Cooking for Good Health: A Series of Cooking Classes Designed to Teach Healthy Eating to American Indian People

Description: Abstract: Stresses eating in moderation to control diabetes. Recipes reflect general principles for good diabetes and blood pressure control--they are reduced in fat, sugar, and calories and where possible, increased in fiber content. The primary objective of the manual are to prepare and taste healthy food dishes in class to increase acceptability and use of low fat and low sugar foods in the home and to provide healthy, culturally acceptable recipes to participants that could be used at home. The target audience is people in the community who have diabetes and their family members.

Development of a Curriculum to Lower Dietary Fat Intake in a Multiethnic Population with Low Literacy Skills

Description: (Abstract) Low-literate, low-income populations face unique issues as they attempt to modify their diet to lower risk of chronic disease. The goal of the Stanford Nutrition Action Program (SNAP) was to design a curriculum that would address such issues and stimulate reduction of dietary fat. Initial focus groups and pilot tests were conducted to assess nutrition knowledge, interests, and dietary habits of a multiethnic, low-literate population. These investigations revealed that a nutrition education curriculum tailored to a population with low literacy skills would need to address the taste, cost, and convenience of low-fat foods, and teach participants how to incorporate low-fat foods and cooking methods into their family's diet with minimal disruption. These findings, combined with published data on food intake and preferences, were used to design the SNAP curriculum. The SNAP classroom curriculum operationalized principles of adult education, constructs from social learning theory, and followed established national guidelines on how to develop appropriate print materials for low-literate adults. Each of its six lessons included role modeling, goal setting, problem solving, group activities, and skills building tasks; many included SNAP videotapes, food demonstrations, and posters that enhanced group discussions. Print materials were written at or below the 5th grade reading level. The SNAP curriculum combined interactive teaching techniques and behavior change methods to successfully teach and stimulate the interest of low-literate, low-income population to overcome barriers to reducing fat.

Diet and Physical Activity Patterns of Lakota Indian Adults

Description: (Abstract) **OBJECTIVES:** This study assessed specific dietary practices and overall physical activity patterns of Lakota adults residing on Indian reservations in South Dakota. Perceived barriers to changing dietary and physical activity behaviors were also examined. **DESIGN:** A convenience sample of Lakota adults was surveyed. Data on consumption of higher-fat foods, fruit and vegetable intake, use of sugar-sweetened beverages, physical activity patterns, and barriers to change in diet and physical activity were collected via in-person interviews. **SUBJECTS/SETTING:** A total of 219 adults from 2 adjacent reservations in South Dakota participated. **RESULTS:** Higher-fat foods consumed most frequently included margarine and butter (32.0% > or = 5 times per week); eggs (30.1% > or = 5 times per week); whole milk (25.7% > or = 5 times per week); potato chips, corn chips, and popcorn (15.1% > or = 5 times per week); and bacon and sausage (13.3% > or = 5 times per week). Few subjects reported consuming fruit on a daily basis. Vegetables were consumed somewhat more frequently. Most subjects reported engaging in mild or moderate physical activities 3 or more times per week, although women were found to engage in moderate and strenuous physical activities less frequently than men. Major barriers to fruit intake included expense (16.4%), quality (14.2%), and availability (13.2%). Barriers to vegetable intake mentioned most frequently included availability (11.4%), cost (10.4%), and quality (9.1%). Taste was the most frequently mentioned (15.8%), lack of time (14.7%), and safety concerns (14.6%) were the most salient barriers to regular exercise. **APPLICATIONS/CONCLUSIONS:** Nutrition interventions are needed that address the major barriers to diet change reported by Lakota adults. Efforts to increase physical activity should focus on Lakota women and should address the identified barriers to regular exercise.

Dietary Survey of Hopi Native American Elementary Students

Description: (Abstract) **OBJECTIVE:** The purpose of this study was to evaluate the diets of 96 Hopi fifth- and sixth-grade students on the Hopi reservation in Arizona. **DESIGN:** Dietary food intakes were collected using a 3-day dietary record and were analyzed with a computer software program to obtain information on the intake of energy, protein, carbohydrate, total fat, saturated fat, cholesterol, fiber, 10 vitamins, and six minerals. **SETTING:** The survey was conducted during the health class or homeroom period in the elementary schools located on the Hopi reservation in Arizona. **SUBJECTS:** The survey population consisted of 96 fifth- and sixth-grade Hopi elementary students attending the five schools on the Hopi reservation. **MAIN OUTCOME:** Before data collection we hypothesized the average diet of Hopi elementary students did not meet dietary recommendations (e.g., Dietary Goals, Recommended Dietary Allowances (RDAs), and/or National Cancer Institute recommendations). **STATISTICS:** The nutrient analyses and demographic data were analyzed for frequencies and percentages of responses. Descriptive and inferential statistics were calculated where appropriate. **RESULTS:** Results of the analysis revealed a mean daily dietary intake of 2,123 kcal consisting of 35% fat (84 g), 48% carbohydrate (261 g; 38% from sugar), and 17% protein (89 g), with 27 g saturated fat, 442 mg cholesterol, 11 g fiber, and 2,477 mg sodium. At least 97% or 100% of the RDA was met for all analyzed vitamins and minerals except for vitamin D (146 IU; 37% RDA), calcium (874 mg; 82% RDA), and zinc (12 mg; 94% RDA). **CONCLUSIONS:** Given the health problems relatively new to Native Americans, such as diabetes, obesity, liver cirrhosis, hypertension, fetal alcohol syndrome, and increasing rates of heart disease and cancer, dietary modification may benefit them in their adult life. Modifications to meet current recommended dietary goals would include reducing fat to below 30% of energy; cholesterol to less than 250 mg; sodium to lower levels but not below 500 mg/day; and decreasing refined sugars. Carbohydrates would be increased to at least 58% energy; fiber to 20 to 30 g; and vitamin D, calcium, and, possibly, zinc to RDA levels.

Early Excess Weight Gain of Children in the Pima Indian Population

Description: (Abstract) **OBJECTIVE:** To determine the period of childhood in which weight relative to height increases in Pima Indian children and young adults in comparison with the general US population. **METHODS:** Heights and weights of children in the Pima Indian population were derived from either clinical examinations conducted by the Department of Public Health Nursing (from 1-48 months of age), or from examinations in the National Institutes of Health longitudinal survey of health in the Pima population (for birth and ages 5-20 years), and compared with standards for the US population recently published by the National Center for Health Statistics.

RESULTS: Weight relative to height (weight-for-length in children aged <24 months, body mass index at ages > or =2 years) was significantly higher in Pima children at all ages examined after the first month of life. Compared with reference values, the most dramatic increases in weight relative to height occurred in 2 stages of childhood: mean z scores of weight-for-length increased between 1 month (mean +/- SEM: males: -0.2 +/- 0.19; females: -0.02 +/- 0.14) and 6 months (males: 0.8 +/- 0.04; females: 0.7 +/- 0.04) of age; mean z scores for body mass index increased gradually between 2 years (males: 0.4 +/- 0.06; females: 0.4 +/- 0.08) and 11 years (males: 1.4 +/- 0.08; females: 1.4 +/- 0.08) and remained stable thereafter. **CONCLUSION:** Excessive weight gain occurs early in the Pima population with changes relative to reference values most marked in the first 6 months of life and between 2 and 11 years. Interventions toward primary prevention of obesity may need to be targeted at children rather than adults in this population.

Food Perceptions and Dietary Behavior of American-Indian Children, Their Caregivers, and Educators: Formative Assessment Findings from Pathways.

Description: (Abstract) Dietary findings from a school-based obesity prevention project (Pathways) are reported for children from six different American-Indian nations. A formative assessment was undertaken with teachers, caregivers, and children from nine schools to design a culturally appropriate intervention, including classroom curriculum, food service, physical education, and family components. This assessment employed a combination of qualitative and quantitative methods (including direct observations, paired-child in-depth interviews, focus groups with child caregivers and teachers, and semi-structured interviews with caregivers and foodservice personnel) to query local perceptions and beliefs about foods commonly eaten and risk behaviors associated with childhood obesity at home, at school, and in the community. An abundance of high-fat, high-sugar foods was detected in children's diets described by caregivers, school food-service workers, and the children themselves. Although children and caregivers identified fruits and vegetables as healthy food choices, this knowledge does not appear to influence actual food choices. Frequent high-fat/high-sugar food sales in the schools, high-fat entrees in school meals, the use of food rewards in the classroom, rules about

finishing all of one's food, and limited family resources are some of the competing factors that need to be addressed in the Pathways intervention.

Food Preferences Predict Eating Behavior of Very Young Mohawk Children.

Description: (Abstract) **OBJECTIVE:** To collect baseline data on energy and nutrient intake and nutrition knowledge, attitudes, and behavior of very young Mohawk children to assist the community in planning an appropriate, targeted nutrition and exercise intervention. **DESIGN:** Energy and nutrient intake data were collected from 24-hour recalls conducted in the children's homes. Nutrition knowledge, attitudes, and behavior were assessed using a 38-item questionnaire that asked children to report on what foods they like the best, eat most of the time, and think are healthful. The questionnaire was completed in an elementary school on the reservation. Before data collection, we hypothesized that the average diet of the Mohawk children would not meet national dietary recommendations. **SUBJECTS:** One hundred forty-three children, pre-kindergarten through third grade (aged 4 to 9 years), completed the 24-hour recalls and the questionnaire. An additional 136 children, also pre-kindergarten through third grade, completed the questionnaire (n = 279). **STATISTICS:** Analysis of variance with a Scheffe's multiple-comparison test was used to test for differences among grades and genders for energy and nutrient intake and questionnaire scores. Multiple regression analysis was used to assess the relationship between eating behavior and selected variables. **RESULTS:** A mean daily energy intake of 1,980 kcal consisted of 34% fat, 13% protein, and 52% carbohydrate with 13 g fiber and 235 mg cholesterol. Food preferences were the strongest predictor of behavior, they explained 71% of the variation in the behavior score. **APPLICATIONS:** The major finding of this study, that food preferences are the strongest predictor of reported eating behavior in very young Mohawk children, has implications for behavior change interventions. Focusing on changing what children like to eat, through repeated exposure to new foods in a positive social context, is more likely to change what foods they choose than is simple nutrition education.

Native American Health Recipes

Description: In the modernization of food processing, today we are consuming upwards of several thousand chemicals. These are designed to make food look good; be preserved for long periods of time (indefinitely in some cases); to retard oxidation and spoilage, and mostly to enhance the taste needs of modern people. Sadly as our tastes change (higher salt and sugar intakes), the food industry adjusts their food processing. Additionally many of the chemicals used are questionable for human consumption. The truth is that we should eat our aboriginal foods when ever possible. Offers a three-week healthy menu.

Native Nutrition Circles: An Anthology of American Indian Studies

Description: Abstract: This book contains 126 pages of traditional Native American stories about food. These short stories have morals about food choices, food preparation, and maintaining traditional ways. There is a short summary after each story, explaining the message clearly. There are old photographs of women from different tribes preparing food in various ways. This book follows the Native American

custom of using storytelling as an educational tool, and can be used to generate discussions of health and good nutrition practices. It could be used in a higher level literacy or ESOL class.

Strong in Body and Spirit: Lifestyle Intervention for Native American Adults with Diabetes in New Mexico

Description: (Abstract) **OBJECTIVE:** To determine the effects of a culturally appropriate diabetes lifestyle intervention for Native Americans on risk factors for complications of diabetes. **RESEARCH DESIGN AND METHODS:** A nonrandomized, community-based diabetes intervention trial was conducted in three Native American sites in New Mexico from 1993-1997. Participants were assigned to intervention or control based on community of residence. Intervention sessions were held approximately 6 weeks apart over approximately 10 months. The intervention was delivered in site A in family and friends (FF) groups (n = 32); site B received the same intervention in one-on-one (OO) appointments (n = 39); and site C received usual medical care (UC) (n = 33) (total participants, n = 104). Primary change in HbA(1c) level was assessed at 1 year. **RESULTS:** Adjusted mean change in HbA(1c) value varied significantly across the three arms at 1 year (P = 0.05). The UC arm showed a statistically significant increase in adjusted mean HbA(1c) change (1.2%, P = 0.001), whereas both intervention arms showed a small nonsignificant (P > 0.05) increase in the adjusted mean change (0.5% and 0.2% for FF and OO arms, respectively). The increase was statistically significantly smaller in the combined intervention arms (0.4%) compared with the UC arm (1.2%, P = 0.02). **CONCLUSIONS:** Lifestyle intervention has

the potential to substantially reduce microvascular complications, mortality, and health care utilization and costs if the change is sustained over time.

The Effect of Indian or Anglo Dietary Preference on the Incidence of Diabetes in Pima Indians

Description: (Abstract) **OBJECTIVE:** In short-term studies, adoption of a traditional diet is associated with reduction in metabolic abnormalities often found in populations experiencing rapid lifestyle changes. We examined the long-term effects of a self-assessed traditional or nontraditional dietary pattern on the development of type 2 diabetes in 165 nondiabetic Pima Indians. **RESEARCH DESIGN AND METHODS:** Dietary intake was assessed in 1988 by a quantitative food frequency method, and subjects were asked to classify their diet as "Indian," "Anglo," or "mixed." The Indian diet reflects a preference for Sonoran-style and traditional desert foods. The Anglo diet reflects a preference for non-Sonoran-style foods typical of the remaining regions of the U.S. **RESULTS:** In women, the intake of complex carbohydrates, dietary fiber, insoluble fiber, vegetable proteins, and the proportion of total calories from complex carbohydrate and vegetable proteins were significantly higher ($P < 0.05$) in the Indian than in the Anglo diet. The mixed diet was intermediate in of all these constituents. In men, the intake for these nutrients was also higher in the Indian than in the Anglo group, but not significantly. Diabetes developed in 36 subjects (8 men and 28 women) during 6.2 years of follow-up (range 0.9-10.9). The crude incidence rates of diabetes were 23, 35, and 63 cases per 1,000 person-years in the Indian, mixed, and Anglo groups, respectively. After adjustment for age, sex, BMI, and total energy intake in a proportional hazards model, the risk of developing diabetes in the Anglo-diet group was 2.5 times as high (95% CI 0.9-7.2) and the rate in the mixed-diet group was 1.3 times as high (0.6-3.3) as in the Indian-diet group. **CONCLUSIONS:** This study suggests that the adoption of

an Anglo diet may increase the risk of developing diabetes in Pima Indians, but it does not provide unequivocal evidence for or against this hypothesis.
