gp160 (317–336)	gp120 (321–340 MN)	YTTKNIIGTIRQAHCNSRA	Vaccine	guinea pig	Chattergoon2002

Vaccine *Vector/Type:* DNA, protein *Strain:* B clade MN *HIV component:* gp120 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Keywords vaccine-specific epitope characteristics, Th1.
Epitope name 1987.

- Hartley guinea pigs were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
- A total of 7 gp120 peptides elicited a delayed type hypersensivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 4/5 animals vaccinated with rec gp120 responded by DTH to this peptide, as did 4/6 vaccinated with plasmid gp120 DNA.

gp160 (317–349)	gp160 (324–356 IIIB)	FVTIGKIGNMRQAHCNISR-AKWNNTLKQIDSKL	HIV-1 infection, Vaccine	human, mouse (H-2^k, H-2^d)	Berzofsky1991b, Berzofsky1991a

Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA)

- FVTIGKIGNMRQAHCNISRAKWNNTLKQIDSKL encompasses several murine Th epitopes and is referred to as a "multideterminant region" or cluster peptide.
- Six multideterminant region cluster peptides were evaluated Th responses in different MHC/HLA backgrounds after vaccination of mice with gp160, or in infected people.
- This cluster peptide elicited proliferative responses in cells from B10.BR mice (H-$2A^k$, E^k) and B10.D2 mice (H-$2A^d$, E^d), but shorter peptides from within this region stimulated H-2^k, H-2^d, H-2^b and H-2^s responses.
- IL-2 production in response to this peptide was observed in 58% (21/36) of asymptomatic HIV-infected individuals.

gp160 (319–338)	gp120 (320–339 89.6)	RRNIIGDIRQAHCNISRAKW	Vaccine	mouse	Dai2001

Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Keywords epitope processing, immunodominance.
Epitope name Peptide 30.
Donor HLA H-2k, H-2d.

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was highly reactive in 7/10 BALB/c mice tested, and in 7/10 CBA/J mice and was considered one of the 3 immunodominant peptides identified that were shared in both mouse strains: RRNIIGDIRQAHCNISRAKW, NNTLQQIVIKLREKFRNKTI, GTNGTEGNDIITLQCRIKQI.

gp160 (319–338)	gp120 (320–339 89.6)	RRNIIGDIRQAHCNISRAKW	Vaccine	mouse (H-2^k, H-2^d)	Dai2001

Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Keywords immunodominance.

- Promiscuous immunodominant epitopes in gp120 were mapped by overlapping peptides in CBA/J H-2^k and BALB/c H-2^d mice, and all were found to be in the outer domain, proximal to regions of structural disorder indicated by the crystal structure or by sequence divergence.
- This peptide was recognized by 7/10 CBA/J and 7/10 BALB/c mice with SI $>$ 4, averaging 6.3 and 4.8, and is considered to be promiscuously immunodominant.
- Uniquely immunodominant sequences tended to be in the inner domain of the protein.

gp160 (363–372)	gp120 (368–377 LAI)	QSSGGDPEIV	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.				
gp160 (364–378)	gp120 (364–378 IIIB, B10)	SSGGKPEIVTHSFNC	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (369–383)	gp120 (369–383 IIIB, B10)	PEIVTHSFNCGGEFF	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (380–393)	gp120 (380–393 IIIB)	GEFFYCNSTQLFNS?	HIV-1 infection	human	Geretti1994
	Keywords immunodominance. **Epitope name** G4. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Five peptides were recognized most frequently: C2 (aa 142-161), C3 (aa 152-171), C5 (aa 172-191), E5 (aa 272-291) and G4 (aa 380-393). The first three were in or near V2, the other two were proximal to the V3 and V4 loops. • 4/15 responders recognized this immunodominant peptide, average SI = 4.4.				
gp160 (381–395)	gp120 (IIIB)	EFFYCNTTQLFNNTW	in vitro stimulation or selectio	human	Manca1995b
	• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming does not always induce T-cells that recognize whole protein.				
gp160 (392–411)	gp120 (392–411 IIIB)	NSTWFNSTWSTEGSNNTEG-S?	HIV-1 infection	human	Geretti1994
	Epitope name G5. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 9.3.				
gp160 (394–408)	gp120 (394–408 IIIB, B10)	TWFNSTWSTKGSNNT	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (396–411)	gp120 (IIIB)	FNNTWRLNHTEGTKGC	in vitro stimulation or selectio	human	Manca1995b
	• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming does not always induce T-cells that recognize whole protein.				
gp160 (399–413)	gp120 (399–413 IIIB, B10)	TWSTKGSNNTEGSDT	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (404–423)	gp120 (400–419 89.6)	GTNGTEGNDIITLQCRIKQI	Vaccine	mouse	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 38. **Donor HLA** H-2k, H-2d. • Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was reactive in 8/10 BALB/c mice tested, and in 6/10 CBA/J mice, and was considered one of the 3 immunodominant peptides identified that were shared in both mouse strains: RRNIIGDIRQAHCNISRAKW, NNTLQQIVIKLREKFRNKTI, GTNGTEGNDIITLQCRIKQI.				
gp160 (404–423)	gp120 (400–419 89.6)	GTNGTEGNDIITLQCRIKQI	Vaccine	mouse ($H\text{-}2^k$, $H\text{-}2^d$)	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** immunodominance.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Promiscuous immunodominant epitopes in gp120 were mapped by overlapping peptides in CBA/J H-2^k and BALB/c H-2^d mice, and all were found to be in the outer domain, proximal to regions of structural disorder indicated by the crystal structure or by sequence divergence. • This peptide was recognized by 4/10 CBA/J and 6/10 BALB/c mice with SI $>$ 4, averaging 4.9 and 5.5 and is considered to be promiscuously immunodominant. • Uniquely immunodominant sequences tended to be in the inner domain of the protein.				
gp160 (405–420)	Env (1007)	SNNTVGNPIILPCRI	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This epitope is located in the V4C4 region of 1007 (US, clade B) and was recognized by 13 hybridomas with Vβ usage Vβ 4, 7, 8.1, 8.2, 10, 12 and not determined – one of the Vβ 8.2 was shown to utilize Vα 2. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant. • The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (410–429)	gp120 (410–429 PV22)	GSDTITLPCRIKQFINMWQE	HIV-1 infection	human (DR4)	Callahan1990
	• Synthetic peptides representing natural variants were used to test for recognition in the context DR4.				
gp160 (410–429)	gp120 (410–429 PV22)	GSDTITLPCRIKQFINMWQE	HIV-1 infection	human (DR4(Dw10))	Polydefkis1990
	• Human CD4+ T-cell clones lyse recombinant vaccinia virus-infected cells that synthesize envelope gp160.				
gp160 (412–431)	gp120 (412–431 IIIB)	DTITLPCRIKQIINMWQKV-G?	HIV-1 infection	human	Geretti1994
	Epitope name H2. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 5.7.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (416–431)	gp120 (IIIB)	LPCRIKQIINMWQEVY	in vitro stimulation or selectio	human	Manca1995b
	• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming does not always induce T-cells that recognize whole protein.				
gp160 (418–436)	Env (417–435)	CRIKQIINMWQGVGKAMYA	HIV-1 infection	human, chimpanzee	Nehete1998b
	• HIV-infected chimpanzees and HIV-positive patients show positive proliferative responses to multiple peptides from five conserved regions of the HIV-1 Env.				
gp160 (421–436)	gp120 (426–441 IIIB)	KQFINMWQEWGKAMYA		human	Furci1997
	• Epitope T1 variant: 9/11 exposed-uninfected individuals in this study had a proliferative response to a C5 peptide, but none reacted with this previously defined epitope. • IIIB position 435 listed as W in this epitope as opposed to V in the sequence.				
gp160 (421–436)	gp120 (428–433 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Wasik2000
	Keywords responses in children, kinetics, Th1. **Epitope name** T1. • Th responses measured by IL-2 responses to P18 and T1 in HIV-1 infected infants were undetectable at less than 1 month of age, and remained low in children with AIDS symptoms, but increased with age in children with slowly progressive disease. • The kinetics and intensity of the CTL activity during the first year of life was related to the child's ability to make Th1 responses.				
gp160 (421–436)	gp120 (428–433 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Wasik1997
	Keywords responses in children, Th1, Th2. **Epitope name** T1. • The breadth and intensity of the CTL response and the type of Th response was studied in seven rapidly progressing HIV-1+ infants. • IL-2 and γ IFN production from Th1 cells correlated with the CTLp frequency against HIV-1 Gag, Env, Nef and Pol. • IL-4 production from Th2 cells was inversely correlated with the CTLp frequency. • The HIV-1+ children with strong CTL responses had levels of anti-CD3 MAb induction of Th1 cells comparable to those of uninfected children.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	Vaccine	human	Berzofsky1988
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** T1. • Proliferative response to T1 and T2 peptides in 14 immunized, uninfected humans.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	Vaccine	goat	Palker1989
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB **Epitope name** T1. • Goats immunized with peptides containing V3 type-specific neutralizing determinants coupled to T1.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Clerici1989
	Epitope name T1. • IL-2 production detection of Th lymphocytes from asymptomatic HIV-positive individuals.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Clerici1991a
	Epitope name T1. • Peptides stimulate Th cell function and CTL activity in similar patient populations.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	Vaccine	human	Clerici1991b

gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA		human	Clerici1992
	Epitope name T1. • Cell-mediated immune response to HIV-1 peptides in HIV-1 exposed seronegative men.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	Vaccine	mouse	diMarzo Veronese1994
	Vaccine *Vector/Type:* bacteriophage coat protein *Strain:* B clade MN *HIV component:* V3 • Epitope T1 was engineered into a filamentous bacteriophage coat protein, and the Th epitope stimulated Ab production to the V3 loop.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	Vaccine	chimpanzee	Haynes1993
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB **Epitope name** T1. • Hybrid T1-V3 peptide immunogenicity reduced when the fusogenic domain of gp41 was added.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Clerici1997
	Epitope name T1. • Used in a study of the influence of pentoxifylline on HIV specific T-cells.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA		human	Pinto1995
	Epitope name T1. • CTL activity analyzed in parallel with Th reactivity in exposed but uninfected health care workers.				
gp160 (421–436)	gp160 (428–433 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection, HIV-1 exposed seronegative	human	Wasik1999
	Keywords immunodominance. **Epitope name** T1. • IL-2 responses associated with beta-chemokine expression were detectable at birth in the majority of uninfected infants born to HIV+ mothers, declining by age 6 months. • T1 peptide: In both uninfected and infected infants of HIV-positive mothers, responses to the T1 peptide were more frequent than responses to P18 (RIQRGPGRAFVTIGK) • T1 is a highly conserved epitope, whereas P18 has a higher mutation rate due to its location in the immunodominant V3 loop region.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Kaul1999
	Epitope name T1. • Kenyan sex workers that remained seronegative were found to frequently have HIV-env peptide specific Th responses detected by an IL-2 assay (11/20 cases) and mucosal genital tract anti-HIV IgA (16/21 cases) • Helper epitopes used in this study were noted to be previously described [Clerici1989], and were not explicitly described in [Kaul1999]				
gp160 (421–436)	gp120 (MN)	KQIINMWQEVGKAMYA	HIV-1 infection, Vaccine	human	Bartlett1998
	Vaccine *Vector/Type:* peptide *Strain:* B clade MN **Epitope name** T1.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• C4-V3 PV (polyvalent HIV envelope synthetic peptide immunogen) consisted of T1 helper epitope presented in tandem with a V3 loop CTL epitope from one of four different North American strains. • This was a pilot phase I study involving vaccination of ten HIV-infected subjects who were HLA-B7-positive. • Enhanced lymphoproliferative response to peptide was observed in 5/8 vaccinees – increase in neutralizing antibody responses in 4/8 vacinees.				
gp160 (421–436)	gp120	KQIINMWQEVGKAMYA	HIV-1 infection, HIV-1 exposed seronegative	human	Kuhn2001a
	Keywords inter-clade comparisons, responses in children, mother-to-infant transmission. **Epitope name** T1. • In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4. • The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents. • 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding. • Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.				
gp160 (421–436)	gp120 (428–443 RF)	KQIINMWQEVGKAMYA	HIV-1 infection		deLorimier1994
	Keywords epitope processing. **Epitope name** T1. • Proton NMR spectroscopy was employed to analyze the solution conformation of a hybrid peptide, T1-SP10RF, in order to better understand the immunogenicity of its' T helper (KQIINMWQEVGKAMYA, CTRPNNNTRKSI), CTL (SITKGPGRVIYATG) and B-cell epitopes (RKSITKGPGRVIYATG). • As a free peptide, the T1 segment, a T-helper epitope is in an extended conformation with nascent helical conformation. It may form a beta strand in native gp120, and a nonnative conformation may account for the inability of free T1 peptide to elicit antibody responses, in contrast to the T1 segment in native gp120. It lacks random-coil conformations, and it is suggested that this may make the peptide less susceptible to complete proteolytic degredation, and be favored within epitopes.				
gp160 (421–436)	Env (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection, HIV-1 exposed seronegative		Clerici1993a
	Keywords mother-to-infant transmission. **Epitope name** T1. **Assay type** cytokine production. • Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activited were infected. • PBL from 10/21 of the mothers showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.				
gp160 (421–436)	Env (IIIB)	KQIINMWQEVGKAMYA	HIV-1 exposed seronegative		Clerici1994a
	Epitope name T1. **Assay type** cytokine production.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Six of eight HIV-exposed health care workers had transient HIV-specific T-helper responses after percutaneous exposure to HIV, responding to two or more Env peptides among the set T1, T2, Th4.1, P18IIIB and P18MN. Responses were lost after 12-56 weeks. The HIV-specific Th responses occurred without seroconversion or PCR evidence for infection. • Six of the eight HIV-exposed individuals responded to two or more peptides, whereas, only one individual exposed to HIV-negative blood responded to one peptide.				
gp160 (421–436)	HIV-1 (IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection		Clerici1994b
	Epitope name T1. **Assay type** cytokine production. • IL-10-specific mRNA was upregulated in PBMC from asymptomatic, HIV-infected (HIV+) patients, and was particularly high in those with severely compromised Th cells function. Th response to HIV peptides *in vitro* could be restored by IL-10 Ab.				
gp160 (421–436)	Env (428–443)	KQIINMWQEVGKAMYA	HIV-1 infection	human	Kuhn2001b
	Keywords responses in children, mother-to-infant transmission. **Epitope name** T1. **Assay type** proliferation. • T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistance of detectable HIV RNA in the mothers at delivery. • The reduction of Th responses in newborns raises the possibility that anti-retrovial exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrame *et al.*, Lancet 354:2050 (1999)).				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human (DR)	Baier1995
	Epitope name T1. • Linked HIV-1 T1 and P18 peptides to anti-HLA-DR and anti-IgD Fab fragments to enhance uptake by antigen presenting cells and thus increase immunogenicity.				
gp160 (421–436)	Env (421–436 IIIB)	KQIINMWQEVGKAMYA	Vaccine	mouse (Ek)	Ahlers2001
	Vaccine *Vector/Type:* peptide *Strain:* modified B clade IIIB *HIV component:* Env **Keywords** binding affinity, Th1. **Epitope name** T1. **Assay type** cytokine production, Th support of CTL response. • BALB/c and A.AL were immunized with an Env-peptide vaccine construct containing the CTL epitope P18IIIB and a T helper epitope. • Substitution of Glu (wt) to Ala, kqiinmwqAvgkamya, caused increased affinity for MHC class II Ek. This resulted in the upregulation of CD40L in the responding Th cells, and shifted the response towards Th1. Increased Th responses stimulated DCs to produce higher levels of IL-12, and B7-1 and B7-2, thus enhance CTL responses. • The modified epitope, T1A, elicited stronger protection against increasing doses of viral challenge with vaccinia expressing HIV-1 IIIB gp120 compared to the wildtype epitope T1.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Assay type proliferation. • Intrarectal vaccination with a Th and CTL peptide vaccine provided better protection against intrarectal challenge with pathogenic SHIV-Ku1 than subcutaneous administered vaccine. In some animals after the initial viremia, viral loads were diminished to undetectable levels in the blood and intestine, and CD4+ T cells were better preserved. • The CD4 T-cell proliferative response correlated with the level of the CTL response.				
gp160 (421–444)	gp160 (428–451 IIIB)	KQIINMWQEVGKAMYAPPI-SGQIR	HIV-1 infection, Vaccine	human, mouse (H-2^{k}, H-2^{b}, H-2^{s}, H-2^{d})	Berzofsky1991b, Berzofsky1991a
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA) • KQIINMWQEVGKAMYAPPISGQIR encompasses several murine Th epitopes and is referred to as a "multideterminant region" or cluster peptide. • Six multideterminant region cluster peptides were evaluated Th responses in different MHC/HLA backgrounds after vaccination of mice with gp160, or in infected people. • This cluster peptide elicited proliferative responses in cells from all H-2 haplotypes tested: B10.BR mice (H-2A^{k}, E^{k}), B10.D2 mice (H-2A^{d}, E^{d}), B10.A(5R) mice (H-2A^{b}, E^{b}), and B10.S(9R) mice (H-2A^{s}, E^{s}) • IL-2 production in response to this peptide was observed in 73% (8/11) of asymptomatic HIV-infected individuals.				
gp160 (421–444)	gp120 (428–451 IIIB)	KQIIMNWQEVGKAMYAPPI-SGQIR	Vaccine	mouse (H2^{d})	Shirai1996a
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB **Epitope name** T1. • Linked to a CTL epitope from hepatitis C virus, induced CD4+ helper cells producing IL-2.				
gp160 (423–440)	gp120 (428–445)	FINMWQEVGKAMYAPPIS	HIV-1 infection	human	Caruso1997
	Keywords rate of progression. • As HIV-1-infected individuals progress to disease, T-cells show reduced ability to proliferate in response to HIV antigen, but retain the ability to express the activation antigens CD25 and CD71. • The ability to express activation markers in response to HIV is retained, but the response to tetanus toxoid recall antigen is lost. • This study investigated CD25 and CD71 expression in PBMC from patients at various stages of progression, measuring the response to *in vitro* stimulation by peptide cocktail containing four antigenic Env peptides, or p17 and p24.				
gp160 (424–438)	gp120 (424–438 IIIB, B10)	INMWQEVGKAMYAPP	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (425–439)	gp160 (432–446 IIIB)	NMWQEVGKAMYAPPI	Vaccine	mouse (H-2^{s})	Berzofsky1991b, Berzofsky1991a
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA) • B10.S(9R) (H-2A^{s}, E^{s}) mice immunized with rec gp160 showed a proliferative response to this peptide. • KQIINMWQEVGKAMYAPPISGQIR encompasses several murine Th epitopes including NMWQEVGKAMYAPPI and is referred to as a "multideterminant region" or cluster peptide.				
gp160 (425–439)	gp120 (432–446 IIIB)	NMWQEVGKAMYAPPI	Vaccine	mouse (H-2^{t4})	Hale1989
	Vaccine *Strain:* B clade IIIB *HIV component:* gp160 • Six multideterminant helper T-cell regions are recognized by mice of three or four MHC types.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (426–441)	gp120 (IIIB)	MWQEVGKAMYAPPIGC	in vitro stimulation or selectio	human	Manca1995b
	• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming does not always induce T-cells that recognize whole protein.				
gp160 (430–444)	gp120 (437–451 IIIB)	VGKAMYAPPISGQIR	Vaccine	mouse (H-$2^{k, d, i5, t4}$)	Hale1989

gp160 (430–453)	gp120 (430–453)	VGKAMYAPPISGQIRCSSN-ITGLL	Vaccine	mouse (H-2^{b})	Sjolander1996
	Vaccine *Vector/Type:* protein *HIV component:* gp160 **Keywords** epitope processing. • Study demonstrates that T-cell determinants from glycoproteins can depend on the glycosylation of the protein. • Peptide stimulation of an *in vitro* proliferative response required *in vivo* priming with glycosylated protein. • Local glycosylation sites thought not to be part of the epitope, but may be important for epitope processing.				
gp160 (432–451)	gp120 (432–451 IIIB)	KAMYAPPISGQIRCSSNIT-G?	HIV-1 infection	human	Geretti1994
	Epitope name H4. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 6.3.				
gp160 (433–447)	Env (UG92005)	AMYAPPIAGLIQCSS	Vaccine	mouse (H-2 IA^{b})	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This epitope is located in the C4 region of UG92005 (UG, clade D) and was recognized by ten hybridomas with Vβ usage Vβ 6, 8.1, 8.2, 13, 14 and not determined – among the ND Vβ set, three Vαs were identified, Vα 2, 8, and 11. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (436–451)	gp120 (IIIB)	APPIGGQISCSSNITY	in vitro stimulation or selectio	human	Manca1995b
	• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming does not always induce T-cells that recognize whole protein.				
gp160 (438–460)	gp120 (443–465 NL43)	PISGQIRCSSNITGLLLTR-DGGN	Vaccine	human	Sitz1999
	Vaccine *Vector/Type:* protein *Strain:* B clade NL43 *HIV component:* gp120, gp160 • There was a great breadth of proliferative response to env peptides in 19 HIV-1 infected rgp160 and 17 HIV-1 infected rgp120 vaccine recipients. • Close to 40% of vaccinees had a stimulation index of greater than 5 to this peptide.				
gp160 (439–448)	gp120 (151–160 W6.ID)	IGGQIRCSSN	Vaccine	human	Jones1999
	Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120 *Adjuvant:* MPL-SE adjuvant, QS21 • HIV-1 specific T-cell lines isolated from an HIV seronegative volunteer vaccinated with rgp120 and a QS21/MPL adjuvant. • One T-cell line responds to two overlapping peptides, and the region of overlap is IGGQIRCSSN. • The IIIB version of the first reactive peptide, EVGKAMYAPPIGGQIRCSSN, has a single substitution and induces proliferation as well as the original W61D peptide: evgkamyappiSgqircssn.

gp160 (499–511)	gp120 (IIIB)	TKAKRRVVEREKR	in vitro stimulation or selectio	human (DR)	Wilson1997b
	• Thought to be a mimic of a HLA class II DR β chain variable region. • Response to this epitope may cause a breakdown of self-tolerance. • Presentation of epitope induced autoreactive T-cell lines in PBMC from uninfected donors. • Suppression of proliferation to soluble antigens by the CD8+ fraction of TKAKRRVVEREKR stimulated T-cells was observed.				
gp160 (499–519)	gp41 (MN)	TKAKRRVVQREKRAAIGALF	HIV-1 infection	human	Malhotra2003
	Keywords HAART, acute infection. **Epitope name** TF20. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy. • This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintainted in Env.				
gp160 (519–543)	Env (519–543)	FLGFLGAAGSTMGAASLTL-TVQARC	Vaccine	macaque	Nehete1993
	Vaccine *Vector/Type:* peptide • Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice, and in rhesus monkeys. • Proliferative response to this peptide was observed in 3/3 immunized rhesus monkeys.				
gp160 (519–543)	Env (519–543)	FLGFLGAAGSTMGAASLTL-TVQARQ	HIV-1 infection	human, chimpanzee	Nehete1998b
	• HIV-infected chimpanzees and HIV-positive patients show positive proliferative responses to multiple peptides from five conserved regions of the HIV-1 Env.				
gp160 (519–543)	gp41 (519–543)	FLGFLGAAGSTMGAASLTL-TVQARC	Vaccine	mouse (H-$2^{bxk, sxd}$)	Sastry1991

gp160 (570–589)	gp41 (MN)	VWGIKQLQARVLAVERYLKD	HIV-1 infection	human (DR)	Malhotra2003
	Epitope name VD20. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy. • This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintainted in Env. • This peptide showed promiscuous binding to DRB1*0101, DRB1*1101, DRB1*1302, DRB1*0701, DRB1*0801 DRB4*0101 DRB5*01.				
gp160 (572–591)	gp41 (572–591)	GIKQLQARILAVERYLKDQQ	Vaccine	mouse (H-$2^{d, b}$)	Brown1995
	Vaccine *Vector/Type:* peptide • This peptide was a good immunogen in BALB/c and CBA mice, producing a strong proliferative response. • At least one of the four residues GIKQ enhances stimulation, and in CBA mice these residues influence the ability to prime T-cells *in vivo*. • QLQARILAVERY stimulated the greatest *in vitro* T-cell response. • VERYLKDQQ was the minimal reactive sequence recognized by a T-cell line.				
gp160 (576–591)	gp41 (576–591)	LQARILAVERYLKDQQ	Vaccine	mouse (H-$2^{d, b}$)	Brown1995
	Vaccine *Vector/Type:* peptide • This peptide was a poor immunogen in BALB/c and CBA mice used in this experiment, producing a weak proliferative response.				
gp160 (578–608)	gp41 (585–615 IIIB)	ARILAVERYLKDQQLLGIW-GCSGKLICTTAV	Vaccine	mouse	Goodman-Snitkoff1990
	Vaccine *Vector/Type:* peptide • Identification of putative Th epitopes that can stimulate an antibody response in peptide immunized mice.				
gp160 (579–601)	gp41 (579–601)	RILAVERYLKDQQLLGGIW-GCSGK	Vaccine	mouse (H-$2^{d, b}$)	Brown1995
	Vaccine *Vector/Type:* peptide • This peptide was a good immunogen in BALB/c and CBA. • This peptide produced a strong Th response in both mice strains which was more responsive towards GIKQLQARILAVERYLKDQQ and LQARILAV-ERYLKDQQ than to immunizing peptide.				
gp160 (579–604)	gp41 (584–609 LAI)	RILAVERYLKDQQLLGIWG-CSGKLIC	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (586–597)	Env (586–598)	YLRDQQLLGIWG	HIV-1 infection	human, chimpanzee	Nehete1998b
	• HIV-infected chimpanzees and HIV-positive patients show positive proliferative responses to multiple peptides from five conserved regions of the HIV-1 Env.				
gp160 (586–598)	Env (586–598)	YLRDQQLLGIWGC	Vaccine	macaque, mouse	Nehete1993
	Vaccine *Vector/Type:* peptide • Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice. • Proliferative response to this peptide was observed in 1/3 immunized rhesus monkeys, with a weak transient response in the other two.				
gp160 (593–604)	gp41 (593–604 IIIB)	LGIWGCSGKLIC	HIV-1 infection	human	Bell1992
	• Elicits T-cell proliferation and B cell responses, but only during the asymptomatic phase of HIV infection.				
gp160 (593–604)	gp41 (598–609 LAV-1)	LGLWGCSGKLIC	Vaccine	mouse ($H2^d$)	Schrier1988
	• Murine T-dependent B-cell response – 7/29 had a proliferative response to this peptide.				
gp160 (594–603)	gp41 (594–603 IIIB)	GIWGCSGKLI	HIV-1 infection	human	Kelleher1998b
	• Epitope documented as a "previously described' epitope [Bell1992], but in Bell *et al.* it was described as gp41(594-603 IIIB), LGIWGCSGKLIC. • Immunization with a p24-VLP virus-like particle did not significantly impact CD4+ lymphocyte count, viral load, or p24 antibody titre. • Immunization with p24-VLP did not increase the proliferative response to this gp41 epitope, however, there was a modest, short-lived increased proliferative response to p24.				
gp160 (594–604)	gp41 (consensus)	GIWGCSGKLIC	HIV-1 infection	human	Mutch1994
	• Core region of peptides that can stimulate proliferative responses from seronegative and seropositive people.				
gp160 (598–609)	gp41 (603–614 LAI)	CSGKLICTTAVP	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.				
gp160 (604–615)	gp41 (609–620 LAI)	CTTAVPWNASWS	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.				
gp160 (606–620)	gp41 (1035)	TNVPWNASWSNKSLE	Vaccine	mouse (Class II I Ab)	Zhan2003
	Vaccine *Vector/Type:* vaccinia prime with gp120 boost *Strain:* B clade 1035 *HIV component:* Env *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** epitope processing, vaccine-induced epitopes, escape, TCR usage. **Assay type** T-cell Elispot. • A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035, to the peptide PKVSFEPIPIHYCAP, located in the C2 region of gp120. The only other peptide recognized using Elispot on Env overlapping peptides to test vaccine responses in the mice was this one: TNVPWNASWSNKSLE, located in gp41.				
gp160 (606–620)	gp41 (UG92005)	TNVPWNASWSNKSLE	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This gp140 epitope of UG92005 (UG, clade D) was recognized by five hybridomas with Vβ usage Vβ 8.1, 14 and not determined – one of the Vβ 8.1 was shown to utilize Vα 8. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (609–616)	gp41 (consensus)	PWNASWSN	HIV-1 infection	human	Mutch1994
	• Core region of peptides that can stimulate proliferative responses from seronegative and seropositive people.				
gp160 (611–620)	gp41 (1007, UG92005)	NASWSNKSLE	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This gp41 epitope is conserved in 1007 (US, clade B) and UG92005 (UG, clade D) and was recognized by two hybridomas from two different mice that were vaccinated with different clades – the Vβ usage was Vβ 4 and 14. • The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (T[TN]VPWNASWSNKSLE and NASWSNKSLEQIWNN) – the only difference between 1007 and UG92005 for these two proteins is that 1007 has a T and UG92005 has an N in the second position of the first peptide. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant. • The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

gp160 (827–841)	gp41 (834–848 IIIB) **Epitope name** TH4. • Peptides stimulate Th cell function and CTL activity in similar patient populations. • Called Th4.1 and TH4.	DRVIEVVQGAYRAIR	HIV-1 infection	human	Clerici1991a
gp160 (827–841)	gp41 (834–848 IIIB) **Vaccine** *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** TH4. • Immunizing uninfected individuals with rgp160 results in stronger Th response than does natural infection. • Called Th4.1 and TH4.	DRVIEVVQGAYRAIR	Vaccine	human	Clerici1991b
gp160 (827–841)	gp41 (834–848 IIIB) **Epitope name** TH4. • Cell-mediated immune response to HIV-1 peptides in HIV-1 exposed seronegative men. • Called Th4.1 and TH4.	DRVIEVVQGAYRAIR		human	Clerici1992
gp160 (827–841)	gp41 (834–848 IIIB) **Epitope name** TH4. • IL-2 production detection of Th lymphocytes from asymptomatic HIV-positive individuals. • Called Th4.1 and TH4.	DRVIEVVQGAYRAIR	HIV-1 infection	human	Clerici1989
gp160 (827–841)	gp41 (834–848 IIIB) **Epitope name** TH4. • Kenyan sex workers that remained seronegative were found to frequently have HIV-env peptide specific Th responses detected by an IL-2 assay (11/20 cases) and mucosal genital tract anti-HIV IgA (16/21 cases) • Helper epitopes used in this study were noted to be previously described [Clerici1989], and were not explicitly described in [Kaul1999]	DRVIEVVQGAYRAIR	HIV-1 infection	human	Kaul1999
gp160 (827–841)	gp41 **Keywords** inter-clade comparisons, responses in children, mother-to-infant transmission. **Epitope name** TH4, Th4.1. • In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4. • The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents. • 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding. • Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.	DRVIEVVQGAYRAIR	HIV-1 infection, HIV-1 exposed seronegative	human	Kuhn2001a
gp160 (827–841)	Env (834–848 IIIB) **Keywords** mother-to-infant transmission. **Epitope name** TH4.1.	DRVIEVVQGAYRAIR	HIV-1 infection, HIV-1 exposed seronegative		Clerici1993a

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Assay type cytokine production. • Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activited were infected. • PBL from 10/21 of the mother showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.				
gp160 (827–841)	Env (IIIB)	DRVIEVVQGAYRAIR	HIV-1 exposed seronegative		Clerici1994a
	Epitope name TH4.1. **Assay type** cytokine production. • Six of eight HIV-exposed health care workers had transient HIV-specific T-helper responses after percutaneous exposure to HIV, responding to two or more Env peptides among the set T1, T2, Th4.1, P18IIIB and P18MN. Responses were lost after 12-56 weeks. The HIV-specific Th responses occurred without seroconversion or PCR evidence for infection. • Six of the eight HIV-exposed individuals responded to two or more peptides, whereas, only one individual exposed to HIV-negative blood responded to one peptide.				
gp160 (827–841)	HIV-1 (IIIB)	DRVIEVVQGAYRAIR	HIV-1 infection		Clerici1994b
	Epitope name TH4.1. **Assay type** cytokine production. • IL-10-specific mRNA was upregulated in PBMC from asymptomatic, HIV-infected (HIV+) patients, and was particularly high in those with severely compromised Th cells function. Th response to HIV peptides *in vitro* could be restored by IL-10 Ab.				
gp160 (827–841)	Env (834–848)	DRVIEVVQGAYRAIR	HIV-1 infection	human	Kuhn2001b
	Keywords responses in children, mother-to-infant transmission. **Epitope name** TH4-1. **Assay type** proliferation. • Th proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistance of detectable HIV RNA in the mothers at delivery. • The reduction of Th responses in newborns raises the possibility that anti-retrovial exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrame *et al.*, Lancet 354:2050 (1999)).				
gp160 (827–841)	gp41 (834–848 IIIB)	DRVIEVVQGAYRAIR	Vaccine	mouse (H-$2^{k, i5}$)	Hale1989
	Vaccine *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** TH4. • Six multideterminant helper T-cell regions are recognized by mice of three or four MHC types. • Called Th4.1 and TH4.				
gp160 (827–841)	gp160 (834–848 IIIB)	DRVIEVVQGAYRAIR	Vaccine	mouse (H-2^k, H-2^b)	Berzofsky1991b, Berzofsky1991a
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA) • This peptide elicited proliferative responses in cells from B10.BR mice (H-$2A^k$, E^k) and B10.A(5R) mice (H-$2A^b$, E^b)				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (827–853)	Env (HIV-1 IIIB)	DRVIEVVQGAYRAIRHIPR-RIRQGLER	Vaccine	macaque	Belyakov2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB, SIV *HIV component:* Env, Gag, Pol *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72), Montanide (ISA 51) **Keywords** mucosal immunity. **Assay type** proliferation. • Different HIV strains were used for different regions: env HIV-1 IIIB, gag SIV, pol SIV • Intrarectal vaccination with a Th and CTL peptide vaccine provided better protection against intrarectal challenge with pathogenic SHIV-Ku1 than subcutaneous administered vaccine. In some animals after the initial viremia, viral loads were diminished to undetectable levels in the blood and intestine, and CD4+ T cells were better preserved. • The CD4 T-cell proliferative response correlated with the level of the CTL response.				
gp160 (829–843)	gp160 (836–850 IIIB)	VIEVVQGAYRAIRHI	Vaccine	mouse (H-2^k, H-2^b)	Berzofsky1991b, Berzofsky1991a

	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				

III-B-15 Env Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	gp120 (IIIB)		Vaccine	mouse	Shiver1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp120, gp160 **Keywords** Th1. • DNA vaccinations of BALBc mice with a gp120 or gp160 DNA vaccine elicited a strong T-cell proliferative response with Th1-like secretion of γ interferon and IL-2, with little or no IL-4, as well as antigen specific gp120 Abs. • An intramuscular route of inoculation gave a stronger proliferative response than intradermal. • A proliferative response could be detected in all lymph tissues tested: spleen, PBMC, and mesenteric, iliac, and inguinal lymph nodes.			
Env	gp120		Vaccine	mouse	Kim1997d
	Vaccine *Vector/Type:* DNA *HIV component:* Gag, gp160, Pol *Adjuvant:* CD86 • A gp160 DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecule CD86, gives an increase in the proliferative responses to gp120 in mice.				
Env	gp120			human	De Berardinis1997
	• Sequences flanking helper T-cell immunogenic domains can be important for immunogenicity.				
Env	gp120		HIV-1 infection	human	Rosenberg1997
	• A strong proliferative response to p24 and gp160 was found in a healthy long term survivor.				
Env	gp120		HIV-1 infection	macaque	Kent1997b
	Keywords Th1, Th2. • Macaca nemestrina can be infected with HIV, and clear the infection within 6 months, so it is of interest to examine their initial immune response. • A strong proliferative response against gp160 with IL-4 production, indicating a Th2 response, was found with 4 weeks of infection. • The gp160 proliferative response by 8 weeks produces both IL-4 and γ interferon, indicating both Th1 and Th2 responses.				
Env	gp120 (HXBc2)		Vaccine	macaque	Letvin1997
	Vaccine *Vector/Type:* DNA prime with gp160 boost *Strain:* B clade HXBc2 *HIV component:* gp160 • Vaccination of Macaca mulatta (rhesus monkeys) with a HXBc2 env DNA prime and a protein boost elicited a T-cell proliferative response, a CTL response, and type-specific neutralizing antibodies. • Vaccinated animals challenged with SHIV-HXB2 were protected from infection.				
Env	gp120 (MN)		HIV-1 infection, Vaccine	human	MacGregor1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* Env, Rev • An HIV DNA env and rev vaccine given to 15 asymptomatic HIV+ individuals at three different dosages, 30, 100 or 300 μg, was safe. • All three groups showed an increased proliferative response after vaccination.				
Env	Env			human	Mazzoli1997
	• Study of HIV-specific immunity in seronegative partners of HIV-positive individuals – Env peptides could stimulate IL-2 production in 9/16 HIV-exposed seronegative individuals, and only 1/50 low-risk controls. • Exposed-uninfected produced more IL-2 and less IL-10 then HIV-infected individuals. • 8/9 of those whose PBMC produce IL-2 in response to Env peptides had concomitantly detected urinary or vaginal tract anti-HIV IgA.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	Env		HIV-1 infection	human	Plana1998
	Keywords HAART.				
	• Patients from later stages of infection given HAART do not show restoration of HIV-1 specific Th proliferative responses.				
Env	Env		HIV-1 infection	human	Kelleher1998a
	Keywords HAART.				
	• Env and gag Th epitopes were pooled and used to test Th proliferative responses after IL2 therapy – while IL2 therapy causes an increase in CD4+ lymphocyte count, it does not increase HIV-1 specific proliferative responses.				
Env	gp160		HIV-1 infection, Vaccine	human	Ratto-Kim1999
	Vaccine *Vector/Type:* protein *HIV component:* gp160				
	• Vaccinations with rgp160 did not enhance Th immunoproliferative responses in individuals who were immunized every 2 months for 5 years starting early in infection.				
Env	gp160		HIV-1 infection, Vaccine	human	Leandersson2000
	Vaccine *Vector/Type:* protein *HIV component:* gp160				
	Keywords inter-clade comparisons.				
	• 27 HIV subtype B, 4 subtype C, 2 D and one of each subtype E, F, G infected individuals were either given rgp160 B clade immunizations or placebo. All rgp160 immunized individuals showed increased proliferation responses to the B clade immunizing antigen rgp160.				
	• gp120 was prepared from A, B, C, D, and E subtype virions and used as antigenic stimulus – 7 of 10 tested individuals responded to native gp120 from at least one additional subtype in addition to B subtype, while a placebo recipient did not respond to any gp120.				
	• This study shows that cross-subtype HIV-specific T-cell proliferative responses can be stimulated in patients already infected with another HIV-1 subtype – all immunized subjects could respond to the subtype B immunogen, but many developed responses to at least one more subtype.				
Env	gp160 (MN)		Vaccine	human	Gorse1999a
	Vaccine *Vector/Type:* gp160 prime with gp120 boost *Strain:* B clade MN *HIV component:* gp120, gp160				
	Keywords Th1, Th2.				
	• Helper T-cell memory responses were induced by MN rgp160 as measured by proliferation and Th1 and Th2 cytokine release – this response could be boosted by MN rgp120.				
Env	gp120		Vaccine	macaque	Heeney1998b
	Vaccine *Vector/Type:* fowlpoxvirus, ISCOM *Strain:* B clade SF2 *HIV component:* gp120				
	Keywords Th1, Th2.				
	• Vaccinated monkeys with the highest level of Th1 and Th2 responses and the highest levels of NAbs were protected against a SHIV SF13 challenge – the ISCOM strategy gave more potent anti -gp120 responses than the Fowl pox strategy.				
	• When animals were challenged 4 months after boost, those that maintained high levels of HIV-1 specific IFNγ responses, indicative of a Th 1 response, were still protected.				
Env	(IIIB)		HIV-1 infection, Vaccine	human	Boyer1999
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* Env, Rev				
	• A DNA vaccine containing env and rev was tested for safety and immune response in 15 HIV+ asymptomatic individuals.				
	• Enhanced proliferative activity and higher levels of MIP-1 alpha were detected in multiple study subjects.				
Env	Env		Vaccine	mouse	Rodríguez1999
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* GM-CSF/ENV chimera				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• A chimeric GM-CSF-env antigen expressed in a vaccinia vector elicits a higher HIV-specific env cellular immune response than when native env is used.				
Env	Env (LAI)		Vaccine	macaque	Kent1998
	Vaccine *Vector/Type:* DNA prime with vaccinia boost *Strain:* B clade LAI *HIV component:* Env, Gag **Keywords** Th1, Th2. • Priming with an HIV-DNA vaccine and boosting with a vaccinia construct induced greater levels of HIV T-cell immunity than either vaccine alone. • The proliferative response to Env and Gag after the DNA vaccination had a mean SI of 1.5-4, but after boosting with rHIV-fowlpox virus, there was a 6-17 fold increase in the mean SI for HIV Gag and Env. The T help response happened despite a fall in antibody titers, suggesting that the Th response was primarily Th1, not Th2. The CTL response was also enhanced.				
Env	gp120		Vaccine	macaque	Heeney1999
	Vaccine *Vector/Type:* DNA, protein, virus-like particle (VLP), ISCOM **Keywords** Th1, Th2. • Ten different vaccine strategies were evaluated for their ability to protect from infection in a rhesus macaque model using a non-pathogenic SHIV challenge. Protection correlated with the magnitude of NAb responses, beta-chemokines, and a balanced Th response. DNA, protein+adjuvant, VLP and ISCOM vaccines were tested. • HIV-1/ISCOMS gave the highest NAb titers, Th1 and Th2 responses, was the only vaccine formulation tested with a detectable CTL response, and gave enhanced beta-chemokine production.				
Env	gp160 (MN)		HIV-1 infection, Vaccine	human	Kundu1998a
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 • This study followed 10 HLA-A2 asymptomatic HIV+ individuals as they received MN gp160 vaccinations over a two year period. • There was an increased lymphoproliferative response but this did not impact viral load or CTL response.				
Env	gp120 (SF2)		Vaccine	macaque	Verschoor1999
	Vaccine *Vector/Type:* DNA, protein, ISCOM *Strain:* B clade SF2 *HIV component:* gp120 *Adjuvant:* MF59 • 16 rhesus Macaques were vaccinated with either an epidermal SF2 gp120 DNA vaccine, rgp120 with a MF59 adjuvant, or rgp120 incorporated into ISCOMs. • DNA vaccination elicited a weak Th type 1 response and low antibody response, rgp120/MF59 triggered a strong antibody response, and rgp120/ISCOM induced both kinds of Th cells, and a strong humoral response. • Animals were challenged with SF13 SHIV. Early induction of Th type 1 and type 2 responses with the rgp120/ISCOM vaccine provided the most effective immunity, protecting from infection.				
Env	Env (MN)		Vaccine	mouse	Kim1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86 • Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.				
Env	Env (LAI, MN)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease • A live attenuated canarypox vector expressing MN gp120 and LAI gp41/gag/protease could induce CTL and a lymphoproliferative response in healthy uninfected volunteers.				
Env	Env		Vaccine	macaque	Akahata2000
	Vaccine *Vector/Type:* DNA *Strain:* ZF1 *HIV component:* complete genome • Rhesus macaques were vaccinated by i.m. injection with naked plasmid DNA carrying an HIV-1 complete genome vaccine, strain ZF1, with a mutated zinc finger in the nucleocapsid to prevent packaging.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Env and Gag specific CTL but no antibody responses were induced in 2/4 vaccinated monkeys (MM145 and MM153) • 2/4 monkeys (MM146 and MM143) produced antibodies against p24 and/or gp160, but no CTL response was detected. • PBMC from all vaccinated monkeys produced IFNγ, in response to HIV-1 gp160, indicating a Th response – this response was 5 times higher in MM145, the animal with the strongest CTL response. • 4 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM145 and MM153 (with a homologous Env) decreased to near or below the detection limit. • 6-8 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM146 and MM143 decreased near or below the detection limit.				
Env	gp120 (W6.ID)		HIV-1 infection	human	Zhang2001b
	• T-helper cell proliferative responses to HIV p24, p55 and gp120 were tested in 27 patients with HIV infection – vigorous responses directed at Gag were detected in ten patients, but an Env specific response was detected in only one patient.				
Env	gp160		HIV-1 infection	human	Blazevic2000
	Keywords HAART. • Prolonged viral suppression resulting from potent anti-retroviral therapy did not allow an HIV T helper response to p24 or gp160, but Th proliferative responses to influenza, alloantigen, and PHA did develop in many HIV+ patients, and asymptomatic patients had stronger and more frequent Th response recovery than AIDS patients.				
Env	gp120		HIV-1 infection	human	Oxenius2000
	Keywords HAART. • Patients who started therapy at acute HIV infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.				
Env	gp120		Vaccine	human	Sabbaj2000
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *HIV component:* gp120 **Keywords** Th1, Th2. • Proliferative responses in PBMC of uninfected individuals that were vaccinated with canarypox vector expressing HIV-1 antigens (ALVAC-HIV) and boosted with a recombinant gp120 subunit vaccine gave a Th1 and Th2 proliferative response upon stimulation with HIV-1 Env. • All vaccinees produced IFNγ and IL10, most also produced IL-2, IL-6, IL-4 and IL-5.				
Env	gp120		HIV-1 infection, Vaccine	human	Hladik2001
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp120 **Keywords** Th1. • 16/29 HIV-1 infected and 24/30 vaccinated individuals had DTH reactions within 48 hours after an intradermal rec gp120 injection. Of nine DTH positive individuals, none had detectable proliferative responses. Thus skin testing may be a sensitive way to identify people with Th recall responses to vaccines, or in the absence of lymphoproliferaion. • No 48 hour DTH responses were detected among uninfected volunteers, although 10/35 (40%) of the high risk and 11/32 (34%) of the low risk individuals developed an induration resembling DTH after 7-12 days, that may be indicative of primary induction of HIV-1 specific Th1-immunity.				
Env	gp120		HIV-1 infection	human	Wilson2000b
	Keywords rate of progression, Th1, Th2. • Dysfunction of HIV-1 specific proliferative responses, but not responses to other antigens, is evident in HIV-1 progressive disease.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Vigorous HIV-1 specific responses to p24, Nef and gp120 with SI between 8-99 were seen in 6/7 long term non-progressors (LTNP), the seventh had a borderline responses. IL-2 production was seen in all cases, and IL-4 production was also evident many responses. • None of the progressors (0/5) had HIV-1 specific proliferative responses, or IL-2 or IL-4 induction. • Non-HIV antigens (cytomegalovirus, PPD, Staphylococcus enterotoxin B, tetanus toxoid) gave similar responses in HIV-1+ LTNP, progressors, and HIV-1 controls.				
Env	gp160		HIV-1 infection	human	Kalams1999a
	Keywords rate of progression, Th1. • The strength of p24 specific Gag proliferative responses (SIs) were inversely correlated with viral load in 21 ARV naive patients. The responses were Th1, IFNgamma producing. • Proliferative responses against gp160 were rarely observed (only 4 cases).				
Env	Env		Vaccine	human	MacGregor2002
	Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade MN *HIV component:* Env, Rev *Adjuvant:* Bupivacaine **Keywords** early-expressed proteins. • A phase I clinical trial of a HIV-1 Env and Rev DNA vaccine with a CMV promoter was conducted and Th proliferative, CTL and Elispot responses monitored. The construct was modified for safety and included no LTRs or packaging signals. The vaccine strategy was safe, and elicited strong CD4-T cell responses, but not CD8 T-cell responses. Rev elicited strong Th responses, and is a early produced protein so may confer advantages. • With a 300 ug dose, 4/6 individuals had a lymphocyte proliferation (LP) responses to gp120, 3/6 to Rev. • With a 1000 ug dose, 4/6 individuals had a LP and 2/6 had IFNgamma Elispot responses to gp160; 3/6 had LP, and 4/6 had IFNgamma Elispot responses to Rev. • No responses to three specific CTL epitopes were observed by Elispot in individuals with appropriate HLA. Some cytoxic activity against whole protein was observed that was CD4+ T-cell mediated.				
Env			HIV-1 infection	human	Clerici2002b
	Keywords HAART. • Specific immunity was compared in a two-year study of chronically HIV-1 infected i) HAART-naive patients who were not progressing and had strong immune responses, ii) newly treated patients followed for 24 months after initiation of HAART, iii) and long-term HAART patients who had been on HAART at least 12 months prior to the study. • HAART naïve patients had strongest proliferative responses at time zero, but long-term HAART patients the most significant increase in specific responses over the two year study period against HIV-1 gp160, influenza, and Candida. Similarly, IL-2 and IFNγ production in responses to gp160 was highest in the naïve group at time zero, but increased the most in the long-term HAART treated patients. • Short-term HAART patients showed a significant improvement in their CD4+ T cell count and a reduction of plasma viremia, and had augmented IL-7 production, which was slightly reduced in long-term HAART patients.				
Env	gp160		HIV-1 infection	human	Palmer2002
	Keywords HAART. • CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses. • gp160 proliferation responses were apparent in 7/32 donors tested, but weaker overall, with a median value for the suppressed group not above that found for HIV seronegative controls.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.				
Env	gp120 (IIIB)		HIV-1 infection	human	Geretti1994
	• Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 4/15 responders recognized this peptide, average SI = 4.4.				
Env	gp120 (IIIB)		HIV-1 infection	human	Geretti1994
	• Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 4/15 responders recognized this peptide, average SI = 4.4.				
Env	gp120 (SF2)		HIV-1 infection	human	Imami2002b
	Keywords inter-clade comparisons, rate of progression. • 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. • In a comparison of responses to HIV-1 proteins based on 10 non-progressors, 3 immunologically discordant, and 70 progressors, SIs were always much higher for non-progressors and immunologically discordant than progressors. Among the non-progressors, the responses to different antigens were greater using p24 peptides than native p24. Native p24, Nef, gp120 proteins, and Remune (gp120 depleted HIV-1, p24 is subtype G), had roughly comparable distributions of SI values from the non-progressors, Nef and gp120 responses were somewhat diminished in immunologically discordant patients.				
Env	(BRU)		Vaccine	mouse	Haas1991
	Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade BRU *HIV component:* virus *Adjuvant:* Complete Freund's Adjuvant (CFA) • Of 5 mouse inbred lines tested: DBA/2 (H-2d, Ad, Ed), B10.A(4R) (H-2h4, Ak) and B10.A(5R) (H-2i5) showed particularly good CD4+ T cell proliferative responses to HIV proteins (gp160, gp120, p17, p24, Nef and RT), after vaccination with inactivated virus. • B10.BR (H-2k, Ak, Ek) and C57BL/6 (H-2b and Ab) had weaker responses.				
Env	gp120 (HIV-1,IIIB)		HIV-1 exposed seronegative	human	Fowke2000
	Keywords HIV exposed persistently seronegative (HEPS). **Assay type** cytokine production. • A cohort of Nairobi sex-worders were defined to be resistant to infection by virtue of remaining seronegative despite repeated high risk exposure. 24 were tested for HIV specific T-helper responses detemined by IL-2 production *in vitro* in response to gp120 peptides or soluble gp120 protein. • In 7/17 resistant women showed IL-2 stimulation >= 2.0, and specific CTL responses were detected in 15/22 resistant women. 0/12 of the control low-risk subjects had detecatble T-cell responses.				
Env	gp160		HIV-1 infection, Vaccine	human	Hejdeman2003
	Vaccine *Vector/Type:* protein *HIV component:* gp160 *Adjuvant:* aluminum phosphate **Keywords** HAART, immunotherapy.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Assay type proliferation.				
	• Groups of ten asymptomatic HAART-treated HIV-1+ patients with undetected viral loads were monitored for two years after i) no immunization, ii) immunization with rgp160, or iii) immunization with tetanus. Ten NIV-1 negative volunteers were immunized with tetanus as a control. Results were compared with an rgp160 group tested before HAART was available. The HAART-treated group had increased magnitude and duration of proliferative response to rgp160, maintaining the response for the two year study period. CD4 T-cell responses to tetenus were also improved in the HAART group.				
	• The recall response to tetanus toxoid and tuberculin were boosted by the rgp160 immunization, particularly in the HAART-treated group.				
Env			HIV-1 exposed seronegative		Puro2000
	Keywords HIV exposed persistently seronegative (HEPS), acute infection, early treatment.				
	Assay type cytokine production.				
	• This was a case report of a health care worker who had an percutaneous injury and exposure to HIV, and was immediatedly given combination therapy. The individual remained HIV Ab negative, but had tranisiently detectable viral RNA 2-3 weeks after the exposure. 58 weeks after exposure a Th response was detected by IL-2 production in response to HIV Env peptides.				
Env			Vaccine	rabbit	Radaelli2003
	Vaccine *Vector/Type:* fowlpoxvirus, DNA prime with virus-like particle (VLP) boost *Strain:* B clade 89.6 *HIV component:* Env, Gag-Pol				
	Keywords Th1, Th2.				
	Assay type cytokine production.				
	• Rabbits were immunized with fowlpox recombinant vectors or expression plasmids, which express either SIVmac239 gag/pol or HIV-1 env 89.6P genes, and then boosted with virus-like particles (VLPs)(gag/pol SIV with HIV env 89.6).				
	• A lymphoproliferative Th0 profile response and homologous neutralizing Ab were seen in all three groups. The pcDNA3gag/pol SIV construct was more efficient at producing Abs than the fowlpox construct, although the fowlpox env89.6 construct elicited good humoral and cellular responses. VLP boosting was shown to be efficacious; the pseudoviral structure of the VLP providing a more natural protein conformational was considered helpful for eliciting long term memory cells.				
Env	gp160		HIV-1 infection, Vaccine	human	Ratto-Kim2003
	Vaccine *Vector/Type:* canarypox prime with gp160 boost *Strain:* B clade MN/LAI-2 *HIV component:* gp160				
	Keywords vaccine-specific epitope characteristics, vaccine-induced epitopes.				
	Assay type proliferation.				
	• The CD4+ T-helper response to vaccinees given ALVAC-HIV(vCP205) alone, rgp160 MN/LAI-2 alone, or the two combined in a prime-boost was investigated by establishing T cell lines and comparing proliferative responses to a series of peptides (15 mers overlapping by 10) spanning autologous gp160 MN/LAI-2. Th responses against Env during natural HIV-1 infection were also studied.				
	• Broad, strong T-helper responses scattered across the Env were obtained from volunteers who received a prime boost vCP205 + rgp160MN/LAI-2, while those receiving rgp160 responded to fewer peptides, and vCP205 to very few peptides.				
	• HIV-1+ volunteers had less breadth and amplitude of Th responses than vaccinees that got the prime-boost vaccine, although T-cell lines were readily generated from HIV+ individuals. Some vaccinees targeted C1 and C5, while infected individuals did not, and some infected individuals targeted V3, while vaccinees did not.				
	• The authors note that the differences in response may be contributed to by the fact the peptides used to screen the responses were the same as the vaccine strain, and different than the strains in the natural infection, but that there also may be real immunological differences in the two scenarios of vaccine verses natural infection.				
Env	gp120		HIV-1 infection		Sullivan2003
	Keywords HAART.				
	Assay type proliferation.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Lymphoproliferative responses to HIV antigens p24, gp120 and Nef were enhanced in eight patients who were switched from protease inhibitors to non-nucleoside reverse transcriptase inhibitors.				
Env	gp120 **Keywords** HAART. **Assay type** cytokine production, proliferation. • Upon initiating HAART, CD4+ T cell proliferative responses in 36 patients were restored to specific antigens, mitogens, and IL-2. Restored recall responses were largely to persistent antigens, and not to HIV-1 or new antigens, and recall responses were associated with IL-2, not IL-4 production.		HIV-1 infection	human	Hardy2003
Env	gp120 **Vaccine** *Vector/Type:* DNA *HIV component:* Env, Gag, Pol *Adjuvant:* IFN-gamma, IL-2, IL-4 **Keywords** Th1. • Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of Th1 cytokine IFNγ drove Th1 immune responses and enhanced CTL responses.		Vaccine	mouse (H-2^d)	Kim2000
Env	gp120 (IIIB) **Vaccine** *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** Th1, Th2. • Helicobacter pylori induces Th1 responses early, but predominantly Th2 responses later in infection (at 6 weeks) – differentiation of HIV-1 gp160 CD4+ help and CD8+ CTL effector cells in response to HIV gp160-vaccinia vaccination is impaired in BALB/c mice infected with H. pylori.		Vaccine	mouse (H-2^d)	Shirai2001
Env	gp120 (V3) and p24 (IIIB, MN, BH10) **Vaccine** *Vector/Type:* virus-like particle (VLP) *Strain:* A clade UG5.94UG018, B clade IIIB *HIV component:* Gag, gp120 **Keywords** inter-clade comparisons. • Different HIV strains were used for different regions: gp120 A clade UG5.94UG018, HIV-1 IIIB • BALB/c mice were given intraperitoneal immunization in the absence of adjuvants with virus-like particles (VLPs) expressing recombinant subtype A gp120 and Pr55gag. • High dose-independent humoral responses were elicited against both gp120 and p24 peptides, and CTL responses were observed against target cells carrying vaccinia expressed gp120 and Gag. • Recombinant rgp120 (clade B, MN) induced T cell proliferative responses *in vitro* from vaccinated animals.		Vaccine	mouse (H-2^d)	Buonaguro2002
Env	gp160 (IIIB) **Vaccine** *Vector/Type:* peptide, protein *Strain:* B clade IIIB *HIV component:* gp160, V3 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** Th1, Th2. • Mice were intranasally immunized with 20 ug of HIV-gp160 and 5 ug of peptide E7 (RIHIGPGRAFYAARK) with the adjuvant LT(R192G), a heat-labile enterotoxin produced by E. coli. • Adjuvant LT(R192G) was required for stimulation of antigen-specific IgG1, IgG2 antibodies, and Th1 and Th2 cytokines responses to gp160, and peptide-specific CTL responses. • Increased IFNγ, IL-10 and IL-6 cytokine production specific to gp160 was measured with co-immunization of gp160 with LT(R192G)		Vaccine	mouse (H2^d)	Morris2000
Env	gp160 (IIIB) **Vaccine** *Vector/Type:* DNA with CMV promotor *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* Br-cAMP **Keywords** Th1.		Vaccine	mouse (H2^d)	Arai2000

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The CMV promotor responds to the intracellular level of cAMP, and 8 Br-cAMP can increase transgene expression so it was co-administered with a CMV-based DNA vaccine both intranasally and intramuscularly. • 8 Br-cAMP increased serum IgG responses, HIV-specific CTL, DTH and Th1 responses, and IgA in the intranasal vaccination. • A CAT assay study showed adjuvant effect was due to CMV promotor activation.				

III-B-16 Nef Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (1–20)	Nef (1–20 LAI)	MGGKWSKSSVVGWPTVRERM	Vaccine	mouse (H-2^d)	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Nef (1–20)	Nef (1–20 HXB2)	MGGKWSKSSVIGWPTVRERM	HIV-1 infection	(H-2^d)	Peng2001
	Keywords class I down-regulation by Nef. • Deletion of the 19 N-terminal amino acids from Nef including the myristolation signal eliminates Nef-induced down-regulation of MHC class I and CD4 molecules. Such a construct has the potential to serve as a more potent immunogen. The known T-cell epitopes that that would be disputed by this deletion are minimal, a murine H-2d Th epitope in the peptide MGGKWSKSSVIGWPTVRERM, and a HLA-B8 CTL epitope, WPTVRERM.				
Nef (14–22)	Nef (14–22 SF2)	SAIRERMRR	in vitro stimulation or selectio	human (DRw6)	Wentworth1994
	Keywords epitope processing. **Epitope name** 95.12, 33.6. **Assay type** proliferation. **Donor HLA** DRw52, DRw6, DRw15(2), DQw1, DQw6, DP4. • Seven CD4+ T-cell clones that proliferated in responses to SF2 Nef were generated *in vitro* by stimulation of PBMC from uninfected donors. These CD4+ clones also had cytotoxic activity. • These seven clones were capable as of presenting their epitopes to themselves, if Nef peptides were provided. • The two clones that recognized the epitope SAIRERMRR could also auto-present Nef protein, suggesting that they recognized this epitope in the context of the intact, unprocessed protein.				
Nef (16–35)	Nef (16–35 LAI)	VRERMRRAEPAADGVGAASR	Vaccine	mouse (H-2^d)	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Nef (31–50)	Nef (31–50 LAI)	GAASRDLEKHGAITSSNTAA	Vaccine	mouse (H-2^d)	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Nef (43–49)	Nef (47–53 SF2)	ITSSNTA	in vitro stimulation or selectio	human (DQw7)	Wentworth1994
	Keywords epitope processing. **Epitope name** 1.13. **Assay type** proliferation. **Donor HLA** DR1, DR8, DRw52, DQw1, DQw7, DP4. • Seven CD4+ T-cell clones that proliferated in responses to SF2 Nef were generated *in vitro* by stimulation of PBMC from uninfected donors. These CD4+ clones also had cytotoxic activity. • These seven clones were capable as of presenting their epitopes to themselves, if Nef peptides were provided.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (45–69)	Nef (45–69 BRU)	SSNTAATNAACAWLEAQEE-EEVGFP	Vaccine	chimpanzee, rat	Estaquier1992
	Vaccine *Vector/Type:* peptide prime with protein boost *Strain:* B clade BRU *HIV component:* Nef • Antigenic domain: ATNAACAWL, priming with peptide enhanced subsequent Ab response to Nef protein immunization.				
Nef (45–69)	Nef (45–69)	SSNTAATNAACAWLEAQEE-EEVGFP	Vaccine	rat	Rouaix1994
	Vaccine *Vector/Type:* peptide *Adjuvant:* aluminum hydroxide **Keywords** vaccine-specific epitope characteristics. • Covalently linking the potent Th epitope Nef 45-69, which can induce Th proliferative responses at low doses with no adjuvant in Lou/M rats, to a weaker epitope from Schistosoma mansoni allows the induction of detectable Th responses to the Schistosoma epitope.				
Nef (46–65)	Nef (46–65 LAI)	SNTAATNAACAWLEAQEEEE	Vaccine	mouse (H-2^{d})	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Nef (56–68)	Nef (56–68 HXB2)	AWLEAQEEEEVGF	Vaccine	mouse (DQ2, DQ3, DQ5, DQ6, DQ7, DQ8,)	Pancré2002
	Vaccine *Vector/Type:* peptide *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** binding affinity, cross-presentation by different HLA, Th1, TCR usage. • This highly conserved Nef epitope has promiscuous HLA-DQ class II binding potential. It has a can bind to 6 different HLA-DQ alleles, but did not bind to any HLA-DR alleles tested. It bound to DQ2 and DQ8 with particularly high affinity, and with DQ7 with low affinity. • DQ transgenic mice (in particular DQ8) mounted strong cellular and humoral responses after immunization with this peptide. • Ex vivo stimulation of CD4+ T-cells from 14 healthy donors (with diverse HLAs) with this peptide presented on autologous DCs resulted in Th1-associated cytokine production. IFNgamma production was stimulated in 7/14 cases, both IFNgamma and IL-2 in 6/14, and just IL-2 in 1/14. No IL-4 or IL-5 production was observed. • Peptide-specific CD4+ T-cell clones with different HLA presenting molecules demonstrated a preference for TCR Vβ6.1.				
Nef (61–80)	Nef (61–80 LAI)	QEEEEVGFPVTPQVPLRPMT	Vaccine	mouse (H-2^{b})	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Nef (64–73)	Nef (68–77 SF2)	EEVGFPVRPQ	in vitro stimulation or selectio	human (DRw15(2))	Wentworth1994
	Keywords epitope processing. **Epitope name** 59.25. **Assay type** proliferation. **Donor HLA** DR1, DRw15(2), DQw1, DP4. • Seven CD4+ T-cell clones that proliferated in responses to SF2 Nef were generated *in vitro* by stimulation of PBMC from uninfected donors. These CD4+ clones also had cytotoxic activity. • These seven clones were capable as of presenting their epitopes to themselves, if Nef peptides were provided.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (66–73)	Nef (70–77 SF2)	VGFPVRPQ	in vitro stimulation or selectio	human (DR1, DRw15(2))	Wentworth1994
	Keywords epitope processing. **Epitope name** 29.16. **Assay type** proliferation. **Donor HLA** DR1, DRw15(2), DQw1, DP4. • Seven CD4+ T-cell clones that proliferated in responses to SF2 Nef were generated *in vitro* by stimulation of PBMC from uninfected donors. These CD4+ clones also had cytotoxic activity. • These seven clones were capable as of presenting their epitopes to themselves, if Nef peptides were provided.				
Nef (66–97)	Nef (66–97 LAI)	VGFPVTPQVPLRPMTYKAA-VDLSHFLKEKGGL	Vaccine	human	Gahery-Segard2000
	Vaccine *Vector/Type:* lipopeptide • Anti-HIV lipopeptide vaccine consisting of six long peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial. • A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 5/10 reacted to this Nef peptide. • 9/12 tested mounted a CTL responses to at least one of the six peptides, each of the six peptides elicited a CTL response in at least one individual. • 5/12 tested had an IgG response to this peptide.				
Nef (76–95)	Nef (76–95 LAI)	LRPMTYKAAVDLSHFLKEKG	Vaccine	mouse (H-2^b)	Hinkula1997

These CD4+ clones also had cytotoxic activity.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• These seven clones were capable as of presenting their epitopes to themselves, if Nef peptides were provided.				
Nef	Nef (LAI)		HIV-1 infection	human	daSilva1998
	• This study compares the level of variation in Nef CTL epitopes to helper and MAb epitopes from the same region. • CTL epitopes tend to be more conserved than either helper or MAb epitopes and there are stronger functional constraints in the regions where CTL epitopes cluster.				
Nef	Nef		Vaccine	human	Calarota1999
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat **Keywords** HAART. • 9/9 HIV-1+ subjects were given one of three DNA vaccinations for nef, rev or tat, and novel proliferative and CTL responses were generated. • The nef DNA immunization induced the highest and most consistent CTLp activity, IFNγ production, and IL-6 and IgG responses. • Highly active antiretroviral treatment (HAART) did not induce new HIV-specific CTL responses but reduced viral load, while DNA vaccination induced new immune responses but did not reduce viral load – thus this is a potentially complementary and promising combination.				
Nef	Nef		HIV-1 infection, Vaccine	human	Calarota2001
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat *Adjuvant:* CpG immunostimulatory sequence (ISS) **Keywords** review, Th1. • This review discusses the cellular immune response, and comments on CpG induction of Th1 cytokines and enhanced immune responses, and HIV-1 DNA vaccine boosting of CTL and Th proliferative responses in asymptomatic HIV+ individuals.				
Nef	Nef		HIV-1 infection	human	Oxenius2000
	Keywords HAART. • Patients who started therapy at acute HIV infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.				
Nef	Nef		HIV-1 infection	human	Wilson2000b
	Keywords rate of progression, Th1, Th2. • Dysfunction of HIV-1 specific proliferative responses, but not responses to other antigens, is evident in HIV-1 progressive disease. • Vigorous HIV-1 specific responses to p24, Nef and gp120 with SI between 8-99 were seen in 6/7 long term non-progressors (LTNP), the seventh had a borderline responses. IL-2 production was seen in all cases, and IL-4 production was also evident many responses. • None of the progressors (0/5) had HIV-1 specific proliferative responses, or IL-2 or IL-4 induction. • Non-HIV antigens (cytomegalovirus, PPD, Staphylococcus enterotoxin B, tetanus toxoid) gave similar responses in HIV-1+ LTNP, progressors, and HIV-1 controls.				
Nef	Nef (BRU)		Vaccine	mouse	Moureau2002
	Vaccine *Vector/Type:* protein *Strain:* B clade BRU *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA), PLG **Keywords** Th2. • BALB/c mice were immunized with Nef alone, Nef with Freund's adjuvant, or Nef encapsulated in poly(DL-lactide-co-glycolide) PLG microparticles. • High Ab titers (predominantly IgG1) against Nef were retained for seven months in the mice infected with Nef-PLG, 3-fold higher than Nef in Freund's, 5-fold higher than Nef alone. • CD4+ T-cell lymphoproliferative were observed, and cytokine profiles indicated this was primarily a Th2 response.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef	Nef (SF2)		HIV-1 infection	human	Imami2002b
	Keywords inter-clade comparisons, rate of progression. • 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. • In a comparison of responses to HIV-1 proteins based on 10 non-progressors, 3 immunologically discordant, and 70 progressors, SIs were always much higher for non-progressors and immunologically discordant than progressors. Among the non-progressors, the responses to different antigens were greater using p24 peptides than native p24. Native p24, Nef, gp120 proteins, and Remune (gp120 depleted HIV-1, p24 is subtype G), had roughly comparable distributions of SI values from the non-progressors, Nef and gp120 responses were somewhat diminished in immunologically discordant patients.				
Nef	(BRU)		Vaccine	mouse	Haas1991
	Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade BRU *HIV component:* RT, virus *Adjuvant:* Complete Freund's Adjuvant (CFA) • Of 5 mouse inbred lines tested: DBA/2 (H-2d, Ad, Ed), B10.A(4R) (H-2h4, Ak) and B10.A(5R) (H-2i5) showed particularly good CD4+ T cell proliferative responses to HIV proteins (gp160, gp120, p17, p24, Nef and RT), after vaccination with inactivated virus. • B10.BR (H-2k, Ak, Ek) and C57BL/6 (H-2b and Ab) had weaker responses.				
Nef	Nef				
Nef	Nef		HIV-1 infection		Sullivan2003
	Keywords HAART. **Assay type** proliferation. • Lymphoproliferative responses to HIV antigens p24, gp120 and Nef were enhanced in eight patients who were switched from protease inhibitors to non-nucleoside reverse transcriptase inhibitors.				
Nef	Nef		HIV-1 infection	human	Hardy2003
	Keywords HAART. **Assay type** cytokine production, proliferation. • Upon initiating HAART, CD4+ T cell proliferative responses in 36 patients were restored to specific antigens, mitogens, and IL-2. Restored recall responses were largely to persistent antigens, and not to HIV-1 or new antigens, and recall responses were associated with IL-2, not IL-4 production.				
Nef	Nef		Vaccine	mouse ($H\text{-}2^d$)	Ayyavoo2000
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Vif, Vpu **Keywords** inter-clade comparisons, Th1. • Splenocytes from BALB/c mice immunized with pVVN-P DNA were incubated with Vif, Vpu or Nef antigens for 3 days and assayed for IL-4 and IFNγ levels. • Antigen stimulation increased IFNγ production in pVVN-P immunized mice, indicating a Th1 response. • IL-4 production was not significantly changed after antigen stimulation compared to control levels. • Cross-clade CTL activity was also observed: A, B clade, CRF01(AE) clade antigens could serve as targets for the B clade immunization stimulated CTL – an HIV-1 AC recombinant, however, did not stimulate a CTL response, but was expressed at lower levels on the target cell.				

III-B-17 HIV-1 Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
HIV-1			HIV-1 infection	human	Kuhn2002
Keywords review, HIV exposed persistently seronegative (HEPS), mother-to-infant transmission. • Intrauterine exposure of infants to HIV from their mothers results in HIV-1 specific T-helper cell proliferative responses in 1/3 of exposed uninfected babies, and HIV-1 specific CTL in some. It is unknown whether these responses are associated with lack of infection, but there is some evidence that HIV-1 T-cell responses may reduce transmission in breastfeeding mothers. Summary tables are provided of CD4 and CD8 T-cell responses detected in earlier studies.					
HIV-1			HIV-1 infection, Vaccine	human	Kahn2000
Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** HAART, rate of progression. • No benefit was observed in terms of progression free survival for HIV-1 patients on ART given vaccinations with HIV-1 antigen (N=1,262) versus those vaccinated with placebo (N=1,265). There was no statistically different outcome in HIV RNA, CD4 percentage, or body weight. HIV-1 ART patients that were vaccinated did have higher absolute CD4 counts.					
HIV-1			HIV-1 infection, Vaccine	human	Moss1999
Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** HAART. • 15 HIV-1+ patients on ARV given vaccinations with HIV-1 antigen versus vaccinated with placebo. Lymphocyte proliferation of CD4+, CD8+ memory cells and NK cells to p24 and Remune HIV-1 antigen increased in HAART treated patients after vaccination.					
HIV-1			HIV-1 infection, Vaccine	human	Moss1997
Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** Th1. • HIV-1 specific stimulation of T-cell proliferation, and beta-chemokines (RANTES) and Th1-type cytokine (IFNgamma) production are found after immunization of HIV-1+ individuals with HIV-1 immunogen.					
HIV-1			HIV-1 infection, Vaccine	human	Levine1996
Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus *Adjuvant:* Incomplete Freund's Adjuvant (IFA) • Long-term follow up of HIV-1+ individuals given HIV-1 immunogen, suggesting those patients who became HIV-DTH-responsive in response to the HIV-1 immunogen had a better clinical outcome. Of twelve who developed DTH-responsiveness, one got an opportunistic infection and died, and one developed KS. Of the 13 patients who remained HIV-DTH-nonresponsive, 9 (69%) progressed to AIDS and 7 of these had died.					
HIV-1			Vaccine	human	Turner1994
Vaccine *Vector/Type:* HIV-1 immunogen *Adjuvant:* Incomplete Freund's Adjuvant (IFA) • A dose response study of HIV immunogen in IFA was conducted. Doses of 50, 100, 200, or 400 micrograms (total protein) were tested by DTH skin testing to the inactivated HIV-1 antigen. The HIV-1 immunogen was well tolerated, and the minimum dose required to induce HIV-1 DTH was 100 micrograms.					
HIV-1			HIV-1 infection	human, macaque	Wodarz2002
Keywords dynamics, HAART.					

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Mathematical modeling is used to support the idea that T-helper cell dysfunction results in a compromised ability to maintain an anti-HIV CTL memory response. Models suggest strategies to restore CTL memory through therapy and improve long-term immunological control of the virus.				
HIV-1			HIV-1 infection, Vaccine	human	Imami2002a
	Vaccine *Vector/Type:* DNA, canarypox, gp120 depleted virus HZ321 (REMUNE(TM)), protein, virus-like particle (VLP), adenovirus *Adjuvant:* GM-CSF, Growth Hormone, IL-12, IL-2, IL-7, CpG immunostimulatory sequence (ISS), Thymosin alpha-1 **Keywords** HAART, review, rate of progression, immunotherapy. • This review addresses the use of immunotherapy and therapeutic immunization to help chronically infected patients maintain a strong anti-HIV-1 T-cell response. The loss of anti HIV-1 proliferative responses early after infection is reviewed, as are therapeutic vaccinations, with or without HAART, and strategies for immunomodulation that can be given with or without vaccination.				
HIV-1			HIV-1 infection	human	Heeney2002
	Keywords review, rate of progression, Th1, Th2. • Review of the importance of balanced Th1 and Th2 HIV-specific CD4 T-cell responses in control of infection and for vaccination strategies.				
HIV-1			HIV-1 infection		Bernaschi2002
	Keywords dynamics, rate of progression, escape. • A cellular automata model was used to model the dynamics of HIV-1 infection and progression to disease. The model suggests the long aymptomatic period is due to immune escape mutants with lower viral fitness, and with AIDS resulting from a drastic reduction of the T-helper cell reservoire.				
HIV-1			Vaccine		Altes2002
	Keywords dynamics, kinetics. • This study employs a mathematical model to study the consequences of increasing the T-helper response through a vaccine, which would have counter-balancing effects in a new infection: a more intense response provides more help but also more target cells. The model indicates that if the infecting virus had a low replication rate, then CTLp and CD4 helper cells could control an infection. Only a vaccine that could increase CTL responsiveness could reduce viral set point with observed replication rates. • A CD4+ T-cell response without maintained CTL response was deleterious in this model.				
HIV-1			HIV-1 infection		Bajaria2002
	Keywords dynamics, HAART, rate of progression. • This paper presents a dynamical model of HIV infection and progression that includes CD4 T-cell naive and memory populations distributed between the peripheral blood and the lymph nodes, as well as the effects of HAART. Increasing viral replication and infectivity and decreasing T-cell immunity had impact on the rate of disease progression in this model.				
HIV-1	(HZ321)		Vaccine	mouse	Ayash-Rashkovsky2002
	Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *Adjuvant:* Incomplete Freund's Adjuvant (IFA), CpG immunostimulatory sequence (ISS) **Keywords** Th1, Th2. • Parasitic helminthic infections in humans, common in parts of Africa and Asia, can shift immune responses to Th2 responses. To model this, BALB/c mice were infected with the parasite Schistosoma mansoni, and the infected mice showed a dominant Th2 immune response. Vaccination with gp120-depleted HIV-1 viral particles and incomplete Freund's adjuvant induced Th2 responses in these mice, but this could be shifted towards a Th1 profile when CpG oligodeoxynucleotide was added to the vaccine as an immunostimulatory agent.				
HIV-1	HIV-1 except gp120		HIV-1 infection	human	Ghanekar2001
	Keywords HAART, rate of progression.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 12 long term non-progressors (>10 years) went on HAART, while 14 elected not to go on HAART. After a year on HAART, higher frequencies and absolute numbers of HIV-specific memory CD4+ T-cells were observed in untreated patients than patients receiving HAART therapy, tested by stimulation an proliferation responses to HIV Remune antigen (gp120 depleted vaccine). • These results indicate a control of viral replication in therapy-naive patients may be mediated by their ability to respond to recall viral antigen, and that the diminished response in treated patients may contribute to viral rebound.				
HIV-1			HIV-1 infection	human	Pido-Lopez2002
	Keywords HAART, Th2. • The thymic output in HAART-treated HIV-1 infected patients with progressive disease was studied. One patient also receiving steroid treatment therapy had a weak response in a sjTREC assay indicating a dysfunctional thymus, while four patients not on steroids had clear positive sjTREC readings after HAART. Stimulation of PBMC with multiple recall antigens including gp120, p24 and Nef and mitogens, and revealed that in the patient treated with steroids there was and induction of a Th2 type response indicated by increased levels of IL-4 secretion in response to antigen.				
HIV-1			Vaccine		Berzofsky2001
	Vaccine *Vector/Type:* peptide *Adjuvant:* GM-CSF, IL-12, IL-2, IL-4, Tumor Necrosis Factor α (TNFα) **Keywords** binding affinity, review, Th1, Th2, mucosal immunity. **Assay type** Th support of CTL response. • Vaccine clusters were constructed containing T helper, CTL aand neutralizing antibody epitopes, and used to immunize mice. Four things were found to enhance the vaccine immune response: i) increasing the affinity of the peptide for the presenting MHC molecule, called epitope enhancement; ii) increasing the avidity of MHC/peptide complex for the T-cell receptor; iii) incorporating cytokines IL-2, GM-CSF, TFN-α, or IL-12 and IL-4 which steer responses towards Th1 or Th2 responses; iv) inducing mucosal immunity specifically, with intrarectal being most effective.				
HIV-1			Vaccine	human	Boyer2002
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag *Adjuvant:* B7, GM-CSF, IL-12, IL-15 **Keywords** review, Th1, Th2. • The first generation of HIV-1 plasmid vaccines in 167 individuals induced T-helper responses in most vaccine recipients, however CTL responses were below a 20% response rate. REV-independent RNA optimized constructs (pGag and pEnv) as well as B7 costimulatory molecules could significantly enhance CD8 effector cell responses. Co-administered GM-CSF enhanced antibody repsonses, IL-12 CTL production. IL-15 increased T cell expansion without increasing T cell help.				
HIV-1	HIV-1		HIV-1 infection		Breen2002
	Keywords review. **Assay type** cytokine production. • HIV-1 triggers immunological dysfunction in multiple ways, including the loss of CD4-positive T helper cells in quantity and function and hyperactivity and changes in the production and activity of cytokines. The role of pro- and anti-inflamatory cytokines are discussed, including IL-10, which can suppress HIV-1, and IL-1, IL-6, TNFα which up-regulate HIV-1.				
HIV-1			HIV-1 infection	human	Clerici1993b
	Assay type cytokine production, proliferation. • rCD4-IgG treatment was associated with improved Th cell function measured by IL-2 production in response to alloantigen or PHA, but not to influenza (a recall antigen response), in 9/10 patients. No clinical benefit was evident. rCD40IgG was also shown to block gp120 induced suppression of Th cells *in vitro*. Proposed mechanisms include: inhibiting HIV-cell fusion by blocking the binding of gp120 to CD4, competing with free gp120 for binding to the CD4 receptor and reducing gp120 induced immunosupression, and gp120-induced direct killing of Th cells.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
HIV-1	Nef		HIV-1 infection	human	Draenert2003

Keywords assay standardization.
Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining.

- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses.

HIV-1	Nef		HIV-1 infection	human	Draenert2003

Keywords assay standardization.
Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining.

- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses.
- Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays.
- Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivites were observed using the B.AU.AF064676 peptides but not the consensus.
- Using an overlap of 10 or 11 amino acids did not make a difference.

HIV-1			HIV-1 infection		Galli2003

Keywords HAART.
Assay type cytokine production.

- HIV-1-infected women who developed Adepose tissue alterations (ATA) while recieving antiretroviral treatment (ART) had a favorable immunological profile with efficient IL-2 production and T-helper function. The authors suggest that ATA may be related to the ART-driven restoration of immune function.
- The most prominant feature of women with ATA that were recieving ART was increased IL-12 production with a lower TNF alpha and IL-10 synthesis.

HIV-1			HIV-1 infection		Norris2002

Keywords review.

- This paper reviews the role of Th cells in controlling HIV-1 infection, and in other viral infections. It describes CD4+ T-cell support of Ab production, CTL responses, as well as antiviral cytokine production and infected-cell killing. HIV+ patients with a low viral load and rare virgorous HIV-specific CD4+ proliferative responses, and the benefit of early treatment in preserving Th HIV-specific responses allowing immune control when therapy is subsequently stopped, are described.

HIV-1			HIV-1 infection	human	Norris2001a

Keywords review, rate of progression, acute infection.

- This review goes over the evidence for HIV-1 specific T-helper cell and CTL responses being critical inhibiting viral replication. LTNPs and those treated during acute HIV-1 infection generate specific T-helper responses, but most chronically infected individuals do not.

HIV-1			HIV-1 and GBV-C co-infection	human	Nunnari2003

Keywords HAART, rate of progression, Th1, Th2.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Assay type cytokine production. • HIV-1 positive patients co-infected the GBV-C, the hepatitis G virus, have a longer survival time to AIDs and higher CD4+ T cell counts than patients that were not infected with GBV-C. GBV-C co-infected patients showed an intact Th-1 profile over time, with high serum levels of IL-2 and IL-12, and diminishing Th-2 responses reflected by lower levels of IL-4 and IL-10. The opposite was true for HIV-1+ patients that were not co-infected with GBV-C. • AIDs progression is slower in patients infected with both HIV-1 and hepatitis G virus. It is unclear whether Th-2 and Th-1 cytokines in co-infected patients show cause or consequence of slower AIDs progression. CD4+ cells may support hepatitis G replication.				
HIV-1	HIV-1		HIV-1 infection	human	Korthals Altes2003
	Keywords dynamics, acute infection. • A model of progression was developed that explicitly assumes CD4+ T-cells are both targets of infection and mediators of the immune response. In this model, high vial inoculum with few initial CD4 T-cells resulted in target-cell-limited infection and high viral load, but with large CD4 clones and low initial inoculum, infection was controlled by CD4+ clones.

T-Helper

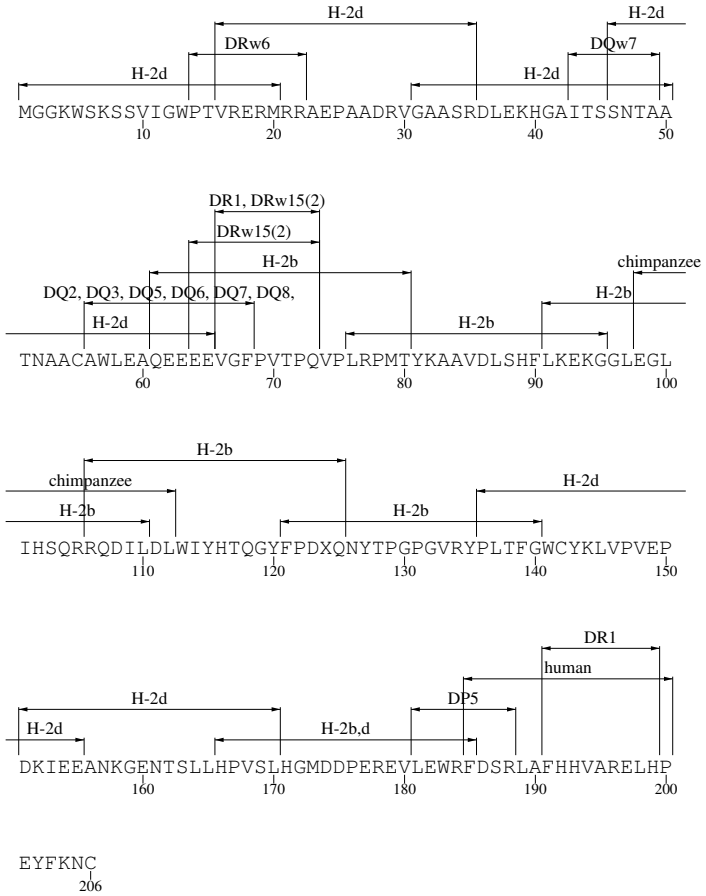
III-C-13 Nef T-Helper epitope map



Part IV

HIV Antibody Binding Sites

IV-A

Summary

Part IV summarizes HIV-specific antibodies (Abs) arranged sequentially according to the location of their binding domain, organized by protein. We attempted to make this part as comprehensive as possible. For the monoclonal antibodies (MAbs) capable of binding to linear peptides, we require that the binding site be contained within a region of 30 or so amino acids to define the epitope, but not that the precise boundaries be defined. MAbs that do not bind to defined linear peptides are grouped by category at the end of each protein. Antibody categories, for example CD4 binding site (CD4BS) antibodies, are also noted in the index at the beginning of this part. Studies of polyclonal Ab responses are also included. Responses that are just characterized by binding to a protein, with no known specific binding site, are listed at the end of each protein. For more recent updates, epitope sequence alignments, and search capabilities, please see our web site: `http://www.hiv.lanl.gov/content/immunology`.

IV-A-1 Indices

Three indices are provided. The first provides a concise list of anti-HIV-1 MAbs by cross-competition category, with both discontinuous epitopes (for example, CD4BS) and some well known linear epitopes (for example, cluster I) summarized. The second lists the MAbs' IDs in alphabetical order so one can find their location in the table. The third is a listing by order of appearance in the tables.

IV-A-2 Tables

Each MAb has a twelve-part basic entry:

Number: Order of appearance in this table.

MAb ID: The name of the monoclonal antibody with synonyms in parentheses. MAbs often have several names. For example, punctuation can be lost and names are often shortened (M-70 in one paper can be M70 in another). Polyclonal responses are listed as "polyclonal" in this field.

HXB2 Location: Position of the antibody binding site relative to the viral strain HXB2 (GenBank Accession Number K03455), which is used as a reference strain throughout this publication. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2, rather the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: `http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html`.

Author Location: The amino acid positions of the epitope boundaries and the reference sequence used to define the epitope are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases, position numbers were provided but the reference sequence identification was not. Because of HIV-1's variability, position numbers require a reference strain to be meaningful. Binding sites that cannot be defined through peptide binding or interference studies are labeled as discontinuous. The approximate location on the protein, sequence number, and reference sequence are listed.

Sequence: The amino acid sequence of the binding region of interest, based on the reference strain used in the study defining the binding site. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed

by a question mark in the table.

Neutralizing: **L**: neutralizes lab strains. **P**: neutralizes at least some primary isolates. **no**: does not neutralize. No information in this field means that neutralization was either not discussed or unresolved in the primary publications referring to the MAb.

Immunogen: The antigenic stimulus of the original B cell response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted on a separate line, and additional information about the vaccine antigen is provided as available.

Species(Isotype): The host that the antibody was generated in, and the isotype of the antibody.

Research Contact: Information about an antibody or how to obtain it, as well as to provide credit.

References: All publications that we could find that refer to the use of a specific monoclonal antibody. First is a list of all references. Additional details for some of the older references can be found in Part V, although we have tried to keep the entries self-contained since 1997. The "donor" field is meant to serve as a potential guide to a source of information about an antibody or how to obtain it, as well as to provide credit.

Keywords: Keywords for antibody entries were initiated in 2004. The set of keywords includes acute infection; ADCC; adjuvant comparison; anti-idiotype; antibody binding site definition and exposure; antibody generation; antibody interactions; antibody sequence, variable domain; assay development; assay standardization; autologous responses; binding affinity; brain/CSF; co-receptor; complement; enhancing activity; escape; genital and mucosal immunity; HAART; HIV exposed persistently seronegative (HEPS); immunodominance; immunoprophylaxis; immunotherapy; immunotoxin; inter-clade comparisons; isotype switch; kinetics; mimotopes; mother-to-infant transmission; mucosal immunity; rate of progression; responses in children; review; structure; Th1; Th2; vaccine antigen design; vaccine-induced epitopes; vaccine-specific epitope characteristics; and variant cross-recognition or cross-neutralization. The keywords are list when available as part of the main entry, and also follow the note in bold type so references pertaining to particular types of studies can be found quickly.

Notes: Describe the context of each study, and what was learned about the antibody in the study.

IV-A-3 HIV protein binding site maps

The names of MAbs and the location of well characterized linear binding sites of 21 amino acids or less are indicated relative to the protein sequences of the HXB2 clone. This map is meant to provide the relative location of epitopes on a given protein, but the HXB2 sequence may not actually bind to the MAb of interest, as it may vary relative to the sequence for which the epitope was defined. Above each linear binding site, the MAb name is given followed by the species in parentheses. Human is represented by 'h', non-human primate by 'p', mouse by 'm', and others by 'o'. More precise species designations for any given MAb can be found using the web search interface or in the tables in this part.

IV-A-4 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the MAb search tool at `http://www.hiv.lanl.gov/content/immunology`. All epitopes are aligned to the HXB2 sequence, with the sequence used to define the epitope indicated directly above it. Sequences are sorted by their subtype and country of origin.

The master alignment files from which the epitope alignments were created are available at our web site (`http://www.hiv.lanl.gov/ALIGN_CURRENT/ALIGN-INDEX.html`). The alignments were modified in some cases to optimize the alignment relative to the defined epitope and minimize insertions and deletions; epitope alignments are generated by anchoring on the C-terminal residue. A dash indicates identity to the consensus sequence, and a period indicates an insertion made to maintain the alignment. Stop codons are indicated with a `$`, and frameshifts by a `#`, or ambiguous codons (nucleotide was `r`, `y`, or `n`) by an `x`; they are inserted to maintain the alignments. In consensus sequences an upper case letter indicates the amino acid was present in all sequences, a lower case letter indicates the amino acid was present in most sequences in a given position, and a question mark indicates two or more amino acids were represented with equal frequency.

cluster III	Fab A9 (1143), Fab G15 (1144), Fab G5 (1145), Fab L1 (1146), Fab L11 (1147), Fab L2 (1148)
cytoplasmic domain	Chessie 8 (1149)
gp120-CD4 complex	8F101 (1150), 8F102 (1151), CG-10 (1152), CG-25 (1153), CG-4 (1154), CG-76 (1155), CG-9 (1156)
immunodominant region	3D6 (698), 105-518 (1157)
p24+gp41	31A1 (1158), 39A64 (1159), 39B86 (1160), 9303 (1161)
six-helix bundle	167-D (706), polyclonal (1055), 1281 (1142), NC-1 (1162)
Nef	
C-term	AE6 (1203), AG11 (1204), EH1 (1205), AE6 (1213)

IV-B-2 Alphabetical listing of MAbs

Cross reference of MAb names and their order of appearance in the tables. Alphanumeric sorting is symbols, digits and letters.

MAb ID	No.

HIV Antibodies Tables

All HIV MAbs and polyclonal Abs that bind to linear epitopes 30 amino acids or less in length arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location, then by antibody type and finally by antibody name. Abs that bind to conformational epitopes or with unknown epitopes are listed at the end of each protein section.

IV-C-1 p17 Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
1	L14.17	p17 (11–25)	p17 (11–25 BRU)	GELDRWEKIRLRPGG	no	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* viral lysate *Strain:* B clade BRU *HIV component:* HIV-1 **References** Robert-Hebmann1992a, Robert-Hebmann1992b, Tatsumi1990					
2	polyclonal	p17 (11–25)	p17 (11–25 LAI)	GELDRWEKIRLRPGG	N	Vaccine	mouse
		Vaccine *Vector/Type:* protein, virus-like particle (VLP) *Strain:* B clade LAI *HIV component:* Gag, p17 Gag, p24 Gag *Adjuvant:* Complete Freund's Adjuvant (CFA) **References** Truong1997 • An ELISA assay was used to study a panel of Gag peptides – mature p24 CA epitopes mapped to residues 176-192, 201-218, 233-253, 285-304, and were recognized by antibodies elicited by rp24CA – one p17MA epitope, residues 11-25, and one p24CA epitope, residues 176-192, were recognized by antibodies raised against anti-p55 virus-like particles, suggesting a differentantigenic properties for p24CA and p17MA antibodies depending on whether they are produced against the mature soluble protein or the immature assembled form of the gag proteins. [Truong1997]					
3	32/5.8.42	p17 (12–19 + 100–105)	p17 (12–19 IIIB)	ELDRWEKI+ALDKIE	no	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* viral lysate **References** Papsidero1989 • 32/5.8.42: Binds to two discontinuous regions, positions 12-19 and 100-105, peptides ELDRWEKI and ALDKIE – inhibited infectivity of cell free virus. [Papsidero1989]					
4	HyHIV-1	p17 (12–29)	p17 (12–29 JMH1)	ELDKWEKIRLRPGGKTLY	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998b, Liu1995 • HyHIV-1: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. [Ota1998b]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
5	HyHIV-2	p17 (12–29)	p17 (12–29 JMH1)	ELDKWEKIRLRPGGKTLY	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998b, Liu1995 • HyHIV-2: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. [Ota1998b]					
6	HyHIV-3	p17 (12–29)	p17 (12–29 JMH1)	ELDKWEKIRLRPGGKTLY	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998b, Liu1995 • HyHIV-3: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. [Ota1998b]					
7	HyHIV-4	p17 (12–29)	p17 (12–29 JMH1)	ELDKWEKIRLRPGGKTLY?	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998b, Ota1998a, Liu1995 • HyHIV-4: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. [Ota1998b] • HyHIV-4: epitope uncertain, based on the best estimate from JMH1 sequence– Ka is 1.8 x 10^7 M-1 for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface. [Ota1998a]					
8	HyHIV-5	p17 (12–29)	p17 (12–29 JMH1)	ELDKWEKIRLRPGGKTLY	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998b, Liu1995 • HyHIV-5: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. [Ota1998b]					
9	HyHIV-6	p17 (12–29)	p17 (12–29 JMH1)	ELDKWEKIRLRPGGKTLY	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998b, Liu1995 • HyHIV-6: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. [Ota1998b]					
10	32/1.24.89	p17 (17–22)	p17 (17–22 IIIB)	EKIRLR	L	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* viral lysate **References** Papsidero1989 • 32/1.24.89: Inhibited infectivity of cell free virus. [Papsidero1989]					
11	3B10	p17 (19–38)	p17 (19–38 SIVmac)	IRLPGGKKKYMLKHVVWAA	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade AGM TYO-7 *HIV component:* HIV-1 **References** Otteken1992					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 3B10: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H) , SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one conserved immunogenic epitope recognized serologically. [Otteken1992]					
12	3E11	p17 (19–38)	p17 (19–38 SIVmac)	IRLPGGKKKYMLKHVVWAA	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade AGM TYO-7 *HIV component:* HIV-1 **References** Nilsen1996, Otteken1992					
		• 3E11: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H), SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one highly conserved immunogenic epitope. [Otteken1992] • 3E11: There is another MAb with this ID that recognizes integrase. [Nilsen1996]					
13	8H10	p17 (30–52)	p17 (30–52 JMH1)	KLKHIVWASRELERFAVNPGLLE		Vaccine	mouse (IgM)
		Vaccine *Vector/Type:* peptide *Strain:* B clade JMH-1 *HIV component:* p17 Gag *Adjuvant:* BSA **References** Ota1999b, Ota1999a					
		• 8H10: Inhibits viral replication of the HIV-1 infected MT-4 cells by decreasing p17 DNA levels in the infected cells, and the effect of growing the 8H10 hybridoma in co-culture with HIV-1 infected MT-4 cells was studied. [Ota1999b] • 8H10: The p17 MAb also can bind to the V3 loop. [Ota1999a]					
14	HyHIV-21	p17 (30–52)	p17 (30–52 JMH1)	KLKHIIWASRELERFAVNPGLLE	no	Vaccine	mouse (IgG2a)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998a, Liu1995					
		• HyHIV-21: epitope uncertain, based on the best estimate from JMH1 sequence – Ka is 3.6 x 10^6 M-1 for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface –inhibited growth of HIV-1 JMH1 in MT-4 cells when added 24 hours after the initial culture. [Ota1998a]					
15	B4f8	p17 (51–65)	p17 (51–65)	LETSEGCRQILGQLQ	no	Vaccine	rat (IgG2a)
		Vaccine *Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1 **References** Shang1991					
		• -B4f8: Did not bind live infected cells, only cells that had been made permeable with acetone. [Shang1991]					
16	HyHIV-22	p17 (52–83)	p17 (53–87 JMH1)	ETSEGCRQILGQRQPSLQTGSEELR-SLYNTIH	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998a, Liu1995					
		• HyHIV-22: epitope uncertain, based on the best estimate from JMH1 sequence – stains the surface of infected cells indicating the antigen is exposed at the cell surface – Ka is 2.3 x 10^5 M-1 for rec p17. [Ota1998a]					
17	12H-D3b3	p17 (62–78)	p17 (62–78)	GQLQPSLQTGSEELRSL	no	Vaccine	rat (IgG2a)
		Vaccine *Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1 **References** Shang1991					
		• 12H-D3b3: Did not bind live infected cells, only cells that had been made permeable with acetone. [Shang1991]					
18	12G-A8g2	p17 (86–115)	p17 (86–115)	YCVHQRIEIKDTKEALDKIEEEQNK-SKKKA	no	Vaccine	rat (IgG2a)
		Vaccine *Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1 **References** Maksiutov2002, Shang1991					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 12G-A8g2: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein(T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKGQ. [Maksiutov2002] • 12G-A8g2: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. [Shang1991]					
19	12G-D7h11	p17 (86–115)	p17 (86–115)	YCVHQRIEIKDTKEALDKIEEEQNK-SKKKA	no	Vaccine	rat (IgG2a)
		Vaccine *Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1 **References** Maksiutov2002, Shang1991 • 12G-D7h11: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKGQ. [Maksiutov2002] • 12G-D7h11: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. [Shang1991]					
20	12G-H1c7	p17 (86–115)	p17 (86–115)	YCVHQRIEIKDTKEALDKIEEEQNK-SKKKA	no	Vaccine	rat (IgG)
		Vaccine *Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1 **References** Maksiutov2002, Shang1991 • 12G-H1c7: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKGQ. [Maksiutov2002] • 12G-H1c7: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. [Shang1991]					
21	12I-D12g2	p17 (86–115)	p17 (86–115)	YCVHQRIEIKDTKEALDKIEEEQNK-SKKKA	no	Vaccine	rat (IgG2a)
		Vaccine *Vector/Type:* HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1 **References** Maksiutov2002, Shang1991 • 12I-D12g2: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKGQ. [Maksiutov2002] • 12I-D12g2: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. [Shang1991]					
22	polyclonal	p17 (86–115)	p17 (86–115)	YSVHQRIDVKDTKEALEKIEEEQNK-SKKKA	L	Vaccine	mouse (IgA)
		Vaccine *Vector/Type:* peptide *HIV component:* p17 Gag *Adjuvant:* Cholera toxin (CT) **References** Bukawa1995 • Polyclonal secretory IgA antibody raised by oral mucosal immunization is able to neutralize IIIB, SF2, and MN – HIV-1 neutralization may be due to the V3, CD4 or HPG30 component of the multicomponent peptide immunogen. [Bukawa1995]					
23	32/5.8.42	p17 (87–19 + 100–105)	p17 (IIIB)	ELDRWEKI+ALDKIE	no	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* viral lysate *HIV component:* HIV-1 **References** Papsidero1989 • 32/5.8.42: Inhibited infectivity of cell free virus – bound to two peptides, ELDRWEKI and ALDKIE, at positions 12-19 + 100-105. [Papsidero1989]					
24	11H9	p17 (101–115)	p17 (101–115 SF2)	LEKIEEEQNKSKKKA?		Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade CBL-1 *HIV component:* HIV-1 **Research Contact** R. B. Ferns and R. S. Tedder **References** Maksiutov2002, Ferns1989, Ferns1987					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 11H9: UK Medical Research Council AIDS reagent: ARP344. • 11H9: This epitope is similar to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKGQ. [Maksiutov2002] • 11H9: Reactive against p18 and p55. [Ferns1987]					
25	3-H-7 (3H7)	p17 (113–122)	p17 (113–122 BH10)	KKAQQAAADT	L	Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade IIIB **References** Levin1997, Robert-Hebmann1992a, Robert-Hebmann1992b, Niedrig1989 • 3-H-7: Called 3H7 – using a bicistronic vector, an intracellular Fab intrabody, 3H7, can inhibit HIV-1 infection when expressed in the cytoplasm of dividing CD4+ T cells – HXBIIIB and SI primary isolate virions from 3H7 expressing cells were far less infectious – 3H7 intrabody acts both at the stage of nuclear import and virus particle assembly. [Levin1997] • 3-H-7: No cross-reactivity with HIV-2 ROD or SIV MAC by immunoblot. [Niedrig1989]					
26	C5126	p17 (113–122)	p17 (113–122 HXB2)	KKAQQAAADT	no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* viral lysate *HIV component:* HIV-1 **References** Hinkula1990 • C5126: Defined epitope by peptide blocking of binding to native protein – WB reactive with p53 and p17. [Hinkula1990]					
27	1D9	p17 (119–132)	p17 (121–134 SF2)	AAGTGNSSQVSQNY		Vaccine	mouse (IgG2a)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade CBL-1 *HIV component:* HIV-1 **Research Contact** R. B. Ferns and R. S. Tedder **References** Ferns1989, Ferns1987 • 1D9: UK Medical Research Council AIDS reagent: ARP316. • 1D9: Reactive against p18, but not p55. [Ferns1987]					
28	4C9	p17 (119–132)	p18 (121–134 SF2)	AAGTGNSSQVSQNY		Vaccine	mouse (IgG2a)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade CBL-1 *HIV component:* HIV-1 **Research Contact** R. B. Ferns and R. S. Tedder **References** Ferns1989, Ferns1987 • 4C9: UK Medical Research Council AIDS reagent: ARP342. • 4C9: Reactive against p18, but not p55. [Ferns1987]					
29	4H2B1	p17 (119–132)	p17 (121–134 SF2)	AAGTGNSSQVSQNY			mouse (IgG1)

150	G11G1	Gag	p17				rat
		References Pincus1996, Shang1991 • G11G1: Immunotoxins were generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but only if the antigen was expressed at the cell surface – ricin-G11G1 did not mediate cell killing. [Pincus1996]					
151	G11H3	Gag	p17				
		References Pincus1998, Shang1991 • G11H3: This MAb is cross-reactive between p17 and mycoplasma – this antibody binds strain specifically to the variable lipoprotein (Vlp) F of M. hyorhinis, in the region of the carboxy-terminal repeat CGGSTPTPEQGNNQGGSTPTPEQGNSQVSK – the p17 epitope is discontinuous, but p17 and Vlp F share the tetrapeptide SQVS. [Pincus1998]					
152	HyHIV-19	Gag	p17 (JMH1)		no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* p17 Gag **References** Ota1998a, Liu1995 • HyHIV-19: Does not react with p17 peptides – Ka is 3.7 x 10^6 M-1 for rec p17 – inhibited growth of HIV-1 JMH1 in MT-4 cells when added 24 hours after the initial culture. [Ota1998a]					
153	IE8G2	Gag	p24			Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade CBL-1 *HIV component:* HIV-1 **Research Contact** R. B. Ferns and R. S. Tedder **References** Ferns1989, Ferns1987 • IE8G2: UK Medical Research Council AIDS reagent: ARP347. • IE8G2: Reacted with both p55 and p24 – broadly reactive – showed less than 75% homologous inhibition. [Ferns1987]					
154	V7-8	Gag	p24		no	HIV-1 infection	mouse (IgG3κ)
		References Montefiori1991, Robinson1990b • V7-8: NIH AIDS Research and Reference Reagent Program: 381. • V7-8: Reacted with HIV-1IIIB, RF, and MN. [Montefiori1991] • V7-8: Did not enhance HIV-1 IIIB infection. [Robinson1990b]					
155	anti-p24	Gag	p24			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* protein, virus-like particle (VLP) *HIV component:* Gag, gp120, Nef, Pol **Research Contact** Intracel Co **References** Buonaguro2001 • anti-p24: HIV-1 pr55 gag-based virus-like particles (VLP) carrying Nef and Pol open reading frames, as well as gp120 of the clade A isolate 94UG018, were created using a Baculovirus expression system to package additional ORFS into the VLP – anti-V3 and anti-p24 Abs were used to assess the expression levels and Gag and gp120-TM were found to be expressed at comparable levels on the VLP. [Buonaguro2001]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
156	human sera	Gag	p24			HIV-1 infection	human (IgG)
		References Binley1997b					
		• Retention of anti-Env antibodies and loss of anti-Gag antibodies during progression was studied, and suggested to be the result of the loss of T-cell help and the unique ability of Env to stimulate B cells even in a backdrop of declining CD4 cells, because of the ability of Env to bind to the CD4 molecule. [Binley1997b]					
157	polyclonal	Gag	Gag (LAI)			Vaccine	mouse
		Vaccine *Vector/Type:* DNA prime with protein boost *Strain:* B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18					
		References Billaut-Mulot2001					
		• DNA vaccinated BALB/c mice primed and boosted with a multiepitopic vaccine with IL18 showed lymphoproliferative and CTL responses – co-administration of IL18 increased T-cell responses but decreased anti-HIV Ab levels. [Billaut-Mulot2001]					
158	polyclonal	Gag	p24		no	Vaccine	rat
		Vaccine *Vector/Type:* gp120 depleted whole killed virus *Strain:* AG recombinant HZ321 *HIV component:* virus *Adjuvant:* Complete Freund's Adjuvant (CFA), CpG immunostimulatory sequence (ISS)					
		References Moss2000					
		• Lewis rats co-immunized with HIV-1 antigen in Freund's and with immunostimulatory sequences CpG stimulated increased IFNγ expressing CD4+ and CD8+ T cells and anti-p24 antibodies relative to antigen in Freund's without CpG. [Moss2000]					
		• Different HIV strains were used for different regions: subtype A env, subtype G gag.					
159	polyclonal	Gag	p24 (SF2)			Vaccine	mouse
		Vaccine *Vector/Type:* protein *Strain:* B clade SF2 *HIV component:* gp120, p24 Gag *Adjuvant:* MF59, PLG					
		References O'Hagan2000					
		• Microparticles were used as an adjuvant for entrapped HIV-1 gp120 and induced strong serum IgG responses in mice – polylactide co-glycolide polymer (PLG) microparticles in combination with MF-59 had the highest Ab response and also induced p24 specific CTL. [O'Hagan2000]					
160	polyclonal	Gag	Gag (SF2)			Vaccine	macaque, guinea pig, mouse
		Vaccine *Vector/Type:* DNA, protein *Strain:* B clade SF2 *HIV component:* Gag *Adjuvant:* aluminum phosphate, MF59, PLG					
		References O'Hagan2001					
		• DNA vaccines of codon-optimized Env and Gag genes driven by CMV promotors absorbed on to PLG microparticles were more effective than naked DNA at eliciting strong Ab responses (more rapid, higher titer, more stable), comparable to gp120 in MF-59. [O'Hagan2001]					
161	polyclonal	Gag	p24		no	Vaccine	rabbit (IgG)
		Vaccine *Vector/Type:* protein *Strain:* B clade *HIV component:* p24 Gag					
		References Gupta2001					
		• Gag p24 is the mostly widely used HIV protein for serological based diagnostic kits — phage display libraries of HIV-1 p24 identified 2 epitope-rich regions: 70% of the clones that were identified using immunized rabbit sera had DNA fragments from the N-terminal region spanning 150–240 of Gag, and 30% from the carboxy-terminal region of p24 containing amino acids 310–360 — subtype B and C comparisons were made. [Gupta2001]					
162	polyclonal	Gag	p55		no	Vaccine	mouse
		Vaccine *Vector/Type:* protein, virus-like particle (VLP) *Strain:* B clade LAI *HIV component:* CD4BS, Gag, V3					
		References Truong1996					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• Antibodies raised against recombinant anti-p55 virus-like particles with the p24 region 196-226 deleted, bearing inserts of either the V3 or the CD4BS regions of gp120 were studied – no neutralizing responses, weak Env and strong Gag responses were elicited – the major homology region (MHR) and proximal sequences was found to be required for capsid assembly. [Truong1996]					
163	polyclonal	Gag	p24 (LAI)			Vaccine	rabbit (IgG)
		Vaccine *Vector/Type:* peptide, virion, baculovirus, E. Coli recombinant protein *Strain:* B clade LAI *HIV component:* p24 Gag *Adjuvant:* Complete Freund's Adjuvant (CFA), Incomplete Freund's Adjuvant (IFA) **References** Devito2000c					
		• To compare vaccine strategies, rabbits were immunized with virion HIV-1/Lai, baculovirus recombinant p24, E. coli recombinant p24-15, and p24-derived peptides – the rabbit immunized with peptides had the broadest linear epitope responses – the capture ELISA method using anti-p24 IgG preparations was shown to capture isolates from HIV-1 subtypes or clades A to G – only immunization with virion HIV-1/Lai and baculovirus recombinant p24 developed IgG that was capable of efficiently capturing HIV-1 p24 in ELISA producing Abs able to recognise native configurations. [Devito2000c]					
164	polyclonal	Gag				Vaccine	mouse
		Vaccine *Vector/Type:* DNA *Adjuvant:* CpG immunostimulatory sequence (ISS), phosphorothioate oligodeoxynucleotides (ODNs) **References** Deml2001					
		• Immunization mice with a codon-optimized Gag was compared with a non-optimized Rev dependent Gag expression vector – Gag expression was at higher levels and Rev independent with the codon-optimized Gag, and i.m. immunization gave a stronger Th1-driven humoral and cellular immune response – intradermal immunization with either Gag DNA induced a Th2 response and no CTL. [Deml2001]					
165	polyclonal	Gag			yes	HIV-1 infection	human
		References Montefiori2001					
		• In 7/9 patients in whom HAART was initiated during early seroconversion, NAbs to autologous strains were not found immediately following treatment interuption after 1-3 years, and Env and Gag Abs were low or undetected by ELISA indicating, that early HAART suppresses the normal antibody response to HIV-1, presumably by limiting the concentration of viral antigens needed to drive B-cell maturation – in 3 patients with a viral rebound autologous NAbs rapidly appeared and correlated with spontaneous down-regulation of viremia – prolonged control of viremia after stopping treatment persisted in the absence of detectable NAbs, suggesting that cellular immune responses alone can control viremia under certain circumstances – these results support the notion that virus-specific B-cell priming, combined with CD8+ CTL induction, may be beneficial for HIV-1 vaccines that aim to suppress viremia in the absence of complete protection to prevent disease and reduce the rate of virus transmission. [Montefiori2001]					
166	polyclonal	Gag				Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* Env, Gag *Adjuvant:* Complete Freund's Adjuvant (CFA) **References** Lebedev2000					
		• Virus-like particles (VLPs) in the form of spherical particles with yeast dsRNA enveloped in a polysaccharide matrix carrying the protein TBI, that contains fragments of HIV Env and Gag, were used to immunize BALB/c mice and induced specific Abs against HIV-1 as measured by ELISA with TBI. [Lebedev2000]					
167	polyclonal	Gag			no	Vaccine	mouse (IgG1, IgG2a)
		Vaccine *Vector/Type:* DNA with CMV promotor, DNA with CMV/MCK hybrid promotor, DNA with MCK promotor **References** Bojak2002a					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• The ability of three different promoters to induce Gag specific immune responses was compared. The cytomegaliovirus (CMV) early gene promoter, which allows constitutive expression in different cells of host tissue, the tissue specific muscle creatine kinase (MCK) promoter, which may be restricted to differentiated, multinucleated myofibers and so safer, and a hybrid MCK/CMV promoter – intramuscular immunization of BALB/c mice utilizing the MCK promoter in combination with a codon optimized gag gene generated humoral (IgG1 (Th1) and IgG2a (Th2)) and CTL immune responses against HIV-1 Gag, however, the quantified immune parameters were clearly reduced as compared to CMV promotor-driven Gag expression. [Bojak2002a]					
168	polyclonal	Gag	p24		no	HIV-1 infection	human
		References Meles2002 • Indeterminant WB in Ethiopians: of 12,124 specimens blood specimens from Ethiopia, 1,437 (11.9%) were HIV-1-positive for antibody, and 91 (0.8%) gave equivocal results, most often due to p24 reactivity – subsequent testing confirmed many of the indeterminants were HIV-negative – the American Red Cross diagnostic criteria was more accurate than CDC or WHO, which would have given some false positive results. [Meles2002]					
169	polyclonal	Gag	Gag (p24)		yes	Vaccine	mouse
		Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* A clade UG5.94UG018 *HIV component:* Gag, gp120 **References** Buonaguro2002 **Keywords** inter-clade comparisons. **Country** Uganda. • BALB/c mice were immunized with VLPs carrying a subtype A gp120. Humoral immune responses directed against B-clade derived Gag (p24) peptides or gp120-Env V3 loop peptide were readily induced following a multi-dose immunization with VLP particles presenting a gp120 molecule from a HIV-1 isolate of clade A. VLP-immunized mice showed autologous and heterologous (against B-clade HIV-1 IIIB strain) neutralization activity. Proliferative responses and CTL were also observed. [Buonaguro2002] (**inter-clade comparisons**)					
170	polyclonal	Gag	Gag			Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* DNA *HIV component:* Gag **References** Bojak2002b **Keywords** Th1. • Balb/c mice vaccinated by syngag, a DNA plasmid expressing HIV-1 Gag modified for human/mammalian codon usage, gave stronger and longer lasting immune responses than wild type gag. Gag-specific antibody and cellular immune responses were both increased, with a clear T-helper 1 polarization. There was a better IgG1/IgG2 response to intramuscular (i.m.) as compared to subcutaneous (s.c.) vaccination. [Bojak2002b] (**Th1**)					
171	polyclonal	Gag	Gag			Vaccine	macaque
		Vaccine *Vector/Type:* DNA, protein, virus-like particle (VLP), PLG microparticle *Adjuvant:* E. coli heat labile enterotoxin **References** Otten2003 • This study evaluates different vaccine technologies that avoid live vectors including plasmid DNA, recombinant p55Gag protein or gag-pol administered by polylactide coglycolide (PLG) microparticles, LTK63 as adjuvant, VLP, and plasmid DNA. 4/4 macaques primed with Gag-PLG and LTK63 showed strong antibody responses after the fourth immunization at week six. The best CTL responses were found for gag DNA, the best Th and Ab were obtained using Gag protein on PLG microparticles; Gag DNA priming with a PLG-protein boost gave high level CTL, Th and Ab responses. [Otten2003]					
172	polyclonal HIVIG	Gag	p24		P	HIV-1 infection	human
		References Nichols2002 • NYBC-HIVIG derived from patients with high NAb titers and NABI-HIVIG derived from patients with high anti-p24 Ab titers were compared in neutralizing assay against a panel of six primary isolates—both could neutralize all isolates tested but the NYBC-HIVIG dose required for 50% neutralization was of 3.2 fold lower, showing that the source plasmas influence the effective concentration of NAb present in HIVIG. [Nichols2002]					

IV-C-7 Protease Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
173	1696	Protease (1–7)	Protease (1–7 BH10)	PQIYLWQ		Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* protein *HIV component:* Protease **Ab type** N-term **References** Lescar2003, Rezacova2002, Rezacova2001, Lescar1999 **Keywords** review, structure. • 1696: Review of the implications of antibody structure and antigen peptide binding for the mechanisms of inhibition of protease activity by two MABs with different binding sites in protease. [Rezacova2002] (**review**, **structure**) • 1696: Study compares the crystal structure of the scFv-1696 in the non-complexed form compared to the complexed Fab-1696 and the Ag-bound scFv-1696 structures. Changes in the three conformational tertiary structures of CDR-H3 as well as in the different relative orientations of the light-chain variable domains of the different structures were observed, deomnstrating plasticity in the antibody binding site. [Lescar2003] (**structure**) • 1696: The crystal structure of the single chain Fv fragment of 1696 bound to a cross-reactive peptide (PQITLWQRR) was obtained. This sturcture suggests that 1696 inhibits portease activity by favoring dissociation of the active homodimer. [Rezacova2001] (**structure**) • 1696: MAb binds to HIV-1 and HIV-2, putative epitopes are PQIYLWQ and PQFSLWK respectively – Pro1 is critical, QIYLWQR residues 2-8, does not compete - MAb disrupts catalytic activity – crystal structure of the ligand-free Fab at 3 A resolution reveals a deep cavity lined by acidic and hydrophobic residues – the binding region is located within the region required for dimerization and the Fab structure could serve as a basis for drug design targeting this region. [Lescar1999] (**structure**)			
174	10E7	Protease (36–46)	Protease (38–45 HXB2)	MSLPGRWKPKM	no	Vaccine	hamster (IgG)
		Vaccine *Vector/Type:* protein *HIV component:* Protease **References** Bjorling1992, Croix1993 • 10E7: Immunodominant region of protease in Armenian hamster (but only weakly reactive in people, see: [Bjorling1992]) – peptide MSLPGRWKP blocks protease binding [Croix1993]. [Bjorling1992, Croix1993]					
175	F11.2.32	Protease (36–46)	Protease (36–46 BH10)	MSLPGRWKPKM		Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade BH10 *HIV component:* Protease **Ab type** flap region **References** Rezacova2002, Lescar1999, Lescar1997, Lescar1996 **Keywords** review, structure. • F11.2.32: Review of the implications of antibody structure and antigen peptide binding for the mechanisms of inhibition of protease activity by two MABs with different binding sites in protease. [Rezacova2002] (**review**, **structure**) • F11.2.32: Crystal strucutre of a Fab peptide complex was obtained. Distortion may occur in the flap region of the protein, important for regulating access of substrate to the catalytic site. [Lescar1999] (**structure**) • F11.2.32: Binding leads to significant inhibition in proteolytic activity – crystal structure of Fab-peptide was determined to 2.2 A resolution – bound peptide shows no structural similarity to the corresponding segment in native protease suggesting binding may distort protein structure. [Lescar1997] (**structure**)			
176	13E1	Protease (38–45)	Protease (38–45 HXB2)	LPGRWKPK	no	Vaccine	hamster (IgG)
		Vaccine *Vector/Type:* protein *HIV component:* Protease **References** Croix1993 • 13E1: Binds to MSLPGRWKPKM with sightly higher affinity. [Croix1993]

IV-C-8 RT Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
180	1E8	RT (65–73)	RT (65–73)	KKDSTKWRK	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* RT *Adjuvant:* nitrocellulose **References** Gu1996, Wu1993 • 1E8: Significantly inhibits DNA polymerase activity of RT by hindering binding of dNTPs – additive or synergistic RT inhibition with nevirapine and delavirdine. [Gu1996] • 1E8: Inhibits RT activity, binding site overlaps with two AZT resistance mutations. [Wu1993]					
181	polyclonal	RT (249–263)	RT (dis 249–263)	KDSWTVNDIQKLVGK		Vaccine, in vitro stimulation or selectio	human (IgG)
		Vaccine *Vector/Type:* peptide presented on icosahedral protein scaffold *HIV component:* RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Ab type** C2 **References** Domingo2003 **Keywords** vaccine antigen design. • A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from Bacillus stearothermophilus has been engineered to display 60 copies of one or more epitopes on a single molecule. An E2DISP scaffold which displayed pep23, a 15-residue B and T helper HIV-1 RT epitope elicited a pep23-specific T-helper response *in vitro*. The E2DISP scaffold displaying peptide RT2, which is a CTL HIV-1 RT epitope, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to both the class I and class II processing pathways. The Th response in vaccinated mice supported Pep23-specific IgG responses. [Domingo2003] (**vaccine antigen design**)					
182	1.152 B3	RT (294–302)	RT (294–302)	PLTEEAELE	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* RT **References** Orvell1991 • 1.152 B3: Weakly positive by immunofluorescence – binding inhibits RT enzymatic activity. [Orvell1991]

		Research Contact Amon Hizi, Sackler School of Medicine, Tel Aviv, Isreal					
		References Herschhorn2003					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

Keywords antibody generation, antibody sequence, variable domain, immunotherapy.

- 5B11: One of five a human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. [Herschhorn2003] (**antibody generation**, **immunotherapy**, **antibody sequence, variable domain**)

198 6B10 RT RT (BH-10) HIV-1 infection human

Research Contact Amon Hizi, Sackler School of Medicine, Tel Aviv, Isreal
References Herschhorn2003
Keywords antibody generation, antibody sequence, variable domain.

- 6B10:One of five a human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (DDDP and RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. In contrast, 6B10 seemed to enhance DDDP activity and did not effect RDDP. [Herschhorn2003] (**antibody generation**, **antibody sequence, variable domain**)

199 6E9 RT RT (BH-10) in vitro stimulation or selectio human

Research Contact Amon Hizi, Sackler School of Medicine, Tel Aviv, Isreal
References Herschhorn2003
Keywords antibody generation, antibody sequence, variable domain, immunotherapy.

- 6E9: One of five a human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. [Herschhorn2003] (**antibody generation**, **immunotherapy**, **antibody sequence, variable domain**)

200 E-4 RT RT (BH-10) HIV-1 infection human

Research Contact Amon Hizi, Sackler School of Medicine, Tel Aviv, Isreal
References Herschhorn2003
Keywords antibody generation, antibody sequence, variable domain.

- E-4:One of five a human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. In contrast, E-4 seemed to enhance RDDP. [Herschhorn2003] (**antibody generation**, **antibody sequence, variable domain**)

201 6B9 RT RT (dis 155–250) yes Vaccine mouse (IgG)

Vaccine *Vector/Type:* vaccinia *Strain:* B clade HXB2 *HIV component:* RT
Ab type palm domain
References Ohba2001, Chiba1997, Chiba1996

- 6B9: In contrast to MAb 7C4, which binds to the thumb region of RT, 6B9 binds to the palm subdomain and does not inhibit RT activity. [Chiba1996]

202 5F RT RT (252–335) yes Vaccine mouse

Vaccine *Vector/Type:* vaccinia *Strain:* B clade HXB2 *HIV component:* RT
Ab type thumb domain
References Ohba2001

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 5F: BALB/c mice were vaccinated with vaccinia carrying RT and a phage display library was produced and panned with RT – Fabs 5F and 5G were cloned, both recognizing an immunodominant neutralizing RT epitope in the region of the template primer-binding site in the thumb domain also recognized by MAb 7C4 – sequencing revealed the heavy chains and light chains of 7C4, 5G and 7C4 are related. [Ohba2001]					
203	5G	RT	RT (252–335)		yes	Vaccine	mouse
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade HXB2 *HIV component:* RT **Ab type** thumb domain **References** Ohba2001 • 5G: BALB/c mice were vaccinated with vaccinia carrying RT and a phage display library was produced and panned with RT – Fabs 5F and 5G were cloned, both recognizing an immunodominant neutralizing RT epitope in the region of the template primer-binding site in the thumb domain also recognized by MAb 7C4 – sequencing revealed the heavy chains and light chains of 7C4, 5G and 7C4 are related. [Ohba2001]					
204	7C4	RT	RT (dis 252–335)		yes	Vaccine	mouse (IgG2a)
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade HXB2 *HIV component:* RT **Ab type** thumb domain **References** Ohba2001, Chiba1997, Chiba1996 • 7C4: Fabs 5F and 5G both recognize the same immunodominant neutralizing RT epitope in the region of the template primer-binding site in the thumb domain recognized by MAb 7C4 – sequencing revealed the heavy chains and light chains of 7C4, 5G and 7C4 are related. [Ohba2001] • 7C4: 7C4 inhibits RT from HIV-1 strains IIIB, Bru, and IMS-1 but not HIV-2 strains GH-1 and LAV-2, SIV MAC, nor SIV MND. [Chiba1997] • 7C4: 7C4 was produced from a hybridoma cell line derived from a BALB/c mouse repeatedly immunized with RT in a vaccinia construct, and was found to inhibit RT through binding to the template primer-binding site, a possible target for RT inhibitors. [Chiba1996]					

IV-C-9 Integrase Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
205	1C4	Integrase (1–16)	Integrase (1–16 HXB2)	FLDGIDKAQDEHEKYH	no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **Ab type** N-term **References** Nilsen1996, Haugan1995 • 1C4: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. [Nilsen1996] • 1C4: MAb interferes with integrase binding to DNA. [Haugan1995]					
206	2C11	Integrase (1–16)	Integrase (1–16 HXB2)	FLDGIDKAQDEHEKYH	no	Vaccine	mouse (IgG1κ)

		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **Ab type** N-term **References** Nilsen1996 • 7C6: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. [Nilsen1996]					
214	6C5	Integrase (17–38)	Integrase (17–38 HXB2)	SNWRAMASDFNLPPVVAKEIVA	no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **Ab type** N-term **References** Nilsen1996, Haugan1995 • 6C5: This MAb inhibits end processing and DNA joining, but had little effect on integration activities. [Nilsen1996] • 6C5: MAb interferes with integrase binding to DNA. [Haugan1995]					
215	8G4	Integrase (22–31 + 82–101)	Integrase (12–42 HXB2)	MASDFNLPPV+GYIEAEVIPAETGQ-ETAYFI?	no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **References** Nilsen1996, Haugan1995 • 8G4: MAb interferes with integrase binding to DNA. [Haugan1995] • 8G4: This MAb reacted strongly with peptides IN(12-31) and IN(22-42), and less strongly with peptide IN(82-101) – it did not react with a deletion mutant of positions 17-38 – this MAb inhibits end processing and DNA joining, but had little effect on integration activities. [Nilsen1996]					
216	17 (mAb17)	Integrase (25–35)	Integrase (25–35)	DFNLPPVVAKE	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* Int **References** Yi2000b, Levy-Mintz1996, Bizub-Bender1994					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 17: Epitope mapped to helix-turn-helix motif in the N-term domain of Integrase, positions 25-35 – Zn binding stabilizes the Integrase-mAb17 complex – both MAb and Fab form of mAb17 inhibit Integrase activity – epitope region likely to be involved in protein-protein interaction. [Yi2000b] • 17: Used for the creation of single chain variable antibody fragments (SFvs) for internal cellular expression – neutralization of IN activity prior to integration, whether the Ab is expressed in the nucleolus or the cytoplasm – relative binding affinity to IN: 12 > 17 = 33 > 21 > 4. [Levy-Mintz1996] • 17: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – the Zn finger motif is in the binding region – MAbs 14 and 17 form a competition group. [Bizub-Bender1994]					
217	4D6	Integrase (42–55)	Integrase (42–55 HXB2)	KCQLKGEAMHGQVD	no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **Ab type** N-term **References** Nilsen1996, Haugan1995 • 4D6: This MAb inhibits end processing and DNA joining, and reduces reintegration activity. [Nilsen1996] • 4D6: MAb interferes with integrase binding to DNA. [Haugan1995]					
218	7-16 (7-19)	Integrase (50–159)	Integrase (50–159 HXB2)		no	Vaccine	mouse (IgG2b)
		Vaccine *Vector/Type:* chimeric maltose binding protein (MBP) *Strain:* B clade IIIB *HIV component:* Int **Ab type** Integrase catalytic core **Research Contact** Yoshihiro Kitamura, Div of Mol Genetics, Nat Inst of Infectious Diseases, Musashimurayama, Japan **References** Ishikawa1999 • 7-16: Binds to the central catalytic domain – the paper seems to sometimes call this antibody 7-16, sometimes 7-19, a possible typo. [Ishikawa1999]					
219	4F6	Integrase (56–102)	Integrase (56–102 HXB2)	CSPGIWQLDCTHLEGKVILVAVHVA-SGYIEAEVIPAETGQETAYFLL	no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **Ab type** Integrase catalytic core **References** Nilsen1996, Haugan1995 • 4F6: MAb interferes with integrase binding to DNA. [Haugan1995] • 4F6: MAb binding had minimal effects on IN *in vitro* activities. [Nilsen1996]					
220	anti-K159	Integrase (151–163)	Integrase (163–175)	VESMNKELKKIIG		Vaccine	rabbit (IgG)
		Vaccine *Vector/Type:* peptide *HIV component:* Int **References** Maksiutov2002, Maroun1999 • anti-K159: This epitope is similar to a fragment of the human protein Apoptosis regulator BCL-W (KIAA0271), ESVNKEMEPLVGQV. [Maksiutov2002] • anti-K159: Both the peptide K159, SQGVVESMNKELKKIIGQVRDQAEHLKTA, and the Abs raised against this peptide inhibit Integrase activity – K159 was found to fulfill condition of minimal number of helical heptads to achieve the formation of a stable coiled-coil structure – Integrase is proposed to function as a dimer interacting in this region. [Maroun1999]					
221	5D9	Integrase (186–250)	Integrase (186–250 HXB2)		no	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *Strain:* B clade HXB2 *HIV component:* Int **Ab type** Integrase DNA binding domain **References** Nilsen1996, Haugan1995 • 5D9: While C-term and N-term anti-Integrase MAbs interfere with Integrase-DNA binding, 5D9 which binds more centrally, does not. [Haugan1995] • 5D9: MAb binding had minimal effects on IN *in vitro* activities. [Nilsen1996]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
222	8-6	Integrase (211–227)	Integrase (211–227 HXB2)	KELQKQITKIQNFRVYY	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* chimeric maltose binding protein (MBP) *Strain:* B clade IIIB *HIV component:* Int **Research Contact** Yoshihiro Kitamura, Div of Mol Genetics, Nat Inst of Infectious Diseases, Musashimurayama, Japan **References** Ishikawa1999 • 8-6: Antibody binds proximal to the DNA binding region. [Ishikawa1999]					
223	19 (2-19, scAb2-19)	Integrase (228–236)	Integrase (228–236 LAI)	RDSRNPLWK	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* Int **References** Kitamura1999, Levy-Mintz1996, Bizub-Bender1994 • 19: Called 2-19, scAb2-19 is a single-chain Ab made from MAb 2-19 –acts intra-cellularly to block infection at low MOI by binding to integrase – scAb interfered with the folding of Gag-Pol polyprotein, the Ab did not affect viral production in LAI transfected cells, but the virus produced was less infectious – authors suggest that the epitope may be conformational. [Kitamura1999] • 19: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – 19 has a low binding affinity. [Bizub-Bender1994]					
224	2-19	Integrase (228–236)	Integrase (228–236 HXB2)	RDSRNPLWK	no	Vaccine	mouse (IgG2b)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
245	F-6	Pol	RT (BH-10)			in vitro stimulation or selectio	human

Ab type C-term **Research Contact** Amon Hizi, Sackler School of Medicine, Tel Aviv, Isreal
References Herschhorn2003
Keywords antibody generation, antibody sequence, variable domain, immunotherapy.

- F-6: One of five a human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to bind to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. To pinpoint the mechanism of inhibition, three peptides were synthesized corresponding to the CDR3 sequences of F-6, and a cyclic version of the CDR H3 region bound to purified RT and blocked RDDP. [Herschhorn2003] (**antibody generation**, **immunotherapy**, **antibody sequence, variable domain**)

246	RT-4	Pol	RT		no		mouse (IgG2b)

References Gu1996, Li1993

- RT-4: Increased nevirapine and delavirdine inhibition, no effect on AZT inhibition. [Gu1996]

247	RT7O	Pol	RT (231–315)			Vaccine	mouse (IgG1)

Vaccine *Vector/Type:* protein *HIV component:* RT
Research Contact B. Ferns and R. Tedder
References Ferns1991

- RT7O: UK Medical Research Council AIDS reagent: ARP381.
- RT7O: Conformational epitope located centrally in the protein – inhibited RT enzyme activity and thus may bind close to the active site of the enzyme. [Ferns1991]

248	RT7U	Pol	RT (231–315)			Vaccine	mouse

Vaccine *Vector/Type:* protein *HIV component:* RT
Research Contact B. Ferns and R. Tedder
References Ferns1991

- RT7U: UK Medical Research Council AIDS reagent: ARP380.
- RT7U: Has a conformational epitope – reacts with p66 and p51 in WB. [Ferns1991]

249	anti-HIV-1 RT	Pol	RT				mouse (IgG)

References Wainberg1995, Maciejewski1995, diMarzo Veronese1986

- Commentary on Maciejewski *et al.* [Wainberg1995]
- anti-HIV-1 RT: Cloned heavy and light chains to express Fab intracellularly, preventing HIV infection *in vitro* – this MAb was broadly cross-reactive with clinical strains and even HIV-2. [Maciejewski1995]

250	polyclonal	Pol	p55		no	Vaccine	macaque

Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* Gag, gp120, V3
References Wagner1998b

- A VLP is a non-infectious virus-like particle self-assembled from HIV Pr55 gag – macaques were immunized with VLPs bound to either gp120 or V3+CD4 linear domains – gag and env CTL specific CTL were stimulated in each case, and Ab response to gag and gp120 and was elicited, but the gp120 neutralizing response occurred only with whole gp120, not V3+CD4 – despite the CTL and Ab response, immunized macaques were infected by intervenous challenge with SHIV chimeric challenge stock. [Wagner1998b]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
251	polyclonal	Pol	RT			Vaccine	mouse
		Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12 **References** Kim1997b • A gag/pol, vif or CMN160 DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules B7 and IL-12, gave a dramatic increase in both the cytotoxic and proliferative responses in mice, as well as Ab response detected by ELISA. [Kim1997b]					
252	polyclonal	Pol	RT (203–219)			Vaccine	mouse (IgA)
		Vaccine *Vector/Type:* Salmonella *HIV component:* RT **References** Burnett2000 • A live attenuated bacterial vaccine, Salmonella SL3261-pHART, with an inserted HIV RT gene fragment in the Lpp-OmpA-HIV fusion protein, induced a lymphoproliferative Th response and fecal RT-specific IgA in BALB/c mice. [Burnett2000]					
253	33 (mAb33, Fab33, 33D5, mab 33)	Pol	Integrase (223–268 HXB2)		no	Vaccine	mouse (IgG2b)
		Vaccine *Vector/Type:* protein *HIV component:* Int **Ab type** C-term **References** Yi2002, Yi2000a, Levy-Mintz1996, Bizub-Bender1994 • 33: Called mAb33 – mAb33 and mAb32 compete for binding to the C-term domain of Integrase – while mAb32 only weakly inhibits IN activity, mAb33 inhibits strongly, mAb32 has a lower affinity than mAb33, and Fab32 does not inhibit at all while Fab33 inhibits catalytic activity and DNA binding – heteronuclear NMR indicated eight residues of Integrase are immobilized upon Fab33 binding, two in the core of the protein, and 6 on the outer face that form a contiguous patch likely to contain the epitope – 223F, 224R, 226Y, 244K, 267I, and 268I, which may be a useful target for drug design – the Fab33-IN complex is far more soluble than IN alone and may be useful for crystallization. [Yi2002] • 33: Limited proteolysis combined with mass spectrometric analysis were used to define the binding site for Fab32, but Fab33 binding to the Intergrase C-term domain left it resistant to proteolytic digestion. [Yi2000a] • 33: Used for the creation of single chain variable antibody fragments (SFvs) for internal cellular expression – neutralization of IN activity prior to integration, whether the Ab is expressed in the nucleolus or the cytoplasm – relative binding affinity to IN: 12 > 17 = 33 > 21 > 4. [Levy-Mintz1996] • 33: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – MAbs 32 and 33 form a competition group. [Bizub-Bender1994]					

IV-C-11 Vif Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

IV-C-12 Vpr Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
258	polyclonal	Vpr	Vpr (89.6)			HIV-1 infection	human (IgG)

References Richardson2003
Keywords rate of progression.
Country France.

- Serum samples were obtained from the French GRIV (gentic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses, as both may contribute as extracellular proteins to pathogenesis. Serum anti-Vpr IgG responses were significantly higher in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) and unstable non-progressors (declined during a 20 month follow up), than fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). [Richardson2003] (**rate of progression**)

IV-C-13 Tat Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
259	polyclonal	Tat (1–15)	Tat (1–15 89.6)	MEPVDRPLEPWKHPG		Vaccine	macaque (IgG)

Vaccine *Vector/Type:* protein *Strain:* B clade 89.6, B clade HXBc2 *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Ab type C-term, N-term, Tat basic region
References Silvera2002
Keywords antibody binding site definition and exposure, vaccine antigen design.

- Anti-Tat and Tat toxoid responses were raised in rhesus macaques using HxBc2 and 89.6P Tat, and Tat toxoids.High anti-Tat IgG responses were observed in all animals, and helper responses were detected in 8/16, and IFN gamma CTL in 11/16.. Ab and proliferative responses were observed, and the trucated 86 amino acid IIIB Tat was more immunogenic than the full 102 amino acid Tat. Tat vaccinated animals when challenged with SHIV89.6 were infected despite a robust immune response. The most consistent reactions to the vaccinations were to peptides in regions: N-term, 1-15 (MEPVDRPLEPWKHPG), basic domain 46-60 (SYGRKKRRQRRRAHQ), and 61-91, particularly C-term 76-90 (QPRGDPTGPKQKKK). [Silvera2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)

Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), macrophage activating lipopeptide-2 (MALP-2)
References Borsutzky2003

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		Keywords adjuvant comparison, genital and mucosal immunity, immunodominance, mucosal immunity, Th1, Th2, vaccine-induced epitopes. • Intranasal immunization of BALB/c mice Tat with MALP-2 induced stronger immune responses than i.p. vaccination of Tat with IFA. Also i.n. MALP-2 vaccination favored Th1 responses, while i.p IFA favored Th2. Ab, T help and CTL responses were observed. MALP-2 enhanced Tat-specific IgA responses in the lung and in the genital tract. Three linear Ab epitopes were recognized. The most frequent response (80% of vaginal lavage, 100% of sera and lung lavage) was to Tat peptide 1-20. The second strongest to Tat 46-60 (20% of vaginal lavage, 50% of lung lavage, 50% of sera. Finally, 50% of the sera of Tat+ IFA i.p. immunized mice recognized Tat 73-86. [Borsutzky2003] (**adjuvant comparison**, **genital and mucosal immunity**, **vaccine-induced epitopes**, **immunodominance**, **mucosal immunity**, **Th1**, **Th2**)					
264	polyclonal	Tat (1–24)	Tat (1–24)	MEPVDPRLEPWKHPGSQPKTACTN		HIV-1 infection, Vaccine	human (IgG)
		Vaccine *Vector/Type:* protein *Strain:* B clade *HIV component:* Tat *Adjuvant:* Montanide (ISA 51) **Ab type** N-term **References** Noonan2003 **Keywords** immunotherapy, vaccine-specific epitope characteristics. • Intramuscular injection of Tat-toxoid induced high titers of nti-Tat reactivity in serum samples of six HIV-1 positive and in four HIV negative study subjects. Anti-Tat antibodies successfully blocked extracellular Tat from transactivating HIV Tat-sensitive promotors. The anti-Tat IgG response in sera from two healthy and HIV infected patients inhibited cell entry of synthetic Tat, thus blocking its functional activity. Additionally, the anti-Tat antibodies inhibited intercellular Tat transfer as demonstrated by a co-culture cell system. All HIV-1 infected patients had Ab responses to the N-term region of Tat, and 4/4 HIV-1+ and 5/6 HIV-1 negative patients responded to the basic domain. Several additional peptides were recognized either exclusively or more commonly in the HIV+ people. The N-terminus region of Tat mediates binding to CD26, that may be involved in modulation of chemokine function, and may also mediate T-cell apotosis. Keywords immunotherapy, vaccine-specific epitope characteristics.

- Intramuscular injection of Tat-toxoid induced high titers of anti-Tat reactivity in serum samples of six HIV-1 positive and in four HIV negative study subjects. Anti-Tat Abs successfully blocked extracellular Tat from transactivating HIV Tat-sensitive promotors. The anti-Tat IgG response in sera from two healthy and HIV infected patients inhibited cell entry of synthetic Tat, thus blocking its functional activity. Additionally, the anti-Tat Abs inhibited intercellular Tat transfer in a co-culture cell system. All HIV-1 infected patients had Ab responses to the N-term region of Tat, and 4/4 HIV-1+ and 5/6 HIV-1 negative patients responded to the basic domain. Several additional peptides were recognized either exclusively or more commonly in the HIV+ people. The basic region of Tat mediates binding to VEGFR2 on Kaposi's sarcoma cells and endothelial cells, and HIV patients with Kaposi's sarcoma lack Abs to this domain.. 		• 12 rabbits were immunized with different combinations of Tat peptides. Abs raised against peptide aa 8-53 did not react with the peptide 19-53, suggesting that the N-terminal region is important. Serum from these animals was able to inhibit Tat-induced apoptosis, and Tat antibodies in humans are associated with long term survival. [Belliard2003] (**rate of progression**)					
286	polyclonal	Tat	Tat		yes	Vaccine	mouse (IgG1, IgG2a, IgG3)
		Vaccine *Vector/Type:* protein *HIV component:* Tat *Adjuvant:* Complete Freund's Adjuvant (CFA), red blood cells **References** Dominici2003 **Keywords** adjuvant comparison, immunotherapy, Th1, Th2. • BALB/c mice were immunized intra-peritineally with Tat protein bound to red blood cells via biotin-avidin conjugation. This antigen delivery system was successfully internalized by dendritic cells, and induced more consistent anti-Tat NAbs responses and sightly increased Tat-specific CTL responses relative to Tat protein with CFA. RBC-Tat immunization induced Th1 (IgG2a)and Th2 (IgG1 and IgG3)type immune responses. (**adjuvant comparison**, **immunotherapy**, **Th1**, **Th2**)					
287	polyclonal	Tat	Tat			Vaccine	mouse (IgA, IgG)
		Vaccine *Vector/Type:* chitosan nanoparticles *HIV component:* Tat *Adjuvant:* adjuvant oily structure (IMS) **References** Le Buanec2001 **Keywords** adjuvant comparison, mucosal immunity. • Mice were immunized with Tat toxoid (Tat detoxified by carboxamidation) either intranasally or orally using either adjuvant oily structure (IMS), nanoparticles of chitosan, or microparticles of polylactide-co-glycolide. Each of these strategies triggered IgG and IgA that inhibited Tat activity. [Le Buanec2001] (**adjuvant comparison**, **mucosal immunity**)					
288	polyclonal	Tat	Tat (IIIB)			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* Tat *Adjuvant:* Cholera toxin (CT), E. coli mutant heat labile enterotoxin (LT-R72), E. coli heat labile enterotoxin **References** Marinaro2003 **Keywords** adjuvant comparison, mucosal immunity. • Intranasal immunization of BALB/c mice with Tat and e.coli heat-labile enterotoxin (LT) and non-toxic LT-R72 LT induced strong antigen-specific IgG Abs which remained stable for one year. Tat-specific IgA reponses were measured in vaginal and intestinal secretions. Immunization of BALB/c mice with native Tat (aa1-86) induced serum IgG directed against an immunodominant epitope (aa1-20) and against a second epitope (aa 46-60). CTL responses were also observed. Anti-Tat serum Abs neutralized Tat activity in a dose-independent manner. C57BL/6 remained unresponsive to Tat immunizations when Tat was co-adminstered with LT or cholera toxin (CT) as adjuvant; BALB/c mice are H-2d, C57BL/6 are H-2b. Congenic BALB.B mice that express H-2b rather than H-2d also could not respond to Tat, suggesting the repsonse to Tat is constrained by the haplotype. [Marinaro2003] (**adjuvant comparison**, **mucosal immunity**)					
289	polyclonal	Tat	Tat			Vaccine	macaque (IgG)
		Vaccine *Vector/Type:* protein, vaccinia *Strain:* B clade MN *HIV component:* gp160, Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), polyphosphazene **References** Pauza2000 • 16 Macaques mulatta were immunized with Tat toxoid, or with Tat plus gp160, and challenged with the SHIV 89.6PD isolate. Sera from 14/16 animals neutralized Tat *in vitro*. 8 macaques developed both cellular and humoral responses to Tat, and 7/8 of these had low viral set points after rectal challenge with SHIV89.6PD. CD4+ T cells in Tat vaccinated infected animals had lower IFN-alpha and chemokine receptor expression, features of infection associated with extracellular Tat. [Pauza2000]

Vaccine *Vector/Type:* vaccinia *HIV component:* Env
Ab type C1
References Collado2000

- Vaccinia p14 can elicit NAbs and p39 tends to be immunodominant, so these two proteins were fused to regions of HIV-1 Env – reduced glycosylation was noted when p14 or p39 was placed in the N-term region of the fusion protein – chimeric proteins shifted the Env Ab response from V3 to either a C1 or C4 domain, depending on the construct – all chimeric Env proteins: 14kEnv, 39kEnv, and Env39k elicited a strong Ab response to the C1 region of gp120 (LFCASDAKAYDTEVHNVWAT), and Env39k mounted a strong response to the C4 region (KAMYAPPISGQIRCSSNITG) [Collado2000]

References Pantophlet2003b, Yang2000, Binley1998, Wyatt1997, Binley1997a, Moore1996, Wyatt1995, Moore1994d, Moore1994c, Thali1993, Niedrig1992b
Keywords vaccine antigen design.

- 133/290: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 133/290: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000]
- 133/290: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998]
- 133/290: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. [Wyatt1997]

329	C6 (Ch6)	gp160 (91–100)	gp120 (91–100 LAI)	ENFDMWKNDM		Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *Strain:* B clade LAI *HIV component:* gp160 **Ab type** C1 **References** Pincus1996, Moore1994c, Abacioglu1994, Pincus1993a • C6: NIH AIDS Research and Reference Reagent Program: 810. • C6: Called Ch6 – binds to gp120 but not to infected cells – when linked to ricin A, the immunotoxin did not mediate cell killing – sCD4 has no effect. [Pincus1993a, Pincus1996] • C6: There is FNM/FDM polymorphism in LAI-based peptides – N is essential (J. P. Moore, per. comm.) • C6: The relative affinity for denatured/native gp120 is 0.9. [Moore1994c] • C6: C1 region – epitope boundaries mapped by peptide scanning, FNMW core. [Abacioglu1994]					
330	MF49.1	gp160 (91–100)	gp120 (91–100 LAI)	ENFDMWKNDM		Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade LAI *HIV component:* Env **Ab type** C1 **References** Moore1994c, Thiriart1989 • MF49.1: The relative affinity of denatured/native gp120 is 3.8. [Moore1994c]					
331	T1.1	gp160 (91–100)	gp120 (91–100 LAI)	ENFDMWKNDM		Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* vaccinia *HIV component:* gp160 **Ab type** C1 **References** Moore1994c, Broliden1990, Akerblom1990 • T1.1: C1 region – the relative affinity for denatured/native gp120 is 1. [Moore1994c] • T1.1: No ADCC activity – reactive peptide: NVTENFNMWKNDMVEQ, IIIB. [Broliden1990] • T1.1: Also reacted in solid phase with gp120(234-248) NGTGPCTNVSTQCT. [Akerblom1990]					
332	T7.1	gp160 (91–100)	gp120 (91–100 LAI)	ENFDMWKNDM		Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade LAI *HIV component:* Env					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		Ab type C1 **References** Moore1994d, Moore1994c, Bolmstedt1990, Akerblom1990 • T7.1: The relative affinity of denatured/native gp120 is 4.0. [Moore1994c]					
333	T9	gp160 (91–100)	gp120 (91–100 LAI)	ENFDMWKNDM		Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade LAI *HIV component:* Env **Ab type** C1 **Research Contact** Lennart Akerblom, Britta Wahren and Jorma Hinkula **References** Binley1997a, Moore1994d, Moore1994c, Bolmstedt1990, Akerblom1990 • T9: Binds to the C1 region – 45 W/S, 88 N/P, 256 S/Y, 262 N/T, 475 M/S, 485 1.83, and 491 I/F enhanced binding, no substitution tested significantly inhibited. [Moore1994d] • T9: The relative affinity of denatured/native gp120 is 7.9. [Moore1994c] • T9: There are two HIV-Abs with the name T9, one binds to gp41, one to gp120.					
334	GV4D3	gp160 (92–100)	gp120 (92–100 IIIB)	NFNMWKNDM		Vaccine	mouse
		Vaccine *Vector/Type:* protein-Ab complex *HIV component:* gp120-Mab complex **Ab type** C1 **Research Contact** Patricia Earl and Christopher Broder, NIH **References** Denisova1996 • GV4D3: When anti-V3 MAb M77 was bound to gp120 and used as an immunogen, it stimulated many MAbs to linear epitopes – MAbs GV4H4 and GV5F9 are homologous to GV4D3 and were generated in the same experiment. [Denisova1996]					
335	B27	gp160 (93–96)	gp120 (94–97 BH10)	FNMW	no	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *Strain:* B clade NL43 *HIV component:* gp160 **Ab type** C1 **References** Bristow1994, Abacioglu1994 • B27: C1 MAb generated in a study of the humoral immune response to Baculovirus-expressed mis-folded rgp160 IIIB:NL43, MicroGenSys. [Bristow1994] • B27: C1 region – epitope boundaries mapped by peptide scanning. [Abacioglu1994]					
336	B9	gp160 (93–96)	gp120 (93–96 LAI)	FNMW		Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *Strain:* B clade LAI *HIV component:* gp160 **Ab type** C1 **References** Abacioglu1994 • B9: Binds C1 region – epitope boundaries mapped by peptide scanning. [Abacioglu1994]

[Moore1994c]					
354	11/65 (11/65a/5h)	gp160 (102–121)	gp120 (311–321 HXB10)	EQMHEDIISLWDQSLKPCVK		Vaccine	rat (IgG2b)
		Vaccine *Vector/Type:* protein *Strain:* B clade BH10 *HIV component:* gp120 **Ab type** C1 **References** Peet1998, McKeating1993b, McKeating1992a • 11/65: UK Medical Research Council AIDS reagent: ARP3076. • 11/65: Called 11/65a/5h – The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind – 11/65 was not affected by V3 serine substitutions – mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. [Peet1998] • 11/65: Binds only soluble gp120, not virion bound – used to quantify gp120 shedding – (numbering is incorrect in original?) [McKeating1992a]					
355	W1	gp160 (102–121)	gp120 (102–121 LAI)	EQMHEDIISLWDQSLKPCVK		Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade LAI *HIV component:* Env **Ab type** C1 **Research Contact** D. Weiner, U. Penn. **References** Moore1994c • W1: The relative affinity for denatured/native gp120 is 6 – mutations 113 D/A, 113 D/R, and 117 K/W impair binding. [Moore1994c]					
356	T11	gp160 (102–125)	gp120 (102–125)	EQMHEDIISLWDQSLKPCVKLTPL		Vaccine	mouse
		Vaccine *Vector/Type:* protein *HIV component:* oligomeric gp140 **Ab type** C1 **Research Contact** R. Doms, Univ. of Pennsylvania **References** Jagodzinski1996, Earl1994 • T11: The sulfated polysaccharide, curdlan sulfate (CRDS), binds to the Envelope of T-tropic viruses and neutralizes virus – deletion of the V3 loop from gp120 results in more potent T11 inhibition by CRDS. [Jagodzinski1996] • T11: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]					
357	GV1A8	gp160 (105–113)	gp120 (105–113 IIIB)	HEDIISLWD		Vaccine	mouse
		Vaccine *Vector/Type:* protein-Ab complex *HIV component:* gp120-Mab complex **Ab type** C1 **References** Denisova1996					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• GV1A8: When anti-V3 MAb M77 was bound to gp120 and used as an immunogen, it stimulated many MAbs to linear epitopes – MAbs GV7A4 and GV5H5 are homologous to GV1A8 and were generated in the same experiment. [Denisova1996]					
358	11	gp160 (111–120)	gp120 (101–120 LAI)	LWDQSLKPCV		Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade LAI *HIV component:* Env **Ab type** C1 **References** Moore1994c, Thiriart1989 • 11: The relative affinity for denatured/native gp120 is 7.8 – mutation 113 D/R impairs binding. [Moore1994c]					
359	12G10	gp160 (111–120)	gp120 (101–120 LAI)	LWDQSLKPCV		Vaccine	mouse (IgG)
		Vaccine *Strain:* B clade LAI *HIV component:* Env **Ab type** C1 **References** Moore1994c, Thiriart1989 • 12G10: The relative affinity for denatured/native gp120 is 17 – mutation 117 K/W impairs binding. [Moore1994c]					
360	135/9 (87-135/9)	gp160 (111–120)	gp120 (111–120 LAI)	LWDQSLKPCV	L	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** C1 **Research Contact** Matthias Niedrig **References** Yang2000, Kropelin1998, Binley1998, Binley1997a, Trkola1996a, Moore1996, Moore1994d, Moore1994c, Niedrig1992b • 135/9: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000] • 135/9: Noted to bind to C1 peptide HEDIISLWDQSLK – blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) [Kropelin1998] • 135/9: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998] • 135/9: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] • 135/9: Binding is enhanced by some anti-C1 and anti-C5 antibodies – enhances binding of some anti-V3, anti-C4 and anti-V2 MAbs – 135/9 binds to predicted alpha-helix in C1. [Moore1996] • 135/9: Substitutions 106 E/A, 113 D/A or R, and 117 K/W impair binding, some substitutions enhance binding. [Moore1994d] • 135/9: The relative affinity for denatured/native gp120 is 15 – mutation 113 D/R impairs binding to native and denatured, 113 D/A only to denatured. [Moore1994c] • 135/9: Defines the epitope as gp120(114-123) MHEDIISLWD (core LWD?) – weak neutralization of lab strain. [Niedrig1992b]

		Ab type V2 **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center) or Cellular Products Inc, Buffalo NY **References** Gorny2004, He2002, Maksiutov2002, Edwards2002, Nyambi2000, Hioe2000, Gorny2000a, Stamatatos1998, Nyambi1998, Parren1997c, Fouts1997, Binley1997a, Trkola1996a, Moore1995b, Forthal1995, Gorny1994 **Keywords** ADCC, antibody binding site definition and exposure, co-receptor, enhancing activity, inter-clade comparisons, review, variant cross-recognition or cross-neutralization. • 697-D: In a review of Envelope binding MAbs in this database, V2-specific MAbs in are noted have some ability to neutralize HIV-1, but generally weak with limited cross-reactivity; it weakly neutralizes some primary but not TCLA strains. 697-D is the best characterized of the anti-V2 MAbs, and binds weakly and sporadically to isolates from clades A-D. [Gorny2004] (**variant cross-recognition or cross-neutralization**, **review**, **inter-clade comparisons**) • 697-D: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIRLKVQK. [Maksiutov2002] • 697-D: Called 697D – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A, 4117C and 697D were used as controls. [He2002] • 697-D: Called 697D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] (**antibody binding site definition and exposure**) • 697-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 anti-V2 MAbs, which showed weak and sporadic binding, with the most frequent binding to C and D clades. [Nyambi2000] (**inter-clade comparisons**) • 697-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V2 MAb 697-D did not effect proliferation. [Hioe2000] • 697-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V2 MAbs 697-D, 1357 and 1361 favored the monomer by approximately 2 fold. [Gorny2000a] (**antibody binding site definition and exposure**) • 697-D: Called 697-30D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. [Stamatatos1998] (**variant cross-recognition or cross-neutralization**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 697-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – V2 Abs 697-D, 1361, and 1357 tended to bind weakly with a similar pattern of specificity to virions, and bound well to soluble gp120: weak binding to 1/4 B clade viruses (CA5), and weak binding to viruses from subtype A and D. [Nyambi1998] (**inter-clade comparisons**) • 697-D: Does not neutralize TCLA strains but neutralizes some primary isolates weakly. [Parren1997c] (**variant cross-recognition or cross-neutralization**) • 697-D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 697-D bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997] (**antibody binding site definition and exposure**) • 697-D: Partial inhibition of gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**co-receptor**) • 697-D: Review: called 697/30D – neutralizes some primary, but not lab adapted strains. [Moore1995b] (**variant cross-recognition or cross-neutralization**, **review**) • 697-D: Not neutralizing, no ADCC activity, and no viral enhancing activity. [Forthal1995] (**ADCC**, **enhancing activity**) • 697-D: Conformational with weak reactivity to V2 peptide ISTSIRGKVQKEYAFFYKLD – neutralized 3/4 primary isolates, but none of 4 lab strains – V2 substitutions 176/177 FY/AT, 179/180 LD/DL, 183/184 PI/SG, and 192-194 YSL/GSS abrogate binding – anti-C4 MAbs G3-536 and G45-60 enhance binding – mild oxidation of carbohydrate moieties inhibits binding. [Gorny1994] (**antibody binding site definition and exposure**)

		Ab type V2 **Research Contact** S. Tilley, Public Health Research Institute, NY, NY **References** Gorny2004, Alsmadi1998, Mondor1998, Ugolini1997, Warrier1996, Warrier1995, Wu1995, Warrier1994 **Keywords** ADCC, antibody binding site definition and exposure, antibody generation, antibody interactions, antibody sequence, variable domain, review, variant cross-recognition or cross-neutralization. • C108G: This MAb is unsual among V2-directed MAbs. It is glycan dependent and can neutralize both a primary isolate (BaL and a TCLA (IIIB) strain. [Gorny2004] (**antibody binding site definition and exposure**, **review**) • C108G: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – C108G bound and directed lysis against only IIIB – this is first demonstration of ADCC directed by a V2 specific MAb. [Alsmadi1998] (**ADCC**, **variant cross-recognition or cross-neutralization**) • C108G: Inhibits HX10 binding to both CD4 positive and negative HeLa cells. [Mondor1998] • C108G: Viral binding inhibition by C108G was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997] (**antibody binding site definition and exposure**) • C108G: Synergistic neutralization of HIV-1 when combined with anti-V3 MAbs 0.5beta and C311E, or anti-CD4BS MAbs, 1125H and 5145A – neutralization further enhanced by presence of both 1125H and 0.5beta. [Warrier1996] (**antibody interactions**) • C108G: Characterization of MAb variable region. [Warrier1995] (**antibody sequence, variable domain**) • C108G: Strain specificity: LAI, BaL, HXB2 – conformational character – glycosylation site at 160 critical – mutation of conserved glycosylation site at 156 increased epitope exposure. [Wu1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • C108G: Chimps were infected with HIV-1 IIIB, and this high affinity MAb gave potent neutralization of HIV-1 IIIB – binding not affected by reduction of disulfide bonds – binding disrupted by removal of N-linked glycans – peptide binds with lower affinity than glycosylated Env. [Warrier1994] (**antibody binding site definition and exposure**, **antibody generation**)

Keywords antibody binding site definition and exposure, antibody generation, inter-clade comparisons, review, variant cross-recognition or cross-neutralization.

- 8.22.2: This broad review of anti-Envelope MAbs notes that V2 MAbs are generally weakly neutralizing at best, and somewhat strain specific. 8.22.2 weakly neutralizes SF162. [Gorny2004] (**review**)
- 8.22.2: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIRLKVQK. [Maksiutov2002]
- 8.22.2 : Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2kappa MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with HIV SF162 gp120 – several of the MAbs obtained were effective at neutralizing the autologous strain – 8.22.2 was the only V2-specific MAb created and it could cross-compete with MAb 697D – 8.22.2 could cross-react with BaL and JR-FL, two B clade R5 strains, but not B clade X4 or E clade viruses, and it could weakly neutralize autologous strain SF162. [He2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

Keywords antibody interactions, vaccine antigen design.

- G3-136: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- G3-136: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V2 MAb used. [Zwick2003] (**antibody interactions**)
- G3-136: Called G3.136 – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- G3-136: Called G3.136 – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. [Stamatatos1998]
- G3-136: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- G3-136: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. [Wyatt1997]
- G3-136: Called G3.136 – does not mediate gp120 virion dissociation in contrast to anti-V2 MAb G3-4 – not neutralizing for SF162 or SF128A in either primary macrophages or PBMC. [Stamatatos1997]
- G3-136: Described epitope as STSIRGKVKEYAFFYKLDI – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT123 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. [Poignard1996a]
- G3-136: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes cell free Hx10. [Sattentau1995b]
- G3-136: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V2 loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a – anti-V2 MAbs G3-4 and G3.136 don't bind to T-cell tropic SF2. [Stamatatos1995]
- G3-136: HIV-1 RF V2 substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity. [Yoshiyama1994]
- G3-136: Binding enhanced by selected antibodies to C1, C4, C5, V3 and anti-CD4 binding site MAbs – enhances binding of selected V3, C4 and anti-CD4 binding site MAbs. [Moore1993b]
- G3-136: Marginal binding to peptide, binding inhibited by 183/184 PI/SG substitution. [Moore1993b]
- G3-136: Conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. [Moore1993a]
- G3-136: V2 region – binds and neutralizes IIIB and RF in CEM-SS cells, but not MN – neutralization activity against a few primary isolates in PBMC – sCD4 binding inhibits binding (contrast with BAT085) – deglycosylation or reduction of gp120 by DTT diminishes reactivity. [Fung1992]

389 G3-4 (G3.4) gp160 (170–180) gp120 (170–180 BH10) QKEYAFFYKLD L Vaccine mouse (IgG2bκ)

Keywords antibody interactions, vaccine antigen design.

- G3-4: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- G3-4: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V2 MAbs used. [Zwick2003] (**antibody interactions**)
- G3-4: Called G3.4 – Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – G3.4 recognized o-gp140. [Srivastava2002]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• G3-4: Called G3.4 – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000] • G3-4: Called G3.4 – Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. [Stamatatos1998] • G3-4: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] • G3-4: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. [Wyatt1997] • G3-4: Called G3.4 – mediates gp120 virion dissociation in contrast to anti-V2 MAb G3-136 – not neutralizing for SF162 or SF128A in either primary macrophages or PBMC. [Stamatatos1997] • G3-4: Described epitope as STSIRGKVKEYAFFYKLDI – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT085 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. [Poignard1996a] • G3-4: Binding enhanced by selected antibodies to C1, C4, C5, V3 and anti-CD4 binding site MAbs – enhances binding of selected V3, C4 and anti-CD4 binding site MAbs. [Moore1996] • G3-4: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – deletion of the V3 loop from gp120 results in more potent G3-4 binding inhibition by CRDS – G3-4 epitope described as 176-184 FYKLDIIPI and 191-193 YSL. [Jagodzinski1996] • G3-4: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes Hx10 cell-free virus. [Sattentau1995b] • G3-4: Reactive with BH10, RF, and MN – binds native, but not denatured or deglycosylated gp120, binds to deglycosylated V1V2 fusion protein, suggesting importance of glycans outside the V1V2 region. [Wu1995] • G3-4: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V2 loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a – anti-V2 MAbs G3-4 and G3.136 don't bind to T-cell tropic SF2. [Stamatatos1995] • G3-4: Neutralizes RF – substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity and result in neutralization escape. [Yoshiyama1994] • G3-4: gp41 mutation (582 A/T) that reduces neutralization of anti-CD4 binding site MAbs does not alter G3-4s ability to neutralize. [Thali1994] • G3-4: Weakly neutralizing, IC 50 = 53 mug/ml. [Gorny1994] • G3-4: Conformationally sensitive – sporadic cross-reactivity among, and outside, B clade gp120s. [Moore1994b] • G3-4: V2 region, marginal binding to peptide, binding inhibited by 183/184 PI/SG substitution. [Moore1993b] • G3-4: Conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. [Moore1993a] • G3-4: Increased binding in the presence of sCD4. [Sattentau1993] • G3-4: Substitutions in residues 176 to 184 affect MAb recognition – substitutions in V2 can result in gp120-gp41 dissociation. [Sullivan1993] • G3-4: Neutralizes IIIB and RF, not MN – blocks sCD4-gp120, not as potent as MAb 15e – V2 binding MAbs BAT085 and G3-136 block G3-4 gp120 binding – sensitive to reduction of gp120 by DTT. [Ho1992] • G3-4: Binding is sensitive to removal of glycans by endo H – 50% neutralization of 4/9 primary isolates – has conformational features. [Ho1991a]

		References Parren1998a, Ditzel1997, Binley1997a, Poignard1996a, Moore1996, Sattentau1995b, Wu1995, Yoshiyama1994, Gorny1994, Moore1994d, D'Souza1994, Moore1993b, Thali1993, Pirofski1993, Moore1993a, Fung1992, Fung1987 • BAT085: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] • BAT085: Epitope suggested to be QKEYAFFYKLD – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT123 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. [Poignard1996a] • BAT085: Binding is blocked by other V2 region antibodies, enhanced by several anti-C1 MAbs, and anti-V3 MAb G511 – reciprocal enhancement of CD4i MAb 48d binding. [Moore1996] • BAT085: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes cell free Hx10. [Sattentau1995b] • BAT085: HXB10 strain specificity – binds native, deglycosylated, or denatured gp120. [Wu1995] • BAT085: Neutralizes RF – substitution 177 Y/H in the V2 loop of RF does not inhibit neutralization, in contrast to MAbs G3-4 and SC258. [Yoshiyama1994] • BAT085: Interacts with two overlapping peptides with region of overlap KEYAFFYKLD. [Gorny1994] • BAT085: Multi-lab study for antibody characterization and assay comparison – did not bind MN or SF2. [D'Souza1994] • BAT085: Peptide affinities of G3-136 and G3-4 are 100-fold less than BAT085, but BAT085 has lower affinity for BH10 gp120 and is weaker at neutralization. [Moore1993b] • BAT085: 7/8 V2 murine MAbs required gp120 native structure to bind, but BAT085 was the exception – type-specific. [Moore1993b] • BAT085: Called BAT-85 – conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. [Moore1993a] • BAT085: V2 region – sCD4 does not block – neutralizes IIIB and some primary isolates, but not MN or RF – binds MN – deglycosylation or DDT reduction of gp120 does not diminish reactivity. [Fung1992]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• IIIB-V3-21: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] • IIIB-V3-21: Does not block HIV-1 LAI binding or entry into CEM cells. [Valenzuela1998] • IIIB-V3-21: Binds to NP40 treated gp120, and epitope is probably obscured by local glycosylation. [Laman1993] • IIIB-V3-21: Binds to the base of the V3 loop on denatured gp120. [Laman1992]				
426	polyclonal	gp160 (296–327)	gp120 (MN)	CNYNKRKRIHIGPGRAFYTTKNIIG-TIC	L		rabbit (IgA, IgG)
		Ab type V3 **References** FitzGerald1998 • Polyclonal response to MN, or Thai E V3 loop inserted into Pseudomonas Exotoxin for vaccination – inserts of 14 or 26 amino acids were used from MN or a Thai E strain, constrained by disulfide bond – sera from vaccinated rabbit were reactive with strain-specific gp120 – administration to mucosal surfaces elicits IgA. [FitzGerald1998]					
427	polyclonal	gp160 (297–330)	Env (dis 303–335 LAI)	TRPNNNTRKSIHIGPGRAFYATGEI-IGDIRQAH	no	Vaccine	human (IgG)
		Vaccine *Vector/Type:* lipopeptide *Strain:* B clade LAI *HIV component:* V3 *Adjuvant:* QS21 **Ab type** V3 **References** Pialoux2001 • 28 subjects were vaccinated with six HIV-1 peptides that were selected to be particularly rich in CTL epitopes, presented in lipopeptides with or without adjuvant QS21 – HIV-specific Ab responses were detected in 25/28 (89%), proliferative in 19/28 (79%), and CTL in 13/24 (54%) of testable volunteers – 14/28 had non-neutralizing Ab responses to this peptide (E), 7/24 had proliferative responses, and multiple CTL responses were detected. [Pialoux2001]

		Ab type V3 **References** Carlos1999 • Antibody response to the epitopes in a vaccine construct (VEI) containing peptides from 5 hypervariable regions of gp120 was detected in the sera of HIV-1 positive subjects, including sera from 6 non-subtype B infections – serum samples from San Francisco, Canada and Puerto Rico cohort showed presence of antibodies against all five VEI hypervariable regions, but most consistently against the V3 region peptide NNNTRKSIRIGPGRAFYTTGDIGNIRQ. [Carlos1999]					
437	9284 (NEA 9284)	gp160 (301–312)	gp120 (307–318 IIIB)	NNTRKSIRIQRG	L	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade IIIB *HIV component:* HIV-1 **Ab type** V3 **Research Contact** Dupont de Nemours, Les Ulis, France or Wilmington, Delaware **References** Schonning1998, Parren1998a, Binley1997a, Cao1997b, Poignard1996a, Moore1996, Fontenot1995, VanCott1995, Sattentau1995b, Sorensen1994, Okada1994, Cook1994, Thali1994, VanCott1994, Thali1993, Trujillo1993, Moore1993c, Sattentau1993, McKeating1992a, Wyatt1992, Sattentau1991, Skinner1988a, Skinner1988b • 9284: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, 9284 was found to have an inaccessible epitope on the oligomeric form of Env and anti-V3 MAbs were found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan more efficiently than HIV-BRU. [Schonning1998] • 9284: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] • 9284: Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to and CD4BS MAb F105 or sCD4. [Cao1997b] • 9284: V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus, mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. [Poignard1996a] • 9284: Binds V3 loop – anti-C1 MAbs 133/290 and 135/9 enhance binding – reciprocal binding inhibition of other anti-V3 MAbs. [Moore1996] • 9284: Used to monitor HIV-1 Env expression in infected H9 cells, binds native and reduced gp120s similarly. [VanCott1995] • 9284: Binds equally well to monomer and oligomer, rapid association and potent neutralization of lab strains – neutralizes cell-free virus Hx10. [Sattentau1995b] • 9284: Did not neutralize infection of HIV/HTLV-I pseudotype. [Sorensen1994] • 9284: Binding domain aa 301-310: TRKSIRIQRG – mutations in the V3 loop from basic residues can destroy virus infectivity and syncytium formation: R306T, R309T and R313G can also reduce binding of V3 MAbs with two different binding sites: 9284 and 0.5beta – called NEA9284. [Okada1994]

		• 9284: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. [Cook1994] • 9284: gp41 mutation that confers resistance to neutralization by anti-CD4 binding site antibodies does not reduce neutralizing efficiency of this V3 region MAb. [Thali1994] • 9284: Does not bind MN gp120, just IIIB. [VanCott1994] • 9284: Peptide RIQRGPGRAFVTIGKIGNMRQA – Reacts with three human brain proteins of 35, 55, 110 kd – called NEA-9284. [Trujillo1993] • 9284: Inhibits C4 region antibodies (G3-299, G3-519) which have conformational requirements. [Moore1993c] • 9284: Increased binding in the presence of sCD4. [Sattentau1993] • 9284: Single amino acid substitutions in the C4 region (427 W/V or W/S) or at the base of the V3 loop (298 R/G) can significantly increase binding and neutralization– position 427 is also important for CD4 binding and anti-CD4 binding site MAbs. [Wyatt1992] • 9284: Two fold increase in binding to gp120 in the presence of bound sCD4. [Sattentau1991] • 9284: IIIB type-specific binding and neutralization. [Skinner1988b]			
438	polyclonal	gp160 (301–325)	gp120 (IIIB)	NNTRKSIRIQRGPGRAFVTIGKIGN	L	Vaccine	mouse (IgA)
		Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *Adjuvant:* Cholera toxin (CT) **Ab type** V3 **References** Bukawa1995 • Polyclonal secretory IgA antibody raised by mucosal immunization is able to neutralize IIIB, SF2, and MN – HIV-1 neutralization may be due to V3, CD4 or HPG30 component of the multicomponent peptide immunogen. [Bukawa1995]					
439	polyclonal	gp160 (301–325)	gp120 (IIIB)	NNTRKSIRIQRGPGRAFVTIGKIGN	L	Vaccine	mouse (IgA22a)
		Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* Env, Rev **Ab type** V3 **References** Sasaki1998 • An anti-env response was sought, and co-expression of Rev was required – intramuscular versus nasal vaccination with DNA vaccine with a QS21 adjuvant was studied – QS21 enhanced the IgG2a response mediated via Th1 cytokines IFNgamma and IL-2. [Sasaki1998]					
440	polyclonal	gp160 (302–317)	Env (B consensus)	NTRKSIHIGPGRAF		HIV-1 infection	human
		Ab type V3 **References** Morris2001 • Ab responses before HAART therapy and after one year of therapy were measured in 8 individuals that were classified HAART successes, and 10 patients who were classified as HAART failures – V3 peptide antibody binding titers to the B-consensus and MN and SF2 variants, and neutralization of HIV-1 MN and four subtype B clinical isolates were tested – subjects with strong anti-V3 and NAb humoral immune responses before starting HAART were more likely to achieve sustained viral suppression to <500 copies RNA/ml on HAART – HIV-specific Ab responses declined after 1 year of successful viral suppression on HAART. [Morris2001]					
441	polyclonal	gp160 (302–318)	Env	NTRKSIHIGPGRAFY	L P	HIV-1 infection	human
		Ab type V3 **References** Bongertz2001 • Non-transmitting mothers had an increased frequency of high neutralizing plasma Ab titers against HIV-1 MN (1:50 dilution, >90% neutralization, 33/88 pregnant women), compared to plasma from transmitting mothers (0/8 pregnant women) – non-transmitting mothers also had more potent neutralization against primary isolates from transmitting mothers, but neutralization of autologous virus was comparable for non-transmitting (7/13) and transmitting mothers (2/4) [Bongertz2001]

446	1324-E (1324E)	gp160 (303–308)	Env (subtype CRF01)	TRTSVR	L	HIV-1 infection	human (IgG1κ)

Ab type V3 **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center)
References Gorny2004, Nyambi2000, Zolla-Pazner1999b, Zolla-Pazner1999a, Gorny1998
Keywords antibody generation, inter-clade comparisons, review, variant cross-recognition or cross-neutralization.

- 1324-E: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**)
- 1324-E: Called 1324E – A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1324E showed poor cross-reactivity, and was the only MAb tested that was derived from a non-B clade infected patient, an E clade infection was the source of 1324E. [Nyambi2000] (**inter-clade comparisons**)
- 1324-E: MAb reacted with peptides from E clade, while B clade derived MAbs could not. [Zolla-Pazner1999b] (**inter-clade comparisons**)
- 1324-E: E clade stimulated MAb did not cross-react with B clade peptides nor did B clade derived peptides with an E clade V3 loop, but both E and B clade stimulated Abs can cross-react with some peptides from other clades – this Ab showed strong binding to several E, A and F peptides, one C peptide, and no reactivity with B peptides and most D peptides. [Zolla-Pazner1999a] (**inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 1324-E: A human MAb was derived from an HIV-1 E clade infection from a US service man who had served in Thailand, selected with the consensus V3 peptide from clade E – cross-reactive with V3 peptides, and gp120 from E, C and A clades, as well as cells infected with a C-clade primary isolate, but not with B and D clade V3 peptides or rgp120 – neutralizes E clade virus adapted for growth in H9 cells, but not 5 primary E clade isolates, including the autologous isolate – kinetic parameters were measured, 1324E was comparable to 447-52D. [Gorny1998] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

		Keywords antibody binding site definition and exposure, binding affinity, complement, inter-clade comparisons, kinetics, review, vaccine antigen design, variant cross-recognition or cross-neutralization. • 412-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**) • 412-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 412-D showed limited reactivity. [Nyambi2000] (**inter-clade comparisons**) • 412-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**) • 412-D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**) • 412-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 412-D was bound only to B clade virions and to D clade MAL. [Nyambi1998] (**inter-clade comparisons**) • 412-D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 412-D has a relatively fast dissociation, thus low affinity among V3 MAbs. [Gorny1998] (**kinetics**) • 412-D: Called 412 – The tip of the V3 loop was presented in a mucin backbone – higher valency correlates with higher affinity constant. [Fontenot1995] (**vaccine antigen design**, **binding affinity**) • 412-D: Called 412-10D – relatively rapid dissociation and weak homologous neutralization. [VanCott1994] (**binding affinity**) • 412-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. [Spear1993] (**complement**) • 412-D: Neutralizes MN, does not bind SF2 or HXB2 – not reactive with hexa or heptapeptides by Pepscan. [Gorny1993] (**variant cross-recognition or cross-neutralization**)					
457	polyclonal	gp160 (304–320)	gp120 (MN)	RKRIHIGPGRAFYTT	L (MN ALA-1)	HIV-1 infection	human
		Ab type V3 **References** Spear1994 • 40% of antibody in serum that can bind to native viral proteins on MN-infected cells can be blocked by the peptide RKRIHIGPGRAFYTT, which can also block 75-95% of the complement activation on HIV infected cells. [Spear1994]					
458	CGP 47 439	gp160 (304–322)	gp120	RKRIRIQRGPGRAFVTIGK?	L	Vaccine	human
		Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** V3 **References** Jacobson1998, Gauduin1998, Gunthard1994, Safrit1993, Liou1989 • CGP 47 439: Review of passive immunotherapy, summarizing [Gunthard1994] in relation to other studies [Jacobson1998]. [Gunthard1994, Jacobson1998] • CGP 47 439: Post-exposure passive transfer of murine BAT123 can confer protection to hu-PBL-SCID mice challenged with HIV-1 LAI – this protection is not elicited by CGP 47 439, suggesting that the protection is mediated by complement – the protective ability of BAT123 is lost when mice were treated with cobra venom factor, which inactivates serum complement – in this circumstance complement activation provided a protective advantage. [Gauduin1998] • CGP 47 439: Phase I/IIA clinical trial studying multidose tolerability, immunogenicity and pharmacokinetic responses – GP 47 439 was well tolerated, serum t_1/2 was 8-16 days, and a virus burden reduction was noted in some patients. [Gunthard1994] • CGP 47 439: passive transfer to Hu-PBS-SCID mice confers protection against challenge with homologous cell-free virus – CGP 47 439 is a BAT123-human Ig chimera. [Safrit1993]

		Ab type V3 **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center) **References** Gorny2004, Zhang2002, Vella2002, York2001, Park2000, Nyambi2000, Oggioni1999, Beddows1999, Zolla-Pazner1999b, Zolla-Pazner1999a, Stamatatos1998, Gorny1998, Yang1998, LaCasse1998, Hioe1997b, Hill1997, Stamatatos1997, Schutten1997, Schutten1996, Wisnewski1996, Fontenot1995, Schutten1995b, Schutten1995a, Zolla-Pazner1995a, D'Souza1995, Stamatatos1995, VanCott1994, D'Souza1994, Spear1993, Cavacini1993a, Gorny1993, Karwowska1992b, D'Souza1991, Gorny1991 **Keywords** antibody binding site definition and exposure, antibody interactions, antibody sequence, variable domain, assay development, binding affinity, co-receptor, complement, enhancing activity, inter-clade comparisons, kinetics, review, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization. • 257-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**) • 257-D: NIH AIDS Research and Reference Reagent Program: 1510. • 257-D: UK Medical Research Council AIDS reagent: ARP3023. • 257-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**variant cross-recognition or cross-neutralization**) • 257-D: Called ARP3023: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. [Vella2002] (**assay development**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 257-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001]
- 257-D: Called 257D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000]
- 257-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 257-D showed intermediate reactivity. [Nyambi2000] (**inter-clade comparisons**)
- 257-D: Study of a live-vector mucosal vaccine that expresses HIV-1 V3 domains using the bacterium Streptococcus gordonii which can express heterologous Ag and can colonize the oral cavity and vagina of mice – 268-D and 257-D recognized S. gordonii expressing the V3 domain of MN – the vaccine stimulated V3-specific IgG2a in mice. [Oggioni1999] (**vaccine antigen design**)
- 257-D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 257-D bound rgp120 W61D but could only neutralize the W61D isolate following T-cell line adaptation. [Beddows1999] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **vaccine-specific epitope characteristics**)
- 257-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**)
- 257-D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**)
- 257-D: Called 257D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V3 MAbs 391-95D or 257D. [Stamatatos1998] (**vaccine antigen design**, **inter-clade comparisons**)
- 257-D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 257-D has a slow dissociation, thus the highest affinity among V3 MAbs. [Gorny1998] (**kinetics**, **binding affinity**)
- 257-D: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. [Yang1998] (**assay development**)
- 257-D: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. [LaCasse1998] (**co-receptor**, **variant cross-recognition or cross-neutralization**)
- 257-D: Called 257 – gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. [Hill1997] (**antibody binding site definition and exposure**, **co-receptor**)
- 257-D: Binds less extensively than MAb 391-95D on the surface of HIV-1 isolates SF162 and SF128A – neutralizes less potently than 391-95D – stronger neutralization of primary macrophage targets than PBMC. [Stamatatos1997] (**variant cross-recognition or cross-neutralization**)
- 257-D: Neutralized (>90%) an SI-env chimeric virus and enhanced (>200%) an NSI-env chimeric virus. [Schutten1997] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- 257-D: IIIB neutralizing MAbs *in vitro* fail to neutralize in a mouse model *in vivo*. [Schutten1996]
- 257-D: 257-D is V H5 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- 257-D: Comparable affinity for SI and NSI viruses, in contrast to MAb MN215. [Schutten1995b] (**variant cross-recognition or cross-neutralization**)
- 257-D: Only inhibition of SI phenotype virus, and strong enhancement of NSI phenotype chimeric viruses, that incorporated different envs from the same donor. [Schutten1995a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 257-D: In serotyping study using flow-cytometry, bound only to virus with KRIHI. [Zolla-Pazner1995a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • 257-D: Called 257-D-IV – could neutralize MN and closely related JRCSF, but not 2 B subtype and 1 D subtype primary isolates in a multi-laboratory study involving 11 labs. [D'Souza1995] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**) • 257-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 better revealed this V3 epitope on TCLA SF2 and dual tropic (MU3) viruses than on macrophage tropic isolates. [Stamatatos1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • 257-D: Potent MN neutralization, slow dissociation constant. [VanCott1994] (**binding affinity**) • 257-D: Included a multi-lab study for antibody characterization and assay comparison – best NAb against MN, but not IIIB. [D'Souza1994] (**variant cross-recognition or cross-neutralization**) • 257-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG – complement mediated virolysis of MN, but not in the presence of sCD4. [Spear1993] (**complement**) • 257-D: Additive MN or SF2 neutralization when combined with CD4 binding site MAb F105 – does not neutralize RF. [Cavacini1993a] (**antibody interactions**, **variant cross-recognition or cross-neutralization**) • 257-D: Neutralizes MN – binds SF2: epitope KSIYI – specificity: MN, SF2, NY5, RF. [Gorny1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • 257-D: Reacts with MN, NY5, CDC4 and SF2, does not cross-react with RF, WM52, or HXB2. [Karwowska1992b] (**variant cross-recognition or cross-neutralization**) • 257-D: Called 257-2-D-IV – potent neutralizing MAb. [D'Souza1991]

- 391/95-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**)
- 391/95-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 391/95-D: The phenotype and genotype of viral env sequences were studied over a period of seroconversion in one individual – Env trans-complementation demonstrated infectivity of clones derived pre-seroconversion were not influenced by MAb 391/95-D, but post-seroconversion clones were enhanced in the presence of 391/95-D, although the V3 binding region was unchanged – a change in the CD4-binding site was observed (NL43 427 Glu–>Lys) to be present in the post-seroconversion 391/95-D enhanced clone (see [Guillon2002]) [Lawson2002]. [Guillon2002, Lawson2002] (**enhancing activity**, **acute infection**)
- 391/95-D: The affect of Ab binding on infectivity was studied by pseudotyping three related envs with different phenotypes – R5 viruses were preferentially enhanced, not X4 – the V3 region was the main determinant of Ab-mediated enhancement and modulation of the interaction between CCR5 and gp120 is critical – tests with MAbs anti-V3 391/95-D and CD4BS-specific GP68 indicate that Ab specificity did not determine whether or not infectivity was enhanced or neutralized, rather the phenotype was determined by Env conformation. [Guillon2002] (**co-receptor**, **enhancing activity**)
- 391/95-D: Called 391/95D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000] (**antibody binding site definition and exposure**)
- 391/95-D: Called 391-95D – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000] (**antibody binding site definition and exposure**)
- 391/95-D: Called 391.5 – MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**)
- 391/95-D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 391/95-D: Called 391-95D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V3 MAbs 391-95D or 257D. [Stamatatos1998] (**antibody binding site definition and exposure**, **inter-clade comparisons**) • 391/95-D: Called 391-95D – binds more extensively than MAb 257-D on the surface of HIV-1 isolates SF162 and SF128A – neutralizes more potently than 257-D – stronger neutralization of primary macrophage targets than PBMC – binding post-gp120-sCD4 association related to anti-V3 Abs neutralizing capacity. [Stamatatos1997] (**variant cross-recognition or cross-neutralization**) • 391/95-D: Competition ELISAs with serial deletions estimated the epitope to be KRIHIGPGRAFY – unconstrained peptide had higher affinity than cyclic. [Seligman1996] (**antibody binding site definition and exposure**) • 391/95-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 better revealed this V3 epitope on macrophage tropic and dual tropic (MU3) viruses, but not in TCLA SF2. [Stamatatos1995] (**antibody binding site definition and exposure**) • 391/95-D: Neutralizes MN – binds to SF2, not IIIB. [Gorny1993]				
465	Aw	gp160 (305–320)	gp120 (Gun-1wt)	KSITIGPGRAFHAI	L	Vaccine	rat
		Vaccine *Vector/Type:* peptide *Strain:* Gun-1 *HIV component:* V3 **Ab type** V3 **References** McKnight1995 • Aw: Rat antibodies were raised against V3 peptides that represent either the wildtype (wt), or brain-cell tropic variant (v) of the isolate Gun-1 – Aw gives weak neutralization of both wildtype and v strains. [McKnight1995]					
466	Bw	gp160 (305–320)	gp120 (Gun-1wt)	KSITIGPGRAFHAI	L	Vaccine	rat
		Vaccine *Vector/Type:* peptide *Strain:* Gun-1 *HIV component:* V3 **Ab type** V3 **References** McKnight1995 • Bw: Rat antibodies were raised against V3 peptides that represent either the wildtype (wt), or brain-cell tropic variant (v) of the isolate Gun-1 – Bw gives weak neutralization of only the wildtype strain, does not bind to variant. [McKnight1995]					
467	DO142-10 (DO 142-10)	gp160 (305–320)	gp120 (MN)	KRIHIGPGRAFYTT	L	HIV-1 infection	human (IgG1)
		Ab type V3 **References** Gorny2004, Kwong2002, Sullivan1998a, Parren1998a, Parren1997a, Parren1997c, Ditzel1997, Seligman1996 **Keywords** antibody binding site definition and exposure, antibody generation, binding affinity, enhancing activity, review, variant cross-recognition or cross-neutralization. • DO124-10: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. DO124-10 neutralizes some TCLA strains. [Gorny2004] (**variant cross-recognition or cross-neutralization**, **review**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• D0124-10: Called D0124. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**) • DO124-10: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab Ab fragment DO124-10 also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism – while DO124-10 enhances YU2 entry 6-fold, it neutralizes HXBc2 under identical conditions. [Sullivan1998a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**) • DO142-10: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different that Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**variant cross-recognition or cross-neutralization**, **binding affinity**) • DO142-10: Binds to gp120 MN and an MN V3 peptide with equal affinity, but binds a consensus B peptide and JRCSF less well, and to IIIB gp120 not at all. [Parren1997a] (**variant cross-recognition or cross-neutralization**, **binding affinity**) • DO142-10: Neutralizes TCLA strains but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**) • DO142-10: Phage expression libraries panned against MN peptide were used to select Fab DO142-10 – Fab binds MN gp120, but not a primary isolate rec gp120. [Ditzel1997] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • DO142-10: Fab fragment – competition ELISAs with serial deletions defined the epitope KRIHIGPGRAFYTT. [Seligman1996] (**antibody binding site definition and exposure**, **antibody generation**)

472	polyclonal	gp160 (305–322)	gp140 (SF162)	KSITIGPGRAFYATGD	yes	Vaccine	macaque, rabbit (IgG)
		Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade SF162 *HIV component:* gp140 *Adjuvant:* MF59 **Ab type** V3 **References** Barnett2001 • SF162ΔV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization – when incorporated into a codon-optimized DNA vaccine with a CMV promoter, delivered by gene gun, SF162Δ2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162ΔV2, but not intactSF162, was used as the immunogen – NAbs titers specific for SF162 increased with multiple immunizations, while titers for non-homologous isolates decreased, but anti-V3 peptide binding Abs were not likely the source of this distinction because anti-V3 titers were much lower than those against the entire envelope, and the second booster immunization did not increase the titer of anti-V3 loop Abs. [Barnett2001]					
473	50.1 (R/V3-50.1, Fab 50.1)	gp160 (306–310)	gp120 (MN)	RIHIG	L	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3 **Ab type** V3 **Research Contact** Mary White-Scharf, Repligen Corporation, Cambridge, MA **References** Zhang2002, York2001, Park2000, Hoffman1999, Stanfield1999, LaCasse1998, Berman1997, Seligman1996, Fontenot1995, VanCott1995, Moore1994b, Robert-Guroff1994, VanCott1994, Bou-Habib1994, Rini1993, Ghiara1993, Potts1993, White-Scharf1993, D'Souza1991 • 50.1: NIH AIDS Research and Reference Reagent Program: 1289. • 50.1: Called R/V3-50.1 – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] • 50.1: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – the dissociation constant, Kd of 50.1 for the cell associated primary and TCLA Envs was equal, 7nM. [York2001] • 50.1: Called R/V3-50.1 – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes – 50.1 could only neutralize the sensitive form. [Park2000]			

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 50.1: The crystal structure of V3 loop peptides bound to Fabs was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different Fabs were bound. [Stanfield1999] • 50.1: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. [LaCasse1998] • 50.1: Binds to 6/7 isolates from breakthrough cases from a MN gp120 vaccine trial. [Berman1997] • 50.1: Competition ELISAs with serial deletions produced comparable estimate of epitope length to crystal structure and alanine substitution – KRIHIGP. [Seligman1996] • 50.1: Used to monitor HIV-1 Env expression in infected H9 cells. [VanCott1995] • 50.1: Shows modest cross-reactivity among B clade gp120s, little outside B clade. [Moore1994b] • 50.1: Chimeric MN V3 loop in an HXB2 background allows increased FACS signal, Ab affinity, and viral neutralization. [Robert-Guroff1994] • 50.1: Potent MN neutralization, slow dissociation rate. [VanCott1994] • 50.1: No neutralization of primary isolate JR-CSF – greater affinity for and neutralization of T cell tropic strain T-CSF, derived from JR-CSF. [Bou-Habib1994] • 50.1: Crystal structure of V3 loop bound to 50.1 – light chain binds just to the left of GPG, heavy chain binds further to the left. [Rini1993] • 50.1: Crystal structure of a 24 amino acid peptide from the V3 loop bound to 59.1 and 50.1 Fab fragments – epitope KRIHIGP. [Ghiara1993] • 50.1: No synergistic neutralization of MN when combined with CD4BS MAb F105 – isotype stated to be IgG2a. [Potts1993] • 50.1: Epitope defined by peptide reactivity and changes affinity with amino acid substitutions – epitope RIHIGP. [White-Scharf1993] • 50.1: Called R/V3-50.1 – potent neutralizing of lab strains. [D'Souza1991]			
474	polyclonal	gp160 (306–318)	gp120 (NY5)	KKGIAIGPGRTLY			(IgM)
		Ab type V3 **References** Metlas1999a, Metlas1999b • Auto-Abs that react with the V3 loop of NY5 are present in the sera of HIV- individuals, and are predominantly IgM. [Metlas1999b]					
475	BAT123 (BAT-123, CGP 47 439)	gp160 (306–322)	gp120 (308–322 HXB2)	RIRIQRGPGRAFVTIGK	L	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade IIIB *HIV component:* HIV-1 **Ab type** V3 **Research Contact** Tanox Biosystems Inc and David Ho, ADARC, NY **References** Gauduin1998, Parren1998a, Andrus1998, Poignard1996a, Sattentau1995b, Gauduin1995, Pirofski1993, Thali1993, Safrit1993, Moore1993a, Fung1990, Liou1989, Fung1987 • BAT123: Post-exposure passive transfer of murine BAT123 can confer protection to hu-PBL-SCID mice challenged with HIV-1 LAI – this protection is not elicited by CGP 47 439, a BAT123 chimera that has a human IgG1 Fc domain, suggesting that the protection is mediated by complement – the protective ability of BAT123 is lost when mice were treated with cobra venom factor, which inactivates serum complement – IgG1 does not fix complement efficiently so an IgG2 MAb might perform better. [Gauduin1998] • BAT123: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] • BAT123: Post-exposure prophylaxis was effective when MAb 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. [Andrus1998] • BAT123: Epitope described as RGPGRAFVTIGK – V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus (BAT123 less so than the others), mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. [Poignard1996a] • BAT123: Binds with high affinity to monomer and oligomer, rapid association and potent neutralization of lab strain. [Sattentau1995b]			

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- BAT123: Passive transfer of BAT123 to hu-PBL-SCID mice 1 hour prior to inoculation with HIV-1 LAI, or up to four hours post-exposure, could protect mice from infection – the protection, like the MAb, was specific for the viral strain LAI. [Gauduin1995]
- BAT123: Variable region sequenced – heavy chain: V 3660-SB32, D unknown, J H3 – light chain: V kappa21, J kappa2. [Pirofski1993]
- BAT123: Passive transfer to Hu-PBS-SCID mice confers protection against challenge with homologous cell-free virus. [Safrit1993]
- BAT123: Called BAT-123 – conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120 – does not inhibit HIV-1 sera from binding to IIIB gp120. [Moore1993a]
- BAT123: Anti-idiotypic MAb, AB19-4i, stimulates anti-anti-ID which neutralizes MN and IIIB. [Fung1990]
- BAT123: CGP 47 439 is a BAT123 chimera that has a human IgG1 Fc domain.

476 838-D (838) gp160 (307–311) Env (RF) KSITK L HIV-1 infection human (IgG1λ)

Keywords antibody binding site definition and exposure, antibody generation, inter-clade comparisons, review, variant cross-recognition or cross-neutralization.

- 838-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**variant cross-recognition or cross-neutralization**, **review**)
- 838-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002]
- 838-D: Called 838 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. [He2002]
- 838-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 838-D showed intermediate reactivity. [Nyambi2000] (**inter-clade comparisons**)
- 838-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. [Gorny2000a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 838-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**)
- 838-D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed strong binding to many A, B, C and F peptides, poor binding to D and E. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**)
- 838-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 838-D bound B clade virions but had limited cross-reactivity with other clades, with low levels of binding to A and D virions. [Nyambi1998] (**inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 838-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**) • 838-D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 838-D was cross-reactive with V3 peptides from clade A and C, and could bind to 5/8 B clade V3 peptides – 50% neutralization of RF was obtained. [Gorny1997] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

Center) **References** Gorny2004, Zhang2002, Nyambi2000, Zolla-Pazner1999b, Zolla-Pazner1999a, Gorny1997 **Keywords** antibody binding site definition and exposure, antibody generation, inter-clade comparisons, review. • 1027-15D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**) • 1027-15D: Called 1027-D – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**antibody binding site definition and exposure**)				

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 1027-15D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1027-15D showed strong cross-reactivity. [Nyambi2000] (**inter-clade comparisons**) • 1027-15D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**) • 1027-15D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed moderate binding to several B and F peptides, one C peptide, and was not reactivity with A, D and E peptides. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**) • 1027-15D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 1027-15D was not cross-reactive with V3 peptides from clade A or E, but could bind to 3/8 B clade V3 peptides, and 1/2 C clade V3 peptides. [Gorny1997] (**antibody binding site definition and exposure**, **antibody generation**, **inter-clade comparisons**)

		Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** V3 **References** Boudet1995, Boudet1994, Boudet1991 • F19.57-11: Anti-anti-idiotypic antibodies (Ab3) were raised in BALBc mice that had greater breadth of reactivity than the original F19.57-11 (Ab3 could also recognize 1282 and SF2, with aa TRK(R or S)IYIGPGRA(WY or FH)T) [Boudet1995] • F19.57-11: MAb F19.57-11 is strain specific for LAI – used to raise anti-idiotype rabbit antibodies (called 57-B Ab2) [Boudet1994]					
484	M77	gp160 (307–320)	gp120 (IIIB)	IRIQRGPGRAFVTI	L	HIV-1 infection	human (IgG)
		Ab type V3 **Research Contact** Advanced BioScience Laboratories, Rockville, MD, commercial **References** Gorny2004, Finnegan2002, Denisova2000, Watkins1996, Denisova1996, Denisova1995, DeVico1995, Cook1994, Watkins1993, diMarzo Veronese1993, diMarzo Veronese1992, Pal1992 **Keywords** antibody binding site definition and exposure, escape, review, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization. • M77: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. M77 neutralizes some TCLA strains. [Gorny2004] (**review**) • M77: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. Cluster I and II MAbs bound to gp120/gp41 complexes at the cell-to-cell contact interface, in contrast to M77 which bound to gp120 that was evenly dispersed over the target cell surface. [Finnegan2002]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• M77: M77 is highly strain specific for IIIB, but anti-idiotypic Abs directed against M77 can in turn elicit an Ab response with expanded HIV cross-reactivity – this mechanism may serve to prolong the primary response and to counter-balance viral immune evasion by mutation. [Denisova2000] (**variant cross-recognition or cross-neutralization**) • M77: Native M77 is highly strain specific, and V3 binding is primarily dependent on its heavy chain – a light chain switched Fab version of M77 could recognize HIV-1 strains that had substitutions on the left side of the V3 loop – R in GPGR is likely to be critical for binding. [Watkins1996] (**variant cross-recognition or cross-neutralization**) • M77: Used M77 bound to gp120 as an immunogen – analysis of polyclonal and monoclonal (62 MAbs were generated) response suggests the M77-gp120 immunogen generated MAbs to more linear epitopes than gp120 alone or gp120 bound to CD4. [Denisova1996] (**vaccine-specific epitope characteristics**) • M77: Stated to be a murine MAb – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – M77 neutralization was only slightly reduced by this mutation. [Watkins1993] (**escape**) • M77: Conformational rearrangements upon binding of M77 to gp120 generates novel epitopes called metatopes. [Denisova1995] • M77: Reacted with both reduced and non-reduced covalently cross-linked gp120-CD4 complex. [DeVico1995] (**antibody binding site definition and exposure**) • M77: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. [Cook1994] • M77: Antibody binding to viral isolates from IIIB infected lab worker followed through time – A to T substitution resulted in the loss of neutralization and native gp120 binding, but not peptide binding. [diMarzo Veronese1993] (**escape**) • M77: IIIB-specific MAb, immunoprecipitates deglycosylated form. [diMarzo Veronese1992] (**variant cross-recognition or cross-neutralization**)

References Gorny2004, Pantophlet2003b, Zwick2003, Poignard2003, Kwong2002, Zhang2002, Schulke2002, Kolchinsky2001, Park2000, Binley1999, Trkola1998, Parren1998a, Mondor1998, Parren1997c, Boots1997, Ugolini1997, Fouts1997, Binley1997a, D'Souza1997, Trkola1996a, Wu1996, Gauduin1996, Sattentau1995c, Moore1995b, Moore1995a, Moore1995c, Sattentau1995a, Moore1994a, Moore1994b, Scott1990

Keywords antibody binding site definition and exposure, antibody interactions, review, vaccine antigen design.

- 19b: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, and a subset also neutralize some primary isolates. [Gorny2004] (**review**)
- 19b: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. [Pantophlet2003b] (**vaccine antigen design**)
- 19b: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. [Zwick2003] (**antibody interactions**)
- 19b: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- 19b: Virion capture assays are not a good preditor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, A DA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. [Poignard2003]
- 19b: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002]
- 19b: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. [Schulke2002]
- 19b: Mutations in two glycosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 19b. [Kolchinsky2001]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 19b: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form but 19b was an exception and required around 950 ng/ml to neutralize either form. [Park2000]
- 19b: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999]
- 19b: No detectable neutralizing activity among primary isolates with different co-receptor usage – some neutralization of TCLA strains. [Trkola1998]
- 19b: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- 19b: Used as a control in this Hx10 binding and neutralizing MAb study because 19b does not bind to Hx10. [Mondor1998]
- 19b: Neutralizes TCLA strains but not primary isolates. [Parren1997c]
- 19b: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 19b has an epitope involving the tip of the V3 loop, with 5 or 6 essential amino acids distributed within a 12 amino acid stretch – the previously determined binding site was confirmed -I—-G–FY-T and some tolerated variants described, the I can be I, V, or L, the Y can be Y, F, or W – probably a beta-turn is required for FY or FF binding, but WY in can bind with out the context of the turn. [Boots1997]
- 19b: Viral binding inhibition by 19b was weakly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997]
- 19b: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 19b bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997]
- 19b: In a multilaboratory blinded study, failed to consistently neutralize any of nine B clade primary isolates – there were four sequences with variations in the defined epitope among the 9 isolates tested. [D'Souza1997]
- 19b: Inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a]
- 19b: MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 – binding of 19b blocks this inhibition. [Wu1996]
- 19b: Not as effective as IgG1b12 at neutralization *ex vivo* of virus direct from plasma of HIV-1 infected individuals. [Gauduin1996]
- 19b: Review: more broadly cross-reactive than anti-V3 tip MAb 447-D. [Moore1995b]
- 19b: Despite broad gp120 binding reactivity, not broadly neutralizing. [Moore1995a]
- 19b: Binds to some gp120s from clades A,B,C,E, and F – weakly neutralized some B and one C clade virus. [Moore1995c]
- 19b: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. [Sattentau1995c]
- 19b: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. [Moore1994a]
- 19b: V3 loop binding MAb that is more broadly clade cross-reactive than most (binds to 19/29 clade B and 10/12 clade E gp120s) [Moore1994b]

There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**) • 419-D: Called 419 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. [He2002] • 419-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 419-D showed intermediate reactivity, and no neutralization when tested against five strains – discrepancy between the epitope as described in earlier papers and as described here, KRIHIGP. [Nyambi2000] (**inter-clade comparisons**) • 419-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**) • 419-D: Review of clade specificity and anti-V3 HIV-1-Abs – epitope is described as KRIHIGP. [Zolla-Pazner1999a] (**antibody binding site definition and exposure**, **review**) • 419-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 419-D bound to 3/4 B clade virions, and to D clade MAL. [Nyambi1998] (**inter-clade comparisons**) • 419-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**) • 419-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. [Spear1993] (**complement**) • 419-D: Neutralizes MN – binds SF2: IYIGPGR. [Gorny1993] (**variant cross-recognition or cross-neutralization**) • 419-D: MN, NY5 and SF2 strain specific, does not cross-react with RF, CDC4, WM52 or HXB2. [Karwowska1992b] (**variant cross-recognition or cross-neutralization**)

499 83.1 (MAb 83.1) gp160 (309–315) gp120 (SF2) IYIGPGR L Vaccine mouse (IgG1)

Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3
Ab type V3 **Research Contact** Mary White-Scharf, Repligen Corporation, Cambridge, MA
References Binley1999, Keller1999, Jelonek1999, Potts1993, White-Scharf1993

- 83.1: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999]
- 83.1: 19 day old mice injected with 83.1 have a shift in IgG1 response away from the V3 loop upon vaccination, without decreasing the total IgG anti-gp120 response, suggesting that prior treatment with a MAb can mask immunogenic sites and shift the immune response to vaccination. [Keller1999]
- 83.1: Maternally transferred anti-V3 loop MAb selectively inhibits the anti-V3 loop Ab component of the IgG response to rgp120 SF2 in 21 day old BALBc mice. [Jelonek1999]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 83.1: Study of synergism of neutralization and binding comparing F105 and sCD4 with the V3 MAbs: 50.1, 59.1, 83.1, and 58.2 – synergy was observed, and the data suggest that binding of one ligand (F105) can increase the binding of the second (e. g. V3 loop MAbs) due to conformational changes. [Potts1993] • 83.1: Neutralizes SF2. [White-Scharf1993]

		Vaccine *Vector/Type:* virus derived protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** V3 **References** Schonning1999, Schonning1998, Jacobson1998, Hinkula1994, Arendrup1993, Moore1993c, Marks1992, Broliden1991, Broliden1990, Akerblom1990 • P4/D10: Called P4D10 – the stoichiometry of MAb neutralization was tested and the data indicated that binding for neutralization was was incremental not all or none, i.e., each envelope oligomer binds a single MAb and each Env oligomer bound reduces the chances of infection – MAb BC1071 was used for virion quantification – P4D10 binds only to Env with a glycosylation site mutation at the base of the V3 loop A308T. [Schonning1999] • P4/D10: Called P4D10 – In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, anti-V3 MAbs were found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan more efficiently than HIV-BRU – Ab binding site was suggested to be 314-323 of BRU. [Schonning1998] • P4/D10: Review of passive immunotherapy, summarizing [Hinkula1994] in relation to other studies [Jacobson1998]. [Hinkula1994, Jacobson1998] • P4/D10: Used for passive immunotherapy in four late-stage HIV-infected patients – the serum level of p24 did not decrease in any of these four – see also MAb F58/H3. [Hinkula1994]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• P4/D10: Primary isolates from different time points from one individual were not susceptible to neutralization by P4/D10. [Arendrup1993] • P4/D10: Binding to native gp120 3 fold greater than to denatured – 314G/W substitution abolishes binding, changes outside the loop have little effect. [Moore1993c] • P4/D10: Variable domain sequenced and is identical to F58/H3. [Marks1992] • P4/D10: Neutralizing and ADCC activity. [Broliden1990]					
504	IIIB-13 V3 (1044-13 IIIB-V3-13 1727)	gp160 (309–317)	gp120 (308–316 IIIB)	IQRGPGRAF	L	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB **Ab type** V3 **References** Zhang2002, Chakrabarti2002, Watkins1993, D'Souza1994, Laman1993, Laman1992 • IIIB-13 V3: NIH AIDS Research and Reference Reagent Program: 1727. • IIIB-13 V3: UK Medical Research Council AIDS reagent: ARP3046. • IIIB-13 V3: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] • IIIB-13 V3: Called 1727: Used as a standard for comparing immune responses to modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation – experiment showed enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. [Chakrabarti2002] • IIIB-13 V3: Called IIIB-V3-13 – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – IIIB-V3-13 neutralization was only slightly reduced by this mutation. [Watkins1993] • IIIB-13 V3: Included in a panel of antibodies used in a multi-lab study for antibody characterization and assay comparison, some neutralization of strains other than IIIB. [D'Souza1994] • IIIB-13 V3: Neutralizes IIIB but not MN. [Laman1992] • IIIB-13 V3: Also known as 1044-13 and as IIIB-V3-13 (J. P. Moore, per. comm.)					
505	IIIB-34 V3 (IIIB-V3-34)	gp160 (309–317)	gp120 (308–316 IIIB)	IQRGPGRAF	L	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB **Ab type** V3 **References** Laman1993, Laman1992 • IIIB-34 V3: UK Medical Research Council AIDS reagent: ARP3047. • IIIB-34 V3: Called IIIB-V3-34 – IIIB strain specific neutralization – binding is reduced somewhat by DTT or SDS-DTT, enhanced by NP40, but binds to native and denatured gp120. [Laman1993] • IIIB-34 V3: Neutralizes IIIB but not MN – QXGPG are critical amino acids for binding by Pepscan analysis. [Laman1992]

		Ab type V3 **References** Gorny2004, Ohlin1992 **Keywords** antibody binding site definition and exposure, antibody generation, review. • M093/V3: Review. provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains; a subset can also neutralize some primary isolates. The three IgMs, M096, M097, and M099, are non-neutralizing. [Gorny2004] (**review**) • M096/V3: Generated in response to IIIB Env 286-467 upon *in vitro* stimulation of uninfected-donor lymphocytes, and binds to two peptides: 309-318 + 329-338. [Ohlin1992] (**antibody binding site definition and exposure**, **antibody generation**)					
510	μ5.5 (5.5, mu5.5, Rmu5.5)	gp160 (309–319)	gp120 (MN)	IHIGPGRAFYT	L P		mouse (IgG1κ)
		Ab type V3 **References** Okamoto1998, Maeda1992 • mu5.5: Rmu5.5 is a humanized antibody of mouse MAb m5.5 – neutralized primary isolates with similar V3 loops – passive transfer of MAb to SCID-hu or hu-PBL-SCID mice conferred protection. [Okamoto1998] • mu5.5: sCD4 causes loss of IIIB type-specificity for MAb 0.5beta, allowing binding and neutralization of MN, in contrast to MAb mu5.5. [Maeda1992]					
511	loop 2 (Loop 2, IgG1 Loop 2, loop2)	gp160 (309–320)	gp120	SISGPGRAFYTG	L	HIV-1 infection	human
		Ab type V3 **Research Contact** D. Burton, Scripps Research Institute, La Jolla, CA **References** Gorny2004, Pantophlet2003b, Zwick2003, Sullivan1998a, Parren1998a, Mondor1998, Parren1997a, Parren1997c, Ugolini1997, Ditzel1997, Wu1996, Moore1994b, Barbas III1993 **Keywords** antibody generation, antibody interactions, antibody sequence, variable domain, binding affinity, co-receptor, inter-clade comparisons, review, vaccine antigen design, variant cross-recognition or cross-neutralization. • loop 2: Called loop2. This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. loop 2 neutralizes some TCLA strains. [Gorny2004] (**variant cross-recognition or cross-neutralization**, **review**) • loop 2: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. [Pantophlet2003b] (**vaccine antigen design**) • loop 2: Called loop2. scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. [Zwick2003] (**antibody interactions**) • loop 2: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – loop 2 enhances YU2 at concentrations up to 20 ug/ml. [Sullivan1998a]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- loop 2: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope – binding affinity of divalent IgG1 loop 2 is only 2-fold greater than monovalent Fab loop 2, suggesting the IgG1 form may bind with only one arm. [Parren1998a] (**binding affinity**)
- loop 2: Neutralizes TCLA strains but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- loop 2: Epitope is suggested to be GPGRAF – binds to 10/17 US clade B monomeric gp120s – IgG1 form can neutralize MN and 2 primary isolates tested. [Parren1997a]
- loop 2: Viral binding inhibition by loop 2 MAb or Fab was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997]
- loop 2: Binds to gp120 from MN and SF2 but not LAI. [Ditzel1997] (**variant cross-recognition or cross-neutralization**)
- loop 2: MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 – binding of loop 2 blocks this inhibition. [Wu1996] (**co-receptor**)
- loop 2: Called Loop 2 – shows modest cross-reactivity among B clade gp120s, little outside B clade. [Moore1994b] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- loop 2: Sequences of the heavy and light chain Fab variable regions were generated. [Barbas III1993] (**antibody sequence, variable domain**)
- loop 2: Also known as Loop 2, IgG1 Loop 2 was a obtained by engineering Fab loop2 into an IgG1 molecule. (**antibody generation**)

- 268-D: NIH AIDS Research and Reference Reagent Program: 1511.
- 268-D: UK Medical Research Council AIDS reagent: ARP3024.
- 268-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera—2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5—thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002]
- 268-D: Called ARP3024: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. [Vella2002]
- 268-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – one of the TCLA V3 viruses 320SI-C3.3 shows reduced binding with this MAb, the sequence of the epitope in 320SI is HIGPGR and in 320SI-C3.3 is RIGPGR. [York2001]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
				• 268-D: Called 268D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000] • 268-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 268-D showed weak reactivity. [Nyambi2000] • 268-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V3 MAbs 447-52-D and 268-10-D did not effect proliferation. [Hioe2000] • 268-D: Called MAb 268 – To identify potential mimotopes of V3, a hexapeptide phage library was screened with MAb 268 – two hexamers were identified, HLGPGR or KAIHRI that bind to 268 with the same binding site as the V3 loop and inhibit 268 MN gp120 – KLH conjugated hexamer KAIHRI stimulates Abs in rabbits that cross-react with ML gp120. [Laisney1999] • 268-D: Called 268-11D – Study of a live-vector mucosal vaccine that expresses HIV-1 V3 domains using the bacterium Streptococcus gordonii which can express heterologous Ag and can colonize the oral cavity and vagina of mice – 268-D and 257-D recognized S. gordonii expressing the V3 domain of MN – the vaccine stimulated V3-specific IgG2a in mice. [Oggioni1999] • 268-D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 268-D bound rgp120 W61D but could only neutralize the W61D isolate following T-cell line adaptation. [Beddows1999] • 268-D: Peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group – MAb 453, with an identical core epitope to 268 based on prior experiments (HIGPGR), was not part of this reactivity group, illustrating that context can be critical. [Zolla-Pazner1999b] • 268-D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] • 268-D: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. [LaCasse1998] • 268-D: Poor reactivity against HIV-1 isolates SF162 and SF128A and no neutralization, in contrast to MAbs 391/95-D and 257-D. [Stamatatos1997] • 268-D: 268-D is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] • 268-D: Failed to neutralize HXB2 and chimeric virus with gp120 from primary isolates in an HXB2 background. [McKeating1996b] • 268-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 did not influence the binding of 268-D to virion-associated gp120, although sCD4 binding did alter epitope exposure for other anti-V3 MAbs. [Stamatatos1995] • 268-D: Serotyping study using flow-cytometry, if H of HIGPGR was substituted in virus, 268-D did not bind. [Zolla-Pazner1995a] • 268-D: Moderate dissociation rate and homologous neutralization titer. [VanCott1994] • 268-D: Mediated deposition of complement component C3 on HIV infected cells, but not in the presence of sCD4. [Spear1993] • 268-D: Neutralizes MN – binds SF2: YIGPGR – specificity: MN, SF2, NY5, RF, CDC4. [Gorny1993] • 268-D: Reacts with MN, NY5, CDC4, RF and SF2, does not cross-react with WM52 or HXB2. [Karwowska1992b] • 268-D: Called 268-11-D-IV – strain specific weakly neutralizing. [D'Souza1991]

516	418-D (418, 418D)	gp160 (310–316)	gp120 (MN)	HIGPGRA	L	HIV-1 infection	human (IgG1κ)
		Ab type V3 **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center) **References** Gorny2004, Zhang2002, Nyambi2000, Zolla-Pazner1999b, Zolla-Pazner1999a, Gorny1993, Karwowska1992b **Keywords** antibody binding site definition and exposure, inter-clade comparisons, review, variant cross-recognition or cross-neutralization. • 418-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**) • 418-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] • 418-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 418-D showed intermediate reactivity. [Nyambi2000] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**) • 418-D: Called 418 – MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**) • 418-D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**) • 418-D: Neutralizes MN, does not bind to SF2 or HXB2. [Gorny1993] (**variant cross-recognition or cross-neutralization**)

References Parren1998a, Ugolini1997, Binley1997a, Jeffs1996, McDougal1996, Poignard1996a, Moore1996, Sattentau1995b, Sattentau1995c, Klasse1993a, Thali1993, Moore1993c, Pirofski1993, McKeating1992a, Langedijk1992, Sattentau1991, Cordell1991, Moore1990b, Thomas1988, Reitz1988

- 110.5: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- 110.5: Viral binding inhibition by 110.5 was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997]
- 110.5: Deletion of the V1V2 regions did not affect anti-V3 Abs ability to bind when compared to intact rec gp120. [Jeffs1996]
- 110.5: Neutralizes HIV-1 LAI. [McDougal1996]
- 110.5: V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus, mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. [Poignard1996a]
- 110.5: Reciprocal binding inhibition with other anti-V3 MAbs – enhances binding of some anti-V2 MAbs – binding enhanced by some CD4 binding site MAbs. [Moore1996]
- 110.5: Binds with high affinity to monomer and oligomer, rapid association and potent neutralization of lab strains – neutralizes cell-free Hx10. [Sattentau1995b]
- 110.5: Pretreatment of HX10-infected H9 cells with sCD4 decreases signal from 110.5 at 37 degrees due to dissociation of gp120-gp41. [Sattentau1995c]
- 110.5: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to conformationally sensitive neutralizing MAbs – neutralization efficiency of 110.5 is not affected. [Klasse1993a, Reitz1988]
- 110.5: Thrombin cleavage of V3 loop between R-315 and A-316 abrogates binding – can inhibit C4 region antibody which has conformational requirements (G3-299) – binding to native gp120 100-300 fold greater than to denatured. [Moore1993c]
- 110.5: Variable region sequenced – heavy chain: V 3660-SB32, D closest to DSP2.3, 2.4 and .6, J H2 – light chain: V kappa21, J kappa2. [Pirofski1993]
- 110.5: Two fold increase in binding to gp120 in the presence of bound sCD4. [Sattentau1991]
- 110.5: Binding insensitive to gp120 reduction. [Cordell1991]
- 110.5: Did not induce dissociation of gp120, as sCD4 did – discrepancy with [Poignard1996a], that was suggested to be due to MAb interference with detection, as the gp120-MAb complex was denatured in the Poignard study [Moore1990b]. [Moore1990b, Poignard1996a]

523 58.2 gp160 (310–317) gp120 (MN) HIGPGRAF L Vaccine mouse (IgG1κ)

Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3
Ab type V3 **Research Contact** Repligen Corp.
References York2001, Stanfield1999, Seligman1996, Moore1994b, Potts1993, White-Scharf1993

- 58.2: 58.2's epitope was noted to be IGPGRAF – Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 58.2: The crystal structure of Fab 58.2 bound to V3 loop peptides was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different MAbs were bound – 58.2's epitope was defined as KRKRIHIGPGRAFY. [Stanfield1999] • 58.2: Competition ELISAs with serial deletions produced longer estimates of epitope length, RIHIGPGRAFY, than Alanine substitution, suggesting significance of non-contact residues. [Seligman1996] • 58.2: Modest cross-reactivity among B clade gp120s, little outside B clade – core epitope as I-IHIG. [Moore1994b] • 58.2: Did not synergistically neutralize MN in combination with MAb F105 – there was synergistic neutralization when combined with sCD4. [Potts1993] • 58.2: Epitope defined by peptide reactivity and changes in affinity with amino acid substitutions – 4/7 primarily isolates were neutralized. [White-Scharf1993]					
524	polyclonal	gp160 (310–318)	gp120	QRGPGRAFV?	L	Vaccine	mouse (IgA, IgG1, IgG2a)
		Vaccine *Vector/Type:* peptide keyhole limpet hemocyanin (KLH) conjugate, peptide Brucella abortus (Ba) conjugate, peptide lipopolysaccharide (LPS) conjugate *Strain:* B clade MN *HIV component:* V3 **References** Golding2002a • Internasal (i.n.) immunization with V3-Ba induced mucosal anti-V3 NAbs and IFN-gamma secreting T cells – V3-Ba, V3-KLH and V3-LPS could each induce serum and mucosal IgA and IgG in BALB/c mice – i.n. plus i.p. immunizations gave higher titers than i.n. alone – the response to V3-KLH was mainly restricted to IgG1, and to V3-Ba, IgG2a – class II KO mice (CD4+-deficient) did not respond to V3-KLH, but did respond to V3-Ba, suggesting that V3-Ba may be effective in eliciting Ab responses in HIV-1 infected individuals that have impaired CD4+ T cell function. [Golding2002a]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• RC25: MD14 is a R5X4 SHIV with a B clade Env; the V3 loop of an E-clade Env was inserted in to MD14 to create SHIV-TH09V3, an R5 virus. SHIV-TH09V3 could infect both cynomolgous and pig-tailed macaques, and the R5 co-receptor usage was maintained after passage through macaques. The MAb RC25 recognized B clade V3 loops, and reacted with SHIV-MD14. Rabbit anti-sera raised against a NSI Clade E consensus preferentially recognized SHIV-TH09V3. [Kaizu2003] (**co-receptor**) • RC25: RC25 is a humanized MAb that recognizes the epitope IGPGRA – it has strong neutralizing activity against JRFL (R5 virus) and weak against NL4-3 (X4 virus) and is used as a control in a study of NAb activity in patients undergoing HAART. [Kimura2002] (**HAART**)					
528	5023A (5023, NEA-9205, NEA 9205)	gp160 (311–317)	gp120 (311–317 BH10)	RgPGRAF	L	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* peptide *Strain:* B clade BH10 *HIV component:* V3 **Ab type** V3 **Research Contact** Paul Durda, Du Pont de Nemours and Co **References** Schonning1998, Rovinski1995, Back1993, D'Souza1991, Langedijk1991 • 5023A: Called NEA-9205 – The N306 glycan of the V3 loop makes the tip of the V3 loop inaccessible to this MAb in oligomeric Env, loss of this glycan enhances neutralization sensitivity. [Schonning1998] • 5023A: Called 5023 in this paper – Used to precipitate gp160 in immunoblots in a study examining the feasibility of using unprocessed gp160 glycoprotein as an immunogen. [Rovinski1995] • 5023A: Called 5023 – Langedijk also has an MAb called 5023B – gp41 amino acid substitutions 668 (N/S) and 675 (I/M) in gp41 interfere with 5023s neutralization potency, region 662-675 is ELDKWANLWNWFNI. [Back1993] • 5023A: Called 5023 – Langedijk also has an MAb called 5023B – strong cross-reactive neutralizing MAb. [D'Souza1991] • 5023A: Generation and Fine mapping of murine MAbs. [Langedijk1991]

- 0.5beta: For Fv fragment of 0.5beta, the combined variable regions of the heavy and light chain residues, were purified. Binding of the V3 peptide epitope TRKSIRIQRGPGRAFVTIGK was studied through mutagenesis of arginines and the free energy of binding in various salt concentrations. R4A, R8A, and R11A all reduce the free energy; R8 is embedded in the peptide-Fv fragment, while R11 is more solvent exposed. [Faiman1996] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 0.5beta: 0.5beta was used as a control for gp120 expression relative to Nef expression soon after infection of cultures. The goal of this study was to elicit anti-Nef IgM human Abs in trans-chromosome mice that carry human chromosomes responsible for Ig production. These mice were immunized with recombinant Nef protein. Human heavy chain, mouse light chain anti-Nef IgM were obtained. The hope was that these human IgM anti-Nef chimeric Abs would activate complement mediated cytolysis; C3 deposition was induced but not at high enough levels to induce lysis. [Kawai2003] (**complement**)
- 0.5beta: NIH AIDS Research and Reference Reagent Program: 1591.
- 0.5beta: UK Medical Research Council AIDS reagent: ARP3025.
- 0.5beta: NMR and mutation cycles were employed to generate a model of the peptide-antibody complex, showing aa residues that interact or do not contribute to the binding of MAb 0.5beta Fv with the peptide – F96(L) of 0.5beta binds to Pro13, H52(H) interacts with Ile7, Ile9, Gln10, and D56(H) interacts with Arg11 of the V3 loop peptide – RGPG retains hairpin conformation binds in the center of a groove. [Zvi2000] (**structure**)
- 0.5beta: 14/18 residues of peptide P1053, RKSIRIQRGPGRAFVTIG, were shown to be involved in the Ab recognition site using NMR – QRGPGR forms a beta-hairpin turn at the center of the binding pocket. [Tugarinov2000] (**antibody binding site definition and exposure**)
- 0.5beta: MAbs 0.5beta and G3-42 were used to study synthesis of oligomeric and monomeric forms of Env – inhibition of glycosylation by tunicamycin results in reduction of oligomeric gp120 at the cell surface and of monomer in the cytoplasm – neither MAb recognized non-glycosylated Env precursor. [Jagodzinski2000]
- 0.5beta: Host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. [Fortin2000] (**antibody interactions**)
- 0.5beta: NMR structure reveals that Ab bound IIIB-V3 peptide adopts an unexpected type VI cis proline beta-turn. [Tugarinov1999] (**structure**)
- 0.5beta: The Fv fragment was purified and the temperature dependence and effect of mutations was studied. [Faiman1997]
- 0.5beta: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. [Wyatt1997] (**antibody binding site definition and exposure**)
- 0.5beta: The structure of a 17 amino acid V3 peptide bound to the Fab was studied using NMR. [Zvi1997] (**structure**)
- 0.5beta: Relative to the native peptide, an O-linked alpha-galactosamine modified V3 peptide enhanced binding to 0.5 beta, while an N-linked beta-glucosamine modified peptide showed reduced binding. [Huang1997] (**antibody binding site definition and exposure**)
- 0.5beta: Deletion of the V1V2 regions did not affect anti-V3 Abs ability to bind when compared to intact rec gp120. [Jeffs1996] (**antibody binding site definition and exposure**)
- 0.5beta: Synergistic neutralization of HIV-1 when combined with anti-V2 MAb C108G. [Warrier1996] (**antibody interactions**)
- 0.5beta: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS inhibits 0.5beta binding – 0.5beta epitope described as GPGRAFVTIG. [Jagodzinski1996]
- 0.5beta: NMR of 0.5beta bound NNTRKSIRIQRGPGRAFVTIGKIG suggests that the bound amino acids are in the region SIRIQRGPGRAFVT. [Zvi1995a] (**antibody binding site definition and exposure**)
- 0.5beta: The interactions of the peptide RKSIRIQRGPGRAFVT 0.5beta were studied by NMR, and hydrophobic interactions between the two Is and the V form the base of a 12 amino acid loop with GPGR at the apex. [Zvi1995b] (**antibody binding site definition and exposure**)
- 0.5beta: Type-specific neutralization of IIIB – does not neutralize SF2. [Broder1994] (**variant cross-recognition or cross-neutralization**)
- 0.5beta: Binding domain aa 310-319: RGPGRAFVTIGKIG – mutations in the V3 loop from basic residues can destroy virus infectivity and syncytium formation: R306T, R309T and R313G can also reduce binding of V3 MAbs with two different binding sites: 9284 and 0.5beta. [Okada1994] (**antibody binding site definition and exposure**)
- 0.5beta: gp41 mutation that confers resistance to neutralization by anti-CD4 binding site antibodies does not reduce neutralizing efficiency of this V3 region MAb. [Thali1994]
- 0.5beta: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. [Cook1994] (**brain/CSF**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 0.5beta: A neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – of the MAbs tested , 0.5beta neutralization was the most profoundly affected by this mutation. [Watkins1993] (**escape**)
- 0.5beta: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to some antiserum and conformationally sensitive neutralizing MAbs – neutralization efficiency of 0.5beta is not affected. [Klasse1993a, Reitz1988] (**antibody binding site definition and exposure**)
- 0.5beta: Binding to native gp120 100-300 fold greater than to denatured. [Moore1993c] (**antibody binding site definition and exposure**)
- 0.5beta: Neutralization of virus carrying an A to T substitution (contrast with MAb M77) [diMarzo Veronese1993]
- 0.5beta: Monoclonal anti-idiotype antibodies that mimic the 0.5beta epitope were generated. [Sperlagh1993] (**anti-idiotype**)
- 0.5beta: sCD4 causes loss of IIIB type-specificity, allowing binding and neutralization of MN, in contrast to MAb mu5.5. [Maeda1992]
- 0.5beta: Chimeric mouse-human MAb Cbeta1 was constructed by combining the human Cgamma1 and Ckappa constant regions with the 0.5beta murine MAb – ADCC and neutralizing activity. [Matsushita1992] (**complement**)
- 0.5beta: Potent neutralizing activity. [D'Souza1991]
- 0.5beta: Emergence of virus resistant to MAb 0.5beta and autologous sera neutralization in IIIB infected chimps. [Nara1990] (**escape**)
- 0.5beta: Type-specific neutralization of IIIB – does not neutralize MN or RF. [Matsushita1988, Skinner1988b] (**antibody generation**)

- NM-01: Called hNM01. scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. The humanized version of this MAb was one of the V3 MAbs used. [Zwick2003] (**antibody interactions**)
- NM-01: Called hNM01. The CDR region of the murine MAb NM-01 was put into a human IgG frame. The epitope recognition was preserved, but the neutralizing potency of the humanized form was enhanced. It could activate complement. [Nakamura2000] (**complement**, **immunotherapy**)

		• N70-1.9b: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**review**) • N70-1.9b: Type specific neutralization, ADCC directed against MN infected cells. [Scott1990] (**ADCC**, **variant cross-recognition or cross-neutralization**) • N70-1.9b: Type specificity. [Robinson1990a] (**variant cross-recognition or cross-neutralization**)					
547	902	gp160 (313–324)	gp120 (IIIB)	PGRAFVTIGKIG	L	Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Ab type** V3 **Research Contact** Bruce Chesebro, Rocky Mountain National Laboratory, Montana **References** Sakaida1997, Earl1994, Broder1994, Laman1993, Chesebro1988 • 902: NIH AIDS Research and Reference Reagent Program: 522. • 902: V3-BH10 peptide with loop-structure inhibits IL-2 induced T-cell proliferation, thought to be due to altering intracellular signaling, and MAb 908 can block the peptide inhibition. [Sakaida1997] • 902: Used as a control in a study of the influence of oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994] • 902: Epitope may be partially masked or altered in the oligomeric molecule. [Broder1994] • 902: Strain specific neutralization of HIV. [Chesebro1988]					
548	694/98-D (694/98, 694.8, 694/98D)	gp160 (314–317)	gp120 (IIIB)	GRAF	L	HIV-1 infection	human (IgG1λ)
		Ab type V3 **Research Contact** Drs. S. Zolla-Pazner and M. Gorny, NYU Med Center NY, NY **References** Gorny2004, Zwick2003, Zhang2002, He2002, Edwards2002, Park2000, Nyambi2000, Altmeyer1999, Zolla-Pazner1999b, Zolla-Pazner1999a, Schonning1998, Nyambi1998, Andrus1998, Li1998, Smith1998, Zolla-Pazner1997, Li1997, Forthal1995, Zolla-Pazner1995a, VanCott1995, Cook1994, VanCott1994, Laal1994, Gorny1994, Spear1993, Cavacini1993a, Gorny1993, Gorny1992, Gorny1991, Skinner1988b **Keywords** antibody interactions, review, variant cross-recognition or cross-neutralization. • 694/98D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. [Gorny2004] (**variant cross-recognition or cross-neutralization**, **review**) • 694/98D: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. [Zwick2003] (**antibody interactions**) • 694/98-D: Called 694 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. [He2002] • 694/98-D: Called 694/98D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] • 694/98-D: Called 694/98D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000] • 694/98-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 694/98-D showed intermediate reactivity. [Nyambi2000]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 694/98-D: A Semliki Forest virus (SFV) expression system carrying BX08 env was used to study the conformation of gp120 – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not linear V3 MAbs – expression in rat brain also showed that surface-expressed Env was recognized only by the conformation-dependent antibodies and not by anti-V3 antibodies. [Altmeyer1999] • 694/98-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. [Zolla-Pazner1999b] • 694/98-D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] • 694/98-D: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, anti-V3 MAbs were found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan more efficiently than HIV-BRU. [Schonning1998] • 694/98-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 694/98-D bound only to B and D clade virions and had limited cross reactivity. [Nyambi1998] • 694/98-D: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS) [Li1998] • 694/98-D: The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 694/98-D was among the Abs used – chimeric viruses elicited potent NAbs in guinea pigs against ALA-1 and MN. [Smith1998] • 694/98-D: Used to study pre- and post-exposure prophylaxis Hu-PBL-SCID mice infected by an intraperitoneal injection of HIV-1 LAI – MAb half-life in plasma in mice is 9 days – 2 hours post-694/98-D mice were challenged with LAI, and at an Ab concentration of 1.32 mg/Kg, 50% of the mice were infected – one of the infected mice carried the resistant form GRTF rather than GRAF (critical amino acids for binding are GRA) – post-exposure prophylaxis was effective if delivered 15 min post-exposure, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. [Andrus1998] • 694/98-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – could only achieve 50% neutralization alone – all Ab combinations tested showed synergistic neutralization – 694/98-D has synergistic response with MAbs F105, 15e, b12, 2F5, 17b, 2G12, and 48d, and with HIVIG. [Li1997] • 694/98-D: ADCC activity, and no viral enhancing activity. [Forthal1995] • 694/98-D: Serotyping study using flow-cytometry – bound GRAX bearing virus in 10/11 cases – somewhat conformation dependent. [Zolla-Pazner1995a] • 694/98-D: Human HIV-1 infected sera and MAb 694/98 have high reactivity to MN and RF infected H9 cells, but Genentech rec gp120 IIIB vaccine recipients do not. [VanCott1995] • 694/98-D: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – V3 MAbs can inhibit gp120 binding to GalCer *in vitro* – binding of GalCer to gp120 inhibited but did not completely block MAb binding. [Cook1994] • 694/98-D: GRVY did not alter peptide binding – GRVI and GQAW enhanced dissociation – GQVF and GQAL did not bind. [VanCott1994] • 694/98-D: Potent neutralization of IIIB – no neutralization synergy in combination with CD4 binding domain MAbs. [Laal1994] • 694/98-D: 50% neutralization of HIV-IIIB at a concentration of 0.15mug/ml. [Gorny1994] • 694/98-D: Called 694-D – complement mediated virolysis of IIIB, but not in the presence of sCD4. [Spear1993] • 694/98-D: Neutralizes MN and IIIB (GRAF) – binds SF2 (GRAF) – binding reactivity: MN, IIIB, SF2, NY5, RF, CDC4, WM52. [Gorny1993] • 694/98-D: Type-specific lab isolate neutralization was observed – binds with 1-3 fold greater affinity to gp120 than to peptides. [Gorny1992] • 694/98-D: This MAb was first described here. [Skinner1988b]					
549	MO101/V3,C4	gp160 (314–323 + 494–503) **Ab type** V3-C4 **References** Ohlin1992	gp120 (314–323)	GRAFVTIGKI+LGVAPTKAKR		in vitro stimulation or selectio	human (IgM)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• MO101: Generated in response to IIIB Env 286-467 upon *in vitro* stimulation of uninfected-donor lymphocytes – reacts with peptides 314-323 + 494-503 from the V3 and C4 regions. [Ohlin1992]					
550	MO101/V3,C4	gp160 (314–323 + 494–503) **Ab type** V3-C5 **References** Ohlin1992	gp120 (314–323)	GRAFVTIGKI+LGVAPTKAKR		in vitro stimulation or selectio	human (IgM)
		• MO101: Generated through *in vitro* stimulation of uninfected-donor lymphocytes with pB1 containing IIIB Env 286-467 – reacts with peptides from the V3 and C4 regions, positions 314-323 + 494-503, peptides GRAFVTIGKI + LGVAPTKAKR. [Ohlin1992]					
551	MO101/V3,C4	gp160 (314–323 + 494–503) **Ab type** V3-C5 **References** Ohlin1992	gp120 (494–503)	GRAFVTIGKI+LGVAPTKAKR		in vitro stimulation or selectio	human (IgM)
		• MO101: Generated through *in vitro* stimulation of uninfected-donor lymphocytes with pB1 containing IIIB Env 286-467 – reacts with peptides from the V3 and C4 regions, positions 314-323 + 494-503, peptides GRAFVTIGKI + LGVAPTKAKR. [Ohlin1992]					
552	9205 (NEA-9205 NEA9205)	gp160 (315–317) **Vaccine** *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 **Ab type** V3 **Research Contact** NEN, Boston MA, commercial **References** Gram2002, Schonning1999, Schonning1998, Fontenot1995, VanCott1994, Allaway1993, Trujillo1993, Durda1990	gp120 (IIIB)	RAF(corereactivity)	L	Vaccine	mouse (IgG1)
		• 9205: Called NEA9205 – gp120 capture ELISAs with MAbs D7324 (anti-C-term) or 9205 (anti-V3) were compared in a study of orientation of glycosylation sites – CD4 binding could only inhibit deglycosylation when gp120 was bound to the plate by D7324, not by 9205, while Abs from HIV-1 infected people inhibited deglycosylation most effectively when gp120 was caught by 9205. [Gram2002] • 9205: Called NEA-9205 – the stoichiometry of MAb neutralization was tested and the data indicated that binding for neutralization was was incremental not all or none, i.e., each envelope oligomer binds a single MAb and each Env oligomer bound reduces the chances of infection – 9205 binds only to Env with a glycosylation site mutation in the V3 loop, A308T. [Schonning1999] • 9205: Called NEA-9205 – The N306 glycan of the V3 loop makes the tip of the V3 loop inaccessible to this MAb in oligomeric Env, loss of this glycan enhances neutralization sensitivity. [Schonning1998] • 9205: Neutralizes IIIB but not MN – significantly slower dissociation constant for IIIB than MN. [VanCott1994] • 9205: Synergy with combinations of CD4-based molecules in inhibition of HIV-1 Env mediated cell fusion. [Allaway1993] • 9205: Called NEA-9205, epitope RIQRGPGRAFVTIGK – reacts with three human brain proteins of 35, 55, 110 kd molecular weight – similar to 9284 – RAF is the core reactivity. [Trujillo1993] • 9205: Also see MAb called 5023A.					
553	110.I	gp160 (316–322) **Vaccine** *Vector/Type:* protein *HIV component:* gp120 **Ab type** V3 **Research Contact** F. Traincard, Pasteur Institute, France **References** Parren1998a, Wyatt1997, Poignard1996a, Moore1996, Sattentau1995b, Moore1994c, Moore1993c	gp120 (316–322)	AFVTIGK	L	Vaccine	mouse
		• 110.I: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] • 110.I: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. [Wyatt1997] • 110.I: Epitope suggested to be RAFVTIGK – V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus, mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. [Poignard1996a]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 110.I: Reciprocal binding inhibition with other anti-V3 and anti-C4 MAbs – and enhances binding of some anti-V2 MAbs – binding enhanced by some anti-CD4 binding site MAbs. [Moore1996] • 110.I: Binds equally well to monomer and oligomer, rapid association and potent neutralization of lab strains. [Sattentau1995b] • 110.I: Binds to carboxy-terminal side of the V3 loop – inhibits binding of C4 region MAb G3-299. [Moore1993c]

		• 7F11: There is another MAb with this name that binds to integrase. [Nilsen1996]					
566	E51	gp160 (420–423)	gp120 (420–423 HXB2)	IKQI	P		human
		Ab type CD4i **Research Contact** Joseph Sodroski, joseph_sodroski@dfci.harvard.edu **References** Xiang2003 **Keywords** antibody binding site definition and exposure, antibody generation, co-receptor, inter-clade comparisons, variant cross-recognition or cross-neutralization. • E51: E51 recognizes a highly conserved epitope localized in the basic β19-strand (gp120 aa420-423), a region involved in CCR5 binding. The MAb was isolated from a EBV transformed B-cell line established from an HIV+ individual undergoing early STI. Fab fragments were also produced. E51, like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. The presence sCD4 induces a conformational change in gp120, which enhances ligand recognition. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and CD4BS MAb F105 binding, and K421D inhibits F105 binding, but not sCD4. E51 has more cross-neutralizing potency than other prototype CD4i MAbs (17b) for B and C clade isolates. E51 and 17b both neutralized HIV-1 clade B strains HXBc2 and ADA, while JR-FL and 89.6 were only neutralized by E51, not 17b. Clade C strains MCGP1.3 and SA32 were both inhibited by 17b and E51, but E51 was more potent against SA32. [Xiang2003] (**antibody binding site definition and exposure**, **antibody generation**, **co-receptor**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

		Vaccine *Vector/Type:* virus derived protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** C4 **References** Sun1989 • G3-211, 42, 299, 508, 519, 536, 537: Cross-react with diverse strains by immunofluorescence – blocks HIV binding to CD4+ cells – different neutralization efficiencies. [Sun1989]					
569	G3-537	gp160 (423–437)	gp120 (423–437 IIIB)	IINMWQKVGKAMYAP	L	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* virus derived protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** C4 **References** Zwick2003, McKeating1992b, Ho1991b, Sun1989 **Keywords** antibody interactions. • G3-537: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4 MAbs used. [Zwick2003] (**antibody interactions**) • G3-537: Weakly neutralizing – binds to a linear binding domain of gp120, NMWQEVGKAMYAPPISG. [McKeating1992b]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• G3-537, 211, 299, 508, 519, 536, 42: Cross-react with diverse strains by immunofluorescence – blocks HIV binding to CD4+ cells – different neutralization efficiencies. [Sun1989]					
570	polyclonal	gp160 (425–436)	gp120	NMWQEVGKAMYA	L	Vaccine	mouse (IgA)
		Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *Adjuvant:* Cholera toxin (CT) **Ab type** CD4BS **References** Bukawa1995 • Polyclonal secretory IgA antibody raised by mucosal immunization is able to neutralize IIIB, SF2, and MN – HIV-1 neutralization may be due to the V3, CD4 or HPG30 component of the multicomponent peptide immunogen. [Bukawa1995]					
571	1795	gp160 (425–441)	gp120 (425–441 IIIB)	NMWQEVGKAMYAPPISG	L	Vaccine	
		Vaccine *Vector/Type:* poliovirus *HIV component:* Env **Ab type** CD4BS **References** McKeating1992b • 1795: CD4 binding site – weakly neutralizing – binding inhibited by WQEVGKAMYA, GKAM may be involved. [McKeating1992b]					
572	ICR38.1a (38.1a, 388/389, ARP388/389)	gp160 (429–438)	gp120 (427–436 BRU)	EVGKAMYAPP	L	Vaccine	rat (IgG2b)
		Vaccine *Vector/Type:* protein *Strain:* B clade BH10 *HIV component:* gp120 **Ab type** C3, C4 **References** Vella2002, Kropelin1998, Peet1998, Jeffs1996, Moore1993c, McKeating1993a, McKeating1993b, McKeating1992c, McKeating1992a, McKeating1992b, Cordell1991 • ICR38.1a: UK Medical Research Council AIDS reagent: ARP388/ARP389. • ICR38.1a: Called ARP388/ARP389: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs – lists epitope as WQEVGKAMYA. [Vella2002] • ICR38.1a: Called 388/389 – anti-C1 region MAb 87-135/9 blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) [Kropelin1998] • ICR38.1a: The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind – ICR38.1a was not affected by V3 serine substitutions – mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. [Peet1998] • ICR38.1a: Called 38.1a – 10 to 20 fold increased binding when V1/V2 or V1/V2 and V3 were deleted from gp120. [Jeffs1996] • ICR38.1a: Unreactive with solid-phase decapeptide, competed in solution phase assay – ICR 38.1a and ICR 38.8f were initially reported to be independent MAbs, but are actually subclones of the same MAb. [Moore1993c] • ICR38.1a: Studied in the context of a neutralization escape mutant. [McKeating1993a] • ICR38.1a: Unable to exert a synergistic effect in combination with V3 directed MAbs, in contrast to MAb 39.13g, that binds to a conformational epitope involved in CD4 binding. [McKeating1992a] • ICR38.1a: Weakly neutralizing – binds linear determinant in the CD4 binding domain – cross-competition with MAbs G3-536, 5C2E5, and ICR38.8f. [Cordell1991, McKeating1992b]					
573	G3-299	gp160 (429–438)	gp120 (429–438 BRU)	EVGKAMYAPP	L	Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* virus derived protein *HIV component:* gp120 **Ab type** C4 **Research Contact** M. Fung and Tanox Biosystems Inc and David Ho, ADARC, NY **References** Zwick2003, Kwong2002, Parren1998a, Wyatt1997, Ditzel1997, Binley1997a, Poignard1996a, Moore1996, Sattentau1995b, Moore1993c, Sun1989

Keywords antibody binding site definition and exposure, antibody interactions.

- G3-299: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4-V3 MAbs used. [Zwick2003] (**antibody interactions**)
- G3-299: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the G3-299 epitope as V3 loop/outer domain. [Kwong2002] (**antibody binding site definition and exposure**)
- G3-299: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- G3-299: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. [Wyatt1997]
- G3-299: Epitope described as KQIINMWQKVGKAMYAPPIS – binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAb 50-69. [Poignard1996a]
- G3-299: Discontinuous V3-C4 epitope, binding enhanced by a few anti-C1, anti-CD4 binding site, and V2 MAbs – binding reciprocally inhibited by anti-V3 MAbs – G3-229 enhances the binding of some anti-V2 MAbs. [Moore1996]
- G3-299: Binds with higher affinity to monomer than to oligomer, slow association rate, although faster than other C4 MAbs tested, with more potent neutralization of lab strain. [Sattentau1995b]
- G3-299: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – G3-42, G3-299 lower affinity than G3-508, G3-519, and G3-536 – bound native gp120, not denatured – poor peptide binding, epitope spans V3-C4 regions – 433A/L, 435Y/H and 430V/S substitutions impaired binding, V3 loop cleavage or insertion abolished binding. [Moore1993c]
- G3-299: Best neutralization of IIIB in panel of 7 MAbs that bind overlapping epitope. [Sun1989]

574	G3-42 (G3 42)	gp160 (429–438)	gp120 (429–438 BRU)	EVGKAMYAPP	L	Vaccine	mouse (IgG1)

Keywords antibody interactions.

- G3-42: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4-V3 MAbs used. [Zwick2003] (**antibody interactions**)

B Cell

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 0.5beta: MAbs 0.5beta and G3-42 were used to study synthesis of oligomeric and monomeric forms of Env – inhibition of glycosylation by tunicamycin results in reduction of oligomeric gp120 at the cell surface and of monomer in the cytoplasm – neither MAb recognized non-glycosylated Env precursor. [Jagodzinski2000]
- G3-42: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999]
- G3-42: Called G3 42 – Does not inhibit gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study – described as V3-C4 discontinuous epitope. [Trkola1996a]
- G3-42: Epitope described as KQIINMWQKVGKAMYAPPIS – binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAb 50-69. [Poignard1996a]
- G3-42: Inhibits binding of many anti-V3, -CD4 binding site, and -C4 region MAbs – enhances binding of some anti-V2 region MAbs. [Moore1996]
- G3-42: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS potently inhibits G3-42 binding – G3-42 epitope described as KVGKAMYAPP. [Jagodzinski1996]
- G3-42: Binds with higher affinity to monomer than to oligomer, slow association rate. [Sattentau1995b]
- G3-42: Inhibits binding of CD4 inducible MAb 48d. [Thali1993]
- G3-42: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – G3-42, G3-299 have lower affinity than G3-508, G3-519, and G3-536 – bound native gp120, not denatured – poor peptide binding, epitope spans V3-C4 regions – 433A/L, 435Y/H and 430V/S substitutions impaired binding, V3 loop insertion abolished binding. [Moore1993c]
- G3-42: Neutralization of IIIB but not RF. [Sun1989]

575	G3-508 (G3 508)	gp160 (429–438)	gp120 (429–438 BRU)	EVGKAMYAPP	L	Vaccine	mouse (IgG1)

- G3-508: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998]
- G3-508: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- G3-508: Called G3 508 – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a]
- G3-508: Binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAb 50-69. [Poignard1996a]
- G3-508: Inhibits binding of some V3, C4 and CD4 binding site MAbs, enhances binding of V2 region MAbs. [Moore1996]
- G3-508: Binds with higher affinity to monomer than to oligomer, slow association rate. [Sattentau1995b]
- G3-508: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – bound denatured with 10 fold greater affinity than native – 433A/L, 435Y/H and 430V/S substitutions impaired binding. [Moore1993c]
- G3-508: Inhibits binding of CD4 inducible MAb 48d. [Thali1993]
- G3-508: Neutralization of IIIB and RF. [Sun1989]

Ab type V5-C5 **Research Contact** Fulvia di Marzo Veronese
References Zwick2003, Yang2000, Binley1998, Ditzel1997, Moore1996, Moore1994d, Moore1994c, diMarzo Veronese1992
Keywords antibody interactions.

- M91: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- M91: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000]
- M91: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998]
- M91: C5 region linear epitope, binds weakly to nondenatured monomeric gp120 – M91 binding was enhanced by 1C1, but 1C1 binding was inhibited by M91 – non-reciprocal binding enhancement of C1 and V2 antibodies – non-reciprocal binding inhibition of CD4 binding site antibodies. [Moore1996]
- M91: 470 P/L impairs binding, but not 475 D/V, in contrast to CRA1 – some C2 mutations can enhance binding. [Moore1994d]
- M91: The relative affinity for denatured/native gp120 is 24 – mutation in position 470 P/L impairs binding. [Moore1994c]
- M91: Immunoblot reactive, RIP negative, but precipitates deglycosylated gp120 – reacts with strains IIIB, 451, MN, RF, and RUTZ. [diMarzo Veronese1992]

		References Denisova1996 • GV1G2: When anti-V3 MAb M77 was bound to gp120 and used as an immunogen, it stimulated many MAbs to linear epitopes – MAbs GV12F6 and GV3H1 are homologous to GV1G2 and were generated in the same experiment. [Denisova1996]					
614	750-D	gp160 (498–504)	gp120 (503–509)	PTKAKRR	no	HIV-1 infection	human (IgG3λ)
		Ab type C-term **References** Hioe2000, Forthal1995 • 750-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – C5 MAbs 450-D and 750-D did not effect proliferation. [Hioe2000] • 750-D: Not neutralizing, positive ADCC activity, and no viral enhancing activity. [Forthal1995]					
615	450-D (450-D-3, 450D)	gp160 (498–504)	gp120 (475–486 BH10)	PTKAKRR(orRRVVQRE,orMRDNW-RSELYKYdependingonreferen-ce)	no	HIV-1 infection	human (IgG1λ)
		Ab type C5 **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu), NYU Med Center, NY, NY **References** Verrier2001, Hioe2001, Hioe2000, Hioe1997b, Li1997, Manca1995a, Forthal1995, Cook1994, Gorny1994, Laal1994, Spear1993, Karwowska1992b, Karwowska1992a, Durda1988 • 450-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] • 450-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFN gamma production – 450-D does not have this effect and was used as a control in this study. [Hioe2001] • 450-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – C5 MAbs 450-D and 750-D did not effect proliferation. [Hioe2000] • 450-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] • 450-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 6 mug/ml. [Li1997] • 450-D: Virions complexed to gp120 Ab facilitate presentation of p66 RT epitopes to Th cells. [Manca1995a] • 450-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. [Forthal1995] • 450-D: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – MAbs against the carboxy-terminus of gp120 do not inhibit gp120 binding to GalCer – binding of GalCer to gp120 does not inhibit MAb binding. [Cook1994] • 450-D: Epitope is defined as PTKAKRR. [Gorny1994] • 450-D: Not neutralizing alone, could synergize anti-CD4 binding site antibody neutralization. [Laal1994] • 450-D: Did not mediate deposition of complement component C3 on HIV infected cells. [Spear1993] • 450-D: Bound to MN, SF-2 and IIIB, but was not neutralizing. [Karwowska1992a]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
616	670-D (670)	gp160 (498–504)	gp120 (503–509)	PTKAKRR	no	HIV-1 infection	human (IgG1λ)

Ab type C5 **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu), NYU, NY
References Zwick2003, Verrier2001, Nyambi2000, Gorny2000b, Altmeyer1999, Nyambi1998, Gorny1998, Hioe1997b, Gorny1997, Hill1997, Forthal1995, Zolla-Pazner1995a
Keywords antibody interactions.

- 670-D: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- 670-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001]
- 670-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 670-D bound 21/26, and was the most cross-reactive C5 MAb. [Nyambi2000]
- 670-D: A gp120 C5 MAb used as a negative control in a study of anti-gp41 MAbs. [Gorny2000b]
- 670-D: A Semliki Forest virus (SFV) expression system carrying BX08 env was used to study the conformation of gp120 – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not V3 MAbs – expression in rat brain also showed that surface-expressed Env was recognized only by the conformation-dependent antibodies and not by anti-V3 antibodies. [Altmeyer1999]
- 670-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-C5 Abs 670-D and 1331A bound to 3/4 B clade viruses (they didn't bind to IIIB), and to subtype D MAL – 670-D also reacted with subtype A. [Nyambi1998]
- 670-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b]
- 670-D: gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. [Hill1997]
- 670-D: Not neutralizing, positive ADCC activity, and no viral enhancing activity, numbering provided suggests epitope is RRVVQRE. [Forthal1995]
- 670-D: Group specific cross-clade binding in serotyping study using flow-cytometry. [Zolla-Pazner1995a]

617	polyclonal	gp160 (503–509)	gp120 (471–477)	RRVVQRE		Vaccine	mouse (IgG)

Vaccine *Vector/Type:* peptide *HIV component:* gp120
References Jeyarajah1998

- Mice were immunized with peptide APTKAKRRVVQREKR – epitope excision and extraction combined with mass spectrometry was used to map the fine structure of epitopes recognized by polyclonal Ab to HIV-1 Env – a major epitope was identified between positions 472 and 478. [Jeyarajah1998]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 1331A: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. [Zwick2003] • 1331A: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] • 1331A: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control as binding was not diminished by treating gp120 with DTT or sodium metaperiodate to reduce disulfide bonds), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) [Gorny2002] • 1331A: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 858-D bound only 4/26, the worst of all anti-C5 MAbs tested, while MAb 1331A, which shares the same core epitope (positions 495-516), bound to 18/26. [Nyambi2000] • 1331A: The Ab binding site was studied with epitope excision (protein is bound in native conformation to immobilized MAb, then digested with proteolytic enzymes) and extraction (protein is digested then allowed to react with Ab), followed by mass spectroscopy – two non-contiguous aa in C5 were protected, E-507 and I-487, which are thought to be located on opposite sides of hydrophobic pocket involved in gp120/gp41 interaction. [Hochleitner2000b] • 1331A: Core epitope dwVVQREKR maps to gp120(510-516) – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – C5 MAbs 858-D, 989-D and 1331A bound with a 5-10 fold preference for the monomer. [Gorny2000a] • 1331A: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-C5 Abs 670-D and 1331A bound to 3/4 B clade viruses (they don't bind to IIIB), and to subtype D MAL. [Nyambi1998]

		• 4D4: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**antibody binding site definition and exposure**, **vaccine antigen design**) • 4D4: Generated by electrofusion of PBL from HIV-1 positive volunteers with CB-F7 cells. - 50-69: This is one of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. [Gorny2004] (**review**)
- 50-69: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**)
- 50-69: Called 50-69D. Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**)
- 50-69: NIH AIDS Research and Reference Reagent Program: 531.
- 50-69: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**)
- 50-69: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – MAb 50-69 binding to infected cells is enhanced by sCD4, while 4E10 and Z13 binding is essentially unaltered. [Zwick2001b] (**antibody binding site definition and exposure**)
- 50-69: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 50-69 bound the majority of isolates although binding was moderate to weak – specifies discontinuous binding site range as aa 579-613. [Nyambi2000] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 50-69: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. [Gorny2000a] (**antibody binding site definition and exposure**)
- 50-69: A cluster I epitope that binds to rgp41 567-647, recognizes a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41 – this MAb doesn't react with either of the peptides N51 or C43 individually – MAbs 50-69 and 1367 had similar properties – MAb 50-69 bound the fusogenic form of the protein in liquid phase. [Gorny2000b] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 50-69: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGKLICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613 – identifies non-contiguous W596-G597-C598 and C604-T605 as minimal epitope. [Mitchell1998] (**antibody binding site definition and exposure**) • 50-69: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 50-69 maps to an immunodominant domain in gp41 – three groups of peptides were selected, one which seems most closely related to gp41 sequence peptide consensus is WGCxx(RK)(x n)LxC – the analogous gp41 sequence WGCSGKLIC is present in most M group clades, except D with a common L to H substitution. [Boots1997] (**mimotopes**) • 50-69: Binding of anti-gp120 MAbs IgG1b12 or 654-30D does not mediate significant exposure of the gp41 epitopes for MAbs 2F5 and 50-69. [Stamatatos1997] (**antibody interactions**) • 50-69: Used to test exposure of gp41 upon sCD4 binding. [Klasse1996] • 50-69: Binds to a linear epitope located in the cluster I region – binding of 50-69 and 240-D inhibited by Fabs A1, A4, M8B, M26B, M12B and T2. [Binley1996] (**antibody binding site definition and exposure**) • 50-69: Prebinding of anti-V3, and CD4i MAbs 48d and 17b, but not anti-V2 neutralizing MAbs, expose the 50-69 epitope. [Poignard1996a] (**antibody interactions**) • 50-69: Does not neutralize HIV-1 LAI. [McDougal1996] (**variant cross-recognition or cross-neutralization**) • 50-69: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. [Manca1995a] • 50-69: Preferentially binds oligomer – binding increased after pretreatment of infected cells with sCD4 – binding domain overlaps site that is critical for gp120-gp41 association. [Sattentau1995c] (**antibody binding site definition and exposure**) • 50-69: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. [Chen1995] (**antibody binding site definition and exposure**) • 50-69: Epitope described as cluster I, 601-604, conformational – does not neutralize IIIB or synergize neutralization by anti-V3 MAb 447-52D or by CD4 BS MAbs. [Laal1994] (**antibody binding site definition and exposure**, **antibody interactions**) • 50-69: Did not mediate deposition of complement component C3 on HIV infected cells unless cells were pre-incubated with sCD4 – complement mediated virolysis of MN and IIIB in the presence of sCD4. [Spear1993] (**complement**) • 50-69: Called SZ-50.69 – binds to an epitope within aa 579-613. [Eddleston1993] (**antibody binding site definition and exposure**) • 50-69: Two fold increase in binding to gp120 in the presence of bound sCD4. [Sattentau1991] (**antibody binding site definition and exposure**) • 50-69: Enhances HIV-1 infection *in vitro* – synergizes with huMAb 120-16 *in vitro* to enhance HIV-1 infection to level approaching that found in polyclonal anti-HIV serum. [Robinson1991] (**antibody interactions**, **enhancing activity**) • 50-69: The epitope is affected by the conformation conferred by the two cysteines at amino acids 598 and 604. [Xu1991] (**antibody binding site definition and exposure**) • 50-69: Kills HIV-infected cells when coupled to deglycosylated ricin A chain. [Gorny1989] (**immunotoxin**) • 50-69: Reacts preferentially with gp160 oligomer, compared to gp41 monomer. [Pinter1989] (**antibody binding site definition and exposure**) • 50-69: Combined with deglycosylated A chain of ricin is toxic to lines of HIV-infected T cells (H9) and monocytes (U937) [Till1989] (**immunotoxin**)				
645	9-11	gp160 (579–604)	gp41 (584–609)	RILAVERYLKDQQLLGIWGCSGKLIC		Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* gp160 **References** Mani1994 • 9-11: required the C-C disulfide bridge and loop formation, can bind simultaneously with 41-1. [Mani1994]					
646	98-43	gp160 (579–604)	gp41 (579–604 HXB2)	RILAVERYLKDQQLLGIWGCSGKLIC	no	HIV-1 infection	human (IgG2κ)
		References Xu1991, Tyler1990, Gorny1989, Pinter1989 • 98-43: NIH AIDS Research and Reference Reagent Program: 1241. • 98-43: 579-604 binds in the immunodominant region. [Xu1991] • 98-43: Poor ADCC (in contrast to MAb 120-16, gp41(644-663)) [Tyler1990]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 98-43: Reacts equally well with oligomer and monomer. [Pinter1989]					
647	41-1 (41.1)	gp160 (579–608)	gp41 (584–609)	RILAVERYLKDQQLLGIWGCSGKLI-CTTAV		Vaccine	mouse (IgG1κ)
		Vaccine *Vector/Type:* protein *HIV component:* gp160 **References** Pincus1998, Pincus1996, Mani1994, Pincus1993a, Pincus1991, Dalgleish1988, Gosting1987 • 41-1: Called 41.1, and described as a human MAb, binding 579-604 – a panel of immunotoxins was generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. [Pincus1996] • 41-1: Did not require the C-C disulfide bridge and loop formation, can bind simultaneously with 9-11. [Mani1994] • 41-1: Called 41.1, and described as a human MAb – cross-competes with 41.4 – sCD4 enhances the efficacy of immunotoxins *in vitro* 30-fold – MAb was coupled to ricin A chain (RAC) [Pincus1993a] • 41-1: Efficacious as an immunotoxin when coupled to RAC – gave linear epitope as gp160 579-603. [Pincus1991] • 41-1: This antibody seems to have been named the same as a different MAb to gp41(735-752) [Dalgleish1988] • 41-1: Broadly reactive. [Gosting1987] • 41-1: Also called 41.1, although possibly not, the literature is confusing because two gp41 MAbs that bind to this region with similar names (dash versus period) are listed as murine and human. • 41-1: This antibody to gp41(584-609) [Mani1994] seems to have been named the same as a different MAb to gp41(735-752 IIIB) [Dalgleish1988]. [Dalgleish1988, Mani1994]				
648	41.4	gp160 (579–608)	gp41 (584–609)	RILAVERYLKDQQLLGIWGCSGKLI-CTTAV			
		Research Contact Jan McClure, Bristol-Myers Squibb Pharmaceutical Res Inst, Seattle, WA **References** Pincus1993a • 41.4: Binds to peptide weakly, but to gp160 with higher affinity than 41.1, and cross-competes with 41.1 – probably conformational – MAb was coupled to ricin A chain (RAC) – sCD4 enhances the efficacy of immunotoxins *in vitro* 30-fold. [Pincus1993a]

- 246-D: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. [Gorny2004] (**review**)
- 246-D: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**)
- 246-D: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**)
- 246-D: NIH AIDS Research and Reference Reagent Program: 1245.
- 246-D: Called 246D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] (**antibody binding site definition and exposure**)
- 246-D: Called 246 – Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades tested, A, B, C, D, F and CRF01 (clade E) [Gorny2002] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 246-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**) • 246-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 246-D bound strongly or moderately to all 26 HIV-1 group M clades viruses tested and showed the strongest binding of all anti-Env MAbs tested, including the V3 and C5 region MAbs – notes core epitope as LLGI – no neutralizing activity was observed when 246-D was tested with five isolates. [Nyambi2000] (**inter-clade comparisons**) • 246-D: Core epitope aa 591 to 597, a cluster I epitope that does not bind to either a peptide complex that approximates the core of the fusogenic form of gp41 or the individual peptides N51 and C43 that form this structure – MAbs 181-D and 246-D had similar properties. [Gorny2000b] (**antibody binding site definition and exposure**) • 246-D: This antibody, along with murine MAb D61, can be blocked by any of a group of 8 conformational MAbs (M10, D41, D54, T4, T6, T9, T10 and T35) [Earl1997] (**antibody interactions**) • 246-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations and 246-D neutralized 91US056 – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**) • 246-D: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGKLICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613. [Mitchell1998] (**antibody binding site definition and exposure**) • 246-D: Ab-mediated activation of complement on HIV+ cells is higher than Ab independent activation—what has been termed "Ab independent" in fact results in part from IgM in normal human serum that is HIV-cross-reactive. [Saarloos1995] (**complement**) • 246-D: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. [Manca1995a] • 246-D: No neutralizing activity, both ADCC and viral enhancing activity. [Forthal1995] (**complement**, **enhancing activity**) • 246-D: Called SZ-246.D. [Eddleston1993] • 246-D: No neutralizing activity, some enhancing activity. [Robinson1991] (**enhancing activity**) • 246-D: Did not mediate deposition of complement component C3 on HIV infected cells unless cells were pre-incubated with sCD4. [Spear1993] (**complement**) • 246-D: Fine mapping indicates core is LLGI. [Xu1991] (**antibody binding site definition and exposure**)

- F240: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. [Gorny2004] (**review**)
- F240: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. [Finnegan2002] (**antibody binding site definition and exposure**)
- F240: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**)
- F240: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. Anti-gp41 MAb F240 could inhibit B4e8 neutralization. [Cavacini2003] (**antibody interactions**)
- F240: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate, with the exception of F240 which bound both equally well, which captured more virus than any other human MAb tested, and didn't neutralize either isolate.F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 and the gp41 MAb 2F5 for both R5X4 and R5 isolates. F240 binding to gp41 was not affected by the binding of the V3 loop MAb B4a1, but preincubation with F240 could enhance B4a1 binding of the R5 isolate. Synergistic neutralization between F240 and CD4i MAbs 17b and 48d was noted for the R5X4 but not the R5 isolate, and F240 also enhanced neutralization of the R5X4 isolate by 2F5, but had no effect on R5 virus. In contrast, F240 combined with 2G12 demonstrated enhanced neutralization of R5 virus at low Ab concentrations. [Cavacini2002] (**antibody interactions**, **co-receptor**)
- F240: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• F240: Distinct from MAb 240-D, an antibody with a similar epitope in the immunodominant region of gp41 – dose-dependent reactivity with HIV isolates RF, SF2, IIIB, and MN was observed – F240 had no neutralizing activity and enhances infection in the presence of complement – reactivity of F240 is enhanced by preincubation of cells with sCD4 or anti-CD4BS MAb F105 – heavy and light chain variable domains were sequenced, and a strong homology to hu MAb 3D6 was observed, as 3D6 binds to the same epitope, these MAbs may define a human Ab clonotype. [Cavacini1998a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**, **antibody sequence, variable domain**)					
668	D49	gp160 (592–608)	gp41 (597–613)	LLGIWGCSGKLICTTAV		Vaccine	mouse
		Vaccine *Vector/Type:* protein *HIV component:* dimeric Env **Ab type** cluster I **References** Earl1997, Earl1994 • D49: Binding maps to region 597-613: WGCSGKLICTTAVPWNA – immunodominant region containing two Cys residues. [Earl1997] • D49: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]					
669	D61	gp160 (592–608)	gp41 (592–608 HXB2)	LLGIWGCSGKLICTTAV		Vaccine	mouse
		Vaccine *Vector/Type:* protein *HIV component:* dimeric Env **Ab type** cluster I **Research Contact** Patricia Earl and Christopher Broder, NIH **References** Golding2002b, Earl1997, Weissenhorn1996, Richardson1996, Earl1994 **Keywords** antibody binding site definition and exposure, antibody generation. • D61: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b – nor did it alter two gp41 MAbs, T9 and D61, inability to inhibit fusion. [Golding2002b] (**antibody binding site definition and exposure**) • D61: Binding maps to region 597-613: WGCSGKLICTTAVPWNA – immunodominant region containing two Cys residues – this antibody, along with human MAb 246-D, can be blocked by any of a group of 8 conformational MAbs (M10, D41, D54, T4, T6, T9, T10 and T35) – members of this competition group are blocked by sera from HIV-1+ individuals. [Earl1997] (**antibody binding site definition and exposure**) • D61: Does not precipitate gp41(21-166), but due to a structural difference in the disulfide bonding region near the two cysteines – the authors propose that this region may change conformation during the activation of the membrane fusion state of the HIV-1 glycoprotein. [Weissenhorn1996] (**antibody binding site definition and exposure**) • D61: Linear gp41 epitope in the cluster I region – human sera blocked binding in oligomeric ELISA assay to a similar extent for gp41 MAbs D20, D43, D61, and T4. [Richardson1996] (**antibody binding site definition and exposure**) • D61: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 3D6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**)
- 3D6: Cavacini *et al.* note that both MAbs F223 and 3D6 are anti-HIV-1 Env MAbs that have an autoimmune response and that both use uses VH3 germline genes. [Cavacini1999]
- 3D6: Binds to the immunodominant region of gp41 – a strong homology between heavy variable domains of hu MAb 3D6 and MAb F20 was observed, these MAbs may define a human Ab clonotype. [Cavacini1998a] (**antibody sequence, variable domain**)
- 3D6: The complete V, J and D(H) domain was sequenced – in contrast the sequences of five neutralizing MAbs, 3D6 had very little somatic mutation, with homologies of 97-98% relative to germline genes. [Kunert1998] (**antibody sequence, variable domain**)
- 3D6: 3D6 is V H3 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- 3D6: Optimum peptide for binding 3D6 Fab was CSGKLICTTAVPW. [Stigler1995] (**antibody binding site definition and exposure**)
- 3D6: Called IAM 41-3D6: binding increased after pretreatment of infected cells with sCD4 – binding domain overlaps site that is critical for gp120-gp41 association. [Sattentau1995c] (**antibody binding site definition and exposure**)
- 3D6: This MAb binds to HIV gp41, and to a 43 kd protein found in human T, B and monocyte cell lines, proposed molecular mimicry. [Chen1994b]
- 3D6: Fab fragment crystal structure. [He1992] (**structure**)

Keywords antibody binding site definition and exposure, antibody generation.

- D50: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. D50 prefers the triggered form after receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. D50 binds equally to the fusion-intermediate and six-helix bundle. 2F5 neutralization seems to block a later step of the fusion process. [deRosny2004] (**antibody binding site definition and exposure**)
- D50: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – D50 was used to capture the o-gp140 for ELISA to test the antigencity of o-gp140 using a panel of well characterized MAbs. [Srivastava2002]

		• D50: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-) [Yang2000] (**antibody binding site definition and exposure**) • D50: Found to bind to a linear peptide, between Env amino acids 642-655 – can be blocked by the conformation dependent MAbs D16, D17, D31, D36, D37, D40, D44, D55, D59, T37, and T45 – the region is in the immunogenic cluster two region – reactive with 9/10 HIV-1 strains tested, all except HIV-1 ADA, in which the change E659D and E662A may result in the loss of binding (ELLE to DLLA) [Earl1997] (**antibody binding site definition and exposure**) • D50: Richardson suggests this is a linear gp41 epitope. [Richardson1996] (**antibody binding site definition and exposure**) • D50: Thought to be a discontinuous epitope recognizing residues between 649-668 – designated cluster II – Fabs D5, D11, G1, T3, M12, M15, S6, S8, S9, S10 block binding. [Binley1996] (**antibody binding site definition and exposure**) • D50: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994] (**antibody generation**)

[Gorny2004] (**review**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 98-6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**)
- 98-6: Called 98-6D. Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**)
- 98-6: NIH AIDS Research and Reference Reagent Program: 1240.
- 98-6: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. [Golding2002b] (**antibody binding site definition and exposure**)
- 98-6: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6—six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D, while six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 98-6: The fusogenic form of gp41 is recognized by 98-6, and the epitope is a conformational epitope formed by the interaction of two regions of gp41 which form an alpha-helical bundle. [Taniguchi2000] (**antibody binding site definition and exposure**)
- 98-6: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs – no neutralizing activity was observed when tested against 5 isolates, but 98-6 did not bind to these isolates. [Nyambi2000] (**inter-clade comparisons**)
- 98-6: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. [Gorny2000a] (**antibody binding site definition and exposure**)
- 98-6: 98-6 and 2F5 both bind to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, and to C43 alone but not to N51 alone – 98-6 and 2F5 have comparable affinities for C43, but 98-6 has a higher affinity for the complex and the binding of 98-6 is not inhibited by N51. [Gorny2000b] (**antibody binding site definition and exposure**, **binding affinity**)
- 98-6: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-gp41 Abs 98-6, 1367 and 1342 were not able to bind detectably with any of the viruses from any clade. [Nyambi1998] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 98-6: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**) • 98-6: 98-6 is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**) • 98-6: Preferentially recognizes oligomeric form of gp41 – enhanced binding to HIV-1 infected cells at 37 degrees relative to 4 degrees – addition of sCD4 enhances binding. [Sattentau1995c] (**antibody binding site definition and exposure**) • 98-6: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. [Manca1995a] • 98-6: No neutralizing activity, positive ADCC activity, and no viral enhancing activity. [Forthal1995] (**ADCC**, **enhancing activity**) • 98-6: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. [Chen1995] (**antibody binding site definition and exposure**) • 98-6: Epitope described as cluster II, 644-663, conformational – does not neutralize IIIB or synergize neutralization by anti-V3 MAb 447-52D or by CD4 BS MAbs. [Laal1994] (**antibody binding site definition and exposure**, **antibody interactions**, **variant cross-recognition or cross-neutralization**) • 98-6: This MAb was expressed as a surface anti-gp41 monoclonal antibody receptor for gp41 on a CD4-negative B-cell line. Transfected cells could bind HIV Envelope, but could not be infected by HIV-1. When CD4 delivered by retroviral constructs was expressed on these cells, they acquired the ability to replicate HIV-1, and sIg/gp41 specifically enhanced viral replication. [Tani1994] • 98-6: Did not mediate deposition of complement component C3 on HIV infected cells, binding enhanced by sCD4. [Spear1993] (**complement**) • 98-6: Called SZ-98.6 – binds to a conformational domain within aa 644-663 of gp41, and reacts with astrocytes, as do 167-7 and ND-15G1. [Eddleston1993] (**antibody binding site definition and exposure**) • 98-6: Appeared to be specific for a conformational or discontinuous epitope. [Xu1991] (**antibody binding site definition and exposure**) • 98-6: No neutralizing or enhancing activity. [Robinson1991] (**enhancing activity**) • 98-6: Two fold increase in binding to gp120 in the presence of bound sCD4. [Sattentau1991] (**antibody binding site definition and exposure**) • 98-6: Serves as target for antibody-dependent cellular cytotoxicity, ADCC. [Tyler1990] (**ADCC**) • 98-6: No neutralizing or enhancing activity for HIV-1 IIIB. [Robinson1990b] (**enhancing activity**) • 98-6: Toxic to HIV-infected T cells (H9) and monocytes (U937) when coupled to deglycosylated A chain of ricin. [Till1989] (**immunotoxin**) • 98-6: Kills HIV-infected cells when coupled to deglycosylated ricin A chain. [Gorny1989] (**immunotoxin**) • 98-6: Reacts preferentially with gp160 oligomer, compared to gp41 monomer. [Pinter1989] (**antibody binding site definition and exposure**)

- 2F5: This paper reviews MAbs that bind to HIV-1 Env. 2F5 binds to a region of gp41 proximal to cluster II (aa 662-676), neighboring the binding site of the broadly neutralizing MAb 4E10 and of neutralizing Fab Z13. 2F5 is broadly neutralizing. [Gorny2004] (**review**)
- 2F5: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. D50 prefers the triggered form after receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. D50 binds equally to the fusion-intermediate and six-helix bundle. 2F5 neutralization seems to block a later step of the fusion process, but it does not inhibit binding of NC-1, a MAb specific for the six-helix bundle, so it does not prevent formation of the six-helix bundle. The results are most consistent with 2F5 inhibiting a post-fusion-intermediate step. [deRosny2004] (**antibody binding site definition and exposure**, **antibody interactions**)
- 2F5: The broadly neutralizing antibodies 2F5 and 2G12 were class-switched from IgG to IgA and IgM isotypes. Neutralizing potency was increased with valence for 2G12 so the IgM form was most potent, but for 2F5 the IgG form was most potent. Eight primary isolates were tested including two subtype A isolates. The polymeric IgM and IgA Abs, but not the corresponding IgGs, could interfere with HIV-1 entry across a mucosal epithelial layer, although they were limited in a standard neutralization assay. All isotypes could interact with activated human sera, presumably through complement, to inhibit HIV replication. [Wolbank2003] (**complement**, **isotype switch**, **variant cross-recognition or cross-neutralization**, **mucosal immunity**, **inter-clade comparisons**)
- 2F5: The antiviral response to intravenously administered MAbs 2F5 and 2G12 was evaluated in 7 HAART-naÃ¯ve asymptomatic HIV-1 infected patients during a treatment period of 28 days. MAb therapy reduced plasma HIV RNA in 3/7 patients during the treatment period, and transiently reduced viral load in two more. CD4 counts were up in 3/7 through day 28, and transiently increased in three more. Vigorous complement activation was observed after 48/56 Ab infusions. Before treatment, 2F5 neutralized isolates from five patients and no escape was observed during treatment. [Stiegler2002] (**complement**, **variant cross-recognition or cross-neutralization**, **escape**, **immunotherapy**)
- 2F5: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. 2F5 recognized most variants from 3/4 individuals by gp41 WB; the 4th individual had the ELDKWA variant Aldkwa in all three isolates. The other single Env that was not recognized carried eldRwa. [Ohagen2003] (**brain/CSF**, **escape**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessaton of therapy, which then declined to a low level. The polylconal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. [Montefiori2003] (**acute infection**, **escape**)
- 2F5: Cyclic peptides ELLELDKWASLW that adopt constrained beta-turn conformation of the 2F5 epitope beta-turn in the complexed crystal structure were synthesized and optimize 2F5 binding affinity. This peptide elicts high titer peptide-specific immune responses in guinea pigs that do not neutralize; the authors propose this may be the result of a short CDR3 loop in guinea pigs. [McGaughey2003] (**antibody binding site definition and exposure**, **vaccine antigen design**, **binding affinity**, **structure**)
- 2F5: A polyepitope vaccine was designed based on three repeats of the 2F5 core epitope ELDKWA combined with the V3 region peptide GPGRAFY. Abs raised in mice could recognize the peptides, sgp41, and CHO-WT cells that expressed HIV-1 Env on their surface. [Li2002] (**vaccine antigen design**)
- 2F5: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. [Kitabwalla2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **inter-clade comparisons**)
- 2F5: A mouse MAb was raised against a variant of ELDKWA core epitope of the NAb 2F5, eldEwa, derived from the 2F5 neutralization resistant variant MVP5180. 2F5 does not bind to the variants eldEwa, elNkwa (B.TH.TH936705) or elEkwa, while 14D9 binds only to eldEwa and not ELDKWA. The eldEwa variant is common in the HIV-1 O group. [Huang2002] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 2F5: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. [Wang2003] (**vaccine antigen design**, **review**)
- 2F5: Most plasma samples of patients from early infection had NAb responses to early autologous viruses, and NAbs against heterologous strains tended to be delayed. Serial plasma samples were tested against serial isolates, and neutralization escape was shown to be rapid and continuous throughout infection. Autologous neutralization-susceptible and resistant viruses from four patients were tested for susceptability to neutralizing Ab responses using MAbs 2G12, IgG1b12 and 2F5. No correlation was established, all viruses tested were susceptible to at least one of the neutralizing MAbs. Two patients that did not have an autologous NAb response also did not evolve changes in susceptibility to these MAbs, while one patient with a pattern of autologous neutralization and escape acquired a 2G12 sensitive virus at month 6, and lost IgG1b12 sensitivity at month 21. [Richman2003] (**autologous responses**, **acute infection**, **escape**)
- 2F5: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. [Dey2003]
- 2F5: UK1-br and MACS2-br are R5 isolates derived from brain tissue samples from AIDS patients with dementia and HIV-1 encephalitis; both are neurotropic, but only UK1-br induced neuronal apoptosis and high levels of syncytium formation in macrophages. UK1-br Env had a greater affinity for CCR5 than MACS-br, and required low levels of CCR5 and CD4 for cell-to-cell fusion and single round infection. PBMC infected with UK1-br and MACS2-br virus isolates were resistant to neutralization by MAb 2G12. UK1-br was more sensitive than MACS2-br to IgG1b12, 2F5 and CD4-IgG2 neutralization. This pattern of Ab reactivity was similar to the to CD4-independent varient ADA197N/K, and thought to result from conformational changes which better expose the CCR5 binding regions, although the loss of the particular N-linked glycosylation site in the V1V2 stem region of ADA was experimentally shown to not be responsible for the the CD4-independent phenotype of UK1-br. [Gorry2002] (**brain/CSF**, **co-receptor**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. 2F5 behaved very differently than these non-neutralizing antibodies: it bound to Env in the absence of target cells, and it was distributed evenly all over the cell surface, not localized in fusion domains. It did not interact with cells that exhibited cytoplasmic mixing. 2F5 was unusual in that it exhibited temperature dependence, and did not interact below 19 degrees C, in contrast to 2G12, M77 98-6 and IgG1b12 which bound strongly at temperatures ranging between 4-37 degrees. The authors suggest the temperature dependence of 2F5 may be due to encreased flexibility of the Envelope spike at warmer temperatures facilitating epitope exposure. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**)
- 2F5: A complex of the epitope peptide ELDKWAS bound to 2F5 was crystalized, and the peptide was found to interact with amino acids near the base of the very long (22 residue) CDR 3H region of the Ab. Ala substitution of the CDR H3 region confirmed the importance of these sites near the base of the H3 loop for interaction with the epitope in the context of intact gp41 as well as the peptide. A Phe at the apex of the loop was not located directly in the binding site, however binding of 2F5 to the epitope was very sensitive to non-conservative substitutions in this position (F100G, F100H, and F100R); these diminished both binding affinity and 2F5 neutralization, suggesting a role for the very long CDR 3H region. The authors suggest that particularly long CDR H3 regions may be a common feature of HIV-1 NAbs, based on the 22 residues in H3 of 2F5, the 18 H3 residues in b12, and the 22 H3 residues in X5. They express concern that because small animals like mice are be unable to elicit Ab responses with such long H3s, they may be poor model systems for HIV vaccine studies. [Zwick2004] (**antibody binding site definition and exposure**, **antibody interactions**, **antibody sequence, variable domain**, **structure**)
- 2F5: This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. [Mascola2003a] (**immunoprophylaxis**, **review**)
- 2F5: This study investigates the effects of glycosylation inhibitors on the binding between HIV-1 gp120 and mannose-binding lectin (MBL). Mannosidase I inhibitor deoxymannojirimycin (dMM) inhibits formation of complex and hybrid N-linked saccharides and yields virus with more mannose residues. dMM added during viral production significantly enhanced the binding 2F5 and 2G12, but not IgG1b12 in a viral capture assay. [Hart2003] (**antibody binding site definition and exposure**)
- 2F5: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. [Ferrantelli2003] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)
- 2F5: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate, with the exception of F240 which bound both equally well, which captured more virus than any other human MAb tested, and didn't neutralize either isolate. F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 and the gp41 MAb 2F5 for both R5X4 and R5 isolates. F240 also enhanced neutralization of the R5X4 isolate by 2F5, but had no effect on R5 virus. Anti-V3 MAb B4a1 did not impact 2F5 neutralization. [Cavacini2002] (**antibody binding site definition and exposure**, **antibody interactions**, **co-receptor**)
- 2F5: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other MAb against gp41 tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**)
- 2F5: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 NAbs 2F5 and 4E10 are able to potently neutralize the SOS pseudovirion post-attachment, although 2F5 performed relatively poorly in the pre-attachment assay, a further support for previous studies that indicated it does not bind well to native Env, and may bind best after the virus is attached to cells. [Binley2003] (**vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: IgG1b12 neutralized many South African (5/8) and Malawian (4/8) clade C primary HIV-1 isolates, being more effective than 2F5 which neutralized only two Malawian and no South African isolates. 2G12 did not neutralize any of the 16 isolates. [Bures2002] (**inter-clade comparisons**)
- 2F5: NIH AIDS Research and Reference Reagent Program: 1475.
- 2F5: UK Medical Research Council AIDS reagent: ARP3063.
- 2F5: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. [Liu2002] (**immunoprophylaxis**, **vaccine antigen design**, **review**)
- 2F5: Review of NAbs that notes that 2F5 alone or in combination with other MAbs can protect some macaques against SHIV infection, that it is safe and well tolerated in humans, and that illustrates gp41's conformational change and exposure of the 2F5 epitope in the transient pre-hairpin form. [Ferrantelli2002] (**immunoprophylaxis**, **review**)
- 2F5: A 2F5 anti-idiotype murine MAb Ab2/3H6 was developed that blocks 2F5 binding to a synthetic epitope peptide and to gp160 in an ELISA competition assay – Ab2/3H6 diminished the neutralizing potency of 2F5 – Ab2/3H6 Fab fragments were capable of inducing neutralizing Abs and 2F5-epitope specific responses in immunized B6D2F1 mice. [Kunert2002] (**vaccine antigen design**)
- 2F5: Rhesus macaques were better protected from vaginal challenge with SHIV89.6D (MAb 2G12, 2/4; MAbs 2F5/2G12, 2/5; and HIVIG/2F5/2G12, 4/5 infected) than from intravenous challenge (MAb 2G12, 0/3; MAbs 2F5/2G12, 1/3; and HIVIG/2F5/2G12, 3/6 infected)– the animals that were infected by vaginal challenge after Ab infusion had low or undetectable viral RNA levels and modest CD4 T-cell decline. [Mascola2002] (**immunoprophylaxis**)
- 2F5: HIV-1 gp160ΔCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160ΔCT with a reconstituted membrane ten-fold better than the same protein on beads (except for the YU2 form that doesn't bind 2F5)—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160ΔCT PLs indistinguishably from gp160ΔCT expressed on the cell surface. [Grundner2002] (**vaccine antigen design**)
- 2F5: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b]
- 2F5: A combination of MAbs 2F5 and 2G12 given in multiple infusions was found to be safe and well tolerated even in high doses in a phase I study of seven HIV-1 infected healthy volunteers—the median elimination half-life was 7.94 days for 2F5, and 16.48 for 2G12—no anti-2F5 or anti-2G12 IgM or IgG responses were detected—although there was some transient increases, overall plasma viral RNA levels decreased in 6/7 volunteers, by a median of 0.62 log_10 [Armbruster2002] (**immunotherapy**)
- 2F5: Six sera from HIV-exposed uninfected individuals(EU) had IgA neutralizing activity dominated by recognition of a distinctive epitope within gp41, QARILAV – sera of QAFILAV-immunized BALB/c mice was neutralizing with the dose-dependent behavior similar to 2F5. [Clerici2002a] (**HIV exposed persistently seronegative (HEPS)**)
- 2F5: DP178 is a peptide derived from the C-term heptad repeat of gp41 that is a potent inhibitor of viral-mediated fusion—it contains the 2F5 epitope but fails to stimulate 2F5-like NAbs upon immunization—the peptide was extended to force an increase in helicity, and the modified peptide had a increase in affinity for 2F5, but upon guinea pig immunization although high peptide-specific Ab titers were achieved the sera were incapable of viral neutralization—the authors propose that 2F5 may bind with low affinity to a maturation intermediate, which may account for its breadth and why it is hard to recreate the epitope, but also suggests that the high concentrations required for neutralization are not relevant *in vivo* [Joyce2002] (**antibody binding site definition and exposure**)
- 2F5: A modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. [Chakrabarti2002] (**vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. [Xu2002] (**antibody interactions**, **immunoprophylaxis**, **inter-clade comparisons**)
- 2F5: ELDKWAS was embedded into a beta-turn-like conformational site on a framework of an antibody specific for human leukocyte antigen HLA-DR – this construct was recognized by 2F5, and is suggested as an adjuvant-independent vaccine candidate. [Ho2002] (**vaccine antigen design**)
- 2F5: Expanding the minimal epitope ELDKWA to an end-capped, linear nonapeptide, Ac-LELDKWASL-amide attained maximal affinity within a set of native gp41-sequence peptides – scanning single residue substitutions confirmed that essential recognition requirements were the central DKW core sequence and the importance of the terminal Leu residues for high-affinity binding – high specificity binding pockets at central Lys and Trp side-chains and an absolute requirement for the carboxylate group of the Asp side chain were found – the nine residue fragment flanked by pairs of Ser and constrained by a disulfide bridge had high affinity for 2F5. [Tian2002] (**antibody binding site definition and exposure**)
- 2F5: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140 – SOS gp140-2F5-IgG1b12 formed multiple ring structures composed of two SOS gp140 proteins bridged by two Ab molecules, while 2F5 and 2G12 formed extended chains rather than closed rings. [Schulke2002] (**vaccine antigen design**)
- 2F5: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. [Golding2002b]
- 2F5: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – 2F5 recognized o-gp140. [Srivastava2002] (**vaccine antigen design**)
- 2F5: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. [Xu2001] (**antibody interactions**)
- 2F5: A combination of MAbs IgG1b12, 2F5, and 2G12 was given postnatally to four neonates macaques that were then challenged with highly pathogenic SHIV89.6P – one of the four infants remained uninfected after oral challenge, two infants had no or a delayed CD4(+) T-cell decline. [Hofmann-Lehmann2001] (**immunoprophylaxis**)
- 2F5: 4E10 binds proximal to 2F5 and neutralizes primary isolates of clades A, B, C, D, and E – viruses that were resistant to 2F5 were neutralized by 4E10 and vice versa. [Stiegler2001] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 2F5: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 2F5: A luciferase-reporter gene-expressing T-cell line was developed to facilitate neutralization and drug-sensitivity assays – luciferase and p24 antigen neutralization titer end points were found comparable using NAb from sera from HIV+ donors, and MAbs 2F5, 2G12 and IgG1b12. [Spenlehauer2001] (**assay development**)
- 2F5: Matrix-assisted laser desorption ionization mass spectrometry (MALDI-MS) in combination with proteolytic protection was used to identify the functional epitope for MAb 2F5, NEQELLELDKWASLWN, in the disulfide bond associated gp120/gp41 protein SOS-gp140 (JRFL) – this minimal epitope is much larger than the ELDKWA core epitope previously defined by peptide ELISA, and this could help explain why ELDKWA-peptides are poor immunogens in terms of eliciting a 2F5-like antibody response. [Parker2001] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: Neutralizing synergy between MAbs 1b12, 2G12 and 2F5 was studied using surface plasmon resonance to determine the binding kinetics for these three mAbs with respect to monomeric and oligomeric env protein gp160 IIIB – the 2G12 epitope is highly accessible on both monomeric and oligomeric Envs, 1b12 is highly accessible on monomers but not oligomers, and 2F5 on neither form – binding of 2G12 exposes the 2F5 epitope on gp160 oligomers. [Zeder-Lutz2001] (**antibody interactions**)
- 2F5: Moore and colleagues review the data concerning the lack of a clear relationship between genetic subtype and serotype – 2F5 is considered in some detail, as it represents a rare vulnerability from the neutralizing antibody perspective, although while it is apparently linear, attempts to present the peptide to the immune system have failed to elicit neutralizing Abs. [Moore2001] (**review**, **inter-clade comparisons**)
- 2F5: Review of studies in macaques that have shown immune control of pathogenic SHIV viremia, improved clinical outcome, and protection, and the implications of the observations for HIV vaccines. [Mascola2001] (**review**)
- 2F5: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2. [Zwick2001c] (**antibody interactions**)
- 2F5: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – the minimal 2F5 epitope is determined to be EQELLELDKWASLW, based on screening a gp160 fragment expression library, longer than previous studies – broadly neutralizing MAbs 2F5, IgG1b12, and 4E10 and Z13 fail to neutralize different subsets of viruses. [Zwick2001b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 2F5: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001] (**variant cross-recognition or cross-neutralization**)
- 2F5: A phage peptide library was screened with MAb 2F5, and from the peptides that bound the amino acids DKW were found to be most critical for binding – the mimetic peptide RDWSFDRWSLSEFWL elicited a cross-reactive Ab response to gp41 when used to immunize rabbits. [Tumanova2001]
- 2F5: A peptide called 5-Helix was designed that binds to the C-peptide region of gp41 – 5-Helix is a potent inhibitor of HIV-1 entry that binds immediately COOH-terminal to the C-peptide region targeted by 5-Helix – the conformation of the bound 2F5 epitope is a hairpin turn. [Root2001]
- 2F5: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to antibody 2F5. [Kolchinsky2001] (**variant cross-recognition or cross-neutralization**)
- 2F5: ELNKWA is an escape variant not recognized by the broadly neutralizing MAb 2F5, which recognizes the core epitope ELDKWA – Abs were raised against the peptide escape variant CGELNKWAGELNKWA linked to KLH carrier – these polyclonal antibodies, like the monoclonal antibody TH-Ab1 also raised to ELNKWA, could recognize ELDKWA and escape mutant peptide epitopes ELEKWA and ELDEWA. [Dong2001] (**variant cross-recognition or cross-neutralization**)
- 2F5: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. [Si2001]
- 2F5: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-) – 2F5 did not bind efficiently to these constructs, presumably because of the YU2 strain has a substitution in the 2F5 epitope (ALDKWA instead of ELDKWA) [Yang2000] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: 2F5 or sCD4-IgG chimeric immunoadhesin were transferred into 3T3 cells, incorporated into a collagen structure called the neo-organ, and transplanted into SCIDhu mice that were then challenged with MN or LAI – the continuous production of the therapeutic molecules in this context resulted in dramatic reduction of viral load. [Sanhadji2000] (**immunotherapy**)
- 2F5: ELDKWAS co-crystallized bound to the Fab' 2F5 fragment showed the epitope peptide in a type I beta-turn conformation. [Pai2002] (**structure**)
- 2F5: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs. [Nyambi2000] (**inter-clade comparisons**)
- 2F5: ELDKWA peptide vaccine study. [Lu2000b] (**vaccine antigen design**)
- 2F5: ELDKWA peptide vaccine study. [Lu2000c] (**vaccine antigen design**)
- 2F5: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002]
- 2F5: Low levels of anti-ELDKWA antibodies are observed in HIV-1+ individuals, so a C-domain P2 peptide linked to a carrier was used to immunize mice and rabbits, and stimulated a high-level anti-ELDKWA response. [Liao2000] (**vaccine antigen design**)
- 2F5: 2F5 is a candidate for immunotherapy, but generally IgG1 has a longer half life in humans than IgG3, so the isotype was switched – rec CHO-derived MAb 2F5 IgG1kappa and hybridoma-derived MAb 2F5 IgG3kappa displayed identical specificity, *in vitro* function, and epitope (ELDKWA) – it remains to be determined if isotype switching will prolongs beta-clearance. [Kunert2000] (**immunotherapy**)
- 2F5: MAbs 98-6 and 2F5 both bind to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, and to C43 alone but not to N51 alone – 98-6 and 2F5 have comparable affinities for C43, but 98-6 has a higher affinity for the complex and 2F5 may bind to an epitope of C43 that is directly involved with complex formation –and IgG1 rec form of the Ab was used in this study. [Gorny2000b] (**antibody binding site definition and exposure**)
- 2F5: A mini-review of observations of passive administration of IgG NAbs conferring protection against intervenous or vaginal SHIV challenge, that considers why IgG MAbs might protect against mucosal challenge. [Robert-Guroff2000] (**review**)
- 2F5: Paper uses IgG1 form of 2F5 – a triple combination of 2F5, F105 and 2G12 effectively neutralized perinatal infection of macaque infants when challenged with SHIV-vpu+ – the plasma half-life was 4.2 +/- 0.8 days. [Baba2000] (**immunoprophylaxis**)
- 2F5: Because HIV-1 is most often transmitted across mucosal surfaces, the ability of passive transfer of infused HIVIG/2F5/2G12 to protect against mucosal exposure of macaques to pathogenic SHIV 89.6PD was studied – HIVIG/2F5/2G12 protected 4/5 animals against vaginal challenge, 2F5/2G12 combined protected 2/5 animals, and 2G12 alone protected 2/4 animals – in contrast, Mascola and co-workers had previously shown single MAbs could not protect against intervenous challenge – Ab treated animals that got infected through vaginal innoculation had low viral loads and only modest declines in CD4 counts – the infused Abs were detected in the nasal, vaginal, and oral mucosa. [Mascola2000] (**immunoprophylaxis**, **mucosal immunity**)
- 2F5: Combinations of HIVIG, 2F5, 2G12 were administered in passive-transfer experiments 24 hours prior to challenge with pathogenic SHIV 89.6PD – 3/6 animals given HIVIG/2F5/2G12 were completely protected, the others had reduced viremia and normal CD4 counts – 1/3 monkeys given 2F5/2G12 showed transient infection, the other two had reduced viral load – all monkeys that received HIVIG, 2F5, or 2G12 alone became infected and developed high-level plasma viremia, although animals that got HIVIG or 2G12 had a less profound CD4 T cell decline. [Mascola1999] (**immunoprophylaxis**)
- 2F5: Review of the neutralizing Ab response to HIV-1. [Parren1999] (**review**)
- 2F5: In a study of 116 HIV-1+ individuals, Ab reactivity to a peptide encompassing the ELDKWA peptide decreased in CDC stage C patients compared with stage A patients, and longitudinal studies showed a decline in 6/8 patients, while overall Ab reactivity to rec soluble gp160 stayed constant. [Muhlbacher1999]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: Hu-PBL-SCID mice were infected with HIV-1s JRCSF and SF162 to study the effect of NAbs on an established infection – no significant differences in the initial rate of decrease in viral load or the plateau levels of viral RNA between the b12 treated and control mice were seen – in most of the Ab treated mice b12 escape mutants were observed with varying patterns of mutations – a combination of b12, 2G12 and 2F5 protected 1/3 mice, and an isolate from one of the other two was resistant to neutralization by all three MAbs. [Poignard1999] (**immunotherapy**)
- 2F5: A meeting summary presented results regarding neutralization –MAbs 2G12 and 2F5 tested for their ability to neutralize primary isolate infection of genetically engineered cell lines (cMAGI and others, presented by T. Matthews, A. Trkola, J. Bradac) – an advantage of such cells lines over PBMCs is that markers (X-Gal) can be added for staining to simplify the assay – the consensus of the meeting was that these engineered cell lines did not improve the sensitivity of detection of primary isolate neutralization – D. Burton and J. Mascola presented results concerning passive immunization and protection of hu-PBL-SCID mice and macaques, respectively, and both found combinations of MAbs that were able to achieve 99% neutralization *in vitro* corresponded to efficacy *in vivo*. [Montefiori1999] (**review**)
- 2F5: rgp120 derived from a R5X4 subtype B virus was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs. [Beddows1999]
- 2F5: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. [Frankel1998] (**mucosal immunity**)
- 2F5: The complete V, J and D(H) domain was sequenced – unlike non-neutralizing anti-gp41 MAb 3D6, five neutralizing MAbs (2F5, 2G12, 1B1, 1F7, and 3D5) showed extensive somatic mutations giving evidence of persistent antigenic pressure over long periods – in contrast to Geffin98, where multiple pediatric sera were found to compete with 2F5, cross-competition was noted to be very rare in sera from HIV+ adults – Kunert *et al.* propose that because there is a binding site of human complement factor H which overlaps the 2F5 binding site, it may generally be masked from the immune system – 2F5 also has a remarkably long CDR3 loop of 22 amino acids, and this region could not be readily assigned to any described D(H) fragment, leading to the suggestion of recombination of two fragments from novel regions. [Kunert1998] (**antibody sequence, variable domain**)
- 2F5: The natural immune response to the epitope of 2F5, ELDKWA, was studied in perinatally infected children and levels of reactivity to this epitope were correlated with absolute CD4 numbers over time and health status – 3/10 children who had no antibody reactivity to ELDKWA had substitutions in the epitope (ALDKWA, ELDQWA, and KLDKWA) – 2F5 competed with the ELDKWA-reactive sera depending on the serum titer. [Geffin1998]
- 2F5: MAbs 2G12, 2F5 and b12 are broadly neutralizing, as are some human polyconal sera, but this paper describes a set of primary isolates that are resistant to all three MAbs and 2 broadly neutralizing sera – results indicate that resistance levels of pediatric isolates might be higher than adult isolates – resistance in general did not seem to be conferred by a loss of binding affinity for gp120 or gp41, rather by a more global perturbation of oligomeric Envelope. [Parren1998b] (**variant cross-recognition or cross-neutralization**)
- 2F5: Used as a control in the study of anti-gp41 MAb NC-1 – 2F5 does not react with HIV-2 gp41 or gp160. [Jiang1998] (**variant cross-recognition or cross-neutralization**)
- 2F5: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS) [Li1998] (**antibody interactions**)
- 2F5: Induces complement-mediated lysis in MN but not primary isolates – primary isolates are refractive to CML. [Takefman1998] (**complement**)
- 2F5: The ELDKWA epitope was inserted into the antigenic site B of influenza hemagglutinin and expressed on baculovirus infected insect cells, flanked by 3 additional random amino acids, xELDKWAxx – FACS was used to isolate the clone that displayed the epitope with the most markedly increased binding capacity for 2F5, to identify particularly specific immunogenic constructs – PELDKWAPP was a high affinity form selected by FACS. [Ernst1998] (**vaccine antigen design**)
- 2F5: Points out that 2G12 and 2F5, potent neutralizing antibodies, were identified by screening for cell surface (oligomeric Envelope) reactivity. [Fouts1998]
- 2F5: A wide range of neutralizing titers was observed that was independent of co-receptor usage – 2F5 was the most potent of the MAbs tested. [Trkola1998] (**variant cross-recognition or cross-neutralization**)
- 2F5: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. [Yang1998] (**assay development**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. [Connor1998] (**variant cross-recognition or cross-neutralization**)
- 2F5: This MAb and the results of [Ugolini1997] are discussed – the authors propose that an Ab bound to gp41 would typically project less from the surface of the virion and so be unable to interfere with attachment [Parren1998a]. [Parren1998a, Ugolini1997] (**review**)
- 2F5: Post-exposure prophylaxis was effective when MAb 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. [Andrus1998] (**immunoprophylaxis**)
- 2F5: This review summarizes results about 2F5: it binds extracellularly, near the transmembrane domain, it is the only gp41 MAb that is neutralizing, it reacts with many non-B clade viruses and has a paradoxically weak binding to virus, given the neutralizing titers. [Burton1997] (**review**)
- 2F5: The only MAb out of a large panel to show no correlation between viral binding inhibition and neutralization. [Ugolini1997]
- 2F5: Used to standardize polyclonal response to CD4 BS. [Turbica1997]
- 2F5: Using concentrations of Abs achievable *in vivo*, the triple combination of 2F5, 2G12 and HIVIG was found to be synergistic to have the greatest breadth and magnitude of response against 15 clade B primary isolates. [Mascola1997] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 2F5: Binding of anti-gp120 MAbs IgG1b12 or 654-30D does not mediate significant exposure of the gp41 epitopes for MAbs 2F5 and 50-69. [Stamatatos1997] (**antibody interactions**)
- 2F5: Review: MAbs 2F5, 2G12 and IgG1b12 have potential for use in combination with CD4-IgG2 as an immunotherapeutic or immunoprophylactic – homologous MAbs to these are rare in humans and vaccine strategies should consider including constructs that may enhance exposure of these MAbs' epitopes. [Moore1997] (**review**)
- 2F5: IgG1b12 was more potent with greater breadth than MAb 2F5 in an infection reduction assay including 35 primary isolates. [Kessler II1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB Env – strong neutralizer of SHIV-vpu+ – all Ab combinations tested showed synergistic neutralization – 2F5 has synergistic response with MAbs 694/98-D (anti-V3), 2G12, b12, and F105. [Li1997] (**antibody interactions**)
- 2F5: A JRCSF variant that was selected for IgG1b12 resistance remained sensitive to MAbs 2G12 and 2F5, for combination therapy. [Mo1997] (**antibody interactions**)
- 2F5: In a multilab evaluation of monoclonal antibodies, only IgG1b12, 2G12, and 2F5 could neutralize at least half of the 9 primary test isolates at a concentration of < 25 mug per ml for 90% viral inhibition – the isolates with no 2F5 neutralizing susceptibility had the sequences ALGQWA or ELDTWA instead of EDLKWA – 7/9 primary isolates were neutralized, and ALDKWQ and ALDKWA were susceptible to neutralization. [D'Souza1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: Of three neutralizing MAbs (257-D, IgG1b12, and 2F5), 2F5 was the only one to inhibit the entry of all viruses studied, both SI and NSI, with a potency proportional to its affinity for monomeric gp126. [Schutten1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: Called IAM 2F5 – antibody mediated enhancement or inhibition seemed to be determined by isolate rather than antibody specificity – in this study, only 2F5 inhibited the entry of all the viruses studied, irrespective of their phenotype, and directly proportional to its affinity to monomeric HIV-1 gp160. [Schutten1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: A panel of immunotoxins were generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. [Pincus1996] (**immunotoxin**)
- 2F5: 2F5 was infused into two chimpanzees which were then given an intravenous challenge with a primary HIV-1 isolate – both became infected, but with delayed detection and prolonged decrease in viral load relative to controls, indicating that preexisting, neutralizing antibodies (passively administered or actively elicited) affect the course of acute-phase virus replication and can be influential after the Ab can no longer be detected in the peripheral circulation. [Conley1996] (**immunoprophylaxis**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2F5: Review: only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. [Sattentau1996] (**review**)
- 2F5: Review: one of three MAbs (IgG1b12, 2G12, and 2F5) generally accepted as having significant potency against primary isolates. [Poignard1996b] (**review**)
- 2F5: Neutralizes HXB2, primary isolates, and chimeric virus with gp120 from primary isolates in an HXB2 background. [McKeating1996b] (**variant cross-recognition or cross-neutralization**)
- 2F5: Primary isolates from clade A, B, and E are neutralized by 2F5 – neutralization requires the LDKW motif – neutralization resistant isolates or 2F5 selected variants all had substitutions in the D or K. [Purtscher1996] (**inter-clade comparisons**)
- 2F5: ELDKWAS is in a gp41 binding region for the negative regulator of complement factor H (CFH) – Abs to HIV generally do not cause efficient complement-mediated lysis, but binding of 2F5 can interfere with CHF binding, facilitating HIV destruction by complement. [Stoiber1996] (**complement**)
- 2F5: Only 4/20 Argentinian and 3/43 Swedish HIV+ sera reacted with LLELDKWASL – sera reacting with peptides that contained ELDKWA tended to have high neutralization titers – the region carboxyl terminal to EDLKWA was found to be more important for polyclonal sera AB binding, 670-675 WNWFDI – 2F5 bound most strongly to the peptide QELLELDKWA. [Calarota1996] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 2F5: Broad cross-clade neutralization of primary isolates – additive neutralization in combination with anti-CD4BS MAb IgG1b12 (Called BM12) [Kessler1995] (**inter-clade comparisons**)
- 2F5: MAb binding decreases the accessibility or alters the conformation of the gp41 fusion domain and of gp120 domains, including the binding site for the CD4 cell receptor. [Neurath1995] (**antibody binding site definition and exposure**)
- 2F5: Review: binds to the only generally accepted strong neutralizing epitope outside of gp120, one of only 3 MAbs with strong broad activity against primary viruses, the others are 2G12 and IgG1b12 – unique member of epitope cluster [Moore1995b] and John Moore, per comm 1996. [Moore1995b] (**review**)
- 2F5: Called IAM 41-2F5 – exposed in the presence of gp120 on the cell surface, while most of gp41 is masked – binds proximal to transmembrane region. [Sattentau1995c] (**antibody binding site definition and exposure**)
- 2F5: Cross-clade primary virus neutralizing activity – LDKW defined as the core epitope. [Trkola1995] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 2F5: Found to neutralize MN, JRCSF, and two B subtype primary isolates, but not a D subtype primary isolate, by most labs in a multi-laboratory study involving 11 labs. [D'Souza1995] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 2F5: 2F5 epitope ELDKWA inserted into an immunogenic loop in influenza virus hemagglutinin can elicit IIIB, MN and RF neutralizing sera in immunized mice. [Muster1994] (**vaccine antigen design**)
- 2F5: gp41 mutation (582 A/T) that reduces neutralization of anti-CD4 binding site MAbs does not alter 2F5's ability to neutralize. [Thali1994]
- 2F5: Called IAM-41-2F5 – neutralized lab and primary isolates – t 1/2 dissociation 122 min for the peptide, and 156 min for gp41 – core D(K/R)W – Ab resistant isolate had the sequence KLDNWA. [Conley1994b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 2F5: Included in a multi-lab study for antibody characterization binding and neutralization assay comparison. [D'Souza1994] (**assay development**)
- 2F5: MAb generated by electrofusion of PBL from HIV-1 positive volunteers with CB-F7 cells. [Buchacher1994] (**antibody generation**)
- 2F5: Failed to show synergy with anti-CD4 binding site IIIB neutralizing antibodies. [Laal1994] (**antibody interactions**)
- 2F5: Broadly reactive neutralizing activity, ELDKWA is relatively conserved – neutralized 2 primary isolates. [Purtscher1994] (**variant cross-recognition or cross-neutralization**)
- 2F5: Called IAM-41-2F5 – reports MAb to be IgG1 – the gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to conformationally sensitive neutralizing MAbs – neutralization efficiency of 2F5 is not affected. [Klasse1993a] (**variant cross-recognition or cross-neutralization**)
- 2F5: Synergy with combinations of CD4-based molecules in inhibition of HIV-1 Env mediated cell fusion. [Allaway1993] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 2F5: DKWA defined as the core sequence – highly conserved epitope neutralizing MAb. [Buchacher1992, Muster1993] (**antibody binding site definition and exposure**)					
708	polyclonal	gp160 (659–670)	gp41 (659–670)	ELLELDKWASLW	no	Vaccine	guinea pig
		Vaccine *Vector/Type:* peptide *Strain:* B clade *HIV component:* gp41 *Adjuvant:* QS21 **References** McGaughey2003 **Keywords** antibody binding site definition and exposure, binding affinity, vaccine antigen design. • 2F5: Cyclic peptides ELLELDKWASLW that adopt constrained beta-turn conformation of the 2F5 epitope beta-turn in the complexed crystal structure were synthesized and optimize 2F5 binding affinity. This peptide elicts high titer peptide-specific immune responses in guinea pigs that do not neutralize; the authors propose this may be the result of a short CDR3 loop in guinea pigs and additional recessed contact points between 2F5 and gp41. [McGaughey2003] (**antibody binding site definition and exposure**, **vaccine antigen design**, **binding affinity**)					
709	14D9	gp160 (662–667)	gp41 (669–674 MVP5180)	ELDEWA		Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* peptide keyhole limpet hemocyanin (KLH) conjugate *Strain:* natural variants *HIV component:* gp41 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Ab type** adjacent to cluster II, C-term **References** Huang2002 **Keywords** antibody binding site definition and exposure, antibody generation, inter-clade comparisons, variant cross-recognition or cross-neutralization. • 14D9: This mouse MAb was raised against a variant of ELDKWA core epitope of the NAb 2F5, eldEwa, derived from the 2F5 neutralization resistance variant MVP5180. The eldEwa peptide was conjugated to the carrier protein keyhole limpet hemocyanin (KLH) and adminstered to BALB/c mice and 14D9 was prepared using standard hybridoma methods. 2F5 does not bind to the variants eldEwa, elNkwa (B.TH.TH936705) or elEkwa, while 14D9 binds only to eldEwa and not ELDKWA. The eldEwa variant is common in the HIV-1 O group. [Huang2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)					
710	polyclonal	gp160 (662–667)	gp41 (662–667)	ELDKWA	no	Vaccine	guinea pig
		Vaccine *HIV component:* gp41 **References** Joyce2002 • 2F5: DP178 is a peptide derived from the C-term heptad repeat of gp41 that is a potent inhibitor of viral-mediated fusion – it contains ELDKWA but fails to stimulate 2F5-like NAbs upon immunization – the peptide was extended to force an increase in helicity, and the modified peptide had a increase in affinity for 2F5, but upon guinea pig immunization although high peptide-specific Ab titers were achieved the sera were incapable of viral neutralization – the authors propose that 2F5 may be a low affinity maturation intermediate, which may account for its breadth and why it is hard to recreate the NAb response, but also suggests that the high concentrations required for neutralization are not relevant *in vivo*. [Joyce2002]					
711	5B2	gp160 (662–667)	Env (669–674 IIIB)	ELDKWA		Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* peptide keyhole limpet hemocyanin (KLH) conjugate *Strain:* B clade IIIB *HIV component:* gp41 **Ab type** C-domain **References** Tian2001 • 5B2: Peptides GPGRAFY and ELDKWA were conjugated to keyhole limpet hemocyanin and used to raise mouse MAbs – MAb hybridomas were generated with defined specificity – 5B2 and 9G11 bind to the peptide and to rgp41. [Tian2001] • 5B2: There is an RT specific Ab [Szilvay1992] and a gp41 specific Ab [Tian2001] both called 5B2. [Tian2001]					
712	9G11	gp160 (662–667)	Env (669–674 IIIB)	ELDKWA		Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* peptide keyhole limpet hemocyanin (KLH) conjugate *Strain:* B clade IIIB *HIV component:* gp41

References Gorny2004, Kitabwalla2003, Wang2003, Fiebig2003, Ferrantelli2003, Binley2003, Ferrantelli2002, Xu2002, Xu2001, Zwick2001c, Zwick2001b, Stiegler2001, D'Souza1994, Buchacher1994, Buchacher1992

Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, immunoprophylaxis, inter-clade comparisons, mother-to-infant transmission, review, vaccine antigen design, variant cross-recognition or cross-neutralization.

- 4E10: This paper reviews MAbs that bind to HIV-1 Env. 4E10 binds to a region of gp41 proximal to cluster II (aa 662-676), neighboring the binding site of the broadly neutralizing MAb 2F5 and overlapping the epitope of neutralizing Fab Z13. 4E10 is the most broadly neutralizaing MAb, neutralizing primary isolates from clades A, B, C, D and CRF01 (E), although not the most potent. [Gorny2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 4E10: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. [Kitabwalla2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **inter-clade comparisons**)
- 4E10: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. [Wang2003] (**vaccine antigen design**, **review**)
- 4E10: Porcine endogenous retroviruses (PERVS) are a concern in the context of procine xenotransplantation into humans; possible strategies for protection include PERV knockout animals or vaccines. Goats immunized with the PERV transmembrane protein revealed two NAb epitope, E1 and E2. E2's epitope (FEGWFN) binds to a sequence that is perfectly preserved in all PERVS and highly conserved in all gammaretroviruses: MuLV carries FEGLFN, FeLV FEGWFN, and it shares three amino acids with the core epitope for the anti-HIV human neutralizing MAB 4E10, (LWNWFN). [Fiebig2003]
- 4E10: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. [Ferrantelli2003] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)
- 4E10: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 NAbs 2F5 and 4E10 are able to potently neutralize the SOS pseudovirion post-attachment. [Binley2003] (**vaccine antigen design**)
- 4E10: Review of NAbs illustrating gp41's conformational change and exposure of the 4E10/Z13 epitope in the transient pre-hairpin form. [Ferrantelli2002] (**antibody binding site definition and exposure**)
- 4E10: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ —the combination b12+2G12+2F5 conferred partial protection against SHIV89.6—such combinations may be useful for prophylaxis at birth and against milk born transmission—the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. [Xu2002] (**antibody interactions**, **immunoprophylaxis**, **inter-clade comparisons**)
- 4E10: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. [Xu2001] (**antibody interactions**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 4E10: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2. [Zwick2001c] (**antibody interactions**)
- 4E10: MAbs 4E10 and Z13 both bind proximally to 2F5 to a conserved linear epitope that has some conformational aspects – both bind to MN virions, bind weakly to infected cells in a manner that is not disrupted by sCD4 and neutralize some primary isolates from clades B, C, and E – maps minimal 4E10 epitope to NWFDIT, contrary to an earlier report – different strains were refractive to neutralization by broadly neutralizing Abs IgG1b12, 2F5, Z13 and 4E10. [Zwick2001b] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 4E10: 4E10 binds proximal to 2F5 and neutralizes primary isolates of clades A, B, C, D, and E – viruses that were resistant to 2F5 were neutralized by 4E10 and vice versa. [Stiegler2001] (**antibody binding site definition and exposure**)
- 4E10: Included in a multi-lab study for antibody characterization, binding and neutralization assay comparison. [D'Souza1994] (**variant cross-recognition or cross-neutralization**)
- 4E10: MAbs generated by hybridoma, electrofusion of PBL from HIV-1+ volunteers with CB-F7 heteromyeloma cells – also binds to MHC class II proteins – anti-class II Abs are only found in HIV-1 positive people – this paper maps 4E10's binding site to AEGTDRV, gp160(823-829), but the later Zwick *et al.* study in 2001 revised the epitope location. [Buchacher1994] (**antibody binding site definition and exposure**, **antibody generation**)

Keywords antibody binding site definition and exposure, antibody generation, review, vaccine antigen design, variant cross-recognition or cross-neutralization.

- Z13: This paper reviews MAbs and Fabs that bind to HIV-1 Env. Z13 binds to a region of gp41 proximal to cluster II (aa 662-676), neighboring the binding site of the broadly neutralizing MAb 2F5 and overlapping the epitope of neutralizing MAb 4E10. Z13 is broadly neutralizing, neutralizing primary isolates from clades A, B, C, D and CRF01 (E). [Gorny2004] (**antibody binding site definition and exposure**, **review**)
- Z13: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. [Wang2003] (**vaccine antigen design**, **review**)
- Z13: Review of NAbs that notes Z13 is a phage display generated FAb fragment from a B clade infected individual and that illustrates gp41's conformational change and exposure of the 4E10/Z13 epitope in the transient pre-hairpin form. [Ferrantelli2002] (**antibody binding site definition and exposure**, **antibody generation**)
- Z13: MAb 4E10 and FAb Z13 both bind proximally to 2F5 to a relatively conserved linear epitope that has some conformational aspects – both bind to MN virions, bind weakly to infected cells in a manner that is not disrupted by sCD4 and can neutralize some primary isolates from clades B, C, and E – Z13 was selected using a phage display library with the MN gp41 peptide LLELDKWASLWNWFDITNWSW from an HIV infected donor who had an exceptionally broad NAb response – different strains were refractive to neutralization by broadly neutralizing Abs IgG1b12, 2F5, Z13 and 4E10 – epitope location noted here is by analogy to MAb 4E10. [Zwick2001b] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**)

		Vaccine *Vector/Type:* peptide keyhole limpet hemocyanin (KLH) conjugate *HIV component:* gp41 **References** Hifumi2003, Hifumi2002, Hifumi2000b, Hifumi2000a **Keywords** anti-idiotype, antibody sequence, variable domain. • 41S-2: A murine Ab called i41SL1-2 was raised against the complementary determining region of the 41S-2 light chain, CRDL-1 (RSSKSLLYSNGNTYLY). As with 41S-2-L, the light chain of i41SL1-2 also had catalytic activity and degraded the immunizing peptide, initally cleaving between the Arg1 and Ser2. i41SL1-2 did not cross-react with gp41 peptide, gp120 V3 loop peptide and bound weakly to 41S-2-L.i41SL1-2 shows homology to the anti-VIP Ab (VIP, vasoactive intestinal peptide) that also has peptidase character. Both light chains contain a catalytic triad composed of Asp, Ser, and His (for i41SL1-2: Asp73, Ser 76 or Ser70 and His 79). Intact i41SL1-2 was unable to degrade CDRL-1, possibly due to an immobile inactive conformation of the catalytic triad. [Hifumi2003] (**anti-idiotype**, **antibody sequence, variable domain**) • 41S-2: 41S-2-L refers to the light chain of 41S-2, which can enzymatically decompose the gp41 protein of HIV-1, but doesn't degrade unrealted proteins. The peptide RGPDRPEGIEEEGGERDRDRS, against which the MAb was raised, can also be cleaved, initially between Glu12-Gly13, followed by successive cleavage reactions. [Hifumi2002] • 41S-2: The complementary determining region of 41S-2-L, the light chain of 41S-2, is strongly involved in gp41 recognition. This light chain can serve as a molecular catalyst for gp41 degredation. [Hifumi2000b] • 41S-2: BALBc mice were immunized with gp41 peptide and a MAb specific for the peptide was generated – isolated MAb light chains displayed proteolytic activity toward the peptide epitope which may be due to a catalytic triad on light chain (Asp73, Ser76, and His79) – no catalytic activity was observed for the whole antibody. [Hifumi2000a]

		Ab type V3 **Research Contact** Dr. Susan Zolla-Pazner, NYU Med Center NY, NY; Veteran Affairs Med Center NY, NY; or Cellular Products Inc, Buffalo, NY, USA **References** Gorny2004, Pantophlet2003b, Zwick2003, Kessler2003, Binley2003, Poignard2003, Ferrantelli2002, He2002, Gorny2002, Sharon2002, Srivastava2002, Verrier2001, York2001, Park2000, Nyambi2000, Ly2000, Hioe2000, Grovit-Ferbas2000, Gorny2000a, Beddows1999, Hioe1999, Nyambi1998, Gorny1998, Connor1998, Zolla-Pazner1999b, Zolla-Pazner1999a, Parren1998a, Smith1998, Mondor1998, Inouye1998, Ugolini1997, Gorny1997, Hill1997, Parren1997c, Boots1997, Hioe1997b, Hioe1997a, Fouts1997, Binley1997a, D'Souza1997, Sattentau1996, Trkola1996a, Jagodzinski1996, Forthal1995, Moore1995b, Moore1995a, Zolla-Pazner1995b, Zolla-Pazner1995a, Sattentau1995c, Saarloos1995, Fontenot1995, Sattentau1995a, Moore1994a, Gorny1994, VanCott1994, Laal1994, Conley1994a, Spear1993, Cavacini1993a, Keller1993, Gorny1993, Karwowska1992b, Buchbinder1992, Gorny1992 **Keywords** acute infection, ADCC, antibody binding site definition and exposure, antibody interactions, antibody sequence, variable domain, assay development, assay standardization, binding affinity, co-receptor, complement, enhancing activity, inter-clade comparisons, kinetics, mimotopes, review, structure, vaccine antigen design, variant cross-recognition or cross-neutralization. • 447-52D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Although 447-52D was selected using a peptide, it has conformational characteristics. Inter-clade cross-neutralization by anti-V3 conformation-dependent MAbs is reduced. [Gorny2004] (**antibody binding site definition and exposure**, **review**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 447-52D: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. [Pantophlet2003b] (**vaccine antigen design**)
- 447-52D: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. [Zwick2003] (**antibody interactions**)
- 447-52D: The Fv fragment (composed of just the light and heavy variable regions, and the smallest intact binding unit of an Ab) of 447-52 D was expressed and purified. Preliminary NMR with the peptide epitope indicates that an NMR structure determination is feasible. [Kessler2003] (**antibody sequence, variable domain**, **structure**)
- 447-52D: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. 447-52D was able to neutralize the SOS protein better than the wildtype, but did not neutralize SOS well when added post-attachment, as the V3 loop is involved in co-receptor engagement. [Binley2003] (**vaccine antigen design**)
- 447-52D: Virion capture assays are not a good preditor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – Ab 447-52D was able to potently neutralize 89.6 and to neutralize JR-CSF at a high concentration but poorly neutralized ADA – b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, but anti-V3 Abs 447-52D and 19b, which did not neutralize JR-CSF and ADA, captured amounts of p24 equal to or higher than the amounts captured by the neutralizing Ab b12. [Poignard2003] (**antibody binding site definition and exposure**, **assay development**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Review of NAbs. [Ferrantelli2002]
- 447-52D: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. [He2002]
- 447-52D: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 447-52D bound to primary isolates from all clades except CRF01 (E), was conformationally sensitive and showed the some of the most potent neutralizing activity. [Gorny2002] (**variant cross-recognition or cross-neutralization**)
- 447-52D: The feasibility of determining the NMR structure of the V3(MN) peptide bound to the 447-52D Fab fragment was tested and a general strategy for obtaining NMR structures of V3 peptide-Fab fragments developed – preliminary NMR spectra for 447-52D complexed to a 23 amino acid V3 peptide was obtained. [Sharon2002] (**structure**)
- 447-52D: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent—antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs—447-D recognized the gp120 monomer much more readily than o-gp140, suggesting the V3 loop is less exposed on o-gp140 and on intact virions. [Srivastava2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 447-52D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – the dissociation constant, Kd of 447-52D for the cell associated primary and TCLA Envs was equal, 3nM. [York2001] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **binding affinity**)
- 447-52D: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000] (**antibody binding site definition and exposure**)
- 447-52D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 447-52D showed the highest cross-reactivity, bound to 24/26 viruses tested, but achieved 90% neutralization only against MN, 50% against CA5, and no neutralization was observed for 3 other isolates tested. [Nyambi2000] (**inter-clade comparisons**)
- 447-52D: Called 447D – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000] (**antibody binding site definition and exposure**)
- 447-52D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V3 MAbs 447-52-D and 268-10-D did not effect proliferation. [Hioe2000]
- 447-52D: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. [Grovit-Ferbas2000] (**vaccine antigen design**)
- 447-52D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. [Gorny2000a] (**antibody binding site definition and exposure**)
- 447-52D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – TCLA strains showed enhanced 447-52D neutralization sensitivity relative to PBMC-adapted lines (32X increase between HIV-1(M2424/PBMC(p0)) and HIV-1(M2424/H9(p9)) and a >128X increase between HIV-1(W61D/PBMC) and HIV-1(W61D/SupT1) isolates) [Beddows1999] (**variant cross-recognition or cross-neutralization**)
- 447-52D: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. [Hioe1999]
- 447-52D: MAb peptide-reactivity pattern clustered with the immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group – 447 reacted with peptides containing GPGR, but also with many lacking this sequence (GPGQ, for example), and it failed to react with 2/14 peptides containing GPGR, illustrating the importance of context. [Zolla-Pazner1999b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Review of clade specificity and anti-V3 HIV-1-Abs. [Zolla-Pazner1999a] (**review**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 447-52D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 447-52D was the most potent and cross-reactive of 18 human MAbs tested and was the only MAb which bound to virions from isolates CA20 (subtype F), CA13 (subtype H), and VI526 (subtype G) [Nyambi1998] (**inter-clade comparisons**)
- 447-52D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 1324E was comparable to 447-52D. [Gorny1998] (**kinetics**)
- 447-52D: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. [Connor1998]
- 447-52D: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**antibody binding site definition and exposure**)
- 447-52D: Called 447-52-D – The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 447-52D was among the Abs used – chimeric viruses elicited potent NAbs in guinea pigs against ALA-1 and MN. [Smith1998] (**vaccine antigen design**)
- 447-52D: Inhibits binding of Hx10 to both CD4 positive and negative HeLa cells. [Mondor1998] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Called 447-D – 447-D resistance took longer to acquire in virus with the M184V substituted RT, and had the form (AAC N to TAC Y) at position 5 of the V3 loop, rather than the GPGR to GPGR resistance found with wildtype RT. [Inouye1998]
- 447-52D: Used as a control for comparison to five V3 RF selected antibodies – 447-52D was reactive with A, B, and C clade peptides, but not E. [Gorny1997] (**inter-clade comparisons**)
- 447-52D: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 447-52D has an epitope involving the tip of the V3 loop, that was previously studied with this method [Keller1993] – in Keller *et al.*, with no competition, LxGPxR was the most common six-mer, 38% of the peptides – after competition with a gp120 IIIB ligand (QRGPGR)i, RGPxR was the most common and one peptide had the sequence QRGPGR, showing type specific mimotopes can be enriched by strain specific ligand competition protocols [Boots1997]. [Boots1997, Keller1993] (**antibody binding site definition and exposure**, **mimotopes**)
- 447-52D: Called 447 – gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. [Hill1997] (**co-receptor**)
- 447-52D: Neutralizes TCLA strains but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Viral binding inhibition by 447-D was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997] (**antibody binding site definition and exposure**)
- 447-52D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Tested using a resting cell neutralization assay. [Hioe1997a] (**assay standardization**)
- 447-52D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 447-52D bound monomer, oligomer, and neutralized JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- 447-52D: In a multilaboratory blinded study, failed to consistently neutralize any of nine B clade primary isolates – many of these isolates had the GPGR motif at the apex of the V3 loop. [D'Souza1997] (**variant cross-recognition or cross-neutralization**, **assay standardization**)
- 447-52D: Review: called 447-52-D – only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. [Sattentau1996] (**variant cross-recognition or cross-neutralization**, **review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 447-52D: Neutralizes JR-FL – strongly inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**co-receptor**, **variant cross-recognition or cross-neutralization**) • 447-52D: Called 447-52-D – The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS inhibits 447-52D binding. [Jagodzinski1996] (**antibody binding site definition and exposure**) • 447-52D: Neutralizing (- complement), no ADCC activity, and no viral enhancing activity. [Forthal1995] (**ADCC**, **complement**, **enhancing activity**) • 447-52D: Review: the V3 loop motif GPGR is not common outside subtype B isolates, MAb 19b is more cross-reactive than 447-52D. [Moore1995b] (**variant cross-recognition or cross-neutralization**) • 447-52D: Binding affected by identity of amino acids flanking GPGR core – poor breadth of primary virus neutralization. [Moore1995a] (**variant cross-recognition or cross-neutralization**) • 447-52D: Neutralization of primary and prototype laboratory HIV-1 isolates using a resting cell assay enhances sensitivity. [Zolla-Pazner1995b] (**assay development**, **variant cross-recognition or cross-neutralization**) • 447-52D: Serotyping study using flow-cytometry – bound only to GPGR V3 loop tips. [Zolla-Pazner1995a] (**antibody binding site definition and exposure**) • 447-52D: Ab-mediated activation of complement on HIV+ cells is higher than Ab independent activation—what has been termed "Ab independent" in fact results in part from IgM in normal human serum that is HIV-cross-reactive. [Saarloos1995] (**complement**) • 447-52D: Called 447 – The tip of the V3 loop was presented in a mucin backbone – higher valency correlates with stronger affinity constant. [Fontenot1995] (**vaccine antigen design**) • 447-52D: Called 447d – Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. [Sattentau1995c] (**vaccine antigen design**) • 447-52D: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. [Moore1994a] (**acute infection**) • 447-52D: Mild oxidation of carbohydrate moieties does not alter binding. [Gorny1994] (**antibody binding site definition and exposure**) • 447-52D: GPGQ in MAL resulted in enhanced dissociation – GPGQ in CM234 or K14T did not bind – binding affected by identity of amino acids flanking GPGR core. [VanCott1994] (**antibody binding site definition and exposure**) • 447-52D: Neutralization synergy in combination with CD4 binding domain MAbs. [Laal1994] (**antibody interactions**) • 447-52D: Requires GPxR at the tip of the V3 loop, common in B clade – neutralized primary isolates. [Conley1994a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • 447-52D: Complement mediated virolysis of IIIB, but not in the presence of sCD4. [Spear1993] (**complement**) • 447-52D: Additive neutralization of MN and SF2 when combined with CD4 binding site MAb F105 – supra-additive neutralization of RF. [Cavacini1993a] (**antibody interactions**) • 447-52D: Peptide phage library showed that any of the residues ADGLMNQRS in the X position tolerated in peptides that react well with the antibody. [Keller1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • 447-52D: Neutralizes MN and IIIB: GPGR, and binds SF2: GPGR. [Gorny1993] (**variant cross-recognition or cross-neutralization**) • 447-52D: Reacts with MN, NY5, CDC4, SF2, RF, WM52, and HXB2. [Karwowska1992b] (**variant cross-recognition or cross-neutralization**) • 447-52D: 60-fold increase in neutralization potency when combined 1:1 with human MAb 588-D. [Buchbinder1992] (**antibody interactions**) • 447-52D: Requires GPXR at the tip of the V3 loop – neutralizes a broad array of B clade lab isolates. [Gorny1992] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)			
724	C8	gp160 (727–732)	gp41 (727–732 BH10)	PDRPEG	no	Vaccine	mouse (IgG1)

		• C8: The substitution 725 RG (P[R–>G]GPDRPEGIEEEGGERDRDRS) alters the antigenic exposure of this region on the virion resulting in the loss of the downstream neutralizing epitope ERDRD, increased exposure of the epitope GPDRPEG in the virion, while the epitope IEEE remains unchanged. [McLain2001] • C8: Epitope boundaries mapped by peptide scanning. [Abacioglu1994] • C8: Ab response in IIIB lab workers was compared to gp160 LAI vaccine recipients – C8 was used as a control – the dominant response among vaccinees was to this mid-gp41 region, but not among the infected lab workers – Abs binding this region do not neutralize, bind to infected cells, nor serve as immunotoxins. [Pincus1993b] • C8: Immunotoxin of C8 coupled to ricin-A does not mediate cells killing, and is not affected by sCD4. [Pincus1993a]

748	polyclonal	gp160 (739–743)	gp41 (735–752 IIIB)	ERDRD	L	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* Cowpea mosaic virus *HIV component:* gp41 **Ab type** C-term **References** McLain2001, Cleveland2000b • The substitution 725 RG (P[R–>G]GPDRPEGIEEEGGERDRDRS) alters the antigenic exposure of this region on the virion resulting in the loss of the downstream neutralizing epitope ERDRD, increased exposure of the epitope GPDRPEG in the virion, while the epitope IEEE remains unchanged. [McLain2001] • ERDRD-specific IgG recognizes an externalized loop of the gp41 C-terminal tail with high affinity – neutralized HIV-1 B clade strains IIIB, NL-4.3, RF, MN and D clade virus CBL-4, but HXB-2D (clade B) was not recognized – when PRGPDRPEGIEEEGGERDRDRS was used as antigen an immunodominant, non-neutralizing response to IEEE was observed, but immunization GERDRDR shifts the response to ERDRD – NAb does not inhibit attachment of free virus, but does inhibit by an event that precedes fusion-entry. [Cleveland2000b]					
749	DZ	gp160 (822–855)	gp41 (827–860 BRU)	VAEGTDRVIEVVQGACRAIRHIPRR-IRQGLERIL	L	Vaccine	human (IgG1λ)
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* Env **References** Boyer1991 • DZ: Weakly neutralizing IIIB – binds to peptides 827-843 and 846-860 of BRU – reacted specifically with IIIB and RF. [Boyer1991]					

IV-C-16 Env Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
750		Env	gp120 (IIIB)			Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp120 *Adjuvant:* GM-CSF **References** Rodríguez1999 • The murine Ab response to a chimeric of granulocyte-macrophage colony stimulating factor GM-CSF/gp120 in vaccinia was not higher titer that the response to a gp120-vaccinia construct, but the breadth of the Ab response was greater, in particular to the C-term region of gp120 – a cellular response of greater intensity was trigged to the GM-CSF/gp120 vaccinia construct, as measured by Elispot assay. [Rodríguez1999]				
751		Env	Env (384–467)			Vaccine	macaque, rabbit
		Vaccine *Vector/Type:* hepatitis B surface antigen lipoprotein particles (HsBAg) *HIV component:* V3 **References** Michel1993 • Immunization with recombinant HIV1 V3/HBsAg hybrid particles into rabbits or macaques elicited and maintained for several months anti-V3 or HIV-1 Env proliferative, CTL and Ab responses. [Michel1993]				
752		Env			Y	HIV-1 infection, Vaccine	human
		References Burton2000 • This review article touches on why natural immune responses do not tend to favor potent neutralizing Ab production, and discusses possible vaccine strategies to counter this problem. [Burton2000]				
753		Env			P	HIV-1 infection	human
		References Pellegrin1996 • Detection of an autologous NAb response in 12 patients with primary infections was delayed – for patients with a viral isolate obtained at month 1, autologous NAbs to viral isolates were generally not observed before month 6, and there was no apparent relationship between the emergence of neutralizing activity and the decrease of plasma viral load. [Pellegrin1996]				
754		Env	Env			HIV-1 infection	
		References Berger2002 **Keywords** immunotherapy. • This medical hypothesis proposes that HIV shares domains with human proteins are masked from the immune response as they are seen as self. They propose blocking the shared determinants on human proteins in the thymus with antibodies, to allow anti-self responses which are normally inhibited to occur in HIV+ people. (**immunotherapy**)				
755	1008-D	Env	gp120			HIV-1 infection	human
		Ab type CD4BS **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu), NYU Med Center, NY, NY **References** Zwick2003, Zolla-Pazner1995a **Keywords** antibody interactions. • scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)

Ab type cluster II **Research Contact** James Robinson, Tulane University, Tulane, LA
References Binley2003, Schulke2002, Binley1999
Keywords vaccine antigen design.

- 2.2B: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 Abs 7B2 and 2.2B did not neutralize in any format, WT, SOS, nor when added postbinding. [Binley2003] (**vaccine antigen design**)
- 2.2B: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. [Schulke2002] (**vaccine antigen design**)
- 2.2B: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**vaccine antigen design**)

767	30D	Env	gp120		no		

References Yang2002

- 30D: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140Δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002]

[He2002]					
775	4KG5	Env	gp120 (JR-FL)		no	HIV-1 infection	human (IgG)
		Ab type C4, V3, V1-V2 **References** Zwick2003 **Keywords** antibody binding site definition and exposure, antibody generation, antibody interactions, structure, variant cross-recognition or cross-neutralization. • 4KG5: 4KG5, a single-chain Fv (scFv), reacts with a conformational epitope which is formed by the V1, V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. 4KG5 was derived from derived from the serum of HIV-1 infected patient FDA2, who showed broad neutralizng activity, but is not itself neutralizing. Denaturation of gp120 abolished binding of 4KG5 and Fab b12. Addtionally, binding of 4KG5 was abrogated when any of the V1, V2 or V3 loops were deleted. Of a panel of Abs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished or abroated binding: V2 loop MAbs (G3-4, G3-136), V3 loop MAbs (19b, 447-52D, hNM01, AH48, loop2, F425 B4e8, 694-88D), V3-C4 (G3-299, G3-42, G3-519, G3-537), CD4BS (b6, b3, F91, F105, 15e, L33, 1008-D, 654-30D, 559-64D, 1027-30D, Ia3, Ia7, FG39, Fbb14). MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1, V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. 4KG5 recognized HIV-1 envelope proteins derived from JR-FL, JR-CSF, BaL, ADA and R2, but not MN, DH123, HxB2, YU2, SF2 and 89.6. Binding of 4KG5 to different strains of HIV-1 env is probably due sequence differences in V3 and C4, rather than V1 or V2. [Zwick2003] (**antibody binding site definition and exposure**, **antibody generation**, **antibody interactions**, **variant cross-recognition or cross-neutralization**, **structure**)

789	A1g8	Env	gp120			HIV-1 infection	human (IgG1λ)

Ab type V3 **Research Contact** James Robinson, Tulane University Med School, New Orleans, LA, USA
References Cavacini2003, Cavacini2002
Keywords antibody interactions, co-receptor, variant cross-recognition or cross-neutralization.

- A1g8: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to R5X4 virus 92HT593, but only of 48d to the R5 virus 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. [Cavacini2003] (**antibody interactions**, **co-receptor**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• A1g8: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-V3 MAb B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, but only A1g8 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. Anti-gp41 MAb F240 had a synergistic effect on neutralization with CD4i MAbs 48d and 17b, but not with A1g8 for the R5X4 virus. [Cavacini2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)					
790	A9	Env	gp120 (IIIB)			Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* chimeric GM-CSF *Strain:* B clade IIIB *HIV component:* gp120 *Adjuvant:* GM-CSF **References** delReal1999 • A9: Murine antibody response to the chimeric construction granulocyte-macrophage colony stimulating factor GM-CSF/gp120 was tested, MAbs from normal mice were gp120 specific, MAbs from nude mice bound gp120 but were polyreactive, and from reconstituted mice were half way between – the anti-gp120 response used a high frequency of VH81X, VHQ52, and VH7183 genes, a family used during fetal life and associated with autoimmunity – A9 was a gp120 from a BALBc reconstructed nude mouse and had VH gene 7183-2. [delReal1999]					
791	AG10H9	Env	gp41 (717–751)				
		Research Contact BabCO **References** Ohagen2003 **Keywords** brain/CSF, variant cross-recognition or cross-neutralization. • AG10H9: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. AG10H9 recognized most variants gp41 and gp160 from 3/4 individuals by WB, but not the 4th. [Ohagen2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)					
792	AH48	Env	gp120 (V3)			HIV-1 infection	human
		References Zwick2003 **Keywords** antibody generation, antibody interactions. • AH-48: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. AH48 is a novel anti-V3 Fab first used in this study. [Zwick2003] (**antibody generation**, **antibody interactions**)					
793	Ag1211	Env	gp120 (V3 loop) (JRFL)				
		Ab type V3 **References** Kwong2002 **Keywords** antibody binding site definition and exposure.					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- Ag1211: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)

794 B4 Env gp120 (IIIB) Vaccine mouse (IgM)

Vaccine *Vector/Type:* chimeric GM-CSF *Strain:* B clade IIIB *HIV component:* gp120
References delReal1999

- B4: Murine antibody response to the chimeric construction granulocyte-macrophage colony stimulating factor GM-CSF/gp120 was tested, MAbs from normal mice were gp120 specific, MAbs from nude mice bound gp120 but were polyreactive, and from reconstituted mice were half way between – the anti-gp120 response used a high frequency of VH81X, VHQ52, and VH7183 genes, a family used during fetal life and associated with autoimmunity – B4 was an anti-gp120 from a BALBc reconstructed nude mouse and had VH gene J606. [delReal1999]

795 B4a1 Env gp120 (V3) HIV-1 infection human

Ab type V3 **Research Contact** James Robinson, Tulane University Med School, New Orleans, LA, USA
References Cavacini2003, Cavacini2002
Keywords antibody interactions, co-receptor, variant cross-recognition or cross-neutralization.

- B4a1: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. The anti-V3 MAb B4a1 cross-competes with B4e8. [Cavacini2003] (**antibody interactions**)
- B4a1: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 binding was not affected by the binding of the V3 loop MAb B4a1, but preincubation with F240 could enhance B4a1 binding of the R5 isolate. B4a1 reacts with many B clade isolates, and preincubation with sCD4 enhances binding to both the R5 and R5X4 isolates. B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, as well as CD4BS MAbs IgG1b12 and F105 to R5X4 virions, but only A1g8 and IgG1b12 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. B4a1 had an additive affect on neutralization with 2G12 with the R5X4 virus but not the R5 virus, and did not impact 2F5 neutralization. [Cavacini2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)

796 B4e8 (F425 B4e8) Env gp120 (V3 loop) P HIV-1 infection human (IgG2κ)

Ab type V3 **Research Contact** Lisa Cavacini, Beth Isreal Deconess Medical Center, Boston MA, USA
References Zwick2003, Liu2003, Cavacini2003
Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, antibody sequence, variable domain, co-receptor, variant cross-recognition or cross-neutralization.

- B4e8: Called F425 B4e8. scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. [Zwick2003] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• B4e8: The effect of isotype (IgG1 and IgG3) and subtype (IgA) switching of parental F425B4e8 (IgG2)on HIV-1 binding and neutralization was investigated. IgG1-and IgA-F425B4e8 mutants showed virus-specific binding levels and TCLA SF2 isolate compared to the parental IgG2. Comparable levels of neutralization of primary isolates 92HT593 (R5X4) and 92US660 (R5) was achieved by all isotypes and subtypes of F425B4e8. [Liu2003] (**variant cross-recognition or cross-neutralization**, **antibody sequence, variable domain**) • B4e8: This MAb binds to the base of the V3 loop, and binds and neutralizes multiple primary isolates. The anti-V3 MAb B4a1 cross-competes with B4e8. B4e8 and 2G12 enhanced each others binding, and gave synergistic neutralization. B4e8 could neutralize R5X4 virus 92HT593 better than 2G12, while 2G12 was better at neutralizing R5 virus 92US660. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to 92HT593, but only of 48d to the 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. CD4BS MAb IgG1b12 had no effect on B4e8 binding. Anti-gp41 MAb F240 inhibited B4e8 neutralization. [Cavacini2003] (**antibody binding site definition and exposure**, **antibody generation**, **antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)

		• D16: One of eleven MAbs (D16, D17, D31, D36, D37, D40, D44, D55, D59, T37, and T45) that are conformation dependent and that can block the binding of the MAb D50 that binds to the linear peptide gp41(642-665) – reactive with 9/10 HIV-1 strains all except HIV-1 ADA, which has the change E659D and E662A that may result in the loss of binding (ELLE to DLLA) [Earl1997]					
		• D16: Precipitates both oligomeric gp140 and soluble monomeric gp41(21-166)that lacks the fusion peptide and membrane anchor, along with MAbs D16, D38, D40, D41, and D54. [Weissenhorn1996]					
		• D16: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]					
806	D4	Env	gp120 (IIIB)			Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* chimeric GM-CSF *Strain:* B clade IIIB *HIV component:* gp120					
		References delReal1999					
		• D4: Murine antibody response to the chimeric construction granulocyte-macrophage colony stimulating factor GM-CSF/gp120 was tested, MAbs from normal mice were gp120 specific, MAbs from nude mice bound gp120 but were polyreactive, and from reconstituted mice were half way between – the anti-gp120 response used a high frequency of VH81X, VHQ52, and VH7183 genes, a family used during fetal life and associated with autoimmunity – D4 was a gp120 from a BALBc reconstructed nude mouse and had VH gene J558. [delReal1999]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
807	D43	Env	gp41 (HXB2)			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* protein *HIV component:* dimeric Env **Research Contact** Patricia Earl and Christopher Broder, NIH **References** Earl1997, Richardson1996, Earl1994 • D43: Partially conformation dependent – doesn't bind to short peptides, but does bind to the region spanning 641-683 – binding can be blocked by MAbs T3, D38 and D45 – MAbs in this competition group reacted with 9/10 HIV-1 strains, not binding to JRFL. [Earl1997] • D43: This is a linear gp41 epitope, mapping in the region 635-678 – human sera blocked binding in oligomeric ELISA assay to a similar extent for gp41 MAbs D20, D43, D61, and T4. [Richardson1996] • D43: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]				
808	F223	Env	gp120		no	HIV-1 infection	human (IgG3λ)
		References Cavacini1999 • F223: binds to HIV-1 gp120 and to uninfected lymphocytes binding to a 159-kd auto-antigen expressed on most B cells and a small fraction of T and NK cells – the antibody enhances HIV-1 infection in a complement-dependent manner – F223 light chains have a strong homology with VLgamma2, the heavy chain to the germline gene VH3-H.11 – N-linked carbohydrates are key for recognition of both gp120 and the autoantigen – MAb 3D6 also uses VH3 and has autoreactivity. [Cavacini1999]					
809	F285	Env	Env			HIV-1 infection	human (IgG1)
		References Wisnewski1996, Wisnewski1995 • F285: F285 is V H1 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996]					
810	F7	Env	gp120 (IIIB)			Vaccine	mouse (IgG1)
		Vaccine *Vector/Type:* chimeric GM-CSF *Strain:* B clade IIIB *HIV component:* gp120 *Adjuvant:* GM-CSF **References** delReal1999 • F7: Murine antibody response to the chimeric construction granulocyte-macrophage colony stimulating factor GM-CSF/gp120 was tested, MAbs from normal mice were gp120 specific, MAbs from nude mice bound gp120 but were polyreactive, and from reconstituted mice were half way between – the anti-gp120 response used a high frequency of VH81X, VHQ52, and VH7183 genes, a family used during fetal life and associated with autoimmunity – F7 was a gp120 specific MAb from a BALBc mouse and had VH gene 7183(81X), previously found expressed only in fetal liver. [delReal1999]					
811	FG39	Env	gp120			HIV-1 infection	human
		Ab type CD4BS **References** Zwick2003 **Keywords** antibody interactions. • FG39: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This is a novel CD4BS Fab first used in this study. [Zwick2003] (**antibody interactions**)					
812	Fab A12	Env	gp41 (LAI)		no	HIV-1 infection	human (IgG1κ)
		References Binley1996 • Fab A12: Uncharacterized epitope – variable regions sequenced. [Binley1996]

838	P35	Env	Env				human
		Ab type C1 **References** Zwick2003, Kwong2002 **Keywords** antibody binding site definition and exposure, antibody interactions. • P35: called p35. scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C1-binding Fab with a discontinuous epitope that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**) • P35:Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminal, linear. [Kwong2002] (**antibody binding site definition and exposure**)

- T26: Mab is restricted in its binding to gp41 of the LAI isolate and not to gp41 of the MN, Ada and RF isolates. Antibody specificity may be determined by LAI residues D637E, N641D and H648Y. T26 binds to the N-terminal half of the C helix (aa630-680) of the LAI envelope, specifically targeting a confomational epitope within the six-helix bundle of gp41. Addition of the C-helical peptide inhibitor from LAI (T26 reactive) rescued the binding activity of MAb T26 to cell-surface expressed RF envelope (T26 non-reactive) triggered with sCD4 or cell-surface expressed receptors in a surface immunoprecipitation assay. This supports that C-peptide entry inhibitors bind to the gp41 N-helical coiled-coil, disrupting native six-helix bundles. [Kilgore2003] (**antibody binding site definition and exposure**)
- T26: A panel of 138 MAb raised against different forms of soluble Env. [Earl1994] (**antibody generation**)
- T26: T26 was raised against the gp140 tetramer, binds to gp41 and is a highly strain specific. [Earl1997] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

844	T27	Env	gp120 (IIIB)		no	Vaccine	mouse (IgG)

Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* oligomeric gp140
Research Contact P. Earl, National Institute of Allergy and Infectious Diseases, NIH, Bethesda, MD
References Sugiura1999, Earl1994

- T27: A comparison of 25 gp120 specific, conformation dependent MAbs was done – T27 is part of a group of MAbs labeled AII – all AII MAbs were broadly cross-reactive with gp160 from B-clade R5, X4, and R5X4 viruses, and could only partially blocked CD4 binding. [Sugiura1999]
- T27: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]

Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* oligomeric gp140
References Srivastava2002, Yang2000, Stamatatos2000, Binley1999, Earl1997, Otteken1996, Weissenhorn1996, Richardson1996, Broder1994, Earl1994
Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, vaccine antigen design.

- T4: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – T4 recognized o-gp140. [Srivastava2002] (**antibody binding site definition and exposure**)
- T4: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-) [Yang2000] (**vaccine antigen design**)
- T4: Soluble gp140 derived from SF162, a neutralization-resistant primary isolate, and SF162AV2 a neutralization-susceptible isolate with 30 amino acids deleted from the V2 loop, were generated with or without the gp120-gp41 cleavage site intact – all forms are recognized by oligomer-specific MAb T4 and show enhanced binding of CD4i MAb 17b when sCD4 is bound – the fused forms are less efficiently recognized than the cleaved forms by polyclonal neutralizing sera from HIV-infected patients – the V3 loop is more exposed on the fused form. [Stamatatos2000] (**vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• T4: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**vaccine antigen design**) • T4: This antibody, along with 7 others (M10, D41, D54, T6, T9, T10 and T35), can block the linear murine MAb D61, and the human MAb 246-D, which both bind to the immunodominant region near the two Cys in gp41 – most of these antibodies are oligomer dependent – all of the MAbs are reactive with ten different HIV-1 strains – members of this competition group are blocked by sera from HIV-1+ individuals. [Earl1997] (**antibody interactions**) • T4: MAbs T4 and T6 bind only to oligomer, and pulse chase experiments indicate that the epitope is very slow to form, requiring one to two hours. [Otteken1996] (**antibody binding site definition and exposure**) • T4: Does not bind to soluble monomeric gp41(21-166) that lacks the fusion peptide and membrane anchor, only to the oligomer gp140, as does T6. [Weissenhorn1996] (**antibody binding site definition and exposure**) • T4: one of five MAbs (T4, T6, T9, T10 and T35) in a competition group that bind to a conformation-dependent epitope in gp41 and is oligomer specific – neutralizes IIIB and SF2. [Broder1994] (**antibody binding site definition and exposure**) • T4: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994] (**antibody generation**)				
848	m18	Env	Env			HIV-1 infection	human
		References Zhang2003 **Keywords** antibody generation, inter-clade comparisons, variant cross-recognition or cross-neutralization. • m18: m18 was selected from a human Fab phage display library by a new method called sequential antigen panning (SAP), using a series of antigens to screen the library to pick broadly cross-reactive isolates. The epitope of m18 is independent of CD4 binding. The phage display library was constructed using the combined bone marrow of three long term non-progressors with potent NAb activity in their sera. m18 bound to gp140s from primary isolates from clades A-F with nM affinities. The ability to block cell mediated fusion by m18 was compared to Fabs X5 and b12 for a clade A, CRF01 EA, G, and 6 clade B isolates, and the inhibitory activity of m18 was slightly lower but comparable to neutralizing Fabs b12 and X5. It also showed broad cross-neutralization; 11/15 pseudotyped Envs from primary isolates from clades A-F were inhibited in an IC50 assay at concentration less than or equal to 100 ug/ml; X5 was also tested and somewhat more potent, generally requiring lower concentrations and inhibiting 13/15 primary isolates. [Zhang2003] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

References Barnett2001

- SF162ΔV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization—when incorporated into a codon-optimized DNA vaccine with a CMV promoter and delivered by gene gun, SF162ΔV2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162ΔV2, but not intact SF162, was used as the immunogen—Control MAbs 2F5 and 2G12 could neutralize all of the following primary isolates: 91US056(R5), 92US714(R5), 92US660(R5), 92HT593(R5X4), and BZ167(R5X4), while after the first protein boost, the sera from two SF162ΔV2 immunized macaques could neutralize 91US056(R5), 92US714(R5), 92US660(R5) and ADA(R5), but not 92HT593(R5X4) or 92US657(R5)—the pattern of cross-recognition shifted after the second boost. [Barnett2001]

877	polyclonal	Env	gp120			HIV-1 infection	human (IgG)

References Binley1997b

- Retention of anti-Env antibodies and loss of anti-Gag antibodies during progression was studied, and suggested to be the result of the loss of T-cell help and the unique ability of Env to stimulate B cells even in a backdrop of declining CD4 cells, because of the ability of Env to bind to the CD4 molecule. [Binley1997b]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
878	polyclonal	Env	gp120 (W61D)		L	Vaccine	human

Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120
References Beddows1999

- rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with HIV-1 positive subjects – vaccinee sera had more potent responses to linear V1/V2 and V3 epitopes than did the sera from HIV-1+ individuals, but could only neutralize homologous or heterologous virus only after adaptation to T-cell lines – neutralization activity was lost after re-adaptation to growth in PBMCs – in contrast, sera from infected individuals could neutralize both PBMC and T-cell line adapted viruses. [Beddows1999]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
879	polyclonal	Env	gp120		L	Vaccine	macaque

Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* Gag, gp120, V3
References Wagner1998b

- A VLP is a non-infectious virus-like particle self-assembled from HIV Pr55 gag – macaques were immunized with VLPs bound to either gp120 or V3+CD4 linear domains – Gag and Env specific CTL were stimulated in each case, and Ab response to gag and gp120 and was elicited, but the gp120 neutralizing response occurred only with whole gp120, not V3+CD4 – despite the CTL and Ab response, immunized macaques were infected by intervenous challenge with SHIV chimeric challenge stock. [Wagner1998b]

		• A gag/pol, vif or CMN160 DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules B7 and IL-12, gave a dramatic increase in both the cytotoxic and proliferative responses in mice – the Ab response was detected by ELISA, but the CMN160 DNA vaccinated mice showed a neutralizing Ab response. [Kim1997b]					
882	polyclonal	Env	gp120		P	HIV-1 infection	human
		References Bradney1999					
		• Sera were taken from long term non-progressors and evidence for viral escape was noted – serum could neutralize earlier autologous isolates, but not contemporary isolates. [Bradney1999]					
883	polyclonal	Env	gp120		L P	Vaccine	human
		Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade SF2 *HIV component:* Env, Gag					
		References Belshe1998					
		• NAbs were obtained by a HIV-1 gag/env in canary pox vaccination of eight volunteers after boosting with rgp120 against lab strains – 1/8 primary isolates was neutralized, BZ167. [Belshe1998]					
884	polyclonal	Env	gp120		L	Vaccine	human
		Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, Protease *Adjuvant:* MF59					
		References Belshe2001, Belshe1998					
		• A phase 2 trial was conducted in 435 volunteers with vCP201, a canary pox vector carrying gp120 (MN in vCP201, and SF2 in the boost), p55 (LAI) and protease (LAI), either alone or with a gp120 boost – NAbs against MN were obtained in 56% of those who received vCP201 alone, and in 94% of those who got the prime with the gp120 boost. [Belshe1998]					
885	polyclonal	Env	gp120				human
		References Neshat2000					
		• HIV-1 gp120 appears to be a B cell superantigen that binds to members of the V_{H3} Ig gene family—the gp120 binding site was localized to the Fab portion of the Ab, and discontinuous residues in the V_H region were critical. [Neshat2000]					
886	polyclonal	Env	gp41 (539–684 BH10)			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* protein *HIV component:* gp41					
		References Bai2000					
		• Murine rsgp41 antisera recognized a common epitope on human IFNα (aa 29-35 and aa 123-140) and on human IFNβ (aa 31-37 and aa 125-142), suggesting that elevated levels of Ab to IFNs found in HIV+ individuals may be due to a cross-reactive gp41 response. [Bai2000]					
887	polyclonal	Env	gp120 (BH10)			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* DNA *Strain:* B clade 89.6, B clade ADA, B clade IIIB *HIV component:* gp120 *Adjuvant:* C3d fusion					
		References Ross2001					
		• gp120 was fused with murine complement protein C3d in a DNA vaccine to enhance the titers of Ab to Env – fusion to C3d resulted in a more rapid onset of Ab response and avidity maturation, after three immunizations in BALB/c mice with DNA on a gold bead delivered with a gene gun, but not in strong neutralizing Ab response. [Ross2001]					
888	polyclonal	Env	gp120 (SF162DeltaV2)			Vaccine	macaque
		Vaccine *Vector/Type:* DNA prime with protein boost *Strain:* B clade SF162 *HIV component:* gp140 *Adjuvant:* MF59					
		References Cherpelis2001a, Cherpelis2001b					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• HIV-1 SF162ΔV2 gp140 envelope was used in a DNA-prime plus protein-boost vaccination methodology in Rhesus macaques, the animals were depleted of their CD8+ T lymphocytes, and challenged with pathogenic SHIV(SF162P4)—the vaccinated macaques had lower peak viremia, rapidly cleared virus from the periphery, and developed delayed seroconversion to SIV core antigens relative to non-vaccinated controls. [Cherpelis2001a] • Two animals were immunized both intradermally and intramuscularly at weeks 0, 4, and 8 with a codon optimized DNA vector expressing the SF162V2 gp140 envelope with an intact gp120-gp41 cleavage site, and both developed lymphoproliferative responses and potent neutralizing Abs – CD8+ T lymphocytes were depleted in the animals and they were challenged with SHIV162P4 – at peak viremia, plasma viral levels in the vaccinated animals were 1 to 4 logs lower than those in the unvaccinated animals. [Cherpelis2001b]					
889	polyclonal	Env	gp120		P	HIV-1 infection	human
		References Sarmati2001 • Some HIV-1 infected patients have increasing CD4 counts despite failing ARV, and CD4 levels are correlated with HIV-1 specific NAbs – no correlation was found between NAbs and viral load in this patients. [Sarmati2001]					
890	polyclonal	Env	gp41 (539–684 BH10)			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* protein *HIV component:* gp41 **References** Bai2000 • There is a common epitope in HIV-1 gp41, and IFNalpha and IFNbeta. [Bai2000]					
891	polyclonal	Env	gp120 (IIIB)		no		human (IgM)
		References Llorente1999 • Combinatorial antibody analysis by phage display and flow cytometry demonstrated that gp120 in HIV-1 negative people is recognized by IgM, but not IgG Abs – IgM Fab reactivity is observed throughout the entire sequence of HIV-1 IIIB gp120 and is characterized by low affinity binding and near germline configuration reflecting a lack of maturation of the IgM repertoire – no neutralizing activity was observed in a non-infected individual before isotope switching. [Llorente1999]					
892	polyclonal	Env	gp120 (SF2)		L	Vaccine	human (IgM)
		Vaccine *Vector/Type:* protein *Strain:* B clade SF2 *HIV component:* gp120 **References** Locher1999 • High risk volunteers were vaccinated with SF2 gp120 – 3 breakthrough cases were studied – SF2 neutralizing Abs were observed, but Ab titers to autologous virus were never high and took 6 months after HIV-1 infection to develop – viral loads were similar to HIV-1 infected individuals who had not been vaccinated. [Locher1999]					
893	polyclonal	Env	gp120 (subtype A, B, C, D, CRF01)		yes	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* formaldehyde-fixed whole-cell *HIV component:* gp120 **References** Nunberg2002, LaCasse1999 • A retraction was printed (Science 296:1025, 2002) noting that an unknown cytotoxic effect of these complex sera accounted for a major fraction of the neutralization reported in [LaCasse1999] [Nunberg2002]. [LaCasse1999, Nunberg2002] • In this study, immunogens were generated that were thought to capture transient envelope-CD4-coreceptor structures that arise during HIV binding and fusion by formaldehyde-fixation of co-cultures of cells expressing HIV-1 Env and those expressing CD4 and CCR5 receptors – these cells elicited NAbs in CD4- and CCR5-transgenic mice that neutralized 23/24 primary isolates from clades A-E. [LaCasse1999]					
894	polyclonal	Env	(B consensus)		P	HIV-1 infection	human
		References Morris2001					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• Ab responses before HAART therapy and after one year of therapy were measured in 8 individuals that were classified HAART successes, and 10 patients who were classified as HAART failures – V3 peptide antibody binding titers to the B-consensus and MN and SF2 variants, and neutralization of HIV-1 MN and four subtype B clinical isolates were tested – subjects with strong anti-V3 and NAb humoral immune responses before starting HAART were more likely to achieve sustained viral suppression to <500 copies RNA/ml on HAART – HIV-specific Ab responses declined after 1 year of successful viral suppression on HAART. [Morris2001]					
895	polyclonal	Env			P	HIV-1 infection	human (IgG)
		References Pilgrim1997					
		• Sera from long-term nonprogressors(LTNP) had broader NAbs against heterologous primary isolates and were more likely to neutralize the contemporaneous autologous isolate than were sera from short-term nonprogressors and normal progressors – in 4 individuals followed from acute infection, NAbs were detected against the early autologous isolate by 5-40 weeks, and not detected in an additional 2 cases after 27-45 weeks. [Pilgrim1997]					
896	polyclonal	Env			P	HIV-1 infection	human
		References Moog1997					
		• Autologous and heterologous NAbs were studied in 18 individuals who were sampled early after sero-conversion and followed longitudinally – autologous NAbs were not detected in sera collected at the same time as the viruses were isolated – NAbs detected against the seroconversion autologous strains were not detected one year after seroconversion, and were highly specific to the virus present at the early phase of HIV infection – heterologous neutralization of primary isolates were not detected until after 2 years. [Moog1997]					
897	polyclonal	Env			yes	HIV-1 infection	human
		References Montefiori2001					
		• In 7/9 patients in whom HAART was initiated during early seroconversion, NAbs to autologous strains were not found immediately following treatment interuption after 1-3 years, and Env and Gag Abs were low or undetected by ELISA indicating, that early HAART suppresses the normal antibody response to HIV-1, presumably by limiting the concentration of viral antigens needed to drive B-cell maturation – in 3 patients with a viral rebound autologous NAbs rapidly appeared and correlated with spontaneous down-regulation of viremia – prolonged control of viremia after stopping treatment persisted in the absence of detectable NAbs, suggesting that cellular immune responses alone can control viremia under certain circumstances – these results support the notion that virus-specific B-cell priming, combined with CD8+ CTL induction, may be beneficial for HIV-1 vaccines that aim to suppress viremia in the absence of complete protection to prevent disease and reduce the rate of virus transmission. [Montefiori2001]					
898	polyclonal	Env				HIV-1 infection	human (IgG)
		References Scala1999					
		• Random peptide libraries were screened using sera from HIV-infected subjects to identify mimotopes, peptides that mimic conformational or linear epitopes specifically recognized by Abs from HIV-1 infected individuals – the sera of simian SHIV-infected monkeys also recognized the specific peptides, and mice immunized with the selected peptides elicited HIV-specific Abs that neutralized HIV-1 isolates IIIB and NL4-3. [Scala1999]					
899	polyclonal	Env			L	Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* peptide *HIV component:* mimotopes					
		References Scala1999					
		• Random peptide libraries were screened using sera from HIV-infected subjects to identify mimotopes, peptides that mimic conformational or linear epitopes specifically recognized by Abs from HIV-1 infected individuals – the sera of simian SHIV-infected monkeys also recognized the specific peptides, and mice immunized with the selected peptides elicited HIV-specific Abs that neutralized HIV-1 isolates IIIB and NL4-3. Vaccine *Vector/Type:* canarypox, protein *Strain:* B clade LAI, B clade MN *HIV component:* Env, Gag, Protease
References Cao2003
Keywords inter-clade comparisons.
Country Uganda.

- 20 Ugandan seronegative individuals were intramuscularly immunized in this study with an ALVAC HIV GagPol and Env vaccine carrying B clade agtigens.3/20 of subjects produced neutralizing antibodies against the autologous HIV-1 clade B strain MN that was T-cell line adapted; 2 also had NAb reactivity against a primary B clade cell line. No NAb cross-reaction was observed with primary viral isolates UG92029 (subtype A) or UG92046 (subtype D). 4/20 had detectable CTL activity against B clade antigen, and one of these cross-reacted with A clade antigen, one with D clade. [Cao2003] (**inter-clade comparisons**)

920	polyclonal	Env	gp160			SHIV infection	macaque

References Crawford1999
Keywords variant cross-recognition or cross-neutralization.

- Neutralization assays with rsCD4, MAbs, and serum samples from SHIV-infected macaques and HIV-1 infected individuals were used to characterize the antigenic properties of the env glycoprotein of six primary isolate or TCLA SHIV variants. SHIV infected macaques could neutralize autologous virus very effectively, but serum from HXB2c or 89.6 infected animals could not neutralize heterologous SHIVs. Serum from KU infected animals could neutralize only HXB2c, and serum from 89.6PD infected animals could neutralize 89.6, 89.6P, 89.6PD and KB9 (all derived from 89.6) well. Many sera from the SHIV infected macaques could also neutralize HIV-1 strains MN and SF2. [Crawford1999] (**variant cross-recognition or cross-neutralization**)

921	polyclonal	Env	gp160			HIV-1 infection	human

References Crawford1999
Keywords variant cross-recognition or cross-neutralization.

- Neutralization assays with rsCD4, MAbs, and serum samples from SHIV-infected macaques and HIV-1 infected individuals were used to characterize the antigenic properties of the env glycoprotein of six primary isolate or TCLA SHIV variants. Serum from 9 HIV-1 infected people were tested for their ability to neutralize SHIVs. KU2 was least sensitive, 89.6, 89.6P, 89.6PD and KB9 (all derived from 89.6) were moderately susceptible, and SHIV HXB2c was less sensitive than IIIB, the strain from which it was derived. [Crawford1999] (**variant cross-recognition or cross-neutralization**)

922	polyclonal	Env	Env		yes	Vaccine	rabbit, mouse (IgG)

Vaccine *Vector/Type:* Venezuelan equine encephalitis virus (VEE) *Strain:* B clade R2 *HIV component:* gp160ΔCT
References Dong2003
Keywords inter-clade comparisons, variant cross-recognition or cross-neutralization.

- C3H/He mice immunized with replicons expressing RT env protein or the VEE env vector pGP expressing either gp140 or gp160 showed cross-reactive neutralizing Ab responses to five clade B env proteins, a chinese clade C strain and weakly against a chinese clade E (CRF-1) strain.
- Subcutaneous or intradermal immunization with VEE replicons expressing HIV-1 R2 gp140 and with HIV-1 R2 gp160 lacking the cytoplasmic tail. Sera from 3/3 rabbits inhibited SF162 infectivity and 2/3 rabbits were able to neutralize the R2 strain.
- Mice and rabbits were immunized with Venezuelan equine encephalitis virus (VEE) replicon system particles expressing HIV-1 Env from the clone R2 that was derived from a virus that was neutralization sensitive and isolated from an individual that made strong NAb resposnes. Stronger and faster NAb responses were induced with replicons expressing gp160 with the cytoplasmic tail deleted than with gp160 or gp140. NAb responses against heterologous strain SF162 were similar in BALB/c and C3H/He mice and enhanced compared to responses elicited in C57BL/6 mice. Serum from mice neutralized 5 primary clade B env proteins, a chinese clade C strain, but not a chinese clade E (CRF-1) strain. Sera from 3/3 immunized rabbits could neutralize SF162, and from 2/3 neutralized the autologous R2 strain. [Dong2003] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

Keywords assay development, assay standardization, co-receptor, inter-clade comparisons, kinetics.
Country Belgium.

- Plasma samples from six HIV-1+ Belgians showed broad cross-neutralization ability against primary isolates from group M (subtypes A-H) and Group O. Viruses with R5, X4, and R5X4 co-receptor usage were all represented in the test panel. Kinetics of neutralization showed that NAb responses detected useing a PBMC assay with a short incubation period could be lost upon extended culture. No preincubation with Ab was needed to see some inhibition of virus replication, indicating that at least partial neutralization occurs post-virus binding to target cells. [Donners2003] (**assay development**, **co-receptor**, **kinetics**, **inter-clade comparisons**, **assay standardization**)

924	polyclonal	Env	Env			HIV-1 infection	human

Research Contact Rebeca Geffin, Miami School of Medicine
References Geffin2003
Keywords autologous responses, escape, rate of progression, responses in children.

- A longitudinal study of NAb responses in perinatally HIV-1 infected infants and children was undertaken, including 7 with rapid progression (RP) and 9 who did not progress rapidly (NRP). A subset of both RPs and NRPs had some plasma samples that could neutralize contemporaneous autologous viral isolates after 6 months of age, but most isolates could not be neutralized by contemporaneous plasma, only by later samples. The non-contemporaneous NAbs would persist for years, had highest titers against earlier isolates, and tended to be more potent in NRP children. This study indicates that there is ongoing NAb escape in HIV-1+ children. No correlation between HIV RNA levels and Ab production was established, although this might have been complicated by treatment. [Geffin2003] (**autologous responses**, **escape**, **responses in children**, **rate of progression**)

Research Contact Mascola2003b
References Mascola2003b
Keywords escape, review.

- This paper reviews the paper by Wei *et al.* (Nature 2003) that substantiates the notion that HIV evolves to change the number and position of glycosylation sites in Envelope and this facilitates neutralization escape *in vivo*. This NAb escape mechanism is called a glycan shield. [Mascola2003b] (**escape**, **review**)

926	polyclonal	Env					macaque

References Mascola2003a
Keywords immunoprophylaxis, review.

- This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. The binding properties and SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. [Mascola2003a] (**immunoprophylaxis**, **review**)

927	polyclonal	Env	gp120			Vaccine	rabbit

References Radaelli2003
Keywords Th1, Th2.

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• Three different immunization protocols using two recombinant fowlpox (FP) constructs and two expression plasmids (SIV mac239 gg/pol or HIV-1 env 89.6P) for priming and VLP particles for boosting were tested for their ability to elicit neutralizing Ab and cell-mediated immune responses. NAb responses against SHIV 89.6P were elicited in all protocols tested. Plasmid DNA (pcDNA3gag/pl SIV) was more efficient than the FP vector (FPgag/polSIV) in inducing Ab responses to against the gag core protein (p27). DNA plasmid followed by a VLP boost elicited a Th0 profile. [Radaelli2003] (**Th1**, **Th2**)					
928	polyclonal	Env				HIV-1 infection	human
		References Polonis2003 **Keywords** co-receptor, escape, inter-clade comparisons. **Country** Thailand. • Neutralization of 49 subtype E HIV-1 isolates from various stages of disease and 21 subtype B viruses was compared using polyclonal Ab pools and single subtype E plasmas. Non-syncytium-inducing (NSI) CRF01 (subtype E) HIV-1 isolates showed increased sensitivity to neutralization (42%) than syncytium-inducing (SI) subtype E isolates (9%). In contrast, the viral phenotype of subtype B isolates did not correlate with neutralizaiton sensitivity. SI viruses were primarily X4 (one X4R5 was identified), NSI were R5. Low CD4+ T cell numbers in subtype E infected patients correlated with concurrent isolate resistance to neutralizing Ab responses. [Polonis2003] (**co-receptor**, **escape**, **inter-clade comparisons**)					
929	polyclonal	Env	gp120			Vaccine	macaque (IgG)
		Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120, Nef, Tat *Adjuvant:* AS02A (oil-in-water emulsion, 3D-monophosphoryl lipid A, QS21), AS06 (CpG, aluminum hydroxide) **References** Voss2003 **Keywords** adjuvant comparison, variant cross-recognition or cross-neutralization. • Monkeys were immunized with different combinations of gp120/NefTat/SIV-Tat three times over a three-month time period and intravenously challenged with SHIV 89.6P four weeks after the last immunzation. Vaccination induced anti-Tat, -Nef and -gp120 Ab responses which decreased until challenge. Neutralizing Ab responses against HIV-1 MN and HIV-1 W61D were observed. Vaccination with the combination of all three proteins reduced viral load and kept animals from a CD4+ T cell decline, preventing AIDS for more than 2.5 years. The adjuvant AS02A elicited NAbs and protected from disease, while AS06 did not. gp120 alone or TatNef/SIV-Tat without gp120 could not protect from disease. [Voss2003] (**adjuvant comparison**, **variant cross-recognition or cross-neutralization**)					
930	polyclonal	Env	Env			Vaccine	mouse
		Vaccine *Vector/Type:* peptide *Adjuvant:* QS21 **References** Cunto-Amesty2001 **Keywords** mimotopes, vaccine antigen design. • Concanavalin A binds to mannose/glucose, and binds to HIV-1. Con A was used to select peptide mimics of carbohydrates that bound to Con A, and the mimetic peptides were then used for BALB/c mouse immunization. Abs raised against the mimetic peptides binds to HIV+ cells, and could weakly neutralize T cell lab adapted strains. [Cunto-Amesty2001] (**mimotopes**, **vaccine antigen design**)					
931	polyclonal	Env	gp41			Vaccine	rabbit (IgG)

References Li2002
Keywords vaccine antigen design.

- A polyepitope vaccine was designed based on a recombinant GST fusion protein containing three repeats of the 2F5 core epitope ELDKWA combined with the V3 region peptide GPGRAFY. Abs raised in mice could recognize the peptides, sgp41, and CHO-WT cells that expressed HIV-1 Env on their surface. [Li2002] (**vaccine antigen design**)

933	polyclonal	Env	Env			HIV-1 infection	human

References Montefiori2003
Keywords acute infection, autologous responses, escape.

- AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessaton of therapy, which then declined to a low level. The polylconal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. [Montefiori2003] (**autologous responses**, **acute infection**, **escape**)

934	polyclonal	Env	gp120 (dis DH012)			HIV-1 infection, Vaccine	chimpanzee

Vaccine *Vector/Type:* protein
References Zhu2003
Keywords vaccine-specific epitope characteristics.

- This study compares the immunogenicity of the HIV DH012 strain in chimpanzees during a natural infection with DH012 vaccinations. Naturally infected chimpanzees have sera containing potent anti-DH012 neutralization Abs, but the primary epitope is a discontinuous conformational epitope called CEV that involves the V1/V2 region, the bridging sheet, and the V3 loop. Abs that are raised upon gp120 vaccination, in contrast, are primarily against V3. DH012 has preserved the epitopes for the MAbs IgG1b12, 2G12, 17b, however natural DH012 infection in chimpanzees and DH012 gp120 vaccination in guinea pigs does not give rise to Abs against these epitopes. [Zhu2003] (**vaccine-specific epitope characteristics**)

Keywords vaccine antigen design.

- 212A: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 212A: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998]
- 212A: Does not compete with binding of MAb generated in response to gp120-CD4 complex, CG10. [Sullivan1998b]
- 212A: Does not neutralize TCLA strains or primary isolates. [Parren1997c]
- 212A: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids are deleted. [Wyatt1997]
- 212A: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 212A bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997]
- 212A: Binding enhanced by anti-V3 MAb 5G11 – reciprocal inhibition with anti-C1 MAbs. [Moore1996]
- 212A: Mutations that inhibit binding: C1 (45 W/S) and V5 (463 N/D) – and enhance binding: V2 (179/180 LD/DL) and C5 (495 G/K) [Moore1994d]

939 522-149 — Env — gp120 — no — Vaccine — mouse

Vaccine *Vector/Type:* protein *HIV component:* Env
Ab type C1 **Research Contact** G. Robey, Abbott Inc.
References Pantophlet2003b, Zwick2003, Yang2000, Binley1998, Trkola1996a, Moore1996
Keywords antibody interactions, vaccine antigen design.

- 522-149: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 522-149: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C1-binding Fab that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- 522-149: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000]
- 522-149: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 522-149: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] • 522-149: Binding is enhanced by C5 antibodies M91 and 1C1 – mutual binding-inhibition with anti-C1 antibody 133/290 – binding is destroyed by a W/L (position 61, LAI) gp120 amino acid substitution – other C1 antibodies enhance binding to gp120. [Moore1996]					
940	L19	Env	gp120 (HXBc2)			HIV-1 infection	human (IgG1)
		Ab type C1 **References** Ditzel1997 • L19: gp120 immobilized on solid phase by capture with anti-CD4 BS MAb L72 was used for the selection of Fabs – six N-term Fabs, L19 L34, L35, L52, L59, and L69, were obtained that have a similar epitope to Fab p7. [Ditzel1997]					
941	M90	Env	gp120		no	Vaccine	(IgG1)
		Vaccine *Vector/Type:* protein *HIV component:* Env **Ab type** C1 **Research Contact** Fulvia di Marzo Veronese **References** Pantophlet2003b, Yang2000, Binley1999, Binley1998, Wyatt1997, Ditzel1997, Moore1996, DeVico1995, diMarzo Veronese1992 • M90: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] • M90: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000] • M90: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] • M90: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998] • M90: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-82, are deleted. [Wyatt1997] • M90: Reciprocal inhibition of binding of other anti-C1 MAbs – inhibits CD4 binding site MAbs – enhances binding of V2 MAbs G3-4 and SC258. [Moore1996] • M90: Reacted with both non-reduced (but not denatured) covalently cross-linked gp120-CD4 complex. [DeVico1995] • M90: Reactive only with native gp120, so binds to a discontinuous epitope – reacts with multiple strains. [diMarzo Veronese1992]

[Golding2002b] (**antibody binding site definition and exposure**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• T9: This antibody, along with 7 others (M10, D41, D54, T6, T4, T10 and T35), can block the linear murine MAb D61, and the human MAb 246-D, which both bind to the immunodominant region near the two Cys in gp41 – most of these antibodies are oligomer dependent – all of the MAbs are reactive with ten different HIV-1 strains – members of this competition group are blocked by sera from HIV-1+ individuals. [Earl1997] (**antibody binding site definition and exposure**) • T9: One of five MAbs (T4, T6, T9, T10 and T35) in a competition group that bind to a conformation-dependent epitope in gp41 and is oligomer specific – neutralizes IIIB and SF2. [Broder1994] (**antibody generation**, **variant cross-recognition or cross-neutralization**) • There are two HIV-Abs with the name T9, one binds to gp41, one to gp120.				
947	p7	Env	gp120 (HXBc2)			HIV-1 infection	human (IgG1)
		Ab type C1 **References** Parren1997c, Ditzel1997 • p7: Does not neutralize TCLA strains or primary isolates. [Parren1997c] • p7: gp120 immobilized on solid phase by capture with sCD4 was used for selection of Fabs – three novel N-term Fabs were obtained that bind to similar epitopes, p7, p20, and p35 – a C1 W/S substitution at position 45 abolished binding, a Y/D at position 45 reduced binding, and C5 region substitutions 475 M/S and 493 P/K enhanced binding – compete with MAbs M85, M90 and 212A, but not M91 and G3-299. [Ditzel1997]					
948	L100	Env	gp120 (HXBc2)			HIV-1 infection	human (IgG1)
		Ab type C1-C2 **References** Kwong2002, Parren1997a, Parren1997c, Ditzel1997 **Keywords** antibody binding site definition and exposure, antibody generation, variant cross-recognition or cross-neutralization. • L100: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminal, discontinuous. [Kwong2002] (**antibody binding site definition and exposure**) • L100: gp120 immobilized on solid phase by capture with sCD4 and then masked with Fab p7 allowed selection of a new Fab, L100, with a novel specificity for C1 and C2 – gp120 C1 substitutions 69 W/L and 76 P/Y abolish L100 binding, and C2 substitutions 252 R/W, 256 S/Y, 262 N/T and 267 E/L abolish or strongly inhibit L100 binding – inhibits binding of MAbs M90 and G3-299, but not M85, 212A, and M91. [Ditzel1997, Parren1997a] (**antibody binding site definition and exposure**, **antibody generation**) • L100: Does not neutralize TCLA strains or primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)					
949	2/11c (211c, 2.11c, 211/c, 2-11c)	Env	gp120		L (weak)	HIV-1 infection	human

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2/11c: Called 211/c. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminus, discontinuous. [Kwong2002] (**antibody binding site definition and exposure**)
- 2/11c: Used as a negative control in a study of CD4i MAbs. [Xiang2002a]
- 2/11c: Called 211/c – a panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998]
- 2/11c: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-74, are deleted. [Wyatt1997]
- 2/11c: Called 2.11c – One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 67 mug/ml. [Li1997]
- 2/11c: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric env binding – 2/11c bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997]
- 2/11c: Called 211c – does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a]
- 2/11c: Inhibits binding of anti-C1, -C5, -C4, -V3 and anti-CD4 binding site MAbs – induces binding of some anti-V2 and CD4i MAbs (48d and 17b) – similar reactivity pattern to A32, but less cross-reactive and lower affinity – A32 and 211/c are unique among known human and rodent MAbs. [Moore1996]

950	A32	Env	gp120		no	HIV-1 infection	human (IgG1)

References Pantophlet2003b, Zwick2003, Kwong2002, Grundner2002, Yang2002, Yang2000, Binley1999, Binley1998, Sullivan1998b, Parren1997c, Boots1997, Wyatt1997, Burton1997, Fouts1997, Binley1997a, Trkola1996a, Wu1996, Moore1996, Moore1995b, Wyatt1995, Moore1994b

Keywords antibody binding site definition and exposure, antibody interactions, co-receptor, inter-clade comparisons, mimotopes, review, vaccine antigen design, variant cross-recognition or cross-neutralization.

- A32: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- A32: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. A32 is described as having a C1-C4 discontinuous CD4i epitope, and had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- A32: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminal, discontinuous. [Kwong2002] (**antibody binding site definition and exposure**)
- A32: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface – non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12 – the MAb 17b was sCD4 inducible on gp160deltaCT PL. [Grundner2002] (**vaccine antigen design**)
- A32: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002] (**antibody binding site definition and exposure**)
- A32: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000] (**vaccine antigen design**)
- A32: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**antibody binding site definition and exposure**)
- A32: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. [Binley1998] (**antibody binding site definition and exposure**)
- A32: Enhances binding of CD4i MAbs 17b and 48d, and a MAb generated in response to gp120-CD4 complex, CG10. [Sullivan1998b] (**antibody interactions**)
- A32: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – A32 has a unique epitope involving mostly C2 but C1 and C4 contribute – six quite variable phage inserts were recognized, with a consensus of LPWYN – a central Trp was the most conserved element, consistent with W427 being an important residue for binding gp120. [Boots1997] (**antibody binding site definition and exposure**, **mimotopes**)
- A32: Does not neutralize TCLA strains or primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- A32: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. [Wyatt1997] (**antibody binding site definition and exposure**)
- A32: Review. [Burton1997] (**review**)
- A32: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric env binding – A32 bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- A32: Does not neutralize JR-FL, or any strain strongly – partial inhibition of gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**co-receptor**)
- A32: Not neutralizing – binds domains that interact with gp41 – MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 and binding of A32 does not block this inhibition. [Wu1996] (**antibody binding site definition and exposure**)
- A32: Reciprocal inhibition of binding of anti-C1, -C5, -C4, -V3 and anti-CD4 binding site MAbs – induces binding of some anti-V2 and sCD4 inducible MAbs (48d and 17b) – very similar competition pattern between 2/11c, A32 and 211/c are unique among known human and rodent MAbs. [Moore1996] (**antibody binding site definition and exposure**, **antibody interactions**)
- A32: Review: epitope is distinct from CD4BS MAbs, 48d and 17b, and 2G12. [Moore1995b] (**antibody binding site definition and exposure**)
- A32: Epitope is better exposed upon CD4 binding to gp120 – binding of A32 enhances binding of 48d and 17b – studies using a V1/V2 deletion mutant demonstrated that enhanced binding of 48d in the presence sCD4 involves the V1/V2 loops, with more significant involvement of V2. [Wyatt1995] (**antibody binding site definition and exposure**, **antibody interactions**)
- A32: Reacted with virtually every gp120 monomer of every clade tested, most conserved gp120 monomer epitope known. [Moore1994b] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

- C11: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- C11: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. C11 recognized most variants,some from each of the four individuals, by gp120 immunoprecipitation. [Ohagen2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)
- C11: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-term and C-term binding. [Kwong2002] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- C11: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. C11 was used as a negative control, as C11 binding did not alter binding of CD4-independent gp120 to CCR5, nor binding to CCR5-expressing Cf2Th cells. [Raja2003] (**co-receptor**)
- C11: gp120 mutants were used to define the CXCR4 binding site using CXCR4 displayed on paramagnetic proteoliposomes (PMPLs) to reduce non-specific gp120 binding – basic residues in the V3 loop and the beta19 strand (RIKQ, positions 419-422) were involved, and deletion of the V1-V2 loops allowed CD4-independent CXCR4 binding – MAbs 17b (CD4i) and F105 (CD4BS) were used to study conformational changes in the mutants – C11 was used to detect gp120 binding to CXCR4 or CCR5 on PMPLs. [Basmaciogullari2002] (**antibody binding site definition and exposure**)
- C11: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface – non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12 – the MAb 17b was sCD4 inducible on gp160deltaCT PL. [Grundner2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- C11: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002] (**antibody binding site definition and exposure**)
- C11: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**vaccine antigen design**)
- C11: Does not compete with binding of MAb generated in response to gp120-CD4 complex, CG10. [Sullivan1998b] (**antibody interactions**)
- C11: Does not neutralize TCLA strains or primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- C11: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – partial re-exposure if sCD4 was bound – does not bind to HXBc2 gp120 if the 19 C-term amino acids are deleted. [Wyatt1997] (**antibody binding site definition and exposure**)
- C11: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – C11 bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- C11: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**antibody binding site definition and exposure**)
- C11: Did not block ability of gp120-sCD4 complexes to inhibit MIP-1alpha binding – binds to gp41-binding domain. [Wu1996] (**antibody binding site definition and exposure**)
- C11: Binding enhanced by anti-V3 MAb 5G11 – reciprocal inhibition with anti-C1 MAbs. [Moore1996] (**antibody interactions**)
- C11: Mutations that inhibit binding: C1 (45 W/S, 88 N/P) – V5 (463 N/D) – and C5 (491 I/F, 493 P/K and 495 G/K) and enhance binding: C1 (36 V/L) – V1-V2 (152/153 GE/SM) – and DeltaV1/V2/V3. [Moore1994d] (**antibody binding site definition and exposure**)

957	23A (2.3A)	Env	gp120		no		
		Ab type C5 **Research Contact** James Robinson, Tulane University, LA **References** Schulke2002, Binley1999, Fouts1997, Trkola1996a, Wu1996, Thali1993, Thali1992a • 23A: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. [Schulke2002] • 23A: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] • 23A: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric env binding – 23A bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997]					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 23A: C5 binding MAb – does not inhibit gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a]
- 23A: Called 2.3A – Did not block ability of gp120-sCD4 complexes to inhibit MIP-1alpha binding – binds to gp41-binding domain of gp120. [Wu1996]

958 D7324 Env gp120 Vaccine sheep

Vaccine *HIV component:* gp120
Ab type C5 **Research Contact** Aalto BioReagents Ltd, Dublin, Ireland or Cliniqa Inc., Fallbrook, CA, USA
References Zwick2003, Herrera2003, Poignard2003, Basmaciogullari2002, Xiang2002a, Gram2002, Sanders2002, Binley1998, Mondor1998, Ugolini1997, Ditzel1997, Trkola1996a, Wyatt1995, Moore1993c, Moore1993b, Sattentau1991, Moore1990a
Keywords antibody interactions.

- D7324: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding polyclonal Ab that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- D7324: Used to capture gp120 onto solid phase for epitope mapping. [Basmaciogullari2002, Binley1998, Ditzel1997, Herrera2003, Moore1993b, Moore1993c, Poignard2003, Sanders2002, Xiang2002a]
- D7324: Called NEA9205 – gp120 capture ELISAs with MAbs D7324 (anti-C-term) or 9205 (anti-V3) were compared in a study of orientation of glycosylation sites – CD4 binding could only inhibit deglycosylation when gp120 was bound to the plate by D7324, not by 9205, while Abs from HIV-1 infected people inhibited deglycosylation most effectively when gp120 was caught by 9205. [Gram2002]
- D7324: Epitope in C5 – Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a]
- D7324: Binds to the last 15 amino acids in gp120 – used for antigen capture ELISA. [Wyatt1995]
- D7324: Binding unaltered by gp120 binding to sCD4, in contrast to 110.5, 9284, 50-69 and 98-6. [Sattentau1991]

959 10/46c Env gp120 Vaccine rat

Vaccine *Vector/Type:* protein *HIV component:* gp120
Ab type CD4BS
References Peet1998, Jeffs1996, Cordell1991

- 10/46c: The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind – 10/46c was not affected by V3 serine substitutions – mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. [Peet1998]
- 10/46c: Increased binding when V1/V2 or V1/V2 and V3 were deleted from gp120. [Jeffs1996]

960 1027-30-D (1027-30D) Env Env human (IgG1κ)

Ab type CD4BS **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center)
References Gorny2004, Zwick2003, Hioe2000
Keywords antibody interactions, review.

- 1027-30D: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- 1027-30-D: Called 1027-30D. scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)

- 15e: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- 15e: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 15e: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)
- 15e: Called 1.5e. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 15e: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. [Raja2003] (**co-receptor**)
- 15e: UK Medical Research Council AIDS reagent: ARP3016.
- 15e: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished. [Pantophlet2003a] (**antibody binding site definition and exposure**)
- 15e: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**antibody binding site definition and exposure**)
- 15e: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b] (**antibody binding site definition and exposure**)
- 15e: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 15e. [Kolchinsky2001] (**antibody binding site definition and exposure**)
- 15e: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000] (**antibody binding site definition and exposure**)
- 15e: Called 1.5e – the HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – 1.5e enhances and does not neutralize YU2 env even at 50 ug/ml. [Sullivan1998a] (**antibody binding site definition and exposure**)
- 15e: CD4BS MAbs 15e, 21h, and F91 bind with even lower affinity than 205-43-1 and 205-42-15 to JRFL oligomer. [Fouts1998] (**antibody binding site definition and exposure**)
- 15e: No detectable neutralizing activity among primary isolates with different co-receptor usage – some neutralization of TCLA strains. [Trkola1998] (**variant cross-recognition or cross-neutralization**)
- 15e: Competes with CG-10 binding, a MAb raised against a gp120 CD4 complex, this was probably due to the disruption of CD4-gp120 by 15e. [Sullivan1998b] (**antibody binding site definition and exposure**, **antibody interactions**)
- 15e: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4BS MAbs 15e, F91 and IgG1b12 bound better to the deleted protein than to wild type. [Binley1998] (**antibody binding site definition and exposure**)
- 15e: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**antibody binding site definition and exposure**)
- 15e: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. [Wyatt1998a] (**structure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 15e: Neutralizes TCLA strains, but not primary isolates. [Parren1997c]
- 15e: Called 1.5E – Binds to 7/7 isolates from breakthrough cases from a MN gp120 vaccine trial. [Berman1997] (**variant cross-recognition or cross-neutralization**)
- 15e: Does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-93, are deleted. [Wyatt1997] (**antibody binding site definition and exposure**)
- 15e: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 15e could only achieve 50% neutralization, but could act synergistically with anti-V3 MAb 694/98-D to achieve 90% [Li1997] (**antibody interactions**)
- 15e: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 15e bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- 15e: 15e is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- 15e: Neutralizes HIV-1 LAI less potently than V3 specific MAbs. [McDougal1996]
- 15e: Inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**antibody binding site definition and exposure**)
- 15e: Anti-CD4BS MAbs 15e, 21h, and IgG1b12 did not cause gp120 dissociation from virus, or exposure of the gp41 epitope of MAb 50-69, in contrast to CD4i MAb 48d and anti-V3 neutralizing MAbs. [Poignard1996a] (**antibody interactions**)
- 15e: gp120 binding enhanced by anti-V3 MAb 5G11 and anti-V2 MAb G3-136 – binding inhibited by other CD4 binding site MAbs, antibodies that bind to gp120 only when CD4 is bound, and CD4-IgG. [Moore1996] (**antibody interactions**)
- 15e: Called 1.5e – Neutralizes HXB2, but fails to neutralize chimeric virus with gp120 from primary isolates in an HXB2 background. [McKeating1996b] (**variant cross-recognition or cross-neutralization**)
- 15e: The V4 and V5 domains are essential for 1.5e binding, in contrast to the V1, V2, and V3 loops. [Lee1995] (**antibody binding site definition and exposure**)
- 15e: Binds with higher affinity to monomer than to oligomer, moderate association rate. [Sattentau1995b] (**antibody binding site definition and exposure**)
- 15e: Cross-reactive with gp120 proteins from clades B and D, less so with A and C, and not reactive with clade E and F. [Moore1994b] (**inter-clade comparisons**)
- 15e: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – anti-CD4 MAbs moderately inhibit gp120 binding to GalCer, possibly through steric hindrance – binding of GalCer to gp120 inhibited but did not completely block 15e binding. [Cook1994] (**antibody binding site definition and exposure**, **brain/CSF**)
- 15e: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 48d, 21h and 17b) [Thali1994] (**antibody binding site definition and exposure**)
- 15e: Heavy chain is V HIV, V2-1 – light chain is V_kappaI, Hum01/012. Compared to 21h and F105. [Bagley1994] (**antibody sequence, variable domain**)
- 15e: Called 15E – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – 15E neutralization was not affected by this mutation. [Watkins1993] (**antibody binding site definition and exposure**)
- 15e: Binding to Delta V1/2 and Delta V1/2/3 mutant glycoproteins is greater than binding to wildtype gp120. [Wyatt1993] (**antibody binding site definition and exposure**)
- 15e: Conformational, does not bind denatured gp120 – neutralizes IIIB – reactive with SF-2 gp120 – strong inhibition of HIV+ human sera binding to IIIB gp120. [Moore1993a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 15e: Called N70-1.5e – does not enhance infection of HIV-1 IIIB and MN. [Thali1992a] (**enhancing activity**)
- 15e: Amino acid substitutions in HXB2 that strongly inhibit binding, similar to [Ho1992], some additional, 88, 102, 117, 113, 257, 368, 370, 421, 427, 457, 470, 480 [Thali1992a]. [Ho1992, Thali1992a] (**antibody binding site definition and exposure**)
- 15e: Precipitation of Delta 297-329 env glycoprotein, with a deleted V3 loop, is much more efficient that precipitation of wild type. [Wyatt1992] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 15e: gp120 mutants that affect 15e epitope binding: 113, 257, 368, 370, 421, 427, 475 – four of these coincide with amino acids important for the CD4 binding domain. [Ho1992] (**antibody binding site definition and exposure**)
- 15e: Binds to gp120 of HIV-1 IIIB, but not RF – mediates ADCC – deletion of the V3 loop from gp120 does not alter ADCC activity. [Koup1991] (**ADCC**, **variant cross-recognition or cross-neutralization**)
- 15e: Cross-competes with MAbs ICR 39.13g and ICR 39.3b. [Cordell1991] (**antibody interactions**)
- 15e: Broadly neutralizing, binds multiple strains, competes with CD4 for gp120 binding, DTT reduction of env abrogates binding – more potent blocking of gp120-sCD4 binding than MAbs G3-536 and G3-537. [Ho1991b] (**adjuvant comparison**, **variant cross-recognition or cross-neutralization**)

- 21h: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- 21h: UK Medical Research Council AIDS reagent: ARP3017.
- 21h: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations—375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91) was markedly reduced—IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced—2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope—another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b] (**antibody binding site definition and exposure**)
- 21h: CD4BS MAbs 15e, 21h, and F91 bind with even lower affinity than 205-43-1 and 205-42-15 to JRFL oligomer – conclusions of this paper contrast with [Parren1998a] [Fouts1998]. [Fouts1998, Parren1998a] (**binding affinity**)
- 21h: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**antibody binding site definition and exposure**)
- 21h: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. [Wyatt1998a] (**antibody binding site definition and exposure**, **structure**)
- 21h: Neutralizes TCLA strains, but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- 21h: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding – major deletions in C1 and C5 and deletions of the V1V2 and V3 loops do not diminish binding. [Wyatt1997] (**antibody binding site definition and exposure**)
- 21h: Viral binding inhibition by 21h strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997] (**antibody binding site definition and exposure**)
- 21h: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 67 mug/ml. [Li1997] (**variant cross-recognition or cross-neutralization**)
- 21h: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 21h bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- 21h: Called 2.1H – Neutralizes HXB2, but fails to neutralize chimeric virus with gp120 from primary isolates in an HXB2 background. [McKeating1996b] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 21h: 21h is V H3 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- 21h: Anti-CD4BS MAbs 15e, 21h, and IgG1b12 did not cause gp120 dissociation from virus, or exposure of the gp41 epitope of MAb 50-69, in contrast to CD4i MAb 48d and anti-V3 neutralizing MAbs. [Poignard1996a] (**antibody binding site definition and exposure**, **antibody interactions**)
- 21h: Anti-CD4 binding site MAb – reciprocal inhibition by anti-C1, -C4 and other anti-CD4 binding site antibodies – enhanced by some anti-V2 MAbs and anti-V3 MAb 5G11 – enhances binding of some anti-V3 and -V2 MAbs. [Moore1996] (**antibody interactions**)
- 21h: Binds with higher affinity to monomer than to oligomer, moderate association rate. [Sattentau1995b] (**antibody binding site definition and exposure**)
- 21h: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 48d, 15e and 17b) [Thali1994] (**variant cross-recognition or cross-neutralization**)
- 21h: Heavy chain is V HIII, VDP-35 – light chain is V_lambdaIIIa, Hum318. Compared to 15e and F105. [Bagley1994] (**antibody sequence, variable domain**)
- 21h: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. [Moore1994a] (**acute infection**)
- 21h: Has strong cross-reactivity with gp120 monomers from most subtypes, A-F, with the least reactivity to clade E. [Moore1994b] (**inter-clade comparisons**)
- 21h: Conformational, does not bind denatured gp120 – neutralizes IIIB – reactive with SF-2 gp120 – strong inhibition of HIV+ human sera binding to IIIB gp120. [Moore1993a] (**antibody binding site definition and exposure**)
- 21h: Binding to Delta V1/2 and Delta V1/2/3 mutant glycoproteins is greater than binding to wildtype gp120. [Wyatt1993] (**antibody binding site definition and exposure**)
- 21h: Amino acid substitutions in HXB2 that inhibit binding, some shared with CD4 binding inhibition, 88, 113, 257, 368, 370, 421, 470, 480. [Thali1992a] (**antibody binding site definition and exposure**)

- 558-D: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- 558-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – CD4BS Abs tended to bind weakly without clade specificity to virions, but bound well to soluble gp120 – 558-D did not bind to any B clade viruses, and weakly bound to clade A, C, and G isolates – 559/64-D, 558-D and 1202-D had similar reactivities. [Nyambi1998] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 558-D: Blocks gp120-CD4 binding – binds a panel of mutants all except for 256 S/Y and 262 N/T, which are probably conformationally disruptive. [McKeating1992c] (**antibody binding site definition and exposure**)

- 559/64D: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- 559/64D: called 559-64D: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 559/64-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4 induced or CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 559/64-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFNγ production—anti-CD4BS MAbs inhibit gp120 presentation by altering the uptake and/or processing of gp120 by the APCs, not by blocking of gp120 attachment to CD4 on the surface of APCs. [Hioe2001]
- 559/64-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12. [Nyambi2000] (**inter-clade comparisons**)
- 559/64-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – anti-CD4 binding site MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – CD4BS MAbs 654-D, 559/64-D, 588-D, 830-D, 1027-30-D, and 1202-30D strongly diminished proliferation. [Hioe2000]
- 559/64-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – CD4BS MAbs 559/64-D, 654-D, 729-D, 9CL and 1331E bound with a 5-13 fold preference for the oligomer. [Gorny2000a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 559/64-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – CD4BS Abs tended to bind weakly without clade specificity to virions, but bound well to soluble gp120 – 559/64-D did not bind to any B clade viruses, and weakly bound clade A, C, and G isolates – 559/64-D, 558-D and 1202-D had similar reactivities. [Nyambi1998] (**antibody binding site definition and exposure**, **inter-clade comparisons**)
- 559/64-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**)
- 559/64-D: Used in the development of resting cell neutralization assay. [Hioe1997a] (**assay development**)
- 559/64-D: Called 559 – slight, not significant increased binding when V1/V2 or V1/V2 and V3 were deleted from gp120. [Jeffs1996] (**antibody binding site definition and exposure**)
- 559/64-D: Neutralizing activity, no ADCC activity, and no viral enhancing activity. [Forthal1995] (**ADCC**, **enhancing activity**, **variant cross-recognition or cross-neutralization**)
- 559/64-D: Called 559-64D – The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – CD4BS loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a and to T-cell tropic SF2 – binding of anti-CD4BS MAbs to SF2 resulted in a significant amount of dissociation of gp120 from virion surface. [Stamatatos1995] (**antibody binding site definition and exposure**)
- 559/64-D: Did not mediate deposition of complement component C3 on HIV infected cells. [Spear1993] (**complement**)
- 559/64-D: Conformational – reactive with IIIB gp120 in RIP, but not WB assay. [Karwowska1992a] (**antibody binding site definition and exposure**)

- 654-D: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- 654-D: Called 654-30D. scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 654-D: Called 654: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) [Gorny2002]
- 654-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6—six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D, while six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281—no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 654-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFN gamma production – anti-CD4BS MAbs inhibit gp120 presentation by altering the uptake and/or processing of gp120 by the APCs, not by blocking of gp120 attachment to CD4 on the surface of APCs. [Hioe2001]
- 654-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12 – 654-D had the weakest binding among CD4BS MAbs, binding to only 4/26 isolates. [Nyambi2000] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 654-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – MAb 654-D strongly diminished proliferation – there is a discrepancy in isotyping this antibody, previous reports indicated IgG1kappa, while Hioe suggests it is IgG1lambda. [Hioe2000]
- 654-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – CD4BS MAbs 559/64-D, 654-D, 729-D, 9CL and 1331E bound with a 5-13 fold preference for the oligomer. [Gorny2000a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 654-D: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. [Hioe1999]
- 654-D: Called 654.30D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 slightly allowed neutralization by CD4BS MAb 654.30D. [Stamatatos1998] (**antibody binding site definition and exposure**, **inter-clade comparisons**)
- 654-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – CD4-BS Abs tended to bind very weakly without clade specificity to virions, but bound well to soluble gp120 – 654-D bound only to JRFL. [Nyambi1998] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 654-D: Called 654-D100 – 654-D100 and IgG1b12 neutralized viruses HIV-BRU and a mutated virus that lacks the V3 loop glycan equally effectively – in contrast, sera from guinea pigs immunized with BRU gp120 neutralize viruses more effectively that lack the V3 glycan. [Schonning1998] (**variant cross-recognition or cross-neutralization**)
- 654-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 654-D: Anti-CD4 BS MAb 654-30D and IgG1b12 have comparable binding affinities, neither mediates gp120-virion dissociation, but IgG1b12 can neutralize SF128A and SF162 and 654-D cannot – 654-D actually enhances infection by both viruses in primary macrophages. [Stamatatos1997] (**enhancing activity**, **binding affinity**)
- 654-D: Called 654-30D – One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env. [Li1997] (**variant cross-recognition or cross-neutralization**)
- 654-D: Called 654-30D – The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – CD4BS loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a and to T-cell tropic SF2 – binding of anti-CD4BS MAbs to SF2 resulted in a significant amount of dissociation of gp120 from virion surface. [Stamatatos1995] (**antibody binding site definition and exposure**)
- 654-D: Mild oxidation of carbohydrate moieties inhibits binding. [Gorny1994] (**antibody binding site definition and exposure**)
- 654-D: Dissociation constant gp120 IIIB 0.008 – neutralizes IIIB, acts synergistically with anti-V3 MAb 447-52D – reported to be human(IgG1lambda) [Laal1994] (**antibody interactions**, **kinetics**)

[Gorny2004] (**review**) • 830D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – anti-CD4 binding site MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – CD4BS MAbs 654-D, 559/64-D, 588-D, 830-D, 1027-30-D, and 1202-30D strongly diminished proliferation. [Hioe2000] • 830D: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. [Wyatt1998a] (**structure**) • 830D: Called 830-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997b] (**variant cross-recognition or cross-neutralization**)

- F105: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- F105: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- F105: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)
- F105: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. F105 recognized most variants,some from each of the four individuals by gp120 immunoprecipitation. [Ohagen2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)
- F105: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F105: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. [Raja2003] (**antibody binding site definition and exposure**, **co-receptor**)
- F105: 17b: This paper describes the generation of CD4i MAb E51, that like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and F105 binding, and K421D inhibits F105 binding, but not sCD4. [Xiang2003] (**antibody binding site definition and exposure**)
- F105: This study examined Ab interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 to both R5X4 and R5 isolates, but had no effect on neutralization. Anti-V3 MAb B4a1 increased CD4BS MAbs IgG1b12 and F105 to R5X4 virions, but only IgG1b12 binding was increased by B4a1 to the R5 isolate, and neutralization was not impacted. [Cavacini2002] (**co-receptor**)
- F105: NIH AIDS Research and Reference Reagent Program: 857.
- F105: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished. [Pantophlet2003a] (**antibody binding site definition and exposure**)
- F105: Virion capture assays are not a good preditor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. [Poignard2003] (**antibody interactions**)
- F105: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. [Liu2002] (**immunoprophylaxis**)
- F105: Review of NAbs that notes that F105 binds the CD4BS, in combination with other MAbs it can protect some macaques against SHIV infection, and that it has strong ADCC activity. [Ferrantelli2002] (**ADCC**, **antibody interactions**, **immunoprophylaxis**, **review**)
- F105: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**antibody binding site definition and exposure**)
- F105: gp120 mutants were used to define the CXCR4 binding site using CXCR4 displayed on paramagnetic proteoliposomes (PMPLs) to reduce non-specific gp120 binding—basic residues in the V3 loop and the β19 strand (RIKQ, positions 419-422) were involved, and deletion of the V1-V2 loops allowed CD4-independent CXCR4 binding—MAbs 17b (CD4i) and F105 (CD4BS) were used to study conformational changes in the mutants—the affinity of ΔV1 and ΔV1-V2 mutants for F105 was comparable to the wildtype—V3 mutants did not affect F105 binding—the K421A mutation in the β19 strand dramatically reduced F105 affinity, consistent with what is known about the F105 epitope. [Basmaciogullari2002] (**antibody binding site definition and exposure**)
- F105: HIV-1 gp160δCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160δCT with a reconstituted membrane ten-fold better than the same protein on beads, while such an affinity difference was not seen with F105 and 2G12—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160δCT PLs indistinguishably from gp160δCT expressed on the cell surface. [Grundner2002] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F105: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b] (**antibody binding site definition and exposure**)
- F105: A modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. [Chakrabarti2002] (**vaccine antigen design**)
- F105: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. [Xu2002] (**immunoprophylaxis**, **mother-to-infant transmission**)
- F105: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002] (**vaccine antigen design**)
- F105: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001] (**antibody binding site definition and exposure**)
- F105: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to F105. [Kolchinsky2001] (**antibody binding site definition and exposure**)
- F105: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkeys yielded highly pathogenic SHIV KU-1—HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160—substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1—17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. [Si2001] (**antibody binding site definition and exposure**)
- F105: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000] (**vaccine antigen design**)
- F105: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form, although F105 was an exception and cannot neutralize either form of MN – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000]
- F105: Host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. [Fortin2000]
- F105: A triple combination of 2F5, F105 and 2G12 effectively neutralized perinatal infection of macaque infants when challenged with SHIV-vpu+ – the plasma half-life was 7.2 +/- 2.2 days. [Baba2000] (**immunoprophylaxis**, **mother-to-infant transmission**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F105: A mini-review of observations of passive administration of IgG NAbs conferring protection against intervenous or vaginal SHIV challenge, that considers why IgG MAbs might protect against mucosal challenge. [Robert-Guroff2000] (**immunoprophylaxis**, **mucosal immunity**, **review**)
- F105: Anti-C1 region MAb 87-135/9 blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) [Kropelin1998] (**antibody interactions**)
- F105: F105 enhances viral entry of viruses carrying the YU2 envelope glycoproteins, but neutralizes HXBc2. [Sullivan1998a] (**enhancing activity**)
- F105: A comparison of 25 gp120 specific, conformation dependent MAbs was done and F105 was used for competition studies – F105 did cross-compete with multiple CD4BS specific MAbs, however most could not neutralize even the autologous NL4-3 strains. [Sugiura1999] (**antibody interactions**)
- F105: Immunoprecipitation of gp120 and gp160 expressed from a rec Semliki Forest virus by F105 and IgG1b12 indicated that the SFV expressed HIV-1 Env was folded appropriately – and SVF-HIV-1 Env vaccine gave the strongest anti-HIV-1 Env response in mice, when compared to an HIV-1 Env DNA vaccine and a rgp160 protein. [Brand1998] (**vaccine antigen design**)
- F105: The MAb F240 binds to the immunodominant region of gp41 and enhances infection in the presence of complement – reactivity of F240 is enhanced by preincubation of cells with sCD4 or anti-CD4BS MAb F105. [Cavacini1998a] (**antibody interactions**)
- F105: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS) [Li1998] (**antibody interactions**)
- F105: Phase I dose escalation study, single dose of 100 or 500 mg/m2 was given to 4 HIV+ patients – sustained levels, no immune response against F105, no toxicity, infused Ab retained function – there was no evidence of anti-HIV-1 activity and virus was not diminished at day 1 or 7, by culture or plasma RNA. [Cavacini1998b] (**kinetics**, **immunotherapy**)
- F105: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. [Wyatt1998a] (**antibody binding site definition and exposure**, **structure**)
- F105: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-93, are deleted. [Wyatt1997] (**antibody binding site definition and exposure**)
- F105: Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to a CD4BS MAb, F105 or sCD4. [Cao1997b] (**antibody binding site definition and exposure**)
- F105: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – F105 could only achieve 50% neutralization alone – all Ab combinations tested showed synergistic neutralization – F105 has synergistic response with MAbs 694/98-D (anti-V3), 48d, 2F5, and 2G12, and also with HIVIG. [Li1997] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- F105: In a multilaboratory blinded study, failed to neutralize any of nine B clade primary isolates. [D'Souza1997] (**variant cross-recognition or cross-neutralization**)
- F105: Neutralizes TCLA strains, but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- F105: Intracellular co-expression of heavy and light chains of the Fab105 fragment MAb F105 was enhanced by inclusion of an internal ribosome entry site (IRES) sequence – the Fab105 IRES expression cassette was cloned into an adeno-associated virus (AAV) shuttle vector, and transduced into human lymphocytes which were able to produce and secrete the Fab105 fragments while maintaining normal growth – several primary HIV-1 patient isolates were effectively blocked. [Chen1996] (**immunotherapy**)
- F105: Binding of F105 to oligomeric gp120 occurs despite the fact it cannot neutralize primary isolates. [Litwin1996]
- F105: A panel of immunotoxins were generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. [Pincus1996] (**immunotoxin**)
- F105: F105 is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- F105: Neutralizes HIV-1 LAI less potently than V3 specific MAbs. [McDougal1996]
- F105: Phase I study – MAb clearance in plasma has a 13 day half-life. [Wolfe1996] (**kinetics**, **immunotherapy**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F105: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – deletion of the V3 loop results in less potent inhibition of F105 binding by CRDS – binding site of F105 described as 256-257 ST, 368-370 DPE, 421 K, and 470-484 PGGGDMRDNWRSELY. [Jagodzinski1996] (**antibody binding site definition and exposure**)
- F105: Changing heavy chain from IgG1 to IgG3 increased neutralization efficiency. [Cavacini1995]
- F105: Biotinylated F105 was used for competition studies with Ab derived from pregnant HIV-1+ women – a correlation between maternal anti-CD4 BS Abs overlapping the F105 binding site and lack of HIV-1 transmission to infants was noted. [Khouri1995] (**mother-to-infant transmission**)
- F105: Efficient neutralization of T-cell adapted lines HXBc2 and MN, no neutralization of primary isolates 89.6, ADA and YU2 – even some enhancement of infection of ADA and YU2 was observed. [Sullivan1995] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- F105: Eight patient phase Ia trial for use as an immunotherapeutic – no clinical or biochemical side effects observed, plasma levels of 10 ug/ml maintained for 21 days. [Posner1995] (**immunotherapy**)
- F105: An immunoassay for titrating CD4BS serum antibody was developed using a gp120-coated solid phase and competition with MAb F105 – 109/110 French HIV-1+ sera and 51/56 HIV-1+ African sera had detectable CD4BS Abs using this assay, demonstrating CD4 binding site conservation among diverse subtypes – CD4BS Abs were detected soon after seroconversion and persisted – 0/21 HIV-2+ sera reacted, indicating that the HIV-1 and HIV-2 CD4BS Abs are not cross-reactive. [Turbica1995] (**assay development**, **inter-clade comparisons**)
- F105: A human CD4+ T lymphocyte line was transduced to express Fab fragments of F105 – heavy and light chains are joined by an inter-chain linker – in the transduced cells infected with HIV-1, the Fab binds intracellularly to the envelope protein and inhibits HIV-1 production – secreted Fab fragments neutralize cell-free HIV-1 – combined intra- and extracellular binding activities of the expressed Fab make transduced cells resistant to HIV-1 infection and also can protect surrounding lymphocytes by secreting neutralizing antibodies. [Chen1994a, Marasco1993] (**variant cross-recognition or cross-neutralization**)
- F105: Used as a positive control for CD4 BS antibodies in a study of the influence of oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994] (**antibody binding site definition and exposure**)
- F105: Fab fragments show reduced capacity to neutralize IIIB, MN, and RF compared to intact IgG1, suggesting bivalent interaction may be important in binding and neutralization. [Cavacini1994a] (**variant cross-recognition or cross-neutralization**)
- F105: Administered intravenously to four cynomologus monkeys, plasma pharmacokinetics and biological activity tested. [Cavacini1994b] (**kinetics**)
- F105: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – anti-CD4 MAbs moderately inhibit gp120 binding to GalCer, possibly through steric hindrance – binding of GalCer to gp120 inhibited but did not completely block F105 binding. [Cook1994] (**brain/CSF**)
- F105: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs 48d, 21h, 15e and 17b) [Thali1994] (**antibody binding site definition and exposure**)
- F105: Comparison of MAb F105 sequences with those of MAbs 21h and 15e. [Bagley1994] (**antibody sequence, variable domain**)
- F105: A neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – F105 neutralization was not affected by this mutation. [Watkins1993] (**escape**)
- F105: Ab response in IIIB lab workers was compared to gp160 LAI vaccine recipients – F105 was used as a control – infected lab workers and some of the gp160 vaccinees had a MAb response that could inhibit gp120-CD4 binding, at lower titers than the infected lab workers. [Pincus1993b] (**vaccine-specific epitope characteristics**)
- F105: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to a class of conformation sensitive neutralizing MAbs – required >81 fold higher concentrations to neutralize the mutant than wild type. [Klasse1993a] (**antibody interactions**)
- F105: Study of synergy of neutralization and binding comparing F105 and sCD4 with the V3 MAbs: 50.1, 59.1, 83.1, and 58.2 – synergy was observed, and the data suggest that binding of one ligand (F105) can increase the binding of the second (e. g. V3 loop MAbs) due to conformational changes. [Potts1993] (**antibody interactions**)
- F105: Study of synergy between F105 and sera from vaccinated volunteers with V3-loop specific neutralization activity – 2/3 sera demonstrated neutralization synergy, and 3/3 binding/fusion-inhibition synergy. [Montefiori1993] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F105: Binding to Delta V1/2 and Delta V1/2/3 mutant glycoproteins is 2.4- and 13-fold greater, respectively, than binding to wildtype gp120. [Wyatt1993] (**antibody binding site definition and exposure**)
- F105: Serum from all asymptomatic HIV-1 positive people tested block F105 binding, but only from 27% of symptomatic individuals. [Cavacini1993b] (**rate of progression**)
- F105: Additive MN or SF2 neutralization when combined with anti-V3 MAbs 447-52D and 257-D. [Cavacini1993a] (**antibody interactions**)
- F105: No neutralization of primary isolates observed (John Moore, pers comm) (**variant cross-recognition or cross-neutralization**)
- F105: F105 binds to and neutralizes selected lab strains and 3/9 HIV-1 primary isolates – synergistic enhancement of neutralization by seropositive sera. [Posner1993] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- F105: Called F-105 – neutralizes IIIB – strong inhibition of HIV+ human sera binding to IIIB gp120. [Moore1993a]
- F105: Significant enhancement of F105 binding to RF infected cells preincubated with V3-specific MAbs V3-2 and V3-1. [Posner1992a] (**antibody interactions**)
- F105: F105 mediates ADCC against SF2 through the CD16+ population of PBMC – does not mediate complement-dependent cytotoxicity. [Posner1992b] (**ADCC**, **complement**)
- F105: Precipitation of Delta 297-329 env glycoprotein, which has a deleted V3 loop, is much more efficient than precipitation of wild type. [Wyatt1992] (**antibody binding site definition and exposure**)
- F105: MAb cDNA sequence – V H4 V71-4 rearranged with a D H D-D fusion product of dlr4 and da4, and with J H5 – V kappa is from the Humvk325 germline gene joined with Jkappa 2. [Marasco1992] (**antibody sequence, variable domain**)
- F105: Amino acid substitutions that impair F105 neutralization inhibit gp120-CD4 interaction. [Thali1992a] (**antibody binding site definition and exposure**)
- F105: F105 neutralization escape mutants result from changes in amino acids in discontinuous regions: C2, 256-262 and C3, 386-370. [Thali1991] (**antibody binding site definition and exposure**)
- F105: First description of F105, binds topographically near the CD4-binding site – inhibits binding of free, infectious virions to uninfected HT-H9 cells, but does not react with virus adsorbed to uninfected HT-H9 cells – soluble rCD4 pre-bound to infected cells inhibits F105 binding – F105 inhibits infection of HT-H9 cells in standard neutralization assays with HIV-1 and MN strains. [Posner1991] (**antibody binding site definition and exposure**, **antibody generation**)

1004	F91 (F-91)	Env	gp120		no

- F91: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- F91: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- F91: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F91:Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- F91: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. [Raja2003] (**co-receptor**)
- F91: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished. [Pantophlet2003a] (**antibody binding site definition and exposure**)
- F91: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b] (**antibody binding site definition and exposure**)
- F91: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002] (**antibody binding site definition and exposure**)
- F91: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000] (**antibody binding site definition and exposure**)
- F91: CD4BS MAbs 15e, 21h, and F91 bind with even lower affinity than 205-43-1 and 205-42-15 to JRFL oligomer – conclusions of this paper contrast with [Parren1998a] [Fouts1998]. [Fouts1998, Parren1998a] (**antibody binding site definition and exposure**)
- F91: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4BS MAbs 15e, F91 and IgG1b12 bound better to the deleted protein than to wild type. [Binley1998] (**antibody binding site definition and exposure**)
- F91: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**antibody binding site definition and exposure**)
- F91: Weak inhibition of binding of Hx10 to CD4 positive or negative cells, weakly neutralizing. [Mondor1998]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- F91: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – F91 bound monomer, did not bind oligomer or neutralize JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- F91: Unusual pattern of reciprocal enhancement with several anti-V2 and V3 directed MAbs – reciprocal inhibition of other CD4BS MAbs. [Moore1996] (**antibody binding site definition and exposure**, **antibody interactions**)
- F91: Has strong cross-reactivity with gp120 monomers from most subtypes, A-F. [Moore1994b] (**inter-clade comparisons**)
- F91: Called F-91 – neutralizes IIIB – reactive with SF-2 gp120 – strong inhibition of HIV+ human sera binding to IIIB gp120. [Moore1993a] (**variant cross-recognition or cross-neutralization**)

1005 GP13 (ARP3054) Env gp120 L HIV-1 infection human (IgG1)

Ab type CD4BS

References Gorny2004, Vella2002, Schutten1997, Schutten1996, Wisnewski1996, Bolmstedt1996, Schutten1995b, Schutten1995a, Bagley1994, Back1993, Schutten1993

Keywords antibody binding site definition and exposure, antibody interactions, antibody sequence, variable domain, assay development, binding affinity, enhancing activity, escape, inter-clade comparisons, review, variant cross-recognition or cross-neutralization.

- GP13: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- GP13: UK Medical Research council AIDS reagent: ARP3054.
- GP13: Called ARP3054: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. [Vella2002] (**assay development**)
- GP13: Neutralized (50%) an SI-env chimeric virus and enhanced (>5 fold) an NSI-env chimeric virus. [Schutten1997] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- GP13: IIIB neutralizing MAbs *in vitro* fail to neutralize in a mouse model *in vivo*. [Schutten1996]
- GP13: GP13 is V H5 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- GP13: Sera were obtained from guinea pigs vaccinated either with gp160, or with gp160 lacking N-linked glycans at N406, N448, and N463 – these sera could block equally well both the CD4 BS MAb GP13 and the V3 MAb F58/H3. [Bolmstedt1996] (**antibody interactions**)
- GP13: Neutralizes T-cell adapted viruses but not the SI strain 16.2, despite high binding affinity. [Schutten1995b] (**variant cross-recognition or cross-neutralization**, **binding affinity**)
- GP13: Neutralizes IIIB – only slight inhibition of SI phenotype, and strong enhancement of NSI phenotype chimeric viruses, that incorporated different envs from the same donor. [Schutten1995a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- GP13: Mutations in a neutralization resistant isolate obtained by passage of the IIIB isolate in chimpanzees reduced neutralization, but the escape was not as clear as seen with anti-V3 MAbs. [Back1993] (**escape**)
- GP13: Neutralized a broad range of HIV-1 strains from phylogenetically different subfamilies – the following gp120 amino acid substitutions strongly inhibit binding: 256(S/Y), 257(T/G), 262(N/T), 368(D/R or K), 370(E/R or Q or D), 384(Y/E) [Schutten1993] (**antibody binding site definition and exposure**, **inter-clade comparisons**)

1006 GP44 Env gp120 L HIV-1 infection human (IgG1)

Ab type CD4BS

References Gorny2004, Wisnewski1996, Bagley1994, Schutten1993

Keywords antibody binding site definition and exposure, antibody sequence, variable domain, review, variant cross-recognition or cross-neutralization.

- GP44: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- GP44: GP44 is V H1 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- GP44: Exhibited a more restricted pattern of neutralizing activity than GP13 and GP68 – the following gp120 amino acid substitutions strongly inhibit binding: 256(S/Y), 257(T/G), 262(N/T), 368(D/R or K), 370(E/R or Q or D) [Schutten1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

1007 GP68 Env gp120 L HIV-1 infection human (IgG1)

Ab type CD4BS

References Gorny2004, Guillon2002, Wisnewski1996, Schutten1995a, Bagley1994, Klasse1993a, Schutten1993

Keywords antibody binding site definition and exposure, antibody sequence, variable domain, enhancing activity, review, variant cross-recognition or cross-neutralization.

- GP68: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)
- GP68: UK Medical Research Council AIDS reagent: ARP3055.
- GP68: The affect of Ab binding on infectivity was studied by pseudotyping three related envs with different phenotypes – R5 viruses were preferentially enhanced, not X4 – the V3 region was the main determinant of Ab-mediated enhancement and modulation of the interaction between CCR5 and gp120 is critical – tests with MAbs anti-V3 391/95-D and CD4BS-specific GP68 indicate that Ab specificity did not determine whether or not infectivity was enhanced or neutralized, rather the phenotype was determined by Envelope conformation. [Guillon2002] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- GP68: GP68 is V H1 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. [Wisnewski1996] (**antibody sequence, variable domain**)
- GP68: Neutralizes IIIB – only slight inhibition of SI phenotype, and strong enhancement of NSI phenotype chimeric viruses, that incorporated different envs from the same donor. [Schutten1995a] (**variant cross-recognition or cross-neutralization**)
- GP68: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to a class of conformation sensitive neutralizing MAbs – GP68 required markedly higher concentrations to neutralize the mutant than wild type. [Klasse1993a] (**antibody binding site definition and exposure**)
- GP68: Neutralized a broad range of HIV-1 lab strains from phylogenetically different subfamilies – the following gp120 amino acid substitutions strongly inhibit binding: 117(K/W), 256(S/Y), 257(T/G), 262(N/T), 368(D/R or K), 370(E/R or Q), 384(Y/E), 435(Y/H) [Schutten1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

1008 HF1.7 Env gp120 L anti-idiotype mouse (IgM)

Ab type CD4BS

References Chanh1987

- HF1.7: An anti-Id antibody stimulated by anti-CD4 MAb Leu-3a binds to recombinant gp160, suggesting HF1.7 mimics CD4. [Chanh1987]

1009 HT5 (205-43-1) Env gp120 L (weak) HIV-1 infection human

Ab type CD4BS **Research Contact** Ciba-Geigy AG (Basel, Switzerland), and Tanox Biosystems, Houston, Texas

References Gorny2004, Herrera2003, Grovit-Ferbas2000, Parren1998a, Fouts1998, Fouts1997, Moore1995a, Moore1994b

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, inter-clade comparisons, review, vaccine antigen design, variant cross-recognition or cross-neutralization.

- HT5: Also called 205-43-1. This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. [Gorny2004] (**review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- HT5: Called 205-43-1: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. [Grovit-Ferbas2000] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- HT5: Called 205-43-1 – CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (nonneutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the nonneutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – the nonneutralizing MAbs partially competed with b12 for Env binding of the surface of Env-transfected cells – this suggests Env has two categories of binding site for CD4BS MAbs, one recognized by both b12 and nonneutralizing CD4BS MAbs, the other is recognized by only b12 – Ab-gp120 interactions based on the use of monomeric gp120 or Env-transfected cells do not predict the outcome of HIV-1 neutralization assays, and they should be interpreted with caution. [Herrera2003] (**antibody binding site definition and exposure**, **antibody interactions**)
- HT5: HT5 and HT6 bind JRSF oligomer but with low affinity, and are not neutralizing – conclusions of this paper contrast with [Parren1998a] [Fouts1998]. [Fouts1998, Parren1998a] (**antibody binding site definition and exposure**)
- HT5: MAbs IgG1b12, HT5, HT6, and HT7 cross-compete for binding to monomeric gp120, bind equally well, inhibit gp120-sCD4 interactions, but only IgG1b12 neutralizes JRFL. [Fouts1997] (**antibody binding site definition and exposure**, **antibody interactions**)
- HT5: 205-46-9 was cross-reactive across clades A-F, 205-43-1 very cross-reactive but not quite as extensive 205-46-9. [Moore1994b] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- HT5: Despite highly cross-reactive binding to many primary and T-cell adapted viral strains, only weakly neutralizes IIIB and MN. [Moore1995a] (**variant cross-recognition or cross-neutralization**)
- HT5: HT5, HT6, and HT7 are also known as 205-43-1, 205-42-15, and 205-46-9, respectively. Rank order of CD4BS antibodies oligomer binding is IgG1b12 = 2G6 = 205-46-9 > 205-43-1 = 205-42-15 > 15e = 21h = F91, and the only thing notably distinguishing about neutralizing IgG1b12 is that it depends on residues in V2. [Fouts1998] (**binding affinity**)

1010	HT6 (205-42-15)	Env	gp120		L (weak)	HIV-1 infection	human

- IgG1b12: 4KG5, a single-chain Fv (scFv), reacts with a conformational epitope which is formed by the V1, V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Denaturation of gp120 abolished binding of 4KG5 and Fab b12. Addtionally, binding of 4KG5 was abrogated when any of the V1, V2 or V3 loops were deleted. Of a panel of Abs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished or abroated binding: V2 loop MAbs (G3-4, G3-136), V3 loop MAbs (19b, 447-52D, hNM01, AH48, loop2, F425 B4e8, 694-88D), V3-C4 (G3-299, G3-42, G3-519, G3-537), CD4BS (b6, b3, F91, F105, 15e, L33, 1008-D, 654-30D, 559-64D, 1027-30D, Ia3, Ia7, FG39, Fbb14). MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1, V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. 4KG5 did not enhance IgG1b12 neutralization. [Zwick2003] (**antibody binding site definition and exposure**, **antibody interactions**)
- IgG1b12: This paper describes an attempt to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Four Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with seven N-linked glycosylation site sequons and this combination minimized the binding of non-neutralizing MAbs. b12 affinity was lowered, and binding of non-neutralizing MAbs was knocked out. C1 and C5 regions were then removed to eliminate the epitopes for MAbs against these regions, but these also diminished IgG1b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- IgG1b12: The HIV-1 primary isolate DH012 has preserved the epitopes for the MAbs IgG1b12, 2G12, 17b, however natural DH012 infection in chimpanzees and DH012 gp120 vaccination in guinea pigs does not give rise to Abs against these epitopes. [Zhu2003] (**vaccine-specific epitope characteristics**)
- IgG1b12: Called b12. The NAb b12 was administered locally to the vagina in macaques and could protect against subsequent vaginal infection with SHIV-162P4. This NAb model of a topical microbicide was dose dependence, and was effective for up to 2 hours after administration. [Veazey2003] (**immunoprophylaxis**, **mucosal immunity**)
- IgG1b12: AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessaton of therapy, which then declined to a low level. The polylconal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. [Montefiori2003] (**escape**)
- IgG1b12: Recombinant adeno-associated virus was used to deliver the IgG1b12 gene into mice by injection. IgG1b12 was expressed in these mice for over 6 months after the primary injection. This strategy allows for predetermined Ab specificity, and could ultimately be used with synergistic Ab combinations. [Lewis2002] (**immunoprophylaxis**, **vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: Called b6. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. Enthalpy and entropy changes were divergent, but compensated. CD4 and MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy of binding to the gp120 monomer (mean: 26.1 kcal/mol, range 18.6-31.5), but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding and ordering of amino acids upon binding. NAb 2G12 had an entropy value of -1.6. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding that is not faced by other anti-gp120 antibodies. [Kwong2002] (**antibody binding site definition and exposure**, **structure**)
- IgG1b12: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. [Kitabwalla2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**)
- IgG1b12: Called b12. The Fab m18 was selected from a human phage display library by a new method called sequential antigen panning (SAP), using a series of antigens to screen the library to pick broadly cross-reactive isolates. The ability to block cell mediated fusion by m17 was compared to Fabs X5 and b12 for a clade A, CRF01 EA, G, and 6 clade B isolates, and the inhibitory activity of m18 was slightly lower but comparable to neutralizing Fabs b12 and X5. [Zhang2003] (**inter-clade comparisons**)
- IgG1b12: Called b12. Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. [Wang2003] (**vaccine antigen design**, **review**)
- IgG1b12: This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. [Mascola2003a] (**immunoprophylaxis**, **review**)
- IgG1b12: Called IgG1 b12. IgG1b12 induces strong ADCC and CDC cytoxicity of HIV-1 infected cells. A panel of mutants in the Fc region of IgG1b12 was generated. K322A reduced ADCC binding of FcγR and abolished complement-dependent cytotoxicity (CDC) and C1q binding. L234A plus L235 in the lower hinge region of the IgG1 heavy chain abolished both FcγR and C1q binding and ADCC and CDC. These mutants did not impact IgG1b12's ability to neutralize virus. [Hezareh2001] (**ADCC**, **complement**)
- IgG1b12: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. [Raja2003] (**co-receptor**)
- IgG1b12: Called IgG1 b12. This paper is a study of the 2F5 NAb complexed to peptide ELDKWAS; the peptide was found to interact with amino acids near the base of the very long (22 residue) CDR 3H region of the Ab, although a Phe at the apex of the loop was also important. The authors suggest that particularly long CDR H3 regions may be a common feature of HIV-1 neuturalizing antibodies – there are 22 residues in 2F5's H3, 18 in IgG1b12's H3, and 22 residues in X5's H3. They express concern that because small animals like mice are be unable to elicit Ab responses with such long H3s, they may be poor model systems for HIV vaccine studies. [Zwick2004] (**antibody interactions**)
- IgG1b12: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. [Ferrantelli2003] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. [Dey2003] (**immunoprophylaxis**, **immunotherapy**)
- IgG1b12: Called 1b12. The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. CD4BS MAb IgG1b12 had no effect on B4e8 binding. [Cavacini2003] (**antibody interactions**)
- IgG1b12: This study examined Ab interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 to both R5X4 and R5 isolates, but had no effect on neutralization. Anti-V3 MAb B4a1 increased CD4BS MAbs IgG1b12 and F105 to R5X4 virions, but only IgG1b12 binding was increased by B4a1 to the R5 isolate, and neutralization was not impacted. [Cavacini2002] (**co-receptor**)
- IgG1b12: Neutralization assays with rsCD4, MAbs, and serum samples from SHIV-infected macaques and HIV-1 infected individuals were used to characterize the antigenic properties of the env glycoprotein of six primary isolate-like or TCLA SHIV variants. IgG1b12 neutralized SHIV strains HXBc2, KU2, 89.6, but not 89.6P and KB9. 89.6 is a dual tropic primary isolate that is not pathogenic in macaques, 89.6P is a highly pathogenic form of 89.6 obtained after passage in macaques, and KB9 is a molecular clone of 89.6P. Neutralization resistance was cell line independent. [Crawford1999] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. IgG1b12 neutralized SOS and WT proteins comparably, and neither IgG1b12 nor the Fab b12 could neutralize well post-attachment, consistent with the notion that theb12 binding site would be blocked upon cellular binding. [Binley2003] (**vaccine antigen design**)
- IgG1b12: IgG1b12 neutralized many South African (5/8) and Malawian (4/8) clade C primary HIV-1 isolates, being more effective than 2F5 which neutralized only two Malawian and no South African isolates. 2G12 did not neutralize any of the 16 isolates. [Bures2002] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- IgG1b12: NIH AIDS Research and Reference Reagent Program: 2640IgG1b12 was more effective than 2G12 and 2F5 in neutralizing 5/8 south african and 4/8 malawian clade C primary HIV-1 isolates in a p24 ELISA capture assay. (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- IgG1b12: UK Medical Research Council AIDS reagent: ARP3065.
- IgG1b12: Called b12 – CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (nonneutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the nonneutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – the nonneutralizing MAbs partially competed with b12 for Env binding of the surface of Env-transfected cells – this suggests Env has two categories of binding site for CD4BS MAbs, one recognized by both b12 and nonneutralizing CD4BS MAbs, the other is recognized by only b12 – Ab-gp120 interactions based on the use of monomeric gp120 or Env-transfected cells do not predict the outcome of HIV-1 neutralization assays, and they should be interpreted with caution. [Herrera2003] (**antibody interactions**)
- IgG1b12: Called b12 – Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 binding to those that affect binding of sCD4 and two non-neutralizing anti-CD4BS Abs b3 and b6 – while the epitope maps overlapped, there were some differences observed – binding of CD4 was never in enhanced, indicating it had evolved to be optimal – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded – for twelve mutants, b12 neutralization sensitivity and affinity correlated, but for five mutants neutralization efficiency was maintained or increased despite a decrease in affinity suggesting that the subsitutions that influence b12 binding to the monomer are different that those that impact neutralization sensitivity to the trimer. [Pantophlet2003a] (**antibody binding site definition and exposure**, **binding affinity**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: Virion capture assays are not a good preditor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, but anti-V3 Abs 447-52D and 19b, which did not neutralize JR-CSF and ADA captured amounts of p24 equal to or higher than the amounts captured by the neutralizing Ab b12. [Poignard2003] (**assay development**, **variant cross-recognition or cross-neutralization**)
- IgG1b12: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. [Liu2002] (**review**)
- IgG1b12: Review of NAbs that notes IgG1b12 is a recombinant IgG1 from a phage displayed Fab generated against gp120 from a B clade infected individual, that it binds the CD4BS, that alone or in combination with other MAbs it can protect some macaques against SHIV infection, and that it has strong ADCC activity. [Ferrantelli2002] (**review**)
- IgG1b12: A broad review of NAbs that mentions IgG1b12 as an example of a NAb that does not alter the conformation of gp120, but interferes with CD4 binding. [Klasse2002] (**review**)
- IgG1b12: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: HIV-1 gp160ΔCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160ΔCT with a reconstituted membrane ten-fold better than the same protein on beads—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160ΔCT PLs indistinguishably from gp160ΔCT expressed on the cell surface—non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12—the MAb 17b was sCD4 inducible on gp160ΔCT PL. [Grundner2002] (**vaccine antigen design**)
- IgG1b12: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- IgG1b12: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b] (**antibody binding site definition and exposure**)
- IgG1b12: Called ARP3065: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. [Vella2002] (**assay development**)
- IgG1b12: A modified gp140 (gp140ΔCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. [Chakrabarti2002] (**vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. [Xu2002] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **inter-clade comparisons**)
- IgG1b12: Alanine scanning mutagenesis used in conjunction with competition and replacement studies of N-linked carbohydrates and sugars suggest that the 2G12 epitope is formed from mannose residues contributed by the glycans attached to N295 and N332, with the other N-linked carbohydrates in positions N339, N386, and N392 playing a role in maintaining conformation relevant to 2G12 binding – N295A and N332A mutants showed essentially unchanged anti-CD4BS NAb b12 binding affinities, while N339A, N386A and N392A mutants displayed significantly lowered b12 affinity, presumably due to conformational changes. [Scanlan2002] (**antibody binding site definition and exposure**)
- IgG1b12: The crystal structure of IgG1b12 is resolved and is the first structure of an intact human Ab with an ordered, full length hinge – the structure is extremely asymmetric and flexible with an antigen-binding site that has an unusually long CDR H3 region with a ten residue insertion that projects above the rest of the antigen-binding site – this loop may be required for recognition of the recessed CD4 binding site of gp120. [Saphire2002] (**structure**)
- IgG1b12: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140Δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002] (**vaccine antigen design**)
- IgG1b12: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140 – SOS gp140-2F5-IgG1b12 formed multiple ring structures composed of two SOS gp140 proteins bridged by two Ab molecules, while 2F5 and 2G12 formed extended chains rather than closed rings. [Schulke2002] (**vaccine antigen design**)
- IgG1b12: Deglycosylation of gp120 does not significantly affect IG1b12 binding, in contrast to MAB 2G12. [Sanders2002] (**antibody binding site definition and exposure**)
- IgG1b12: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. [Golding2002b]
- IgG1b12: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – Abs directed against the CD4 binding site (IgGCD4 and IgG1b12) reacted slightly more strongly with the gp120 monomer than with the oligomer, as did sCD4. [Srivastava2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- IgG1b12: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. [Xu2001] (**inter-clade comparisons**)
- IgG1b12: A combination of MAbs IgG1b12, 2F5, and 2G12 was given postnatally to four neonates macaques that were then challenged with highly pathogenic SHIV89.6P – one of the four infants remained uninfected after oral challenge, two infants had no or a delayed CD4(+) T-cell decline – the most potent combination included IgG1b12, which alone does not alone neutralize SHIV89.6P. [Hofmann-Lehmann2001] (**antibody interactions**, **immunoprophylaxis**)
- IgG1b12: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 M Abs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**, **co-receptor**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: A luciferase-reporter gene-expressing T-cell line was developed to facilitate neutralization and drug-sensitivity assays – luciferase and p24 antigen neutralization titer end points were found comparable using NAb from sera from HIV+ donors, and MAbs 2F5, 2G12 and IgG1b12. [Spenlehauer2001] (**assay development**)
- IgG1b12: Neutralizing synergy between MAbs 1b12, 2G12 and 2F5 was studied using surface plasmon resonance to determine the binding kinetics for these three MAbs with respect to monomeric and oligomeric env protein gp160 IIIB – the 2G12 epitope is highly accessible on both monomeric and oligomeric Envs, 1b12 is highly accessible on monomers but not oligomers, and 2F5 on neither form – binding of 2G12 exposes the 2F5 epitope on gp160 oligomers. [Zeder-Lutz2001] (**antibody interactions**)
- IgG1b12: Structural aspects of the interaction of neutralizing Abs with HIV-1 Env are reviewed – Env essentially has three faces, one is largely inaccessible on the native trimer, and two that exposed but have low immunogenicity on primary viruses – neutralization is suggested to occur by inhibition of the interaction between gp120 and the target cell membrane receptors as a result of steric hindrance and it is noted that the attachment of approximately 70 IgG molecules per virion is required for neutralization, which is equivalent to about one IgG molecule per spike – the 2G12, 17b and b12 epitopes are discussed in detail – the structure of CD4-bound gp120 reveals features that HIV has evolved to escape anti-CD4BS Abs like IgG1b12 despite profound functional constraints – CD4BS Abs must first access the CD4 binding site, deeply recessed within the gp120 core, and the Fab of an Ab molecule is "wider" than CD4, and in addition the binding site is flanked by variable and glycosylated regions. [Poignard2001] (**review**, **structure**)
- IgG1b12: Intravenous passive transfer of MAb b12 provides dose-dependent protection from infection to macaques vaginally challenged with the R5 virus SHIV(162P4) – the primary isolate HIV-1SF162 is neutralized 90% (IC90) by b12 at 2 µg/ml, and SHIV162P4, derived from HIV-1SF162, was neutralized by 90% at 2 µg/ml in PHA-activated PBMC from rhesus macaques – the 90% neutralization titers achieved in three groups of animals that were given 25-, 5-, and 1-mg/kg doses were approximately 1:400, 1:80, and 1:16, respectively – the half-life of IgG1 b12 in plasma was about 1 week, but while the peak b12 plasma concentration was immediately after the infusion, the peak vaginal fluid concentration was 7-14 days later. [Parren2001] (**immunoprophylaxis**, **kinetics**)
- IgG1b12: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2 – whole IgG1b12 and b12 Fab fragments behaved similarly in the neutralization assays – there was no evidence for cooperativity of binding between b12 and 2G12 to envelope spikes expressed on the cell surface of TCLA or primary isolates. [Zwick2001c] (**antibody interactions**)
- IgG1b12: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – broadly neutralizing MAbs 2F5, IgG1b12, and 4E10 and Z13 fail to neutralize different subsets of viruses. [Zwick2001b] (**inter-clade comparisons**)
- IgG1b12: b12 recognizes a conformational epitope that overlaps with the CD4 binding site – a phage displayed peptide library was used to identify a peptide which bound b12, called B2.1, which competes with b12 in competition assays – B2.1 has significant homology to the D loop of gp120: upper case letters indicate residues B2.1 shares with gp120, heRsymFSDlenrcI – one of the goals of defining peptide mimics to the b12 epitope is to develop an immunogen that can stimulate b12-like antibodies, but B2.1 cross-linked to phage and ovalbumin bound IgG1b12 did not elicit cross-reactive gp120 Abs in mice or rabbits. [Zwick2001a] (**antibody binding site definition and exposure**, **mimotopes**)
- IgG1b12: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. [York2001] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Primary isolates YU2 and ADA are more resistant to IgG1b12 neutralization than HXBc2: 90% Neutralization of HXBc2 is observed with 1.25 ug of IgG1b12, while ADA and YU2 require 2.5 and 5 ug respectively to achieve 50% neutralization, and 90% neutralization could not be achieved with 10 or 20 ug of IgG1b12, respectively. [Yang2001] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: This paper describes the biological implications of the crystal structure of b12 – a remarkable feature of this antibody is a long protruding finger-like CDR H3 that can dock in the recessed CD4-binding site – a contact residues in gp120 are modeled, with numbering based on the variable loop-deleted crystal structure of gp120. [Saphire2001b] (**structure**)
- IgG1b12: This paper describes the technical aspects of the crystallization of b12 at a resolution of 2.7 angstroms with all 12 Ig domains resolved. [Saphire2001a] (**structure**)
- IgG1b12: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, except the mutation 197 S/R which resulted in a carbohydrate addition to 195 N that disrupts the IgG1b12 binding site. [Kolchinsky2001] (**antibody binding site definition and exposure**)
- IgG1b12: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. [Si2001]
- IgG1b12: Fab b12 was used – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000]
- IgG1b12: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12, binding to 22 of 26 isolates tested – 8 MAbs were tested for neutralization and MAb IgG1b12 was most potent, with 90% neutralization of 3/5 isolates tested. [Nyambi2000] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- IgG1b12: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not enhance neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows increased infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000] (**escape**)
- IgG1b12: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. [Grovit-Ferbas2000] (**vaccine antigen design**)
- IgG1b12: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**vaccine antigen design**)
- IgG1b12: Hu-PBL-SCID mice were infected with HIV-1s JRCSF and SF162 to study the effect of NAbs on an established infection – at day 6 post infection, mice were given 50 mg/kg of b12, an amount that would have been protective if given up to 8 hours post-infection, and 100-fold higher than the amount required for 90% neutralization *in vitro* – no significant differences in the initial rate of decrease in viral load or the plateau levels of viral RNA between the b12 treated and control mice were seen – in most of the Ab treated mice escape mutants were observed with varying patterns of mutations – a combination of b12, 2G12 and 2F5 protected 1/3 mice, and an isolate from one of the other two was resistant to neutralization by all three MAbs. [Poignard1999] (**escape**, **immunotherapy**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: does not inhibit attachment of virus to cells and was used as a control of a study of neutralization by a MAb F58 based micro antibody. [Jackson1999]
- IgG1b12: A meeting summary presented results regarding neutralization – D. Burton and J. Mascola presented results concerning passive immunization and protection of hu-PBL-SCID mice and macaques, respectively, and both found combinations of MAbs that were able to achieve 99% neutralization *in vitro* corresponded to efficacy *in vivo*. [Montefiori1999] (**review**)
- IgG1b12: rgp120 derived from a R5X4 subtype B virus was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – TCLA strains showed enhanced IgG1b12 neutralization sensitivity relative to PBMC-adapted lines – IgG1b12 was able to bind, with low affinity, to the rgp120 monomer HIV-1 W61D. [Beddows1999] (**co-receptor**)
- IgG1b12: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. [Hioe1999] (**antibody interactions**)
- IgG1b12: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. [Frankel1998] (**antibody interactions**, **mucosal immunity**)
- IgG1b12: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2, but not V1, diminished neutralization by CD4BS MAb IgG1b12, in contrast to 654.30D and IgGCD4. [Stamatatos1998] (**vaccine antigen design**)
- IgG1b12: anti-C1 region MAb 87-135/9 blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) [Kropelin1998] (**antibody interactions**)
- IgG1b12: Fab b12 – the HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab fragment b12 also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism, while neutralizing HXBc2. [Sullivan1998a]
- IgG1b12: MAbs 654-D100 and IgG1b12 neutralized viruses HIV-BRU and a mutated virus that lacks the V3 loop glycan equally effectively – in contrast, sera from guinea pigs immunized with BRU gp120 neutralize viruses more effectively that lack the V3 glycan. [Schonning1998] (**antibody binding site definition and exposure**)
- IgG1b12: Immunoprecipitation of gp120 and gp160 expressed from a rec Semliki Forest virus by F105 and IgG1b12 indicated that the SFV expressed HIV-1 Env was folded appropriately – and SVF-HIV-1 Env vaccine gave the strongest anti-HIV-1 Env response in mice, when compared to an HIV-1 Env DNA vaccine and a rgp160 protein. [Brand1998] (**vaccine antigen design**)
- IgG1b12: MAbs 2G12, 2F5 and b12 are broadly neutralizing, as are some human polyconal sera, but this paper describes a set of primary isolates that are resistant to all three MAbs and 2 broadly neutralizing sera – results indicate that resistance levels of pediatric isolates might be higher than adult isolates – resistance in general did not seem to be conferred by a loss of binding affinity for gp120 or gp41, rather by a more global perturbation of oligomeric Envelope. [Parren1998b] (**variant cross-recognition or cross-neutralization**, **responses in children**)
- IgG1b12: Induces Complement-mediated lysis in MN but not primary isolates – primary isolates are refractive to CML. [Takefman1998] (**complement**)
- IgG1b12: Binds JRSF oligomer with high affinity, as do 205-46-9 and 2G6, but IgG1b12 is neutralizing, the other two are not – conclusions of this paper contrast with Parren98 – authors propose a model where 205-46-9 and 2G6 may inhibit CD4 binding, but cause a conformational shift which enhances CCR5 binding and thus counteracts the neutralizing effect – rank order of CD4BS antibodies oligomer binding is IgG1b12 = 2G6 = 205-46-9 > 205-43-1 = 205-42-15 > 15e = 21h = F91, and the only thing notably distinguishing about neutralizing IgG1b12 is that it depends on residues in V2. [Fouts1998] (**antibody binding site definition and exposure**)
- IgG1b12: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4BS MAbs 15e, F91 and IgG1b12 bound better to the deleted protein than to wild type. [Binley1998] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. [Connor1998] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: IgG1b12, Fab b12 and 3B3 derived from b12 were all included in this study – the rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope – binding affinity of divalent IgG1b12 is 17-fold greater than monovalent Fab b12. [Parren1998a] (**binding affinity**)
- IgG1b12: Enhances binding of Hx10 to CD4 positive or negative HeLa cells, inhibits binding to CD4+ T-cell line A3.01 – neutralizes HeLa and A3.01 cell Hx10 infection. [Mondor1998]
- IgG1b12: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding – IgG1b12 is an unusual CD4BS antibody because it is particularly potent as a neutralizing antibody and it is susceptible to changes in the V1-V2 stem loop structure, and so it may disrupt an interaction between CD4 and conserved amino acids on the V1-V2 stem. [Wyatt1998a] (**structure**)
- IgG1b12: MAb was slightly more efficient at neutralization than Fab – inhibits viral binding to cells and viral entry – doesn't affect CD4-independent binding to T-cells. [Valenzuela1998]
- IgG1b12: Fab b12 is unusual in that it binds to gp140 and monomeric gp120 with similar affinities, and with a higher affinity to the native oligomer—authors propose this antibody may be exceptional because it binds the virus rather than viral debris—IgG1b12 can protect against infection prior to or shortly after challenge of hu-PBL-SCID mice with TCLA strains and primary strains, but the serum concentrations required *in vivo* were higher than for *in vitro* neutralization. [Parren1997c, Parren1997b] (**antibody binding site definition and exposure**, **immunoprophylaxis**)
- IgG1b12: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – IgG1b12 blocks CD4 binding and is the most potent neutralizing Ab – many 15 and 21-mer phage inserts were recognized, but it was not possible to derive a consensus – common features were a W and at least one acidic residue, and one sequence was found multiple times: NWPRWWEEFVDKHSS, and this peptide could compete with gp120 – two short stretches found in the phage peptides might mimic gp120 components of the epitope: positions 382-384, FFY(I), and 423-426 I(FV)I(V)NM. [Boots1997] (**mimotopes**)
- IgG1b12: In this review, the technique and potential application of Fab expression and selection in phage display libraries, and subsequent production of IgG molecules is discussed – b12 is exceptionally potent at neutralization and can successfully neutralize most B clade primary isolates, and many isolates from other subtypes as well – 3B3 was derived from b12 by selection for higher affinity using the CDR walking strategy – 3B3 has 8-fold enhancement of binding, a linear correlation was found between neutralization and affinity, and 3B3 can neutralize strains b12 cannot. [Parren1997a] (**binding affinity**, **review**)
- IgG1b12: This is a review that includes a description of IgG1b12, noting approximately equivalent affinities for sgp120 and unprocessed gp160, and somewhat enhanced affinity for the native oligomer on TCLA viruses – primary viruses have reduced affinity, but still in the useful range for neutralization – there can be complete protection in hu-PBL-SCID mice with Ab even when administered several hours after viral challenge – competes with sCD4, but unlike other CD4BS antibodies, it is sensitive to mutations in V2. [Burton1997] (**review**)
- IgG1b12: Major deletions in C1 and C5 and deletions of the V1V2 and V3 loops do not diminish binding. [Wyatt1997] (**antibody binding site definition and exposure**)
- IgG1b12: Viral binding inhibition by IgG1b12 strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997]
- IgG1b12: Review: MAbs 2F5, 2G12 and IgG1b12 have potential for use in combination with CD4-IgG2 as an immunotherapeutic or immunoprophylactic – homologous MAbs to these are rare in humans and vaccine strategies should consider including constructs that may enhance exposure of these MAbs' epitopes. [Moore1997] (**review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: 35 primary isolates were tested and all were neutralized by IgG1b12 (including 4, UG270, RW92/026, ZB20, and 301727 which been had reported as not neutralized by IgG1b12 [Trkola1995]) – IgG1b12 could neutralize even when added after the virus to the culture – selection for 400-fold increased affinity did not enhance neutralization by antibody – IgG1b12 was more potent with greater breadth than MAb 2F5 [Kessler II1997]. [Kessler II1997, Trkola1995] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- IgG1b12: b12 was used in its IgG1 form – of 14 human MAbs, the most potent neutralizer of SHIV-vpu+, which expressed HIV-1 IIIB env – all Ab combinations tested showed synergistic neutralization – b12 has a synergistic response with MAbs 694/98-D (anti-V3), 2F5, and 2G12. [Li1997] (**antibody interactions**)
- IgG1b12: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – IgG1b12 bound monomer, oligomer, and neutralized JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- IgG1b12: JRCSF was cultured in the presence of IgG1b12 until a 100-fold resistance to neutralization was selected – resistance was due to three changes: V2 substitution D182N and C3 substitution P365L conferred resistance, and V2 D164N was also required for a viable virus – IgG1b12 resistant virus remained sensitive to MAbs 2G12 and 2F5. [Mo1997] (**escape**)
- IgG1b12: Inhibited some SI- and NSI-env chimeric viruses but enhanced one NSI-env chimeric virus 3 fold. [Schutten1997] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- IgG1b12: In a multilab evaluation of monoclonal antibodies, only IgG1b12, 2G12, and 2F5 could neutralize at least half of the 9 primary test isolates at a concentration of < 25 mug per ml for 90% viral inhibition – IgG1b12 failed to neutralize only 1/9 primary isolates, although there was some variation between test sites. [D'Souza1997] (**variant cross-recognition or cross-neutralization**, **assay standardization**)
- IgG1b12: Review: Only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. [Sattentau1996] (**review**)
- IgG1b12: Neutralizes JR-FL – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**antibody binding site definition and exposure**)
- IgG1b12: Anti-CD4BS MAbs 15e, 21h, and IgG1b12 did not cause gp120 dissociation from virus, or exposure of the gp41 epitope of MAb 50-69, in contrast to CD4i MAb 48d and anti-V3 neutralizing MAbs. [Poignard1996a] (**antibody interactions**)
- IgG1b12: Review: Unique among anti-CD4BS MAbs in terms of being potent against both lab adapted virus and primary isolates – one of three MAbs (IgG1b12, 2G12, and 2F5) generally accepted as having significant potency against primary isolates. [Poignard1996b] (**review**)
- IgG1b12: Potent neutralizing *ex vivo* of virus taken directly from plasma of HIV-1 infected individuals – little correlation between neutralization sensitivity of passaged virus and plasma derived virus – more effective than MAb 19b. [Gauduin1996] (**antibody interactions**)
- IgG1b12: Saturation mutagenesis of the complementarity-determining region and optimization strategies were used to create very high affinity versions of this Fab – increased affinity was dominated by a slowing of the off rate. [Yang1997c] (**binding affinity**)
- IgG1b12: Fab b12 showed potent neutralization of T-cell-line-adapted strains, but much reduced neutralization of 3 primary isolates – 2 of the 3 primary isolates also had reduced binding affinity, but the third was as efficiently immunoprecipitated as HXBc2. [Sullivan1995] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Because Fab b12 shows reduction in binding when the V2 loop is deleted and when aa 183/184 PI/SG substitutions are made competition studies were done with Fab L78 and anti-V2 MAbs SC258 and 684-238 and they do not compete with IgG1b12. [Ditzel1995] (**antibody interactions**)
- IgG1b12: Could potently neutralize primary isolates from within clade B, but showed a slight reduction in efficacy outside of clade B. [Trkola1995] (**inter-clade comparisons**)
- IgG1b12: Review: unusual properties for anti-CD4 BS MAb: sensitive to V2 substitutions, preferential recognition of the oligomer on the cell surface. [Moore1995b] (**review**)
- IgG1b12: Called BM12 – broad cross-clade neutralization of primary isolates – additive neutralization in combination with MAb 2F5. [Kessler1995] (**antibody interactions**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- IgG1b12: Complete protection against HIV-1 infection was achieved in hu-PBL-SCID mice by passive immunization with physiologically relevant doses – pharmacokinetics showed serum half-life of 30.2 +/- 1.3 hours for Fab b12 and 7.4 +/- 0.7 days for IgG1 b12 in mice, but IgG1 half-lives in human are generally between 21-23 days. [Parren1995, Parren1997a] (**immunoprophylaxis**, **kinetics**)
- IgG1b12: Anti-CD4 binding site MAb – very potent neutralization of a number of primary isolates. [Moore1995a] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. [Sattentau1995c] (**vaccine antigen design**)
- IgG1b12: Cross-reactive with some gp120s, (but not all), from clades A-D – not reactive with gp120 from clades E or F. [Moore1994b] (**inter-clade comparisons**)
- IgG1b12: Very potent neutralization, of primary and lab strains, at concentrations that could be achieved by passive immunization – reduced binding with A,C, and D clade viruses relative to B clade, poor reactivity with E clade – isolates that were refractive to neutralization by sera from HIV-1+ donors could be neutralized by IgG1 b12. [Burton1994] (**inter-clade comparisons**)
- IgG1b12: Anti-CD4 binding site Fab, potent neutralizing activity, greater affinity for a subpopulation of gp120 molecules suggested to be in a mature confirmation – mutations in gp120 that abrogate binding: 368 D/R or D/T, 370 E/R, and 477 D/V, of clone HXBc2 of LAI – sensitive to V1 and V2 substitutions. [Roben1994] (**antibody binding site definition and exposure**)
- IgG1b12: The original Fab fragment was derived from a combinatorial phage library from bone marrow of an HIV-1 positive individual who had been asymptomatic for six years. [Burton1991] (**antibody generation**)
- IgG1b12: Fab b12 was derived from IgG1b12, Fab 3B3 was derived from Fab b12 by random mutagenesis and selected for increased affinity to sgp120 – database note. (**antibody generation**)

1015	IgGCD4 (IgG-CD4)	Env	gp120				human (IgG)

Ab type CD4BS

References Srivastava2002, Ly2000, Stamatatos1998, Capon1989

- IgGCD4: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – Abs directed against the CD4 binding site (IgGCD4 and IgG1b12) reacted slightly more strongly with the gp120 monomer than with the oligomer, as did sCD4. [Srivastava2002]
- IgGCD4: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000]
- IgGCD4: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 slightly enhanced neutralization by CD4BS MAb IgGCD4. [Stamatatos1998]
- IgGCD4: An antibody-like immunoadhesins molecule was constructed incorporating the gp120-binding domain of CD4. [Capon1989]

Ab type CD4BS

References Gorny2004, Ditzel1995

Keywords antibody binding site definition and exposure, antibody sequence, variable domain, review.

- L28: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. [Gorny2004] (**review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• L28: Substitutions at 257 T/R, 368 D/R, 370 E/R and 370 E/Q, 475 M/S 102 E/L and 463 N/D reduce binding – binding was enhanced by removal of the V3 loop and by substitutions 45 W/S, 298 R/G, 381 E/P, 382 F/L, 420 I/R, 435 Y/H or Y/R – binding is sensitive to deglycosylation – heavy and light chain variable region sequence is available. [Ditzel1995] (**antibody binding site definition and exposure**, **antibody sequence, variable domain**)					
1017	L33	Env	gp120		L	HIV-1 infection	human (IgG1κ)
		Ab type CD4BS **References** Gorny2004, Zwick2003, Ditzel1995 **Keywords** antibody binding site definition and exposure, antibody interactions, antibody sequence, variable domain, review. • L33: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. [Gorny2004] (**review**) • L33: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**) • L33: binding is sensitive to deglycosylation – heavy and light chain variable region sequence is available. [Ditzel1995] (**antibody binding site definition and exposure**, **antibody sequence, variable domain**)

Keywords binding affinity, immunoprophylaxis, review.

- b13: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. [Gorny2004] (**review**)
- b13: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**binding affinity**)
- b13: Fab b13 was used as a control in a hu-PBL SCID mouse study – animals were protected from HIV-1 SF2 infection by IgG1b12, somewhat by Fab b12, but not by b13. [Parren1995, Parren1997a] (**immunoprophylaxis**)

1042 b14 Env gp120 human

Ab type CD4BS

References Gorny2004, Parren1998a

Keywords binding affinity, review.

- b14: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. [Gorny2004] (**review**)
- b14: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**binding affinity**)

1043 b3 Env gp120 human

Ab type CD4BS

References Gorny2004, Pantophlet2003b, Zwick2003, Pantophlet2003a, Parren1998a, Parren1997c

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, review, vaccine antigen design, variant cross-recognition or cross-neutralization.

- b3: This review summarizes MAbs directed and HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. [Gorny2004] (**review**)
- b3: A gp120 molecule was design to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- b3: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)
- b3: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 binding to those that affect binding of sCD4 and two non-neutralizing anti-CD4BS Abs b3 and b6 – while the epitope maps overlapped, there were some differences observed – binding of CD4 was never in enhanced, indicating it had evolved to be optimal – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded. [Pantophlet2003a] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- b3: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**binding affinity**)
- b3: Neutralizes TCLA strains, but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)

1044 b6 Env gp120 L human

Ab type CD4BS **Research Contact** Dennis Burton, Scripps, San Diego, CA, USA

References Pantophlet2003b, Zwick2003, Pantophlet2003a, Poignard2003, Kwong2002, Parren1998a, Parren1997c

Keywords antibody binding site definition and exposure, antibody interactions, vaccine antigen design.

- b6: A gp120 molecule was design to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- b6: scFv 4KG5 reacts with a conformational epitope which is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. [Zwick2003] (**antibody interactions**)
- b6: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- b6: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 binding to those that affect binding of sCD4 and two non-neutralizing anti-CD4BS Abs b3 and b6 – while the epitope maps overlapped, there were some differences observed – binding of CD4 was never in enhanced, indicating it had evolved to be optimal – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded. [Pantophlet2003a]
- b6: Virion capture assays are not a good preditor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. [Poignard2003]
- b6: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- b6: Neutralizes TCLA strains, but not primary isolates. [Parren1997c]

References Sugiura1999, Earl1994

- D33: A comparison of 25 gp120 specific, conformation dependent MAbs was done – D33 is part of a group of MAbs labeled A1 – all A1 MAbs were broadly cross-reactive with gp160 from B-clade R5, X4, and R5X4 viruses, blocked CD4 binding, were sensitive to mutations in gp120 positions 368 and 370 that directly contact CD4 – D33 was unusual for the group of A1 MAbs, because while it blocked CD4 binding completely, but competed with MAbs that did not in a BIAcore assay – both the N- and C-terminal ends of gp120 are involved in D33 binding. [Sugiura1999]
- D33: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]

Ab type CD4BS, CD4i, V2, V3
References Moore2001

- Moore and colleagues review structural aspects of gp120 and how they relate to antigenic domains, and review the data concerning the lack of a clear relationship between genetic subtype and serotype – they suggest the primary goal in vaccine efforts should be to design an immunogen that can be shown to elicit neutralizing antibodies against a significant proportion of primary isolates – assay artifacts that can result in confused interpretations are also discussed, such as Ab binding to defective spikes, which does not affect HIV-1 infectivity, but can dominant an assay signal. [Moore2001]

- 17b: This review summarizes MAbs directed and HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. [Gorny2004] (**antibody binding site definition and exposure**, **review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 17b: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 17b: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a CD4i MAb that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- 17b: The HIV-1 primary isolate DH012 has preserved the epitopes for the MAbs IgG1b12, 2G12, 17b, however natural DH012 infection in chimpanzees and DH012 gp120 vaccination in guinea pigs does not give rise to Abs against these epitopes. [Zhu2003] (**vaccine-specific epitope characteristics**)
- 17b: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. 17b recognized most variants,some from each of the four individuals, by gp120 immunoprecipitation. [Ohagen2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)
- 17b: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- 17b: This paper describes the generation of CD4i MAb E51, that like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. E51 has more cross-neutralizing potency than other prototype CD4i MAbs (17b) for B and C clade isolates. E51 and 17b both neutralized HIV-1 clade B strains HXBc2 and ADA, while JR-FL and 89.6 were only neutralized by E51, not 17b. Clade C strains MCGP1.3 and SA32 were both inhibited by 17b and E51, but E51 was more potent against SA32. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and F105 binding, and K421D inhibits F105 binding, but not sCD4. [Xiang2003] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 17b: This study shows the fragments of CD4i MAbs are better able to neutralize virus than whole IgG. Neutralization of HIV-1 R5 isolates JRFL, JR-CSF and ADA by CD4i MAbs X5, 17b, and 48d decreased with increased molecule size, the neutralizing potency of single-chain Fv (scFv) > than Fab fragments > whole Ab molecules. (With the exception of IgG 48d neutralization of HIV-1 ADA.) HIV-1 X4 isolates 89.6 and HxB2 are both relatively sensitive even to the larger IgG version. R5X4 isolate neutralization was dependent on the isolate and co-receptor usage. The CD4i MAb fragments neutralize HIV-1 subsequent to CD4 binding. The CD4i MAbs bind near the co-receptor binding sites on gp120. Co-receptors bind to the conserved beta19 strand and part of the V3 loop, regions which are masked by the V1V2 loops in the CD4-unbound state. When CD4 is bound, the co-receptor site is exposed near the membrane surface where it would be optimally accessible to co-receptors, and the smaller versions of the molecules are better able to overcome the steric hindrence. [Labrijn2003] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 17b: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. 17b was used to demonstrate that the Cluster I and II MAbs bound to gp120/gp41 complexes, not to gp41 after shedding of gp120. [Finnegan2002]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 17b: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. It neutralized 5/6 R5 and X4 strains from the B clade, but was only moderately protective against a D clade isolate, and did not neutralize clade A, C, E, and F isolates. [Dey2003] (**co-receptor**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **immunotherapy**, **inter-clade comparisons**)
- 17b: Called 1.7b. The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to R5X4 virus 92HT593, but only of 48d to the R5 virus 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. [Cavacini2003] (**antibody interactions**, **co-receptor**)
- 17b: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-V3 MAb B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, but only A1g8 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. Anti-gp41 MAb F240 had a synergistic effect on neutralization with CD4i MAbs 48d and 17b, but not with A1g8 for the R5X4 virus. [Cavacini2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 17b: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. CD4i Abs 17b and X5 were weakly neutralizing in all formats, WT, SOS, and when added postbinding. [Binley2003] (**vaccine antigen design**)
- 17b: NIH AIDS Research and Reference Reagent Program: 4091.
- 17b: The two N-terminal domains of CD4, termed D1 and D2, when expressed in the absence of the remaining domains of CD4 retain the capacity to bind to gp120—coding sequences of D1D2 and Igαtp were fused to create a large, multivalent rec protein D1D2Igαtp, which, unlike CD4, does not enhance infection at sub-optimal concentrations—the MAb 17b can also enhance viral replication at sub-optimal concentrations, but D1D2-Igα inhibited the 17b enhancement of two primary isolates. [Arthos2002] (**variant cross-recognition or cross-neutralization**)
- 17b: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002]
- 17b: gp120 mutants were used to define the CXCR4 binding site using CXCR4 displayed on paramagnetic proteoliposomes (PMPLs) to reduce non-specific gp120 binding—basic residues in the V3 loop and the β19 strand (RIKQ, positions 419-422) were involved, and deletion of the V1-V2 loops allowed CD4-independent CXCR4 binding—MAbs 17b (CD4i) and F105 (CD4BS) were used to study conformational changes in the mutants—the affinity of ΔV1 and ΔV1-V2 for 17b was dramatically increased and no longer inducible in the presence of sCD4—V3 mutants R298A and R327A were not recognized by 17b except in the presence of sCD4—mutations in the β19 strand dramatically reduced 17b affinity in the presence or absence of sCD4, consistent with known 17b contact residues in this region. [Basmaciogullari2002]
- 17b: HIV-1 gp160ΔCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160ΔCT with a reconstituted membrane ten-fold better than the same protein on beads—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160ΔCT PLs indistinguishably from gp160ΔCT expressed on the cell surface—non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12—the MAb 17b was sCD4 inducible on gp160ΔCT PL. [Grundner2002] (**vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 17b: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] (**vaccine-specific epitope characteristics**)
- 17b: Five CD4i MAbs were studied, 17b, 48d and three new MAbs derived by Epstein-Barr virus transformation of PBMC from an HIV+ long term non-progressor – 23e and 21c were converted to hybridomas to increase Ab production – all compete with the well-characterized 17b CD4i MAb in an ELISA antigen capture assay – critical binding residues are mapped and the CD4i MAb epitopes were distinct but share a common element near isoleucine 420, also important for CCR5 binding, and all five can block CCR5 binding to a sCD4-gp120 complex – the MAb 48d has the epitope most similar to the CCR5 binding site. [Xiang2002a] (**antibody binding site definition and exposure**)
- 17b: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b] (**variant cross-recognition or cross-neutralization**)
- 17b: CD4 residue Phe43 significantly contributes to the affinity of CD4-gp120 interactions – despite decreased affinities for gp120, CD4 proteins and CD4-mimetic peptides lacking a Phe side-chain enhance binding of gp120 to 17b in a manner similar to Phe-bearing ligands indicating the Phe42 interaction is not critical for CD4-induced conformational changes in gp120. [Dowd2002]
- 17b: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140Δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002]
- 17b: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. [Schulke2002] (**vaccine antigen design**)
- 17b: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. [Golding2002b]
- 17b: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – 17b recognized both gp120 monomer and o-gp140. [Srivastava2002]
- 17b: Structural aspects of the interaction of neutralizing Abs with HIV-1 Env are reviewed – Env essentially has three faces, one is largely inaccessible on the native trimer, and two that exposed but have low immunogenicity on primary viruses – neutralization is suggested to occur by inhibition of the interaction between gp120 and the target cell membrane receptors as a result of steric hindrance and it is noted that the attachment of approximately 70 IgG molecules per virion is required for neutralization, which is equivalent to about one IgG molecule per spike – the 2G12, 17b and b12 epitopes are discussed in detail – the 17b epitope is masked prior to CD4 binding by the V1-V2 loop and in contrast to sCD4, the binding of cell surface CD4 to virus does not appear to make the epitope accessible to binding by 17b to allow neutralization. [Poignard2001] (**antibody binding site definition and exposure**, **review**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 17b: 17b binds to a CD4 inducible epitope which partially overlaps the CCR5 binding site – JRFL, YU2, 89.6, and HXB2 and their C1-, V1/V2-, C5 -deletion mutants were used to study how 17b binding affects gp120-CD4 interactions – 17b reduced CD4-gp120 interactions by decreasing the on-rate and increasing the off-rate of sCD4, while enhanced binding of sCD4 binding was observed for the 17b-bound, V1/V2 deleted gp120s – 17b was considered to be a surrogate for CCR5, and the authors suggest that 17b binding may shift V1/V2 into a position that interferes with CD4 binding, forcing a release. [Zhang2001a] (**antibody binding site definition and exposure**, **kinetics**)
- 17b: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – 17b bound at somewhat greater levels to 168C than to 168P, but this is not a general feature of 17b binding to primary versus TCLA strains. [York2001] (**variant cross-recognition or cross-neutralization**)
- 17b: Mutations in two glycosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone—these same mutations tended to increase the neutralization sensitivity of the virus, including to 17b—only the CD4i antibodies 17b and 48d showed an increased affinity of the CD4 independent viruses relative to wild-type. [Kolchinsky2001] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. [Si2001] (**variant cross-recognition or cross-neutralization**)
- 17b: Mutagenesis defines Ile-420, Lys-421, Gln-422, Pro-438, and Gly-441 to be important residues for CCR5 binding – these positions are located on two strands that connect the gp120 bridging sheet and outer domain, suggesting a mechanism for conformational shifts induced by CD4 binding to facilitate CCR5 binding. [Rizzuto2000] (**antibody binding site definition and exposure**)
- 17b: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000] (**vaccine antigen design**)
- 17b: Soluble gp140 derived from SF162, a neutralization-resistant primary isolate, and SF162AV2 a neutralization-susceptible isolate with 30 amino acids deleted from the V2 loop, were generated with or without the gp120-gp41 cleavage site intact – all forms are recognized by oligomer-specific MAb T4 and show enhanced binding of CD4i MAb 17b when sCD4 is bound – the fused forms are less efficiently recognized than the cleaved forms by polyclonal neutralizing sera from HIV-infected patients – the V3 loop is more exposed on the fused form. [Stamatatos2000] (**vaccine antigen design**)
- 17b: sCD4 can activate fusion between effector cells expressing Env and target cells expressing coreceptor (CCR5 or CXCR4) alone without CD4 – CD4i MAbs 17b and 48d have little effect on a standard cell fusion assay but potently block sCD4 activated fusion – 17b was broadly cross-reactive inhibiting sCD4 activated fusion with Env from clades A, B, C, D, E, F, and F/B. [Salzwedel2000] (**inter-clade comparisons**)
- 17b: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000] (**antibody binding site definition and exposure**)
- 17b: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 17b: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. [Grovit-Ferbas2000] (**vaccine antigen design**)
- 17b: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**vaccine antigen design**)
- 17b: A CD4-independent viral variant of IIIB, IIIBx, was generated on CXCR4-expressing cells – IIIBx exhibited greater exposure of the 17b and 48d epitopes and enhanced neutralization by CD4i MAbs and by polyclonal human sera – the 17b epitope has significant overlap with the CCR5 coreceptor binding site. [Hoffman1999] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 17b: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 enabled neutralization by CD4i MAbs 17b and 48d. [Stamatatos1998] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 17b: A panel of MAbs was shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4i MAbs 17b and 48d bound better to the deleted protein than to wild type. [Binley1998] (**antibody binding site definition and exposure**)
- 17b: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops, and the presence of V1/V2 increased the enhancement – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – 17b enhances YU2 enhanced viral entry 10-fold, whereas HXBc2 was neutralized. [Sullivan1998a]
- 17b: sCD4 induces 17b binding in primary isolates and TCLA strains – amino acids that reduce the efficiency of binding were determined and found also to compromise syncytia formation and viral entry – V1V2 deletion or sCD4 binding can expose the 17b epitope for both HXBc2 and macrophage tropic YU2 – neutralizing potency of 17b is probably weak due to poor exposure of the epitope – 17b epitope exposure upon sCD4 binding can occur over a wide range of temperatures, consistent with the energy of CD4 binding being sufficient to drive the V1/V2 loop into a new conformation. [Sullivan1998b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 17b: Site directed mutagenesis of a WU2 protein with the V1-V2 loops deleted revealed key residues for 17b-gp120 interaction and interaction of gp120 and CCR5 – mutations in residues that reduced 17b by 70% were R/D 419, I/R 420, Q/L 422, Y/S 435, I/S 423, K/D 121 and K/D 421– 17b can neutralize HIV-1 strains that use different chemokine receptors, supporting a common region in gp120 in chemokine-receptor interaction. [Rizzuto1998] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 17b: Moore and Binley provide a commentary on the papers by [Rizzuto1998], [Wyatt1998a] and [Kwong1998] – they point out 17b shares binding elements in gp120 with chemokine receptor molecules, and that CD4 needs to bind to gp120 first to make the 17b epitope accessible and it may be sterically blocked in the CD4 bound virus, thus making it a poor NAb for primary isolates [Moore1998]. [Kwong1998, Moore1998, Rizzuto1998, Wyatt1998a] (**review**, **structure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 17b: Summary of the implications of the crystal structure of a gp120 core bound to CD4 and 17b, combined with what is known about mutations that reduce NAb binding to gp120 – probable mechanism of neutralization is interference with chemokine receptor binding – mutations in 88N, 117K, 121K, 256S, 257T, N262, Delta V3, E370, E381, F 382, R 419, I 420, K 421, Q 422, I 423, W 427, Y 435, P 438, M 475 of HXBc2 (IIIB) reduce binding – the only variable residues in gp120 that contact 17b are 202T and 434M – the contact points for 17b with the crystallized incomplete gp120 are mostly in the heavy chain of the Ab, and there is a gap between 17b's light chain and the partial gp120 which may be occupied by the V3 loop in a complete gp120 molecule – the authors propose that the V2 and V3 loops may mask the CD4i Ab binding site, and that the V2 loop may be repositioned upon CD4 binding. [Wyatt1998a] (**structure**)
- 17b: 17b Fab was co-crystallized with a gp120 core and CD4, and it's binding site can be directly visualized—17b binds to the "bridging sheet" of gp120, an antiparallel beta sheet region, contacting residues from the C4 region and the V1/V2 stem—the contact area is small for an Ab-antigen interactive surface, and dominated in the Ab by the heavy chain—the center of the binding region has hydrophobic interactions, and the periphery charge interactions, acidic on 17b and basic on gp120. [Kwong1998] (**structure**)
- 17b: Neutralizes TCLA strains, but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- 17b: Binds to sgp120 efficiently, but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – partial re-exposure if sCD4 was bound – could not bind to HXBc2 gp120 if the 19 C-term amino acids were deleted in conjunction with amino acids 31-93 in C1, but binding was restored in the presence of sCD4. [Wyatt1997] (**antibody binding site definition and exposure**)
- 17b: Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to a CD4BS MAb, F105, or sCD4. [Cao1997b] (**vaccine antigen design**)
- 17b: 48d binds to the IIIB protein and not IIIB V3 peptide, while binding to the Can0A V3 peptide, suggesting Can0A V3 is a conformer that mimics the 48d – it does not bind to 17b, distinguishing the epitopes. [Weinberg1997]
- 17b: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 17b has synergistic response in combination with anti-V3 MAb 694/98-D. [Li1997]
- 17b: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 17b bound monomer, oligomer, and neutralized JRFL in the presence of sCD4, but if sCD4 was not present, 17b only bound monomer. [Fouts1997]
- 17b: Neutralizes JR-FL – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a]
- 17b: MIP-1α binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 — binding of 17b blocks this inhibition. [Wu1996]
- 17b: Binding did not result in significant gp120 dissociation from virion, in contrast to 48d, although the gp41 epitope of MAb 50-69 was exposed. [Poignard1996a] (**antibody interactions**)
- 17b: Many MAbs inhibit binding (anti-C1, -C5, -C4, -CD4BS) – anti-V3 MAb 5G11 enhances binding, as do C1-C4 discontinuous epitopes A32 and 2/11c – enhances binding of some anti-V2 MAbs. [Moore1996] (**antibody interactions**)
- 17b: Binds with higher affinity to monomer and oligomer, slow association rate, poor neutralization of lab strain – this is in contrast to 48d, which has very different kinetics. [Sattentau1995b] (**kinetics**, **binding affinity**)
- 17b: Studies using a V1/V2 deletion mutant demonstrated that enhanced binding of 17b in the presence sCD4 involves the V1/V2 loops, with more significant involvement of V2 – similar effect observed for 48d and A32. [Wyatt1995] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 17b: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 48d, 21h and 15e) [Thali1994] (**variant cross-recognition or cross-neutralization**)
- 17b: Binding of 48d is much more influenced by sequence variation among molecular clones of LAI than is binding of 17b. [Moore1993d] (**variant cross-recognition or cross-neutralization**)
- 17b: Epitope is better exposed upon CD4 binding to gp120 – competes with 15e and 21h, anti-CD4 binding site MAbs – 113 D/R, 252 R/W, 257 T/A or G, 370 E/D, 382 F/L, 420 I/R, 433A/L, 438 P/R and 475 M/S confer decreased sensitivity to neutralization. [Thali1993] (**antibody binding site definition and exposure**, **antibody interactions**)

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, co-receptor, inter-clade comparisons, kinetics, review, structure, vaccine antigen design, variant cross-recognition or cross-neutralization.

- 48d: This review summarizes MAbs directed and HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. [Gorny2004] (**review**)
- 48d: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 48d: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a CD4i MAb that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- 48d: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- 48d: This study shows the fragments of CD4i MAbs are better able to neutralize virus than whole IgG. Neutralization of HIV-1 R5 isolates JRFL, JR-CSF and ADA by CD4i MAbs X5, 17b, and 48d decreased with increased molecule size, the neutralizing potency of single-chain Fv (scFv) > than Fab fragments > whole Ab molecules. (With the exception of IgG 48d neutralization of HIV-1 ADA being better than the Fab – for 48d, only the IgG and Fab forms were available, not the scFv.) HIV-1 X4 isolates 89.6 and HxB2 are both relatively sensitive even to the larger IgG version. R5X4 isolate neutralization was dependent on the isolate and co-receptor usage. The CD4i MAb fragments neutralize HIV-1 subsequent to CD4 binding. The CD4i MAbs bind near the co-receptor binding sites on gp120. Co-receptors bind to the conserved beta19 strand and part of the V3 loop, regions which are masked by the V1V2 loops in the CD4-unbound state. When CD4 is bound, the co-receptor site is exposed near the membrane surface where it would be optimally accessible to co-receptors, and the smaller versions of the molecules are better able to overcome the steric hindrence. [Labrijn2003] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 48d: Called 4.8d. The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to R5X4 virus 92HT593, but only of 48d to the R5 virus 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. [Cavacini2003] (**antibody interactions**, **co-receptor**)
- 48d: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-V3 MAb B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, but only A1g8 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. Anti-gp41 MAb F240 had a synergistic effect on neutralization with CD4i MAbs 48d and 17b, but not with A1g8 for the R5X4 virus. [Cavacini2002] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 48d: NIH AIDS Research and Reference Reagent Program: 1756.
- 48d: Called 4.8D – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**variant cross-recognition or cross-neutralization**)
- 48d: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] (**co-receptor**)
- 48d: Five CD4i MAbs were studied, 17b, 48d and three new MAbs derived by Epstein-Barr virus transformation of PBMC from an HIV+ long term non-progressor – 23e and 21c were converted to hybridomas to increase Ab production – all compete with the well-characterized 17b CD4i MAb in an ELISA antigen capture assay – critical binding residues are mapped and the CD4i MAb epitopes were distinct but share a common element near isoleucine 420, also important for CCR5 binding, and all five can block CCR5 binding to a sCD4-gp120 complex – the MAb 48d has the epitope most similar to the CCR5 binding site. [Xiang2002a] (**antibody binding site definition and exposure**, **co-receptor**)
- 48d: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. [Xiang2002b]
- 48d: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002]
- 48d: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. [Golding2002b]
- 48d: Called 4.8d – A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001]
- 48d: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 48d – only the CD4i antibodies 17b and 48d showed an increased affinity of the CD4 independent viruses relative to wild-type. [Kolchinsky2001]
- 48d: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. [Yang2000]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 48d: sCD4 can activate fusion between effector cells expressing Env and target cells expressing coreceptor (CCR5 or CXCR4) alone without CD4 – CD4i MAbs 17b and 48d have little effect on a standard cell fusion assay but potently block sCD4 activated fusion. [Salzwedel2000] (**co-receptor**)
- 48d: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. [Park2000]
- 48d: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. [Ly2000]
- 48d: Called 4.8D – host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. [Fortin2000]
- 48d: A CD4-independent viral variant of IIIB, IIIBx, was generated on CXCR4-expressing cells – IIIBx exhibited greater exposure of the 17b and 48d epitopes and enhanced neutralization by CD4i MAbs and by polyclonal human sera. [Hoffman1999]
- 48d: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. [Frankel1998]
- 48d: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 enabled neutralization by CD4i MAbs 17b and 48d. [Stamatatos1998]
- 48d: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4i MAbs 17b and 48d bound better to the deleted protein than to wild type. [Binley1998]
- 48d: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. [Yang1998]
- 48d: CD4i MAbs 17b and 48d compete with MAb CG10, and the binding sites may overlap – MAb A32 enhances binding of 17b, 48d and CG10. [Sullivan1998b]
- 48d: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a]
- 48d: Inhibits binding of Hx10 to both CD4 positive and CD4 negative HeLa cells. [Mondor1998]
- 48d: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization of 48d is interference with chemokine receptor binding – CD4 binding increases exposure of epitope due to V2 loop movement – 88N, 117K, 121K, 256S, 257T, N262, delta V3, E370, E381, F 382, R 419, I 420, K 421, Q 422, I 423, W 427, Y 435, P 438, M 475 mutations in HXBc2 (IIIB) decrease binding. [Wyatt1998a] (**structure**)
- 48d: Neutralizes TCLA strains, but not primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- 48d: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. [Wyatt1997] (**antibody binding site definition and exposure**)
- 48d: Viral binding inhibition by 48d was strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997]
- 48d: Prefers CD4-gp120 complex to gp120 alone, but does not enhance fusion, in contrast to MAb CG10, in fact it inhibits syncytium formation. [Lee1997] (**antibody binding site definition and exposure**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 48d: 48d binds to the IIIB protein and not IIIB V3 peptide, while binding to the Can0A V3 peptide, suggesting Can0A V3 is a conformer that mimics the 48d, (but not 17b), epitope. [Weinberg1997] (**antibody binding site definition and exposure**)
- 48d: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – all Ab combinations tested showed synergistic neutralization – 48d has synergistic response with MAbs 694/98-D (anti-V3) and F105. [Li1997] (**antibody interactions**)
- 48d: Neutralizes JR-FL – slightly inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**antibody binding site definition and exposure**, **co-receptor**)
- 48d: Binding resulted in gp120 dissociation from virion, mimicking sCD4, and exposure of the gp41 epitope of MAb 50-69, in contrast to CD4BS MAbs. [Poignard1996a] (**antibody interactions**)
- 48d: Many MAbs inhibit binding (anti-C1, -C5, -C4, -CD4BS) – anti-C1-C4 discontinuous epitope MAbs A32 and 2/11c enhance binding – reciprocal enhanced binding with some anti-V2 MAbs. [Moore1996] (**antibody interactions**)
- 48d: Binds with similar affinity to monomer and oligomer, moderate association rate, potent neutralization – this is in contrast to 17b, which has very different kinetics. [Sattentau1995b] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**)
- 48d: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. [Sattentau1995c] (**vaccine antigen design**)
- 48d: Studies using a V1/V2 deletion mutant demonstrated that enhanced binding of 48d in the presence of sCD4 involves the V1/V2 loops, with more significant involvement of V2 – similar effect observed for 17b and A32. [Wyatt1995] (**vaccine antigen design**)
- 48d: Called 4.8D – Found to neutralize MN, but not JRCSF, two B subtype primary isolates, or a D subtype primary isolate, by most labs in a multi-laboratory study involving 11 labs. [D'Souza1995] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- 48d: Poor cross-reactivity with gp120 from most clades. [Moore1994b] (**inter-clade comparisons**)
- 48d: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 21h, 15e and 17b) [Thali1994] (**variant cross-recognition or cross-neutralization**)
- 48d: Binding of 48d is much more influenced by sequence variation among molecular clones of LAI than is binding of 17b. [Moore1993d] (**variant cross-recognition or cross-neutralization**)
- 48d: Called 4.8d – Neutralizes IIIB – reactive with SF-2 gp120 – does not inhibit HIV-1 sera from binding to IIIB gp120. [Moore1993a] (**variant cross-recognition or cross-neutralization**)
- 48d: Epitope is better exposed upon CD4 binding to gp120 – competes with ICR 39.13, 15e and 21h, anti-CD4 binding site MAbs – inhibited by anti-CD4BS MAb ICR 39.13g and linear anti-C4 MAbs G3-42 and G3-508 – 113 D/R, 252 R/W, 257 T/A or G, 370 E/D, 382 F/L, 420 I/R, 421 K/L, 433A/L, 438 P/R and 475 M/S confer decreased sensitivity to neutralization. [Thali1993] (**antibody binding site definition and exposure**, **antibody interactions**)
- 48d: 48d and 17b have similar epitopes, and the pair are unique among human and rodent MAbs.

1053 X5 (Fab X5) Env gp120 (JRFL) P HIV-1 infection human

Ab type CD4i

References Gorny2004, Pantophlet2003b, Zwick2004, Zwick2003, Zhang2003, Labrijn2003, Binley2003, Moulard2002

Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, co-receptor, inter-clade comparisons, review, vaccine antigen design, variant cross-recognition or cross-neutralization.

- X5: This review summarizes MAbs directed and HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. [Gorny2004] (**review**)
- X5: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- X5: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a CD4i MAb that had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- X5: The Fab m18 was selected from a human phage display library by a new method called sequential antigen panning (SAP), using a series of antigens to screen the library to pick broadly cross-reactive isolates. The ability to block cell mediated fusion by m18 was compared to Fabs X5 and b12 for a clade A, CRF01 EA, G, and 6 clade B isolates, and the inhibitory activity of m18 was slightly lower but comparable to neutralizing Fabs b12 and X5. It also showed broad cross-neutralization; 11/15 pseudotyped Envs from primary isolates from clades A-F were inhibited in an IC50 assay at concentration less than or equal to 100 ug/ml; X5 was also tested and somewhat more potent, generally requiring lower concentrations and inhibiting 13/15 primary isolates. [Zhang2003] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)
- X5: This study shows the fragments of CD4i MAbs are better able to neutralize virus than whole IgG. Neutralization of HIV-1 R5 isolates JRFL, JR-CSF and ADA by CD4i MAbs X5, 17b, and 48d decreased with increased molecule size, the neutralizing potency of single-chain Fv (scFv) > than Fab fragments > whole Ab molecules. (With the exception of IgG 48d neutralization of HIV-1 ADA.) HIV-1 X4 isolates 89.6 and HxB2 are both relatively sensitive even to the larger IgG version. R5X4 isolate neutralization was dependent on the isolate and co-receptor usage. The CD4i MAb fragments neutralize HIV-1 subsequent to CD4 binding. The CD4i MAbs bind near the co-receptor binding sites on gp120. Co-receptors bind to the conserved beta19 strand and part of the V3 loop, regions which are masked by the V1V2 loops in the CD4-unbound state. When CD4 is bound, the co-receptor site is exposed near the membrane surface where it would be optimally accessible to co-receptors, and the smaller versions of the molecules are better able to overcome the steric hindrence. [Labrijn2003] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- X5: Called Fab X5. This paper is a study of the 2F5 NAb complexed to peptide ELDKWAS; the peptide was found to interact with amino acids near the base of the very long (22 residue) CDR 3H region of the Ab, although a Phe at the apex of the loop was also important. The authors suggest that particularly long CDR H3 regions may be a common feature of HIV-1 neuturalizing antibodies – there are 22 residues in 2F5's H3, 18 in b12's H3, and 22 residues in X5's H3. They express concern that because small animals like mice are be unable to elicit Ab responses with such long H3s, they may be poor model systems for HIV vaccine studies. [Zwick2004] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• X5: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. CD4i Abs X5 and 17b were weakly neutralizing in all formats, WT, SOS, and when added postbinding. [Binley2003] (**vaccine antigen design**) • X5: The human Fab X5 was selected from a phage display library derived from an HIV-1 positive donor with a highly neutralizing serum – it was selected for binding to purified gp120-CD4-coreceptor complexes – the Fab neutralizes PBMC infection by a selection of HIV-1 primary isolates from clades A, B, C, D, E, F, and G, and neutralizes R5, X4, and R5X4 isolates – it binds to a conserved epitope on gp120 induced by CD4 binding, its binding is slightly enhanced by CCR5 binding – while CD4i MAb 17b binds the CCR5 binding site, X5 also competes with Fab b12 which overlaps with the CD4 binding site, suggesting the epitope for is near both the CD4 and CCR5 binding sites. [Moulard2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)			
1054	T22	Env	gp120 (IIIB)			Vaccine	mouse (IgG)
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* oligomeric gp140 **Ab type** Env oligomer **Research Contact** P. Earl, National Institute of Allergy and Infectious Diseases, NIH, Bethesda, MD **References** Sugiura1999, Otteken1996, Earl1994 • T22: A comparison of 25 gp120 specific, conformation dependent MAbs was done – T22 is part of a group of MAbs labeled AII – all AII MAbs were broadly cross-reactive with gp160 from B-clade R5, X4, and R5X4 viruses, and could only partially blocked CD4 binding. [Sugiura1999] • T22: Pulse label experiments of 4 MAbs (D20, D27, T20, and T22) binding to noncleavable gp140 revealed that these anti-CD4BS MAbs bound with a delay, and that the epitope formed with a t 1/2 of about 10 minutes. [Otteken1996] • T22: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. [Earl1994]					
1055	polyclonal	Env	gp41			Vaccine	rabbit (IgG)
		Vaccine *Vector/Type:* peptide *Adjuvant:* gp41 N-HR and C-HR helical peptides **Ab type** C-HR, N-HR, six-helix bundle **References** Golding2002b, deRosny2001 • The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter anti-C-HR Abs inability to inhibit fusion. [Golding2002b] • A panel of Abs against gp41 heptad repeats N-HR, C-HR, and self-assembled stable N-HR and C-HR six helix bundles were generated. [deRosny2001]					
1056	2A2	Env	gp41		no	HIV-1 infection	human (IgG1κ)
		Ab type N-term **References** Weissenhorn1996 • Soluble gp41(21-166) forms a rod like structure that can be visualized with electron microscopy, and 2A2 binds to one end of the rod. [Weissenhorn1996]

[Moore1993a] • CRA-4: Changes at residues 191/192/193 (YSL/GSS) within V2, 435 (Y/H) in C4, abrogate binding – type-specific neutralization. [McKeating1993b]					
1080	L17	Env	gp120				human
		Ab type V2 **References** Gorny2004, Kwong2002, Parren1998a, Ditzel1997 **Keywords** antibody binding site definition and exposure, binding affinity, review, variant cross-recognition or cross-neutralization. • L17: In a review of Envelope binding MAbs in this database, V2-specific MAbs in are noted have some ability to neutralize HIV-1, but generally weakly with limited cross-reactivity. L15 and L17 are Fabs specific for V2. [Gorny2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **review**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• L17: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**) • L17: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**binding affinity**)			
1081	SC258 (52-581-SC258)	Env	gp120		L	Vaccine	mouse
		Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp120 **Ab type** V2 **Research Contact** Gerry Robey, Abbott Laboratories **References** He2002, Ditzel1997, Trkola1996a, Moore1996, Ditzel1995, Moore1994b, Yoshiyama1994, Gorny1994, Thali1993, Moore1993b • SC258: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. [He2002] • SC258: Does not inhibit gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study – listed as not neutralizing. [Trkola1996a] • SC258: Several MAbs binding to various gp120 epitopes enhance binding, but the only MAb that SC258 enhanced binding of was anti-CD4 binding site MAb F91 – reciprocal inhibition with V2 region antibodies. [Moore1996] • SC258: Does not compete with IgG1b12 – reciprocal inhibition with MAbs L39, L40, and L78. [Ditzel1995] • SC258: Very poor reactivity with gp120 molecules outside of clade B. [Moore1994b] • SC258: HIV-1 RF V2 substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity – 177 Y/H inhibits SC258 neutralization. [Yoshiyama1994] • SC258: Called 52-581-SC258 – binds to BH10, MN, and RF gp120 – neutralizes BH10 – binding inhibited by deletion of the V2 loop, and the following amino acid substitutions: 176/177 FY/AT, 179/180 LD/DL, 183/184 PI/SG, and 192-194 YSL/GSS. [Moore1993b]

Keywords antibody binding site definition and exposure, antibody sequence, variable domain, review, variant cross-recognition or cross-neutralization.

- L78: In a review of Envelope binding MAbs in this database, V2-specific MAbs in are noted have some ability to neutralize HIV-1, but generally weakly with limited cross-reactivity. L25, L39, L40 and L78 are Fabs specific for V2 that are also associated with sCD4 bindingsite regions; among these only L25 and L78 mediate weak neutralization of some TCLA strains. [Gorny2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **review**)
- L78: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. - 2182: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary islates. Inter-clade cross-neutralization by these anti-V3 MAbs is reduced. [Gorny2004] (**review**, **inter-clade comparisons**)
- 2182: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated from cells of asymptomatic HIV-1-infected individuals by selection of heterhybridomas using a V3-fusion protein (V3-fp), the HIV-1 JRCSF V3 loop inserted into a truncated murine leukemia virus gp70 – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 5/6 MAbs were derived from individuals infected in the US, presumably with clade B, and one, 2182, was derived from an individual who was infected abroad with clade A who is presently living in New York city – 2412 and 2456 were produced from cells obtained from the same individual, while the other MAbs were each generated from different subjects – 2182 bound to 8/16 of the diverse isolates, not to any clade C or CRF01. [Gorny2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

References Gorny2004, Gorny2002
Keywords review.

- 2456: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary islates. Inter-clade cross-neutralization by these anti-V3 MAbs is reduced. [Gorny2004] (**review**)

- 2456: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated from cells of asymptomatic HIV-1-infected individuals by selection of heterhybridomas using a V3-fusion protein (V3-fp), the HIV-1 JRCSF V3 loop inserted into a truncated murine leukemia virus gp70 – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 5/6 MAbs were derived from individuals infected in the US, presumably with clade B, and one, 2182, was derived from an individual who was infected abroad with clade A who is presently living in New York city – 2412 and 2456 were produced from cells obtained from the same individual, while the other MAbs were each generated from different subjects – 2456 bound to 12/16 of the diverse isolates. [Gorny2002]

1095 39F Env gp120 no

Ab type V3 **Research Contact** James Robinson, Tulane University, New Orleans, LA, USA
References Kwong2002, Grundner2002, Yang2002
Keywords antibody binding site definition and exposure.

- 39F: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- 39F: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface. [Grundner2002]
- 39F: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002]

1096 55/68b Env gp120 (300–315)

Ab type V3
References Peet1998

- 55/68b: The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind, and anti-V3 MAb 55/68b binding was abrogated by V3 serine substitutions in the V3 loop – mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. [Peet1998]

		• 55/45a/11: The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind, and anti-V3 MAb 55/45a/11 binding was only marginally diminished by V3 serine substitutions – mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. [Peet1998]

- 2G12: This paper is a reviw of anti-HIV-1 Envelope antibodies. This unique epitope is formed from carbohydrates. The mechanism of MAb neutralization is thought to be steric inhibition of CCR5 binding. 2G12 neutralizes many TCLA strains and about 40% of primary isolates tested. [Gorny2004] (**review**)
- 2G12: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. [Pantophlet2003b] (**vaccine antigen design**)
- 2G12: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. 2G12 had no impact on 4KG5 binding. [Zwick2003] (**antibody interactions**)
- 2G12: The broadly neutralizing antibodies 2F5 and 2G12 were class-switched from IgG to IgA and IgM isotypes. Neutralizing potency was increased with valence for 2G12 so the IgM form was most potent, but for 2F5 the IgG form was most potent. Eight primary isolates were tested including two subtype A isolates. The polymeric IgM and IgA Abs, but not the corresponding IgGs, could interfere with HIV-1 entry across a mucosal epithelial layer, although they were limited in a standard neutralization assay. All isotypes could interact with activated human sera, presumably through complement, to inhibit HIV replication. [Wolbank2003] (**complement**, **isotype switch**, **variant cross-recognition or cross-neutralization**, **mucosal immunity**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: The antiviral response to intravenously administered MAbs 2F5 and 2G12 was evaluated in 7 HAART-naïve asymptomatic HIV-1 infected patients during a treatment period of 28 days. MAb therapy reduced plasma HIV RNA in 3/7 patients during the treatment period, and transiently reduced viral load in two more. CD4 counts were up in 3/7 through day 28, and transiently increased in three more. Vigorous complement activation was observed after 48/56 Ab infusions. Virus derived from 2/7 patients could be neutralized by 2G12, and escape from 2G12 was observed in both cases after infusion; one year after the infusion, isolates were again sensitive to 2G12. [Stiegler2002] (**complement**, **variant cross-recognition or cross-neutralization**, **escape**, **immunotherapy**)
- 2G12: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. 2G12 was the only MAb tested to recognize all blood and brain isolates from all four patients by gp120 immunoprecipitation. [Ohagen2003] (**variant cross-recognition or cross-neutralization**)
- 2G12: AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessaton of therapy, which then declined to a low level. The polylconal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. [Montefiori2003] (**acute infection**, **escape**)
- 2G12: Polyclonal Abs raised against soluble trivalently linked N35CCG-N13 and N34CCG, the internal trimeric core of the coiled-coil ectodomain, inhibit HIV-1 Env-mediated cell fusion at levels comparable to 2G12. [Louis2003] (**vaccine antigen design**)
- 2G12: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, except for 2G12, which might not have bound well to the carbohydrate additions on the Drosophila expressed core. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. 2G12 had an entropy value of -1.6. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. [Kwong2002] (**antibody binding site definition and exposure**)
- 2G12: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. [Kitabwalla2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **inter-clade comparisons**)
- 2G12: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. The carbohydrated binding MAb 2G12 also inhibited CD4-independent syncytium formation. [Raja2003] (**co-receptor**)
- 2G12: To begin to design vaccine antigens that can mimic the carbohydrate structure, the gp120 peptide 336-342 was synthesized with Man(9), Man(6), and Man(5) moieties attached. [Singh2003] (**vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. They have shown that both N-glycans, at 295N and 332N are required for 2G12 binding, emphasizing the oligosaccharide cluster nature of the epitope, and suggest the uniqueness of the target structure may not result in autoimmune reactions. [Wang2003] (**vaccine antigen design**, **review**)
- 2G12: Most plasma samples of patients from early infection had NAb responses to early autologous viruses, and NAbs against heterologous strains tended to be delayed. Serial plasma samples were tested against serial isolates, and neutralization escape was shown to be rapid and continuous throughout infection. Autologous neutralization-susceptible and resistant viruses from four patients were tested for susceptability to neutralizing Ab responses using MAbs 2G12, IgG1b12 and 2F5. No correlation was established, all viruses tested were susceptible to at least one of the neutralizing MAbs. Two patients that did not have an autologous NAb response also did not evolve changes in susceptibility to these MAbs, while one patient with a pattern of autologous neutralization and escape acquired a 2G12 sensitive virus at month 6, and lost IgG1b12 sensitivity at month 21. [Richman2003] (**autologous responses**, **acute infection**, **escape**)
- 2G12: This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. [Mascola2003a] (**immunoprophylaxis**, **review**)
- 2G12: This study investigates the effects of glycosylation inhibitors on the binding between HIV-1 gp120 and mannose-binding lectin (MBL). Mannosidase I inhibitor deoxymannojirimycin (dMM) inhibits formation of complex and hybrid N-linked saccharides and yields virus with more mannose residues. dMM added during viral production significantly enhanced the binding 2F5 and 2G12, but not IgG1b12 in a viral capture assay. [Hart2003] (**antibody binding site definition and exposure**)
- 2G12: UK1-br and MACS2-br are R5 isolates derived from brain tissue samples from AIDS patients with dementia and HIV-1 encephalitis; both are neurotropic, but only UK1-br induced neuronal apoptosis and high levels of syncytium formation in macrophages. UK1-br Env had a greater affinity for CCR5 than MACS-br, and required low levels of CCR5 and CD4 for cell-to-cell fusion and single round infection. PBMC infected with UK1-br and MACS2-br virus isolates were resistant to neutralization by MAb 2G12. UK1-br was more sensitive than MACS2-br to IgG1b12, 2F5 and CD4-IgG2 neutralization. [Gorry2002] (**brain/CSF**, **co-receptor**)
- 2G12: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. [Ferrantelli2003] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. [Dey2003] (**co-receptor**)
- 2G12:The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 and 2G12 enhanced each others binding, and gave synergistic neutralization. B4e8 could neutralize R5X4 virus 92HT593 better than 2G12, while 2G12 was better at neutralizing R5 virus 92US660. [Cavacini2003] (**antibody interactions**)
- 2G12: This study examined Ab interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 did not affect binding of 2G12 to either R5X4 and R5 isolates, and anti-V3 MAb B4a1 increased 2G12 binding to R5X4 virions but not R5. Neutralization with B4al and 2G12 was additive for the R5X4 virus, and was enhanced for the R5 virus. [Cavacini2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 2G12: Neutralization assays with rsCD4, MAbs, and serum samples from SHIV-infected macaques and HIV-1 infected individuals were used to characterize the antigenic properties of the env glycoprotein of six primary isolate-like or TCLA SHIV variants. 2G12 neutralized the five SHIV strains tested, HXBc2, KU2, 89.6, 89.6P and KB9, in MT-2 cells. [Crawford1999] (**variant cross-recognition or cross-neutralization**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. 2G12 is able to neutralize both the wildtype and SOS protein comparably, but 2G12 could not neutralize SOS when added post-attachment. [Binley2003] (**vaccine antigen design**)
- 2G12: IgG1b12 neutralized many South African (5/8) and Malawian (4/8) clade C primary HIV-1 isolates, being more effective than 2F5 which neutralized only two Malawian and no South African isolates. 2G12 did not neutralize any of the 16 isolates. [Bures2002] (**inter-clade comparisons**)
- 2G12: SOS-Env is a mutant protein engineered to have a disulfid bond between gp120 and gp41. Cells expressing SOS-Env due not fuse with target cells expressing CD4 and CCR5, although the fusion process proceeds to an intermediate state associated with CD4 and co-receptors, prior to the formation of the six helix bundle that allows fusion.2G12 was used to monitor surface expression of SOS-Env compared to wildtype. [Abrahamyan2003] (**co-receptor**, **vaccine antigen design**)
- 2G12: 2G12 was used as a positive control to test for a NAb activity in mice intranasally immunized with gp120 or gp140 with IL-12 and Cholera Toxin B. [Albu2003]
- 2G12: NIH AIDS Research and Reference Reagent Program: 1476.
- 2G12: UK Medical Research council AIDS reagent: ARP3030.
- 2G12: CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (non-neutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the non-neutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – 2G12 was used to normalize and as a control in these experiments. [Herrera2003] (**antibody interactions**)
- 2G12: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded. [Pantophlet2003a] (**antibody binding site definition and exposure**)
- 2G12: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. [Liu2002] (**review**)
- 2G12: Review of NAbs that notes 2G12 alone or in combination with other MAbs can protect some macaques against SHIV infection, that it has strong ADCC activity, and that it is safe and well tolerated in humans. [Ferrantelli2002] (**immunoprophylaxis**)
- 2G12: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. [Zhang2002] (**antibody binding site definition and exposure**)
- 2G12: Rhesus macaques were better protected from vaginal challenge with SHIV89.6D (MAb 2G12, 2/4; MAbs 2F5/2G12, 2/5; and HIVIG/2F5/2G12, 4/5 infected) than from intravenous challenge (MAb 2G12, 0/3; MAbs 2F5/2G12, 1/3; and HIVIG/2F5/2G12, 3/6 infected)– the animals that were infected by vaginal challenge after Ab infusion had low or undetectable viral RNA levels and modest CD4 T-cell decline. [Mascola2002] (**immunoprophylaxis**, **mucosal immunity**)
- 2G12: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads, while such an affinity difference was not seen with F105 and 2G12 – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface. [Grundner2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. [Edwards2002] (**antibody binding site definition and exposure**)
- 2G12: A modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. [Chakrabarti2002] (**vaccine antigen design**)
- 2G12: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. [Xu2002] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and MAbs C11, A32, and 30D which did not bind the stabilized oligomer. [Yang2002] (**antibody binding site definition and exposure**)
- 2G12: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140 – 2G12 complexes with SOS gp140 or with gp120 had a very unusual linear structure. [Schulke2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 2G12: Alanine scanning mutagenesis used in conjunction with competition and replacement studies of N-linked carbohydrates and sugars suggest that the 2G12 epitope is formed from mannose residues contributed by the glycans attached to N295 and N332, with the other N-linked carbohydrates in positions N339, N386, and N392 playing a role in maintaining conformation relevant to 2G12 binding – N295A and N332A mutants showed essentially unchanged anti-CD4BS NAb b12 binding affinities, while N339A, N386A and N392A mutants displayed significantly lowered b12 affinity, presumably due to conformational changes. [Scanlan2002] (**antibody binding site definition and exposure**)
- 2G12: The 2G12 epitope is composed of carbohydrates involving high-mannose and hybrid glycans of residues 295, 332, and 392, with peripheral glycans from 386 and 448 contributing on either flank, and with little direct gp120 protein surface involvement – these mannose residues are proximal to each other near the chemokine receptor binding surface. [Sanders2002] (**antibody binding site definition and exposure**)
- 2G12: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. [Golding2002b] (**antibody binding site definition and exposure**)
- 2G12: A phase I trial in seven HIV+ individuals was conducted with MAbs 2F5 and 2G12 – no clinical or laboratory abnormalities were observed throughout the study – eight infusions were administered over a 4-week period (total dose 14 g) – the elimination half-life ($t\_1/2$) was calculated to be 7.94 (range, 3.46–8.31) days for 2F5 and 16.48 (range, 12.84–24.85) days for 2G12. [Armbruster2002] (**kinetics**, **immunotherapy**)
- 2G12: Chloroquine reduces the HIV-1-infectivity of H9 IIIB cells, apparently through altering the conformation of envelope – there is a reduction of reactivity of 2G12 to its epitope in chloroquine treated cultures. [Savarino2001] (**antibody binding site definition and exposure**)
- 2G12: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. [Xu2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: A combination of MAbs IgG1b12, 2F5, and 2G12 was given postnatally to four neonates macaques that were then challenged with highly pathogenic SHIV89.6P – one of the four infants remained uninfected after oral challenge, two infants had no or a delayed CD4(+) T-cell decline. [Hofmann-Lehmann2001] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**)
- 2G12: A luciferase-reporter gene-expressing T-cell line was developed to facilitate neutralization and drug-sensitivity assays – luciferase and p24 antigen neutralization titer end points were found comparable using NAb from sera from HIV+ donors, and MAbs 2F5, 2G12 and IgG1b12. [Spenlehauer2001] (**assay development**)
- 2G12: Neutralizing synergy between MAbs 1b12, 2G12 and 2F5 was studied using surface plasmon resonance to determine the binding kinetics for these three MAbs with respect to monomeric and oligomeric Env protein gp160 IIIB – the 2G12 epitope is highly accessible on both monomeric and oligomeric Envs, 1b12 is highly accessible on monomers but not oligomers, and 2F5 on neither form – binding of 2G12 exposes the 2F5 epitope on gp160 oligomers – 2G12-gp160 oligomer interactions were best fitted to a two state model, with the first complex having a high association constant and fast dissociation, stabilized by conformational changes induced by the binding of a second MAb. [Zeder-Lutz2001] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**)
- 2G12: Structural aspects of the interaction of neutralizing Abs with HIV-1 Env are reviewed – Env essentially has three faces, one is largely inaccessible on the native trimer, and two that exposed but have low immunogenicity on primary viruses – neutralization is suggested to occur by inhibition of the interaction between gp120 and the target cell membrane receptors as a result of steric hindrance and it is noted that the attachment of approximately 70 IgG molecules per virion is required for neutralization, which is equivalent to about one IgG molecule per spike – the 2G12, 17b and b12 epitopes are discussed in detail – although it is potently neutralizing, 2G12 does not interfere with CD4 and coreceptor binding, and this Ab specificity is uncommon in sera from HIV-1-infected individuals. [Poignard2001] (**antibody binding site definition and exposure**, **review**)
- 2G12: Moore and colleagues review structural aspects of gp120 and how they relate to antigenic domains, and review the data concerning the lack of a clear relationship between genetic subtype and serotype – an exception exists for human MAb 2G12, which does not recognize CRF01 envelopes because of an unusual additional disulfide bond in the V4 loop region that appears to be unique to the subtype E, CRF01 gp120 protein. [Moore2001] (**antibody binding site definition and exposure**, **review**)
- 2G12: SF162DeltaV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization – when incorporated into a codon-optimized DNA vaccine with a CMV promoter and delivered by gene gun, SF162DeltaV2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162DeltaV2, but not intact SF162, was used as the immunogen – Control MAbs 2F5 and 2G12 could neutralize all of the following primary isolates: 91US056(R5), 92US714(R5), 92US660(R5), 92HT593(R5X4), and BZ167(R5X4), while after the first protein boost, the sera from two SF162DeltaV2 immunized macaques could neutralize 91US056(R5), 92US714(R5), 92US660(R5) and ADA(R5), but not 92HT593(R5X4) or 92US657(R5) – the pattern of cross-recognition shifted after the second boost. [Barnett2001] (**vaccine antigen design**)
- 2G12: Review of studies in macaques that have shown immune control of pathogenic SHIV viremia, improved clinical outcome, and protection, and the implications of the observations for HIV vaccines. [Mascola2001] (**review**)
- 2G12: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2 – there was no evidence for cooperativity of binding between b12 and 2G12 to envelope spikes expressed on the cell surface of TCLA or primary isolates. [Zwick2001c] (**antibody interactions**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. [Si2001]
- 2G12: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – 2G12 was an exception and could not neutralize MN in either form. [Park2000]
- 2G12: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. [Grovit-Ferbas2000] (**vaccine antigen design**)
- 2G12: A triple combination of 2F5, F105 and 2G12 effectively neutralized perinatal infection of macaque infants when challenged with SHIV-vpu+ – the mean plasma half-life was 14.0 +/- 7.9 days, the longest of the three Abs. [Baba2000] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: A mini-review of observations of passive administration of IgG NAbs conferring protection against intervenous or vaginal SHIV challenge, that considers why IgG MAbs might protect against mucosal challenge. [Robert-Guroff2000] (**immunoprophylaxis**, **mucosal immunity**, **review**)
- 2G12: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. [Binley1999] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 2G12: Because HIV-1 is most often transmitted across mucosal surfaces, the ability of passive transfer of infused HIVIG/2F5/2G12 to protect against mucosal exposure of macaques to pathogenic SHIV 89.6PD was studied – HIVIG/2F5/2G12 protected 4/5 animals against vaginal challenge, 2F5/2G12 combined protected 2/5 animals, and 2G12 alone protected 2/4 animals – in contrast, Mascola and co-workers had previously shown single MAbs could not protect against intervenous challenge – Ab treated animals that got infected through vaginal innoculation had low viral loads and only modest declines in CD4 counts – the infused Abs were detected in the nasal, vaginal, and oral mucosa. [Mascola2000] (**immunoprophylaxis**, **mucosal immunity**)
- 2G12: Combinations of HIVIG, 2F5, 2G12 were administered in passive-transfer experiments 24 hours prior to challenge with pathogenic SHIV 89.6PD – 3/6 animals given HIVIG/2F5/2G12 were completely protected, the others had reduced viremia and normal CD4 counts – 1/3 monkeys given 2F5/2G12 showed transient infection, the other two had reduced viral load – all monkeys that received HIVIG, 2F5, or 2G12 alone became infected and developed high-level plasma viremia, although animals that got HIVIG or 2G12 had a less profound CD4 T cell decline. [Mascola1999] (**antibody interactions**)
- 2G12: Review of the neutralizing Ab response to HIV-1. [Parren1999] (**review**)
- 2G12: Hu-PBL-SCID mice were infected with HIV-1s JRCSF and SF162 to study the effect of NAbs on an established infection – no significant differences in the initial rate of decrease in viral load or the plateau levels of viral RNA between the b12 treated and control mice were seen – in most of the Ab treated mice b12 escape mutants were observed with varying patterns of mutations – a combination of b12, 2G12 and 2F5 protected 1/3 mice, and an isolate from one of the other two was resistant to neutralization by all three MAbs. [Poignard1999] (**antibody interactions**, **escape**)
- 2G12: A Semliki Forest virus (SFV) expression system carrying BX08 Env was used to study the conformation of gp120 Env – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not V3 MAbs – expression in rat brain also showed that surface expressed Env was recognized only by the conformation-dependent Abs and not by anti-V3 Abs. [Altmeyer1999]
- 2G12: rgp120 derived from a R5X4 subtype B virus was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 2G12 was able to bind with low affinity to the rgp120 monomer HIV-1 W61D. [Beddows1999]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: A meeting summary presented results regarding neutralization –MAbs 2G12 and 2F5 tested for their ability to neutralize primary isolate infection of genetically engineered cell lines (cMAGI and others, presented by T. Matthews, A. Trkola, J. Bradac) – an advantage of such cells lines over PBMCs is that markers (X-Gal) can be added for staining to simplify the assay – the consensus of the meeting was that these engineered cell lines did not improve the sensitivity of detection of primary isolate neutralization – D. Burton and J. Mascola presented results concerning passive immunization and protection of hu-PBL-SCID mice and macaques, respectively, and both found combinations of MAbs that were able to achieve 99% neutralization *in vitro* corresponded to efficacy *in vivo*. [Montefiori1999] (**review**)
- 2G12: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. [Frankel1998] (**mucosal immunity**)
- 2G12: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, 2G12 was found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan and has a mutation at the tip of the loop more efficiently than it neutralizes HIV-BRU. [Schonning1998] (**antibody binding site definition and exposure**)
- 2G12: The complete V, J and D(H) domain was sequenced – unlike non-neutralizing anti-gp41 MAb 3D6, five neutralizing MAbs (2F5, 2G12, 1B1, 1F7, and 3D5) showed extensive somatic mutations giving evidence of persistent antigenic pressure over long periods – 2G12 D(H) has the best homology to a D(H) segment between D3-22 and D4-23, a region not usually considered for heavy-chain rearrangement because it lacks associated recombination signals in the flanking regions, Kunert *et al.* suggest this may be why Abs that compete with 2G12 are rare. [Kunert1998] (**antibody sequence, variable domain**)
- 2G12: Review of the antigenic and receptor binding-domains of gp120 in relation to the structure of the molecule – MAbs are discussed by category (anti-V2, anti-V3, CD4i, CD4BS...), however as 2G12 binds to a rarely immunogenic region, and it is dependent on glycosylation, it was discussed individually. [Wyatt1998b] (**review**)
- 2G12: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS) [Li1998] (**antibody interactions**)
- 2G12: MAbs 2G12, 2F5 and b12 are broadly neutralizing, as are some human polyconal sera, but this paper describes a set of primary isolates that are resistant to all three MAbs and 2 broadly neutralizing sera – results indicate that resistance levels of pediatric isolates might be higher than adult isolates – resistance in general did not seem to be conferred by a loss of binding affinity for gp120 or gp41, rather by a more global perturbation of oligomeric Envelope. [Parren1998b] (**variant cross-recognition or cross-neutralization**)
- 2G12: Induces complement-mediated lysis in MN but not primary isolates – primary isolates are refractive to CML. [Takefman1998] (**complement**, **variant cross-recognition or cross-neutralization**)
- 2G12: Notes that 2G12 and 2F5, potent neutralizing antibodies, were identified by screening for cell surface (oligomeric Envelope) reactivity. [Fouts1998] (**antibody binding site definition and exposure**)
- 2G12: A wide range of neutralizing titers was observed that was independent of co-receptor usage. [Trkola1998] (**co-receptor**, **variant cross-recognition or cross-neutralization**)
- 2G12: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – MAb 2G12 was the only exception to this, showing reduced binding efficiency. [Binley1998] (**antibody binding site definition and exposure**)
- 2G12: Does not compete with binding of MAb generated in response to gp120-CD4 complex, CG10. [Sullivan1998b] (**antibody interactions**)
- 2G12: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. [Connor1998]
- 2G12: Enhances Hx10 binding to CD4 positive or negative HeLa cells, but inhibited binding to CD4+ T-cell line A3.01 – neutralizes Hx10 infection of the HeLa cells. [Mondor1998]

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 2G12: Summary of the implications of the crystal structure of gp120 combined with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by 2G12 is unknown, but dependent on proper glycosylation and 2G12 is predicted to be oriented toward the target cell when bound, so neutralization may be due to steric hindrance – mutations in positions N 295, T 297, S 334, N 386, N 392 and N 397 HXBc2 (IIIB) decrease 2G12 binding, and the binding region is 25 angstroms from the CD4 binding site – probably the Ab binds in part to carbohydrates, which may account for both its broad reactivity and the scarcity of Abs in the same competition group. [Wyatt1998a] (**antibody binding site definition and exposure**)
- 2G12: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. [Parren1998a] (**antibody binding site definition and exposure**)
- 2G12: Post-exposure prophylaxis was effective when MAb 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect when delivered 4 hours post infection. [Andrus1998] (**immunoprophylaxis**)
- 2G12: Neutralizes TCLA strains and primary isolates. [Parren1997c] (**variant cross-recognition or cross-neutralization**)
- 2G12: Review that discusses this MAb – reacts with residues at the base of the V3 loop and V4, and most of the changes that reduce binding are glycosylation sites – it is not clear whether the binding site is peptidic or direct carbohydrate. [Burton1997] (**antibody binding site definition and exposure**, **review**)
- 2G12: Viral binding inhibition by 2G12 was strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) [Ugolini1997] (**antibody binding site definition and exposure**)
- 2G12: Using concentrations of Abs achievable *in vivo*, the triple combination of 2F5, 2G12 and HIVIG was found to be synergistic to have the greatest breadth and magnitude of response against 15 clade B primary isolates. [Mascola1997] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 2G12: Review: MAbs 2F5, 2G12 and IgG1b12 have potential for use in combination with CD4-IgG2 as an immunotherapeutic or immunoprophylactic – homologous MAbs to these are rare in humans and vaccine strategies should consider including constructs that may enhance exposure of these MAbs' epitopes. [Moore1997] (**immunoprophylaxis**, **immunotherapy**, **review**)
- 2G12: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB Env – 2G12 was a strong neutralizer of SHIV-vpu+ – all Ab combinations tested showed synergistic neutralization – 2G12 has synergistic response with MAbs 694/98-D (anti-V3), 2F5, F105, and b12. [Li1997] (**antibody interactions**)
- 2G12: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 2G12 bound monomer, and weakly bound oligomer and neutralized JRFL. [Fouts1997] (**antibody binding site definition and exposure**)
- 2G12: A JRCSF variant that was selected for IgG1b12 resistance remained sensitive to MAbs 2G12 and 2F5, for combination therapy. [Mo1997] (**escape**)
- 2G12: In a multilab evaluation of monoclonal antibodies, only IgG1b12, 2G12, and 2F5 could neutralize at least half of the 9 primary test isolates at a concentration of < 25 mug per ml for 90% viral inhibition – neutralized 6 of 9 primary isolates. [D'Souza1997] (**variant cross-recognition or cross-neutralization**)
- 2G12: Review: Only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. [Sattentau1996] (**review**)
- 2G12: Neutralizes primary isolates, HXB2, and chimeric virus with gp120 from primary isolates in an HXB2 background. [McKeating1996b] (**variant cross-recognition or cross-neutralization**)
- 2G12: Neutralizes JR-FL – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. [Trkola1996a] (**co-receptor**)
- 2G12: Review: exceptional capacity to neutralize primary isolates in terms of both breadth and potency – one of three MAbs (IgG1b12, 2G12, and 2F5) generally accepted as having significant potency against primary isolates. [Poignard1996b] (**variant cross-recognition or cross-neutralization**, **review**)
- 2G12: Review: binding site is distinct from CD4BS MAbs epitope and is unique among known gp120 MAbs, human or rodent. [Moore1995b] (**review**)
- 2G12: Binding weakly enhanced by some anti-C1, -C4, -V3, and CD4 binding site MAbs – unusual in that 2G12 binding neither enhanced or inhibited the binding of other MAbs included in the study. [Moore1996] (**antibody interactions**)
- 2G12: Conformationally sensitive epitope destroyed by mutations altering the N-linked glycosylation sites near the base of the V3 loop and the amino-terminal flank of the V4 loop. [Trkola1996b] (**antibody binding site definition and exposure**)
- 2G12: Highly potent Cross-clade neutralizing activity. [Trkola1995] (**inter-clade comparisons**)

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 2G12: Human MAb generated by electrofusion of PBL from HIV-1+ volunteers with CB-F7 cells. [Buchacher1994] (**antibody generation**)					
1126	1367	Env	gp41			HIV-1 infection	human (IgG1λ)
		Ab type cluster I **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center) **References** Gorny2004, Nyambi2000, Gorny2000a, Gorny2000b, Nyambi1998 **Keywords** antibody binding site definition and exposure, inter-clade comparisons, review. • 1367: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. [Gorny2004] (**review**) • 1367: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 1367 weakly bound to the majority of isolates – no neutralizing activity was observed when tested with 5 isolates, but 1367 did not bind well to these isolates. [Nyambi2000] (**inter-clade comparisons**) • 1367: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. [Gorny2000a] (**antibody binding site definition and exposure**) • 1367: A cluster I epitope that binds to rgp41 567-647, recognizes a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41 – this MAb doesn't react with either of the peptides N51 or C43 individually – MAbs 50-69 and 1367 had similar properties. [Gorny2000b] (**antibody binding site definition and exposure**) • 1367: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-gp41 Abs 98-6, 1367 and 1342 were not able to bind detectably with any of the viruses from any clade. [Nyambi1998] (**inter-clade comparisons**)					
1127	126-6 (SZ-126.6)	Env	gp41 (HXB2)		no	HIV-1 infection	human (IgG2κ)
		Ab type cluster II **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu), NYU Med Center, NY, NY **References** Gorny2004, Finnegan2002, Nyambi2000, Gorny2000b, Hioe1997b, Earl1997, Binley1996, Chen1995, Eddleston1993, Xu1991, Robinson1991, Robinson1990b **Keywords** antibody binding site definition and exposure, enhancing activity, inter-clade comparisons, kinetics, review, variant cross-recognition or cross-neutralization. • 126-6: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. [Gorny2004] (**review**) • 126-6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**) • 126-6: NIH AIDS Research and Reference Reagent Program: 1243. • 126-6: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs. [Nyambi2000] (**variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)

- 126-6: This cluster II MAb binds to a conformational epitope in the region 644-663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone – MAb 126-6 was biotinylated and used as a probe to determine that anti-gp41 MAb 50-69 bound the fusogenic form of the protein in liquid phase. [Gorny2000b] (**antibody binding site definition and exposure**)
- 126-6: Discontinuous epitope recognizing residues between 649-668 – designated cluster II – Fabs D5, D11, G1, T3, M12, M15, S6, S8, S9, S10 block binding. [Binley1996] (**antibody binding site definition and exposure**)
- 126-6: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. [Chen1995] (**antibody binding site definition and exposure**)
- 126-6: Called SZ-126.6. [Eddleston1993]
- 126-6: Specific for a conformational epitope. [Xu1991] (**antibody binding site definition and exposure**)
- 126-6: No enhancing or neutralizing activity. [Robinson1991] (**enhancing activity**)
- 126-6: No enhancing activity for HIV-1 IIIB. [Robinson1990b] (**enhancing activity**)

1142	1281 (1281-D)	Env	gp41			HIV-1 infection	human (IgG1λ)
		Ab type cluster II, six-helix bundle **Research Contact** Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center) **References** Gorny2004, Follis2002, Golding2002b, Verrier2001, Gorny2000a, Gorny2000b, Hioe1997b **Keywords** antibody binding site definition and exposure, antibody interactions, review, variant cross-recognition or cross-neutralization. • 1281: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. [Gorny2004] (**review**) • 1281: Alanine mutations were introduced into the N- and C-terminal α-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**) • 1281: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. [Golding2002b] (**antibody binding site definition and exposure**)					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• 1281: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. [Verrier2001] (**antibody interactions**) • 1281: Binds within the region gp41 647-682 – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. [Gorny2000a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**) • 1281: This cluster II MAb binds to a conformational epitope in the region 644-663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone. [Gorny2000b] (**antibody binding site definition and exposure**) • 1281: Called 1281-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. 		• 8F101: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. 8F101 selectively stains gp120-CD4 complexes after dissociation from gp41, and did not stain cells arrested earlier than 30 min of co-culture, but 8F101 and cluster I and II MAbs co-localized at fusing cell interfaces at 30 min coculture. After extended co-culture, only 8F101 bound. [Finnegan2002] (**antibody binding site definition and exposure**, **kinetics**) • 8F101: MAbs specifically reactive to crosslinked gp120 and CD4 were derived (8F101, 8F102) – conformation dependent – competition studies indicate the epitope is immunogenic in infected humans. [DeVico1995] (**antibody generation**)

References deRosny2004, Follis2002, Yang2002, Yang2000, Jiang1998

Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, inter-clade comparisons, variant cross-recognition or cross-neutralization.

- NC-1: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. 2F5 neutralization seems to block a later step of the fusion process, but it does not inhibit binding of NC-1, a MAb specific for the six-helix bundle, so it does not prevent formation of the six-helix bundle. The results are most consistent with 2F5 inhibiting a post-fusion-intermediate step. [deRosny2004] (**antibody binding site definition and exposure**, **antibody interactions**)
- NC-1: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. [Follis2002] (**antibody binding site definition and exposure**)
- NC-1: Uncleaved soluble gp140 can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif (gp140delta683(-/GCN4)) or using a T4 trimeric motif derived from T4 bacteriophage fibritin (gp140delta683(-/FT)) – NC-1 binds to 15% of the GCN4 motif trimers, but this was significantly reduced for the T4 fibritin stabilized structures, indicating little is in the six-helix bundle, fusogenic conformation. [Yang2002] (**antibody binding site definition and exposure**)
- NC-1: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – approximately 16% of the gp140(-GNC4) stabilized trimer recognized by pooled sera was precipitated by NC-1, indicating that at a fraction assumes a fusogenic gp41 six-helix bundle conformation – gp140(-) monomers were not able to bind to the NC-1, nor was gp130(-/GCN4) glycoprotein, consistent with the expectation that the absence of C34 helices would preclude formation of the six-helix bundle. [Yang2000] (**antibody binding site definition and exposure**)
- NC-1: Ab elicited in response to immunization with N36(L6)C34, a peptide that folds into a six helix bundle like gp41 – NC-1 binds to the surface of HIV-1 infected cells only in the presence of sCD4, recognizing the fusogenic core structure – binding affinity was decreased by point mutations that disrupt core formation and abolish membrane fusion activity, (I573P and I573A) – NC-1 can recognize discontinuous epitopes from B clade isolate SC, but not E clade strain N243, O group strain GAB, or HIV-2 ROD. [Jiang1998] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **inter-clade comparisons**)

IV-C-17 Nef Antibodies

IV-C-18 HIV-1 Antibodies

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
1214		HIV-1				HIV-1 infection	
		References Goepfert2003 **Keywords** review. • A general review of anti-HIV human immune responses and the implications of these responses for vaccines, summarizing neutralizing antibodies, CD4+ and CD8+ T cell responses. A general overview of methods used to study these responses is presented. [Goepfert2003] (**review**)					
1215	polyclonal	HIV-1				HIV-1 infection	human
		References Fournier2002b • Purified B lymphocytes secret only a fraction of Ig and anti-HIV-1 Ab compared with unfractionated cells because monocytes and natural killer cells enhance both secretions by cell-to-cell contacts, involving adhesion and CD27, CD80 costimulatory molecules and IL-6 – cell-to-cell contacts and soluble factors induce maturation of activated B cells *in vitro* to allow prolonged survival and terminal differentiation. [Fournier2002b]					
1216	polyclonal	HIV-1				HIV-1 infection	human
		References Fournier2002a • An early and sustained fall in plasma viral load to below detection was observed in 17 HAART responders while HIV-1 RNA remained detectable in 13 incomplete responders – HIV-1 specific Ab secretion decreased in parallel with plasma viral load – HIV-1 specific Abs became negative in only six responders, and was correlated with greater increases of CD4 T-cell counts and higher levels of HIV-specific IgA secretion at baseline – persistent immune activation may be due to residual HIV antigen. [Fournier2002a]					
1217	polyclonal	HIV-1				HIV-1 infection	human
		References Subbramanian2002 • Sera from 39 patients were used to study the relative prevalence of neutralizing Abs (NAbs), ADCC-Abs and enhancing Abs – 69% of the sera were positive for NAbs but only 39% could neutralize in the presence of complement – 60% had ADCC Abs – 72% mediated the enhancement of infection in the presence of complement. [Subbramanian2002]					
1218	polyclonal	HIV-1				HIV-1 infection	human (IgA, IgG1)
		References Battle-Miller2002 • In a study of HIV-1 infected women, ADCC Abs were detected in 16% (12/51) of cervicovaginal fluids, and 56% (25/45) of serum samples – 3 women had ADCC in cervical lavage fluids, but not sera, suggesting local production. [Battle-Miller2002]					
1219	polyclonal	HIV-1				HIV-1 infection	human (IgA1, IgA2, IgM)
		References Wu2002 • IgA1 accounted for the majority of anti-HIV-1 IgA in the saliva in HIV-1 infected individuals – there was no anti-gp41 IgA in saliva, in contrast to plasma – lower levels of IgA and IgM were found in saliva than in plasma. [Wu2002]					
1220	polyclonal	HIV-1			P	HIV-1 infection	human
		References Hioe1997a					

No.	MAb ID	HXB2 Location	Author's Location	Sequence	Neutralizing	Immunogen	Species(Isotype)
		• Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. [Hioe1997a]				
1221	polyclonal	HIV-1			no	HIV-1 infection	human (IgA, IgG)
		References Oelemann2002					
		• A urine based commercial EIA kit from Calypte Biomedical Corporation, Berkeley, CA was found to work well as a primary screening for HIV in Brazilian samples – 76 HIV+ samples were correctly identified (100% sensitivity), and 278/284 negative samples 97.9% specificity. [Oelemann2002]					
1222	polyclonal	HIV-1	HIV-1		no	HIV-1 infection	human (IgE)
		References Pellegrino2002, Secord1996					
		• Pediatric long term survivors (LTS) have been found to carry HIV-1 specific IgE – serum from these children inhibit HIV-1 production in culture, but this inhibition did not seem to be due to neutralization, rather due to a cytoxic event – serum lost the HIV-1 inhibitory effect when depleted of IgE. [Pellegrino2002]					
		• HIV-specific IgE found in clinically healthy HIV-1 infected children. [Secord1996]					
1223	polyclonal	HIV-1	gp120 and p55		no	Vaccine	macaque
		Vaccine *Vector/Type:* vaccinia *Strain:* B clade 89.6 *HIV component:* Env, Gag-Pol *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)					
		References Ambrose2003					
		Keywords genital and mucosal immunity.					
		• Systemic priming with rVVs expressing HIV-1 Env and SHIV Gag-Pol followed by intragastric and intranasal mucosal boosting of LT(R192G) and aldrithiol-2 (AT-2)-inactiviated SHIV induced SHIV-specific IgA and IgG plasma and mucosal Abs. Viral loads in vaccinated animals were reduced after vaginal challenge with SHIV 89.6. [Ambrose2003] (**genital and mucosal immunity**)					

IV-D

Maps of MAb Locations Plotted by Protein

Linear epitopes less than twenty-two amino acids long are shown with their antibody ID and the experimental species.

Key	Species
h	human
p	non-human primate
m	murine
o	other

Table IV-D.1: The species for which the epitopes react

VI-A

Introduction and Historical Overview of the Nonhuman Primates HIV/SIV Vaccine Trials Database

The development of an effective vaccine against HIV is urgently needed given the continual increase in the number of people infected with HIV, estimated to be about 40 million, in addition to 20 million people who have already died due to HIV since the beginning of the epidemic two decades ago. A general consensus is that the development of an effective vaccine is the best way to tackle this epidemic. Unfortunately, the effort to develop a good and reliable vaccine against HIV has proven to be difficult. HIV is the most studied infectious agent in medical history. The vaccine research is increasingly becoming an important focus as a large number of data continue to emerge from different laboratories. As of October 2004, a quick search using a string argument containing "HIV or SIV and vaccine" yielded 6439 references. Using the search string "((HIV OR SIV) AND vaccine) AND macaque", 820 references were retrieved from PUBMED.

Since traditional approaches for vaccine development have proven ineffective for HIV, it is important to encourage new methodologies and to increase the numbers of studies in order to speed up the process required to develop an effective vaccine against HIV. Consequently, a large number of studies on HIV and SIV-related vaccine are being generated. In addition, studies vary considerably in the way the vaccine trials are being conducted, including the design and formulation of vaccines, the doses, the animals used, the challenge viruses, etc. This makes it difficult to adequately compare the studies. It is important to continue to monitor the ever growing number of data generated by researchers working to understand the complexity of HIV pathogenicity and to follow up the ongoing preclinical research in animal models and phase I-III human trials.

To begin to address this problem, we have constructed a relational database named *Nonhuman Primate HIV/SIV Vaccine Trials Database* to serve the scientific community, particularly those engaged in vaccine development as well as policy makers.

The published data pertaining to HIV vaccine development in nonhuman primate models have been curated and compiled in such a way that users can interactively search and retrieve them online through the internet. In order to qualify for entry in the database, the trial must meet the following criteria: 1) SIV or HIV-based vaccine or passive immunization have been used in nonhuman primates; 2) an assessment for immunogenicity or immunotherapeutic property of the immunogen has been performed. A challenge virus may also have been injected to the immunized and control animals to assess the efficacy of the vaccine.

Historically, prior to the development of this database, Dr. Jon Warren at the EMMES Corporation had maintained a similar database, though organized differently, and with different data fields and somewhat different nomenclature. The studies in that database include those published through 1999. We have made that database accessible through the internet, and integrated it into the search interface of the Los Alamos National Laboratory vaccine database. This will be available to the public until we have integrated all of those studies into the Los Alamos database.

The Los Alamos Nonhuman Primate HIV/SIV Vaccine Trials Database home page can be accessible at `http://www.hiv.lanl.gov/cgi-bin/vaccine/public/index.cgi`, and is depicted in Figure VI-A.1.

The data in the database can be accessed in two ways, using the Search Form or the Cross-Table Form which are displayed on the home page. The Search Form allows users to retrieve technical information pertaining to vaccine studies using multiple choice menus to construct logical arguments for searching the database. The search argument is a combination of items chosen from the menus which include the study Objectives, the Species or experimental animal model, the Reference, the Vaccine and Challenge virus (Figure VI-A.2).

The search argument formulated by the user sends an electronic query to both the Los Alamos (also known as the *Current Database*) and the data collected by

In *HIV Immunology and HIV/SIV Vaccine Databases 2003*. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. LA-UR 04-8162. pp. 1127–1332.

Figure VI-A.1: Home page of the vaccine trials database

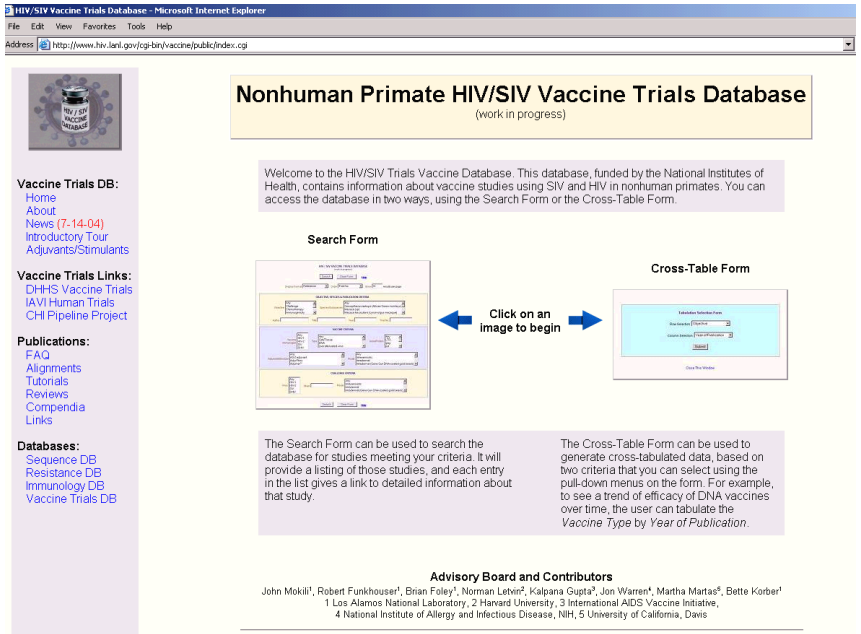

Figure VI-A.2: Search Form

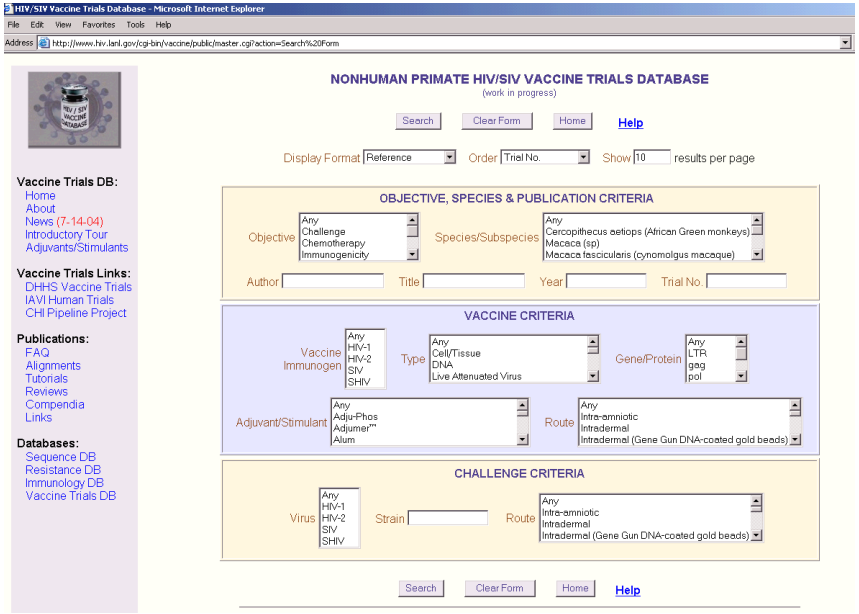

Jon Warren (also known as the *Previous Database*). Where the search argument cannot be applied to the Previous Database, a message to this effect is displayed. Of note, the Previous Database has fewer display choices, and the data were organized by Stage. A *Stage* is generally defined as a point in a trial where results for a group of test subjects was assessed. In some cases, stages span multiple published studies. The Los Alamos Database or Current Database does not organize data along the concept of stages, rather each published paper is treated as a distinct trial. However, in some few cases a published study may encompass multiple but directly related experiments. In such cases a suffix *experiment number* is added so that the first experiment of, say, NHP92 will be shown as NHP92.1, the second as NHP92.2, etc. In this compendium, we have selected only the information contained in the Current Database; a hard copy summary of Jon Warren's final database was published in the Journal of Clinical Primatology under the title "Preclinical AIDS vaccine research: survey of SIV, SHIV, and HIV challenge studies in vaccinated nonhuman primates" (please see *J Med Primatol* 2002 Aug; 31(4-5):237-256).

Table VI-A.1: Example of an output using the Cross-Table Form. In this specific case, the HIV subtype (across) and the Virus (down) from which the immunogen was based.

	HIV-1 subtype										
Immunogen Origin	**A**	**B**	**C**	**CRF02_AE**	**D**	**F**	**G**	**H**	**J**	**K**	**L**
HIV-1	1	66 [65/321]	1	1	1	0	0	0	0	0	0
HIV-2	0	0	0	0	0	0	0	0	0	0	0
SHIV	0	10 [2/42]	0	0	0	0	0	0	0	0	0
SIV	0	21 [22/142]	0	0	0	0	0	0	0	0	0

The data entered in the database can also be retrieved using the Cross-Table Search Form. This tool was designed to allow users to retrieve data in a cross-tabulated format. For example, Table VI-A.1 shows a tabulation of the origin of vaccine immunogens (HIV-1, HIV-2, SIV or SHIV) by the subtype shows that the great majority of vaccines trials used so far are based on subtype B. The number in each bifurcation box refers to the number of studies in the database and the ratio of animals protected from infection with the challenge virus over the total number of animals immunized and challenged.

VI-A-1 Organization and contents of the compendium

This vaccine trials compendium is divided in 5 chapters.

- Vaccines
- Challenges
- Adjuvants and Stimulants
- Trial Summaries
- References

An introduction is provided at the beginning of each section.

VI-B

Vaccines

This section contains a list of vaccines used in the studies compiled in the database. We devised a simple nomenclature to group the vaccines by type of vaccine. This includes the following:

- DNA
- Live Attenuated Virus
- Recombinant Live Attenuated Virus
- Live Virus
- Cell/Tissue
- Whole (killed) Inactivated Virus
- Virus-like Particle
- Purified Viral Products
- Synthetic Protein/Peptide
- Recombinant Subunit Protein
- Recombinant Vector (virus/bacteria)
- Passive Antibody
- Other

In most cases the name and description of the vaccine, as provided by the authors of the paper, was retained. The virus (HIV, SIV or SHIV), the viral component (gene or protein) and the subtype (for HIV or HIV fragment in SHIV) were also recorded. The database trial numbers (NHP number) where the vaccine was used are listed for reference.

VI-B-1 DNA vaccines

Vaccine Name **bSIVgp120**
Description Recombinant baculovirus expressing SIV gp120

Trial(s) NHP.33

Vaccine Name **CHO-SIVgp120**
Description Recombinant Chinese hampster cells expressing SIV gp120

Trial(s) NHP.33, NHP.156

Vaccine Name **CMV SHIV dEN**
Description CMV-SHIVdEN) was constructed from an env and nef deletion SHIV DNA (SIVGP1 DNA) by replacing the 5' long terminal repeat region with a cytomegalovirus promoter with an immediate-early enhancer and the 3' long terminal repeat region with simian virus 40 poly(A).

Virus SHIV *Strain:* SIVGP1 DNA *Subtype:* B *Gene/Protein:* gag, pol, Accessory (vif,vpx, vpr (partial))
Notes lacking env and nef

Trial(s) NHP.326

Vaccine Name **CMVKm2-gp140TM**
Description The sequence for the native subtype B HIV-1US4 envelope was modified to reflect the optimal codon usage in highly expressed human genes. Contained the oligomeric secreted membrane-bound gp140TM, which include the membrane-spanning domain of gp41 (residues1-691). The gene cassettes constructedsynthetically using EcoR1 and Xba1 by the Midland Certified Reagent Company, and were cloned into plasmid vectors for DNA vaccination (pCMVKm2).

Virus HIV-1 *Strain:* HIV-1.US4 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.354

Vaccine Name **d81**
Description In this vaccine the SIVmac239 env-nef expression cassette was inserted into the TK gene of the HSV-1 genome. It has a deletion in the essential ICP27 gene in addition to the deletion in TK, rendering it replication defective in Vero cells. CMV, promoter/enhancer sequences of the CMV IE gene; PA, signal sequences for poly(A) addition. The SIV sequences are from the SphI site (nucleotide 6450) rightward in SIVmac239. These include rev exon 1, the entire env ORF, rev exon 2, and the nef open reading frame
Notes Herpes simplex vector

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env

Trial(s) NHP.54

Vaccine Name **DNA (pCMVKm2) gp140**
Description Unmodified gp140. pCMVKm2 vector expressing the gp140 ectodomain form of the HIV envelope immunogen, with an intact gp120-gp41 cleavage site

Virus HIV-1 *Strain:* SF162 *Subtype:* B

Trial(s) NHP.22

Vaccine Name **DNA Vaccine pNL432-ZF1***

Description DNA vaccine derived from pNL432, an infectious molecular clone of HIV-1 in which the first two cysteine residues of the N-terminal zinc finger motif (Cys-X2-Cys-X4-His-X4-Cys) were replaced by serine residues

Virus HIV-1 *Strain:* NL432 *Subtype:* B *Gene/Protein:* All (Full genome (modified))
Notes first two amino cysteine residues of the N-terminal zinc finger motif (Cys-X2-Cys-X4-His-X4-Cys) were replaced by serine residues

Trial(s) NHP.31, NHP.149.2

Vaccine Name **DNA-gag,env**
Description DNA vaccines encoding SIVmac239 Gag and HIV-1-89.6P Env
Notes 2 constructs

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.23

Vaccine Name **DNA-pCI-rev**
Description Eukaryotic expression vector pCI (Promega, Charbonnieres, France) with HIV-1 primary isolate ACH320 2.1 rev cDNA. Expression checked in 293T cells.

Virus HIV-1 *Strain:* ACH320 2.1 *Subtype:* B *Gene/Protein:* rev
HXB2 5970-6045 (exon 1) and 8379-8653 (exon 2)

Trial(s) NHP.276

Vaccine Name **DNA-pCI-tat**
Description Eukaryotic expression vector pCI (Promega, Charbonniers, France) with tat cDNA cloned from primary isolate ACH320 2.1. Expression checked in 293T cells.

Virus HIV-1 *Strain:* ACH320 2.1 *Subtype:* B *Gene/Protein:* tat
HXB2 5831-6045 (exon 1) and 8379-8479 (exon 2)

Trial(s) NHP.276

Vaccine Name **DNA-SIV**
Description This vaccine consists of five plasmids expressing different combinations of SIV mac proteins. The 5 plasmids enconded for non-infectious SIVmac239 virus particle, envelope of SIVmac239 and SIVmac251, and a monocyte/macrophage tropic isolate of SIVmac316

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All
Virus SIV *Strain:* SIVmac251 *Gene/Protein:* env
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env
Virus SIV *Strain:* SIVmac316

Trial(s) NHP.275

Vaccine Name **DNA.pND14-G1.SIVmac251.env**
Description DNA vaccine; DNA vector using hCMV IE promoter and expressing SIVmac251 structural env gene

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* env

Trial(s) NHP.58

Vaccine Name **DNA.PTH.SIVmac.J5.gptnr**
Description DNA vaccine; DNA vector using hCMV IE promoter expressing SIVmac251J5 structural (gag,pol) and regulatory (tat, nef and rev) genes

Virus SIV *Strain:* SIVmac251.J5 *Gene/Protein:* gag, pol

Trial(s) NHP.58

Vaccine Name **DNA.SF162ΔV2 gp140**

Description This is a DNA vector expressing the SF162ΔV2 gp140 envelope with an intact gp120-gp41 cleavage site. The DNA construct was codon optimized for high expression in mammalian cells

Virus HIV-1 *Strain:* HIV-1.SF162 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.62

Vaccine Name **FMSIV**

Description This is a chimeric simian-human immunodeficiency virus (SHIV) with ecotropic Friend murine leukemia virus (FMLV) env in place of SHIV env in combination with FMLV receptor , mCAT1, which is not normally expressed in primate cells. FMSIV DNA has SIV-derived LTR, gag, pol, vif, vpx and partial vpr sequences, HIV-1-derived partial vpr, tat, rev and partial env (containing the second exon of tat, the second exon of rev, and RRE) sequences and FMLV-derived env sequences.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* LTR, gag, pol, Accessory (vif,vpx)

Virus HIV-1 *Strain:* HIV-1DH12 *Subtype:* B *Gene/Protein:* env, Accessory (vpr,tat,partial env (containing the second exon of tat, the second exon of rev, and RRE))

Trial(s) NHP.67, NHP.70, NHP.350

Vaccine Name **HIV env_{MN}/rev(pCEnv)**

Description Plasmid DNA containing HIV-1 env/rev

Virus HIV-1 *Strain:* HIV-1.MN *Subtype:* B *Gene/Protein:* env, Accessory (rev)

Trial(s) NHP.16.1, NHP.16.2, NHP.363

Vaccine Name **HIV-1 89.6P Env gp140 (KB9) DNA**

Description KB9 plasmid expressing HIV-1 89.6P

Virus HIV-1 *Strain:* HIV-1.89.6P *Subtype:* B *Gene/Protein:* env (gp140)

Trial(s) NHP.400

Vaccine Name **HIV-1.89.6P env DNA**

Description

Virus HIV-1 *Strain:* HIV-1.89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.126

Vaccine Name **HIV-1.89.6P env DNA**

Description

Virus SHIV *Strain:* SHIV89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.60.1, NHP.60.3, NHP.98

Vaccine Name **HIV-2UC2.tat.nef.gag**

Description A mixture of 3 plamids constructs based on the gene sequences of the gp140 envelope, p55 Gag, Nef, and Tat proteins from the HIV-2UC2 isolate. The plasmid DNA was then resuspended to 2 mg/ml in 2x phosphate buffer saline for intramuscular and intradermalimmunizations
or in water for intranasal immunizations and stored at −20^{0}C.

Virus HIV-2 *Strain:* HIV-2UC2 *Gene/Protein:* gag, Accessory (tat,nef,p55)

Trial(s) NHP.378

Vaccine Name **K81**

Description This is a replication-competent HSV recombinant K81. The SIVmac239 env-nef expression cassette was inserted into the TK gene of the HSV-1 genome. CMV, promoter/enhancer sequences of the CMV IE gene; PA, signal sequences for poly(A) addition. The SIV sequences are from the SphI site (nucleotide 6450) rightward in SIVmac239. These include rev exon 1, the entire env ORF, rev exon 2, and the nef open reading frame

Notes Herpes simplex vector

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env

Trial(s) NHP.54

Vaccine Name **MVA.HIVA**

Description Same vaccine used in human trial in Oxford, UK and Nairoby, Kenya

Trial(s) NHP.118

Vaccine Name **p55gagSF2**

Description

Virus HIV-1 *Strain:* HIV-1.SF2 *Subtype:* B *Gene/Protein:* gag

Trial(s) NHP.354

Vaccine Name **pC-SIV17E-Fred (gagpolenv)**

Description This is a plasmid DNA vaccine encoding the SIVmac17E-Fr (which is closely related to SIVmac239) gag-pol-env, including vif, vpx, vpr, tat, and rev, except that the 5' LTR is deleted and the 3' LTR is truncated by 360 bp. SIV nef was truncated atthe sequencefor amino acid 93 by insertion of a stop codon

Virus SIV *Strain:* SIVmac17E-Fr *Gene/Protein:* env, gag

Trial(s) NHP.52

Vaccine Name **pC-SIVrev**

Description DNA vaccine; Contains pC-SIVnef-TPA and pC-SIVnef (both constructed based on pC-SIVmac17E-Fred)

Trial(s) NHP.52

Vaccine Name **pc-synGag (SIVmac239)**

Description Contains a codon-optimized gene, cloned under transcriptional control of the cytomegalovirus immediate-early promoter-enhancer unit in pcDNA 3.1 (Invitrogen). Protein expression is about four- to fivefold greater than that of the corresponding wild-type construct

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.374

Vaccine Name **pc-syngp120 (SHIV-189.6p)**

Description Contains a codon-optimized gene, cloned under transcriptional control of the cytomegalovirus immediate-early promoter-enhancer unit in pcDNA 3.1 (Invitrogen). Protein expression is about four- to fivefold greater than that of the corresponding wild-type construct

Virus SHIV *Strain:* SHIV-1.89.6P *Subtype:* B *Gene/Protein:* env (gp120)

Trial(s) NHP.374

Vaccine Name **pc-synTat (HIV-1IIIB)**

Description contain a codon-optimized gene, cloned under transcriptional control of the cytomegalovirus immediate-early promoter-enhancer unit in pcDNA 3.1 (Invitrogen). Protein expression is about four- to fivefold greater than that of the corresponding wild-type construct

Virus HIV-1 *Strain:* HIV-1IIIB *Subtype:* B *Gene/Protein:* Accessory (tat)

Trial(s) NHP.374

Vaccine Name **pcDNA3–tet.CCR5**

Description This DNA vaccine encodes for CCR5 and tetanus genes.

Trial(s) NHP.68

Vaccine Name **pcDNA3-CCR5**

Description

Trial(s) NHP.68

Vaccine Name **pCGag/Pol**

Description DNA constructs expressing HIV-1-IIIB gag/pol protein

Virus HIV-1 *Strain:* HIV-1.IIIB *Gene/Protein:* gag, pol

Trial(s) NHP.71

Vaccine Name **pCI-Nef plasmid**

Description A mixture of six pCI-Nef plasmids expressing the nef epitopes from SIVmac251 primary isolate (BK28, SO4, SO5, SO8, SO9 and SO12)

Virus SIV *Strain:* SIVmac251 (BK28)
Virus SIV *Strain:* SIVmac251 (SO4)
Virus SIV *Strain:* SIVmac251 (SO5)
Virus SIV *Strain:* SIVmac251 (SO8)
Virus SIV *Strain:* SIVmac251 (SO9)
Virus SIV *Strain:* SIVmac251 (SO12)

Trial(s) NHP.12

Vaccine Name **pCMN160 (HIV-1 MN env)**

Description DNA constructs expressing HIV-1-MN env and rev proteins (pCMN160)

Virus HIV-1 *Strain:* HIV-1.MN *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.71

Vaccine Name **pCMN160 HIV-1.MN env-rev**

Description A DNA vaccine (plasmid) expressing HIV-1 MN env and rev

Virus HIV-1 *Strain:* HIV-1.MN *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.202

Vaccine Name **pCMV-gag-mod**

Description HIV-1SF2 p55 Gag modified to highly expressed human codons; regions with INS were inactivated. Produces a p55 Gag protein with three amino acid changes (Asn377Thr, Ile403Thr, and Lys405Arg). An optimal initiation of translation (GCCACCAUGG) was employed. This 1,527 bp SF2-gag-mod sequence was cloned into the SalI and EcoRI sites of pCMVKm2(Chiron Corporation, Emeryville, Calif.).

Notes zur Megede et al J Virol 74(6): 2628 (2000) PubMed ID 10684277

Virus HIV-1 *Strain:* SF2 *Subtype:* B *Gene/Protein:* gag

Trial(s) NHP.321, NHP.354

Vaccine Name **pCMV-V3.S (HBV-HIV vaccine)**

Description HIV-1 LAI V3 inserted within the frame of HBV envelope in pCV-S2.S

Virus HIV-1 *Strain:* *Subtype:* B

Virus HIV-1 *Strain:* HIV-1.LAI *Subtype:* B

Trial(s) NHP.10

Vaccine Name **pCMV/nef**

Description pCMV/nef plasmid vaccine comprises the PstI-StuI Nef-encoding fragment of clone BK28 inserted into pCMV5

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.56

Vaccine Name **pCMV/SIVsmH4/rev-gp160**

Description

Virus SIV *Strain:* SIVsmH4 *Gene/Protein:* env, Accessory (rev)

Trial(s) NHP.371

Vaccine Name **pCMVKm2-Delta-V2 gp140**

Description Modified V2-deleted gp140. pCMVKm2 vector expressing the unmodified gp140 ectodomain form of the HIV envelope immunogen, with an intact gp120-gp41 cleavage site

Virus HIV-1 *Strain:* SF162 *Subtype:* B

Trial(s) NHP.22

Vaccine Name **pCMVKm2-gp140mut**

Description The sequence for the native subtype B HIV-1US4 envelope was modified to reflect the optimal codon usage in highly expressed human genes. Contained the oligomeric secreted gp140mut (uncleaved, containing a single R522S cleavage site mutation; includes residues 1-668). The gene cassettes constructedsynthetically using EcoR1 and Xba1 by the Midland Certified Reagent Company, and were cloned into plasmid vectors for DNA vaccination (pCMVKm2).

Virus HIV-1 *Strain:* HIV-1US4 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.354

Vaccine Name **pCMVmCAT1**
Description constructed from pCMV (Clontech) by replacing the B-gal gene with a PCR fragment encoding mCAT1B (See Matano, 2000 for details)

Virus HIV-1 *Strain:*

Trial(s) NHP.350

Vaccine Name **pCSGag/Pol.SIV**
Description SIV gag/pol

Virus SIV *Strain:* ND *Gene/Protein:* gag, pol

Trial(s) NHP.16.1, NHP.16.2

Vaccine Name **pCV-tat**
Description DNA vaccine: the plasmid pCV-tat contains the cDNA of the HIV-1 tat gene (BH-10) under the transcriptional control of the adenovirus major late promoter and the vector pCV-0. Plasmids were purified on CsCl gradient and dialyzed for 48 h against 300 volumes of sterile PBS without calcium and magnesium.

Virus HIV-1 *Strain:* BH10 *Subtype:* B *Gene/Protein:* Accessory (tat)

Trial(s) NHP.2, NHP.162

Vaccine Name **pGA1-gag-pol DNA vaccine**
Description The Gag-Pol (SIVmac239) insert was cloned into the pGA1 expression vector (GenBank accession no. AF425297)

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.89

Vaccine Name **pGA2/JS2-HIV-1.gag.pol.env**
Description A vaccine derived from pGA1/JS1 after a series of safety measures (mutation and deletion) in the HIV-1 inserts. The vaccine uses pGA expression vectors that use the CMV immediate early promoter and the bovine growth hormone polyadenylation sequence to express RNAs.

Virus HIV-1 *Strain:* HIV-1.BH10 *Subtype:* B *Gene/Protein:* gag, pol, env, Accessory

Trial(s) NHP.384

Vaccine Name **pGagpol/EnvRev SIV239 DNA**
Description This is a DNA vaccine containing a plasmaid backbone which takes advantages of a CMV promoter and a SV40 poly A signal to express SIV239 gagpol and EnvRev (in two recombinant plasmid constructs). The effect of the rev gene is thought to increase the expression of gagpolconstruct (in vitro assays)

Virus SIV *Strain:* SIVmac239
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env

Trial(s) NHP.300

Vaccine Name **pJW4303/HXB-2.dpol**
Description A DNA immunogen expressing the pol gene of SHIV-IIIB

Virus SHIV *Strain:* SHIV-IIIB *Subtype:* B *Gene/Protein:* pol

Trial(s) NHP.56

Vaccine Name **pJW4303/HXB-2.gp120**

Description Same as pHXB2gp120; This is a eukaryotic expression vector that uses enhancer and promoter elements, including intron A from the cytomegalovirus immediate-early promoter, and polyadenylation sequences from the bovine growth hormone pJW4303 supports Env expression in the absence of Rev. A stop codon introduced at the boundary of the surface (SU) and transmembrane (TM) subunits of Env followed by a BamHI site for cloning into the BamHI site in pJW4303

Virus HIV-1 *Strain:* HIV1.HXB2 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.56

Vaccine Name **pJW4303/HXB-2.gp140**

Description A recombinant plasmid onstructed by cloning env fragments in frame with a synthetic tissue plasminogen activator-(tPA)- leader sequence in pJW4303. This is an eukaryotic expression vector that uses enhancer and promoter elements, including intron A from the cytomegalovirus immediate-early promoter, and polyadenylation sequences from the bovine growth hormone pJW4303 supports Env expression in the absence of Rev. Contain a stop codon immediately prior to the transmembrane domain of TM

Virus HIV-1 *Strain:* HIV-1.HXB2 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.56

Vaccine Name **pMA SHIV89.6**

Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* Accessory, gag, LTR, pol (LTR, gag,pol,vpx,vpr,nef)

Virus HIV-1 *Strain:* HIV89.6 *Subtype:* B *Gene/Protein:* Accessory, env (tat,rev,vpu,env)

Trial(s) NHP.140

Vaccine Name **Pooled SIVgag/HIVtat.rev DNA vaccine**

Description Mixture of 3 plasmids encoding SIVmac239gag (pSIVoptgag), HIV-1.NL4.3 tat and rev. Plasmid pCMVNLtat, encoding the HIV-1NL4- tat, was constructed from plasmid vector pEGFP-N1 by replacing the EGFP coding sequence with the SalI-BamHI restricted tat fragment from the cDNA clone pCR2-tat1. The expression of tat is under the control of the human cytomegalovirus (CMV) immediate-
early promoter. HIV-1NL4.3 rev expression is under the control of the rous sarcoma virus promoter

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Virus HIV-1 *Strain:* HIV-1.NL4.3 *Subtype:* B *Gene/Protein:* Accessory (tat)

Virus HIV-1 *Strain:* HIV-1.NL4.3 *Subtype:* B *Gene/Protein:* Accessory (rev)

Trial(s) NHP.339

Vaccine Name **pRS102 -SIVmac239 gag-pol proteins**

Description The plasmid pRS102 expresses SIVmac239 Gag and Pol proteins. The vaccine insert for pRS102 comprised a Kozak sequence, the SIV239 gag-pol region (nucleotides 1309-5753) and the Mason-Pfizer Monkey virus cytoplasmic transport element. This insert wasclonedinto the HindIII and NheI sites of the eukaryotic expression vector pJW4303, and expression in transiently transfected COS cells was verified.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.56

Vaccine Name **pSabRV1-SIV**

Description Polio virus vector expressing SIV gag, pol, env, nef, and tat in overlapping fragments

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env, gag, pol

Trial(s) NHP.13

Vaccine Name **pSabRV2-SIV**
Description Polio virus vector expressing SIV gag, pol, env, nef, and tat in overlapping fragments

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env, gag, pol

Trial(s) NHP.13

Vaccine Name **pSHIV-NM-3rn ZF1***
Description the construct was based on the infectious molecular clone of SHIV-NM-3rn (Kuwata et al., 1995) from which the BamHI-PvuII fragment was subcloned between the BamHI/HincII sites of pUC119 and, using this plasmid as a template, site-directed mutagenesis ofthe zinc-finger motifs was performed by PCR. The plasmid pSHIV-NM-3rn ZF1* has mutations (Cys... Cys... His... CysSer... Ser... His... Cys) in an N-terminal zinc-finger motif of the NC protein in the gag region of SHIV-NM-3rn see paper for details)

Virus HIV-1 *Strain:* HIV-1.NL432 *Subtype:* B *Gene/Protein:* env, Accessory (vpr,tat,vpu,env,nef)
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* LTR, gag, pol, Accessory (vif,vpx)

Trial(s) NHP.322

Vaccine Name **pSIVNef-TPA**
Description DNA vaccine; Constructed based on SIVmac17E-fred +nef

Trial(s) NHP.323

Vaccine Name **pTH.HW DNA**
Description A DNA vaccine contained an SIV gag-derived epitope, TPYDINQML, recognized by CTLs in rhesus macaques (Macaca mulatta) in the context of the Mamu-A*01 MHC class I molecule

Trial(s) NHP.57

Vaccine Name **pTHr.HIVA DNA**
Description Same vaccine used in human trial in Oxford, UK and Nairoby, Kenya

Trial(s) NHP.118

Vaccine Name **pUCgp120SF2-gold particle**
Description Vaccine based on a modification of pCMV6agp120SF2 which has been previously described. pUCgp120 expresses gp120 of HIV-1 SF2 by using the cytomegalovirus promoter-intron A, tissue plasminogen activator signal sequences, and bovine growth hormone termination sequences; Plasmid DNA was isolated by using plasmid purification columns and endotoxin-free buffers (Qiagen, Chatsworth, Calif.). DNA was bound to 2.6-μm-diameter gold particles to a concentration of 2 μg of DNA/mg of gold

Virus HIV-1 *Strain:* HIV-1.SF2 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.75

Vaccine Name **pV1P-HIV-1.89.6P env**
Description Plasmid DNA expressing HIV-1 89.6P env

Virus HIV-1 *Strain:* HIV-1.89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.24.1

Vaccine Name **pV1P-SIVmac239 gag**
Description Plasmid DNA expressing SIVmac239

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.24.1

Vaccine Name **pV1R-SIVmac239-gag**
Description A plasmid DNA constructed by annealing a series of overlaping oligonucleotides.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.306.1, NHP.306.2

Vaccine Name **pVacc1 DNA**
Description pVacc1 includes a full SIVmac239 genome with multiple mutations in the NC basic domain and the functional domains of RT and INT, under the control of the CMV promoter. A 3.1-kb SphI-NcoI fragment that includes the env gene from pSHIV-KB9-3' replaced the corresponding SphI-SnaBI fragment of pVacc1 that includes the SIV env of SIVmac239. In addition, a stop codon replaced the initiation codon of the vpr gene.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All

Trial(s) NHP.61

Vaccine Name **pVacc4 DNA**
Description The DNA plasmid pVacc4 used in the vaccination is a derivative of pVacc1; It includes a full SIVmac239 genome with multiple mutations in the NC basic domain and the functional domains of RT and INT, under the control of the CMV promoter. A 3.1-kb SphI-NcoI fragment that includes the env gene from pSHIV-KB9-3' replacedthe corresponding SphI-SnaBI fragment of pVacc1 that includes the SIV env of SIVmac239. In addition, a stop codon replaced the initiation codon of the vpr gene.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All

Trial(s) NHP.366

Vaccine Name **rFPV**
Description Designed to express the gag, pol, env and nef genes of SHIV-IIIb

Virus SHIV *Strain:* SHIV.IIIB *Subtype:* B *Gene/Protein:* gag

Trial(s) NHP.56

Vaccine Name **SeV-gag**
Description This is a Gag-expressing Sendai virus (SeV is a nonsegmented negative-strand RNA virus considered nonpathogenic for humans and nonhuman primates)

Virus SIV *Strain:* ND *Gene/Protein:* gag

Trial(s) NHP.69, NHP.70, NHP.326

Vaccine Name **SIV Diected GLV**
Description SIV GLV of PC-derived, directed inserts in the UB vector

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.120

Vaccine Name **SIV mac239 Gag DNA**
Description pV1R plasmid expressing SIVmac239 gag.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag (gag)

Trial(s) NHP.400

Vaccine Name **SIV Random-GLV**
Description SIV GLV comprised of random genomic-DNA inserts expressed in the UB and tPA vectors (Random-GLV)

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.120

Vaccine Name **SIV-HIV89.6 DNA vaccine**
Description SHIV-89.6 sequences cloned into the vector pGA2; This cloning deleted both LTRs and nef; SHIV sequence is internally mutated for a 12bp region encoding the first four amino acids of the 2nd zinc finger in nucleocapsid which renders it noninfectious

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env, Accessory (tat,rev)
Virus SIV *Strain:* *Gene/Protein:* gag, pol, Accessory (vpr, vpx)
Notes No LTR

Trial(s) NHP.19, NHP.132, NHP.325, NHP.349

Vaccine Name **SIV-pcDNA3gag/pol**
Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.9.2

Vaccine Name **SIV-Run-Cyt. GLV**
Description An SIV random library from sheared proviral DNA plus plasmids encoding IL-2 and GMCSF

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.120

Vaccine Name **SIV/17E-Fr gag-pol-env**
Description SIV strain 17E-Fr (SIV/17E-Fr) gag sequences isolated using StuI and BamHI sites and cloned into pCMV-BGHpA/AMP. pol-env sequences isolated from SIV/17E-Fr and were ligated into WRG7132 by using BsiEI and DraIII sites to generate vaccine plasmid WRG7135 carrying SIV/17E-Fr gag-pol-env. Cloning fully deleted the 5' LTR and truncated the 3' LTR by 360 bp. SIV nef truncated at amino acid 93 by the insertion of a stop codon

Virus SIV *Strain:* SIV17E-Fr *Gene/Protein:* env, gag, pol

Trial(s) NHP.63

Vaccine Name **SIVmac17E-Fr Nef**
Description DNA vaccine

Virus SIV *Strain:* SIVmac17E-Fr

Trial(s) NHP.52

Vaccine Name **SIVmac239 gag DNA**
Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.126

Vaccine Name **SIVmac239 gag DNA**
Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.60.1, NHP.60.3, NHP.98

Vaccine Name **SIVmac239 sbbvΔ3 DNA**
Description Contains the full genome of mac239 with a 105-bp (35-amino-acid) deletion in the 3' nef/LTR, analogous to the common deletion observed in HIV-1 strains isolated from the Sydney Blood Bank Cohort (SBBC)

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.66

Vaccine Name **SIVmac239 sbbvΔ3Delta5 DNA**
Description Contains the full genome of mac239 with a 105-bp (35-amino-acid) deletion in the 3' nef/LTR, analogous to the common deletion observed in HIV-1 strains isolated from the Sydney Blood Bank Cohort (SBBC) and additional deletion at the 5'LTR

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.66

Vaccine Name **V1R-SIV gag**
Description pUC-based vector that utilizes the human cytomegalovirus immediate-early promoter with intron A and bovine growth hormone transcription terminator/polyadenylation signal as expression regulatory elements and expresses full-length SIV gag. The SIV gag openreading frame is homologous to that of SIVmac239 and was synthesized using optimal codons for human gene expression.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.59

Vaccine Name **VEE-SIVsm (SIV MA/CA-VRP and gp160-VRP)**
Description VEE replicon plasmid pVR2 with SIVgag (Gly to Ala change in codon 2 ablate myristylation signal; entire env ORF (gp160; base 6587 to 9244); env lacking 3' region encoding membrane-spanning domain and cytoplasmic tail (gp140; base 6587 to 8626)
Notes gag encoding matrix-capsid (MA/CA; nucleotides 1049 to 2143, numbering from the 5' end of the SIVsm H-4i genome)

Virus SIV *Strain:* SIVsm H-4i *Gene/Protein:* gag
MAC239 1049 -2143
Virus SIV *Strain:* SIVsm H-4i *Gene/Protein:* env
MAC239 6587 to 9244
Virus SIV *Strain:* SIVsm H-4i
MAC239 6587 to 8626

Trial(s) NHP.27

Vaccine Name **vSIVgp160**
Description Recombinant vaccinia virus expressing SIV gp160

Trial(s) NHP.33

Vaccine Name **vvrgp140**
Description Vaccinia expressing SIVmac251 env gp140

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* env

Trial(s) NHP.73

VI-B-2 Live attenuated virus vaccines

Vaccine Name **AT-2 rx HIV-1.DH12**
Description Aldrithiol-2 (AT-2)-inactivated HIV-1.DH12

Trial(s) NHP.303

Vaccine Name **AT-2 rx SIVmac239**
Description Aldrithiol-2 (AT-2)-inactivated SIVmac239

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.303

Vaccine Name **DeltavpuDeltaNefSHIV-4**
Description

Trial(s) NHP.107, NHP.112

Vaccine Name **DeltavpuSHIV-ppc**
Description

Trial(s) NHP.107, NHP.112

Vaccine Name **S8-NCΔZF2**
Description This onstruct is based on the pCEP4 mammalian expression vector from Invitrogen Corp. (Carlsbad, Calif.); contains the complete coding region of SIV(Mne), including the nef gene. The 5' portion of the U3 region in the 5' long terminal repeat (LTR) and host genomic sequences upstream from the StyI site were removed. In addition, the R and U5 regions of the 3' LTR were also deleted and replaced with the simian virus 40 (SV40) poly(A)

Virus SIV *Strain:* SIV.Mne

Trial(s) NHP.64, NHP.65.2, NHP.265

Vaccine Name **SHIV-4 (Deltavpu-Deltanef)-I**
Description
Notes T-cell tropic

Virus SHIV *Strain:* SHIV-4 *Subtype:* B

Trial(s) NHP.17

Vaccine Name **SHIV-dn**
Description Live attenuated SHIV lacking the nef gene. The deletion is at the 5'-portion including the initial codon of the nef gene.

Virus SIV *Strain:* mac239 *Gene/Protein:* gag, LTR (LTR, gag, pol, vif and/or vpx)
Virus HIV-1 *Strain:* NL432 *Subtype:* B *Gene/Protein:* pol (env, tat, rev and vpu)

Trial(s) NHP.35, NHP.131

Vaccine Name **SHIV-drn**

Description Live attenuated SHIV lacking the nef gene. The deletion is at the 5'-portion including the initial codon of the nef anf vpr genes. The splicing of vpr was modified so that it does not function..

Virus SIV *Strain:* mac239 *Gene/Protein:* gag, LTR (LTR, gag, pol, vif and/or vpx)
Virus HIV-1 *Strain:* NL432 *Subtype:* B *Gene/Protein:* pol (env, tat, rev and vpu)

Trial(s) NHP.28, NHP.35

Vaccine Name **SHIV-dxrn**
Description Live attenuated SHIV lacking the nef gene. The deletion is at the 5'-portion including the initial codon of the nef, vpr gene and the 3' portion of vpx. The initial codon of vpx was modified to a non-sense codon.

Virus SIV *Strain:* mac239 *Gene/Protein:* gag, LTR (LTR, gag, pol, vif and/or vpx)
Virus HIV-1 *Strain:* NL432 *Subtype:* B *Gene/Protein:* pol (env, tat, rev and vpu)

Trial(s) NHP.28, NHP.35

Vaccine Name **SHIV-NM3n**
Description

Trial(s) NHP.114

Vaccine Name **SHIV-PPC (Deltavpu)**
Description
Notes This vaccine is dual tropic and was administered orally

Virus SHIV *Strain:* SHIV-PPC

Trial(s) NHP.17

Vaccine Name **SIMmac239Δ2**
Description Contains 182bp deletion in nef and a 172bp deletion upstream of U3 of LTR.

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.207

Vaccine Name **SIV(Mne)NCΔZF2 DNA**
Description A live attenuated SIVMne. It consists of a 12-nucleotide deletion in the gene coding for the NC protein [nucleotide positions 1772 to 1783 of the SIV(Mne) sequence (GenBank accession no. M32741) were deleted]. Also known as ΔCys 33-Cys 36 or pRB130.

Virus SIV *Strain:* SIVMne

Trial(s) NHP.64, NHP.65.1, NHP.65.2, NHP.265

Vaccine Name **SIV-IFN**
Description This is a clone of SIVmac239 (SIVΔNU) for which a total of 513bp in the nef and U3 region has been replaced with the coding region of IFN

Trial(s) NHP.309

Vaccine Name **SIV-IL4**
Description This is a clone of SIVmac239 (SIVΔNU) for which a total of 513bp in the nef and U3 region has been replaced with the coding region of IL-4.

Trial(s) NHP.309

Vaccine Name **SIV-PBJ6.6Δnef**
Description

Trial(s) NHP.34

Vaccine Name **SIV.GX2**
Description SIVgx2 is a nef-disrupted molecular clone. EcoRI-NdeI fragment of an SIVmacJ5 proviral clone was replaced with a PCR product that was amplified from proviral DNA isolated from an SIVmacJ5-infected macaque. This resulted in a 66 bp deletion in nef, removing the coding sequence for aa 62-83.

Virus SIV *Strain:* SIV.GX2 *Gene/Protein:* All (nef disrupted)
Notes Nef gene disrupted

Trial(s) NHP.397

Vaccine Name **SIVDeltaNU**
Description SIVDeltaNef is a nef deleted mac239

Trial(s) NHP.327.1, NHP.327.2

Vaccine Name **SIVhu**
Description A pathogenic virus isolated from a lab. worker infected accidentally with biological materials from rhesus macaque infected with SIVsmB670; it has 97.9% genetic homology with parental SIVsmB670; 4 base deletion in nef gene causing a frame shift in nef

Virus SIV *Strain:* SIV.hu/SIVsmB670

Trial(s) NHP.36, NHP.72

Vaccine Name **SIVmac1A11**
Description The SIVmac1A11 is a live attenuated virus. The virus stock was grown on stimulated CD4-enriched rhesus macaque peripheral blood mononuclear cells (PBMC) and had a titer of 10^5 50% tissue culture infectious doses (TCID50)/ml.

Virus SIV *Strain:* SIVmac1A11

Trial(s) NHP.240, NHP.294

Vaccine Name **SIVmac239Δ3**
Description Contains 182bp deletion in nef and a 172bp deletion upstream of U3 of LTR. It has an additional 101-bp deletion in vpr. This is is a derivatives of SIVmac239. It lacks the nef, vpr and U5 sequences.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* LTR, gag, pol, env (Lacks nef, vrp and US)

Trial(s) NHP.37, NHP.150.2, NHP.207, NHP.305

Vaccine Name **SIVmac239Δ3**
Description Produced by transfection of cloned DNA into CEMx174 cells; SIVmac239Δ3 is missing unique nef, vpr, and nef sequences that overlap U3. Described by Gibbs et al ARHR 10(5): 607-616 (1994).

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All (All but nef, vpr and the U3 region overlapping with nef)

Trial(s) NHP.32, NHP.323

Vaccine Name **SIVmac239Δ3+**
Description Produced by infection of rhesus macaquest with cloned SIVmac239Δ3 DNA. SIVmac239Δ3 is missing unique nef, vpr, and nef sequences that overlap U3. A pathogenic variant named SIVmac239Δ3+ was selected and cloned. Described byGibbs et al ARHR 10(5): 607-616 (1994).

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All (all but vpr, nef and LTR/U3 regions.)

Trial(s) NHP.323

Vaccine Name **SIVmac239Δ3x**
Description Produced by transfection of cloned DNA into CEMx174 cells; SIVmac239Δ3X is missing nef, vpx,and US sequences.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All but nef, vpx and U

Trial(s) NHP.32

Vaccine Name **SIVmac239Δ4**
Description Produced by transfection of cloned DNA into CEMx174 cells; SIVmac239Δ4 is missing nef, vpr, vpx, and US.

Virus SIV *Strain:* Mac239 *Gene/Protein:* All but nef, vpr, vpx, and US

Trial(s) NHP.32

Vaccine Name **SIVmac239ΔNef**
Description

Virus SIV *Strain:* *Gene/Protein:* All
Notes Lacking nef

Trial(s) NHP.148

Vaccine Name **SIVmac239-Δnef**
Description Constructed by deleting a 186-base pair fragment of the nef coding sequences of SIV mac239
Notes dkdkd

Trial(s) NHP.33, NHP.34, NHP.109

Vaccine Name **SIVmac239Delta5G**
Description created by mutagenesis of the parental infectious DNA clone so that the asparagine residues for N-glycosylation at positions 79, 146, 171, 460, and 479 were converted to glutamine residues

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All

Trial(s) NHP.39

Vaccine Name **SIVmac251ΔNef**
Description derived from the SIVmac251 BK28 clone by three modifications: (i) the premature stop codon at position 8785 in the env gene was mutated to restore a complete env ORF, (ii) the nef initiator codon ATG was mutated to ACG (cont'd, see notes)
Notes at position 9059, and (iii) nucleotides 9225 to 9401 in the nef region, which do not overlap either the 3' end of env or the U3 part of the LTR, were deleted

Trial(s) NHP.38, NHP.101

Vaccine Name **SIVmac251Δnef**

Description

Trial(s) NHP.108

Vaccine Name **SIVmac251, 32H, (C8)**

Description grown in the human C8166 cell line. The nef coding region contains an in-frame deletion of four amino acids in pC8 and two conservative amino acid changes

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* All

Trial(s) NHP.40, NHP.194.1, NHP.194.2

VI-B-3 Recombinant live attenuated virus vaccines

Vaccine Name **SIV 17E-CL**

Description SIV/17E-CL is a recombinant molecular clone that contains gp120 and part of gp41 from SIV/17E-Br (a macrophage-tropic strain obtained by passage of SIVmac239 in rhesus macaques, Sharma et al., J. Infect. Dis. 66:3550, 1992) into the SIVmac239 molecular clone.

Virus SIV	*Strain:* SIVmac239	*Gene/Protein:* Accessory, gag, pol
Virus SIV	*Strain:* SIV/17E-Br	*Gene/Protein:* env (gp120, gp41)

Trial(s) NHP.100

VI-B-4 Live virus vaccines

Vaccine Name **HIV-2 SBL6669**
Description Isolated from the PBMCs of a patient from Gambia by cocultivation with the T cells of the neoplastic cell line HUT-78.
Notes under Franchini 30-JAN-1989 in sequence database.

Virus HIV-2 *Strain:* HIV-2 SBL6669 *Gene/Protein:* All

Trial(s) NHP.4

Vaccine Name **RT-SHIV**
Description The chimeric simian/human immunodeficiency virus (SHIV) containing the HIV-1 HXBc2 gene for reverse transcriptase (RT) in the genomic background of SIVmac239 (RT-SHIV)

Virus HIV-1 *Strain:* HXB2 *Subtype:* B *Gene/Protein:* pol
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* All

Trial(s) NHP.111

Vaccine Name **SFV- Pr56gag VLP-type II**
Description Components: Pr56-wt; gp120-TM

Trial(s) NHP.77

Vaccine Name **SHIV-4**
Description The chimeric SHIV-4 contains the gag, pol, vif, vpx, vpr and nef genes of SIVmac239 and the env, tat and rev genes of HIV-1IIIB

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol, Accessory (vif,vpx,vpr)
Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* env, Accessory (tat,rev)

Trial(s) NHP.93

Vaccine Name **SHIV89.6**
Description This is a chimeric virus containing HIV-1.89.6 env in the the SIV backbone

Virus HIV-1 *Strain:* HIV-189.6 *Subtype:* B *Gene/Protein:* env (Env,tat,rev,vpu)
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* Accessory, gag, LTR, pol (gag,pol,LTR,vpx,vpr,nef)

Trial(s) NHP.24.1, NHP.29.1, NHP.140

Vaccine Name **SHIV89.6P**
Description

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env
Virus SIV *Strain:* SIVmac *Gene/Protein:* LTR

Trial(s) NHP.24.1

Vaccine Name **SHIVIIIBc2**
Description

Virus HIV-1 *Strain:* HIVIIIBc2 *Subtype:* B

Virus SIV *Strain:* ???

Trial(s) NHP.24.1

Vaccine Name **SIV-Mac-32H**
Description Live SIV-Mac-32H virus propagated on MT-2 cells

Virus SIV *Strain:* MAC-32H *Gene/Protein:* All (All, complete genome)

Trial(s) NHP.320

Vaccine Name **SIV-Mac-MPBMC**
Description Not described by authors.

Virus SIV *Strain:* MAC-MPBMC *Gene/Protein:* All (all, complete genome)

Trial(s) NHP.320

Vaccine Name **SIVmac251**
Description

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* All

Trial(s) NHP.41, NHP.194.2, NHP.345

Vaccine Name **SIVsmE660**
Description

Virus SIV *Strain:* SIVsmE660 *Gene/Protein:* All

Trial(s) NHP.18, NHP.41, NHP.198

VI-B-5 Cell/tissue vaccines

Vaccine Name	**AT-2 inactivated SIV-loaded DC**
Description	AT-2 SIV (mac251) loaded dendritic cells suspended in RPMI 1640 medium
Virus	SIV *Strain:* SIVmac251
Trial(s)	NHP.299
Vaccine Name	**SIVmac239Δ3 (cell-infected)**
Description	SIVmac239Δ3-infected perpheral blood mononuclear cells
Trial(s)	NHP.305

VI-B-6 Whole (killed) inactivated virus vaccines

Vaccine Name **AT-2-Inactivated SHIV89.6**
Description Aldritiol-2 (AT-2) inactivated $SHIV_{89.6}$

Trial(s) NHP.319

Vaccine Name **Fixed inactivated SIVmac251 infected cells**
Description The vaccine was prepared from SIVmac251 recovered from infected a rhesus monkey, and was mixed with withC8166 cells and fixed in 0.2% of β-propiolactone

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* All

Trial(s) NHP.157.1, NHP.157.2, NHP.157.3

Vaccine Name **HIV-1 GB8**
Description Whole/killed inactivated HIV-1. A subtype B virus, GB8 was the first (October 1986) of a series of five sequential viral isolates isolated from a single British AIDS patient during his last 18 months of life.

Trial(s) NHP.203

Vaccine Name **$SIV/Delta_{B670}$**
Description Whole killed inactivated virus harvested from H9 cells . HPLC analysis revealed that complete virus particle was represented with 2-3% of the total protein consisting of the external glycoprotein gp110 and both full length and truncated glycoprotein gp41 and gp 35, respectively, along with the predicted stoichiometric amounts of the remaining viral core proteins (p61/61, p26, p17,p14 and p9). The harvested virion was formalin inactivated.

Virus SIV *Strain:* SIVB670 *Gene/Protein:* All

Trial(s) NHP.248

Vaccine Name **SIVmac HUT-78 ((Psoralem-UV)**
Description SIVmacgrown in HUT-78 T-cell cullture, inactivated with Psoralem and UV light

Virus SIV *Strain:* SIVmac *Gene/Protein:* All

Trial(s) NHP.239

Vaccine Name **SIVmac251 (encapsulated)**
Description Gradient-purified SIVmac251 treated with formalin, encapsulated with emulsion-based process to produce 1-10ul microphere

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* All

Trial(s) NHP.200

Vaccine Name **SIVmac251, 32H, (C8)**
Description Inactivated, partially purified SIVmac251 32H grown in C8166 cell line.

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.203

Vaccine Name **SIVmac251.whole inactivated**

Description Gradient-purifie d SIVmac251 grown in HuT-78 cells was treated with formalin before encapsulation by an emulsion-based process to produce 1- to 10-mm microspheres

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.73

Vaccine Name **SIVmac251/32H (Tween/Ether)**

Description The virus was obtained from in-vitro passage of SIVmac251 and the product was designated SIVmac251/32H. SIVmac251/32H was then grown in C81-66 cells, then purified by column chromatography. After TE extraction, , about 6 mg of the virus were dissolved in 4 ml PBS and 0.25% Tween. 4 ml of diethyl ether was added... (for details see Stahl-Hennig et al, 1992; Virology 186: 588-596)

Virus SIV *Strain:* SIVmac251/32H *Gene/Protein:* All

Trial(s) NHP.97, NHP.99.2, NHP.151

Vaccine Name **Whole inactivated HIV-1 IIIB**

Description A sucrose-gradient purified HIV-1 IIIB, inactivated by various methods including formaldehyde.

Virus HIV-1 *Strain:* HIV-1 IIIB *Subtype:* B

Trial(s) NHP.204

Vaccine Name **Whole inactivated SIVmac239 (encapsulated)**

Description This is a HuT-78 grown in sucrose gradient purified, formalin-inactivated and encapsulated in poly(DL-lactide-co-glycolide) microspheres. The median size of the resulting particle was 3 um

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.74

Vaccine Name **Whole inactivated SIVmac251**

Description

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.201.1, NHP.201.2, NHP.245.1, NHP.245.2, NHP.245.3

VI-B-7 Virus-like particle vaccines

Vaccine Name **HIV-IIIB-p55gag-VLP**
Description HIV-1 isolate LAI/IIIB p55 gag protein in virus-like particle

Virus	HIV-1	*Strain:* HXB2	*Subtype:* B	*Gene/Protein:* gag

Trial(s) NHP.321

Vaccine Name **HPV/SHIV-VLP**
Description This is a recombinant human papillona virus -like particle encoding HIV-1 tat and rev and SIV p27.

Virus	HIV-1	*Strain:* HIV-1.AD8	*Subtype:* B	*Gene/Protein:* Accessory (tat)
Virus	HIV-1	*Strain:* HIV-1.NL4.3	*Subtype:* B	*Gene/Protein:* Accessory (rev)
Virus	SIV	*Strain:* SIVmac239		*Gene/Protein:* gag (gag p27)

Trial(s) NHP.339

Vaccine Name **SFV-SIV Pr56gag VLP-type I**
Description Components: Pr56-V3, CD4BR,gp41

Trial(s) NHP.77

Vaccine Name **SIV Pr56gag VLP-type II**
Description This is a pseudovirion. The gp41 transmembrane domain of the Gp160 wild-type HIV-1 glycoprotein was replaced by a heterologous Epstein-Barr virus derived type I transmembrane region, consisting of a 22 amino acid spanning transmembrane domain and a shortcytoplasmic domain, which was covalently linked to the C-terminus of gp120 by a flexible -S-G-S-G-A-G- hinge region (gp120-TM). Components: Pr56-wt; gp120-TM

Trial(s) NHP.77

VI-B-8 Purified viral products vaccines

Vaccine Name **biologically active Tat protein**
Description

Trial(s) NHP.78

Vaccine Name **gp160/BSC-40**
Description This is a gp160 protein produced in BSC-40 cells infected with recombinant vaccinia virus

Trial(s) NHP.269

Vaccine Name **HIV-1 gp160**
Description subunit consisting of oligomeric gp160 purified from tissue culture fluid of cells productively infected with HIV-1 IIIB

Virus HIV-1 *Strain:* HIV-1.IIIB

Trial(s) NHP.47

Vaccine Name **HIV-1 HXBc2 Tat**
Description Contact authors

Virus HIV-1 *Strain:* HIVHXBc2 *Subtype:* B *Gene/Protein:* Accessory (tat)

Trial(s) NHP.121

Vaccine Name **HIV-1 IIIB gp120**
Description HTLV-III(451) gp120 purified by sequential affinity chromatographic steps. Amino acid sequence analysis of gp120 showed the loss of the signal peptide.

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.53, NHP.247, NHP.371

Vaccine Name **HIV-1 IIIB gp140**
Description gp140 protein was purified by lentil lectin chromatography from the serum-free medium of cells infected with the recombinant viruses, then further purified by chromatography on Superdex-200; Virtually all of the gp140 was oligomeric; Contained gp41

Virus HIV-1 *Strain:* IIIB *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.14, NHP.53

Vaccine Name **HIV-2 gp160**
Description subunit consisting of oligomeric gp160 purified from tissue culture fluid of cells productively infected with HIV-2.NIHZ

Virus HIV-2 *Strain:* HIV-2.NIHZ

Trial(s) NHP.47

Vaccine Name **HIV-2 native gp125**
Description purified native HIV-2 gp125 protein

Virus HIV-2 *Strain:* HIV-2 SBL6669 *Gene/Protein:* env (gp125)

Trial(s) NHP.4

Vaccine Name **MVA(SIVsmH-4)gag-pol-env**
Description Viral components from SIVsmH-4 env. Selected after transfection of transfer plasmid pMC03gag-pol into CEF infected with MVA-env recombinant

Virus SIV *Strain:* SIVsmH4 *Gene/Protein:* gag, pol

Trial(s) NHP.45

Vaccine Name **Native SIV gp120**
Description Purified by sequential affinity chromatographic steps using a monoclonal antibody to HIV-1 gp41 and an anti-HIV-1-positive human serum; heavily glycosylated and contain complex carbohydrates

Virus SIV *Strain:* SIVsmH4 *Gene/Protein:* env (gp120)

Trial(s) NHP.5, NHP.205.1, NHP.205.3

Vaccine Name **Native SIV gp148 env**
Description The glycoproteins were purified by a one-step procedure to a high level of purity by using Galanthus nivalis agglutinin (GNA).

Virus SIV *Strain:* SIVsm *Gene/Protein:* env

Trial(s) NHP.125

Vaccine Name **p55Gag**
Description p55Gag (source virus not specified, but presumed to be HIV-1 subtypeB) produced in yeast.

Trial(s) NHP.321

Vaccine Name **Prt-env gp160**
Description full- length, unmutated Env of HIV-1-IIIb. The IIIb Env had an apparent molecular weight of 160 kDa with gp120 and gp41 covalently attached

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.56

Vaccine Name **SHIV89.6P tat**
Description Contact authors

Virus SHIV *Strain:* SHIV89.6P *Gene/Protein:* Accessory (tat)

Trial(s) NHP.121

Vaccine Name **SIVmac251 p27**
Description

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.125

Vaccine Name **SIVmac251-gp120**
Description The SIV gp120 was purified from the serum-free culture supernatant of SIVmac251 chronically infected Hut 78 cells by immunoaffinity column chromatography using anti-gp120 Ab

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.30, NHP.328, NHP.363

Vaccine Name **soluble gp160**
Description HIV-1 MN strain from Pasteur Merieux Connaught, Paris)

Trial(s) NHP.78

VI-B-9 Synthetic protein/peptide vaccines

Vaccine Name **C4/89.6-V3**
Description Peptides were synthesized by SynPep Corporation (Dublin, Calif.) and purified by reverse-phase high-pressure liquid chromatography (HPLC). Peptides were >95% purified as determined by HPLC and mass spectrometry. SHIV-89.6 and SHIV-KB9 V3 loop peptideswere synthesized C-terminal to a T-helper determinant located in the C4 region of gp120 for enhanced immunogenicity
Notes Two additional peptides are available (89.6-V3 and 89.6P-V3) consisted of the V3 loop portions of the C4/89.6-V3 and C4/89.6P-V3 peptides lacking C4.

Virus SHIV *Strain:* 89.6 *Subtype:* B *Gene/Protein:* env (C4)
Notes Subtype is for the HIV-1 component
Virus SHIV *Strain:* 89.6 *Subtype:* B *Gene/Protein:* env (V3)
Notes Subtype is for the HIV-1 component

Trial(s) NHP.7

Vaccine Name **C4/89.6P-V3**
Description Peptides were synthesized by SynPep Corporation (Dublin, Calif.) and purified by reverse-phase high-pressure liquid chromatography (HPLC). Peptides were >95% purified as determined by HPLC and mass spectrometry. SHIV-89.6 and SHIV-KB9 V3 loop peptideswere synthesized C-terminal to a T-helper determinant located in the C4 region of gp120 for enhanced immunogenicity

Virus SHIV *Strain:* 89.6P *Subtype:* B *Gene/Protein:* env (C4)
Notes Subtype is for the HIV-1 component
Virus SHIV *Strain:* 89.6P *Subtype:* B *Gene/Protein:* env (V3)
Notes Subtype is for the HIV-1 component

Trial(s) NHP.7

Vaccine Name **CCR5 peptides**
Description N-terminus human CCR5 N1 MDYQVSSPIYDINYYTSEPC; N-terminus human CCR5 N1/N2 MDYQVSSPIYDINYYTSEPCQKINVKQIAA; 1st extracellular loop human CCR5 X1 HYLAAQWDFGNTMC;2nd extracellular loop human CCR5 X2.2 YTCSSHFPYSQYQFWKNFQT

Trial(s) NHP.68

Vaccine Name **gp120/gp41 mimotopes**
Description This is a coctail of 5 synthetic peptides (p195: KSSGKLISL, p217: CNGRLYCGP, p197: GTKLVCFAA, p287: CAGGLTCSV, p335: SGRLYDKP). p195, p217 and p197 display similarity with some discret regions of HIV-1 in V1, C2 and gp41, respectively. Peptides p287 andp335 have no obvious sequence homology with HIV protein domains.

Trial(s) NHP.81

Vaccine Name **o-gp140-US4**
Description Oligomeric gp140US4 (o-gp140US4) was purified and characterized by immunoblot, antigen capture enzyme-linked immunosorbent assay (ELISA), CD4 binding and glycosylation profile. After the purification, o-gp140US4 was stored in citrate buffer (10 mmol/l sodium citrate, 500 mmol/l sodium chloride) at a concentration of 0.2 mg/ml for immunizations.

Virus HIV-1 *Strain:* HIV-1 *Subtype:* B *Gene/Protein:* env (gp140)

Trial(s) NHP.354

Vaccine Name **oligomeric gp130**
Description gp130 oligomer s of Mac-32H

Virus SIV *Strain:* MAC-32H *Gene/Protein:* env gp130

Trial(s) NHP.320

Vaccine Name **P3CSS CTL**
Description The "P3CSS CTL epitopes" were a mixture of 4 lipopeptides. The sequences are taken from the SIVmac32H consensus sequences published or provided by Neil Almond et al (AIDS Research and Human Retroviruses, 8, 77 (1992)) and used for the basis of the overlapping peptides provided by the AIDS Reagent Repository at the NIBSC, UK

Virus SIV *Strain:* SIVmac251-32H *Gene/Protein:* gag
MAC239 35-59
Notes sequence: VWAANELDRFGLAESLLENKEGCQK
Virus SIV *Strain:* SIVmac251-32H *Gene/Protein:* gag
MAC239 171-195
Notes Sequence VPGFQALSEGCTPYDINQMLNCVGD
Virus SIV *Strain:* SIVmac251-32H
MAC239 108-123
Notes Sequence: LRTMSYKLAIDMSHFI
Virus SIV *Strain:* SIVmac251-32H
MAC239 155-178
Notes Sequence: DWQDYTSGPGIRYPKTFGWLWKLV

Trial(s) NHP.119

Vaccine Name **PCLUS3-CL10/PCLUS6.1-CL10/PCLUS3_POL_143/PCLUS3_GAG_372**
Description Cocktail of 4 peptides each containing 1 CTL and 1 helper epitope
Notes This vaccine is a cocktail of 4 synthetic chimeric peptides containing T helper and CTL epitopes in HIV (env) and SIV(gag or pol), repectively.

Virus SIV *Strain:* MM239 *Gene/Protein:* gag
MAC239 181-190: (CTPYDINQML)
Notes LOCATION-SIVmac239: (amino acids) Gag 181 - 190 = Capsid(p27) 46 - 55
Virus HIV-1 *Strain:* IIIB *Subtype:* B *Gene/Protein:* env
HXB2 421-444: KQIINMWQEVGKAMYAPPISGQIR
Notes LOCATION: (amino acids) Env 421 - 444
Virus HIV-1 *Strain:* IIIB *Subtype:* B *Gene/Protein:* env
HXB2 827-853: DRVIEVVQGAYRAIRHIPRRIRQGLER
Virus SIV *Strain:* MM239 *Gene/Protein:* pol
MAC239 106-114: GPHYTPKIV
Virus SIV *Strain:* MM239 *Gene/Protein:* gag
MAC239 372-380: LAPVPIPFA

Trial(s) NHP.1

Vaccine Name **Peptomer SIVmac251 (gp120: 435-452)**

Description The SIV peptomer was constructed with an 18 amino acid peptide polymer, is representative of part of the putative CD4 binding region in SIVmac251 gp120 (amino acids435-452: HIRQIINTWHKVGKNVYL)),

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* env (gp120)
MAC239 435-452

Trial(s) NHP.5

Vaccine Name **Synthetic tat**
Description CVDPNLEPWKHPGS (tat HXB2: 3-16), CRQRRRAPDSSQNHQ(TatHXB2: 52-66) conjugated to diphtheria toxoid

Trial(s) NHP.268.1

Vaccine Name **Tat 1-61**
Description

Virus HIV-1 *Strain:* BRU *Subtype:* B *Gene/Protein:* Tat
HXB2 5831-6013 (amino acids 1-61 in protein)

Trial(s) NHP.330

Vaccine Name **Tat 19-53**
Description
Notes two amino acids different from HXB2 peptide

Virus HIV-1 *Strain:* BRU *Subtype:* B *Gene/Protein:* Tat
HXB2 5885-5986 (19 to 53 in Protein)

Trial(s) NHP.330

Vaccine Name **Tat 19-53m**
Description

Virus HIV-1 *Strain:* BRU *Subtype:* B *Gene/Protein:* Tat
HXB2 5885-5986 (amino acids 19 to 53 in protein)

Trial(s) NHP.330

Vaccine Name **Tat 44-61**
Description

Virus HIV-1 *Strain:* *Gene/Protein:* Tat
HXB2 5960-6013 (44 to 61 in protein)

Trial(s) NHP.330

Vaccine Name **Tat1-20**
Description HXB2 Tat peptide amino acids 1-20 synthesized on ABI433A

Virus HIV-1 *Strain:* HXB2 *Subtype:* B *Gene/Protein:* Tat
HXB2 5831-5890 (1-20 in Tat protein)

Trial(s) NHP.330

Vaccine Name **Tat8-53**
Description
Notes 2 amino acids different from same region of HXB2 peptide

Virus HIV-1 *Strain:* BRU *Subtype:* B *Gene/Protein:* Tat
HXB2 5851-5986 (8-53 in Tat protein)

Trial(s) NHP.330

Vaccine Name **V2-MAP**
Description The V2 fragment is a gp130 at positions 168-190: KFNMTGLKRDKTKEYNET; MAP: multiple antigen peptides (branched peptide)

Virus SIV *Strain:* SIVmac
MAC239 168-190

Trial(s) NHP.119

Vaccine Name **V2-P3CSS**
Description The V2 fragment is a gp130 at positions 168-190: KFNMTGLKRDKTKEYNET

Virus SIV *Strain:* SIVmac
MAC239 168-190

Trial(s) NHP.119

Vaccine Name **V2.V3.HIV-1.SF2 Synth.peptides**
Description

Virus HIV-1 *Strain:* HIV-1.SF2 *Subtype:* B *Gene/Protein:* env (V2)
Virus HIV-1 *Strain:* HIV-1.SF2 *Subtype:* B *Gene/Protein:* env (V3)

Trial(s) NHP.164

Vaccine Name **V4.32-MAP**
Description The V4 fragment is a gp130; MAP: multiple antigen peptides (branched peptide); gp130410-430 (V4.32), VEDRDVTNQRPKERHRRNYVP; gp130410-430 (V4.32H), VEDRNTTNQKPKEQHKRNYVP (Torres et al., 1993

Virus SIV *Strain:* SIVmac
MAC239 410-430

Trial(s) NHP.119

VI-B-10 Recombinant subunit protein vaccines

Vaccine Name	**CHO cell-expressed HIV-1SF2 gp120**			
Description				
Virus	HIV-1	*Strain:* HIV-1.SF2	*Subtype:* B	*Gene/Protein:* env (gp120)
Trial(s)	NHP.141, NHP.193			
Vaccine Name	**Delta-V2 gp140 oligomeric**			
Description	Purified oligomeric lacking the V2 region of gp140			
Virus	HIV-1	*Strain:* HIV-1.SF162	*Subtype:* B	
Trial(s)	NHP.22			
Vaccine Name	**Gag-Pol particles**			
Description				
Trial(s)	NHP.65.1			
Vaccine Name	**gp140 oligomeric**			
Description	Purified gp140 oligomeric			
Virus	HIV-1	*Strain:* HIVSF162		
Trial(s)	NHP.22			
Vaccine Name	**HIV BH10-tat protein**			
Description				
Virus	HIV-1	*Strain:* BH10	*Subtype:* B	*Gene/Protein:* Accessory (tat)
Trial(s)	NHP.2			
Vaccine Name	**HIV-1 W6.1D gp120**			
Description	recombinant gp120 of HIV-1W6.1D from an infectious molecular clone			
Virus	HIV-1	*Strain:* HIV-1 W6.1D	*Subtype:* B	
Trial(s)	NHP.21			
Vaccine Name	**HIV-1.MN.rgp120**			
Description				
Virus	HIV-1	*Strain:* HIV-1.MN	*Subtype:* B	*Gene/Protein:* env (gp120)
Trial(s)	NHP.198			
Vaccine Name	**HIV-1.SF2 gp120/p24 Recombinant**			
Description	Monomeric recombinant gp120 and p24 of HIV-1.SF2			
Virus	HIV-1	*Strain:* HIV-1.F2	*Subtype:* B	*Gene/Protein:* gag, env (gp120, p24)

Trial(s) NHP.164

Vaccine Name **HIV-189.6 Env gp140-ISCOM**
Description 200 µl of ISCOM matrix mixed overnight at 4°C with 25 µg of HIV-189.6 Env gp140 (produced in human 293T cells, containing gp120 and the gp41 ectodomain, and purified by lectin chromatography [University of Pennsylvania, Philadelphia]) in 250 µl of PBS.

Virus HIV-1 *Strain:* HIV-1.89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.374

Vaccine Name **HIV-1SF2 rgp120**
Description Recombinant protein produced in Chinese hamster ovary cells

Virus HIV-1 *Strain:* HIV-1.SF2 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.75

Vaccine Name **HIV-2 gp160**
Description

Virus HIV-2 *Strain:* ND *Gene/Protein:* env

Trial(s) NHP.174

Vaccine Name **HSP70-Baculovirus-infected cells.gp120-pGEX-3X.p27**
Description Recombinant SIVmac251 gp120 was expressed in Baculovirus-infected cells and recombinant SIV p27 was generated in pGEX-3X as a glutathione S-transferase fusion protein. With both preparations 100μg was covalently linked to HSP70 by 0.0025% glutaraldehyde (Sigma Fine Chemicals Ltd.) and 200 μg was mixed with equal concentration of HSP70; thus, a total of 400μg of HSP70 and 200μg
(3

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* gag, env (gp120, p27)

Trial(s) NHP.395

Vaccine Name **Mono-gp120H (89.6)**
Description Recombinant protein purified from plasmid expressing gp120 of HIV 89.6 strain; the proteines were tagged with histidine to facilitate their purification

Virus HIV-1 *Strain:* HIV-1 89.6

Trial(s) NHP.11, NHP.363

Vaccine Name **Mono-gp120H (DH12)**
Description Recombinant protein purified from plasmid expressing gp120 of HIV DH12 strain; the proteines were tagged with histidine to facilitate their purification

Virus HIV-1 *Strain:* HIV-1 DH12

Trial(s) NHP.11

Vaccine Name **Monomeric rgp120**
Description Monomeric rgp120 of the LAI isolate of HIV-1 was commercially produced by Intracel (Rockville, MD) by expressing HIV-1LAI gp120 DNA in CHO cells.The expression product was characterized by Western blot assay using sheep antibody to HIV-1 gp20 and sequencing. Purity of the recombinant product was >98%

Trial(s) NHP.79

Vaccine Name **Nef-Tat**
Description Nef-Tat is a full-length fusion protein of the two viral proteins. Antigens were expressed in the yeast <ital>Pichia pastoris</ital> as His-tagged proteins. The HIV-1 nef gene derived from the clone Bru/Lai, SIV nef was derived from the cloneSIVmac239 without a premature stop codon, and the HIV-1 tat gene derived from the clone BH10

Trial(s) NHP.296

Vaccine Name **Oligomeric HIV-1.89.6 gp140**
Description The 89.6 gp140 was produced from BS-C-1 cells infected with recombinant vaccinia virus vBD1 and purified by lentil lectin and Superdex 200 chromatography

Virus HIV-1 *Strain:* HIV-1.89.6 *Gene/Protein:* env

Trial(s) NHP.90.1, NHP.90.2

Vaccine Name **Poly-gp120H**
Description Recombinant protein purified from plasmid expressing gp120 of HIV AD8, Bal, Lai, RF, 89.6 and DH12 strains; the proteines were tagged with histidine to facilitate their purification

Virus HIV-1 *Strain:* HIV-1 DH12 *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 AD8 *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 BAL *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 LAI *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 RF *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 89.6 *Subtype:* B

Trial(s) NHP.11

Vaccine Name **Poly-gp120H (-DH12)**
Description Recombinant protein purified from plasmid expressing gp120 of HIV AD8, Bal, Lai, RF and 89.6 strains; ; the proteines were tagged with histidine to facilitate their purification

Virus HIV-1 *Strain:* HIV-1 AD8 *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 BAL *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 LAI *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 RF *Subtype:* B
Virus HIV-1 *Strain:* HIV-1 89.6 *Subtype:* B

Trial(s) NHP.11

Vaccine Name **Recombinant gagpol particles**
Description

Virus SIV *Strain:* SIVmne *Gene/Protein:* gag, pol

Trial(s) NHP.134

Vaccine Name **Recombinant gagpolenv particles**
Description

Virus SIV *Strain:* SIVmne

Trial(s) NHP.134

Vaccine Name **Recombinant gp120**
Description Antigen derived from the Dutch clinical HIV isolate ACH320, expressed in CHO cells

Virus HIV-1 *Strain:* HIV-1.ACH320

Trial(s) NHP.296

Vaccine Name **Recombinant gp130**
Description Recombinant subunit protein produced by African green monkey kidney (BSC-40) cells infected with recombinant vaccinia virus expressing the gp130 glycoprotein under the control of the late vaccinia virus 11K promoter

Virus SIV *Strain:* SIVmne

Trial(s) NHP.134

Vaccine Name **Recombinant HIV-1 env gp160 antigen**
Description This is a recombinant protein (HIV-1 gp160 antigen) expressed in pMB1790

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.204

Vaccine Name **Recombinant HIV-1 gag core (p24,p15) antigen**
Description This is a recombinant protein (HIV-1 p24 and p15 antigen) expressed in pCO1

Virus HIV-1 *Strain:* HIV-1.IIIB *Gene/Protein:* gag

Trial(s) NHP.204, NHP.328

Vaccine Name **Recombinant p27**
Description rSIVp27 was expressed in pGEX3X as a glutathione-S-transferase fusion protein

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.106, NHP.185.1, NHP.185.2, NHP.201.1, NHP.201.2

Vaccine Name **rgp120**
Description This protein was purified from cell culture medium containing 1%- -vo/vol- fetal calf serum) conditioned by the growth of the gD-env-trunc cell line

Trial(s) NHP.242, NHP.267

Vaccine Name **rgp120W6.1D**
Description recombinant gp120W6.1D antigen derived from HIV-1 clone 320.3 isolated from a Dutch AIDS patient

Trial(s) NHP.80

Vaccine Name **rgp140-env (HIV-1.89.6)**
Description

Virus HIV-1 *Strain:* 89.6 *Subtype:* B *Gene/Protein:* env (gp140)

Trial(s) NHP.348.1, NHP.348.2

Vaccine Name **rgp160**
Description Recombinant subunit protein produced by African green monkey kidney (BSC-40) cells infected with recombinant vaccinia virus expressing the gp160 glycoprotein under the control of the late vaccinia virus 11K promoter

Virus SIV *Strain:* SIVmne

Trial(s) NHP.134

Vaccine Name **rgp160**
Description See Mannhalter et al, 1991; ARHR, Vol. 7 (5) 485-493.

Virus HIV-1 *Strain:* HIV-1 IIIB *Subtype:* B *Gene/Protein:* env (gp160)

Trial(s) NHP.362

Vaccine Name **rsgp160**
Description Glycosylated This protein was produced in CHO under the transcriptional control of the SV40 early promoter. It differ from the wild type gp160 at the N terminus. The signal signal sequence and 12 amino acids of the wild type gp160 have been replaced with the signal sequence and 9 amino acids from the mature N-terminus of herpes simplex virus type 1 glycoprotein D

Trial(s) NHP.267

Vaccine Name **rSIV-gp120 protein**
Description Recombinant SIVmac251 gp120 was expressed in Baculovirusinfected cells

Virus SIV *Strain:* SIVmac251

Trial(s) NHP.106, NHP.185.1, NHP.185.2, NHP.201.1, NHP.201.2

Vaccine Name **SF162ΔV2 gp140 protein**
Description gp140 lacking the V2 region

Virus HIV-1 *Strain:* HIV-1.SF162 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.62

Vaccine Name **SIV Nef**
Description

Virus SIV *Strain:* SIVmac239

Trial(s) NHP.296

Vaccine Name **SIV(Mne) gp160Env protein**
Description

Trial(s) NHP.65.1

Vaccine Name **SIVenv-Bgal peptides**
Description This is a cocktail of 4 SIVenv epitopes (2 from gp120 and 2 from gp32). These epitopes appear to be homologous in sequence and location to thehighly concerved HIV-env epitopes as well as being hydrophilic in nature. The oligonucleotides coding for thesepeptides were prepared and inserted at the 5' end of thegene under the trp expresiionelement of E. coli. The four recombinant SIVenv-B-galactosidase polipetides were expresed in bacteria and purified by HPLC.

Virus SIV *Strain:* SIVmac *Gene/Protein:* env (gp32, gp120)

Trial(s) NHP.94, NHP.154

Vaccine Name **SIVmac239 Gag-Pol-ISCOM**

Description 25 µl SCOM matrix (Isconova, Uppsala, Sweden) mixed overnight at 4°C with either 25 µg SIVmac239 Gag-Pol in 250 µl of PBS

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.374

Vaccine Name **Soluble 89.6 gp120 protein**

Description Produced by infection of BS-C-1 cells with recombinant vaccinia virus, vBD2,13 at a multiplicity of infection of 5 plaque-forming units (pfu) per cell. Protein was purified from the media by lectin and Superdex-200 chromatography

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env (gp120)

Trial(s) NHP.349

Vaccine Name **tat protein**

Description HIV-1 Tat (IIIB) expressed in Eschericia coli, purified to homogeneity by heparin-affinity chromatography and high-performance liquid chromatography and stored lyophilized at -80 °C. Purified Tat had full biological activity in several assays. Tat wasresuspended in degassed buffer before use in vitro or in saline containing 20% of autologous serum for monkey injection.

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* Accessory (tat)

Trial(s) NHP.374

VI-B-11 Recombinant vector (virus/bacteria) vaccines

Vaccine Name **AD4-gp160(MN)**
Description

Virus HIV-1 *Strain:* HIV-1.MN *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.141

Vaccine Name **AD5-gp160(MN)**
Description

Virus HIV-1 *Strain:* HIV-1.MN *Gene/Protein:* env

Trial(s) NHP.141

Vaccine Name **Ad5-SIVgag**
Description This vaccine was constructed using the adenovirus as the vector. The adenovirus vector was based on the serotype 5 that has been rendered incompetent to replicate by the deletion of E1 and E3 viral genes. The adenoviral vector, pHCMVIBGHpA1 contains Ad5nucleotides 1-341 and 3,534-5,798 and an expression cassette containing the human cytomegalovirus promoter with intron and the bovine growth hormone poly adenylation signal (see paper for more information)

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.306.1, NHP.306.2

Vaccine Name **Ad5hr-SIVenv**
Description E3-deleted Ad5hr vector containing the SIVsmH4 (also known as F236, accession number X14307)envelope gene
Notes An E3-deleted Ad5hr vector containing the SIVsmH4 envelope gene

Virus SIV *Strain:* SIVsmH4 *Gene/Protein:* env
Notes The H4 (F236) isolate of SIV-SMM is not related to the MAC251/MAC239 lineage.

Trial(s) NHP.5, NHP.205.1, NHP.205.3, NHP.324.1, NHP.328

Vaccine Name **Ad5hr-SIVmac239gag**
Description Adenovirus Ad5hr with a codon-optimized Gag cDNA derived from Mac239, with silent mutations to optimize expression and eliminate the inhibitory sequences.

Virus SIV *Strain:* Mac239 *Gene/Protein:* gag (Gag)
MAC239 1053-2585

Trial(s) NHP.324.1, NHP.328, NHP.363

Vaccine Name **Ad5hr-SIVnefδ1-13**
Description

Virus SIV *Strain:* Mac239 *Gene/Protein:* Nef
MAC239 9115-9858 delta 1-13 amino acids 1-39 bases premature stop corrected to GAA

Trial(s) NHP.328, NHP.363

Vaccine Name **Ad5hr-SIVsmH4 env/rev**

Description Ad5hr-SIVsmH4 env/rev, a replication-competent Ad5hr-SIV recombinant carrying the SIVsmH4env and rev genes in the deleted E3 region and expressing the entire SIV envelope and Rev proteins

Virus SIV *Strain:* *Gene/Protein:* env, Accessory (rev)

Trial(s) NHP.363, NHP.371

Vaccine Name **AD7-gp160(MN)**
Description

Virus HIV-1 *Strain:* HIV-1.MN *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.141

Vaccine Name **ALVAC-HIV-2 (gag,pol,gp125)**
Description Recombinant canarypox virus expressing HIV-2 env, gag and pol genes

Virus HIV-2 *Strain:* HIV-2 SBL6669 *Gene/Protein:* gag, pol
Virus HIV-2 *Strain:* HIV-2 SBL6669 *Gene/Protein:* env (gp125)

Trial(s) NHP.4

Vaccine Name **ALVAC-SIV-gp**
Description Recombinant SIV vaccine composed of a live, weakened canarypox virus (ALVAC™) into which parts of SIV genes (gag and pol) were inserted. When ALVAC infects a human cell, the inserted SIV genes direct the cell to make SIV proteins. These proteinsare packaged into SIV-like particles that bud from the cell membrane. The particles are not infectious, fool the immune system and mount immune response to SIV. As a safety precaution, ALVAC can infect but not grow in human or macaques cells.

Virus SIV *Strain:* ? *Gene/Protein:* pol

Trial(s) NHP.345

Vaccine Name **ALVAC-SIV-gpe (vcp180)**
Description The ALVAC-SIV-gpe (vcp180) was engineered to express the gag, pol, and env genes of SIVmac251(K6W)

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* env, gag, pol

Trial(s) NHP.30, NHP.123, NHP.274

Vaccine Name **ALVAC/vCP153 HIV-2 gag,pol,env**
Description

Virus HIV-2 *Strain:* ND *Gene/Protein:* env, gag, pol

Trial(s) NHP.174

Vaccine Name **FP-SIV-gp (FP74)**
Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.9.2, NHP.345

Vaccine Name **FPV.HIV-1.gag/pol**

Description recombinant fowlpoxvirus (rFPV) vaccines expressing HIV-1 antigens gag and pol. The HIV-1gag/pol genes of ARV-2/SF2 strain were inserted into the FPV genome (FPV M3 strain) along with the E. coli Beta-gal and/orgpt selection and marker genes.

Virus HIV-1 *Strain:* HIV-1.ARV-2/SF2 *Subtype:* B *Gene/Protein:* gag, pol

Trial(s) NHP.48

Vaccine Name **FPV.HIV-1.gag/pol-IFNgamma**
Description recombinant fowlpoxvirus (rFPV) vaccines expressing both HIV-1 antigens and interferon-gamma. The HIV-1gag/pol genes of ARV-2/SF2 strain with the human IFNgamma gene were inserted into the FPV genome (FPV M3 strain) along with the E. coli Beta-gal and/orgpt selection and marker genes.

Virus HIV-1 *Strain:* ARV-2/SF2 *Subtype:* B *Gene/Protein:* gag, pol

Trial(s) NHP.48

Vaccine Name **MVA SIVsmH4 gag-pol**
Description

Virus SIV *Strain:* SIVsmH4 *Gene/Protein:* gag, pol

Trial(s) NHP.3, NHP.45, NHP.46

Vaccine Name **MVA-mac(J5)**
Description MVA constructs expressing env, gag-pol, nef, rev and tat genes of SIVmacJ5

Virus SIV *Strain:* SIVmacJ5 *Gene/Protein:* gag, pol, env

Trial(s) NHP.51

Vaccine Name **MVA-rev**
Description Modified Vaccinia Anlkara expressing HIV-1 subtype B isolate IIIB rev cDNA.

Virus HIV-1 *Strain:* IIIB *Subtype:* B *Gene/Protein:* rev
HXB2 5970-6045 (exon 1) and 8379-8653 (exon 2)

Trial(s) NHP.276

Vaccine Name **MVA-SIV gag-pol and HIV-1 89.6 env**
Description MVA vectors (pLW-9 and pLW-17) expressing SIV gag-pol and HIV-1 89.6 env

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol
Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.24.2

Vaccine Name **MVA-SIV239tat**
Description This vector encodes the full-length SIVmac239 Tat

Trial(s) NHP.88

Vaccine Name **MVA-SIV251 32H tat**
Description This vector encodes the full-length SIVmac251 32H Tat (clone J5)

Virus SIV *Strain:* SIVmac251.32H

Trial(s) NHP.88

Vaccine Name **MVA-SIVgag**
Description This MVA-SIV gag vaccine was constructed by cloning the SIV gag gene into the pSC59 shutle vector. This plasmid was designed to insert the transgene fragment into a viral thymidine kinase region and to drive the transgene from a synthetic early/late promoter. The recombinant plasmid was inserted into the MVA for immunization of monkeys.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.306.1, NHP.306.2

Vaccine Name **MVA-SIVmac239gag**
Description Recombinant MVA virus vT338 contains the gag gene from SIVmac239 inserted into the deletion III region of the MVA genome under the control of the vaccinia virus 40K (H5R) promoter. The virus also contains the Escherichia coli lacZ gene under the control of the fowlpox C1 promoter for use as a colorimetric screen for recombinant viruses

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.308

Vaccine Name **MVA-SIVmacJ5 (gag-pol)**
Description MVA constructs expressing gag-pol genes of SIVmac251 32H (pJ5) under the transcriptional control of the natural vaccinia virus early/late promoter P7.5
Notes poorly immunogenic

Virus SIV *Strain:* SIVmac251 32H (pJ5) *Gene/Protein:* gag, pol

Trial(s) NHP.3

Vaccine Name **MVA-SIVSL8-tat28-35**
Description This vector encodes a single Mamu-A*01-restricted CTL epitope Tat-SL8(positions 28-35)(STPESANL) inserted within the immunodominant region of hepatitis B core antigen

Virus SIV *Strain:* SIVSL8
MAC239 28-35

Trial(s) NHP.88

Vaccine Name **MVA-SIVsmH-4 -env**
Description MVA recombinants expressing the SIVsmH-4 env (MVA-env)

Virus SIV *Strain:* SIVsmH-4 *Gene/Protein:* env

Trial(s) NHP.45

Vaccine Name **MVA-tat**
Description Modified Vaccinia Ankara expressing HIV-1 IIIB strain tat cDNA

Virus HIV-1 *Strain:* IIIB *Subtype:* B *Gene/Protein:* tat
HXB2 5831-6045 (exon 1) and 8379-8479

Trial(s) NHP.276

Vaccine Name **MVA.HW**

Description This is a recombinant MVA.HW expressing an MVA and SIV gag-derived epitope, TPYDINQML, recognized by CTLs in rhesus macaques (Macaca mulatta) in the context of the Mamu-A*01 MHC class I molecule

Virus SIV *Strain:* ND *Gene/Protein:* gag

Trial(s) NHP.57

Vaccine Name **MVA.pUCII.SIVmac.J5**
Description MVA vaccine expressing SIV structural (gag,pol) and regulatory genes (tat,nef and rev)

Virus SIV *Strain:* SIVmac.J5 *Gene/Protein:* gag, pol

Trial(s) NHP.58

Vaccine Name **MVA/HIV 48**
Description MVA/HIV 48 is an rMVA expressing HIV-1 clade B Gag, protease, RT, and Env constructed by homologous recombination in chick embryo fibroblasts. Contains HXB2 gag and BH10 pol. The pol sequences contained three safety mutations in RT and a truncated integrase. The env from CCR5-tropic HIV-1.ADA contained silent mutations to eliminate two copies of a TTTTTNT sequence that acts as a poxvirus transcription termination signal (See LINDA S. WYATT, et al. 2004)

Virus HIV-1 *Strain:* HIV-1.BH10 *Subtype:* B *Gene/Protein:* pol
Virus HIV-1 *Strain:* HIV-1.HXB2 *Subtype:* B *Gene/Protein:* gag
Virus HIV-1 *Strain:* HIV-1.ADA *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.384

Vaccine Name **MVAgagpol**
Description The SIVsmH4 gag pol ORF (1049-5397) cloned into pMC03, then the product transfected into chicken embryo fibroblasts that had been infected with MVA. Plaques that stained blue upon addition of X-Gluc (CLONTECH) were purified

Virus SIV *Strain:* SIVsmH4 *Gene/Protein:* gag, pol
MAC239 1049-5397

Trial(s) NHP.44

Vaccine Name **MVAmacJ5-nef**
Description A highly immunogenic vector construct with high anti-CTL response; associated with protection

Virus SIV *Strain:* SIVmac251 32H (pJ5) *Gene/Protein:* Accessory (nef)

Trial(s) NHP.3

Vaccine Name **MVApIII-sp.SIVmac.J5.env**
Description Recombinant MVA vaccine expressing SIVmac.J5 env gene

Virus SIV *Strain:* SIVmac.J5 *Gene/Protein:* env

Trial(s) NHP.58

Vaccine Name **NYVAC-SIV-gag-pol-env (NYVAC-SIV-gpe)**
Description A highly attenuated poxvirus NYVAC-SIV-gag-pol-env (NYVAC-SIV-gpe); Induce both CD4+ and CD8+ t cell responses in rhesus macaques and demonstrate effectiveness as a preventive vaccine candidate.
Notes vaccinia

Virus	SIV	*Strain:* Mac251		
Notes	Described by Benson et al. J Virol. 1998 May;72(5):4170-82. PMID: 9557706			
Virus	SIV	*Strain:* Mac251		*Gene/Protein:* env expression cassette under control of vaccinia H6 promoter and gag-pol with I3L promoter.
Notes	Described by Benson et al. J Virol. 1998 May;72(5):4170-82. PMID: 9557706			
Trial(s)	NHP.9.1, NHP.274			

Vaccine Name	**Polio (Sabin 1) - HIV-1.gag/env (2)**			
Description				
Virus	HIV-1	*Strain:* IIIB?LAI (HXB2)		*Gene/Protein:* gag, env (gp120,gp140 (lacking signal sequece) gp120+gp140 ectodomain, p55 fused with VP4)
Virus	HIV-1	*Strain:* 92TH021	*Subtype:* D	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* 92TH022	*Subtype:* CRF02_AE	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* 92RW020	*Subtype:* A	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* 92BR025	*Subtype:* C	*Gene/Protein:* env (gp120)
Trial(s)	NHP.348.1			

Vaccine Name	**Polio (Sabin 1) -HIV-1.gag/env (1)**			
Description				
Virus	HIV-1	*Strain:* 92RW020	*Subtype:* A	*Gene/Protein:* env (GP120)
Virus	HIV-1	*Strain:* 92TH022	*Subtype:* CRF02_AE	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* 92UG021	*Subtype:* D	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* IIIB/LAI (HXB2)	*Subtype:* B	*Gene/Protein:* gag, env (gp120,gp140 (lacking signal sequence), gp120+gp41 ectodomain, p55 fused with VP4)
Trial(s)	NHP.348.1			

Vaccine Name	**Polio (Sabin 2) - HIV-1.gag/env (3)**			
Description				
Virus	HIV-1	*Strain:* IIIB/LAI (HXB2)	*Subtype:* B	*Gene/Protein:* gag, env (gp120,gp140 (lacking signal sequence), gp120+gp41 ectodomain, p55 fused with VP4)
Virus	HIV-1	*Strain:* 92UG021	*Subtype:* D	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* 92RW09	*Subtype:* A	*Gene/Protein:* env (gp120)
Virus	HIV-1	*Strain:* 92TH026	*Subtype:* CRF02_AE	*Gene/Protein:* env (gp120)
Trial(s)	NHP.348.1			

Vaccine Name	**Polio (Sabin 2) - HIV-1.gag/env (4)**			
Description				
Virus	HIV-1	*Strain:* IIIB/LAI(HXB2)	*Subtype:* B	*Gene/Protein:* gag, env (gp120,gp140 (lacking signal sequence), gp120+gp41 ectodomain, p55 fused with VP4)
Trial(s)	NHP.348.1			

Vaccine Name **Polio- SIVmac239gag**

Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.348.2

Vaccine Name **Polio-LAI/IIIB-Env**
Description

Virus HIV-1 *Strain:* IIIB/LAI *Subtype:* B *Gene/Protein:* env (gp120)

Trial(s) NHP.348.2

Vaccine Name **rBCG-SIV[3]**
Description A mixture of 3 transformed strains of <ital>Mycobacterium bovis</ital> BCG expressing the SIV-MAC-251 gag, nef and env genes.

Virus SIV *Strain:* MAC251 *Gene/Protein:* Accessory, env, gag (nef, gag, env)

Trial(s) NHP.353

Vaccine Name **Recombinant fowlpox (rFPV) SIVmac239 gag**
Description Recombinant fowlpox virus expressing SIVmac239 gag. The SIV gene was inserted in the BamJHI region of POXVAC-TC (Schering-Plough) strain of FPV

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.400

Vaccine Name **Recombinant fowlpox (rFPV).SHIV89.6P env**
Description Recombinant fowlpox virus expressing SHIV89.6P env. The SHIV gene was inserted in the BamJHI region of POXVAC-TC (Schering-Plough) strain of FPV.

Virus SHIV *Strain:* SHIV89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.400

Vaccine Name **Recombinant MVA-SHIV89.6P env**
Description Recombinant MVA expressing SHIV89.6P gp140 (env). The SHIV gene was inserting in the deletion III region of a plaque-purified isolate of the replication-defective strain of vaccinia virus designated MVA. The env gene was under the control of the vacciniavirus 40K(H5R) promoter.

Virus SHIV *Strain:* SHIV89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.400

Vaccine Name **Recombinant MVA-SIVmac239 gag**
Description Recombinant MVA expressing SIVmac239 gag. The SIVmac239 gene was inserting in the deletion III region of a plaque-purified isolate of the replication-defective strain of vaccinia virus designated MVA. The gag gene was under the control of the vacciniavirus 40K(H5R) promoter.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.400

Vaccine Name **Recombinant vaccinia gagpol (v-SG11)**
Description

Virus SIV *Strain:* SIVmne *Gene/Protein:* gag, pol

Trial(s) NHP.134

Vaccine Name **Recombinant vaccinia gagpolenv (v-SGE14)**
Description

Virus SIV *Strain:* SIVmne *Gene/Protein:* env, gag, pol

Trial(s) NHP.134

Vaccine Name **Recombinant vaccinia gp130 (v-SE6)**
Description

Virus SIV *Strain:* SIVmne

Trial(s) NHP.134

Vaccine Name **Recombinant vaccinia virus vac-gp160 (v-SE5)**
Description Recombinant vaccinia virus vac-gp160 (v-SE5) contains the coding sequence of the full-length gp160 of SIVmne molecular clone 8 (GenBank accession number M32741) in a New York City Board of Health strain (v-NY) of vaccinia virus (16, 17). v-SE5 was plaquepurified and propagated on African green monkey kidney cells (BSC-40)

Virus SIV *Strain:* SIVmne *Gene/Protein:* env

Trial(s) NHP.134, NHP.269

Vaccine Name **Recombinant vaccinia virus-HIVgp160 (cocktail)**
Description Recombinanat vaccinia virus expressing gp160 of HIV-1 isolates Bal, LAI, RF (vCB43, vCB41, and vCB36, respectively), 89.6 (vBD3), DH12, and AD8 (vvDHenv and vvADenv, respectively).

Virus HIV-1 *Strain:* HIV-1 BAL *Subtype:* B *Gene/Protein:* env
Virus HIV-1 *Strain:* HIV-1 LAI *Subtype:* B *Gene/Protein:* env
Virus HIV-1 *Strain:* HIV-1 RF *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.11

Vaccine Name **Recombinant vaccinia viruse (rVac).SHIV89.6P Env**
Description Recombinant vaccinia virus expressing SHIV89.6P env, constructed by inserting the SHIV env gene in the HindIII M region of TBC-Wy Therion strain of vaccinia (see Mazzara, G. P., Destree, A.&Mahr, A. (1993) Methods Enzymol. 217, 557-581).

Virus SHIV *Strain:* SHIV89.6P *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.400

Vaccine Name **Recombinant vaccinia viruse (rVac).SIVmac239 gag**
Description Recombinant vaccinia virus expressing SIVmac239 gag, constructed by inserting the SIV gag gene in the HindIII M region of TBC-Wy Therion strain of vaccinia (see Mazzara, G. P., Destree, A.&Mahr, A. (1993) Methods Enzymol. 217, 557-581).

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.400

Vaccine Name **rMVA (SIVsm) gagpolenv**

Description The rMVA-SIVsm co-expresses the gag-pol and env of SIVsmmH4. gag-pol was under the transcriptional control of the vaccinia early-late promoter P7·5. Env was expressed using a strong synthetic vaccinia virus early-late promoter. MVA-SIVsmwas amplified on primary chicken embryo fibroblasts and purified by ultracentrifugation. Purified viruses were reconstituted in PBS and titrated by end-point dilution in CEF to obtain the TCID50, aliquotted and stored at -70 °C.

Virus SIV *Strain:* SIVsmmH4 *Gene/Protein:* gag, pol, env

Trial(s) NHP.125

Vaccine Name **rMVA 89.6**

Description The MVA double recombinant virus expressed both the HIV 89.6 Env and the SIV 239 Gag-Pol, which were inserted into deletion II and deletion III of MVA, respectively . The 89.6 Env protein was truncated for the COOH-terminal 115 amino acids of gp41

Notes The modified H5 promoter controlled the expression of both foreign genes

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env
Virus SIV *Strain:* SIVmac329 *Gene/Protein:* gag, pol

Trial(s) NHP.19, NHP.132, NHP.325, NHP.349

Vaccine Name **rMVA SIV239 gag-pol**

Description this recombinant MVA expresses SIV239 Gag-Pol

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.89

Vaccine Name **rMVA SIVmac239 gagpolenv**

Description For construction of MVA-SIVgpe, chicken embryo fibroblast cells were incubated simultaneously with five infectious units each of MVA/SIV239gagpol and MVA/SH4wt. The latter virus expresses the SIVmac239 env gene, truncated after amino acid 733, under the control of the moderate-strength vaccinia virus promoter p7.5. A virus isolate expressing all three genes was clonally purified and amplified.

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* env, gag, pol

Trial(s) NHP.294

Vaccine Name **rMVA-SIVmac251 32H**

Description Recombinant MVA expressing SIVmac251 genes (gag,pol,tat,rev or nef, separetly) under the transcriptional control of vaccinia virus early and late promoters P7.5 and sP

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* gag, pol

Trial(s) NHP.52

Vaccine Name **rMVA.SIVmac239gagpolHIVenv**

Description

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol
Virus HIV-1 *Strain:* Unknown *Gene/Protein:* env

Trial(s) NHP.366

Vaccine Name **rMVA.SIVmac32H.tat.rev**

Description Recombinant MVA expressing SIVmac32H tat and rev genes

Virus SIV *Strain:* SIVmac32H *Gene/Protein:* Accessory (tat,rev)

Trial(s) NHP.49

Vaccine Name **rMVASIV239gagpol.HIV89.6env**

Description A recombinant virus expressing the SIVmac239gagpol gene was constructed by insertion of the entire open reading frame from plasmid p239SpSp5' into a plasmid transfer vector, pLW-9 (Wyatt et al., 1996). The rMVA, MVA/SIV239gagpol, was selected by immunostaining with serum from an SIV-infected macaque. For construction of the double recombinant virus, CEF were incubated simultaneously with 5 infectious units each of MVA/SIV239gagpol and MVA/89.6T

Virus HIV-1 *Strain:* HIV-1.89.6 *Gene/Protein:* env
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.24.1, NHP.90.1, NHP.90.2

Vaccine Name **rSalmonella typhi-SIVgag**

Description Salmonella typhi expressing SIV gag

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag
MAC239 146-213
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag
MAC239 4-284

Trial(s) NHP.308

Vaccine Name **rSalmonella typhimurium-SIVgag**

Description Salmonella typhimurium expressing SIV gag

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag
MAC239 146-213
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag
MAC239 4-507

Trial(s) NHP.308

Vaccine Name **rSFV-SIVmac32H.rev.tat**

Description Recombinant Semliki Forest Virus encoding SIVmac32H rev and tat genes.

Virus SIV *Strain:* *Gene/Protein:* Accessory (rev, tat)

Trial(s) NHP.49

Vaccine Name **rVaccinia-gp160**

Description Recombinant vaccinia virus expressing HIV-1 HXB2 gp160

Virus HIV-1 *Strain:* HIV-1 HXB2 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.78

Vaccine Name **rVaccinia-SIVmac-env.gagpol**

Description Recombinant vaccinia virus containing both SIVmac env and SIVmac gag-pol (vAbT386.6.1)

Virus SIV *Strain:* SIVmac *Gene/Protein:* env, pol

Trial(s) NHP.76

Vaccine Name **rVV-HIV-1.DH12env**
Description Recombinant vaccinia virus expressing HIV-1 DH12 gp160 (env) protein.

Virus HIV-1 *Strain:* HIV-1.DH12 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.303

Vaccine Name **rVV-SIVmacgag/pol**
Description This is a recombinant vaccinia virus expressing SIV gag and pol (for additional information on this vaccine please contact Dr M. Cho directly)

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag, pol

Trial(s) NHP.303

Vaccine Name **SFV-rev**
Description Semliki Forest Virus from pSFV (Invitrogen, Cergy-Pontoise, France) with rev cDNA from HIV-1 primary isolate ACH320 2.1 first subcloned in pCI (Promega, Charbonnieres, France) expression vector and then re-cloned into pSFV. Recombinant SFV-rev stocks prepared on BHK-21 cells.

Virus HIV-1 *Strain:* ACH320 2.1 *Subtype:* B *Gene/Protein:* rev
HXB2 5970-6045 (exon 1) and 8379-8653 (exon 2)

Trial(s) NHP.276

Vaccine Name **SFV-tat**
Description Semliki Forest Virus from pSFV (Invitrogen, Cergy-Pontoise, France) containing tat cDNA from HIV-1 subtype B primary isolate ACH320 2.1 first subcloned into pCI expression vector before re-cloning into pSFV.

Virus HIV-1 *Strain:* ACH320 2.1 *Subtype:* B *Gene/Protein:* tat
HXB2 5831-6045 (exon 1) and 8379-8479

Trial(s) NHP.276

Vaccine Name **SFVpSFVI.SIVmac.J5.gpetnr**
Description A recombinant semliki forest virus expressing SIVmac clone J5 structural (gag,pol) and regulatory (tat, nef and rev) genes

Virus SIV *Strain:* SIVmacJ5 *Gene/Protein:* env, gag

Trial(s) NHP.58

Vaccine Name **vAbT394**
Description Recombinant vaccinia (NYCBH) expressing SIV_{MAC251} Gag-Pol.

Virus SIV *Strain:* MAC251 *Gene/Protein:* Gag-Pol

Trial(s) NHP.319

Vaccine Name **Vaccinia-rDIsSIVgag**
Description A recombinant vaccinia virus DIs expressing SIV Gag. Contains a full-length gag gene of SIVmac239 in the vector construct. rDIs expressing SIVmac239 Gag (rDIsSIVGag)

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.365

Vaccine Name **vP1047, NYVAC HIV-2.SBL-ISY gp160.gag-pol**
Description To generate the NYVAC-recombinant viruses, plasmids encoding sequences for HIV-2.SBL-ISY gp160 plus gag-pol were used by invitro recombination, using the NYVAC vector vP866 as rescue virus

Virus HIV-2 *Strain:* HIV-2.SBL-ISY *Gene/Protein:* gag, pol

Trial(s) NHP.47

Vaccine Name **vP991, NYVAC HIV-1IIIB gp120.gag-pol**
Description To generate the NYVAC-recombinant viruses, plasmids encoding sequences for HIV-1 IIIB gp120 (aa residues 1-511) plus gag-pol were used by invitro recombination, using the NYVAC vector vP866 as rescue virus

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B
HXB2 1-511

Trial(s) NHP.47

Vaccine Name **vSIVgp120**
Description Recombinant vaccinia virus expressing SIV gp120

Trial(s) NHP.33

Vaccine Name **VSV(GCh)-Env+Gag**
Description Recombinant vesicular stomatitis virus (VSV) encoding HIV-1.89.6 env gene and SIV gag. The VSV G protein (Indiana serotype, GI) was subtitued with the VSV Chandipura glycoprotein (GCh)

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env
Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag

Trial(s) NHP.55

Vaccine Name **VSV(GNJ)-Env+Gag**
Description Recombinant vesicular stomatitis virus (VSV) expressing HIV-1.89.6 env and SIVmac239 gag. The VSV G protein (Indiana serotype, GI) was replaced with the G protein of the VSV New Jersey serotype (GNJ)

Virus SIV *Strain:* SIVmac239 *Gene/Protein:* gag
Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.55

Vaccine Name **VSV-(GI)-Env**
Description Recombinant vesicular stomatitis virus (VSV) vector encoding HIV-1 env gene

Virus HIV-1 *Strain:* HIV-1.89.6 *Subtype:* B *Gene/Protein:* env

Trial(s) NHP.55

Vaccine Name **vT107**
Description Recombinant vaccinia (NYCBH)expressing HIV-1 89.6 Env

Virus HIV-1 *Strain:* 89.6 *Subtype:* B *Gene/Protein:* env (Env)

Trial(s) NHP.319

VI-B-12 Passive antibody vaccines

Vaccine Name **Anti-HIV-1 ch1206**
Description Anti-HIV-1 antibodies obtaine from chimpanzees infected with HIV-1DH12. The chimpanzee was infected for 2.8 years prior to sample collection

Trial(s) NHP.86.1, NHP.86.2

Vaccine Name **Anti-HIV-1 ch4750**
Description Anti-HIV-1 antibodies obtaine from chimpanzees infected with HIV-1DH12, HIV-1DH20 and HIV-1DH20. The chimpanzee was infected for 3 years prior to sample collection

Trial(s) NHP.86.1

Vaccine Name **Anti-HIV-1 ch911**
Description Anti-HIV-1 antibodies obtaine from chimpanzees infected with HIV-1 IIIB. The chimpanzee was infected for 9.9 years prior to sample collection

Trial(s) NHP.86.1

Vaccine Name **Anti-HIV-2**
Description Antibody obtained from a Cynomolgous macaque inoculated with HIV-2 (SBL-6669) in a whole inactivated form. The monkey has subsequently shown to be protected from an autologous challenge.

Virus HIV-2 *Strain:* HIV-2 SBL6669) *Gene/Protein:* All

Trial(s) NHP.149.1, NHP.149.2

Vaccine Name **Anti-SHIV Plasma**
Description Pool of antiSHIV plasma from macaques infected with non-pathogenic SHIV-4. This pool consists mainly of polyclonal IgG

Trial(s) NHP.87

Vaccine Name **Anti-SIVmac251**
Description Antibodies generated by the immunization of pregnant macaques with whole-inactivated SIVmac251 plus montanide ISA 51 adjuvant.

Virus SIV *Strain:* SIVmac251 *Gene/Protein:* All

Trial(s) NHP.294

Vaccine Name **Anti-SIVmacC8**
Description Pool of antibodies collected from 4 cynomolgous macaques (L103, L106) inoculated with 10^4 TCID50 of 9/90 live attenuated virus SIVmacC8, prepared in C8166 cell. all macaques were shown to be infected and were subsequencently challenged with SIVmacJ5M and SHIV-4. The challenge did not induce superinfection. Serum collected from the 4 monkeys was stored at -70^{o}C and used as reagent.

Trial(s) NHP.215

Vaccine Name **Cβ1 anti-V3**
Description This is a mouse-human IgG1 chimeric monoclonal antibody. It contains the intact variable region of the murine 0.5 β monoclonal antibody which is directed to the V3 loop of HIV-1 IIIB variant gp120 and has potent in vitro IIIB-specific virus-neutralizing activity.

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* env (V3)

Trial(s) NHP.152.1, NHP.152.2

Vaccine Name **Chimp anti-HIV IgG**

Description Antibodies were obtained from chimpanzees that were infected with a variety of HIV-1 isolates and subsequently developed high-titer neutralizing antibodies

Trial(s) NHP.249

Vaccine Name **Chimp-anti-HIV-IgG**

Description The authors [Nishimura et al J Virol 76(5): 2123-30 (2002)] state that the IgG was harvested in 2000, from chimpanzee 4750 which had been infected in 1993 with 3 different HIV-1 strains including HIV-1 strain DH12.

Trial(s) NHP.354, NHP.394

Vaccine Name **F105/2G12/2F5 mab**

Description Coctail of 3 monoclonal antibodies (F105, 2G12 and 2F5)

Trial(s) NHP.85, NHP.117

Vaccine Name **HIVIG**

Description Anti-HIV-1 immunoglubulin obtained by plasmapheresis from HIV-1 infected individuals. The neutralising antibody titer was above or equal to 1:128. Virus-sterilized coagulation factors by application of solvents and detergents were used to inactivate thevirus in the plasma.

Notes derived from the pooled plasma of several HIV-1 positive donors

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B *Gene/Protein:* All

Trial(s) NHP.8, NHP.82.1, NHP.82.2, NHP.361

Vaccine Name **IgG1 b12**

Description Human antibody (IgG1,) recognizing an epitope overlapping the CD4 binding site of gp120 , contained <1 IU of endotoxin/ml

Trial(s) NHP.6, NHP.15, NHP.304

Vaccine Name **mAb B4**

Description This is a monoclonal antibody directed against HIV receptor complex;Broad neutralizing activity against HIV; Provides postexposure prophylaxis to hu-peripheral blood leukocyte (PBL)-severe combined immunodeficient mice and chimpanzees;Recognized a complexreceptor site for HIV on the T cell surfaceincludeing CD4;Preferentially neutralizes primary HIV-1 isolates compared with T cell line-adapted strains, including SI and NSI-inducing phenotypes, representatives from HIV-1 subtypes A-G, HIV-2, SIV, and SHIV

Trial(s) NHP.84

Vaccine Name **Monoclonal antibody 2F5**

Description

Notes 2F5 is an subclass IgG1. recognizes the gp41 sequence ELDKWA that is conserved among many HIV-1 strains

Trial(s) NHP.8, NHP.15, NHP.82.1, NHP.82.2, NHP.304

Vaccine Name **Monoclonal antibody 2G12**

Description 2G12 is a subclass IgG1. Binds to a conformationally sensitive epitope in the C3-V4 region of gp120

Trial(s) NHP.8, NHP.15, NHP.82.1, NHP.82.2, NHP.304

Vaccine Name **Monoclonal antibody 4E10**
Description This is a human monoclonal antibody that recognizesthe concerved HIV-1 gp41 epitope NWEDIT

Trial(s) NHP.304

Vaccine Name **Monoclonal antibody F105**
Description obtained by fusion of antibody- producing EBV-transformed cells with the HMMA2.11TG/O cell line; This is a IgG1 kappa antibody that binds to the surfaces of cells infected with all HIV-1 strains tested: MN, RF, IIIB, and SF2, but not uninfected cells

Trial(s) NHP.15

Vaccine Name **SIVIG**
Description Approximately 16 g of IgG purified from 1.5 liters of plasma obtained by plasmapheresis from a single long-term nonprogressing Macaca mulatta macaque, infected with the F236 isolate of SIVsm and remaining clinically healthy for more than 6 years

Virus SIV *Strain:* SIVsmF236 *Gene/Protein:* All

Trial(s) NHP.377

Vaccine Name **SIVIG-1**
Description Antibody preparation from pooled plasma from SIVmac251-infected macaques. The preparation contains 15 mg/ml of purified IgG, a titer of 68,000 gp120; 31,00 anti-p27 and 1.15 ug/ml 50% neutralization titer

Trial(s) NHP.83

Vaccine Name **SIVIG-2**
Description Antibody preparation from pooled plasma from SIVmac251-infected macaques. The preparation contains 16 mg/ml of purified IgG, a titer of 170,000 gp120; 30,00 anti-p27 and 0.6 ug/ml 50% neutralization titer

Trial(s) NHP.83, NHP.363

VI-B-13 Other vaccines

Vaccine Name **CD4 Immunoadhesin (CD4-IgG)**
Description A chimeric consisting of the N-terminal two immunoglobulin-like regions of CD4 joined to the Fc region of human IgG1. This is used as a CD4 analogue because it has a half life longer than CD4. In human, the complexe results in 25 folds increase of concentration of CD4-IgG in the blood compared with recombinant CD4.

Trial(s) NHP.156

Vaccine Name **Crosslinked gp120-CD4**
Description HIV-1 IIIB gp120 and CD4 chemically crosslinked with 0.5 mM bis(sulfosuccinimidyl)suberate (BS3, Sigma)

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B

Trial(s) NHP.53

Vaccine Name **Crosslinked gp140-CD4**
Description HIV-1 IIIB gp140 and CD4 chemically crosslinked with 0.5 mM bis(sulfosuccinimidyl)suberate (BS3, Sigma)

Virus HIV-1 *Strain:* HIV-1.IIIB *Subtype:* B

Trial(s) NHP.53

Vaccine Name **HIV-1 HXBc2 Tat Toxoid**
Description Contact authors

Virus HIV-1 *Strain:* HXBc2 *Gene/Protein:* Accessory (tat)

Trial(s) NHP.121

Vaccine Name **inactivated Tat toxoid**
Description

Trial(s) NHP.78

Vaccine Name **SHIV89.6P tat toxoid**
Description Contact authors

Virus SHIV *Strain:* SHIV89.6P *Subtype:* B *Gene/Protein:* Accessory (tat)

Trial(s) NHP.121

VI-C

Challenges

This chapter contains a list of challenge viruses used in the studies compiled in the database. Challenge viruses are grouped into the following categories:

- SHIV
- SIV
- HIV-1
- HIV-2

In most cases, the name and description of challenge viruses were retained as provided by the authors in the paper reporting the trial. For HIV-1, HIV-2 and simian/human synthetic recombinant viruses, the subtype of the HIV-1 or HIV-2 portion(s) of the genome has been recorded. In addition, the studies in which each challenge virus was used are also shown for each challenge virus.

Viruses used in primate models of AIDS and vaccine studies are tremendously variable in infectivity, sequence diversity, and pathogenicity. For example, the SHIV89.6P virus is much more rapidly lethal to Rhesus macaques than the SHIV-89.6 virus from which it was derived [1,2]. The SHIV89.6P acutely pathogenic virus has mutations which alter the carboxy terminus of the env gp41 protein and also alter the Nef protein. Similarly, some of the PBJ isolates are far more acutely lethal than the SMM9 stock from which they were derived [3,4].

The database contains links to genetic sequences of challenge viruses whenever such sequences are available. Caution should be used in interpreting such links because the sequence may not be 100% identical to the challenge virus. Even with an infectious molecular clone of a virus, the challenge dose is often created from culturing the clone though several amplification passages which could result in an accumulation of mutations.

VI-C-1 SHIV Challenges

Strain	**SHIV-4.vpu+**
Description	Contains gag, pol, vif and nef ORF of SIVmac239 (open nef) and tat, rev, vpu and env genes of HIVHXBc2, with defective start codon of vpu (ACG in HXB2) corrected. Obtained from Virus Research Institute, Cambridge MA, USA. Described in Li et al JAIDS 5:639-646 (1992) and J Virol 69(11):7061-7 (1995) PubMed ID 7474126
HIV Subtype	B
Notes	http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=pubmed&dopt=Abstract&list_uids=1613662
Trials	NHP.77

Strain	**SHIV-BX08**
Description	The SHIV-BX08 construct is a chimeric virus derived from SIV-MAC239 (gag, pol, vif, vpx and nef genes), HIV-1 isolate BX08 (env gp120), and HIV-1 isolate LAI (env gp41, tat and rev). Although SHIV-BX08m has been used in numerous studies, no DNA sequencesare available for the BX08 virus.
HIV Subtype	B
Trials	NHP.276

Strain	**SHIV-C2/1**
Description	SHIV-C2/1 is an SHIV-89.6 variant isolated by passaging the peak of initial plasma viremia from an infected cynomologus macaque as described in J Gen Virol 80(5):1231-40 (1999) by Shinohara et al. The original pSHIV, containing the SHIV-89.6P (and not the 89.6 as implied by Shinohara in J Gen Virol) was kindly provided by Y. Lu at the Harvard AIDS Institute (Boston, Mass. yichenlu@hsph.harvard.edu).
HIV Subtype	B
Notes	http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=pubmed&dopt=Abstract&list_uids=10355770
Trials	NHP.365

Strain	**SHIV-DH12clone7**
Description	Infectious molecular clone derived from SHIV-DH12R-PS1 which in turn was derived from HIV-MD14YE [Igarashi et al PNASU 96(24): 14049-14054 (1999)].
HIV Subtype	B
Trials	NHP.386

Strain	**SHIV-DH12clone8**
Description	Infectious molecular clone derived from SHIV-DH12R-PS1 which in turn was derived from HIV-MD14YE [Igarashi et al PNASU 96(24): 14049-14054 (1999)].
HIV Subtype	B
Trials	NHP.386

Strain	**SHIV-IIIB/HXB2**
Description	Also known as SHIV-4, Described in J AIDS 5: 639-646 (1992) by Li et al. SIV-Mac239 virus with HIV-1 HXB2 env inserted. Described in J Virol 70(5):3198-3206 (1996) only as the arent plasmid from which SHIV-89.6 was created by replacing part of HXB2 gp160 with the same region for another HIV-1 subtype B virus with different tropism.
HIV Subtype	B
Notes	http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=pubmed&dopt=Abstract&list_uids=1613662
Trials	NHP.14, NHP.16.1, NHP.16.2, NHP.47, NHP.56

Strain	**SHIV-KU2**
Description	SHIV-Ku2 is a chimeric virus containing the HIV-1 IIIB strain (HXBc2) envelope gene and SIVmac239 gag and pol genes, and is pathogenic in rhesus macaque
HIV Subtype	B
Trials	NHP.1, NHP.79, NHP.107

Strain **SHIV-MD14YE (DH12)**
Description Derived from SHIV-1DH12, but with the HIV-1 nef gene replaced by SIV-Mac239 nef with two mutations R17Y and Q17E. The SIV nef R17Y mutation is known to create virus that depletes macaque T-cells self-activates T-cells such that the virus can replicate innon-stimulated PBMCs. R17Y creates SH2 binding ITAM motif YXXLXXXXXXXYXXL.
HIV Subtype B
Notes The tat, rev and env genes and the remainder of the vpr gene were derived mostly from HIV-1DH12, except for a small segment (145 bp) at the SIV/HIV-1 junction in vpr) that is of HIV-1NL4-3 origin.
Trials NHP.86.1, NHP.86.2, NHP.387, NHP.389

Strain **SHIV-NM-3rN**
HIV Subtype B
Notes The subtype relates to the HIV component only
Trials NHP.28, NHP.31, NHP.35, NHP.322

Strain **SHIV-vpu+**
Description Described in Li et al J Virol 69(11):7061-7 (1995) PubMed ID 7474126. SHIV-4 modified by site-directed mutagenesis to correct defective vpu. HIV-1 subtype B clone HXB2 has a defective vpu gene due to an ATG to ACG mutation in the vpu start codon. ThisSHIV has a corrected start codon, plus a P5Q mutation in vpu.
HIV Subtype B
Trials NHP.15, NHP.85, NHP.117

Strain **SHIV.229(mn)**
Description The SHIV229(mn) is based on $SHIV_{IIIB}$ encoding HIV-1_{HXBc2}tat, rev and env on a SIV_{mac239} backbone, passaged through M. nemestrina in vivo to become pathogenic. The challenge stock was generated by expanding the SHIV229(mn) on PHA-activated M. nemestrina PBMC.
HIV Subtype B
Trials NHP.339

Strain **SHIV.DH12 (MD1)**
Description This chimeric simian-human immunodeficiency virus (SHIVs) carries envelope glycoproteins from a T cell-macrophage dual-tropic primary isolate (human immunodeficiency virus type 1 [HIV-1] strain DH12) in the SIVmac239 backbone. DH12 is also known as MD1.MD14 is derived from MD1 by replacing the DH12 nef with Mac239 nef.
HIV Subtype B
Trials NHP.11

Strain **SHIV.DH12R-PS1**
Description This SHIV was obtained from the nonpathogenic SHIVDH12 (SHIVMD1) (Shibata, JID 176:362-73 1997). This highly pathogenic SHIVDH12R was isolated at week 68 from rhesus monkey 565Z (Igarashi et al PNASU 96(24):14049-14054 1999). Virus isolated at week 52 from animal 565Z also induced an irreversible and extremely rapiddepletion of CD4+ T lymphocytes following its inoculation into rhesus monkey PS1 and was designated SHIVDH12R-PS1.
HIV Subtype B
Notes http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=pubmed&dopt=Abstract&list_uids=10570196
Trials NHP.157.3, NHP.303, NHP.391

Strain **SHIV.KU1**
Description SHIV.KU1 was described in ARHR 13(8): 635-645 (1997) PMID: 9168232 and J Virol 73(2):976-84 (1999) PMID: 9882298. It is derived from SHIV-P3 by passage in donor PBMCs from a normal macaque.
HIV Subtype B

Notes This is an extremely virulent chimeric virus. Has an open vpu in addition to numerous mutations in the env and nef. Replicates efficiently in macrophage cultures and at extremely high titers in monkeys, with loss of CD4+ T cells and AIDS
Trials NHP.87, NHP.112

Strain **SHIV.MD1**
Description It carries a portion of the U3 LTR, the R-U5 LTR, gag, pol, vif, and vpx, and approximately 20% of vpr from SIVmac239. The remainder of vpr, tat, rev, env, and nef and a portion of the U3 LTR are derived from HIV-1; most of the HIV-1 sequences came from aT-cell/macrophage dual-tropic primary isolate HIV-1DH12 except for small segments at SIV-HIV-1 junctions (145 bp in vpr; 27 bp in nef) that were derived from HIV-1NL43. NRE, negative regulatory element.
Shibata et al. J Inf Dis 176:362 (1997)
HIV Subtype B
Notes http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=pubmed&dopt=Abstract&list_uids=9237701
Trials NHP.207, NHP.389, NHP.394

Strain **SHIV.SF13**
Description Described in AIDS 10(12): 1331-7 (1996) PubMed ID 8902061. This SHIV is a SIV-Mac239 LTR-Gag-Pol and Nef with HIV-1 subtype B clone SF13 Tat-Rev-Vpu-Env. The SF13 clone is from the same patient as the HIV-1 SF2 clone.
HIV Subtype B
Trials NHP.80, NHP.164

Strain **SHIV.W6.1D**
Description $SIV_{W6.1d}$ was constructred by replacing an NheI-to-AvrII fragment encompasing Env gp160, of SHIV-4 with the W6.1D cloned Env from HIV-1 subtype B isolate 320.3 which is a dual-tropic virus from a Dutch AIDS patient.
HIV Subtype B
Trials NHP.80

Strain **SHIV162P4**
HIV Subtype B
Trials NHP.6, NHP.62

Strain **SHIV33**
Description This SHIV contains the tat, rev, vpu, and env genes of HIV-1 subtype B isolate SF33. The SHIV-SF33 construct was then passaged in Rhesus macaque to generate SHIV-SF33A. See also the entry with accession number AF401229, from this same SHIV construct.
HIV Subtype B
Trials NHP.268.1

Strain **SHIV33A**
Description This SHIV contains the tat, rev, vpu, and env genes of HIV-1 subtype B isolate SF33. The SHIV-SF33 construct was then passaged in Rhesus macaque to generate SHIV-SF33A. See also the entry with accession number AF401229, from this same SHIV construct.
HIV Subtype B
Trials NHP.268.1

Strain **SHIV89.6**
HIV Subtype B
Trials NHP.7, NHP.15, NHP.90.1, NHP.114, NHP.126, NHP.319

Strain **SHIV89.6P**

Description Parental SHIV was SHIV-4 (also known as SHIV-IIIB/HXB2) from which env of HXB2 was replaced by env of 89.6 (also HIV-1 subtype B but different tropism). Described in J Virol 70(5): 3198-3206 (1996) by Reimann et al. Passaged to gain pathogenicity as described in J Virol 71(6): 4218-25 (1997) by Karlsson et al.
HIV Subtype B
Notes http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=PubMed&cmd=Retrieve&list_uids=9151808&dopt=Citation
Trials NHP.2, NHP.7, NHP.16.2, NHP.17, NHP.19, NHP.23, NHP.24.2, NHP.28, NHP.36, NHP.37, NHP.55, NHP.56, NHP.60.1, NHP.60.3, NHP.79, NHP.80, NHP.89, NHP.90.2, NHP.107, NHP.117, NHP.121, NHP.126, NHP.131, NHP.132, NHP.304, NHP.306.1, NHP.306.2, NHP.325, NHP.348.2, NHP.349, NHP.366, NHP.374, NHP.400

Strain **SHIV89.6PD**
HIV Subtype B
Trials NHP.8, NHP.34, NHP.70, NHP.72, NHP.78, NHP.81, NHP.82.1, NHP.82.2, NHP.326, NHP.398

Strain **SHIV89.6v**
Description This is a stock virus from the SHIV89.6 after passage in rhesus macaques through intra vaginal inoculation and brief culture in rhesus PBMC. The stock concentration was determined as 10^3 TCID50/ml by culture on CEMx174 cells and p27 production
HIV Subtype B
Trials NHP.20

Strain **$SHIV_{SF162-PC}$**
Description $SHIV_{SF162-PC}$ is derived from $SHIV_{SF162}$ by replacing env V1-V5 with env V1-V5 from a passaged $SHIV_{SF162}$ that was more infectious and pathogenic ($SHIV_{SF162-P3}$).
HIV Subtype B
Trials NHP.312

Strain **SHIVHan2**
Description Described in AIDS 10(12): 1331-7 (1996) PubMed ID 8902061. This SHIV is a SIV-Mac239 LTR-Gag-Pol and Nef with HIV-1 subtype B clone pNL43 Tat-Rev-Vpu-Env, from which the SacII-HindIII region (most of env) was replaced by HIV-1 subtype B isolate Han2.
HIV Subtype B
Trials NHP.80

Strain **SHIVsbg0.1**
Trials NHP.10

VI-C-2 SIV Challenges

Strain	**SIV mac251 (European) stock 5**
Description	prepared by passaging the European SIVmac251-32H 11/88 challenge virus once through rhesus PBMC
Trials	NHP.119
Strain	**SIV(Mne) Cell-free**
Trials	NHP.269
Strain	**SIV(Mne) clone E11S**
Trials	NHP.64, NHP.65.1, NHP.65.2, NHP.94, NHP.134, NHP.154, NHP.265, NHP.269
Strain	**SIVDeltaB670**
Description	The virus was described by Mickey Corb in a paper published by Gormus et. al. in the Journal of Infectious Diseases, Vol 160, No 3, Sept 1989. The virus came from mangabey A022 (naturally infected with SIV), was passed to rhesus macaque 8664, then passed to B670. Sooty mangabey A022 came from Yerkes to Tulane and appears to have been born at Yerkes.
Trials	NHP.63, NHP.248
Strain	**SIVmac (not detemined)**
Trials	NHP.239, NHP.240
Strain	**SIVmac220**
Notes	Viral challenge (SIVmac 220) which is a cell-free virus stock prepared from the spleen of a rhesus monkey infected with the J5 molecular clone of SIVmac 251 (32H)
Trials	NHP.106, NHP.397
Strain	**SIVmac239**
Trials	NHP.16.2, NHP.18, NHP.39, NHP.54, NHP.61, NHP.67, NHP.69, NHP.88, NHP.148, NHP.308
Strain	**SIVmac239/nef-open**
Trials	NHP.52, NHP.309
Strain	**SIVmac251**
Trials	NHP.9.1, NHP.13, NHP.32, NHP.33, NHP.38, NHP.51, NHP.57, NHP.66, NHP.73, NHP.74, NHP.108, NHP.109, NHP.120, NHP.123, NHP.148, NHP.157.1, NHP.157.2, NHP.200, NHP.201.2, NHP.205.1, NHP.205.2, NHP.205.3, NHP.245.1, NHP.245.2, NHP.245.3, NHP.294, NHP.300, NHP.324.1, NHP.327.1, NHP.327.2, NHP.353, NHP.363
Strain	**SIVmac251 (561)**
Description	This challenge stock was prepared by culturing PHA-activated peripheral blood mononuclear cells (PBMC) from a Mamu-A*01-positive infected macaque (561L) exposed to SIVmac251 by the vaginal route. The SIVmac251 (561) was titered in vivo in rhesus macaquesby inoculating 6 animals with different dilutions of virus stock via the rectal route. 6/6 animals inoculated with the virus (0.5 ml diluted to 1.5 ml with RPMI medium) became infected, evidenced by high plasma viremia and a drop in CD4 counts.
Trials	NHP.30, NHP.274
Strain	**SIVmac251 (J5)**
Trials	NHP.126, NHP.185.2
Strain	**SIVmac251(32H)**
Trials	NHP.5, NHP.41, NHP.49, NHP.97, NHP.99.2, NHP.116, NHP.151, NHP.152.1, NHP.152.2, NHP.185.1, NHP.194.1, NHP.203, NHP.205.2

Strain **SIVmac251,32H.spl**
Notes virus stock was prepared from a spleen homogenate of a rhesus monkey inoculated with SIVmac251, 32H and titrated in vitro in human T cells and in vivo in rhesus monkeys
Trials NHP.40

Strain **SIVmac251BK28**
Notes molecular clone grown in monkey PBMCs
Trials NHP.40

Strain **SIVmac32H.IXc**
Description Pathogenic cell-associated SIV from primary, uncultured rhesus monkey PBMC
Trials NHP.58

Strain **SIVmac8980**
Description SIVmac 8980 grown in rhesus monkey PBMC and analyzed for CCR5 coreceptor binding using the "Ghost system" (see Trkola A et al., J Virol 1998;72:1876-85).
Trials NHP.395

Strain **SIVmacJ5M**
Trials NHP.215

Strain **SIVmacR71**
Trials NHP.107

Strain **SIVmne clone A2-clone 5**
Trials NHP.41

Strain **SIVsm**
Description SIV-sm described by Fultz et al Proc Nat Acad Sci 83(14):5286-90 (1986) PubMed ID 3014542 from an infected macaque at Yerkes. This SIV-sm is from the same animal from which the SIV-SMM9 virus was obtained. J. Virol. 66(1); 414-9 (1992)
PubMed ID 1727495cites Fultz (1986) as the source of SMM9.
Trials NHP.4, NHP.68, NHP.93, NHP.125, NHP.194.2

Strain **SIVsmB670**
Trials NHP.36, NHP.203

Strain **SIVsmE660**
Trials NHP.18, NHP.27, NHP.37, NHP.44, NHP.45, NHP.59, NHP.377

VI-C-3 HIV-1 Challenges

Strain	**HIV-1 Han2**
Description	Isolate HAN was isolated from a 39 year old homosexual German patient with AIDS related complex, in 1986. This patient died from complications of AIDS in 1987. HAN was highly cytopathic in MT-2 T cell line, it was able to productively infect MT-4, H9 or Jurkatcell lines. Genomic DNA from infected MT-2 cells was used to prepare a lambda phage genomic library. Two full-length clones, HAN/2 and HAN/3 were purified. HAN/3 was used for DNA sequencing, and has a defective env gene
HIV Subtype	B
Trials	NHP.21
Strain	**HIV-1 IIIB**
HIV Subtype	B
Trials	NHP.71, NHP.202, NHP.242, NHP.247, NHP.267, NHP.361
Strain	**HIV-1.5016**
HIV Subtype	B
Trials	NHP.141
Strain	**HIV-1.DH12**
HIV Subtype	B
Trials	NHP.84, NHP.392
Strain	**HIV-1.LAI**
HIV Subtype	B
Trials	NHP.48, NHP.204
Strain	**HIV-1.SF2**
HIV Subtype	B
Trials	NHP.141, NHP.193
Strain	**LAV-1 or NY5**
HIV Subtype	B
Trials	NHP.249

VI-C-4 HIV-2 Challenges

Strain	**HIV-2 (UC2-10568)**
Description	HIV-2 group A isolate UC2 was isolated from a woman originally from Burkina Faso but who was living in Cote d'Ivoire. She had developed AIDS and was co-infected with HIV-1. The isolate was cocultured in PBMC with then passaged through a baboons 9429, 12281 and 10568.
HIV Subtype	A
Trials	NHP.310
Strain	**HIV-2 (UC2-11966)**
Description	HIV-2 group A isolate UC2 was isolated from a woman originally from Burkina Faso but who was living in Cote d'Ivoire. She had developed AIDS and was co-infected with HIV-1. The isolate was cocultured in PBMC with then serially passaged through a baboons9429, 12281, 10568, 11999 and 11966.
HIV Subtype	A
Trials	NHP.310
Strain	**HIV-2 (UC2-11999)**
Description	HIV-2 group A isolate UC2 was isolated from a woman originally from Burkina Faso but who was living in Cote d'Ivoire. She had developed AIDS and was co-infected with HIV-1. The isolate was cocultured in PBMC with then serially passaged through a baboons9429, 12281, 10568 and 11999.
HIV Subtype	A
Trials	NHP.310
Strain	**HIV-2 (UC2-12281)**
Description	HIV-2 group A isolate UC2 was isolated from a woman originally from Burkina Faso but who was living in Cote d'Ivoire. She had developed AIDS and was co-infected with HIV-1. The isolate was cocultured in PBMC with then passaged through a baboons 9429 and12281.
HIV Subtype	A
Trials	NHP.310
Strain	**HIV-2 (UC2-12741)**
Description	HIV-2 group A isolate UC2 was isolated from a woman originally from Burkina Faso but who was living in Cote d'Ivoire. She had developed AIDS and was co-infected with HIV-1. The isolate was cocultured in PBMC with then serially passaged through a baboons9429, 12281, 10568, 11999, 11966 and 12741.
HIV Subtype	A
Trials	NHP.310
Strain	**HIV-2 (UC2-9429)**
Description	HIV-2 group A isolate UC2 was isolated from a woman originally from Burkina Faso but who was living in Cote d'Ivoire. She had developed AIDS and was co-infected with HIV-1. The isolate was cocultured in PBMC with then passaged through a baboon 9429.
HIV Subtype	A
Trials	NHP.310, NHP.378
Strain	**HIV-2.SBL6669**
HIV Subtype	A
Trials	NHP.47, NHP.149.1, NHP.174

VI-D

Adjuvants and Stimulants

As part of the vaccines database, we developed a separate and general database table and search interface for adjuvants and stimulants. The majority of the data on adjuvants was obtained from the National Institute of Allergy and Infectious Diseases. We are indebted to Dr. Carl Alving for making the adjuvant data available. In this vaccine compendium, we have listed only the adjuvants which were used in the Nonhuman Primate HIV/SIV Vaccine Trials Database. For information about other adjuvants and stimulants, the reader is advised to use the Adjuvant/Stimulant search form at `http://www.hiv.lanl.gov/cgi-bin/vaccine/public/adjuvant_search.cgi?process=start`.

Name	**Adju-Phos**
Other Names	Aluminum phosphate gel
Description	Amorphous aluminum hydroxyphosphate. A schematic of the unit layer of amorphous aluminum bydroxyphosphate showing the surface hydroxyl, water, and phosphate groups. Key: Al, small closed circle; OH, large closed circle; H_20, open circle; $P0_4$, hatched circle. Obtained by precipitation. The degree of substitution of phosphate for hydroxyl depends on the concentration of reactants and precipitation conditions. White gelatinous precipitate in aqueous suspension.
Trials	NHP.330
Name	**Adjumer™**
Other Names	PCPP salt; polyphosphazene; polyidi (carboxylatophenoxy) lphosphazene
Description	Synthetic Solid: beige to off white powder. Aqueous solution: clear, colorless liquid
Trials	NHP.72, NHP.78
Name	**Alum**
Other Names	Alhydrogel; Aluminum hydroxide gel;
Description	Crystalline aluminum oxyhydroxide AIOOH, known mineralogically as boehmite. The structure consists of corrugated sheets of aluminum octahedra. Obtained by precipitation of aluminum hydroxide under alkaline conditions. White gelatinous precipitate in aqueous suspension.
Trials	NHP.97, NHP.99.2, NHP.151, NHP.162, NHP.185.1, NHP.185.2, NHP.198, NHP.205.3, NHP.248, NHP.349, NHP.362
Name	**AS-2 adjuvant**
Trials	NHP.21
Name	**B7-2**
Description	The gene product encoded by B7-2 is a co-stimulatory molecule for GM-CSF. The genes had been cloned by PCR from baboon peripheral blood mononuclear cells (PBMC) and were sequenced, then sub-cloned into the mammalian expression vector, pND-14.
Trials	NHP.378
Name	**Bupivacaine**
Trials	NHP.2, NHP.16.1, NHP.202, NHP.322
Name	**Bupivacaine-HCl**

Trials NHP.300

Name **BWZL**
Trials NHP.204

Name **CCR5 peptides**
Description N-terminal (aa 1-20): Met-Asp-Tyr-Gln-Val-Ser-Ser-Pro-ILe-Tyr-Asp-ILe-Asp-Tyr-Tyr-Thr-Ser-Glu-Pro-Cys
First loop (aa 89-102): His-Tyr-Ala-Ala-Ala-Gln-Trp-Asp-Phe-Gly-Asn-Thr-Met-Cys-Gln Second loop (aa 178-197): Cys-Ser-Ser-His-Phe-Pro-Tyr-Ser-Gln-Tyr-Gln-Phe-Trp-Lys-Asn-Phe-Gln-Thr-Leu-Lys Neosystem Laboratories (Strasbourg, France)
Trials NHP.395

Name **CpG 2006**
Description Eurogentec, Seraing, Belgium
Trials NHP.330

Name **CRL1005**
Other Names Block Copolymer P1205
Description ABA block polymer with mean values of x = 8 and y = 205. SOURCE: Linear chain polymers are synthesized by condensation of propylene oxide and ethylene glycol initiator in the presence of a cesium salt catalyst to form polyoxypropylene chain, followed by condensation of ethylene oxide on either end of the chain. Individual polymeric species of triblock nonionic block copolymers result from controlled synthesis of chains with pre-determined length. Clear, colorless to slightly yellow, viscous liquid.
Trials NHP.306.1, NHP.306.2

Name **Diphtheria toxoid**
Trials NHP.268.1

Name **DL-PGL**
Other Names Polyester poly (DL-lactide-co-glycolide)
Trials NHP.200

Name **Freund's Complete Adjuvant**
Other Names Complete Freund's adjuvant; CIA; FCA
Description Mixture of mineral oil (Marco 52) and emulsifier (Arlacel A [mannide monooleate]) as an emulsion of 85% mineral oil and 15% emulsifier with 500 µg heat-killed and dried Mycobacterium tuberculosis per mL of emulsifier mixture. M. tuberculosis grown and adjuvant is manufactured at the Statens Seruminstitut, Copenhagen, Denmark. Thick viscous liquid without color.
Trials NHP.79, NHP.94, NHP.154, NHP.268.1

Name **Freund's Incomplete Adjuvant**
Other Names Incomplete Freund's Adjuvant; IFA;FIA
Description Mixture of mineral oil (Marcol 52) and emulsifier (Arlacel A [mannide monooleate]) as an 80% mineral oil, and 15% emulsifier emulsion. Manufactured by Statens Seruminstitut, Copenhagen, Denmark Thick viscous liquid without color.
Trials NHP.7, NHP.56, NHP.65.1, NHP.78, NHP.79, NHP.94, NHP.121, NHP.134, NHP.154, NHP.204, NHP.268.1, NHP.269, NHP.320, NHP.348.1

Name **GM-CSF**
Other Names Granulocyte-macrophage colony stimulating factor; Sargramostim (yeast-derived rh-GM-CSF)

Description STRUCTURE: GM-CSF is a glycoprotein of 127 amino acids. Recombinant human GM-CSF is produced in yeast and it differs from the natural human GM-CSF by substitution of Leu for Arg at position 23. Walter, M. R., et al., 1992, Three-dimensional structure of recombinant human granulocyte-macrophage colony stimulating factor, J. Mol. Biol. 224: 1075-1085. Sequence of recombinant human GM-CSF (Sargramostin): APARSPSPSTQPWEHVNAIQEALRLLNLSRDTAA-EMNETVEVISEMFDLQEPTC LQTRLELYKQGLRGSLTKLKGPLTMMASHYKQHCPPTPETSCATQIITFESFKE NLKDFLLVIPFDCWEPVQE Recombinant protein produced in yeast (S. cerevisiae). White, lyophilized powder (before reconstitution), or a clear colorless solution (after reconstitution).
Trials NHP.68, NHP.106

Name **IFN-gamma in pCDNA3**
Trials NHP.16.1

Name **IL-12 DNA**
Description The rhesus macaque IL-12 expression plasmid was derived from the plasmid pSFG.hIL12.p40.Lp35, which expresses human IL-12, by substituting the sequences encoding the human p40 and p35 subunits with the corresponding rhesus macaque sequences, positioned in the same configuration to produce plasmid pRM.IL-12.p40-p35. In this plasmid, the IL-12 p40 and -30 subunits are produced as a fusion protein in which the p35 subunit, deleted of its leader sequence, is fused to the p40 subunit by a Gly6Ser linker. IL-12 production by rmIL-12.p40.Lp35 was tested in 293T transfection supernatant by ELISA.
Trials NHP.366

Name **IL-12/GMCSF plasmid (Sykes)**
Description Plasmids expressing the human cytokine IL-12 and GMCSF. Constructed by amplifying the cDNA coding sequences from pED and pXM vectors. EcoRI and SalI sites were incorporated into the end of the cDNAs encoding GMCSF and IL-12 subunit p35 by PCR (for more information contact authors) Sykes et al
Trials NHP.120

Name **IL-2 in pCDNA3**
Trials NHP.16.1

Name **IL-2/lg plasmid**
Trials NHP.23, NHP.60.1, NHP.60.3, NHP.98, NHP.126, NHP.366, NHP.400

Name **IL-2/lg protein**
Trials NHP.24.1, NHP.60.1, NHP.98, NHP.126

Name **IL-4**
Trials NHP.106, NHP.309

Name **IL-4 in pCDNA3**
Trials NHP.16.1

Name **Interferon-γ**
Other Names Actimmune® (rhIFN-gamma, Genentech, Inc.); immune interferon; IFN-γ gamma-interferon
Description Noncovalent dimer. Low resolution crystal structure available. Monomer consists of 140 amino acids, no glycosylation or cysteines in human form. Murine form is a covalent dimer (one cysteine per monomer). Ealick, S. E. et al., 1991, Three-dimensional structure of recombinant human interferon-g , Science, 252: 698- 702. Sequence of human interferon-gamma: QDPYVKEAENLKKYFNAGHSDVADNGTLFLGILKNWKEESDRKIMQSQIVSFYFKLFKNFKDDQSI QKSVETIKEDMNVKF-FNSNKKKRDDFEKLTNYSVTDLNVQRKAIHELIQVMAELSPAAKTGKRKRS QMLFRGRRASQ Both human (rhIFN-gamma) and murine (rmuIFN-gamma) forms are expressed in Escherichia coli and distributed in a completely pure state. Clear aqueous solution.
Trials NHP.309

Name **Interleukin-2**
Other Names IL-2; T-cell growth factor; aldesleukin (des-alanyl-1, serine-125 human interleukin 2); Proleukin®; Teceleukin®

Description Native human IL-2 contains 133 amino acids (see below); aldesleukin contains 132 amino acids. IL-2 exists as six alpha helical domains, termed A to F. Glycosylation not essential for function. Rosenberg, S. A. et al., 1983, Biological activity of recombinant human interleukin-2 produced in Escherichia coli, Science, 223: 1412-14. Brandhuber, B. J. et al., 1987, Three dimensional structure of interleukin-2, Science, 238: 1707-09. Ju, G. et al., 1987, Structure function analysis of human interleukin-2: Identification of amino acid residues required for biological activity. J. Biol. Chem., 262: 5723-31. Sequence of human IL-2: APTSSSTKKTQLQLEHLLLDLQMILNGINNYKNPKLTRMLTFKFYMPKKATELKHLQCLEEELKPLE EVLNLAQSKNFHLRPRDLISNINVIVLELKGSETTFMCE-YADETATIVEFLNRWITFCQSIISTLT Recombinant protein expressed in E. coli. Lyophilized, white to off-white colored solid, Reconstituted with water for injection to give a clear, colorless solution.

Trials NHP.106, NHP.126, NHP.245.3

Name **ISCOM(s)™**

Other Names Immune stimulating complexes

Description ISCOMs are a complex composed of typically 0.5% Quillaja saponins, 0.1% cholesterol, 0.1% phospholipid, and antigen in phosphate-buffered saline (PBS). Occasionally, surfactants are used t are ISCOMs (such as Mega 10) but are removed from the final formulation before use. The adjuvant-active components of ISCOMs are derived by aqueous extraction of the bark of Quillaja saponaria and are further purified by chromatography. Quil A is a purified form of this. Further chromatographic purification provides components with high adjuvant activity and ISCOM-forming properties (see Iscoprep 7.0.3 TM). ISCOMs form a clear product in solution.

Trials NHP.75, NHP.125, NHP.164, NHP.374

Name **Kehole Limpet Hemocyanin**

Description Unknown. Used in J Virol 71: 9475-9481 (1997) Jurkiewicz et al.

Trials NHP.320

Name **Lipid-based Adjuvant**

Other Names LBA

Description Data not available Mannhalter et al, 1991

Trials NHP.362

Name **Liposomes**

Other Names Liposomes (L) containing protein or Th-cell and/ or B-cell peptides, or microbes with or without co-entrapped interieukin-2, BisHOP or DOTMA (see below). A, [L (Antigen)]; B, [L (IL-2 or DOTMA or BisHOP + Antigen)]; C, [L (Antigen)-mannose]; D, [L (Th-cel

Description A: Multilamellar liposornes prepared by the dehydration-rehydration method (average diameter 600-800 nm) composed of egg phosphatidy1choline (PC) or distearoyl phosphatidylcholine (DSPQ and equimolar cholesterol and containing antigens such as tetanus toxoid and synthetic Th-cell peptides. 13: As in A with IL-2 (10^3 - 10^4 Cetus units) co-entrapped with the antigen in the aqueous phase or with 1,2-bis (hexadecylcycloxy)-3-trimethylaminopropane-HCL (BisHOP) or N-(2,3-dioleyloxy)-NNN-triethylammonium (DOTMA) incorporated into the lipid phase of liposomes (0.8: 1.0: 0.2 molar ratio for PC or DSPC, cholesterol and DOTMA or BisHOP). C, as in A with marmosylated albumin covalently coupled to the surface of antigen-containing liposomes. D: As in A with Th-cell and B-cell peptides co-entrapped in the aqueous phase. E: Giant liposornes (average diameter 5-9 μm) prepared as in A or by a solvent-spherule evaporation method, composed of PC or DSPC, cholesterol, triolein (TO), and phosphatidylglycerol (PG) (4: 4: 1: 2 molar ratio) and containing killed or live Bacillus subtilis or killed Bacille Calmette-Guérin (BCG) with or without co-entrapped tetanus toxoid. PC, DSPC, and PG in pure forin from Lipid Products, Nuthill, Surrey, U. K.; TO in pure form from Sigma Chemical Co., Poole, Dorset, U. K.; recombinant interieukin-2 (des-Ala1-Ser125 mutein; 3 x 10 6 Cetus units/ mg) obtained from Cetus Corporation, Emeryville, CA; BisHOP and DOTMA obtained from Syntex Research, Palo Alto, CA. White, opalescent colloidal suspensions (A-E).

Trials NHP.61, NHP.94

Name **LT(R192G)**

Other Names mutant heat-labile E. coli enterotoxin

Description heat-labile enterotoxin with R-192-G mutation, eliminating trypsin cleavage site required for enterotoxin activation. Dickinson and Clements Infect. Immunol. 63: 1617-1623 (1995)

Trials NHP.319

Name **LT-R192G**
Trials NHP.1

Name **LTK63**
Other Names mutated E. coli heat-labile enterotoxin
Description mutated E. coli heat-labile enterotoxin which eliminates toxicity while retaining adjuvant activity. Pizza et al. Int. J. Med. Microbiol. 290: 455-461 (2000)
Trials NHP.321

Name **MF59**
Other Names None
Description Squalene/ water emulsion. Composition: 43 mg/ mL squalene, 2.5 mg/ mL polyoxyethylene sorbitan monooleate (Polysorbate 80), 2.4 mg/ mL sorbitan trioleate (Span 85). Chiron Corporation, Emeryville, CA. White liquid.
Trials NHP.22, NHP.23, NHP.62, NHP.75, NHP.141, NHP.193, NHP.354

Name **MONTANIDE ISA 51**
Other Names Purified IFA; Incomplete Freund's adjuvant
Description Mannide oleate (mostly mannide monooleate, esters of mannitol and oleic acids -an example shown below) (MONTANIDE 80) in mineral oil solution (DRAKEOL 6VR). Manufactured by SEPPIC. Limpid clear yellow liquid.
Trials NHP.1, NHP.119

Name **MONTANIDE ISA 720**
Other Names metabolizable oil adjuvant
Description A highly refined emulsifier from the mannide monooleate family (an example of mannide monooleate shown below) in a natural metabolizable oil solution. The exact nature of the emulsifier and the metabolizable in MONTANIDE ISA 720 is proprietary, but can be disclosed under specific agreement with SEPPIC. manufactured by SEPPIC. Yellow, odorless liquid
Trials NHP.330

Name **MPL™**
Other Names 3-Q-desacyl-4
Description MPL™is composed of a series of 4'-monophosphoryl lipid A species that vary in the extent and position of fatty acid substitution. The hexaacyl structure shown below is the most highly acylated and most abundant component in MPLO. Species with five and four fatty acids are also present. All structures contribute to the adjuvant activity of MPLO. Derived from the lipopolysaccharide (LPS) of Salmonella minnesota R595. Obtained by treatment of LPS with mild acid and base hydrolytic conditions, and chromatographic purification of the resulting 3D-MLA. Colorless, odorless white powder.
Trials NHP.306.1

Name **MPL-SE**
Other Names MPL-SE (monophosphoryl A-stable emulsion)
Description Wyeth-Lederle Vaccines
Trials NHP.328, NHP.363

Name **MTP-PE**
Other Names N-acetyl-L-alanyl-D-isoglutaminyl-L-alanine-2-(1,2-dipalmitoyl-sn-glycero-3-(hydroxy-phosphoryloxy)) ethylamide, mono sodium salt.
Description Chemical synthesis by Ciba-Geigy Ltd., Basel, Switzerland. White powder.
Trials NHP.141

Name **p-Hydroxybenzoique acid methyl ester**

Trials NHP.2

Name **pCIL-10**
Trials NHP.71

Name **pCIL12**
Trials NHP.71, NHP.276

Name **pCMVmCAT1**
Trials NHP.67, NHP.70

Name **pCMVN**
Trials NHP.70

Name **Peptomer-NP**
Trials NHP.5

Name **PLG**
Other Names polyactide coglycolide
Trials NHP.321

Name **QS-21**
Other Names Stimulon™QS-21 Adjuvant.
Description Natural product of the bark of the Quillaja saponaria Molina tree (species native to Chile and Argentina). Extracted from the bark by aqueous extraction. Purified by normal phase and reverse phase chromatography. Kensil, C. R. et al., 1991, Separation and characterization of saponins with adjuvant activity from Quillaja saponaria Molina cortex. J. Immunol., 146: 431-437. Solid: white odorless powder. Aqueous solution: clear, colorless solution.
Trials NHP.11, NHP.14, NHP.53, NHP.81, NHP.303, NHP.371

Name **Quil-A**
Other Names Quil-A saponin, Quillaja saponin
Description A complex but purified mixture of Quillaja saponins which are glycosides of Quillaic acid and carbohydrates. The Higuchi formula of Quil A is shown below. Purified extract from the bark of the South American tree Quillaja saponaria Molina. Lyophilized powder. Color is light brownish, almost white.
Trials NHP.157.1, NHP.157.2

Name **Rehydragel HPA**
Other Names High Protein Adsorbency Aluminum Hydroxide Gel; alum
Description Crystalline aluminum oxyhydroxide AlOOH, known minerologically as boehmite. the structure consists of corrugated sheets of aluminum octahedra. Synthetic oxyhydroxide of aluminum (aluminum hydroxide) prepared by acid-base precipitation. Translucent, thixotropic, colloidal aqueous gel supplied sterile.
Trials NHP.47, NHP.174, NHP.201.1, NHP.201.2, NHP.203, NHP.204, NHP.242, NHP.306.1

Name **RIBI**
Trials NHP.94, NHP.119, NHP.162, NHP.320

Name **Ribilike adjuvant system (MPL, TMD,CWS)**
Trials NHP.68

Name **SAF-1**
Other Names SAF-m; Syntex Adjuvant Formulation
Description Composed of threonyl-MDP (0.05-1%) in an emulsion vehicle [5% squalane, 2.5% Pluronic® L121, 0.2% Polysorbate 80 and phosphate buffered saline (pH 7.4)]. See individual components. White, fluid, oil-in-water emulsion.

Trials NHP.203, NHP.205.1, NHP.245.2, NHP.245.3

Name **Squalene 2**
Other Names Spinacene; Supraene; 2,6,10,15,19, 23-hexamethyl-2,6,10,14,18,22 tetracosahexaene
Description Found in shark liver oil and some vegetable oils. Intermediate in the biosynthesis of cholesterol. Clear oil, colorless. Faint, agreeable odor.
Trials NHP.245.1

Name **Threonyl muramyl dipeptide (TMDP)**
Other Names Termurtide™; [thr^{1}]-MDP; N-acetyl muramyl-L-threonyl-D-isoglutamine
Description Synthetic. G. J. Jones, et al, Novel immunological adjuvant compounds and methods of preparation thereof. Syntex, U. S. A., U. S. Patent # 4,082,735. White to off-white, odorless powder.
Trials NHP.239, NHP.245.2, NHP.248

VI-E

Trial Summaries

This chapter contains a listing of studies compiled in the database. There are currently 388 trials in the relational database created at LANL and 218 trials carried over from Jon Warren's database. This listing is a printed version of the results of searching our database with the default settings (find any or all) and the Trial Summary display format. Each summary contains data from the following fields unless they are empty in the database:

- Trial number
- Title
- Authors
- Citation and PubMed ID number
- Objectives
- Species/subspecies
- Vaccine name, type, formulation and route of inoculation
- A short description of the vaccine
- Challenge virus name and route
- A summary of the main findings

The database itself contains much more detailed information for each trial, including information about each group of animals.

NHP.1 (11726972) **Mucosal AIDS vaccine reduces disease and viral load in gut reservoir and blood after mucosal infection of macaques**

Authors Belyakov IM, Hel Z, Kelsall B, Kuznetsov VA, Ahlers JD, Nacsa J, Watkins DI, Allen TM, Sette A, Altman J, Woodward R, Markham PD, Clements JD, Franchini G, Strober W, Berzofsky JA

Journal Nat Med 2001 Dec;7(12):1320-6

Objectives Challenge, Immunogenicity To compare whether a mucosal vaccine could induce mucosal CTLs and protect rhesus macaques against mucosal infection with SHIV more effectively than the same vaccine given subcutaneously.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name PCLUS3-CL10/PCLUS6.1-CL10/PCLUS3_POL_143/PCLUS3_GAG_372 *Type:* Synthetic Protein/Peptide *Routes:* Intrarectal, Subcutaneous

Challenge SHIV-KU2 *Route:* Intrarectal

Main Findings

- Mucosal SIV specific CTL can be induced by intrarectal immunization of macaques with synthetic-peptide vaccine coupled with LT(R192G) adjuvant.
- CTL response correlates with helper response.
- CD4+ T cells preserved better in animal mucosally immunized than in animals immunized by subcutaneous route and control.
- In contrast with subcutaneous immunization, intrarectal immunization reduced viral load to undetectable level.

NHP.2 (11282197) **Vaccination with DNA containing tat coding sequences and unmethylated CpG motifs protects cynomolgus monkeys upon infection with simian/human immunodeficiency virus (SHIV89.6P)**

Authors Cafaro A, Titti F, Fracasso C, Maggiorella MT, Baroncelli S, Caputo A, Goletti D, Borsetti A, Pace M, Fanales-Belasio E, Ridolfi B, Negri DR, Sernicola L, Belli R, Corrias F, Macchia I, Leone P, Michelini Z, ten Haaft P, Butto S, Verani P, Ensoli B
Journal Vaccine 2001 Apr 6;19(20-22):2862-77
Objectives Challenge, Immunogenicity To test the immunogenicity and protective value of a tat-expressing vector containing defined unmethylated CpG sequences (pCV-tat) in cynomolgus monkeys challenged with SHIV.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name HIV BH10-tat protein *Type:* Recombinant Subunit Protein *Routes:* Intradermal, Intramuscular
Vaccine Name pCV-tat *Type:* DNA *Routes:* Intradermal, Intramuscular
Challenge SHIV89.6P *Route:* Intravenous
Main Findings

- Intramuscular inoculation of the pCV-tat contained primary infection with HIV89.6P virus.
- Control of CD4 T cell decline in all the vaccinated monkeys.
- Correlation between undetectable virus replication and negative virus isolation in all caseswith anti-tat CTLs.
- CD8-mediated non-cytolytic antiviral activity not present in all protected animals.
- CpG-rich tat DNA vaccine, potential for cross-clade application in human as a therapeutic and preventive vaccine.

NHP.3 (11514732) **Induction of simian immunodeficiency virus (SIV)-specific CTL in rhesus macaques by vaccination with modified vaccinia virus Ankara expressing SIV transgenes: influence of pre-existing anti-vector immunity**

Authors Sharpe S, Polyanskaya N, Dennis M, Sutter G, Hanke T, Erfle V, Hirsch V, Cranage M
Journal J Gen Virol 2001 Sep;82(Pt 9):2215-23
Objectives Immunogenicity To assess the immunogenicity of an MVA vaccine expressing structural and regulatory genes of SIV, and the influence of pre-existing immunity to vector in immunized Mamu A*01 MHC class 1 rhesus monkeys.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name MVA-SIVmacJ5 (gag-pol) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Vaccine Name MVAmacJ5-nef *Type:* Recombinant Vector (virus/bacteria) *Route:* Intraocular
Vaccine Name MVA SIVsmH4 gag-pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intraocular
Main Findings

- MVA SIVmacJ5 gag-pol construct was poorly immunogenic.
- Nab weak and transient.
- SIV-specific CTL detected in all animals immunized with MVA-SIV vaccines, 4-8 weeks post immunization (not in control animals). One immunization is enough and boosting does not increase the magnitude of immune response.
- MVA-SIVnef produced the strongest response compared to MVA-SIVtat and MVA-SIVrev.

NHP.4 (11413371) **Cross-protection against mucosal simian immunodeficiency virus (SIVsm) challenge in human immunodeficiency virus type 2-vaccinated cynomolgus monkeys**

Authors Walther-Jallow L, Nilsson C, Soderlund J, ten Haaft P, Makitalo B, Biberfeld P, Bottiger P, Heeney J, Biberfeld G, Thorstensson R
Journal J Gen Virol 2001 Jul;82(Pt 7):1601-12
Objectives Challenge, Immunogenicity To compare the efficacy of a live attenuated HIV-2 vaccine alone versus boosting with live non-pathogenic HIV-2 following priming with ALVAC HIV-2 (recombinant canarypox virus expressing HIV-2 env, gag and pol).
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name HIV-2 SBL6669 *Type:* Live Virus *Route:* Intravenous
Vaccine Name ALVAC-HIV-2 (gag,pol,gp125) *Type:* Recombinant Vector (virus/bacteria) *Route:* ND
Vaccine Name HIV-2 native gp125 *Type:* Purified Viral Products *Route:* ND
Challenge SIVsm *Route:* Intrarectal

Main Findings

- Vaccination with an ALVAC HIV-2 vaccine followed by exposure to live HIV-2 could induce cross-protection against mucosal infection with SIVsm and seemed to be more efficient than immunization with a live HIV-2 vaccine only

---

NHP.5 (11429125) **A conformational C4 peptide polymer vaccine coupled with live recombinant vector priming is immunogenic but does not protect against rectal SIV challenge**

Authors Patterson LJ, Robey F, Muck A, Van Remoortere K, Aldrich K, Richardson E, Alvord WG, Markham PD, Cranage M, Robert-Guroff M

Journal AIDS Res Hum Retroviruses 2001 Jun 10;17(9):837-49

Objectives Challenge, Immunogenicity To compare SIV peptomer and native gp120 subunit boosts following two adenovirus type 5 host range (Ad5hr)-SIVenv recombinant priming immunizations.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Peptomer SIVmac251 (gp120: 435-452) *Type:* Synthetic Protein/Peptide *Routes:* Subcutaneous, Intramuscular

Vaccine Name Ad5hr-SIVenv *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intratracheal, Oral, Intranasal

Vaccine Name Native SIV gp120 *Type:* Purified Viral Products *Route:* Intramuscular

Challenge SIVmac251(32H) *Route:* Intrarectal

Main Findings

- Peptomer immunization elicited peptomer and SIV gp120-specific binding antibodies.
- Only native gp120 boosting elicited SIV neutralizing antibodies.
- Upon intrarectal challenge with SIVmac32H, all nine macaques became infected.
- The solely envelope-based vaccine conferred no protection.

NHP.6 (11483779) **Antibody protects macaques against vaginal challenge with a pathogenic R5 simian/human immunodeficiency virus at serum levels giving complete neutralization in vitro**

Authors Parren PW, Marx PA, Hessell AJ, Luckay A, Harouse J, Cheng-Mayer C, Moore JP, Burton DR

Journal J Virol 2001 Sep;75(17):8340-7

Objectives Challenge, Immunogenicity To evaluate the role of passive intravenous transfer of the human neutralizing monoclonal antibody b12 to provide dose-dependent protection to macaques vaginally challenged with the R5 virus SHIV162P4.

Species/Subspecies Macaca (sp)

Vaccine Name IgG1 b12 *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV162P4 *Route:* Vaginal or perivaginal

Main Findings

- Passive immunization with b12 antibody protects monkeys from challenge with SHIV.
- The immunization with b12 antibodies induced sterile protection in vaccinees

---

NHP.7 (11287566) **Vaccine-elicited V3 loop-specific antibodies in rhesus monkeys and control of a simian-human immunodeficiency virus expressing a primary patient human immunodeficiency virus type 1 isolate envelope (a)**

Authors Letvin NL, Robinson S, Rohne D, Axthelm MK, Fanton JW, Bilska M, Palker TJ, Liao HX, Haynes BF, Montefiori DC

Journal J Virol 2001 May;75(9):4165-75

Objectives Challenge, Immunogenicity To evaluate the role of vaccine elicited antibodies in the protection against SHIV containing the envelope of a primary isolate of HIV.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name C4/89.6-V3 *Type:* Synthetic Protein/Peptide *Route:* Intramuscular

Vaccine Name C4/89.6P-V3 *Type:* Synthetic Protein/Peptide *Route:* Intramuscular

Challenge SHIV89.6, SHIV89.6P *Route:* Intravenous

Main Findings

- SHIV-89.6 not suitable to assess viral set point between vaccinees and controls.
- Both peptides (vaccine and mock) were immunogenic- the mock C4/scrbl-V3 was immunogenic due to the presence of C4 fragment in the peptide.
- Immunization with the C4/89.6-V3 peptide generated 10-fold-higher titre of V3-specific antibodies than infection with SHIV-89.6.
- Neutralization of immunogens (C4/89.6-V3, C4/89.6P) induced Ab were virus specific (SHIV-89.6 and SHIV-89.6P, respectively).

NHP.8 (10655111) **Protection of macaques against vaginal transmission of a pathogenic HIV-1/SIV chimeric virus by passive infusion of neutralizing antibodies**

Authors Mascola JR, Stiegler G, VanCott TC, Katinger H, Carpenter CB, Hanson CE, Beary H, Hayes D, Frankel SS, Birx DL, Lewis MG

Journal Nat Med 2000 Feb;6(2):207-10

Objectives Challenge, Passive Immunization To evaluate the protective effect of HIV-1 specific antibodies using the SHIV-macaque vaginal challenge model.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Monoclonal antibody 2G12 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Monoclonal antibody 2F5 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name HIVIG *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV89.6PD *Route:* Vaginal or perivaginal

Main Findings

- 14 antibody-treated macaques were either completely protected against infection or against pathogenic manifestations of SHIV-infection
- Some types of antibody response could play a role in protection against mucosal transmission of HIV-1
- 5/5 control animals were viremic upon SHIV challenge and had decline CD4+ T cells

---

NHP.9.1 (11017146) **Viremia control following antiretroviral treatment and therapeutic immunization during primary SIV251 infection of macaques**

Authors Hel Z, Venzon D, Poudyal M, Tsai WP, Giuliani L, Woodward R, Chougnet C, Shearer G, Altman JD, Watkins D, Bischofberger N, Abimiku A, Markham P, Tartaglia J, Franchini G

Journal Nat Med 2000 Oct;6(10):1140-6

Objectives Challenge, Immunogenicity, Immunotherapy To explore the effect of therapeutic immunization in the context of ART during primary infection using the simian immunodeficiency virus (SIV251) macaque model.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name NYVAC-SIV-gag-pol-env (NYVAC-SIV-gpe) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Challenge SIVmac251 *Route:* Intravenous

Main Findings

- Vaccination of Rhesus macaques with the highly attenuated poxvirus-based NYVAC-SIV vaccine expressing structural genes elicited vigorous virus-specific CD4 + and CD8+ T cell responses in macaques that responded effectively to ART.
- Following discontinuation of a six-month ART regimen, viral rebound occurred in most animals, but was transient in six of eight vaccinated animals.
- Viral rebound was also transient in four of seven mock-vaccinated control animals.

NHP.9.2 (12890631) **Prior DNA immunization enhances immune response to dominant and subdominant viral epitopes induced by a fowlpox-based SIVmac vaccine in long-term slow-progressor macaques infected with SIVmac251**

Authors Radaelli A, Nacsa J, Tsai WP, Edghill-Smith Y, Zanotto C, Elli V, Venzon D, Tryniszewska E, Markham P, Mazzara GP, Panicali D, De Giuli Morghen C, Franchini G

Journal Virology 2003 Jul 20;312(1):181-95

Objectives Immunogenicity, Immunotherapy, Chemotherapy To investigate whether a combination of DNA and recombinant poxvirus vaccine can induce high level of virus-specific CD4+ T-cell response and broadens the cytolytic activity in SIVmac251-infected macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name FP-SIV-gp (FP74) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name SIV-pcDNA3gag/pol *Type:* DNA *Routes:* Intradermal, Intramuscular

Main Findings

- The combination of a DNA expressing the gag and pol genes (DNA-SIV-gp) of SIVmac239 followed by a recombinant fowlpox expressing the same SIVmac genes (FP-SIV-gp) was significantly more immunogenic than two immunizations of FP-SIV-gp in SIVmac251-infectedmacaques treated with ART.
- The DNA/FP combination significantly expanded and broadened Gag-specific T-cell responses.
- The combination of these vaccine modalities also induced a sizeable expansion in most macaques of Gag-specific CD8-(CD4+) T-cells able to produce TNF-alpha.

NHP.10 (11257382) **Expansion of HBV-specific memory CTL primed by dual HIV/HBV genetic immunization during SHIV primary infection in rhesus macaques**

Authors Borgne SL, Michel ML, Camugli S, Corre B, Le Grand R, Riviere Y

Journal Vaccine 2001 Mar 21;19(17-19):2485-95

Objectives Challenge, Immunogenicity To evaluate the humoral and cellular immune response to immunization with HIV/HBV vaccine and the protection against SHIV challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pCMV-V3.S (HBV-HIV vaccine) *Type:* DNA *Route:* Intradermal

Challenge SHIVsbg0.1 *Route:* Intravenous

Main Findings

- DNA-immunized primates and control challenged with SHIV were all infected.
- Peak viremia correlates with HBV envelop specific CTL precursor detected in primary infection.
- HBV or SHIV specific cytotoxicity corresponded in part to CD8 T cells presenting a memory phenotype.

NHP.11 (11160726) **Polyvalent envelope glycoprotein vaccine elicits a broader neutralizing antibody response but is unable to provide sterilizing protection against heterologous Simian/human immunodeficiency virus infection in pigtailed macaques**

Authors Cho MW, Kim YB, Lee MK, Gupta KC, Ross W, Plishka R, Buckler-White A, Igarashi T, Theodore T, Byrum R, Kemp C, Montefiori DC, Martin MA

Journal J Virol 2001 Mar;75(5):2224-34

Objectives Challenge, Immunogenicity To compare the breadth of NAb and protective immune response following vaccination of pigtailed macaques with envelope protein(s) derived from either single or multiple viral isolates against the challenge with SHIVDH12.

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Recombinant vaccinia virus-HIVgp160 (cocktail) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Vaccine Name Poly-gp120H *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Vaccine Name Poly-gp120H (-DH12) *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Vaccine Name Mono-gp120H (89.6) *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Vaccine Name Mono-gp120H (DH12) *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge SHIV.DH12 (MD1) *Route:* Intravenous

Main Findings

- Mixtures of HIV-1 envelope glycoproteins elicit broader immune responses than individual Env immunogens.
- 5/8 animals immunized with polyvalent vaccines made NAbs against three or more viral strains.
- NAb activity almost entirely homologous to strains used in the vaccine.
- No sterilizing protection against heterologous SHIV challenge.
- Protection of animals against SIV or HIV-1 infection correlates with the presence of NAbs, not gp120 binding activity.

NHP.12 (11145897) **DNA vaccination of macaques with several different Nef sequences induces multispecific T cell responses**

Authors Couillin I, Letourneur F, Lefebvre P, Guillet JG, Martinon F

Journal Virology 2001 Jan 5;279(1):136-45

Objectives Immunogenicity To study the ability of DNA vaccine to induce a wide spectrum of TCL responses to recognize several epitopes and multiple isolates.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pCI-Nef plasmid *Type:* DNA *Route:* Intradermal

Main Findings

- DNA immunization with several sequences elicits multispecific T cell responses that recognize several epitopes expressed in the different Nef immunogens.
- DNA immunization with Nef sequences induced interferon-gamma (IFN-gamma) secreting cell responses directed against several regions of Nef.
- CD8+ T cells were predominantly involved in anti-Nef IFN-gamma secreting cell responses.

NHP.13 (11462016) **Protection against simian immunodeficiency virus vaginal challenge by using Sabin poliovirus vectors**

Authors Crotty S, Miller CJ, Lohman BL, Neagu MR, Compton L, Lu D, Lu FX, Fritts L, Lifson JD, Andino R

Journal J Virol 2001 Aug;75(16):7435-52

Objectives Challenge, Immunogenicity To assess the immunogenicity and protection of a vector-based vaccine (polio Sabin 1 and 2) coupled with SIV genes against vaginal challenge with highly pathogenic SIVmac251.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name pSabRV1-SIV *Type:* DNA *Route:* Intranasal

Vaccine Name pSabRV2-SIV *Type:* DNA *Route:* Intranasal

Challenge SIVmac251 *Route:* Vaginal or perivaginal

Main Findings

- 4/7 vaccinated animals exhibited substantial protection against the vaginal SIV challenge.
- All 12 control monkeys became SIV positive (infection).
- No virological evidence of infection following challenge in 2/7 SabRV-SIV-vaccinated monkeys, indicating complete protection.
- Two additional SabRV-SIV-vaccinated monkeys exhibited a pronounced reduction in postacute viremia to $<10^3$ copies/ml, suggesting that the vaccine elicited an effective cellular immune response.
- 3/6 control animals developed clinical AIDS by 48 weeks postchallenge. In contrast, all seven vaccinated monkeys remained healthy as judged by all clinical parameters.

NHP.14 (11134278) **Immunogenicity and protective efficacy of oligomeric human immunodeficiency virus type 1 gp140**

Authors Earl PL, Sugiura W, Montefiori DC, Broder CC, Lee SA, Wild C, Lifson J, Moss B

Journal J Virol 2001 Jan;75(2):645-53

Objectives Challenge, Immunogenicity To test the immunogenicity and protective efficacy of oligomeric gp140 in the rhesus macaque model, against homologous challenge with SHIV-HXB2.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name HIV-1 IIIB gp140 *Type:* Purified Viral Products *Route:* Intramuscular

Challenge SHIV-IIIB/HXB2 *Route:* Intravenous

Main Findings

- Strong neutralizing antibodies against a homologous virus and modest neutralization of heterologous laboratory-adapted isolates were elicited.
- No neutralization of primary isolates.
- 3/4 vaccinated macaques exhibited no evidence of virus replication.
- Infected animals demonstrated high, sustained neutralizing antibody titers to the challenge strain, while those that were protected exhibited waning titers.

NHP.15 (11462019) **Postnatal passive immunization of neonatal macaques with a triple combination of human monoclonal antibodies against oral simian-human immunodeficiency virus challenge**

Authors Hofmann-Lehmann R, Vlasak J, Rasmussen RA, Smith BA, Baba TW, Liska V, Ferrantelli F, Montefiori DC, McClure HM, Anderson DC, Bernacky BJ, Rizvi TA, Schmidt R, Hill LR, Keeling ME, Katinger H, Stiegler G, Cavacini LA, Posner MR, Chou TC, Andersen J, Ruprecht RM

Journal J Virol 2001 Aug;75(16):7470-80

Objectives Challenge, Passive Immunization To develop prophylaxis against mother-to-child of SIV by postnatal passive immunization of neonatal macaques with a triple combination of human monoclonal antibodies.

Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Monoclonal antibody 2G12 *Type:* Passive Antibody *Route:* Intravenous
Vaccine Name Monoclonal antibody 2F5 *Type:* Passive Antibody *Route:* Intravenous
Vaccine Name IgG1 b12 *Type:* Passive Antibody *Route:* Intravenous
Vaccine Name Monoclonal antibody F105 *Type:* Passive Antibody *Route:* Intravenous
Challenge SHIV89.6, SHIV-vpu+ *Route:* Oral
Main Findings

- Two neonates macaques passively immunized with monoclonal antibodies (F105, 2G12, and 2F5), were protected from oral SHIV-vpu+ challenge, while four untreated control animals became persistently infected.
- Among SHIV89.6P-challenged animals, the MAb combination was partially successful in preventing infection.
- Half of the treated infants were protected from the acute, severe T-cell depletion.

NHP.16.1 (11257383) **Modulation of antigen-specific cellular immune responses to DNA vaccination in rhesus macaques through the use of IL-2, IFN-gamma, or IL-4 gene adjuvants**
Authors Kim JJ, Yang JS, Manson KH, Weiner DB
Journal Vaccine 2001 Mar 21;19(17-19):2496-505
Objectives Challenge, Immunogenicity To examine the effects of cytokine gene adjuvants to enhance the level of cell-mediated immune responses generated by a multicomponent DNA vaccine in the rhesus macaque primate model.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name HIV env_{MN}/rev(pCEnv) *Type:* DNA *Route:* Intramuscular
Vaccine Name pCSGag/Pol.SIV *Type:* DNA *Route:* Intramuscular
Challenge SHIV-IIIB/HXB2 *Route:* Intravenous
Main Findings

- Coadministration of Il-2 and IFN-gamma cDNA enhances antigen-specific T cell-mediated immune response.
- Antibody-specific responses can be driven to a higher level through the use of cytokine genetic adjuvants in rhesus macaques.
- Overall, low CTL response.
- The stimulated T cells from vaccinated rhesus macaques produced higher levels of IFN-gamma than the control animals.
- 3/8 immunized and challenged animals were protected from SHIV challenge.
- Protection to SHIV challenge was associated with CTL

NHP.16.2 (11437655) **Protection from immunodeficiency virus challenges in rhesus macaques by multicomponent DNA immunization**
Authors Kim JJ, Yang JS, Nottingham LK, Lee DJ, Lee M, Manson KH, Wyand MS, Boyer JD, Ugen KE, Weiner DB
Journal Virology 2001 Jul 5;285(2):204-17
Objectives Challenge, Immunogenicity To test the ability of rhesus macaques immunized with DNA vaccines enconding HIV env/rev and SIV gag/pol to control infection with SIVmac239.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name HIV env MN *Type:* –
Vaccine Name HIV env_{MN}/rev(pCEnv) *Type:* DNA *Route:* Intramuscular
Vaccine Name pCSGag/Pol.SIV *Type:* DNA *Route:* Intramuscular
Challenge SIVmac239, SHIV89.6P, SHIV-IIIB/HXB2 *Route:* Intravenous
Main Findings

- Following the pathogenic challenges, all three vaccinated animals were negative for viral coculture and antigenemia and were negative by PCR.
- The control animals exhibited antigenemia by 2 weeks postchallenge and exhibited greater than 10 logs of virus/10^6 cells in limiting dilution coculture.

NHP.17 (11145906) **Sequential immunization of macaques with two differentially attenuated vaccines induced long-term virus-specific immune responses and conferred protection against AIDS caused by heterologous simian human immunodeficiency Virus (SHIV(89.6)P)**

Authors Kumar A, Lifson JD, Li Z, Jia F, Mukherjee S, Adany I, Liu Z, Piatak M, Sheffer D, McClure HM, Narayan O

Journal Virology 2001 Jan 5;279(1):241-56

Objectives Challenge, Immunogenicity To investigate the immunological response and protection in rhesus macaques sequentially immunized with live vaccines ΔvpuΔnefSHIV-4 (vaccine-I) and Δvpu SHIVPPC (vaccine-II).

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SHIV-4 (Deltavpu-Deltanef)-I *Type:* Live Attenuated Virus *Route:* Subcutaneous

Vaccine Name SHIV-PPC (Deltavpu) *Type:* Live Attenuated Virus *Route:* Oral

Challenge SHIV89.6P *Route:* Intravenous

Main Findings

- The vaccine viruses did not replicate productively in the PBMCs of the vaccinated animals.
- 4/4 vaccinees developed binding antibodies against both vaccine envelope glycoproteins but neutralizing antibodies were elicited by only one vaccine; and virus-specific CTLs that recognized homologous as well as heterologous pathogenic SHIVs.
- 3 naive control animals were infected with the challenged strain and 2/3 controls were immunocompromised and succumbed to AIDS 6mpc.
- 4/4 vaccinees became infected with challenge virus but virus in these animals replicated approximately 200- to 60,000-fold less efficiently than in control animals and eventually, plasma viral RNA became undetectable in three of the four vaccinates

---

NHP.18 (11581387) **Role of CD8(+) lymphocytes in control of simian immunodeficiency virus infection and resistance to rechallenge after transient early antiretroviral treatment**

Authors Lifson JD, Rossio JL, Piatak M Jr, Parks T, Li L, Kiser R, Coalter V, Fisher B, Flynn BM, Czajak S, Hirsch VM, Reimann KA, Schmitz JE, Ghrayeb J, Bischofberger N, Nowak MA, Desrosiers RC, Wodarz D

Journal J Virol 2001 Nov;75(21):10187-99

Objectives Challenge, Immunogenicity, Immunotherapy To study the role of CD8+ in the control of SIV infection and rechallenge after tansient early antiretroviral theratpy.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVsmE660 *Type:* Live Virus *Route:* Intravenous

Challenge SIVsmE660, SIVmac239 *Route:* Intravenous

Main Findings

- Animals that controlled plasma viremia following transient postinoculation treatment showed substantial resistance to subsequent intravenous rechallenge with homologous (SIVsmE660) and highly heterologous (SIVmac239) SIV isolates, up to more than 1 year later, despite the absence of measurable neutralizing antibody.

NHP.19 (11393868) **Control of a mucosal challenge and prevention of AIDS by a multiprotein DNA/MVA vaccine**

Authors Amara RR, Villinger F, Altman JD, Lydy SL, O

Journal Science 2001 Apr 6;292(5514):69-74

Objectives Challenge, Immunogenicity To assess the protective value of an immunization scheme consisting of DNA priming followed by a recombinant modified vaccinia Ankara (rMVA) booster.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIV-HIV89.6 DNA vaccine *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name rMVA 89.6 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Challenge SHIV89.6P *Route:* Intrarectal

Main Findings

- Two DNA inoculations at 0 and 8 weeks and a single rMVA booster at 24 weeks effectively controlled an intrarectal challenge administered 7 months after the booster

---

NHP.20 (11507204) **Evidence for early local viral replication and local production of antiviral immunity upon mucosal simian-human immunodeficiency virus SHIV(89.6) infection in Macaca nemestrina**

Authors Ambrose Z, Larsen K, Thompson J, Stevens Y, Finn E, Hu SL, Bosch ML

Journal J Virol 2001 Sep;75(18):8589-96

Objectives Immunogenicity, Immunotherapy To study the differences in viremia, CD4 T-cell percentages, and mucosal and systemic anti-SHIV humoral and cellular immune responses during primary infection of animals infected either intravenously or intravaginally.

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Challenge SHIV89.6v *Route:* Intravenous, Vaginal or perivaginal

Main Findings

- SHIV Positive viral cocultures, peripheral blood mononuclear cell viral load peaks, and CD4 cell declines were delayed by 1 week in the intravaginally inoculated animals compared to the animals infected intravenously, demonstrating delayed viral spreading to the periphery.
- Mucosal anti-SHIV antibody levels were greater in magnitude and arose more rapidly and mucosal CD8(+) T-cell responses were enhanced in the intravaginally inoculated animals.

NHP.21 (11424009) **Protection from secondary human immunodeficiency virus type 1 infection in chimpanzees suggests the importance of antigenic boosting and a possible role for cytotoxic T cells**

Authors Balla-Jhagjhoorsingh SS, Mooij P, ten Haaft PJ, Bogers WM, Teeuwsen VJ, Koopman G, Heeney JL

Journal J Infect Dis 2001 Jul 15;184(2):136-43

Objectives Challenge, Immunogenicity To investigate correlates of protection against secondary and subsequent HIV infection.

Species/Subspecies Pan troglodytes verus (chimpanzee), Macaca (sp)

Vaccine Name HIV-1 W6.1D gp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge HIV-1 Han2 *Route:* Intravenous

Main Findings

- After exposure to an infectious dose of heterologous primary isolate, 4/8 HIV-1 seropositive chimpanzees resisted secondary infection, whereas 2 naive controls became readily infected.
- Only animals who were immunologically boosted were protected.
- Protection from heterologous secondary exposure appeared to be related to the repertoire of the cytolytic CD8+ T cell responses to HIV-1.

NHP.22 (11356960) **The ability of an oligomeric human immunodeficiency virus type 1 (HIV-1) envelope antigen to elicit neutralizing antibodies against primary HIV-1 isolates is improved following partial deletion of the second hypervariable region**

Authors Barnett SW, Lu S, Srivastava I, Cherpelis S, Gettie A, Blanchard J, Wang S, Mboudjeka I, Leung L, Lian Y, Fong A, Buckner C, Ly A, Hilt S, Ulmer J, Wild CT, Mascola JR, Stamatatos L

Journal J Virol 2001 Jun;75(12):5526-40

Objectives Immunogenicity To investigate whether the modified, SF162V2-derived envelope may elicit higher titers of cross-reactive neutralizing antibodies than the unmodified SF162-derived envelope.

Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca (sp)

Vaccine Name Delta-V2 gp140 oligomeric *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Vaccine Name DNA (pCMVKm2) gp140 *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name pCMVKm2-Delta-V2 gp140 *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name gp140 oligomeric *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Main Findings

- Modified immunogen was more effective in eliciting potent binding and neutralizing antibodies, against homologous and several heterologous primary HIV-1 isolates.

NHP.23 (11595290) **Vaccine-elicited immune responses prevent clinical AIDS in SHIV(89.6P)-infected rhesus monkeys**

Authors Barouch DH, Fu TM, Montefiori DC, Lewis MG, Shiver JW, Letvin NL

Journal Immunol Lett 2001 Nov 1;79(1-2):57-61

Objectives Challenge, Immunogenicity To study the role of adjuvant IL-2/Ig, a fusion protein consisting of IL-2 and the Fc portion of IgG, in DNA vaccines encoding SIVmac239 Gag and HIV-189.6P Env.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name DNA-gag,env *Type:* DNA *Route:* Intramuscular

Challenge SHIV89.6P *Route:* Intravenous

Main Findings

- Animals immunized with DNA vaccines plus IL-2/Ig plasmid or protein developed significantly higher levels of p11C- and p41A-specific CTLs.
- No prevention of infection in vaccinees upon intravenous challenge with SHIV89.6.
- Control of viremia to nearly undetectable levels in vaccinees.
- Control monkeys developed high levels of viremia and exhibited a rapid loss of CD4+ T cells, significant clinical disease progression, and death in half of the animals by day 140 following challenge.

NHP.24.1 (11160750) **Elicitation of high-frequency cytotoxic T-lymphocyte responses against both dominant and subdominant simian-human immunodeficiency virus epitopes by DNA vaccination of rhesus monkeys**

Authors Barouch DH, Craiu A, Santra S, Egan MA, Schmitz JE, Kuroda MJ, Fu TM, Nam JH, Wyatt LS, Lifton MA, Krivulka GR, Nickerson CE, Lord CI, Moss B, Lewis MG, Hirsch VM, Shiver JW, Letvin NL

Journal J Virol 2001 Mar;75(5):2462-7

Objectives Immunogenicity To compare the CTL response to vaccination with plasmid DNA, live recombinant vector and infection with simian-human immunodeficiency virus (SHIV).

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name rMVASIV239gagpol.HIV89.6env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name SHIV89.6 *Type:* Live Virus *Route:* Intravenous

Vaccine Name SHIV89.6P *Type:* Live Virus *Route:* Intravenous

Vaccine Name SHIVIIIBc2 *Type:* Live Virus *Route:* Intravenous

Vaccine Name pV1P-SIVmac239 gag *Type:* DNA *Route:* Intramuscular

Vaccine Name pV1P-HIV-1.89.6P env *Type:* DNA *Route:* Intramuscular

Main Findings

- The p11C-specific CTL response was high frequency and dominant and the p41A-specific CTL response was low frequency and subdominant in both SHIV-infected monkeys and in monkeys vaccinated with recombinant modified vaccinia virus Ankara vectors expressingthese viral antigens.
- Vaccination with plasmid DNA, but not vaccination with a live recombinant vector or infection with SHIV, elicits potent CTL responses against both dominant and subdominant epitopes in rhesus monkeys.
- Plasmid DNA vaccination leads to high-frequency CTL responses specific for both of env p41A and Gag p11C epitopes.

NHP.24.2 (11333896) **Reduction of simian-human immunodeficiency virus 89.6P viremia in rhesus monkeys by recombinant modified vaccinia virus Ankara vaccination**

Authors Barouch DH, Santra S, Kuroda MJ, Schmitz JE, Plishka R, Buckler-White A, Gaitan AE, Zin R, Nam JH, Wyatt LS, Lifton MA, Nickerson CE, Moss B, Montefiori DC, Hirsch VM, Letvin NL

Journal J Virol 2001 Jun;75(11):5151-8

Objectives Challenge, Immunogenicity To study the immune responses elicited in rhesus monkeys by a recombinant poxvirus vaccine and the degree of protection afforded against a pathogenic simian-human immunodeficiency virus SHIV-89.6P challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name MVA-SIV gag-pol and HIV-1 89.6 env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Challenge SHIV89.6P *Route:* Intravenous
Main Findings

- Immunization with MVA vectors expressing SIVmac239 gag-pol and HIV-1 89.6 env elicited potent Gag-specific CTL responses but no detectable SHIV-specific NAb responses.
- MVA-vaccinated monkeys had high-frequency secondary CTL responses, high-titer secondary SHIV-89.6-specific NAb responses, rapid SHIV-89.6P-specific NAb responses, partial preservation of CD4+ T lymphocytes, reduced setpoint viral RNA levels, and no clinical disease or mortality by day 168 postchallenge (in contrast to control animals).

NHP.27 (10590126) **Vaccination of macaques against pathogenic simian immunodeficiency virus with Venezuelan equine encephalitis virus replicon particles**
Authors Davis NL, Caley IJ, Brown KW, Betts MR, Irlbeck DM, McGrath KM, Connell MJ, Montefiori DC, Frelinger JA, Swanstrom R, Johnson PR, Johnston RE
Journal J Virol 2000 Jan;74(1):371-8
Objectives Challenge, Immunogenicity To evaluate the immunogeneicity and protective value of an SIV vaccine in VEE vector against SIV challenge.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name VEE-SIVsm (SIV MA/CA-VRP and gp160-VRP) *Type:* DNA *Routes:* Intravenous, Subcutaneous
Challenge SIVsmE660 *Route:* Intravenous
Main Findings

- 4/4 vaccinees were protected against disease for at least 16 mpc (intravenous) with a pathogenic SIV swarm, while two of four controls required euthanasia at 10 and 11 weeks.
- Vaccination reduced the mean peak viral load 100-fold.

NHP.28 (10600597) **Protection of macaques against a SHIV with a homologous HIV-1 Env and a pathogenic SHIV-89.6P with a heterologous Env by vaccination with multiple gene-deleted SHIVs**
Authors Ui M, Kuwata T, Igarashi T, Ibuki K, Miyazaki Y, Kozyrev IL, Enose Y, Shimada T, Uesaka H, Yamamoto H, Miura T, Hayami M
Journal Virology 1999 Dec 20;265(2):252-63
Objectives Challenge, Immunogenicity To evaluate the potential of SHIVs as anti-HIV-1 live attenuated virus vaccines.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SHIV-drn *Type:* Live Attenuated Virus *Route:* Intravenous
Vaccine Name SHIV-dxrn *Type:* Live Attenuated Virus *Route:* Intravenous
Challenge SHIV-NM-3rN, SHIV89.6P *Route:* Intravenous
Main Findings

- In 4 macaques that had been vaccinated with SHIV-drn and challenged with SHIV-NM-3rN, no challenge virus was detected by DNA PCR in, or recovered from, two of the macaques. In the other two, challenge virus was detected once and twice, respectively.
- Plasma viral loads were much lower than those in unvaccinated controls.
- Another four macaques vaccinated with SHIV-dxrn, control of infection was evident but less than that of SHIV-drn-vaccinated macaques.
- When the two SHIV-drn-vaccinated macaques were challenged with pathogenic SHIV-89.6P, which has an HIV-1 Env that is antigenically different from that of SHIV-drn, replication of the challenge virus was restricted.
- Protection involved not only neutralizing antibodies and killer cell activity, but also other unknown specific and nonspecific immunity elicited by the infection

---

NHP.29.1 (12584336) **Simian-Human Immunodeficiency Virus SHIV89.6-Induced Protection against Intravaginal Challenge with Pathogenic SIVmac239 Is Independent of the Route of Immunization and Is Associated with a Combination of Cytotoxic T-Lymphocyte and Alpha Interferon Responses**
Authors Abel K, Compton L, Rourke T, Montefiori D, Lu D, Rothaeusler K, Fritts L, Bost K, Miller CJ
Journal J Virol 2003 Mar 1;77(5):3099-3118

Objectives Challenge, Immunogenicity To compare the the mucosal (intranasal, intravaginal) vs. intravenous immunization with live nonpathogenic SHIV89.6 in rhesus macaques subsequently challenged intravaginally with SIVmac239.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SHIV89.6 *Type:* Live Virus *Routes:* Intravenous, Vaginal or perivaginal, Intranasal
Main Findings

- The route of immunization did not affect mucosal challenge outcome after a prolonged period of systemic infection with the nonpathogenic vaccine virus.
- Protection from the SIV challenge was associated with the induction of multiple host immune effector mechanisms: vaccinated-protected animals had higher frequencies of SIV Gag-specific cytotoxic T lymphocytes and gamma interferon-secreting cells during the acute phase postchallenge than the vaccinated unprotected ones.
- Vaccinated-protected animals had a more pronounced increase in peripheral blood mononuclear cell IFN-gamma mRNA levels than did the vaccinated-unprotected animals in the first few weeks after challenge.

NHP.29.2 (14694116) **Gamma interferon-mediated inflammation is associated with lack of protection from intravaginal simian immunodeficiency virus SIVmac239 challenge in simian-human immunodeficiency virus 89.6-immunized rhesus macaques**
Authors Abel K, La Franco-Scheuch L, Rourke T, Ma ZM, De Silva V, Fallert B, Beckett L, Reinhart TA, Miller CJ
Journal J Virol 2004 Jan;78(2):841-54
Objectives Challenge, Immunogenicity To determine the relationship between IFN-Γ-related host immune responses and challenge virus replication in lymphoid tissues of SHIV89.6-vaccinated and unvaccinated rhesus macaques after challenge with SIVmac239.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Vaccinated-protected monkeys had low tissue viral RNA (vRNA) levels.
- Vaccinated-unprotected animals had moderate tissue vRNA levels.
- Unvaccinated animals had high tissue vRNA levels.
- Vaccinated-protected monkeys had slightly increased tissue IFN-Γ mRNA levels and a high frequency of IFN-Γ secreting T cells responding to in vitro SIVgag peptide stimulation.

NHP.30 (11739694) **ALVAC-SIV-gag-pol-env-based vaccination and macaque major histocompatibility complex class I (A*01) delay simian immunodeficiency virus SIVmac-induced immunodeficiency**
Authors Pal R, Venzon D, Letvin NL, Santra S, Montefiori DC, Miller NR, Tryniszewska E, Lewis MG, VanCott TC, Hirsch V, Woodward R, Gibson A, Grace M, Dobratz E, Markham PD, Hel Z, Nacsa J, Klein M, Tartaglia J, Franchini G
Journal J Virol 2002 Jan;76(1):292-302
Objectives Challenge, Immunogenicity To assess whether immunization with an ALVAC-based vaccine expressing the SIVmac251 Gag, Pol, and Env and subsequent boosting with subunit gp120 could confer immunity and prevent or contain SIVmac251 replication following a mucosal exposure to SIVmac251.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name ALVAC-SIV-gpe (vcp180) *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intrarectal, Intramuscular, Intranasal
Vaccine Name SIVmac251-gp120 *Type:* Purified Viral Products *Routes:* Intrarectal, Intramuscular, Intranasal
Challenge SIVmac251 (561) *Route:* Intrarectal
Main Findings

- MHC-I Mamu-A*01 genotype and vaccination of rhesus macaques with ALVAC-SIV-gag-pol-env (ALVAC-SIV-gpe) restrict SIVmac251 replication, preserve CD4+ T cells, and delay disease progression following intrarectal challenge exposure of the animals to SIVmac251.
- ALVAC-SIV-gpe immunization induced CTL responses cumulatively in 67% of the immunized animals.
- Significant delay in CD4+ T-cell loss was observed in Mamu-A*01-positive macaques.
- Neither boosting the ALVAC-SIV-gpe with gp120 immunizations nor administering the vaccine by the combination of mucosal and systemic immunization routes increased significantly the protective effect of the ALVAC-SIV-gpe vaccine.

- In the case of intravenous or intrarectal challenge with the chimeric SIV/HIV strains SHIV(89.6P) or SHIV(KU2), respectively, MHC-I Mamu-A*01-positive macaques did not significantly restrict primary viremia.

NHP.31 (11017793) **DNA vaccination of macaques by a full genome HIV-1 plasmid which produces noninfectious virus particles**

Authors Akahata W, Ido E, Shimada T, Katsuyama K, Yamamoto H, Uesaka H, Ui M, Kuwata T, Takahashi H, Hayami M

Journal Virology 2000 Sep 15;275(1):116-24

Objectives Challenge, Immunogenicity To evaluate the humoral and cell-mediated immune response to a DNA vaccine containing full genome of HIV-1.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name DNA Vaccine pNL432-ZF1* *Type:* DNA *Route:* Intramuscular

Challenge SHIV-NM-3rN *Route:* Intravenous

Main Findings

- Immunological responses against HIV-1 were elicited in all of the vaccinated monkeys: stable anti-HIV-1 Env antibodies were raised in two monkeys and CTL activities were induced in the other monkeys. After holomogous challenge of the macaques intravenously 54 weeks with 100 TCID50 of SHIV-NM-3rN, in all of the vaccinated macaques, the peak plasma viral loads were two to three orders of magnitude lower than those of the naive controls

---

NHP.32 (10233957) **Highly attenuated vaccine strains of simian immunodeficiency virus protect against vaginal challenge: inverse relationship of degree of protection with level of attenuation**

Authors Johnson RP, Lifson JD, Czajak SC, Cole KS, Manson KH, Glickman R, Yang J, Montefiori DC, Montelaro R, Wyand MS, Desrosiers RC

Journal J Virol 1999 Jun;73(6):4952-61

Objectives Challenge, Immunogenicity To compare 3 levels of attenuation of SIV-based vaccine and their ability to protect against mucosal challenge with pathogenic SIV.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239Δ3 *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name SIVmac239Δ3x *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name SIVmac239Δ4 *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVmac251 *Route:* Intravenous, Vaginal or perivaginal

Main Findings

- All three vaccines elicited strong protective effect up to 1 year from immunization to challenge.
- Degree of protection correlated inversely with the level of attenuation.
- Protection against vaginal challenge was easier to achieve than protection against intravenous challenge.
- Protection associated with high antibody avidity indices.
- Protection in absence of detectable serum Nab was associated with CTL response in immunized animals. No vaccine virus recovered in 11 of 12 vaccinees.

NHP.33 (11085585) **Enhanced safety and efficacy of live attenuated SIV vaccines by prevaccination with recombinant vaccines**

Authors Jones L, Ahmad S, Chan K, Verardi P, Morton WR, Grant R, Yilma T

Journal J Med Primatol 2000 Aug;29(3-4):231-9

Objectives Challenge, Immunogenicity To evaluate the safety of a live attenuated vaccine (delta nef) in macaques pre-immunized with a recombinant DNA vaccine.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239-Δnef *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name vSIVgp120 *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Vaccine Name CHO-SIVgp120 *Type:* DNA *Route:* Intramuscular

Vaccine Name vSIVgp160 *Type:* DNA *Route:* Intradermal

Vaccine Name bSIVgp120 *Type:* DNA *Route:* Intramuscular

Challenge SIVmac251 *Route:* Intravenous

Main Findings

- Preimmunized macaques advanced to disease SLOWER than controls after challenge with virulent SIV.
- 5 animals survived for 3 years without disease and only the vaccine virus (SIVΔnef) could be isolated at this time.
- In another experiment, preimmunized animals had lower virus loads and no disease compared to controls.

NHP.34 (9882330) **Limited protection from a pathogenic chimeric simian-human immunodeficiency virus challenge following immunization with attenuated simian immunodeficiency virus**

Authors Lewis MG, Yalley-Ogunro J, Greenhouse JJ, Brennan TP, Jiang JB, VanCott TC, Lu Y, Eddy GA, Birx DL

Journal J Virol 1999 Feb;73(2):1262-70

Objectives Challenge, Immunogenicity To test the ability of two live attenuated SIV constructs with single deletion to stimulate protective immunity in macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca nemestrina (pigtailed macaque)

Vaccine Name SIVmac239-Δnef *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name SIV-PBJ6.6Δnef *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SHIV89.6PD *Route:* Intravenous

Main Findings

- Each construct generated high levels of specific immunity in all of the immunized animals.
- SIV239Δnef grew to high levels in all immunized animals. The SIVPBj6.6Δnef was effectively controlled by all of the immunized animals.
- Challenge strain: SIV89.6PD.
- Vaccination with attenuated SIV can protect macaques from disease and in some cases from infection by a highly pathogenic SHIV. Inability to control the immunizing virus may result in rapid disease progression.

NHP.35 (10593491) **Protective immunity of gene-deleted SHIVs having an HIV-1 Env against challenge infection with a gene-intact SHIV**

Authors Ui M, Kuwata T, Igarashi T, Miyazaki Y, Tamaru K, Shimada T, Nakamura M, Uesaka H, Yamamoto H, Hayami M

Journal J Med Primatol 1999 Aug-Oct;28(4-5):242-8

Objectives Challenge, Immunogenicity To assess the level of immunogenicity and protection of a SHIV-deleted live attenuated vaccine virus against a gene-intact SHIV challenge virus.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SHIV-dn *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name SHIV-drn *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name SHIV-dxrn *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SHIV-NM-3rN *Route:* Intravenous

Main Findings

- Protective immunity of live attenuated SHIV vaccine is inversely dependent upon the level of attenuation of the virus.
- Most immunized macaques had HIV-1 env and/or SIV gag-specific CTL responses.
- 10/12 vaccinated macaques had NK cell activities higher than those of normal macaques (<10%): NK cells may be involved in protection against challenge.

NHP.36 (11112494) **Induction of long-term protective effects against heterologous challenge in SIVhu-infected macaques**

Authors Villinger F, Switzer WM, Parekh BS, Otten RA, Adams D, Shanmugam V, Bostik P, Mayne AE, Chikkala NF, McClure HM, Novembre F, Yao Q, Heneine W, Folks TM, Ansari AA

Journal Virology 2000 Dec 5;278(1):194-206

Objectives Challenge, Immunogenicity To measure the immunogenicity and protective effect of a live attenuated vaccine SIVhu (isolated from a human accidentally exposed) against challenge with SHIV89.6P.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVhu *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVsmB670, SHIV89.6P *Route:* Intravenous

Main Findings

- SIVhu which accidentally infected human had a truncated nef which failed to repair itself and added additional stop codons post-infection.
- Infection with SIVhu was associated with minimal acute viral replication, followed by undetectable plasma viral loads and only intermittent PCR detection up to 5 ypi.
- 3/3 animals infected with SIVhu remained healthy and with stable CD4(+) lymphocyte levels and undetectable plasma viral loads at >20 months post-SHIV89.6p challenge.

NHP.37 (10482586) **Protection by live, attenuated simian immunodeficiency virus against heterologous challenge**

Authors Wyand MS, Manson K, Montefiori DC, Lifson JD, Johnson RP, Desrosiers RC

Journal J Virol 1999 Oct;73(10):8356-63

Objectives Challenge, Immunogenicity To examine the ability of a live, attenuated deletion mutant (SIVmac2393), which is missing nef and vpr genes, to protect against challenge by heterologous strains SHIV89.6p and SIVsmE660.

Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca (sp)

Vaccine Name SIVmac239Δ3 *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVsmE660, SHIV89.6P *Route:* Intravenous

Main Findings

- By the criteria of CD4+ cell counts and disease, strong protection against the SHIV89.6p challenge was observed in 4/4 vaccinated monkeys (group 1).

NHP.38 (11152522) **Persistence of pathogenic challenge virus in macaques protected by simian immunodeficiency virus SIVmacDeltanef**

Authors Khatissian E, Monceaux V, Cumont MC, Kieny MP, Aubertin AM, Hurtrel B

Journal J Virol 2001 Feb;75(3):1507-15

Objectives Challenge, Immunogenicity To investigate virological and immunological characteristics of five rhesus macaques immunized with a nef-inactivated SIVmac251 molecular clone (SIVmac251nef) and challenged 15 months later with the pathogenic SIVmac251 isolate.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac251ΔNef *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVmac251 *Route:* Intravenous

Main Findings

- No total protection against homologous virus challenge but control of infection with challenge virus in the absence of a secondary immune response.
- Challenge and vaccine viruses may persist in a replication-competent form for long periods after the challenge, possibly resulting in recombination between the two viruses.

NHP.39 (11287551) **Quintuple deglycosylation mutant of simian immunodeficiency virus SIVmac239 in rhesus macaques: robust primary replication, tightly contained chronic infection, and elicitation of potent immunity against the parental wild-type strain**

Authors Mori K, Yasutomi Y, Ohgimoto S, Nakasone T, Takamura S, Shioda T, Nagai Y

Journal J Virol 2001 May;75(9):4023-8

Objectives Challenge, Immunogenicity To assess the immunogenicity and protection effect of a deglycosylated SIVmac239 mutant vaccine.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239Delta5G *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVmac239 *Route:* Intravenous

Main Findings

- Monkeys infected with the mutant tolerated a challenge infection with wild-type SIV very well.
- Analyses of host responses following challenge revealed no neutralizing antibodies against the challenge virus but strong secondary responses of cytotoxic T lymphocytes against multiple antigens, including Gag-Pol, Nef, and Env.
- Quintuple deglycosylation mutant appeared to represent a novel class of SIV live attenuated vaccine.

NHP.40 (10191194) **Long-lasting protection by live attenuated simian immunodeficiency virus in cynomolgus monkeys: no detection of reactivation after stimulation with a recall antigen**

Authors Sernicola L, Corrias F, Koanga-Mogtomo ML, Baroncelli S, Di Fabio S, Maggiorella MT, Belli R, Michelini Z, Macchia I, Cesolini A, Cioe L, Verani P, Titti F

Journal Virology 1999 Apr 10;256(2):291-302

Objectives Challenge, Immunogenicity To determine the breadth of the protection after repeated challenges of monkeys with SIV.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name SIVmac251, 32H, (C8) *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVmac251BK28, SIVmac251,32H.spl *Route:* Intravenous

Main Findings

- Monkeys immunized with live attenuated C8 vaccine were protected from consecutive challenge with SIVmac251, SIVmac32H.
- The C8 virus remained genotypically stable, and depletion of CD4+ cells was not observed during 3 years of follow-up.

NHP.41 (10998338) **Replication of simian immunodeficiency virus (SIV) in ex vivo lymph nodes as a means to assess susceptibility of macaques in vivo**

Authors Margolis L, Glushakova S, Chougnet C, Shearer G, Markham P, Robert-Guroff M, Benveniste R, Miller CJ, Cranage M, Hirsch V, Franchini G

Journal Virology 2000 Sep 30;275(2):391-7

Objectives Challenge, Immunogenicity To investigate whether infectability of ex vivo lymph nodes could predict resistance and/or susceptibility to SIV infection.

Species/Subspecies Macaca (sp)

Vaccine Name SIVmac251 *Type:* Live Virus *Route:* Mucosal

Vaccine Name SIVsmE660 *Type:* Live Virus *Route:* Mucosal

Challenge SIVmne clone A2-clone 5, SIVmac251(32H) *Route:* Mucosal

Main Findings

- Six macaques, apparently uninfected, following low-dose exposure to the pathogenic SIV(mac251) and SIV(SME660) by the mucosal route, were re-exposed to a less pathogenic SIV(MNE): 4/6 macaques resisted viral infection.
- PBMC and lymph-node resistance or susceptibility to infection ex vivo correlate with in vivo infectivity.

NHP.42 (10593484) **Antigen-specific cytokine responses in vaccinated Macaca nemestrina**

Authors Mulvania T, Lynch JB, Robertson MN, Greenberg PD, Morton WR, Mullins JI

Journal J Med Primatol 1999 Aug-Oct;28(4-5):181-9

Objectives Challenge, Immunogenicity Macaca nemestrina vaccinated with a minimally pathogenic HIV-2 strain KR. Group 1 was then inoculated with a non-infectious stock of a pathogenic strain, HIV-2287.

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Main Findings

- Both groups 1 and 2 were subsequently challenged with an infectious stock of HIV-2287.
- 5/6 group 1 animals were protected against CD4 decline.
- 3/6 animals in group 2 were protected.
- Analysis of CTL responses demonstrated strong activityagainst HIV-2(KR)-Gag in group 1.
- Strong correlation between CTL responses and antigen-specific T-helper (Th) type 1 responses.

NHP.43 (10593486) **An anti-HIV strategy combining chemotherapy and therapeutic vaccination**

Authors Rosenwirth B, Bogers WM, Nieuwenhuis IG, Haaft PT, Niphuis H, Kuhn EM, Bischofberger N, Erfle V, Sutter G, Berglund P, Liljestrom P, Uberla K, Heeney JL

Journal J Med Primatol 1999 Aug-Oct;28(4-5):195-205

Objectives Challenge, Immunogenicity, Immunotherapy .

Main Findings

- Chemotherapy/therapeutic vaccination regimen induced a significant reduction in the steady-state level of viremia in one out of two chronically infected rhesus macaques.
- Chemotherapeutic treatment alone did not achieve reduction of viremia in two chronically infected animals. The nature of the immune responses assumed to have been induced by vaccination in one out of the two monkeys remains to be elucidated.

NHP.44 (10684264) **Immunization with a modified vaccinia virus expressing simian immunodeficiency virus (SIV) Gag-Pol primes for an anamnestic Gag-specific cytotoxic T-lymphocyte response and is associated with reduction of viremia after SIV challenge**

Authors Seth A, Ourmanov I, Schmitz JE, Kuroda MJ, Lifton MA, Nickerson CE, Wyatt L, Carroll M, Moss B, Venzon D, Letvin NL, Hirsch VM

Journal J Virol 2000 Mar;74(6):2502-9

Objectives Challenge, Immunogenicity To explore the immunogenicity and protective efficacy of rMVA expressing the SIV gag-pol proteins in rhesus monkeys expressing the MHC class I allele, MamuA*01.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name MVAgagpol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intravenous

Challenge SIVsmE660 *Route:* Intravenous

Main Findings

- MVA-gag-pol-immunized macaques exhibited a rapid and substantial anamnestic CTL response specific for the p11C, C-M Gag epitopes.
- The level at which CTL stabilized after resolution of primary viremia correlated inversely with plasma viral load set point (P = 0.03).
- The magnitude of reduction in viremia in the vaccinees was predicted by the magnitude of the vaccine-elicited CTL response prior to SIV challenge.

NHP.45 (10684290) **Comparative efficacy of recombinant modified vaccinia virus Ankara expressing simian immunodeficiency virus (SIV) Gag-Pol and/or Env in macaques challenged with pathogenic SIV**

Authors Ourmanov I, Brown CR, Moss B, Carroll M, Wyatt L, Pletneva L, Goldstein S, Venzon D, Hirsch VM

Journal J Virol 2000 Mar;74(6):2740-51

Objectives Challenge, Immunogenicity To evaluate the protective effects of prior immunization with MVA-SIV recombinant vaccines as a sole immunogen without boosting with Env protein and to optimize expression of Gag-Pol.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name MVA-SIVsmH-4 -env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name MVA(SIVsmH-4)gag-pol-env *Type:* Purified Viral Products *Route:* Intramuscular

Vaccine Name MVA SIVsmH4 gag-pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Challenge SIVsmE660 *Route:* Intravenous

Main Findings

- Although all animals became infected post challenge, plasma viremia was significantly reduced in animals that received the MVA-SIV recombinant vaccines as compared with animals that received nonrecombinant MVA (P = 0.0011 by repeated-measures analysis ofvariance).
- Immunization significantly modifies viral load following SIV challenge.
- Recombinant MVA has considerable potential as a vaccine vector for human AIDS.

NHP.46 (9707609) **Recombinant modified vaccinia virus Ankara-simian immunodeficiency virus gag pol elicits cytotoxic T lymphocytes in rhesus monkeys detected by a major histocompatibility complex class I/peptide tetramer**

Authors Seth A, Ourmanov I, Kuroda MJ, Schmitz JE, Carroll MW, Wyatt LS, Moss B, Forman MA, Hirsch VM, Letvin NL

Journal Proc Natl Acad Sci U S A 1998 Aug 18;95(17):10112-6

Objectives Immunogenicity To explore the utility of MVA as a vector for eliciting AIDS virus-specific CTL in the SIV/rhesus monkey model.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name MVA SIVsmH4 gag-pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Main Findings

- Intramuscular immunization with recombinant MVA-SIVSM gag pol elicited a Gag epitope-specific CTL response readily detected in peripheral blood lymphocytes by using a functional killing assay. Moreover, those immunizations also elicited a population of CD8+ T lymphocytes in the peripheral blood that bound a specific major histocompatibility complex class I/peptide tetramer.
- Tetramer staining may be a useful technology for monitoring CTL generation in vaccine trials in nonhuman primates and in humans.

NHP.47 (11101054) **Cross-protection in NYVAC-HIV-1-immunized/HIV-2-challenged but not in NYVAC-HIV-2-immunized/SHIV-challenged rhesus macaques**

Authors Patterson LJ, Peng B, Abimiku AG, Aldrich K, Murty L, Markham PD, Kalyanaraman VS, Alvord WG, Tartaglia J, Franchini G, Robert-Guroff M

Journal AIDS 2000 Nov 10;14(16):2445-55

Objectives Challenge, Immunogenicity To evaluate the immunization with attenuated poxvirus-HIV-1 recombinants followed by protein boosting in rhesus monkeys model.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name vP991, NYVAC HIV-1IIIB gp120.gag-pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name vP1047, NYVAC HIV-2.SBL-ISY gp160.gag-pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name HIV-1 gp160 *Type:* Purified Viral Products *Route:* Intramuscular

Vaccine Name HIV-2 gp160 *Type:* Purified Viral Products *Route:* Intramuscular

Challenge HIV-2.SBL6669, SHIV-IIIB/HXB2 *Route:* Intravenous

Main Findings

- Both immunization groups developed homologous binding antibodies.
- Homologous Nab only observed in NYVAC-HIV-2-immunized macaques.
- No cross-reactive neutralizing antibodies detected.
- Immunization groups displayed cross-reactive CTL.
- Significant CD8AA observed for only one NYVAC-HIV-2-immunized macaque.
- Both immunizations significantly reduced viral burdens and partially protected against HIV-2 challenge.
- Humoral antibody and/or CTL and CD8AA associated with protection against homologous HIV-2 challenge.
- No significant protection observed in the SHIV-challenged macaques, although NYVAC-HIV-1 immunization resulted in significantly lower viral burdens compared with controls.

NHP.48 (10717345) **A recombinant avipoxvirus HIV-1 vaccine expressing interferon-gamma is safe and immunogenic in macaques**

Authors Kent SJ, Zhao A, Dale CJ, Land S, Boyle DB, Ramshaw IA

Journal Vaccine 2000 Apr 28;18(21):2250-6

Objectives Immunogenicity, Immunotherapy To construct and assess FPVgag/pol-IFNgamma as a therapeutic vaccine for safety and immunogenicity in Macaca nemestrina previously infected with HIV-1.

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name FPV.HIV-1.gag/pol-IFNgamma *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name FPV.HIV-1.gag/pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Challenge HIV-1.LAI *Route:* Intravenous

Main Findings

- FPVgag/pol-IFNgamma vaccinations were safe and enhanced T cell proliferative responses to Gag antigens (but not control tetanus antigens).
- Enhanced CTL responses to gag/pol antigens were also observed following IFNgamma expressing vaccinations.
- Since cellular immunity may be critical to controlling or preventing HIV-1 infection, these observations suggest that avipox vectors co-expressing IFNgamma should be further evaluated as therapeutic or preventive HIV-1 vaccines

---

NHP.49 (10418922) **Vaccination with Rev and Tat against AIDS**

Authors Osterhaus AD, van Baalen CA, Gruters RA, Schutten M, Siebelink CH, Hulskotte EG, Tijhaar EJ, Randall RE, van Amerongen G, Fleuchaus A, Erfle V, Sutter G

Journal Vaccine 1999 Jun 4;17(20-21):2713-4
Objectives Challenge, Immunogenicity A pilot study to investigate the role of cytotoxic T cell in the containment of primatate lentivirus infection.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name rSFV-SIVmac32H.rev.tat *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Vaccine Name rMVA.SIVmac32H.tat.rev *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Challenge SIVmac251(32H) *Route:* Intravenous

NHP.51 (11555138) **Effect of vaccination with recombinant modified vaccinia virus Ankara expressing structural and regulatory genes of SIV(macJ5) on the kinetics of SIV replication in cynomolgus monkeys**

Authors Negri DR, Baroncelli S, Michelini Z, Macchia I, Belli R, Catone S, Incitti F, ten Haaft P, Corrias F, Cranage MP, Polyanskaya N, Norley S, Heeney J, Verani P, Titti F
Journal J Med Primatol 2001 Aug;30(4):197-206
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name MVA-mac(J5) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Challenge SIVmac251 *Route:* Intravenous
Main Findings

- Vaccination with rMVA-J5 performed at week 0, 12, and 24 induced a moderate proliferative response to whole SIV, a detectable humoral response to all but Nef SIV antigens, and failed to induce neutralizing antibodies.
- All control monkeys were infected by week two and seroconverted by weeks four to eight.
- In contrast a sharp increase of both humoral and proliferative responses at two weeks post-challenge was observed in vaccinated monkeys compared to control monkeys.
- Although all vaccinated monkeys were infected, vaccination with rMVA-J5 appeared to partially control viral replication during the acute and late phase of infection as judged by cell- and plasma-associated viral load.

NHP.52 (12072518) **Immunization of rhesus macaques with a DNA prime/modified vaccinia virus Ankara boost regimen induces broad simian immunodeficiency virus (SIV)-specific T-cell responses and reduces initial viral replication but does not prevent disease progression following challenge with pathogenic SIVmac239**

Authors Horton H, Vogel TU, Carter DK, Vielhuber K, Fuller DH, Shipley T, Fuller JT, Kunstman KJ, Sutter G, Montefiori DC, Erfle V, Desrosiers RC, Wilson N, Picker LJ, Wolinsky SM, Wang C, Allison DB, Watkins DI
Journal J Virol 2002 Jul;76(14):7187-202
Objectives Challenge, Immunogenicity To test the immunogenicity and protective value of a DNA prime/modified vaccinia virus Ankara boost regimen immunization in rhesus macaques against intrarectal challenge with simian immunodeficiency virus (SIV) mac239.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pC-SIVrev *Type:* DNA *Route:* Intradermal
Vaccine Name rMVA-SIVmac251 32H *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intrarectal, Intradermal
Vaccine Name pC-SIV17E-Fred (gagpolenv) *Type:* DNA *Route:* Intradermal
Vaccine Name SIVmac17E-Fr Nef *Type:* DNA *Route:* Intradermal
Challenge SIVmac239/nef-open *Route:* Intrarectal
Main Findings

- Immunization resulted in induction of virus-specific CD8+ and CD4+ responses in all vaccinees.
- Anamnestic nab responses against laboratory-adapted SIVmac251 developed after the challenge.
- No neutralizing antibodies against SIVmac239.
- Vaccinated animals had significantly reduced peak viremia compared with controls (P<0.01).

- Most animals had gradual CD4 depletion and progressed to disease despite the induction of virus-specific CTL responses and reduced peak viral loads.

NHP.53 (12192089) **Crosslinked HIV-1 envelope-CD4 receptor complexes elicit broadly cross-reactive neutralizing antibodies in rhesus macaques**

Authors Fouts T, Godfrey K, Bobb K, Montefiori D, Hanson CV, Kalyanaraman VS, DeVico A, Pal R.

Journal Proc Natl Acad Sci U S A. 2002 Aug 21

Objectives Immunogenicity To evaluate the immunogenicity of crosslinked gp120-CD4 complexes in rhesus monkeys.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Crosslinked gp120-CD4 *Type:* Other *Route:* Intramuscular

Vaccine Name Crosslinked gp140-CD4 *Type:* Other *Route:* Intramuscular

Vaccine Name HIV-1 IIIB gp120 *Type:* Purified Viral Products *Route:* Intramuscular

Vaccine Name HIV-1 IIIB gp140 *Type:* Purified Viral Products *Route:* Intramuscular

Main Findings

- The animals immunized with anti-env-CD4 exhibited a broad pattern of neutralization of primary viruses regardless of coreceptor usage and genetic subtype.
- anti-env-CD4 neutralization more biased toward primary isolates than laboratory adapted strains, unlike anti-env which neutralized only laboratory adapted strains.
- anti-Env-CD4 antisera failed to neutralize SHIV89.6, SHIV89.6P, and SHIVKU2 in the human PBMC-based assays and SIVmac239 in assays with either human or macaque PBMCs.

NHP.54 (10933680) **Vaccine protection against simian immunodeficiency virus by recombinant strains of herpes simplex virus**

Authors Murphy CG, Lucas WT, Means RE, Czajak S, Hale CL, Lifson JD, Kaur A, Johnson RP, Knipe DM, Desrosiers RC

Journal J Virol 2000 Sep;74(17):7745-54

Objectives Challenge, Immunogenicity To develop and use replication-competent and replication-defective strains of recombinant herpes simplex virus (HSV) that express envelope and Nef antigens of SIV.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name K81 *Type:* DNA *Routes:* Subcutaneous, Intramuscular

Vaccine Name d81 *Type:* DNA *Routes:* Intradermal, Intramuscular

Challenge SIVmac239 *Route:* Intrarectal

Main Findings

- The HSV recombinants induced antienvelope antibody responses that persisted at relatively stable levels for months after the last administration.
- 2/7 rhesus vaccinated monkeys were solidly protected, and another showed a sustained reduction in viral load following rectal challenge with pathogenic SIVmac239 at 22 weeks following the last vaccine administration.

NHP.55 (11551502) **An effective AIDS vaccine based on live attenuated vesicular stomatitis virus recombinants**

Authors Rose NF, Marx PA, Luckay A, Nixon DF, Moretto WJ, Donahoe SM, Montefiori D, Roberts A, Buonocore L, Rose JK

Journal Cell 2001 Sep 7;106(5):539-49

Objectives Challenge, Immunogenicity To test live attenuated vesicular stomitits virus vectors expressing SIV ?env and gag genes in rhesus monkeys.

Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca (sp)

Vaccine Name VSV-(GI)-Env *Type:* Recombinant Vector (virus/bacteria) *Routes:* Oral, Intramuscular

Vaccine Name VSV(GCh)-Env+Gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Oral, Intramuscular

Vaccine Name VSV(GNJ)-Env+Gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Oral, Intramuscular

Challenge SHIV89.6P *Route:* Intravenous

Main Findings

- Vectors with glycoproteins from different VSV serotypes boosted response.
- 7/8 controls progressed to AIDS at about 148 dpc with severe loss of CD4+ T cells, high viral loads.

- 7/8 vaccinees infected with SHIV89.6P remained healthy up to 14 mpc (low or undetectable viral loads).

NHP.56 (10229229) **Neutralizing antibody-independent containment of immunodeficiency virus challenges by DNA priming and recombinant pox virus booster immunizations**

Authors Robinson HL, Montefiori DC, Johnson RP, Manson KH, Kalish ML, Lifson JD, Rizvi TA, Lu S, Hu SL, Mazzara GP, Panicali DL, Herndon JG, Glickman R, Candido MA, Lydy SL, Wyand MS, McClure HM

Journal Nat Med 1999 May;5(5):526-34

Objectives Challenge, Immunogenicity To compare 8 different protocols for their ability to protect against immunodeficiency virus challenges in rhesus macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pRS102 -SIVmac239 gag-pol proteins *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal

Vaccine Name pCMV/nef *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal

Vaccine Name pJW4303/HXB-2.dpol *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal

Vaccine Name pJW4303/HXB-2.gp140 *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal

Vaccine Name pJW4303/HXB-2.gp120 *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal

Vaccine Name Prt-env gp160 *Type:* Purified Viral Products *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal

Vaccine Name rFPV *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal, Intramuscular

Challenge SHIV89.6P, SHIV-IIIB/HXB2 *Route:* Intravenous

Main Findings

- Intradermal DNA priming followed by recombinant fowl pox virus booster immunizations was a more efficient protocol in inducing immune response and containment of challenge infection than the gene gun inoculation method.

NHP.57 (10438842) **Effective induction of simian immunodeficiency virus-specific cytotoxic T lymphocytes in macaques by using a multiepitope gene and DNA prime-modified vaccinia virus Ankara boost vaccination regimen**

Authors Hanke T, Samuel RV, Blanchard TJ, Neumann VC, Allen TM, Boyson JE, Sharpe SA, Cook N, Smith GL, Watkins DI, Cranage MP, McMichael AJ

Journal J Virol 1999 Sep;73(9):7524-32

Objectives Challenge, Immunogenicity To test multi-CTL epitope gene and a DNA prime-MVA boost vaccination regimen in rhesus macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca (sp)

Vaccine Name pTH.HW DNA *Type:* DNA *Route:* Intradermal (Gene Gun DNA-coated gold beads)

Vaccine Name MVA.HW *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Challenge SIVmac251 *Route:* Intrarectal

Main Findings

- High SIV gag specific-CTL response by immunization, capable of killing SIV-infected cells in vitro.
- After intrarectal challenge with pathogenic SIVmac251, 2/3 vaccinated animals were infected.
- Correlates of protective immunity not defined.
- DNA prime-MVA boost regimen is an effective protocol for induction of CTLs in macaques.

NHP.58 (11085589) **A vaccine strategy utilizing a combination of three different chimeric vectors which share specific vaccine antigens**

Authors Heeney JL, Koopman G, Rosenwirth B, Bogers W, van Dijk J, Nieuwenhuis I, Niphuis H, ten Haaft P, Hanke T, Rhodes G, Berglund P, Burny A, Bex F, Sutter G, Liljestrom P

Journal J Med Primatol 2000 Aug;29(3-4):268-73

Objectives Immunogenicity Overcomes an anti-vector immune response with chimeric vectors that have in common only the specific antigens for immunization.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name DNA.PTH.SIVmac.J5.gptnr *Type:* DNA *Route:* Intradermal

Vaccine Name DNA.pND14-G1.SIVmac251.env *Type:* DNA *Route:* Intradermal

Vaccine Name MVA.pUCII.SIVmac.J5 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Vaccine Name MVApIII-sp.SIVmac.J5.env *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular
Vaccine Name SFVpSFVI.SIVmac.J5.gpetnr *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intravenous, Intradermal
Challenge SIVmac32H.IXc *Route:* Intravenous
Main Findings

- Anti-vector immune response to foreign genes of engineered vectors may preclude sufficient 'priming' or immunogenicity, or impair optimal 'boosting' upon repeated immunization.
- Describes a new strategy that avoids increased anti-vector responses,allows the use of combinations of vectors to present the same or related antigen differently to the immune system and at alternative sites.
- New strategy induces optimal type of immunity against the pathogen.

NHP.59 (10906202) **Simian immunodeficiency virus (SIV) gag DNA-vaccinated rhesus monkeys develop secondary cytotoxic T-lymphocyte responses and control viral replication after pathogenic SIV infection**

Authors Egan MA, Charini WA, Kuroda MJ, Schmitz JE, Racz P, Tenner-Racz K, Manson K, Wyand M, Lifton MA, Nickerson CE, Fu T, Shiver JW, Letvin NL
Journal J Virol 2000 Aug;74(16):7485-95
Objectives Challenge, Immunogenicity To use plasmid DNA construct to elicit protective immunity in SIV/macaque model.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name V1R-SIV gag *Type:* DNA *Route:* Intramuscular
Challenge SIVsmE660 *Route:* Intravenous
Main Findings

- Soluble major histocompatibility class I/peptide tetramers and peptide-specific killing assays are used to monitor CD8(+) T-lymphocyte responses to a dominant SIV Gag epitope in rhesus monkeys.
- Codon-optimized SIV gag DNA vaccine construct elicits high-frequency SIV-specific CTL response in peripheral blood and lymph node lymphocytes.
- After IV challenge with SIVsm E660, gag plasmid DNA-vaccinated monkeys have better containment of viral replication by 50 dpc.

NHP.60.1 (11039923) **Control of viremia and prevention of clinical AIDS in rhesus monkeys by cytokine-augmented DNA vaccination**

Authors Barouch DH, Santra S, Schmitz JE, Kuroda MJ, Fu TM, Wagner W, Bilska M, Craiu A, Zheng XX, Krivulka GR, Beaudry K, Lifton MA, Nickerson CE, Trigona WL, Punt K,Freed DC, Guan L, Dubey S, Casimiro D, Simon A, Davies ME, Chastain M, Strom TB, Gelman RS, Montefiori DC, Lewis MG, Emini EA, Shiver JW, Letvin NL
Journal Science 2000 Oct 20;290(5491):486-92
Objectives Challenge, Immunogenicity Reports the protective efficacy of vaccine-elicited immune responses against a pathogenic SHIV-89.6P challenge in rhesus monkeys.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac239 gag DNA *Type:* DNA *Route:* Intramuscular
Vaccine Name HIV-1.89.6P env DNA *Type:* DNA *Route:* Intramuscular
Challenge SHIV89.6P *Route:* Intravenous
Main Findings

- The monkeys that received the DNA vaccines plus IL-2/Ig protein or IL-2/Ig plasmid demonstrated markedly higher vaccine-elicited CTL responses than the animals that received the DNA vaccines alone.
- All monkeys that received DNA vaccines augmented with IL-2/Ig were infected, demonstrated potent secondary CTL responses, stable CD4+ T cell counts, preserved virus-specific CD4+ T cell responses, low to undetectable setpoint viral loads, and no evidence of clinical disease or mortality by 140 dpc
- After the final immunization at week 40, the vaccinated monkeys developed significant circulating p11C- and p41A-specific CD8+ T lymphocytes, in contrast with the control monkeys that had no detectable circulating tetramer-positive CD8+ T lymphocytes.

NHP.60.2 (11797012) **Eventual AIDS vaccine failure in a rhesus monkey by viral escape from cytotoxic T lymphocytes**

Authors Barouch DH, Kunstman J, Kuroda MJ, Schmitz JE, Santra S, Peyerl FW, Krivulka GR, Beaudry K, Lifton MA, Gorgone DA, Montefiori DC, Lewis MG, Wolinsky SM, Letvin NL
Journal Nature 2002 Jan 17;415(6869):335-9
Objectives Challenge .
Main Findings

- Viral escape from CTL recognition can result in the long-term failure of partial immune protection to challenge (i.e. to control viral replication and prevent clinical disease progression).
- In a cohort of rhesus monkeys that were vaccinated and subsequently infected with a pathogenic hybrid SHIV, the frequency of viral sequence mutations within CTL epitopes correlated with the level of viral replication.
- Viral escape from CTL recognition may be a major limitation of the CTL-based AIDS vaccines.

NHP.60.3 (12021371) **Prior vaccination increases the epitopic breadth of the cytotoxic T-lymphocyte response that evolves in rhesus monkeys following a simian-human immunodeficiency virus infection**

Authors Santra S, Barouch DH, Kuroda MJ, Schmitz JE, Krivulka GR, Beaudry K, Lord CI, Lifton MA, Wyatt LS, Moss B, Hirsch VM, Letvin NL
Journal J Virol 2002 Jun;76(12):6376-81
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac239 gag DNA *Type:* DNA
Vaccine Name HIV-1.89.6P env DNA *Type:* DNA
Challenge SHIV89.6P *Route:*
Main Findings

- rMVA vaccination elicited high-frequency CTL responses to dominant epitopes but with substantially lower frequency to subdominant epitopes.
- Animals immunized with DNA plus IL-2/Ig plasmid showed higher frequency p41A-specific CTL responses than animals immunized with DNA alone and controls.

NHP.61 (11044096) **Effective induction of simian immunodeficiency virus-specific systemic and mucosal immune responses in primates by vaccination with proviral DNA producing intact but noninfectious virions**

Authors Wang SW, Kozlowski PA, Schmelz G, Manson K, Wyand MS, Glickman R, Montefiori D, Lifson JD, Johnson RP, Neutra MR, Aldovini A
Journal J Virol 2000 Nov;74(22):10514-22
Objectives Challenge, Immunogenicity Reports a pilot evaluation of a DNA vaccine producing genetically inactivated SIV particles in primates, focuses on eliciting mucosal immunity.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pVacc1 DNA *Type:* DNA *Routes:* Intrarectal, Intradermal (Gene Gun DNA-coated gold beads), Intradermal, Intramuscular
Challenge SIVmac239 *Route:* Intrarectal
Main Findings

- IgA in rectal secretions of macaques that received the DNA vaccine intradermally and at the rectal mucosa are higher than in natural infection.
- CTL responses were low and sporadic.
- After rectal challenge with cloned SIVmac239, some animals with high SIV-specific IgA levels became infected.
- High levels of IgA alone are not sufficient to prevent the establishment of chronic infection, although mucosal IgA responses may reduce the infectivity of the initial viral inoculum.

NHP.62 (11152527) **DNA vaccination with the human immunodeficiency virus type 1 SF162DeltaV2 envelope elicits immune responses that offer partial protection from simian/human immunodeficiency virus infection to CD8(+) T-cell-depleted rhesus macaques**

Authors Cherpelis S, Shrivastava I, Gettie A, Jin X, Ho DD, Barnett SW, Stamatatos L
Journal J Virol 2001 Feb;75(3):1547-50

Objectives Challenge, Immunogenicity To conduct DNA immunization of macaques with the SF162V2 envelope, then challenge with SHIV162P4.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name DNA.SF162ΔV2 gp140 *Type:* DNA *Routes:* Intradermal, Intramuscular
Vaccine Name SF162ΔV2 gp140 protein *Type:* Recombinant Subunit Protein *Routes:* Intradermal, Intramuscular
Challenge SHIV162P4 *Route:* Intravenous
Main Findings

- Immunization elicited lymphoproliferative responses and potent neutralizing antibodies.
- Animals were depleted of their CD8+ T lymphocytes and then challenged intravenously with SHIV162P4.
- Compared to unvaccinated animals, vaccinated macaques had lower peak viremia levels, rapidly cleared plasma virus, and delayed seroconversion.

NHP.63 (11884556) **Induction of mucosal protection against primary, heterologous simian immunodeficiency virus by a DNA vaccine**
Authors Fuller DH, Rajakumar PA, Wilson LA, Trichel AM, Fuller JT, Shipley T, Wu MS, Weis K, Rinaldo CR, Haynes JR, Murphey-Corb M
Journal J Virol 2002 Apr;76(7):3309-17
Objectives Challenge, Immunogenicity To analyze immunogenicity and protective efficacy of a DNA vaccine containing SIV strain 17E-Fr (SIV/17E-Fr) gag-pol-env in rhesus macaques.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIV/17E-Fr gag-pol-env *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal
Challenge SIVDeltaB670 *Route:* Intrarectal
Main Findings

- First report of mucosal protection against a primary pathogenic, heterologous isolate of SIV using a commercially viable vaccine approach.
- Vaccinated and naive control monkeys were challenged intrarectally with SIV strain DeltaB670 (SIV/DeltaB670), whose env is 15% dissimilar to that of the vaccine strain.
- Postchallenge, in 4/7 vaccinees no SIV viral RNA or DNA sequences were found in the peripheral blood, and anamnestic antibody responses were absent.

NHP.64 (11085583) **Mucosal challenge of Macaca nemestrina with simian immunodeficiency virus (SIV) following SIV nucleocapsid mutant DNA vaccination**
Authors Gorelick RJ, Lifson JD, Yovandich JL, Rossio JL, Piatak M Jr, Scarzello AJ, Knott WB, Bess JW Jr, Fisher BA, Flynn BM, Henderson LE, Arthur LO, Benveniste RE
Journal J Med Primatol 2000 Aug;29(3-4):209-19
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca nemestrina (pigtailed macaque)
Vaccine Name SIV(Mne)NCΔZF2 DNA *Type:* Live Attenuated Virus *Route:* Intramuscular
Vaccine Name S8-NCΔZF2 *Type:* Live Attenuated Virus *Routes:* Subcutaneous, Intramuscular
Challenge SIV(Mne) clone E11S *Route:* Intrarectal
Main Findings

- Challenged mucosally, all 12 macaques became infected, the 4 immunized animals greatly restricted their viral replication.
- One immunized animal that controlled replication remains antibody negative, no disease evident 46 wpc.

NHP.65.1 (11090194) **Protection of Macaca nemestrina from disease following pathogenic simian immunodeficiency virus (SIV) challenge: utilization of SIV nucleocapsid mutant DNA vaccines with and without an SIV protein boost**
Authors Gorelick RJ, Benveniste RE, Lifson JD, Yovandich JL, Morton WR, Kuller L, Flynn BM, Fisher BA, Rossio JL, Piatak M Jr, Bess JW Jr, Henderson LE, Arthur LO
Journal J Virol 2000 Dec;74(24):11935-49
Objectives Challenge, Immunogenicity To evaluate SIV nucleocapsid mutant DNA vaccines with and without an SIV protein boost.
Species/Subspecies Macaca nemestrina (pigtailed macaque)
Vaccine Name SIV(Mne)NCΔZF2 DNA *Type:* Live Attenuated Virus *Route:* Intramuscular

Vaccine Name SIV(Mne) gp160Env protein *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name Gag-Pol particles *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge SIV(Mne) clone E11S *Route:* Intravenous
Main Findings

- Background: 11 pigtailed macaques were inoculated with nucleocapsid mutant SIV expressing DNA, intramuscularly (i.m.) in one study and i.m. and subcutaneously in another study. Six control animals received vector DNA lacking SIV sequences.
- Post IV challenge, all control animals became infected and 3/4 developed progressive SIV disease.
- 2 ypc, most immunized animals had low postacute levels of plasma SIV RNA, no CD4+ T-cell depletion or clinical evidence of progressive disease (see experiment 2 for additional information).

NHP.65.2 (11090194) **Protection of Macaca nemestrina from disease following pathogenic simian immunodeficiency virus (SIV) challenge: utilization of SIV nucleocapsid mutant DNA vaccines with and without an SIV protein boost**
Authors Gorelick RJ, Benveniste RE, Lifson JD, Yovandich JL, Morton WR, Kuller L, Flynn BM, Fisher BA, Rossio JL, Piatak M Jr, Bess JW Jr, Henderson LE, Arthur LO
Journal J Virol 2000 Dec;74(24):11935-49
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca nemestrina (pigtailed macaque)
Vaccine Name SIV(Mne)NCΔZF2 DNA *Type:* Live Attenuated Virus *Routes:* Subcutaneous, Intramuscular
Vaccine Name S8-NCΔZF2 *Type:* Live Attenuated Virus *Routes:* Subcutaneous, Intramuscular
Challenge SIV(Mne) clone E11S *Route:* Intravenous
Main Findings

- The vaccine induced only modest and inconsistent humoral responses and no cellular immune responses prior to challenge.
- Following iv challenge with 20 animal infectious doses of the pathogenic SIV(Mne) in a long-term study, all control animals became infected and 3/4 animals developed progressive SIV disease leading to death.
- All 11 NC mutant SIV DNA-immunized animals became infected following challenge but decreased initial peak plasma SIV RNA levels compared to those of control animals.

NHP.66 (11689679) **Vaccination with attenuated simian immunodeficiency virus by DNA inoculation**
Authors Kent SJ, Dale CJ, Preiss S, Mills J, Campagna D, Purcell DF
Journal J Virol 2001 Dec;75(23):11930-4
Objectives Challenge, Immunogenicity To evaluate attenuated proviral DNA vaccine in macaques.
Species/Subspecies Macaca nemestrina (pigtailed macaque)
Vaccine Name SIVmac239 sbbvΔ3 DNA *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal, Intramuscular
Vaccine Name SIVmac239 sbbvΔ3Delta5 DNA *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal, Intramuscular
Challenge SIVmac251 *Route:* Intrarectal
Main Findings

- Innoculated with wild-type simian immunodeficiency virus strain mac239 (SIV(mac239)) DNA or SIV(mac239) DNA containing a single deletion in the 3' nef-long terminal repeat overlap region (nef/LTR) led to sustained SIV infections and AIDS.
- Injectionof SIV(mac239) DNA containing identical deletions in both the 5' LTR and 3' nef/LTR resulted in attenuated SIV infections and substantial protection against subsequent mucosal SIV(mac251) challenge.

NHP.67 (10869776) **Induction of protective immunity against pathogenic simian immunodeficiency virus by a foreign receptor-dependent replication of an engineered avirulent virus**
Authors Matano T, Kano M, Odawara T, Nakamura H, Takeda A, Mori K, Sato T, Nagai Y
Journal Vaccine 2000 Aug 1;18(28):3310-8

Objectives Challenge, Immunogenicity To develop a chimeric (SIV,Friend Murine leukemia virus) DNA vaccine to induce restricted replication of an avirulent virus.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name FMSIV *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intramuscular
Challenge SIVmac239 *Route:* Intravenous
Main Findings

- A novel strategy: a vaccine consisting of a chimeric SIV and a Friend murine leukemia virus, in which the SIV env is replaced with ecotropic Friend murine leukemia virus (FMLV) env to confine its replication to FMLV receptor (mCAT1)-expressing cells.
- Macaques vaccinated with both the FMSIV DNA and the mCAT1-expression plasmid DNA generated SIV Gag-specific cellular immune responses and resistance against pathogenic SIVmac239 challenge.
- Vaccination with FMSIV DNA alone was insufficient to prevent the disease onset.

NHP.68 (11118363) **Induction of immune responses and break of tolerance by DNA against the HIV-1 coreceptor CCR5 but no protection from SIVsm challenge**
Authors Zuber B, Hinkula J, Vodros D, Lundholm P, Nilsson C, Morner A, Levi M, Benthin R, Wahren B
Journal Virology 2000 Dec 20;278(2):400-11
Objectives Challenge, Immunogenicity To explore genetic immunization to induce an immune response directed to CCR5 structures and break immunological tolerance toward endogenous CCR5.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name pcDNA3-CCR5 *Type:* DNA *Route:* Intradermal (Gene Gun DNA-coated gold beads)
Vaccine Name pcDNA3–tet.CCR5 *Type:* DNA *Route:* Intradermal (Gene Gun DNA-coated gold beads)
Vaccine Name CCR5 peptides *Type:* Synthetic Protein/Peptide *Route:* Intramuscular
Challenge SIVsm *Route:* Intrarectal
Main Findings

- Intramucosal immunization of cynomolgus macaques with CCR5 DNA followed by boosts with CCR5 peptides induced prominent IgG and IgA antibody responses.
- The CCR5-specific antibodies neutralized the infectivity of primary human R5 HIV-1 strains, and the macaque SIVsm.
- CCR5 gene and CCR5 peptide immunizations induced B- and T-cell responses.
- Tolerance was broken against endogenous macaque CCR5.
- Neither protection against nor enhancement of SIVsm infection was achieved.

NHP.69 (10894297) **Elicitation of protective immunity against simian immunodeficiency virus infection by a recombinant Sendai virus expressing the Gag protein**
Authors Kano M, Matano T, Nakamura H, Takeda A, Kato A, Ariyoshi K, Mori K, Sata T, Nagai Y
Journal AIDS 2000 Jun 16;14(9):1281-2
Objectives Challenge, Immunogenicity To use recombinant SeV expressing the Gag antigen of SIV, SeV/SIVgag, to elicit protective immunity.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name SeV-gag *Type:* DNA *Route:* Intranasal
Challenge SIVmac239 *Route:* Intravenous
Main Findings

- The vaccinated animals and controls were all infected by the challenge virus SIVmac239. Only animals immunized with SeV-SIV-gag were able to control infection by reducing the viral load to below detectable level

---

NHP.70 (11689672) **Rapid appearance of secondary immune responses and protection from acute CD4 depletion after a highly pathogenic immunodeficiency virus challenge in macaques vaccinated with a DNA prime/Sendai virus vector boost regimen**
Authors Matano T, Kano M, Nakamura H, Takeda A, Nagai Y
Journal J Virol 2001 Dec;75(23):11891-6

Objectives Challenge, Immunogenicity To test the immunogenicity and protective effect of a SHIV-DNA prime vaccine followed by a single booster with a Gag-expressing Sendai virus (SeV-Gag).
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SeV-gag *Type:* DNA *Route:* Intranasal
Vaccine Name FMSIV *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intramuscular
Challenge SHIV89.6PD *Route:* Intravenous
Main Findings

- All naive control macaques showed acute CD4(+) T-cell depletion at 2 wpc (iv SHIV89.6PD).
- All vaccinated macaques with prime/boost regimen were protected from depletion and showed greatly reduced peak viral loads.
- Vaccination with DNA alone or SeV-Gag alone did not confer protection.
- Differences in secondary responses between the protected and unprotected macaques was clear at 1 wpc.
- Rapid secondary responses reduce peak viral loads and protect from acute CD4(+) T-cell depletion.

NHP.71 (10983638) **Therapeutic immunization of HIV-infected chimpanzees using HIV-1 plasmid antigens and interleukin-12 expressing plasmids**
Authors Boyer JD, Cohen AD, Ugen KE, Edgeworth RL, Bennett M, Shah A, Schumann K, Nath B, Javadian A, Bagarazzi ML, Kim J, Weiner DB
Journal AIDS 2000 Jul 28;14(11):1515-22
Objectives Immunogenicity, Immunotherapy To assess HIV-1 DNA vaccination and co-immunization with interleukin (IL)-12 and IL-10 as immunotherapy in the HIV-1 infected chimpanzee model system.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Vaccine Name pCMN160 (HIV-1 MN env) *Type:* DNA *Route:* Intramuscular
Vaccine Name pCGag/Pol *Type:* DNA *Route:* Intramuscular
Challenge HIV-1 IIIB *Route:*
Main Findings

- No evidence of systemic toxicity associated with DNA immunization or the cytokine-expressing plasmids.
- IL-12/HIV-1 DNA vaccinated animals enhanced proliferative responses to multiple HIV-1 antigens at multiple time points.
- Animal co-immunized with HIV-1 and IL-10 did not have any changes in the proliferative responses.
- Control chimpanzee demonstrated moderate increases in the proliferative responses to HIV-1 antigens.

NHP.72 (9971763) **Acute effects of pathogenic simian-human immunodeficiency virus challenge on vaccine-induced cellular and humoral immune responses to Gag in rhesus macaques**
Authors Steger KK, Waterman PM, Pauza CD
Journal J Virol 1999 Mar;73(3):1853-9
Objectives Challenge, Immunogenicity To test immunization with recombinant Salmonella typhimurium (expressing Gag) or soluble Gag in adjuvant, by challenge with SHIV89.6PD (macaques).
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVhu *Type:* Live Attenuated Virus *Routes:* Intragastric, Intramuscular
Challenge SHIV89.6PD *Route:* Intrarectal
Main Findings

- Virus infection accompanied by rapid losses of lymphoproliferative responses to Gag or phytohemagglutinin.
- 8 wpc mitogen responses recovered to near normal levels but antigen-specific immunity remained low or undetectable.
- Serum antibody levelselevated initially but soon dropped well below levels achieved by immunization.
- Rapid depletion of preexisting Gag-specific CD4(+) T cells prevent or limit subsequent antiviral cellular and humoral immune responses during acute SHIV infection.

NHP.73 (10461832) **Combined systemic and mucosal immunization with microsphere-encapsulated inactivated simian immunodeficiency virus elicits serum, vaginal, and tracheal antibody responses in female rhesus macaques**

Authors Israel ZR, Gettie A, Ishizaka ST, Mishkin EM, Staas J, Gilley R, Montefiori D, Marx PA, Eldridge JH

Journal AIDS Res Hum Retroviruses 1999 Aug 10;15(12):1121-36

Objectives Challenge, Immunogenicity To determine the efficacy of immunization with microsphere-encapsulated whole inactivated SIV by combined systemic and mucosal administration to protect female rhesus macaques against vaginal challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac251.whole inactivated *Type:* Whole (killed) Inactivated Virus *Routes:* Intratracheal, Oral, Intramuscular

Vaccine Name vvrgp140 *Type:* DNA *Routes:* Oral

Challenge SIVmac251 *Route:* Vaginal or perivaginal

Main Findings

- Intramuscular priming resulted in strong IgG and modest IgA response.
- Intratracheal boosting following intramuscular priming resulted in high bronchial alveolar wash IgG and less pronounced IgA.
- IgG was present in the animals immunized intramuscularly boosted either intramuscularly or intratracheally.
- No neutralizing antibody to homologous SIVmac251 in response to the immunization with the whole inactivated SIV vaccine.
- On vaginal challenge none of the immunized groups was infected at a lesser frequency than the unimmunized controls.

NHP.74 (10438051) **Induction of mucosal antibody responses by microsphere-encapsulated formalin-inactivated simian immunodeficiency virus in a male urethral challenge model**

Authors Ishizaka ST, Israel ZR, Gettie A, Mishkin EM, Staas JK, Gilley RM, Dailey PJ, Montefiori DC, Marx PA, Eldridge JH

Journal Vaccine 1999 Jul 16;17(22):2817-25

Objectives Challenge, Immunogenicity To test use of microsphere-encapsulated formalin-inactivated SIV particles against mucosal SIV challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Whole inactivated SIVmac239 (encapsulated) *Type:* Whole (killed) Inactivated Virus *Routes:* Intratracheal, Intramuscular

Challenge SIVmac251 *Route:* Urethral

Main Findings

- Macaques, primed intramuscularly, boosted tracheally, had strong Iga response to SIV vaccine.
- The bulk of antibody response was against non-envelope epitopes.
- No neutralizing antibody observed.
- Intraurethral challenge with cell-free rhesus-grown virus showed no evidence of protection against challenge.
- Microsphere-based immunization raises local and system responses, but does not provide sufficient immunity to protect against mucosal challenge.

NHP.75 (10074183) **Comparison of immunity generated by nucleic acid-, MF59-, and ISCOM-formulated human immunodeficiency virus type 1 vaccines in Rhesus macaques: evidence for viral clearance**

Authors Verschoor EJ, Mooij P, Oostermeijer H, van der Kolk M, ten Haaft P, Verstrepen B, Sun Y, Morein B, Akerblom L, Fuller DH, Barnett SW, Heeney JL

Journal J Virol 1999 Apr;73(4):3292-300

Objectives Challenge, Immunogenicity To compare the kinetics of T-helper immune responses in rhesus monkeys by 3 HIV vaccine strategies: a rgp120SF2 expressed in vivo by DNA immunization or when it was delivered as a subunit protein vaccine formulated with the MF59 adjuvant or by ISCOMs.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pUCgp120SF2-gold particle *Type:* DNA *Route:* Intradermal (Gene Gun DNA-coated gold beads)

Vaccine Name HIV-1SF2 rgp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Main Findings

- Virus-neutralizing antibodies against HIV-1SF2 reached similar titers in the two rgp120SF2 protein-immunized groups, with different kinetics, while nab were delayed and low in the DNA-immunized animals.

- rgp120/ISCOM-immunized animals rapidly developed marked IL-2, IFN-gamma (type 1-like), and IL-4 responses that peaked after the second immunization.
- Protection challenge with SHIV was observed in the two groups receiving the rgp120 subunit vaccines. Half of the animals in the ISCOM group were completely protected from infection.

NHP.76 (1708168) **Recombinant virus vaccine-induced SIV-specific CD8+ cytotoxic T lymphocytes**

Authors Shen L, Chen ZW, Miller MD, Stallard V, Mazzara GP, Panicali DL, Letvin NL

Journal Science 1991 Apr 19;252(5004):440-3

Objectives Immunogenicity To determine whether a genetically restricted live recombinant virus, the vaccinia-simian immunodeficiency virus of macaques (SIVmac) could generate a T lymphocyte-mediated antiviral response in a primate.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name rVaccinia-SIVmac-env.gagpol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Main Findings

- Vaccinia-SIVmac vaccination elicited an SIVmac Gag-specific, CD8+ CTL response in rhesus monkeys.
- The rhesus monkey major histocompatibility complex (MHC) class I gene product restricting this CTL response was defined.
- Both the vaccinated and control SIVmac-infected monkeys that shared this MHC class I gene product developed CTLs with the same Gag epitope specificity.
- The findings support the use of recombinant virus vaccines for the prevention of HIV infections in humans.

NHP.77 (10506654) **Accelerated clearance of SHIV in rhesus monkeys by virus-like particle vaccines is dependent on induction of neutralizing antibodies**

Authors Notka F, Stahl-Hennig C, Dittmer U, Wolf H, Wagner R

Journal Vaccine 1999 Sep;18(3-4):291-301

Objectives Challenge, Immunogenicity To investigate efficacy of recombinant, insect cell derived SIV Pr56(gag) virus-like particles modified either by inserting HIV-1 Gp160 derived peptides into the Pr56(gag) precursor or by integrating the complete HIV-1 gp120 in the particle membrane.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIV Pr56gag VLP-type II *Type:* Virus-like Particle

Vaccine Name SFV- Pr56gag VLP-type II *Type:* Live Virus

Vaccine Name SFV-SIV Pr56gag VLP-type I *Type:* Virus-like Particle

Challenge SHIV-4.vpu+ *Route:* Intravenous

Main Findings

- All vaccinated monkeys became infected upon challenge with SHIV-4, but animals vaccinated with VLPs presenting the complete gp120 cleared virus faster than nonimmunized controls.
- Observed virus elimination significantly correlated with an anamnesticantibody response and accelerated appearance of neutralizing antibodies postchallenge.

NHP.78 (10725402) **Vaccination with tat toxoid attenuates disease in simian/HIV-challenged macaques**

Authors Pauza CD, Trivedi P, Wallace M, Ruckwardt TJ, Le Buanec H, Lu W, Bizzini B, Burny A, Zagury D, Gallo RC

Journal Proc Natl Acad Sci U S A 2000 Mar 28;97(7):3515-9

Objectives Challenge, Immunogenicity To study the role of tat by immunizing macaques with chemically inactivated tat toxoid and challenging animals intrarectally with SHIV89.6PD.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name inactivated Tat toxoid *Type:* Other *Routes:* Intradermal, Intramuscular

Vaccine Name rVaccinia-gp160 *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Vaccine Name soluble gp160 *Type:* Purified Viral Products *Route:* Intramuscular

Vaccine Name biologically active Tat protein *Type:* Purified Viral Products *Routes:* Intradermal, Intramuscular

Challenge SHIV89.6PD *Route:* Intrarectal
Main Findings

- Immune animals had significantly attenuated disease with lowered viral RNA, interferon-Alpha, and chemokine receptor expression (CXCR4 and CCR5) on CD4+ T cells, features linked to in vitro effects of Tat.
- Immunization with Tat toxoid inhibits key steps in viral pathogenesis.

NHP.79 (10936096) **Evaluation of immune responses induced by HIV-1 gp120 in rhesus macaques: effect of vaccination on challenge with pathogenic strains of homologous and heterologous simian human immunodeficiency viruses**
Authors Kumar A, Lifson JD, Silverstein PS, Jia F, Sheffer D, Li Z, Narayan O
Journal Virology 2000 Aug 15;274(1):149-64
Objectives Challenge, Immunogenicity To evaluate monomeric recombinant gp120 of HIV-1(LAI) (rgp120) vaccines against (SHIV(KU-2) and SHIV(89.6)P.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Monomeric rgp120 *Type:* Recombinant Subunit Protein *Route:* Intradermal
Challenge SHIV-KU2, SHIV89.6P *Route:* Intravenous
Main Findings

- All 8 vaccinated macaques developed high antibody titers against rgp120 that reacted efficiently with envelope proteins of homologous SHIVKU-2 and poorly with the SHIV89.6P envelope.
- Vaccinated macaques showed anamnestic antibody and T-helper cell responses, but T-helper responses were short-lived.
- After challenge, level of productive virus replication was indistinguishable between vaccine and control groups, suggesting that rgp120 did not confer protection against virus replication.

NHP.80 (10756013) **Evidence for viral virulence as a predominant factor limiting human immunodeficiency virus vaccine efficacy**
Authors Mooij P, Bogers WM, Oostermeijer H, Koornstra W, Ten Haaft PJ, Verstrepen BE, Van Der Auwera G, Heeney JL
Journal J Virol 2000 May;74(9):4017-27
Objectives Challenge, Immunogenicity Using vaccination with CCR5 binding envelope of HIV-1W6.1D to determine if virus virulence or genetic distance had a greater impact on HIV-1 vaccine efficacy against SHIV challenge (rhesus macaques).
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name rgp120W6.1D *Type:* Recombinant Subunit Protein
Challenge SHIV.W6.1D, SHIV.SF13, SHIVHan2, SHIV89.6P *Route:*
Main Findings

- Protection from either of the divergent SHIVsf13 or SHIVhan2 challenges was demonstrated in the majority of the vaccinated animals.
- Second challenge with the virulent SHIV89.6p achieved protection in only one of the previously protected vaccinees.
- Immunization beneficial to viral load and CD4+ T-cell counts, but failed to protect from infection.

NHP.81 (11689887) **Protection of rhesus macaques against disease progression from pathogenic SHIV-89.6PD by vaccination with phage-displayed HIV-1 epitopes**
Authors Chen X, Scala G, Quinto I, Liu W, Chun TW, Justement JS, Cohen OJ, vanCott TC, Iwanicki M, Lewis MG, Greenhouse J, Barry T, Venzon D, Fauci AS
Journal Nat Med 2001 Nov;7(11):1225-31
Objectives Challenge, Immunogenicity To test an array of HIV-specific epitopes that behave as antigenic mimics (mimotopes) of conformational epitopes of gp120 and gp41 proteins for clades A-F.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name gp120/gp41 mimotopes *Type:* Synthetic Protein/Peptide *Route:* Intramuscular
Challenge SHIV89.6PD *Route:* Intravenous
Main Findings

- Upon intravenous challenge with 60 MID50 of pathogenic SHIV-89.6PD, phage-borne epitopes elicit envelope-specific antibody responses.

- 4/5 mimotope-immunized monkeys had lower levels of peak viremia, followed by viral set points of undetectable or transient levels of viremia, mild decline of CD4+ T cells, protection from progression to AIDS-like illness.

NHP.82.1 (10196297) **Protection of Macaques against pathogenic simian/human immunodeficiency virus 89.6PD by passive transfer of neutralizing antibodies**

Authors Mascola JR, Lewis MG, Stiegler G, Harris D, VanCott TC, Hayes D, Louder MK, Brown CR, Sapan CV, Frankel SS, Lu Y, Robb ML, Katinger H, Birx DL

Journal J Virol 1999 May;73(5):4009-18

Objectives Challenge, Immunogenicity Used a chimeric SHIV based on the envelope of a primary isolate (HIV-89.6) to perform passive-transfer experiments and study the role of anti-envelope antibodies in protection (rhesus macaques).

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Monoclonal antibody 2G12 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Monoclonal antibody 2F5 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name HIVIG *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV89.6PD *Route:* Intravenous

Main Findings

- 3/6 animals given HIVIG/2F5/2G12 were completely protected; the remaining 3 animals became SHIV infected but displayed reduced plasma viremia and near normal CD4(+)-cell counts.
- 1/3 monkeys given 2F5/2G12 exhibited only transient evidence of infection; 2/3 had marked reductions in viral load.
- All monkeys that received HIVIG, 2F5, or 2G12 alone became infected and developed high-level plasma viremia.
- General correlation between in vitro neutralization and protection.

NHP.82.2 (10196297) **Protection of Macaques against pathogenic simian/human immunodeficiency virus 89.6PD by passive transfer of neutralizing antibodies**

Authors Mascola JR, Lewis MG, Stiegler G, Harris D, VanCott TC, Hayes D, Louder MK, Brown CR, Sapan CV, Frankel SS, Lu Y, Robb ML, Katinger H, Birx DL

Journal J Virol 1999 May;73(5):4009-18

Objectives Challenge, Immunogenicity, Passive Immunization Used a chimeric SHIV based on the envelope of a primary isolate (HIV-89.6) to perform passive-transfer experiments and study the role of anti-envelope antibodies in protection.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Monoclonal antibody 2G12 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Monoclonal antibody 2F5 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name HIVIG *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV89.6PD *Route:* Intravenous

NHP.83 (10772996) **Passive infusion of immune serum into simian immunodeficiency virus-infected rhesus macaques undergoing a rapid disease course has minimal effect on plasma viremia**

Authors Binley JM, Clas B, Gettie A, Vesanen M, Montefiori DC, Sawyer L, Booth J, Lewis M, Marx PA, Bonhoeffer S, Moore JP

Journal Virology 2000 Apr 25;270(1):237-49

Objectives Immunotherapy, Passive Immunization To investigate the role of passive immunization in controling viremia and disease progression in infected macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVIG-1 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name SIVIG-2 *Type:* Passive Antibody *Route:* Intravenous

Main Findings

- Despite restoring anti-SIV titers to levels typical of macaques with a normal disease course, SIVIG had only a modest effect on plasma SIV RNA and cell-associated viral load.
- The kinetics of the viremia changes are inconsistent with neutralization of new cycles of infection. More likely, perhaps unexpectedly, is that infused antibodies killed SIV-infected cells, via an effector mechanism such as antibody-dependent cellular cytotoxicity

---

NHP.84 (10468614) **Postexposure immunoprophylaxis of primary isolates by an antibody to HIV receptor complex**

Authors Wang CY, Sawyer LS, Murthy KK, Fang X, Walfield AM, Ye J, Wang JJ, Chen PD, Li ML, Salas MT, Shen M, Gauduin MC, Boyle RW, Koup RA, Montefiori DC, Mascola JR, Koff WC, Hanson CV

Journal Proc Natl Acad Sci U S A 1999 Aug 31;96(18):10367-72

Objectives Immunotherapy To evaluate neutralizing activity of mAb B4, a monoclonal antibody directed against HIV receptor complex.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Vaccine Name mAb B4 *Type:* Passive Antibody

Challenge HIV-1.DH12 *Route:* Intravenous

Main Findings

- mAb B4 preferentially neutralized primary HIV-1 isolates, including syncytium-inducing(si) and non-si phenotypes, for subtypes A-G and HIV-2, SIV, SHIV.
- Neutralization demonstrated in both pre- and postinfection models.
- Administration of mAb B4 after infectious challenge totally interrupted the infection of hu-PBL-severe combined immunodeficient mice by PBL-grown HIV-1 and the infection of chimpanzees by chimp-adapted HIV-1.

NHP.85 (10655110) **Human neutralizing monoclonal antibodies of the IgG1 subtype protect against mucosal simian-human immunodeficiency virus infection**

Authors Baba TW, Liska V, Hofmann-Lehmann R, Vlasak J, Xu W, Ayehunie S, Cavacini LA, Posner MR, Katinger H, Stiegler G, Bernacky BJ, Rizvi TA, Schmidt R, Hill LR, Keeling ME, Lu Y, Wright JE, Chou TC, Ruprecht RM

Journal Nat Med 2000 Feb;6(2):200-6

Objectives Challenge, Passive Immunization To evaluate triple combination of the human IgG1 monoclonal antibodies F105, 2G12 and 2F5, which neutralize SHIV-vpu+, a chimeric simian-human virus that encodes the env gene of HIV-IIIB, to develop immunoprophylaxis against intrapartum HIV-1 transmission.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name F105/2G12/2F5 mab *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV-vpu+ *Route:* Intravenous, Oral

Main Findings

- Four pregnant macaques treated with a triple combination of mab F105, 2G12 and 2F5 were protected from SHI-vpu+ challenge.
- Infants treated with the mab triple combination at birth and and challenged orally: no evidence of infection in any infant during 6 months of follow-up.
- Epitopes recognized by the three monoclonal antibodies are important determinants for achieving substantial protection.

NHP.86.1 (9930869) **Neutralizing antibody directed against the HIV-1 envelope glycoprotein can completely block HIV-1/SIV chimeric virus infections of macaque monkeys**

Authors Shibata R, Igarashi T, Haigwood N, Buckler-White A, Ogert R, Ross W, Willey R, Cho MW, Martin MA

Journal Nat Med 1999 Feb;5(2):204-10

Objectives Challenge, Passive Immunization To assess whether HIV-1 envelope-specific antibodies confer resistance against primate lentivirus infections (pigtailed macaques).

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Anti-HIV-1 ch4750 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Anti-HIV-1 ch1206 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Anti-HIV-1 ch911 *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV-MD14YE (DH12) *Route:* Intravenous

Main Findings

- In pigtailed macaques passively immunized with HIV-1 specific antibodies from chimpanzees, anti-SHIV neutralizing activity is the absolute requirement for antibody-mediated protection.
- Ti ter in plasma for complete protection of SHIV-challenged macaques in range of 1:5-1:8.

- HIV-1-specific nab studied are able to bind to native gp120 present on infectious virus particles.
- Administration of non-neutralizing anti-HIV IgG neither inhibited nor enhanced a subsequent SHIV infection

---

NHP.86.2 (9930869) **Neutralizing antibody directed against the HIV-1 envelope glycoprotein can completely block HIV-1/SIV chimeric virus infections of macaque monkeys**

Authors Shibata R, Igarashi T, Haigwood N, Buckler-White A, Ogert R, Ross W, Willey R, Cho MW, Martin MA

Journal Nat Med 1999 Feb;5(2):204-10

Objectives Challenge, Immunogenicity, Passive Immunization .

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Anti-HIV-1 ch1206 *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV-MD14YE (DH12) *Route:* Intravenous

NHP.87 (10082123) **Passively administered neutralizing serum that protected macaques against infection with parenterally inoculated pathogenic simian-human immunodeficiency virus failed to protect against mucosally inoculated virus**

Authors Joag SV, Li Z, Wang C, Foresman L, Jia F, Stephens EB, Zhuge W, Narayan O

Journal AIDS Res Hum Retroviruses 1999 Mar 1;15(4):391-4

Objectives Challenge, Immunogenicity, Passive Immunization To determine whether passive immunization with neutralizing serum would protect macaques against infection with pathogenic SHIV following oral inoculation of the virus.

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Anti-SHIV Plasma *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV.KU1 *Route:* Oral

Main Findings

- Ten pigtail macaques were inoculated orally with one animal infectious dose of SHIV(KU-1). Four of the 10 had been given pooled anti-SHIV plasma (15 ml/kg) 24 hr earlier, 4 others were given the same dose of anti-SHIV plasma 2 hr after virus challenge, and the 2 remaining animals were used as controls.
- The neutralizing antibodies failed to protect macaques against infection after mucosal challenge with SHIV(KU-1)

NHP.88 (11907251) **Tat-vaccinated macaques do not control simian immunodeficiency virus SIVmac239 replication**

Authors Allen TM, Mortara L, Mothe BR, Liebl M, Jing P, Calore B, Piekarczyk M, Ruddersdorf R, O'Connor DH, Wang X, Wang C, Allison DB, Altman JD, Sette A, Desrosiers RC, Sutter G, Watkins DI

Journal J Virol 2002 Apr;76(8):4108-12

Objectives Challenge, Immunogenicity To assess the role of Tat-specific CTL in controlling pathogenic SIVmac239 replication after using a DNA-prime, vaccinia virus Ankara-boost vaccine regimen.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name MVA-SIV239tat *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Vaccine Name MVA-SIVSL8-tat28-35 *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal

Vaccine Name MVA-SIV251 32H tat *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intrarectal, Intradermal

Challenge SIVmac239 *Route:* Intrarectal

Main Findings

- Despite the induction of Tat-specific CTL, there was no significant reduction in either peak or viral set point in animals immunized with a DNA-prime, vaccinia virus Ankara-boost vaccine regimen and challenged with SIVmac239 compared to controls.

NHP.89 (12021347) **Critical role for Env as well as Gag-Pol in control of a simian-human immunodeficiency virus 89.6P challenge by a DNA prime/recombinant modified vaccinia virus Ankara vaccine**

Authors Amara RR, Smith JM, Staprans SI, Montefiori DC, Villinger F, Altman JD, O'Neil SP, Kozyr NL, Xu Y, Wyatt LS, Earl PL, Herndon JG, McNicholl JM, McClure HM, Moss B, Robinson HL

Journal J Virol 2002 Jun;76(12):6138-46
Objectives Challenge, Immunogenicity To test Gag-Pol DNA priming and Gag-Pol rMVA boosting to evaluate the contribution of anti-Env immune responses to viral control.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pGA1-gag-pol DNA vaccine *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intradermal
Vaccine Name rMVA SIV239 gag-pol *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular
Challenge SHIV89.6P *Route:* Intrarectal
Main Findings

- Gag-specific T cell response to a gag-pol DNA vaccine was similar to those raised against the gag-pol-env vaccine and were capable of controlling challenge infection with SHIV89.6P.
- The control of the SHIV 89.6P challenge was delayed and inconsistent in the Gag-Pol-vaccinated group and all of the animals underwent severe and, in most cases, sustained loss of CD4(+) cells.
- Most of the lost CD4(+) cells in the Gag-Pol-vaccinated group were uninfected cells, suggesting that the rapid appearance of binding antibody for Env in Gag-Pol-Env-vaccinated animals helped protect uninfected CD4(+) cells from Env-induced apoptosis.

NHP.90.1 (12009868) **Comparison of vaccine strategies using recombinant env-gag-pol MVA with or without an oligomeric Env protein boost in the SHIV rhesus macaque model**

Authors Earl PL, Wyatt LS, Montefiori DC, Bilska M, Woodward R, Markham PD, Malley JD, Vogel TU, Allen TM, Watkins DI, Miller N, Moss B
Journal Virology 2002 Mar 15;294(2):270-81
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name rMVASIV239gagpol.HIV89.6env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Vaccine Name Oligomeric HIV-1.89.6 gp140 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge SHIV89.6 *Route:* Intravenous
Main Findings

- All control and vaccinated animals except one became infected. However, the levels of viremia were as follows: controls >rMVA alone > rMVA >protein. The differences were statistically significant between immunized and control groups but not between the two immunized groups.
- A relationship between vaccine-induced antibody titers and reduction in virus burden was observed.

NHP.90.2 (12009868) **Comparison of vaccine strategies using recombinant env-gag-pol MVA with or without an oligomeric Env protein boost in the SHIV rhesus macaque model**

Authors Earl PL, Wyatt LS, Montefiori DC, Bilska M, Woodward R, Markham PD, Malley JD, Vogel TU, Allen TM, Watkins DI, Miller N, Moss B
Journal Virology 2002 Mar 15;294(2):270-81
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name rMVASIV239gagpol.HIV89.6env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Vaccine Name Oligomeric HIV-1.89.6 gp140 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge SHIV89.6P *Route:* Intravenous
Main Findings

- All animals became infected.
- The vaccinated group exhibited a 5-fold reduction in peak viremia and a 10-fold reduction in the postacute phase viremia in comparison to the controls.
- All of the controls required euthanasia by 10 mpc. A relationship between vaccine-induced antibody titers and reduction in virus burden was observed in both studies.

- Immunization with MVA/SHIV89.6 alone or with a protein boost stimulated both arms of the immune system and resulted in significant control of viremia and delayed progression to disease after challenge with SHIV-89.6P

NHP.92 (12111421) **Characterization of simian and human immunodeficiency chimeric viruses re-isolated from vaccinated macaque monkeys after challenge infection**

Authors Kwofie TB, Miura T, Ibuki K, Enose Y, Suzuki H, Ui M, Kuwata T, Hayami M

Journal Arch Virol 2002 Jun;147(6):1091-104

Objectives Challenge, Immunogenicity To examine the biological properties of circulating viruses whose replication has been suppressed in vaccinated monkeys.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Monkeys vaccinated with nef-deleted SHIVs were either fully or partially protected against challenge with acute pathogenic SHIV-89.6 P
- Though the vaccination did not completely prevent the replication of the challenge virus in the monkeys it did contain the challenge virus by suppressing the pathogenic variants.

NHP.93 (12100017) **Spontaneous production of RANTES and antigen-specific IFN-gamma production in macaques vaccinated with SHIV-4 correlates with protection against SIVsm challenge**

Authors Ahmed RK, Makitalo B, Karlen K, Nilsson C, Biberfeld G, Thorstensson R

Journal Clin Exp Immunol 2002 Jul;129(1):11-8

Objectives Challenge, Immunogenicity To investigate the production of beta-chemokines in eight cynomolgus macaques vaccinated with non-pathogenic SHIV-4 in relation to protection against pathogenic SIVsm challenge.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name SHIV-4 *Type:* Live Virus *Route:* Intravenous

Challenge SIVsm *Route:* Intrarectal

Main Findings

- 2/8 vaccinated monkeys were completely protected and one was partially protected against the challenge virus.
- The monkeys that resisted infectious SIVsm virus challenge showed higher spontaneous beta-chemokine production by peripheral blood mononuclear cells and had higher numbers of antigen-induced IFN-gamma secreting cells compared to the non-protected animals
- The genetic background of the host and/or environmental factors are involved in the chemokine production and beta-chemokines contribute to protection against HIV/SIV infection.

NHP.94 (1281660) **Vaccination of macaques with SIV conserved envelope peptides suppressed infection and prevented disease progression and transmission**

Authors Shafferman A, Lewis MG, McCutchan FE, Benveniste RE, Jahrling PB, Hickman RL, Lai CY, Burke DS, Eddy GA

Journal AIDS Res Hum Retroviruses 1992 Aug;8(8):1483-7

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVenv-Bgal peptides *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge SIV(Mne) clone E11S *Route:* Intravenous

Main Findings

- Vaccinated macaques became transiently viremic following challenge with SIVmne.
- Lymph nodes from all vaccinated macaques remain SIV-PCR positive.
- Lymph nodes and whole blood from vaccinated macaques challenged with SIV could not transmit SIV to naive macaques.

NHP.95.1 (1433263) **Comparison of protection from homologous cell-free vs cell-associated SIV challenge afforded by inactivated whole SIV vaccines**

Authors Heeney JL, de Vries P, Dubbes R, Koornstra W, Niphuis H, ten Haaft P, Boes J, Dings ME, Morein B, Osterhaus AD

Journal J Med Primatol 1992 Feb-May;21(2-3):126-30

Objectives Challenge, Immunogenicity To determine if SIV vaccines could protect against challenge with PBMCs from an SIV infected rhesus monkeys.

Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings
- 100% SIV vaccinated animals challenged with the 11-88 cell-free stock of SIVmac32H were protected, whereas only 50% of the SIV vaccinated monkeys receiving the same infectious dose of the 1XC cell stock were protected

---

NHP.95.2 (1466991) **Comparison of protection afforded by whole virus ISCOM versus MDP adjuvanted formalin-inactivated SIV vaccines from IV cell-free or cell-associated homologous challenge**
Authors Osterhaus A, de Vries P, Morein B, Akerblom L, Heeney J
Journal AIDS Res Hum Retroviruses 1992 Aug;8(8):1507-10
Objectives Challenge, Immunogenicity To test SIV-ISCOM and SIV-MDP adjuvanted vaccines for their potential to induce protection from intravenous homologous SIV challenge in rhesus monkeys.
Main Findings
- 7/7 monkeys vaccinated 4x over a 4-month period with the SIV-ISCOM or the SIV-MDP vaccine were protected from developing viremia during a three-month observation period since intravenous challenge with 10 MID50 cell-free SIVmac251(32H).
- 2/4 and 2/4 monkeys in 2 other groups of 4 monkeys vaccinated in the same way with either of these vaccines, then challenged (intravenously with 10 MID50 of SIVmac251(32H)-infected PBMC of a rhesus monkey) were protected.
- All the control animals vaccinated with measles virus ISCOMS or MDP adjuvanted measles virus antigen were infected upon challenge.
- Conclusion: vaccinated previously unchallenged nonhuman primates can be protected from infection with lentivirus-infected PBMC from another animal. Serological analysis indicated that SIV-specific serum antibody titers were considerably higher in SIV-ISCOM vaccinated animals than in the SIV-MDP vaccinated animals

---

NHP.96 (1346285) **Intrarectal challenge of macaques vaccinated with formalin-inactivated simian immunodeficiency virus**
Authors Cranage MP, Baskerville A, Ashworth LA, Dennis M, Cook N, Sharpe S, Farrar G, Rose J, Kitchin PA, Greenaway PJ
Journal Lancet 1992 Feb 1;339(8788):273-4
Objectives Challenge, Immunogenicity To test the immunogenicity and efficacy of a formalin-inactivated SIV in rhesus macaques.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings
- 4 rhesus macaques vaccinated with a formalin-inactivated SIV given intramuscularly were protected from challenge up to 10 mpc.

NHP.97 (1466966) **Immunization of rhesus monkeys with high- and low-dose Tween-ether-disrupted SIVMAC**
Authors Voss G, Stahl-Hennig C, Petry H, Coulibaly C, Nick S, Fuchs D, Wachter H, Luke W, Hunsmann G
Journal AIDS Res Hum Retroviruses 1992 Aug;8(8):1397-400
Objectives Challenge, Immunogenicity To test the immunogenicity and protection from challenge induced by a low dose of tween-ether-disrupted SIVmac251.32H.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac251/32H (Tween/Ether) *Type:* Whole (killed) Inactivated Virus
Challenge SIVmac251(32H) *Route:*
Main Findings
- 3/3 naive controls infected 14 dpc (increased neopterin levels correlated with infection).
- 4/7 protected from infection.

NHP.98 (10759543) **Augmentation of immune responses to HIV-1 and simian immunodeficiency virus DNA vaccines by IL-2/Ig plasmid administration in rhesus monkeys**
Authors Barouch DH, Craiu A, Kuroda MJ, Schmitz JE, Zheng XX, Santra S, Frost JD, Krivulka GR, Lifton MA, Crabbs CL, Heidecker G, Perry HC, Davies ME, Xie H, Nickerson CE, Steenbeke TD, Lord CI, Montefiori DC, Strom TB, Shiver JW, Lewis MG, Letvin NL
Journal Proc Natl Acad Sci U S A 2000 Apr 11;97(8):4192-7

Objectives Immunogenicity To investigate whether DNA vaccine-elicited immune responses in rhesus monkeys could be augmented by using either an IL-2/Ig fusion protein or a plasmid expressing IL-2/Ig.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac239 gag DNA *Type:* DNA *Route:* Intramuscular
Vaccine Name HIV-1.89.6P env DNA *Type:* DNA *Route:* Intramuscular
Main Findings

- The administration of both IL-2/Ig protein and IL-2/Ig plasmid induced a significant and sustained in vivo activation of peripheral T cells in the vaccinated monkeys.
- The monkeys that received IL-2/Ig plasmid generated 30-fold higher Env-specific antibody titers and 5-fold higher Gag-specific, tetramer-positive CD8+ T cell levels than the monkeys receiving the DNA vaccines alone.
- IL-2/Ig protein also augmented the vaccine-elicited immune responses, but less effectively than IL-2/Ig plasmid.
- Augmentation of the immune responses by IL-2/Ig was evident after the primary immunization and increased with subsequent boost immunizations.

NHP.99.1 (11713828) **Cytokine-induced augmentation of DNA vaccine-elicited SIV-specific immunity in rhesus monkeys**
Authors Barouch DH, Letvin NL
Journal Dev Biol (Basel) 2000;104:85-92
Objectives Immunogenicity To investigate the ability of an IL-2/lg cytokine fusion protein and a plasmid expressing IL-2/lg to augment immune responses in rhesus monkeys induced by DNA vaccines encoding SIV gag and HIV-1 env 89.6P.
Main Findings

- Both IL-2/lg protein and IL-2/lg plasmid augment DNA vaccine-elicited antibody and CTL responses.
- The most consistent and dramatic augmentation was observed using the IL-2/lg plasmid.

NHP.99.2 (1466966) **Immunization of rhesus monkeys with high- and low-dose Tween-ether-disrupted SIVMAC**
Authors Voss G, Stahl-Hennig C, Petry H, Coulibaly C, Nick S, Fuchs D, Wachter H, Luke W, Hunsmann G
Journal AIDS Res Hum Retroviruses 1992 Aug;8(8):1397-400
Objectives Challenge, Immunogenicity To test the immunogenicity and protection from challenge induced by a HIGH dose of tween-ether-disrupted SIVmac251.32H.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac251/32H (Tween/Ether) *Type:* Whole (killed) Inactivated Virus
Challenge SIVmac251(32H) *Route:*
Main Findings

- 3/3 naive historic controls infected 14 dpc.
- 4/5 protected from infection.

NHP.100 (11085584) **Maturation of envelope-specific antibody responses to linear determinants in monkeys inoculated with attenuated SIV**
Authors Cole KS, Paliotti MJ, Murphey-Corb M, Montelaro RC
Journal J Med Primatol 2000 Aug;29(3-4):220-30
Objectives Immunogenicity To characterize the evolution of antibody responses to define linear determinants of the SIV envelope protein.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIV 17E-CL *Type:* Recombinant Live Attenuated Virus *Route:* Intravenous
Main Findings

- Antibodies to certains envelope peptide domains have different patterns of antibody maturation to distinct linear envelope antigenic determinants.
- Potential for domain-specific serology to produce a high-resolution characterization of SIV-specific antibody responses that can be used to evaluate experimental vaccine responses and to identify potential immune correlates of protection.

NHP.101 (10954580) **Induction of mucosal homing virus-specific CD8(+) T lymphocytes by attenuated simian immunodeficiency virus**

Authors Cromwell MA, Veazey RS, Altman JD, Mansfield KG, Glickman R, Allen TM, Watkins DI, Lackner AA, Johnson RP
Journal J Virol 2000 Sep;74(18):8762-6
Objectives Immunogenicity To determine if virus-specific CD8+ lymphocytes induced in rhesus macaques by immunization with attenuated SIV express the mucosa-homing receptor $\alpha 4\beta 7$ (and traffic to the intestinal mucosa).
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac251ΔNef *Type:* Live Attenuated Virus *Route:* Intravenous
Main Findings

- Virus-specific CD8+ T cells are induced by immunization with attenuated SIV express $\alpha 4\beta 7$ and home to mucosal sites, whereas those induced by a DNA-MVA vaccine lack expression of the intestinal homing receptor.
- SIV-specific CD8+ T lymphocytes expressing $\alpha 4\beta 7$ by a vaccine approach that replicates in mucosal tissue suggest that induction of virus-specific lymphocytes that are able to home to mucosal sites may be an important characteristic of asuccessful AIDS vaccine

---

NHP.102 (10856795) **Anti-major histocompatibility complex antibody responses in macaques via intradermal DNA immunizations**
Authors Dela Cruz CS, MacDonald KS, Barber BH
Journal Vaccine 2000 Jul 15;18(27):3152-65
Objectives Immunogenicity To determine if DNA immunization with class I and class II MHC-encoding plasmids elicite xenogeneic and allogeneic antibody response against conformationally intact MHC molecules in rhesus macaques.
Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca fascicularis (cynomolgus macaque)
Main Findings

- Intradermal immunizations of non-human primates with plasmid DNA encoding human MHC alleles can safely elicit xenogeneic anti-MHC antibody responses.
- DNA encoding a specific macaque allogeneic MHC induced anti-allogeneic MHC antibodies production.

NHP.103 (10763887) **Control of viral replication and disease onset in cynomolgus monkeys by HIV-1 TAT vaccine**
Authors Ensoli B, Cafaro A
Journal J Biol Regul Homeost Agents 2000 Jan-Mar;14(1):22-6
Objectives Challenge, Immunogenicity To test the hypothesis that humoral and cellular anti-Tat immunity have a protective role and may control disease progression.
Main Findings

- High titers of anti-Tat antibodies capable of neutralizing Tat activity and the in vitro infection with the SHIV89.6P, Tat-specific proliferation, CTLs, TNFalpha production and skin tests were detected in the vaccinated monkeys.
- Upon challenge with the highly pathogenic SHIV89.6P (10 MID50, i.v.), 5/7 of the vaccinated monkeys showed no signs of infection nor CD4+-T cell decline over 19 months of follow-up, whereas 3/3 controls were highly infected.

NHP.104 (10729127) **Evidence for recombination of live, attenuated immunodeficiency virus vaccine with challenge virus to a more virulent strain**
Authors Gundlach BR, Lewis MG, Sopper S, Schnell T, Sodroski J, Stahl-Hennig C, Uberla K
Journal J Virol 2000 Apr;74(8):3537-42
Objectives Challenge, Immunogenicity To increase the immunogenicity of the vaccine virus with IL-2 and to investigate whether a recombination event between the vaccine and challenge viruses could explain the negative effect of vaccination with live, attenuated immunodeficiency viruses.
Main Findings

- Detection of recombination between a live attenuated vaccine and the challenge strain resulting in a more adverse clinical outcome in vaccinated animals.
- 3 of the vaccinated macaques developed higher set point viral load levels than unvaccinated control monkeys. 2 of these vaccinated monkeys developed AIDS, while the control monkeys infected in parallel remained asymptomatic.
- Emergence of more-virulent recombinants of live, attenuated viruses and less-aggressive wild-type viruses is an additional risk of live, attenuated immunodeficiency virus vaccines

---

NHP.105 (11713807) **DNA vaccine protection against challenge with simian/human immunodeficiency virus 89.6 in rhesus macaques**

Authors Habel A, Chanel C, Le Grand R, Martinon F, Couillin L, Moog C, Doms R, Gauduin MC, Hurtrel B, Guillet JG, Aubertin AM, Girard M

Journal Dev Biol (Basel) 2000;104:101-5

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- 6/6 control monkeys became infected with challenge strain (SHIV89.6, 750 TCID50).
- In monkeys immunized with DNA only: 5/6 had challenge virus recovered by co-cultivation; in the DNA-protein group 2/6 were culture positive.
- Rechallenge using 600TCID50 of pathogenic SHIV-89.6P. A rapid CD4 cell count decline in the 4 control monkeys as well as in the monkey vaccinated with DNA only, but not 4 animals immunized with DNA + protein.
- No virus was recovered from PBMC in two of these monkeys, and viral RNA loads in plasma were greatly reduced in three of them as compared with the controls. Absence of virus in PBMC was ascertained by whole blood transfusion to naive recipients. Altogether, this shows that the DNA prime-protein boost vaccine regimen could provide some protection against mucosal SHIV infection in rhesus monkeys, whereas DNA alone was ineffective.

NHP.106 (10792505) **Up-regulation of beta-chemokines and down-modulation of CCR5 co-receptors inhibit simian immunodeficiency virus transmission in non-human primates**

Authors Lehner T, Wang Y, Cranage M, Tao L, Mitchell E, Bravery C, Doyle C, Pratt K, Hall G, Dennis M, Villinger L, Bergmeier L

Journal Immunology 2000 Apr;99(4):569-77

Objectives Challenge, Immunogenicity To evaluate in vivo the mechanism of protection from SIV that involves up-regulation of chemokines, which bind and may down-modulate the CCR5 coreceptors, thereby preventing transmission.

Species/Subspecies -

Vaccine Name rSIV-gp120 protein *Type:* Recombinant Subunit Protein *Route:* Subcutaneous

Vaccine Name Recombinant p27 *Type:* Recombinant Subunit Protein *Route:* Subcutaneous

Challenge SIVmac220 *Route:* Intrarectal

Main Findings

- Immunization induced significant increases in the concentrations of CD8 cell-derived suppressor factor (CD8SF), regulated on activation normal T cells expressed and secreted (RANTES), macrophage inflammatory protein (MIP)1 and MIP1, and down-modulation of the proportion of cells expressing CCR5 ($r = 0.737$, $P < 0.05$)
- In vivo immunization up-regulates chemokines, which may down-modulate CCR5 coreceptors, and both functions are significantly correlated with the viral load

---

NHP.107 (12359422) **Immunization of Macaques with Live Simian Human Immunodeficiency Virus (SHIV) Vaccines Conferred Protection Against AIDS Induced by Homologous and Heterologous SHIVs and Simian Immunodeficiency Virus**

Authors Kumar A, Mukherjee S, Shen J, Buch S, Li Z, Adany I, Liu Z, Zhuge W, Piatak M, Lifson J, McClure H, Narayan O

Journal Virology 2002 Sep 30;301(2):189

Objectives Challenge, Immunogenicity To evaluate the vaccine potential of SHIVs attenuated by deletion of viral accessory genes.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name DeltavpuDeltaNefSHIV-4 *Type:* Live Attenuated Virus *Route:* Subcutaneous

Vaccine Name DeltavpuSHIV-ppc *Type:* Live Attenuated Virus *Routes:* Oral, Subcutaneous

Challenge SHIV-KU2, SIVmacR71, SHIV89.6P *Route:* Intrarectal

Main Findings

- No virological evidence of productive infection with the vaccine strains.
- 7/7 animals developed binding as well as neutralizing antibodies.

- Virus-specific CTLs that recognized homologous as well as heterologous pathogenic SHIVs and SIV, and also soluble inhibitory factors that blocked the in vitro replication of the vaccine strains and different challenge viruses.
- 2/2 control animals were infected, succomed to AIDS upon challenge.
- 7/7 vaccinees were also infected with challenge viruses, but peak VL were 2-5 lower than in the control and later plasma viral RNA became undetectable in vaccinees (in lymph nodes of 6/7 vaccinees, SHIV89.6P in 5/7, and SHIVKU in 3/7 animals).

NHP.108 (10839807) **Effects of in vivo CD8(+) T cell depletion on virus replication in rhesus macaques immunized with a live, attenuated simian immunodeficiency virus vaccine**

Authors Metzner KJ, Jin X, Lee FV, Gettie A, Bauer DE, Di Mascio M, Perelson AS, Marx PA, Ho DD, Kostrikis LG, Connor RI

Journal J Exp Med 2000 Jun 5;191(11):1921-31

Objectives Challenge, Immunogenicity To investigate the role of CD8(+) T lymphocytes in controlling replication of live, attenuated simian immunodeficiency virus (SIV) as part of a vaccine study to examine the correlates of protection in the SIV/rhesus macaque model.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac251Δnef *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVmac251 *Route:* Intravenous

Main Findings

- CD8+ T cell depletion was associated with a 1-2 log increase in SIVmac239-nef plasma viremia.
- Control of SIVmac239-nef replication was temporally associated with the recovery of CD8+ T cells between days 8 and 10. The challenge virus, SIVmac251, was not detectable in either the plasma or lymph nodes after depletion of CD8+ T cells.
- CD8+ T cells play an important role in controlling replication of live, attenuated SIV in vivo.

NHP.109 (10612675) **Simian immunodeficiency virus-specific cytotoxic T lymphocytes and protection against challenge in rhesus macaques immunized with a live attenuated simian immunodeficiency virus vaccine**

Authors Nixon DF, Donahoe SM, Kakimoto WM, Samuel RV, Metzner KJ, Gettie A, Hanke T, Marx PA, Connor RI

Journal Virology 2000 Jan 5;266(1):203-10

Objectives Challenge, Immunogenicity To examine the role of SIV-specific CTLs in macaques immunized with an attenuated strain of simian immunodeficiency virus (SIVmac239Deltanef) in protection against pathogenic challenge with SIVmac251.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239-Δnef *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SIVmac251 *Route:* Intravenous

Main Findings

- Attenuated SIVmac239Deltanef can elicit specific CTL precursor cells (CTLp), but no correlation was observed between breadth or strength of CTLp response to structural proteins SIV-Env, -Gamg or -Pol and protection against infection.
- The low level of Mamu-A*01/p11C, C-M-specific CTLs induced through attenuated SIVmac239Deltanef vaccination increased in the absence of detectable SIVmac251 or SIVmac239Deltanef proviral DNA.

NHP.110 (9371609) **Identification of the V1 region as a linear neutralizing epitope of the simian immunodeficiency virus SIVmac envelope glycoprotein**

Authors Jurkiewicz E, Hunsmann G, Schaffner J, Nisslein T, Luke W, Petry H

Journal J Virol 1997 Dec;71(12):9475-81

Objectives Immunogenicity To investigate the role of the V1 in neutralization.

Species/Subspecies Macaca mulatta (Rhesus macaque)

NHP.111 (10644340) **Antiretroviral therapy during primary immunodeficiency virus infection can induce persistent suppression of virus load and protection from heterologous challenge in rhesus macaques**

Authors Rosenwirth B, ten Haaft P, Bogers WM, Nieuwenhuis IG, Niphuis H, Kuhn EM, Bischofberger N, Heeney JL, Uberla K

Journal J Virol 2000 Feb;74(4):1704-11
Objectives Challenge, Immunogenicity To study rhesus macaques with the pathogenic simian/human immunodeficiency virus RT-SHIV and treat them with the antiretroviral drug (R)-9-(2-phosphonylmethoxypropyl)adenine (PMPA) for 8 weeks starting 7 or 14 days postinfection.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name RT-SHIV *Type:* Live Virus *Route:* Intravenous
Main Findings

- Rhesus macaques inoculated with the pathogenic RT-SHIV then treated with the antiretroviral drug (R)-9-(2-phosphonylmethoxypropyl)adenine (PMPA) for 8 weeks starting 7 or 14 days postinfection, showed suppressed viral replication efficiently.
- Suppression of viral replication was transient in 4/6 monkeys.
- The challenge of the monkeys with better out come with SIV(8980) shows that both monkeys proved to be protected against the heterologous virus.

NHP.112 (9765452) **Oral immunization of macaques with attenuated vaccine virus induces protection against vaginally transmitted AIDS**
Authors Joag SV, Liu ZQ, Stephens EB, Smith MS, Kumar A, Li Z, Wang C, Sheffer D, Jia F, Foresman L, Adany I, Lifson J, McClure HM, Narayan O
Journal J Virol 1998 Nov;72(11):9069-78
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca (sp)
Vaccine Name DeltavpuDeltaNefSHIV-4 *Type:* Live Attenuated Virus *Route:* Subcutaneous
Vaccine Name DeltavpuSHIV-ppc *Type:* Live Attenuated Virus *Route:* Oral
Challenge SHIV.KU1 *Route:* Oral, Vaginal or perivaginal
Main Findings

- 4/4 controls developed low CD4+ T-cell counts (<200/µl) and AIDS.
- 12/12 vaccinees became infected with SHIVKU-1, and two in group 1 developed a persistent productive infection followed by development of AIDS in one. The other 10 maintained almost complete control over virus replication
- First demonstration of protection against virulent SHIV administered by the intravaginal route. Thus, sexually transmitted HIV disease can be prevented by parenteral or oral immunization

---

NHP.113 (11054270) **Characterization of immune escape viruses from a macaque immunized with live-virus vaccine and challenged with pathogenic SHIVKU-1**
Authors Stipp HL, Kumar A, Narayan O
Journal AIDS Res Hum Retroviruses 2000 Oct 10;16(15):1573-80
Objectives Challenge To characterize immune escape viruses (SHIV(KU-1/105w52) and SHIV(KU-1/105w98)) from a macaque immunized with DeltavpuDeltanef SHIV-4 and challenged with pathogenic SHIV(KU-1).
Main Findings

- The two newly identified escape variant viruses could not be neutralized by anti-SHIV(KU-1)-specific neutralizing antibodies and were poorly recognized by challenge virus-specific CTLs.
- Sequence analysis of the gene encoding gp120 revealed several mutations in the protein that might have contributed to the development of the immune-escape viruses.

NHP.114 (10888354) **Protective immune responses induced by a non-pathogenic simian/human immunodeficiency virus (SHIV) against a challenge of a pathogenic SHIV in monkeys**
Authors Yoshino N, Ami Y, Someya K, Ando S, Shinohara K, Tashiro F, Lu Y, Honda M
Journal Microbiol Immunol 2000;44(5):363-72
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name SHIV-NM3n *Type:* Live Attenuated Virus
Challenge SHIV89.6 *Route:* Intravenous

Main Findings

- After the heterologous virus challenge, all of the vaccinees were completely protected from SHIV challenge.
- The inhibition of CD4+ cell depletion was associated with maintaining the proliferative response of helper T-cells against SIV p27 in the vaccinated animals following the pathogenic virus challenge.
- Decline of CD28+ cells, the increase in CD95+ cells, and the enhancement of in vitro apoptosis in PBMC were inhibited in the non-pathogenic virus-inoculated animals.

NHP.115 (11348720) **Enhanced simian immunodeficiency virus-specific immune responses in macaques induced by priming with recombinant Semliki Forest virus and boosting with modified vaccinia virus Ankara**

Authors Nilsson C, Makitalo B, Berglund P, Bex F, Liljestrom P, Sutter G, Erfle V, ten Haaft P, Heeney J, Biberfeld G, Thorstensson R

Journal Vaccine 2001 May 14;19(25-26):3526-36

Objectives Challenge, Immunogenicity To investigate the the immunogenicity and protection from challenge of two vector-based vaccines, either given alone or in a prime-boost regimen.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Main Findings

- Generally, antibody responses, T-cell proliferative responses and cytotoxic T-cell responses remained low or undetectable in vaccinees receiving MVA-SIVmac or SFV-SIVmac alone, in contrast with monkeys who first received SFV-SIVmac twice and then were boosted with MVA-SIVmac.
- No evidence of protection was seen against an intrarectal heterologous SIVsm challenge given 3 months after the last immunization.

NHP.116 (11514733) **In situ hybridization and immunolabelling study of the early replication of simian immunodeficiency virus (SIVmacJ5) in vivo**

Authors Canto-Nogues C, Jones S, Sangster R, Silvera P, Hull R, Cook R, Hall G, Walker B, Stott EJ, Hockley D, Almond N

Journal J Gen Virol 2001 Sep;82(Pt 9):2225-34

Objectives Pathogenicity To determine the distribution of virus-infected cells in cynomolgus macaques following intravenous challenge with 1000 TCID50 of the wild-type simian immunodeficiency virus SIVmacJ5 (stock J5C).

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Challenge SIVmac251(32H) *Route:* Intravenous

Main Findings

- Following intravenous inoculation with SIVmacJ5, all macaques became infected, as determined by virus isolation and/or DNA PCR.
- At day 4 post-infection detection of the virus was sporadic. By 7 dpc significant SIV loads were detected in the blood and lymphoid tissues by DNA PCR and virus co-cultivation. Large numbers of cells expressing SIV RNA were detected in mesenteric lymph nodes by ISH and significantly fewer ($P<0.05$) in the spleen.
- A major site of the initial replication of SIV is gut-associated lymphoid tissue.

NHP.117 (11983253) **Passive immunization with human neutralizing monoclonal antibodies: correlates of protective immunity against HIV**

Authors Xu W, Hofmann-Lehmann R, McClure HM, Ruprecht RM

Journal Vaccine 2002 May 6;20(15):1956-60

Objectives Challenge, Immunogenicity, Passive Immunization To determine the value of passive immunization to protect rhesus macaque against SHIV challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name F105/2G12/2F5 mab *Type:* Passive Antibody

Challenge SHIV89.6P, SHIV-vpu+ *Route:* Intravenous, Oral

Main Findings

- Passive immunization with synergistic combinations of human monoclonal antibodies (mAbs) directed against conserved epitopes of the HIV envelope completely protected 13/16 rhesus monkeys challenged intravenously or orally with chimeric simian-humanimmunodeficiency virus (SHIV) strains; partial protection was seen in another 2.
- A high degree of protection was seen among orally challenged neonates.

NHP.118 (11752703) **A DNA/MVA-based candidate human immunodeficiency virus vaccine for Kenya induces multi-specific T cell responses in rhesus macaques**

Authors Wee EG, Patel S, McMichael AJ, Hanke T

Journal J Gen Virol 2002 Jan;83(Pt 1):75-80

Objectives Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pTHr.HIVA DNA *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name MVA.HIVA *Type:* DNA *Route:* Intradermal

Main Findings

- The very same vaccines that had entered clinical trials in Oxford and Nairobi (plasmid pTHr.HIVA DNA and recombinant modified vaccinia virus Ankara MVA.HIVA in a prime-boost protocol) induced cellular immune responses specific for multiple HIV-derived epitopes in rhesus macaques.

NHP.119 (11752704) **Induction of anti-simian immunodeficiency virus cellular and humoral immune responses in rhesus macaques by peptide immunogens: correlation of CTL activity and reduction of cell-associated but not plasma virus load following challenge**

Authors Vogel TU, Beer BE, zur Megede J, Ihlenfeldt HG, Jung G, Holzammer S, Watkins DI, Altman JD, Kurth R, Norley S

Journal J Gen Virol 2002 Jan;83(Pt 1):81-91

Objectives Challenge, Immunogenicity To test the ability of branched peptide constructs to induce humoral and celular response against SIV infection in rhesus macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name P3CSS CTL *Type:* Synthetic Protein/Peptide *Route:* Subcutaneous

Vaccine Name V2-P3CSS *Type:* Synthetic Protein/Peptide *Route:* Subcutaneous

Vaccine Name V2-MAP *Type:* Synthetic Protein/Peptide *Routes:* Subcutaneous, Intramuscular

Vaccine Name V4.32-MAP *Type:* Synthetic Protein/Peptide *Routes:* Subcutaneous, Intramuscular

Challenge SIV mac251 (European) stock 5 *Route:* Intravenous

Main Findings

- Although none of the monkeys were protected from infection, most demonstrated an anamnestic CTL response with epitope-specific CTL precursor frequencies reaching as high as 1 in 20 total PBMC as measured by limiting dilution CTL assay or 25% of all CD8+ T-cells using tetrameric MHC-I/peptide complexes.
- A significant inverse correlation between the levels of CTLp and the number of infected cells in circulation. However, no such correlation with the plasma viral load (RNA copies/ml) was evident

NHP.120 (12009295) **Evaluation of SIV library vaccines with genetic cytokines in a macaque challenge**

Authors Sykes KF, Lewis MG, Squires B, Johnston SA

Journal Vaccine 2002 May 22;20(17-18):2382-95

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIV Random-GLV *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name SIV-Run-Cyt. GLV *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name SIV Diected GLV *Type:* DNA *Routes:* Intradermal, Intramuscular

Challenge SIVmac251 *Route:* Intravenous

Main Findings

- 8/12 animals in the three test groups showed some anti-SIV immune response, whereas the controls did not.
- Six months after priming, monkeys were intravenously challenged with virulent SIVmac251: All were infected but animals in two groups vaccinated with SIV libraries showed a trend toward lower viral-loads, mitigated clinical disease, and higher survival rates than controls.

- Significantly, co-administering the GMCSF and IL-12-encoding plasmids worsened the measures of protection.

NHP.121 (11907220) **Outcome of simian-human immunodeficiency virus strain 89.6p challenge following vaccination of rhesus macaques with human immunodeficiency virus Tat protein**

Authors Silvera P, Richardson MW, Greenhouse J, Yalley-Ogunro J, Shaw N, Mirchandani J, Khalili K, Zagury JF, Lewis MG, Rappaport J

Journal J Virol 2002 Apr;76(8):3800-9

Objectives Challenge, Immunogenicity To investigate whether vaccination with biologically active Tat or inactive Tat toxoid derived from HIV-1(IIIB) and SHIV strain 89.6p would induce protective immunity in rhesus macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name HIV-1 HXBc2 Tat Toxoid *Type:* Other *Route:* Intramuscular

Vaccine Name SHIV89.6P tat toxoid *Type:* Other *Route:* Intramuscular

Vaccine Name HIV-1 HXBc2 Tat *Type:* Purified Viral Products *Route:* Intramuscular

Vaccine Name SHIV89.6P tat *Type:* Purified Viral Products *Route:* Intramuscular

Challenge SHIV89.6P *Route:* Intravenous

Main Findings

- Vaccination induced high titers of anti-Tat immunoglobulin G in all immunized animals by week 7, but titers were somewhat lower in the 89.6p Tat group.
- Tat-specific T-helper responses were detected in 50% of immunized animals.
- T-cell epitopes appeared to map within amino acids (aa) 1 to 24 and aa 37 to 66.
- Tat-specific gamma interferon responses were detected in CD4+ and/or CD8+ T lymphocytes in 11/16 immunized animals on the day of challenge.
- All animals became infected upon intravenous challenge with 30 AID50 of SHIV 89.6p, and there were no significant differences in viral loads or CD4+ T-cell counts between immunized and control animals

---

NHP.123 (11823518) **Recombinant canarypox vaccine-elicited CTL specific for dominant and subdominant simian immunodeficiency virus epitopes in rhesus monkeys**

Authors Santra S, Schmitz JE, Kuroda MJ, Lifton MA, Nickerson CE, Lord CI, Pal R, Franchini G, Letvin NL

Journal J Immunol 2002 Feb 15;168(4):1847-53

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name ALVAC-SIV-gpe (vcp180) *Type:* Recombinant Vector (virus/bacteria)

Challenge SIVmac251 *Route:* Intrarectal

Main Findings

- Following a series of five immunizations, memory gag-specific (not pol) CTL responses specific were demonstrated in vaccinated monkeys.
- Following challenge with SIVmac251, the vaccinated animals developed high frequency CTL responses specific for the dominant Gag epitope, associated with the early containment of viral replication.
- The vaccinees, but not the control animals, developed CTL responses to the subdominant Pol epitope that were detectable only after containment of early viremia.

NHP.124 (12076047) **DNA prime/protein boost vaccine strategy in neonatal macaques against simian human immunodeficiency virus**

Authors Rasmussen RA, Hofmann-Lehman R, Montefiori DC, Li PL, Liska V, Vlasak J, Baba TW, Schmitz JE, Kuroda MJ, Robinson HL, McClure HM, Lu S, Hu SL, Rizvi TA, Ruprecht RM

Journal J Med Primatol 2002 Feb;31(1):40-60

Objectives Challenge, Immunogenicity .

Main Findings

- Following SHIV-vpu+ challenge, containment of infection was observed in 4/15 animals given DNA priming/protein boost vaccination and in 3/4 animals given gp160 boosts only.
- Rechallenge with homologous virus of 6 animals that contained the first challenge virus resulted in rapid viral clearance or low viral loads.

- Upon additional rechallenge with heterologous, pathogenic SHIV89.6P, 4/6 animals maintained normal CD4+ T-cell counts with no or limited SHIV89.6P infection.
- Humoral and cellular immune mechanisms may have contributed to the containment of SHIV89.6P; however, viral interference with SHIV-vpu+ could also have played a role.
- Immunogenicity and efficacy of candidate AIDS vaccines are not affected when vaccination is initiated during infancy as compared with later in life

---

NHP.125 (11907330) **Immunization with recombinant modified vaccinia virus Ankara can modify mucosal simian immunodeficiency virus infection and delay disease progression in macaques**

Authors Nilsson C, Sutter G, Walther-Jallow L, ten Haaft P, Akerblom L, Heeney J, Erfle V, Bottiger P, Biberfeld G, Thorstensson R

Journal J Gen Virol 2002 Apr;83(Pt 4):807-18

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name rMVA (SIVsm) gagpolenv *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name Native SIV gp148 env *Type:* Purified Viral Products *Route:* Intramuscular

Vaccine Name SIVmac251 p27 *Type:* Purified Viral Products *Route:* Intramuscular

Challenge SIVsm *Route:* Intrarectal

Main Findings

- At the time of challenge, antibody titers to SIV Env and lymphocyte proliferation responses to whole viral antigen were highest in vaccinees receiving MVA-SIVsm with protein immunizations.
- One immunized animal was completely protected from intrarectal challenge SIVsm.
- A prolonged survival time was observed in 2/4 monkeys in each of the groups immunized with MVA-SIVsm, in 2 monkeys given MVA-SIVsm followed by protein and in 3/4 monkeys given wild-type MVA, compared with naive controls.
- Immunization with MVA-SIVsm, as well as wild-type MVA alone, seemed to delay disease progression after mucosal SIV infection in a proportion of the monkeys.

NHP.126 (11751978) **Vaccine protection against functional CTL abnormalities in simian human immunodeficiency virus-infected rhesus monkeys**

Authors McKay PF, Schmitz JE, Barouch DH, Kuroda MJ, Lifton MA, Nickerson CE, Gorgone DA, Letvin NL

Journal J Immunol 2002 Jan 1;168(1):332-7

Objectives Challenge, Immunogenicity To assess cytokine production by virus-specific CTL in the rhesus monkey model for AIDS to determine its contribution to the functional impairment of CTL.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name HIV-1.89.6P env DNA *Type:* DNA *Route:* Intramuscular

Vaccine Name SIVmac239 gag DNA *Type:* DNA *Route:* Intramuscular

Challenge SIVmac251 (J5), SHIV89.6, SHIV89.6P *Route:* Intravenous

Main Findings

- CTL from monkeys infected with nonpathogenic isolates of simian and simian-human immunodeficiency virus expressed high levels of IFN-gamma, TNF-alpha, and IL-2 after in vitro exposure to a nonspecific mitogen or the optimal peptide representing a dominantvirus-specific CTL epitope.
- CTL from vaccinated monkeys that effectively controlled the replication of a highly pathogenic simian-human immunodeficiency virus isolate following challenge demonstrated a preserved capacity to produce these cytokines.

NHP.127 (12743287) **Comparative immunogenicity in rhesus monkeys of DNA plasmid, recombinant vaccinia virus, and replication-defective adenovirus vectors expressing a human immunodeficiency virus type 1 gag gene**

Authors Casimiro DR, Chen L, Fu TM, Evans RK, Caulfield MJ, Davies ME, Tang A, Chen M, Huang L, Harris V, Freed DC, Wilson KA, Dubey S, Zhu DM, Nawrocki D, Mach H, Troutman R, Isopi L, Williams D, Hurni W, Xu Z, Smith JG, Wang S, Liu X, Guan L, Long R, Trigona W, Heidecker GJ, Perry HC, Persaud N, Toner TJ, Su Q, Liang X, Youil R, Chastain M, Bett AJ, Volkin DB, Emini EA, Shiver JW

Journal J Virol 2003 Jun;77(11):6305-13
Objectives Immunogenicity To evaluate an MVA vector and a replication-defective adenovirus serotype 5 (Ad5) vector, each expressing the same codon-optimized HIV-1 gag gene for immunogenicity in rhesus monkeys.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- The Ad5-gag vector was the most effective in eliciting anti-Gag CTL; the vaccine produced both CD4(+) and CD8(+) T-cell responses, with the latter consistently being the dominant component.
- Of the formulations tested, the DNA-CRL1005 vaccine primed T-cell responses most effectively and provided the best overall immune responses after boosting with Ad5-gag.
- Conclusion: An immunization strategy for humans that is based on the adenovirusvector and in which existing adenovirus immunity may be overcome by combined immunization with adjuvanted DNA and adenovirus vector boosting

---

NHP.128 (11751749) **Prime-boost immunization generates a high frequency, high-avidity CD8(+) cytotoxic T lymphocyte population**
Authors Estcourt MJ, Ramsay AJ, Brooks A, Thomson SA, Medveckzy CJ, Ramshaw IA
Journal Int Immunol 2002 Jan;14(1):31-7
Objectives Challenge, Immunogenicity To study a 'prime-boost' immunization with DNA vaccines and recombinant poxvirus vectors that generates high frequencies of CTL.
Main Findings

- The 'prime-boost' immunization with DNA vaccines and recombinant poxvirus vectors generated high frequencies of cytotoxic T lymphocytes (CTL) that recognize target cells expressing very low levels of specific antigen; these cells persist for at least 6 months at levels representing approximately 10% of the CD8(+) T cell population.
- Prime-boost immunized animals were capable of eliminating target cells expressing 10- to 100-fold less immunogenic peptide than mice given either vector alone.
- Viral challenge led to rapid expansion of CTL effectors in prime-boost groups, to levels representing >30% of total CD8(+) T cell numbers

---

NHP.129 (12208982) **Sustained Peptide-Specific Gamma Interferon T-Cell Response in Rhesus Macaques Immunized with Human Immunodeficiency Virus gag DNA Vaccines**
Authors Caulfield MJ, Wang S, Smith JG, Tobery TW, Liu X, Davies ME, Casimiro DR, Fu TM, Simon A, Evans RK, Emini EA, Shiver J
Journal J Virol 2002 Oct 1;76(19):10038-43
Objectives Immunogenicity To examine the influence of dose and method of antigen delivery on the dynamics and durability of T-cell responses to candidate human immunodeficiency virus (HIV) vaccines.
Main Findings

- Cell-mediated immune (CMI) response in rhesus macaques persisted for at least 18 months following a four-dose vaccination regimen.
- The plasmid vaccine, with or without CRL8623, was immunogenic in macaques; however, the form coadministered with adjuvant exhibited improved T-cell responses, with a bias toward more antigen-specific CD8(+) T cells.
- Broad and durable CMI response to HIV DNA vaccines can be induced in a relevant nonhuman primate model.

NHP.131 (12127792) **Protection by intranasal immunization of a nef-deleted, nonpathogenic SHIV against intravaginal challenge with a heterologous pathogenic SHIV**
Authors Enose Y, Ui M, Miyake A, Suzuki H, Uesaka H, Kuwata T, Kunisawa J, Kiyono H, Takahashi H, Miura T, Hayami M
Journal Virology 2002 Jul 5;298(2):306-16
Objectives Challenge, Immunogenicity To examine the possibility of using an attenuated virus for mucosal immunization, four female macaques were intranasally or intravenously administered with a chimeric simian-human immunodeficiency virus with a deleted nef gene (SHIV-dn).
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SHIV-dn *Type:* Live Attenuated Virus *Routes:* Intravenous, Intranasal
Challenge SHIV89.6P *Route:* Vaginal or perivaginal

Main Findings

- Although all the monkeys had anti-HIV-1 antibodies with neutralizing activity in the plasma, the intranasally immunized monkeys had much higher levels of HIV-1 Env-specific IgG and IgA antibodies in mucosal secretions compared with the intravenously immunized monkeys.
- 3/4 intranasally immunized monkeys were completely protected from intravaginal challenge with a pathogenic virus, SHIV-89.6P, whereas only 1 intravenously immunized monkey was protected.
- Intranasal immunization of an attenuated virus can induce the protective efficacy against intravaginal infection.

NHP.132 (12097576) **Different patterns of immune responses but similar control of a simian-human immunodeficiency virus 89.6P mucosal challenge by modified vaccinia virus Ankara (MVA) and DNA/MVA vaccines**

Authors Amara RR, Villinger F, Staprans SI, Altman JD, Montefiori DC, Kozyr NL, Xu Y, Wyatt LS, Earl PL, Herndon JG, McClure HM, Moss B, Robinson HL

Journal J Virol 2002 Aug;76(15):7625-31

Objectives Challenge, Immunogenicity To evaluate the ability of the MVA component of this vaccine to serve as both a prime and a boost for an AIDS vaccine.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIV-HIV89.6 DNA vaccine *Type:* DNA *Route:* Intradermal

Vaccine Name rMVA 89.6 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intravenous, Intramuscular

Challenge SHIV89.6P *Route:* Intrarectal

Main Findings

- Compared to the DNA/MVA vaccine, the MVA-only vaccine raised less than one-tenth the number of vaccine-specific T cells but 10-fold-higher titers of binding antibody for Env.
- Postchallenge, the animals vaccinated with MVA alone increased their CD8 cell numbers to levels that were similar to those seen in DNA/MVA-vaccinated animals.
- By 5 wpc, the MVA-only-vaccinated animals had achieved as good control of the viral infection as the DNA/MVA group.

NHP.133 (11085582) **SHIV89.6P pathogenicity in cynomolgus monkeys and control of viral replication and disease onset by human immunodeficiency virus type 1 Tat vaccine**

Authors Cafaro A, Caputo A, Maggiorella MT, Baroncelli S, Fracasso C, Pace M, Borsetti A, Sernicola L, Negri DR, Ten Haaft P, Betti M, Michelini Z, Macchia I, Fanales-Belasio E, Belli R, Corrias F, Butto S, Verani P, Titti F, Ensoli B

Journal J Med Primatol 2000 Aug;29(3-4):193-208

Objectives Challenge, Immunogenicity .

Main Findings

- A vaccine based on the Tat protein of HIV blocks primary infection with SHIV89.6P and prevents the CD4 T cell decline and disease onset in cynomolgus monkeys.
- No signs of virus replication were found in five out of seven vaccinated macaques for almost 1 year of follow-up.
- Since the inoculated virus is shown to be highly pathogenic in cynomolgus macaques, the results indicate efficacy of Tat vaccination in protection against highly pathogenic virus challenge.
- There was a correlation of protection with a cytotoxic T cell response.

NHP.134 (10482571) **Role of immune responses against the envelope and the core antigens of simian immunodeficiency virus SIVmne in protection against homologous cloned and uncloned virus challenge in Macaques**

Authors Polacino PS, Stallard V, Klaniecki JE, Pennathur S, Montefiori DC, Langlois AJ, Richardson BA, Morton WR, Benveniste RE, Hu SL

Journal J Virol 1999 Oct;73(10):8201-15

Objectives Challenge, Immunogenicity To examine (i) the effect of priming by recombinant vaccinia virus; (ii) the role of surface antigen gp130; and (iii) the role of core antigens (Gag and Pol) in eliciting protective immunity.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name Recombinant vaccinia virus vac-gp160 (v-SE5) *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification

Vaccine Name Recombinant vaccinia gp130 (v-SE6) *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification
Vaccine Name Recombinant vaccinia gagpol (v-SG11) *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification
Vaccine Name Recombinant vaccinia gagpolenv (v-SGE14) *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification
Vaccine Name rgp160 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name Recombinant gp130 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name Recombinant gagpol particles *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name Recombinant gagpolenv particles *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge SIV(Mne) clone E11S *Route:* Intravenous
Main Findings

- Priming with recombinant vaccinia virus was more effective than subunit antigen in eliciting protective responses.
- While both gp130 and gp160 elicited similar levels of SIV-specific antibodies, gp130 was not as effective as gp160 in protection, indicating a possible role for the transmembrane protein in presenting functionally important epitopes.
- Although animals immunized with core antigens failed to generate any neutralizing antibody and were infected upon challenge, their virus load was 50- to 100-fold lower than that of the controls.
- Complete protection against intravenous infection by the pathogenic uncloned SIVmne was achieved by immunization with both the envelope and the core antigens.

NHP.135 (10203053) **Protection from pathogenic SIV challenge using multigenic DNA vaccines**
Authors Haigwood NL, Pierce CC, Robertson MN, Watson AJ, Montefiori DC, Rabin M, Lynch JB, Kuller L, Thompson J, Morton WR, Benveniste RE, Hu SL, Greenberg P, Mossman SP
Journal Immunol Lett 1999 Mar;66(1-3):183-8
Objectives Challenge, Immunogenicity To compare the efficacy of DNA immunization alone and in combination with subunit protein boosts.
Main Findings

- Humoral immune responses were stronger in the macaques receiving subunit boosts.
- Significant Nab titers to SIVmne detected in one of the subunit-boosted animals and in none of the DNA-only animals prior to challenge.
- T-cell proliferative responses to gp160 and to Gag were detected in all immunized animals after three immunizations, and these responses increased after four immunizations.

NHP.136 (9930869) **Neutralizing antibody directed against the HIV-1 envelope glycoprotein can completely block HIV-1/SIV chimeric virus infections of macaque monkeys**
Authors Shibata R, Igarashi T, Haigwood N, Buckler-White A, Ogert R, Ross W, Willey R, Cho MW, Martin MA
Journal Nat Med 1999 Feb;5(2):204-10
Objectives Challenge, Immunogenicity, Passive Immunization To assess whether human immunodeficiency virus type 1 (HIV-1) envelope-specific antibodies confer resistance against primate lentivirus infections.
Main Findings

- Passive immunization of pig-tailed macaques with IgG purified from multiply infected HIV-1+ chimpanzees followed by intravenous challenge with a SHIV (env derived form HIV-1DH12).
- Anti-SHIV neutralizing activity is the absolute requirement for antibody-mediated protection in vivo.
- Administration of non-neutralizing anti-HIV IgG neither inhibited nor enhanced a subsequent SHIV infection.

NHP.137 (9863867) **Live attenuated simian immunodeficiency virus (SIV)mac in macaques can induce protection against mucosal infection with SIVsm**
Authors Nilsson C, Makitalo B, Thorstensson R, Norley S, Binninger-Schinzel D, Cranage M, Rud E, Biberfeld G, Putkonen P
Journal AIDS 1998 Dec 3;12(17):2261-70
Objectives Challenge, Immunogenicity To investigate whether vaccination of macaques with attenuated simian immunodeficiency virus (SIV)macC8 could induce long-term protective immunity against rectal exposure to SIVsm and intravenous exposure to the more divergent HIV-2.

Main Findings

- At the time of challenge, 8/10 vaccinees were PCR-positive for SIVmacC8 DNA but no virus could be isolated from peripheral blood mononuclear cells.
- After SIVsm challenge, 3/6 vaccinees were repeatedly SIVsm PCR-negative. In 1/3 infected monkeys, the challenge virus was initially suppressed but the monkey ultimately developed AIDS after increased replication of the pathogenic virus. Monkeys protected from initial challenge remained uninfected after rechallenge.
- Infection with SIV did not protect from challenge with HIV-2.
- All controls became infected with either SIVsm or HIV-2.
- At the time of challenge the vaccinees had neutralizing antibodies to SIVmac but no demonstrable cross-neutralizing antibodies to SIVsm or HIV-2.
- Titers of antigen-binding or neutralizing antibodies did not correlate with protection.
- Cytotoxic T-cell responses to SIV Gag/Pol and virus-specific T-cell proliferative responses were low.

NHP.138 (9747945) **Presence of circulating CTL induced by infection with wild-type or attenuated SIV and their correlation with protection from pathogenic SHIV challenge**

Authors Vogel TU, Fournier J, Sherring A, Ko D, Parenteau M, Bogdanovic D, Mihowich J, Rud EW

Journal J Med Primatol 1998 Apr-Jun;27(2-3):65-72

Objectives Challenge, Immunogenicity To evaluate the role of CTLs in the protection from challenge with pathogenic SHIV in macaques vaccinated with attenuated virus.

Main Findings

- SIVmacC8-vaccinated monkeys demonstrated a broader CTL response than the SIVmacJ5-infected animals.
- CTL against some proteins in SIVmacC8-vaccinated monkeys became progressively more difficult to detect through the day of challenge.
- Neither the presence of circulating CTL nor the CTL precursor frequency against any of the tested proteins correlated with the outcome of the challenge when SIVmacJ5- and SIVmacC8-infected animals were analyzed together.
- Only the protected animal had detectable CTL precursors with moderate frequencies against all three tested proteins at the day of challenge.

NHP.139 (9814958) **Prime-boost immunization strategies against HIV**

Authors Barnett SW, Klinger JM, Doe B, Walker CM, Hansen L, Duliege AM, Sinangil FM

Journal AIDS Res Hum Retroviruses 1998 Oct;14 Suppl 3:S299-309

Objectives Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SHIV89.6 *Type:* Live Virus *Routes:* Intravenous, Vaginal or perivaginal, Intranasal

Vaccine Name pMA SHIV89.6 *Type:* DNA *Routes:* Targeted Lymph node immunization, Intradermal, Intramuscular, Intranasal

---

NHP.141 (9811775) **Vaccine protection against a heterologous, non-syncytium-inducing, primary human immunodeficiency virus**

Authors Robert-Guroff M, Kaur H, Patterson LJ, Leno M, Conley AJ, McKenna PM, Markham PD, Richardson E, Aldrich K, Arora K, Murty L, Carter L, Zolla-Pazner S, Sinangil F

Journal J Virol 1998 Dec;72(12):10275-80

Objectives Challenge, Immunogenicity Follow up study: to challenge the three previously protected chimpanzees a third time, with the heterologous primary isolate HIV-15016.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Vaccine Name AD4-gp160(MN) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intranasal

Vaccine Name AD5-gp160(MN) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intranasal
Vaccine Name AD7-gp160(MN) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intranasal
Vaccine Name CHO cell-expressed HIV-1SF2 gp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge HIV-1.SF2, HIV-1.5016 *Route:* Intravenous
Main Findings

- Following challenge with HIV-1.5016, complete protection in 1/3 chimpanzees previously protected against low- and high-dose HIV-1SF2 exposures after immunization with an adenovirus-HIV-1MN gp160 priming-HIV-1SF2 gp120 boosting regimen.
- At challenge, the protected chimpanzee exhibited broad humoral immunity, including neutralizing antibody activity

---

NHP.142 (9811759) **Enhanced T-cell immunogenicity and protective efficacy of a human immunodeficiency virus type 1 vaccine regimen consisting of consecutive priming with DNA and boosting with recombinant fowlpox virus**
Authors Kent SJ, Zhao A, Best SJ, Chandler JD, Boyle DB, Ramshaw IA
Journal J Virol 1998 Dec;72(12):10180-8
Objectives Challenge, Immunogenicity To evaluate a consecutive immunization strategy involving priming with DNA and boosting with rFPV vaccines encoding common HIV-1 antigens.
Main Findings

- A dramatic boosting effect on DNA vaccine-primed HIV-1-specific helper and cytotoxic T-lymphocyte responses, but a decline in HIV-1 antibody titers, was observed following rFPV immunization.
- The vaccine regimen protected macaques from an intravenous HIV-1 challenge, with the resistance most likely mediated by T-cell responses.

NHP.143 (9765452) **Oral immunization of macaques with attenuated vaccine virus induces protection against vaginally transmitted AIDS**
Authors Joag SV, Liu ZQ, Stephens EB, Smith MS, Kumar A, Li Z, Wang C, Sheffer D, Jia F, Foresman L, Adany I, Lifson J, McClure HM, Narayan O
Journal J Virol 1998 Nov;72(11):9069-78
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca (sp)
Main Findings

- Six adult macaques immunized subcutaneously with DeltavpuDeltanefSHIV-4 (vaccine 1), and six were immunized orally with DeltavpuSHIVPPc (vaccine 2). Both viruses caused infection in all inoculated animals, but whereas vaccine 1 virus caused only a nonproductive type of infection, vaccine 2 virus replicated productively but transiently for a 6- to 10-week period.
- The 12/12 vaccinated animals became infected with the challenge virus SHIVKU-1, and two in group 1 developed a persistent productive infection followed by development of AIDS in one. The other 10 have maintained almost complete control over virus replication even though spliced viral RNA was detected in lymph nodes.

NHP.144 (1466990) **Inactivated whole SIV vaccine in macaques: evaluation of protective efficacy against challenge with cell-free virus or infected cells**

Journal AIDS Res Hum Retroviruses 1992 Aug;8(8):1501-5
Objectives Challenge, Immunogenicity To evaluate the protective efficacy against challenge with cell-free virus or infected cells.

NHP.146 (1466992) **Prevention of HIV-2 and SIVSM infection in cynomolgus monkeys by active or passive immunization**
Authors Biberfield G, Putkonen P, Thorstensson R, Norrby E
Journal AIDS Res Hum Retroviruses 1992 Aug;8(8):1511-3
Objectives Challenge, Immunogenicity, Passive Immunization .
Main Findings

- Protection against homologous HIV-2 infection was demonstrated in 2/2 monkeys immunized with a Triton-X100-treated whole HIV-2SBL-6669 vaccine in incomplete Freund's adjuvant and in 2/4 monkeys immunized with a formalin-inactivated whole HIV-2 vaccine in RIBI adjuvant.

- Monkeys preinfected with a live poorly replicating HIV-2 strain were shown to develop cross-protection against SIV-induced disease.
- HIV-2 and SIVsm infection in cynomolgus monkeys can be prevented by passive immunization

NHP.147 (1470916) **Cellular proteins bound to immunodeficiency viruses: implications for pathogenesis and vaccines**

Authors Arthur LO, Bess JW Jr, Sowder RC 2nd, Benveniste RE, Mann DL, Chermann JC, Henderson LE

Journal Science 1992 Dec 18;258(5090):1935-8

Main Findings

- Retracted from public display.

NHP.148 (1470917) **Protective effects of a live attenuated SIV vaccine with a deletion in the nef gene**

Authors Daniel MD, Kirchhoff F, Czajak SC, Sehgal PK, Desrosiers RC

Journal Science 1992 Dec 18;258(5090):1938-41

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239ΔNef *Type:* Live Attenuated Virus *Route:* Intramuscular

Challenge SIVmac239, SIVmac251 *Route:* Intravenous

Main Findings

- Rhesus monkeys vaccinated with live SIV deleted in nef were completely protected against challenge by intravenous inoculation of live, pathogenic SIV.
- 2/2 naive controls infected 14 dpc and dead of SAIDS 252 dpc.
- 2/2 vaccinees protected from increased viral load and disease and remain healthy >208 wpc (>4 years).
- 2/2 vaccinees protected from infection >208 wpc (>4 years).

NHP.149.1 (1677743) **Prevention of HIV-2 and SIVsm infection by passive immunization in cynomolgus monkeys**

Authors Putkonen P, Thorstensson R, Ghavamzadeh L, Albert J, Hild K, Biberfeld G, Norrby E

Journal Nature 1991 Aug 1;352(6334):436-8

Objectives Challenge, Passive Immunization To determine whether a transfer of antibodies can prevent HIV-2 and SIVsm (SIV of sooty mangabey origin) infection in cynomolgus monkeys.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name Anti-HIV-2 *Type:* Passive Antibody *Route:* Intravenous

Challenge HIV-2.SBL6669 *Route:* Intravenous

Main Findings

- All 6 control animals treated with normal monkey serum or no serum (n = 39) became infected by the challenge virus.
- 5/7 animals pretreated with antibody-containing serum at a dose of 9 ml kg-1 resisted infection.
- Conclusion: passively transferred antibodies can protect against a low-dose lentivirus challenge in a nonhuman primate

---

NHP.149.2 (1677743) **Prevention of HIV-2 and SIVsm infection by passive immunization in cynomolgus monkeys**

Authors Putkonen P, Thorstensson R, Ghavamzadeh L, Albert J, Hild K, Biberfeld G, Norrby E

Journal Nature 1991 Aug 1;352(6334):436-8

Objectives Challenge, Passive Immunization .

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name DNA Vaccine pNL432-ZF1* *Type:* DNA *Route:* Intravenous

Vaccine Name Anti-HIV-2 *Type:* Passive Antibody *Route:* Intravenous

Main Findings

- Antibody titers declined to undetectable level after challenge.
- Active infection did not occur during 6-10 months of follow up in 3/4 passively immunized monkeys.

NHP.150.1 (8986737) **Resistance of neonatal monkeys to live attenuated vaccine strains of simian immunodeficiency virus**

Authors Wyand MS, Manson KH, Lackner AA, Desrosiers RC

Journal Nat Med 1997 Jan;3(1):32-6

Objectives Challenge, Immunogenicity, Passive Immunization .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- High viral loads and disease were observed in only 2 of 18 neonatal monkeys infected with gene-deleted vaccine strains of simian immunodeficiency virus.
- Pathogenicity was restricted to neonates born to unvaccinated mothers and that received extremely high doses of vaccine virus orally.
- No in utero transmission of vaccine virus was observed in 4 neonates born to mothers vaccinated during the second trimester.
- Conclusion: Live attenuated vaccine approach should remain a viable option for preventing HIV infection and disease in high-risk human populations.

NHP.150.2 (8986737) **Resistance of neonatal monkeys to live attenuated vaccine strains of simian immunodeficiency virus**

Authors Wyand MS, Manson KH, Lackner AA, Desrosiers RC

Journal Nat Med 1997 Jan;3(1):32-6

Objectives Challenge, Passive Immunization .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239Δ3 *Type:* Live Attenuated Virus *Routes:* Oral, Intraplacental

Main Findings

- 0/4 cases of vertical transmission of SIVmac239Δ3.
- Maternal antibody dd not prevent transmission of the autologous challenge in 3/4 neonates.

NHP.151 (1733103) **Immunization with tween-ether-treated SIV adsorbed onto aluminum hydroxide protects monkeys against experimental SIV infection**

Authors Stahl-Hennig C, Voss G, Nick S, Petry H, Fuchs D, Wachter H, Coulibaly C, Luke W, Hunsmann G

Journal Virology 1992 Feb;186(2):588-96

Objectives Challenge, Immunogenicity To study immunogenicity and protective values of tween-ether-disrupted SIVmac251/32H adsorbed onto aluminum hydroxide immunization in monkeys.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac251/32H (Tween/Ether) *Type:* Whole (killed) Inactivated Virus *Route:* Intravenous

Challenge SIVmac251(32H) *Route:* Intravenous

Main Findings

- 4/7 immunized animals did not show any signs of virus replication and therefore appeared to be protected.
- Nonvaccinated control animals and the vaccine failures showed a rise in their urinary neopterin concentrations 1 to 2 weeks after infection.
- After the challenge, control animals and infected vaccinees showed a primary or secondary antibody response while antibody titers declined in virus-negative animals.
- Specific cytotoxic T-lymphocytes were not present prior to challenge.

NHP.152.1 (1741059) **Prevention of HIV-1 infection in chimpanzees by gp120 V3 domain-specific monoclonal antibody**

Authors Emini EA, Schleif WA, Nunberg JH, Conley AJ, Eda Y, Tokiyoshi S, Putney SD, Matsushita S, Cobb KE, Jett CM, et al.

Journal Nature 1992 Feb 20;355(6362):728-30

Objectives Challenge, Passive Immunization To demonstrate the protective efficacy of anti-V3 domain antibody in vivo.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Vaccine Name Cβ1 anti-V3 *Type:* Passive Antibody *Route:* Intravenous

Challenge SIVmac251(32H) *Route:* Intravenous

Main Findings

- 1/1 control chimpanzee infected.

- 1/1 protected from infection >336 dpc.

NHP.152.2 (1741059) **Prevention of HIV-1 infection in chimpanzees by gp120 V3 domain-specific monoclonal antibody**

Authors Emini EA, Schleif WA, Nunberg JH, Conley AJ, Eda Y, Tokiyoshi S, Putney SD, Matsushita S, Cobb KE, Jett CM, et al.

Journal Nature 1992 Feb 20;355(6362):728-30

Objectives Challenge, Immunotherapy To demonstrate the protective efficacy of anti-V3 post challenge with live virus.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Vaccine Name Cβ1 anti-V3 *Type:* Passive Antibody *Route:* Intravenous

Challenge SIVmac251(32H) *Route:* Intravenous

Main Findings

- 1 OF 1 CONTROL CHIMPANZEE INFECTED 56 DPC.
- 1 OF 1 PROTECTED FROM INFECTION >224 DPC.

NHP.153 (9593009) **Passive immunization of newborn rhesus macaques prevents oral simian immunodeficiency virus infection**

Authors Van Rompay KK, Berardi CJ, Dillard-Telm S, Tarara RP, Canfield DR, Valverde CR, Montefiori DC, Cole KS, Montelaro RC, Miller CJ, Marthas ML

Journal J Infect Dis 1998 May;177(5):1247-59

Objectives Challenge, Passive Immunization To determine if passively acquired antiviral antibodies modulate virus transmission and disease progression in human pediatric AIDS.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Untreated neonates became infected after oral SIV inoculation and had high viremia, and most animals developed fatal AIDS within 3 months.
- In contrast, SIV hyperimmune serum given subcutaneously prior to oral SIV inoculation protected 6 newborns against infection.
- When SIV hyperimmune serum was given to 3 newborns 3 weeks after oral SIV inoculation, viremia was not reduced, and all 3 infants died within 3 months of age due to AIDS and immune-complex disease.
- Conclusion: passively acquired anti-HIV IgG may decrease perinatal HIV transmission

---

NHP.154 (1871125) **Protection of macaques with a simian immunodeficiency virus envelope peptide vaccine based on conserved human immunodeficiency virus type 1 sequences**

Authors Shafferman A, Jahrling PB, Benveniste RE, Lewis MG, Phipps TJ, Eden-McCutchan F, Sadoff J, Eddy GA, Burke DS

Journal Proc Natl Acad Sci U S A 1991 Aug 15;88(16):7126-30

Objectives Challenge, Immunogenicity To evaluate envelope peptide vaccine based on conserved HIV-1 sequences.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVenv-Bgal peptides *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge SIV(Mne) clone E11S *Route:* Intravenous

Main Findings

- After challenge with virulent virus, controls became virus positive and developed gradually rising antibody titers to SIV over 63 weeks.
- Immunized macaques developed a postchallenge anamnestic response to SIVenv antigens within 3-6 weeks followed bya gradual, fluctuating decline in SIV antibody titers and partial or total suppression of detectable SIV.
- Virus suppression correlated with prechallenge neutralizing antibody titers.

NHP.155 (1883540) **Efficacy of SIV/deltaB670 glycoprotein-enriched and glycoprotein-depleted subunit vaccines in protecting against infection and disease in rhesus monkeys**

Authors Murphey-Corb M, Montelaro RC, Miller MA, West M, Martin LN, Davison-Fairburn B, Ohkawa S, Baskin GB, Zhang JY, Miller GB, et al.

Journal AIDS 1991 Jun;5(6):655-62

Objectives Challenge, Immunogenicity To define the role of virion components in the induction of protective immunity.

Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings
- Immunization with the glycoprotein-enriched preparation prevented infection in 2/4 monkeys, whereas the glycoprotein-depleted vaccine failed to prevent infection in all 4 vaccinates tested.
- Glycoprotein-depleted vaccine appeared to moderate the progression of SIV-induced disease compared with non-immunized infected control monkeys inoculated with the same challenge dose.
- Conclusion: subunit vaccines containing sufficient quantities of viral glycoproteins can protect against SIV infection, whereas subunit vaccines composed predominantly of viral core proteins cannot.

NHP.156 (1907354) **Prevention of HIV-1 IIIB infection in chimpanzees by CD4 immunoadhesin**
Authors Ward RH, Capon DJ, Jett CM, Murthy KK, Mordenti J, Lucas C, Frie SW, Prince AM, Green JD, Eichberg JW
Journal Nature 1991 Aug 1;352(6334):434-6
Objectives Challenge, Passive Immunization To evaluate the CD4 immunoadhesin (CD4-IgG) in the protection against HIV-1 infection in chimpanzees.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Vaccine Name CHO-SIVgp120 *Type:* DNA *Route:* Intravenous
Vaccine Name CD4 Immunoadhesin (CD4-IgG) *Type:* Other *Routes:* Intravenous, Intramuscular
Main Findings
- Pretreatment with CD4-IgG can prevent the infection of chimpanzees with HIV-1.

NHP.157.1 (1979369) **Preliminary report: protection of cynomolgus macaques against simian immunodeficiency virus by fixed infected-cell vaccine**
Authors Stott EJ, Chan WL, Mills KH, Page M, Taffs F, Cranage M, Greenaway P, Kitchin P
Journal Lancet 1990 Dec 22-29;336(8730):1538-41
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name Fixed inactivated SIVmac251 infected cells *Type:* Whole (killed) Inactivated Virus *Route:* Subcutaneous
Challenge SIVmac251 *Route:* –
Main Findings
- Upon challenged with 10 MID50 of SIVmac251, virus and proviral DNA were not found in any of the vaccinated cynomolgus macaques immunized with with inactivated SIV-infected cells and 'Quil-A' as adjuvant.
- Virus was repeatedly isolated from unvaccinated animals on at least 5 separate occasions and proviral DNA was detected in circulating lymphocytes by polymerase chain reaction amplification (Trials 1,2).
- In animals previously infected, vaccination regimen did not eliminate virus (Trial 3).

NHP.157.2 (1979369) **Preliminary report: protection of cynomolgus macaques against simian immunodeficiency virus by fixed infected-cell vaccine**
Authors Stott EJ, Chan WL, Mills KH, Page M, Taffs F, Cranage M, Greenaway P, Kitchin P
Journal Lancet 1990 Dec 22-29;336(8730):1538-41
Objectives Challenge, Immunogenicity see experiment 1 (except the challenge was carried out at week 18).
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name Fixed inactivated SIVmac251 infected cells *Type:* Whole (killed) Inactivated Virus *Route:* Subcutaneous
Challenge SIVmac251 *Route:* Subcutaneous
Main Findings
- See Experiment 1.

NHP.157.3 (1979369) **Preliminary report: protection of cynomolgus macaques against simian immunodeficiency virus by fixed infected-cell vaccine**
Authors Stott EJ, Chan WL, Mills KH, Page M, Taffs F, Cranage M, Greenaway P, Kitchin P

Journal Lancet 1990 Dec 22-29;336(8730):1538-41
Objectives Immunotherapy To evaluate whether a vaccine would reduce the course of SIV infection in animals already infected with the live virus and have active progressive infection.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name Fixed inactivated SIVmac251 infected cells *Type:* Whole (killed) Inactivated Virus *Route:* Subcutaneous
Challenge SHIV.DH12R-PS1 *Route:* –
Main Findings

- The vaccine that protected from challenge in Trial 1 and 2, did little to eliminate the virus in already infected animals

---

NHP.158 (1979745) **Infection of cynomolgus monkeys with HIV-2 protects against pathogenic consequences of a subsequent simian immunodeficiency virus infection**
Authors Putkonen P, Thorstensson R, Albert J, Hild K, Norrby E, Biberfeld P, Biberfeld G
Journal AIDS 1990 Aug;4(8):783-9
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Main Findings

- At the time of SIV challenge the HIV-2-infected monkeys had neutralizing antibodies against HIV-2, but virus could no longer be recovered from their PBMCs and no clinical symptoms or decrease in CD4+ lymphocytes were observed.
- Protection from challenge with SIVsm including SIV-induced immunodeficiency (no decrease of CD4+ lymphocytes) and lymphadenopathy was observed in HIV-2-infected monkeys for 9 months post challenge.
- 4 naive control monkeys that were inoculated with the same dose of SIV became persistently infected and developed a decrease of the absolute numbers of CD4+ cells and showed a marked lymphadenopathy

---

NHP.159 (1988952) **Immunization of chimpanzees confers protection against challenge with human immunodeficiency virus**
Authors Girard M, Kieny MP, Pinter A, Barre-Sinoussi F, Nara P, Kolbe H, Kusumi K, Chaput A, Reinhart T, Muchmore E, et al.
Journal Proc Natl Acad Sci U S A 1991 Jan 15;88(2):542-6
Objectives Challenge, Immunogenicity To evaluate protection against challenge with human immunodeficiency virus in immunized chimpanzees.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Main Findings

- After 6 months of follow-up, immunized chimpanzees appeared uninfected by serologic and virologic criteria, including polymerase chain reaction analysis and failure to isolate virus from peripheral blood lymphocytes, bone marrow, and lymph node tissue.
- Of 2 chimpanzees monitored for 1 yr, virus was isolated initially from 1 animal at 32 weeks, but the second chimpanzee was virus negative by all assays through 12 mo; the third animal has remained virus negative through 9 mo of follow-up.

NHP.160 (2078406) **Vaccine protection of rhesus macaques against simian immunodeficiency virus infection**
Authors Carlson JR, McGraw TP, Keddie E, Yee JL, Rosenthal A, Langlois AJ, Dickover R, Donovan R, Luciw PA, Jennings MB, et al.
Journal AIDS Res Hum Retroviruses 1990 Nov;6(11):1239-46
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque), Macaca (sp)
Main Findings

- Method: Rhesus macaques were immunized with an inactivated whole SIVmac vaccine and muramyl dipeptide (MDP), incomplete Freund's adjuvant (IFA), or aqueous suspension were challenged intravenously with 0.1 TCID50 of cell-free SIVmac.
- Virus was readily recovered from the PBMCs of 10/10 controls.
- 3/3 animals that received the vaccine with MDP were protected from challenge.
- 1/2 animals that received the vaccine with IFA were protected from challenge.
- 1/3 animals that received the aqueous vaccine were protected from challenge.

NHP.161 (2127681) **Yeast-expressed p55 precursor core protein of human immunodeficiency virus type 1 does not elicit protective immunity in chimpanzees**
Authors Emini EA, Schleif WA, Quintero JC, Conard PG, Eichberg JW, Vlasuk GP, Lehman ED, Polokoff MA, Schaeffer TF, Schultz LD, et al.
Journal AIDS Res Hum Retroviruses 1990 Nov;6(11):1247-50
Objectives Challenge, Immunogenicity .

NHP.162 (11282197) **Vaccination with DNA containing tat coding sequences and unmethylated CpG motifs protects cynomolgus monkeys upon infection with simian/human immunodeficiency virus (SHIV89.6P)**
Authors Cafaro A, Titti F, Fracasso C, Maggiorella MT, Baroncelli S, Caputo A, Goletti D, Borsetti A, Pace M, Fanales-Belasio E, Ridolfi B, Negri DR, Sernicola L, Belli R, Corrias F, Macchia I, Leone P, Michelini Z, ten Haaft P, Butto S, Verani P, Ensoli B
Journal Vaccine 2001 Apr 6;19(20-22):2862-77
Objectives Challenge .
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name pCV-tat *Type:* DNA *Route:* Intramuscular
Main Findings
- A Tat-expressing vector (pCV-tat), expressing the HIV-1 BH10 isolate Tat gene, and containing unmethylated CpG dinucleotides, induced an anti-Tat CTL response that was protective in containing primary infection with SHIV89.6P

NHP.163 (11282197) **Vaccination with DNA containing tat coding sequences and unmethylated CpG motifs protects cynomolgus monkeys upon infection with simian/human immunodeficiency virus (SHIV89.6P)**
Authors Cafaro A, Titti F, Fracasso C, Maggiorella MT, Baroncelli S, Caputo A, Goletti D, Borsetti A, Pace M, Fanales-Belasio E, Ridolfi B, Negri DR, Sernicola L, Belli R, Corrias F, Macchia I, Leone P, Michelini Z, ten Haaft P, Butto S, Verani P, Ensoli B
Journal Vaccine 2001 Apr 6;19(20-22):2862-77
Objectives Challenge, Immunogenicity To verify whether a DNA vaccine utilizing the tat gene expressed by a vector containing defined unmethylated CpG sequences would be capable of enhancing antigen-specific CTL responses against Tat and inducing an effective protection against AIDS.
Main Findings
- Intramuscular inoculation of the pCV-tat contained primary infection with the highly pathogenic SHIV89.6P virus preventing the CD4+ T cell decline in all the vaccinated monkeys.
- Undetectable virus replication and negative virus isolation correlatedin all cases with the presence of anti-Tat CTLs.
- CD8-mediated non cytolytic antiviral activity was present in all protected animals.
- CpG-rich tat DNA vaccine may represent a promising candidate for preventive and therapeutic vaccination against AIDS.

NHP.164 (9747943) **The role of type-1 and type-2 T-helper immune responses in HIV-1 vaccine protection**
Authors Heeney JL, van Gils ME, van der Meide P, de Giuli Morghen C, Ghioni C, Gimelli M, Raddelli A, Davis D, Akerblom L, Morein B
Journal J Med Primatol 1998 Apr-Jun;27(2-3):50-8
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name HIV-1.SF2 gp120/p24 Recombinant *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name V2.V3.HIV-1.SF2 Synth.peptides *Type:* Synthetic Protein/Peptide *Route:* Intramuscular
Challenge SHIV.SF13 *Route:* Intravenous

NHP.165 (9733821) **Env-independent protection induced by live, attenuated simian immunodeficiency virus vaccines**
Authors Gundlach BR, Reiprich S, Sopper S, Means RE, Dittmer U, Matz-Rensing K, Stahl-Hennig C, Uberla K
Journal J Virol 1998 Oct;72(10):7846-51
Objectives Challenge, Immunogenicity .
Main Findings

- In contrast to the results with naive control monkeys, no challenge virus could be isolated from the SIV-IL2- and SIVNU-infected macaques.
- Challenge virus sequences detected by nested PCR in some of the vaccinated macaques.
- 4 vaccinated macaques were rechallenged with an SIV-murine leukemia virus (MLV) hybrid were protected from productive infection with the SIV-MLV hybrid in the absence of measurable Nab, while 2 naive control monkeys were readily infected.
- Chemokine inhibition and receptor interference phenomena were not involved in protection.
- Conclusion: protective responses induced by live attenuated SIV vaccines can be independent of host immune reactions directed against Env

NHP.166 (9718118) **Neutralizing antibodies administered before, but not after, virulent SHIV prevent infection in macaques**

Authors Foresman L, Jia F, Li Z, Wang C, Stephens EB, Sahni M, Narayan O, Joag SV

Journal AIDS Res Hum Retroviruses 1998 Aug 10;14(12):1035-43

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- 3/6 macaques inoculated with anti-SHIV plasma and challenged 24 hr later with approximately 300 AID of SHIV(KU-2), completely resisted infection with SHIV(KU-2). A fourth animal failed to yield infectious virus, but DNA extracted from its peripheral blood mononuclear cells (PBMC) and lymph nodes had viral sequences.
- 2/6 vaccinees had partial control of infection.
- 6/6 macaques given the same dose of anti-SHIV plasma 18 hr after exposure to virus became infected.
- 2/2 macaques given anti-SHIV plasma only 2 hr after exposure to virus became infected.

NHP.167 (9718117) **Fine specificity of anti-V3 antibodies induced in chimpanzees by HIV candidate vaccines**

Authors Coeffier E, Girard M, Barre-Sinoussi F, Meignier B, Muchmore E, Fultz PN, LeClerc C

Journal AIDS Res Hum Retroviruses 1998 Aug 10;14(12):1023-34

Objectives Challenge, Immunogenicity To assess the specificity of the anti-V3 antibody responses induced in chimpanzees immunized by various human immunodeficiency type 1 (HIV-1) candidate vaccines and challenged by heterologous strains of HIV-1.

Species/Subspecies Pan Troglodytes (Chimpanzee)

NHP.168 (8896498) **Immunogenicity and protective efficacy of a human immunodeficiency virus type 2 recombinant canarypox (ALVAC) vaccine candidate in cynomolgus monkeys**

Authors Andersson S, Makitalo B, Thorstensson R, Franchini G, Tartaglia J, Limbach K, Paoletti E, Putkonen P, Biberfeld G

Journal J Infect Dis 1996 Nov;174(5):977-85

Objectives Challenge, Immunogenicity To investigate the efficacy of a recombinant HIV-2 canarypox (ALVAC HIV-2) vaccine candidate given alone or in combination with HIV-2 envelope gp125 or HIV-2 V3 synthetic peptides in cynomolgus monkeys.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Main Findings

- High antibody titers to HIV-2 gp125 and significant lymphocyte proliferative responses to killed HIV-2 virions demonstrated in monkeys given booster immunizations with gp125.
- Neutralizing antibody titers were low.
- 3/12 monkeys generated HIV-2-specific cytotoxic T lymphocytes prior to viral challenge.
- 4/10 monkeys immunized with ALVAC HIV-2 plus HIV-2 gp125 or V3 peptides were protected

NHP.173 (8827215) **Protection against mucosal SIVsm challenge in macaques infected with a chimeric SIV that expresses HIV type 1 envelope**

Authors Quesada-Rolander M, Makitalo B, Thorstensson R, Zhang YJ, Castanos-Velez E, Biberfeld G, Putkonen P

Journal AIDS Res Hum Retroviruses 1996 Jul 20;12(11):993-9

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Main Findings

- 4/4 immunized monkeys were infected with the vaccine virus.
- All monkeys developed neutralizing antibodies to HIV-1 and high antibody titers to HIV-1 env glycoproteins, but no Nabs to SIVsm.
- After a follow-up period of 1 year, 2/4 SHIV-infected monkeys were completely protected against SIVsm infection.
- 2/2 SHIV-immunized and infected with the challenge virus, but were able to control this infection.
- CTL in 1/4 of the immunized animals.
- All 6 control animals yielded virus repeatedly after SIVsm challenge and 3 of them showed declining CD4 cell counts.

NHP.174 (8827214) **Multiple immunizations with attenuated poxvirus HIV type 2 recombinants and subunit boosts required for protection of rhesus macaques**

Authors Myagkikh M, Alipanah S, Markham PD, Tartaglia J, Paoletti E, Gallo RC, Franchini G, Robert-Guroff M

Journal AIDS Res Hum Retroviruses 1996 Jul 20;12(11):985-92

Objectives Challenge, Immunogenicity To study macaques immunized twice with NYVAC or ALVAC recombinants carrying HIV-2 env, gag, and pol genes, then boosted either with an additional recombinant immunization or an HIV-2 gp160 protein.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name ALVAC/vCP153 HIV-2 gag,pol,env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name HIV-2 gp160 *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge HIV-2.SBL6669 *Route:* Intravenous

Main Findings

- Macaques primed with ALVAC recombinant exhibited sporadic T cell proliferative activity, and all but one failed to develop neutralizing antibodies.
- In contrast, macaques primed with NYVAC recombinants had no T cell proliferative activity but exhibited neutralizing antibody titers (highest in the three recombinant group) that declined by the time of challenge.
- None of the macaques exhibited significant CTL activity.
- Following challenge at 32 weeks with HIV-2SBL6669 all macaques became infected. Thus, immunization regimen was not sufficient to confer protective immunity in the HIV-2 rhesus macaque model.
- Delayed infection in macaques immunized with the NYVAC-HIV-2 recombinant may have been associated with the development of memory B cells capable of providing a neutralizing antibody response on challenge

NHP.185.1 (8673922) **Protective mucosal immunity elicited by targeted iliac lymph node immunization with a subunit SIV envelope and core vaccine in macaques**

Authors Lehner T, Wang Y, Cranage M, Bergmeier LA, Mitchell E, Tao L, Hall G, Dennis M, Cook N, Brookes R, Klavinskis L, Jones I, Doyle C, Ward R

Journal Nat Med 1996 Jul;2(7):767-75

Objectives Challenge, Immunogenicity To evaluate a novel route of immunization (the targeted iliac lymph node-TILN) aiming close to the iliac lymph nodes draining the genitorectal mucosa.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name rSIV-gp120 protein *Type:* Recombinant Subunit Protein *Route:* Targeted Lymph node immunization

Vaccine Name Recombinant p27 *Type:* Recombinant Subunit Protein *Route:* Targeted Lymph node immunization

Challenge SIVmac251(32H) *Route:* Intrarectal

Main Findings

- Rectal challenge with the SIVmac 32H J5 molecular clone induced total protection in 4/7 macaques immunized by targeted iliac lymph node (TILN), compared with infection in 13/14 unimmunized macaques or immunized by other routes (P = 0.025)(experiment 1 and experiment 2).
- Protection was associated with significant increase in the iliac lymph nodes of IgA antibody-secreting cells to p27 (P < 0.02), CD8-suppressor factor (P < 0.01), and the chemokines RANTES and MIP-1 beta (P < 0.01)

NHP.193 (8605050) **Resistance of chimpanzees immunized with recombinant gp120SF2 to challenge by HIV-1SF2**
Authors el-Amad Z, Murthy KK, Higgins K, Cobb EK, Haigwood NL, Levy JA, Steimer KS
Journal AIDS 1995 Dec;9(12):1313-22
Objectives Challenge, Immunogenicity To determine whether vaccination with recombinant HIV-1SF2 gp120 in a novel oil-in-water adjuvant emulsion, MF59, protects chimpanzees against challenge with HIV-1SF2, the homologous virus isolate.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Vaccine Name CHO cell-expressed HIV-1SF2 gp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge HIV-1.SF2 *Route:* Intravenous
Main Findings

- 1/2 vaccinated animals showed no serologic or virologic evidence of infection suggesting a complete sterilizing protection from challenge in 1 animal and a transient infection in the other animal.
- Both control animals showed evidence of seroconversion in ELISA and Western blot assays; virus was detected in the early, acute phase of infection of both control animals by plasma RNA PCR, virus culture and PBMC DNA PCR assays

---

NHP.194.1 (8623530) **Protection from pathogenic SIVmac challenge following short-term infection with a nef-deficient attenuated virus**
Authors Norley S, Beer B, Binninger-Schinzel D, Cosma C, Kurth R
Journal Virology 1996 May 1;219(1):195-205
Objectives Challenge, Immunogenicity To determine if protection could be achieved against challenge with a "swarm" of SIVmac251-32H produced in monkey cells and if protection could be demonstrated after a short period of infection with the attenuated virus.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac251, 32H, (C8) *Type:* Live Attenuated Virus *Route:* Intravenous
Challenge SIVmac251(32H) *Route:* Intravenous
Main Findings

- 3/4 monkeys challenged at 10 weeks and 3/4 challenged at 20 weeks were protected from productive superinfection.
- No apparent correlation between the levels of binding or neutralizing antibodies on the day of challenge and subsequent protection.

NHP.194.2 (8623530) **Protection from pathogenic SIVmac challenge following short-term infection with a nef-deficient attenuated virus**
Authors Norley S, Beer B, Binninger-Schinzel D, Cosma C, Kurth R
Journal Virology 1996 May 1;219(1):195-205

Objectives Challenge, Immunogenicity To determine the breadth of protection afforded by immunization with live attenuated virus.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac251 *Type:* Live Virus *Route:* Intravenous
Vaccine Name SIVmac251, 32H, (C8) *Type:* Live Attenuated Virus *Route:* Intravenous
Challenge SIVsm *Route:* Intrarectal, Intravenous, Intravenous
Main Findings

- Animals previously immunized with live attenuated SIVmac251 then with the wild type SIVmac251 were protected from infection with SIVsm.
- The virus load was 2-3 orders of magnitude lower than the control animals.

NHP.195 (8680896) **Utility of SHIV for testing HIV-1 vaccine candidates in macaques**

NHP.198 (8537682) **Protection of MN-rgp120-immunized chimpanzees from heterologous infection with a primary isolate of human immunodeficiency virus type 1**
Authors Berman PW, Murthy KK, Wrin T, Vennari JC, Cobb EK, Eastman DJ, Champe M, Nakamura GR, Davison D, Powell MF, Bussiere J, Francis DP, Matthews T, Gregory TJ, Obijeski JF
Journal J Infect Dis 1996 Jan;173(1):52-9
Objectives Challenge, Immunogenicity .
Species/Subspecies Pan Troglodytes (Chimpanzee)
Vaccine Name HIV-1.MN.rgp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name SIVsmE660 *Type:* Live Virus *Route:* Intravenous
Main Findings

- The control animal was infected by the challenge virus: viral infection was detected in the control animal by viral culture, PCR, and multiple serologic assays beginning 2 weeks after infection.
- 3/3 animals immunized with gp120 were not infected (during 12 months of follow-up).
- No neutralization activity in gp120 immunized animals.
- Conclusions: (1) Immunization with recombinant gp120 derived from a T cell-adapted isolate prevented infection by a heterologous primary isolate of HIV-1. (2) In vitro virus neutralization assays utilizing primary isolates cultured in PBMC may be imperfect indicators of protection in vivo.

NHP.199 (9420212) **Administration of an anti-CD8 monoclonal antibody interferes with the clearance of chimeric simian/human immunodeficiency virus during primary infections of rhesus macaques**

NHP.200 (8493576) **Protection against vaginal SIV transmission with microencapsulated vaccine**

Authors Marx PA, Compans RW, Gettie A, Staas JK, Gilley RM, Mulligan MJ, Yamshchikov GV, Chen D, Eldridge JH

Journal Science 1993 May 28;260(5112):1323-7

Objectives Challenge, Immunogenicity To study the immunogenicity and protection confered by formalin inactivated SIV macaques.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac251 (encapsulated) *Type:* Whole (killed) Inactivated Virus *Routes:* Intratracheal, Oral, Intramuscular

Challenge SIVmac251 *Route:* Vaginal or perivaginal

Main Findings

- 5/6 macaques immunized with formalin-treated SIV in biodegradable microspheres by the intramuscular plus oral or plus intratracheal route were protected against vaginal challenge.
- Oral immunization alone did not protect.
- After a second vaginal challenge, 3/4 intramuscularly primed and mucosally boosted macaques remained protected.

NHP.201.1 (9419166) **Induction of Th2 cytokine expression for p27-specific IgA B cell responses after targeted lymph node immunization with simian immunodeficiency virus antigens in rhesus macaques**

Authors Kawabata S, Miller CJ, Lehner T, Fujihashi K, Kubota M, McGhee JR, Imaoka K, Hiroi T, Kiyono H

Journal J Infect Dis 1998 Jan;177(1):26-33

Objectives Immunogenicity To determine if there is an association between the isotype of SIV-specific B cell responses and the profile of Th1 and Th2 cytokine expression.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name rSIV-gp120 protein *Type:* Recombinant Subunit Protein *Route:* Targeted Lymph node immunization

Vaccine Name Whole inactivated SIVmac251 *Type:* Whole (killed) Inactivated Virus *Route:* Targeted Lymph node immunization

Vaccine Name Recombinant p27 *Type:* Recombinant Subunit Protein *Route:* Targeted Lymph node immunization

Main Findings

- In rhesus macaques immunized with SIV antigens, when CD4+ T cells purified from antigen-stimulated PBMCs were analyzed, the levels of Th2 cytokine production were gradually increased after the second and third immunizations with no change of interferon-gamma.
- The main isotype following the second and third immunization was IgG.
- Induction of Th2 type responses in TLN-immunized rhesus macaques reflects the sequence of initial induction of SIV-specific IgG-producing cells followed by IgA-secreting cells

---

NHP.201.2 (9456249) **Targeted lymph-node immunization with whole inactivated simian immunodeficiency virus (SIV) or envelope and core subunit antigen vaccines does not reliably protect rhesus macaques from vaginal challenge with SIVmac251**

Authors Lu X, Kiyono H, Lu D, Kawabata S, Torten J, Srinivasan S, Dailey PJ, McGhee JR, Lehner T, Miller CJ

Journal AIDS 1998 Jan 1;12(1):1-10

Objectives Challenge, Immunogenicity To investigate protection from challenge by recombinant subunit protein inoculation targeting iliac lymph node.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name rSIV-gp120 protein *Type:* Recombinant Subunit Protein *Route:* Targeted Lymph node immunization

Vaccine Name Whole inactivated SIVmac251 *Type:* Whole (killed) Inactivated Virus *Route:* Targeted Lymph node immunization

Vaccine Name Recombinant p27 *Type:* Recombinant Subunit Protein *Route:* Targeted Lymph node immunization

Challenge SIVmac251 *Route:* Vaginal or perivaginal

Main Findings

- High-titer SIV-specific IgG antibodies in serum in all animals immunized with recombinant subunit proteins inoculated by (targeted) iliac lymph node immunization.
- Upon intravaginal challenge with SIVmac251, all animals became virus isolation-positive, except 1 animal immunized with SIV p27 and gp120.

- Conclusion: Reliable protection from vaginal transmission of SIV was not achieved by the targeted lymph node immunization procedure.

NHP.202 (9395361) **DNA vaccination as anti-human immunodeficiency virus immunotherapy in infected chimpanzees**

Authors Boyer JD, Ugen KE, Chattergoon M, Wang B, Shah A, Agadjanyan M, Bagarazzi ML, Javadian A, Carrano R, Coney L, Williams WV, Weiner DB

Journal J Infect Dis 1997 Dec;176(6):1501-9

Objectives Immunogenicity, Immunotherapy To evaluate the role of DNA vaccine as anti-HIV immunotherapy in infected chimpanzees.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Vaccine Name pCMN160 HIV-1.MN env-rev *Type:* DNA *Route:* Intramuscular

Challenge HIV-1 IIIB *Route:* Intravenous

Main Findings

- Two HIV-1-infected chimpanzees were vaccinated with plasmid pCMN160-HIV-1.MN.env-rev demonstrated enhanced humoral responses, decrease in viral load to background levels from week 20.
- The control chimpanzee was subsequently vaccinated with pCMN160 following the inoculation with a control sham plasmid, had the antibody responses increased and, as in the first animal, and the virus load decreased.
- Conclusion: the immune response has a direct impact on HIV-1 replication in chimpanzees.

NHP.203 (8427714) **Studies on the specificity of the vaccine effect elicited by inactivated simian immunodeficiency virus**

Authors Cranage MP, Polyanskaya N, McBride B, Cook N, Ashworth LA, Dennis M, Baskerville A, Greenaway PJ, Corcoran T, Kitchin P, et al.

Journal AIDS Res Hum Retroviruses 1993 Jan;9(1):13-22

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac251, 32H, (C8) *Type:* Whole (killed) Inactivated Virus *Route:* Intramuscular

Vaccine Name HIV-1 GB8 *Type:* Whole (killed) Inactivated Virus *Route:* Intramuscular

Challenge SIVsmB670, SIVmac251(32H) *Route:* Intravenous

Main Findings

- Partially purified SIVmac protected macaques from intravenous challenge with homologous and heterologous SIV grown on human cells but not on monkey grown cells.
- HIV-1 grown on human C8166 T cell line protected macaques against challenge with human cell-grown SIVmac.
- All vaccinated macaques had anti-cell antibodies.

NHP.204 (8427039) **Immune response of chimpanzees after immunization with the inactivated whole immunodeficiency virus (HIV-1), three different adjuvants and challenge**

Authors Niedrig M, Gregersen JP, Fultz PN, Broker M, Mehdi S, Hilfenhaus J

Journal Vaccine 1993;11(1):67-74

Objectives Challenge, Immunogenicity .

Species/Subspecies Pan troglodytes troglodytes (chimpanzee)

Vaccine Name Whole inactivated HIV-1 IIIB *Type:* Whole (killed) Inactivated Virus *Route:* Intramuscular

Vaccine Name Recombinant HIV-1 gag core (p24,p15) antigen *Type:* Recombinant Subunit Protein *Route:* Subcutaneous

Vaccine Name Recombinant HIV-1 env gp160 antigen *Type:* Recombinant Subunit Protein *Routes:* Subcutaneous, Intramuscular

Challenge HIV-1.LAI *Route:* Intravenous

Main Findings

- Weak and inconsistent responses were observed in animals that received HIV-1 formulated with alum as adjuvant, whereas HIV-1 formulated with incomplete Freund's adjuvant or an experimental adjuvant (BWZL) induced good humoral and cellular immune responses to the virus.
- The 3 animals that received HIV-1 with the BWZL adjuvant generated overall the best immune responses.

- Upon challenge with infectious HIV-1, despite good humoral and cell-mediated immunity, all 3 immunized animals and a control animal became infected within 4 weeks.

NHP.205.1 (9343211) **An adenovirus-simian immunodeficiency virus env vaccine elicits humoral, cellular, and mucosal immune responses in rhesus macaques and decreases viral burden following vaginal challenge**

Authors Buge SL, Richardson E, Alipanah S, Markham P, Cheng S, Kalyan N, Miller CJ, Lubeck M, Udem S, Eldridge J, Robert-Guroff M

Journal J Virol 1997 Nov;71(11):8531-41

Objectives Challenge, Immunogenicity To investigate the immunogenicity of an adenovirus expressing SIV env and its ability to protect rhesus macaques against vaginal challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Ad5hr-SIVenv *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intratracheal, Oral, Intranasal

Vaccine Name Native SIV gp120 *Type:* Purified Viral Products *Route:* Intratracheal

Challenge SIVmac251 *Route:* Vaginal or perivaginal

Main Findings

- The vaccine induced SIV-specific neutralizing antibodies and HIV gp120 binding IgG and IgA detected in nasal and rectal secretions.
- SIV-specific IgGs were also observed in vaginal secretions and saliva.
- T-cell proliferative responses to SIV gp140 and T-helper epitopes were sporadically detected in all immunized macaques.
- Following vaginal challenge with SIVmac251, transient or persistent infection resulted in both immunized and control monkeys.
- Conclusion: Ad5hr-SIV env recombinant and gp120 subunit induces strong humoral, cellular, and mucosal immunity in rhesus macaques.

NHP.205.2 (12021334) **Rhesus macaque resistance to mucosal simian immunodeficiency virus infection is associated with a postentry block in viral replication**

Authors Peng B, Voltan R, Lim L, Edghill-Smith Y, Phogat S, Dimitrov DS, Arora K, Leno M, Than S, Woodward R, Markham PD, Cranage M, Robert-Guroff M

Journal J Virol 2002 Jun;76(12):6016-26

Objectives Challenge To investigate the mechanism of resistance to challenge of an unvaccinated control rhesus macaque.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Challenge SIVmac251(32H), SIVmac251 *Route:* Intrarectal, Vaginal or perivaginal

Main Findings

- Rhesus macaque 359, a vaccine control animal, resisted 2 successive intravaginal challenges with SIVmac251 (and failed to seroconvert) an additional intrarectal SIVmac32H challenge.
- Resistance of this macaque to SIV infection was not due to a highlevel of CD8+ suppressor activity but to an inherent resistance of its CD4+ T cells.
- Resistance is due to a postentry block in viral replication and implicates a cellular inhibitory mechanism in its CD4+ T cells

---

NHP.205.3 (10438833) **Factors associated with slow disease progression in macaques immunized with an adenovirus-simian immunodeficiency virus (SIV) envelope priming-gp120 boosting regimen and challenged vaginally with SIVmac251**

Authors Buge SL, Murty L, Arora K, Kalyanaraman VS, Markham PD, Richardson ES, Aldrich K, Patterson LJ, Miller CJ, Cheng SM, Robert-Guroff M

Journal J Virol 1999 Sep;73(9):7430-40

Objectives Challenge .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Ad5hr-SIVenv *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intratracheal, Oral, Intranasal

Vaccine Name Native SIV gp120 *Type:* Purified Viral Products *Route:* Intratracheal

Challenge SIVmac251 *Route:* Vaginal or perivaginal

Main Findings

- Reboosting and re-challenge of macaques vaccinated and challenged in trials 205.1 and 205.2 again resulted in partial protection from pathogenicity of challenge

NHP.206 (8411103) **Immunization of Macaca fascicularis with inactivated SIV preparations: challenge with human- or monkey-derived SIV and the effects of a longer immunization schedule**

Authors Titti F, Koanga Mogtomo ML, Borsetti A, Geraci A, Sernicola L, Panzini G, Turillazzi GP, Baroncelli S, Giovannetti A, Zamarchi R, et al.

Journal J Med Primatol 1993 Feb-May;22(2-3):110-8

Objectives Challenge, Immunogenicity To compare two human-derived SIVmac251 whole virus vaccines, a long vs short immunization schedule, and two different challenge viruses.

Main Findings

- Both vaccines induced protection after challenge with human-derived SIVmac251/32H.
- No difference between the 2 schedules of immunization.
- 5/7 were protected following the first challenge (human-derived).
- No protection was observed in monkeys that were reboosted and rechallenged with monkey-derived SIVmac251.

NHP.207 (9343164) **Live, attenuated simian immunodeficiency virus vaccines elicit potent resistance against a challenge with a human immunodeficiency virus type 1 chimeric virus**

Authors Shibata R, Siemon C, Czajak SC, Desrosiers RC, Martin MA

Journal J Virol 1997 Nov;71(11):8141-8

Objectives Challenge, Immunogenicity To ask what protection live attenuated vaccines can provide against SHIVdh12 challenge. A long term follow up.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIMmac239Δ2 *Type:* Live Attenuated Virus *Route:* Intravenous

Vaccine Name SIVmac239Δ3 *Type:* Live Attenuated Virus *Route:* Intravenous

Challenge SHIV.MD1 *Route:* Intravenous

Main Findings

- 3 rhesus macaques, previously immunized with SIVΔ3 or SIVΔ2, then challenged with 30,000 TCID50 dose of SHIV.DH12 controlled the SHIV infection by reducing the viral load to barely detectable levels.
- Only SIV sequences, derived from the vaccine, could be amplified from numerous tissue samples collected at the conclusion of the experiment, 60 weeks postchallenge, but SHIV-specific sequences (viz., HIV-1 env) could not.
- Live attenuated SIV vaccines provide strong long-term protection even against challenge strains with highly divergent envelope sequences

NHP.208 (8363756) **Protection of monkeys by a split vaccine against SIVmac depends upon biological properties of the challenge virus**

Authors Stahl-Hennig C, Voss G, Dittmer U, Coulibaly C, Petry H, Makoschey B, Cranage MP, Aubertin AM, Luke W, Hunsmann G

Journal AIDS 1993 Jun;7(6):787-95

Objectives Challenge, Immunogenicity To investigate the role of the anti-cellular immune response in the protection of rhesus macaques against infection with SIVmac and to determine the biological differences between SIV challenge stocks grown either on human T-cell lines or on monkey PBMC.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Main Findings

- Protection from virus challenge with C8166-grown SIVmac251/32H or SIVmac251/MPBMC did not correlate with anti-cellular antibodies or proliferative T-cell reactivities.
- Control animals infected with SIVmac251/MPBMC showed high persistent antigenaemia and high plasma virus titres.
- Neither the antibody nor the proliferative T-cell response to SIVmac correlates with protection from virus challenge. In contrast to SIVmac251/32H grown on C8166 cells, the MPBMC-grown challenge virus SIVmac251 appears to belong to the 'rapid-high' phenotype, possibly explaining the lack of protection against this SIV.

NHP.209 (9333153) **Superinfection with human immunodeficiency virus type 2 can reactivate virus production in baboons but is contained by a CD8 T cell antiviral response**

Authors Locher CP, Blackbourn DJ, Barnett SW, Murthy KK, Cobb EK, Rouse S, Greco G, Reyes-Teran G, Brasky KM, Carey KD, Levy JA
Journal J Infect Dis 1997 Oct;176(4):948-59
Objectives Challenge, Immunogenicity To assess resistance to superinfection by human immunodeficiency virus.
Main Findings

- Background: Asymptomatic baboons previously infected with HIV-2, were first challenged with homologous virus (HIV-2UC2 or HIV-2UC14) and later with heterologous virus (HIV-2UC12).
- After both virus inoculations, either resistance to viral infection or a transient viremia was observed.
- The original virus was recovered in 3 baboons, suggesting that reactivation of a latent infection occurred on heterologous challenge and that HIV-2 superinfection is blocked by processes established during prior infection.
- Low antibody titers and low levels of virus neutralization.
- Suppression of HIV-1 replication was observed attributed to CD8 T cells.

NHP.210 (8312055) **In vitro spontaneous production of anti-SIV antibodies is a reliable tool in the follow-up of protection of SIV-vaccinated monkeys**
Authors Zamarchi R, Veronese ML, Titti F, Geraci A, Verani P, Rossi GB, Amadori A, Chieco-Bianchi L
Journal AIDS Res Hum Retroviruses 1993 Nov;9(11):1139-44
Objectives Challenge, Immunogenicity To assess the reliability of the spontaneous in vitro synthesis of simian immunodeficiency virus (SIV)-specific antibodies as a marker in the monitoring of protection in SIV-vaccinated animals.
Main Findings

- Backgound: Macaca fascicularis monkeys were immunized with formalin-inactivated SIVmac251 or SIVmac251/32H, and challenged with human-derived (SIVmac251/32H) or monkey-derived live SIV.
- Immunized animals were protected against human-derived SIV challenge.
- No spontaneous in vitro synthesis of anti-SIV antibody was observed in nonstimulated PBMC cultures over a 4-month follow-up.
- Human cell-grown SIVmac251 immunization did not afford protection against monkey-derived SIV, and all the animals became infected and showed spontaneous in vitro synthesis of anti-SIV antibodies.

NHP.211 (9315483) **Gene gun-based nucleic acid immunization alone or in combination with recombinant vaccinia vectors suppresses virus burden in rhesus macaques challenged with a heterologous SIV**
Authors Fuller DH, Simpson L, Cole KS, Clements JE, Panicali DL, Montelaro RC, Murphey-Corb M, Haynes JR
Journal Immunol Cell Biol 1997 Aug;75(4):389-96
Objectives Challenge, Immunogenicity To evaluate the ability of gene gun-based DNA immunization alone or in combination with recombinant vaccinia vectors to elicit protective immune responses in rhesus macaques challenged with a pathogenic heterologous SIV.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Geometric mean end-point IgG titres in the DNA + VAC and VAC + DNA groups were substantially higher than the responses seen in the VAC + VAC and DNA + DNA groups, demonstrating a synergistic relationship between DNA-based vaccines and recombinant vacciniavirus-based vaccines.
- The vaccines did not prevent infection.
- All vaccine groups showed significant virus load reductions from 7 to 56 days post challenge when compared to controls.
- DNA + DNA group developed the lowest prechallenge antibody responses and the most significant reduction (200-fold) in virus load was associated with this group. In addition, a significant delay in CD4+ T cell loss relative to controls was observed in the DNA + DNA group

---

NHP.212 (9271187) **Mechanisms of protection induced by attenuated simian immunodeficiency virus. IV. Protection against challenge with virus grown in autologous simian cells**
Authors Almond N, Corcoran T, Hull R, Walker B, Rose J, Sangster R, Silvera K, Silvera P, Cranage M, Rud E, Stott EJ
Journal J Med Primatol 1997 Feb-Apr;26(1-2):34-43
Objectives Challenge, Immunogenicity To test the mechanism of protection provided by live attenuated SIV.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Main Findings

- Background: 8 animals infected with live attenuated SIV then challenged with wild-type grown in autologous and heterologous cells.
- Animals infected with attenuated SIV are protected against wild-type SIV grown in autologous or heterologous cells.
- Live attenuated SIV protects by the induction of allogeneic antibodies is not tenable.

NHP.213 (8217348) **Lymphoproliferative responses in macaques immunized with inactivated SIV vaccine**
Authors Teng XC, Ashworth LA, Sharpe SA, Dennis MJ, Cranage MP
Journal AIDS Res Hum Retroviruses 1993 Aug;9(8):799-801
Objectives Challenge, Immunogenicity To examine the lymphoproliferative response of macaques immunized with inactivated, partially purified SIVmac32H grown in C8166 cells.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Animals vaccinated with partially purified C8166 cell-grown SIVmac32H in alum adjuvant (Group 1) were protected from initial challenge with SIVmac32H but became infected when rechallenged with SIVmac251.
- No association could be demonstrated betweenprotection from challenge and lymphoproliferative response to one particular antigen tested against.

NHP.214 (9266989) **Macaques infected with attenuated simian immunodeficiency virus resist superinfection with virulence-revertant virus**
Authors Sharpe SA, Whatmore AM, Hall GA, Cranage MP
Journal J Gen Virol 1997 Aug;78 (Pt 8):1923-7
Objectives Challenge, Immunogenicity To examine the protective values of live attenuated virus vaccine to protect against revertant autologous strains.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- 3 macaques already infected with the attenuated molecular clone SIVmacC8 were resistant to superinfection with virulent virus that arose in vivo following repair of a 12 bp attenuating lesion in the nef/3' LTR.
- 4 naive animals became infected following inoculation with blood taken from the macaque in which virulent virus arose.

NHP.215 (9266988) **Mechanisms of protection induced by attenuated simian immunodeficiency virus. I. Protection cannot be transferred with immune serum**
Authors Almond N, Rose J, Sangster R, Silvera P, Stebbings R, Walker B, Stott EJ
Journal J Gen Virol 1997 Aug;78 (Pt 8):1919-22
Objectives Challenge, Passive Immunization To evaluate the role in protection induced by live attenuated SIVmacC8 against SIVmajJ5 challenge.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name Anti-SIVmacC8 *Type:* Passive Antibody *Route:* Intraperitoneal
Challenge SIVmacJ5M *Route:* ND
Main Findings

- 4/4 control animals were infected as indicated by the test at 14 dpc.
- 2 of passively immunized animals were protected from infection at 14 dpc but were shown to be infected thereafter.
- The failure of passive immunization to transfer protection indicates that serum components alone are not sufficient to mediate the potent protection obtained using live attenuated vaccines.

NHP.216 (8198872) **Reduced virus load in rhesus macaques immunized with recombinant gp160 and challenged with simian immunodeficiency virus**
Authors Ahmad S, Lohman B, Marthas M, Giavedoni L, el-Amad Z, Haigwood NL, Scandella CJ, Gardner MB, Luciw PA, Yilma T
Journal AIDS Res Hum Retroviruses 1994 Feb;10(2):195-204
Objectives Challenge, Immunogenicity To evaluate the potential of SIVmac239 gp160 expressed by recombinant vaccinia virus (vSIVgp160) and baculovirus (bSIVgp160) to protectively immunize rhesus macaques against intravenous infection with pathogenic SIVmac isolates.

Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Binding antibodies to gp130 were induced in all animals following immunization with SIVgp160.
- Immunization did not induce neutralizing antibodies up to 1 week prior to virus challenge.
- No protection from challenge: All animals became infected after i.v. inoculation with 1-10 AID50 of either challenge virus.

NHP.217 (8198871) **Passive immunization of cynomolgus macaques with immune sera or a pool of neutralizing monoclonal antibodies failed to protect against challenge with SIVmac251**

Authors Kent KA, Kitchin P, Mills KH, Page M, Taffs F, Corcoran T, Silvera P, Flanagan B, Powell C, Rose J, et al.
Journal AIDS Res Hum Retroviruses 1994 Feb;10(2):189-94
Objectives Passive Immunization .

NHP.218 (9256490) **Potent, protective anti-HIV immune responses generated by bimodal HIV envelope DNA plus protein vaccination**

Authors Letvin NL, Montefiori DC, Yasutomi Y, Perry HC, Davies ME, Lekutis C, Alroy M, Freed DC, Lord CI, Handt LK, Liu MA, Shiver JW
Journal Proc Natl Acad Sci U S A 1997 Aug 19;94(17):9378-83
Objectives Challenge, Immunogenicity To study prime-boost regimen using HIV-1 env DNA and synthetic protein and neutralizing antibodies in nonhuman primate species.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- HIV-1 Env protein as a boosting immunogen generates a high titer neutralizing antibody response in rehesus macaques.
- HIV-1 env DNA (multiple doses) followed by a final immunization with HIV-1 env DNA plus HIV-1 Env protein (env gene from HXBc2 cloneof HIV IIIB; Env protein from parental HIV IIIB) completely protects monkeys from infection after i.v. challenge with a chimeric virus expressing HIV-1 env (HXBc2) on a simian immmunodeficiency virusmac backbone (SHIV-HXBc2).

NHP.219 (8179961) **Immune responses induced by prototype vaccines for AIDS in rhesus monkeys**

Authors Ohkawa S, Wilson LA, Larosa G, Javaherian K, Martin LN, Murphey-Corb M
Journal AIDS Res Hum Retroviruses 1994 Jan;10(1):27-38
Objectives Challenge, Immunogenicity To profile humoral and cell mediated immune response induced by immunization with candidate vaccines consisting of recombinant SIV gp110 with SAF-M adjuvant or rgp140+FA adjuvant.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- All the monkeys were infected after intravenous challenge.
- 16 days following infection, viral antigenemia was reduced in both groups of vaccinates compared to controls.
- After 23 days antigenemia in the gp110 + SAF-M group remained at the same level as on day 16, whereas antigenemia in the gp140 + FA group was significantly reduced further than the level observed on day 16.
- Both vaccines induced high ELISA titers of IgG antibody against rgp140.
- gp110 +/- SAF-M (not gp140 + FA) induced high titers of neutralizing antibody.

NHP.220 (9223408) **Anti-major histocompatibility complex antibody responses to simian B cells do not protect macaques against SIVmac infection**

Authors Polyanskaya N, Sharpe S, Cook N, Leech S, Banks J, Dennis M, Hall G, Stott J, Cranage M
Journal AIDS Res Hum Retroviruses 1997 Jul 20;13(11):923-31
Objectives Challenge, Immunogenicity To investigate the efficacy of alloimmunization with simian B cells expressing high level of MHC class I and class II molecules to confer protection against systemic challenge with SIVmac.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Antibody responses to allogeneic MHC molecules do not protect against infection with immunodeficiency lentiviruses.

NHP.221 (8176640) **Long-standing protection of macaques against cell-free HIV-2 with a HIV-2 iscom vaccine**

Authors Putkonen P, Bjorling E, Akerblom L, Thorstensson R, Lovgren K, Benthin L, Chiodi F, Morein B, Biberfeld G, Norrby E, et al.

Journal J Acquir Immune Defic Syndr 1994 Jun;7(6):551-9

Objectives Challenge, Immunogenicity To investigate the capacity of two immunostimulating-complex (iscom) formulations including inactivated native HIV-2 viral proteins and selected peptides to induce protective immunity against HIV-2 in a nonhuman primate.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Main Findings

- 3/4 immunized macaques were protected from challenge.
- 4/4 control macaques became readily infected with challenge virus.
- 1/3 protected animals showed an anamnestic antibody response to a dominating antigenic site.
- The vaccine-protected monkeys were subsequently resistant to rechallenge infection at 12, 15, and 18 months after the first challenge, suggesting that a reasonable duration of protective immunity had been induced by the vaccine.

NHP.222 (9188572) **Evolution of envelope-specific antibody responses in monkeys experimentally infected or immunized with simian immunodeficiency virus and its association with the development of protective immunity**

Authors Cole KS, Rowles JL, Jagerski BA, Murphey-Corb M, Unangst T, Clements JE, Robinson J, Wyand MS, Desrosiers RC, Montelaro RC

Journal J Virol 1997 Jul;71(7):5069-79

Objectives Challenge, Immunogenicity .

Main Findings

- The establishment of long-term protective immunity in general parallels the absence of further detectable changes in antibody responses and a maintenance of relatively constant antibody titer, avidity, conformational dependence, and the presence of neutralizing antibody for at least 2 years postinoculation.
- Attenuated SIV vaccine and whole virus elicited mature antibody response.
- Envelope subunit vaccines elicited in general immature antibody response characterized by poor reactivity with native envelope proteins, low avidity, low conformational dependence, and the absence of neutralization activity against the challenge strain.

NHP.223 (8107246) **Incomplete protection, but suppression of virus burden, elicited by subunit simian immunodeficiency virus vaccines**

Authors Israel ZR, Edmonson PF, Maul DH, O'Neil SP, Mossman SP, Thiriart C, Fabry L, Van Opstal O, Bruck C, Bex F, et al.

Journal J Virol 1994 Mar;68(3):1843-53

Objectives Challenge, Immunogenicity To compare the efficacy of immunization with either SIV Env glycoprotein, Gag-Env, or whole inactivated virus, with or without recombinant live vaccinia vector priming, in protecting rhesus macaques from challenge with SIVmac251 clone BK28.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Sterilizing immunity was induced only by whole inactivated vaccine.
- Abortive infection (strong immunity) was observed in 2 animals (one VV-Env and one Gag-Env).
- Suppression of infection (incomplete or partial immunity) occurred in the 8/12 of subunit-vaccinated animals.
- Active infection developed in all controls and 2/3 VV-Gag-Env-immunized animals.

NHP.224 (8046353) **Major histocompatibility complex class I-associated vaccine protection from simian immunodeficiency virus-infected peripheral blood cells**

Authors Heeney JL, van Els C, de Vries P, ten Haaft P, Otting N, Koornstra W, Boes J, Dubbes R, Niphuis H, Dings M, et al.

Journal J Exp Med 1994 Aug 1;180(2):769-74

Objectives Challenge, Immunogenicity To evaluate the effectiveness of vaccine protection from infected cells from another individual of the same species.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- 50% of the SIV-vaccinated animals were protected from challenge.
- 50% SIV-vaccinees were unprotected and rapidly progressed to AIDS.
- Protection was unrelated to either total antibody titers to human cells, used in the production of the vaccine, to HLA antibodies, or to virus neutralizing activity.
- All animals protected against cell-associated virus challenge were those which were SIV vaccinated and which shared the MHC class I allele (Mamu-A26) with the donor of the infected cells.
- CTL specific for SIV envelope protein were detected in 3/4 protected animals vs. 1/4 unprotected animals, suggesting a possible role of MHC class I-restricted CTL in protection from infected blood cells

---

NHP.225 (9185593) **Challenge of chimpanzees immunized with a recombinant canarypox-HIV-1 virus**

Authors Girard M, van der Ryst E, Barre-Sinoussi F, Nara P, Tartaglia J, Paoletti E, Blondeau C, Jennings M, Verrier F, Meignier B, Fultz PN

Journal Virology 1997 May 26;232(1):98-104

Objectives Challenge, Immunogenicity To evaluate the potential protective efficacy of a live recombinant HIV-1 canarypox vaccine candidate.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Main Findings

- Vaccination against HIV-1(IIIB(LAI)) or HIV-1(MN) did not protect animals from challenge with heterologous cell-free HIV-1(DH12).
- 1/2 chimpanzees vaccinated 5 times with ALVAC-HIV-1 vCP250 and challenged by iv injection of PBMC from an HIV-1(IIIB(LAI))-infected chimpanzee were protected.
- After booster inoculation 5 months post-challenge, both animals were re-challenged with HIV-1(DH12) and neither animal had neutralizing antibodies to HIV-1(DH12) and neither was protected from infection.
- ALVAC-HIV-1 vCP250 expresses HIV-1(IIIB(LAI))gp120/TM, gag and protease gene products.

NHP.226 (9142121) **Protection of chimpanzees from high-dose heterologous HIV-1 challenge by DNA vaccination**

Authors Boyer JD, Ugen KE, Wang B, Agadjanyan M, Gilbert L, Bagarazzi ML, Chattergoon M, Frost P, Javadian A, Williams WV, Refaeli Y, Ciccarelli RB, McCallus D, Coney L, Weiner DB

Journal Nat Med 1997 May;3(5):526-32

Objectives Challenge, Immunogenicity To examine the immunogenicity and efficacy of of an HIV-1 DNA vaccine encoding env, rev, gag/pol in a chimpanzee model system.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Main Findings

- The immunized animals developed specific cellular and humoral immune responses.
- The DNA constructs induced protection from the establishment of infection with a heterologous challenge (HIV-1 SF2).
- Control animal was infected.

NHP.227 (9135877) **Live attenuated SIV vaccines are not effective in a postexposure vaccination model**

Authors Linhart H, Gundlach BR, Sopper S, Dittmer U, Matz-Rensing K, Kuhn EM, Muller J, Hunsmann G, Stahl-Hennig C, Uberla K

Journal AIDS Res Hum Retroviruses 1997 May 1;13(7):593-9

Objectives Challenge, Immunogenicity, Immunotherapy To evaluate the value of live attenuated vaccine therapeutic immunization.

Species/Subspecies -

Main Findings

- 4/4 controls (vaccinated with delta nef only - i.e., without the SIV IL-2 construct) were infected.
- 0/4 vaccinees protected from increased viral loads.
- 0/4 vaccinees protected from infection.
- All coinfected macaques had a high viral load, and some of them developed AIDS-like symptoms and pathological alterations rapidly.
- In the presence of pathogenic SIV, both live attenuated SIV vaccines did not protect from disease in this postexposure vaccination model.

NHP.228 (7986590) **Induction of antigen-specific killer T lymphocyte responses using subunit SIVmac251 gag and env vaccines containing QS-21 saponin adjuvant**

Authors Newman MJ, Munroe KJ, Anderson CA, Murphy CI, Panicali DL, Seals JR, Wu JY, Wyand MS, Kensil CR

Journal AIDS Res Hum Retroviruses 1994 Jul;10(7):853-61

Objectives Challenge, Immunogenicity To increase the immunogenicity of recombinant subunit vaccine (SIVmac251 gag and env) with QS-21 adjuvant.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Antigen-specific killer cell responses could be induced by a subunit vaccine formulated with the QS-21 saponin adjuvant that was detected was mediated by both CD4+ and CD8+ lymphocytes.
- Despite the presence of these killer cells, all of the animals became infected with the SIVmac251 on experimental challenge.
- The characteristics of the responses suggested that the effector cells were T lymphocytes, expressing either CD4 or CD8.

NHP.229 (9123856) **Macaques infected with live attenuated SIVmac are protected against superinfection via the rectal mucosa**

Authors Cranage MP, Whatmore AM, Sharpe SA, Cook N, Polyanskaya N, Leech S, Smith JD, Rud EW, Dennis MJ, Hall GA

Journal Virology 1997 Mar 3;229(1):143-54

Objectives Challenge, Immunogenicity To determine if protection against systemic challenge in the SIVmac model of AIDS extends to intrarectal mucosal challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- 4 macaques previously infected with the attenuated SIVmacC8 resisted superinfection with SIVmacJ5, following intrarectal inoculation.
- Immunization with live attenuated SIV protected 4 macaques from intrarectal challenge with SHIV (composed of SIVmac239 expressing the HXBc2 env, tat, and rev genes).
- In protected animals, SIV-specific CTL were detected in gut-associated lymph nodes and may have a role in limiting superinfection following mucosal exposure.

NHP.230.1 (7986589) **High-titer immune responses elicited by recombinant vaccinia virus priming and particle boosting are ineffective in preventing virulent SIV infection**

Authors Daniel MD, Mazzara GP, Simon MA, Sehgal PK, Kodama T, Panicali DL, Desrosiers RC

Journal AIDS Res Hum Retroviruses 1994 Jul;10(7):839-51

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Method: Monkeys primed with a recombinant vaccinia virus expressing SIV Gag, Pol, and Env polypeptides +/- SIV particles boost in adjuvant.
- Despite the induction of vigorous immune responses, 17/18 rhesus monkeys became infected on challenge with a low dose of virulent SIVmac.
- Vaccination may have diminished SIV burdens and rates of CD4+ cell declines in some of the animals.
- Vaccinated/challenged/infected animals eventually developed fatal disease similar to control animals.

NHP.230.2 (7986589) **High-titer immune responses elicited by recombinant vaccinia virus priming and particle boosting are ineffective in preventing virulent SIV infection**

Authors Daniel MD, Mazzara GP, Simon MA, Sehgal PK, Kodama T, Panicali DL, Desrosiers RC

Journal AIDS Res Hum Retroviruses 1994 Jul;10(7):839-51

Objectives Challenge, Immunogenicity To evaluate the ability of two different vaccinia virus recombinant to elicit immune response and to protect macaques against challenge.

NHP.230.3 (7986589) **High-titer immune responses elicited by recombinant vaccinia virus priming and particle boosting are ineffective in preventing virulent SIV infection**

Authors Daniel MD, Mazzara GP, Simon MA, Sehgal PK, Kodama T, Panicali DL, Desrosiers RC
Journal AIDS Res Hum Retroviruses 1994 Jul;10(7):839-51
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)

NHP.231 (7966239) **Efficacy of inactivated whole HIV-2 vaccines with various adjuvants in cynomolgus monkeys**
Authors Putkonen P, Nilsson C, Walther L, Ghavamzadeh L, Hild K, Broliden K, Biberfeld G, Thorstensson R
Journal J Med Primatol 1994 Feb-May;23(2-3):89-94

NHP.232 (9108105) **Vaccine effect using a live attenuated nef-deficient simian immunodeficiency virus of African green monkeys in the absence of detectable vaccine virus replication in vivo**
Authors Beer B, Baier M, zur Megede J, Norley S, Kurth R
Journal Proc Natl Acad Sci U S A 1997 Apr 15;94(8):4062-7
Objectives Challenge, Immunogenicity To test a live attenuated virus vaccine (SIVagm3-Delta nef)) in its natural host (African green monkey).
Species/Subspecies Cercopithecus aetiops (African Green monkeys)
Main Findings

- Preinoculated African green monkeys showed drastic decreases in virus load or were protected from challenge.
- Vaccine protection occurred in the absence of detectable vaccine virus replication and humoral immune response, suggesting a protective cellular immune response similar to that associated with subinfectious or abortive infections.
- SIVagm3(delta)nef replication was delayed marginally in vitro, but hightly attenuated in vivo.

NHP.233 (7966237) **Immunization with whole inactivated vaccine protects from infection by SIV grown in human but not macaque cells**
Authors Goldstein S, Elkins WR, London WT, Hahn A, Goeken R, Martin JE, Hirsch VM
Journal J Med Primatol 1994 Feb-May;23(2-3):75-82
Objectives Challenge, Immunogenicity To determine whether the species of origin of the cell line used to generate virus stock influenced the degree of protection mediated by WI-SIV vaccine.
Species/Subspecies Macaca (sp)
Main Findings

- Two groups of animals were vaccinated then challenged with either SIV-Human or SIV-Macaque virus.
- All SIV-Human vaccinees were protected from infection, and all SIV-Macaque vaccinees became infected.
- Difference between the two groups is due to cellular proteins in the virus preparation rather than the pathogenic or genetic properties of the virus<Immune responses of all vaccinees were indistinguishable from one another.
- No virus was isolated from PBMC of macaques challenged with SIV-Human during the course of the study.

NHP.234 (7966232) **Passive immunization of macaques against SIV infection**
Authors Gardner MB, Rosenthal A, Jennings M, Yee JA, Antipa L, MacKenzie M
Journal J Med Primatol 1994 Feb-May;23(2-3):164-74
Objectives Challenge, Passive Immunization To evaluate the mechanism responsible for protection achieved by an inactivated whole SIV vaccine and to test antiviral effect against SIV challenge of inactivated plasma or purified Ig.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Plasma from a monkey that had been protected by an inactivated-whole SIV(mac) vaccine conferred protection to animals challenged iv 4-18 hours later with 10 AID50 of homologous cell-free virus.
- Plasma or purified immunoglobulin (Ig) from SIVmac infected asymptomatic monkeys failed to protect any recipients, and may have enhanced infection and accelerated disease.

- Anti-SIV Ig administered 24 hours post challenge may have enhanced infection

---

NHP.235 (7966226) **Cellular immune responses in rhesus macaques infected rectally with low dose simian immunodeficiency virus**

Authors Salvato MS, Emau P, Malkovsky M, Schultz KT, Johnson E, Pauza CD

Journal J Med Primatol 1994 Feb-May;23(2-3):125-30

Objectives Challenge, Immunogenicity To test hypothesis that cellular immune responses in previously-infected animals are a correlate of protection.

Species/Subspecies -

Main Findings

- Monkeys infected rectally with low dose of SIV were resistant to high dose challenge with SIV.
- PBMC from 2/4 challenged monkeys were unable to support SIV replication in vitro unless cultures were depleted of CD8+ lymphocytes.
- Monkeys that survived high dose rectal infection with SIV also suppressed virus replication in cultured PBMC.
- Virus-suppressive activity of PBMC may be an important correlate of protective immunity in AIDS.

NHP.236 (7887023) **Protection of rhesus macaques from SIV infection by immunization with different experimental SIV vaccines**

Authors de Vries P, Heeney JL, Boes J, Dings ME, Hulskotte EG, Dubbes R, Koornstra W, ten Haaft P, Akerblom L, Eriksson S, et al.

Journal Vaccine 1994 Nov;12(15):1443-52

Objectives Challenge, Immunogenicity To compare the immunogenicity and efficacy of an inactivated whole SIVmac (32H) preparation adjuvanted with muramyl dipeptide (SIV-MDP) and a gp120-enriched SIVmac (32H) ISCOM preparation (SIV-ISCOM).

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Higher SIV-specific serum antibody titres were found in the SIV-MDP-immunized monkeys than in the SIV-ISCOM-immunized ones.
- 4/4 SIV-MDP- and 4/4 SIV-ISCOM-immunized monkeys were protected against intravenous challenge.
- 2/2 in each control group were infected with the challenge virus.
- 0/4 in each vaccinee group were protected after reboost and rechallenge with 10 MID50 of the same virus produced in PBMC from a rhesus macaque
- SIV-ISCOM-immunized animals of PBMC-only (Group B) did not develop clinical symptoms during observation period, unlike most other animals in this trial.
- Both SIV preparations induced low VN antibody titres, possibly caused by denatured form of gp120after formaldehyde or acid treatment in both vaccine preparations

---

NHP.237 (9032322) **Rhesus macaques previously infected with simian/human immunodeficiency virus are protected from vaginal challenge with pathogenic SIV-mac239**

Authors Miller CJ, McChesney MB, Lu X, Dailey PJ, Chutkowski C, Lu D, Brosio P, Roberts B, Lu Y

Journal J Virol 1997 Mar;71(3):1911-21

Objectives Challenge, Immunogenicity To determine if a previous infection with SHIV 89.6 by vaginal inoculation could protect animals from vaginal challenge with pathogenic SIV.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- 5 Rhesus macaques infected intravaginally with SHIV89.6 then challenged intravaginally with pathogenic SIV-mac239 had low or undetectable viral RNA levels in plasma compared to control animals.
- 3/5 of the SHIV-immunized animals remained virus isolation negative for more than 8 months, while 2 became virus isolation positive.
- The presence of SIV Gag-specific cytotoxic T lymphocytes in peripheral blood mononuclear cells and SIV-specific antibodies in cervicovaginal secretions at the time of challenge was associated with resistance to pathogenic SIV infection after vaginal challenge

---

NHP.238 (9000087) **Rapid development of vaccine protection in macaques by live-attenuated simian immunodeficiency virus**

Authors Stahl-Hennig C, Dittmer U, Nisslein T, Petry H, Jurkiewicz E, Fuchs D, Wachter H, Matz-Rensing K, Kuhn EM, Kaup FJ, Rud EW, Hunsmann G

Journal J Gen Virol 1996 Dec;77 (Pt 12):2969-81
Objectives Challenge, Immunogenicity To investigate the efficacy the nature of the immune protection induced of a nef-deleted mutant of SIVmac32H called pC8.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- All monkeys infected with pC8 live attenuated virus became persistently infected, exhibiting low cell-associated viral loads, but strong cellular and strong humoral antiviral responses.
- 2/8 pC8-infected monkeys developed an immunodeficiency and were not challenged with complete replenishment of the deletion.
- 6 monkeys, 2 preinfected for 42 weeks and 4 for 22 weeks, were challenged with pathogenic spleen-derived SIV; complete protection was achieved in 4 vaccinees.
- Protection from challenge virus infection or a delayed disease development seemed to be associated with a sustained SIV-specific T helper cell response after challenge.
- Conclusion: sterilizing immunity against superinfection with pathogenic SIV can be induced even after a relatively short waiting period of 22 weeks.

NHP.239 (2157886) **Inactivated simian immunodeficiency virus vaccine failed to protect rhesus macaques from intravenous or genital mucosal infection but delayed disease in intravenously exposed animals**
Authors Sutjipto S, Pedersen NC, Miller CJ, Gardner MB, Hanson CV, Gettie A, Jennings M, Higgins J, Marx PA
Journal J Virol 1990 May;64(5):2290-7
Objectives Challenge, Immunogenicity To test efficacy of a whole-virus vaccine inactivated with psoralen and UV light.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac HUT-78 ((Psoralem-UV) *Type:* Whole (killed) Inactivated Virus
Challenge SIVmac (not detemined) *Route:* Urethral, Vaginal or perivaginal, Mucosal
Main Findings

- The vaccine elicited humoral immune response prior to challenge.
- All immunized animals became infected after challenge, but their clinical course was delayed compared with controls.
- Route of infection affected disease course, with animals infected by the iv route more likely to develop acute form of SIV than those infected by the genital mucosal route.
- Concentration of challenge did not affect outcome; vaccinated animals did not fare any better following minimal mucosal challenge than a much greater iv infection.

NHP.240 (2164591) **Immunization with a live, attenuated simian immunodeficiency virus (SIV) prevents early disease but not infection in rhesus macaques challenged with pathogenic SIV**
Authors Marthas ML, Sutjipto S, Higgins J, Lohman B, Torten J, Luciw PA, Marx PA, Pedersen NC
Journal J Virol 1990 Aug;64(8):3694-700
Objectives Challenge, Immunogenicity Tp test the potential of virulence-attenuated virus to protect against iv challenge with a pathogenic SIV(MAC) strain.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac1A11 *Type:* Live Attenuated Virus *Route:* Intravenous
Challenge SIVmac (not detemined) *Route:* Intravenous
Main Findings

- Live SIVmacIAII is immunogenic, did not induce disease, but failed to protect against moderately high dose of pathogenic virus.
- Immunization prevented severe, early disease and prolonged the lives of monkeys subsequently infected with pathogenic SIV.
- Within 1-6 weeks iv inoculated animals developed transient viremia without clinical disease and persistent humoral antibody response.
- Time until severe clinical symptoms: 267-304 days in immunized monkeys, 38-227 days PC in naive controls.

NHP.241 (2370678) **Antibody-mediated in vitro neutralization of human immunodeficiency virus type 1 abolishes infectivity for chimpanzees**
Authors Emini EA, Nara PL, Schleif WA, Lewis JA, Davide JP, Lee DR, Kessler J, Conley S, Matsushita S, Putney SD, et al.

Journal J Virol 1990 Aug;64(8):3674-8
Objectives Challenge, Immunogenicity To determine whether antibody against the HIV-1 V3 loop can abolish infectivity of HIV-1 in chimpanzees.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Main Findings

- Antibody to the gp120 prinicpal neutralization determinant (V3 loop) prevented HIV-1 infection in vitro and inhibited infection in vivo.

NHP.242 (2455898) **Human immunodeficiency virus type 1 challenge of chimpanzees immunized with recombinant envelope glycoprotein gp120**
Authors Berman PW, Groopman JE, Gregory T, Clapham PR, Weiss RA, Ferriani R, Riddle L, Shimasaki C, Lucas C, Lasky LA, et al.
Journal Proc Natl Acad Sci U S A 1988 Jul;85(14):5200-4
Objectives Challenge, Immunogenicity .
Species/Subspecies Pan troglodytes troglodytes (chimpanzee)
Vaccine Name rgp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Challenge HIV-1 IIIB *Route:* Intravenous
Main Findings

- The recombinant gp120 was effective in eliciting cellular and humoral immunity as well as immunologic memory.
- Anti-rgp120 antibodies reacted with authentic viral gp120 in immunological blot assays and were able to neutralize HIV-1 infectivity in vitro.
- Sera from the rgp120-immunized animals were able to neutralize HIV-1 pseudotypes of vesicular stomatitis virus prepared from the IIIB isolate, from which the gene encoding rgp120 was derived, as well as two heterologous isolates, ARV-2 and RF.
- The immune response elicited against the rgp120 was not effective in preventing viral infection after intravenous challenge with HIV-1.

NHP.243 (2370678) **Antibody-mediated in vitro neutralization of human immunodeficiency virus type 1 abolishes infectivity for chimpanzees**
Authors Emini EA, Nara PL, Schleif WA, Lewis JA, Davide JP, Lee DR, Kessler J, Conley S, Matsushita S, Putney SD, et al.
Journal J Virol 1990 Aug;64(8):3674-8
Objectives Challenge, Immunogenicity To determine whether antibody against the HIV-1 V3 loop can abolish infectivity of HIV-1 in chimpanzees.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Main Findings

- Antibody to the gp120 prinicpal neutralization determinant (V3 loop) prevented HIV-1 infection in vitro and inhibited infection in vivo.

NHP.244 (2470398) **Cell-mediated immune proliferative responses to HIV-1 of chimpanzees vaccinated with different vaccinia recombinant viruses**
Authors Van Eendenburg JP, Yagello M, Girard M, Kieny MP, Lecocq JP, Muchmore E, Fultz PN, Riviere Y, Montagnier L, Gluckman JC
Journal AIDS Res Hum Retroviruses 1989 Feb;5(1):41-50
Objectives Immunogenicity To compare proliferative responses to HIV and to vaccinia virus antigens of lymphocytes taken at various times from chimpanzees vaccinated with recombinant vaccinia virus expressing different HIV genes.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Main Findings

- Irrespective of the HIV gene utilized, lymphocyte proliferation to HIV was usually weak and rapidly decreased after each inoculation, contrasting with strong and sustained responses to vaccinia virus.
- IL-2-producing VV did not lead to increased responsiveness.
- Reactivity to soluble purified gp160, but not to p25, could be detected in PBL from animals that had received both VV160 and VV25, while immunization with VVF resulted in a significant response to this protein in 1/2 animals.

NHP.245.1 (2548210) **Vaccine protection against simian immunodeficiency virus infection**
Authors Desrosiers RC, Wyand MS, Kodama T, Ringler DJ, Arthur LO, Sehgal PK, Letvin NL, King NW, Daniel MD
Journal Proc Natl Acad Sci U S A 1989 Aug;86(16):6353-7
Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Whole inactivated SIVmac251 *Type:* Whole (killed) Inactivated Virus *Route:* Intramuscular
Challenge SIVmac251 *Route:* Intravenous
Main Findings

- 2/6 vaccinated monkeys showed no evidence of infection following the live virus challenge.
- Transfusion of 10 ml of whole blood from these 2 into uninfected, naive rhesus monkeys did not result in infection of the recipients, providing further support for the lack of infection in the 2 previously vaccinated animals.
- 4/4 unvaccinated control monkeys inoculated with live SIV became infected and 3 of these died with AIDS 118-258 days after infection (in contrast with 1/6 vaccinated monkeys).
- 4/4 naive controls infected and developed SAIDS.
- 4/4 naive controls infected and diseased.
- 0/4 vaccinees protected from infection.
- 1/4 protected from increased viral load and disease to 930 dpc.

NHP.245.2 (2548210) **Vaccine protection against simian immunodeficiency virus infection**
Authors Desrosiers RC, Wyand MS, Kodama T, Ringler DJ, Arthur LO, Sehgal PK, Letvin NL, King NW, Daniel MD
Journal Proc Natl Acad Sci U S A 1989 Aug;86(16):6353-7
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Whole inactivated SIVmac251 *Type:* Whole (killed) Inactivated Virus *Route:* Intramuscular
Challenge SIVmac251 *Route:* Intramuscular

NHP.245.3 (2548210) **Vaccine protection against simian immunodeficiency virus infection**
Authors Desrosiers RC, Wyand MS, Kodama T, Ringler DJ, Arthur LO, Sehgal PK, Letvin NL, King NW, Daniel MD
Journal Proc Natl Acad Sci U S A 1989 Aug;86(16):6353-7
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Whole inactivated SIVmac251 *Type:* Whole (killed) Inactivated Virus
Challenge SIVmac251 *Route:* Intramuscular

NHP.247 (2555541) **Challenge of chimpanzees (Pan troglodytes) immunized with human immunodeficiency virus envelope glycoprotein gp120**
Authors Arthur LO, Bess JW Jr, Waters DJ, Pyle SW, Kelliher JC, Nara PL, Krohn K, Robey WG, Langlois AJ, Gallo RC, et al.
Journal J Virol 1989 Dec;63(12):5046-53
Objectives Challenge, Immunogenicity To determine the efficacy of the immunization of a gp120 immunization to prevent infection from homologous HIV-1 IIIB challenge in chimpanzees.
Species/Subspecies Pan troglodytes troglodytes (chimpanzee)
Vaccine Name HIV-1 IIIB gp120 *Type:* Purified Viral Products
Challenge HIV-1 IIIB *Route:* Intravenous
Main Findings

- 2/2 animals became infected with HIV, indicating that the immune response elicited by immunization with gp120 formulated in alum was not effective in preventing infection with HIV-1.

NHP.248 (2555923) **A formalin-inactivated whole SIV vaccine confers protection in macaques**
Authors Murphey-Corb M, Martin LN, Davison-Fairburn B, Montelaro RC, Miller M, West M, Ohkawa S, Baskin GB, Zhang JY, Putney SD, et al.
Journal Science 1989 Dec 8;246(4935):1293-7

Objectives Challenge, Immunotherapy Evaluate capacity of formalin-inactivated whole virus vaccine to prevent infection and/or block development of SIV.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIV/Delta$_{B670}$ *Type:* Whole (killed) Inactivated Virus *Route:* Intramuscular
Challenge SIVDeltaB670 *Route:* Intravenous
Main Findings

- Immunization with formalin-inactivated whole SIV potentiated with either MDP or MDP combined with alum protected 9/9 juvenile rhesus monkeys against disease for at least 1 year after challenge
- A high dose of highly purified material was used for all immunizations
- The vaccine contained all major virion proteins
- A rest period sufficient to establish appropriate memory cells was allowed before exposure to live virus

---

NHP.249 (3475581) **Effect of immunization with a vaccinia-HIV env recombinant on HIV infection of chimpanzees**
Authors Hu SL, Fultz PN, McClure HM, Eichberg JW, Thomas EK, Zarling J, Singhal MC, Kosowski SG, Swenson RB, Anderson DC, et al.
Journal Nature 1987 Aug 20-26;328(6132):721-3
Objectives Challenge, Immunogenicity .
Species/Subspecies Pan troglodytes troglodytes (chimpanzee)
Vaccine Name Chimp anti-HIV IgG *Type:* Passive Antibody
Challenge LAV-1 or NY5 *Route:* Intravenous
Main Findings

- Although HIV-specific antibody and T-cell responses were elicited by immunization, virus was isolated from lymphocytes of all challenged chimpanzees, indicating that immunization did not prevent infection by HIV.
- Among the animals that received a higher dose of LAV-1, 1/2 control chimpanzees, but none of the 4 v-env5-immunized chimpanzees developed substantial and persistent lymphadenopathy.

NHP.250 (7584989) **Early suppression of SIV replication by CD8+ nef-specific cytotoxic T cells in vaccinated macaques**
Authors Gallimore A, Cranage M, Cook N, Almond N, Bootman J, Rud E, Silvera P, Dennis M, Corcoran T, Stott J, et al.
Journal Nat Med 1995 Nov;1(11):1167-73
Objectives Challenge, Immunogenicity To evaluate potential of subunit vaccine (nef) to elicit protection with nef-specific CTLs.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Main Findings

- Strong CTL responses substantially reduce viral load and appear to clear infection.
- Early decline in viraemia, observed in both vaccinated and unvaccinated control animals was associated with the development of virus-specific CTL activity and not with the presence of virus-specific neutralizing antibodies.

NHP.251 (7585061) **HIV-1 recombinant poxvirus vaccine induces cross-protection against HIV-2 challenge in rhesus macaques**
Authors Abimiku AG, Franchini G, Tartaglia J, Aldrich K, Myagkikh M, Markham PD, Chong P, Klein M, Kieny MP, Paoletti E, et al.
Journal Nat Med 1995 Apr;1(4):321-9
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Background: Rhesus macaques immunized with attenuated vaccinia or canarypox HIV-1 recombinants and boosted with HIV-1 protein subunits formulated in alum, then challenged with HIV-2.SBL6669.
- Following challenge with HIV-2SBL6669, 3/8 immunized macaques resisted infection for 6 months and another exhibited significantly delayed infection, whereas all 3 naive controls became infected.
- Immunizations elicited both humoral and cellular immune responses with no clear correlation with protection.

NHP.252 (7585217) **Long-term protection against SIV-induced disease in macaques vaccinated with a live attenuated HIV-2 vaccine**

Authors Putkonen P, Walther L, Zhang YJ, Li SL, Nilsson C, Albert J, Biberfeld P, Thorstensson R, Biberfeld G

Journal Nat Med 1995 Sep;1(9):914-8

Objectives Challenge, Immunogenicity To test the ability of a live attenuated human immunodeficiency virus type 2 (HIV-2) vaccine to protect cynomolgus monkeys against superinfection with a pathogenic simian immunodeficiency virus (SIVsm).

Main Findings

- 3/4 monkeys vaccinated with live HIV-2 were protected against immunosuppression and SIV-induced disease during more than 5 years of follow-up.
- The quality of the immunity was permissive for infection, but monkeys that survived showed restricted viral replication in peripheral blood and lymph nodes.
- Protection against a pathogenic heterologous primate lentivirus is possible.
- Vaccine can prevent disease in vaccinated monkeys even if infection is not prevented.

NHP.253 (7625117) **Heterologous HIV-2 challenge of rhesus monkeys immunized with recombinant vaccinia viruses and purified recombinant HIV-2 proteins**

Authors Vogt G, le Grand R, Vaslin B, Boussin F, Auboyer MH, Riviere Y, Putkonen P, Sonigo P, Kieny MP, Girard M, et al.

Journal Vaccine 1995 Feb;13(2):202-8

Objectives Challenge, Immunogenicity To analyze the role of anti-envelope immunity in the protection of rhesus monkeys against an HIV-2 intravenous challenge.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- None of the animals was protected in spite of high humoral immune responses on day of challenge as determined by ELISA and Western Blot assays.

NHP.254 (7521918) **Vaccine-induced neutralizing antibodies directed in part to the simian immunodeficiency virus (SIV) V2 domain were unable to protect rhesus monkeys from SIV experimental challenge**

Authors Schlienger K, Montefiori DC, Mancini M, Riviere Y, Tiollais P, Michel ML

Journal J Virol 1994 Oct;68(10):6578-88

Objectives Challenge, Immunogenicity To analyze the role of an SIV V2 vaccine as an effective region to boost SIV-neutralizing antibodies and to protect against live SIV challenge.

Main Findings

- 2 rhesus macaques primed with vaccinia virus recombinants expressing the surface glycoprotein gp140 of SIVmac then given booster with the SIVmac V2 domain: The 2 vaccinated macaques exhibited SIV-neutralizing antibodies (part of which directed specifically to the V2 region) after primer injections that were enhanced by the V2/HBsAg injections.
- Animals not protected against homologous challenge with SIVmac251.BK28.
- Vaccinees had higher viral loads than control animals after challenge.

NHP.255 (7632466) **In vivo administration of CD4-specific monoclonal antibody: effect on provirus load in rhesus monkeys chronically infected with the simian immunodeficiency virus of macaques**

Authors Reimann KA, Cate RL, Wu Y, Palmer L, Olson D, Waite BC, Letvin NL, Burkly LC

Journal AIDS Res Hum Retroviruses 1995 Apr;11(4):517-25

Objectives Immunotherapy, Passive Immunization To study the potential role of monoclonal antibodies specific for CD4 as an AIDS therapy.

Main Findings

- 6 infected monkeys treated with anti-CD4 MAb demonstrated a significant decrease in SIVmac provirus level after 9 days (3 had >800 CD4 cell/microliter and developed strong antimouse Ig response that prevented further treatment; the remaining 3 monkeys had <800 CD4 cell/microliter and failed to develop antimouse Ig antibody response).
- 4 control monkeys that received a control MAb of irrelevant specificity for 9-22 days showed either no significant change or a transient increase in SIVmac provirus

NHP.256 (7666524) **Vaccine-induced protection of chimpanzees against infection by a heterologous human immunodeficiency virus type 1**
Authors Girard M, Meignier B, Barre-Sinoussi F, Kieny MP, Matthews T, Muchmore E, Nara PL, Wei Q, Rimsky L, Weinhold K, et al.

Authors Clements JE, Montelaro RC, Zink MC, Amedee AM, Miller S, Trichel AM, Jagerski B, Hauer D, Martin LN, Bohm RP, et al.
Journal J Virol 1995 May;69(5):2737-44
Objectives Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings
- Rhesus macaques inoculated with an attenuated macrophage-tropic recombinant of SIVmac239 (SIV/17E-Cl) exhibited vigorous type-specific nab responses restricted to SIV/17E-Cl by 2 weeks postinfection.
- Cross-reactive neutralizing antibodies emerged by 7 months, which neutralized not only SIV/17E-Cl but also the heterologous primary isolate SIV/DeltaB670.
- Challenge of SIV/17E-Cl-infected monkeys with SIV/DeltaB670: protective responses associated with cross-reactive neutralizing antibodies.
- Passive transfer of sera from SIV/17E-Cl-infected animals passively protected 2/4 naive recipients

NHP.258.2 (7707496) **Cross-protective immune responses induced in rhesus macaques by immunization with attenuated macrophage-tropic simian immunodeficiency virus**

Objectives Passive Immunization .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings
- Passive transfer of sera from SIV/17E-Cl-infected animals passively protected 2/4 naive recipients

NHP.259 (7707540) **Macaques immunized with HLA-DR are protected from challenge with simian immunodeficiency virus**
Authors Arthur LO, Bess JW Jr, Urban RG, Strominger JL, Morton WR, Mann DL, Henderson LE, Benveniste RE
Journal J Virol 1995 May;69(5):3117-24

Objectives Challenge, Immunogenicity To identify the potential antigens involved in protection induced by the immunization with uninfected human cells against the challenge with SIV propagated in human cells.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Main Findings

- All macaques immunized with beta 2M and HLA class I developed high antibody titers to beta 2M, BUT were not protected from a subsequent challenge with infectious SIV grown in human cells.
- The macaques immunized with class II protein (HLA-DR) and mock virus developed antibodies to class II protein and were protected from the intravenous infectious virus challenge.
- The protection seen with human class II protein did not extend to protection from infection with SIV containing macaque class II proteins.
- Immunization with a purified cellular protein can protect from virus infection.

NHP.265 (11090194) **Protection of Macaca nemestrina from disease following pathogenic simian immunodeficiency virus (SIV) challenge: utilization of SIV nucleocapsid mutant DNA vaccines with and without an SIV protein boost**
Authors Gorelick RJ, Benveniste RE, Lifson JD, Yovandich JL, Morton WR, Kuller L, Flynn BM, Fisher BA, Rossio JL, Piatak M Jr, Bess JW Jr, Henderson LE, Arthur LO
Journal J Virol 2000 Dec;74(24):11935-49
Objectives Challenge, Immunogenicity To use molecular clones (that express nucleocapsid deletion mutant SIVs that are replication defective but capable of completing virtually all of the steps of a single viral infection cycle) in a vaccine challenge study.
Species/Subspecies Macaca nemestrina (pigtailed macaque)
Vaccine Name SIV(Mne)NCΔZF2 DNA *Type:* Live Attenuated Virus *Routes:* Subcutaneous, Intramuscular
Vaccine Name S8-NCΔZF2 *Type:* Live Attenuated Virus *Routes:* Subcutaneous, Intramuscular
Challenge SIV(Mne) clone E11S *Route:* Intravenous
Main Findings

- 11/11 animals immunized with nucelocapside mutant SIV DNA; immunized animals became infected following challenge but typically showed decreased initial peak plasma SIV RNA levels compared to those of control animals; all control animals became infected and 3/4 animals developed progressive SIV disease leading to death.
- Only modest and inconsistent humoral responses and no cellular immune responses were observed prior to challenge.
- Immunization of macaques with DNA that codes for replication-defective but structurally complete virions appears to protect from or at least delay the onset of AIDS after infection with a pathogenic immunodeficiency virus.

NHP.266 (12390544) **Protection by SIV VLP DNA prime/protein boost following mucosal SIV challenge is markedly enhanced by IL-12/GM-CSF co-administration**

Authors O'Neill E, Martinez I, Villinger F, Rivera M, Gascot S, Colon C, Arana T, Sidhu M, Stout R, Montefiori DC, Martinez M, Ansari AA, Israel ZR, Kraiselburd E

Journal J Med Primatol 2002 Aug;31(4-5):217-27

Objectives Challenge, Immunogenicity To induce and enhance antiviral responses using a DNA prime/virus-like particles (VLP) protein boost strategy adjuvanted with interleukin (IL)-12/GM-CSF in rhesus macaques challenged with simian immunodeficiency virus (SIV).

Main Findings

- All except 1 immunized monkey became infected.
- All immunized monkeys showed a marked reduction of acute viral peaks.
- Reduction of viral load set points was only achieved in groups whose prime-boost immunizations were supplemented with IL-12/GM-CSF (prime) and/or with IL-12 (boost).
- Control of viremia correlated with lack of disease progression and survival.
- Detection of virus in rectal washes at 1 year post-challenge was only successful in monkeys whose immunizations did not include cytokine adjuvant, but these loads did not correlate with plasma viral loads.

NHP.267 (2190095) **Protection of chimpanzees from infection by HIV-1 after vaccination with recombinant glycoprotein gp120 but not gp160**

Authors Berman PW, Gregory TJ, Riddle L, Nakamura GR, Champe MA, Porter JP, Wurm FM, Hershberg RD, Cobb EK, Eichberg JW

Journal Nature 1990 Jun 14;345(6276):622-5

Objectives Challenge, Immunogenicity To study chimpanzees that were immunized with recombinant forms of the HIV-1 glycoproteins gp120 and gp160 produced in Chinese hamster ovary cells, and then challenged with HIV-1.

Species/Subspecies Pan Troglodytes (Chimpanzee)

Vaccine Name rgp120 *Type:* Recombinant Subunit Protein

Vaccine Name rsgp160 *Type:* Recombinant Subunit Protein

Challenge HIV-1 IIIB *Route:*

Main Findings

- The control and the 2 animals immunized with the gp160 variant became infected within 7 weeks of challenge.
- The 2 animals immunized with the gp120 variant have shown no signs of infection after more than 6 months.
- Conclusion: recombinant gp120, formulated in an adjuvant approved for human use, can elicit protective immunity against a homologous strain of HIV-1.

NHP.268.1 (10812220) **Minimization of chronic plasma viremia in rhesus macaques immunized with synthetic HIV-1 Tat peptides and infected with a chimeric simian/human immunodeficiency virus (SHIV33)**

Authors Goldstein G, Manson K, Tribbick G, Smith R

Journal Vaccine 2000 Jun 15;18(25):2789-95

Objectives Challenge, Immunogenicity To study the effect of Tat on HIV-1 replication in vivo during acute, chronic asymptomatic and AIDS stages of infection by comparisons of plasma viremia in Tat-immunized or control monkeys challenged with SHIV33 or SHIV33A.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Synthetic tat *Type:* Synthetic Protein/Peptide *Route:* Intramuscular

Challenge SHIV33, SHIV33A *Route:* Intravenous

Main Findings

- Immunization of monkeys with tat affected the outcome of challenge: chronic plasma viremia became undetectable or minimized in Tat-immunized asymptomatic SHIV33-infected monkeys while the high viral loads of acute infection or SHIV33A-induced simian AIDS were unaffected by Tat immunization.
- Active or passive immunotherapies targeting Tat provide potential approaches to controlling chronic HIV-1 viremia and preventing AIDS.

NHP.268.2 (10812220) **Minimization of chronic plasma viremia in rhesus macaques immunized with synthetic HIV-1 Tat peptides and infected with a chimeric simian/human immunodeficiency virus (SHIV33)**

Authors Goldstein G, Manson K, Tribbick G, Smith R

Journal Vaccine 2000 Jun 15;18(25):2789-95

Objectives Challenge, Immunogenicity To study the effect of Tat on HIV-1 replication in vivo during acute, chronic asymptomatic and AIDS stages of infection by comparisons of plasma viremia in Tat-immunized or control monkeys challenged with SHIV33 or SHIV33A.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- See NHP.268.

NHP.269 (10074165) **Protection of macaques against intrarectal infection by a combination immunization regimen with recombinant simian immunodeficiency virus SIVmne gp160 vaccines**

Authors Polacino P, Stallard V, Montefiori DC, Brown CR, Richardson BA, Morton WR, Benveniste RE, Hu SL

Journal J Virol 1999 Apr;73(4):3134-46

Objectives Challenge, Immunogenicity To examine the protective efficacy of recombinant simian immunodeficiency virus SIVmne envelope (gp160) vaccines against mucosal challenge by the cloned homologous virus E11S clone and the uncloned SIVmne.

Species/Subspecies Macaca fascicularis (cynomolgus macaque)

Vaccine Name Recombinant vaccinia virus vac-gp160 (v-SE5) *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification

Vaccine Name gp160/BSC-40 *Type:* Purified Viral Products *Route:* Intramuscular

Challenge SIV(Mne) clone E11S, SIV(Mne) Cell-free *Route:* Intrarectal

Main Findings

- Protection correlates with high levels of SIV-specific antibodies.
- 4/4 vaccinees developed low levels of SIV-specific antibody responses after the recombinant vaccinia virus immunization; level increased 10-30 fold by boost envelop subunit.
- After intrarectal challenge with E11S, all 3 control animals became persistently infected, whereas 3/4 immunized macaques were completely protected.

NHP.270.1 (11514732) **Induction of simian immunodeficiency virus (SIV)-specific CTL in rhesus macaques by vaccination with modified vaccinia virus Ankara expressing SIV transgenes: influence of pre-existing anti-vector immunity**

NHP.274 (12490410) **Equivalent Immunogenicity of the Highly Attenuated Poxvirus-Based ALVAC-SIV and NYVAC-SIV Vaccine Candidates in SIVmac251-Infected Macaques**

Authors Hel Z, Nacsa J, Tsai WP, Thornton A, Giuliani L, Tartaglia J, Franchini G

Journal Virology 2002 Dec 5;304(1):125-34

Objectives Challenge, Immunogenicity, Immunotherapy To compare the immunogenicity of two vaccine candidates, the canarypox-based ALVAC-SIV-gag-pol-env and the vaccinia-based NYVAC-SIV-gag-pol-env, in rhesus macaques infected with SIVmac251 and treated with ART by 2 weeks postinfection.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name NYVAC-SIV-gag-pol-env (NYVAC-SIV-gpe) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name ALVAC-SIV-gpe (vcp180) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Challenge SIVmac251 (561) *Route:* Intravenous

Main Findings

- Both ALVAC-SIV-gpe and NYVAC-SIV-gpe vaccine candidates induced and/or enhanced a virus-specific CD8+ T cell response to a similar extent, as demonstrated by tetramer staining of Gag-specific CD8+ T cells.
- Both vaccines elicited comparable lymphoproliferative responses (LPRs) to the SIV p27 Gag and gp120 Env proteins.
- The vaccine was given after infection and initiation of HAART, as a therapuetic vaccine, not as protection from infection

---

NHP.275 (9234548) **SIV DNA vaccine trial in macaques: post-challenge necropsy in vaccine and control groups**

Authors Lu S, Manson K, Wyand M, Robinson HL

Journal Vaccine 1997 Jun;15(8):920-3

Objectives Challenge To study histopathologic findings from 9 macaques in a simian immunodeficiency virus (SIV) DNA vaccine trial evaluating the ability of a 5-plasmid DNA vaccine to protect against an uncloned SIVmac251 challenge (Lu et al., J. Virol. 1996, 70, 3978-3991).

Species/Subspecies Macaca (sp)

Vaccine Name DNA-SIV *Type:* DNA *Routes:* Intravenous, Intradermal (Gene Gun DNA-coated gold beads), Intramuscular

Main Findings

- 3 vaccinated and 1 control macaques developed disease and were sacrificed in the first year following challenge.
- Diseased and clinically "normal" animals had developed typical SIV-related lymphoid changes, inflammatory disorders and opportunistic infections (all but 1 vaccinated animal and both controls).
- The ability to contain challenge was superior in animals immunized by 3 routes (iv,im and gene gun) as compared to those that received the control DNA or DNA vaccine by gene gun only

---

NHP.276 (12396607) **Evaluation in rhesus macaques of Tat and rev-targeted immunization as a preventive vaccine against mucosal challenge with SHIV-BX08**

Authors Verrier B, Le Grand R, Ataman-Onal Y, Terrat C, Guillon C, Durand PY, Hurtrel B, Aubertin AM, Sutter G, Erfle V, Girard M

Journal DNA Cell Biol 2002 Sep;21(9):653-8

Objectives Challenge, Immunogenicity To evaluate whether vaccination with Tat or Tat and Rev could significantly reduce viral load in nonhuman primates.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SFV-tat *Type:* Recombinant Vector (virus/bacteria) *Route:* Subcutaneous

Vaccine Name SFV-rev *Type:* Recombinant Vector (virus/bacteria) *Route:* Subcutaneous

Vaccine Name MVA-tat *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name MVA-rev *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Vaccine Name DNA-pCI-tat *Type:* DNA *Routes:* Intradermal, Intramuscular

Vaccine Name DNA-pCI-rev *Type:* DNA *Routes:* Intradermal, Intramuscular

Challenge SHIV-BX08 *Route:* Intrarectal

Main Findings

- The immunization strategy by priming with either DNA or SFV seemed to be equivalent, but the additive or synergistic effect of a rev vaccine could not be clearly established.
- None of the animals was protected from infection.
- Peak viremia was reduced more than 200-fold compared to sham controls in one third (6/18) of vaccinated macaques.
- 4/6 protected animals did not seroconvert.

NHP.277 (12396606) **Immunogenicity of HIV-1 IIIB and SHIV 89.6P Tat and Tat toxoids in rhesus macaques: induction of humoral and cellular immune responses**

Authors Richardson MW, Mirchandani J, Silvera P, Regulier EG, Capini C, Bojczuk PM, Hu J, Gracely EJ, Boyer JD, Khalili K, Zagury JF, Lewis MG, Rappaport J

Journal DNA Cell Biol 2002 Sep;21(9):637-51

Objectives Challenge, Immunogenicity To compare immune responses in rhesus macaques immunized with unmodified HIV-1 IIIB Tat, SHIV89.6P Tat, and carboxymethylated IIIB and 89.6P Tat toxoids.

Main Findings

- Immunization with either IIIB or 89.6P preparation induced high titer and broadly cross-reactive serum anti-Tat IgG that recognized HIV-1 subtype-E and SIVmac251 Tat.
- Proliferative responses to Tat toxoids corresponding to the immunogen were evident in vitro in both IIIB and 89.6P groups.
- All animals were infected upon intravenous challenge with 30 MID(50) of SHIV89.6P and outcome of vaccine groups was not different from controls.
- Tat specific CD8+ T-cell responses may not appropriately recognize infected cells in vivo in rhesus macaque model.

NHP.278 (12477432) **Co-immunization of rhesus macaques with plasmid vectors expressing IFN-gamma, GM-CSF, and SIV antigens enhances anti-viral humoral immunity but does not affect viremia after challenge with highly pathogenic virus**

Authors Lena P, Villinger F, Giavedoni L, Miller CJ, Rhodes G, Luciw P

Journal Vaccine 2002 Dec 19;20 Suppl 4:A69-79

Objectives Challenge, Immunogenicity To investigate the adjuvant capacity of.

Main Findings

- Proliferative responses significantly enhanced by co-immunization with the cytokines GM-CSF and interferon-γ.
- 12 immunized monkeys and 6 naive controls, were challenged by the oral mucosal route with the uncloned and highly pathogenic SIVmac251 and became infected.
- Plasma viremia set points were not different in co-immunized group and the non-immunized control group.
- Monkeys vaccinated with equivalent amounts of empty vector plasmid (i.e. no cytokine inserts) along with plasmids expressing viral antigens demonstrated a slight but significant decrease in acute viremia compared to non-immunized controls (P<0.02).
- Conclusion: results underscore the need for further testing of cytokines as vaccine adjuvants in relevant animal models

---

NHP.279 (12396605) **Potent, persistent cellular immune responses elicited by sequential immunization of rhesus macaques with Ad5 host range mutant recombinants encoding SIV Rev and SIV Nef**

Authors Patterson LJ, Malkevitch N, Zhao J, Peng B, Robert-Guroff M

Journal DNA Cell Biol 2002 Sep;21(9):627-35

NHP.280 (12396604) **Design and in vivo immunogenicity of a polyvalent vaccine based on SIVmac regulatory genes**

Authors Hel Z, Tryniszewska E, Tsai WP, Johnson JM, Harrod R, Fullen J, Kalyanaraman VS, Altman JD, McNally J, Karpova T, Felber BK, Tartaglia J, Franchini G

NHP.281 (12391256) **Vaccination of macaques with long-standing SIVmac251 infection lowers the viral set point after cessation of antiretroviral therapy**

Authors Tryniszewska E, Nacsa J, Lewis MG, Silvera P, Montefiori D, Venzon D, Hel Z, Parks RW, Moniuszko M, Tartaglia J, Smith KA, Franchini G

Journal J Immunol 2002 Nov 1;169(9):5347-57

Objectives Immunotherapy, Chemotherapy Tested ART, ART plus therapeutic vaccine, ART plus therapeutic vaccine plus IL-2, ART plus IL-2.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Therapeutic vaccines reduced average viral load at set point, but not peak viral load following cessation of ART. Addition of IL-2 to therapeutic vaccine produced virus-specific proliferative resopnses lower than therapeutic vaccine alone

---

NHP.282 (12391187) **Containment of simian immunodeficiency virus infection in vaccinated macaques: correlation with the magnitude of virus-specific pre- and postchallenge CD4+ and CD8+ T cell responses**

Authors Herrera C, Spenlehauer C, Fung MS, Burton DR, Beddows S, Moore JP
Journal J Virol 2003 Jan;77(2):1084-91
Objectives Passive Immunization To investigate whether nonneutralizing monoclonal antibodies to the gp120 subunit of env glycoprotein complex of HIV-1 can interfere with HIV-1 neutralization by another anti-gp120 MAb.
Main Findings
- REMOVE THIS.

NHP.293 (1708168) **Recombinant virus vaccine-induced SIV-specific CD8+ cytotoxic T lymphocytes**
Authors Shen L, Chen ZW, Miller MD, Stallard V, Mazzara GP, Panicali DL, Letvin NL
Journal Science 1991 Apr 19;252(5004):440-3

NHP.294 (12477823) **Immunization of newborn rhesus macaques with simian immunodeficiency virus (SIV) vaccines prolongs survival after oral challenge with virulent SIVmac251.*****
Authors Van Rompay KK, Greenier JL, Cole KS, Earl P, Moss B, Steckbeck JD, Pahar B, Rourke T, Montelaro RC, Canfield DR, Tarara RP, Miller C, McChesney MB, Marthas ML
Journal J Virol 2003 Jan;77(1):179-90
Objectives Challenge, Immunogenicity To evaluate immunization of infant macaques at birth and 3 weeks of age with either MVA-SIV Gag, Pol, and Env or live-attenuated SIVmac1A11.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name rMVA SIVmac239 gagpolenv *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intramuscular, Intranasal
Vaccine Name SIVmac1A11 *Type:* Live Attenuated Virus *Routes:* Intravenous, Oral, Intranasal
Vaccine Name Anti-SIVmac251 *Type:* Passive Antibody *Route:* Intraplacental
Challenge SIVmac251 *Route:* Oral
Main Findings
- Upon challenge with virulent SIVmac251, all animals became infected.
- The immunized animals mounted better antiviral antibody responses, controlled virus levels more effectively, and had a longer disease-free survival than the unvaccinated infected monkeys.
- Maternal antibodies did not significantly reduce the efficacy of the MVA-SIVgpe vaccine.

NHP.295 (11000207) **Intrinsic susceptibility of rhesus macaque peripheral CD4(+) T cells to simian immunodeficiency virus in vitro is predictive of in vivo viral replication**
Authors Goldstein S, Brown CR, Dehghani H, Lifson JD, Hirsch VM
Journal J Virol 2000 Oct;74(20):9388-95
Main Findings
- Following intravenous infection of macaques with SIVsmE543-3, the wide range in plasma viremia followed the same rank order as the relative susceptibility established by in vitro studies.
- Significant correlation between plasma viremia at 2-8 wpi and in vitro susceptibility ($P < 0.05$).
- Simian T-lymphotropic virus type 1 appears to enhance susceptibility to SIV infection.
- Intrinsic susceptibility of CD4+ target cells influences early virus replication patterns in vivo.

NHP.296 (12502820) **Prevention of Disease Induced by a Partially Heterologous AIDS Virus in Rhesus Monkeys by Using an Adjuvanted Multicomponent Protein Vaccine**
Authors Voss G, Manson K, Montefiori D, Watkins DI, Heeney J, Wyand M, Cohen J, Bruck C
Journal J Virol 2003 Jan;77(2):1049-58
Objectives Challenge To assess the efficacy of a recombinant human immunodeficiency virus type 1 (HIV-1) gp120, NefTat fusion protein, and simian immunodeficiency virus (SIV) Nef formulated in the clinically tested adjuvant AS02A.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Recombinant gp120 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name Nef-Tat *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name SIV Nef *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Main Findings
- Multiantigen subunit protein vaccine was able to prevent the development of disease induced in rhesus monkeys by a partially heterologous AIDS virus.

- Upon challenge of genetically unselected rhesus monkeys with the highly pathogenic and partially heterologous SIV/HIV strain SHIV89.6p, the vaccine was able to reduce virus load and protect the animals from a decline in CD4-positive cells.
- Vaccination prevented the development of AIDS for more than 2.5 years.

NHP.297 (12502815) **Increased mucosal transmission but not enhanced pathogenicity of the CCR5-tropic, simian AIDS-inducing simian/human immunodeficiency virus SHIV(SF162P3) maps to envelope gp120**

Authors Hsu M, Harouse JM, Gettie A, Buckner C, Blanchard J, Cheng-Mayer C

Journal J Virol 2003 Jan;77(2):989-98

Objectives Pathogenicity To determine whether envelope glycoprotein gp120 is responsible for increased pathogenesis and transmissibility of the SHIV-SF162P3.

Main Findings

- See NHP.312.

NHP.298 (12477842) **Importance of B-cell responses for immunological control of variant strains of simian immunodeficiency virus**

Authors Johnson WE, Lifson JD, Lang SM, Johnson RP, Desrosiers RC

Journal J Virol 2003 Jan;77(1):375-81

Objectives Immunogenicity, Pathogenicity To compare the pathogenicity of three variants of cloned simian immunodeficiency virus strain 239 (SIV239).

Main Findings

- All 3 cloned strains (M5, DeltaV1-V2 and 316) of SIVmac239 were capable of significant levels of fusion independent of CD4, and all 3 were considerably more sensitive to antibody-mediated neutralization than the parent strain from which they were derived.
- The 3 clones induce viral loads at peak height around day 14 that are indistinguishable from or only slightly less than those observed in monkeys infected with the parental SIV239 strain.
- Viral loads at the set point 20 to 50 weeks after infection, however, were more than 400- to 10,000-fold lower with the variant strains.
- Depletion of B cells around the time of infection with M5 resulted in less effective immunological control and much higher viral loads at the set point in 2/3 monkeys

---

NHP.299 (12496959) **Therapeutic dendritic-cell vaccine for simian AIDS**

Authors Lu W, Wu X, Lu Y, Guo W, Andrieu JM

Journal Nat Med 2003 Jan;9(1):27-32

Objectives Immunogenicity, Immunotherapy To investigate the ability of a vaccination with chemically inactivated SIV-pulsed dendritic cells to induce cellular and humoral immunity in SIV infected rhesus monkey model.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name AT-2 inactivated SIV-loaded DC *Type:* Cell/Tissue *Route:* Subcutaneous

Main Findings

- Chemically inactivated SIV-pulsed dendritic cells induced an effective and durable SIV-specific cellular and humoral immunity in SIV-infected rhesus monkeys.
- After 3 immunizations made at 2-week intervals, the animals exhibited a 50-fold decrease of SIV DNA and a 1,000-fold decrease of SIV RNA in peripheral blood with reduced viral load levels maintained over the remaining 34 weeks.

NHP.300 (12531331) **A Gag-Pol/Env-Rev SIV239 DNA vaccine improves CD4 counts, and reduce viral loads after pathogenic intrarectal SIV(mac)251 challenge in Rhesus Macaques**

Authors Muthumani K, Bagarazzi M, Conway D, Hwang DS, Manson K, Ciccarelli R, Israel Z, Montefiori DC, Ugen K, Miller N, Kim J, Boyer J, Weiner DB

Journal Vaccine 2003 Jan 30;21(7-8):629-37

Objectives Challenge, Immunogenicity To study plasmid vaccines supplemented by IL-2 Ig cytokine gene adjuvants or boosted by recombinant MVA vectors expressing relevant SIV and HIV antigens.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pGagpol/EnvRev SIV239 DNA *Type:* DNA *Route:* Intramuscular
Challenge SIVmac251 *Route:* Intrarectal
Main Findings

- The immunization strategy employed in this study prevented CD4(+) T-cell loss and lowered viral loads following pathogenic challenge.
- Using a pathogenic SIV251 rhesus mucosal challenge model, pGag/Pol+pEnv/Rev plasmid vaccines could not prevent SIVinfection: vaccinated animals exhibited significant improvement in control of viral challenge and protection against CD4(+) T-cell loss compared to control animals

NHP.301 (12526038) **Human and simian immunodeficiency virus-infected chimpanzees do not have increased intracellular levels of beta-chemokines in contrast to infected humans**
Authors Ondoa P, Vereecken C, Fransen K, Colebunders R, Van Der Groen G, Heeney JL, Kestens L
Journal J Med Virol 2003 Mar;69(3):297-305
Objectives Immunogenicity, Pathogenicity To explain why chimpanzees infected with HIV-1 or SIVcpz are relatively resistant to AIDS.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Main Findings

- In humans, the percentage of B-chemokine-positive cells was significantly higher in CD8+ T and natural killer (NK) cells than in CD4+ T cells in both uninfected and HIV-1-infected individuals.
- In the presence of HIV-1 infection, however, both CD8+ and CD4+ T cell subsets contained significantly more B-chemokine-positive cells than in the absence of infection.
- In chimpanzees, the percentage of B-chemokine-positive CD8+ T and NK cells was significantly higher than in uninfected humans.
- In contrast to humans, infection of chimpanzees with either HIV-1 or with SIVcpz was not associated with increased numbers of B-chemokine-positive cells.

NHP.302 (12393472) **Impact of simian immunodeficiency virus (SIV) infection on lymphocyte numbers and T-cell turnover in different organs of rhesus monkeys**
Authors Sopper S, Nierwetberg D, Halbach A, Sauer U, Scheller C, Stahl-Hennig C, Matz-Rensing K, Schafer F, Schneider T, ter Meulen V, Muller JG
Journal Blood 2003 Feb 15;101(4):1213-9

NHP.303 (12502833) **Control of viremia and prevention of simian-human immunodeficiency virus-induced disease in rhesus macaques immunized with recombinant vaccinia viruses plus inactivated simian immunodeficiency virus and human immunodeficiency virus type 1 particles**
Authors Willey RL, Byrum R, Piatak M, Kim YB, Cho MW, Rossio Jr JL Jr, Bess Jr J Jr, Igarashi T, Endo Y, Arthur LO, Lifson JD, Martin MA
Journal J Virol 2003 Jan;77(2):1163-74
Objectives Challenge, Immunogenicity To evaluate the protective efficacy of a vaccine regimen that uses recombinant vaccinia viruses expressing SIV and HIV-1 structural proteins in combination with intact inactivated SIV and HIV-1 particles.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name rVV-SIVmacgag/pol *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal
Vaccine Name rVV-HIV-1.DH12env *Type:* Recombinant Vector (virus/bacteria) *Route:* Intradermal
Vaccine Name AT-2 rx SIVmac239 *Type:* Live Attenuated Virus *Route:* Intramuscular
Vaccine Name AT-2 rx HIV-1.DH12 *Type:* Live Attenuated Virus *Route:* Intramuscular
Challenge SHIV.DH12R-PS1 *Route:* Intravenous
Main Findings

- Following virus challenge, control animals experienced a rapid and complete loss of CD4(+) T cells, sustained high viral loads, and developed clinical disease by 17 to 21 weeks.
- All the vaccinated monkeys became infected, displayed reduced post-peak viremia, had no significant loss of CD4(+) T cells, and have remained healthy for more than 15 mpc.
- CD8(+) T-cell and nab responses demonstrated in vaccinated animals following challenge.
- Immunologic control of infection was incomplete (no sterilizing protection) by 22 wpc.

NHP.304 (12556683) **Post-exposure prophylaxis with human monoclonal antibodies prevented SHIV89.6P infection or disease in neonatal macaques**

Authors Ferrantelli F, Hofmann-Lehmann R, Rasmussen RA, Wang T, Xu W, Li PL, Montefiori DC, Cavacini LA, Katinger H, Stiegler G, Anderson DC, McClure HM, Ruprecht RM.

Journal AIDS 2003 Feb 14;17(3):301-309

Objectives Challenge, Immunotherapy, Passive Immunization To develop passive immunization with human neutralizing monoclonal antibodies against mother-to-child transmission of HIV during delivery and through breastfeeding.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Monoclonal antibody 2G12 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Monoclonal antibody 2F5 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name Monoclonal antibody 4E10 *Type:* Passive Antibody *Route:* Intravenous

Vaccine Name IgG1 b12 *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV89.6P *Route:* Oral

Main Findings

- 2/4 macaque infants treated with neutralizing mAbs showed no evidence of infection; the other 2 maintained normal CD4 T cell counts.
- In contrast, all control animals became highly viremic and had profound CD4 T cell losses; 3/4 died from AIDS within 1.5-6 weeks of the challenge
- Conclusions: Passive immunization with this quadruple neutralizing mAbs combination may represent a promising approach to prevent peri- and postnatal HIV transmission

---

NHP.305 (12545074) **Live attenuated, nef-deleted SIV is pathogenic in most adult macaques after prolonged observation**

Authors Hofmann-Lehmann R, Vlasak J, Williams AL, Chenine AL, McClure HM, Anderson DC, O'Neil S, Ruprecht RM

Journal AIDS 2003 Jan 24;17(2):157-66

Objectives Immunogenicity, Pathogenicity To demonstrate the pathogenicity of a live attenuated SIV (SIVmac239Δ3).

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVmac239Δ3 (cell-infected) *Type:* Cell/Tissue *Route:* Intravenous

Vaccine Name SIVmac239Δ3 *Type:* Live Attenuated Virus *Routes:* Intravenous, Oral, Intra-amniotic

Main Findings

- 11/11 rhesus macaques vaccinated with SIVmac239δ3 developed signs of immune disfunction.
- 11/11 vaccinated animals had inverted CD4:CD8 ratio.
- 7/11 (64%) had persistent recurrent viremia.
- Other signs of immune disfunction included decreased CD4, low CD4CD29 lymphocyte subsets, low anti-gag antibodies, etc
- 2/11 (18%) vaccinees developed AIDS.
- Conclusion: Live attenuated virus can cause immune disfunction in vaccinees and similar live attenuated HIV seems contraindicated for mass vaccination of humans

---

NHP.306.1 (11797011) **Replication-incompetent adenoviral vaccine vector elicits effective anti-immunodeficiency-virus immunity**

Authors Shiver JW, Fu TM, Chen L, Casimiro DR, Davies ME, Evans RK, Zhang ZQ, Simon AJ, Trigona WL, Dubey SA, Huang L, Harris VA, Long RS, Liang X, Handt L, Schleif WA, Zhu L, Freed DC, Persaud NV, Guan L, Punt KS, Tang A, Chen M, Wilson KA, Collins KB, Heidecker GJ, Fernandez VR, Perry HC, Joyce JG, Grimm KM, Cook JC, Keller PM, Kresock DS, Mach H etc

Journal Nature 2002 Jan 17;415(6869):331-5

Objectives Challenge, Immunogenicity To compare vaccine vector delivery systems: 3 formulations of a plasmid DNA vector (MVA) and a replication incompetent adenovirus type 5 vector expressing SIV gag protein.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pV1R-SIVmac239-gag *Type:* DNA *Route:* Intramuscular
Vaccine Name MVA-SIVgag *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Vaccine Name Ad5-SIVgag *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Challenge SHIV89.6P *Route:* Intravenous
Main Findings

- A replication-incompetent Ad5 vector, used either alone or as a booster inoculation after priming with a DNA vector elicited the most effective response.
- After challenge with a pathogenic SHIV, the animals immunized with Ad5 vector exhibited the most pronounced attenuation of the virus infection.
- The replication-defective adenovirus is a promising vaccine vector for development of an HIV-1 vaccine.

NHP.306.2 (11797011) **Replication-incompetent adenoviral vaccine vector elicits effective anti-immunodeficiency-virus immunity**

Authors Shiver JW, Fu TM, Chen L, Casimiro DR, Davies ME, Evans RK, Zhang ZQ, Simon AJ, Trigona WL, Dubey SA, Huang L, Harris VA, Long RS, Liang X, Handt L, Schleif WA, Zhu L, Freed DC, Persaud NV, Guan L, Punt KS, Tang A, Chen M, Wilson KA, Collins KB, Heidecker GJ, Fernandez VR, Perry HC, Joyce JG, Grimm KM, Cook JC, Keller PM, Kresock DS, Mach H etc

Challenge SHIV89.6P *Route:* Intravenous

NHP.308 (12551977) **Mucosal priming of simian immunodeficiency virus-specific cytotoxic T-lymphocyte responses in rhesus macaques by the Salmonella type III secretion antigen delivery system**

Authors Evans DT, Chen LM, Gillis J, Lin KC, Harty B, Mazzara GP, Donis RO, Mansfield KG, Lifson JD, Desrosiers RC, Galan JE, Johnson RP
Journal J Virol 2003 Feb;77(4):2400-9
Objectives Challenge, Immunogenicity To test attenuated strains of Salmonella expressing fragments of the SIV Gag protein fused to the type III-secreted SopE protein for the ability to prime virus-specific CTL responses in rhesus macaques.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name rSalmonella typhimurium-SIVgag *Type:* Recombinant Vector (virus/bacteria) *Route:* Intragastric
Vaccine Name rSalmonella typhi-SIVgag *Type:* Recombinant Vector (virus/bacteria) *Route:* Intragastric
Vaccine Name MVA-SIVmac239gag *Type:* Recombinant Vector (virus/bacteria) *Route:* Intragastric
Challenge SIVmac239 *Route:* Intrarectal
Main Findings

- Strong Gag-specific CTL responses were consistently detected, and tetramer staining revealed the expansion of Gag181-189-specific CD8+ T-cell responses in peripheral blood also in lymphocytes isolated from the colon.
- A significant percentage of the Gag181-189-specific T-cell population in each animal also expressed the intestinal homing receptor $\alpha 4ß7$.
- Salmonella-primed/MVA-boosted animals did not exhibit improved control of virus replication following a rectal challenge with SIVmac239.

NHP.309 (12573592) **Replication, immunogenicity, and protective properties of live-attenuated simian immunodeficiency viruses expressing interleukin-4 or interferon-gamma**

Authors Stahl-Hennig C, Gundlach BR, Dittmer U, ten Haaft P, Heeney J, Zou W, Emilie D, Sopper S, Uberla K
Journal Virology 2003 Jan 20;305(2):473-85
Objectives Challenge, Immunogenicity, Pathogenicity To study the effect of interferon-γ and interleukin-4 on viral load, immunogenicity, and protective properties of Nef-lacking mutants of SIV-expressing SIV-IL4 or SIV-IFN.
Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIV-IL4 *Type:* Live Attenuated Virus *Route:* Intravenous
Vaccine Name SIV-IFN *Type:* Live Attenuated Virus *Route:* Intravenous
Challenge SIVmac239/nef-open *Route:* Intravenous
Main Findings

- During the acute phase of infection, the cell-associated viral load, but not the plasma viral RNA load, was approximately 10-fold lower in SIV-IFN-infected macaques than in SIV-IL4-infected animals.
- The viral load declined to hardly detectable levels 4 months postinfection in all animals.
- The titers and affinity of SIV antibodies were higher in SIV-IL4-infected macaques than in SIV-IFN-infected animals.
- Subsequent challenge with SHIV revealed protection in the absence of neutralizing antibodies.

NHP.310 (12477812) **Increased virus replication and virulence after serial passage of human immunodeficiency virus type 2 in baboons**
Authors Locher CP, Witt SA, Herndier BG, Abbey NW, Tenner-Racz K, Racz P, Kiviat NB, Murthy KK, Brasky K, Leland M, Levy JA
Journal J Virol 2003 Jan;77(1):77-83
Objectives Pathogenicity To enhance the pathogenicity of HIV-2 in order to shorten the amount of time to the development of disease in baboons.
Species/Subspecies Papio cynocephalus (Baboon)
Challenge HIV-2 (UC2-12741), HIV-2 (UC2-11999), HIV-2 (UC2-10568), HIV-2 (UC2-11966), HIV-2 (UC2-12281), HIV-2 (UC2-9429) *Route:* Intravenous
Main Findings

- After these serial passages, virus levels in plasma, peripheral blood mononuclear cells (PBMC) and lymphatic tissues in the acutely infected baboons were increased.
- Within 1 year of the HIV-2 infection, all of the inoculated baboons showed specific signs of AIDS-related disease progression within the lymphatic tissues, such as vascular proliferation and lymphoid depletion.
- HIV-2(UC2) isolate recovered after several serial passages in baboons will be useful in future studies of AIDS pathogenesis and vaccine development by using this animal model.

NHP.312 (12502815) **Increased mucosal transmission but not enhanced pathogenicity of the CCR5-tropic, simian AIDS-inducing simian/human immunodeficiency virus SHIV(SF162P3) maps to envelope gp120**
Authors Hsu M, Harouse JM, Gettie A, Buckner C, Blanchard J, Cheng-Mayer C
Journal J Virol 2003 Jan;77(2):989-98
Species/Subspecies Macaca mulatta (Rhesus macaque)
Challenge $SHIV_{SF162\text{-}PC}$ *Route:* Intravenous, Vaginal or perivaginal
Main Findings

- $SHIV_{SF162\text{-}PC}$ was as infectious as $SHIV_{SF162}$, and intermediate in pathogenicity between $SHIV_{SF162}$ and $SHIV_{SF162\text{-}P3}$.
- Fusogenic capacity and inhibition by T-20 fusion inhibitor were also assayed.
- Compared to wild-type SHIV(SF162) gp120, P3 gp120 conferred in vitro neutralization resistance and increased entry efficiency of the virus, but was compromised in its fusion-inducing capacity.
- In vivo, SHIV(SF162PC) infected 2/2 and 2/3 rhesus macaques by the intravenous and intravaginal routes, respectively.
- Although peak viremia reached 10^6 to 10^7 RNA copies per ml of plasma in some infected animals and was associated with depletion of gut-associated CD4(+) lymphocytes, none of the animals maintained a viral set point that would be predictive of progression to disease.

NHP.313.1 (12663776) **Global Dysfunction of CD4 T-Lymphocyte Cytokine Expression in Simian-Human Immunodeficiency Virus/SIV-Infected Monkeys Is Prevented by Vaccination**
Authors McKay PF, Barouch DH, Schmitz JE, Veazey RS, Gorgone DA, Lifton MA, Williams KC, Letvin NL
Journal J Virol 2003 Apr 15;77(8):4695-4702
Objectives Challenge, Immunogenicity To assess the functional capacity of CD4+ T lymphocytes in rhesus monkeys both prospectively during the course of a simian immunodeficiency virus (SIV) infection and in a cohort of SIV/SHIV-infected animals with nonprogressive disease.

Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Loss of the capacity of peripheral blood CD4+ T lymphocytes to express cytokines was first detected in SIV-infected monkeys during the peak of viral replication during primary infection and persisted thereafter.
- Infected monkeys with progressive disease had peripheral blood CD4+ T lymphocytes that expressed significantly less cytokine than infected monkeys that had undetectable viral loads and intact CD4+ T-lymphocyte counts.
- CD4+ T lymphocytes from vaccinated monkeys that effectively controlled the replication of a highly pathogenic immunodeficiency virus isolate following a challenge had a preserved functional capacity.

NHP.313.2 (12663776) **Global Dysfunction of CD4 T-Lymphocyte Cytokine Expression in Simian-Human Immunodeficiency Virus/SIV-Infected Monkeys Is Prevented by Vaccination**
Authors McKay PF, Barouch DH, Schmitz JE, Veazey RS, Gorgone DA, Lifton MA, Williams KC, Letvin NL
Journal J Virol 2003 Apr 15;77(8):4695-4702
Objectives Pathogenicity To compare the CD+ T cell profile in progressor and nonprogressor rhesus monkeys infected with SIV/SHIV.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Small difference between the cytokine expression profiles of the peripheral blood CD4+ T lymphocytes from normal monkeys and those from SIV/SHIV-infected clinical nonprogressor monkeys.

NHP.318 (10803879) **Multi-envelope HIV vaccine safety and immunogenicity in small animals and chimpanzees**
Authors Lockey TD, Slobod KS, Caver TE, D'Costa S, Owens RJ, McClure HM, Compans RW, Hurwitz JL
Journal Immunol Res 2000;21(1):7-21
Objectives Immunogenicity To compare the multi envelope vaccine vs. those containing a single component, inoculated by cutaenous or subcutaenous route.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Main Findings

- Cutaenous lesions were not required to elicit HIV-1 envelope or vaccinia virus-humoral immune response.
- Antibody responses could be substantially enhanced with envelope booster immunization.
- Immune response to envelope protein persisted to >1 year.
- Multi-envelope vaccines are more immunogenic than those containing a single envelope component.

NHP.319 (12706101) **Evidence for immune-mediated reduction of viral replication in Macaca nemestrina mucosally immunized with inactivated SHIV(89.6)**
Authors Ambrose Z, Thompson J, Larsen K, Kuller L, Panicali DL, Clements JD, Agy M, Montefiori DC, Hu SL, Bosch ML
Journal Virology 2003 Mar 30;308(1):178-90
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name vT107 *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification
Vaccine Name vAbT394 *Type:* Recombinant Vector (virus/bacteria) *Route:* Scarification
Vaccine Name AT-2-Inactivated SHIV89.6 *Type:* Whole (killed) Inactivated Virus *Routes:* Intragastric, Intranasal
Challenge SHIV89.6 *Route:* Vaginal or perivaginal
Main Findings

- Anti-SHIV T-cell responses were significant only in primed and boosted animals (group 2). Primed and boosted animals also showed significantly decreased viral loads compared to boosted only

---

NHP.320 (9371609) **Identification of the V1 region as a linear neutralizing epitope of the simian immunodeficiency virus SIVmac envelope glycoprotein**
Authors Jurkiewicz E, Hunsmann G, Schaffner J, Nisslein T, Luke W, Petry H
Journal J Virol 1997 Dec;71(12):9475-81

Objectives Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIV-Mac-32H *Type:* Live Virus
Vaccine Name SIV-Mac-MPBMC *Type:* Live Virus
Vaccine Name oligomeric gp130 *Type:* Synthetic Protein/Peptide
Main Findings

- Rhesus macaques infected with clone Mac32H or immunized with Mac gp130 developed neutralizing antibodies directed at an epitope in the V1 region of Env

---

NHP.321 (12719603) **Induction of broad and potent anti-human immunodeficiency virus immune responses in rhesus macaques by priming with a DNA vaccine and boosting with protein-adsorbed polylactide coglycolide microparticles**
Authors Otten G, Schaefer M, Greer C, Calderon-Cacia M, Coit D, Kazzaz J, Medina-Selby A, Selby M, Singh M, Ugozzoli M, Zur Megede J, Barnett SW, O'Hagan D, Donnelly J, Ulmer J
Journal J Virol 2003 May 15;77(10):6087-92
Objectives Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pCMV-gag-mod *Type:* DNA *Route:* Intramuscular
Vaccine Name HIV-IIIB-p55gag-VLP *Type:* Virus-like Particle *Route:* Intramuscular
Vaccine Name p55Gag *Type:* Purified Viral Products *Route:* Intramuscular
Main Findings

- Priming with Gag DNA and boosting with Gag protein adsorbed to polylactide coglycolide microparticles produced a stronger and broader immune response than either vaccine alone

---

NHP.322 (12867656) **DNA vaccination of macaques by a full-genome simian/human immunodeficiency virus type 1 plasmid chimera that produces non-infectious virus particles**
Authors Akahata W, Ido E, Akiyama H, Uesaka H, Enose Y, Horiuchi R, Kuwata T, Goto T, Takahashi H, Hayami M
Journal J Gen Virol 2003 Aug;84(Pt 8):2237-2244
Objectives Challenge, Immunogenicity To evaluate the immunogenicity and protection from chanllenge of a full-genome SHIV plasmid in rhesus monkeys.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pSHIV-NM-3rn ZF1* *Type:* DNA *Route:* Intramuscular
Challenge SHIV-NM-3rN *Route:* Intravenous
Main Findings

- High CTL activity in vaccinees.
- In all macaques vaccinated, peak plasma virus loads after homologous challenge with SHIV were 2 to 3 orders of magnitude lower than those of the naive controls, and virus loads fell below the level of detection at 6 weeks post-challenge suggesting that the vaccination regime in this study was partially effective.

NHP.323 (12919751) **Convergent evolution of SIV env after independent inoculation of rhesus macaques with infectious proviral DNA**
Authors Buckley KA, Li PL, Khimani AH, Hofmann-Lehmann R, Liska V, Anderson DC, McClure HM, Ruprecht RM
Journal Virology 2003 Aug 1;312(2):470-80
Objectives Pathogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac239Δ3 *Type:* Live Attenuated Virus *Route:* Intramuscular
Vaccine Name SIVmac239Δ3+ *Type:* Live Attenuated Virus *Route:* Intramuscular
Vaccine Name pSIVNef-TPA *Type:* DNA *Route:* Intramuscular

Main Findings

- Rhesus macaques innoculated with SIV-MAC239, MAC239-delta3 or Mac239-delta3+ pathogenic revertant of delta3, each developed similar mutations, indicative of convergent evolution, in env

---

NHP.324.1 (12922139) **Boosting of SIV-specific immune responses in rhesus macaques by repeated administration of Ad5hr-SIVenv/rev and Ad5hr-SIVgag recombinants**

Authors Zhao J, Lou Y, Pinczewski J, Malkevitch N, Aldrich K, Kalyanaraman VS, Venzon D, Peng B, Patterson LJ, Edghill-Smith Y, Woodward R, Pavlakis GN, Robert-Guroff M

Journal Vaccine 2003 Sep 8;21(25-26):4022-35

Objectives Challenge To evaluate ELISPOT reactivity to Gag, Env and Rev proteins after each of 2 innoculations with Adenovirus-Env-Rev and Adenovirus-Gag vectors.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Ad5hr-SIVenv *Type:* Recombinant Vector (virus/bacteria) *Routes:* Oral, Intranasal

Vaccine Name Ad5hr-SIVmac239gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Oral, Intranasal

Challenge SIVmac251 *Route:* Intrarectal

Main Findings

- Vaccination with 2 Ad4hr vectors containing SIV-smH4 Env-Rev and SIV-Mac239 Gag was followed by ELISPOT cellular immune response detection, and antibody titre of humoral responses.
- The second innuculation significantly boosted both responses.
- Second paper described intrarectal challenge with SIV-Mac251 at week 42.
- All animals developed persistent infection, but viral burden at peak viremia was reduced (14 fold; $P < 0.0001$) in vaccinated animals as compared to controls.
- Viremia at set point was not significanlty reduced in vaccinated animals compared to controls

---

NHP.324.1 (12857905) **Improved protection of rhesus macaques against intrarectal simian immunodeficiency virus SIV(mac251) challenge by a replication-competent Ad5hr-SIVenv/rev and Ad5hr-SIVgag recombinant priming/gp120 boosting regimen**

Authors Zhao J, Pinczewski J, Gomez-Roman VR, Venzon D, Kalyanaraman VS, Markham PD, Aldrich K, Moake M, Montefiori DC, Lou Y, Pavlakis GN, Robert-Guroff M

Journal J Virol 2003 Aug;77(15):8354-65

NHP.325 (12097576) **Different patterns of immune responses but similar control of a simian-human immunodeficiency virus 89.6P mucosal challenge by modified vaccinia virus Ankara (MVA) and DNA/MVA vaccines**

Authors Amara RR, Villinger F, Staprans SI, Altman JD, Montefiori DC, Kozyr NL, Xu Y, Wyatt LS, Earl PL, Herndon JG, McClure HM, Moss B, Robinson HL

Journal J Virol 2002 Aug;76(15):7625-31

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIV-HIV89.6 DNA vaccine *Type:* DNA *Route:* Intradermal

Vaccine Name rMVA 89.6 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Challenge SHIV89.6P *Route:* Intrarectal

Main Findings

- Although individual animals in DNA/MVA and MVA/MVA groups had varying levels of antibody and CD8 T-cell response, all controlled challenge virus, as measured by viral load and decline in CD4 T-cells, equally well post challenge

---

NHP.326 (12915583) **Protective Efficacy of an AIDS Vaccine, a Single DNA Priming Followed by a Single Booster with a Recombinant Replication-Defective Sendai Virus Vector, in a Macaque AIDS Model**

Authors Takeda A, Igarashi H, Nakamura H, Kano M, Iida A, Hirata T, Hasegawa M, Nagai Y, Matano T
Journal J Virol 2003 Sep 1;77(17):9710-9715
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name SeV-gag *Type:* DNA *Route:* Intranasal
Vaccine Name CMV SHIV dEN *Type:* DNA *Route:* Intramuscular
Challenge SHIV89.6PD *Route:* Intravenous

NHP.327.1 (14970317) **Early protection against pathogenic virus infection at a mucosal challenge site after vaccination with attenuated simian immunodeficiency virus**

Authors Tenner-Racz K, Hennig CS, Uberla K, Stoiber H, Ignatius R, Heeney J, Steinman RM, Racz P
Journal Proc Natl Acad Sci U S A 2004 Feb 17;
Objectives Challenge, Immunogenicity Exp 1: To investigate long-term protection induced by live attenuated delta deleted SIV.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVDeltaNU *Type:* Live Attenuated Virus *Routes:* Intravenous, Other
Challenge SIVmac251 *Route:* Other
Main Findings

- Experiment 1 and experiment 2: A traumatic application of attenuated SIVmac239Deltanef vaccine to the tonsils of rhesus macaques provided protection against challenge 26 weeks later with infectious SIVmac251 applied through this route.
- 10/10 vaccinnes did not show significantly raised RNA levels in the plasma or increase in infected cells in lymphoid tissue after challenge (exp. 2).
- Vaccine virus was found in the tonsils of all vaccinees, but challenge virus was only detected at this portal of entry in 4/10 monkeys.
- During tonsillar SIVDeltanef vaccination, infection is blocked early at the entry portal.

NHP.327.2 (14970317) **Early protection against pathogenic virus infection at a mucosal challenge site after vaccination with attenuated simian immunodeficiency virus**

NHP.330 (12804847) **Specificity and effect on apoptosis of Tat antibodies from vaccinated and SHIV-infected rhesus macaques and HIV-infected individuals**

Authors Belliard G, Romieu A, Zagury JF, Dali H, Chaloin O, Le Grand R, Loret E, Briand JP, Roques B, Desgranges C, Muller S

Journal Vaccine 2003 Jul 4;21(23):3186-99
Objectives Immunogenicity, Immunotherapy To study the the recognition of several Tat mutants as well as various synthetic Tat fragments by anti-Tat monoclonal antibodies and by IgG antibodies in SHIV)-infected macaques (also human long-term survivals infected with HIV).
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name Tat8-53 *Type:* Synthetic Protein/Peptide *Routes:* Intramuscular, Intranasal
Vaccine Name Tat1-20 *Type:* Synthetic Protein/Peptide *Routes:* Intramuscular, Intranasal
Vaccine Name Tat 19-53 *Type:* Synthetic Protein/Peptide *Routes:* Intramuscular, Intranasal
Vaccine Name Tat 19-53m *Type:* Synthetic Protein/Peptide *Routes:* Intramuscular, Intranasal
Vaccine Name Tat 1-61 *Type:* Synthetic Protein/Peptide *Routes:* Intramuscular, Intranasal
Vaccine Name Tat 44-61 *Type:* Synthetic Protein/Peptide *Routes:* Intramuscular, Intranasal
Main Findings

- Tat peptides innoculated into Rhesus macaques produced antibody responses capable of inhibiting functions of extracellular Tat protein.

NHP.332 (9223407) **Protection of SIVmac-infected macaque monkeys against superinfection by a simian immunodeficiency virus expressing envelope glycoproteins of HIV type 1**
Authors Dunn CS, Hurtrel B, Beyer C, Gloeckler L, Ledger TN, Moog C, Kieny MP, Mehtali M, Schmitt D, Gut JP, Kirn A, Aubertin AM
Journal AIDS Res Hum Retroviruses 1997 Jul 20;13(11):913-22
Objectives Challenge, Immunogenicity To determine whether host immune responses to envelope glycoprotein are an essential component of the immunity to primate lentiviruses.
Main Findings

- Superinfection of SIVmac-infected macaque monkeys with a large dose of SHIVsbg resulted in isolation of the chimeric SHIVsbg by coculture of PBMCs from 4/5 SIV-infected monkeys, but 3 animals were protected from extracellular SHIV viremia and did not seroconvert to HIV-1 glycoproteins.
- In the 2 SIV-infected monkeys that did develop SHIV viremia, cell-associated viral load was reduced at least 100-fold.

Authors Dale CJ, Liu XS, De Rose R, Purcell DF, Anderson J, Xu Y, Leggatt GR, Frazer IH, Kent SJ
Journal Virology 2002 Sep 15;301(1):176-87
Objectives Challenge, Immunogenicity To evaluate HPV-HIV VLPs for immunogenicity and protective immunity using a mucosal SHIV challenge model in macaques and to evaluate a DNA vaccine prime and HPV-HIV VLP boost approach to induce T cell mediated immunity in macaques.
Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Pooled SIVgag/HIVtat.rev DNA vaccine *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intramuscular
Vaccine Name HPV/SHIV-VLP *Type:* Virus-like Particle *Routes:* Intrarectal, Intramuscular
Challenge SHIV.229(mn) *Route:* Intrarectal
Main Findings

- HPV L1 antibodies were induced in all immunized macaques.
- Weak antibody or T cell responses to the chimeric SHIV antigens were detected only in animals receiving the DNA prime/HPV-SHIV VLP boost vaccine regimen.
- Significant but partial protection from a virulent mucosal SHIV challenge was detected only in the prime/boosted macaques and not in animals receiving the HPV-SHIV VLP vaccines alone, with 3/5 prime/boosted animals retaining some CD4 T cells following challenge.

NHP.344 (12519210) **Immune responses in baboons vaccinated with HIV-2 genetic expression libraries**
Authors Locher CP, Sykes KF, Blackbourn DJ, Johnston SA
Journal J Med Primatol 2002 Dec;31(6):323-9
Objectives Challenge, Immunogenicity To evaluate the effectiveness of an HIV-2 vaccine made from a genomic expression library in baboons.
Main Findings

- HIV-2 expression library immunization induced HIV-2-specific memory responses but low levels of CD8+ cell anti-viral responses and neutralizing antibodies.
- Immunization with HIV-2 expression library did not sigificantly alter the viral load in vaccinated animals compared to control group.
- The approach does not provide protection in baboons against intravenous challenge with HIV-2.

NHP.345 (14741150) **Avipox-based simian immunodeficiency virus (SIV) vaccines elicit a high frequency of SIV-specific CD4+ and CD8+ T-cell responses in vaccinia-experienced SIVmac251-infected macaques**
Authors Nacsa J, Radaelli A, Edghill-Smith Y, Venzon D, Tsai WP, Morghen Cde G, Panicali D, Tartaglia J, Franchini G
Journal Vaccine 2004 Jan 26;22(5-6):598-607
Objectives Immunogenicity, Immunotherapy, Chemotherapy To test the ability of ALVAC- or fowlpox-based SIV vaccines to boost SIV-specific CD4+ and CD8+ T-cell responses in 10 vaccinia-experienced macaques infected with SIVmac251.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVmac251 *Type:* Live Virus *Route:* Intrarectal
Vaccine Name FP-SIV-gp (FP74) *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Vaccine Name ALVAC-SIV-gp *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular
Main Findings

- The 2 vaccine modalities effectively boosted both CD4+ and CD8+ SIV-specific T-cell response despite prior exposure to the vaccinia-derivative NYVAC vector, suggesting that sequential boosting with either avipox-based vector vaccine candidate is a realistic approach in immune therapy of HIV-1-infected individuals.

NHP.346 (14645590) **Multispecific vaccine-induced mucosal cytotoxic T lymphocytes reduce acute-phase viral replication but fail in long-term control of simian immunodeficiency virus SIVmac239**

Authors Vogel TU, Reynolds MR, Fuller DH, Vielhuber K, Shipley T, Fuller JT, Kunstman KJ, Sutter G, Marthas ML, Erfle V, Wolinsky SM, Wang C, Allison DB, Rud EW, Wilson N, Montefiori D, Altman JD, Watkins DI

Journal J Virol 2003 Dec;77(24):13348-60

Objectives Challenge, Immunogenicity To ascertain the effect of vaccine-induced multispecific mucosal CTL.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- The vaccination induced virus-specific CTL and CD4+ helper T lymphocytes with CTL frequencies as high as 20,000/million peripheral blood mononuclear cells.
- The final rMVA vaccination, delivered intravenously, engendered long-lived mucosal CTL.
- Massive early anamnestic cellular immune responses controlled acute-phase viral replication; however, the 3 vaccinees were unable to control virus replication in the chronic phase.
- Multispecific mucosal CTL, in the absence of neutralizing antibodies, can achieve a modicum of control over early viral replication but unable to control chronic-phase viral replication after a high-dose mucosal challenge with a pathogenic simian immunodeficiency virus.

NHP.348.1 (14585346) **Immunogenicity in pig-tailed macaques of poliovirus replicons expressing HIV-1 and SIV antigens and protection against SHIV-89.6P disease**

Authors Fultz PN, Stallworth J, Porter D, Novak M, Anderson MJ, Morrow CD

Journal Virology 2003 Oct 25;315(2):425-37

Objectives Immunogenicity To determine whether poliovirus replicons expressing various HIV-1 Env and SIVmac239 Gag antigens would be immunogenic in macaques.

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Polio (Sabin 1) -HIV-1.gag/env (1) *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intrarectal, Intranasal

Vaccine Name Polio (Sabin 1) - HIV-1.gag/env (2) *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intrarectal, Intranasal

Journal AIDS Res Hum Retroviruses 2003 Oct;19(10):891-900

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name Soluble 89.6 gp120 protein *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Vaccine Name SIV-HIV89.6 DNA vaccine *Type:* DNA *Route:* Intradermal
Vaccine Name rMVA 89.6 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular
Challenge SHIV89.6P *Route:* Intrarectal

NHP.350 (14583643) **Evaluation of simian immunodeficiency virus-specific immune responses induced by a defective proviral DNA vaccine in macaques**
Authors Takeda A, Nakamura H, Matano T
Journal Jpn J Infect Dis 2003 Aug;56(4):172-3
Objectives Immunogenicity To examine if macaques vaccinated with FMSIV DNA and an mCAT1-expression plasmid DNA (pCMVmCAT1) had SIV-specific T-cell levels significantly higher than control macaques vaccinated with replication-negative FMSIV DNA vaccine.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pCMVmCAT1 *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intramuscular
Vaccine Name FMSIV *Type:* DNA *Routes:* Intradermal (Gene Gun DNA-coated gold beads), Intramuscular
Main Findings

- SIV-specific CD4+ T cells and SIV-specific CD8+ T cells were efficiently induced in macaques vaccinated with FMSIV plus mCAT1 DNAs and levels of SIV-specific CD4+ T cells and SIV-specific CD8+ T cells in the group II macaques were significantly higher than those in the control group.
- Macaques immunized with FMSIV plus pCMVmCAT1 had significantly higher levels of plasma anti-p27 antibodies than those in the control both at week 3 and week 8 after the initial vaccination.

NHP.351 (14557642) **Multigene DNA priming-boosting vaccines protect macaques from acute CD4+-T-cell depletion after simian-human immunodeficiency virus SHIV89.6P mucosal challenge**

NHP.353 (14505895) **Mucosal administration of three recombinant Mycobacterium bovis BCG-SIVmac251 strains to cynomolgus macaques induces rectal IgAs and boosts systemic cellular immune responses that are primed by intradermal vaccination**
Authors Mederle I, Le Grand R, Vaslin B, Badell E, Vingert B, Dormont D, Gicquel B, Winter N
Journal Vaccine 2003 Oct 1;21(27-30):4153-66
Objectives Challenge, Immunogenicity To investigate anti-SIV immune responses induced by intradermal vaccination of cynomolgus macaques with rBCG-SIV strains followed by a late mucosal booster dose.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name rBCG-SIV^3 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intrarectal, Oral, Intradermal
Challenge SIVmac251 *Route:* Intrarectal
Main Findings

- Intradermal immunization of cynomolgus macaques with a multi-component rBCG vaccine induces CTL responses targeted against 3 SIVmac251 antigens.
- PBLs from rBCG-SIV3-immunized monkeys produce interferon-gamma in response to SIV antigens and production increases after the mucosal booster.
- Anti-Gag IgAs are detected in rectal lavages of rBCG-SIV3-immunized monkeys only after the mucosal booster.
- rBCG-SIV3 does not protect against a highly pathogenic SIVmac251 challenge despite induction of anamnestic immune responses.

NHP.354 (15096801) **Immunogenicity of HIV-1 Env and Gag in baboons using a DNA prime/boost regimen**

Authors Leung L, Srivastava IK, Kan E, Legg H, Sun Y, Greer C, Montefiori DC, zur Megede J, Barnett SW
Journal AIDS 2004 Apr 30;18(7):991-1001
Objectives Immunogenicity To evaluate the immunogenicity of sequence-modified HIV env and gag in baboons using DNA prime and protein boost strategy.
Species/Subspecies Papio cynocephalus (Baboon)
Vaccine Name pCMV-gag-mod *Type:* DNA *Route:* Intramuscular
Vaccine Name pCMVKm2-gp140mut *Type:* DNA *Route:* Intramuscular
Vaccine Name CMVKm2-gp140TM *Type:* DNA *Route:* Intramuscular
Vaccine Name o-gp140-US4 *Type:* Synthetic Protein/Peptide *Route:* Intramuscular
Vaccine Name p55gagSF2 *Type:* DNA *Route:* Intramuscular
Vaccine Name Chimp-anti-HIV-IgG *Type:* Passive Antibody
Main Findings

- Modest antibody responses and low or no lymphoproliferative responses were observed following multiple DNA immunizations.
- Strong antibodies and substantial antigen-specific lymphoproliferative responses were seen following booster immunizations with oligomeric Env protein (o-gp140US4) in MF59.
- Neutralizing antibody responses were scored against T cell line adapted HIV-1 strains after the protein boosters, but neutralizing responses were low or absent against homologous and heterologous primary isolate strains.

NHP.361 (3413127) **Failure of a human immunodeficiency virus (HIV) immune globulin to protect chimpanzees against experimental challenge with HIV**
Authors Prince AM, Horowitz B, Baker L, Shulman RW, Ralph H, Valinsky J, Cundell A, Brotman B, Boehle W, Rey F, et al.
Journal Proc Natl Acad Sci U S A 1988 Sep;85(18):6944-8
Objectives Challenge, Passive Immunization To assess the possible efficacy of passive immunization against HIV using plasma from HIV seropositive donors.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Vaccine Name HIVIG *Type:* Passive Antibody *Route:* Intravenous
Challenge HIV-1 IIIB *Route:*

NHP.362 (1714748) **Immunization of chimpanzees with the HIV-1 glycoprotein gp160 induces long-lasting T-cell memory**
Authors Mannhalter JW, Pum M, Wolf HM, Kupcu Z, Barrett N, Dorner F, Eder G, Eibl MM
Journal AIDS Res Hum Retroviruses 1991 May;7(5):485-93
Objectives Immunogenicity To investigate the antigen-specific T-cell response to the recombinant HIV env gp160 and to test the effect of various adjuvant formulations on the efficiency of T-cell priming as well as on magnitude and longevity of the gp160-specific T-cell response.
Species/Subspecies Pan Troglodytes (Chimpanzee)
Vaccine Name rgp160 *Type:* Recombinant Subunit Protein *Route:* Intramuscular
Main Findings

- In combination with an appropriate adjuvant (lipid-based adjuvant or mineral carrier complex), immunization with recombinant gp160 led to the appearance of gp160-primed T cells.
- The memory T-cell response toward the immunogen gp160 was substantial and long-lasting.

NHP.363 (14963117) **Protection against mucosal simian immunodeficiency virus SIV(mac251) challenge by using replicating adenovirus-SIV multigene vaccine priming and subunit boosting**
Authors Patterson LJ, Malkevitch N, Venzon D, Pinczewski J, Gomez-Roman VR, Wang L, Kalyanaraman VS, Markham PD, Robey FA, Robert-Guroff M
Journal J Virol 2004 Mar;78(5):2212-21
Objectives Challenge, Immunogenicity To investigate a prime-boost strategy in macaques using priming with replicating adenovirus recombinants encoding SIV env/rev, gag, and/or nef genes, followed by boosting with SIV gp120 or an SIV polypeptide.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIVIG-2 *Type:* Passive Antibody *Route:* Intramuscular

Vaccine Name Ad5hr-SIVmac239gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intratracheal, Oral, Intranasal
Vaccine Name Ad5hr-SIVnefδ1-13 *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intratracheal, Oral, Intranasal
Vaccine Name Ad5hr-SIVsmH4 env/rev *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intratracheal, Oral, Intranasal
Vaccine Name Mono-gp120H (89.6) *Type:* Recombinant Subunit Protein *Routes:* Intratracheal, Oral, Intranasal
Vaccine Name HIV env_{MN}/rev(pCEnv) *Type:* DNA *Route:* Intramuscular
Vaccine Name SIVmac251-gp120 *Type:* Purified Viral Products *Route:* Intramuscular
Challenge SIVmac251 *Route:* Intrarectal
Main Findings

- Priming with replicating adenovirus recombinants encoding SIV env/rev, gag, and/or nef genes, followed by boosting with SIV gp120 or an SIV polypeptide mimicking the CD4 binding region of the envelope, protects rhesus macaques from intrarectal infection with the highly pathogenic SIV(mac251).
- Within immunization groups exhibiting significant protection, a subset (39%) of macaques have exhibited either no viremia, cleared viremia, or controlled viremia at the threshold of detection, now more than 40 weeks postchallenge.
- Protection in macaques did not correlate with the Mamu A*01 allele.

NHP.365 (14645581) **Intravenous inoculation of replication-deficient recombinant vaccinia virus DIs expressing simian immunodeficiency virus gag controls highly pathogenic simian-human immunodeficiency virus in monkeys**

Authors Izumi Y, Ami Y, Matsuo K, Someya K, Sata T, Yamamoto N, Honda M
Journal J Virol 2003 Dec;77(24):13248-56
Objectives Challenge, Immunogenicity To assess the immunogenicity and protection induced by immunization with rDIsSIVgag.
Species/Subspecies Macaca fascicularis (cynomolgus macaque)
Vaccine Name Vaccinia-rDIsSIVgag *Type:* Recombinant Vector (virus/bacteria) *Route:* Intravenous
Challenge SHIV-C2/1 *Route:* Intravenous
Main Findings

- Intravenous inoculation of 10^6 PFU of rDIsSIVGag in cynomologus macaques induced significant levels of gamma interferon (IFN-gamma) spot-forming cells (SFC) specific for SIV Gag.
- Antigen-specific lymphocyte proliferative responses were also induced and were temporally associated with the peak of IFN-gamma SFC activity in each macaque.
- CD4(+) T lymphocytes were maintained in the peripheral blood and lymphoid tissues of the immunized macaques after challenge with pathogenic SHIV.

NHP.366 (15004179) **Control of Simian/Human Immunodeficiency Virus Viremia and Disease Progression after IL-2-Augmented DNA-Modified Vaccinia Virus Ankara Nasal Vaccination in Nonhuman Primates**

Authors Bertley FM, Kozlowski PA, Wang SW, Chappelle J, Patel J, Sonuyi O, Mazzara G, Montefiori D, Carville A, Mansfield KG, Aldovini A
Journal J Immunol 2004 Mar 15;172(6):3745-3757
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name pVacc4 DNA *Type:* DNA *Route:* Intranasal
Vaccine Name rMVA.SIVmac239gagpolHIVenv *Type:* Recombinant Vector (virus/bacteria) *Route:* Intranasal
Challenge SHIV89.6P *Route:* Intranasal
Main Findings

- The vaccine and challenge induced humoral responses, by the detection of both binding and neutralizing SHIV-specific IgG in plasma, and SHIV-specific IgA in rectal secretions.
- After rectal challenge of vaccinated and naive animals with SHIV89.6P, all animals became infected. However a subset of animals was protected from CD4+ T cell loss and AIDS development.
- SHIV DNA/MVA vaccine administered nasally can stimulate rectal antiviral IgA but was not effective at inducing antiviral systemic IgG.

- IL-2/Ig or IL-12 DNA and the rMVA added to the vaccination did not result in significant differences in these humoral immune responses.

NHP.367 (15003872) **Priming B cell-mediated anti-HIV envelope responses by vaccination allows for the long-term control of infection in macaques exposed to a R5-tropic SHIV**

Authors Buckner C, Gines LG, Saunders CJ, Vojtech L, Srivastava I, Gettie A, Bohm R, Blanchard J, Barnett SW, Safrit JT, Stamatatos L
Journal Virology 2004 Mar 1;320(1):167-80
Objectives Challenge, Immunogenicity .
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Antibodies elicited by the SF162gp140 immunogen recognize elements of the V1, V2, and V3 loops, the CD4-binding site, and the C1 and C2 regions on the homologous SF162 gp120.
- Deletion of the V2 has a two-fold effect: 1) it alters the immunogenicity of the V3 and V1 loops, and 2) it renders the C5 region immunogenic.
- Sterilizing immunity was not achieved.
- All vaccinated animals effectively controlled and remained free of disease over 3 years of observation.

Authors Mooij P, Nieuwenhuis IG, Knoop CJ, Doms RW, Bogers WM, Ten Haaft PJ, Niphuis H, Koornstra W, Bieler K, Kostler J, Morein B, Cafaro A, Ensoli B, Wagner R, Heeney JL

Journal J Virol 2004 Apr;78(7):3333-42

Objectives Challenge, Immunogenicity To determine whether immunization with multiple antigens can influence individual Th responses and increase protection relative to a single antigen.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pc-synTat (HIV-1IIIB) *Type:* DNA *Route:* Intramuscular

Vaccine Name pc-syngp120 (SHIV-189.6p) *Type:* DNA *Route:* Intramuscular

Vaccine Name pc-synGag (SIVmac239) *Type:* DNA *Route:* Intramuscular

Vaccine Name HIV-189.6 Env gp140-ISCOM *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Vaccine Name SIVmac239 Gag-Pol-ISCOM *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Vaccine Name tat protein *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge SHIV89.6P *Route:* Intravenous

NHP.375 (15047809) **Highly effective control of an AIDS virus challenge in macaques by using vesicular stomatitis virus and modified vaccinia virus Ankara vaccine vectors in a single-boost protocol**

Authors Ramsburg E, Rose NF, Marx PA, Mefford M, Nixon DF, Moretto WJ, Montefiori D, Earl P, Moss B, Rose JK

Journal J Virol 2004 Apr;78(8):3930-40

Objectives Challenge, Immunogenicity To compare the effectiveness of single prime-boost protocol consisting of VSV vectors expressing SHIV Env, Gag, and Pol proteins to that of VSV vector prime followed with a single boost with MVA expressing the same SHIV proteins.

Species/Subspecies Macaca mulatta (Rhesus macaque)

NHP.376 (15047820) **Induction of autoantibodies to CCR5 in macaques and subsequent effects upon challenge with an R5-tropic simian/human immunodeficiency virus**

Authors Chackerian B, Briglio L, Albert PS, Lowy DR, Schiller JT

Journal J Virol 2004 Apr;78(8):4037-47

Objectives Challenge, Immunogenicity To generate autoantibodies against CCR5 in macaques and to assess their role in protection from challenge with R5-tropic SHIV.

Main Findings

- 5 rhesus macaques injected with VLP-SA-EC1 developed antibodies against CCR5. IV challenge with SHIV resulted in infection, but some ability to control viremia

---

NHP.377 (15140996) **Passive immunotherapy in simian immunodeficiency virus-infected macaques accelerates the development of neutralizing antibodies**

Authors Haigwood NL, Montefiori DC, Sutton WF, McClure J, Watson AJ, Voss G, Hirsch VM, Richardson BA, Letvin NL, Hu SL, Johnson PR

Journal J Virol 2004 Jun;78(11):5983-95

Objectives Challenge, Passive immunotherapy .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name SIVIG *Type:* Passive Antibody *Route:* Intravenous

Challenge SIVsmE660 *Route:* Intravenous

Main Findings

- SIVIG treatment significantly delayed disease.

- Virus levels in PBMC and plasma predict disease outcome.
- Gag-specific CTLs were detected in macaques surviving beyond 1 year.
- Infused IgG delayed binding antibody and accelerated NAb production.

NHP.378 (15149785) **Human immunodeficiency virus type 2 DNA vaccine provides partial protection from acute baboon infection**

Authors Locher CP, Witt SA, Ashlock BM, Polacino P, Hu SL, Shiboski S, Schmidt AM, Agy MB, Anderson DM, Staprans SI, Megede Jz J, Levy JA

Journal Vaccine 2004 Jun 2;22(17-18):2261-72

Objectives Challenge, Immunogenicity To determine if GM-CSF and B7-2 could boost immune responses to an HIV-2 DNA vaccine and help protect baboons against HIV-2 challenge by the intravaginal route.

Species/Subspecies Papio cynocephalus (Baboon)

Vaccine Name HIV-2UC2.tat.nef.gag *Type:* DNA *Routes:* Intradermal, Intramuscular, Intranasal

Challenge HIV-2 (UC2-9429) *Route:* Vaginal or perivaginal

Main Findings

- Baboons immunized with HIV-2 DNA vaccine with or without the genetic adjuvants had significant reductions in the viral loads in the peripheral blood mononuclear cells (PBMC) following challenge (P=0.028) while the reductions in their plasma viremia were suggestive of a protective effect (P=0.1).
- Partial protection against HIV-2 vaginal challenge, as measured by reduced viral load, can be achieved using only a DNA vaccine formulation.

NHP.379 (15193413) **Enhancement of DNA vaccine potency in rhesus macaques by electroporation**

Authors Otten G, Schaefer M, Doe B, Liu H, Srivastava I, Megede Jz J, O'Hagan D, Donnelly J, Widera G, Rabussay D, Lewis MG, Barnett S, Ulmer JB

NHP.380 (12551968) **Changes in the immunogenic properties of soluble gp140 human immunodeficiency virus envelope constructs upon partial deletion of the second hypervariable region**

Authors Srivastava IK, VanDorsten K, Vojtech L, Barnett SW, Stamatatos L

Journal J Virol 2003 Feb;77(4):2310-20

Objectives Immunogenicity To identify the envelope regions whose immunogenicity is altered following V2 loop deletion.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Antibodies elicited by the SF162gp140 immunogen recognize elements of the V1, V2, and V3 loops, the CD4-binding site, and the C1 and C2 regions on the homologous SF162 gp120.
- Deletion of the V2 has a two-fold effect: 1) it alters the immunogenicity of the V3 and V1 loops, and 2) it renders the C5 region immunogenic.

NHP.381 (15220422) **Heterologous envelope immunogens contribute to AIDS vaccine protection in rhesus monkeys**

Authors Letvin NL, Huang Y, Chakrabarti BK, Xu L, Seaman MS, Beaudry K, Korioth-Schmitz B, Yu F, Rohne D, Martin KL, Miura A, Kong WP, Yang ZY, Gelman RS, Golubeva OG, Montefiori DC, Mascola JR, Nabel GJ

Journal J Virol 2004 Jul;78(14):7490-7

Objectives Challenge, Immunogenicity To evaluate a plasmid DNA prime-recombinant replication-defective adenovirus (ADV) boost immunization strategy for an HIV vaccine.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- Vaccine regimens Gag-Pol-Nef immunogens that included the matched or mismatched Env immunogens conferred better protection against CD4+ T-lymphocyte loss than that seen with comparable regimens that did not include Env immunogens.
- T-lymphocyte immunity to Env can broaden the protective cellular immune response to HIV despite significant sequence diversity of the strains of the Env immunogens and can contribute to immune protection in this AIDS vaccine model.

- The control group had significantly higher peak viral loads than the vaccinated monkeys. However, the 3 groups of experimentally vaccinated monkeys did not differ significantly in their peak viral loads (P = 0.28, Kruskal-Wallis test).

NHP.382 (15210746) **Cytotoxic T Lymphocyte-based Control of Simian Immunodeficiency Virus Replication in a Preclinical AIDS Vaccine Trial**

Authors Matano T, Kobayashi M, Igarashi H, Takeda A, Nakamura H, Kano M, Sugimoto C, Mori K, Iida A, Hirata T, Hasegawa M, Yuasa T, Miyazawa M, Takahashi Y, Yasunami M, Kimura A, O'Connor DH, Watkins DI, Nagai Y

Journal J Exp Med 2004 Jun 21;199(12):1709-18

Objectives Challenge, Immunogenicity .

Species/Subspecies Macaca mulatta (Rhesus macaque)

Main Findings

- 5/8 vaccinees controlled viral replication and had undetectable plasma viremia after 5 weeks of infection.
- 5/8 macaques rapidly selected for CTL escape mutations in Gag, indicating that vaccine-induced CTLs successfully contained replication of the challenge virus.
- Vaccine induction of highly effective CTLs can result in the containment of replication of a highly pathogenic immunodeficiency virus.

NHP.384 (15242543) **Multiprotein HIV type 1 clade B DNA/MVA vaccine: construction, safety, and immunogenicity in Macaques**

Authors Smith JM, Amara RR, McClure HM, Patel M, Sharma S, Yi H, Chennareddi L, Herndon JG, Butera ST, Heneine W, Ellenberger DL, Parekh B, Earl PL, Wyatt LS, Moss B, Robinson HL

Journal AIDS Res Hum Retroviruses 2004 Jun;20(6):654-65

Objectives Immunogenicity To construct and test a Gag-Pol-Env DNA/MVA vaccine.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name pGA2/JS2-HIV-1.gag.pol.env *Type:* DNA *Route:* Intramuscular

Vaccine Name MVA/HIV 48 *Type:* Recombinant Vector (virus/bacteria) *Route:* Intramuscular

Main Findings

- The vaccine constructs contain the gag region derived from HIV-1 HXB2 and do not include the zinc finger mutations found in pGA2/JS2; pol was from pGA2/JS2 including the RT mutations.
- Safety: by abrogating reverse transcription, inactivating RNase H activity and strand transfer activity, Env gene was expression-deffective.
- Safety: No adverse effects of the inoculations on the vaccinated monkeys.
- Vaccine-elicited cellular as well as humoral immunity.
- Vaccine-elicited T cells were at, or below, the level of detection following the DNA primes, rapidly expanded after the rMVA booster and then contracted into memory.
- CD4 and CD8 epitopes are found throughout Gag and Env inserts of the vaccine.
- The immunizations elicited only low levels of raised antibody.

NHP.385 (9557706) **Recombinant vaccine-induced protection against the highly pathogenic simian immunodeficiency virus SIV(mac251): dependence on route of challenge exposure**

Authors Benson J, Chougnet C, Robert-Guroff M, Montefiori D, Markham P, Shearer G, Gallo RC, Cranage M, Paoletti E, Limbach K, Venzon D, Tartaglia J, Franchini G

Journal J Virol 1998 May;72(5):4170-82

Objectives Challenge .

Main Findings

- Vaccination with NYVAC-SIV-gpe carrying SIV-Mac-251 gag pol and env protected against intrarectal, but not intravenous infection with SIV-Mac-251, as determined by culture of virus. Viral loads were lower in vaccinated-infected than in non-vaccinated controls

---

NHP.386 (15113931) **Induction of disease by a molecularly cloned highly pathogenic simian immunodeficiency virus/human immunodeficiency virus chimera is multigenic**

Authors Sadjadpour R, Theodore TS, Igarashi T, Donau OK, Plishka RJ, Buckler-White A, Martin MA
Journal J Virol 2004 May;78(10):5513-9
Species/Subspecies Macaca mulatta (Rhesus macaque)
Challenge SHIV-DH12clone7, SHIV-DH12clone8 *Route:* Intravenous
Main Findings

- $SHIV_{DH12R\text{-}CLone7}$ induces rapid CD4 decline in rhesus macaques whereas the $SHIV_{DH12R}$ parental clone does not. Subtitution of the clone 7 env into the nonpathogenic parental background did not confer pathogenicity. Amino acid changes in multiple genes were required for pathogenic effect

---

NHP.387 (10570196) **Emergence of a highly pathogenic simian/human immunodeficiency virus in a rhesus macaque treated with anti-CD8 mAb during a primary infection with a nonpathogenic virus**

Authors Igarashi T, Endo Y, Englund G, Sadjadpour R, Matano T, Buckler C, Buckler-White A, Plishka R, Theodore T, Shibata R, Martin M
Journal Proc Natl Acad Sci U S A 1999 Nov 23;96(24):14049-54
Species/Subspecies Macaca mulatta (Rhesus macaque)
Challenge SHIV-MD14YE (DH12) *Route:* Intravenous
Main Findings

- Mutations in many genes resulted in increased pathogenicity of the SHIV-DH12R clone

---

NHP.388 (11861859) **Evolution of a human immunodeficiency virus type 1 variant with enhanced replication in pig-tailed macaque cells by DNA shuffling**

Authors Pekrun K, Shibata R, Igarashi T, Reed M, Sheppard L, Patten PA, Stemmer WP, Martin MA, Soong NW
Journal J Virol 2002 Mar;76(6):2924-35
Objectives Pathogenicity .
Main Findings

- A SHIV composed primarily of HIV-1 sequences with a SIV-Mac239 YE version of Nef was created and passaged to achieve a molecular clone that replicates in pig-tailed macaque PBMCs and can infect macaques. SIVMD17 accession number AF465242

NHP.389 (9237701) **Infection and pathogenicity of chimeric simian-human immunodeficiency viruses in macaques: determinants of high virus loads and CD4 cell killing**

Authors Shibata R, Maldarelli F, Siemon C, Matano T, Parta M, Miller G, Fredrickson T, Martin MA
Journal J Infect Dis 1997 Aug;176(2):362-73
Species/Subspecies Macaca fascicularis (cynomolgus macaque), Macaca nemestrina (pigtailed macaque)
Challenge SHIV-MD14YE (DH12), SHIV.MD1 *Route:* Intravenous
Main Findings

- $SHIV_{MD1}$ carrying HIV-1 subtype B sequences from clones pNL43 (vpr) and DH12 (tat-nef) in a SIV_{Mac239} background, produced slower CD4+ T-cell decline in pig-tailed macaques than $SHIV_{MD14YE}$ in which the HIV-1 nef in $SHIV_{MD1}$ was replaced by SIV_{Mac239} nef with R17Y plus Q18E mutations
- The nef with R17Y plus Q18E mutations had previously been shown to be determinants of pathogenicity in the SIV_{SMM9} to SIV_{PBJ14} series of viruses

---

NHP.390 (8648760) **Requirements for lymphocyte activation by unusual strains of simian immunodeficiency virus**

Authors Du Z, Ilyinskii PO, Sasseville VG, Newstein M, Lackner AA, Desrosiers RC
Journal J Virol 1996 Jun;70(6):4157-61
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- A single amino acid change in Nef R17Y was shown to be sufficient to confer pathogenicity to non-activated macaque T-cells in SIV_{Mac239} and that conversely, Y17R reversion in SIV_{PBJ14} eliminated the lymphocyteactivation phenotype of that highly pathogenic clone

- YXXLXXXXXXXYXXL SH2-binding ITAM motif is created by R17Y mutation and abolished by Y28F mutation

---

NHP.391 (10888632) **Short- and long-term clinical outcomes in rhesus monkeys inoculated with a highly pathogenic chimeric simian/human immunodeficiency virus**

Authors Endo Y, Igarashi T, Nishimura Y, Buckler C, Buckler-White A, Plishka R, Dimitrov DS, Martin MA

Journal J Virol 2000 Aug;74(15):6935-45

Species/Subspecies Macaca mulatta (Rhesus macaque)

Challenge SHIV.DH12R-PS1 *Route:* Intrarectal, Intravenous, Vaginal or perivaginal

Main Findings

- $SHIV_{DH12R}$, derived from $SHIV_{MD14YE}$ by passage in rhesus macaque, induces CD4+ T-cell loss in rhesus macaques in a dose-dependent manner. The DH12R innoculum was uncloned, and higher doses apparently allow more antibody neutralization escape variants to survive

---

NHP.392 (7769705) **Isolation and characterization of a syncytium-inducing, macrophage/T-cell line-tropic human immunodeficiency virus type 1 isolate that readily infects chimpanzee cells in vitro and in vivo**

Authors Shibata R, Hoggan MD, Broscius C, Englund G, Theodore TS, Buckler-White A, Arthur LO, Israel Z, Schultz A, Lane HC, et al.

Journal J Virol 1995 Jul;69(7):4453-62

Species/Subspecies Pan Troglodytes (Chimpanzee)

Challenge HIV-1.DH12 *Route:* Intravenous

Main Findings

- Of 23 different HIV-1 isolates tested, only one (DH12) was able to initiate infections in all chimpanzee PBMC cultures tested. The DH12 isolate was innoculated into three chimpanzees and was able to establish a robust infection with symptoms including lymphadenopathy and rashes
- All DH12 clones sequenced had defective vpu genes, although the GenBank entry for the complete genome AF069140 was submitted with the ATA defective start codon corrected to ATG

NHP.393 (7769705) **Isolation and characterization of a syncytium-inducing, macrophage/T-cell line-tropic human immunodeficiency virus type 1 isolate that readily infects chimpanzee cells in vitro and in vivo**

Authors Shibata R, Hoggan MD, Broscius C, Englund G, Theodore TS, Buckler-White A, Arthur LO, Israel Z, Schultz A, Lane HC, et al.

Journal J Virol 1995 Jul;69(7):4453-62

NHP.394 (11836389) **Determination of a statistically valid neutralization titer in plasma that confers protection against simian-human immunodeficiency virus challenge following passive transfer of high-titered neutralizing antibodies**

Authors Nishimura Y, Igarashi T, Haigwood N, Sadjadpour R, Plishka RJ, Buckler-White A, Shibata R, Martin MA

Journal J Virol 2002 Mar;76(5):2123-30

Species/Subspecies Macaca nemestrina (pigtailed macaque)

Vaccine Name Chimp-anti-HIV-IgG *Type:* Passive Antibody *Route:* Intravenous

Challenge SHIV.MD1 *Route:* Intravenous

Main Findings

- Neutralizing antibodies from a chimpanzee infected with HIV-1 isolate DH12 can protect macaques from a SHIV containing the DH12 envelope gene. The recipient serum titre needed to protect 99% of macaques from 75 TCID50 IV innoculation was calculated to be 1:38

NHP.395 (15356916) **CCR5 targeted SIV vaccination strategy preventing or inhibiting SIV infection**

Authors Bogers WM, Bergmeier LA, Oostermeijer H, ten Haaft P, Wang Y, Kelly CG, Singh M, Heeney JL, Lehner T

Journal Vaccine 2004 Aug 13;22(23-24):2974-84

Objectives Challenge, Immunogenicity To attempt to prevent SIV infection by (a) upregulating the three CC chemokines, (b) eliciting antibodies to CCR5 and (c) downmodulating the cell-surface expression of CCR5.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name HSP70-Baculovirus-infected cells.gp120-pGEX-3X.p27 *Type:* Recombinant Subunit Protein *Route:* Intramuscular

Challenge SIVmac8980 *Route:* Intramuscular
Main Findings
- Immunization with protein (HSP70) covalently linked to the CCR5 peptides, SIV gp120 and p27 protected rhesus monkeys from infection after challenge with SIVmac8980

NHP.396 (15452269) **Heterologous human immunodeficiency virus type 1 priming-boosting immunization strategies involving replication-defective adenovirus and poxvirus vaccine vectors**
Authors Casimiro DR, Bett AJ, Fu TM, Davies ME, Tang A, Wilson KA, Chen M, Long R, McKelvey T, Chastain M, Gurunathan S, Tartaglia J, Emini EA, Shiver J
Journal J Virol 2004 Oct;78(20):11434-8
Objectives Immunogenicity To assesse the ability of poxvirus vectors to boost Ad5-primed responses as a means of enhancing the levels of vaccine-elicited responses.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings
- Heterologous Ad5 priming-poxvirus boosting regimen induced a significantly greater immune response in rhesus monkeys than immunization elicited by homologous prime-boost regimens with the individual vectors or by a heterologous poxvirus priming-Ad5 boosting regimen.

NHP.397 (15302953) **Macaques infected long-term with attenuated simian immunodeficiency virus (SIVmac) remain resistant to wild-type challenge, despite declining cytotoxic T lymphocyte responses to an immunodominant epitope**
Authors Sharpe SA, Cope A, Dowall S, Berry N, Ham C, Heeney JL, Hopkins D, Easterbrook L, Dennis M, Almond N, Cranage M
Journal J Gen Virol 2004 Sep;85(Pt 9):2591-602
Objectives Challenge, Immunogenicity To investigate mechanisms of protective immunity induced by live, attenuated SIV.
Species/Subspecies Macaca mulatta (Rhesus macaque)
Vaccine Name SIV.GX2 *Type:* Live Attenuated Virus
Challenge SIVmac220 *Route:* Intravenous
Main Findings
- 3 macaques immunized with live attenuated SIVmacGX2 were resistant to challenge with an uncloned pool of wild-type SIVmac220, whereas four naive controls became infected.
- Both attenuated (vaccine) and wild-type (challenge) viruses induced a disseminated CD8+ T-cell response, which was of a higher magnitude in lymphoid tissues than in the periphery

---

NHP.398 (9732063) **Rhesus macaques that become systemically infected with pathogenic SHIV 89.6-PD after intravenous, rectal, or vaginal inoculation and fail to make an antiviral antibody response rapidly develop AIDS**
Authors Lu Y, Pauza CD, Lu X, Montefiori DC, Miller CJ
Journal J Acquir Immune Defic Syndr Hum Retrovirol 1998 Sep 1;19(1):6-18
Species/Subspecies Macaca mulatta (Rhesus macaque)
Challenge SHIV89.6PD *Route:* Intrarectal, Intravenous, Vaginal or perivaginal
Main Findings
- The pathogenicity of an uncloned stock of SHIV-89.6P was tested in 12 rhesus macaques. Two were injected IV, 6 were innoculated intravaginally, and 4 were innoculated intrarectally. Intraveinous innoculation resulted in peak viremia in 7 days vs 14 daysfor mucosal innoculation

---

NHP.399 (12163269) **A novel chimeric Rev, Tat, and Nef (Retanef) antigen as a component of an SIV/HIV vaccine**
Authors Hel Z, Johnson JM, Tryniszewska E, Tsai WP, Harrod R, Fullen J, Tartaglia J, Franchini G
Journal Vaccine 2002 Aug 19;20(25-26):3171-86
Species/Subspecies Macaca mulatta (Rhesus macaque)
Main Findings

- Retanef is a synthetic open reading frame encoding epitopes from Rev, Tat and Nef proteins. Inserted into the NYVAC vaccinia virus vector, and injected into naive macaques, it induced CTL responses. It also boosted responses 2 to 7-fold in previously infected macaques undergoing HAART

NHP.400 (15258286) **Recombinant poxvirus boosting of DNA-primed rhesus monkeys augments peak but not memory T lymphocyte responses**

Authors Santra S, Barouch DH, Korioth-Schmitz B, Lord CI, Krivulka GR, Yu F, Beddall MH, Gorgone DA, Lifton MA, Miura A, Philippon V, Manson K, Markham PD, Parrish J, Kuroda MJ, Schmitz JE, Gelman RS, Shiver JW, Montefiori DC, Panicali D, Letvin NL

Journal Proc Natl Acad Sci U S A 2004 Jul 27;101(30):11088-93. Epub 2004 Jul 16

Objectives Challenge, Immunogenicity To assess the relative immunogenicity including a CTL response of vaccine regimens that included a cytokine-augmented plasmid DNA prime and a boost with DNA or recombinant pox vectors.

Species/Subspecies Macaca mulatta (Rhesus macaque)

Vaccine Name HIV-1 89.6P Env gp140 (KB9) DNA *Type:* DNA *Route:* Intramuscular

Vaccine Name SIV mac239 Gag DNA *Type:* DNA *Route:* Intramuscular

Vaccine Name Recombinant fowlpox (rFPV).SHIV89.6P env *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Vaccine Name Recombinant fowlpox (rFPV) SIVmac239 gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Vaccine Name Recombinant MVA-SHIV89.6P env *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Vaccine Name Recombinant MVA-SIVmac239 gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Vaccine Name Recombinant vaccinia viruse (rVac).SHIV89.6P Env *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Vaccine Name Recombinant vaccinia viruse (rVac).SIVmac239 gag *Type:* Recombinant Vector (virus/bacteria) *Routes:* Intradermal, Intramuscular

Challenge SHIV89.6P *Route:* Intravenous

Main Findings

- Recombinant vaccinia virus, recombinant modified vaccinia Ankara (MVA), and recombinant fowlpox were comparable in their immunogenicity.
- Whereas the magnitude of the peak vaccine-elicited T lymphocyte responses in the recombinant pox virus-boosted monkeys was substantially greater than that seen in the monkeys immunized with plasmid DNA alone, the magnitudes of recombinant pox boosted CTL responses decayed rapidly and were comparable to those of the DNA-alone-vaccinated monkeys by the time of viral challenge.
- The memory T cell responses for the three vaccines were comparable.
- Protection from clinical disease in all groups of experimentally vaccinated monkeys was similar.
- The steady-state memory, rather than the peak effector vaccine-elicited T lymphocyte responses, may be the critical immune correlate of protection for a CTL-based HIV vaccine
