals
	36:24 Circulation Time	68:08 Androgens
	36:25 (Cystic Fibrosis)	68:12 Contraceptives
	36:26 Diabetes Mellitus	68:16 Estrogens
04:00 ANTIHISTAMINE DRUGS	36:28 Diphtheria	68:18 Gonadotropins
	36:30 Drug Hypersensitivity	68:20 Insulins and Anti-Diabetic Agents
	36:32 Fungi	68:20.08 Insulins
08:00 ANTI-INFECTIVE AGENTS	36:34 Gallbladder Function	68:24 Parathyroid
08:04 Amebicides	36:36 Gastric Function	68:28 Pituitary
08:08 Anthelmintics	36:38 Intestinal Absorption	68:32 Progestogens
08:12 Antibiotics	36:40 Kidney Function	68:34 Other Corpus Luteum Hormones
08:12.02 Aminoglycosides	36:44 Liver Function	68:36 Thyroid and Antithyroid
08:12.04 Antifungal Antibiotics	36:48 Lymphogranuloma Venereum	
08:12.06 Cephalosporins	36:52 Mumps	72:00 LOCAL ANESTHETICS
08:12.08 Chloramphenicol	36:56 Myasthenia Gravis	
08:12.12 Erythromycins	36:60 Myxedema	76:00 OXYTOCICS
08:12.16 Penicillins	36:61 Pancreatic Function	
08:12.24 Tetracyclines	36:62 Phenylketonuria	78:00 RADIOACTIVE AGENTS
08:12.24 Other Antibiotics	36:64 Pheochromocytoma	
08:16 Antituberculosis Agents	36:66 Pituitary Function	80:00 SERUMS, TOXOIDS AND VACCINES
08:18 Antivirals	36:68 Roentgenography	80:04 Serums
08:20 Plasmocidides	36:72 Scarlet Fever	80:08 Toxoids
08:24 Sulfonamides	36:76 Sweating	80:12 Vaccines
08:26 Sulfones	36:78 (Thyroid Function)	
08:28 Treponemicides	36:80 Trichinosis	84:00 SKIN AND MUCOUS MEMBRANE PREPARATIONS
08:32 Trichomonacides	36:84 Tuberculosis	84:04 Anti-Infectives
08:36 Urinary Germicides	36:88 Urine Contents	84:04.04 Antibiotics
08:40 Other Anti-Infective		84:04.08 Fungicides
	40:00 ELECTROLYTIC, CALORIC, AND WATER BALANCE	84:04.12 Scabicides and Pediculicides
10:00 ANTINEOPLASTIC AGENTS		84:04.16 Misc. Local Anti-Infectives
12:00 AUTONOMIC DRUGS	40:04 Acidifying Agents	84:06 Anti-Inflammatory Agents
12:04 Parasympathomimetic Agents	40:08 Alkalinizing Agents	84:08 Antipruritics and Local Anesthetics
12:08 Parasympatholytic Agents	40:10 Ammonia Detoxicants	84:12 Astringents
12:12 Sympathomimetic Agents	40:12 Replacement Solutions	84:16 Cell Stimulants and Proliferants
12:16 Sympatholytic Agents	40:16 Sodium-Removing Resins	84:20 Detergents
12:20 Skeletal Muscle Relaxants	40:18 Potassium-Removing Resins	84:24 Emollients, Demulcents and Protectants
	40:20 Caloric Agents	84:24.04 Basic Lotions and Liniments
16:00 BLOOD DERIVATIVES	40:24 Salt and Sugar Substitutes	84:24.08 Basic Oils and Other Solvents
	40:28 Diuretics	84:24.12 Basic Ointments and Protectants
20:00 BLOOD FORMATION AND COAGULATION	40:36 Irrigating Solutions	84:24.16 Basic Powders and Demulcents
20:04 Antianemia Drugs	40:40 Uricosuric Agents	84:28 Keratolytic Agents
20:04.04 Iron Preparations		84:32 Keratoplastic Agents
20:04.08 Liver and Stomach Preparations	44:00 ENZYMES	84:36 Miscellaneous Agents
		84:50 Pigmenting & Depigmenting Agents
20:12 Coagulants and Anticoagulants	48:00 EXPECTORANTS AND COUGH PREPARATIONS	84:50.04 Depigmenting Agents
20:12.04 Anticoagulants		84:50.06 Pigmenting Agents
20:12.08 Antiheparin Agents	52:00 EYE, EAR, NOSE AND THROAT PREPARATIONS	84:80 Sunscreen Agents
20:12.12 Coagulants	52:04 Anti-Infectives	86:00 SPASMOLYTIC AGENTS
20:12.16 Hemostatics	52:04.04 Antibiotics	88:00 VITAMINS
20:40 Thrombolytic Agents	52:04.06 Antivirals	88:04 Vitamin A
	52:04.08 Sulfonamides	88:08 Vitamin B Complex
24:00 CARDIOVASCULAR DRUGS	52:04.12 Misc. Anti-Infectives	88:12 Vitamin C
24:04 Cardiac Drugs	52:08 Anti-Inflammatory Agents	88:16 Vitamin D
24:06 Antilipemic Agents	52:10 Carbonic Anhydrase Inhibitors	88:20 Vitamin E
24:08 Hypotensive Agents	52:12 Contact Lens Solutions	88:24 Vitamin K Activity
24:12 Vasodilating Agents	52:16 Local Anesthetics	88:28 Multivitamin Preparations
24:16 Sclerosing Agents	52:20 Miotics	
	52:24 Mydriatics	92:00 UNCLASSIFIED THERAPEUTIC AGENTS
28:00 CENTRAL NERVOUS SYSTEM DRUGS	52:28 Mouth Washes and Gargles	
28:04 General Anesthetics	52:32 Vasoconstrictors	94:00 (DEVICES)
28:08 Analgesics and Antipyretics	52:36 Unclassified Agents	
28:10 Narcotic Antagonists		96:00 (PHARMACEUTIC AIDS)
28:12 Anticonvulsants	56:00 GASTROINTESTINAL DRUGS	
28:16 Psychotherapeutic Agents	56:04 Antacids and Adsorbents	
28:16.04 Antidepressants	56:08 Anti-Diarrhea Agents	
28:16.08 Tranquilizers	56:10 Antiflatulents	
28:16.12 Other Psychotherapeutic Agents	56:12 Cathartics and Laxatives	
	56:16 Digestants	
28:20 Respiratory and Cerebral Stimulants	56:20 Emetics and Anti-Emetics	
28:24 Sedatives and Hypnotics	56:24 Lipotropic Agents	
	56:40 Misc. GI Drugs

Vital and Health Statistics series descriptions

- SERIES 1. Programs and Collection Procedures.**—Reports describing the general programs of the National Center for Health Statistics and its offices and divisions and the data collection methods used. They also include definitions and other material necessary for understanding the data.
- SERIES 2. Data Evaluation and Methods Research.**—Studies of new statistical methodology including experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory.
- SERIES 3. Analytical and Epidemiological Studies.**—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- SERIES 4. Documents and Committee Reports.**—Final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 10. Data from the National Health Interview Survey.**—Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, all based on data collected in the continuing national household interview survey.
- SERIES 11. Data From the National Health Examination Survey and the National Health and Nutrition Examination Survey.**—Data from direct examination, testing, and measurement of national samples of the civilian noninstitutionalized population provide the basis for (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- SERIES 12. Data From the Institutionalized Population Surveys.**—Discontinued in 1975. Reports from these surveys are included in Series 13.
- SERIES 13. Data on Health Resources Utilization.**—Statistics on the utilization of health manpower and facilities providing long-term care, ambulatory care, hospital care, and family planning services.
- SERIES 14. Data on Health Resources: Manpower and Facilities.**—Statistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health occupations, hospitals, nursing homes, and outpatient facilities.
- SERIES 15. Data From Special Surveys.**—Statistics on health and health-related topics collected in special surveys that are not a part of the continuing data systems of the National Center for Health Statistics.
- SERIES 20. Data on Mortality.**—Various statistics on mortality other than as included in regular annual or monthly reports. Special analyses by cause of death, age, and other demographic variables; geographic and time series analyses; and statistics on characteristics of deaths not available from the vital records based on sample surveys of those records.
- SERIES 21. Data on Natality, Marriage, and Divorce.**—Various statistics on natality, marriage, and divorce other than as included in regular annual or monthly reports. Special analyses by demographic variables; geographic and time series analyses; studies of fertility; and statistics on characteristics of births not available from the vital records based on sample surveys of those records.
- SERIES 22. Data From the National Mortality and Natality Surveys.**—Discontinued in 1975. Reports from these sample surveys based on vital records are included in Series 20 and 21, respectively.
- SERIES 23. Data From the National Survey of Family Growth.**—Statistics on fertility, family formation and dissolution, family planning, and related maternal and infant health topics derived from a periodic survey of a nationwide probability sample of ever-married women 15-44 years of age.
