

AMSR-E snow depth on sea ice: Processing update¹ & overview of the validation campaign in March 2006²

Thorsten Markus
NASA Goddard Space Flight Center

¹ with D.J. Cavalieri and A. Ivanoff (NASA/GSFC)

² with D.J. Cavalieri (GSFC), A. Gasiewski (CU), S.P. Gogineni (KU), J. Heinrichs (Fort Hays), W. Krabill (NASA/WFF), P. Kanatagtram (KU), M. Klein (CU), C. Leuschen (JHU now KU), J. Maslanik (CU), J. Sonntag (NASA/WFF), J. Stroeve (NSIDC), M. Sturm (CRREL)

Modifications/improvements for the latest version:

Incorporation of temporal information to

- Flag for intermittent melt/freeze events and weather effects**
- Flag for summer melt**
- Improved Arctic multiyear sea ice mask (the previous one was too restrictive)**

Snow depth product 10/2004 - 9/2005

Land

Open ocean

Multiyear ice

Melt/freeze, Wx

Summer melt

Arctic aircraft AMSR-E validation campaign in March 2006

Strategy: 2-tier upscaling process to validate AMSR-E snow depths

Tier 1: Validation of aircraft measurements with in-situ measurements (In-situ measurement led by M. Sturm (CRREL) and J. Maslanik (U. Colorado))

Tier 2: Validation of AMSR-E snow depth retrievals by flying patterns that cover approximately 4 x 8 AMSR-E pixels

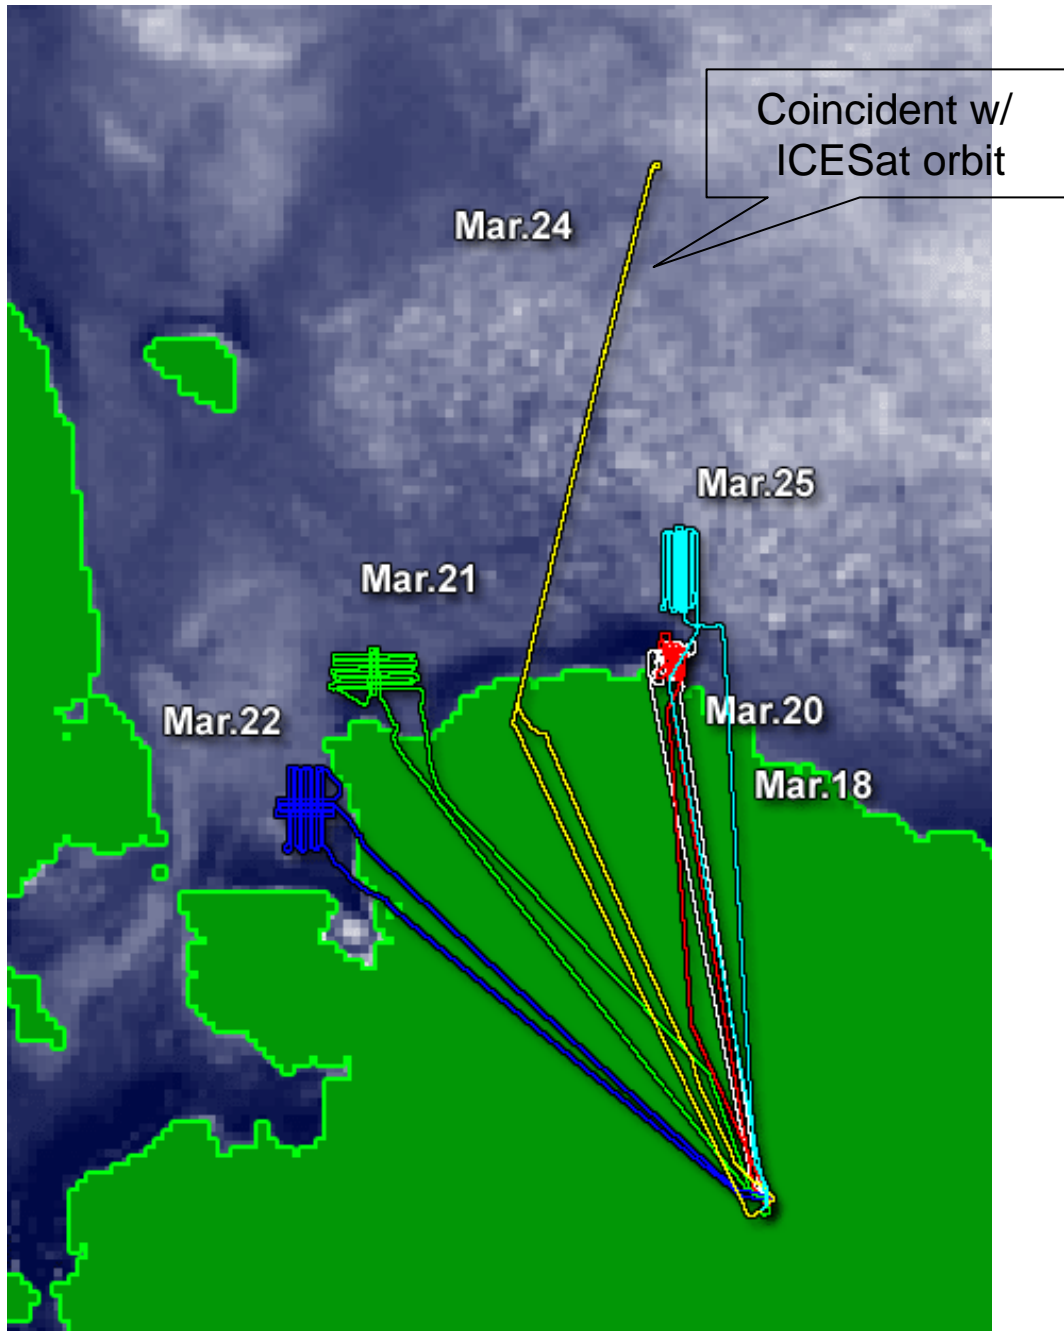

Also: One flight was coordinated with ICESat orbit

Arctic aircraft AMSR-E validation campaign in March 2006

P-3 aircraft primary instrumentation:

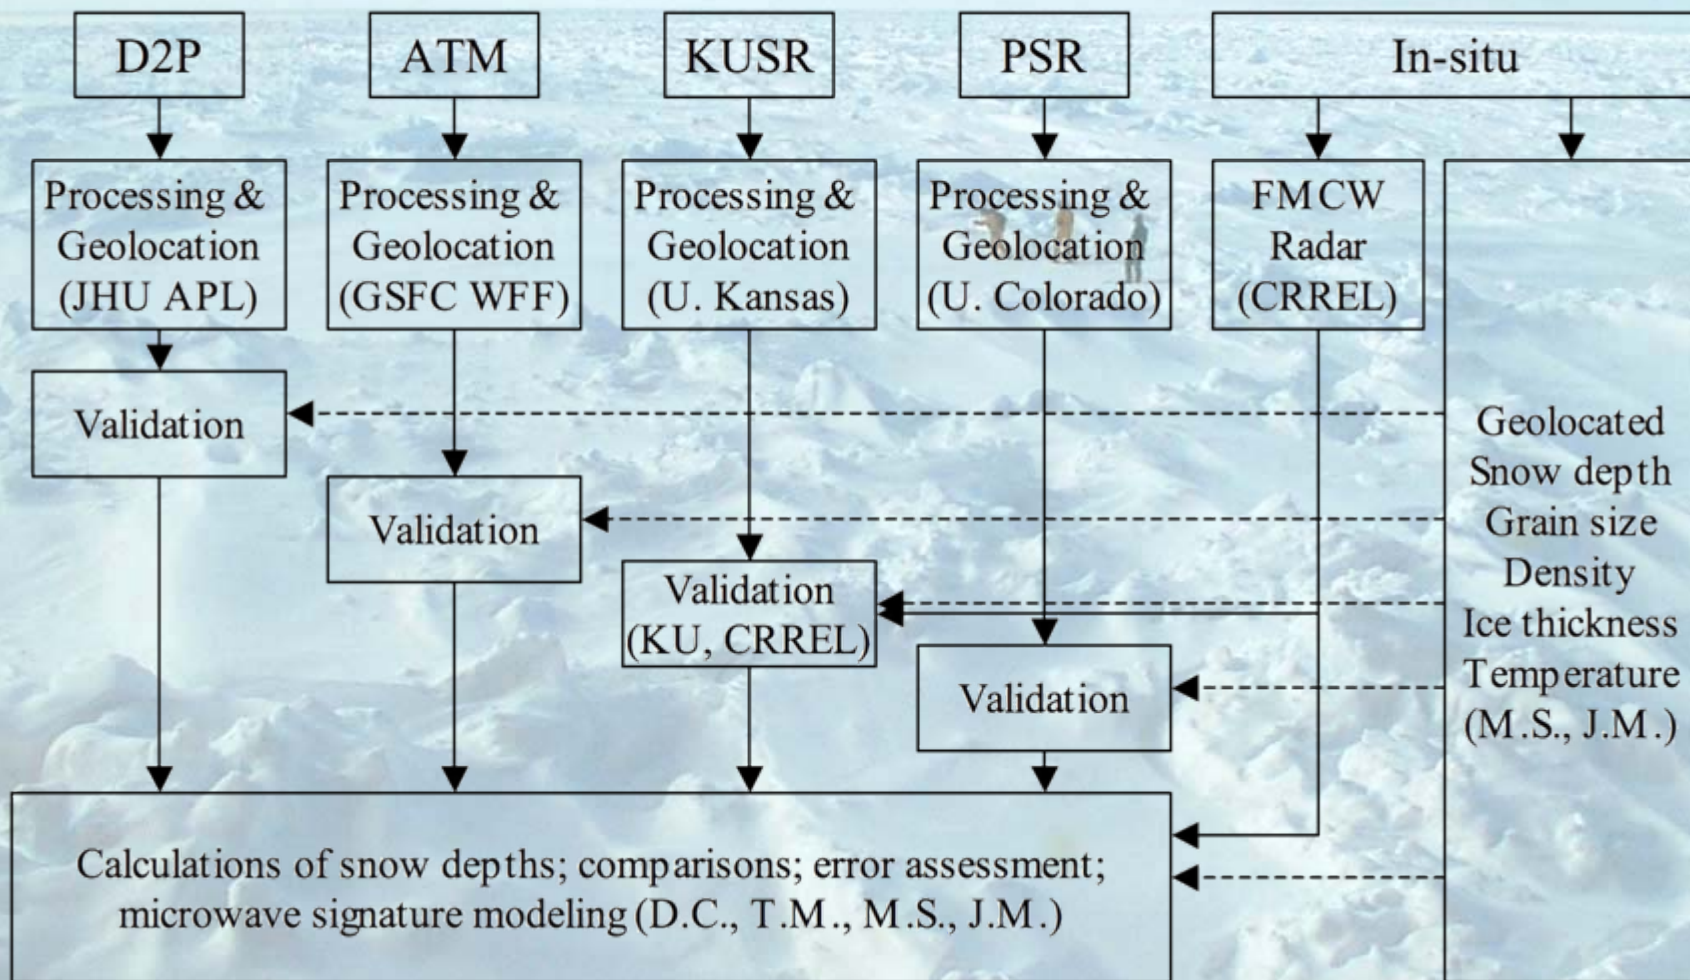

- Polarimetric Scanning Radiometer (Instr.-PI: A. Gasiewski, CU): Microwave radiometer with similar frequencies as AMSR-E.
- Snow radar (Instr.-PI: S.P. ,Gogineni, KU): New radar that can directly measure snow depth on sea ice.
- ATM (Instr.-PI: W. Krabill, GSFC): Laser altimeter, which measures height of the snow.
- D2P (Instr.-PI: Carl Leuschen, JHU APL): Radar altimeter, which measures height of sea ice

Arctic 2006 AMSR-E validation campaign

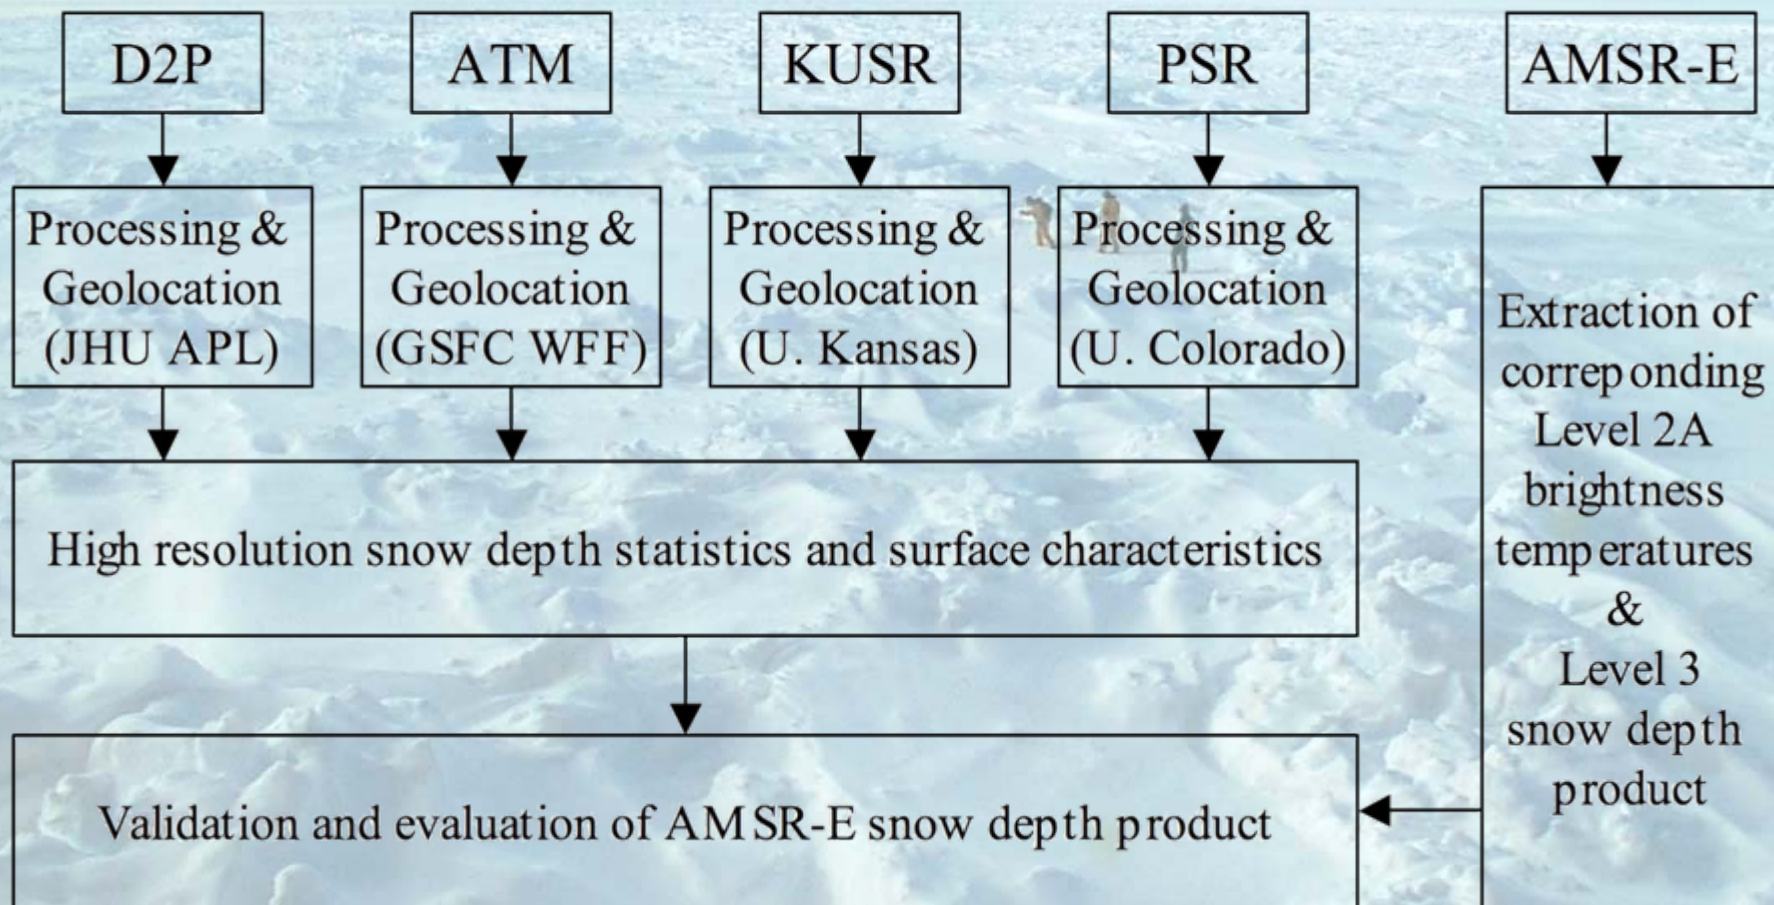

Next steps:

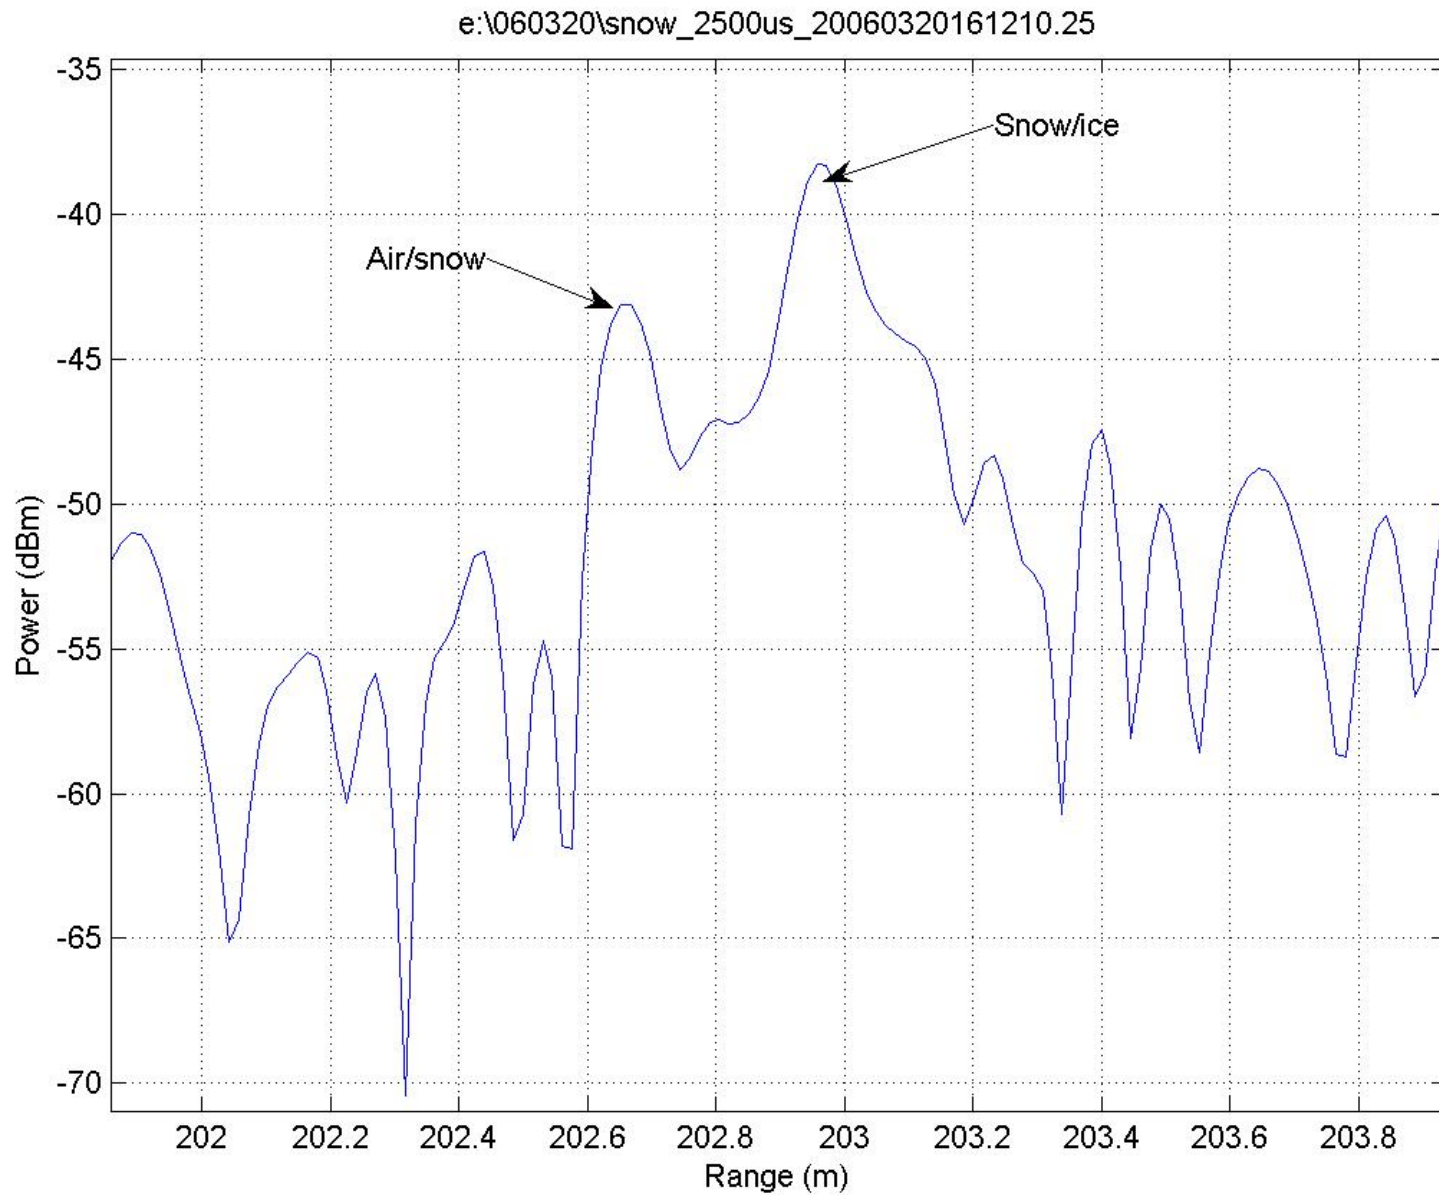

Tier 1 (Barrow flights)

Tier 2 (Chukchi/Beaufort Seas flights)

Snow radar: First results

Barrow flight 1
