Preface

Scope and purpose of the HIV molecular immunology database and the nonhuman primate HIV/SIV vaccine trials databases

HIV Immunology and HIV/SIV Vaccine Databases 2003 is a companion volume to *Human Retroviruses and AIDS Genetic Sequence Compendium*. Parts I–V of this publication, the 2003 issue, is the printed version of the web-based HIV Immunology Database (`http://www.hiv.lanl.gov/content/immunology/`). The web interface for this relational database has many search options, as well as interactive tools to help immunologists design reagents and interpret their results. We summarize through the previous year's literature, which is why the 2003 database is published in 2004.

This year we have produced our first hard copy of the SIV/HIV nonhuman primate vaccine database, and we are sending it as the final part of a two volume set together with the immunology database. Like the data included in the immunology databases, these data are extracted from the HIV/SIV nonhuman primate vaccine literature. Like the HIV sequence and immunology databases, the vaccine database is available in a searchable form on line (`http://www.hiv.lanl.gov/cgi-bin/vaccine/public/index.cgi`). A more comprehensive introduction to this database and its contents can be found at the beginning of Part VI.

In the HIV Immunology Database, HIV-specific B-cell and T-cell responses are summarized and annotated. Immunological responses are divided into three parts, CTL, T helper, and antibody. Within these parts, defined epitopes are organized by protein and binding sites within each protein, moving from left to right through the coding regions spanning the HIV genome. We include human responses to natural HIV infections, as well as vaccine studies in a range of animal models and human trials. Responses that are not specifically defined, such as responses to whole proteins or monoclonal antibody responses to discontinuous epitopes, are summarized at the end of each protein section. Studies describing general HIV responses to the virus, but not to any specific protein, are included at the end of each part.

The annotation includes information such as cross-reactivity, escape mutations, antibody sequence, TCR usage, functional domains that overlap with an epitope, immune response associations with rates of progression and therapy, and how specific epitopes were experimentally defined. Basic information such as HLA specificities for T-cell epitopes, isotypes of monoclonal antibodies, and epitope sequences are included whenever possible. All studies that we can find that incorporate the use of a specific monoclonal antibody are included in the entry for that antibody. A single T-cell epitope can have multiple entries, generally one entry per study.

Finally, maps of all defined linear epitopes relative to the HXB2 reference proteins are provided. Alignments of CTL, helper T-cell, and antibody epitopes are available through the search interface on our web site at `http://www.hiv.lanl.gov/content/immunology`.

Only responses to HIV-1 and HIV-2 are included in the database. CTL responses to SIVs have been periodically summarized in our review section by Dr. Dave Watkins and colleagues. (For their most recent review, please see: Where Have All The Monkeys Gone? Evaluating SIV-Specific CTL in the Post-Mamu-A*01 Era, David H. O'Connor, Todd M. Allen, and David I. Watkins, in the 2001 HIV Immunology compendium). Dr. Christian Brander and colleagues annually provide a concise listing of optimal CTL epitopes. Additional reviews that our editorial board deems of general interest to the HIV research immunology community are solicited each year. This year's reviews are printed in the first part of this database; reviews from previous years can be found at: `http://www.hiv.lanl.gov/content/hiv-db/REVIEWS/reviews.html`.

Comments on the database or requests for the hard copy can be sent via email to `immuno@t10.lanl.gov`.

Citing the database

This publication may be cited as

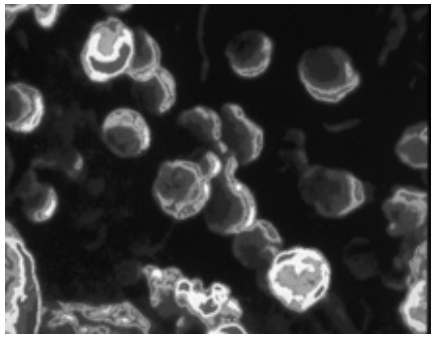
About the cover



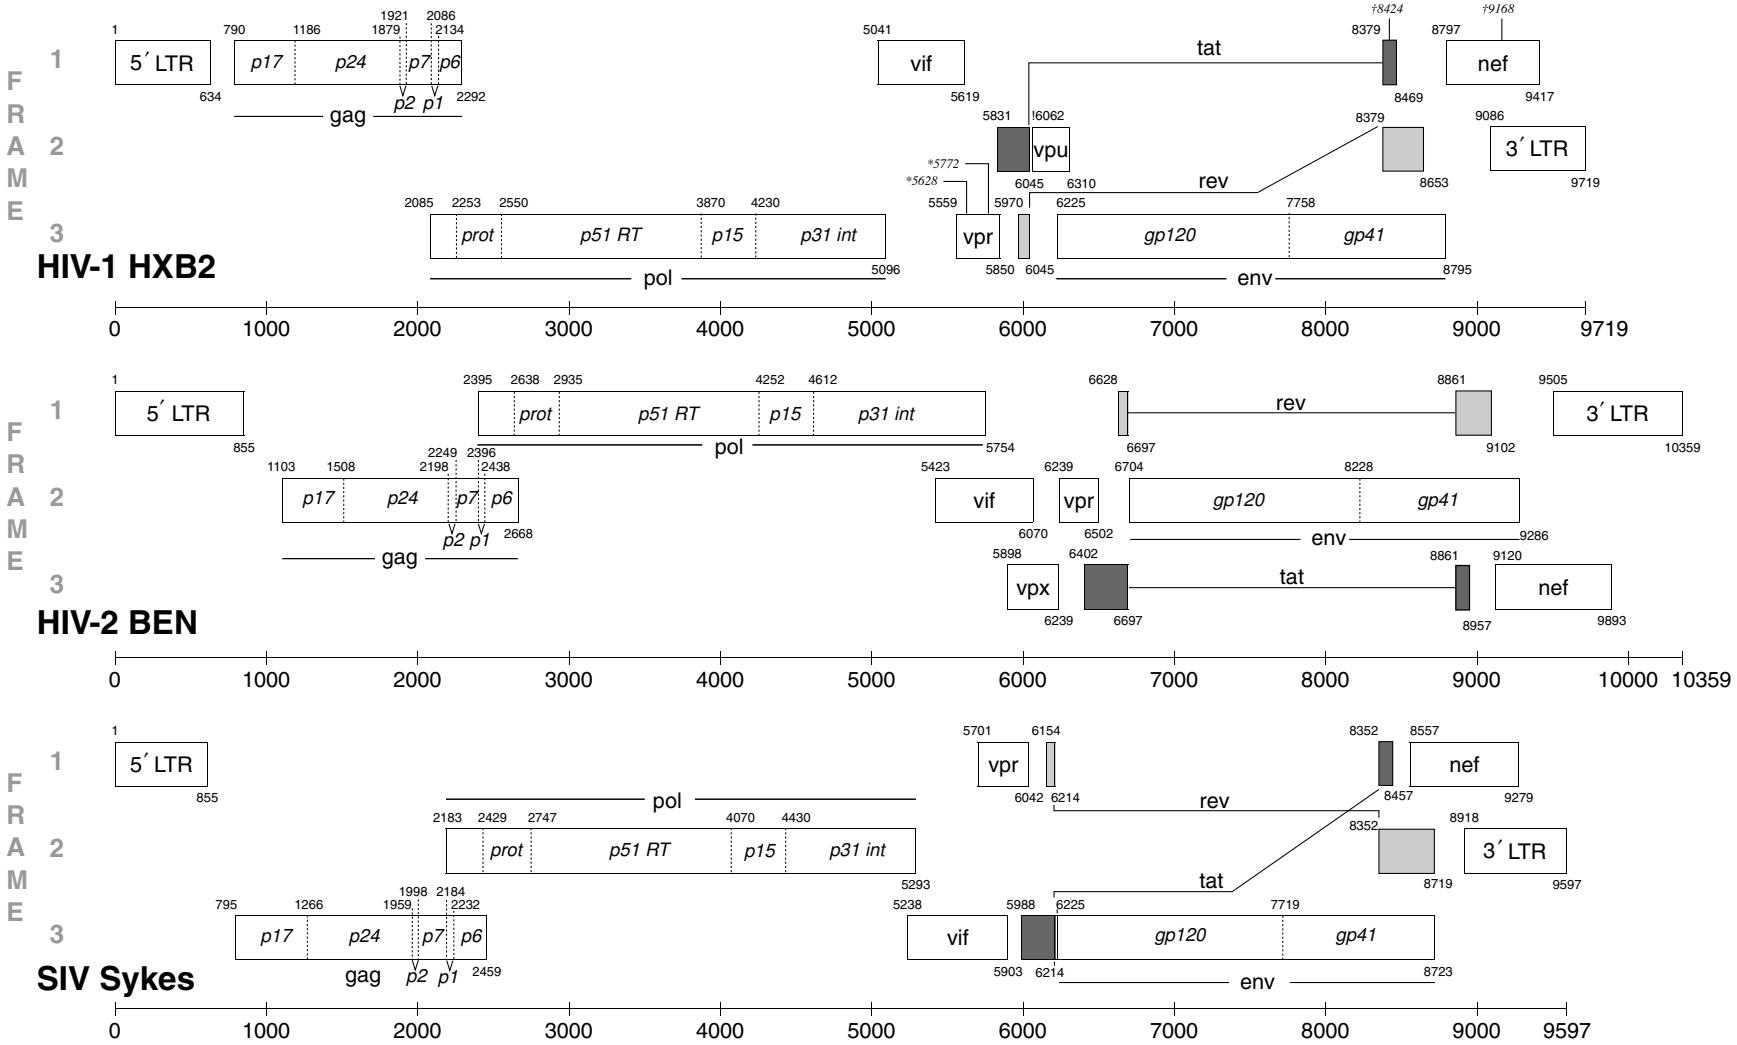
This year's cover is a photograph of several HIV particles located on the surface of a T lymphocyte as seen through a scanning electron microscope. The virus particles have been tinted by a special coloring technique. The capsids of the individual viruses can be seen, and the outgrowth on the virus in center of the picture is probably an aggregate of antibodies against HIV, marked by ferritin. The photo was taken by Dr. h.c. Lennart Nilsson, Karolinska University Hospital, Stockholm, Sweden. Lennart Nilsson has developed new photographic methods and technical improvements, including electron microscopy, opening new dimensions to scientific photography. His work on medical subjects have become world known through publications such as "Behold Man" and "A Child is Born".

About the PDF

The complete *HIV Immunology and HIV/SIV Vaccine Databases 2003* is available in Adobe Portable Document Format (PDF) from our website, `http://www.hiv.lanl.gov/content/immunology`. The PDF version is hypertext enabled and features 'clickable' table-of-contents, indexes, references and links to external web sites.

This volume is typeset using LaTeX. The immunology data tables and epitope maps are produced automatically from the SQL database by a series of Perl programs.

Genome maps



Landmarks of the HIV-1, HIV-2, and SIV genomes. The gene start, indicated by the small number in the upper left corner of each rectangle, normally records the position of the a in the atg start codon for that gene while the number in the lower right records the last position of the stop codon. For *pol*, the start is taken to be the first t in the sequence ttttttag which forms part of the stem loop that potentiates ribosomal slippage on the RNA and a resulting −1 frameshift and the translation of the Gag-Pol polyprotein. The *tat* and *rev* spliced exons are shown as shaded rectangles. In HXB2, *5628 and *5772 mark positions of frameshifts in the *vpr* gene; !6062 indicates a defective acg start codon in *vpu*; †8424 and †9168 mark premature stop codons in *tat* and *nef*. See Korber *et al.*, Numbering Positions in HIV Relative to HXB2CG, in *Human Retroviruses and AIDS*, 1998, p. 102. Available from http://www.hiv.lanl.gov/HTML/reviews/HXB2.html.

HIV/SIV proteins

Name	Size	Function	Localization
Gag MA	p17	membrane anchoring; env interaction; nuclear transport of viral core. (myristylated protein)	virion
CA	p24	core capsid	virion
NC	p7	nucleocapsid, binds RNA	virion
	p6	binds Vpr	virion
Protease (PR)	p15	gag/pol cleavage and maturation	virion
Reverse Transcriptase (RT)	p66, p51	reverse transcription	virion
RNase H	(heterodimer)	RNAse H activity	virion
Integrase (IN)		DNA provirus integration	virion
Env	gp120/gp41	external viral glycoproteins bind to CD4 and chemokine co-receptors	plasma membrane, virion envelope
Tat	p16/p14	viral transcriptional transactivator	primarily in nucleolus/nucleus
Rev	p19	RNA transport, stability and utilization factor (phosphoprotein)	primarily in nuleolus/nucleus shuttling between nucleolus and cytoplasm
Vif	p23	viral infectivity factor, inhibits minus-strand viral DNA hypermutation	cytoplasm (cytosol, membranes), virion
Vpr	p10-15	promotes nuclear localization of preintegration complex, inhibits cell division, arrests infected cells at G2/M	virion nucleus (nuclear membrane?)
Vpu	p16	promotes extracellular release of viral particles; degrades CD4 in the ER; (phosphoprotein only in HIV-1 and SIVcpz)	integral membrane protein
Nef	p27-p25	CD4 and class I downregulation (myristylated protein)	plasma membrane, cytoplasm, (virion?)
Vpx	p12-16	Vpr homolog present in HIV-2 and some SIVs absent in HIV-1	virion (nucleus?)
Tev	p28	tripartite tat-env-rev protein (also named Tnv)	primarily in nucleolus/nucleus

Abbreviations

Common abbreviations used in this database.

Abbrev.	Meaning

Broad HIV-1 Specific CTL Responses Reveal Extensive HLA Class I Binding Promiscuity of HIV-Derived, Optimally Defined CTL Epitopes

Nicole Frahm[a], Philip J.R. Goulder[a,b], Christian Brander[a]

I-A-1 Cytotoxic T lymphocyte (CTL) in HIV infection

Together with neutralizing antibodies and virus specific T-helper cells, HIV specific cytotoxic T lymphocytes (CTL) remain at the center of many vaccine development efforts despite the ongoing debate regarding their *in vivo* induction and function and their potential ability to provide effective protection from infection in vaccines. However, numerous reports support the important role that virus specific CTL responses may have in HIV infection and that their detailed characterization needs to continue. As in past years, we again have compiled an updated list of all optimal HIV derived CTL epitopes that have been described over the last 12 months. The total number of optimal CTL epitopes has now exceeded 200 and increasingly also includes epitopes identified in non-clade B infection and in individuals of non-Caucasian descent. Thus, the collective information on the specificity of these HIV directed responses is of growing relevance for vaccine development in populations most affected by the HIV epidemic and should facilitate further immune analyses in these mostly non-Caucasians ethnicities.

I-A-2 Broad CTL responses are not associated with HIV control

A number of laboratories, including ours, have in the past described the results from comprehensive CTL screening studies, in which overlapping peptide sets spanning the entire HIV genome are used in IFN-γ ELISpot assays [Addo2003, Cao2003a, Draenert2004d, Feeney2003, Frahm2004, Novitsky2002, Sabbaj2003, Kiepiela2004]. While several reports show either a positive or a negative correlation between viral loads and the breadth or magnitude of these CTL responses, none of these recent studies have found any strong significant associations. Importantly, studies describing correlations have often been based on the analysis of CTL responses against a restricted number of proteins or even single epitopes using tetramer stainings and were often restricted to a relatively low number of subjects enrolled [Betts2001, Buseyne2002a, Buseyne2002b, Edwards2002, Ogg1998]. The larger, more comprehensive studies including individuals at different stages of disease fail to see associations between CTL activity and viral loads [Addo2003, Cao2003a, Draenert2004d, Feeney2003, Frahm2004]. Thus, it appears that either total CTL responses are not a correlate of immune protection, or the assays most widely applied do not reflect the number of CTL responses that actually do mediate effective *in vivo* control of viral replication. The latter may indeed play an important role as some of the most widely used approaches clearly have their limitations. Overcoming them may help to obtain a more accurate picture of the HIV specific CTL activity. For instance, recent studies from our laboratory show that the use of autologous test sequences yields more and stronger CTL responses to variable proteins compared to the use of consensus sequence based peptide sets [Altfeld2003]. Thus, most studies may underestimate the true breadth of responses and may hide a

potential association between CTL activity, viral loads and disease progression. This limitation could be overcome by testing an extensive number of individuals using autologous test sequences; an undertaking that, however, will be limited by the exuberant costs for autologous sequence peptide synthesis.

A further concern regards the use of overlapping peptide panels that span the entire expressed HIV genome. In most cases, these utilize peptides that are 15–18 amino acids in length and which overlap by either 10 or 11 amino acids. Recent studies by Draenert [Draenert2004b] indicate that the precise location of the optimal epitope within the overlapping peptide (OLP) significantly affects recognition of the OLP: if the epitope is located precisely at the C-terminal end of the OLP, it will be significantly better recognized than if located in the middle of the OLP. Recent studies in the SIV macaque model, where peptides can be synthesized that correspond exactly to the autologous virus sequence, indicate that even 15-mers overlapping by 11 amino acids fail to pick up a substantial proportion of the responses (Watkins *et al.*, unpublished). The ultimate and ideal situation would be to use a panel of 11-mers overlapping by 10 amino acids, based on autologous virus sequence. The cost of such an enterprise is prohibitive, but for a limited number of subjects this exercise should perhaps be undertaken, as one becomes increasingly aware of the fact that the immunodominant CTL responses may not necessarily be the ones that are critical for immune control.

In addition, only a few different assays are currently being employed for the detection of virus specific CTL. To our knowledge, all optimal CTL epitopes listed in the present database have been identified either by assessing cytotoxic activity in a Cr^{51} release assay or by the induction of IFN-γ in Elispot or intracellular cytokine staining (ICS) assays. While cytolytic function may be an important aspect of effective CTL, IFN-γ release may well be a surrogate for other functions but not occur in all HIV-specific cells. A number of laboratories have tackled these problems and established other assays, such as CD107 degranulation and perforin/granzyme release assays as alternative ways to assess CTL responses. Also, replication inhibition assays of the type first described by Yang *et al.* [Yang1997], in which CTL clones are co-cultured with HLA-matched CD4+ T cells infected with autologous virus clones, may provide a means to come closer to the situation *in vivo*. Such assays will help to address qualitative differences in the viral replication inhibition efficacy of CTL of different specificity and will also help to identify processing mutations that are hard to detect in other, non-replication based assays. The frequency of processing escape mutations is unknown but a recent number of descriptions of mutational processing escape mutations in HIV suggests that this is a mechanism of escape that has been much under-recognized [Draenert2004c, Allen2004, Yokomaku2004]. Overall, these assays still need further adaptation and simplification until comprehensive responses can be measured on a single peptide level in a larger population of HIV infected individuals.

Finally, assessing total CTL responses by comprehensive screening may detect too many immunologically irrelevant responses and thus obscure a possible association between CTL activity and viral control. Indeed, there is compelling evidence that some single epitope-specific responses can control viral replication as viral escape in such epitopes is associated with increased viral loads and acceleration of disease progression [Draenert2004c, Goulder1997c, Cao2003b, Kelleher2001, Allen2000, Barouch2002, Klenerman2002, Leslie2004, Friedrich2004]. Thus, besides single responses that appear to have the capacity to provide strong immune surveillance, the current assays may also detect many less efficient responses and thus hide a possible association between CTL activity and viral load. On the other hand, individuals with high viral loads and fast disease progression can well maintain strong CTL responses without evidence of affecting viral replication [Draenert2004d]. In this study, the lack of control over viral replication could not be explained by sequence variation in the targeted regions of the autologous virus, indicating functional deficiencies specific to these individuals or responses. New data from our lab and other investigators suggest that the ability of HIV-epitope specific CTL to proliferate in response to antigen is lost in the course of infection, and that this defect could be associated with the loss of effective control over viral replication [Migueles2002] (and Lichterfeld *et al.*, unpublished). Together, these studies suggest that at least some HIV specific CTL can exert effective replication control and that the often generalized description of "functional deficiency of HIV specific CTL" is likely an over-simplification.

I-A-3 Extensive HLA class I binding promiscuity of HIV derived optimal epitopes

Regardless of possible associations between CTL activity and viral loads, knowing the precise targets of these CTL is still a prerequisite for many other questions to be asked, such as viral evolution, genetic imprinting and their potential use in epitope-based vaccines. Furthermore, the well-defined epitope landscape can be used to address questions of antigen processing and epitope presentation. In a recent study, we have used the optimally defined CTL epitopes to address the degree of HLA class I binding promiscuity. Briefly, 100 HIV infected individuals of mainly non-Caucasian background were tested for CTL responses against almost 200 described, optimal HIV derived CTL epitopes, regardless of the individual's HLA type. Interestingly, only about 40% of all responses were

detected in individuals who expressed the appropriate HLA class I allele. Another 20% of the responses were attributed to the presence of an allele that fell into the same HLA-supertype as the originally described restricting allele (for instance, an HLA-A3+ individual showing a positive response against an HLA-A11 restricted epitope). This left 40% of all responses to be restricted by alleles that do not share obvious similarities to the originally described allele or were, thus far at least, not grouped into the same HLA-supertype as the original allele. Although more detailed analyses will be required to confirm the precise length and anchor residues for the epitopes presented on alternative alleles, the data strongly suggest the presence of epitopes with wide HLA-class I binding promiscuity. This is supported by some of the epitopes included in the present update, for which presentation and *ex vivo* recognition was documented for up to four different HLA class I alleles (TL9 on B7, B42, B81 and Cw08). Furthermore, strong support for extensive epitope binding promiscuity is derived from the observation that CTL responses to certain regions of the viral genome, such as Gag and Nef, show strong clustering of responses [Frahm2004, Frahm2002a]. In data now publicly available at the Los Alamos database (`http://www.hiv.lanl.gov/content/immunology/hlatem/`), we show that 72 of 150 individuals tested reacted to the very same overlapping 18-mer peptide in Nef. Since these individuals expressed widely diverse HLA types and the number of potential epitopes in a single 18-mer is limited, the data strongly suggest that at least some epitopes must be presented by multiple HLA class I alleles.

I-A-4 Implications for vaccine development and viral evolution studies

Clearly, the identification of CTL epitopes that can bind multiple HLA class I alleles will facilitate the selection of epitopes with an increased population coverage. However, it will also be important to assess potential functional differences between responses to the same epitopes presented on different alleles. This may be of special interest in cases where the epitopes are shared between HLA class I alleles differentially associated with slow or fast HIV disease progression. An example of this is the TL9 response restricted by HLA-B42 and B81. HLA-B81 is associated with low viral loads in the Durban population, whereas B42 is not (Goulder *et al.*, unpublished). Sequencing of the virus indicates that escape mutations are selected in the B81-positive subjects in the region of the virus encoding the TL9 epitope, whereas this does not occur in the B42-positive subjects (Leslie *et al.*, unpublished). Other examples include the epitope QW9, shared by HLA-B57 (slow) and HLA-B53 (fast disease progression). Using these epitopes, one may be able to address the role that the HLA class I molecule or the presented CTL epitope, respectively, play in determining the rate of disease progression. Finally, cross-binding epitopes may also impact the analyses of CTL escape patterns as allele-associated footprints may need to take into consideration other alleles with the ability to share CTL epitopes. Similarly, the assessment of a "functional HLA homozygosity" in which alleles that frequently share CTL epitopes are considered "functionally homozygous" may reveal additional insight into the mechanism by which genetically homozygous individuals show a faster disease progression compared to HLA heterozygous subjects [Carrington1999].

I-A-5 Acknowledgments

As every year, we would like to express our gratitude to the large number of researchers in the field who continuously contribute to this database. The mostly unpublished data added to this years update stemming from the AIDS Research Center at Mass. General Hospital have been largely funded by an NIH contract (#NO1-A1–15442) supporting HLA typing and HIV CTL epitope definition in non-Caucasian populations and non clade B HIV infection.

We very much welcome any criticism, comments and additions to this list since we are sure that some epitopes will unintentionally escape our attention, despite close monitoring of the literature. Please write or call us with any comments you may have at:

I-B

Enhanced Motif Scan: A Tool to Scan for HLA Anchor Residues in Proteins

Karina Yusim[a], James J. Szinger[a], Isobella Honeyborne[b,c], Charles Calef[a], Philip J. R. Goulder[b,c], Bette T. M. Korber[a]

I-B-1 Introduction

The HIV Immunology Database at `http://www.hiv.lanl.gov/` is a repository of information about HIV T-cell and antibody epitopes, integrated with the sequence variability data from the HIV Sequence Database [Kuiken2003]. The immunology database includes tables, maps and alignments of HIV-specific cytotoxic T lymphocyte (CTL) epitopes that are updated through annual summaries of the literature. We also develop simple web-based tools with the goal of assisting immunologists in experimental design and interpretation of their results. While these tools emphasize ease of application for HIV studies, many are also useful for studies of other pathogens and immune responses.

Several tools in the immunology database that rely on HLA anchor motif assignments are available to help identify potential CTL epitopes in HIV proteins[Calef2001, Calef2002, Thakallapally2001]. HLA anchor motifs are the conserved elements in epitopes that allow binding with specific HLA class I or class II proteins for presentation on the cells surface and recognition by T-cells. The peptide binding groove is divided into six pockets (A, B, C, D, E and F). Only 2 to 4 of these are generally occupied, although most of the residues within a peptide contribute to some degree to MHC binding. There are usually two dominant binding anchors for an epitope bound to an MHC class I molecule. These are usually the second position residue and the carboxy-terminus (C-terminus), and these residues bind to the B and F pockets, respectively, of the MHC class I peptide-binding groove. Class I epitopes are typically 9 amino acids long, ranging between 8-12 amino acids long. The optimal length of class II presented epitopes is often higher, and the spacing of the anchor residues relative to each other within the epitope tends to be more variable.

Anchor motif patterns are relatively, although not perfectly, preserved in peptides that are presented by specific HLA molecules. Only a fraction of the peptides that retain an anchor motif will actually bind to the appropriate HLA molecule (for an example, see Altfeld2001), and only a small fraction of those peptides that bind to HLA molecules will actually be properly processed and presented and stimulate specific T-cells responses. So the presence of an anchor motif only suggests the possibility of an epitope that could be presented by a specific HLA molecule. Knowledge of the peptide-binding motif can be very useful, however, for example in fine mapping of novel epitopes when one has identified a CTL response against a longer peptide that contains an epitope.

We have updated our HLA binding motif scanner tool [Thakallapally2001] (Motif Scan) to include a more comprehensive list of known anchor motifs. The interface has been improved, and now includes the ability to track anchor motifs in alignments of proteins, not just single proteins; and to differentiate between C-terminal and interior anchor motif residues. Also, we are working on the feature that would allow to identify all available motifs within protein fragments of up to 100 amino acids in length. Some basic reference sets of HIV proteins can be automatically entered for searches. The general purpose of this tool is to help users to identify known anchor residue motifs for epitopes presented by class I and class II HLA molecules, and then use these motifs to highlight potential epitopes within a protein sequence. Although the automated search capabilities of Motif

Scan are based on HIV proteins, it can be applied to any protein. The tool could also be applied to look for general functionally important motifs of amino acid or nucleotides in sequences that have characteristic spacing. As the program is searching sequences of letters for motifs of interest, it would work equally well for identifying repeated patterns in proteins and in DNA. For example, if one put the restriction enzyme BamHI site `[G]-[G]-[A]-[T]-[C]-[C]` in as a custom motif and searched a DNA alignment, BamHi sites would be highlighted within the alignment.

I-B-2 HLA anchor motif sources

Primary anchor motif sources

The main data source for Motif Scan is a database of HLA binding motifs stored on our website. The HLA binding motif database has been recently updated to include two major motif libraries from *The HLA Facts Book* [Marsh2000] (`http://www.anthonynolan.com/HIG/`) and *MHC Ligands and Peptides Motifs* [Rammensee1997] (`http://syfpeithi.bmi-heidelberg.com`). We also searched the literature for the new motifs, not yet listed in these two major sources. What we found in the primary literature is presented as an additional source. Because motifs presented in different sources sometimes differ, in our tool the motifs presented are listed along with their sources, and the user can choose which ones to use for scanning the protein sequences for specific motif patterns. A number of HLA class I and class II alleles have not been characterized with respect to their peptide binding motif, and so we will continue to periodically update the database as new motifs are defined.

Table I-B.1: HLA motifs that are predicted based on conserved patterns found in a minimum of two optimal HIV epitopes in positions P2 or C-term (see Frahm2004, page 3 this volume, for lists of well defined epitopes presented by these HLA's).

Allele	Anchor motif	Number of epitopes that share this pattern
A*2501	`xxxxxxxxx[W]`	2
A*3201	`x[I]xxxxxxx[W]`	2
A*6802	`x[TV]xxxxxx[VL]`	3
B*4002	`x[E]xxxxxx[IAVL]`	5
B*4201	`x[P]xxxxxx[L]`	3
B*8101	`x[P]xxxxxx[L]`	2

Additional proposed anchor motifs

We have added several additional possible motifs, listed in Table I-B.1, based on conserved patterns in known optimal epitopes in HIV proteins [Frahm2004]. These motifs are not well established, and we will update the suggested motifs as they become better characterized.

Predicting HLA-C motifs by genetic similarities in HLA molecules

Although many of the A and B alleles have had their motif described, very few of the anchor motifs for HLA-C alleles have been characterized to date. As an increasing number of HLA-C-restricted CTL responses are being characterized, we have sought to predict the peptide-binding motif of the currently uncharacterized HLA-C alleles by comparing them to pockets with similar residues. Table I-B.2 shows the positions of amino acids lining the pockets of MHC class I molecules. Predicting the motif is straightforward if there is an identical or similar molecule that has been previously described, because a pocket having the same amino acid side chains can be expected to bind similar residues. Previously described F pockets of Cw*0102 and Cw*0304, for example, are identical, except for a leucine to isoleucine change at amino acid 95 and their motifs have both been found to bind small hydrophobic residues. Characteristics such as size, polarity and hydrophobicity (Table I-B.3) of the amino acid side-chains that line the pocket directly influence the motif. For example, a pocket with an overall strong positive charge will be expected to bind residues with negatively charged side chains, whereas a strongly hydrophobic pocket, where the constituent residues have bulky aromatic side chains, may often bind a small hydrophobic residue in that pocket. Based on this rationale, we have made predictions regarding potential anchor motifs for HLA-C subtype proteins that do not otherwise have a defined anchor motif. For the purposes of prediction we have focused on the principal pockets, B and F, although occasionally alleles have dominant anchor residues in other pockets. Elucidation of Cw*0102 has shown, for example, that residue 3 is an important anchor in the D pocket, and the anchor motif for Cw*0102 includes a proline at residue 3.

Tables I-B.4 and I-B.5 compare the variation in key binding residues along the B and F pockets of HLA-C alleles respectively, and, on the basis of similarity and known anchor motifs, make predictions regarding additional motifs. Table I-B.6 provides the predicted HLA-C summary motifs for B and F pockets.

Here is an example of our approach for motif prediction. The motif for the molecule Cw*0304 has previously been described. In pocket B (Table I-B.4) the residues have canceling charges and several large hydrophobic aromatic

Table I-B.2: The positions of the amino acids lining the HLA-C class I peptide binding site.

Pocket	Constituent residues	Peptide position accomodated
A	5, 7, 59, 63, 66, 99, 159, 163, 167, 171	1
B	7, 9, 24, 25, 34, 45, 63, 66, 67, 70, 99	2
C	9, 70, 73, 74, 97	6
D	99, 113, 114, 155, 156, 159, 160	3
E	97, 114, 147, 152, 156	7
F	77, 80, 81, 84, 95, 116, 123, 143, 146, 147	Carboxy terminus

Table I-B.3: Amino acid categories.

Category of amino acid	Members in group
Non-polar, hydrophobic	A, V, I, L, M
Non-polar, hydrophobic, large aromatic ring structure	F, W, Y
Non-polar, hydrophobic, small	P
Non-polar, hydrophilic	G, S, T, C, N
Positively charged, hydrophilic	R, H, K
Negatively charged, hydrophilic	D, E

residues. This pocket has been found in Cw*0304 to prefer the small hydrophobic residue alanine, and based on the B pocket similarity, we predicted alanine to be the B pocket anchor residue for Cw*0302 and Cw*0303.

The F pocket (Table I-B.5) for these alleles is likely to differ, however, since at position 116 there is a change from tyrosine to serine in Cw*0302 compared to Cw*0304 and Cw*0303. This substantial change would be expected to result in a more spacious F pocket for Cw*0302 than for Cw*0303 and Cw*0304. Thus, since for Cw*0304, the published motif at the F pocket is a medium-sized hydrophobic residue (`L` or `M`), for Cw*0302 we would predict a larger hydrophobic residue such as `F`, `W` or `Y`.

We are currently testing the validity of these predictions. For example, we have identified six HIV-1 relevant HLA-Cw*18 restricted responses toward 18-mer peptides. Using the motifs predicted above we can now compare the predicted optimal epitopes with actual epitopes.

Table I-B.4: Anchor motif predictions for the HLA-C locus B pocket. For each allele, the amino acids lining the pocked are shown along with the published or predicted motif. Amino acids at positions 9, 45, 63 and 67, shown in bold, are believed to be particularly important in determining the resulting motif.

[1]The published motif for Cw*0602 is xxxxxxxx[L].

I-B-3 Using Motif Scan

Data dictionaries

The HLA genotype/serotype classification used in the tool was based on the *The HLA Facts Book* [Marsh2000] and checked against more recent sources [Marsh2002, Schreuder2001]. Motif Scan can also be used as a quick web-based reference to look up associated HLA genotype/serotype nomenclature. Also, we added class I supertype classification and binding supermotifs from work of Sette and Sidney [Sette1999].

Search fields

The main web page of Motif Scan contains links to the downloadable lists of HLA genotypes, serotypes and supertypes, choice for motif length, window for the custom motif and motif sources. Here are detailed explanations for these search fields

HLAs The user can select multiple HLA class I or class II alleles to search the database for known or predicted motifs. (To find motifs for more than one allele, use the mouse to click on the first choice, and then hold down the control key while clicking on additional alleles for the search). HLA alleles may be specified by genotype, serotype or supertype.

- **Genotype** HLA genotypes are in general specified by four digit number, for example A*0201.
- **Serotype** If a user selects a serotype as a search field, anchor residues that have been defined for all related genotypes will be returned. For example, A2 will return motifs for the set of A2 related genotypes, including: A*0201, A*0202, etc. If a user knew only the serotype of the individual, it might be useful to have the anchor residues for all related genotypes displayed; if the specific HLA genotype was defined, then the specific anchor residues would be of greater interest. Because of the way HLA nomenclature has evolved, occasionally a two-digit HLA specification will be related to a genotype in a non-intuitive manner. For example, the genotype B*1513 might be specified by the serotype B15 or B77, where B15 is inclusive of many B*15 genotypes, and B77 is specifically B*1511. The serotype-genotype dictionary link on the main page provides a quick reminder of the naming conventions and relationships.
- **Supertype** Supermotifs will be provided for a given supertype, as defined by Sette and Sidney [Sette1999].

Motif Source Multiple sources (see above) may be selected to search for the variants of the suggested binding motif.

Motif Syntax The anchor residues are shown in the square brackets. The preferred but not dominant amino acids in the anchor positions are shown in parentheses. For example, motif for A*2602 taken from SYFPEITHY library is `x-[VTILF]-x-x-x-x-x-x-[YF(ML)]`. This means that second and C-terminal positions are anchor positions. The dominant amino acids at the second position are `V`, `T`, `I`, `L`, and `F`. At the C-terminal anchor position the dominant amino acids are `Y` and `F`, while `M` and `L` are also found, but not as commonly, among A*2602 epitopes. Note that as a default, Motif Scan will search on all possible anchor position amino acids, both dominant and preferred. It is possible to restrict a search to the dominant amino acids only, by composing a custom motif excluding the amino acids in parentheses (see below).

Supermotif Syntax For the supermotifs, residues within brackets are residues predicted to be tolerated and sometimes cross-presented by multiple Class I molecules within the putative supertype.

Motif Length Motifs are stored in the database with a length of 9 amino acids and the motifs for other lengths (8, 10 or 11 amino acids) are computed on-the-fly by adding or removing amino acids in front of the C terminus. Lengths are adjusted only for motifs from HLA class I genotypes, serotypes and supertypes. Anchor motifs for class II HLAs and custom motifs are not adjusted in length, and often for class II epitopes the last anchor residue of the motif will be embedded within the epitope, and not be the C-terminal amino acid.

Custom Motif A helpful feature of Motif Scan is the ability for users to define custom motifs. The syntax for the custom motif is the same as for the database motifs. Positions where several amino acids may be possible include all amino acids listed within square brackets [], and an `x` denotes arbitrary residues that specify the spacing in a motif. One can optionally use a dash (−) to separate the residues. For example, `x[LM]xxx[K]xx[V]` or `x-[LM]-x-x-x-[K]-x-x-[V]` are equivalent. With regard to defining epitopes, this feature, for example, allows the user to restrict a search to dominant anchor residues, or to add in auxiliary residues that are available in the listings of Marsh2000 and Rammensee1997. Auxiliary residues in epitopes do not bind directly in the pockets of HLA proteins that hold the anchor residues, but still influence the ability of a peptide to bind; auxiliary residues are not included in the Motif Scan database. The custom motif feature is useful also for the purposes other than scanning sequences for the HLA binding motifs. One can scan query sequences for any pattern of

interest, for example, studying motifs with characteristic functions found in functional domains.

Sequences and sequence alignments

To scan for a binding motif, a user can select from our predefined HIV protein sequences or upload or copy and paste their own sequences.

Predefined Sequences The predefined sequences include either all proteins from the HIV-1 HXB2 reference strain, or alignments of consensus and ancestral protein sequences for M group (subtypes A-D, F-H, J, K and circulating recombinant forms CRF01, CRF02) and O Group of HIV-1, from Los Alamos HIV Sequence Database, 2002 [Kuiken2003]. The alignments can give a rapid assessment of how well the search motif is preserved among the diverse forms in the epidemic. This will be updated periodically, as consensus and ancestral sequences are updated.

User's Own Sequences The user can upload or cut and paste either an individual protein sequence, or a set of individual sequences, or an alignment of sequences. User sequences should be input as simple text files in FASTA or TABLE format. Examples of sequence formatting can be obtained by clicking on the links provided on the web page. Individual sequences are stripped of gaps before processing. Gaps inserted to maintain the alignment are specified with a dash (−). If the sequences are aligned and the user wants to preserve the alignment, the user should check "Yes" in the box "Are the input sequences aligned"? In this case the gaps will be maintained and the alignment will be preserved, but they will not be counted as characters in terms of motif spacing.

Output

The results of the program are presented in several stages. First, the motifs corresponding to the input HLA types are presented. Then, the user chooses which motifs or set of motifs to scan with, chooses motif length (between 8-11 amino acids, one can select all possible lengths to be comprehensive), uploads query sequences or chooses predefined sequences, and initiates the scanning of these sequences for the respective motifs.

The final output is organized by search pattern, and all motifs with identical search patterns are grouped together. The matching motifs are presented on the input sequences in two colors: C-terminal anchor amino acids are shown in magenta and anchor amino acids in the other positions are shown in cyan. If a given amino acid is matched by more than one motif, then it is highlighted as a C-terminal anchor amino acid if any of the motifs are matched at the C-terminal anchor. All motif amino acids are shown in uppercase and non-anchors are lowercase. Following the sequences is a list of potential epitopes showing their positions in the input sequences.

The output can be viewed and downloaded in a format convenient for further coding and analysis: sequences can be downloaded in the FASTA format where the anchor amino acids are presented in uppercase and all the remaining ones in lowercase, but the colors are omitted. Alternatively, the color-highlighted motifs can be retained and copied and pasted from the web page directly into a word processor file. The list of potential epitopes and their positions in the protein can be downloaded in CSV (comma-separated value) format, which can be read into a spreadsheet.

Example

The motif search on all motif libraries for HLA A*0214 reveals the following table of motifs:

Genotype	Serotype	Motif	Source	Scan?
A*0214	A2	x-[QV]-x-x-[K]-x-x-[VL]	Luscher2001	☑
A*0214	A2	x-[VQ(L)]-x-x-x-x-x-[L]	Marsh2000	☑
A*0214	A2	x-[VQL(A)]-x-x-x-x-x-x-[L(VM)]	SYFPEITHI	☑

(`x` can be any amino acid). Here the three sources listed give slightly different information. In Luscher2001, either `Q` or `V` is favored in the second position, `K` in the sixth position, and either `V` or `L` is favored in the C-terminal position. In the Marsh2000 and SYFPEITHI sources, only the second and C-terminal positions are listed as anchor positions. In Marsh2000, the second position favors either `V` or `Q`, or less frequently `L`, and the C-terminal position favors `L`. In SYFPEITHI, the second position favors either `V` or `Q` or `L`, or less frequently `A`, and the C-terminal position favors `L`, or less frequently `V` or `M`. We do not address this different sources motif discrepancy in Motif Scan, rather, we display all existing views and let the user decide which one (or more) to use for scanning the protein sequences. Additionally, the user can compose a custom motif that would combine or summarize the information we present.

Once the motif is chosen, the user can either use our predefined consensus and ancestral sequence alignments, or copy-paste or upload their own sequences. For example, we scanned the following two aligned test sequences to search for the Marsh2000 A*0214 motif `x-[VQ(L)]-x-x-x-x-x-x-[L]`:

```
>Test.1
KTIIFKVSSQGDPLIVLHSQN--LEFLYCNLTKLFNSTW
>Test.2
KTI--KKSSQGDPEIVLHSQNCGGEFLHCNSTQFFNSTW
```

The resulting output contains query sequences in lowercase letters, where the anchor residues are uppercase and colored: C-terminal anchor is magenta and the other anchor is cyan[2], and the list of potential epitopes based on these anchor motifs:

```
Test.1    ktiifkVssQ gdpLivLhsq n--LefLycn LtkLfnstw
Test.2    kti--kkssQ gdpeivLhsQ ncggefLhcn stqffnstw
```

Protein	Seq. Pos.	Aln. Pos.	Sequence	Anchors
Test.1	6-14	6-14	KVSSQGDPL	.V.....L
Test.1	9-17	9-17	SQGDPLIVL	.Q.....L
Test.1	21-29	21-31	NLEFLYCNL	.L.....L
Test.1	24-32	26-34	FLYCNLTKL	.L.....L
Test.2	7-15	9-17	SQGDPEIVL	.Q.....L
Test.2	17-25	19-27	SQNCGGEFL	.Q.....L

I-B-4 Summary and future directions

We envision several applications for Motif Scan. It is particularly useful for the situations when a CTL response is partially characterized from an individual with a known HLA type, and already localized to a protein or protein region. The presence of HLA appropriate anchor residues could help focus the search for potential epitopes in known reactive protein regions. These anchor residues have to be considered with caution however, as anchor residues are frequently present in regions with no reactive epitopes, and there are many true epitopes that do not contain the anchor residue motifs. This simple tool is useful, however, as an initial indication for potential epitopes. Many external tools for HLA binding predictions are also available. These include methods based on "extended" motifs including secondary anchors and disfavored residues and statistical matrices representing the weight of every amino acid in every position [De Groot1997, Parker1995, Rammensee1997] and relatively new methods based on artificial neural networks (ANNs) [Buus2003, Milik1998, Schönbach2002], which, in contrast to motif based methods, are well suited to recognize complex nonlinear sequence-dependent correlated effects.

We are working on adding several more features to Motif Scan in the near future. One useful feature would be to identify all possible HLA motifs listed in our database for a peptide. Currently it is possible to do so by scanning the protein sequence for all HLA motifs. However the current output then contains results for both positive matches (those HLAs that have anchor residues in the query peptide) and negative ones (those HLAs that do not), and is a little cumbersome to navigate. We plan in the future to have a special field for this kind of search and have output showing only positive matches in a convenient form.

Motif Scan is useful not only for HIV sequences, but for any protein or DNA sequence; the only feature of the tool that is specifically tailored for HIV is the ready availability of predefined HIV sequences. We are in the process of adapting this tool for the hepatitis C database website (`http://hcv.lanl.gov/`), where we will link Motif Scan with the hepatitis C consensus sequences as the predefined sequences.

[2]For better visibility in print, the example shows the C-terminal anchors in a black box (X) and shows the other anchors in a gray box (X).

Human Monoclonal Antibodies that Neutralize HIV-1

Miroslaw K. Gorny[a], Susan Zolla-Pazner[a,b]

Abstract

The HIV Immunology Database provides continuously updated information on monoclonal antibodies (mAbs) against HIV-1 produced by various techniques, including cellular methods utilizing Epstein-Barr transformation, phage display technology, antigen stimulation of lymphoid cells *in vitro*, and preparation of hybridomas from cells of transgenic mice. In this review, particular attention is focused on those human mAbs that are able to inhibit the infectivity of HIV virions. These mAbs target several clusters of neutralizing epitopes in the HIV-1 envelope proteins, including V1, V2, V3, CD4bs, CD4i in gp120, and cluster I, cluster II, and a region adjacent to cluster II in gp41. Only five of the 174 mAbs listed here can be classified as broadly and potently neutralizing for HIV-1 primary isolates; these include mAbs 2G12, IgG1b12, and 447-52D (specific for gp120) and 2F5 and 4E10 (specific for gp41). Certain other monoclonal reagents are capable of broad neutralization as Fab fragments but not as IgG molecules. The existence of human mAbs with neutralizing activity against diverse HIV-1 isolates demonstrates the ability of the human immune response to recognize B cell epitopes on the HIV-1 envelope that are shared and that, when complexed with antibody, prevent virus infectivity. The paucity of such broadly neutralizing mAbs highlights the challenge faced by designers of HIV-1 vaccines: to design a vaccine that will induce that small proportion of antibodies with broad neutralizing activity.

I-C-1 Introduction

The HIV Immunology Database catalogues existing rodent and human monoclonal antibodies (mAbs) that are specific for various proteins of HIV-1. The human mAbs, which are reviewed herein, were produced by a variety of different techniques, although the two techniques that have given rise to the majority of useful mAbs are based on hybridoma and recombinant technologies. Both techniques have resulted in extremely valuable mAbs that have provided important information about the antigenic structure of neutralizing epitopes. Hybridoma techniques are based on the transformation of B cells from the cells of infected individuals [Gorny1989], and the mAbs derived from these cells represent antibodies that are part of the normal human B cell repertoire. In contrast, while the recombinant technology has several advantages over the cellular technology [Barbas1992], given the random recombination of heavy and light chains that takes place in vitro during this process, the resulting Fab fragments and IgG molecules may not actually represent antibodies that exist in human hosts [Huang2004].

The 174 mAbs summarized in this review are grouped on the basis of the epitopes that they recognize in gp120 and gp41. Among these mAbs and Fab fragments, 11 regions are recognized, however, only five human mAbs specific for four regions of gp120 and gp41 have been established as capable of broad and potent neutralization of HIV-1; these include mAbs 2G12, IgG1b12, and 447-52D (specific for various epitopes in gp120) and 2F5 and 4E10 (specific for gp41). Thus, while the existence of these latter mAbs demonstrates that the human immune system has the capacity to recognize shared neutralizing epitopes on the HIV-1 envelope glycoproteins, the paucity of broadly neutralizing mAbs highlights the limited immunogenicity and/or restricted availability of the regions in the native virions that are critical for virus infectivity.

Several phenomena may explain the rarity of functional antibodies against regions of the virus that are indispensable for its infectivity. These include, but are not limited to, the following: (a) the ability of the virus to continually vary its sequence in critical regions while maintaining function [Zolla-Pazner2004a];

(b) carbohydrate masking of critical epitopes [Back1994, Wei2003]; (c) conformational masking of receptor-binding sites [Kwong2002]; (d) poor immunogenicity of some neutralizing epitopes [Trkola1996b]; and (e) inaccessibility or transient exposure of neutralizing epitopes on the intact virus and on the virus as it binds to cell receptors.

Despite these phenomena, which form the basis for virus escape from the neutralizing potential of antibodies, the human humoral immune response is able to produce antibodies that neutralize HIV-1. The characterization of neutralizing epitopes recognized by human mAbs provides the basic data for the rational design of effective vaccine immunogens. In addition, the identification and characterization of neutralizing human mAbs may provide reagents for passive immunization to prevent infection, as in the setting of maternal-fetal transmission. These mAbs should also provide important information about mechanisms of virus neutralization, the antigenic structure of the virus, and the nature of the B-cell repertoire that can be tapped to provide protective humoral immune responses against the virus.

The characteristics of 174 human mAbs that target the envelope glycoproteins of HIV-1 are reviewed below. The epitopes within gp120 and gp41 that are recognized by these mAbs have been mapped and are catalogued in the HIV Immunology Database. For the convenience of the reader, we have linked the mAbs discussed in this review with each antibody's web page in the HIV Immunology Database (`http://www.hiv.lanl.gov/`).

I-C-2 Anti-V1 mAbs

No anti-V1 mAbs have been derived from the cells of infected humans. However, the HIV Immunology Database provides information on ten human anti-V1 mAbs (Table I-C.1) that were generated from transgenic mice carrying the genes coding for fully human IgGκ. These "xeno-mAbs" were derived from transgenic mice that had been immunized with native recombinant gp120 from HIV-1_{SF162}; the Ab-producing cells were selected with recombinant $gp120_{SF162}$ [He2002]. All of these anti-V1 xeno-mAbs display potent type-specific neutralizing activity against the autologous strain SF162 with 50% neutralizing doses (ND50) in the range of 0.3 to 4.5 µg/ml, as determined in a luciferase assay. Ten out of the 35 xeno-mAbs selected with $rgp20_{SF162}$ were specific for V1, suggesting that in this transgenic model, V1 is an immunodominant epitope [He2002]. The dearth of human anti-V1 mAbs derived from the cells of infected humans is probably related to the very high diversity of the V1 domain; this would render the selection of anti-V1 mAbs with heterologous gp120 reagents a difficult task. However, the lower immunogenicity of this region in the setting of natural infection cannot be excluded.

I-C-3 Anti-V2 mAbs

Anti-V2 antibodies have the capacity to neutralize HIV, but their activity is generally weak and their cross-reactivity is usually limited, suggesting that the antibodies with this specificity may have limited utility in mediating vaccine-induced, broad-based protection. The HIV Immunology Database contains a list of five anti-V2 human mAbs, two Fab fragments generated from HIV-infected individuals, and one xeno-mAb (Table I-C.2). The most thoroughly analyzed of the anti-V2 mAbs, mAb 697-D, could only weakly neutralize three of four primary isolates when a relatively high dose of mAb was used against a low virus input [Gorny1994]; this mAb displayed no neutralizing activity against four TCLA strains [Gorny1994, Nyambi1998]. mAb 697-D recognizes a conformational epitope, showing only weak reactivity with a V2 peptide; it binds weakly and only sporadically to intact virions from clades A, B and D [Nyambi2000]; similarly, other human anti-V2 mAbs, such as mAbs 830A, 1357, 1362 and 1393A, could bind to soluble gp120 but showed only weak and sporadic binding to virions of primary isolates, with the most frequent binding to B, C and D clades [Nyambi1998, Nyambi2000]. mAb 697-D could not inhibit the ability of gp120 to block the binding of MIP-1 beta to CCR5, suggesting that the V2 region does not block envelope/coreceptor interaction [Trkola1996a].

Two Fab fragments, L15 and L17, are specific for the V2 domain (Table I-C.2) and four Fab fragments, L25, L39, L40 and L78, are directed to complex epitopes that include the V2 loop and the CD4 binding site (CD4bs) (Table I-C.3) [Ditzel1995, Ditzel1997]. These latter Fab fragments were retrieved after epitope masking of gp120 with CD4bs Fab fragments during the screening stage. They were characterized by their V2 region-dependence, indicated by their sensitivity to amino acid changes in the V2 loop and by competition with murine anti-V2 mAbs. In addition, they are sensitive to amino acid changes usually associated with CD4 binding, and their binding to gp120 can be inhibited by soluble CD4. Among these several Fab molecules, only L25 and L78 mediate weak neutralization of T cell line-adapted (TCLA) viruses; neutralizing activity against primary isolates was not reported. The poor performance of these anti-V2 and anti-V2/CD4bs Fab fragments in neutralization assays does not exclude the possibility that, as whole IgG molecules, they could display neutralizing activity since Fab fragments usually display affinities that are lower by two to three orders of magnitude than intact IgG molecules. However, no studies of these

fragments as whole IgG molecules have been published, and the lack of potent neutralizing activity by anti-V2 IgG mAbs (see above) is not an encouraging indicator.

In summary, the information about anti-V1 and anti-V2 mAbs is incomplete because the number of mAbs, Fab fragments and xeno-mAbs is still relatively small. The results utilizing these mAbs suggest that anti-V1 mAbs are rather type-specific but can be quite potent, while anti-V2 are more broadly neutralizing but of low activity. A notable exception is the chimp mAb C108G, which is directed against a glycan-dependent epitope localized in V2 and was shown to neutralize primary HIV-1BaL isolate and TCLA strain IIIB [Vijh-Warrier1996].

I-C-4 Anti-V3 mAbs

Human antibodies directed to the V3 loop of gp120 constitute the major group of human mAbs in the database. There are currently 33 IgG mAbs, two Fab fragments generated from HIV-infected individuals, four xeno-mAbs produced by transgenic mice, and three IgM mAbs produced by in vitro stimulation of peripheral blood mononuclear cells (PBMC) with V3 peptides (Table I-C.4). These numbers reflect both the strong immunogenicity of the V3 region and the early interest in anti-V3 Abs generated when it was shown that they could neutralize TCLA virus strains [Rusche1988]; subsequent studies have documented the ability of anti-V3 antibodies to also neutralize primary isolates [Conley1994, Gorny2004, Gorny2002, Scott1990] and to mediate protection as demonstrated

in passive immunization experiments in various animal models [Andrus1998, Emini1992].

Many of the human anti-V3 mAbs were produced from cells of HIV-infected individuals who had been infected for several years; these were shown to neutralize TCLA and/or primary isolates [Gorny2004, Gorny1997, Gorny2002, Gorny1993, Moore1995, Scott1990]. In contrast, the IgG anti-V3 xeno-mAbs displayed neutralizing activity that appeared to be specific for the immunizing SF162 virus strain [He2002], while the IgM mAbs that were induced *in vitro* by antigenic stimulation of cells from HIV-uninfected individuals displayed no neutralizing activity [Ohlin1992]. These results suggest that the induction of broadly reactive and potent anti-V3 antibodies may require prolonged antigenic stimulation, resulting in mature and broadly reactive anti-V3 antibodies. This is consistent with the slow appearance of broadly reactive antibodies in the sera of infected individuals [Pilgrim1997], a factor that could have profound implications for the development of vaccine regimens.

Another important element in the generation of broadly reactive and potent human anti-V3 mAbs is the method used to select for cells producing the appropriate mAbs. Although the most broadly reactive of the neutralizing anti-V3 mAbs, 447-52D, was selected using a V3 peptide, the majority of mAbs selected with V3 peptides do not efficiently neutralize primary isolates [Gorny1993]. This is most probably due to the fact that peptides are highly flexible and may assume a myriad of conformations. Thus, most of the V3 mAbs selected with peptides are directed to structures which are irrelevant in the context of primary isolate infectivity; by chance, the structure of the $V3_{MN}$ peptide that captured mAb 447 bore a relevant conformation. In contrast, the use of a V3 fusion protein for mAb selection in which the V3 region retains a structure which approximates that of the native V3 loop [Kayman1994] resulted in the identification of mAbs that recognize conformation-sensitive V3 epitopes; the majority of these latter anti-V3 mAbs neutralize many primary isolates [Gorny2002]. Thus, within the repertoire of anti-V3 antibodies elicited in HIV-infected subjects, there are broadly reactive neutralizing antibodies, and these can be rescued if appropriate selection methods are employed.

The conformation-sensitive anti-V3 mAbs can neutralize primary isolates, and most can cross-neutralize a variety of isolates from clade B and, to a lesser extent, those from other clades [Gorny2004, Gorny2002]. The mAb 447-52D, though selected with a peptide, recognizes a conformational determinant [Gorny2002, Sharon2003, Stanfield2004], and it is the most broadly neutralizing of all the currently existing anti-V3 mAbs. This mAb interacts with the 14 residues at the crown of the V3 loop; its "core epitope" is defined by the sequence GPxR, a motif that is highly conserved among clade B viruses and which exists in a minority of other HIV subtypes [Gorny1992]. The presence and recognition of the arginine (R) residue in the core epitope is required for mAb 447-52D to exercise its activity [Zolla-Pazner2004b]), a fact that is explained by structural studies of this mAb in complex with a V3 peptide showing salt bridge and cation-pi interactions formed between the R residues in the core epitope and residues in the heavy chain of the mAb [Stanfield2004]. Other anti-V3 mAbs, such as mAbs 2182, 2191, 2219, 2412, 2442 and 2456 (Table I-C.4), do not recognize the same epitope as 447-52D, yet also display the ability to cross-neutralize primary isolates [Gorny2004, Gorny2002]. This cross-reactivity reveals the presence of features within the V3 loop which are conserved despite the sequence variation in this region. This structural conservation is also reflected in the role of the V3 loop in binding to the chemokine receptors which act as coreceptors for the virus [Cormier2002, Hill1997, Suphaphiphat2003, Trkola1996a].

I-C-5 Anti-CD4-binding site (CD4bs) mAbs

The HIV Immunology Database provides information about 30 anti-CD4bs human mAbs and 15 recombinant Fab fragments generated from PBMCs or bone marrow of HIV-1-infected individuals. In addition, there are six human anti-CD4bs mAbs listed which were produced from the cells of transgenic mice (Table I-C.5). Antibodies specific to the CD4bs inhibit the binding of sCD4 to gp120 and, as a consequence, interfere with virus attachment to the target cells. The CD4bs is made up of residues from C2, C3 and C4, conferring the conserved character of this domain and explaining the cross-reactivity of anti-CD4bs mAbs when tested for their ability to bind to gp120 molecules from viruses of diverse subtypes [Jeffs2001]. This immunochemical cross-reactivity is reflected in the ability of these mAbs to neutralize a broad array of TCLA strains; surprisingly, however, most anti-CD4bs mAbs cannot neutralize primary isolates [D'Souza1997, McDougal1996, Sullivan1995]. Since the CD4bs is a key feature of both TCLA and primary isolates, the selective neutralization of TCLA strains as opposed to primary isolates by most anti-CD4bs mAbs is surprising and still not fully explained. MAb IgG1b12 is a striking exception to the generalization that anti-CD4bs do not neutralize primary isolates [Burton1994]. Indeed, this mAb neutralized half of 90 primary isolates from diverse subtypes, and when tested against 30 primary isolates of subtype B, it neutralized 73% [Binley2004, Burton2004].

The differential activity of IgG1b12 vs. other anti-CD4bs mAbs has not been fully explained. It is possible that IgG1b12, which was produced using recombinant technology [Barbas1992], possesses a paratope that does not exist in na-

ture. There is, however, nothing notably unusual about the structure of this mAb [Saphire2001]. Other explanations for its broad and potent activity may lie in its unusual dependence on regions within the V2 domain in order for binding to occur. Thus, it was shown that the Fab fragment of b12, as opposed to that of other anti-CD4bs mAbs, has reduced binding activity to V2-deleted gp120, and that deletion of V2 from isolate SF162, but not of V1, diminished the neutralizing activity of IgG1b12 for this virus; this distinguished IgG1b12 from another anti-CD4bs mAb, 654-D, and from IgG-CD4 [Stamatatos1998]. Additional evidence that the IgG1b12 epitope includes a portion of V2 comes from data showing that escape mutants generated when JR-FL was cultured in the presence of IgG1b12 displayed two substitutions in V2 as well as one in C3 [Mo1997]. The specificity of IgG1b12 for the CD4bs and V2 is reminiscent of the "V2/CD4bs" Fab fragments described by Dietzl *et al.* [Ditzel1995, Ditzel1997] (see above); however, no primary isolate neutralizing activity has been described for these latter Fab fragments, nor have they been compared to IgG1b12 in any published experiments.

A notable feature of mAb IgG1b12 is its long CDR H3 region, consisting of 18 amino acids. The CDR H3 projects above the rest of the antigen-binding site of the mAb, fitting into the pocket of the CD4bs of gp120 [Saphire2001]. Interestingly, several other broadly reactive and potent neutralizing human mAbs, such as anti-V3 mAb447-52D (see above), anti-CD4i mAbX5 (see below) and anti-gp41 mAb 2F5 (see below), also have long CDR H3 regions consisting of 20 to 22 residues [Darbha2004, Kunert1998, Stanfield2004], a characteristic that is shared by many human anti-viral Abs [Stanfield2004].

I-C-6 Anti-CD4-induced (CD4i) epitopes

This is a small group of human mAbs (Table I-C.6) which binds to the gp120 bridging sheet, a beta-sheet consisting of four anti-parallel beta-strands contributed by the C4 region and the V1/V2 stem [Kwong1998].

Several anti-CD4i mAbs were derived by Epstein-Barr virus transformation of B cells from the PBMCs of HIV-infected subjects [Thali1991, Xiang2002], while Fab X5 was selected from a phage display library derived from an HIV-1 infected donor whose serum displayed strong neutralizing activity [Moulard2002]. The phage library was screened with gp120-CD4-CCR5 complexes which exposed the CD4i epitope. The X5 epitope is near the CD4bs and CCR5 binding site but does not overlap with them; its specificity is slightly different than the 17b epitope which reacts with the CCR5 binding site only [Darbha2004, Moulard2002]. Immunochemical analyses show that the CD4i epitope only becomes accessible after the binding of gp120 to CD4. For example, anti-CD4i mAbs have little or no ability to bind to gp120 in ELISA until the envelope protein is preincubated with sCD4, which, by definition, induces the conformational changes that expose the CD4-induced epitope.

Since the bridging sheet interacts with the chemokine receptors, the mechanism of neutralization of the anti-CD4i mAbs is thought to be through the inhibition of gp120 binding to CCR5 and CXCR4 [Trkola1996a]. However, the anti-CD4i mAbs display no neutralizing activity against primary isolates. Only the Fab or single chain forms of antibodies with specificity for the CD4i epitope display neutralizing activity [Labrijn2003]. Thus, the scFv and Fab fragments of mAbs 17b and 48d displayed more potent neutralizing activity against JR-CSF, JR-FL and ADA than did the intact IgG forms of these mAbs, and, similarly, the scFv and Fab fragments of X5 potently neutralized these viruses but lost this activity when converted into a whole IgG molecule [Labrijn2003]. These data suggest that the size of the neutralizing molecule is a critical factor, and models juxtaposing the gp120 molecule on the virus particle and the chemokine receptor on the surface of the target cell indicate that the bulk of an intact IgG molecule prevents its insertion between gp120 and the coreceptor [Dey2003, Labrijn2003, Moulard2002]. Thus, steric hindrance precludes the ability of anti-CD4i IgGs from effectively neutralizing virus infectivity. Nevertheless, the X5 Fab neutralizes primary isolates from clades A, B, C, D, E, F and G, and neutralizes R5, X4 and R5X4 isolates, showing the exceptionally conserved character of CD4i epitopes [Moulard2002].

I-C-7 Anti-carbohydrate mAbs

There is only one neutralizing human mAb, 2G12, which recognizes an epitope composed of carbohydrates (Table I-C.7); this mAb is specific for high-mannose and/or hybrid glycans at residues 295, 332 and 392 with peripheral glycans from 386 and 448 on either flank [Sanders2002, Scanlan2002]. These carbohydrate moieties are located on an exposed surface of the gp120 trimer that does not interact with CD4 or the chemokine receptors. Nonetheless, mAb 2G12 inhibits gp120 interaction with CCR5 as shown in MIP-1beta-CCR5 competition studies [Sanders2002, Trkola1996a]. These data led to the hypothesis that the neutralizing activity of mAb 2G12 is an indirect, steric effect manifested by a binding site that is physically close to the receptor-binding sites of gp120 [Scanlan2002]. mAb 2G12 potently neutralizes TCLA and was recently shown to neutralize 41% of primary isolates representing various subtypes [Binley2004, Burton2004, Scanlan2002, Trkola1996b].

Table I-C.6: Anti-CD4i mAbs

mAbs	Ab type	Neutralization	Reference
17b, 21c, 23e, 48d, 49e	mAb	TCLA	Thali1993, Xiang2002
X5	Fab	PI	Moulard2002

Table I-C.7: Anti-Carbohydrate mAbs

mAbs	Ab type	Neutralization	Reference
2G12	mAb	PI	Buchacher1994

Despite the standard cellular technique used in the generation of mAb 2G12 and the commonly employed approach for selection of the mAb by measuring binding to gp160 [Buchacher1994], mAb 2G12 is unique both in terms of structure as well as specificity. Recent crystallographic studies revealed that two Fabs of mAb 2G12 assemble into an interlocked VH domain-exchanged dimer forming an extended binding site which targets the aforementioned conserved cluster of oligomannose moieties on the surface of gp120 [Calarese2003].

The 2G12 epitope is poorly immunogenic as reflected by competitive binding assays that demonstrated that 2G12-like antibodies were absent from all of 16 sera from HIV-infected long-term survivors and AIDS patients [Trkola1996b]. These factors—the unusual structure of mAb 2G12, its unusual epitope, and the poor immunogenicity of this epitope—suggest that, despite the undeniable potency and breadth of activity of mAb 2G12, the probability of inducing similar Abs with a vaccine may be quite low.

I-C-8 Anti-gp41 mAbs

As shown in Table I-C.8, there are 28 human mAbs and 24 Fab fragments directed to the highly immunogenic regions of gp4 [Binley1996, Xu1991]. Twenty-four mAbs and Fab fragments are directed to the most immunodominant region, cluster I (aa 579–604), 19 mAbs and Fab fragments are specific for cluster II (aa 644–663), three are specific for an epitope adjacent to cluster II, and six Fab fragments are specific for cluster III (a conformational epitope involving aa 619–648). Only four out of these 52 mAbs and Fab fragments have documented neutralizing activity: mAbs 2F5, 4E10, clone 3 and Fab fragment Z13.

MAb 2F5 is one of the best studied of the human mAbs. It has broad and potent activity, neutralizing 67% of 90 isolates from various virus subtypes [Binley2004, Burton2004, Trkola1995]. The linear 2F5 epitope is located near the transmembrane domain at aa 662–667, a region which is adjacent to cluster II and is not well exposed on the virus or on virus-infected cells [Nyambi1998, Ofek2004, Sattentau1995]. Immunochemical data show that 2F5 reacts strongly with peptide C43 representing a portion of the C-heptad repeat region of gp41, while there is no reactivity with peptide N51, the N-heptad repeat region of gp41. While mAb 2F5 reacts with the N51:C43 complex, which forms a coiled-coil complex, it reacts with the complex less strongly than it does with C43 alone [deRosny2004, Gorny2000]. While this might suggest that 2F5 interferes with the formation of the gp41 coiled-coil, this was not borne out by recent studies [deRosny2004]. Thus, the mechanism of neutralization by mAb 2F5 is still unknown, although interference with the late fusion process has been suggested [deRosny2004].

MAb 4E10 and Fab Z13 are also specific for a region that is adjacent to cluster II. They recognize the same epitope, and both are specific for a predominantly linear and relatively conserved epitope at aa 671–677 that is proximal to that of 2F5 [Zwick2001]. mAbs 4E10 and Z13 neutralize primary isolates of diverse clades, including A, B, C, D and E [Zwick2001]. While mAb 4E10 is the most broadly neutralizing mAb currently described, it is less potent than the other well-described, broadly neutralizing mAbs [Binley2004, Burton2004, Zwick2001].

MAb clone 3 binds to a linear epitope between aa 597 and 606 at the C-terminal end of cluster I, the most immunodominant region of gp41 [Cotropia1996]. The epitope is quite conserved, a fact reflected by its ability to neutralize three diverse TCLA viruses from clade B and three primary isolates

Table I-C.8: Anti-gp41 mAbs

mAbs	Ab type	Neutralization	Reference
Cluster I*			
1B8	mAb	non-neutralizing	Banapour1987
86	mAb	non-neutralizing	Sugano1988

* Cluster I: aa 596–613; Cluster II: aa 644–663; Adjacent to Cluster II: aa 662–676; Cluster III: conformational epitope involving aa 619–648.

from group O [Cotropia1996, Ferrantelli2004]. Beyond the activity of clone 3 against these viruses, few details are known about its functional breadth. The clone 3 epitope overlaps with the epitope of mAbs 246 and 240 (aa 590–597 and 592–600, respectively). Interestingly, these latter mAbs bind to cluster I but have little or no neutralizing activity [Hioe1997] despite their ability to bind to intact virus particles [Nyambi1998].

As noted above, the mechanism(s) of neutralization of all four neutralizing anti-gp41 mAbs is still unknown. An indication that at least some anti-gp41 mAbs may interfere with virus/cell fusion was provided by studies of the fusion process at a suboptimal temperature (31.5°C), which prolongs the time during which fusion intermediates are exposed to mAbs [Golding2002]. These experiments showed that human mAbs against cluster II (mAbs 98-6, 1281 and 167-D) strongly inhibited fusion between HIV envelope-expressing effector cells and target cells expressing appropriate receptors [Golding2002].

I-C-9 Concluding remarks

Among the 174 human mAbs summarized in Tables I-C.1–I-C.8, only five mAbs (2G12, IgGb12, 447-52D, 2F5 and 4E10) and two Fab fragments (X5 and Z13) can be classified as broadly and potently neutralizing for HIV-1 primary isolates. Presently, the epitopes targeted by some of these mAbs do not appear to be practical targets for vaccine development due to their weak immunogenicity (2G12, 2F5) or their inaccessibility to antibody molecules (17b, X5, etc.). The CD4bs, which would appear to be an ideal target for neutralizing antibodies, induces antibodies which, for the most part, have little or no activity against primary isolates. And, while the epitopes recognized by neutralizing V3 mAbs are accessible and immunogenic, they induce a spectrum of antibodies ranging from narrowly to broadly cross-reactive, but the latter apparently require prolonged antigenic stimulation to emerge.

While the search for and design of effective immunogens continues, the most efficacious of the mAbs described to date may serve as beacons to illuminate the effort. Meanwhile, continuing work is needed, using new screening techniques, to identify neutralizing mAbs to additional classes of epitopes in order to provide the maximum number of viral determinants to target with a vaccine.

Part II

HIV CTL Epitopes

II-A

Summary

Part II includes tables, maps, and associated references of HIV-specific CTL epitopes arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, and each entry represents a single publication in this part of the database. For more recent updates and useful searching capabilities, please see our web site: `http://www.hiv.lanl.gov/content/immunology`. For a concise listing of the best defined CTL epitopes, see the summary by Nicole Frahm, Christian Brander and Philip Goulder on page 3 in Part I of this compendium. CTL protein reactions with no well-defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T-cell and helper T-cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T-cells responding to antigenic stimulus. When adding the most recent studies, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

II-A-1 CTL epitope tables

Each CTL reference has a multi-part basic entry:

HXB2 Location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2, rather the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: `http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html`.

Author Location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope Sequence: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Immunogen: The original stimulus of the CTL response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted on a separate line, and additional information about the vaccine antigen is provided as available.

Species(HLA): The species responding and HLA or MHC specificity of the epitope.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the printed version to help identify entries of particular interest.

Following the entry for a given CTL epitope are brief comments explaining the context in which the epitope was studied and what was learned about the epitope in a given study.

II-A-2 HIV protein epitope maps

All HIV CTL epitopes mapped to within a region of 21 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of CTL epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

II-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the CTL epitope search tool at `http://www.hiv.lanl.gov/content/immunology`. All epitopes are aligned to the HXB2 sequence, with the sequence used to define the epitope indicated directly above it. Sequences are sorted by their subtype and country of origin.

The master alignment files from which the epitope alignments were created are available at our web site (`http://www.hiv.lanl.gov/ALIGN_CURRENT/ALIGN-INDEX.html`). The alignments were modified in some cases to optimize the alignment relative to the defined epitope and minimize insertions and deletions; epitope alignments are generated by anchoring on the C-terminal residue. A dash indicates identity to the consensus sequence, and a period indicates an insertion made to maintain the alignment. Stop codons are indicated with a `$`, and frameshifts by a `#`, or ambiguous codons (nucleotide was `r`, `y`, or `n`) by an `x`; they are inserted to maintain the alignments. In consensus sequences an upper case letter indicates the amino acid was present in all sequences, a lower case letter indicates the amino acid was present in most sequences in a given position, and a question mark indicates two or more amino acids were represented with equal frequency.

II-B

HIV CTL Epitope Tables

All HIV CTL epitopes arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location and finally by HLA presenting molecule. CTL reactions against proteins with undefined epitopes are listed at the end of the protein that stimulated the response.

II-B-1 p17 CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p17 (11–19)		GELDRWEKI	HIV-1 infection	human (B*4002)	Sabbaj2002b
	Keywords HAART. **Epitope name** Gag-GI9. **Donor HLA** A*0201 A*0217 B*0801 B*4002 Cw*0303 Cw*070. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • This epitope was newly defined in this study. • Patient 01RCH46 was Hispanic, on HAART, and had a viral load of 21000 and CD4 count of 623 – she also recognized KETINEEAA p24(70-78), HLA B*4002, and TAFTIPSI, RT(128-135), HLA A*0217. • Among HIV+ individuals who carried HLA B40, 2/5 (40%) recognized this epitope.			
p17 (11–19)	p17 (11–19)	GELDRWEKI	HIV-1 infection	human (B*4002)	Frahm2004
p17 (11–30)	Gag (11–30)	GELDRWEKIRLRPGGKKKYK	HIV-1 infection	human (B62)	Musey2003
	Keywords genital and mucosal immunity. **Assay type** Chromium-release assay. **Donor HLA** A2, A32, B27, B62. • CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments. • CD8+ T cell clones directed at this epitope were derived from blood and semen.			
p17 (16–30)	p17 (16–30 HXB2)	WEKIRLRPGGKKKYK	HIV-1 infection	human	Addo2003
	Keywords immunodominance, early treatment. **Assay type** T-cell Elispot.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p17 (18–26)	p17 (18–26 IIIB) • C. Brander notes that this is an A*0301 epitope.	KIRLRPGGK		human (A*0301)	Frahm2004
p17 (18–26)	p17 (18–26 SF2) • HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • The reactive peptide p17 gag WEKIRLRPGGKKKYK contained two A*0301-restricted epitopes, KIRLRPGGK and RLRPGGKKK A*0301.	KIRLRPGGK	HIV-1 infection	human (A*0301)	Altfeld2001a
p17 (18–26)	p17 (18–26 IIIB) **Keywords** responses in children, mother-to-infant transmission, escape. • Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study. • KIRLRPGGR and RIRLRPGGR, naturally occurring variants, were found in mother, and are escape mutants.	KIRLRPGGK	HIV-1 infection	human (A3)	Wilson1996
p17 (18–26)	p17 (18–26) **Keywords** dendritic cells. • This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses. • Strong CTL responses were elicited by the epitopes DRFYKTLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA. • A weak response to KLTPLCVSL was stimulated using macrophages as the APC. • No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.	KIRLRPGGK	in vitro stimulation or selectio	human (A3)	Zarling1999
p17 (18–26)	Gag (18–26) • The ability of CTL effector cells was studied by expanding autologous HIV-1 Gag-specific CTL *in vitro*, and adoptive transfer. • The transferred CTLs migrated to the lymph nodes and transiently reduced circulating productively-infected CD4+ T cells, showing that CTL move to appropriate target sites and mediate anti-viral effects.	KIRLRPGGK	HIV-1 infection	human (A3)	Brodie1999
p17 (18–26)	(18–26) • Study tracks and quantifies *in vivo* migration of neo-marked CD8 HIV-specific CTL. • Adoptively transferred gene-marked HIV-specific CTL homed to specific lymph node sites, colocalizing within the parafollicular regions of the lymph node adjacent to cells expressing HIV tat-fusion transcripts, indicative of viral replication. • The CTL clones expressed CCR5 and localized among HIV-1 infected cells expressing MIP-1alpha and MIP-1beta, CC-chemokines produced at sites of viral replication, suggesting a possible homing mechanism.	KIRLRPGGK	HIV-1 infection	human (A3)	Brodie2000

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This study provides a methodology for tracking and studying antigen specific CTL *in vivo*				
p17 (18–26)	p17 (18–26 IIIB)	KIRLRPGGK	HIV-1 infection	transgenic mouse (A3)	Wilson1999a
	Keywords responses in children, mother-to-infant transmission, escape. • This study describes maternal CTL responses in the context of mother-to-infant transmission. • Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants. • KIRLRPGGR and RIRLRPGGR were escape mutants. • This epitope was recognized and many escape mutants were detected in an HLA A3 transmitting mother, and was recognized but invariant in an HLA A3 non-transmitting mother.				
p17 (18–26)	p17 (18–26 IIIB)	KIRLRPGGK	HIV-1 infection	human (A3)	Goulder1997e, Goulder1997a
	Keywords review, escape. • Identical twin hemophiliac brothers were both infected with the same batch of factor VIII. One had a response to this epitope, the other did not. [Goulder1997e] is a review of immune escape that summarizes this study.				
p17 (18–26)	p17 (subtype B)	KIRLRPGGK	HIV-1 exposed seronegative	human (A3)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses. • Low risk individuals did not have such CD8+ cells. • CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
p17 (18–26)	p17 (SF2)	KIRLRPGGK	HIV-1 infection	human (A3)	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • WEKIRLRPGGKKKYKLK was the target of the dominant response in Caucasoids (38%) more frequently than non-Caucasoids (12%) – 7/10 that had a dominant response to this epitope were A3, and 5/7 targeted RLRPGGKKK while 2/7 targeted KIRLRPGGK. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
p17 (18–26)	p17	KIRLRPGGK	HIV-1 infection	human (A3)	Seth2001
	Keywords HAART. • CTL responses were studied by tetramer staining in 41 patients with combination therapy – activated CD8+ T-cells decline as the viral load drops in response to therapy, but the overall level of antigen-specific cells capable of differentiating into effectors stays constant and new epitopes may be recognized.				
p17 (18–26)	p17 (18–26 SF2)	KIRLRPGGK	HIV-1 infection	human (A3)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-A3+ individuals that had a CTL response to this epitope broken down by group: 3/7 group 1, 0/4 group 2, and 2/2 group 3.				
p17 (18–26)	p17 (18–26)	KIRLRPGGK	HIV-1 infection, HIV-1 exposed seronegative	human (A3)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • KIRLRPGGK is cross-reactive for A, B, and D clades. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
p17 (18–26)	p17 (JRCSF)	KIRLRPGGK	HIV-1 infection	human (A3)	Severino2000
	• Primary HLA-A3+ CD4+ and HLA-mismatched lymphocytes from uninfected donors were infected with JRCSF after isolation then cocultured with the A3-restricted CTL clone 11504/A7 specific for KIRLRPGGK, and viral inhibition was MHC-restricted. • Primary monocytes and monocyte-derived DC were generated from the same donors, replication of HIV-1 in these cell types was less efficient than in lymphocytes and could also be inhibited by MHC-restricted CTL. • DC-lymphocyte cluster cultures allowed vigorous viral replication and MHC-restricted CTL viral inhibition was blunted or lost depending on the ratio of DC to CD4+ lymphocyte in the culture.				
p17 (18–26)	p17 (18–26)	KIRLRPGGK	HIV-1 infection	human (A3)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • All patients recognized at least 1 A3 epitope, up to 8 A3 epitopes, but none was clearly dominant.				
p17 (18–26)	p17	KIRLRPGGK	HIV-1 infection	human (A3)	Ostrowski2000
	Keywords dendritic cells. • The role of CD4+ T-cell help in expansion of virus-specific memory CTL was studied through co-culture *ex vivo* • Optimal expansion of HIV-1-specific memory CTL depended on CD4+ T cell help in 9 of 10 patients – CD40 ligand trimer (CD40LT) could enhance CTL in the absence of CD4+ T cell help to a variable degree in most of patients. • Those CTL that didn't respond to CD40LT could expand with IL2 present, and IL15 produced by dendritic cells also contributes. • The T-helper epitope used for CD4+ T cell stimulation was the universal tetanus helper epitope TET830-843 (QYIKANSKFIGITE)				
p17 (18–26)	Gag (p17) (18–26)	KIRLRPGGK	HIV-1 infection	human (A3)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute infection. **Epitope name** A3-KK9. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06 was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 8/14 HLA-A3 positive individuals had detectable A3-restricted responses during acute infection. Only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 7/8 individuals with acute responses had specific responses for this epitope.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• KIRLRPGGK and RLRPGGKKK were the most commonly recognized HLA-A3 epitopes during acute infection, after 1 year of treatment, and after STI. RLRPGGKKK was immunodominant.				
p17 (18–26)	p17 (18–26)	KIRLRPGGK	HIV-1 infection	human (A3, A3.1, B27)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p17 (18–26)		KIRLRPGGK	HIV-1 infection	human (B*0301)	Wilson2000a
	Keywords acute infection. • Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found. • All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39. • ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK. • The subject with A*0201 had a moderately strong response to SLYNTVATL. • Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705. • No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

p17 (20–28)	Gag (p17) (20–28)	RLRPGGKKK	HIV-1 infection	human (A3)	Yu2002a

Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute infection.
Epitope name A3-RK9.
Donor HLA A3, B7, Cw7.

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06 was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 8/14 HLA-A3 positive individuals had detectable A3-restricted responses during acute infection. Only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 7/8 individuals with acute responses had specific responses for this epitope.
- KIRLRPGGK and RLRPGGKKK were the most commonly recognized HLA-A3 epitopes during acute infection, after 1 year of treatment, and after STI. RLRPGGKKK was immunodominant during acute infection and throughout the study period in the 5/6 individuals who targeted it.

p17 (20–28)	Gag (LAI)	RLRPGGKKK	HIV-1 infection	human (A3)	Lewinsohn2002

Keywords class I down-regulation by Nef.

- CTL kill targets through releasing perforin, that forms pore in the plasma membrane, and granzymes, that induce apoptosis.
- Vpr is capable of arresting infected cells in the G2 phase, and it was hypothesized that Vpr may inhibit CTL-mediated apoptosis because it interacts with the granzyme B molecular complex.
- Vpr expression in the target cell did not inhibit epitope specific lysis – neither perforin or granzyme mediated events were inhibited, as measured by a Chromium release assay and a TUNEL assay.
- In contrast, deletion of Nef, which is thought to protect primary HIV infected cells by down-regulating cell-surface expression of MHC class I complexes, increased the susceptibility of HIV-1 infected cells to CTL mediated killing 2-fold using the TUNEL assay.

p17 (20–28)	p17	RLRPGGKKK	HIV-1 infection	human (A3)	Sabbaj2002a

Keywords mother-to-infant transmission.
Donor HLA A3, A11, B35, B51.

- IFNgamma T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release.
- T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFNgamma after stimulation with a peptide that carries known A3 epitope RLRPGGKKK.
- The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.

p17 (20–28)	p17 (20–28)	RLRPGGKKK	HIV-1 infection	human (A3)	Cao2003

Keywords acute infection, early-expressed proteins.
Assay type CD8 T-cell Elispot - IFNγ.
Donor HLA A*0201, A3, B44, B57, Cw5, Cw6; A1, A3, B7, B14, Cw*0702, Cw*0802; A1, A3, B8, B35; A1, A3, B8, B62, Cw3, Cw7.

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This epitope was recognized in four individuals during early infection, each time presented by A3. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

p17 (28–36)	Gag (p17) **Keywords** supervised treatment interruptions (STI), acute infection. **Epitope name** KW9. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2, A24 B38, B60, Cw2, Cw12.	KYKLKHIVW	HIV-1 infection	human (A24)	Montefiori2003

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-1+ patient AC10 underwent early HAART treatment, which was discontiuned 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.				
p17 (28–36)	p17 (728–736 subtype A)	KYRLKHLVW	HIV-1 infection, HIV-1 exposed seronegative	human (Cw4)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-Cw4 women, 2/2 HEPS and 7/11 HIV-1 infected women recognized this epitope. • The dominant response to this HLA allele was to this epitope in both of the 2/2 HEPS cases and in 3 of the 7/11 HIV-1 infected women.				
p17 (28–36)	p17 (28–36)	KYRLKHLVW	HIV-1 infection	human (Cw4)	Appay2000
	• This epitope is newly defined in this study. • Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV. • HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation. • In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α				
p17 (36–44)	p17 (SF2)	WASRELERF	HIV-1 infection	human	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • The dominant response in an African American who was HLA A3/33 B35/B53 Cw4/7 was to this epitope, although the restricting element was not determined – this epitope fell outside the most recognized peptides in the study. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
p17 (36–44)	p17 (35–43 LAI)	WASRELERF	HIV-1 infection	human (B*3501)	Goulder1997d
	• Optimal epitope defined from within p17(30-44), LKHIVWASRELERFA. • Dominant CTL response in an HIV+ asymptomatic donor was to this epitope. • The Phe in the C-term anchor is distinct from the previously-defined Tyr for B*3501 C-term anchors.				
p17 (36–44)	p17 (36–44 LAI)	WASRELERF		human (B*3501)	Frahm2004, Goulder1997b
	• C. Brander notes this is a B*3501 epitope.

p17 (71–79)	p17	GSEELRSLY	HIV-1 infection	human (A1)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** GSE. • Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI). • STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
p17 (71–85)	p17 (71–85 SF2)	GSEELRSLYNTVATL	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Twelve subjects had CTL that could recognize vaccinia-expressed LAI gag. • One of these 12 had CTL response to this peptide. • The responding subject was HLA-A1, A11, B8, B27.				
p17 (71–85)	p17 (71–85 HXB2)	GSEELRSLYNTVATL	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p17 (71–90)	Gag (HXB2)	GSEELRSLYNTVATLYCVHQ	HIV-1 infection	human	Chitnis2003
	Keywords assay standardization, HAART. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2. • 17 perinatally HIV-1 infected children (0.08-16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• In 10/14 children, addition of exogenous IL-15 induced increased frequencies of SFCs to the Gag peptide. IL-2 and IL-7 did not increase SFCs, however IL-2, IL-7 and IL 15 could all increase the intensity of the spots in some patients. In 4 children, IL-15 addition brought the SFC response up to the level of detection.

	• Review of the impact of CTL on viral immunity and escape that notes that SLYNTVATL-tetramer binding cells in individuals that react to this epitope inversely correlate with plasma viral load.				
p17 (77–85)	(SF2, HXBc2/Bal chimeric) **Keywords** rate of progression, escape. **Epitope name** SL9. • Seven HIV-positive subjects tended to make their strongest CD8+ T-cell response against Gag; these responses had varying breadth and magnitude that were unrelated to disease progression. • Patient TX7 primarily recognized SL9 during a three year study period and used six T-cell clonotypes for this recognition. • SLYNTVATL was the only form of the epitope found initially, but three alternate forms eventually appeared: SLYNTVAVL, SLYNTIATL, and most commonly SLYNTIAVL. These distinct forms bind A2, but have distinct abilities to stimulate different T-cell clonotypes. • In subject TX7, the observed mutations of SL9 failed to escape overall CTL recognition, presumably because the six T-cell clonotypes allowed a more flexible response. • The BV17 T-cell clone recognized SL9 but not SLYNTIAVL, and BV17 became undetectable at week 20 when SLYNTIAVL predominated. Subsequently BV17 became the second most common clone. Thus the relative frequency of of the T-cell clonotypes varied with respect to each other and to epitope variation.	SLYNTVATL	HIV-1 infection		Douek2002
p17 (77–85)	Gag p17 (77–85 LAI) **Keywords** HAART, responses in children. **Donor HLA** A*0201. • Longitudinal study of 8 infants with prolonged viral suppression due to combination antiretroviral therapy showed no HIV-1 specific CTL responses in peripheral blood cells. 6/8 were studied using a Chromium release assay and no response was detected using Gag expressed in vaccinia in the target cells. Three HLA-A*0201 children were tested using SLYNTVATL or ILKEPVHGV HLA A*0201 tetramers and again no HIV-specific response was detected, either using PBMC specimens, or PBMC which had been stimulated *in vitro* for a week. • In contrast, one of the children with therapy suppressed HIV viral replication who was co-infected with HIV and EBV, while HIV-tetramer negative, had EBV-tetramer staining cells at a frequency of 0.14% in the PBMC.	SLYNTVATL	HIV-1 infection	human	Luzuriaga2000
p17 (77–85)	p17 (77–85) **Keywords** HAART. • The single cell ELISPOT assay was optimized and highly specific, and found to work well even after the primary cells had been frozen and thawed. • Increases in gamma IFN producing cells were observed in response to anti-retroviral therapy using single cell IFN-gamma-production ELISPOT. • 4/8 A*02 subjects had a positive response to this epitope indicating that it is a major epitope for CD8+ gamma IFN production. • In 3/3 HLA A*02, B*27 individuals, the dominant response in gag measured by both gamma IFN production and T cell lysis was a B27 epitope, p24(263-272), not the A2 SLYNTVATL epitope.	SLYNTVATL	HIV-1 infection	human (A*02)	Huang2000
p17 (77–85)	p17 (77–85) **Keywords** HAART. **Epitope name** SL9. • Administration of triple-drug antiretroviral therapy (IDV, 3TC and ZDV) sometimes showed a transient increase and other times failed to increase CTL responses in patients with advanced HIV disease, but there is a stable population of tetramer stained HIV-specific CD8+ CD45RO+ cells that can persist after therapy and long periods of virus being below the level of detection.	SLYNTVATL	HIV-1 infection	human (A*02)	Rinaldo2000

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p17 (77–85)	p17	SLYNTVATL	HIV-1 infection	human (A*02)	Scott-Algara2001

Keywords HAART, immunodominance.
Epitope name SL9.
- This study examined with CTL response in HLA A*02+ children by tetramer staining for HLA-A2 immunodominant epitopes SLYNTVATL and ILKEPVHGV.
- 71% of the 28 HIV-1 infected HLA-A*02 positive children recognized both epitopes, with cells from 26 children stained positive by the gag tetramer (SLYNTVATL) and 21 children by the pol tetramer (ILKEPVHGV)
- There were no differences observed in children that had therapy versus those that did not.
- Tetramer-binding cells were memory activated CD28-, CD45RO+, CD45RA- HLADR+, CD69-, CD8+ T-cells.

p17 (77–85)	p17 (77–85 HXB2)	SLYNTVATL	HIV-1 infection	human (A*0201)	Brander1999

Keywords epitope processing, immunodominance, escape.
Epitope name SL9.
- Multiple natural variations in the SL9 flanking regions of the immunodominant epitope SLYNTVATL were tested and found not to adversely affect CTL recognition or prevent epitope processing, suggesting that viral escape from the HLA-A*0201-restricted CTL response against SLYNTVATL is probably not linked to variations in the flanking regions of this epitope.
- The substitution Y79F was an escape mutation in that it interfered with CTL recognition by one CTL clone from an A*0201 infected individual, clone 13010.B17, but it was still recognized by another CTL clone, 115.D4.

p17 (77–85)	p17	SLYNTVATL	HIV-1 infection	human (A*0201)	Wilson2000a

Keywords acute infection.
- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

p17 (77–85)	Gag	SLYNTVATL	HIV-1 infection	human (A*0201)	Tan1999

- Adoptive transfer of two autologous *in vitro*-expanded CTL clones against the A*0201 restricted epitopes SLYNTVATL and VIYQYMDDL were infused into a patient – they were well tolerated, but the SLYNTVATL clone was shown by tetramer staining to be rapidly eliminated through apoptosis, and the treatment had no impact upon viral load and CD4 and CD8 cell counts.

p17 (77–85)	p17 (77–85)	SLYNTVATL	HIV-1 infection	human (A*0201)	Betts2000

Keywords immunodominance.
- Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.
- 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes.
- Individuals that did not respond to SLYNTVATL recognized other HIV epitopes, and 2/4 SLYNTVATL responders had stronger responses to epitopes restricted by other class I alleles.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• SLYNTVATL was the only response detected in a one individual that was HLA A*0201, B44, B70.				
p17 (77–85)	p17 (77–85) **Keywords** HAART. **Epitope name** SL9. • CTL effector levels were measured after potent ARV therapy using HLA-tetramer complexes for the A*0201 epitopes SLYNTVATL and ILKEPVHGV in seven patients, and the B*3501 epitope DPNPQEVVL in one additional patient. • Levels of CTL effectors typically decline for 5-7 days and then rebound, fluctuating during the first two weeks of therapy. • After the early fluctuation, there was a steady exponential decay with a median half-life of 45 days.	SLYNTVATL	HIV-1 infection	human (A*0201)	Ogg1999
p17 (77–85)	p17 (77–85) **Epitope name** SL9. • This paper introduces the tetramer methodology which permits quantification of specific CTL based on expression of specific TCRs – HLA-A2 tetramers were prepared that can stain CTL lines specific for ILKEPVHGV and SLYNTVATL, and quantitate HIV-specific CD8+ cell lines in freshly isolated PBMCs. • Three patients only stained the Gag epitope SLYNTVATL, one patient had the highest frequency of tetramer staining to the Pol epitope (0.77%), less to the Gag epitope (0.28%)	SLYNTVATL	HIV-1 infection	human (A*0201)	Altman1996
p17 (77–85)	Gag **Keywords** HAART. • Administration of highly active antiretroviral therapy (HAART) reduced CD8+ cell frequency, and the CD8+ cells detected by tetramer staining were likely to be memory cells, indicating that persistently replicating viral populations are needed to maintain high frequencies of HIV-1 specific CTL.	SLYNTVATL	HIV-1 infection	human (A*0201)	Gray1999
p17 (77–85)	p17 (77–85 SF2) **Keywords** inter-clade comparisons. **Epitope name** SL9. • CTL from a patient infected with clade B virus did not recognize the clade A analog of this epitope.	SLYNTVATL	HIV-1 infection	human (A*0201)	McAdam1998
p17 (77–85)	p17 (77–85) **Keywords** TCR usage. **Epitope name** SL9. • HIV+ individuals were followed longitudinally using MHC tetramers in combination with 14 anti-BV chain MAbs, and clonal expansion of HIV-specific T cells was followed *in vivo*. • Seven HIV+ people were studied, and all showed expansions of particular TCR BV clones, often several, relative to uninfected controls. • Three patients were followed in detail, TCR VB expansions persisted for 2 to 3 years, with occasional transient increases. • An A2-Gag specific line from one patient was found to be BV8, and at its highest level represented 17.5% of the patient's CD8+ T cells.	SLYNTVATL	HIV-1 infection	human (A*0201)	Wilson1998a
p17 (77–85)	p17 (77–85) **Epitope name** SL9. • HLA-tetrameric complexes were used in a cross-sectional study of 14 untreated HLA A*0201 positive individuals, revealing an inverse relationship between HIV Gag and Pol specific CTL effector cells (CTLe) and viral load. • Inclusion of both the p17 SLYNTVATL and RT ILKEPVHGV epitopes gives a good representation of HLA A*0201-restricted activity. • No correlation was observed between the CTLe and CD4 count or clearance rate of productively infected cells.	SLYNTVATL	HIV-1 infection	human (A*0201)	Ogg1998b

	Keywords dendritic cells.				
	• Recombinant canarypox virus vector containing HIV-1 sequences, upon infection of mature dendritic cells, can trigger specific lysis through *in vitro* by T-cells from HIV-1 infected individuals at levels comparable to the response seen to HIV carried in vaccinia vectors.				
	• Recombinant canarypox virus vector containing HIV-1 sequences can also stimulate HIV-specific CD4+ helper T-cell responses.				
p17 (77–85)	p17 (77–85 LAI)	SLYNTVATL	HIV-1 infection	human (A*0201)	Mollet2000
	Keywords HAART.				
	Epitope name G3.				
	• A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using tetramer staining or CD8+ cell IFNgamma production to measure responses.				
	• In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.				
	• Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.				
p17 (77–85)	Gag	SLYNTVATL	HIV-1 infection	human (A*0201)	Gea-Banacloche2000
	• In a study including many long-term non-progressors, no correlation between plasma virus levels and number of HIV-specific CD8+ T-cells was found.				
	• High frequencies of circulating CD8+ T-cells were HIV-1 specific, and the majority of these responses were to gag-pol gene products.				
	• 4/21 subjects were HLA-(A*0201), and of these only 2 subjects (patient 3 and 19) tested positive to this epitope.				
p17 (77–85)	p17 (77–85 SF2)	SLYNTVATL	HIV-1 infection	human (A*0201)	Propato2001
	Keywords supertype, rate of progression.				
	• Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.				
	• Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.				
	• A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.				
	• Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific sells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

p17 (77–85)	p17 (77–85)	SLYNTVATL	computer prediction	(A*0201)	Schönbach2002

Keywords inter-clade comparisons, computational epitope prediction, vaccine-specific epitope characteristics, escape.

- Computational methods (artificial neural networks (ANN), hidden Markov models (HMM), binding matrices based on HLA association rates BIMAS) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.
- The SLYNTVATL epitope received focused discussion. SLYNTVATL, slFntvatl, slyntvaVl, and slyntIaVl are all recognized variants, ANN predicts all four variants would be recognized, while BIMAS only predicts SLYNTVATL and slFntvatl would be recognized. However, [Sewell1997] suggested certain substitutions may be antagonistic, including slFntvatl, and vaccines do not stimulate SLYNTVATL responses as well as natural infections. The authors note these kinds of issues complicate the application of computational predictions of epitopes to vaccine design.

p17 (77–85)	Gag (76–84)	SLYNTVATL	Vaccine	mouse (A*0201)	Singh2002, Sykes1999

Vaccine *Vector/Type:* DNA *HIV component:* HIV-1

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance.

- C3H (H-2k) transgenic mice carrying a fused HLA-A*0201 alpha1 and alpha2 and H-2Dk alpha3 hybrid class I molecule were immunized using an epidermal gene gun with an ubiquitin expression library of 32 plasmids that spanned the HIV-1 genome. Ubiquitin targets the expressed HIV-1 peptides to the proteasome.
- A single immunization with the UB-HIV-1 library vaccine induced potent, stable and multivalent CTL responses against all library members.
- Immunodominant epitopes SLYNTVATL (Gag), ILKEPVHGV(Pol), RIQRGPGRAFVTIGK(P18) and AFHHVAREK (Nef) elicited strong CD8+/IFN- responses and stimulated CTL that were functional in a Cr-release assay and against wild type antigen.
- The presence of multiple plasmids HLA-A*0201-restricted CTL epitopes did not decrease CTL immunogenicity, and CTL responses to single peptide immunizations were comparable to responses based on mixtures of either 16 or 32 peptides.

p17 (77–85)		SLYNTVATL	HIV-1 infection	human (A*0201)	Imami2002b

Keywords rate of progression, Th1, Th2.

Donor HLA A0202/2501, B1801/62, C10/1203, DRB1 1501, DQB1 8.

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. Long term non-progressors had much strong Th responses, particularly to p24 peptides, and they tended to be balanced between Th1, IL-2 producing and Th2, IL-4 producing responses.
- One of the immunologically discordant progressors became symptomatic during the course of the study, and he had a rapid drop in proliferative response to all antigens and also a shift from a Th1 to a Th2 response. To find out if the CD8 response also shifted in cytokine production, the CD8+ T-cell response to SLYNTVATL in this patient was also tested. It to was found to shift, from IFNgamma to IL-4 producing in Elispot, and using a bioassay of indicator lines, from IL-2 to IL-4 production.

p17 (77–85)	Gag p17 (77–85)	SLYNTVATL	HIV-1 infection	human (A*0201)	Cao2003

Keywords binding affinity, acute infection, early-expressed proteins.

Assay type CD8 T-cell Elispot - IFNγ.

Donor HLA A*0201, A11, B51, B61, Cw2, Cw14.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- Only 1/10 HLA A*02 carrying individuals in this study recognized SLYNTVATL.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.				
p17 (77–85)		SLYNTVATL	HIV-1 infection	human (A*0201)	Dagarag2003
	Assay type cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay. • Telomer length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescense. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytolysis, and may have therapeutic potential. • Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope.				
p17 (77–85)	p17 (77–85)	SLYNTVATL	Vaccine	mouse (A*0201)	Okazaki2003
	Vaccine *Vector/Type:* peptide *HIV component:* p24 Gag **Keywords** binding affinity, vaccine-induced epitopes. **Assay type** cytokine production, Chromium-release assay. **Donor HLA** A2.1. • Alanine substitutions of VIYQYMDDL were tested for importance of each amino acid for HLA-A2.1 binding. Peptide variant (vLyqymddV) showed an 8 fold higher MHC binding affinity than wild type. YLyqymddV had an even higher binding affinity, but the Y at positions one blocked TCR recognition. The higher affinity form of vLyqymddV induced CTL *in vivo* that could protect against a vaccinia virus expressing RT and the wild type epitope. • SLYNTVATL was included as a control.				
p17 (77–85)	Gag (77–85)	SLYNTVATL	HIV-1 infection	human (A*0201)	Shacklett2003
	Keywords genital and mucosal immunity. **Epitope name** SL9. **Assay type** Tetramer binding. • Lymphocytes from rectal biopsies were used to characterize the CD8+ T cell response to HIV in GALT, Gut-associated lymphoid tissues. Patients were selected on the basis of being HLA-A2+ and having detectable SLYNTVATL and ILKEPVHGV tetramer responses in PBMC. SLYNTVATL frequency was increased in GALT relative to PBMC in 6/7 patients studied, while a control response to a CMV-peptide was diminished in GALT. Only two patients had ILKEPVHGV CD8+ T cell responses, and both had slightly higher frequencies in GALT than PBMC. • HIV may perturb lymphocyte retention in GALT, suggested by an overall reduction of GALT CD8+ cells expressing alphaEbeta7. GALT HIV-specific CD8+ T cells expressed alphaEbeta7, suggesting mucosal priming.

	Keywords inter-clade comparisons.				
	• More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.				
	• 2/4 tested FSWs recognized the E clade version of this epitope, SLYNTIATL, the B clade version is SLYNTVATL.				
	• This epitope was only conserved in CRF01 and subtypes B and D, and exact matches were uncommon.				
p17 (77–85)	p17 (77–85)	SLYNTVATL	HIV-1 infection	human (A2)	Day2001
	Keywords rate of progression, acute infection.				
	• The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)				
	• 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.				
	• SLYNTVATL was the dominant A2 epitope recognized in patients with chronic infection, except for Subject 11841 who recognized 5/8 epitopes.				
	• Three subjects had an A2 response only to SLYNTVATL.				
	• The two subjects with acute infection did not respond to SLYNTVATL.				
p17 (77–85)	p17 (77–85)	SLYNTVATL	HIV-1 infection	human (A2)	Goulder2001c
	Keywords mother-to-infant transmission, escape.				
	Epitope name SL9.				
	• Immune escape variants in this epitope where transmitted both horizontally and vertically in two families.				
	• Eight transmitting mothers and 14 non-transmitters mothers were studied and variation within the SL9 epitope was associated carrying HLA-A2 (P=0.04), but no link between variation from the SL9 consensus and vertical transmission was established.				
p17 (77–85)	p17 (SF2)	SLYNTVATL	HIV-1 infection	human (A2)	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes, and was one of the epitopes presented by another HLA molecule in an HLA-B60 individual.				
	• The response to the peptide was CD8 dependent, but the HLA presenting molecule and optimal epitope were not determined.				
p17 (77–85)	p17 (77–85 LAI)	SLYNTVATL	HIV-1 infection	human (A2)	Kelleher2001a
	Keywords HAART, epitope processing, immunodominance.				
	• Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in in an intracellular context.				
	• RTV did not reduce antigen presentation and concentration of the two immunodominant Gag CTL epitopes (KRWIIMGLNK (B27) and SLYNTVATL (A2)).				
	• RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.				
p17 (77–85)	p17	SLYNTVATL	HIV-1 infection	human (A2)	Kaul2002
	Keywords HIV exposed persistently seronegative (HEPS).				
	• Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.				
p17 (77–85)	Gag (p17) (77–85 NL43)	SLYNTVATL	HIV-1 infection	human (A2)	Yang2002
	Keywords class I down-regulation by Nef. • Nef down-modulates class I protein expression, and this study demonstrates directly that Nef-deleted HIV-1 NL-43 can be more effectively killed *in vitro* than NL-43 with an intact Nef. The effect was shown to be specific for class I presentation of epitopes, and unlike Nef, deleting Vpr did not alter CTL susceptibility of NL-43. The CTL clone 18030D23, specific for the class I A2 presented SLYNTVATL epitope, was one of four used in this study.				
p17 (77–85)	p17 (77–85 BRU)	SLYNTVATL	HIV-1 infection	human (A2)	Cohen2002
	Keywords epitope processing. • The antigen presentation of two A2-restricted epitopes was compared, SLYNTVATL (p17) and ILKEPVHGV (RT). HIV-1 infected cells were more sensitive to lysis by SLYNTVATL-specific CTL than by ILKEPVHGV-specific CTL, because of a higher density of SLYNTVATL-A2 resulting from differences in processing. • Incubation with a T1-cell proteolytic extract showed that by four hours, 25% of a p17 peptide had a C-term Leu-85 and were SLYNTVATL-precursors, while ILKEPVHGV-precursors were far less frequent (6.8%) even with four times more proteolytic extract after 30 hours. • p17 was preferentially cleaved between Leu85 and Tyr86, while appropriate Val484 and Tyr485 cleavage was minor for RT. • In a competition experiment, RSLYNTVATL bound TAP 3.7-fold more efficiently than RT peptides. • No difference in CTL avidity was detected in six patients with HLA-A2-restricted responses to these epitopes. • No significant difference in HLA-A2 binding of to p17 or RT epitopes was observed.				
p17 (77–85)	p17 (77–85)	SLYNTVATL	Vaccine	mouse (A2)	Kmieciak2001
	Vaccine *Strain:* B clade IIIB *HIV component:* Gag, Pol *Adjuvant:* IL-12 • Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with either a p17-p24-p51 fusion protein (vG/P-92) or the Gag-Pol precursor protein (vVK1). • Compared to vVK1, vG/P-92 induced a significant increase in Gag and Pol induced IFNgamma production and CTL responses, and to the epitopes SLYNTVATL and ILKEPVHGV, as determined by Elispot and 51Cr-release assays.				
p17 (77–85)	Gag (77–85)	SLYNTVATL	HIV-1 infection	human (A2)	Appay2002
	Keywords HAART. **Donor HLA** A2,A3,B7,Bw6. • Four HIV patients with prolonged clinically successful anti-viral therapy but with ongoing evidence of replication and Nef mRNA transcription, showed specific T-cell responses by Elispot and Tetramer staining, maintained for 2-4 years after initiation of HAART. • Nef epitope recognition was detected in all 4 subjects, gp120, Pol and Gag-specific in 1 or 2 subjects. • The HIV-specific CD8+ T-cells had an intermediate maturation phenotype characterized by low levels of perforin and high levels of CD27 expression.				
p17 (77–85)	p17 (77–85 NL-43)	SLYNTVATL	HIV-1 infection	human (A2)	Ali2003
	Keywords class I down-regulation by Nef, escape. • NL43 was passaged in the presencNL43 was passaged in the presence of Nef KEKGGLEGL-specific CTL clones STD11 and KM3, rapid selection of escape mutations, including E93G, E93K, K94N+G99R, G95R+G99R, E98K, E98D, G99R, G99E, L100P, and L100I; insertions, deletions, frameshifts and an early stop codon. 34/36 (94%) of sequences carried mutations in the epitope by seven days, 36/36 (100%) by 14 days. • Several mutations selected by KEKGGLEGL-specific CTL were shown to impair the down regulation of class I MHC by Nef, in particular E93G, E93K, and a truncation mutation at position 51.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Nef deletion mutants increased 100-fold NL-43 susceptibility to inhibition by CTL specific for epitopes in other proteins, the A2 epitopes ILKEPVHGV in RT and SLYNVATL in p17 Gag.				
p17 (77–85)	Gag	SLYNTVATL	HIV-1 infection	human (A2)	Bobbitt2003
	Keywords class I down-regulation by Nef. **Epitope name** SL9. **Assay type** Chromium-release assay, Flow cytometric CTL assay. • Nef, through Nef-mediated MHC-1 down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is more profoundly reduced than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more effeciently recognized when infected with viruses carrying the Rev L60F mutation. • Patients in the asymptomic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.				
p17 (77–85)	Gag (77–)	SLYNTVATL	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Gag77. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This epitope was one of the previously identified HLA-A2 epitopes studied. • 10/17 HIV-infected HLA-A2+ people in this study recognized this epitope, and CTL and CD8+ T cells responses were elicted by immunization of transgenic mice with this peptide.				
p17 (77–85)	Gag (p17)	SLYNTVATL	HIV-1 infection	human (A2)	Kaul2003
	Keywords immunodominance, genital and mucosal immunity. **Assay type** Intracellular cytokine staining. • Predefined immunodominant peptide responses were used to compare CD8+ T cells responses in the blood and cervix of 16 HIV+ Kenyan sex workers. Cervical responses were detected in 8/10 women from whom adequate samples could be obtained. The frequency of the CD8+ T cell response in the genital tract was comparable to the blood, with a trend toward being slightly higher. • The immunodominant response was to this epitope in the PBMC of 1/16 patients (Kaul *et al.* 2001, AIDS, 107:1303).				
p17 (77–85)	Gag (p17)	SLYNTVATL	HIV-1 infection	human (A2)	Montefiori2003
	Keywords supervised treatment interruptions (STI), early treatment. **Epitope name** SL9. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2, A24, B38, B60, Cw2, Cw12.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-1+ patient AC10 underwent early HAART treatment, which was discontiuned 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.				
p17 (77–85)	Gag (77–85)	SLYNTAVTL	HIV-1 infection	human (A2)	Sandberg2003
	Keywords responses in children. **Assay type** CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric CTL assay. • 65 vertically HIV-1 infected children, ages 1-16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T cell counts, and CD8+ T cell responses. • Using vaccina expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. Strong CD8+ T cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no reponse) than older children (only 1/32 had no response, and responses were greater in magnitude). • SLYNTVATL and ILKEPVHGV tetramers were used to quantitate specific responses. 49 chlidren in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV. • Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL reponses.			
p17 (77–85)	Gag (77–85)	SLYNTVATL	HIV-1 infection	(A2)	Sun2003
	Keywords assay standardization, memory cells. **Assay type** cytokine production, CD8 T-cell Elispot - IFNγ, Tetramer binding, Intracellular cytokine staining. **Donor HLA** A2, A3, B27, B51; A2, A3, B27, B57; A2, A23, B57. • This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFNγ. Tetramer-bidning analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag, Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chronium release assay and compared to effector/memory CD8+ T cells in an IFN-γ ELISpot assay. • Results: IFNγ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ Tcells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time. • 3/7 HLA-A2+ patients recognized this epitope.			
p17 (77–85)	p17 (77–85 NL43)	SLYNTVATL	HIV-1 infection	human (A2)	Yang2003
	Keywords escape, TCR usage. **Epitope name** SL9. **Assay type** Chromium-release assay, CTL suppression of replication. • Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts. • Three CTL clones were studied that recognized SLYNTVATL, 161JxA14, 18030D23, and 115DEC4. The different TCR usage on the CTL clones resulted in different patterns of recognition and escape. 161JxA14 suppressed the variant slFntvatl, 18030D23 did not; conversely the variants slfntIaVl and slFntIatl were suppressed by 18030D23, but not 161JxA14.			

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• After two weeks of passage the predominant escape mutant from 161JxA14 was slyntIatl. Amino acid residues flanking SL9 were unchanged. Escape mutations did not occur within two weeks for the two additional SL9-specific CTL clones 18030D23 and 115DEC4.				
p17 (77–85)	p17	SLYNTVATL	HIV-1 exposed seronegative	human (A2, A*0202)	Rowland-Jones1998b
	Keywords inter-clade comparisons. **Epitope name** SL9. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among B and D clade viruses. • The Clade A version of the epitope, SLFNTVATL, was preferentially recognized by CTL. • This epitope was recognized by two different exposed seronegative prostitutes.				
p17 (77–85)	p17 (77–85 LAI)	SLYNTVATL	Vaccine	mouse (A2.1)	Peter2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG **Keywords** binding affinity, vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR23. • The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01). • The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour. • HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants. • All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.				
p17 (77–85)	p17 (77–85 LAI)	SLYNTVATL	Vaccine	mouse (A2.1)	Peter2002
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), IL-12, P30 **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR23. • When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination [Peter2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macropahges in the spleen.				
p17 (77–85)	p17 (77–85)	SLYNTVATL	HIV-1 infection	human (B62)	Goulder1997a
	Keywords review. **Epitope name** SL9. • This paper is a review of CTL and immune evasion, but it presents a study of a shift from an HLA-A*0201 response to SLYNTVATL, to a B62 response to GLNKIVRMY.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• As long as a strong CTL response to SLYNTVATL was evident, the epitope variants SLFNTVATL or SLYNTIATL dominated the viral population – eventually the CTL response to the index peptide became undetectable, the CTL response shifted to a focus on GLNKIVRMY, and the index peptide SLYNTVATL once again established itself as the dominant form.				
p17 (77–85)	Gag (77–85)	SLYNTVATL		human (HLA-A201)	Sandberg2000
	Keywords binding affinity. • This epitope served as a positive control in a study comparing peptide binding affinity to HLA-A201 to CTL responses upon vaccination with a nef DNA vaccine.				
p17 (80–88)	Gag (80–)	NTVATLYCV	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* p17 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Gag80. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was an intermediate A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.				
p17 (82–91)	p17 (82–91 93TH253 subtype CRF01)	IATLWCVHQR	HIV-1 infection, HIV-1 exposed seronegative	human (A11)	Sriwanthana2001
	Keywords HIV exposed persistently seronegative (HEPS). **Epitope name** G82-91. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was weakly reactive in the HEPS study subject 265 who was HLA A2/A11. • This epitope was strongly reactive in HIV+ study subject 053 who carried HLA-A11.				
p17 (82–91)	p17 (82–91 93TH253 subtype CRF01)	IATLWCVHQR	HIV-1 infection	human (A11)	Bond2001
	Keywords inter-clade comparisons. • HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive. • 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified. • This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined. • 3/8 tested FSWs recognized this epitope. • This epitope was not conserved in other subtypes, and exact matches were uncommon.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p17 (84–91)	Gag (83–90)	TLYCVHQR	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords inter-clade comparisons, TCR usage.				
	• Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.				
	• TLYCVHQR was found to elicit clade-specific responses in clade B (TLYCVHQR is most common, and is also common in clade A – the variant tlycvhqK is common in clade B) and clade E (tlWcvhqr is most common). TLYCVHQR was not recognized by any CTL, tlycvhqK was recognized by CTL from 1/5 B clade infected Japanese subjects, and tlWcvhqr was not recognized by CTL from infected Thai subjects, so this seems to be a B clade exclusive epitope.				
	• The binding of the variant peptides to HLA A*1101 was comparable, but CTL that recognized tlycvhqK did not cross-recognize the other forms, implicating TCR interaction differences.				
p17 (84–91)	p17 (83–91)	TLYCVHQR	HIV-1 infection	human (A11)	Harrer1998
	Keywords escape.				
	• Two overlapping epitopes were recognized in a long-term survivor, restricted by two different HLA molecules, HLA-A11(TLYCVHQR) and -A2 (SLYNTVATL)				
	• Viral sequence substitutions were present in this individual which did not affect viral replication and did not alter CTL-recognition of the A2 epitope, but reduced recognition of the A11 epitope, indicative of immune escape.				
	• A Q90E substitution resulted in a loss of the ability of the peptide to induce lysis, a R91K substitution was still reactive, and a R91Q substitution show a reduced ability to stimulate lysis.

	• CTL specific for HIV epitopes were used to show that the mediators of both the cytolytic (granzyme A was used as the marker) and non-cytolytic (HIV-1 inhibitory chemokines MIP-1 α and RANTES were used as markers) anti-viral responses are localized within the CTL's cytotoxic granules.				
p17 (92–101)	p17 (92–101 SF2)	IEIKDTKEAL	HIV-1 infection	human (B60)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B60+ individuals that had a CTL response to this epitope broken down by group: 0/2 group 1, 1/1 group 2, and 0/0 group 3.				
p17 (92–101)	Gag (92–101)	IEIKDTKEAL	HIV-1 infection	human (B60)	Yang2002
	Keywords class I down-regulation by Nef. • Nef down-modulates class I protein expression, and this study demonstrates directly that Nef-deleted HIV-1 NL-43 can be more effectively killed *in vitro* than NL-43 with an intact Nef. The effect was shown to be specific for class I presentation of epitopes, and unlike Nef, deleting Vpr did not alter CTL susceptibility of NL43 infected cells. The CTL clone 161JD27, specific for the class I B60 presented epitope IEIKDTKEAL, was one of four used in this study.				
p17 (92–101)	Gag (p17) (92–101 NL43)	IEIKDTKEAL	HIV-1 infection	human (B60)	Yang2003
	Keywords escape. **Epitope name** IL10. **Assay type** Chromium-release assay, CTL suppression of replication. • Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts. • There was one cloned cell line that recognized IEIKDTKEAL, 161JD27. After 2 weeks of passaging HIV-1 in the presence of 161JD27, no mutations were observed within the epitope in 10 sequences; one of the 10 had a single E -> K substitution 6 amino acids beyond the C-terminal end of the epitope.				
p17 (92–101)	p17 (SF2)	IEIKDTKEAL	HIV-1 infection	human (B60(B*4001)	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes. • B60 is present in 10-20% of the Caucasoid and very common in Asian populations.

	• Noted by Brander to be B*3501 epitope.				
p17 (124–132)	p17	NSSQVSQNY	HIV-1 infection	human (B*3501)	Dorrell2001
	Keywords binding affinity. • The crystal structure of this epitope bound to HLA-B*3501 shows that a serine can fit into the B pocket, which is shared between B35 and B53, with the hydroxyl group of the P2 serine occupying a position almost identical to the P2 proline that was previously considered the anchor motif. • Novel B53 epitopes (DTINEEAAEW and QATQEVKNM) were defined in this study that showed that A and T can also serve as P2 anchor residues for the B pocket of HLA-B35 and B53 – while S, T, and P could all fit into the B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNM for B53.				
p17 (124–132)	p17 (124–132 LAI)	NSSKVSQNY	HIV-1 infection	human (B35)	McMichael1994

	• Established by titration.				
p17 (124–132)	p17 (124–132 LAI)	NSSKVSQNY	in vitro stimulation or selectio	human (B35)	Lalvani1997
	• A peptide-based protocol was optimized for restimulation of CTLp using optimized peptide and IL-7 concentrations – importantly this protocol does not stimulate a primary response, only secondary – peptide-specific CTLp counts could be obtained via staining with peptide-Class I tetramers. • This peptide was one of the B35 presented test peptides used in control experiments showing that the assay gave no activity using lymphocytes from 21 healthy B35 seronegative donors.				
p17 (124–132)	p17	NSSKVSQNY		human (B35)	Rowland-Jones1999
	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive. • HIV-2 version of this epitope is not conserved: PPSGKGGNY, but the CTLs are cross-reactive – this is one of five B35 CTL epitopes that are cross-reactive, see also [Rowland-Jones1995b]				
p17 (124–132)	p17	NSSKVSQNY	HIV-1 infection	human (B35)	Seth2001
	Keywords HAART. • CTL responses were studied by tetramer staining in 41 patients with combination therapy – activated CD8+ T-cells decline as the viral load drops in response to therapy, but the overall level of antigen-specific cells capable of differentiating into effectors stays constant and new epitopes may be recognized.				
p17 (124–132)	p17 (124–132 SF2)	NSSKVSQNY	HIV-1 infection	human (B35)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 0/2 group 1, 0/2 group 2, and 1/1 group 3.				
p17 (124–132)		NSSKVSQNY	HIV-1 infection	human (B35)	Sabbaj2002b
	Epitope name Gag-NY9. • Among HIV+ individuals who carried HLA B35, 1/21 (5%) recognized this epitope.				

II-B-2 p17-p24 CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p17-p24 (127–3)	p17-p24 (127–135 subtype D)	QVSQNYPIV		human (A*6802)	Dong1998a
	• Epitope starts in p17 and ends in p24. • Predicted on binding motif, no truncations analyzed.				
p17-p24 (131–6)	p17-p24 (132–140 SF2)	NYPIVQNL	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• The epitope starts in p17 and ends in p24. • Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 1/4 HIV-1+ people tested. • NYPIVQNL bound to A*2402 with medium strength, and the epitope can be processed in a vaccinia construct and presented – no CTL clone was obtained.				

II-B-3 p24 CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p24 (8–17)	p24 (140–149)	GQMVHQAISP	HIV-1 infection	human (B57)	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the A2+ individuals was HLA A*0201, A1, B57 and responded to four B57 epitopes and two others.				
p24 (8–20)	p24 (140–152 IIIB)	GQMVHQAISPRTL	HIV-1 infection	human (Cw3)	Littaua1991
	• Fine specificity of human Cw3 restricted Gag CTL epitope.				
p24 (8–27)	p24 (140–159)	GQMVHQAISPRTLNAWVKVV	HIV-1 infection	human (B14)	Musey1997
	• CTL specific for this epitope were found in the peripheral blood but not in the cervical mucosa of one donor.				
p24 (9–18)	Gag (173–182)	QMVHQAISPR	HIV-1 infection	human (A3 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).				
p24 (10–18)	Gag (144–152 SF2)	MVHQAISPR	HIV-1 infection, computer prediction	human (A*3303)	Hossain2003
	Keywords binding affinity, computational epitope prediction. **Assay type** Chromium-release assay. • HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing. • This epitope is one of the 4 that are properly processed.				
p24 (10–18)	Gag (174–182)	MVHQAISPR	HIV-1 infection	human (A3 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind 5/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The CTL-dominant response was focused on this epitope in an HIV+ Haitian living in Boston, who was A34/68 B57/71 Cw3/7 – this epitope fell outside the most recognized peptides in the study. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.			
p24 (11–25)	p24 (11–25 HXB2)	VHQAISPRTLNAWVK	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 29% of the study subjects, and it was the third most frequently recognized peptide.			
p24 (11–32)	p24 (143–164 BH10)	VHQAISPRTLNAWVKVVEE-KAF	HIV-1 infection	human (Bw57)	Johnson1991
	• Gag CTL response studied in three individuals.

p24 (15–23)	**Keywords** HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • ISPRTLNAW was consistently recognized by 1/22 HEPS sex worker controls (ML1250), and LSPRTLNAW was recognized by 2 additional HEPS sex worker controls (ML1693 and ML1589)	LSPRTLNAW	HIV-1 infection, HIV-1 exposed seronegative	human	Kaul2001c
p24 (15–23)	p24 **Keywords** HIV exposed persistently seronegative (HEPS). • Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs. • Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.	LSPRTLNAW	HIV-1 infection	human (B*57)	Kaul2002
p24 (15–23)	p24 (147–155 IIIB) • C. Brander notes this is a B*5701 epitope.	ISPRTLNAW	HIV-1 infection	human (B*5701)	Frahm2004
p24 (15–23)	**Keywords** rate of progression, immunodominance.	ISPRTLNAW	HIV-1 infection	human (B*5701)	Migueles2001

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.				
p24 (15–23)		ISPRTLNAW	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW. • CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia. • The HLA-A*0201 SLYNTVATL epitope response was not as strong individuals that carried both A2, B57.				
p24 (15–23)		ISPTRTLNAW	HIV-1 infection	human (B*5701)	Migueles2003
	Keywords rate of progression, escape. **Assay type** Intracellular cytokine staining, Flow cytometric CTL assay. • cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1-7) than LTNPs (median 2, range 0-4). • In general use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.				
p24 (15–23)	Gag (147–155 LAI)	ISPRTLNAW	HIV-1 infection	human (B*5701 B*5801)	Klein1998
	Keywords rate of progression. • B57 has been associated with long-term non-progression in the Amsterdam cohort. • The most pronounced CTL responses in HLA B*5701 LTS were to RT and Gag.				
p24 (15–23)	p24 (147–155)	ISPRTLNAW	HIV-1 infection	human (B57)	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the A2+ individuals was HLA A*0201, A1, B57 and responded to four B57 epitopes and two others, but not SLYNTVATL.				
p24 (15–23)	Gag (SF2)	ISPRTLNAW	HIV-1 infection	human (B57)	Goulder2001a
	Keywords acute infection. **Epitope name** IW9. • This epitope elicited the second strongest CTL response in patient PI004 during acute infection, and maintained the response. • Three CTL responses, to epitopes TSTLQEQIGW, ISPRTLNAW, and KAFSPEVIPMF, were evident early after infection; CTL responses to SLYNTVATL, QASQEVKNW, EIYKRWII, and FLKEKGGL were detectable at 5 months post-infection and beyond.				
p24 (15–23)	p24 (147–155)	ISPRTLNAW	HIV-1 infection	human (B57)	Oxenius2000
	Keywords HAART, acute infection. **Epitope name** ISP. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.

	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
p24 (30–37)	p24 (162–170 LAI)	KAFSPEVI	HIV-1 infection	human (B*5703)	Frahm2004
	• C. Brander notes this is a B*5703 epitope.				
p24 (30–37)	p24 (30–37)	KAFSPEVI	HIV-1 infection	human (B57)	Goulder2000c
	• Two strong clonal CTL responses were generated in donor 026-BMC (HLA A3/-, B42/B57, Cw7/17) against different optimal versions of this epitope, one 8 amino acids long, one 11. • Improved stabilization of the B57-peptide complex was demonstrated by the 11 mer which fits the B57 binding motif, relative to the 8 mer, which does not. • B57 tolerates marked difference in optimal peptide length – and B57 is associated with non-progressive infection.				
p24 (30–37)		KAFSPEVI	HIV-1 infection	human (B57)	Sabbaj2002b
	Epitope name Gag-KI8. • Among HIV+ individuals tested who carried HLA B57, 0/5 (0%) recognized this epitope.				
p24 (30–40)	p24	KAFSPEVIPMF	HIV-1 infection, HIV-1 exposed seronegative	human	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized by 1/22 HEPS sex worker controls, ML1250.				
p24 (30–40)	p24	KAFSPEVIPMF	HIV-1 infection	human (B*57)	Spiegel1999
	Keywords HAART. • Study examines the effect of highly active antiretroviral therapy (HAART) on HIV-1 plasma viral load, CTLp and CTLe frequencies in 8 infected children. • CTLp (precursors) were measured by stimulating in culture and assaying using 51Cr release, against vaccina expressed IIIB Env, Gag, Pol, Nef, and CTLe were measured by ELISPOT.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CTL against B*57-KAFSPEVIPMF was a de novo response observed in one of the children when viral load increased as a result of stopping therapy. • HIV-1 specific CTL responses initially increased in children with complete viral suppression, but then decreased, suggesting viral replication is needed to maintain CTL responses.				
p24 (30–40)	p24 (162–172 LAI)	KAFSPEVIPMF	HIV-1 infection	human (B*5701)	Goulder1996b
	Keywords rate of progression. • This peptide was recognized by CTL from five slow progressors. • Peptide defined on the basis of B*5801 binding motif, yet not cross-restricted except at high concentrations. • This epitope is highly conserved.				
p24 (30–40)	p24 (162–172 LAI)	KAFSPEVIPMF	HIV-1 infection	human (B*5701)	Frahm2004
	• C. Brander notes this is a B*5701 epitope.				
p24 (30–40)		KAFSPEVIPMF	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW. • Attempts to make all for HLA B*5701-epitope tetramers were made, but only the HLA B*5701-KAFSPEVIPMF tetramer folded properly. The percentage of CD8+ T cells staining with this HLA B*57 gag tetramer and the fraction of CD69+IFN-+ cells responding to autologous B cells pulsed with KAFSPEVIPMF was highly correlated (r = 0.84; P = 0.005). The percent of CD8+ T cells that stain with the A*2 gag SLYNTVATL tetramer was low (0-0.31%) in a A2+ B57+ LTNP, emphasizing the focus of the immune response on the B*5701 epitopes.				
p24 (30–40)		KAFSPEVIPMF	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW. • CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia. • The HLA-A*0201 SLYNTVATL epitope response was not as strong in individuals that carried both A2 and B57.				
p24 (30–40)	Gag (162–172)	KAFSPEVIPMF	HIV-1 infection	human (B*5701)	Migueles2003
	Keywords rate of progression, escape. **Epitope name** KAF11. **Assay type** Intracellular cytokine staining, Flow cytometric CTL assay. • cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1-7) than LTNPs (median 2, range 0-4). • In general use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses. • This epitope tends to be quantitavtively immunodominant in B57+ people, including in some of the individuals in this study. It was extremely well conserved in the sequences obtained here, despite strong immune pressure, suggesting fitness constraints.				
p24 (30–40)	p24 (30–40)	KAFSPEVIPMF	HIV-1 infection	human (B*5701, B*5703)	Gillespie2002
	Keywords inter-clade comparisons, rate of progression. **Epitope name** KAFS.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CTL responses of eight HIV+ slow progressors from Nairobi Kenya or Oxford, UK who were B*5701 or B*5703 were studied, as B*57 is associated with slow progression. • This epitope is located between the structurally conserved alpha-helix 1 and alpha-helix 2 (H1-H2) region of the p24 capsid protein, and tends to elicit strong reactions in B*57 individuals. • Broad heterogeneous cross-clade reactivity to 6 clade variants of the KAFS peptide sequence were observed in one B*5701 and 5 B*5703 HLA-restricted patients, measured by IFNγ productionElispot assays as well as tetramer binding. The clade variants were: KAFSPEVIPMF (clades A and B), kGfNpevipmf (clades A/AC); kaLspevipmf (clade A); kafspevipVf (clade A); kafNpeIipmf (group O); kafspeIipmf (A/C); kafsQevipmf (A/C); and kaLspevipmf KNFSPEVIPMF A/G). Not all variants were well recognized in all patients, for example kafsQevipmf was not able to induce IFN gamma production in 3/6 tested, and had a diminished capacity to sensitize target cells for lysis.			
p24 (30–40)	p24 (162–172 LAI) • C. Brander notes this is a B*5703 epitope.	KAFSPEVIPMF	HIV-1 infection	human (B*5703)	Frahm2004
p24 (30–40)	**Keywords** HAART. **Epitope name** Gag-KF11. **Donor HLA** A*3402 A*7401 B*0801 B*5703 Cw*0302 Cw*0701. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • Subject 00RCH59 was African American, on HAART, viral load 170, CD4 count 477. • Among HIV+ individuals who carried HLA-B57, 6/6 (100%) recognized this epitope.	KAFSPEVIPMF	HIV-1 infection	human (B*5703)	Sabbaj2002b
p24 (30–40)	p24 (30–40) • Two strong clonal CTL responses were generated in donor 026-BMC (HLA A3/-, B42/B57, Cw7/17) against different optimal versions of this epitope, one 8 amino acids long, one 11. • Improved stabilization of the B57-peptide complex was demonstrated by the 11mer which fits the B57 binding motif, relative to the 8 mer, which does not. • B57 tolerates marked difference in optimal peptide length – and B57 is associated with non-progressive infection.	KAFSPEVIPMF	HIV-1 infection	human (B57)	Goulder2000c
p24 (30–40)	p24 (162–172) **Keywords** immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the A2+ individuals was HLA A*0201, A1, B57 and responded to four B57 epitopes and two others.	KAFSPEVIPMF	HIV-1 infection	human (B57)	Betts2000
p24 (30–40)	p24 (SF2) **Keywords** inter-clade comparisons, immunodominance. • The CTL-dominant response was focused on this epitope in a HIV+ Caucasian living in Boston – this epitope is not among the most recognized peptides in the study. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.	KAFSPEVIPMF	HIV-1 infection	human (B57)	Goulder2000a

p24 (30–40)	Gag (SF2)	KAFSPEVIPMF	HIV-1 infection	human (B57)	Goulder2001a
	Epitope name KF11. • Three CTL responses in patient PI004, to epitopes TSTLQEQIGW, ISPRTLNAW, and KAFSPEVIPMF, were evident early after infection; CTL responses to SLYNTVATL, QASQEVKNW, EIYKRWII, and FLKEKGGL were detectable at 5 months post-infection and beyond.				
p24 (30–40)	p24 (162–172)	KAFSPEVIPMF	HIV-1 infection	human (B57)	Oxenius2000
	Keywords HAART, acute infection. **Epitope name** KAF. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • None of the 8 study subjects recognized this epitope but none were HLA B57+				
p24 (30–40)	p24	KAFSPEVIPMF	HIV-1 infection	human (B57)	Kostense2001
	• HLA tetramers to six epitopes were used to study HLA-A2, B8 and B57 CTL in 54 patients – HIV-specific tetramer positive cells were inversely correlated with viral load in patients with high CD4, but in patients with CD4 T-cells below 400 high tetramer frequencies were found despite high viral load. • Most patients have high levels of HIV-specific T-cell expansions, but many of these cells aren't functional. • In 15 of the patients, the proportion of IFN gamma producing tetramer cells correlated with AIDS-free survival.				
p24 (30–40)	p24 (162–172 SF2)	KAFSPEVIPMF	HIV-1 infection	human (B57)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B57+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 0/0 group 2, and 2/2 group 3.				
p24 (30–40)	p24 (163–174)	KAFSPEVIPMF	HIV-1 infection	human (B57)	Appay2000
	• Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV. • HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation. • In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α				
p24 (30–40)		KAFSPEVIPMF	HIV-1 infection	human (B57)	Sabbaj2002b
	• Among HIV+ individuals who carried HLA B57, 1/5 (20%) recognized this epitope.				
p24 (30–40)	p24	KAFSPEVIPMF	HIV-1 infection	human (B57)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** KAF. • Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI).				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
p24 (30–40)	p24 (30–40)	KAFSPEVIPMF	HIV-1 infection	human (B57)	Cao2003
	Keywords acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A*0201, A3, B44, B57, Cw5, Cw6. • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • Alleles A3, B35, B57, and B62 were more frequently recognized than alleles A1, A2, A30, and A44 e.g., during primary infection. 2/10 patients, 1372 and 1397, recognized A2-restricted epitopes. The common A2-restricted epitopes Gag SL9 and Pol IV9 were not recognized in peptide tetramer-binding assays.				
p24 (30–40)	Gag (p24)	KAFSPEVIPMF	HIV-1 infection	human (B57)	Kaul2003
	Keywords immunodominance, genital and mucosal immunity. **Assay type** Intracellular cytokine staining. • Predefined immunodominant peptide responses were used to compare CD8+ T cells responses in the blood and cervix of 16 HIV+ Kenyan sex workers. Cervical responses were detected in 8/10 women from whom adequate samples could be obtained. The frequency of the CD8+ T cell response in the genital tract was comparable to the blood, with a trend toward being slightly higher. • The immunodominant response was to this epitope in the PBMC of 10/16 patients (Kaul *et al.* 2001, AIDS, 107:1303).				
p24 (30–40)	p24 (153–164)	KAFSPEVIPMF	HIV-1 infection, HIV-1 exposed seronegative	human (B57, B58)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B57/B58 women, 4/6 HEPS and 12/17 HIV-1 infected women recognized this epitope. • The dominant response to this HLA allele was to this epitope in 2 of the 4/6 HEPS cases and in 7 of the 12/17 HIV-1 infected women.				
p24 (30–40)	p24 (30–40)	KAFSPEVIPMF	HIV-1 infection	human (B57/B58)	Kaul2002
	Keywords HIV exposed persistently seronegative (HEPS). • Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs. • Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.

p24 (41–60)	p24 (179–188 subtype A)	SALSEGATPQDLNMMLNIVG	HIV-1 infection	human (B*8101)	Dorrell1999
	Keywords inter-clade comparisons.				
	• CTL responses in three individuals with non-clade B infections were studied, 2 with subtype A infections, 1 with subtype C – their infections all originated in East Africa.				
	• This CTL epitope is presented by B*8101 in one of the patients with an A subtype infection – B*8101 is a newly discovered HLA allele found in Africans, and the epitope has yet to be mapped precisely.				
	• This epitope is distinct in subtype A relative to subtypes B, C, and D which share the dominant sequence: SALSEGATPQDLNTMLNTVG.				
p24 (41–62)	p24 (173–194 BH10)	SALSEGATPQDLNTMLNTV-GGH	HIV-1 infection	human (B14)	Johnson1991
	• Gag CTL response studied in three individuals.				
p24 (43–52)	p24 (subtype A)	LSEGATPQDL	HIV-1 infection	human (B42, B44)	Cao2000
	Keywords inter-clade comparisons.				
	• HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype. • This optimal epitope sequence, recognized by CTL derived from a Ugandan with an A subtype infection (patient SP 511), is cross-reactive with subtypes A, B and D peptides.				
p24 (44–52)	p24 (176–184)	SEGATPQDL		human (B*4001)	Frahm2004
	• C. Brander notes this is a B*4001, B60 epitope.				
p24 (44–52)	Gag (p24)	SEGATPQDL	HIV-1 infection	human (B60)	Montefiori2003
	Keywords HAART, supervised treatment interruptions (STI), acute infection, early treatment. **Epitope name** SL9. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2, A24, B38, B60, Cw2, Cw12. • HIV-1+ patient AC10 underwent early HAART treatment, which was discontiuned 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.				
p24 (44–52)	p24 (44–52 NL43)	SEGATPQDL	HIV-1 infection	human (B60)	Yang2003
	Keywords escape. **Assay type** Chromium-release assay, CTL suppression of replication. • Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts. • One CTL clone, 161Jx12, recognized this epitope, and apparently no resistance mutations were selected by this clone, although the data was no shown in the paper.				
p24 (44–52)	p24 (SF2)	SEGATPQDL	HIV-1 infection	human (B60(B*4001)	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes. • B60 is present in 10-20% of the Caucasoid and very common in Asian populations.				
p24 (44–52)	p24 (44–52)	SEGATPQDL	HIV-1 infection	human (B60/B61)	Day2001
	Keywords immunodominance. • No immunodominant responses were detected to five B61-restricted epitopes tested. • All five B60-restricted epitopes were reactive in another subject, the strongest CTL response directed against the B60-epitope p24 SEGATPQDL, and the B60-restricted responses together contributed over one-third of the total CTL response.				
p24 (46–59)	p24 (SF2)	GATPQDLNTMLNTV	HIV-1 infection	human	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • The CTL-dominant response was focused on this epitope in a HIV+ African American living in Boston with HLA A*3002/68 B14/*5802 Cw6/8 – this epitope fell within the most recognized peptides in the study. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
p24 (47–55)	p24 (47–55)	ATPQDLNTM	HIV-1 infection	human (B7)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p24 (47–56)	p24 (subtype A)	ATPQDLNMML	HIV-1 exposed seronegative	human (B53)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses. • Low risk individuals did not have such CD8+ cells. • CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
p24 (47–58)	p24 (181–192)	CTPYDINQMLNC	HIV-2 infection	human (B58)	Bertoletti1998a
	• HIV-2 epitope defined from an infection in Gambia, Bertoletti, pers. comm.				
p24 (48–56)	Gag (96ZM651.8)	TPQDLNTML		human (A*4201, B*8101)	Novitsky2001
	Keywords inter-clade comparisons, immunodominance. **Epitope name** G180-TL9. • This study is provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswanan cohort. • 19 of 46 (41.3%) had CTL responses to one or more peptides within the first immunodominant region of Gag (peptides TLNAWVKVIEEKAFSPEVIP, EKAFSPEVIPMFTALSEGAT, and MFTALSEGATPQDLNTMLNT), with magnitudes of response with ELISPOT results median and range 495 (103 to 1,447) SFC/10^6 PBMC. • 7 of 11 HLA-A*4201+ subjects (64%) responded to peptide MFTALSEGATPQDLNTMLNT. • TPQDLNTML is a A*4201 epitope within TLNAWVKVIEEKAFSPEVIP.				
p24 (48–56)	p24 (180–188 IIIB)	TPQDLNTML	HIV-1 infection	human (B*0702)	Frahm2004
	• C. Brander notes this is a B*0702 epitope.				
p24 (48–56)	p24 (179–187 LAI)	TPQDLNTML		human (B*4201)	Frahm2004
	• C. Brander notes this is a B*4201 epitope.				
p24 (48–56)	Gag (173–181 HIV-2)	TPYDINQML	HIV-2 infection	human (B*5301)	Frahm2004
	• C. Brander notes this is a B*5301 epitope.				
p24 (48–56)	p24 (180–188 LAI)	TPQDLNTML	HIV-1 infection	human (B*8101)	Frahm2004
	• C. Brander notes this is a B*8101 epitope.				
p24 (48–56)		TPQDLNTML	HIV-1 infection	human (B*8101, B*5301, B07)	Sabbaj2002b
	Keywords HAART. **Epitope name** Gag-TL9. **Donor HLA** A*3402 A*7401 B*5301 B*8101 Cw*0401 Cw*0802.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • Subjects 00RCH86 and 03RCH59 both recognized this epitope, both restricted by HLA B*8101. • Subject 00RCH86 was African American, not on HAART, viral load 51000, CD4 count 520. • Subject 03RCH59 was African American, male, on HAART, viral load 22000, CD4 count 769. • Among HIV+ individuals who carried HLA B07, 2/9 (22%) recognized this epitope. • Among HIV+ individuals who carried HLA B*5301, 3/15 (20%) recognized this epitope. • Among HIV+ individuals who carried HLA B81, 4/6 (67%) recognized this epitope.				
p24 (48–56)	p24 (C consensus)	TPQDLNTML	HIV-1 infection	human (B42)	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • B42 and B81 are very similar, and both can present this epitope to B42-positive effector cells – this epitope is almost certainly optimal for B81 as well – B42 and or B81 are expressed in 40-45% of Zulu and Xhosa infected individuals in South Africa, and in 14/18 B42 or B81+ individuals, the dominant gag response was to TPQDLNTML. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects.				
p24 (48–56)	Gag	TPQDLNTML	HIV-1 infection	human (B42)	Goulder2000b
	• Tetramer assays were compared with three functional assays in 42 people with chronic HIV infection: ELISPOT, intracellular cytokine staining, and precursor frequency (limiting dilution assay [LDA]) • HIV-specific tetramer staining CTLs appeared to be active, and inert CTL were not found to play a significant role in chronic pediatric or adult HIV infection.				
p24 (48–56)	p24	TPQDLNQML		human (B53)	Rowland-Jones1999
	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, and the B35 allele seems to be protective. • HIV-2 sequence: TPYDINQML, no cross-reactivity, [Gotch1993]				
p24 (48–56)	Gag (173–181 HIV-2)	TPYDINQML	HIV-2 infection	human (B53)	Gotch1993
p24 (48–56)	Gag (180–188 subtype A)	TPQDLNMML	HIV-1 infection, in vitro stimulation or selectio	human (B53)	Dorrell2001
	Keywords inter-clade comparisons. • In vitro restimulation of CTL specific for dominant epitopes from infected individuals is possible using recombinant modified vaccinia virus Ankara (MVA) carrying A or D subtype HIV-1 Gag proteins.				
p24 (48–56)	p24 (180–188 subtype A consensus)	TPQDLNMML	HIV-1 infection	human (B53)	Dorrell2001
	Keywords inter-clade comparisons, immunodominance, TCR usage. • In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This optimal epitope was identified within the 20 mer reactive peptide that carried it by homology with a B53 epitope from HIV-2, a B subtype B7 peptide that corresponds to it, as B53 is part of the B7 superfamily, and by the proline in the anchor at position 2. • TPQDLNMML was recognized in 6/7 HLA-B53 subjects and was immunodominant in most subjects. • TPQDLNMML was A subtype-specific with no cross-recognition of the subtype B, C, and D variant, TPQDLNTML, although the B/C/D variant bound more efficiently to B53 – position 7 show great positional variation in crystal structures of two HLA-B53 complexes, suggesting variation here might significantly alter the position of the peptide in the binding groove and thus affect TCR interactions. • Only one subject might have had a cross-reactive response with the HIV-2 and Mamu-A*01 variant CTPYDINQML, and this subject might have been dual infected with HIV-2.				
p24 (48–56)	Gag (p24)	TPQDLNMML	HIV-1 infection	human (B53)	Kaul2003
	Keywords immunodominance, genital and mucosal immunity. **Assay type** Intracellular cytokine staining. • Predefined immunodominant peptide responses were used to compare CD8+ T cells responses in the blood and cervix of 16 HIV+ Kenyan sex workers. Cervical responses were detected in 8/10 women from whom adequate samples could be obtained. The frequency of the CD8+ T cell response in the genital tract was comparable to the blood, with a trend toward being slightly higher. • The immunodominant response was to this epitope in the PBMC of 2/16 patients (Kaul *et al.* 2001, AIDS, 107:1303).				
p24 (48–56)	p24 (180–188 IIIB)	TPQDLNTML	HIV-1 infection	human (B7)	Wilson1999a
	Keywords responses in children, mother-to-infant transmission, escape. • This study describes maternal CTL responses in the context of mother-to-infant transmission. • Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants. • No variants of this epitope were found in a non-transmitting mother that had a CTL response to this epitope.				
p24 (48–56)	p24 (180–188)	TPQDLNTML	HIV-1 infection	human (B7)	Jin2000b
	Keywords immunodominance. • This is the optimal epitope for the immunodominant response defined using a conventional approach in an HLA B7+ long-term non-progressor. • Three additional sub-dominant HLA B7 epitopes were defined using EpiMatrix, a non-anchor based strategy for defining potential epitopes, which highlighted 2078 possible epitopes in the autologous HIV-1 derived from the study subject – this was followed by B7 anchor residue prediction which narrowed the set to 55 peptides, three of which could serve as functional CTL epitopes.				
p24 (48–56)	p24 (SF2)	TPQDLNTML	HIV-1 infection	human (B7)	Goulder2001a
	Epitope name TL9. • Recognized by patient 9354 during chronic infection, used as a positive control in a study of the SLYNTVATL epitope.				
p24 (48–56)	p24 (48–56)	TPQDLNTML	HIV-1 infection	human (B7)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes. • An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes. • The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.				
p24 (48–56)	p24 (48–56)	TPQDLNTML	HIV-1 infection	human (B7)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** B7-TL9. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 1/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 1/4 individuals had detectable responses to this epitope after STI.				
p24 (48–56)	p24	TPQDLNTML	HIV-1 infection	human (B7)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** B7-TL9(p24). **Donor HLA** A32,A?,B7,B14. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).				
p24 (48–56)	p24 (180–188 LAI)	TPQDLNTML	HIV-1 infection	human (C*0802(Cw8))	Frahm2004
	• C. Brander notes this is a C*0802(Cw8) epitope.				
p24 (48–57)	Gag	TPQDLNMMLN		human (B7)	De Groot2001
	• The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes. • A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFNγ production in an ELISPOT assay. • TPQDLNMMLN was newly defined as an HLA-B7 epitope in this study, athough it was previously published as a B*8101 epitope. • TPQDLNMMLN was shown to stimulate an ELISPOT response, but could not be shown to bind to HLA-B7. • The variant TPQDLNTMLN was cross-reactive, had previously been identified as a HLA-B14 epitope, and could bind to HLA-B7.				
p24 (49–57)	p24 (181–189 LAI)	PQDLNTMLN	HIV-1 infection	human (B14, Cw8)	Lubaki1997
	• Eighty two HIV-1-specific CTL clones from 5 long-term non-progressors were isolated and analyzed for breadth of response. • A sustained Gag, Env and Nef response was observed, and clones were restricted by multiple HLA epitopes, indicating a polyclonal response.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Despite this being a well defined conserved epitope, none of the 11 gag-specific clones from a B-14 positive subject could recognize either it or p24 RAEQASQEV. • Christian Brander notes that B14 and Cw8 are in linkage disequilibrium, and that this epitope may be Cw8.				
p24 (51–59)	p24	DLNTMLNTV	HIV-1 infection	chimpanzee	Santra1999
	• 3/4 animals displayed HIV-1 Gag-specific CTL activity. • Effector cells from two chimpanzees were able to recognize two epitopes also recognized by human HIV-1 Gag-specific CTL (SPRTLNAWV, HLA-B7, and DLNTMLNTV, HLA-B14) • No chimpanzee CTL were detected to the following human HIV-1 specific Gag epitopes, although they were embedded within 20mer peptides that contained a reactive epitope: ISPRTLNAW, HLA-B57; KRWIILGLNK, HLA-B27; and DRFYKTLRA, HLA-B14.				
p24 (51–59)	p24 (subtype A)	DLNMMLNIV	HIV-1 exposed seronegative	human (B14)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses. • Low risk individuals did not have such CD8+ cells. • CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
p24 (51–59)	p24	DLNMMLNIV	HIV-1 infection	human (B14)	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized in 1/22 HEPS sex worker controls, ML1792.				
p24 (51–59)	p24 (183–191 LAI)	DLNTMLNTV	HIV-1 infection	human (B14)	Mollet2000
	Keywords HAART. **Epitope name** G5. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.				
p24 (51–59)	p24 (183–191)	DLNMMLNIV	HIV-1 infection, HIV-1 exposed seronegative	human (B14)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • Variants DLNMMLNIV/DLNTMLNVV are specific for clades A/B. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B14 women, 4/4 HEPS and 3/7 HIV-1 infected women recognized this epitope, likelihood ratio 4.8, p value 0.1, and HEPS women tended to respond to DLNMMLNIV/DLNTMLNVV, while infected women tended to respond to DRF(F/W)KTLRA. • The dominant response to this HLA allele was to this epitope for all 4/4 HEPS cases and in only one of the 3/7 HIV-1 infected women. • Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort. • Four epitopes were considered to be "resistant epitopes", as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24.			
p24 (51–59)	p24	DLNMMLNIV	HIV-1 infection	human (B14)	Kaul2002
	Keywords HIV exposed persistently seronegative (HEPS). • Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs. • Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.			
p24 (51–59)	p24 (183–191 LAI)	DLNTMLNTV	HIV-1 infection	human (B14, Cw8)	Johnson1992, Nixon1988
	• Recent evidence indicates this is a Cw8 epitope; B14 and Cw8 are in linkage disequilibrium and the HLA presenting molecule is hard to distinguish (P. Goulder, personal communication)				
p24 (51–59)	p24	DLNTMLNTV	HIV-1 exposed seronegative	human (B14, Cw8)	Rowland-Jones1998a
	Keywords inter-clade comparisons. • A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating. • The A subtype consensus is identical to the B clade epitope. • The D subtype consensus is dLNmMLNiV. • Recent evidence indicates this is a Cw8 epitope;B14 and Cw8 are in linkage disequilibrium and the HLA presenting molecule is hard to distinguish (P. Goulder, personal communication)				
p24 (51–59)	p24 (183–191 LAI)	DLNTMLNTV	HIV-1 infection	human (Cw8)	McMichael1994
	Keywords review. • Review of HIV CTL epitopes – defined by B14 motif found within a larger peptide. • Recent evidence indicates this is a Cw8 epitope;B14 and Cw8 are in linkage disequilibrium and the HLA presenting molecule is hard to distinguish (P. Goulder, personal communication)				
p24 (51–59)	p24 (subtype B)	DLNTMLNTV	HIV-1 exposed seronegative	human (Cw8, B*1402)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among B and D clade viruses. • The Clade A version of the epitope, DLNNMLNIV, was preferentially recognized by CTL. • Recent evidence indicates this is a Cw8 epitope;B14 and Cw8 are in linkage disequilibrium and the HLA presenting molecule is hard to distinguish (P. Goulder, personal communication)				
p24 (51–70)	p24 (183–202 SF2)	DLNTMLNTVGGHQAAMQMLK	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Twelve subjects had CTL that could recognize vaccinia-expressed LAI gag. • One of these 12 had CTL response to this peptide. • The responding subject was HLA-A26, A30, B38.				
p24 (51–82)	Gag (183–214 LAI)	DLNTMLNTVGGHQAAMQML-KETINEEAAEWDR	Vaccine	human	Gahery-Segard2000
	Vaccine *Vector/Type:* lipopeptide • Anti-HIV lipopeptide vaccine consisting of six long amino acid peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial. • A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 2/10 reacted to this peptide. • 9/12 tested mounted a CTL response to at least one of the six peptides; each of the six peptides elicited a CTL response in at least one individual. • None of the 12 tested had an IgG response to this peptide.

	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p24 (65–72)	Gag (p24)	AMQMLKET	Vaccine	mouse (H-2d)	Bojak2002b
	Vaccine *Vector/Type:* DNA *HIV component:* Gag **Epitope name** A9I. **Assay type** Chromium-release assay. • Codon-optimized gag gene DNA vaccines were compared to wild type by vaccination of BALB/c mice. Codon optimized DNA gave a Th1 polarized Th response, a strong antibody response that persisted from more than 20 weeks, and CTL responses, while wild-type DNA induced weak and inconsistent immune respones.				
p24 (65–73)	Gag (199–207)	AMQMLKETI	Vaccine	mouse	Vajdy2001
	Vaccine *Vector/Type:* vaccinia, Sindbis *HIV component:* Gag **Keywords** genital and mucosal immunity. **Epitope name** p7g. **Assay type** CD8 T-cell Elispot - IFNγ. • Nasal, vaginal, rectal and i.m. immunization was performed with Sindbis virus expressing HIV-1 Gag (SIN-Gag), followed by intravaginal or intrarectal challenge with vaccinia virus expressing either Gag (VV-Gag) or gp160 (VV-gp160) as a control. • Intranasal and intramuscular immunization followed by intravaginal challenge induced HIV-1 Gag specific, IFN-γ producing CD8+ T cells in the vaginal/uteral mucosal tissue, as well as in the draining iliac lymph nodes and in the spleen, but could not protect against a VV-Gag infection of the ovaries. Local vaginal or rectal immunization, despite lower CD8+ T cells responses, did provide protection.				
p24 (65–73)	Gag (Du422)	AMQMLKDTI	Vaccine	mouse	vanHarmelen2003
	Vaccine *Vector/Type:* DNA *Strain:* C clade Du422 *HIV component:* Gag **Keywords** inter-clade comparisons, variant cross-recognition or cross-neutralization. **Assay type** Chromium-release assay.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Donor HLA H-2d. • The pTHgagC DNA vaccine employed in this study expressed the gag gene derived from the South African isolate Du422, which was selected on the basis of being the natural strain most similar to the South African subtype C consensus sequence (aa distance of 1.8%). • A E7D mutation was introduced into the epitope to match the gag subtype C sequence in the vaccine. Mice vaccinated with the gag DNA made strong CTL responses against AMQMLKDTI, boosting enhanced the response, and memory cells persisted for 15 weeks.				
p24 (65–73)	Gag (p24) (197–205)	AMQMLKETI?	Vaccine	mouse	Yoshizawa2003
	Vaccine *Vector/Type:* protein *HIV component:* Gag *Adjuvant:* Cholera toxin (CT) **Keywords** TCR usage, genital and mucosal immunity. **Assay type** CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Chromium-release assay. **Donor HLA** H-2d. • Intranasal immunization triggered CTL response in the nasal-associated lymphoid tissue (NALT), posterior cervical lymph nodes (pCLNs) and the spleen, but not in the mesenteric lymph nodes (MLNs). Rectal immunzation elicited CTL responses only in the MLNs. By immunizing mice nasally following rectal immunization, CTL responses were detected in NALT, pCLNs, spleen and MLNs. Epitope-specific CD8+ T-cells were primarily located in NALT after 6 days and in pCLNs after 2 months. • The strongest specific lysis was induced by NALT-specific CTL clones. pCLNs derived memory CTL clones originated from NALT CTL clones, as determined by T cell receptor Vβ usage.				
p24 (65–73)	Gag (199–207 HXB2)	AMQMLKETI	Vaccine	mouse (H-2^d)	Qiu1999
	Vaccine *Vector/Type:* DNA *Strain:* B clade HXB2 *HIV component:* Gag • Different expression vectors were tested to increase Gag expression in cell lines and create suitable vectors for DNA vaccines. • Stable Gag expression was achieved in murine p815 cells, using a Gag gene that had mutated silent base positions that disrupt inhibitory RNA sequences which promote RNA degradation. • Silent mutations were more effective than introduction of the D retrovirus cis-acting posttranscriptional control element (CTE) for enhancing Gag expression. • The gag vector with silent mutations given as a vaccine to BALB/c mice gave CTL responses in splenic mononuclear cells, using peptide pulsed cells as targets.				
p24 (65–73)	p24 (199–207 SF2)	AMQMLKETI	Vaccine	mouse (H-2^d)	Neidleman2000
	Vaccine *Vector/Type:* protein, vaccinia *Strain:* B clade SF2 *HIV component:* Gag, Gag-Pol *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Epitope name** p7g. • Intranasal immunization of CB6F1 (H2bxd) mice with soluble gag p55 with LT ADP-ribosyltransferase mutants (LTK63 and LTK73) from Escherichia coli as adjuvants was tested. • Intranasal and intramucosal immunization of p55 gag protein with LTK63 or LTK72 adjuvant induced a CTL response comparable to intramuscular immunization responses. • Oral co-administration of LTR72, with residual ADP-ribosyltransferase activity, induced systemic CTL responses, but LTK63 with no ADP-ribosyltransferase activity did not.				
p24 (65–73)	p24 (66–74)	AMQMLKETI	Vaccine	mouse (H-2^d)	Marsac2002
	Vaccine *Vector/Type:* DNA *HIV component:* Gag *Adjuvant:* vesicular stomatitis virus glycoprotein (VSV-G) • BALB/c mice were injected with plasmids expressing HIV-1 Gag with or without coinjection of a plasmid expressing vesicular stomatitis virus glycoprotein (VSV-G). The combination encodes VSV-G pseudotyped Gag particles that can be taken up by cells for presentation in either the class I or class II pathways, while exogenous Gag alone can only be taken into the class II pathway.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Vaccination with DNA expressing VSV-G pseudotyped Gag particles rather than just Gag increase Gag-specific CTL responses generally as well as the specific H-2d restricted anti-AMQMLKETI response.				
p24 (65–73)	Gag (p24) (199–207 SF2)	AMQMLKETI	Vaccine	mouse (H-2^{kd})	O'Hagan2002
	Vaccine *Vector/Type:* protein *Strain:* B clade SF2 *HIV component:* Gag *Adjuvant:* DDA, DOTAP, CpG immunostimulatory sequence (ISS), MF59, PLG, urea **Keywords** dendritic cells. **Epitope name** p7G. • Intramuscular or intraperitoneal immunization of BALB/c or CB6F1 mice with urea-solubilized, emulsified, or PLG-microparticle associated p55 Gag was studied in conjunction with the adjuvant CpG. CpG did not enhance CTL immunity when combined with urea solubilized p55, but did when combined with emulsions and PLG-microparticle antigen. • CpG shifted the Ab response towards a IgG2a, and CpG was shown to upregulate CD86 on mouse bone-marrow derived dendritic cells.				
p24 (65–73)	p24 (199–207 SF2)	AMQMLKETI	Vaccine	mouse (H-$2K^d$)	Doe1996
	Vaccine *Vector/Type:* vaccinia *HIV component:* Gag, Pol **Keywords** immunodominance. • Immunodominant murine CTL response to this peptide observed after immunization with vaccine VVgagpol. • Optimal peptide was defined.				
p24 (65–73)	Gag (197–205)	AMQMLKETI	Vaccine	mouse (H-$2K^d$)	Rayevskaya2001
	Vaccine *Vector/Type:* Listeria monocytogenes *HIV component:* Gag • BALB/c mice were immunized with a highly attenuated recombinant Listeria monocytogenes, Lmdaldat, that can grow only when supplemented with D-alanine, and that expresses HIV-1 HXB2 Gag. • Parenteral immunization provided protection against systemic and mucosal challenges with a recombinant vaccinia virus expressing HIV-1 gag, and a long lasting memory CTL response against Gag in spleen, mesenteric lymph nodes, and Peyer's patches directed against the gag protein. • Oral immunization gave protection only against mucosal virus challenge and was associated with a transient CTL response in the three lymphoid tissues examined. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.				
p24 (65–73)	Gag (197–205 SF2)	AMQMLKETI	Vaccine	mouse (H-$2K^d$)	Mata1998
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag **Keywords** immunodominance. • BALB/c mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways. • This is the immunodominant CTL epitope in Gag in BALB/c mice. • AMQMLKETI does not contain established Kd anchoring residue in position 2, tyrosine or phenylalanine, thus deviating from the typical Kd anchoring motif – the lack of the aromatic anchor residue is compensated for by interaction of the glutamine at P3 with pocket D of Kd.				
p24 (65–73)	Gag (HXB2)	AMQMLKETI	Vaccine	mouse (H-$2K^d$)	Haglund2002a
	Vaccine *Vector/Type:* vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag **Keywords** immunodominance.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Different HIV strains were used for different regions: Env IIIB, Gag HXB2 • BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag, Env, or both, and compared to using rec Env and Gag in vaccinia virus (rVVs). The primary response was determined by cell lysis, cytokine production and tetramer staining. • Primary CTL responses to the immunodominant Gag (AMQMLKETI) epitope peaked in 7 days for GAG-rVSV, 3% of the cells were tetramer positive, and this response was 8-fold higher than for Gag-rVV. • Vaccinating with GagEnv-rVSV carrying both Gag and Env allowed recognition of both HIV-1 proteins, but at reduced levels compared to either Gag-rVSV or Env-rVSV alone. • Intranasal immunization with Env-rVSV yielded CTL responses that were strong but reduced compared to an intraperitoneal route.				
p24 (65–73)	Gag (HXB2)	AMQMLKETI	Vaccine	mouse (H-2K^{d})	Haglund2002b
	Vaccine *Vector/Type:* vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag **Keywords** immunodominance. • Different HIV strains were used for different regions: Env IIIB, Gag HXB2 • BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN-gamma production. • Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive. • Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN-gamma production. • A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost. • A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN-gamma producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit. • A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.				
p24 (65–73)	Gag	AMQMLKETI	Vaccine	mouse (H-2Kd)	Peters2003
	Vaccine *Vector/Type:* Listeria monocytogenes *HIV component:* Gag **Keywords** genital and mucosal immunity. **Assay type** Tetramer binding, Intracellular cytokine staining. **Donor HLA** H-2d. • Intravenous, rectal, and oral vaccination of recombinant L. monocytogenes expressing HIV-1 Gag antigen, were compared for their ability to stimulate a mucosal CTL response; mucosal administration of this vaccine gave strong mucosal response that was readily boosted. • This CTL epitope is the immunodominant epitope in Gag for BALB/c mice, and was used to characterize the vaccine responses.				
p24 (65–73)	Gag (197–205)	AMQMLKETI	Vaccine	mouse (H-2Kd)	Rayevskaya2003
	Vaccine *Vector/Type:* vaccinia, Listeria monocytogenes *HIV component:* Gag, Nef **Keywords** memory cells. **Assay type** cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay. **Donor HLA** H-2d. • Splenocytes derived from BALB/c mice immunized and boosted with Lmdd-gag were stimulated with gag-peptide specific antigen *in vitro*. In culture, CTL activity against this epitope reached a maximum at 9 days, then declined. Peptide restimulation gave a delayed (18 hours) but potent response, and growth was IL-2 or IL-15 dependent. Adoptive transfer of 5000 of the sorting purified cells could protect recipient BALB/c against vaccinia-gag challenge up to 3 months after transfer.

p24 (84–92)	p24 (84–92)	HPVHAGPIA	HIV-1 infection	human (B7)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** B7-HA9. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 1/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection—10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 3/4 individuals had detectable responses to this epitope after STI.				
p24 (87–101)	Gag (219–233 LAI)	HAGPIAPGQMREPRG	HIV-1 infection	human	Buseyne1993a
	• Vertical transmission of HIV ranges from 13% to 39% • Primary assays showed cytotoxic activity against at least one HIV protein was detected in 70% of infected children. • Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures. • Patient EM28 (CDC P2A) had a CTL response to four epitopes in Gag.				
p24 (87–101)	p24 (219–233 BRU)	HAGPIAPGQMREPRG	HIV-1 infection	human (A2)	Claverie1988
	• One of 4 epitopes predicted then shown to stimulate HLA-A2 restricted CTL line.				
p24 (91–110)	p24 (223–242 SF2)	IAPGQMREPRGSDIAGTTST	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Twelve subjects had CTL that could recognize vaccinia-expressed LAI gag. • One of these 12 had CTL response to this peptide. • The responding subject was HLA-A2, A24, B13, B35.

	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Twelve subjects had CTL that could recognize vaccinia-expressed LAI gag. • One of these 12 had CTL response to this peptide. • The responding subject was HLA-A26, A30, B38.				
p24 (107–115)	Gag (239–247 SF2)	TTSTLQEQI	Vaccine	mouse (H-2K^{d})	Mata1998
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag • BALB/c mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.				
p24 (108–117)		TSTLQRQIGW	HIV-1 infection	human	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized in 1/22 HEPS sex worker controls (ML1250)				
p24 (108–117)		TSTLQEQIGW	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.				
p24 (108–117)		TSTLQEQIGW	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW. • CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia. • The HLA-A*0201 SLYNTVATL epitope response was not as strong individuals that carried both A2, B57.				
p24 (108–117)		TSTLQEQIGN	HIV-1 infection	human (B*5701)	Migueles2003
	Keywords rate of progression, escape. **Assay type** Intracellular cytokine staining, Flow cytometric CTL assay. • cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1-7) than LTNPs (median 2, range 0-4). • In general use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.

	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p24 (108–117)	p24	TSTLQEQIGW	HIV-1 infection	human (B57)	Kaul2002
	Keywords HIV exposed persistently seronegative (HEPS). • Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs. • Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.				
p24 (108–117)	p24	TSTLQEQIGW	HIV-1 infection	human (B57)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** TST.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI). • STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
p24 (108–117)	p24 (108–117)	TSTLQEQIGW	HIV-1 infection	human (B57, B58)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins, cross-presentation by different HLA. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A1, A26, B35, B57, Cw4, Cw0601; A1, A30, B42, B52, Cw7, Cw17; A1, A*0201, B44, B57, Cw5, Cw6. • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • This epitope was recognized in three of the acutely infected individuals and was presented by both HLA-B57 and B58. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.				
p24 (108–117)	p24 (235–243)	TSTLQEQIGW	HIV-1 infection, HIV-1 exposed seronegative	human (B57, B58)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • TSTLQEQIGW cross reacts with both for the A and B clades. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
p24 (108–117)	p24 (241–250)	TSTVEEQQIW	HIV-2 infection	human (B58)	Bertoletti1998a
	• HIV-2 epitope defined from an infection in Gambia, Bertoletti, pers. comm. • All HIV-2 sequences from the database are TSTVEEQIQW in this region, not TSTVEEQQW as in the paper.				
p24 (108–117)	p24	TSTLQEQIGW	HIV-1 exposed seronegative	human (B58)	Rowland-Jones1999
	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, and the B35 allele seems to be protective. • HIV-2 sequence: TSTVEEQIQW, CTL are cross-reactive, [Bertoletti1998b]				
p24 (108–117)	p24 (240–249)	TSTLQEQIGW	HIV-2 infection	human (B58)	Bertoletti1998b
	Keywords inter-clade comparisons, rate of progression, immunodominance. • CTL responses in HLA-B*5801 positive HIV-2 infected individuals have a dominant response to Gag and tolerate extensive substitution, thus HLA-B*5801+ individuals may have an enhanced potential for cross-protection between HIV-1 and HIV-2. • This can be an immunodominant epitope in HLA-B57 and B*5801 infected individuals, and is associated with long-term non-progression [Goulder1996b]				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-2 sequence: HIV-2 ROD has the epitope sequence TSTVEEQIQW, and the CTL from a person infected with HIV-2 was cross-reactive with HIV-1 epitopes. • The epitope is TSTLQEQIGW in HIV-1 B clade, and TSTVEEQIQW in HIV-2 ROD. • HLA B*5801 and B35 may preferentially select HIV-1 and HIV-2 cross-reactive epitopes.				
p24 (108–117)	p24 (240–249 SF2)	TSTLQEQIGW	HIV-1 infection	human (B58)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B58+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 1/1 group 2, and 0/0 group 3.				
p24 (108–117)	p24 (108–117)	TSTLQEQIGW	HIV-1 infection	human (B58)	Goulder2001c
	Keywords acute infection. **Epitope name** TW10. • Responses to this dominant A3-restricted Gag epitope are present during the time of decreasing viral load in acute infection. • Mutations in this epitope were observed in autologous clones of subjects who were B58-positive with a higher frequency than those who were B58-negative (P = 0.02) • These mutations are being sexually transmitted in adult infections.				
p24 (108–118)	p24 (240–249 LAI)	TSTLQEQIGWF	HIV-1 infection	human (B*57, B*5801)	Goulder1996b
	Keywords rate of progression. • Response to this epitope was found in 4 slow progressing HLA-B*57 individuals, in 2 it was dominant or very strong. • For one donor (from Zimbabwe) this was defined as the optimal peptide. • This epitope can be presented in the context of the closely related HLA molecules B*5801 and B*57.				
p24 (108–118)	p24 (240–249 LAI)	TSTLQEQIGWF	HIV-1 infection	human (B*5701)	Frahm2004
	• C. Brander notes this is a B*5701 epitope.				
p24 (108–118)		TSTLQEQIGWF	HIV-1 infection	human (B57)	Sabbaj2002b
	Epitope name Gag-TF11. • Among HIV+ individuals who carried HLA B57, 2/5 (40%) recognized this epitope.				
p24 (109–117)	Gag (241–249 LAI)	STLQEQIGW	HIV-1 infection	human (B*5701 B*5801)	Klein1998
	Keywords rate of progression. • B57 has been associated with long-term non-progression in the Amsterdam cohort. • The most pronounced CTL responses in HLA B*5701 LTS were to RT and Gag.				
p24 (109–117)		STLQEQIGW	HIV-1 infection	human (B57)	Sabbaj2002b
	Epitope name Gag-SW9. • Among HIV+ individuals who carried HLA B57, 1/5 (20%) recognized this epitope.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Among HIV+ individuals who carried HLA B58, 1/4 (25%) recognized this epitope.				
p24 (110–118)	Gag (242–)	TLQEQIGWM	HIV-1 infection, Vaccine	human (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* p24 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Gag242. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was an intermediate A2 binder that did not induce CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 2/17 HIV+ HLA-A2 subjects.				
p24 (118–126)	Gag (282–290)	MTNNPPIPV	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).				
p24 (121–135)	p24 (121–135 HXB2)	NPPIPVGEIYKRWII	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p24 (121–135)	p24 (253–267)	NPPIPVGEIYKRWII	HIV-1 infection	human (B8)	Gotch1990
	• High frequency of memory and effector Gag-specific CTL.				
p24 (121–135)	p24 (255–274 SF2)	NPPIPVGEIYKRWII	HIV-1 infection	human (B8)	Goulder1997a, Phillips1991
	Keywords review, immunodominance, escape. • Longitudinal study of CTL escape mutants in people with the appropriate HLA types – little variation was observed in the immunodominant B27 epitope, relative to B8 epitopes, which varied over time.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• [Goulder1997a] is a review of immune escape that points out that there may be a protective effect associated with B27, and that HLA-B8 individuals tend to progress more rapidly than HLA B27 patients.

p24 (122–130)	p24 (260–268 LAI)	PPIPVGDIY	in vitro stimulation or selectio	human (B35)	Lalvani1997
	• A peptide-based protocol was optimized for restimulation of CTLp using optimized peptide and IL-7 concentrations – importantly this protocol does not stimulate a primary response, only secondary – peptide-specific CTLp counts could be obtained via staining with peptide-Class I tetramers. • This peptide was one of the B35 presented test peptides used in control experiments showing that the assay gave no activity using lymphocytes from 21 healthy B35 seronegative donors.				
p24 (122–130)	p24 (260–268 LAI)	PPIPVGDIY	HIV-1 infection	human (B35)	McMichael1994
	Keywords review. • Review of HIV CTL epitopes.				
p24 (122–130)	p24 (subtype B)	PPIPVGEIY	HIV-1 exposed seronegative	human (B35)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among B and D clade viruses. • The Clade A version of the epitope, PPIPVGDIY, was preferentially recognized by CTL.				
p24 (122–130)		PPIPVGEIY	HIV-1 infection	human (B35)	Wilson2000a
	Keywords acute infection. • Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers—high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load. • All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39. • ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK. • The subject with A*0201 had a moderately strong response to SLYNTVATL.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705. • No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.				
p24 (122–130)	p24	PPIPVGDIY		human (B35)	Rowland-Jones1999
	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, and the B35 allele seems to be protective. • HIV-2 version of this epitope is not conserved: NPVPVGNIY, but the CTLs are cross-reactive – one of five B35 CTL epitopes that are cross-reactive, see also [Rowland-Jones1995b]				
p24 (122–130)	p24 (260–268)	PPIPVGDIY	HIV-1 infection	human (B35)	Oxenius2000
	Keywords HAART, acute infection. **Epitope name** PPI. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • One of two HLA B35+ among the eight study subjects recognized this epitope. • Patient SC15 (HLA A1/68, B8/35, Bw4/6, Cw4/0704) was given acute and sustained therapy and recognized epitopes PPIPVGDIY and VPLRPMTY during 331 days of HAART treatment.				
p24 (122–130)	p24 (122–130)	PPIPVGDIY	HIV-1 infection	human (B35)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p24 (122–130)	p24 (254–262 SF2)	PPIPVGDIY	HIV-1 infection	human (B35)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 0/2 group 1, 0/2 group 2, and 1/1 group 3.				
p24 (122–130)	p24 (260–268)	PPIPVGDIY	HIV-1 infection, HIV-1 exposed seronegative	human (B35)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B35 women, 1/3 HEPS and 3/4 HIV-1 infected women recognized this epitope. • The dominant response to this HLA allele was to this epitope in the 1/3 HEPS case and in the all 3/4 responsive HIV-1 infected women. • Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVIYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion.				
p24 (122–130)		PPIPVGDIY	HIV-1 infection	human (B35)	Sabbaj2002b
	Epitope name Gag-PY9. • Among HIV+ individuals who carried HLA B35, 2/21 (10%) recognized this epitope. • Among HIV+ individuals who carried HLA B*5301, 0/11 (0%) recognized this epitope.				
p24 (122–130)	p24	PPIPVGEIY	HIV-1 infection, Vaccine	human (B35)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
p24 (124–138)	p24 (256–270 LAI)	IPVGEIYKRWIILGL	HIV-1 infection	human (B8)	Buseyne1993b
	• Clustering of Gag p24 CTL epitopes recognized in 29 HIV-infected people.				
p24 (124–138)	Gag (256–270 LAI)	IPVEGEIYKRWIILGL	HIV-1 infection	human (B8)	Buseyne1993a
	• Vertical transmission of HIV ranges from 13% to 39% • Primary assays showed cytotoxic activity against at least one HIV protein was detected in 70% of infected children. • Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures. • Two children, EM16 (CDC P2A+D2) and EM18 (CDC P2A), had a CTL response to this epitope, and it was shown to be presented by B8 in EM18.				
p24 (126–140)	p24 (126–140 HXB2)	VGEIYKRWIIGLNK	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p24 (127–135)	p24 (259–267 SF2)	GDIYKRWII	HIV-1 infection	human (B*0801)	McAdam1998
	• GDIYKRWII specific CTL clone also recognized GEIYKRWII.				
p24 (127–135)	p24 (261–269)	GEIYKRWII	HIV-1 infection	human (B8)	Sutton1993
	• Predicted epitope based on B8-binding motifs, from larger peptide NPPIPVGEIYKRWII.				
p24 (127–135)	p24 (259–267)	GEIYKRWII	in vitro stimulation or selectio	human (B8)	Zarling1999
	Keywords dendritic cells. • This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses. • Strong CTL responses were elicited by the epitopes DRFYKTLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA. • A weak response to KLTPLCVSL was stimulated using macrophages as the APC. • No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.				
p24 (127–135)	p24 (259–267 LAI)	GEIYKRWII	HIV-1 infection	human (B8)	Klenerman1994
	• Naturally occurring variant GDIYKRWII may act as antagonist.				
p24 (127–135)	p24 (259–267)	GEIYKRWII	HIV-1 infection	human (B8)	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the HLA A2+ was HLA A*0201, A31, B8, B51 and responded to this epitope as well as seven others.				
p24 (127–135)	p24 (259–267)	GEIYKRWII	HIV-1 infection	human (B8)	Nowak1995
	Keywords dynamics, escape. • Longitudinal study of CTL response and study of immune escape – GDIYKRWII could also stimulate CTL, reactivity fluctuated.				
p24 (127–135)	p24 (259–267)	GEIYKRWII	HIV-1 infection	human (B8)	McAdam1995
	• Equivalent sequence GDIYKRWII also recognized by CTL from some donors.				
p24 (127–135)	p24 (259–267)	GEIYKRWII	HIV-1 infection	human (B8)	Oxenius2000
	Keywords HAART, supervised treatment interruptions (STI), immunodominance, escape, acute infection. **Epitope name** GEI. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Six of the 7/8 study subjects that were HLA B8 recognized this epitope. • Patient SC2 (HLA A1, B7/8, Cw0701/0702, DR4/53, DQ7) had CTL responsiveness against epitopes FLKEKGGL, GPKVKQWPL, and GEIYKRWII peptides – FLKEKGGL tetramer staining steadily declined and at day 1340 the FLKEKGGL stained cells were no longer detected and the escape mutant FLKENGGI was found in 8/10 clones. • Patient SC9 (HLA A1/2, B8/13, Cw0/0701, DR2/11, DQ6/7) had a CTL response against epitopes FLKEKGGL, ILKEPVHGV, SQRRQDILDLWIYHTQ-GYFPDWQNY, and GEIYKRWII and all responses declined during therapy initiated at day 390 but were restored when therapy become intermittent. • Patient SC19(HLA A11/12, B8/44, Cw06/0701, DR3/7, DR52/53, DQ 2/8) had a CTL response to epitopes FLKEKGGL, GEIYKRWII, ACQGVGGPGHK, AVDLSHFLK, and FNCGGEFFY that declined during therapy initiated at day 197. • Patient SC10(HLA A1/3, B8/35, DR1/8, DQ 4/5) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL and a response to GEIYKRWII through day 1088. • Patient SC12(HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL throughout and minor responses to GEIYKRWII, DCKTILKAL, GGKKKYKLK – GEIYKRWII and GGKKKYKLK responses were stimulated by a brief period off therapy. • Patient SC11(HLA A1, B8, Cw0201, DR3/11, DR52, DQ2/7) started therapy early, remained on therapy for 40 days, then reinitiated HAART at day 640 had a CTL response to FLKEKGGL, GPKVKQWPL, and GEIYKRWII throughout and received a benefit from the early limited course therapy.			
p24 (127–135)	p24 (259–267 SF2)	GEIYKRWII	HIV-1 infection	human (B8)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B8+ individuals that had a CTL response to this epitope broken down by group: 2/3 group 1, 2/3 group 2, and 2/2 group 3.				
p24 (127–135)	p24	GEIYKRWII	HIV-1 infection	human (B8)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** GEI. • Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI). • STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
p24 (127–135)	p24	GEIYKRWII	HIV-1 infection, Vaccine	human (B8)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. 	• Tetramer assays were compared with three functional assays in 42 people with chronic HIV infection: ELISPOT, intracellular cytokine staining, and precursor frequency (limiting dilution assay [LDA]) • HIV-specific tetramer staining CTLs appeared to be active, and inert CTL were not found to play a significant role in chronic pediatric or adult HIV infection.				
p24 (128–135)	p24	DIYKRWII	HIV-1 infection	human (B8)	Appay2002
	Keywords HAART. **Donor HLA** A2,A11,B8,B60,Bw6. • Four HIV patients with prolonged clinically successful anti-viral therapy but with ongoing evidence of replication and Nef mRNA transcription, showed specific T-cell responses by Elispot and Tetramer staining, maintained for 2-4 years after initiation of HAART. • Nef epitope recognition was detected in all 4 subjects, gp120, Pol and Gag-specific in 1 or 2 subjects. • The HIV-specific CD8+ T-cells had an intermediate maturation phenotype characterized by low levels of perforin and high levels of CD27 expression.				
p24 (128–135)	Gag (260–267 IIIB)	EIYKRWII	HIV-1 infection	human (B8)	Kurane2003
	Assay type Chromium-release assay. • Three CD8+ CTL cell clones were derived from 2 HIV-1 positive asymptomatic patients, and their epitope specificities and HLA presenting proteins were defined.				
p24 (129–136)	p24 (263–270 SF2)	IYKRWIIL	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This peptide induced CTL in 1/4 HIV-1+ people tested. • IYKRWIIL bound to A*2402 with medium strength, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
p24 (129–138)	p24 (263–272 SF2)	IYKRWIILGL	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 1/4 HIV-1+ people tested. • IYKRWIILGL bound to A*2402 with medium strength, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
p24 (129–138)	p24 (263–272)	IYKRWIILGL	HIV-1 infection	human (B27)	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the A2+ individuals was B27 and responded to IYKRWIILGL.				
p24 (129–148)	Gag (261–280)	IYKLWIILGLNKIVRMYSPT	HIV-1 infection	human (B27, B62)	Musey2003
	Keywords genital and mucosal immunity. **Assay type** Chromium-release assay. **Donor HLA** A3, A31, B27, B38; A24, B27, B62. • CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments. • CD8+ T cell clones directed at this epitope were derived from blood and rectum of one individual, and blood and semen of another. Both individuals are HLA-B27 positive, and within the peptide there is a B27 epitope that was recognied in the blood and rectum of the first patient, and in the blood of the second. A HLA-B62 epitope is also recognized in this peptide in the second individual, and the CD8+ T cells clones from both the blood and semen recognized this epitope.				
p24 (130–148)	p24 (265–280 BRU)	YKRWIILGLNKIVRMYSPT	HIV-1 infection	human (B27)	Dadaglio1991
	• Used as a positive control for HLA specificity.				
p24 (131–139)	Gag (265–273)	KRWIILGLN	HIV-1 infection	chimpanzee (Patr-B*03)	Balla-Jhagjhoorsingh1999b
	• Certain HLA-alleles have been associated with long-term survival – among them are HLA-B*27 and HLA-B*57. • Of more than 150 chimpanzees that have been reported to be infected with HIV-1, only one has developed AIDS. • CTL responses were studied in two HIV-1 infected chimpanzees that have strong CTL responses, and they were found to respond to highly conserved epitopes that are recognized in humans in the context of HLA-B*27 and HLA-B*57. • The human HLA protein which presents this Patr-B*03 epitope is HLA B*2705 but the amino acid sequences in the binding pockets of HLA-B*2705 and Patr-B*03 are distinctive.				
p24 (131–140)	Gag (263–272 LAI)	KRWILLGLNK	HIV-1 infection	human	Buseyne1993a
	• Vertical transmission of HIV ranges from 13% to 39% • Primary assays showed cytotoxic activity against at least one HIV protein was detected in 70% of infected children. • Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures.

	• C. Brander notes this is a B*2705 epitope.				
p24 (131–140)	p24 (263–272)	KRWIILGLNK	HIV-1 infection	human (B*2705)	Kelleher2001b
	Keywords escape. • A mutation in 4/5 B*2705 patients had substitution to lysine (K) at HIV-1 gag residue 264 (R264K), in three the change occurred late in infection – in one patient a substitution of glycine at HIV-1 gag residue 264 (R264G) was detected – these substitutions reduce binding to B27. • The R264K mutations were associated with a L268M mutation that may be compensatory, and R264G occurred in conjunction with E260D. • Positions 260, 264, and 268 all lie along one aspect of helix seven of the capsid protein, a region that is important for capsid self-association and assembly. • R264G and R264K escape mutation outgrowth occurred in conjunction with high viral loads.				
p24 (131–140)	p24 (263–272)	KRWIIMGLNK	HIV-1 infection	human (B*2705)	Appay2000
	• Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV. • HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α				
p24 (131–140)	p24	KRWIILLGLNK	HIV-1 infection, Vaccine	human (B*2705)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag				
	Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance.				
	• The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000].				
	• Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
p24 (131–140)	p24 (263–272 LAI)	KRWIILGLNK	HIV-1 infection	human (B*2705, B27)	Goulder1997c, Goulder1997a
	Keywords review, rate of progression, immunodominance, escape.				
	• HLA-B*2705 is associated with slow HIV disease progression.				
	• 11/11 HLA-B*2705 donors make a response to this epitope, usually an immunodominant response.				
	• This is a highly conserved epitope.				
	• The HLA-B*2705 binding motif includes R at position 2, and L in the C-term position.				
	• [Goulder1997a] is a review on CTL immune escape that discusses this epitope in the context of the difficulty in detection of immune escape – KRWIILGLNK and an R2K change, KKWIILGLNK, show little difference in titration curves, yet the K2 variants fail to bind to targets for more than 1 hour, while the R2 form can sensitize lysis by CTL for over 24 hours – minigene transfection experiments confirmed the importance of this for the CTL response.

	Keywords responses in children, mother-to-infant transmission, immunodominance, escape, acute infection. **Epitope name** KK10. • 85% of B27+ adults have CTL that recognize this epitope, but only 2/6 children did. • Responses to this dominant B27-restricted Gag epitope are present during the time of decreasing viral load in acute infection. • Three children who shared B27 with their mothers did not respond to this epitope and inherited escape mutations from their mothers. • A transmitted R132T anchor residue mutation abrogated binding to B27. • In the three children infected with the non-binding KK10 variants, the dominant CTL specificity was still HLA-B27-restricted, but it was directed against an epitope in p17, IRLRPGGKK, only rarely recognized in adults when KRWIILGLNK is the dominant response. • Mutations in this epitope were observed in autologous clones of subjects who were B27-positive with a higher frequency than those who were B27-negative (P = 0.0005) • These mutations are being sexually transmitted in adult infections.				
p24 (131–140)		KRWIILGLNK	HIV-1 infection	human (B27)	Sabbaj2002b
	Epitope name Gag-KK10. • Among HIV+ individuals who carried HLA B27, 2/3 (66%) recognized this epitope.				
p24 (131–140)	p24 (263–272 LAI)	KRWIIMGLNK	HIV-1 infection	human (B27)	Kelleher2001a
	Keywords HAART, epitope processing, immunodominance. • Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in an intracellular context. • RTV did not reduce antigen presentation and concentration of the two immunodominant Gag CTL epitopes (KRWIIMGLNK (B27) and SLYNTVATL (A2)).				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.				
p24 (131–140)	p24	KRWIILGLNK	HIV-1 infection	human (B27)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** B27-KK10(p24). **Donor HLA** A24,A?,B7,B27; A30,A32,B18,B27. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef). Patient D also displayed the greatest response to B27-KK10(p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).				
p24 (131–140)	Gag (263–272)	KRWIILGLNK	HIV-1 infection	human (B27)	Currier2002a
	Keywords inter-clade comparisons. **Donor HLA** B27. • Cross-reactive responses were found in PBMC isolated from individuals infected with either B or CRF01_AE clade viruses, as determined by Elispot assays of target cells expressing recombinant vaccinia viruses expressing HIV-1 gag, env, nef and pol from many clades. • Subject AIHP-6 (Thai, CDF01-AE infected) recognized this epitope. This subject showed cross-subtype CTL responses to gag constructs derived from subtypes A, B, C, D, F, G, and H, and this epitope was perfectly preserved in all of these but subtype A which had the sequence KRWMILGLNK. • This subject didn't respond to a Gag CRF01 sequence which had a R->K mutation in position 2.

	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p24 (131–145)	p24 (SF2)	KRWILGLNKIVRMY	HIV-1 infection	human	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • The CTL-dominant response was focused on this epitope in a HIV+ African American living in Boston with unknown HLA – this epitope did not fall within the three most recognized peptides in the study.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
p24 (131–145)	p24 (131–145 HXB2)	KRWIILGLNKIVRMY	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** CD8 T-cell Elispot - IFNγ. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p24 (131–145)	p24 (263–277 LAI)	KRWIILGLNKIVMRY	HIV-1 infection	human (A33)	Buseyne1993b

	Keywords review, escape. • This paper is a review of CTL and immune evasion, but it presents a study of a shift from an HLA-A*0201 response to SLYNTVATL, to a B62 response to GLNKIVRMY. • As long as a strong CTL response to SLYNTVATL was evident, the epitope variants SLFNTVATL or SLYNTIATL dominated the viral population – eventually the CTL response to the index peptide became undetectable, the CTL response shifted to a focus on GLNKIVRMY, and the index peptide SLYNTVATL once again established itself as the dominant form.				
p24 (137–145)	p24 (SF2)	GLNKIVRMY	HIV-1 infection	human (B62)	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • The CTL-dominant response was focused on this epitope in a HIV+ African American living in Boston – this epitope did not fall within the three most recognized peptides in the study. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYVDRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
p24 (137–145)	p24 (267–277 SF2)	GLNKIVRMY	HIV-1 infection	human (B62)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B62+ individuals that had a CTL response to this epitope broken down by group: 0/1 group 1, 0/1 group 2, and 1/1 group 3.				
p24 (137–145)	p24 (137–145)	GLNKIVRMY	HIV-1 infection	human (B62)	Day2001
	Keywords immunodominance. • No immunodominant responses were detected to four B62-restricted epitopes tested.				
p24 (137–145)	p24 (137–145)	GLNKIVRMY	HIV-1 infection	human (B62)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A1, A3, B8, B62, Cw3, Cw7. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.				
p24 (137–145)	Gag (269–277)	GLNKIVRMY	HIV-1 infection	human (B62)	Musey2003
	Keywords genital and mucosal immunity. **Assay type** Chromium-release assay. **Donor HLA** A2, A24, B27, B62. • CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments. • CD8+ T cell clones directed at this epitope were derived from blood, rectum and semen.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The TCRbeta VDJ rearrangement of the CTL clones was Vβ22S1DJ1.2, demonstrating expansion of CTL clones in all three compartments from the same progenitor cell.

	Keywords HIV exposed persistently seronegative (HEPS).				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Variants FRDYVDRF(Y/F)K are specific for the B,D/A,C clades. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B18 women, 3/4 HEPS and 1/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYVDRFY/FK, while infected women tended to respond to YPLTFGWCY/F. • The dominant response to this HLA allele was to this epitope for all 3/4 HEPS cases and for the single HIV-1 infected women that responded to this epitope. • Four epitopes were considered to be "resistant epitopes", as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLNM/TLN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24. • Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.				
p24 (161–170)	p24	FRDYVDRFYK	HIV-1 infection, Vaccine	human, macaque (B18)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
p24 (161–174)	p24 (161–174 HXB2)	FRDYVDRFYKTLRA	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

p24 (163–173)	Gag (297–307 SF2)	DYVDRFYKTLR	HIV-1 infection, computer prediction	human (A*3303)	Hossain2003
	Keywords binding affinity, computational epitope prediction. **Assay type** Chromium-release assay. • HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing. • This epitope is one of the 2/6 peptides that could induce CTL responses in the PBMC of infected individuals, but was not properly processed in a vaccinia-HIV infected target cell.				
p24 (164–172)	Gag (296–304)	YVDRFYKTL	HIV-1 infection	human (A*0207)	Currier2002a
	Keywords inter-clade comparisons. **Donor HLA** A*0207. • Cross-reactive responses were found in PBMC isolated from individuals infected with either B or CRF01_AE clade viruses, as determined by Elispot assays of target cells expressing recombinant vaccinia viruses expressing HIV-1 gag, env, nef and pol from many clades. • The Thai subject VAIP-4 demonstrated broad CTL cross-reactivity towards gag constructs derived from subtypes A, B, C, D, F, G, H, and CRF-01_AE. Sequence alignments of this epitope showed conservation for clades B and D, and Y->F substitutions at position 6 for subtypes A, C, CDR01-AE, F, G, and H. YVDRFYKTL and the variant epitope YVDRFFKTL are recognized equally well.

Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance.

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].

p24 (166–174)	p24 (166–174)	DRFYKTLRA	HIV-1 infection	human (B14)	Cao2003

Keywords acute infection, early-expressed proteins.
Assay type CD8 T-cell Elispot - IFNγ.
Donor HLA A1, A3, B7, B14, cw*0702, Cw*0802; A1, A1, B8, B14, Cw7, Cw8.

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in two subjects early in infection, presented by B14 in each case.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

p24 (166–174)	p24 (subtype B)	DRFYKTLRA	HIV-1 exposed seronegative	human (B14, B*1402)	Rowland-Jones1998b

Keywords inter-clade comparisons.

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among B and D clade viruses.
- The Clade A version of the epitope, DRFFKLTRA, was preferentially recognized by CTL.
- This epitope was recognized by two different exposed and uninfected prostitutes.

p24 (166–175)	p24 (298–306 HX10)	DRFYKTLRAE	HIV-1 infection	human (B14)	Wagner1999

Keywords immunodominance.

- The immunodominant CTL response in a long-term survivor was to this highly conserved and functionally relevant epitope.
- By testing mutations in an HXB2 background, it was found that all mutations within the epitope that abrogated CTL recognition also abolished viral infectivity.

	• The epitope in this study overlaps the major homology region for which highly conserved residues exist in all known lenti- and onco-viruses and yeast transposons. • Patient was part of the study in [Harrer1996a]				
p24 (166–175)	Gag (298–307)	DRFYKTRAE	HIV-1 infection	human (B14)	Musey2003
	Keywords TCR usage, genital and mucosal immunity. **Assay type** Chromium-release assay. **Donor HLA** A24, A33, B14, B27. • CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments. • CD8+ T cell clones directed at this epitope were derived from blood and cervix.				
p24 (169–185)	p24 (169–184 HXB2)	YKTLRAEQASQDVKNWN	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • Responses to this peptide were detected in 17% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p24 (169–188)	Gag (301–320)	FKTLRAEQATQDVKNWMTDT	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 8 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
p24 (169–188)	Gag (301–320)	YKTLRAEQASQEVKNWMTET	HIV-1 infection	human (B57)	Musey2003
	Keywords TCR usage, genital and mucosal immunity. **Assay type** Chromium-release assay. **Donor HLA** A1, A66, B52, B57. • CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments. • CD8+ T cell clones directed at this epitope were derived from blood and rectum.				
p24 (173–181)		RAEQASQEV	HIV-1 infection	human	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized in 1/22 HEPS sex worker controls ML1792.				
p24 (173–181)	p24 (305–313)	RAEQASQEV	HIV-1 infection	human (Cw8)	Johnson1991
	• Originally reported as HLA-B14 restricted, but subsequently found not to be presented by cells transfected with B14. • Thought to be HLA-Cw8 restricted (C. Brander and B. Walker)				
p24 (173–181)	p24	RAEQASQEV	HIV-1 exposed seronegative	human (Cw8)	Rowland-Jones1998a
	Keywords inter-clade comparisons. • A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating. • The A subtype consensus is RAeQAtQEV. • The D subtype consensus is RAEQsQdV. • Thought to be HLA-Cw8 restricted, not B14 as originally reported (C. Brander, B. Walker, and S. Rowland-Jones, personal communication)				
p24 (173–181)	p24 (305–313)	RAEQASQEV	HIV-1 infection	human (Cw8)	Price1995
	• Study of cytokines released by HIV-1 specific activated CTL. • Thought to be HLA-Cw8 restricted, not B14 as originally reported (C. Brander, B. Walker, and S. Rowland-Jones, personal communication)				
p24 (173–181)	p24 (305–313)	RAEQASQEV	HIV-1 infection	human (Cw8)	Lubaki1997
	• Eighty two HIV-1-specific CTL clones from 5 long-term non-progressors were isolated and analyzed for breadth of response. • A sustained Gag, Env and Nef response was observed, and clones were restricted by multiple HLA epitopes, indicating a polyclonal response. • Despite this being a well defined conserved epitope, and thought to be presented by B14, none of the 11 gag-specific clones from a B-14 positive subject could recognize either it or p24 PQDLNTMLN. • Thought to be HLA-Cw8 restricted, not B14 as originally reported (C. Brander, B. Walker, and S. Rowland-Jones, personal communication)				
p24 (173–181)	p24 (305–313)	RAEQASQEV	HIV-1 infection, HIV-1 exposed seronegative	human (Cw8)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

	• C. Brander notes this is a B*4402 epitope.				
p24 (174–184)	p24 (306–316 LAI)	AEQASQDVKNW		human (B*4402, B44)	Brander1997
	• Pers. comm. from D. Lewinsohn to C. Brander and B. Walker, C Brander *et al.*, this database, 1999.				
p24 (174–184)	Gag (306–316)	AEQASQEVKNW	HIV-1 infection	human (B44)	Brodie1999
	• The ability of CTL effector cells was studied by expanding autologous HIV-1 Gag-specific CTL *in vitro*, and adoptively transferring them. • The transferred CTLs migrated to the lymph nodes and transiently reduced circulating productively infected CD4+ T cells, showing that CTL move to appropriate target sites and mediate anti-viral effects.				
p24 (174–184)	p24 (306–316)	AEQASQEVKNW	HIV-1 infection	human (B44)	Brodie2000
	• Study tracks and quantifies *in vivo* migration of neo-marked CD8 HIV-specific CTL.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Adoptively transferred gene-marked HIV-specific CTL homed to specific lymph node sites, colocalizing within the parafollicular regions of the lymph node adjacent to cells expressing HIV tat-fusion transcripts, indicative of viral replication. • The CTL clones expressed CCR5 and localized among HIV-1 infected cells expressing MIP-1alpha and MIP-1beta, CC-chemokines produced at sites of viral replication, suggesting a possible homing mechanism. • This study provides a methodology for tracking and studying antigen specific CTL *in vivo*				
p24 (174–184)	p24 (306–316 LAI) **Keywords** HAART. **Epitope name** G3. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.	AEQASQDVKNW	HIV-1 infection	human (B44)	Mollet2000
p24 (174–184)	p24 (174–184) • B44-restricted CTL response was strongest to this epitope in one individual.	AEQASQDVKNW	HIV-1 infection	human (B44)	Day2001
p24 (174–184)	p24 **Keywords** HAART, supervised treatment interruptions (STI). **Epitope name** B44-AW11(p24). **Donor HLA** A32,A?,B44,B?. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample.	AEQASQDVKNW	HIV-1 infection	human (B44)	Altfeld2002
p24 (174–185)	Gag (p24) (174–185)	AEQASQEVKNWM		human (Cw*05)	Frahm2004
p24 (175–186)	p24 (307–318) • HIV is found in semen both as cell-associated and cell-free forms, and HIV-specific CTL could be found in the semen of 5/5 men with CD4 greater than 500 – 3 of the men were analyzed in detail and had broad CTL to gag, env and pol. • Two CTL lines from one donor recognized this epitope. • Isolation of CTLs specific to HIV in both male and female urinal tracts provide evidence that virus-specific lymphocytes come from the urogenital mucosa, and the authors speculate that CTL in mucosal tissues may be correlated with lower viral load in semen and reduced transmission.	EQASQEVKNWMT	HIV-1 infection	human (B44)	Quayle1998

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p24 (176–184)	p24 (308–316 LAI)	QASQEVKNW	HIV-1 infection	human (B*5301)	Frahm2004
	• C. Brander notes this is a B*5301 epitope.				
p24 (176–184)		QASQEVKNW	HIV-1 infection	human (B*5301, B57)	Sabbaj2002b
	Keywords HAART. **Epitope name** Gag-QW9. **Donor HLA** 01RCH59 A*0201 A*3201 B*4002 B*5301 Cw*0202 Cw*0401. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • Subject 01RCH59 was Hispanic, was not on HAART, viral load 5100, CD4 count 349, and she also recognized PIQKETWETW, RT(392-401), A*3201. • Among HIV+ individuals who carried HLA B*5301, 11/15 (73%) recognized this epitope. • Among HIV+ individuals who carried HLA B57, 3/6 (60%) recognized this epitope.				
p24 (176–184)	p24 (309–317 LAI)	QASQEVKNW	HIV-1 infection	human (B*5701)	Goulder1996b
	• Recognition of this peptide by two long-term non-progressors. • Peptide defined on the basis of B*5801 binding motif, yet not cross-restricted except at high concentrations. • Described as B*5701 in C. Brander *et al.*, this database, 1999.				
p24 (176–184)	p24 (311–319 LAI)	QASQEVKNW	HIV-1 infection	human (B*5701)	Frahm2004
	• C. Brander notes this is a B*5701 epitope.				
p24 (176–184)		QASQEVKNW	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW. • Only QASQEVKNW was recognized in all of the LTNP's tested.				
p24 (176–184)		QASQEVKNW	HIV-1 infection	human (B*5701)	Migueles2001
	Keywords rate of progression, immunodominance. • CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their CD8+ T-cell response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, or QASQEVKNW. • CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia. • The HLA-A*0201 SLYNTVATL epitope response was not as strong individuals that carried both A2, B57.				
p24 (176–184)	Gag (308–316)	QASQEVKNW	HIV-1 infection	human (B*5701)	Migueles2003
	Keywords rate of progression, escape. **Epitope name** QW9. **Assay type** Intracellular cytokine staining, Flow cytometric CTL assay. • cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1-7) than LTNPs (median 2, range 0-4). • In general use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The substituion E312D (qasqDvknw) was common in progressors (8/17) and rare in LTNP (1/8) (p = 0.06). qasqDvknw and qasqEvknw peptides were made; this mutation does not affect binding to B*57. 2/4 progressors that carried only the D variant could not recognize the D variant peptide, but could recognize the E variant peptide, demonstrating immune escape.				
p24 (176–184)	p24 (308–316 LAI)	QASQEVKNW	HIV-1 infection	human (B53)	Buseyne1997
	• Minimal sequence determined through epitope mapping. • This is a relatively conserved epitope. • HLA-Cw*0401 was defined as the restricting element, but cells that carry Cw*0401 varied in their ability to present this epitope – this could be the result of diminished cell-surface expression of Cw*0401 in some cells. • The HLA presenting molecule for this epitope was originally described as Cw*0401, but subsequent experiments with an HLA B53+ C4- cell line and with C1R cells transfected with HLA-B53 have shown that the HLA restricting element is HLA-B53 (F. Buseyne, pers. comm. 2000)				
p24 (176–184)	(LAI)	QASQEVKNW		human (B53)	Buseyne1999, Frahm2004
p24 (176–184)	p24 (NL43)	QASQEVKNW	in vitro stimulation or selectio	human (B53)	Buseyne2001
	Keywords epitope processing, dendritic cells. **Epitope name** QW9. • Exogenous presentation or cross-presentation of epitopes by antigen presenting cells (APC) without protein synthesis is an alternative pathway for CTL epitope processing that may be important in the initial generation of viral specific CTL. • Dendritic cells treated with AZT to inhibit protein synthesis were able to elicit a strong specific CTL response in QASQEVKNW specific CTL clone 141 without protein synthesis, while macrophages demonstrated a decreased presentation efficiency. • Exogenous Gag epitope presentation was Env-dependent and required receptor-dependent fusion.				
p24 (176–184)	p24 (308–316)	QATQEVKNW	HIV-1 infection, HIV-1 exposed seronegative	human (B53)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B53 women, 1/2 HEPS and 7/9 HIV-1 infected women recognized this epitope.				
p24 (176–184)	p24 (308–316 subtype A consensus)	QATQEVKNM	HIV-1 infection	human (B53)	Dorrell2001
	Keywords binding affinity, inter-clade comparisons. • In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays. • Two of the new epitopes lacked the predicted by P2 anchors, DTINEEAAEW and QATQEVKNM, and bound to B53 with high affinity, thus extending the anchor residue motif for B53 and the related B35. • While S, T, and P could all fit into the HLA-B35 or HLA-B53 B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNM for B53. • QATQEVKNM was recognized in 6/7 HLA-B53 subjects.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Cross-recognition of QATQEVKNM was not studied here, but it was noted that both the A, QATQEVKNM, and B, QASQDVKNW, subtype version of this epitope, are also presented by HLA-B57 and B58, common HLA alleles in Africans.				
p24 (176–184)	Gag (SF2)	QASQEVKNW	HIV-1 infection	human (B57)	Goulder2001a
	Keywords acute infection. **Epitope name** QW9. • This peptide elicited a weak CTL response during acute infection of patient PI004. • Three CTL responses, to epitopes TSTLQEQIGW, ISPRTLNAW, and KAFSPEVIPMF, were evident early after infection; CTL responses to SLYNTVATL, QASQEVKNW, EIYKRWII, and FLKEKGGL were detectable at 5 months post-infection and beyond.				
p24 (176–184)	(LAI)	QASQEVKNW		human (Cw4)	Buseyne1999

	• Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 3/11 of the HLA A2+ individuals were HLA B51 and two of these responded to this epitope as well as to other epitopes.				
p24 (193–201)	p24 (324–335 IIIB)	NANPDCKTI	HIV-1 infection	human (B51)	Wilson1999a
	Keywords responses in children, mother-to-infant transmission, escape. • This study describes maternal CTL responses in the context of mother-to-infant transmission. • Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants. • No variants of this epitope were found in a non-transmitting mother that had a CTL response to this epitope.				
p24 (193–201)	p24 (323–333)	NANPDCKTI	HIV-1 infection	human (B51)	Oxenius2000
	Keywords HAART, acute infection. **Epitope name** NAN. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • None of the 8 study subjects recognized this epitope but none were HLA B51+				
p24 (193–201)	p24 (191–205)	NANPDCKTI	HIV-1 infection	human (B8)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p24 (195–202)	p24 (323–342)	NPDCKTIL	HIV-1 infection	human (B35)	Bernard1998
	• This study focuses on six rare long-term survivor HIV-infected people who were infected for many years without exhibiting immune dysregulation – such immunologically normal HIV-infected (INHI) cases occur at a frequency between 0.1 and 1% in the infected population. • No direct CTL were found in any of the six INHIs, but above background CTLp activity was founded in 3/6 INHIs. • Epitope sequences were deduced from larger reactive peptides based on HLA binding motifs – XPXXXXXL is a B35 binding motif.				
p24 (195–202)		NPDCKTIL	HIV-1 infection	human (B35)	Sabbaj2002b
	Epitope name Gag-NL8. • Among HIV+ individuals who carried HLA B35, 3/17 (18%) recognized this epitope.				
p24 (197–205)	p24 (329–337 LAI)	DCKTILKAL		human (B*0801)	Frahm2004
	• C. Brander notes this is a B*0801 epitope.				
p24 (197–205)	p24 (329–337 LAI)	DCKTILKAL		human (B8)	Sutton1993
	• Predicted epitope based on B8-binding motifs, from larger peptide VQNANPDCKTILKAL.				
p24 (197–205)	p24 (329–337)	DCKTILKAL	HIV-1 infection	human (B8)	Nowak1995
	Keywords escape. • In a longitudinal study of CTL response and immune escape – the variant DCRTILKAL was also found, binds to B8, but is not recognized.				
p24 (197–205)	p24 (329–337)	DCKTILKAL		human (B8)	McAdam1995
	• Defined as minimal epitope by titration and binding studies.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p24 (197–205)	p24 (197–205)	DCKTILKAL		human (B8)	Goulder1997g
	• Included in a study of the B8 binding motif.				
p24 (197–205)	p24 (329–337)	DCKTILKAL	HIV-1 infection	human (B8)	Oxenius2000
	Keywords HAART, supervised treatment interruptions (STI), immunodominance, acute infection. **Epitope name** DCK. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • This epitope was recognized at a low level by only 1 of the 7/8 study subjects that were HLA B8. • Patient SC12(HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL throughout and minor responses to GEIYKRWII, DCKTILKAL, GGKKKYKLK – GEIYKRWII and GGKKKYKLK responses were stimulated by a brief period off therapy.			
p24 (197–205)	p24 (197–205)	DCKTILKAL	HIV-1 infection	human (B8)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
p24 (197–205)	p24 (197–205)	DCKTILKAL	HIV-1 infection	human (B8)	Day2001
	• B8-restricted CTL accounted for about 1/3 of the total CTL response in one individual.				
p24 (197–205)	p24	DCKTILKAL	HIV-1 infection	human (B8)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** DCK. • Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI). • STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
p24 (199–218)	Gag (331–350)	KTILRALGPGATLEEMMTAC	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
p24 (209–217)	Gag (341–)	ATLEEMMTA	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* p24 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Gag341. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that did not induce CTL and CD8+ T-cell IFN gamma responses in mice, although responses were detected in 2/17 HIV+ HLA-A2 subjects.				
p24 (211–230)	p24 (345–364 SF2)	LEEMMTACQGVGGPGHKARV	HIV-1 infection	human	vanBaalen1993

	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Twelve subjects had CTL that could recognize vaccinia-expressed LAI gag. • One of these 12 had CTL response to this peptide. • The responding subject was HLA-A1, A2, B50, B57.				
p24 (213–221)	Gag (345–)	EMMTACQGV	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* p24 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Gag345. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced a response in 1/6 transgenic mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.				
p24 (217–227)	p24 (349–359 IIIB)	ACQGVGGPGHK	HIV-1 infection	human (A*1101)	Frahm2004
	• C. Brander notes this is an A*1101 epitope.				
p24 (217–227)	Gag (349–359)	ACQGVGGPGHK	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords inter-clade comparisons, TCR usage. • Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals. • ACQGVGGPGHK was found to elicit clade-specific responses in clade B (ACQGVGGPGHK is most common in clades A and B) and clade E (acqgvggpShk is most common and is also common in clades C and D). ACQGVGGPGHK was recognized by CTL from 4/5 B clade infected Japanese subjects, and acqgvggpShk from 3/7 E clade infected Thai subjects. • The binding of the two variants to HLA A*1101 was almost identical, but bulk CTL generated from individuals did not cross-react with the cross-clade peptides, indicating the lack of cross-reactivity was due to TCR specificity.				
p24 (217–227)	p24 (349–359 IIIB)	ACQGVGGPGHK	HIV-1 infection	human (A11)	Sipsas1997
	• HIV IIIB proteins were used to define the range of CTL epitopes recognized by three lab workers accidentally infected with HIV-1 IIIB.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• ACQGVGGPSHK, a variant found in HIV RF, was also recognized.				
p24 (217–227)	p24 (SF2)	ACQGVGGPGHK	HIV-1 infection	human (A11)	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • The CTL-dominant response was focused on this epitope in a HIV+ Caucasian living in Boston – this epitope did not fall within the three most recognized peptides in the study. • Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
p24 (217–227)	p24 (349–359)	ACQGVGGPGHK	HIV-1 infection	human (A11)	Oxenius2000
	Keywords HAART, supervised treatment interruptions (STI), immunodominance, acute infection. **Epitope name** ACQ. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • Both of the 2/8 HLA-A11 study subjects recognized this CTL epitope. • Patient SC19(HLA A11/12, B8/44, Cw06/0701, DR3/7, DR52/53, DQ 2/8) had a CTL response to epitopes FLKEKGGL, GEIYKRWII, ACQGVGGPGHK, AVDLSHFLK, and FNCGGEFFY that declined during therapy initiated at day 197. • Patient SC18(HLA A2/11, B8/44, Cw06/0701, DR3/7, DR52/53, DQ2) recognizes the epitopes ACQGVGGPGHK, QVPLRPMTYK, AVDLSHFLK, and one called QIY but not fully described – he had brief therapy upon seroconversion and has had low viral load during 600 days of follow up.

p24 (223–231)	p24 (223–231 SF2)	GPGHKARVL	HIV-1 infection	human (B7)	Altfeld2001b

Keywords HAART, acute infection.

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 1/4 group 1, 2/3 group 2, and 0/1 group 3.

p24 (223–231)	p24 (223–231)	GPGHKARVL	HIV-1 infection	human (B7)	Day2001

Keywords rate of progression, acute infection.

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

p24 (223–231)	p24 (223–231)	GPGHKARVL	HIV-1 infection	human (B7)	Yu2002a

Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute infection.
Epitope name B7-GL9.
Donor HLA A3, B7, Cw7.

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- Only two epitopes were detected during acute infection in patient AC-06, B7 restricted gp41 epitope IPRRIRQGL and Gag GPGHKARVL. GPGHKARVL was the first targeted peptide, and remained immunodominant through the 34 month study period.
- 3/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 1/4 individuals had detectable responses to this epitope after STI.

II-B-4 p24-p2p7p1p6 CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p24-p2p7p1p6 (223–1)	Gag	GPGHKARVLA		human (B7)	De Groot2001

- The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes.
- A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFNγ production in an ELISPOT assay.
- GPGHKARVLA was confirmed as an HLA-B7 epitope in this study, and had been previously published.

p24-p2p7p1p6 (225–8)	Gag (357–372 LAI)	GHKARVLAEATLSQVN	HIV-1 infection	human	Buseyne1993a

- Vertical transmission of HIV ranges from 13% to 39%
- Primary assays showed cytotoxic activity against at least one HIV protein was detected in 70% of infected children.
- Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures.
- Patient EM28 (CDC P2A) had a CTL response to four epitopes in Gag.

p24-p2p7p1p6 (230–7)	Gag (386–)	VLAEAMSQV		human (A*0201)	Altfeld2001c

Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction, immunodominance.
Epitope name Gag-386.

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- VLAEAMSQV binds to all five HLA-A2 supertype alleles tested: A*0201, A*0202, A*0203, A*0206 and A*6802 (highest affinity)
- 4/22 individuals with chronic HIV-1 infection recognized this epitope, and it was immunodominant in 3/4 by ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.

p24-p2p7p1p6 (230–7)		VLAEAMSQV	HIV-1 infection	human (A02)	Sabbaj2002b

Epitope name Gag-VV9.

- Among HIV+ individuals who carried HLA A02, 3/29 (10%) recognized this epitope.

p24-p2p7p1p6 (230–7)	Gag (362–)	VLAEAMSQV	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003

Vaccine *Vector/Type:* peptide *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Keywords binding affinity, inter-clade comparisons, computational epitope prediction.
Epitope name Gag362(9L).
Assay type T-cell Elispot, Chromium-release assay, Flow cytometric CTL assay.

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects. • The variant vlaeamsqA was also immunogenic in A2 transgenic mice, eliciting a CD8+ T-cell response, as was recognized in 3/17 HIV+ people, including the person that recognized the vlaeamsqV variant.				
p24-p2p7p1p6 (230–7)	Gag (397–405)	VLAEAMSQV	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)

p2p7p1p6 (5–13)	Gag (SF2)	SQVTNPANI	Vaccine	mouse (H-2D^b)	Paliard1998
	Vaccine *Strain:* B clade SF2 *HIV component:* Gag • HIV-1(SF2)p55gag vaccination of H-2 mice activates a CTL response against this epitope. • CTL that recognized SQVTNPANI in the context of H-2D^b cross-reacted with H-2 alloantigens H-2L^d and an unidentified self-peptide. • A postulate: heterozygosity at the MHC level could prevent the maturation of some T cell receptor combinations for foreign peptide and self-MHC constructs because of thymic depletion and tolerance.				
p2p7p1p6 (18–37)	Gag (96ZM651.8)	SNFKGNKRMVKCFNCGKEGH		human (A*02011)	Novitsky2001
	• This study is provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswanan cohort. • 4 of 8 individuals (50%) who were positive for HLA-A*02011 responded to the peptide SNFKGNKRMVKCFNCGKEGH.				
p2p7p1p6 (33–41)	p2p7p1p6 (33–41)	KELYPLTSL	HIV-1 infection	human (B*4001)	Frahm2004

p2p7p1p6 (42–50)	p15 (42–50 SF2)	CRAPRKKGC	HIV-1 infection	human (B14)	Yu2002b
	Keywords immunodominance. **Donor HLA** B14. • 26/57 HIV-1 infected subjects displayed Gag p15-specific CD8+ T-cell IFNgamma responses were measured by Elispot and intracellular staining. The immunodominant regions targeted by CD8+ T-cells were mapped to three functional domains: the zinc finger structures, the protease cleavage site p7/p1, and to the Vpr binding site in p6. • p15 contributed on average 17% of the total Gag response (rage 0-100%). • 3 optimal CTL epitopes were mapped within p15: KELYPLTSL, CRAPRKKGC, and FLGKIWPSYK. • 2/6 HLA-B14+ subjects recognized this epitope. The binding motif for B14 is C-term Cys, positions 2 and 5 Arg.				
p2p7p1p6 (55–70)	p15 (446–460 BRU)	KEGHQMKDCTERQANF	HIV-1 infection	human (A2)	Claverie1988
	• One of 4 epitopes first predicted, then subsequently shown to stimulate an HLA-A2 restricted CTL line.				
p2p7p1p6 (63–71)	p15 (63–71)	CTERQANFL	HIV-1 infection	human (B61)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A*0201, A11, B51, B61, Cw2, Cw14. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.				
p2p7p1p6 (64–71)		TERQANFL	HIV-1 infection	human (B*4002)	Sabbaj2002b
	Keywords HAART. **Epitope name** Gag-TL8. **Donor HLA** A*0201 A*3201 B*4002 B*5301 Cw*0202 Cw*0401. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • This epitope was newly defined in this study. • Patient 01RCH59 was Hispanic, not on HAART, and had a viral load of 5100 and CD4 count of 349 – she also recognized AEWDRVHPV, p24(78-86), HLA-B*4002 and KEKGGLEGL, Nef(92-100), HLA-B*4002. • Among HIV+ individuals who carried HLA B40, 3/5 (60%) recognized this epitope.				
p2p7p1p6 (64–71)	p15 (64–71)	TERQANFL		human (B*4002)	Frahm2004
p2p7p1p6 (66–80)	p15 (66–80)	RQANFLGKIWPSYKG	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
p2p7p1p6 (70–77)	Gag (433–)	FLGKIWPS	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Gag433. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 7/17 HIV+ HLA-A2 subjects.				
p2p7p1p6 (70–79)	p15 (70–79 SF2)	FLGKIWPSYK	HIV-1 infection	human (A*0201)	Yu2002b
	Keywords immunodominance.

p2p7p1p6 (70–79)	p2p7p1p6 (1–10)	FLGKIWPSYK	HIV-1 infection	human (A*0201)	Frahm2004
p2p7p1p6 (83–97)	Gag (453–462 BH10, LAI) • This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is PEPTAPPFLQ) has similarity with the T-cell surface glycoprotein CD5, fragment PEPTAPPRLQ.	GNFLQSRPEPTAPPF	HIV-1 infection	human	Maksiutov2002
p2p7p1p6 (83–97)	p15 (418–433 BRU) • One of 4 epitopes first predicted, then subsequently shown to stimulate an HLA-A2 restricted CTL line.	GNFLQSRPEPTAPPF	HIV-1 infection	human (A2)	Claverie1988
p2p7p1p6 (118–126)	p2p7p1p6 (118–126) • C. Brander notes that this is a B*4001 epitope.	KELYPLTSL		human (B*4001(B60))	Frahm2004
p2p7p1p6 (118–126)	p15 (118–126 SF2) **Keywords** immunodominance, cross-presentation by different HLA. **Epitope name** p15-24. • 26/57 HIV-1 infected subjects displayed Gag p15-specific CD8+ T-cell IFNgamma responses were measured by Elispot and intracellular staining. The immunodominant regions targeted by CD8+ T cells were mapped to three functional domains: the zinc finger structures, the protease cleavage site p7/p1, and to the Vpr binding site in p6. • p15 contributed on average 17% of the total Gag response (rage 0-100%). • 3 optimal CTL epitopes were mapped within p15: KELYPLTSL, CRAPRKKGC, and FLGKIWPSYK. • Four patients who were HLA-B60+ recognized KELYPLTSL. • The binding motif for B60 is C-term Leu and 2nd position Glu. • Four patients who did not carry HLA-B60 also recognized the 15 amino acid long peptide carrying KELYPLTSL, suggesting other epitopes in this immediate region can be presented by other HLA class I molecules.	KELYPLTSL	HIV-1 infection	human (B60, B*4001)	Yu2002b
p2p7p1p6 (121–130)	Gag (484–493) • This B7 epitope is one of three subdominant CTL responses detected in a long-term non-progressor. • A dominant B7 epitope was defined using conventional methods, and three additional sub-dominant HLA B7 epitopes were defined by first using a non-anchor based strategy, EpiMatrix, to identify 2078 possible epitopes in the autologous HIV-1, followed by B7 anchor residue prediction to narrow the set to 55 peptides for experimental testing.	YPLTSLRSLF	HIV-1 infection	human (B7)	Jin2000b

II-B-6 Gag CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	Gag (IIIB)		Vaccine	macaque	Paliard2000
	Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* Gag				
	• CTLs primed by HIV-1 p55 gag virus-like particle (VLP) vaccination recognized epitopes in four different 20 amino acid peptides p17/4, p17/8, p24/13 and p14/9.				
	• Cytotoxic T cell response lasted greater than 8.5 months.				
Gag	Gag (IIIB)		HIV-1 infection	human	Wasik2000
	Keywords rate of progression, Th1.				
	• HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of beta-chemokines and IL-2 relative to other HIV+ infants.				
	• HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors.				
	• CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.				
Gag	Gag (LAI)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp41, Protease, V3				
	• The vaccine used was a rec canarypox with HIV-1 gp120 MN, tm/gag/protease LAI (vCP205), alone or with p24E-V3 MN synthetic peptide (CLTB-36))				
	• Twenty HIV negative subjects were vaccinated in phase I trial with combinations of vCP205 and CLTB-36.				
	• Immunization with vCP205 induced HIV-1-specific ABs to gp120, V3, and p24 antigens, and CTL immune responses against vCP205 were detected after the fourth immunization in 33% of the subjects against Env, Gag and Pol, but the CLTB-36 peptide did not produce AB or CTL immune responses against p24 or gp160.				
Gag	p24		Vaccine	human	Klein1997
	Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag				
	• Immunization of HIV+ people with an HIV-1 p17/p24 Ty virus-like particle (p24-VLP) resulted in a marginal, short-lived increased proliferative response to p24 and p17 and a transient elevation in viral load.				
	• Two of four subjects that received 500 or 1000 μg of p24-VLP had an increase in gag-specific CTL.				
Gag	p24 (SF2)		Vaccine	mouse, baboon	O'Hagan2000
	Vaccine *Vector/Type:* DNA *Strain:* B clade SF2 *HIV component:* gp120, p24 Gag *Adjuvant:* MF59, PLG				
	• PLG (Polylactide co-glycolide polymer) microparticles administered in MF59 emulsion induced gp120 Ab responses and CTL immune responses against p24 gag.				
Gag	Gag		HIV-1 infection	human	Lubaki1999
	• Three strategies were used to analyze CTL activity: area under the net HIV-specific lysis curve (ACU), linear regression (LR) of net specific lysis, and the standard method, lytic units (LU20)				
	• A correlation between low HIV plasma viral load and increased levels of HIV-specific Gag and Nef CTL activity was observed using ACU and LR, but not LU20.				
Gag	Gag		HIV-1 infection	human	Kalams1999a
	• The presence of HIV-1 p24-specific proliferative responses was positively correlated with Gag-specific memory CTL and negatively correlated with viral load in untreated subjects.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Gag proliferative responses were the most readily detected – Gag CTL responses were the only responses with a significant correlation with Gag stimulated help, although there was a positive trend with Nef, Env and RT.				
Gag	p55 (IIIB)		HIV-1 infection	human	Greenough1999
	• 7/128 HIV-1 infected hemophiliac were identified as long-term non-progressors (LTNPs) and were monitored for viral and host immune parameters over 15 years – LTNPs maintained a low viral load, high frequencies of CTL precursors directed against Gag antigen and low levels of HIV-specific effector CTL activity – effector cell activity suggests low level ongoing viral replication.				
Gag	Gag		HIV-1 infection	human	Trickett1998
	• Twelve HIV-1 infected patients were re-infused with their own lymphocytes, cryopreserved from an earlier time point in the infection. • Improvement in CD4+ and CD8+ T cells was seen in 7/12, and an increase in the CTL response to Gag was seen in one patient.				
Gag	Gag (IIIB)		HIV-1 infection	human	Betts1999
	Keywords rate of progression. • This study demonstrated an inverse correlation between HIV Type I plasma viral load and CTL activity directed against HIV-1 Pol, and stronger combined effects of Pol- and Env-specific CTL, in long-term survivors (LTS) of HIV-1 infection.				
Gag	Gag (LAI)		HIV-1 infection	human	Legrand1997
	• Seventeen recently infected patients were tested for CTL response to HIV proteins Env, Gag, Pol, Rev, Nef, Vif and Tat. • An early response (within a month following PI) was noted in 87% of the subjects to Gag, 75% to Env, and 50% to Nef. • Early responses to Pol, Rev, Vif and Tat were rare.				
Gag	Gag (IIIB)		HIV-1 infection	human	Betts1997
	Keywords inter-clade comparisons. • 6/8 individuals from Zambia infected with C clade virus had CTL that were able to make response to B clade HIV-1 IIIB vaccinia-expressed Gag, Pol and Env proteins. • A vigorous cross-clade response was not limited to a particular protein, and the level of recognition of different proteins varied among the six patients.				
Gag	Gag		HIV-1 infection	human	De Maria1997
	• CD3+ cells that also carry a natural killer cell receptor (NKR+) can exhibit down regulation of T cell function. • Anti-NKR IgM MAb masked this inhibitory function and increased HIV-1 specific CTL activity in phytohemagglutinin-activated PBMC cultured in the presence of IL-2 from 3/5 patients, and in one other case anti-NKR MAb brought HIV-1 specific CTL activity to detectable levels.				
Gag	Gag (LAI)		Vaccine	human	Belshe1998
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Protease • The live canarypox vaccine ALVAC-HIV(vCP205) carrying MN gp120, LAI gp41, Gag and Protease, and boosted with SF-2 rpg120, was given to HIV-1 seronegative volunteers – HIV-specific Env or Gag CD8+ CTL were detected in 64% of the volunteers.				
Gag	Gag (LAI)		HIV-1 infection	human	Buseyne1998a
	• This study showed a correlation between strong CTL memory and breadth of response in 7-12 month old infants, and remaining AIDS-free for the first year of life, higher absolute CD4 and CD8 cells, and lower viral load.				
Gag	Gag (LAI)		HIV-1 infection	human	Buseyne1998b
	Keywords inter-clade comparisons. • In infants with positive CTL responses, most responses showed cross-clade reactivity with somewhat diminished recognition of epitopes from different subtypes.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	Gag		HIV-1 exposed seronegative	human	Goh1999
	• 13/37 exposed uninfected individuals with repeated high-risk sexual exposure had HIV-1 specific CTL against Env, Gag, Pol, or a combination of proteins – CTL activity was correlated with a CCR5 wildtype genotype. • In this group, the highest CTLp frequencies were directed at Gag, but the most common response was to Env and four individuals had responses to multiple HIV-1 proteins.				
Gag	Gag (LAI)		Vaccine	human	Evans1999
	Vaccine *Vector/Type:* canarypox *HIV component:* Gag, gp120, gp41, Nef, Protease, RT • A Canarypox vaccine expressing gp120, gp41, Gag, Protease, Nef and Pol CTL epitopes gave rise to CTL that could be detected in 61% of the volunteers – responses to Gag, Env, Nef and Pol were detected 3-6 months after the last vaccination.				
Gag	p17		HIV-1 infection	human	Kuiken1999
	Keywords epitope processing. • A correlation between conserved regions of p17 or Nef and CTL epitope density was noted – the authors suggest that this may be due to a biological reason such as epitope processing, or may possibly be an artifact of experimental strategy for epitope definition such that conserved epitopes would tend to be identified because they would be more likely to be cross-reactive with the test reagents. • In contrast to p17 and Nef, p24 is a more conserved protein and known epitopes are evenly distributed across p24.				
Gag	Gag (LAI)		Vaccine	macaque	Kent1998
	Vaccine *Vector/Type:* DNA prime with vaccinia boost *Strain:* B clade LAI *HIV component:* Env, Gag **Keywords** Th1, Th2. • Priming with an HIV-DNA vaccine and boosting with a vaccinia construct induced greater levels of HIV T cell immunity than either vaccine alone. • The proliferative response to Env and Gag after the DNA vaccination had a mean SI of 1.5-4, but after boosting with rHIV-fowlpox virus, there was a 6-17 fold increase in the mean SI for HIV Gag and Env. The T help response happened despite a fall in antibody titers, suggesting that the Th response was primarily Th1, not Th2. The CTL response was also enhanced.				
Gag	Gag/Pol (LAI, MN)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease • A live attenuated canarypox vector expressing MN gp120 and LAI gp41/gag/protease could induce CTL and a lymphoproliferative response in healthy, uninfected volunteers.				
Gag	Gag/Pol (MN)		Vaccine	chimpanzee	Kim1998
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86 • The study explores the use of co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.				
Gag	Gag (BRU)		HIV-1 infection	human	Aladdin1999
	Keywords rate of progression. • *In vitro* measurements of CTL-activity by Cr release assay in bulk culture showed no correlation between CTL-activity (gp120, Gag, Pol and Nef) and disease progression as measured by viral load, CD4 and time to death.				
Gag	p24 (C consensus)		HIV-1 infection	human	Goulder2000a
	Keywords inter-clade comparisons, immunodominance. • The CTL-dominant response was focused on this epitope in a HIV+ South African – this epitope did not fall within the five most recognized peptides in the study.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses. • Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYV-DRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.				
Gag	Gag		Vaccine	macaque	Akahata2000
	Vaccine *Vector/Type:* DNA *Strain:* ZF1 *HIV component:* complete genome • Rhesus macaques were vaccinated by i.m. injection with naked plasmid DNA carrying an HIV-1 complete genome vaccine, strain ZF1, with a mutated zinc finger in the nucleocapsid to prevent packaging. • Env and Gag specific CTL but no antibody responses were induced in 2/4 vaccinated monkeys (MM145 and MM153) • 2/4 monkeys (MM146 and MM143) produced antibodies against p24 and/or gp160, but no CTL response was detected. • PBMC from all vaccinated monkeys produced IFN-gamma, in response to HIV-1 gp160, indicating a Th response – this response was 5 times higher in MM145, the animal with the strongest CTL response. • 4 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM145 and MM153 (with a homologous Env) decreased to near or below the detection limit. • 6-8 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM146 and MM143 decreased near or below the detection limit.				
Gag	Gag		HIV-1 infection	human	Salerno-Goncalves2000
	Keywords rate of progression. • A general test of CD8 anti-viral activity was developed based on proviral load of coculture of autologous CD8+ cells with CD4+ cells after homogeneous superinfection with NSI virus. • Significantly decreased the CD4+ T-cell proviral loads were found in 12 HIV+ slow progressors relative to 10 rapid progressors. • Significant CD8+ mediated cytotoxicity directed against autologous cells infected with vaccinia carrying the HIV-1 gag gene was observed in slow progressors in contrast to rapid progressors, but no correlation was found between plasma viral load in 22/22 asymptomatic HIV infected individuals.				
Gag	Gag		HIV-1 infection	human	Young2001
	• Addition of recombinant rec human IL12 (rhIL12) to cultures increased HIV-specific lysis of HIV-Gag, Pol and gp120 vaccinia expressed antigens (11/15 tested increased lysis by > 5%) if the culture was derived from HIV+ individuals who had CD4 cells/ul > 500. • 2/10 individuals with <200 CD4 cells/ul, and 3/10 individuals with 200-500 CD4cells/ul, had an increase of >5% upon treatment of the culture with rhIL12, so a few individuals in late stage disease had CD8 cells that maintained responsiveness to rhIL12.				
Gag	p24		HIV-1 infection	mouse	deQuiros2000
	• CB-17 SCID-Hu mice engrafted with peripheral blood mononuclear cells of four long-term nonprogressors (viral load < 50 copies/ml) displayed resistance to challenge with HIV-1 SF162, mediated by CD8+ T-cells and associated with proliferation in response to p24 – these patients did not have a higher level of HIV-1 specific immunity *in vitro*, so the mechanism is unknown.				
Gag	Gag (subtype A, B, D)		HIV-1 infection	human	Cao2000
	Keywords inter-clade comparisons. • HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in HIV infected Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, RT or Nef from HIV-1 clades A, B, and D. • Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	Gag		HIV-1 infection	human	White2001
• HIV-specific CTL activity was detected in the female reproductive tract of only 1/3 HIV-infected women who underwent a hysterectomy, although CTL could be identified in the PBMC of all three women.					
Gag	Gag (HXB2)		HIV-1 infection	human	Chun2001
• Suppression of viral replication in the resting CD4+ T-cell reservoir by autologous CD8+ T-cells via CD4+/CD8+ cell contacts was observed in long-term nonprogressors and patients undergoing antiretroviral treatment, but this activity appears to be independent of Gag-specific CTL activity.					
Gag	Gag (IIIB)		HIV-1 infection	human	Jin2000a
Keywords rate of progression.					
• The CTL precursor level (CTLp) was measured in long term non-progressors (LTNP) with low viral load using limiting dilution analysis and measuring CTL against Env Gag and Pol expressed in vaccinia in autologous targets.					
• LTNPs have high memory CTL numbers and low viral load.					
Gag	Gag		HIV-1 exposed seronegative	human	Rowland-Jones2001
Keywords review, HIV exposed persistently seronegative (HEPS).					
• This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.					
• The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.					
• CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.					
• CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.					
• HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.					
Gag			Vaccine	mouse	Nabel2002
Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol					
Keywords review, vaccine-specific epitope characteristics.					
• Using DNA that had humanized codon usage, CTL responses to DNA vaccines containing either Gag, Pol, Gag-Pol fusion protein, or Gag-Pol pseudoparticles suggested that the greatest breadth and most potent response was to the Gag-Pol fusion protein. The Gag-Pol fusion lacks the Gag precursor protein required for viral assemble, so does not form releaseable particles; the author speculates that longer retention of the Gag-Pol protein with in the cell may enhance antigen presentation.					
Gag			HIV-1 exposed seronegative	human	De Maria1994, Kuhn2002
Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission.					
• 6/24 HIV uninfected infants (ages 15-50 months) born to HIV+ mothers had HIV-1 specific CTL responses to vaccinia-expressed Nef, Gag/Pol, Env.					
• Reviewed in [Kuhn2002].					
Gag			HIV-1 infection	human	Aldhous1994, Kuhn2002
Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission.					
• Six of nine HIV vertically infected infants had HIV-1 specific CTL responses to vaccinia expressed Tat (4/6), Pol (6/6), Env (1/6), or Gag (1/6), but not all responses were detected at all time points.					

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Two of eleven babies that were not infected though born to HIV+ mothers had detectable responses to Tat (1/2), Pol (2/2), Gag (1/2). • Reviewed in [Kuhn2002].				
Gag			HIV-1 infection	human	Kuhn2002, Wasik1999
	Keywords HAART, HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission, rate of progression. • In HIV-infected infants HIV-specific, CTL responses were not detectable in icord blood or in PBMC collected shortly after birth and were absent or remained very low in 3 infants with a rapidly progressive disease. For those who progressed more slowly, the HIV-specific CTL activity varied. • The two infants with high levels of Env peptide-stimulated IL-2 responses had the highest CTLp frequencies. • Stronger responses were detected after initiation of the antiretroviral therapy. • Two babies that were not infected though born to HIV+ mothers had detectable though low HIV-specific CTLp responses to Env (1/2), Pol (2/2), Gag (1/2) cord blood and transiently in PBMC after birth. • Reviewed in [Kuhn2002].				
Gag			HIV-1 infection	human	Kuhn2002, McFarland1994
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • Only 9% of HIV+ infants had HIV-specific CTL against Env or Gag in unstimulated PBMC. After CD3 stimulation of PBMC, Gag and Env specific CTL were found in PBMC from 91% and 78% of HIV-infected children, respectively, with high precursor frequencies. • Reviewed in [Kuhn2002].				
Gag			HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed. p17 is much more variable than p24.				
Gag	p24 (HXB)		HIV-1 infection	human	Lu2000a
	Keywords epitope processing, vaccine-specific epitope characteristics. • Bacillus anthrax lethal toxin (LFn)-HIV fusion proteins are candidate HIV vaccines that are safe in mice, and LFn-V3 region fusion proteins induce CD8 T cells in BALBc mice. LFn causes exogenous protein to be taken up and processed in a class I pathway. Expressed proteins from Gag p24 and Nef fragments cloned into the LFn expression plasmid stimulate gag-specific CD4 proliferation and CTL responses in HIV-infected donor PBMCs *in vitro*.				
Gag	(HXB2)		HIV-1 infection	human	Edwards2002
	• 96% (26/27) chronically infected HIV-1 infected patients elicited gamma-IFN CD8+ T-cell responses against Gag. • Nef and/or Pol CTL responses were detected in 86% of the subjects. • The magnitude and breadth of Gag and p24 T-cell responses correlated with absolute CD4 counts, and inversely correlated with viral load. • Pol and Int CTL responses correlated positively with absolute CD4+ T-cell count. • Nef and Env responses did not correlate with either CD4 counts or viral load.				
Gag			HIV-1 infection	human	Larsson2002b
	Keywords HAART, dendritic cells. • Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	(IIIB)		HIV-1 infection	human	Trickett2002
	Keywords immunotherapy.				
	• Conditions were optimized for ex-vivo expansion of CD8+ and CD4+ T-cells with the goal of functional T-cell production for autologous immunotherapy. 10,000-fold expansions were obtained in 14 days with optimized concentrations of IL-2, anti-CD3 and anti-CD28 coated microspheres, and decreasing amounts of serum over the first 8 days.				
Gag	(IIIB)		HIV-1 and HCV co-infection	human	Lauer2002
	Keywords rate of progression.				
	• HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFNgamma production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins.				
	• All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load.				
	• Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted.				
	• HIV-specific CD4 proliferative responses were detected in 9/17 coinfected patients, but no HCV responses were detected.				
Gag			HIV-1 infection	human	Luzuriaga1995
	Keywords responses in children.				
	• 2/3 infants infected in utero had detectable HIV-1 Gag and Env specific CTL responses, one by 4 months, one by 11 months of age. Levels of the responses varied at different time point. Pol responses were not detected.				
	• 2/4 infants infected intrapartum had detectable responses, one note until 11 months, one not until 42 months.				
	• HIV-specific CTL were not detected in ten HIV- infants that were born to HIV+ mothers.				
Gag			Vaccine	human	Gupta2002
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade MN *HIV component:* Env, Gag				
	• Different HIV strains were used for different regions: Gag, LAI; gp120, MN; and gp41, LAI				
	• A safety and immunogeniticity study of a vaccine dosing schedule was studied in a trial conducted in high and low risk study subjects. There was a 76% cumulative probability of detecting a Gag or Env CTL response by day 728.				
Gag			HIV-1 infection	human	Scott2001
	Keywords HAART, responses in children.				
	• CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.				
	• Before ART 2/13 infants <6 months of age showed IFNgamma Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy– 3 infants were coinfected with CMV and all 3 had CMV-specific CD8+ T-cell responses.				
	• One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.				
	• Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.				
Gag	(IIIB, MN)		HIV-1 infection	human	Larsson2002a
	Keywords dendritic cells.				
	• Dendritic cells acquire and present HIV-1 antigens derived from dead, apoptotic cells or from non-infectious, fusion-competent HIV-1 virions, and these DC cells could stimulate CD4+ and CD8+ T-cells resulting in IFNgamma production in an Elispot assay. Both HLA Class I and class II molecules were used for presentation. This may be an important aspect of the initial immune response to HIV-1 infection of CD4+ cells in the mucosal subepithelia.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	(IIIB)		HIV-1 infection	human	Ortiz2001

Keywords HAART, supervised treatment interruptions (STI).

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.

Gag	Gag			human	
Gag	Gag			human	
Gag	Gag		HIV-1 infection	human	Amicosante2002

Keywords HAART, computational epitope prediction, supervised treatment interruptions (STI).
Assay type Intracellular cytokine staining.

- A new assay was developed to detect CTL responses to HIV using 28 pooled 15-mer peptides from conserved regions in Gag that were selected to be rich in HLA class I motifs, carrying potential epitopes for more than 90% of HLA class I haplotypes, and to be conserved between subtypes. Some peptide variants were included, expanding the potential for cross-clade recognition. 12 Caucasians, even those on successful HAART, had detectable CTL responses using this assay, and as did five Africans. People with either B subtype or A-G recombinant infections all reacted.
- The Gag peptide ICS assay was more sensitive to picking up CTL reactivity than whole Gag in HAART treated people. Initiation of STI increased the number of IFN-gamma producing CD8+ T-cells detected using the peptide assay.

Gag	Gag		Vaccine	macaque	Caulfield2002

Vaccine *Vector/Type:* vaccinia *HIV component:* Gag *Adjuvant:* block copolymer CRL8623
Keywords vaccine-induced epitopes.
Assay type CD8 T-cell Elispot - IFNγ.

- Codon-optimized HIV Gag DNA vaccines were given i.m. with or without a nonionic block copolymer(CRL8623) as adjuvant. DNA-CRL8623 fourmulations induced 2-fold higher Elispot responses, shifting the response towards CD8+ T-cells.
- 23 monkeys recognized 25 different epitopes with an average of 2.7 epitopes per monkey, and a minimum of 1 and a maximum of 5 peptides per monkey.
- Responses were detected up to 18 months after vaccination.

Gag	Gag			human	Currier2003

Keywords inter-clade comparisons.
Assay type Flow cytometric CTL assay.

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.
- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

Gag	Gag (SF2)		Vaccine	macaque	Otten2003

Vaccine *Vector/Type:* DNA, protein, virus-like particle (VLP), PLG microparticle *Strain:* B clade SF2 *HIV component:* Gag *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72), LTK63
Assay type proliferation, Chromium-release assay.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Immunization strategies for Gag (p55) in macaques were compared. GAG DNA prime with a boost of Gag adsorbed onto PLG (polyactide coglycolide) microparticles with LTK63 as adjuvant gave the strongest CD4+ T cell proliferative, CTL, and antibody responses, compared with Gag protein, or Gag virus-like particles (VLP). GAG DNA was best for inducing CTL responses, Gag-PLG for T-help and antibody; the prime-boost combination gave strong responses for all three.				
Gag	Gag		HIV-1 infection	human (A*0201 and Cw*08)	Shacklett2000
	• HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.				
Gag			computer prediction	(A*0201, B*3501)	Schönbach2002
	Keywords inter-clade comparisons, computational epitope prediction. • Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.				
Gag	Gag		HIV-1 infection	human (B*35)	Jin2002
	Keywords rate of progression. • Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501. • Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env. • The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.				
Gag			Vaccine	human (B60)	Ferrari2001
	Vaccine *Vector/Type:* canarypox prime with gp120 boost, canarypox prime with gp160 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Nef, Pol **Keywords** inter-clade comparisons, vaccine-specific epitope characteristics. • Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2 • HLA-B60 responses dominated the responses against an Gag vaccine in an individual (022G0Z) who was HLA A1, A11, B8, B60. The strongest response was against the MN peptide 107-136. Low level Gag responses were observed against B8 and A11 epitopes, no response was observed against A1 epitopes. • Vaccinee 202T7 (HLA A2, B27, C25) made the strongest response to an epitope at positions 131-140 of Gag. The response was highly cross-reactive with D clade Gag expressed from vaccinia, less so with C, and only minimally cross-reactive with A and CRF01.				
Gag	p24		Vaccine	mouse (H-2^b, H-2^d, H-2^k)	Iroegbu2000
	Vaccine *Vector/Type:* DNA *HIV component:* p17/p24 Gag • The p24 sequence is more conserved than is p17 within patient, and nonsynonymous substitutions are spread evenly throughout its coding regions, not concentrated in CTL epitopes. • Minor changes in p24 did not alter the immunogenicity in H-2b,d, or k mice, while changes in p17 (92% similarity) did alter immunogenicity.				
Gag	Gag (SF2)		Vaccine	mouse (H-2^{bxd})	Otten2000
	Vaccine *Vector/Type:* DNA, vaccinia *Strain:* B clade SF2 *HIV component:* Gag, Pol • CB6F1 were primed with gag DNA by im injection and challenged with vaccinia expressing Gag/Pol (rVVgag-pol)				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Gag-specific CTL responses were detected by IFNgamma secretion in the spleen, independent of the route (intraperitoneal, intranasal or intrarectal) of rVV gag-pol challenge. • The gag DNA vaccine induced CTL responses in 4/4 monkeys 2 weeks post immunization, but antibody responses were detected in only 1/4 monkeys after 3 immunizations. • CTL cross-reactivity against Gag sequences 1-80, 254-323, and 421-496 was observed, suggesting multiple CTL epitope recognition.				
Gag	p24		Vaccine	mouse (H-2^d)	Qiu2000
	Vaccine *Vector/Type:* DNA *HIV component:* Gag • Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein. • Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors. • IFN-gamma levels were increased compared to an undetectable IL-4 response. • CTL levels were also increased in secreted Gag expression vaccination studies.				
Gag	Gag (SF2)		Vaccine	macaque, mouse (H-2^d)	zurMegede2000
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade SF2 *HIV component:* Gag, Protease • Sequence-modified Rev-independent gag and gag-protease gene constructs lead to increased expression levels and elevated CTL and antibody immunogenicity in BALB/c and CB6F1 mice. • A CTL response in mice could be detected after a single immunization with codon-optimized gag, using 2 ng of plasmid; wild type gag required 200 ng to detect a response. • Recognition of 3 different Gag peptide pools was observed, indicating a polyclonal CTL response. • Significant gag-specific CTL responses were detected in 4/4 rhesus monkeys, in contrast to 1/4 using wildtype gag.				
Gag	p24		Vaccine	mouse (H-2^d)	Halim2000
	Vaccine *Vector/Type:* coxsackievirus *HIV component:* p24 Gag • An avirulent recombinant coxsackievirus (CB4-P) construct was generated that can express p24 Gag sequences – CB4-P is attenuated even in immunodeficient mice and T help responses can be elicited from peptides embedded in a surface loop of the VP1 capsid. • This paper describes the vaccine strategy and generation of constructs, and employs amino-terminal fusion of Gag sequences to the viral polyprotein with subsequent cleavage to elicit CTL responses via MHC class I presentation in BALB/c mice.				
Gag	Gag		Vaccine	mouse (H-2^d)	Huang2001
	Vaccine *Vector/Type:* DNA *Strain:* B clade HXB2, B clade NL43 *HIV component:* Gag, Pol • Different HIV strains were used for different regions: gag HXB2, pol NL43 • Mice were immunized with four humanized DNA constructs: GagPol, that would form a pseudoparticle carrying Gag and Pol, Gag, Pol or a GagPol fusion construct. • The GagPol pseudoparticle, Gag and GagPol fusion construct all elicited strong anti-Gag CTL, but only the GagPol fusion construct elicited strong anti-Pol CTL.				
Gag	Gag (HXB)		Vaccine	mouse (H-2^d, H-2^b)	Mata2001
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag **Keywords** Th1. • BALB/c and C57BL/6 mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag and mice were challenged with vaccinia expressing Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CD4+ Th1 T-cells mediated the Gag specific immunological protection in mice immunized with Lm-Gag and challenged with vaccinia-Gag. • Gag-specific CTL may enhance viral clearance via IFN-gamma secretion, but are not essential for immunity.				
Gag	Gag		Vaccine	mouse (H-2^d, H-2^b)	Mata2000
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag **Keywords** review, Th1. • BALB/c and C57BL/6 mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag and mice were challenged with vaccinia expressing Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways. • This article is a review of L. monocytogenes biology and its potential as a vaccine vector for HIV, comparing to other vector systems, and discussing CD4+ Th1 T-cells mediated Gag specific immunological protection in mice and the Gag CTL response.				

II-B-7 Gag/Pol CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag/Pol	Gag/Pol (ARV-2 SF2)		Vaccine	macaque	Kent2000
	Vaccine *Vector/Type:* fowlpoxvirus *Strain:* B clade ARV-2, B clade SF2 *HIV component:* Gag, Pol *Adjuvant:* IFN-gamma				
	• Vaccination with FPV Gag/Pol-IFN-gamma increased HIV-1 specific CTL and T cell proliferative responses to Gag/Pol antigens, respectively, in infected Macaca nemestrina.				
	• HIV-1 viral loads remained low and unchanged following vaccinations.				
Gag/Pol	RT		Vaccine	mouse	Kim1997d
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12				
	• A Gag/Pol or Env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules CD86, gave a dramatic increase in both the cytotoxic and proliferative responses in mice.				
	• When CD86 was present, CTL response could be detected even without *in vitro* stimulation.				
Gag/Pol	RT		HIV-1 infection	human	Gamberg1999
	Keywords TCR usage.				
	• 13/13 subjects with advanced HIV infections showed CD8 T cell proliferation and differentiation of CTL *in vitro*, and six individuals showed HIV-specific responses to Gag, Pol, Env or Nef antigens.				
	• Data suggests that the functional and genetic integrity of the CD8 T cell repertoire (TCR Vβ gene intrafamily genetic diversity) remains intact through advanced HIV infection, although HIV-specific CTL activity decreases.				
Gag/Pol			Vaccine	mouse	Muthumani2002
	Vaccine *Vector/Type:* adenovirus *HIV component:* Gag-Pol, Nef, Vpr				
	• Vpr can cause cells to go into G2 arrest, and it surpresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens.				
	• Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol.				
	• In vitro, Vpr reduced T-cell cytokine production of IL-12 and TNFalpha, indicative of Vpr-mediated immune suppression.				

II-B-8 Protease CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Protease (3–11)	RT (71–79 subtype A, B, D) • C. Brander notes this is an A*6802 epitope.	ITLWQRPLV		human (A*6802)	Frahm2004
Protease (3–11)	Pol	ITLWQRPLV	HIV-1 infection, Vaccine	human (A*6802)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
Protease (3–11)	Protease (71–79 LAI) **Keywords** inter-clade comparisons. • Predicted on binding motif, no truncations analyzed. • Clade A/B/D consensus, S. Rowland-Jones, pers. comm.	ITLWQRPLV		human (A*6802, A*7401, A19)	Dong1998a
Protease (3–11)	RT (71–79 subtype A, B, D) • C. Brander notes this is an A*7401 epitope.	ITLWQRPLV		human (A*7401)	Frahm2004
Protease (3–11)	Pol (59–)	ITLWQRPLV	HIV-1 infection, Vaccine	transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Protease *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Pol59. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was an intermediate A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice, but responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.				
Protease (3–11)	Pol (59–65) • One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.	ITLWQRPLV	HIV-1 infection	human (A28)	Ferrari2000

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Protease (3–11)	RT (71–79 LAI)	ITLWQRPLV	HIV-1 infection	human (A28supertype)	Mollet2000
	Keywords HAART, supertype. **Epitope name** P2. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.				
Protease (3–11)	Pol	ITLWQRPLV	HIV-1 infection, HIV-1 exposed seronegative	human (A74)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ITLWQRPLV cross-reacts with clades A, B and D. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
Protease (4–14)	Pol (60–70 SF2)	TLWQRPLVTIR	HIV-1 infection, computer prediction	human (A*3303)	Hossain2003
	Keywords binding affinity, computational epitope prediction. **Assay type** Chromium-release assay. • HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing. • This epitope is one of the 4 that are properly processed.				
Protease (11–20)	Pol (91–100)	VTILIGGQLK	HIV-1 infection	human (A3 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).				
Protease (12–20)	Pol (92–100)	TIKIGGQLK	HIV-1 infection	human (A3 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Protease (30–38)	Pol (subtype B)	DTVLEEMNL	HIV-1 exposed seronegative	human (A*6802)	Rowland-Jones1998b
	Keywords inter-clade comparisons.				
	• HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi—these CTL may confer protection.				
	• Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.				
	• Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.				
	• This epitope is conserved among B and D clade viruses.				
	• The Clade A version of the epitope: DTVLEDINL.				
	• This epitope was recognized by two different exposed and uninfected prostitutes.				
	• This epitope was identified by screening 49 HIV-1 peptides with the predicted A*6802 anchor residue motif x(VT)xxxxxx(VL)				
Protease (30–38)	Pol (subtype A)	DTVLEDINL	HIV-1 exposed seronegative	human (A*6802)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 IFNγ responses in the cervix—systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses.				
	• Low risk individuals did not have such CD8+ cells.				
	• CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
Protease (30–38)	RT (85–93 subtype D)	DTVLEEWNL		human (A*6802)	Frahm2004
	• C. Brander notes this is an A*6802 epitope.				
Protease (30–38)	Pol (subtype A)	DTVLEDINL	HIV-1 infection	human (A*6802)	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS), escape.				
	• This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.				
	• DTVLEDINL was recognized in 3 of the 6 women (ML857, ML1203, and ML1707), and the response was present in the last available sample prior to seroconversion, 3-7 months.				
	• In each of the three women, 20/20 sequences of the infecting strain had no substitutions in this epitope, all were DTVLEDINL, so there was no evidence for escape.				
	• The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire.				
	• This epitope was recognized in 3/22 HEPS sex worker controls, ML851, ML1432, and ML1601.				
Protease (30–38)	Pol (85–93)	DTVLEDINL	HIV-1 infection, HIV-1 exposed seronegative	human (A*6802)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance.				
	• ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
	• Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.				
	• 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.				
	• Among HLA-A*6802 women, 11/12 HEPS and 6/11 HIV-1 infected women recognized this epitope likelihood ratio 4.4, p value 0.08, and HEPS women tended to respond to DTVLEDINL, infected women tended to ETAYFYILKL.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The dominant response to this HLA allele was to this epitope in 10 of the 11/12 HEPS cases, but in only 4 of the 6/11 HIV-1 infected women. • Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort. • Four epitopes were considered to be "resistant epitopes", as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24. • Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVIYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion, and the loss of the pre-seroconversion response was not due to sequence variation within these epitopes. • Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPGV/IRYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV. • Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion, and the loss of the pre-seroconversion response was not due to sequence variation within the epitope. • Subject ML 1830 made no detectable response prior to seroconversion, but responded to A*6802 DTVLEDINL and A*6802 ETAYFILKL post-seroconversion.			
Protease (30–38)	Pol	DTVLEDINL	HIV-1 infection	human (A*6802)	Kaul2002
	Keywords HIV exposed persistently seronegative (HEPS). • Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs. • Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.				
Protease (34–42)	Protease (34–42)	EEMNLPGRW		human (B*44)	Frahm2004
Protease (45–54)	Pol (125–134)	KMIGGIGGFI	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).				
Protease (75–84)	Protease (75–84 MN)	VLVGPTPVNI	in vitro stimulation or selectio	human (A*0201)	Konya1997
	Keywords binding affinity. • Peptide predicted to be reactive based on HLA-A*0201 binding motif. • Peptide could stimulate CTL in PBMC from 5/6 seronegative donors. • Peptide located in a highly conserved region of protease. • Both 9-mer and 10-mer could stimulate CTL: VLVGPTPVNI and LVGPTPVNI. • Binding affinity to A*0201 was measured, $C_{1/2\ max}\mu M = 6$ for 10-mer, 3 for 9-mer. • MAL variant of Pr(75-84 MN), with substitutions V77, G78, and P79, gave reduced binding and CTL recognition.				
Protease (76–84)	Pol (163–)	LVGPTPVNI	HIV-1 infection	human (A*0201)	Altfeld2001c
	Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Epitope name Pol-163. • HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested. • Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2) • LVGPTPVNI binds to 4/5 HLA-A2 supertype alleles: A*0201, A*0202, A*0206 (highest affinity) and A*6802, but not A*0203. • 1/22 individuals with chronic HIV-1 infection recognized this epitope by ELISPOT. • 0/12 acutely infected individuals recognized this epitope.				
Protease (76–84)	Protease (76–84 HXB2)	LVGPTPVNI	HIV-1 infection	human (A2)	Karlsson2003
	Keywords HAART, escape. **Epitope name** PR82V. **Assay type** Intracellular cytokine staining, Chromium-release assay. • This epitope contains two positions that are commonly associated with protease inhibitor escape, lvgptpAni (V82A) and lvgptpvnV (I84V). 29 HIV-1 infected patients (15 were HLA-A2+) with a history of protease inhibitor failure were screened for mutations within the protease gene and CD8+ T cells recognition of the wt and V82A variant peptides. CTL pressure alone, despite high functional avidity, did not drive the V82A substitution. Suprisingly V82A was found more frequently among HLA-A2- individuals (10/14) than HLA-A2+ (7/15), despite the mutation conferring not only drug resistance but CTL escape. • 8/15 HLA-A2+ patients carried had a Val at position 82; 7/8 of these recognized the WT peptide, but only 3/8 could also recognize V82A. • 7/15 had the V82A substitution; 2/7 recognized the wt and the V82A mutation, 1/7 recognized only the peptide with the V82A substitution.				
Protease (76–84)	Pol (156–164)	LVGPTPVNI	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).				

II-B-9 Protease-RT CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Protease-RT (95–5)	Gag (175–184)	CTLNFPISPI	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • The epitope starts in Protease and ends in RT. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)				
Protease-RT (96–5)	Pol (176–184)	TLNFPISPI	HIV-1 infection	human (A2 supertype)	Propato2001

II-B-10 RT CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
RT (3–12)	RT (LAI)	SPIETVPVKL	HIV-1 infection	human (A2, B61)	vanderBurg1997
	• Recognized by CTL from a long-term survivor, EILKEPVGHGV was also recognized. • Highly conserved across clades.				
RT (3–12)	Pol	SPIETVPVKL		human (B7)	De Groot2001
	• The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes. • A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes could stimulate IFNγ production in an ELISPOT assay. • SPIETVPVKL was newly identified as HLA-B7 epitope in this study, it had been previously shown to be presented by HLA-A2 and B61.				
RT (5–12)	RT (5–12)	IETVPVKL	HIV-1 infection	human (B*4001)	Frahm2004
RT (5–29)	RT (160–184 HXB2)	IETVPVKLKPGMDGPKVKQ-WPLTEE	HIV-1 infection	human (B8)	Walker1989
	• One of five epitopes defined for RT-specific CTL clones in this study.				
RT (18–26)	RT (185–193 LAI)	GPKVKQWPL		human (B*0801)	Frahm2004
	• C. Brander notes this is a B*0801 epitope.				
RT (18–26)	RT (18–26)	GPKVKQWPL	HIV-1 infection	human (B8)	Meier1995, Menendez-Arias1998
	• HIV proteins with mutations in this epitope allowed transactive inhibition of specific CTL-mediated lysis. • Article reviewed in [Menendez-Arias1998], with a discussion of antagonism.				
RT (18–26)	RT (173–181)	GPKVKQWPL		human (B8)	Goulder1997g, Menendez-Arias1998
	• Included in a study of the B8 binding motif. • Article reviewed in [Menendez-Arias1998], with a discussion of antagonism.				
RT (18–26)	RT (185–193 LAI)	GPKVKQWPL		human (B8)	Sutton1993
	• Predicted epitope based on B8-binding motifs, from larger peptide IETVPVKLKPGMDGPKVKQWPLTEE.				
RT (18–26)	RT (185–193 LAI)	GPKVKQWPL	HIV-1 infection	human (B8)	Klenerman1995, Menendez-Arias1998
	• Naturally occurring antagonist GPRVKQWPL found in viral PBMC DNA and RNA. • Article reviewed in [Menendez-Arias1998] with a discussion of antagonism.				
RT (18–26)	RT (18–26)	GPKVKQWPL	in vitro stimulation or selectio	human (B8)	Zarling1999
	Keywords dendritic cells. • This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses. • Strong CTL responses were elicited by the epitopes DRFYKTLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA. • A weak response to KLTPLCVSL was stimulated using macrophages as the APC.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.				
RT (18–26)	RT (185–193)	GPKVKQWPL	HIV-1 infection	human (B8)	Oxenius2000
	Keywords HAART, supervised treatment interruptions (STI), immunodominance, escape, acute infection. **Epitope name** GPK. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • Two of the 7/8 study subjects that were HLA B8+ recognized this epitope. • Patient SC2 (HLA A1, B7/8, Cw0701/0702, DR4/53, DQ7) had CTL responsiveness against epitopes FLKEKGGL, GPKVKQWPL, and GEIYKRWII peptides – FLKEKGGL tetramer staining steadily declined and at day 1340 the FLKEKGGL stained cells were no longer detected and the escape mutant FLKENGGI was found in 8/10 clones. • Patient SC11(HLA A1, B8, Cw0201, DR3/11, DR52, DQ2/7) started therapy early, remained on therapy for 40 days, then reinitiated HAART at day 640 had a CTL response to FLKEKGGL, GPKVKQWPL, and GEIYKRWII throughout and received a benefit from the early limited course therapy.			
RT (18–26)	Pol	GPKVKQWPL	HIV-1 infection	human (B8)	Seth2001
	Keywords HAART. • CTL responses were studied by tetramer staining in 41 patients with combination therapy – activated CD8+ T-cells decline as the viral load drops in response to therapy, but the overall level of antigen-specific cells capable of differentiating into effectors stays constant and new epitopes may be recognized.				
RT (18–26)	RT (185–193 SF2)	GPKVKQWPL	HIV-1 infection	human (B8)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B8+ individuals that had a CTL response to this epitope broken down by group: 0/3 group 1, 0/3 group 2, and 2/2 group 3.				
RT (18–26)	Pol (171–180)	GPKVKQWPL	HIV-1 infection, HIV-1 exposed seronegative	human (B8)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • GPKVKQWPL is cross-reactive for clades A, B, C, and D. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
RT (18–26)	RT (18–26)	GPKVKQWPL	HIV-1 infection	human (B8)	Day2001
	• B8-restricted CTL accounted for about 1/3 of the total CTL response in one individual.				
RT (18–26)	RT	GPKVKQWPL	HIV-1 infection	human (B8)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** GPK.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI). • STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
RT (18–27)	Pol	GPKVKQWPLT		human (B7, B8)	De Groot2001
	• The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes. • A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFNγ production in an ELISPOT assay. • GPKVKQWPLT was confirmed as a previously identified HLA-B8 epitope, and newly identified as an HLA-B7 epitope in this study.				
RT (33–41)	RT (33–41 LAI)	ALVEICTEM	HIV-1 infection	human (A*0201)	Frahm2004
	• C. Brander notes this is an A*0201 epitope.				
RT (33–41)	RT (33–41 LAI)	ALVEICTEL	HIV-1 infection	human (A*0201)	Samri2000
	Keywords binding affinity, computational epitope prediction. • This epitope contains the mutation M41L, a mutation induced by nucleosidee reverse transcriptase inhibitors. • Patient 201#5, (A*0201), was found by ELISPOT to recognize the mutated peptide after zidovudine treatment, but not the wild-type peptide – the mutation M41L gave an increased A2 binding score (http://bimas.dcrt.nih.gov/molbio/hla_bind) compared to the wildtype RT sequence. • Three additional A*0201 individuals and one B27 individual did not respond to this epitope before or after treatment. • M41L occurred at anchor positions p2 and p9 in several computer predicted RT epitopes (33-41, 32-41, and 40-49) (http//bimas.dcrt.nih.gov/molbio/hla_bind), and increased the predicted binding affinity for 6 HLA molecules (B2705, B5102, C3, A0201, B2705 and B3901)				
RT (33–41)	RT (33–41)	ALVEICTEM	HIV-1 infection	human (A2)	Haas1998
	• Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively) • New clusters of epitopes were defined utilizing different HLA molecules.				
RT (33–41)	RT (33–41)	ALVEICTEM	HIV-1 infection	human (A2)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • SLYNTVATL was the dominant A2 epitope recognized in patients with chronic infection, except for Subject 11841 who recognized 5/8 epitopes and who had a dominant A-2 response to ALVEICTEM.				
RT (33–43)	RT (33–43)	ALVEICTEMEK	HIV-1 infection	human (A*0301)	Haas1998
	• Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively) • New clusters of epitopes were defined utilizing different HLA molecules. • C. Brander notes that this is an A*0301 epitope in the 1999 database, G. Haas, pers. comm.

Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction.
Epitope name Pol-316.

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- 2/22 individuals with chronic HIV-1 infection recognized this epitope in ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.
- YTAFTIPSI binds to five HLA-A2 supertype alleles: A*0201, A*0202,A*0203, A*0206 and A*6802 (highest affinity)

RT (127–135)	Pol (306–314)	YTAFTIPSI	HIV-1 infection	human (A2 supertype)	Propato2001

Keywords supertype, rate of progression.

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)

RT (128–135)		TAFTIPSI	HIV-1 infection	human (A*0217, B*5101)	Sabbaj2002b

Keywords HAART.
Epitope name Pol-TI8.
Donor HLA A*0201 A*0217 B*0801 B*4002 Cw*0303 Cw*070.

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- Patient 01RCH46 was Hispanic, on HAART, and had a viral load of 21000 and CD4 count of 623 – she also recognized GELDRWEKI, p17(11-19), HLA B*4002, and KETINEEAA p24(70-78), HLA B*4002.
- Among HIV+ individuals who carried HLA A*02, 7/36 (19%) recognized this epitope, two of which also carried B*5101 which can also restrict this epitope.

RT (128–135)	RT (295–302 IIIB)	TAFTIPSI	HIV-1 infection	human (B*5101)	Frahm2004

- C. Brander notes this is a B*5101 epitope.

RT (128–135)	Pol (283–290 SF2)	TAFTIPSI	HIV-1 infection	human (B*5101)	Tomiyama1999

Keywords inter-clade comparisons, rate of progression.

- HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA-B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996;Lancet 22:1187, 1986;Hum Immunol 22:73, 1988;Hum Immunol 44:156, 1995)
- 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3%

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed. • Four of the six epitopes were highly conserved among B subtype sequences, but TAFTIPSI is somewhat variable.				
RT (128–135)	RT (295–302) **Keywords** HAART, escape. **Epitope name** P5. • The epitope TAFTIPSI was recognized by patient 246#1 in a study of the effects of therapy escape mutations on CTL recognition.	TAFTIPSI	HIV-1 infection	human (B*5101)	Samri2000
RT (128–135)	RT (128–135 IIIB) **Keywords** epitope processing, escape. • HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing. • TAFTIPSI was one of two epitopes characterized in detail. C-terminal I135x substitutions were associated with people who carried HLA-B5 – 39/40 (98%) of HLA-B*5101 individuals had substitutions in this position, while only 127/431 (29%) who did not have HLA-B*5101 did. The predominant substitution was kytaftipsT, and this mutation is predicted to abrogate binding to HLA-B*5101.	TAFTIPSI	HIV-1 infection	human (B*5101)	Moore2002b
RT (128–135)	RT (295–302 IIIB) **Keywords** review. • HIV IIIB proteins were used to define the range of CTL epitopes recognized by 3 lab workers accidentally infected with HIV-1 IIIB. • TAFTIPST, a variant found in HIV-1 CAM1, was also recognized but 100-fold more peptide was needed. • TAFTIPSV, a variant found in HIV-1 VE1RT, was also recognized, but 10-fold more peptide was needed. • TVFTIPSI, a variant found in HIV-1 MANC, was also recognized. • [Menendez-Arias1998], in a review, notes that this epitope includes a region near the active site of RT – the substitution of the position two conservative change from A to V decreases CTL recognition.	TAFTIPSI	HIV-1 infection	human (B51)	Menendez-Arias1998, Sipsas1997
RT (128–135)	RT (295–302) **Keywords** immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • Three of the four individuals that responded to SLYNTVATL recognized additional HIV epitopes, and all three were also HLA B51 and recognized this epitope as well as other epitopes.	TAFTIPSI	HIV-1 infection	human (B51)	Betts2000
RT (128–135)	RT (295–302) **Keywords** HAART, acute infection. **Epitope name** TAF. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • None of the 8 study subjects recognized this epitope but none were HLA B51+	TAFTIPSI	HIV-1 infection	human (B51)	Oxenius2000

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
RT (128–135)	RT (295–302 LAI) **Keywords** HAART. **Epitope name** P5. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.	TAFTIPSI	HIV-1 infection	human (B51)	Mollet2000
RT (128–135)	Pol **Keywords** mother-to-infant transmission. **Donor HLA** A3, A11, B35, B51. • IFNgamma T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release. • T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFNgamma after stimulation with either of two overlapping peptides that carry known B51 epitope TAFTIPSI. • The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.	TAFTIPSI	HIV-1 infection	human (B51)	Sabbaj2002a
RT (128–135)	RT (128–135) **Keywords** binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A*0201, A11, B51, b61, Cw2, Cw14. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.	TAFTIPSI	HIV-1 infection	human (B51)	Cao2003
RT (151–159)	Pol (306–314 SF2) **Keywords** inter-clade comparisons, rate of progression. • HLA-B27, -B51, and -B57 are associated with slow progression to AIDS. • 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3% • Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed. • Four of the six epitopes were highly conserved among B subtype sequences, QGWKGSPAI is conserved.	QGWKGSPAI	HIV-1 infection	human (B*5101)	Tomiyama1999

RT (151–168)	RT (151–168 HXB2)	QGWKGSPAIFQSSMTKIL	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.			
RT (153–165)	RT (308–320)	WKGSPAIFQSSMT	HIV-1 infection	human (B7)	Brander1995b
	Keywords responses in children, mother-to-infant transmission. • Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study.				
RT (153–165)	Pol (308–320)	WKGPAIFQSSMT	HIV-1 infection	human (B7)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
RT (153–167)	RT (SF2)	WKGSPAIFQSSMTKI	HIV-1 infection	human	Altfeld2001a
	• HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • RT peptides SQIYPGIKVRQLCKL and WKGSPAIFQSSMTKI were recognized.				
RT (156–164)	RT (311–319 SF2)	SPAIFQSSM	HIV-1 infection	human (B*3501)	Menendez-Arias1998, Tomiyama1997
	Keywords review. • A CTL clone responsive to this epitope was obtained. • Only 1/7 B35-positive individuals had a CTL response to this epitope. • [Menendez-Arias1998], in a review, notes that this epitope is near the active site of RT.				
RT (156–164)	RT (311–319 SF2)	SPAIFQSSM	HIV-1 infection	human (B35)	Menendez-Arias1998, Shiga1996
	Keywords review. • Binds HLA-B*3501. • [Menendez-Arias1998], in a review, notes that this epitope includes catalytic residues in the active site of RT.				
RT (156–164)	Pol (311–319)	SPAIFQSSM	HIV-1 infection	human (B35)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
RT (156–164)	Pol (156–164 HXB2)	SPAIFQSSM	HIV-1 infection	human (B7)	Hay1999b
	Keywords rate of progression, immunodominance. • CTL response to IPRRIRQGL was the immunodominant response in a rapid progressor – there was a subdominant response to SPAIFQSSM in Pol, and interestingly, no response to commonly immunodominant HLA A*0201 epitope SLYNTVATL, although this individual was HLA A*0201. • The individual showed a strong initial CTL response at the time of the initial drop in viremia, but it was quickly lost, although memory cells persisted. • Despite the initial narrow response to two epitopes, no other CTL responses developed. • No HIV-specific lymphoproliferative responses were detected in this patient, and neutralizing antibody response was weak. • Variants of this epitopes were observed *in vivo* (spaifqCsm, spSifqssm), but the binding motifs for B7 were preserved (P2, and C-term aromatic or hydrophobic)				
RT (156–164)	Pol	SPAIFQSSM	HIV-1 infection	human (B7)	Islam2001
	Keywords rate of progression, acute infection. • Subject 053i was followed longitudinally from acute infection through death, and had rapid progression to AIDS. • This individual had a dominant response to IPRRIRQGL with strong *in vivo* activated responses and *in vitro* stimulated memory responses and a subdominant response to SPAIFQSSM – during the course of disease progression (4 Years), the functional CTL responses were lost and no sequence variation occurred with in both epitopes, but CTL clones specific for IPRRIRQGL persisted throughout.				
RT (156–164)	RT (323–331 SF2)	SPAIFQSSM	HIV-1 infection	human (B7)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 0/4 group 1, 0/3 group 2, and 1/1 group 3.				
RT (156–164)	RT (156–164)	SPAIFQSSM	HIV-1 infection	human (B7)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** B7-SM9. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 1/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 3/4 individuals had detectable responses to this epitope after STI.				
RT (156–165)	RT (311–319 LAI)	SPAIFQSSMT	HIV-1 infection	human (B35)	Samri2000
	Keywords HAART, escape. **Epitope name** P4. • This epitope contains the mutation P157S which can be induced by nucleosidee reverse transcriptase inhibitors. • It was recognized by patient 252#0 in a study of the effects of therapy escape mutations on CTL recognition.

RT (158–166)	Pol	AIFQSSMTK	HIV-1 infection, Vaccine	human, macaque (A*0301, A11, A33)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000].				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
RT (158–166)	RT (325–333 LAI)	AIFQSSMTK	HIV-1 infection	human (A*1101)	Frahm2004
	• C. Brander notes this is an A*1101 epitope.				
RT (158–166)	Pol (313–321)	AIFQSSMTK	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords inter-clade comparisons. • Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals. • AIFQSSMTK is commonly found in viruses representing subtypes A-E. It was strongly recognized by CTL from 2/5 B clade infected Japanese subjects, and 5/6 E clade infected Thai subjects.				
RT (158–166)	RT (325–333)	AIFQSSMTK	HIV-1 infection	human (A*1101, A3, A*0301, A*6801)	Menendez-Arias1998, Threlkeld1997
	• Study of the fine specificity of an A3-like super-type epitope (the A3 super-type includes A*0301, A*1101, A*3101, A*3301, and A*6801) • A3 super-type is characterized by a hydrophobic or hydroxyl containing anchor residue at position 2, and a positive charge in the C-term position. • While most lines were specific, promiscuous cloned CTL lines were also derived from HIV+ donors that could recognize epitope presented by either A3 or A11 or A*6801. • Alanine substitutions throughout the epitope and natural variants indicate that the same amino acid positions are critical for presentation by either MHC molecule, A3 or A11. • AIFQSSMTK is presented by three members of the A3 superfamily: A*0301, A*1101, and A*6801, and the naturally occurring variants A1S and K9R are recognized with similar efficiency to wild type epitope – AIFQRSMTR can also bind to two additional members of the A3 superfamily, A*3101 and A*3301.				
RT (158–166)	RT	AIFQSSMTK	HIV-1 infection	human (A11)	Wagner1998a
	• CTL specific for HIV epitopes were used to show that the mediators of both the cytolytic (granzyme A was used as the marker) and non-cytolytic (HIV-1 inhibitory chemokines MIP-1 α and RANTES were used as markers) anti-viral responses are localized within the CTL's cytotoxic granules.

	• Among HIV+ individuals who carried HLA B35, 4/21 (19%) recognized this epitope.				
RT (175–183)	Pol	NPDIVIYQY	HIV-1 infection	human (B35)	Sabbaj2002a
	Keywords mother-to-infant transmission. **Donor HLA** A3, A11, B35, B51. • IFNgamma T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release. • T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFNgamma after stimulation with a peptide that carries known B35 epitope NPDIVIYQY. • The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.				
RT (175–183)	Pol	HPDIVIYQY	HIV-1 infection, Vaccine	human, macaque (B35)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
RT (175–184)	RT (175–184 LAI)	NPDIVIYQYM	HIV-1 infection	human (B51)	Samri2000
	• This epitope contains the mutation M184V, a frequent mutation induced by nucleoside reverse transcriptase inhibitors. • Patient 246#1 (B51), was found by ELISPOT to recognize the wild type and the mutated peptide after zidovudine treatment. • The resistance mutation M184V gave an increased predicted binding score to B51 (http://bimas.dcrt.nih.gov/molbio/hla_bind) compared to the wildtype RT sequence and also an increased ELISPOT reactivity.				
RT (175–199)	RT (342–366 LAI)	NPDIVIYQYMDDLYVGSDL-EIGQHR	HIV-1 infection	human (A11)	Menendez-Arias1998, Walker1989

RT (179–187)	Pol (346–354)	VIYQYMDDL	Vaccine	human (A2)	Woodberry1999

Vaccine *Vector/Type:* DNA prime with vaccinia boost

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^{d} – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- VIYQYMDDL was recognized by 3 of the HLA-A2 patients.

RT (179–187)	RT (179–187)	VIYQYMDDL	HIV-1 infection	human (A2)	Schmitt2000

Keywords escape, immunotherapy.

- The mutation M184V confers resistance to lamivudine, and is in the middle of the HLA-A2 epitope VIYQYMDDL.
- 1/28 individuals tested produced HIV-1 RT-specific CTL that recognized the peptide representing the lamivudine escape mutants VIYQYVDDL and VIYQYIDDL, but failed to recognize the wildtype epitope VIYQYMDDL.
- This suggests immunotherapy stimulating anti-VIYQYVDDL responses maybe helpful for reducing lamivudine escape.

RT (179–187)	RT (179–187)	VIYQYMDDL	HIV-1 infection	human (A2)	Haas1998

- Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively)

RT (179–187)	Pol (339–347 93TH253 subtype CRF01)	VIYQYMDDL	HIV-1 infection	human (A2)	Sriwanthana2001

Keywords HIV exposed persistently seronegative (HEPS).
Epitope name P334-342.

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope was reactive in HIV+ control study subject 144 who carried HLA-A2.

RT (179–187)	Pol (339–347 93TH253 subtype CRF01)	VIYQYMDDL	HIV-1 infection	human (A2)	Bond2001

Keywords inter-clade comparisons.

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 2/4 tested FSWs recognized the E clade version of this epitope, which is identical to the previously defined B clade version VIYQYMDDL.
- This epitope was conserved in many subtypes, and exact matches were very uncommon.

RT (179–187)	RT (179–187)	VIYQYMDDL	HIV-1 infection	human (A2)	Day2001

Keywords rate of progression, acute infection.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.				
RT (179–187)	Pol (346–354 LAI)	VIYQYMDDL	HIV-1 infection	human (A2)	Kelleher2001a
	Keywords HAART, epitope processing. • Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in an intracellular context. • RTV did not alter the presentation two RT A2 epitopes processed by distinct pathways: ILKEPVHGV, generated by the constitutive proteasome containing the MB1 beta subunit, and VIYQYMDDL which is dependent on IFNgamma induction of LMP7 which replaces MB1 in the immunoproteasome, and is destroyed by MB1 in the constitutive proteasome. • RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.				
RT (179–187)	Pol (334–)	VIYQYMDDL	HIV-1 infection	human (A2)	Corbet2003
	Keywords binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Pol334. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This epitope was one of the previously identified HLA-A2 epitopes studied. • 1/17 HIV-infected HLA-A2+ people in this study recognized this epitope.				
RT (179–187)	Pol (subtype B)	VIYQYMMDL	HIV-1 exposed seronegative	human (A2, A*0202)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among A, B and D clade viruses.				
RT (179–187)	RT (346–354 LAI)	VIYQYMDDL	Vaccine	mouse (A2.1)	Peter2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG **Keywords** binding affinity, vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR26. • The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01). • The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants. • All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.				
RT (179–187)	RT (346–354 LAI)	VIYQYMDDL	Vaccine	mouse (A2.1)	Peter2002
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), IL-12, P30 **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR26. • When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination [Peter2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macropahges in the spleen.

RT (202–210)	RT (SF2)	IEELRQHLL	HIV-1 infection	human (B60)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B60+ individuals that had a CTL response to this epitope broken down by group: 0/2 group 1, 1/1 group 2, and 0/0 group 3.				
RT (202–210)	RT	IEELRQHLL	HIV-1 infection	human (B60)	Montefiori2003
	Keywords HAART, supervised treatment interruptions (STI), early treatment. **Epitope name** IL9. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2, A24, B38, B60, Cw2, Cw12. • HIV-1+ patient AC10 underwent early HAART treatment, which was discontiuned 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.				
RT (202–210)	RT (SF2)	IEELRQHLL	HIV-1 infection	human (B60(B*4001)	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes. • B60 is present in 10-20% of the Caucasoid and very common in Asian populations.				
RT (202–210)	RT (202–210)	IEELRQHLL	HIV-1 infection	human (B60/B61)	Day2001
	Keywords immunodominance. • No immunodominant responses were detected to five B61-restricted epitopes tested.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• All five B60-restricted epitopes were reactive in another subject, and the B60-restricted responses together contributed over one-third of the total CTL response.				
RT (203–212)	RT (LAI)	EELRQHLLRW	HIV-1 infection	human (B44)	Menendez-Arias1998, vanderBurg1997
	• The only epitope recognized by CTL from a long-term survivor in two samples taken six years apart. • Recognized by CTL from a progressor, EILKEPVGHGV and TWETWWTEYW were also recognized.				
RT (209–220)	RT (209–220)	LLRWGLTTPDKK	HIV-1 infection	human (A2)	Haas1998
	• Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively) • New clusters of epitopes were defined utilizing different HLA molecules.				
RT (240–257)	RT (240–257 HXB2) **Keywords** supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.	TVQPIVLPEKDSWTVNDI	HIV-1 infection	human	Addo2003
RT (243–252)	RT (LAI) • Recognized by CTL from a progressor and a long-term survivor, KITTESIVIW was also recognized.	PIVLPEKDSW	HIV-1 infection	human (B*5701)	Menendez-Arias1998, vanderBurg1997
RT (243–252)	RT (LAI) **Keywords** binding affinity, escape. • Recognized by CTL from long-term survivor, whose CTL response persisted for more than 10 years – the substitution V3M reduced affinity but was well recognized, on the other hand V3T and D8G did not reduce affinity, but abrogated CTL response.	PIVLPEKDSW	HIV-1 infection	human (B*5701)	Menendez-Arias1998, vanderBurg1997
RT (243–252)	RT (410–419) **Keywords** HAART, acute infection. **Epitope name** PIV. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • None of the 8 study subjects recognized this epitope but none were HLA B57+	PIVLPEKDSW	HIV-1 infection	human (B57)	Oxenius2000

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
RT (243–252)	RT	PIVLPEKDSW	HIV-1 infection	human (B57)	Oxenius2002b
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** PIV. • Using previously defined epitopes [Oxenius2000, Oxenius2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI). • STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.				
RT (244–252)	RT (399–407)	IVLPEKDSW		human (B*5701)	Frahm2004
	• Subtype of B57 not determined. • C. Brander notes this is a B*5701 epitope.				
RT (244–252)	RT (244–252 LAI)	IVLPEKDSW	HIV-1 infection	human (B*5701, B*5801)	Klein1998
	Keywords binding affinity, rate of progression, escape. • This peptide was defined as the optimal epitope. • B57 has been associated with long-term non-progression in the Amsterdam cohort. • The most pronounced CTL responses in HLA B*5701 LTS were to RT and Gag. • B57 restricted CTL responses are targeted at multiple proteins, but one LTS had a response that was dominated by reactivity to the epitope – two variants were found in this LTS: ITLPEKESW, which bound to B*5701 with similar affinity as the index peptide but was an escape mutant that was not recognized by CTL, and IMLPEKDSW, which bound to B*5701 with reduced affinity but could still be recognized. • In an additional HIV+ LTS, only the variant IELPEKDSW was found, and this epitope was recognized by CTL but had less affinity for B*5701 than the index peptide. • This epitope was recognized in the context of both HLA-B*5701 and B*5801.				
RT (244–252)	Pol (244–252)	IVLPEKDSW	HIV-1 infection	human (B*5801)	Appay2000
	• Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV. • HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation. • In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α				
RT (244–252)	RT (399–407)	IVLPEKDSW		human (B57)	vanderBurg1997
RT (244–252)	RT (244–252)	IVLPEKDSW	HIV-1 infection	human (B57)	Guillon2002
	Keywords early-expressed proteins, kinetics. • An early-expressed Nef protein was modified to contain Env and Pol epitopes to enable the study the effect of expression kinetics on CTL mediated suppression of replication. The "EpiNef" construct was inserted into a recombinant vaccinia virus which was used to infect a target cell line; the target cells were lysed by CTL clones specific for the Env and Pol epitopes indicating that they were properly processed.				
RT (244–252)	RT (244–252 ACH320.2A.2.1)	IVLPEKDSW	HIV-1 infection	(B57)	vanBaalen2002
	Keywords acute infection, early-expressed proteins, kinetics.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Tat, Rev and Nef are the first HIV proteins expressed upon acute infection of T-cells (< 6 hours), and RT is not expressed until after 24 hours. The B14-restricted Rev-SAEPVPLQL specific CD8 T-cell clone TCC108, and the B57-restricted RT-IVLPEKDSW specific CD8 T-cell clone TCL1C11 were co-incubated with CD4+ cultures innoculated with HIV-1 at low MOI. Co-incubation with the Rev-specific CTL resulted in two logs less HIV-1 production in ten days of culture. When the RT epitope was cloned into the Nef gene of the infecting strain, another early expressed protein, it proved as effective as the Rev epitope at inhibiting viral production. A mathematical model of CTL-target interactions suggest early proteins are important for vaccine design.				
RT (245–252)	Pol	IVPEKDSW	HIV-1 infection	human (B57)	Kostense2001
	• HLA tetramers to six epitopes were used to study HLA-A2, B8 and B57 CTL in 54 patients – HIV-specific tetramer positive cells were inversely correlated with viral load in patients with high CD4, but in patients with CD4 T-cells below 400 high tetramer frequencies were found despite high viral load. • Most patients have high levels of HIV-specific T-cell expansions, but many of these cells aren't functional. • In 15 of the patients, the proportion of IFN gamma producing tetramer cells correlated with AIDS-free survival.				
RT (259–267)	Pol	KLVGKLNWA	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802). • Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific sells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

RT (263–271)	RT	KLNWASQIY	HIV-1 infection	human (A*3002)	Goulder2001a
	Epitope name KY9 (RT-35). • HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule. • A rapid method was developed combining ELISPOT with intracellular IFN-γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood. • Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• In both HLA-A*3002 individuals the response to RSLYNTVATLY was dominant. • In subject 199 four additional A*3002 epitopes were identified. • Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)				
RT (263–271)	RT	KLNWASQIY	HIV-1 infection	human (A30)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** A30-KY11(RT). **Donor HLA** A30,A32,B18,B27. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).			
RT (266–285)	Pol (421–440)	WASQIYPGIKVRQLCKLLRG	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
RT (268–282)	RT (SF2)	SQIYPGIKVRQLCKL	HIV-1 infection	human	Altfeld2001a
	• HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • RT peptides SQIYPGIKVRQLCKL and WKGSPAIFQSSMTKI were recognized.				
RT (269–277)	Pol (424–432)	QIYAGIKVK	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords binding affinity, inter-clade comparisons. • binding affinity, inter-clade comparisons. • Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals. • QIYAGIKVK is commonly found in viruses representing subtypes A, B and E. It was strongly recognized by CTL from 1/5 B clade infected Japanese subjects, and 5/7 E clade infected Thai subjects. • QIYAGIKVK had the highest A*1101 binding affinity, but qiyagikvR and qiyPgikvR (the most common C and D clade variant both bound to A*1101). QIYAGIKVK and qiyagikvR were both cross-presented by a clone from a B clade infection, but qiyPgikvR was not.

	Keywords HAART, responses in children. **Donor HLA** A*0201. • Longitudinal study of 8 infants with prolonged viral suppression due to combination antiretroviral therapy showed no HIV-1 specific CTL responses in peripheral blood cells. 6/8 were studied using a Chromium release assay and no response was detected using Gag expressed in vaccinia in the target cells. Three HLA-A*0201 children were tested using SLYNTVATL or ILKEPVHGV HLA A*0201 tetramers and again no HIV-specific response was detected, either using PBMC specimens, or PBMC which had been stimulated *in vitro* for a week. • In contrast, one of the children with suppressed HIV viral replication who was co-infected with HIV and EBV, while HIV-tetramer negative, had EBV-tetramer staining cells at a frequency of 0.14% in the PBMC.				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A*02)	Huang2000
	Keywords HAART. • The single cell ELISPOT assay was optimized and highly specific, and found to work well even after the primary cells had been frozen and thawed. • Increases in gamma interferon producing cells were observed in response to anti-retroviral therapy using single cell IFN-gamma-production ELISPOT.				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A*02)	Rinaldo2000
	Keywords HAART. • Administration of triple-drug antiretroviral therapy (IDV, 3TC and ZDV) sometimes showed a transient increase and other times failed to increase CTL responses in patients with advanced HIV disease, but there is a stable population of tetramer stained HIV-specific CD8+ CD45RO+ cells that persist after therapy and long periods of virus being below the level of detection.				
RT (309–317)	RT	ILKEPVHGV	HIV-1 infection	human (A*02)	Scott-Algara2001
	Keywords HAART, immunodominance. **Epitope name** IV9. • This study examined with CTL response in HLA A*02+ children by tetramer staining for HLA-A2 immunodominant epitopes SLYNTVATL and ILKEPVHGV. • 71% of the 28 HIV-1 infected HLA-A*02 positive children recognized both epitopes, with cells from 26 children stained positive by the gag tetramer (SLYNTVATL) and 21 children by the pol tetramer (ILKEPVHGV) • There were no differences observed in children that had therapy versus those that did not. • Tetramer-binding cells were memory activated CD28-, CD45RO+, CD45RA- HLADR+, CD69-, CD8+ T-cells.				
RT (309–317)		ILKEPVHGV	HIV-1 infection	human (A*0201)	Wilson2000a
	Keywords acute infection. • Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and a close temporal relationship between the number of circulating HIV-specific T cells and viral load. • All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39. • ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK. • The subject with A*0201 had a moderately strong response to SLYNTVATL. • Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705. • No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

	• High levels of CD8+ HIV-1 specific and cytomegalovirus specific CTL were detected by HLA-A*0201-peptide tetramers in 3 infected subjects with very low CD4 counts, but CD8 T cell mediated effector activity was not seen. • Thus HIV-1 specific CD8+ cells may be present but may lack direct effector activity in late disease, suggesting that overcoming antigen unresponsiveness may be a useful therapeutic strategy.				
RT (309–317)	Pol (476–484)	ILKEPVHGV	HIV-1 infection	human (A*0201)	Sewell1999
	Keywords epitope processing, immunodominance. • Proteasome regulation influences epitope processing and could influence immunodominance. • The proteasome is inhibited by lactacystin treatment, and gamma IFN induces expression of proteasome subunits, LMP2 and LMP7, which combine with the proteasome to create an immunoproteasome. • IFN-gamma induction of the immunoproteasome and lactacystin inhibition increases the presentation of the A*0201 VIYQYMDDL epitope, but decreases the presentation of the A*0201 ILKEPVHGV epitope, which is immunodominant within pol proteins, showing the two epitopes are processed by different pathways. • ILKEPVHGV seems to be processed by the classical proteasome pathway, while VIYQYMDDL appears to be destroyed by this pathway. • This epitope contains the catalytic site (YMDD) of RT, a conserved sequence in HIV-1 which restricts escape mutants.				
RT (309–317)	Pol (476–484)	ILKEPVHGV	HIV-1 infection	human (A*0201)	Loing2000
	Keywords epitope processing. • The ILKEPVHGV was modified by the addition of an N-palmitoyl-lysine residue at the P0, P1 or P10 positions of the parent peptide to create a lipopeptide for direct antigen delivery to the cytoplasm for processing. • The N-terminal modification increased the life span for functional CTL recognition up to 48 hours in comparison to the parent peptide.				
RT (309–317)	Pol (510–518)	ILKEPVHGV	Vaccine	human (A*0201)	Larsson1999
	Vaccine *Vector/Type:* canarypox, vaccinia *HIV component:* Env, Gag, Nef, Pol • ELISPOT was used to assay the CD8 T cell response to the HIV-1 proteins Gag, Pol, Nef or Env expressed in vaccinia or canarypox vectors in 19 HIV+ people. • The highest CTL frequency was directed at epitopes in Pol. • In A*0201 individuals, higher numbers of spot-forming T cells were directed against HIV-1 proteins expressed in vaccinia than to peptides SLYNTVATL and ILKEPVHGV presented by A2.				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A*0201)	Wilson1998a
	Keywords TCR usage. • HIV+ individuals were followed longitudinally using MHC tetramers in combination with 14 anti-BV chain MAbs, and clonal expansion of HIV-specific T cells was followed *in vivo*. • Seven HIV+ people were studied, and all showed expansions of particular TCR BV clones, often several, relative to uninfected controls. • Three patients were followed in detail, TCR VB expansions persisted for 2 to 3 years, with occasional transient increases.				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A*0201)	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 2/11 of the A2+ individuals responded to ILKEPVHGV, and neither of these two responded to SLYNTVATL.

	• The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
RT (309–317)	Pol (476–484)	ILKEPVHGV	in vitro stimulation or selectio	human (A*0201)	Andrieu2003
	Keywords epitope processing, dendritic cells. • This study demonstrates that lipopeptides carrying epitopes can be taken up by human dendritic cells, processed using different pathways, and recognized by epitope-specific CD8+ T-cells originally derived from HIV+ individuals. The RT ILKEPVHGV peptide was embedded in a longer peptide fragment in the lipopeptide, and was internalized by endocytosis and processed in the cytosol by proteasomal cleavage by following an endosome-to-cytosol pathway for processing and presentation. Administration of epoxomycin, a proteasome inhibitor, completely abrogated epitope presentation to a CD8+ T-cell line, while monensin, an inhibitor of acid-dependent endosomal enzyme activity did not. • In contrast to the RT epitope, dendritic cell presentation of the Nef epitope QVPLRPMTYK embedded in a longer peptide in a lipopeptide was not inhibited by epoxomycin, but was inhibited by monensin, indicative of endocytolitic epitope processing.				
RT (309–317)		ILKEPVHGV	HIV-1 infection	human (A*0201)	Dagarag2003
	Epitope name IV9. **Assay type** cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay. • Telomer length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescense. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytolysis, and may have therapeutic potential. • Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope. An IV9-specific monoclonal cell line, 68A62 was also generated.				
RT (309–317)	Pol (464–472)	ILKEPVHGV	Vaccine	transgenic mouse (A*0201)	Daftarian2003
	Vaccine *Vector/Type:* peptide *HIV component:* RT *Adjuvant:* CpG immunostimulatory sequence (ISS) **Epitope name** I9V. **Assay type** cytokine production, Tetramer binding, Intracellular cytokine staining, Chromium-release assay. **Donor HLA** H-A2/Kb. • HLA-A*0201 transgenic mice were immunized with a Th-CTL-fusion peptide composed of the I9V CTL epitope linked to the promiscuous PADRE Th epitope. The peptide only when given in combination with CpG elicited strong I9V-CTL responses. • The peptide-CpG vaccinated mice, when challenged with pol embedded in vaccinia (pol-vv), could clear the virus from the ovaries. Additionally, intranasal immunized mice given an intranasal pol-vv challenge had reduced virus in the lungs.

	Vaccine *Vector/Type:* vaccinia • A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2. • HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^{d} – this transgene is the only MHC molecule expressed in the mice. • CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost. • No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL) • Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested. • ILKEPVHGV was recognized by 2 of the patients.				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A2)	Kolowos1999
	Keywords inter-clade comparisons, TCR usage. • TCR usage in CTL specific for this epitope was examined in three patients and identical Vβ6.1 and Valpha2.5 gene segments were used and two of the patients had very similar complementarity-determining regions – clonal expansion of RT-HIV-specific CTL can contribute to the skewed TCR repertoire in HIV-1 infected patients.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CTL clones from all three patients showed similar sensitivity to mutation in the epitope, ilkepvhEv was well recognized (the sequence from SF2), ilkDpvhgv was not (the common A clade form)				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A2)	Collins1998
	• Nef down-regulates MHC class I molecules, which inhibits CTL killing of HIV-infected targets. • The anti-RT CTL clone killed Nef- cells less efficiently than anti-gag clones, correlated with the reduced expression of RT.				
RT (309–317)	RT (476–484 LAI)	ILKEPVHGV	HIV-1 infection	human (A2)	Fan1997
	Keywords dendritic cells. • The capacity of dendritic cells to process and present antigen and stimulate anti-HIV-1 CTL memory responses was studied.				
RT (309–317)	RT (464–472)	ILKEPVHGV	HIV-1 infection	human (A2)	Kundu1998b
	Keywords dendritic cells. • Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients. • 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated. • ILKEPVHGV is a conserved HLA-A2 epitope included in this study – 5/6 patients had this sequence as their HIV direct sequence, and these had a detectable CTL response– one person carried the form ILREPVHGV and had no detectable CTL.				
RT (309–317)	RT (476–484)	ILKEPVHGV	HIV-1 infection	human (A2)	Menendez-Arias1998, Tsomides1994

	Keywords binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Pol476. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This epitope was one of the previously identified HLA-A2 epitopes studied. • 9/17 HIV-infected HLA-A2+ people recognized this epitope.				
RT (309–317)	RT (309–317)	ILKEPVHGV	Vaccine, in vitro stimulation or selectio	transgenic mouse (A2)	Domingo2003
	Vaccine *Vector/Type:* peptide *HIV component:* RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Epitope name** RT2. • A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from Bacillus stearothermophilus has been engineered to display 60 copies of one or more epitopes on a single molecule. • The E2DISP scaffold displaying pep23 is able to stimulate a Th responses, and peptide RT2, which is a CTL epitope from HIV-1 RT, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to the class I and class II processing pathways.				
RT (309–317)	Pol (476–484)	ILKEPVHGV	HIV-1 infection	human (A2)	Sandberg2003
	Keywords responses in children. **Assay type** CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric CTL assay. • 65 vertically HIV-1 infected children, ages 1-16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T cell counts, and CD8+ T cell responses. • Using vaccina expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. The strong CD8+ T cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no reponse) than older children (only 1/32 had no response, and responses were greater in magnitude). • SLYNTVATL and ILKEPVHGV tetramers were used to quantitate specific responses. 49 chlidren in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV. • Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL reponses.				
RT (309–317)	RT (309–317)	ILKEPVHGV	HIV-1 infection	(A2)	Sun2003
	Keywords assay standardization, memory cells. **Assay type** cytokine production, CD8 T-cell Elispot - IFNγ, Tetramer binding, Intracellular cytokine staining. **Donor HLA** A2, A3, B27, B51; A2, A3, B27, B57; A2, A23, B57. • This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFNγ. Tetramer-bidning analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag, Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chronium release assay and compared to effector/memory CD8+ T cells in an IFN-γ ELISpot assay.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Results: IFNγ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ Tcells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time. • 3/7 HLA-A2+ patients recognized this epitope.				
RT (309–317)	RT (309–317 NL43) **Keywords** escape. **Epitope name** IV9. **Assay type** Chromium-release assay, CTL suppression of replication. • Virus was cultured in the presence of CTL lines specific for 4 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts. • There was one cloned cell line that recognized ILKEPVHGV, 68A62. After 2 weeks of passaging HIV-1 in the presence of 68A62, the mutated epitope ilkeLvhgv was found in 6/12 sequences.	ILKEPVHGV	HIV-1 infection	human (A2)	Yang2003
RT (309–317)	Pol (476–484) **Keywords** supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).	ILKEPVHGV	HIV-1 infection	human (A2 supertype)	Propato2001

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Phage display of the CTL epitope, ILKEPVHGV coupled with T helper epitope KDSWTVNDIQKLVGK, elicited specific CTL responses *in vitro* in PBMC from HIV negative individuals in and *in vivo* in immunization of HLA-A2 transgenic mice. • Bacteriophage presentation of peptides is generally used for stimulation of antibodies, and this novel discovery of CTL epitope processing and presentation suggests new possibilities for these vectors.				
RT (309–317)	Pol	ILKEPVHGV	Vaccine	transgenic mouse (A2.1)	Ishioka1999
	Vaccine *Vector/Type:* DNA • A minigene vaccine construct encoding 6 HLA 2.1 and 3 HLA A11 restricted CTL epitopes, the universal Th cell epitope PADRE (pan-DR epitope) and an ER translocating signal sequence was constructed. • The epitopes were chosen for dominant recognition by CTLs during HBV and HIV infections in humans. • HLA transgenic mice were used for quantitating *in vivo* immunogenicity of DNA vaccines encoding HLA-restricted CTL epitopes – strong responses were observed to all nine epitopes, and CTL memory persisted up to four months after a single injection.				
RT (309–317)	RT (476–484 LAI)	ILKEPVHGV	Vaccine	mouse (A2.1)	Peter2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG **Keywords** binding affinity, vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR22. • The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01). • The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour. • HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants. • All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.				
RT (309–317)	RT (476–484 LAI)	ILKEPVHGV	Vaccine	mouse (A2.1)	Peter2002
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), IL-12, P30 **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR22. • When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination [Peter2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macropahges in the spleen.

	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
RT (328–352)	RT (495–515 LAI)	EIQKQGQGQWTYQIYQEPF-KNLKTG	HIV-1 infection	human (A11)	Menendez-Arias1998, Walker1989

	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
RT (373–390)	RT (373–390 HXB2)	QKIATESIVIWGKTPKFK	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 21% of the study subjects, and it was one of the 25 most frequently recognized peptides.

	Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced a CTL responses 1/6 transgenic mice, but responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.				
RT (416–424)	Pol (563–571 93TH253 subtype CRF01)	FVNTPPLVK	HIV-1 exposed seronegative	human (A11)	Sriwanthana2001
	Keywords HIV exposed persistently seronegative (HEPS). **Epitope name** P571-579. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was weakly reactive in the HEPS study subject 128 who was HLA A11/A33.				
RT (416–424)	Pol (563–571 93TH253 subtype CRF01)	FVNTPPLVK	HIV-1 infection	human (A11)	Bond2001
	Keywords inter-clade comparisons. • HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive. • 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified. • This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 1/8 tested FSWs recognized it. • This epitope was conserved many subtypes (but not subtype H), but exact matches were not very common.				
RT (421–429)	RT (421–429)	PLVKLWYQL	HIV-1 infection	human (A2)	Haas1998
	• Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively) • New clusters of epitopes were defined utilizing different HLA molecules.				
RT (432–440)	RT (587–597 SF2)	EPIVGAETF	HIV-1 infection	human (B*3501)	Menendez-Arias1998, Tomiyama1997
	Keywords review. • A CTL clone responsive to this epitope was obtained. • 5/7 B35-positive individuals had a CTL response to this epitope. • An E to D substitution at position 1, and V to I at position 4, reduces activity but not binding to B*3501. • [Menendez-Arias1998] note in their review that this epitope is near the protease cleavage site and conservation of this region is important for proper viral maturation.				
RT (432–440)	Pol (587–595)	EPIVGAETF	HIV-1 infection	human (B*3501)	Tomiyama2000a
	• CD8+ T-cells that bound one of six HIV-specific B*3501-epitope tetramers did not express CD28 or CD45A. • A significant increase in CD28-CD45RA- cells and a decrease of CD28+CD45RA+ cells was observed in chronically HIV-1-infected individuals relative to healthy individuals.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CD28-CD45RA- cells are likely to be effector cells and have high levels of perforin in their cytoplasm. • The mean percentage of total CD28- CD8+ cells in chronically infected HIV-1-infected patients was 76.6% in comparison to HIV-1-uninfected individuals (40.6%)				
RT (432–440)		EPIVGAETF	HIV-1 infection	human (B35)	Wilson2000a
	Keywords acute infection. • Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found. • All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39. • ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK. • The subject with A*0201 had a moderately strong response to SLYNTVATL. • Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705. • No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.			
RT (432–440)	Pol (587–595)	EPIVGAETF	HIV-1 infection	human (B35)	Dyer1999
	• CTL specific responses were measured over a 1.3 to 1.5 year period in members of the Sydney Blood Bank Cohort (SBBC) who had been infected with a natural attenuated strain of HIV-1 which was Nef-defective. • Some of these patients had prolonged high levels of CTL effector and memory cells despite low viral load.				
RT (432–440)	RT (587–596 SF2)	EPIVGAETF	HIV-1 infection	human (B35, B51)	Shiga1996
	• Binds HLA-B*3501, and is also presented by B51 – but CTL could not kill RT-vaccinia virus infected cells that expressed B51.				
RT (432–440)	Pol (587–595)	EPIVGAETF	HIV-1 infection	human (B35, B51)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
RT (432–441)	Pol (587–596)	EPIVGAETFY	HIV-1 infection	human (B*3501)	Tomiyama2000a
	• CD8+ T-cells that bound one of six HIV-specific B*3501-epitope tetramers did not express CD28 or CD45A. • A significant increase in CD28-CD45RA- cells and a decrease of CD28+CD45RA+ cells was observed in chronically HIV-1-infected individuals relative to healthy individuals. • CD28-CD45RA- cells are likely to be effector cells and have high levels of perforin in their cytoplasm. • The mean percentage of total CD28- CD8+ cells in chronically infected HIV-1-infected patients was 76.6% in comparison to HIV-1-uninfected individuals (40.6%)				
RT (432–441)	RT (587–597 SF2)	EPIVGAETFY	HIV-1 infection	mouse (B35)	Menendez-Arias1998, Shiga1996
	Keywords review. • Binds HLA-B*3501, but not presented by B51, in contrast to the peptide EPIVGAETF. • [Menendez-Arias1998] note in their review that this epitope is located near the protease cleavage site and conservation of this region is important for viral maturation.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This epitope spans the Pol p66 RT – p15 (RNAse) domain.				
RT (432–441)	RT (587–597 SF2)	EPIVGAETFY	HIV-1 infection	human (B35)	Kawana1999
	Keywords rate of progression. • HLA B35 is associated with rapid disease progression. • The sequences of 9 previously described HIV-1 B35 CTL epitopes were obtained in 10 HLA B35+ and 19 HLA B35- individuals. • 3/9 CTL epitopes had substitutions that were more common in B35+ individuals than in B35- individuals, but this was one of the six that had no B35 associated pattern of mutation.				
RT (434–447)	RT (LAI)	IVGAETFYVDGAAS	HIV-1 infection	human (A*6802)	Menendez-Arias1998, vanderBurg1997
	• Recognized by CTL from a long-term survivor that recognized a set of 5 overlapping peptides spanning IVGAETFYVDGAAS as well as PIVLPEKDSW and KITTESIVIW. • A*6802 is a subset of HLA-A28. • This epitope spans the Pol p66 RT – p15 (RNAse) domain.				
RT (436–445)	RT (591–600 IIIB)	GAETFYVDGA	HIV-1 infection	human (B45)	Menendez-Arias1998
	• This epitope spans the Pol p66 RT – p15 (RNAse) domain.				
RT (436–445)	Pol (591–600 IIIB)	GVETFYVDGA	HIV-1 infection	human (B45)	Wilson1999a
	Keywords responses in children, mother-to-infant transmission, escape. • This study describes maternal CTL responses in the context of mother-to-infant transmission. • Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants. • No variants of this epitope were found in a non-transmitting mother who had a CTL response to it. • This epitope spans the Pol p66 RT – p15 (RNAse) domain.				
RT (437–445)		AETFYVDGA	HIV-1 infection	human (B*4501)	Sabbaj2002b
	Keywords HAART. **Epitope name** Pol-AA9. **Donor HLA** A*3002 A*3201 B*4501 B*5301 Cw*0401 Cw*1202. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • Subject 00RCH33 was on HAART had a viral load of 2900 and CD4 count of 727 and also recognized the epitopes YPLTFGWCY, Nef(135-143), HLA B*5301; RSLYNTVATLY, p17(76-86), HLA A*3002; and HIGPGRAFY, gp160(310-318), HLA A*3002. • Among HIV+ individuals who carried HLA B45, 3/9 (33%) recognized this epitope.				
RT (437–447)	RT (592–602 LAI)	AETFYVDGAAN		human (A28)	Brander1996b, Menendez-Arias1998
	• P. Johnson, pers. comm. • This epitope spans the Pol p66 RT – p15 (RNAse) domain.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
RT (437–447)	Pol (592–602)	AETFYVDGAAN	HIV-1 infection	human (A28)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
RT (438–448)	RT (593–603 IIIB)	ETFYVDGAANR	HIV-1 infection	human (A26)	Menendez-Arias1998

RT (520–528)	Pol (675–683)	QIIEQLIKK	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords inter-clade comparisons, TCR usage. • Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals. • QIIEQLIKK was found to elicit clade-specific responses in clade B (QIIEQLIKK is most common) and clade E (qiieElikk is most common). QIIEQLIKK was strongly recognized by CTL from 1/5 B clade infected Japanese subjects, and qiieElikk from 3/7 E clade infected Thai subjects. The variant qiieKliEk, common in the A subtype, was also recognized in 2/7 E clade infected Thai subjects. • The binding of QIIEQLIKK, qiieElikk and qiieKliEk to HLA A*1101 was similar, but CTL clones from individuals did not cross-react with the cross-clade peptides indicating that the substitutions inhibited TCR interaction.			
RT (520–528)	RT (80–88)	QIIEQLIKK	HIV-1 infection	human (A*1101)	Frahm2004

	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).				
Integrase (22–31)	Pol (764–773)	MASDFNLPPV	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)				
Integrase (28–36)	Pol (743–751 SF2)	LPPVVAKEI	HIV-1 infection	human (B*5101)	Tomiyama1999
	Keywords inter-clade comparisons, rate of progression. • HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA-B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996;Lancet 22:1187, 1986;Hum Immunol 22:73, 1988;Hum Immunol 44:156, 1995) • 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3% • Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed. • Four of the six epitopes were highly conserved among B subtype sequences – LPPVVAKEI is highly conserved.				
Integrase (82–89)	RT (797–804 SF2)	GYIEAEVI	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 1/4 HIV-1+ people tested. • GYIEAEVI bound to A*2402 weakly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
Integrase (89–98)	Pol (805–814 BH10, LAI)	IPAETGQETA	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is PAETGQETAY) has similarity with Integrin beta-4 precursor (GP150)(CD104), fragment PAETNGEITAY.				
Integrase (89–98)	Pol	IPAETGQETA		human (B56)	De Groot2001
	• The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes could stimulate IFNγ production in an ELISPOT assay. • IPAETGQETA was newly identified as an HLA-B56 epitope in this study.				
Integrase (96–104)	Integrase (823–831)	ETAYFILKL		human (A*6802)	Dong1998b
	Keywords inter-clade comparisons. • Epitope found in clade A, B, and D – pers. comm. S. Rowland-Jones and T. Dong.				
Integrase (96–104)	Pol (subtype A)	ETAYFILKL	HIV-1 exposed seronegative	human (A*6802)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses. • Low risk individuals did not have such CD8+ cells. • CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
Integrase (96–104)	Pol	ETAYFILKL	HIV-1 infection	human (A*6802)	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized in 1/22 HEPS sex worker controls (ML1671)				
Integrase (96–104)	Pol (744–752)	ETAYFYILKL	HIV-1 infection, HIV-1 exposed seronegative	human (A*6802)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • ETAYFYILKL cross-reacts with clades A, B and D. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-A*6802 women, 3/12 HEPS and 9/11 HIV-1 infected women recognized this epitope likelihood ratio 7.9, p value 0.01, and HEPS women tended to respond to DTVLEDINL, while infected women to ETAYFYILKL. • The dominant response to this HLA allele was to this epitope in 2 of the 3/12 HEPS cases and in all 9/11 HIV-1 infected women that responded to the epitope. • Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort. • Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV. • Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Subject ML 1830 made no detectable response prior to seroconversion, but responded to A*6802 DTVLEDINL and A*6802 ETAYFILKL post-seroconversion.				
Integrase (96–104)	Pol (744–752)	ETAYFILKL	HIV-1 infection	human (A*6802)	Appay2000
	• This epitope is newly defined in this study. • Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV. • HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation. • In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α

	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 21% of the study subjects, and it was one of the 25 most frequently recognized peptides.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01). • The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour. • HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants. • All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.				
Integrase (241–249)	RT (956–964 HXB2R)	LLWKGEGAV	Vaccine	mouse (A2.1)	Peter2002
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), IL-12, P30 **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR28. • When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination [Peter2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macropahges in the spleen.

Pol	RT (LAI)		HIV-1 infection	human	Buseyne1998a
	• This study showed a correlation between strong CTL memory and breadth of response in 7-12 month old infants, and remaining AIDS-free for the first year of life, higher absolute CD4 and CD8 cells, and lower viral load.				
Pol	p66 (LAV)		HIV-1 infection	human	Zheng1999
	Keywords epitope processing, dendritic cells.				
	• Protein delivery (gp160 LAV, p66 LAV, and p24 NY5) to human dendritic cells (DC) with liposomes provides enhanced memory CTL response relative to delivery of protein alone.				
	• Chloroquine administration enhanced epitope presentation, and brefeldin A and peptide aldehyde inhibitors inhibited antigen presentation, suggesting epitopes were processed by classical proteasome pathway.				
Pol	Pol (IIIB)		HIV-1 infection	human	Wasik2000
	Keywords rate of progression, Th1.				
	• HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of beta-chemokines and IL-2 relative to other HIV+ infants.				
	• No HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors.				
	• CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.				
Pol	Pol (LAI)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp41, Protease, V3				
	• The vaccine used was a rec canarypox with HIV-1 gp120 MN, tm/gag/protease LAI (vCP205), alone or with p24E-V3 MN synthetic peptide (CLTB-36))				
	• Twenty HIV negative subjects were vaccinated in phase I trial with combinations of vCP205 and CLTB-36.				
	• Immunization with vCP205 induced HIV-1-specific ABs to gp120, V3, and p24 antigens, and CTL immune responses against vCP205 were detected after the fourth immunization in 33% of the subjects against Env, Gag and Pol, but the CLTB-36 peptide did not produce AB or CTL immune responses against p24 or gp160.				
Pol	Pol (172–219 subtype B)		Vaccine	human	Gorse1999b
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade SF2 *HIV component:* Env, Gag, Nef, Protease				
	• The vaccine used was rec canarypox expressing HIV-1 env, gag, pol, nef and protease (vCP300) with or without administration of HIV-1 SF-2 rgp120.				
	• In vitro inducible CTL activity against HIV-1 Env, Gag, Pol, and Nef antigens was observed in 79% (15 of 19) of vaccine recipients.				
	• The combination of vCP300 and vP1291 together resulted in an overall increase in CTL induction and detection sensitivity.				
Pol	Pol (IIIB)		HIV-1 infection	human	Betts1999
	Keywords rate of progression.				
	• This study demonstrated an inverse correlation between HIV Type I plasma viral load and CTL activity directed against HIV-1 Pol, and stronger combined effects of Pol- and Env-specific CTL, in long-term survivors (LTS) of HIV-1 infection.				
Pol	Pol (BRU)		HIV-1 infection	human	Aladdin1999
	Keywords rate of progression.				
	• In vitro measurements of CTL-activity by Cr release assay in bulk culture showed no correlation between CTL-activity (gp120, Gag, Pol and Nef) and disease progression as measured by viral load, CD4 and time to death.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Pol	RT (LAI)		HIV-1 infection	human	Buseyne1998b
	Keywords inter-clade comparisons.				
	• In infants with positive CTL responses, most responses showed cross-clade reactivity with somewhat diminished recognition of epitopes from different subtypes.				
Pol	RT		Vaccine	mouse	Kim1997c
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12				
	• A gag/pol, vif or gp160 DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules B7 and IL-12, gave a dramatic increase in both the cytotoxic and proliferative responses in mice.				
	• When IL-12 was present, CTL response could be detected even without *in vitro* stimulation.				
Pol	RT		HIV-1 infection	human	Trickett1998
	• Twelve HIV-1 infected patients were re-infused with their own lymphocytes, cryopreserved from an earlier time point in the infection.				
	• Improvement in CD4+ and CD8+ T cells were seen in 7/12, and an increase in the CTL response to Pol was seen in one patient.				
Pol	RT		HIV-1 infection	human	Froebel1997
	Keywords rate of progression.				
	• Two HIV-1 infected children with contrasting disease courses were followed longitudinally – one died of AIDS, the other is a long-term non-progressor.				
	• Reactivity against Gag, Pol, Env and Tat proteins was tested by PBMC bulk cultured cells reacting with protein expressed in vaccinia constructs in autologous EBV transformed B cells.				
	• The child who progressed consistently had CTL against Pol and Tat.				
	• The long-term non-progressing child had no detectable CTL, but was heterozygous for a mutation in the CCR5 receptor and for HLA-B49, which has been shown to be associated with slower progression.				
Pol	Pol (IIIB)		HIV-1 infection	human	Betts1997
	Keywords inter-clade comparisons.				
	• 6/8 individuals from Zambia infected with C clade virus had CTL that were able to make response to B clade HIV-1 IIIB vaccinia-expressed Gag, Pol and Env proteins.				
	• A vigorous cross-clade response was not limited to a particular protein, and the level of recognition of different proteins varied among the six patients.				
Pol	RT		HIV-1 infection	human	De Maria1997
	• CD3+ cells that also carry a natural killer cell receptor (NKR+) can exhibit down regulation of T cell function.				
	• Anti-NKR IgM MAb masked this inhibitory function and increased HIV-1 specific CTL activity in phytohemagglutinin-activated PBMC cultured in the presence of IL-2 from 3/5 patients, and in one other case anti-NKR MAb brought HIV-1 specific CTL activity to detectable levels.				
Pol	Pol (LAI, MN)		HIV-1 exposed seronegative	human	Goh1999
	• 13/37 exposed uninfected individuals with repeated high-risk sexual exposure had HIV-1 specific CTL against Env, Gag, Pol, or a combination of proteins – CTL activity was correlated with a CCR5 wildtype genotype.				
	• In this group, the highest CTLp frequencies were directed at Gag, but the most common response was to Env and four individuals had responses to multiple HIV-1 proteins.				
Pol	Pol (LAI)		Vaccine	human	Evans1999
	Vaccine *Vector/Type:* canarypox *HIV component:* Gag, gp120, gp41, Nef, Protease, RT				
	• A Canarypox vaccine expressing gp120, gp41, Gag, Protease, Nef and Pol CTL epitopes gave rise to CTL that could be detected in 61% of the volunteers – responses to Gag, Env, Nef and Pol were detected 3-6 months after the last vaccination.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Pol	Gag/Pol (MN)		Vaccine	chimpanzee	Kim1998
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86				
	• The study explores the use of co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.				
Pol	Pol (IIIB)		HIV-1 infection	human	Jin1998a
	• CTL precursor frequencies were determined in HIV-1 infected pregnant women, and significantly higher CTLp frequencies to Pol and Nef were found in non-transmitting mothers than in transmitting mothers;				
Pol	Pol		HIV-1 infection	human	Young2001
	• Addition of recombinant rec human IL12 (rhIL12) to cultures increased HIV-specific lysis of HIV-Gag, Pol and gp120 vaccinia expressed antigens (11/15 tested increased lysis by > 5%) if the culture was derived from HIV+ individuals who had CD4 cells/ul > 500.				
	• 2/10 individuals with <200 CD4 cells/ul, and 3/10 individuals with 200-500 CD4cells/ul, had an increase of >5% upon treatment of the culture with rhIL12, so a few individuals in late stage disease had CD8 cells that maintained responsiveness to rhIL12.				
Pol	RT (subtype A, B, D)		HIV-1 infection	human	Cao2000
	Keywords inter-clade comparisons.				
	• HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in HIV infected Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D.				
	• Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype.				
Pol	Pol		HIV-1 infection	human	White2001
	• HIV-specific CTL activity was detected in the female reproductive tract of only 1/3 HIV-infected women who underwent a hysterectomy, although CTL could be identified in the PBMC of all three women.				
Pol	Pol (IIIB)		HIV-1 infection	human	Jin2000a
	Keywords rate of progression.				
	• The CTL precursor level (CTLp) was measured in long term non-progressors (LTNP) with low viral load using limiting dilution analysis and measuring CTL against Env Gag and Pol expressed in vaccinia in autologous targets.				
	• LTNPs have high memory CTL numbers and low viral load.				
Pol	Pol		HIV-1 exposed seronegative	human	Rowland-Jones2001
	Keywords review, HIV exposed persistently seronegative (HEPS).				
	• This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.				
	• The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.				
	• CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.				
	• CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.				
Pol			HIV-1 exposed seronegative	human	De Maria1994, Kuhn2002
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • 6/24 HIV uninfected infants (ages 15-50 months) born to HIV+ mothers had HIV-1 specific CTL responses to vaccinia-expressed Nef, Gag/Pol, Env. • Reviewed in [Kuhn2002].				
Pol			HIV-1 infection	human	Kuhn2002, Wasik1999
	Keywords HAART, HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission, rate of progression. • In HIV-infected infants HIV-specific, CTL responses were not detectable in icord blood or in PBMC collected shortly after birth and were absent or remained very low in 3 infants with a rapidly progressive disease. For those who progressed more slowly, the HIV-specific CTL activity varied. • The two infants with high levels of Env peptide-stimulated IL-2 responses had the highest CTLp frequencies. • Stronger responses were detected after initiation of the antiretroviral therapy. • Two babies that were not infected though born to HIV+ mothers had detectable though low HIV-specific CTLp responses to Env (1/2), Pol (2/2), Gag (1/2) cord blood and transiently in PBMC after birth. • Reviewed in [Kuhn2002].				
Pol			HIV-1 infection	human	Aldhous1994, Kuhn2002
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • Six of nine HIV vertically infected infants had HIV-1 specific CTL responses to vaccinia expressed Tat (4/6), Pol (6/6), Env (1/6), or Gag (1/6), but not all responses were detected at all time points. • Two of eleven babies that were not infected though born to HIV+ mothers had detectable responses Tat (1/2), Pol (2/2), Gag (1/2). • Reviewed in [Kuhn2002].				
Pol			HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed, however, epitopes were not found that span the invariant, most highly conserved regions of RT and Protease. This might be due to the virus evolving conserved features that disallow the CTL responses in these most conserved regions, as functional constraints for enzyme function would not tolerate change and normal capacity for immune escape by rapid evolution is lost in these domains.				
Pol			HIV-1 infection	human	Loemba2002
	Keywords HAART, inter-clade comparisons. • Therapeutic RT inhibitors were used to select *in vitro* for resistance mutations in subtype C viruses. Many of the resistance mutations were located within analogs to CTL epitopes that had been defined for the B subtype,				
Pol	(IIIB) **Keywords** HAART, acute infection.		HIV-1 infection	human	Ortiz2002

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Subjects treated with HAART early in HIV-infection showed a correlation between the number of viremic episodes and the total as well as the Pol-specific CD8 T-cell activity as measured by Elispot SFC per million PBMC summed across Pol, Env, Nef and Gag. The subjects treated early after infection had higher levels of CD8+ T-cell activity (N = 31) than those treated later (N = 23), and a greater capacity to enhance CD8+ T-cell responses to viremic episodes.				
Pol	(MN)		HIV-1 infection	human	Edwards2002
	Keywords rate of progression. • 96% (26/27) chronically infected HIV-1 infected patients elicited gamma-IFN CD8+ T-cell responses against Gag. • Nef and/or Pol CTL responses were detected in 86% of the subjects. • The magnitude and breadth of Gag and p24 T-cell responses correlated with absolute CD4 counts, and inversely correlated with viral load. • Pol and Int CTL responses correlated positively with absolute CD4+ T-cell count. • Nef and Env responses did not correlate with either CD4 counts or viral load.				
Pol			HIV-1 infection	human	Larsson2002b
	Keywords HAART, dendritic cells. • Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.				
Pol	(IIIB)		HIV-1 infection	human	Trickett2002
	Keywords immunotherapy. • Conditions were optimized for ex-vivo expansion of CD8+ and CD4+ T-cells with the goal of functional T-cell production for autologous immunotherapy. 10,000-fold expansions were obtained in 14 days with optimized concentrations of IL-2, anti-CD3 and anti-CD28 coated microspheres, and decreasing amounts of serum over the first 8 days.				
Pol	(IIIB)		HIV-1 and HCV co-infection	human	Lauer2002
	Keywords rate of progression. • HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFNgamma production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins. • All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load. • Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted. • HIV-specific CD4 proliferative responses were detected in 9/17 coinfected patients, but no HCV responses were detected.				
Pol			HIV-1 infection	human	Scott2001
	Keywords HAART, responses in children. • CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age. • Before ART 2/13 infants <6 months of age showed IFNgamma Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy– 3 infants were coinfected with CMV and all 3 had CMV-specific CD8+ T-cell responses. • One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol. • Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Pol	(IIIB, MN)		HIV-1 infection	human	Larsson2002a
	Keywords dendritic cells.				
	• Dendritic cells acquire and present HIV-1 antigens derived from dead, apoptotic cells or from non-infectious, fusion-competent HIV-1 virions, and these DC cells could stimulate CD4+ and CD8+ T-cells resulting in IFNgamma production in an Elispot assay. Both HLA Class I and class II molecules were used for presentation. This may be an important aspect of the initial immune response to HIV-1 infection of CD4+ cells in the mucosal subepithelia.				
Pol	(IIIB)		HIV-1 infection	human	Ortiz2001
	Keywords HAART, supervised treatment interruptions (STI).				
	• Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.				
Pol	Pol		HIV-1 infection	human (A*0201 and Cw*08)	Shacklett2000
	• HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.				
Pol			computer prediction	(A*0201, B*3501)	Schönbach2002
	Keywords inter-clade comparisons, computational epitope prediction.				
	• Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.				
Pol	RT (IIIB)		HIV-1 infection	human (A2)	Moore2002b
	Keywords epitope processing, escape.				
	• HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.				
	• 25 negative associations were also found between polymorphism and HLA alleles. The authors propose this is due to escape mutations in epitopes presented by common HLA types dominating in the population, and give examples of five amino acids which are in the consensus and tend to be stable in those with the most common HLA allele, HLA-A2.				
Pol	Pol		HIV-1 infection	human (B*35)	Jin2002
	Keywords rate of progression.				
	• Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.				
	• Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.				
	• The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.				
Pol	Pol		Vaccine	mouse (H-2^d)	Huang2001
	Vaccine *Vector/Type:* DNA *Strain:* B clade HXB2, B clade NL43 *HIV component:* Gag, Pol				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Different HIV strains were used for different regions: gag HXB2, pol NL43 • Mice were immunized with four humanized DNA constructs: GagPol, that would form a pseudoparticle carrying Gag and Pol, Gag, Pol or a GagPol fusion construct. • The GagPol pseudoparticle, Gag and GagPol fusion construct all elicited strong anti-Gag CTL, but only the GagPol fusion construct elicited strong anti -Pol CTL.				

II-B-14 Vif CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Vif (17–26)		RIRTWKSLVK	HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed. • What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.			
Vif (17–26)	Vif (17–26 SF2)	RIRTWKSLVK	HIV-1 infection	human (A*0301)	Altfeld2001a
	Epitope name RK10. • CTL responses against HIV-1 Vpr, Vpu, and Vif were analyzed in multiple HIV-1-infected individuals. • 10/29 (35%) individuals tested responded to Vif. • This epitope was recognized by 3/15 individuals expressing A*0301 allele. • HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • Overlapping Vif peptides QVDRMRIRTWKSLVK and RIRTWKSLVKHHMYI both reacted with T-cells from AC-06 and contained epitope RIRTWK-SLVK.			
Vif (17–26)	Vif (17–26)	RIRTWKSLVK	HIV-1 infection	human (A*0301)	Addo2002b
	Keywords early-expressed proteins. • CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot. • 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides. • All known optimally defined epitopes were summarized for the five proteins.				
Vif (17–26)		RIRTWKSLVK	HIV-1 infection	human (A03)	Sabbaj2002b
	Epitope name Vif-RK10. • Among HIV+ individuals who carried HLA A03, 3/21 (14%) recognized this epitope.				
Vif (17–26)	(LAI)	RIRTWKSLVK		(A3)	Altfeld2000a, Frahm2004
Vif (17–26)	Vif (17–26)	RIRTWKSLVK	HIV-1 infection	human (A3)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** A3-RK10. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 1/7 individuals had detectable responses to this epitope after STI.				
Vif (23–31)	Vif (23–)	SLVKHHMYV	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Vif *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Vif23(9V). **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. A response was detected in 1/17 HIV+ HLA-A2 subjects. • The variant slvkhhmyI was an intermediate A2 binder, and was able to stimulate immune reponses in fewer A2 transgenic mice. The same person recognized both variants.				
Vif (27–41)	Vif	HHMYISKKAKGWGWFYR	HIV-1 infection	human	Addo2002b
	Keywords early-expressed proteins. • CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot – 33% (23/70) targeted one or more Vif peptides, and this peptide was the most frequently recognized epitope in Vif (25%). • The regulatory proteins Rev and Tat combined contributed to 3%, and the accessory proteins Vif, Vpr and Vpu to 7%, of the total magnitude of HIV-1 specific CTL responses in a subset of 22 HIV-1 infected individuals in whom all HIV-1 proteins were studied.				
Vif (28–36)	Vif (28–36)	HMYISKKAK	HIV-1 infection	human (A*03)	Frahm2004

	Keywords early-expressed proteins. • CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot. • 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides. • All known optimally defined epitopes were summarized for the five proteins.				
Vif (28–36)	Vif (28–36)	HMYISKKAK	HIV-1 infection	human (A3)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** A3-HK9. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 2/7 individuals had detectable responses to this epitope after STI.				
Vif (31–39)		ISKKAKGWF	HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed. • What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.				
Vif (31–39)	Vif (31–39 SF2)	ISKKAKGWF	HIV-1 infection	human (B*5701)	Altfeld2001a
	• CTL responses against HIV-1 Vpr, Vpu, and Vif were analyzed in multiple HIV-1-infected individuals. • 10/29 (35%) individuals tested responded to Vif. • This epitope was recognized by 2/6 individuals expressing B*5701 allele.

Vpr (34–42)		FPRIWLHGL	HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed. • What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.				
Vpr (34–42)	Vpr (34–)	FPRPWLHGL	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Vpr *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Vpr34. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced a CD8+ T-cell IFN gamma response in 1/6 mice. Responses were detected in 3/17 HIV+ HLA-A2 subjects.				
Vpr (34–42)	Vpr (34–42 SF2)	FPRIWLHGL	HIV-1 infection	human (B*0702)	Altfeld2001a
	Keywords acute infection. **Epitope name** FL9. • CTL responses against HIV-1 Vpr, Vpu, and Vif were analyzed in multiple HIV-1-infected individuals. • This epitope was recognized by 2/2 individuals expressing B*8101 allele and 4/8 individuals expressing B*0702 allele.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Individuals with long-term nonprogressive and treated chronic HIV-1 infection targeted Vpr more frequently than individuals with treated acute infection. • Vpr is a frequent target of HIV-1 specific CD8+ T-cells – a response was detected in 45% of individuals tested and Vpr and p17 were the most preferentially targeted proteins per unit length by CD8+ T-cells. • HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • FPRIWLHGL was the only epitope identified in Vpr for AC-06.				
Vpr (34–42)	Vpr (34–42) **Keywords** early-expressed proteins. • CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot. • 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides. • All known optimally defined epitopes were summarized for the five proteins.	FPRIWLHGL	HIV-1 infection	human (B*0702)	Addo2002b

Vpr (41–49)	Vpr	SLGQHIYET	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003

Vaccine *Vector/Type:* peptide *HIV component:* anchored gp120, Vpr *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Keywords binding affinity, inter-clade comparisons, computational epitope prediction.
Epitope name Vpr41.
Assay type T-cell Elispot, Chromium-release assay, Flow cytometric CTL assay.

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice, but responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.

Vpr (52–62)	Vpr (52–62)	DTWAGVEAIIR	HIV-1 infection	human (A*6801)	Frahm2004
Vpr (53–63)	Vpr (53–63)	TWAVEAIIRI	HIV-1 infection	human	Cao2003

Keywords acute infection, early-expressed proteins.
Assay type CD8 T-cell Elispot - IFNγ.
Donor HLA A1, A3, B7, B14, cw*0702, Cw*0802.

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Vpr (55–70)	Vpr	AGVEAIIRILQQLLFI	HIV-1 infection	human	Addo2002b

Keywords early-expressed proteins.

- CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot – 40% (28/70) targeted one or more Vpr peptides, and this peptide was the most frequently recognized epitope in Vpr (41%).
- The regulatory proteins Rev and Tat combined contributed to 3%, and the accessory proteins Vif, Vpr and Vpu to 7%, of the total magnitude of HIV-1 specific CTL responses in a subset of 22 HIV-1 infected individuals in whom all HIV-1 proteins were studied.

Vpr (59–67)		AIIRILQQL	HIV-1 infection	human	Yusim2002

Keywords epitope processing, escape.

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Nef, through Nef-mediated MHC-1 down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is more profoundly reduced than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more effeciently recognized when infected with viruses carrying the Rev L60F mutation. • Patients in the asymptomic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.				
Tat (16–30)	Tat (16–30)	SQPKTACNKCYCKRC	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
Tat (17–26)		QPKTACTTCY	HIV-1 infection	human	Yusim2002

The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • Two individuals recognized this epitope both presented by Cw*1203. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.				
Tat (30–37)	Tat (30–37)	CCFHCQVC	HIV-1 infection	human (Cw*1203)	Cao2003
	Keywords acute infection, early treatment. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A3, A26, B7, B*3801, Cw*0702, Cw*1203; A*0201, A*2501, B18, B51, Cw*0102, Cw*1203. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • Two individuals recognized this epitope both presented by Cw*1203. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.				
Tat (36–50)	(subtype C)	VCFQTKGLGISYGRK		human	Novitsky2001
	Keywords immunodominance, escape. • This study is provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswanan cohort. • 17 of 46 patient reacted with Tat immunodominant peptide VCFQTKGLGISYGRK. • Most of the CTL responses occurred despite a mismatch between the autologous viral sequence and peptide – complete matches were seen only in 4 of 19 cases (21%) and the mismatched CTL tended not to respond to the autologous viral peptide indicative of immune escape.				
Tat (36–50)	Tat (36–50)	VCFQTKGLGISYGRK	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 8 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
Tat (36–52)	Tat	VCFTTKALGISYGRKKR	HIV-1 infection	human	Addo2002b
	Keywords early-expressed proteins. • CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot – 28% (19/70) targeted one or more Tat peptides, and this peptide was the most frequently recognized epitope in Tat (27%).				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The regulatory proteins Rev and Tat combined contributed to 3%, and the accessory proteins Vif, Vpr and Vpu to 7%, of the total magnitude of HIV-1 specific CTL responses in a subset of 22 HIV-1 infected individuals in whom all HIV-1 proteins were studied.				
Tat (38–47)	(subtype C) **Keywords** immunodominance. **Epitope name** T38-FY10. • This study is provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswanan cohort. • 17 of 46 patient reacted with Tat immunodominant peptide VCFQTKGLGISYGRK. • FQTKGLGISY was the optimal epitope in the peptide VCFQTKGLGISYGRK among B*1503+ individuals.	FQTKGLGISY		human (B*1503)	Novitsky2001
Tat (38–47)	Tat (38–47)	FQTKGLGISY	HIV-1 infection	human (B*1503)	Frahm2004
Tat (39–49)	Tat (38–48) **Keywords** assay standardization. **Epitope name** Tat-4.8. • This epitope and HLA-A*6801 presenting molecule were rapidly defined using a modified Elispot assay. • The 11-mer is the optimal epitope but A*6801 epitopes tolerate length variation.	ITKGLGISYGR	HIV-1 infection	human (A*6801)	Oxenius2002a
Tat (39–49)	Tat (39–49)	ITKGLGISYGR	HIV-1 infection	human (A*6801)	Frahm2004
Tat (39–49)	Tat (38–48) **Keywords** early-expressed proteins. • CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot. • 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides. • All known optimally defined epitopes were summarized for the five proteins.	ITKGLGISYGR	HIV-1 infection	human (A68)	Addo2002b
Tat (40–49)	**Keywords** epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed. • What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.	TKALGISYGR	HIV-1 infection	human	Yusim2002
Tat (49–57)	Tat (49–57) • The Tat peptide RKKRRQRRR when conjugated to a protein can cause that protein to be taken up by APCs and presented to CTL. • The system was demonstrated by vaccinating mice with an OVA-Tat peptide conjugate and immunizing H-2 K^b mice. • The CTL response to the H-2 K^b specific OVA peptide SIINFEKL was stimulated.	RKKRRQRRR		mouse	Kim1997a

Tat (49–57)	Tat (49–57)	RKKRRQRRR	Vaccine	mouse (H-2^{d})	Billaut-Mulot2001
	Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18 **Keywords** Th1. • DNA vaccinated BALB/c mice primed and boosted with the multiepitopic vaccine with IL18 showed lymphoproliferative responses 7 weeks post immunization. • Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime/DNA boost was more effective than DNA prime protein boost. • Immunization with either the multiepitopic DNA or with the mixed DNA vaccine induced HIV-1 specific Th1 cytokines (IL-2 and IFN-gamma) • Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.				
Tat (83–92)	Tat	GPKESKKKVE		human (B58)	De Groot2001
	• The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes. • A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes could stimulate IFNγ production in an ELISPOT assay. • GPKESKKKVE was newly identified as an HLA-B58 epitope in this study.				
Tat	Tat		Vaccine	human	Calarota1999
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat **Keywords** HAART. • 9/9 HIV-1+ subjects were given one of three DNA vaccinations for nef, rev or tat, and novel proliferative and CTL responses were generated. • The nef DNA immunization induced the highest and most consistent CTLp activity, IFN-gamma production, and IL-6 and IgG responses. • Highly active antiretroviral treatment (HAART) did not induce new HIV-specific CTL responses but reduced viral load, while DNA vaccination induced new immune responses but did not reduce viral load – thus this is a potentially complementary and promising combination.				
Tat	Tat		HIV-1 infection	human	Froebel1997
	Keywords rate of progression. • Two HIV-1 infected children with contrasting disease courses were followed longitudinally – one died of AIDS, the other is a long-term non-progressor. • Reactivity against Gag, Pol, Env and Tat proteins was tested by PBMC bulk cultured cells reacting with protein expressed in vaccinia constructs in autologous EBV transformed B cells. • The child who progressed consistently had CTL against Pol and Tat. • The long-term non-progressing child had no detectable CTL, but was heterozygous for a mutation in the CCR5 receptor and for HLA-B49, which has been shown to be associated with slower progression.				
Tat	Tat		HIV-1 infection, Vaccine	human	Calarota2001
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat *Adjuvant:* CpG immunostimulatory sequence (ISS) **Keywords** review. • This review discusses the cellular immune response, and comments on the stimulatory role of CpG motifs and how HIV-1 DNA vaccines can boost the CTL and Th proliferative responses in asymptomatic HIV+ individuals.				
Tat	Tat		Vaccine	macaque	Cafaro2001
	Vaccine *Vector/Type:* DNA *Strain:* B clade BH10 *HIV component:* Tat *Adjuvant:* Immune stimulating complexes (ISCOM), CpG immunostimulatory sequence (ISS) • Macaques (macaca fascicularis) were immunized with HIV-1 Tat on an adenovirus major late promotor in a plasmid with 23 CpG sequences, 12 unmethylated.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The vaccinated animals contained a primary infection challenge with SHIV89.6P, preventing CD4+ T-cell decline in the animals, suggesting Tat may be useful at blocking viral replication at its early stage.				
Tat			HIV-1 infection	human	Aldhous1994, Kuhn2002
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • Six of nine HIV vertically infected infants had HIV-1 specific CTL responses to vaccinia expressed Tat (4/6), Pol (6/6), Env (1/6), or Gag (1/6), but not all responses were detected at all time points. • Two of eleven babies that were not infected though born to HIV+ mothers had detectable responses to Tat (1/2), Pol (2/2), Gag (1/2). • Reviewed in [Kuhn2002].				
Tat	Tat		HIV-1 infection, Vaccine	human	Gruters2002
	Keywords review, escape, early-expressed proteins. • This paper is a review that makes a case for using Tat and Rev as part of a vaccine strategy. • CTL against Tat and Rev were found preferentially in long term non-progressors. • Tat/Rev vaccinations of macaques provided protection or reduction in viremia, with high levels of CTL providing protection from challenge, lower levels of CTL having lower viremia, while Gag/Pol vaccinations with did not result in decreased viremia. • Early expression of Tat/Rev may in part explain the enhanced benefit of a CTL response directed at these proteins, and CTL escape is more prominent in these proteins.				
Tat	Tat (BH10)		Vaccine	mouse	Caputo2003
	Vaccine *Vector/Type:* DNA *Strain:* B clade BH10 *HIV component:* Tat *Adjuvant:* cationic block copolymer K2 **Assay type** proliferation, Chromium-release assay. **Donor HLA** H-2d. • Mice were immunized intramuscularly with a plasmid DNA vaccine (HIV-1 pCV-tat DNA) alone or complexed with a cationic block polymer K1, K2, or K5, which block digestion by DNAase I and enhance DNA delivery to APC. • CTL responses to low dose Tat DNA vaccination with K2 were greatly enhanced relative to responses to DNA alone.				
Tat	Tat		Vaccine	macaque	Fanales-Belasio2002a
	Vaccine *Vector/Type:* DNA, protein *HIV component:* Tat *Adjuvant:* aluminum hydroxide, Ribi adjuvant (MPL+TDM) (RIBI) **Keywords** review, early-expressed proteins. • HIV-1 Tat protein is efficiently taken up by monocyte-derived dendritic cells (MDDCs) and promotes Th1 immune responses. A Tat based vaccine can elicit an immune response that can control primary infection in monkeys that are in early stage of in infection with SHIV89.6P. • Tat-specific CTL activity was detected in four monkeys inoculated with i.m. with pCV-tat.				
Tat	Tat		Vaccine	mouse (H-2^d)	Xin2001
	Vaccine *Vector/Type:* adeno-associated virus (AAV) *HIV component:* Env, Rev, Tat *Adjuvant:* IL-2 • An AAV vector expressing HIV-1 env, tat, and rev genes (AAV-HIV vector) was used to vaccinate BALB/c mice. • A single injection stimulated and long lasting serum IgG, fecal IgA, and HIV-specific CTL. • Boosting enhanced the humoral response, and IL2 enhanced T-cell immunity.				
Tat	Tat (IIIB)		Vaccine	mouse (H-2d)	Borsutzky2003
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), macrophage activating lipopeptide (MALP) **Assay type** T-cell Elispot.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• BALB/c mice that were vaccinated intranasally with Tat protein plus mucosal adjuvant macrophage-activating lipopeptide-2 (MALP-2) had increased proliferative, antibody, and IFN-gamma producing T-cell responses than did with Tat+IFA delivered by the i.p. route. • IFA as adjuvant stimulated a Th2-dominant response pattern, and MALP-2 as adjuvant shifted to a Th1 response. Anti-Tat IgG1 dominated the Ab response with IFA, IgG2b dominated with MALP-2. In animals vaccinated with Tat+MALP-2, IFN-gamma and IL-2 were the most prominent cytokines, with some IL-6. In contrast, in mice vaccinated with Tat+IFA, IL-6 was the dominant cytokine. Secreted IL-4, IL-5 and IL-10 were below the detection limit in both cases.				
Tat	Tat		Vaccine	mouse (H-2d)	Dominici2003
	Vaccine *Vector/Type:* protein *HIV component:* Tat *Adjuvant:* Complete Freund's Adjuvant (CFA), red blood cells **Keywords** dendritic cells, Th1, Th2, immunotherapy. **Assay type** Chromium-release assay. • BALB/c mice were immunized with Tat protein bound to red blood cells via biotin-avidin conjugation. This antigen delivery system was successfully internalized by dendritic cells, and induced more consistent anti-Tat Abs responses and sightly increased Tat-specific CTL responses relative to Tat with CFA.

Rev (67–75)	Rev **Keywords** escape.	SAEPVPLQL	HIV-1 infection	human (B14)	Schutten2001
	• Molecularly cloned primary NSI macrophage tropic strain 2.1 and SI non-macrophage tropic strain 1.2 were isolated from study participant ACH320 and use to infect irradiated XID mice that had been reconstituted with human PBMC from B14+ seronegative donors – results indicate CTL may favor selective outgrowth of macrophage tropic strains. • The CTL clone TCC108 specific for SAEPVPLQL, previously described by van Baalen 1997, and van Baalen 1998, was stimulated *in vitro* and given to the mice to apply specific CTL pressure. • The macrophage-tropic HIV-1 strain #2.1 escaped CTL pressure more efficiently (7/14 animals) than its non-macrophage-tropic counterpart #1.2(SI) – the latter isolate was suppressed in 13/14 animals – macrophage may serve as a CTL sanctuary and reduced pressure on macrophage tropic HIV strains may allow additional replication to assist with acquisition of escape. • Specific HIV-1 variants selectively induced by TCC108 were for strain 1.2: SEEPVPLQL, and for strain 2.1: SAEHVPLQL, SAESVPLQL, SVEPVPLQL, SLEPVPLQL, SAEPVPFQL, and SAEPVPFQL.				
Rev (67–75)	Rev (67–75) **Keywords** acute infection, early-expressed proteins, kinetics.	SAEPVPLQL	HIV-1 infection	human (B14)	vanBaalen2002
	• Tat, Rev and Nef are the first HIV proteins expressed upon acute infection of T-cells (< 6 hours), and RT is not expressed until after 24 hours. The B14-restricted Rev-SAEPVPLQL specific CD8 T-cell clone TCC108, and the B57-restricted RT-IVLPEKDSW specific CD8 T-cell clone TCL1C11 were co-incubated with CD4+ cultures innoculated with HIV-1 at low MOI. Co-incubation with the Rev-specific CTL resulted in two logs less HIV-1 production in ten days of culture. When the RT epitope was cloned into the Nef gene of the infecting strain, another early expressed protein, it proved as effective as the Rev epitope at inhibiting viral production. A mathematical model of CTL-target interactions suggest early proteins are important for vaccine design.

	• CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot. • 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides. • All known optimally defined epitopes were summarized for the five proteins.				
Rev (67–75)	Rev (67–75 IIIB)	SAEPVPLQL	HIV-1 infection	human (B14, Cw8)	vanBaalen1998
	• The Rev-specific CTL response studied here was from an individual infected with HIV-1 for more than 12 years without developing symptoms – Rev and Tat are expressed early and CTL activity against these proteins has been correlated with long-term survival. • The CTL clone TCC108 specific for this epitope was studied *in vitro*. • CTLs added immediately after infection suppressed viral production, indicative of CTL interference with viral production prior to lysis – CTL-mediated lysis occurred after the onset of progeny viral release, but prior to peak viral production. • Rapid selection of a E69K mutation, which abolished CTL, recognition was observed. • The epitope was originally listed as B14, but Cw8 and B14 are in linkage disequilibrium, and in this case were not distinguished (pers. comm., Christian Brander, 1999)				
Rev (67–75)	(LAI)	SAEPVPLQL		human (Cw*0501)	Addo2001, Frahm2004
Rev (67–75)	Rev (SF2)	SAEPVPLQL	HIV-1 infection	human (Cw5)	Goulder2001a
	Keywords acute infection. **Epitope name** SL9. • Data from patient AC13 suggest a role for this epitope in initial control of viremia in acute infection, as it is one of several subdominant CTL epitopes recognized during the initial decline in viremia. • A CTL response to SL9, SLYNTVATL, was not evident until 18 months post-presentation.				
Rev (67–75)	Rev (67–75 SF2)	SAEPVPLQL	HIV-1 infection	human (Cw5)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-Cw5+ individuals that had a CTL response to this epitope broken down by group: 2/6 group 1, 0/1 group 2, and 0/2 group 3.				
Rev (67–75)	Rev (67–75)	SAEPVPLQL	HIV-1 infection	human (Cw5)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A1, A*0201, B44, B57, Cw5, Cw6. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

	Vaccine *Vector/Type:* peptide *HIV component:* Rev *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Rev73. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced CTL responses in mice, but responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.				
Rev (75–83)		LPPLERLTL	HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

	• CTL from HLA-A2 positive subject react with this peptide.				
gp160 (33–42)	Env (32–41 subtype B)	KLWVTVYYGV	HIV-1 infection, Vaccine	human (A2.1)	Kundu1998a
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period. • Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual. • CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.				
gp160 (34–42)		LWVTVYYGV	HIV-1 infection	human (A*0201)	Dagarag2003
	Assay type cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay. • Telomer length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescense. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytolysis, and may have therapeutic potential. • Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope.				
gp160 (34–55)	gp120 (25–46 BRU)	LWVTVYYGVPVWKEATTTL-FCA	HIV-1 infection	human (A2)	Dadaglio1991
	• Defined through peptide blocking of CTL activity, and Env deletions.				
gp160 (36–44)	Env (35–)	VTVYYGVPV	HIV-1 infection, Vaccine	human (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Env *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Env35. **Assay type** CD4 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced a CD8+ T-cell IFN gamma response in 1/6 mice, but responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.				
gp160 (36–46)	gp120 (36–46 CM243 subtype CRF01)	VTVYYGVPVWR	HIV-1 exposed seronegative	human (A11)	Sriwanthana2001
	Keywords HIV exposed persistently seronegative (HEPS). **Epitope name** E36-4. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope after a second stimulation *in vitro* gave a weak response in HEPS study subject 186 who was HLA A2/A11.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (36–46)	gp120 (36–46 CM243 subtype CRF01)	VTVYYGVPVWR	HIV-1 infection	human (A11)	Bond2001
	Keywords inter-clade comparisons. • HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive. • 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified. • This epitope was not predicted by the EpiMatrix method to be likely to bind to A11, though it served as an epitope in the FSWs, and it was one of the six A11 epitopes that had been previously defined. • 1/8 tested FSWs recognized this epitope. • This epitope was only conserved in CRF01 and subtypes B and C, and exact matches were uncommon.				
gp160 (36–46)	gp120	VTVYYGVPVWK	HIV-1 infection	human (A11 and A*6801)	Threlkeld1997
	• Study of the fine specificity of an A3-like-HLA-super-type epitope (the A3-super-type includes A*0301, A*1101, A*3101, A*3301, and A*6801) • The A3 super-type is characterized as a hydrophobic or hydroxyl containing anchor residue at position 2, and a positive charge in the C-term position. • While most lines were specific, a promiscuous cloned CTL line was derived from an HIV+ donor that could recognize this epitope presented by either A11 or A*6801.				
gp160 (37–46)	gp120 (37–46 LAI)	TVYYGVPVWK	Vaccine	human (A*0301)	Johnson1994b
	Vaccine *Vector/Type:* vaccinia *HIV component:* gp160 • Multiple CTL clones obtained from two vaccinees. • C. Brander notes that this is an A*0301 epitope in the 1999 database.				
gp160 (37–46)	gp120 (37–46 LAI)	TVYYGVPVWK	Vaccine	human (A*0301)	Frahm2004
	Vaccine *Vector/Type:* vaccinia *HIV component:* gp160 • C. Brander notes this is an A*0301 epitope.				
gp160 (37–46)	gp120	TVYYGVPVWK	HIV-1 infection, Vaccine	human (A*0301)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
gp160 (37–46)		TVYYGVPVWK	HIV-1 infection	human (A03)	Sabbaj2002b
	Epitope name Env-VK9. • Among HIV+ individuals who carried HLA A03, 0/20 (0%) recognized this epitope.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (37–46)	Env	TVYYGVPVWK	Vaccine	transgenic mouse (A11)	Ishioka1999
	Vaccine *Vector/Type:* DNA • A minigene vaccine construct encoding 6 HLA 2.1 and 3 HLA A11 restricted CTL epitopes, the universal Th cell epitope PADRE (pan-DR epitope) and an ER translocating signal sequence was constructed. • The epitopes were chosen for dominant recognition by CTLs during HBV and HIV infections in humans. • HLA transgenic mice were used for quantitating *in vivo* immunogenicity of DNA vaccines encoding HLA-restricted CTL epitopes.				
gp160 (37–46)	gp120 (37–46)	TVYYGVPVWK	Vaccine	human (A3)	Carruth1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease • The vaccine used was a live recombinant canarypox (CP) virus vaccine containing multiple HIV-1 genes (HIV-1 MN gp120, HIV-1 LAI gp41, HIV-1 LAI Gag, HIV-1 LAI protease) • CD4+ and CD8+ Gag and Env specific CTL responses were detected in only 1/5 vaccinated volunteers, and were not detectable 1 year after vaccination. • CTL responses to epitopes SLYNTVATL and TVYYGVPVWK from HIV+ control patients were used as positive controls. • The study explored why vaccinees were non-responsive – non-response was not due to inherent defects or differences in the ability of these individuals to process and present antigen.				
gp160 (37–46)	gp120 (37–46 LAI)	TVYYGVPVWK	HIV-1 infection	human (A3)	Goulder1997e, Goulder1997a
	Keywords review, escape. • Identical twin hemophiliac brothers were both infected with the same batch of factor VIII. • One had a response to this epitope, the other did not. • [Goulder1997a] is a review of immune escape that summarizes this study.				
gp160 (37–46)	gp120 (36–45)	TVYYGVPVWK	HIV-1 infection	human (A3)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
gp160 (37–46)	gp120 (37–46)	TVYYGVPVWK	HIV-1 infection	human (A3)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • All patients recognized at least 1 A3 epitope, up to 8 A3 epitopes, but none was clearly dominant.				
gp160 (37–46)	Env (49–58)	TVYYGVPVWK	HIV-1 infection	human (A3 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).				
gp160 (37–46)	gp120 (38–41 LAI)	TVYYGVPVWK	Vaccine	human (A3.1)	Johnson1994a
	Vaccine *Vector/Type:* vaccinia *HIV component:* gp160				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Highly conserved epitope recognized by multiple CTL clones from vaccinee.				
gp160 (37–46)	gp120 (37–46 LAI)	TVYYGVPVWK	Vaccine	human (A3.1)	Ferris1999, Hammond1995
	Vaccine *Vector/Type:* vaccinia *HIV component:* gp160				
	• This peptide can be processed for HLA-A3.1 presentation by TAP-1/2 independent and dependent pathways.				
gp160 (37–46)	gp120 (37–46 LAI)	TVYYGVPVWK	HIV-1 infection	human (B*0301)	Wilson2000a
	Keywords acute infection.				
	• Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.				
	• All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.				
	• ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.				
	• The subject with A*0201 had a moderately strong response to SLYNTVATL.				
	• Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.				
	• No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.				
gp160 (38–48)	gp120 (45–55)	VYYGVPVWKEA	HIV-1 infection	human (Cw7)	Nehete1998a
	• Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one.				
	• HLA-C antigens are expressed on lymphoid cells to a lesser extent than either HLA-A or -B.				
	• HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.				
gp160 (42–51)	gp120 (42–51 PV22)	VPVWKEATTT	HIV-1 infection	human (B*5501)	Frahm2004
	• C. Brander notes this is a B*5501 epitope.				
gp160 (42–51)	gp120 (42–51 PV22)	VPVWKEATTT	HIV-1 infection	human (B55)	Brander1995b
	• P. Johnson, unpublished.				
gp160 (42–51)	gp120 (41–55)	VPVWKEATTT	HIV-1 infection	human (B55)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
gp160 (42–52)	Env (43–52 BH10, LAI)	VPVWKEATTTL	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins.				
	• This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this peptide is PVWKEATTTL) has similarity with the platelet membrane glycoprotein IIIA precursor (GLIIIA) (integrin beta-3) (CD61): PLYKEATSTF.				
gp160 (42–52)	gp120 (42–52)	VPVWKEATTTL	HIV-1 infection	human (B*3501)	Frahm2004
	• C. Brander notes this is a B*3501 epitope.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HLA B35 is associated with rapid disease progression. • The sequences of 9 previously described HIV-1 B35 CTL epitopes were obtained in 10 HLA B35+ and 19 HLA B35- individuals. • 3/9 CTL epitopes had substitutions that were more common in B35+ individuals than in B35- individuals, but this was one of the six that had no B35 associated pattern of mutation.				
gp160 (78–86)	gp120 (77–85 SF2)	DPNPQEVVL	HIV-1 infection	human (B35)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 1/2 group 1, 0/2 group 2, and 0/1 group 3.				
gp160 (78–86)		DPNPQEVVL	HIV-1 infection	human (B35)	Sabbaj2002b
	Epitope name Env-DL9. • Among HIV+ individuals who carried HLA B35, 3/20 (15%) recognized this epitope.				
gp160 (78–86)	gp120 (78–86)	DPNPQEVVL	HIV-1 infection	human (B35)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A3, A33, B14, B35, Cw*0401, Cw*0802. • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.				
gp160 (78–86)	gp120 (77–85 SF2)	DPNPQEVVL	HIV-1 infection	human (B35, B51)	Shiga1996
	• Binds HLA-B*3501 and B*5101 – binds and kills gp120-vaccinia virus infected cells carrying B35 or B51.				
gp160 (78–86)	gp120 (77–85)	DPNPQEVVL	HIV-1 infection, HIV-1 exposed seronegative	human (B51)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
gp160 (103–111)	Env (102–110)	QMHEDIISL	HIV-1 infection	human (A*0201)	Kmieciak1998a
	Keywords binding affinity, TCR usage.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CTL responses in six patients to four Env epitopes were studied: D2: LLNATAIAV, 5.3: RLRDLLLIV, D1: KLTPLCVTL, and 4.3: QMHEDIISL – all have A2 anchor residues. • The C terminal epitopes (D2 and 5.3) were highly variable and the variability was considered responsible for limited CTL response, while D1 and 4.3, N-terminal epitopes, were much more conserved and gave evidence of high levels of CTL response *in vitro*. • Peptides 4.3 and D1 bound HLA-A*0201 molecules with high affinity. • Peptides 4.3 and D1 stimulated CTL with a relatively limited TCR Vβ repertoire.

gp160 (105–117)	gp120 (112–124 IIIB) • Helper and cytotoxic T cells can be stimulated by this peptide (T2)	HEDIISLWDQSLK	HIV-1 infection	human (A2)	Clerici1991a
gp160 (108–116)	Env (107–115 subtype B) **Vaccine** *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period. • Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.	IISLWDQSL	Vaccine	human (A2.1)	Kundu1998a

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.				
gp160 (109–117)	Env (109–117 CM243 subtype CRF01) **Keywords** HIV exposed persistently seronegative (HEPS). **Epitope name** E109-117. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was weakly reactive in the HEPS study subject 265 who was HLA A2/A11, and had been predicted to be a possible A11 epitope using Epimer in [Bond2001]	ISLWDQSLK	HIV-1 exposed seronegative	human (A11)	Bond2001
gp160 (112–130)	gp120 (119–139 SF2) • Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160. • One of these 11 had CTL response to this peptide. • The responding subject was HLA-A2 and B-21.	WDQSLKPCVKLTPLCVSLK	HIV-1 infection	human	Lieberman1997a
gp160 (112–131)	gp120 (MN) **Keywords** assay standardization, HAART. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2. • 17 perinatally HIV-1 infected children (0.08-16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.	WDQSLKPCVKLTPLCVTLNC	HIV-1 infection	human	Chitnis2003
gp160 (117–126)	Env (72–81) • This B7 epitope is one of three subdominant CTL responses detected in a long-term non-progressor. • A dominant B7 epitope was defined using conventional methods, and three additional sub-dominant HLA B7 epitopes were defined by first using a non-anchor based strategy, EpiMatrix, to identify 2078 possible epitopes in the autologous HIV-1, followed by B7 anchor residue prediction to narrow the set to 55 peptides for experimental testing.	KPCVKLTPLC	HIV-1 infection	human (B7)	Jin2000b
gp160 (121–129)	Env (120–128) **Keywords** binding affinity, TCR usage. • CTL responses in six patients to four Env epitopes were studied: D2: LLNATAIAV, 5.3: RLRDLLLIV, D1: KLTPLCVTL, and 4.3: QMHEDIISL—all have A2 anchor residues. • The C terminal epitopes (D2 and 5.3) were highly variable and the variability was considered responsible for limited CTL response, while D1 and 4.3, N-terminal epitopes, were much more conserved and gave evidence of high levels of CTL response *in vitro*. • Peptides 4.3 and D1 bound HLA-A*0201 molecules with high affinity. • Peptides 4.3 and D1 stimulated CTL with a relatively limited TCR Vβ repertoire. • In a longitudinal study, the CTL response to the variable D2 epitope diminished over time, while the response to the conserved epitope D1 stayed higher over time.	KLTPLCVTL	HIV-1 infection	human (A*0201)	Kmieciak1998a

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (121–129)	Env (134–)	KLTPLCVTL	HIV-1 infection	human (A*0201)	Altfeld2001c
	Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction. **Epitope name** Env-134. • HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested. • Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2) • 2/22 individuals with chronic HIV-1 infection recognized this epitope in ELISPOT. • 0/12 acutely infected individuals recognized this epitope. • KLTPLCVTL binds to four HLA-A2 supertype alleles: A*0201, A*0202, A*0203 and A*6802 (highest affinity).			
gp160 (121–129)	gp120 (120–128 LAI)	KLTPLCVTL	Vaccine	human (A2)	Dupuis1995
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 • CTL from HLA-A2 positive subject react with this peptide.				
gp160 (121–129)	gp120 (120–128)	KLTPLCVTL	Vaccine	human (A2)	Woodberry1999
	Vaccine *Vector/Type:* vaccinia • A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2. • HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^{d} – this transgene is the only MHC molecule expressed in the mice. • CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost. • No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL) • Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested. • KLTPLCVTL was recognized by 3 of the patients.			
gp160 (121–129)	gp120 (120–128)	KLTPLCVTL	HIV-1 infection	human (A2)	Kundu1998b
	Keywords dendritic cells. • Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients. • 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated. • KLTPLCVTL is a conserved HLA-A2 epitope included in this study – all six patients had this sequence as their HIV direct sequence, and a detectable CTL response. • CTL demonstrated against peptide-coated target, epitope is naturally processed and enhancible with vaccine.			
gp160 (121–129)	gp120 (120–128)	KLTPLCVTL	HIV-1 infection	human (A2)	Kmieciak1998b
	• Increased CTL response to cells expressing a VV construct Δv3 mutant compared with a full-length env gene product.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (121–129)	gp120 (121–129)	KLTPLCVSL	in vitro stimulation or selectio	human (A2)	Zarling1999
	Keywords dendritic cells. • This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses. • Strong CTL responses were elicited by the epitopes DRFYKTLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA. • A weak response to KLTPLCVSL was stimulated using macrophages as the APC. • No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.				
gp160 (121–129)	gp120 (120–128)	KTLPLCVTL	HIV-1 infection	human (A2)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
gp160 (121–129)	gp120 (121–129 IIIB)	KLTPLCVTL	Vaccine	mouse (A2)	Kiszka2002
	Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade IIIB *HIV component:* gp160, gp160ΔV3 *Adjuvant:* IL-12 **Keywords** vaccine-specific epitope characteristics. **Epitope name** D1. • Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV. • Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells.				
gp160 (121–129)	Env (121–)	KLTPLCVTL	HIV-1 infection	human (A2)	Corbet2003
	Keywords binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Env121. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This epitope was one of the previously identified HLA-A2 epitopes studied. • 3/17 HIV-infected HLA-A2+ people recognized this epitope.				
gp160 (121–129)	Env (134–142)	KLTPLCVTL	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).				
gp160 (121–129)	Env	KLTPLCVTL	Vaccine	transgenic mouse (A2.1)	Ishioka1999
	Vaccine *Vector/Type:* DNA				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• A minigene vaccine construct encoding 6 HLA 2.1 and 3 HLA A11 restricted CTL epitopes, the universal Th cell epitope PADRE (pan-DR epitope) and an ER translocating signal sequence was constructed. • The epitopes were chosen for dominant recognition by CTLs during HBV and HIV infections in humans. • HLA transgenic mice were used for quantitating *in vivo* immunogenicity of DNA vaccines encoding HLA-restricted CTL epitopes – strong responses were observed to all nine epitopes, and CTL memory persisted up to four months after a single injection.				
gp160 (121–129)	Env (120–128 subtype B) **Vaccine** *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period. • Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual. • CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses. gp160 (192–200)	gp120 (192–199)	KLTSCNTSV	HIV-1 infection	human (A2)	Huang2000
	Keywords HAART. • The single cell ELISPOT assay was optimized and highly specific, and found to work well even after the primary cells had been frozen and thawed. • Increases in gamma interferon producing cells were observed in response to anti-retroviral therapy using single cell IFN-gamma-production ELISPOT.				
gp160 (192–200)	gp120 (197–205)	TLTSCNTSV	Peptide-HLA interaction	human (A2)	Garboczi1992
	• Crystallization of HLA-A2 molecules complexed with antigenic peptides – refers to Dadaglio *et al.* 1991.				
gp160 (192–200)	gp120 (199–207)	TLTSCNTSV	HIV-1 infection	human (A2.1)	Brander1996a
	• This epitope was recognized by PBMC from 6/14 HIV+ asymptomatic patients. • This epitope was used along with pol CTL epitope ALQDSGLEV and a tetanus toxin T helper epitope for a synthetic vaccine. • This vaccine failed to induce a CTL response, although a helper response was evident.				
gp160 (192–211)	gp120 (199–219 SF2)	SLTSCNTSVITQACPKVSFE	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160. • One of these 11 had CTL response to this peptide.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The responding subject was HLA-A2, -B21.				
gp160 (199–207)	Env (202–210)	SVITQACPK	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords inter-clade comparisons, TCR usage. • Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals. • SVITQACPK was found to elicit clade-specific responses in clade B (SVITQACPK is most common, sAitqacpk is most common variant in clade A, C and D) and clade E (saiKqacpk is most common). SVITQACPK was recognized by CTL from 3/5 B clade infected Japanese subjects, and aiKqacpk by CTL from 0/7 E clade infected Thai subjects, so this seems to be a B clade exclusive epitope. • The binding of the three variant peptides to HLA A*1101 was comparable, implicating TCR interaction differences.

gp160 (201–225)	gp120 (201–225 LAI)	ITQACPKVSFEPIPHYCAP-AGFAI	Vaccine	human (CD4+ CTL)	Johnson1994b, Johnson1994a
	Vaccine *Vector/Type:* vaccinia *HIV component:* gp160 • CD4+ CTL isolated from LAI IIIB gp160 vaccinees.				
gp160 (202–221)	gp120 (209–228)	TQACPKVSFEPIPIHYCAPA	HIV-1 infection	human	Lieberman1995
	• HIV-specific CTL lines developed by *ex vivo* stimulation with peptide.				
gp160 (202–221)	gp120	TQACPKVSFEPIPIHYCAPA	HIV-1 infection	human	Weekes1999b
	Keywords TCR usage. • Peptide 740.18: Almost all CD8+ T cells are CD28+ at birth, and the proportion of CD28-CD8+ cells increases with age – this study examines the contribution of CD8+CD28- cells to CTL memory pools for CTL clones specific for two persistent human viruses, CMV and HIV – clones were found to be similarly distributed the CD28 depleted cell population. • HIV CTL responses to 3 Env and 2 Gag peptides were studied. • The clonal composition of the TCR Vβ responses were studied and was found to be highly focused, with one TCR beta-chain sequence tending to dominate the peptide-specific response – clones to this epitope were Vβ13.1.				
gp160 (202–221)	gp120	TQACPKVSFEPIPIHYCAPA	HIV-1 infection	human	Weekes1999a
	• Peptide 740.18: Memory CTL specific for HIV-1 may contribute to oligoclonal expansions within the CD57+ CD28- CD8+ CTLp populations.				
gp160 (202–221)	gp120 (209–228 SF2)	TQACPKVSFEPIPIHYCAPA	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160. • One of these 11 had CTL response to this peptide.				
gp160 (202–221)	gp120 (209–228 SF2)	TQACPKVSFEPIPIHYCAPA	HIV-1 infection	human	Lieberman1997b
	• CTL expanded *ex vivo* were later infused into HIV-1 infected patients.				
gp160 (207–216)	gp120 (subtype A)	KMTFEPIPIH	HIV-1 infection	human (A29)	Cao2000
	Keywords inter-clade comparisons. • HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype. • CTL derived from subtype A clade infection (patient SP 528), recognized the subtype A version of the peptide (KMSFEPIPIH), had a slightly reduced specific lysis using the B clade version of the peptide (KVSFEPIPIH), and no lysis using the D clade version of the epitope (KVTFEPIPIH) • Patient SP 528 is HLA A1, A29, B57, B81, Bw4, Bw6.				
gp160 (208–217)	gp120 (subtype B)	VSFEPIPIHY	HIV-1 exposed seronegative	human (A29)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses. • Low risk individuals did not have such CD8+ cells. • CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
gp160 (208–217)	gp120 (263–272)	VSFEPIPHY	HIV-1 infection, HIV-1 exposed seronegative	human (A29)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
gp160 (208–217)	gp120	VSFEPIPIHY	HIV-1 infection	human (A29)	Kaul2003
	Keywords immunodominance, genital and mucosal immunity. **Assay type** Intracellular cytokine staining. • Predefined immunodominant peptide responses were used to compare CD8+ T cells responses in the blood and cervix of 16 HIV+ Kenyan sex workers. Cervical responses were detected in 8/10 women from whom adequate samples could be obtained. The frequency of the CD8+ T cell response in the genital tract was comparable to the blood, with a trend toward being slightly higher. • The immunodominant response was to this epitope in the PBMC of 1/16 patients (Kaul *et al.* 2001, AIDS, 107:1303).				
gp160 (208–219)	Env	VSFEPIPPHYCA	HIV-1 infection	human (A2)	Cao2002
	Keywords epitope processing. • SP 511 is an A2 restricted CTL clone generated from a Ugandan subject that recognizes VSFEPIPPHYCA. • CTL could be activated by a fusion protein of an HIV protein and anthrax lethal factor (LFn-HIV) that promotes antigen presenting cell uptake of exogenous protein and allows processing through the MHC class I pathway. This strategy for CTL detection could allow antigen presentation without generation of cells by the standard methods of using live viral vectors carrying a protein, or by loading the cells with peptides and by-passing processing.				
gp160 (209–217)	(LAI)	SFEPIPIHY		(A29)	Altfeld2000a, Frahm2004
gp160 (209–217)	gp120 (213–221 SF2)	SFEPIPIHY	HIV-1 infection	human (A29)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Number of HLA-A29+ individuals that had a CTL response to this epitope broken down by group: 1/3 group 1, 0/0 group 2, and 0/0 group 3.				
gp160 (209–217)	gp120 (209–217)	SFEPIPIHY	HIV-1 infection	human (A29)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A*0201, A29, B58, B62, Cw*0301, Cw*1601; A*0201, A29, B44, B60, Cw3, Cw16. • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • Two subjects recognized this epitope during primary infection, both in the context of A29. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.				
gp160 (212–231)	gp120	PIPIHYCAPAGFAILKCNNK	HIV-1 infection	human	Weekes1999a

gp160 (252–271)	gp120 (256–275 LAI)	RPVVSTQLLLNGSLAEEEVV	HIV-1 infection	human (B7)	Shankar1996
gp160 (291–307)	Env (292–301 BH10, LAI)	SVEINCTRPNNNTRKSI	HIV-1 infection	human	Maksiutov2002
• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is VEINCTRPNN) has similarity with the FasI receptor precursor (Apptosis-mediating surface antigen fas) (APO-1 antigen) (CD95 antigen) fragment VEINCTRQN.					
gp160 (291–307)	gp120 (295–312 BRU)	SVEINCTRPNNNTRKSI	HIV-1 infection	human (A2)	Dadaglio1991
• Defined through blocking CTL activity, and Env deletions.					
gp160 (291–307)	gp120 (291–307 IIIB)	SVEINCTRPNNNTRKRI	Vaccine	mouse (A2)	Kiszka2002
Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* IL-12 **Keywords** vaccine-specific epitope characteristics. • Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV. • Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells. • The most intense CTL responses to the intact gp160 vaccine were directed at three V3 peptides.					
gp160 (297–322)	gp120 (297–322 IIIB)	TRPNNNTRKRIRIQRGPGR-AFVTIGK	Vaccine	mouse (H-2D^{d})	Chang1999
Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* liposome • Induction of peptide-specific CTLs in BALB/c mice was dependent on immunization with peptide encapsulated liposomes containing MPL as adjuvant. • T26K (26mer) elicited a stronger AB and CTL response than R15K (a V3 15mer, RIQRGPGRAFVTIGK)					
gp160 (297–330)	Env (303–335 BX08)	TRPNNNTRKSIHIGPGRAF-YATGEIIGDIRQAH	Vaccine	human	Gahery-Segard2000
Vaccine *Vector/Type:* lipopeptide • Anti-HIV lipopeptide vaccine consisting of six long amino acid peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial. • A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 6/10 reacted to this peptide. • 9/12 tested mounted a CTL response to at least one of the six peptides; each of the six peptides elicited a CTL response in at least one individual – this peptide was particularly immunogenic, eliciting a CTL response in five vaccinees. • None of the 12 tested had an IgG response to gp120 or gp160 and vaccinees could be differentiated from HIV-1 seropositive individuals with a commercial HIV detection kit – no neutralizing antibodies were observed.					
gp160 (298–307)	gp120 (298–307)	RPNNNTRKSI	HIV-1 infection	human (B*07)	Ferris1999, Hammond1995
Keywords epitope processing, TCR usage. • The processing of this epitope is TAP1/2-dependent, as are most Env epitopes, and it contains an N-linked glycosylation site that is glycosylated in Env. • Peptide that had been deglycosylated, a process that changes asparagine (N) to aspartic acid (D) (RPNDNTRKSI) was recognized a 100-fold more efficiently than either glycosylated or non-glycosylated RPNNNTRKSI. • Position 5 is not involved with HLA B*07 binding, so is probably important for TCR recognition.					

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-1 Env epitopes are typically processed by a TAP1/2 dependent mechanism, which involves cotranslational translocation into the ER, glycosylation, export back into the cytosol, and deglycosylation for processing, and retransport into the ER for the association with class I molecules. • The particular pathway of generating an epitope may have an impact on the presentation of that epitope, quantitatively as well as qualitatively.				
gp160 (298–307)	gp120 (302–312 HXB2) • C. Brander notes this is a B*0702 epitope.	RPNNNTRKSI	HIV-1 infection	human (B*0702)	Frahm2004

gp160 (298–307)	gp120 (302–312 HXB2) • Peptide processed by a TAP-1/2-dependent pathway only. • CTL from an acute seroconverter.	RPNNNTRKSI	HIV-1 infection	human (B7)	Hammond1995
gp160 (298–307)	gp120 (302–312 HXB2) • Longitudinal study of epitope variation *in vivo*.	RPNNNTRKSI	HIV-1 infection	human (B7)	Wolinsky1996
gp160 (298–307)	gp120 (302–311 subtype B) **Keywords** inter-clade comparisons, immunodominance. • The extent of CTL interclade cross-reactivity from CTL isolated from individuals newly infected with B clade virus was studied, and extensive cross-reactivity was observed. • Two HLA B7 individuals had CTL response to B_LAI, A_92UG037 and C_92BR025 gp160, but were B clade strain MN non-responders – the authors note that the B7 epitope RPNNNTRKSI is immunodominant, conserved between the LAI and clade A and C strains, but is very divergent in MN (RPNYNKRKRI), and that this epitope might be dominating the specificity of the response in the HLA B7 individuals.	RPNNNTRKSI	HIV-1 infection	human (B7)	Wilson1998b
gp160 (298–307)	gp120 (303–312 SF2) **Keywords** HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 0/4 group 1, 1/3 group 2, and 1/1 group 3.	RPNNNTRKSI	HIV-1 infection	human (B7)	Altfeld2001b
gp160 (298–307)	gp120 (298–307) **Keywords** rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes. • An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes. • The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.	RPNNNTRKSI	HIV-1 infection	human (B7)	Day2001

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.				
gp160 (298–307)	gp120 (298–307)	RPNNNTRKSI	HIV-1 infection	human (B7)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** B7-RI10. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 4/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 1/4 individuals had detectable responses to this epitope after STI.				
gp160 (298–307)	gp120	RPNNNTRKSI	HIV-1 infection	human (B7)	Appay2002
	Keywords HAART. **Donor HLA** A2,A3,B7,Bw6. • Four HIV patients with prolonged clinically successful anti-viral therapy but with ongoing evidence of replication and Nef mRNA transcription, showed specific T-cell responses by Elispot and Tetramer staining, maintained for 2-4 years after initiation of HAART. • Nef epitope recognition was detected in all 4 subjects, gp120, Pol and Gag-specific in 1 or 2 subjects. • The HIV-specific CD8+ T-cells had an intermediate maturation phenotype characterized by low levels of perforin and high levels of CD27 expression.				
gp160 (298–307)	gp120 (303–312 IIIB)	RPNNNTRKSI	HIV-1 infection	human (B7?)	Wilson1996
	Keywords responses in children, mother-to-infant transmission. • Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study. • RPNNNTRKDI and RPNNNTRKGI, naturally occurring variants, were found in non-transmitting mother – ability to recognize these variants has not yet been determined.				
gp160 (299–319)	Env (299–319)	PNNNTRKSIRIGPGQTFYA	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
gp160 (303–322)	gp120	TRKSIHIGPGRAFYTTGE	Vaccine	mouse	Luo1998
	Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* B clade consensus *HIV component:* Gag, V3 • Intramuscular injection of chimeric gag-env virus-like particles (VLPs) containing V3 loop sequences into BALB/c mice induce V3 specific CTL – TRKSIHIGPGRAFYTTGE is a B subtype consensus that stimulated a cross-reactive CTL response.				
gp160 (304–318)	gp120 (304–318 IIIB)	RKSIRIQRGPGRAFV	Vaccine	mouse (H-2^d)	Kang1999
	Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* B clade IIIB, B clade MN, B clade RF, B clade SF2, HIV-2 VLP *HIV component:* Gag, V3 • Virus-like particles could be formed from HIV-2 gag after deleting 143 amino acids at the C-terminal end – a proline rich region in positions 373-377 was critical to VLP formation. • CTL responses in BALB/c mice were induced by chimeric gag-V3 particles against the V3 region of HIV-1 clade B isolates IIIB (SIRIQRGRAFVTI), MN (KRIHIGPGRAFYTTK), RF (SITKGPGRVIYATGQ), and SF2 (SIYIGPGRAFHTTGR)				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The vaccine induced CTL were cross-reactive with a broad spectrum of B clade isolates, with the exception of the RF V3 which did not induce CTL.				
gp160 (305–321)	gp120 (MN)	KRIHIGPGRAFYTTK	HIV-1 infection	human	Chitnis2003
	Keywords assay standardization, HAART. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2. • 17 perinatally HIV-1 infected children (0.08-16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.				
gp160 (306–322)	gp160 (LAI)	SIRIQGPGRAFVTIGI	Vaccine	mouse (H-2D^d)	Deml1999
	Vaccine *Vector/Type:* protein *Strain:* B clade LAI *HIV component:* gp160 *Adjuvant:* aluminum hydroxide, CpG immunostimulatory sequence (ISS) **Keywords** immunodominance, Th1, Th2. • Addition of CpG oligodeoxynucleotide to a gp160/alum vaccine given to BALB/c mice shifted the response to Th0/Th1 from Th2, but no still CTL response to this immunodominant epitope was induced.				
gp160 (308–321)	Env (gp160)	RIQRGPGRAFVTIK	Vaccine	mouse	Sakaue2003
	Vaccine *Vector/Type:* hemagglutinating virus of Japan (HVJ)-liposome *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** genital and mucosal immunity. **Epitope name** P18IIIB. **Assay type** cytokine production, Chromium-release assay. **Donor HLA** H-2d. • BALB/c mice were immunized nasally with HIVgp160-encapsulated hemagglutininating virus of Japan (HVJ)-liposome. Vaccination induced IgG in serum and IgA in nasal wash, saliva, fecal extract, and vaginal wash, with some ability to neutralize the primary field isolate HIV-MNp. • Th1 and Th2-type responses were stimulated, as well as gp160 V3-specific MHC class I-restricted CTL responses.				
gp160 (308–321)	Env (IIIB)	RIQRGPGRAFVTIG	Vaccine	mouse (Dd)	Ahlers2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 **Keywords** binding affinity, Th1. **Epitope name** P18IIIB. • BALB/c and A.AL were immunized with an Env-peptide vaccine construct containing the CTL epitope P18IIIB and the T helper epitope T1, KQIIN-MWQEVGKAMYA. • Substitution of Glu (wt) to Ala in T1, kqiinmwqAvgkamya, caused increased affinity for MHC class II Ek, resulting in the upregulation of CD40L in the responding Th cells, and shifting the response towards Th1. Increased Th responses stimulated DCs to produce higher levels of IL-12, and B7-1 and B7-2, and enhanced CTL responses to P18. • The modified epitope, T1A, elicited stronger protection against increasing doses of viral challenge with vaccinia expressing HIV-1 IIIB gp120 compared to the wt epitope T1.				
gp160 (308–322)	gp160 (MN)	RIHIGPGRAFYTTKN	Vaccine	human	Pinto1999
	Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3 *Adjuvant:* Montanide (ISA 51) • Peptide P18: Eight HIV+ individuals were vaccinated with peptides containing specific T helper, CTL and Ab epitopes in Montanide ISA 51 in a Phase I trial. • Four displayed a 4-fold increase in PCLUS 3-18 MN-specific T helper responses.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• One patient developed a new, sustained P18MN-peptide-specific CTL response – the patient's HLA haplotype was A2,30; B53,7; Cw2,4, and anti-HLA A2 antibody did not inhibit the response, suggesting it was not A2. • Patients with low baseline Ab levels developed an increase of neutralizing Ab titers. • No significant change was observed in plasma HIV viral loads and CD4 cell counts.				
gp160 (308–322)	gp120 (MN)	RIHIGPGRAFYTTKN	HIV-1 infection	chimpanzee	Lubeck1997
	• Epitope-specific CTL detected in chimpanzees immunized with adenovirus-HIV-1 MN gp160 recombinant. • CTL response may account for protection against subsequent HIV-1 SF2 challenge in a chimpanzee lacking neutralizing antibodies.

	• CTL and T helper cell reactivity in healthcare workers exposed to HIV.				
gp160 (308–322)	gp120 (110–122)	RIQRGPGRAFVTIGK	Vaccine	mouse	Moore2002a
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *Adjuvant:* FLt3 ligand (FL), GM-CSF, IL-12, IL-15, IL-2 **Keywords** vaccine-specific epitope characteristics. • Intramuscular immunization of BALB/c mice with DNA vaccines carrying either gp160 or Nef in the expression vector plasmid pNGVL gave different responses – gp160 induced strong gp160-specific CTL and IFN-responses and low-titer humoral responses, and Nef generated humoral (IgG1, IgG2a) responses and IFN-responses but little CTL activity. • Co-injection of DNA plasmids encoding cytokines and/or hematopoietic growth factors, IL2, IL-12, IL-15, Flt3 ligand (FL), and GMCSF tended to give responses that were enhanced quantitatively, but not altered qualitatively. • Co-administration of GMCSF most strongly enhanced CTL and IFN-responses against pNGVL-gp160. • Repeated immunization with pNGVL-Nef failed to induce CTL responses. Co-administration of IL-12 most strongly enhanced humoral and IFNgamma responses. • FL, which enhances innate immune responses, in combination with IL-2, IL-12 or IL-15 generated with most potent Nef responses.				
gp160 (308–322)	Env (315–329)	RIQRGPGRAFVTIGK	Vaccine	mouse (A*0201)	Singh2002, Sykes1999
	Vaccine *Vector/Type:* DNA *HIV component:* HIV-1 **Keywords** epitope processing, vaccine-specific epitope characteristics, immunodominance. **Epitope name** P18. • C3H (H-2k) transgenic mice carrying a fused HLA-A*0201 alpha1 and alpha2 and H-2Dk alpha3 hybrid class I molecule were immunized using an epidermal gene gun with an ubiquitin expression library of 32 plasmids that spanned the HIV-1 genome. Ubiquitin targets the expressed HIV-1 peptides to the proteasome. • A single immunization with the UB-HIV-1 library vaccine induced potent, stable and multivalent CTL responses against all library members. • Immunodominant epitopes SLYNTVATL (Gag), ILKEPVHGV(Pol), RIQRGPGRAFVTIGK(P18) and AFHHVAREK (Nef) elicited strong CD8+/IFN-responses and stimulated CTL that were functional in a Cr-release assay and against wild type antigen. • The presence of multiple plasmids HLA-A*0201-restricted CTL epitopes did not decrease CTL immunogenicity, and CTL responses to single peptide immunizations were comparable to responses based on mixtures of either 16 or 32 peptides.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	Vaccine	human (A11)	Achour1994
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 • One of 3 HLA type restrictions associated with this peptide.

	Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* Env, Gag • Env bound to virus-like particles (VLPs) can elicit a CTL response that is dependent on the amount of Env presented on the VLP.				
gp160 (308–322)	gp120 (313–327 MN)	RIHIGPGRAFYTTKN	Vaccine	mouse (H-2^d)	Fomsgaard1998a
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* gp160, V3 • Enhanced B and CTL responses to the V3 region occur following epidermal immunization by gene gun with a chimeric DNA vaccine of V3-hepatitis B surface antigen relative to a gp160 plasmid vaccine.				
gp160 (308–322)	gp120 (313–327 MN)	RIHIGPGRAFYTTKN	Vaccine	mouse (H-2^d)	Ahlers1996, Ahlers1997a
	Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3 *Adjuvant:* GM-CSF, IL-12 **Keywords** Th1. • Vaccine constructs containing helper, antibody and CTL peptide epitopes induce strong Th1, CTL and NAb responses against the autologous HIV-1 virus. • The peptide CTL response was as cross-reactive as one elicited by a vaccinia construct expressing rgp160 MN. • GM-CSF and IL-12 were the two cytokines most effective for inducing and boosting CTLs.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	Vaccine	mouse (H-2^d)	Layton1993
	Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* B clade IIIB *HIV component:* Gag, V3 • V3-Ty-Virus-like particles can induce type-specific CTL in mice in the absence of adjuvant.				
gp160 (308–322)	gp120 (IIIB)	RIQRGPGRAFVTIGK	Vaccine	mouse (H-2^d)	Barouch1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp120 *Adjuvant:* IL-2, IL2/Ig • A discistronic IL-2 gp120 expression vector gave a weaker CTL response than gp120 alone in the expression vector, however co-administration of an Il-2/IgG fusion protein enhanced the immune response and administration of a Il-2/IgG plasmid had a response that depended on the timing of administration. • This study showed that a response to an HIV-1 DNA vaccine could be either augmented or suppressed by plasmid Cytokine/Ig administration.				
gp160 (308–322)	Env (308–322 IIIB)	RIQRGPGRAFVTIGK	Vaccine	mouse (H-2^d)	Uno-Furuta2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* B7, CpG immunostimulatory sequence (ISS), in vivo electroporation **Keywords** Th1. **Epitope name** P18.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Peptide immunization usually doesn't elicit a good CTL response because epitopes are not internalized and processed and presented, so vaccination with electric pulsing was tried (i.m. injection followed by 8 electric pulses), to enhance peptide uptake through electroporation. • BALB/c immunized with HIV P18 or hepatitis C P17 peptides with an electric pulse elicited a CTL response, those that did not receive the pulse did not. • The CTL response was enhanced by addition of immunostimulatory sequences ISS in the plasmid pCMV-LacZ, that contains hexamers GACGTC, AGCGCT, AACGCT, sequences common in prokaryotic genomes but rare in eukaryotic genomes that elicit Th1 cytokines and result in B cell and T-cell proliferation. • The CTL response was also enhanced by addition of B7-1 cDNA – the B7 family of proteins transduce co-stimulatory signals through interaction with CD28.				
gp160 (308–322)	gp160 (MN)	RIHIGPGRAFYTTKN	Vaccine	mouse (H-2^{d}, H-2^{b})	Fomsgaard1998b
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* gp160 • CTL responses to a primary gene gun vaccination were rapid and strong for several methods of vaccinations: i.m., bupivacaine pretreatment, cardiotoxin pretreatment or gene gun – the CTL response was more rapid and consistent than the antibody response.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	Vaccine	mouse (H-$2D^{d, p, q}$, H-2^{u})	Shirai1996b
	Vaccine *Vector/Type:* vaccinia *HIV component:* gp160 • Multiple murine MHC can cross-present this epitope (P18) and HP53, DRVIEVVQGAYRAIR, to specific CTL.

	Vaccine *Vector/Type:* liposome *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* oligomannose				
	• The peptide RIQRGPGRAFVTIGK was incorporated into liposomes and given as a subcutaneous injection, which induces a MHC class I restricted CTL response in mice.				
	• Liposomes coated with oligomannose show no toxicity and can elicit a potent CTL response upon a single subcutaneous infection, while non-coated liposomes do not, suggesting that oligomannose may be a good adjuvant for CTL responses.				
gp160 (308–322)		RIQRGPGRAFVTIGK	Vaccine	mouse (H-2D^d)	Lu2000a
	Vaccine *Vector/Type:* fusion protein with anthrax delivery domain *HIV component:* V3 *Adjuvant:* B. anthracia lethal toxin LF component				
	Keywords epitope processing, vaccine-specific epitope characteristics.				
	Epitope name P18.				
	• Bacillus anthrax lethal toxin (LFn)-HIV fusion proteins are candidate HIV vaccines that are safe in mice, and LFn-V3 region fusion proteins induce CD8 T cells in BALBc mice. LFn causes exogenous protein to be taken up and processed in a class I pathway. Expressed proteins from Gag p24 and nef fragments cloned into the LFn expression plasmid stimulate gag-specific CD4 proliferation and CTL responses in HIV-infected donor PBMCs *in vitro*.				
gp160 (308–322)	gp120 (V3 loop) (MN)	RIHIGPGRAFYTTKN	Vaccine	mouse (H-2D^d)	Staats2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-12, IL-18, IL-1alpha				
	• Cholera toxin (CT) is a potent adjuvant used in animal studies that is not safe in humans, so combinations of cytokins were used in nasal immunization of BALB/c mice V3 peptides to attempt to replace CT as a potent adjuvant.				
	• Peptide vaccine induced CTL activity was significantly increased by IL-1alpha , IL-18, and GMCSF given alone as adjuvant, but CT gave more potent CTL activity than any single cytokine.				
	• Combinations of cytokins could be more potent that CT as an adjuvant. The highest tetramer binding of H-2Dd peptide-specific PBMC after nasal immunization was observed with IL-1alpha plus IL-18 as adjuvant.				
	• Nasal immunization with HIV peptide in the presence of IL-1alpha, IL-12 and GM- CSF induced IFN-gamma-secreting cells in the cervical lymph node, the lung and the spleen, and was associated with upregulation of MHC class II and B7.1 on nonlymphocytes in NALT/nasal mucosal cells.				
	• Consistent results were obtained for the IIIB and the MN peptides.				
gp160 (308–322)	gp160 (315–329 MN)	RIHIGPGRAFYTTKN	in vitro stimulation or selectio	mouse (H-2D^d)	Yokosuka2002
	Keywords TCR usage.				
	Epitope name P18.				
	Donor HLA H-2d.				
	• The TCR repertoire and its specificity was studied through analyzing the spectrum of TCR-alpha and beta chains able to reconstitute a reaction to the H-2 Dd-restricted P18 peptide. The RT-1 TCR alpha chain was able to react with 1/3 of the tested TCR beta chains to create a specific response. Experiments in transgenic mice also supported the observation that a single TCR alpha chain would confer the specificity of the response and could interact with a large variety of TCR beta chains.

gp160 (309–317)	gp120 (310–318 SF2)	IYIGPGRAF	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 1/4 HIV-1+ people tested. • IYIGPGRAF bound to A*2402 strongly, the epitope can be processed in a vaccinia construct and presented – no specific CTL clones were obtained.				
gp160 (309–318)	gp120 (314–323 CM243 subtype CRF01)	ITVGPGQVFY	HIV-1 infection	human (A11)	Sriwanthana2001
	Keywords HIV exposed persistently seronegative (HEPS). **Epitope name** E309-318. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was strongly reactive in HIV+ control study subject 184 who carried HLA-A11.				
gp160 (309–318)	gp120 (314–323 CM243 subtype CRF01)	ITVGPGQVFY	HIV-1 infection	human (A11)	Bond2001
	Keywords inter-clade comparisons. • HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive. • 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified. • This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 2/8 tested FSWs recognized it. • This epitope was not conserved in other subtypes, and exact matches were rare.				
gp160 (310–318)		HIGPGRAFY	HIV-1 infection	human (A*3002)	Sabbaj2002b
	Keywords HAART. **Epitope name** Env-HY9. **Donor HLA** A*3002 A*3201 B*4501 B*5301 Cw*0401 Cw*1202. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • This epitope was newly defined in this study. • Subject 00RCH33 was on HAART had a viral load of 2900 and CD4 count of 727 and also recognized the epitopes YPLTFGWCY, Nef(135-143), HLA B*5301; AETFYVDGA, RT(437-445), HLA B*4501; and RSLYNTVATLY, p17(76-86), HLA A*3002. • Among HIV+ individuals who carried HLA A30, 3/16 (19%) recognized this epitope.				
gp160 (310–318)	gp120 (310–318)	HIGPGRAFY	HIV-1 infection	human (A*3002)	Frahm2004
gp160 (310–318)		HIGPGRAFY	HIV-1 infection	human (A02)	Sabbaj2002b
	Epitope name Env-HY9. • Among HIV+ individuals who carried HLA A02, 6/29 (21%) recognized this epitope.				
gp160 (310–323)	gp120 (315–328 MN)	HIGPGRAFYTTKNI	Vaccine	mouse (H-2D^{d})	Arp1999
	Vaccine *Vector/Type:* canarypox prime with pseudovirion boost *Strain:* B clade IIIB, B clade MN *HIV component:* Gag, gp120, Protease				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Epitope name p97. • The vaccine vCP205, canarypox vector, MN gp120 + Gag/Pro IIIB, with a HIV-1 pseudovirion boost was given to mice;) • HIV-1 pseudovirion boost enhanced the CTL to this epitope in immunized BALB/ c mice as measured by CTL lysis and IFN gamma production.				
gp160 (311–318)	(MN)	IGPGRAFY	Vaccine	mouse (H-2D^{d})	Golding2002a
	Vaccine *Vector/Type:* B. abortus complex *Strain:* B clade MN *HIV component:* V3 • Intranasal immunization of B. abortus conjugated to V3 peptides induces mucosal IFN-gamma producing T-cell responses in BALB/c mice.				
gp160 (311–319)	gp120 (311–320 IIIB)	RGPGRAFVT	Vaccine	mouse (A2)	Kiszka2002
	Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* IL-12 **Keywords** vaccine-specific epitope characteristics. • Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV. • Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells. • The most intense CTL responses to the intact gp160 vaccine were directed at three V3 peptides.				
gp160 (311–319)	gp120 (312–320 SF2)	IGPGRAFHT	Vaccine	mouse (D^{d})	Selby1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade SF2 *HIV component:* gp120 • Murine CTL response to peptide observed after immunization with DNA plasmid containing HIV-1 (SF2) gp120 gene regulated by bacteriophage T7 promoter. • CTL response required coadministration of rec vaccinia virus expressing T7 RNA polymerase or T7 RNA polymerase soluble protein.				
gp160 (311–319)	gp120 (SF2)	IGPGRAFHT	Vaccine	mouse (H-2D^{d})	Barnett1997
	Vaccine *Vector/Type:* DNA prime with gp120 boost *Strain:* B clade SF2 *HIV component:* gp120 • CTL were induced by vaccine, and restimulated *in vitro* with V3 peptide. • DNA vaccine with protein boost stimulated both CTL and antibodies. • Strains SF2 (IGPGRAFHT), US4 (IGPGRAFYA), and CM235 (IGPGQVFYR) were tested.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	macaque	Okuda1997
	Vaccine *Vector/Type:* DNA prime with peptide boost *Strain:* B clade IIIB *HIV component:* CD4BS, gp160, HPG30, V3 • Murine BALB/c (H-2^{d}) and macaque both showed highest level of CTL vaccine response when a DNA vaccine was boosted with a peptide including four peptide subtypes of the V3 region, HPG-30 and a fragment of the CD4 binding region.				
gp160 (311–320)	gp120 (318–327)	RGPGRAFVTI	HIV-1 infection	human	Kmieciak1998b
	• Increased CTL response to cells expressing a VV construct ΔV3 mutant compared with a full-length env gene product. • This epitope doesn't have A2 anchors, but has features that confer promiscuous A2 binding, which may relate to the inhibitory effect seen in this paper.				
gp160 (311–320)	Env (IIIB)	RGPGRAFVTI	Vaccine	mouse	Lu1999
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* MIP-1alpha • MIP-1alpha co-inoculation increased IgG1/IgG2a ratio T-helper type 1 response. • A MIP-1 alpha expression plasmid increased the CTL response to this DNA vaccine, as well as the T help response, presumably by the MIP-1 alpha interacting with T lymphocytes and macrophages.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (311–320)		RGPGRAFVTI	Vaccine	mouse	Barouch2002
Vaccine *Vector/Type:* DNA *Strain:* B clade BH10 *HIV component:* gp120 *Adjuvant:* GM-CSF **Epitope name** P18. • gp120 encoding DNA co-injected with a plasmid carrying GMCSF gave meager CD4+ T-cell responses in BALB/c mice relative to the enhanced response to bicistronic gp120 and GMCSF cloned into the same vector and expressed from the same promoter. • Both mono and bicistronic DNA vaccines induced similar CTL responses directed against the H-2Dd restricted P18 peptide RGPGRAFTVTI in murine splenocytes despite the greatly enhanced proliferative responses.					
gp160 (311–320)	gp120 (313–322 BRU)	RGPGRAFVTI	Vaccine	mouse	Arora2001
Vaccine *Vector/Type:* DNA *Strain:* B clade BRU *HIV component:* gp160, Rev, Tat **Keywords** inter-clade comparisons, Th1. **Epitope name** Pep 09. • Plasmid DNA encoding gp160, tat, rev was given i.m. to immunize BALB/c mice. • Vaccine-induced CTL activity produced a low degree of cell lysis of V3-peptide pulsed target cells, using a B (RGPGRAFVTI) or C (RIGGPGQTFYATG) clade V3 peptides. Th1 proliferative T-cell responses were observed, and weak Ab responses.					
gp160 (311–320)	Env (IIIB)	RGPGRAFVTI	Vaccine	mouse	Gherardi2003
Vaccine *Vector/Type:* influenza prime with vaccinia boost *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** Th1, Th2, genital and mucosal immunity. **Epitope name** 10 Env. **Assay type** cytokine production, proliferation, CD8 T-cell Elispot - IFNγ. **Donor HLA** H-2d. • Mice were intranasally primed with a recombinant influenza virus A vector that carries HIV-1 Env inserted into its hemagglutinin protein. Boosting was performed intranasally with either influenza-Env or intraperitoneally with two vaccinia virus recombinants expressing the Env protein, VVenv and MVAenv. • Peritoneal heterologous immunization with VVenv induced a 60-fold higher CD8+ IFN-gamma T cell responses than homologous influenza prime-boost. The intraperitoneal MVAenv boost response was greater than the VVenv boost in the spleen and genital lymph nodes, while the VVenv response gave the highest boost with the intranasal route. • Mice with increased CD8+-T-cell responses also had a higher Th1/Th2 ratio, indicated by the cytokine secretion profile and the IgG2a/IgG1 ratio.					
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	in vitro stimulation or selectio	human (A*0201)	Alexander-Miller1996
• This epitope stimulates a CTL line derived from an HIV negative donor. • This immunogenic peptide does not have the known binding motif for A2.1. • The same optimal peptide for this human HLA-A2.1 epitope was observed for a murine H-2 D^d epitope.					
gp160 (311–320)	gp120 (311–320 IIIB)	RGPGRAFVTI		human (A*0201)	Frahm2004
• C. Brander notes this is an A*0201 epitope.					
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	human (A2)	Achour1996
Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 • Individual was immunized with rec vaccinia gp160 IIIB and boosted with purified gp160. • Lysis only occurs with IIIB P18 peptide pulsed onto autologous targets; MN, RF, SIMI P18 peptides fail to stimulate CTL. • Restimulating immune cells from gp160 IIIB vaccinees with MN, RF, or SIMI P18 did not enhance the MN, RF, or SIMI specific CTL response.					
gp160 (311–320)	gp160 (318–327 SIMI)	MGPKRAFYAT	Vaccine	human (A2)	Achour1996
Vaccine *Vector/Type:* vaccinia prime with gp160 boost *Strain:* B clade SIMI *HIV component:* gp160					

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Individual was immunized with rec vaccinia gp160 SIMI and boosted with purified recombinant gp160 SIMI. • P18 MN and RF peptides were able to stimulate the HIV-specific CTL that arose in response to the SIMI vaccination, thus the P18 MN peptide (IGPGRAFYTT) and the P18 RF peptide (KGPGRVIYAT) could cross-react. • The P18 IIIB peptide does not cross-react (RGPGRAFVTI in the epitope region) • gp160 SIMI primed immune cells could generate a significantly broader specificity when stimulated with P18 MN or P18RF peptides, but not P18 IIIB.				
gp160 (311–320)	gp120 (311–320)	RGPGRAFVTI	HIV-1 infection	human (A2)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (A2.1)	Peter2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG **Keywords** binding affinity, vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR25. • The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01). • The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour. • HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants. • All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (D)	Nehete1995
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 • RGPGRAFVTI was defined as the optimal peptide for vaccination, out of RIQRGPGRAFVTIGK. • This peptide, in a carrier-free form in Freund's adjuvant, could stimulate Env specific CTL in BALB/c mice.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (D^d)	Takahashi1993
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 **Keywords** dendritic cells. • Successful priming with vaccination of peptide pulsed splenic dendritic cells.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (D^d)	Takahashi1996
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 • Exposure of CD8+ CTL to free peptide corresponding to the epitope results in strong inhibition of the CTL response to targets presensitized with the same peptide. • The authors propose this is due to a "self-veto", where the CTL is inactivated by a CD8+ cell carrying the appropriate peptide-MHC complex.				
gp160 (311–320)	gp120 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse ($H\text{-}2^{d, p, u}$)	Shirai1997
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Three class I MHC, H-$2^{d,p,u}$, that differ in sequence and serology, cross-present this peptide to T cells of each of the other haplotypes. • The amino acids R, F, and I are each critical for strong CTL activity with all three MHC molecules.				
gp160 (311–320)	gp160	RGPGRAFVTI	Vaccine	mouse (H-2^{d17})	Hanke1998a
	Vaccine *Vector/Type:* vaccinia • MVA is an attenuated vaccinia that can not replicate in mammalian cells – strings of CTL epitopes were delivered and expressed in a MVA DNA vector. • INFγ and CTL activity were induced after a single vaccination. • An MVA boost enhanced the response.				
gp160 (311–320)	gp160	RGPGRAFVTI	Vaccine	mouse (H-2^{d})	Gherardi2000
	Vaccine *Vector/Type:* DNA, vaccinia *HIV component:* Env *Adjuvant:* IL-12 • Induction of HIV-1 specific CD8 gamma IFN secreting cells was enhanced when IL-12 and Env were given together in a prime, followed by a VV expressing Env boost. • If IL-12 was also delivered as a boost from the viral vector, impairment of the IL-12 effects was noted, indicating that the vaccination schedule can be a critical parameter for success with DNA and vaccinia vectors used in combination with immunomodulators. • The negative effect observed when IL-12 was delivered with the boost involved nitric oxide.				
gp160 (311–320)	Env	RGPGRAFVTI	Vaccine	mouse (H-2^{d})	Xin1999
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* IL-12, IL-15, IL-2 **Keywords** Th1. • A study of the DNA vaccine pCMV160IIIB/REV with IL-15 and IL-2 or IL-12 expression plasmids. • Intranasal immunization of BALB/c mice with HIV DNA and IL-15 plasmid induced increased Th1 and CTL responses. • Co-administration of IL-15 with IL-12 or IL-2 plasmids did not alter the effect of IL-15. • Both the CTL (peptide pulsed targets) and DTH response (injection of peptide into footpad) to this peptide was monitored. • The Ab response to NNTRKSIRIQRGPGRAFVTIGKIGN was monitored, and IL-15 co-administration resulted in a decrease in the IgG1/IgG2a ratio.				
gp160 (311–320)	Env	RGPGRAFVTI	Vaccine	mouse (H-2^{d})	Villacres1999
	Vaccine *Vector/Type:* vaccinia, Sindbis *HIV component:* V3 • HIV-1 epitope p18 was expressed in two different vaccine vectors and the CTL response was compared in BALB/c mice. • Class I tetramer staining showed that up to 13% of the CD8+ splenocytes were p18 specific in the acute response using vaccinia, only 4% using Sindbis. • vp18 had more gamma IFN secreting splenocytes and activated CD4+ and CD8+ T cells. • The overall decline in CD8+ T cells in the transition into memory was 2-3 fold for both vectors. • Sindbis virus recombinants induced protective memory cytotoxic T cells, although reduced quantitatively, without vaccinia associated inflamation and replication.				
gp160 (311–320)	Env (318–327)	RGPGRAFVTI		mouse (H-2^{d})	Lopez2000
	Keywords epitope processing, immunodominance. • A series of protease and proteasome inhibitors was used to identify elements of the processing pathway of this epitope, called p18, both from within Env and from within a chimeric hepatitis B protein which allows proper processing. • Lactacystin, a proteasome inhibitor, partially inhibits endogenous processing of p18 epitope suggesting both a proteasome pathway and an additional pathway can be used. • Both TAP dependent and TAP-independent pathways can be used. • 1,10-phenanthrolin (metallopeptidases inhibitor) blocks epitope presentation demonstrating metalloproteinase processing in the Tap-dependent pathway. • The Tap-independent pathway does not involve processing by metalloproteinases.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This epitope is immunodominant in mice, and is presented by multiple human HLA alleles – it as been suggested that the high processing efficiency of this epitope might result in poor presentation of co-expressed epitopes.				
gp160 (311–320)	gp120	RGPGRAFVTI	Vaccine	mouse (H-2^d)	Hanke1998a, Hanke1998b
	Vaccine *Vector/Type:* vaccinia • This murine epitope was incorporated into a vaccine of CTL epitopes expressed together including 20 HIV epitopes recognized by humans from 12 HLA types, one murine HIV epitope and three macaque HIV epitopes, delivered in a vaccinia virus Ankara (VVA) construct. • The murine vaccination was more effective at generating CTL when given i.v. rather than i.m.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2^d)	Hamajima1997
	Vaccine *Vector/Type:* peptide *HIV component:* CD4BS, HPG30, V3 *Adjuvant:* IL-12 • B cell epitope HGP-30 also serves as a CTL epitope. • Vaccine combined HGP-30, V3 loop peptide variants, and CD4 binding site peptide. • IL-12 expression plasmid included with the vaccination enhanced the CTL response.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2^d)	Arai2000
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** Th1, Th2. • Low-dosage 8 Br-cAMP given in combination with a DNA vaccine to BALB/c mice increased IgG and sIgA levels, and enhanced Th1, Th2 and CTL activity – the adjuvant activity may be mediated by activation of the CMV promotor in the DNA vaccine.				
gp160 (311–320)	gp120 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2^d)	Goletz1997
	Vaccine *Vector/Type:* fusion protein with anthrax delivery domain *HIV component:* gp120 • Anthrax lethal toxin can deliver proteins to the cytosol of eukaryotic cells. • A fusion protein linking the delivery domain of the anthrax protein to gp120 achieved cellular uptake, and gp120 was processed allowing presentation of this V3 epitope to CTL *in vitro*.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	in vitro stimulation or selectio	mouse (H-2^d)	Takahashi2001
	Epitope name I-10. • Pre-incubation of HIV-1 (IIIB) gp160 specific CTL with peptide without APCs reduced cytolytic activity 3.5 fold and induced peptide concentration dependent IL-2 unresponsiveness that might be due to IL-2Rbeta down regulation. • An enhanced cytolytic activity was observed by addition of anti-IFN-gamma, TNF-alpha or MIP-1beta to I-10 suppressed CTLs.				
gp160 (311–320)	gp160 (IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2^d)	Shirai2001
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** Th1, Th2. • Helicobacter pylori induces Th1 responses early, but predominantly Th2 responses later in infection (at 6 weeks) – differentiation of HIV-1 gp160 CD4+ help and CD8+ CTL effector cells in response to HIV gp160-vaccinia vaccination is impaired in BALB/c mice infected with H. pylori.				
gp160 (311–320)	Env (89.6)	IGPGRARYAR	Vaccine	mouse (H-2D)	Belyakov1998b
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade 89.6 *HIV component:* gp160 • Recombinant modified vaccinia virus Ankara (MVA), an attenuated vaccina which has lost the ability to replicate in mammalian cells, was used as the live vector for this vaccine study. • A single intrarectal mucosal immunization resulted in long lasting mucosal CTL responses and production of proinflammatory cytokines in mucosal sites, indicating that MVA was as effective in inducing mucosal CTL as replicating recombinant vaccinia.

	• XGPXRXXXXI are critical for binding, consistent with H-2D^d motif XGPX(RKH)XXX(X)(LIF)				
gp160 (311–320)	Env	RGPGRAFTVTI	Vaccine	mouse (H-2D^d)	Hanke1999a, Hanke1999b
	Vaccine *Vector/Type:* DNA *HIV component:* V3				
	• Vaccinated mice elicited a CTL response to a gene gun-delivered multiepitope vaccine to two epitopes studied that are known to elicit CTL in mice: SYIPSAEKI from Plasmodium berghei and RGPGRAFTVTI from HIV-1 Env.				
	• Different vaccination protocols were tested and it was found that a gene gun mediated delivery followed by an MVA boost was as good as i. m. immunization followed by a MVA boost – this is advantageous as gene gun delivery requires far less DNA than i.m. DNA priming.				
	• CTL activity was high (60% - 70% specific lysis at effector target) when vaccinated with a single gene gun immunization and an MVA boost, and improved with two gene gun vaccinations.				
gp160 (311–320)	Env (IIIB)	RGPGRAFVTI	in vitro stimulation or selectio	mouse (H-2D^d)	Nakagawa2000
	Keywords epitope processing, immunodominance.				
	Epitope name I-10.				
	• The CTL line LINE-IIIB was generated by repetitive restimulation of BALB/c spleen cells with vSC-25, IIIB gp160-expressing vaccinia.				
	• RGPGRAFVTI represents the active minimal epitope within the previously described immunodominant epitope P18IIIB (RIQRGPGRAFVTIGK, gp160(308-322)				
	• External processing of P18IIIB results in the removal of the 2 C-terminal residues (GK) of I-10 by ACE (angiotensin-1-converting-enzyme) in sera to produce I-10, and this processing is essential for target cell presentation of RIQRGPGRAFVTIGK.				
gp160 (311–320)	Env (IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2D^d)	Haglund2002a
	Vaccine *Vector/Type:* vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag				
	Keywords immunodominance.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Epitope name p18-I10. • Different HIV strains were used for different regions: Env IIIB, Gag HXB2 • BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag, Env, or both, and compared to using rec Env and Gag in vaccinia virus (rVVs). The primary response was determined by cell lysis, cytokine production and tetramer staining. • Primary CTL responses to the immunodominant Env (RGPGRAFVTI) epitope peaked 5-7 days after intraperitoneal vaccination with Env-rVSV, 40% of the CD8+ cells were tetramer positive, and this response was 6-fold higher than the response to Env-rVV. • Vaccinating with GagEnv-rVSV carrying both Gag and Env allowed recognition of both HIV-1 proteins, but at reduced levels compared to either Gag-rVSV or Env-rVSV alone. • Intranasal immunization with Env-rVSV yielded CTL responses that were strong but reduced compared to an intraperitoneal route.				
gp160 (311–320)	Env (IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2D^{d})	Haglund2002b
	Vaccine *Vector/Type:* vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2 *HIV component:* Env, Gag **Keywords** immunodominance. **Epitope name** p18-I10. • Different HIV strains were used for different regions: Env IIIB, Gag HXB2 • BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN-gamma production. • Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive. • Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN-gamma production. • A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost. • A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN-gamma producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit. • A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.				
gp160 (311–320)	gp120 (V3 loop) (IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2D^{d})	Staats2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-12, IL-18, IL-1alpha • Cholera toxin (CT) is a potent adjuvant used in animal studies that is not safe in humans, so combinations of cytokins were used in nasal immunization of BALB/c mice V3 peptides to attempt to replace CT as a potent adjuvant. • Peptide vaccine induced CTL activity was significantly increased by IL-1alpha , IL-18, and GMCSF given alone as adjuvant, but CT gave more potent CTL activity than any single cytokine. • Combinations of cytokins could be more potent that CT as an adjuvant. The highest tetramer binding of H-2Dd peptide-specific PBMC after nasal immunization was observed with IL-1alpha plus IL-18 as adjuvant. • Nasal immunization with HIV peptide in the presence of IL-1alpha, IL-12 and GM- CSF induced IFN-gamma-secreting cells in the cervical lymph node, the lung and the spleen, and was associated with upregulation of MHC class II and B7.1 on nonlymphocytes in NALT/nasal mucosal cells. • Consistent results were obtained for the IIIB and the MN peptides.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2D^{d})	Wierzbicki2002
	Vaccine *Vector/Type:* DNA prime with vaccinia boost *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* beta-glucan lentinan, IL2/Ig, liposome, PLG **Keywords** immunodominance.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• BALB/c mice were give an oral immunization with (PLG)-encapsulated plasmid DNA expressing gp160 and a boost of rec gp160 vaccinia vectors (rVV) with addition of murine IL-2/Ig plasmid or lentinan-associated liposomes. Lentinan increased CTL activity as measured by Cr-release assays against the immunodominant epitope RGPGRAFVTI, but didn't alter Ab responses. IL-2/Ig increased both type I and II activities, and increased Env specific CTL and Abs. Administration of liposomes and PLG microparticles with adjuvants facilitated gastrointestinal uptake.				
gp160 (311–320)	gp120 (LAI)	RGPGRAFVTI	Vaccine	mouse (H-2D^d)	Horner2001
	Vaccine *Vector/Type:* protein *Strain:* B clade LAI *HIV component:* Gag, gp120 *Adjuvant:* CpG immunostimulatory sequence (ISS) **Epitope name** P18. • Immunostimulatory sequences (ISS), also known as CpG motifs, stimulate innate immunity and enhance vaccine-specific immune responses. • Intranasal immunization (i.n.) of BALB/c mice was more effective than intradermal (i.d.), and immunization with a gp120-ISS conjugate was more potent than immunizing with gp120 and separate ISS molecule – increased IgG1, IgG2a, IFN-gamma, MIP1-alpha and MIP1-beta production was observed, and only i.n. immunization gave IgA responses. • The highest mucosal CTL activity in both the Lamina Propria and the Peyer's Patch was observed following intranasal delivery with the gp120/ISS conjugate. • Cytokine, chemokine and CTL responses following gp120/ISS conjugate vaccination were CD4+ T-cell independent; gp120 specific antibodies were dependent on helper T cells.				
gp160 (311–320)	gp160 (V3) (IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2D^d)	Takahashi2002
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** acute infection. **Epitope name** I10. • During acute infection, high doses of virus result in "clonal exhaustion", a depletion of antigen specific T-cells. • Recently stimulated CTL from BALB/c mice vaccinated with gp160-vaccinia showed a dose- and time-dependent induction of apoptosis when stimulated with antigenic peptide or H-2Dd/peptide tetramers. • Restimulated CTL showed an upregulation of CD3-chain phosphorylation in comparison to cells stimulated with target cells, indicative of TCR-mediated apoptosis. Furthermore, apoptosis was inhibited by cyclosporin A and U0126, a mitogen activated kinase inhibitor specific for the ERK1/ERK2 MAPK kinase pathway, and a caspase 3 inhibitor.				
gp160 (311–320)	gp160 (V3) (MN)	IGPGRAFYAT	Vaccine	mouse (H-2D^d)	Takahashi2002
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Keywords** acute infection. **Epitope name** MNT10. • During acute infection, high doses of virus result in "clonal exhaustion", a depletion of antigen specific T-cells. • Recently stimulated CTL from BALB/c mice vaccinated with gp160-vaccinia showed a dose- and time-dependent induction of apoptosis when stimulated with antigenic peptide or H-2Dd/peptide tetramers. • Restimulated CTL showed an upregulation of CD3-chain phosphorylation in comparison to cells stimulated with target cells, indicative of TCR-mediated apoptosis. Furthermore, apoptosis was inhibited by cyclosporin A and U0126, a mitogen activated kinase inhibitor specific for the ERK1/ERK2 MAPK kinase pathway, and a caspase 3 inhibitor.				
gp160 (311–320)	gp160 (V3) (HIV-IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2Dd)	Oh2003a
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* IL-15, IL-2 **Epitope name** P18-I10. **Assay type** cytokine production, Tetramer binding, Chromium-release assay. **Donor HLA** H-2d.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• IL-2 and IL-15 in vaccinia constructs were given with an HIV gp160 vaccinia vaccine to BALB/c mice. Both IL-2 and IL-15 induced strong and long-lasting antibody responses. Short-term CTL responses against HIV gp120 were enhanced by IL-2, but IL-15 enhanced both immediate CD8+ T cell responses and CD8+ T memory cells.				
gp160 (311–320)	gp160 (IIIB)	RGPGRAFVTI	Vaccine	mouse (H-2Dd)	Oh2003b
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* B7, ICAM, LFA-3 **Epitope name** P18-I10. **Assay type** proliferation, CD8 T-cell Elispot - IFNγ, Tetramer binding. **Donor HLA** H-2d. • BALB/c mice were vaccinated with T-cell depleted splenocytes pulsed with peptides given in combination with immunostimulatory molecules B7, ICAM or LFA expressed in a recombinant pox virus. Increasing antigen gave an increased frequency of CD8+ T-cells, but the co-stimulatory molecules increased the avidity of the response.				
gp160 (311–320)	(89.6)	IGPGRAFYAR	Vaccine	mouse (H-2Dd)	Sailaja2003
	Vaccine *Vector/Type:* DNA *HIV component:* gp120 *Adjuvant:* Flex, a dendric cell growth factor **Keywords** dendritic cells. **Assay type** Intracellular cytokine staining. **Donor HLA** H-2d. • BALB/c mice were given a DNA vaccine that contained gp120 DNA covalently attached to the extracellular domain of the Fms-like tyrosine kinase receptor-3 ligand (FLex), a dendritic cell growth factor. • Mice vaccinated i.m. with the FLex:gp120 chimeric gene gave a DC expansion similar to native Flex protein. • gp120-specific stable CD8+ T-cell responses lasted 114 days after a prime/boost, and were observed in the presence and absence of Flex-DNA-induced dendritic cell (DC) expansion; strong Ab responses required DC expansion.				
gp160 (311–320)	gp120 (V3 loop)	RGPGRAFVTI	Vaccine	mouse (H-2Dd)	Wang2003
	Vaccine *Vector/Type:* herpes simplex virus type-1 (HSV-1) amplicon *HIV component:* gp120 **Keywords** kinetics, memory cells. **Assay type** Tetramer binding, JAM cytotoxicity assay. **Donor HLA** H-2d. • Prime-boost combinations of gp120 combined with herpes simplex virus type-1 (HSV-1) amplicon particles, or gp120 in naked amplicon plasmid DNA, were compared in BLAB/c mice. Plasmid prime with particle boosts gave the strong primary (2 weeks) and memory responses (4 months). • CD8+ T-cells reached their peak 8-28 days after the initial amplicon delivery.				
gp160 (311–320)	gp160 (318–327 IIIB)	RGPGRAFVTI	Vaccine	mouse (L^d)	Tobery1997
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* Env, Nef • An HIV-1 Env vaccine was targeted for rapid cytoplasmic degradation. • The rapidly degraded form rapidly stimulated CTL to this peptide, faster than the normal vaccinia-env. • The rapidly degraded form also stimulated greater specific CTL lysis and higher CTLp frequencies than normal Env. • Similar results were obtained for a Nef protein designed for rapid degradation.				
gp160 (312–320)	gp120 (V3 loop) (IIIB)	GPGRAFVTI	Vaccine	mouse ($H\text{-}2^d$)	Vázquez Blomquist2002
	Vaccine *Vector/Type:* fowlpoxvirus *Strain:* B clade BRVA, B clade IIIB, B clade JY1, B clade LR150, B clade MN, B clade RF *HIV component:* V3 **Keywords** vaccine-specific epitope characteristics, immunodominance.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• BALB/c mice were vaccinated with a polyepitope V3 vaccine in a fowlpoxvirus carrying concatonated 15 mer sections of the V3 loops of HIV-1 isolates LR150, JY1, RF , MN, BRVA and IIIB with 5-aa linkers between, fused to the N-term of p64K protein from Neisseria meningitidis. • Intraperitoneal immunization elicited the strongest V3-specific IFN-gamma response in splenocytes, compared to intravenous and subcutaneous immunization. Intraperitoneal immunization conferred protection in a recombinant vaccinia virus challenge model. • The immunodominant response was directed against the IIIB peptide (the IIIB immunizing peptide was SIRIQRGPGRAFVTI, the peptide used to probe the response by Elispot was GPGRAFVTI). • Low CTL responses were also detected to the LR150 (SRGIRIGPGRAILAT) and RF (RKRITMGPGRVYYTT) peptides, no responses were detected to the JY1 (RQSTPIGLGQALYTT), BRVA (RKSITKGPGRVIYAT), or MN (RKRIHIGPGRAFYTT) peptides.			
gp160 (314–322)	gp120 (314–322) • Study of peptide binding to HLA-B27.	GRAFVTIGK	Peptide-HLA interaction	human (B27)	Jardetzky1991
gp160 (337–361)	gp120 (337–368 LAI) **Vaccine** *Vector/Type:* vaccinia *HIV component:* gp160 • CD4+ CTL clones were obtained from an HIV-1 vaccinia-env vaccinee.	KWNNTLKQIDSKLREQFGN-NKTIIF	Vaccine	human (CD4+ CTL)	Johnson1994a
gp160 (339–354)	gp120 (339–361 LAI) **Vaccine** *Vector/Type:* vaccinia *HIV component:* gp160 • CD4+ CTL isolated from LAI IIIB gp160 vaccinees.	NNTLKQIDSKLREQFG	Vaccine	human (CD4+ CTL)	Johnson1994b
gp160 (340–348)	gp120 (346–354 CM243 subtype CRF01) **Keywords** HIV exposed persistently seronegative (HEPS). **Epitope name** E340-348. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was weakly reactive in HIV+ control study subject 053 who carried HLA-A11.	RVLKQVTEK	HIV-1 infection	human (A11)	Sriwanthana2001
gp160 (340–348)	gp120 (346–354 CM243 subtype CRF01) **Keywords** inter-clade comparisons. • HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive. • 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified. • This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 2/8 tested FSWs recognized it. • This epitope was not conserved in other subtypes, and exact matches were rare.	RVLKQVTEK	HIV-1 infection	human (A11)	Bond2001
gp160 (340–349)	gp120 (W6.ID) **Vaccine** *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120 **Keywords** immunodominance.	NTLKQIVIKL	Vaccine	chimpanzee (Patr-B*14)	Balla-Jhagjhoorsingh1999a

	• CDC42 (TGDIITLPCRIKQII-NRWQV), Eli (TNTNITLQCRIKQIIKMVAG) and Z3 (CTGNITLPCRIKQIIMNWQE) variants did not induce proliferation, cytotoxic or anergic responses.				
gp160 (416–424)	Env (413–421 SF2)	LPCRIKQII	HIV-1 infection	human (B*5101)	Tomiyama1999
	Keywords inter-clade comparisons, rate of progression.				
	• HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA-B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996;Lancet 22:1187, 1986;Hum Immunol 22:73, 1988;Hum Immunol 44:156, 1995)				
	• 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3%				
	• Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed.				
	• Four of the six epitopes were highly conserved among B subtype sequences, LPCRIKQII is not conserved.				
gp160 (416–424)	gp160 (416–424 LAI)	LPCRIKQII		human (B*5101)	Frahm2004
	• C. Brander notes this is a B*5101 epitope.				
gp160 (416–424)	gp120 (378–385)	LPCRIKQII	HIV-1 infection, HIV-1 exposed seronegative	human (B51)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS).				
	• ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
gp160 (416–429)	gp120 (410–429 H3DCG)	LPCRIKQFINMWQE	HIV-1 infection	human (DR4 CD4+)	Siliciano1988
	• CD4+ CTL restricted by class II HLA-DR4, targets primed by CD4 mediated uptake of gp120.				
gp160 (416–435)	gp120 (421–440 LAI)	LPCRIKQFINMWQEVGKAMY	HIV-1 infection	human (A2)	Dadaglio1991
	• Defined through blocking CTL activity, and Env deletions.				
gp160 (419–427)	gp120 (424–432 HXB2)	RIKQIINMW		human (A*3201)	Harrer1996b
	• C. Brander notes that this is an A*3201 epitope in the 1999 database.				
gp160 (419–427)	gp120 (419–427 HXB2)	RIKQIINMW		human (A*3201)	Frahm2004
	• C. Brander notes this is an A*3201 epitope.				
gp160 (419–427)	gp120 (419–427)	RIKQIINMW?	HIV-1 infection	human (A29, A32)	Betts2000
	Keywords immunodominance.				
	• Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.				
	• 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes.				
	• 1/11 of the A2+ individuals was A29 and responded to RIKQIINMW, and another responder was A32 and these are thought to be presenting molecules.				
	• The sequence is unclear – Betts calls both peptide 30 and peptide 32 gp120 419–427 and the peptide sequences are not provided.				
gp160 (419–427)	gp120 (424–432 LAI)	RIKQFINMW	HIV-1 infection	human (A32)	Ray1998
	• Autologous virus was used to detect CTL in two individuals, and in both cases strain-specific autologous CTL were found.				
	• The autologous epitope sequence was RIKQIINMW, MN and RF were KIKQFINMW and RIKQFVNMW respectively, and all were reactive with CTL clones.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (419–427)	gp120 (420–428)	RIKQIINMW	HIV-1 infection	human (A32)	Ferris1999
	• This epitope is processed by a TAP1/2 dependent mechanism.				
gp160 (419–427)	gp120	RIKQIINMW	HIV-1 infection	human (A32)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** A32-RW10(gp120). **Donor HLA** A32,A?,B44,B?; A30,A32,B18,B27. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).			
gp160 (421–435)	gp120 (421–440 LAI)	KQFINMWQEVGKAMY	HIV-1 infection	human (A2)	Dadaglio1991
	• Defined through blocking CTL activity, and Env deletions.				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 exposed seronegative	human	Pinto1995
	• CTL and T helper cell reactivity in healthcare workers exposed to HIV.				
gp160 (421–436)	gp120 (MN)	KQIINMWQEVGKAMYA	HIV-1 infection	chimpanzee	Lubeck1997
	• Epitope-specific CTL detected in chimpanzees immunized with adenovirus-HIV-1 MN gp160 recombinant. • CTL response may account for protection against subsequent HIV-1 SF2 challenge in a chimpanzee lacking neutralizing antibodies. • Helper and cytotoxic T cells can be stimulated by this peptide (T1)				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human (A2)	Clerici1991a
	• Helper and cytotoxic T cells can be stimulated by this peptide (T1)				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	HIV-1 infection	human (A2)	Cease1987
	• Helper and cytotoxic T cells can be stimulated by this peptide (T1)				
gp160 (421–436)	gp120 (428–443 IIIB)	KQIINMWQEVGKAMYA	Vaccine	mouse (H-$2^{a, b, f}$)	Shirai1992
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 • In a murine system multiple class I molecules can present to CTL.				
gp160 (432–451)	gp120 (439–458 IIIB)	KAMYAPPISGQIRCSSNITG	Vaccine	macaque	Wagner1998b
	Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* CD4BS, Gag, gp120, V3				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• A VLP is a non-infectious virus-like particle self-assembled from HIV Pr55 gag – macaques were immunized with VLPs bound to either gp120 or V3+CD4 linear domains Gag and Env specific CTL were stimulated in each case, and Ab response to gag and gp120 was elicited, but the gp120 neutralizing response occurred only with whole gp120, not V3+CD4 – despite the CTL and Ab response, immunized macaques were infected by intervenous challenge with SHIV chimeric challenge stock. • CTL specific for this epitope could be found both before and after SHIV challenge.				
gp160 (434–443)	gp120 (431–440)	MYAPPIGGQI	Vaccine	mouse (H-2K^{d})	Duarte1996
	Vaccine *Vector/Type:* peptide • Tolerization of CTL response with continued administration of soluble peptide.				
gp160 (435–443)	Env (89.6)	YAPPISGQI	Vaccine	macaque	Barouch2000, Shen2000
	Vaccine *Vector/Type:* DNA *Strain:* B clade 89.6, SIV *HIV component:* Env, Gag *Adjuvant:* IL2/Ig **Epitope name** p41A. • Different HIV strains were used for different regions: SIVmac239 Gag and HIV-1 89.6P Env • Monkeys that received the DNA vaccines augmented with IL-2/Ig were infected when challenged with pathogenic SHIV-89.6P, but had potent CTL responses, stable CD4+ T-cell counts, preserved virus-specific CD4+ T-cell responses, low to undetectable viral loads, and no evidence of disease or mortality by day 140 after challenge – monkeys that got a sham vaccine had high viral load, progressed to disease, and were half were dead by day 140. • IL2/Ig consisting of interleukin-2 (IL-2) for immune stimulation, and the Fc portion of immunoglobulin G (IgG) for stability, was delivered either as protein or as DNA – both enhance the CTL response to vaccination, DNA IL2/Ig giving the most intense response. • Responses to a dominant Mamu A*01 gag epitope SIV Gag p11C (CTPYDINQM) and a subdominant epitope HIV-1 Env p41A (YAPPISGQI) were tracked and had good durability prior to challenge, and the higher the prechallenge peak p11C CTL response, the lower the post-challenge viral load. • No NAb responses were detected in the vaccinated monkeys prior to challenge, and comparable peak NAb titers developed in vaccinated monkeys and control monkeys with preserved CD4+ T-cells. • Shen *et al.* 2000 is an accompanying commentary.				
gp160 (435–443)	Env (89.6)	YAPPISGQI	Vaccine	macaque	Barouch2001b
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade 89.6, SIV *HIV component:* Env, Gag-Pol *Adjuvant:* IL2/Ig **Keywords** immunodominance. **Epitope name** p41A. • Different HIV strains were used for different regions: SIVmac239 Gag/Pol and HIV-1 89.6P Env • Four monkeys were vaccinated with a modified vaccinia Ankara (MVA) vaccine that elicited strong CTL to the immunodominant SIV gag epitope in 4/4 animals, and 1/4 made a response to the HIV Env epitope YAPPISGQI, as determined by tetramer staining and chromium release assays. • The animals were infected when challenged with pathogenic SHIV-89.6P, but had potent CTL responses, secondary NAb responses upon challenge, partial preservation of CD4+ T-cell counts, lower viral loads, and no evidence of disease or mortality by day 168 after challenge – monkeys that got a sham vaccine had high viral load, progressed to disease, and 2/4 were dead by day 168.				
gp160 (435–443)		YAPPISGQI	SHIV infection	macaque (Mamu A*01)	Egan1999
	• SHIV-infected rhesus macaques have high frequencies of response to the SIVmac epitope gag p11C,C-M (CTPYDINQM) but only a fraction of A*01 monkeys tested have responses to SIVmac pol epitope STPPLVRLV and HIV-1 env epitope YAPPISGQI.				
gp160 (435–443)	gp41 (89.6)	YAPPISGQI	SHIV infection, Vaccine	macaque (Mamu A*01)	Barouch2001a
	Vaccine *Vector/Type:* DNA, modified vaccinia Ankara (MVA) *Strain:* B clade 89.6, B clade HXBc2 *HIV component:* Env, Gag *Adjuvant:* IL2/Ig **Keywords** immunodominance. **Epitope name** p41A.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Mamu-A*01+ rhesus monkeys infected with SHIV-89.6 and SHIV-HXBc2 make immunodominant responses to SIV Gag p11C epitope (CTPYDINQM) and a subdominant response to HIV-1 Env p41A epitope (YAPPISGQI) • The binding affinities are the same for the two Mamu A*01 epitopes, so that is not what dictates the dominance. • Monkeys vaccinated with MVA vectors carrying SIV gag/pol and HIV-1 env showed the same p11C epitope dominance and p41A epitope subdominance, but co-dominance was observed and the response to p41A increased when DNA vaccination was done using the SIV and HIV genes under CMV promotor control with IL2-IG adjuvant.				
gp160 (444–453)	Env	RCSSNITGLL		human (B56)	De Groot2001
	• The program Epimatrix was used in conjunction with the program Conservatrix to identify conservered regions of HIV that might serve as epitopes. • A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 of the predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFNγ production in an ELISPOT assay. • RCSSNITGLL was newly defined as an epitope in this study, and was shown to stimulate an ELISPOT response, despite not detectably binding to HLA-B7.				
gp160 (489–508)	Env (496–506 BH10, LAI)	VKIEPLGVAPTKAKRRVVQR	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is VAPTKAKRRVV) has similarity with the mast/stem cell growth factor receptor precursor fragment VVPTKADKRRSV.				
gp160 (489–508)	Env (497–512 BH10, LAI)	VKIEPLGVAPTKAKRRVVQR	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is APTKAKRRVVQREKRA) has similarity with the human interferon-related IFRD2 (PC4-B) protein fragment ARTKARSRVRDKRA.				
gp160 (489–508)	gp120 (494–513 BRU)	VKIEPLGVAPTKAKRRVVQR	HIV-1 infection	human (A2)	Dadaglio1991
	• Defined through blocking CTL activity, and Env deletions.				
gp160 (519–543)	gp41 (519–543)	FLGFLGAAGSTMGAASLTL-TVQARC	HIV-1 infection	human (Cw7)	Nehete1998a
	• Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one. • HLA-C antigens are expressed on lymphoid cells to a lesser extent, 10% of either HLA-A or HLA-B. • HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.				
gp160 (529–537)	Env (529–)	TMGAASITL	HIV-1 infection, Vaccine	human (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* gp160 *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Env529. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This peptide was an intermediate A2 binder that did not induce CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 5/17 HIV+ HLA-A2 subjects.				
gp160 (552–571)	Env (552–571)	QSNLLRAIEAQQHMLQLTVW	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
gp160 (557–565)	gp41 (557–565 IIIB)	RAIEAQQHL	HIV-1 infection	human	Wilson1996
	Keywords responses in children, mother-to-infant transmission. • Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study. • RAIDAQQHL and RVIEAQQHL, naturally occurring variants, were found in mother and are recognized.				
gp160 (557–565)	gp41 (557–565)	RAIEAQQHL	HIV-1 infection	human	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the A2+ individuals was HLA A*0201, A32, B60, B78, and responded to RAIEAQQHL, previously noted to be B51.				
gp160 (557–565)	gp41 (557–565 IIIB)	RAIEAQQHL	HIV-1 infection	human	Wilson1999a
	Keywords mother-to-infant transmission, escape. • This study describes maternal CTL responses in the context of mother-to-infant transmission. • Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants. • This epitope was invariant in both the mother and her infant.				
gp160 (557–565)	Env (555–567 BH10, LAI)	RAIEAQQHL	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is LLRAIEAQQHLL) has similarity with human MHC class II regulatory factor RFX1 fragment LLRLMEDQQHMA.				
gp160 (557–565)	gp41 (557–665)	RAIEAQQWQ	HIV-1 infection	human (B*5101)	Samri2000
	Keywords HAART, escape. **Epitope name** E3. • The epitope was recognized by patient 246#1 in a study of the effects of therapy escape mutations on CTL recognition.				
gp160 (557–565)	gp41 (557–565 IIIB)	RAIEAQQHL	HIV-1 infection	human (B51)	Sipsas1997
	• HIV IIIB proteins were used to define the range of CTL epitopes recognized by 3 lab workers accidentally infected with HIV-1 IIIB. • KAIEAQQHL, a variant found in HIV-1 NY5CG, was also recognized. • RAIEAQQHM, a variant found in HIV-1 JRCSF, was also recognized. • RAIDAQQHL, a variant found in HIV-1 ETR, was also recognized. • RAIKAQQHL, a variant found in HIV-1 CDC42, was also recognized.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (557–565)	gp41 (557–565)	RAIEAQQHL	HIV-1 infection	human (B51)	Ferris1999
	• This epitope can be processed by a TAP1/2 dependent mechanism.				
gp160 (557–565)	gp41 (557–565)	RAIEAQQWQ	HIV-1 infection	human (B51)	Oxenius2000
	Keywords HAART, acute infection. **Epitope name** RAI. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • None of the 8 study subjects recognized this epitope but none were HLA B51+				
gp160 (557–565)	gp41 (47–55)	RAIEAQQHL	HIV-1 infection	human (B51)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
gp160 (557–565)	gp41 (557–565 LAI)	RAIEAQQHL	HIV-1 infection	human (B51)	Mollet2000
	Keywords HAART. **Epitope name** E3. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.				
gp160 (557–565)	Env (gp160) (557–565)	RAIEAQQHL	HIV-1 infection	human (Cw*0304)	Currier2002a
	Keywords inter-clade comparisons. • Cross-reactive responses were found in PBMC isolated from individuals infected with either B or CRF01_AE clade viruses, as determined by Elispot assays of target cells expressing recombinant vaccinia viruses expressing HIV-1 gag, env, nef and pol from many clades. • CTL from subject US101, infected with a clade B virus, displayed broad cross-reactivity to HIV-1 clade A, B, C, D, CRF01_AE, F G, recognized this epitope. Clade B and C had a L->M change in the C-term position that was tolerated. The H clade Env was not cross-reactive, and had the sequence RAIAARQHM.				
gp160 (557–565)	gp41 (46–54)	RAIEAQQHL		human (Cw*0304)	Frahm2004
gp160 (557–565)	gp41 (46–54)	RAIEAQQHL		human (Cw*15)	Frahm2004
gp160 (565–573)	Env (565–)	LLQLTVWGI	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Env *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Env565. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced CD8+ T-cell IFN gamma responses in mice, but responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.				
gp160 (565–573)	Env (731–739)	LLQLTVWGI	HIV-1 infection	human (A2 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).				
gp160 (570–589)	gp41 (571–590 LAI)	VWGIKQLQARILAVERYLKD	Vaccine	human (CD4+ CTL(DR-1))	Kent1997a
	Vaccine *Vector/Type:* vaccinia prime with gp160 boost *Strain:* B clade LAI *HIV component:* gp160 • VWGIKQLQARILAVERYLKD, present in HIV-1 LAI, was the immunizing strain. • VWGIKQLQARVLAVERYLKD, present in HIV-1 MN, was also recognized. • VWGIKQPQARVLAVERYLRD was the form carried by the autologous strain that infected the vaccinee. • Lysis of the target cells by CD4+ CTL was inhibited with the addition of the peptide representing the autologous strain. • The infecting virus epitope also antagonized the proliferative functions of the CD4+ CTL clone. • The behavior of the autologous strain presents a possible mechanism for vaccine failure since the infecting virus not only escapes CTL activity, but inhibits the ability of CTL to recognize other variants.				
gp160 (572–590)	gp41 (572–590 BRU)	GIKQLQARILAVERYLKDQ	Vaccine	human (DPw4.2)	Hammond1991
	Vaccine *Vector/Type:* protein *Strain:* B clade BRU *HIV component:* gp160 • CD4+ CTL.

gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human	Price1995
	• Study of cytokines released by HIV-1 specific activated CTL.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human	Borrow1994
	• Three out of five patients with HIV-1 symptomatic infection controlled their viral infection well and mounted an early, strong HIV-1 specific MHC restricted CTL response. • One of the three, study subject BORI, specifically recognized this peptide.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (584–592)	gp41 (584–592 HXB2) **Keywords** HAART. **Epitope name** E4. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.	ERYLKDQQL	HIV-1 infection	human (A32, B14)	Mollet2000
gp160 (584–592)	gp41 **Keywords** HIV exposed persistently seronegative (HEPS). • Neisseria gonorrhea cervititis in 9 HIV+ Kenyan sex workers caused a functional deficiency in IFN-gamma production in HIV-1 epitope-specific CD8+ T-cells, detected by intracellular cytokine production and tetramer assays, while not affecting the total number of epitope-specific CTLs. • Ghonorrhea caused the weaker HIV-1 specific CTL responses in 4 HIV-1 exposed persistently seronegative (HEPS) women to become undetectable by Elispot and tetramer assays, and CMV-specific CTL in 2 HEPS subjects were shown to have impaired function with regard to IFN-gamma production.	ERYLRDQQL	HIV-1 infection	human (B*14)	Kaul2002
gp160 (584–592)	gp41 (584–592 PV22) • C. Brander notes this is a B*1402 epitope.	ERYLKDQQL	HIV-1 infection	human (B*1402)	Frahm2004
gp160 (584–592)	gp41 • CTL specific for HIV epitopes were used to show that the mediators of both the cytolytic (granzyme A was used as the marker) and non-cytolytic (HIV-1 inhibitory chemokines MIP-1 α and RANTES were used as markers) anti-viral responses are localized within the CTL's cytotoxic granules.	ERYLKDQQL	HIV-1 infection	human (B14)	Wagner1998a
gp160 (584–592)	gp41 (584–592) **Keywords** HAART. • Two patients were followed before and after HAART – reduced plasma HIV-1 RNA levels resulted in a decline in HIV *in vivo* activated specific CTL such that by day 260 CTL activities were undetectable. • ERYLKDQQL was the dominant response in one of the individuals, SLYNTVATL subdominant. • Sporadic breakthrough in viremia resulted in increases in CTLp. • Peptide-tetramer staining demonstrated that declining levels of *in vivo*-activated CTL were associated with a decrease in expression of CD38. • Memory CTL frequency directed against Vac-Gag, Vac-RT, Vac-Env, and Vac-Nef initially increased with HAART and then decreased with the decline of the viral load.	ERYLKDQQL	HIV-1 infection	human (B14)	Kalams1999b
gp160 (584–592)	gp41 (591–599 SF2) • Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160. • One of these 11 had CTL response to this peptide. • The responding subject was HLA-A3, -A32, -B7, -B14.	ERYLKDQQL	HIV-1 infection	human (B14)	Lieberman1997a
gp160 (584–592)	gp41 (591–599 SF2) **Keywords** inter-clade comparisons. • The consensus sequence for clades B, C, and D is ERYLKDQQL. • The consensus sequence for clade A is ERYLRDQQL and it is equally reactive.	ERYLKDQQL	HIV-1 infection	human (B14)	Cao1997a

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The consensus sequence for clade E is ERYLKDQKF and it is not reactive.				
gp160 (584–592)	gp41	ERYLKDQQL	HIV-1 exposed seronegative	human (B14)	Rowland-Jones1998a
	Keywords inter-clade comparisons. • A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating. • The A and D subtype consensus are identical to the B clade epitope, ERyLkDQQL.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Sipsas1997
	• HIV IIIB proteins were used to define the range of CTL epitopes recognized by 3 lab workers accidentally infected with HIV-1 IIIB.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Yang1996
	• CD4+ cell lines acutely infected with HIV were studied to determine their susceptibility to lysis by CTL. • Clones specific for RT lysed HIV-1 infected cells at lower levels than Env or Gag specific clones. • The distinction was thought to be due to lower expression of RT relative to Env and Gag. • CTL can lyse infected cells early after infection, possibly prior to viral production.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Yang1997a
	Assay type CTL suppression of replication. • CTL inhibit HIV-1 replication at effector cell concentrations comparable to those found *in vivo*. • CTL produced HIV-1-suppressive soluble factors – MIP-1α, MIP-1β, RANTES, after antigen-specific activation. • CTL suppress HIV replication more efficiently in HLA-matched cells.				
gp160 (584–592)	gp41 (584–592 PV22)	ERYLKDQQL	HIV-1 infection	human (B14)	Johnson1992
	• Two overlapping CTL epitopes were mapped with different HLA restriction (also see YLKDQQLL HLA-B8)				
gp160 (584–592)	gp41 (584–592 PV22)	ERYLKDQQL	HIV-1 infection	human (B14)	Jassoy1993
	• HIV-1 specific CTLs release γ-IFN, and α- and β-TNF.				
gp160 (584–592)	gp41 (584–592 HXB2)	ERYLKDQQL	HIV-1 infection	human (B14)	Kalams1994, Kalams1996
	• Longitudinal study of T cell receptor usage in a single individual. • Persistence of oligoclonal response to this epitope for over 5 years.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	Peptide-HLA interaction	human (B14)	DiBrino1994a
	• Epitope studied in the context of HLA-B14 binding.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Hammond1995
	• This peptide can be processed for HLA-B14 presentation in a TAP-1/2 independent pathway.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Kalams1996
	• CTL response to this epitope was studied in 5 HLA-B14 positive persons. • CTL responses were detected in all five, and CTL clones were isolated from 4/5. • A diverse repertoire of TCRs recognized this epitope, with similar fine specificities. • 3/5 subjects showed no variation in viral sequence, 2/5 had a dominant variant that resulted in poor recognition, ERYLQDQQL. • A minor CTL response specific for the ERYLQDQQL could be detected by two individuals, but the major CTL response was to the ERYLKDQQL form even when it was the minority form.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Some single amino acid substitutions were well tolerated by most of the CTL clones tested, but others, particularly in the center three amino acid positions, abrogated peptide stimulatory activity.				
gp160 (584–592)	gp120 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Ferris1999, Hammond1995
	• This epitope is processed by both TAP1/2 dependent and independent mechanisms.				
gp160 (584–592)	gp41	ERYLKDQQL		human (B14)	Rowland-Jones1999
	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, and the B35 allele seems to be protective. • HIV-2 sequence: EKYLQDQAR – no cross-reactivity [Johnson1992]				
gp160 (584–592)	gp41 (SF2)	ERYLKDQQL	HIV-1 infection	human (B14)	Goulder2001a
	Keywords acute infection. **Epitope name** EL9. • Data from patient AC13 suggest a role for this epitope in initial control of viremia in acute infection, as it is one of several subdominant CTL epitopes recognized during the initial decline in viremia. • A CTL response to SL9, SLYNTVATL, was not evident until 18 months post-presentation. • Recognized by two A*0201-positive chronically infected subjects.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Islam2001
	Keywords HAART, TCR usage. **Epitope name** 588K. • Transcript frequencies of four CTL clones from patient 115, with a chronic and stable HIV-1 infection, were tracked in a longitudinal study of samples collected 6-11 years post infection: clone M21 and E15 recognize ERYLKDQQL,and clone D87 recognizes variant ERYLQDQQL, and clone p175b recognizes the A2 epitope SLYNTVATL. • CTL clone M21 uses the Vβ 4, CDR3 VKDGA, Jβ 1.2 TCR beta gene, and clone E15 uses the Vβ 4, CDR3 VEDWGGAS Jβ 2.1 TCR beta gene, and D87 uses Vβ8, ALNRVD, Jβ2.1. • Responses were stable even through HAART with undetectable viral loads but frequencies varied over time by 100-fold, ranging from 0.012% of the total population for SLYNTVATL at its lowest point to 3.78% for M21, with the relative frequencies of clones shifting over time.				
gp160 (584–592)	gp41 (589–597 SF2)	ERYLKDQQL	HIV-1 infection	human (B14)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B14+ individuals that had a CTL response to this epitope broken down by group: 3/3 group 1, 1/2 group 2, and 0/0 group 3.				
gp160 (584–592)	gp41 (589–597)	ERYLRDQQL	HIV-1 infection, HIV-1 exposed seronegative	human (B14)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS).				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
gp160 (584–592)	gp41 (JRCSF)	ERYLKDQQL	HIV-1 infection	human (B14)	Severino2000
	• Primary HLA-B14+ CD4+ CD3+ and HLA-mismatched lymphocytes from uninfected donors were infected with JRCSF after isolation then cocultured with the B14-restricted CTL clone 15160/D75 specific for ERYLKDQQL, and viral inhibition was MHC-restricted. • Primary monocytes and monocyte-derived DC were generated from the same donors, replication of HIV-1 in these cell types was less efficient than in lymphocytes and could also be inhibited by MHC-restricted CTL. • DC-lymphocyte cluster cultures allowed vigorous viral replication and MHC-restricted CTL viral inhibition was blunted or lost depending on the ratio of DC to CD4+ lymphocyte in the culture.				
gp160 (584–592)	gp41 (SF2)	ERYLKQQL	HIV-1 infection	human (B14)	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes, and was one of the epitopes presented by another HLA molecule in an HLA-B60 individual.				
gp160 (584–592)	Env (589–597)	ERYLKDQQL	HIV-1 infection	human (B14)	Guillon2002
	Keywords early-expressed proteins, kinetics. • An early-expressed Nef protein was modified to contain Env and Pol epitopes to enable the study the effect of expression kinetics on CTL mediated suppression of replication. The "EpiNef" construct was inserted into a recombinant vaccinia virus which was used to infect a target cell line; the target cells were lysed by CTL clones specific for the Env and Pol epitopes indicating that they were properly processed.				
gp160 (584–592)	gp41 (584–592)	ERYLKDQQL	HIV-1 infection	human (B14)	Yang2002
	Keywords class I down-regulation by Nef. • Nef down-modulates class I protein expression, and this study demonstrates directly that Nef-deleted HIV-1 NL-43 can be more effectively killed *in vitro* than NL-43 with an intact Nef. The effect was shown to be specific for class I presentation of epitopes, and unlike Nef, deleting Vpr did not alter CTL susceptibility of NL43 infected cells. The CTL clone 15160D75, specific for the class I B14 presented epitope ERYLKDQQL, was one of four used in this study.				
gp160 (584–592)	gp41	ERYLKDQQL	HIV-1 infection	human (B14)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** B14-EL9(gp41). **Donor HLA** A32,A?,B7,B14. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).

gp160 (584–592)	gp41	ERYLKDQQL	HIV-1 infection, Vaccine	human (B14)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].			
gp160 (584–592)	gp41 (subtype B)	ERYLKDQQL	HIV-1 exposed seronegative	human (B14, B*1402)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among B and D clade viruses. • The Clade A version of the epitope is ERYLRDQQL.				
gp160 (584–594)	gp41 (584–594)	ERYLKDQQLLG	HIV-1 infection	human	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A1, A1, B8, B14, Cw7, Cw8. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.				
gp160 (585–592)	gp41 (584–591 SF2)	RYLRDQQL	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 2/4 HIV-1+ people tested. • RYLRDQQL bound to A*2402 weakly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
gp160 (585–592)	gp41 (590–597 LAI)	RYLKDQQL	HIV-1 infection	human (B27)	Shankar1996

Keywords acute infection, early-expressed proteins.
Assay type CD8 T-cell Elispot - IFNγ.
Donor HLA A*2301, B*3501, B*1503 (B72), Cw2, Cw7.

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

gp160 (585–593)	gp41 (584–591 SF2)	RYLRDQQLL	HIV-1 infection	human (A*2402)	Ikeda-Moore1997

- Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402.
- This peptide induced CTL in 4/4 HIV-1+ people tested.
- RYLRDQQLL bound to A*2402 strongly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.

gp160 (585–593)	gp41 (591–598 LAI)	RYLKDQQLL		human (A*2402)	Frahm2004

- C. Brander notes this is an A*2402 epitope.

gp160 (585–593)	gp41	RYLKDQQLL	HIV-1 infection	human (A24)	Altfeld2002

Keywords HAART, supervised treatment interruptions (STI).
Epitope name A24-RL9(gp41).
Donor HLA A24,A?,B7,B27.

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

gp160 (585–593)	Env	RYLKDQQLL	HIV-1 infection	human (A24)	Montefiori2003

Keywords acute infection, early treatment.
Epitope name RW8.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Assay type CD8 T-cell Elispot - IFNγ. **Donor HLA** A2, A24, B38, B60, Cw2, Cw12. • HIV-1+ patient AC10 underwent early HAART treatment, which was discontiuned 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.				
gp160 (585–595)	gp41 (584–591 SF2)	RYLRDQQLLGI	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 4/4 HIV-1+ people tested. • RYLRDQQLLGI bound to A*2402 with medium strength, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
gp160 (585–595)	Env (584–594)	RYLRDQQLLGI	Vaccine	human (A*2402)	Kawana-Tachikawa2002
	Vaccine *Vector/Type:* Sendai virus vector system (SeV) **Epitope name** Env584-11. • A Sendai virus vector system (SeV) was developd that expressed HLA-A*2402-restricted class I/peptide complexes; this system could be used to detect responses and has the potential to elicit immune responses. • MHC class I/peptide tetramers could be made using this system that bound to epitope-specific CTLs in PBMCs. • Cells transfection with SeV modified to express A*2402-HIV epitope complexes induced CTL mediated specific cell lysis.				
gp160 (586–593)	gp160	YLRDQQLL	HIV-1 infection	human	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized in 1/22 HEPS sex worker controls, ML887.				
gp160 (586–593)	gp41 (584–591 NL43)	YLKDQQLL	HIV-1 infection	human (A*2402)	Dai1992
	• The lysine (K) is critical for eliciting a HLA-A24 CTL response. • C. Brander notes that this is an A*2402 epitope in the 1999 database, and suggested that the epitope is RYLKQQLL.				
gp160 (586–593)	gp41 (591–598)	YLRDQQLL	HIV-1 infection, HIV-1 exposed seronegative	human (A24)	Kaul2001a
	Keywords inter-clade comparisons, HIV exposed persistently seronegative (HEPS), immunodominance. • Variants (R)YL(R/K)DQQLL are specific for the A/B clade. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Among HLA-A24 women, 3/4 HEPS and 10/10 HIV-1 infected women recognized this epitope, and (R)YL(R/K)DQQLL tended to be reactive in HEPS and infected women, RDYVDRFFKTL in infected women only. • The dominant response to this HLA allele was to this epitope in all 3/4 HEPS cases but in only 4 of the 10/10 HIV-1 infected women. • Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.				
gp160 (586–593)	gp41 (580–587 CM243 subtype CRF01) **Keywords** inter-clade comparisons. • More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested. • The only HLA-A24 FSW tested did not recognized the E clade version of this epitope RYLKDQKLL, which differs from the previously defined B clade version by one amino acid, YLKDQQLL, with an additional amino acid added on.	YLKDQQLL	HIV-1 infection	human (A24)	Bond2001
gp160 (586–593)	gp41 (subtype A) **Vaccine** *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].	YLKDQQLL	HIV-1 infection, Vaccine	human, macaque (A24, B8)	Hanke2000, Wee2002
gp160 (586–593)	gp41 (586–593 LAI) **Keywords** HAART. **Epitope name** E1. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.	YLKDQQLL	HIV-1 infection	human (A24, B8)	Mollet2000
gp160 (586–593)	gp41 (586–593) • C. Brander notes this is a B*0801 epitope.	YLKDQQLL	HIV-1 infection	human (B*0801)	Frahm2004
gp160 (586–593)	gp41 (586–593) • Two overlapping CTL epitopes were mapped with different HLA restriction (also see ERYLKDQQL HLA-B14)	YLKDQQLL	HIV-1 infection	human (B8)	Johnson1992

	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive. • HIV-2 sequence: YLQDQARL – no cross-reactivity [Johnson1992]				
gp160 (586–593)	gp41 (586–593)	YLKDQQLL	HIV-1 infection, HIV-1 exposed seronegative	human (B8)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
gp160 (586–593)	gp41 (586–593)	YLKDQQLL	HIV-1 infection	human (B8)	Day2001
	• B8-restricted CTL accounted for about 1/3 of the total CTL response in one individual.				
gp160 (586–598)	gp41 (586–598)	YLRDQQLLGIWGC	HIV-1 infection	human (Cw7)	Nehete1998a
	• Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one. • HLA-C antigens are expressed on lymphoid cells to a lesser extent, 10% of either HLA-A or HLA-B. • HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.				
gp160 (594–608)	gp41 (SF2)	GIWGCSGKLICTTAV	HIV-1 infection	human (B17(57))	Carmichael1996
	Epitope name Peptide2. **Assay type** Chromium-release assay. • Cross-reactivity of Env-specific CTL clones from 14 seropositive HIV-1 infected patients was tested using peptides based on 3 B clade variants (MN, IIIB, and RF). The proportion of CTL clones that cross-recognized conserved variants was low. Most CTL clones recognized only one peptide variant, indicating most Env responses are not cross-reactive within the B clade. • This HLA B17(57) epitope was newly identified within gp41 of HIV-1 SF2. SF2 and IIIB have identical sequences within this peptide, but the T-cell clone that recognizes this peptide does not recognize the MN (gFwgcsgklicttTv) or RF (giwgcsgklicttTv) variants of this peptide.				
gp160 (594–608)	gp41	GIWGCSGKLICTTAV	HIV-1 infection	human (B57)	Jin1998b
	• Progressive HIV-1 infection and CD4 decline was associated decreased the IL-2-expandable HIV-1 CTL response in 10 asymptomatic HIV-infected patients – this observation may be partially due to a reduction and impaired function of T helper cells, CTL exhaustion and APC dysfunction. • Continued presence of HIV-1 specific memory cells (CTLp) was observed in three patients, one to GIWGCSGKLICTTAV, one to ALIWEDLRSLCLFSY, and one to PIPIHYCAPAGFAILKCNNK.				
gp160 (606–614)	gp41 (605–615 LAI)	TAVPWNASW	Vaccine	human (B*3501)	Frahm2004

gp160 (606–614)	gp41 (606–614)	TAVPWNASW	HIV-1 infection	human (B35)	Ferris1999
	• This epitope is processed by a TAP1/2 dependent mechanism.				
gp160 (606–614)	gp41 (subtype B)	TAVPWNASW	HIV-1 exposed seronegative	human (B35)	Rowland-Jones1998b
	Keywords inter-clade comparisons.				
	• HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.				
	• Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.				
	• Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.				
	• This epitope is conserved among A, B and D clade viruses.				
gp160 (606–614)	gp41 (606–614)	TAVPWNASW	HIV-1 infection, HIV-1 exposed seronegative	human (B35)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS).				
	• ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
gp160 (606–614)	gp41 (606–614)	TAVPWNASW	HIV-1 infection	human (B35)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins.				
	Assay type CD8 T-cell Elispot - IFNγ.				
	Donor HLA A3, A33, B14, B35, Cw*0401, Cw0802.				
	• All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.				
	• All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.				
gp160 (634–648)	gp41 (641–655 SF2)	EIDNYTNTIYTLLEE	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160. • One of these 11 had CTL response to this peptide. • The responding subject was HLA-A1, A2, B51, and B57.				
gp160 (678–686)	Env (679–687 subtype B)	WLWYIKIFI	Vaccine	human (A2.1)	Kundu1998a
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period. • Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual. • CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.				
gp160 (680–688)	gp41 (679–687 SF2)	WYIKIFIMI	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 1/4 HIV-1+ people tested. • WYIKIFIFMI bound to A*2402 strongly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
gp160 (681–689)	Env (681–)	YIKIFIMIV	HIV-1 infection, Vaccine	human, transgenic mouse (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Env *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Env681. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 2/17 HIV+ HLA-A2 subjects.				
gp160 (685–693)	Env (686–694 subtype B)	FIMIVGGLV	Vaccine	human (A2.1)	Kundu1998a
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual. • CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses. • ALTERNATIVE EPITOPE: IMIVGGLVGL – no CTL response was shown to the peptides FIMIVGGLV or IMIVGGLVGL.				
gp160 (698–707)	Env (696–706)	VFAVLSIVNR	HIV-1 infection	human (A*3303)	Hossain2001, Takiguchi2000
	• HLA-A33 a very common allele in Asian, with HLA-A*3303 the most common among the Japanese. New A*3303 epitopes were defined to better characterize the immune response in this population. • The anchor motif for HLA*3303 (A, I, L, V, F, Y in position 2 (F and Y bind most strongly), and R (K is also tolerated) in the C-terminal position) was used to define 82 potentially reactive peptides in Env; 37/82 peptides bound to A*3303; 3/37 peptides could induce peptide-specific CTL in bulk PBMC cultures from 1/3 HLA A*3303 positive individuals tested. • CTL clones were isolated that killed target cells in a concentration dependent manner after pulsing with the VFAVLSIVNR peptide, that could also kill cells transfected with env expressed from a vaccinia vector. Bulk cultures were tested from six additional people, and only 1/6 reacted with this peptide, but the peptide is in a highly variable region.				
gp160 (698–707)	gp41 (187–196)	VFAVLSIVNR	HIV-1 infection	human (A*3303)	Frahm2004
gp160 (700–708)	Env (695–705 BH10, LAI)	AVLSVVNRV	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is LRIVFAVLSVV) has similarity with the human chemokine-factor 3 fragment LRLVFALVTAV .				
gp160 (700–708)	gp41 (705–714)	AVLSVVNRV	HIV-1 infection	human (A2)	Ferris1999
	• This epitope is processed by a TAP1/2 dependent mechanism.				
gp160 (701–720)	gp41 (701–720 BH10)	VLSIVNRVRQGYSPLSFQTH	HIV-1 infection	human (A32)	Safrit1994a
	• Recognized by CTL derived from acute seroconverter.				
gp160 (702–721)	Env (702–721)	LSIVNRVRQGYSPLSFQTLT	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
gp160 (704–712)	gp160 (704–712 LAI)	IVNRNRQGY		human (A*3002)	Frahm2004, Goulder2001a
	• C. Brander notes this is an A*3002 epitope.				
gp160 (704–712)	gp41	IVNRVRQGY	HIV-1 infection	human (A*3002)	Goulder2001a
	Epitope name IY9 (gp41). • HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• A rapid method was developed combining ELISPOT with intracellular IFN-γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood. • Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean. • In both HLA-A*3002 individuals the response to RSLYNTVATLY was dominant. • In subject 199 four additional A*3002 epitopes were identified. • Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)				
gp160 (742–761)	Env (742–761) **Keywords** inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.	RDRSIRLVSGFLALAWDDLR	HIV-1 infection	human	Novitsky2002
gp160 (747–755)	gp41 (747–755) • Studied in the context of HLA-A2 peptide binding.	RLVNGSLAL	HIV-1 infection	human (A2)	Parker1992
gp160 (747–755)	gp41 (741–749 CM243 subtype CRF01) **Keywords** HIV exposed persistently seronegative (HEPS). **Epitope name** E747-755. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was reactive in HIV+ control study subject 144 who carried HLA-A2.	RLVSGFLAL	HIV-1 infection	human (A2)	Sriwanthana2001
gp160 (747–755)	gp41 (741–749 CM243 subtype CRF01) **Keywords** inter-clade comparisons. • More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested. • 2/4 tested FSWs recognized the E clade version of this epitope, which differs from the previously defined B clade version by two amino acids, RLVNGSLAL. • This epitope was somewhat conserved 4/8 subtypes: CRF01 (E), B, C, and G.	RLVSGFLAL	HIV-1 infection	human (A2)	Bond2001
gp160 (754–768)	gp41 (SF2) **Epitope name** Peptide78. **Assay type** Chromium-release assay. • Cross-reactivity of Env-specific CTL clones from 14 seropositive HIV-1 infected patients was tested using peptides based on 3 B clade variants (MN, IIIB, and RF). The proportion of CTL clones that cross-recognized conserved variants was low. Most CTL clones recognized only one peptide variant, indicating most Env responses are not cross-reactive within the B clade. • This HLA B22(55) epitope was defined using SF2 peptides. The CTL clone that recognized it did not cross-recognize the MN, IIIB, or RF variants of this peptide.	ALIWERDLRSLCLFSY	HIV-1 infection	human (B22(55))	Carmichael1996

gp160 (770–780)	gp41 (769–780)	RLRDLLLIVTR	HIV-1 infection	human (A3)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection. **Epitope name** A3-RR11. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied. • One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 1/7 individuals began to have detectable responses to this epitope after STI.			
gp160 (770–780)	gp41 (770–780)	RLRDLLLIVTR	HIV-1 infection	human (A31)	Ferris1999, Hammond1995
	• This epitope is processed by a TAP1/2 dependent mechanism.

gp160 (794–802)	gp41	KYCWNLLQY	HIV-1 infection	human (A*3002)	Goulder2001a
	Epitope name KY9 (gp41). • HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule. • A rapid method was developed combining ELISPOT with intracellular IFN-γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood. • Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean. • In both HLA-A*3002 individuals the response to RSLYNTVATLY was dominant. • In subject 199 four additional A*3002 epitopes were identified. • Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)				
gp160 (794–802)	gp41 (283–291)	KYCWNLLQY	HIV-1 infection	human (A*3002)	Frahm2004
gp160 (794–814)	gp41 (SF2)	KYCWNLLQYWSQELKNSAV-SL	HIV-1 infection	human	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes, and was one of the epitopes presented by another HLA molecule in an HLA-B60 individual.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The response to the peptide was CD8 dependent, but the HLA presenting molecule and optimal epitope were not determined.				
gp160 (795–816)	gp41 (802–823 HXB2)	YWWNLLQYWSQELKNSAVN-LLN	HIV-1 infection	human	Lieberman1992
	• CTL epitope defined by T cell line and peptide mapping.				
gp160 (799–807)	Env (800–808 subtype B)	LLQYWSQEL	Vaccine	human (A2.1)	Kundu1998a
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period. • Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual. • CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.				
gp160 (805–814)	Env (799–813 BH10, LAI)	QELKNSAVSL	HIV-1 infection	human	Maksiutov2002
	• This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is LLQYWSQELKNSAVS) has similarity with the complement component C6 fragment LTQFSSEELKNSGLT. • This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is NSAVSLLNATAIAVA) also has similarity with the human INT-2 proto-oncogene protein precursor (fibroblast growth factor-3) fragment NSAYSILEITAVEVG.				
gp160 (805–814)	gp41 (810–819 LAI)	QELKNSAVSL		human (B*4001)	Frahm2004
	• C. Brander notes this is a B*4001,B60 epitope.				
gp160 (805–814)	gp41 (SF2)	QELKNSAVSL	HIV-1 infection	human (B60(B*4001))	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes. • B60 is present in 10-20% of the Caucasoid and very common in Asian populations.				
gp160 (805–814)	gp41 (805–814)	QELKNSAVSL	HIV-1 infection	human (B60/B61)	Day2001
	Keywords immunodominance. • No immunodominant responses were detected to five B61-restricted epitopes tested. • All five B60-restricted epitopes were reactive in another subject, and the B60-restricted responses together contributed over one-third of the total CTL response.				
gp160 (813–822)	gp41 (814–823 LAI)	SLLNATDIAV	Vaccine	human (A*0201)	Dupuis1995
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 • Of two CTL clones, one reacted only with 815-823, the other with 814-823 and 815-823. • Noted to be A*0201 in Brander *et al.*, 1999 database.				
gp160 (813–822)	gp41 (818–827 LAI)	SLLNATDIAV	Vaccine	human (A*0201)	Frahm2004
	Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• C. Brander notes this is an A*0201 epitope.				
gp160 (813–822)	gp41 (814–823) **Keywords** dendritic cells. • Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients. • 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated. • SLLNATDIAV is a conserved HLA-A2 epitope included in this study – 4/6 patients had this sequence as their HIV direct sequence, and 3 of these had a detectable CTL response – the other two had either the sequence SLFNAIDIAV or SLLNTTDIVV and no detectable CTL response. • CTL demonstrated against peptide-coated target, epitope is naturally processed and enhancible with vaccine.	SLLNATDIAV	HIV-1 infection	human (A2)	Kundu1998b
gp160 (813–822)	gp41 (818–827) **Keywords** immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the A2+ individuals that didn't respond to SLYNTVATL reacted with seven other epitopes, including this epitope.	SLLNATDIAV	HIV-1 infection	human (A2)	Betts2000
gp160 (813–822)	gp41 (SF2) **Keywords** acute infection. **Epitope name** SV10. • Dominant CTL epitope in acute infection of patient AC13– response to this epitope corresponded to reduction of initial viremia. • Several other subdominant CTL epitopes were identified in the acute phase, but a response to SL9, SLYNTVATL, was not evident until 18 months post-presentation.	SLLNATAIAV	HIV-1 infection	human (A2)	Goulder2001a
gp160 (813–822)	gp41 (77–85 SF2) **Keywords** HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-A2+ individuals that had a CTL response to this epitope broken down by group: 1/10 group 1, 2/6 group 2, and 1/4 group 3.	SLLNATDIAV	HIV-1 infection	human (A2)	Altfeld2001b
gp160 (813–822)	gp41 (814–823 CM243 subtype CRF01) **Keywords** HIV exposed persistently seronegative (HEPS). **Epitope name** E813-82. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was reactive in HIV+ control study subjects 125 and 144 who carried HLA-A2.	SLLNATAIAV	HIV-1 infection	human (A2)	Sriwanthana2001

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (813–822)	gp41 (814–823 CM243)	SLLNATAIAV	HIV-1 infection	human (A2)	Bond2001

Keywords inter-clade comparisons.

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 1/4 tested FSWs recognized the E clade version of this epitope, which differs from the previously defined B clade version by one amino acid, SLLNATDIAV.
- This epitope was somewhat conserved 4/8 subtypes: CRF01 (E), B, D, and F.

gp160 (813–822)	gp41 (813–822)	SLLNATDIAV	HIV-1 infection	human (A2)	Day2001

Keywords rate of progression, acute infection.

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.

gp160 (813–822)	gp41 (813–822 IIIB)	SLLNATAIAV	Vaccine	mouse (A2)	Kiszka2002

Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade IIIB *HIV component:* gp160, gp160ΔV3 *Adjuvant:* IL-12

Keywords vaccine-specific epitope characteristics.

Epitope name D2.

- Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV.
- Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells.

gp160 (813–822)	Env (813–)	SLLNATDIAV	HIV-1 infection	human (A2)	Corbet2003

Keywords binding affinity, inter-clade comparisons, computational epitope prediction.

Epitope name Env813.

Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay.

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- None of the 17 HIV-infected HLA-A2+ people in this study recognized this epitope.

gp160 (813–822)	Env (814–823 subtype B)	SLLNATDIAV	Vaccine	human (A2.1)	Kundu1998a

Vaccine *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160

Keywords binding affinity.

- Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.
- Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity.
- Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.
- CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• CTL to overlapping peptides in this region gave a positive response in the greatest number of patients. • ALTERNATIVE EPITOPES: LLNATDIAV and LLNATDIAVA – CTL were induced by vaccine in those that had the sequence SLLNATAIAVA in their own infection, but not in those with: NLLNTIAIAVA or NLFNTTAIAVA or SLLNATAITVA.				
gp160 (813–822)	gp41 (814–823 LAI)	SLLNATDIAV	Vaccine	mouse (A2.1)	Peter2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG **Keywords** binding affinity, vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR27. • The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01). • The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour. • HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants. • All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.				
gp160 (813–822)	gp41 (814–823 LAI)	SLLNATDIAV	Vaccine	mouse (A2.1)	Peter2002
	Vaccine *Vector/Type:* peptide *Strain:* B clade LAI *Adjuvant:* Incomplete Freund's Adjuvant (IFA), IL-12, P30 **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** LR27. • When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination [Peter2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macropahges in the spleen.				
gp160 (813–822)	gp41	SLLNATDIAV	HIV-1 infection	human (A68)	Altfeld2001c
	Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction. **Epitope name** gp41 SV10. • HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested. • Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2) • This epitope binds to three HLA-A2 supertype alleles: A*6802 (highest affinity), A*0202 and A*0203 (but not A*0201 and not A*0206) • This epitope did not elicit an ELISPOT response in 22 chronic HIV HLA-A2 infections, but elicited a strong response in 1/12 acute HLA-A2 infections – this individual, AC13, was HLA A*0201/68 B44/14 and also had a strong response to HLA-A2 vpr epitope AIIRILQQL.				
gp160 (813–828)	gp41 (MN)	SLLNATAIAVAEGTDR	HIV-1 infection	human	Chitnis2003
	Keywords assay standardization, HAART. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 17 perinatally HIV-1 infected children (0.08-16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.				
gp160 (814–822)	Env (815–823)	LLNATAIAV	HIV-1 infection	human (A*0201)	Kmieciak1998a
	Keywords binding affinity. • CTL responses in six patients to four Env epitopes were studied: D2: LLNATAIAV, 5.3: RLRDLLLIV, D1: KLTPLCVTL, and 4.3: QMHEDIISL—all have A2 anchor residues. • The C terminal epitopes (D2 and 5.3) were highly variable and the variability was considered responsible for limited CTL response, while D1 and 4.3, N-terminal epitopes, were much more conserved and gave evidence of high levels of CTL response *in vitro*. • Peptides 5.3 and D2 bound to HLA A*0201 with low affinity and were variable, particularly D2. • Substitutions in peptide D2: llnTIaiav did not abrogate the response, but diminished it. • In a longitudinal study, the CTL response to the variable D2 epitope diminished over time, while the response to the conserved epitope D1 stayed higher.

	• Multiple murine MHC can cross-present this epitope (HP53), and P18 RIQRGPGRAFVTIGK, to specific CTL.				
gp160 (828–836)	gp41 (829–837 LAI) **Vaccine** *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 • CTL from HLA-A2 positive subject react with this peptide.	RVIEVLQRA	Vaccine	human (A2)	Dupuis1995
gp160 (828–836)	gp41 (829–837 CM243 subtype CRF01) **Keywords** inter-clade comparisons. • More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested. • 1/4 tested FSWs recognized the E clade version of this epitope, which differs from the previously defined B clade version by three amino acids, RvievLqRa. • This epitope was only conserved in CRF01 (subtype E), and identities were rare.	KVIEVAQGA	HIV-1 infection	human (A2)	Bond2001
gp160 (828–836)	Env (829–837 subtype B) **Vaccine** *Vector/Type:* protein *Strain:* B clade MN *HIV component:* gp160 **Keywords** binding affinity. • Ten HIV-1+ HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period. • Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity. • Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual. • CTL responses after reimmunization may include recall responses – individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.	RVIEVLQRA	Vaccine	human (A2.1)	Kundu1998a
gp160 (830–854)	gp41 (831–853) • Study of cytokines released by HIV-1 specific activated CTL.	IEVVQGAYRAIIRHIPRRI-RQGLERI	HIV-1 infection	human	Price1995
gp160 (831–838)	Env (830–837) • HLA-A33 a very common allele in Asia, with HLA-A*3303 the most common among the Japanese. New A*3303 epitopes were defined to better characterize the immune response in this population. • The anchor motif for HLA*3303 (A, I, L, V, F, Y in position 2 (F and Y bind most strongly), and R (K is also tolerated) in the C-terminal position) was used to define 82 potentially reactive peptides in Env; 37/82 peptides bound to A*3303; 3/37 peptides could induce peptide-specific CTL in bulk PBMC cultures from 1/3 HLA A*3303 positive individuals tested. • 2/3 peptides that reacted with the bulk culture, EVAQRAYR and VIEVAQRAYR, were overlapping, with one encompassing the other, but EVAQRAYR was shown to be the one that was reactive with a CTL clone. • CTL clones were isolated that killed target cells in a concentration dependent manner after pulsing with the EVAQRAYR peptide, that could also kill cells transfected with env expressed from a vaccinia vector. Bulk cultures were tested from six additional people, and only 2/6 reacted with this peptide, but the peptide is in a highly variable region.	EVAQRAYR	HIV-1 infection	human (A*3303)	Hossain2001, Takiguchi2000
gp160 (831–838)	gp41 (320–327)	EVAQRAYR	HIV-1 infection	human (A*3303)	Frahm2004
gp160 (835–843)	Env (834–842 SF2) **Keywords** rate of progression.	RAYRAILHI	HIV-1 infection	human (B*5101)	Tomiyama1999

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA-B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996;Lancet 22:1187, 1986;Hum Immunol 22:73, 1988;Hum Immunol 44:156, 1995) • 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3% • Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed. • This peptide could stimulate CTL from one person, however this CTL clone did not recognize B*5101 positive target cells infected with HIV-1 recombinant vaccinia expressing Env, so it was not confirmed that this peptide was a properly processed epitope.				
gp160 (837–856)	gp120 (844–863)	YRAIRHIPRRIRQGLERILL	HIV-1 infection	human	Lieberman1995
	• HIV-specific CTL lines developed by *ex vivo* stimulation with peptide.				
gp160 (837–856)	gp120 (844–863 SF2)	YRAIRHIPRRIRQGLERILL	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160. • One of these 11 had CTL response to this peptide. • The responding subject was HLA-A2, A26, B7, and B38.				
gp160 (837–856)	gp120 (844–863 LAI)	YRAIRHIPRRIRQGLERILL	HIV-1 infection	human (B35)	Shankar1996

gp160 (842–856)	gp41 (SF2)	HIPRRIRQGLERALL	HIV-1 infection	human	Altfeld2001a
	• HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • The only Env peptide recognized was gp41 HIPRRIRQGLERALL.				
gp160 (843–851)	gp41 (848–856 LAI)	IPRRIRQGL		human (B*0702)	Frahm2004
	• C. Brander notes this is a B*0702 epitope.				
gp160 (843–851)	gp41 (848–856 LAI)	IPRRIRQGL		human (B7)	Brander1995b
	Keywords mother-to-infant transmission. • Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study.				
gp160 (843–851)		IPRRIRQGL	HIV-1 infection	human (B7)	Soudeyns1999
	Keywords immunodominance, escape. • Following primary infection, progressive diversification and accumulation of mutations of HIV-env nucleotide sequences was observed, focused in V2 in one individual and in V8 in another. • The patient with the V2 diversification showed only transient CTL against Env and Nef. • The patient with the V8 diversification had an immunodominant CTL response to V8 epitope IPRRIRQGL, and multiple escape variants emerged within a year: ipTrirqgl and ipTrirqgF, which abrogated the CT response *in vitro*, and also iprrLqgl and iprrirqDl which gave diminished responses.				
gp160 (843–851)	gp41 (848–856 LAI)	IPRRIRQGL	HIV-1 infection	human (B7)	Cao1997a
	Keywords inter-clade comparisons. • The consensus peptide of clades A, B, D, and F is IPRRIRQGL. • The consensus peptide of clade C is iprrirqgF, and it is equally reactive.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (843–851)	gp41 (848–856 subtype B)	IPRRIRQGL	HIV-1 infection	human (B7)	Wilson1998b
	Keywords inter-clade comparisons, acute infection. • The extent of CTL interclade cross-reactivity from CTL isolated from individuals newly infected with B clade virus was studied, and extensive cross-reactivity was observed. • Two HLA B7 individuals had CTL response to B_LAI, A_92UG037 and C_92BR025 gp160, but were B clade strain MN non-responders – the authors note that the B7 epitope IPRRIRQGL is conserved between the LAI and clade A and C strains, but that MN has a non-conservative Arg to Thr substitution at position three that may be contributing to the specificity of the response in the HLA B7 individuals.				
gp160 (843–851)	gp41 (843–851 HXB2)	IPRRIRQGL	HIV-1 infection	human (B7)	Hay1999b
	Keywords rate of progression, immunodominance. • CTL response to IPRRIRQGL was the immunodominant response in a rapid progressor – there was a subdominant response to SPAIFQSSM in Pol, and interestingly, no response to commonly immunodominant HLA A*0201 epitope SLYNTVATL, although this individual was HLA A*0201. • The individual showed a strong initial CTL response at the time of the initial drop in viremia, but it was quickly lost, although memory cells persisted. • Despite the initial narrow response to two epitopes, no other CTL responses developed. • No HIV-specific lymphoproliferative responses were detected in this patient, and neutralizing antibody response was weak. • Variants were observed *in vivo*, the most common form of the viral epitope at presentation at 3 months was the only form that did not elicit a CTL response: iprrTrqgl; the other forms detected were iprrirqgF, iprriLqgF, VprrirqgF and they could elicit a CTL response although the response to iprriLqgF was reduced. • A second rapid progressor had a detectable CTL response exclusively to this epitope.				
gp160 (843–851)	gp41 (subtype A)	IPRRIRQGF	HIV-1 infection	human (B7)	Cao2000
	Keywords inter-clade comparisons. • HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D. • Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype. • This optimal epitope sequence, recognized by CTL derived from a Ugandan with an A subtype infection, is cross-reactive with subtypes A and B, but not in subtype D.				
gp160 (843–851)	gp41	IPRRIRQGL	HIV-1 infection	human (B7)	Islam2001
	Keywords rate of progression, acute infection. • Subject 053i was followed longitudinally from acute infection through death, and had rapid progression to AIDS. • This individual had a dominant response to IPRRIRQGL with strong *in vivo* activated responses and *in vitro* stimulated memory responses and a subdominant response to SPAIFQSSM – during the course of disease progression (4 Years), the functional CTL responses were lost and no sequence variation occurred with in both epitopes. • At 3 months post-presentation, seven IPRRIRQGL CTL clones were obtained, five used the T-cell receptor Vβ 6S1 and Jβ 2.7 and had the CDR3 WAASS, two used Vβ16S1, ERSPPGD, Jβ 2.7 and one CTL clone isolated at 39 months was Vβ 14S1, CR3 PTAAG, and Jβ 2.1 – all of these clones persisted over the course of the infection, even to time of death, despite the loss of CTL functional responses over time.				
gp160 (843–851)	gp41 (843–851 SF2)	IPRRIRQGL	HIV-1 infection	human (B7)	Altfeld2001b
	Keywords HAART, acute infection.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 2/4 group 1, 1/3 group 2, and 1/1 group 3.				
gp160 (843–851)	gp41 (848–856)	IPRRIRQGL	HIV-1 infection, HIV-1 exposed seronegative	human (B7)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • IPRRIRQGL cross-reacts with clades A, B and D. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B7 women, 2/5 HEPS and 5/6 HIV-1 infected women recognized this epitope. • The dominant response to this HLA allele was to this epitope in 2 of the 5/6 HIV-1 infected women that responded to the epitope, but in neither of the 2/5 HEPS cases. • Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPGV/IRYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.				
gp160 (843–851)	gp41 (843–851)	IPRRIRQGL	HIV-1 infection	human (B7)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes. • An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes. • The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested. • The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.				
gp160 (843–851)	gp41 (SF2)	IPRRIRQGL	HIV-1 infection	human (B7)	Altfeld2000b
	• This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes, and was one of the epitopes presented by another HLA molecule in an HLA-B60 individual.				
gp160 (843–851)	gp41 (842–852)	IPRRIRQGL	HIV-1 infection	human (B7)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute infection. **Epitope name** B7-IL9. **Donor HLA** A3, B7, Cw7. • CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7. • Only two epitopes were detected during acute infection in patient AC-06, B7 restricted gp41 epitope IPRRIRQGL and Gag GPGHKARVL. GPGHKARVL was the first targeted peptide, and remained immunodominant through the 34 month study period. • 6/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.				
gp160 (843–851)	gp41	IPRRIRQGL	HIV-1 infection	human (B7)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** B7-IL9(gp41). **Donor HLA** A24,A?,B7,B27. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).				
gp160 (843–851)	Env	IPRRIRQGL	HIV-1 infection	human (B7)	Bobbitt2003
	Keywords class I down-regulation by Nef. **Epitope name** EW10. **Assay type** Chromium-release assay, Flow cytometric CTL assay. • Nef, through Nef-mediated MHC-1 down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is more profoundly reduced than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more effeciently recognized when infected with viruses carrying the Rev L60F mutation. • Patients in the asymptomic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.				
gp160 (843–851)	gp41 (843–851)	IPRRIRQGL	HIV-1 infection	human (B7)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A1, A3, B7, B14, cw*0702, Cw*0802.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

II-B-20 Env CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	gp160 (LAI, MN)		Vaccine	human	Belshe1998
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Protease • The live canarypox vaccine ALVAC-HIV(vCP205) carrying MN gp120, LAI gp41, Gag and Protease, and boosted with SF-2 rpg120, was given to HIV-1 seronegative volunteers – HIV-specific Env or Gag CD8+ CTL were detected in 64% of the volunteers.				
Env	gp160 (LAV)		HIV-1 infection	human	Zheng1999
	Keywords epitope processing, dendritic cells. • Protein delivery (gp160 LAV, p66 LAV, and p24 NY5) to human dendritic cells (DC) with liposomes provides enhanced memory CTL response relative to delivery of protein alone. • Chloroquine administration enhanced epitope presentation, and brefeldin A and peptide aldehyde inhibitors inhibited antigen presentation, suggesting epitopes were processed by classical proteasome pathway.				
Env	Env (IIIB)		HIV-1 infection	human	Wasik2000
	Keywords rate of progression, Th1. • HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of IL-2, as well as beta-chemokines, relative to other HIV+ infants. • No HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors. • CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.				
Env	gp120		HIV-1 infection	human	Soudeyns2000
	Keywords HAART. • Analysis of T cell receptor beta chain variable region repertoire indicates that antiretroviral therapy (ART) and highly active antiretroviral therapy (HAART) decrease global CD8 T cell oligoclonality during primary HIV infection. • A sharp decline in HIV-1 gp120-specific CTL clones was observed in HAART-treated subjects.				
Env	Env (LAI, MN)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp41, Protease, V3 • The vaccine used was a rec canarypox with HIV-1 gp120 MN, tm/gag/protease LAI (vCP205), alone or with p24E-V3 MN synthetic peptide (CLTB-36)) • Twenty HIV negative subjects were vaccinated in phase I trial with combinations of vCP205 and CLTB-36. • Immunization with vCP205 induced HIV-1-specific ABs to gp120, V3, and p24 antigens, and CTL immune responses against vCP205 were detected after the fourth immunization in 33% of the subjects against Env, Gag and Pol, but the CLTB-36 peptide did not produce AB or CTL immune responses against p24 or gp160.				
Env	Env		HIV-1 infection	human	Gamberg1999
	Keywords TCR usage. • 13/13 subjects with advanced HIV infections showed CD8 T cell proliferation and differentiation of CTL *in vitro*, and six individuals showed HIV-specific responses to Gag, Pol, Env or Nef antigens. • Data suggests that the functional and genetic integrity of the CD8 T cell repertoire (TCR betaV gene intrafamily genetic diversity) remains intact through advanced HIV infection, although HIV-specific CTL activity decreases.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	Env (LAI, MN)		Vaccine	human	Gorse1999b
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade SF2 *HIV component:* Env, Gag, Nef, Protease • The vaccine used was rec canarypox expressing HIV-1 env, gag, pol, nef and protease (vCP300) with or without administration of HIV-1 SF-2 rgp120. • In vitro inducible CTL activity against HIV-1 Env, Gag, Pol, and Nef antigens was observed in 79% (15 of 19) of vaccine recipients. • The combination of vCP300 and vP1291 together resulted in an overall increase in CTL induction and detection sensitivity.				
Env	Env (LAI)		HIV-1 infection	human	Buseyne1998b
	Keywords inter-clade comparisons. • In infants with positive CTL responses, most responses showed cross-clade reactivity with somewhat diminished recognition of epitopes from different subtypes.				
Env	gp120 (IIIB)		Vaccine	macaque	Shiver1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp120, gp160 • DNA vaccinations of Rhesus monkeys with a gp120 or gp160 DNA vaccine elicited a strong CD8 cytotoxic T cell response.				
Env	gp160		HIV-1 infection	macaque	Kent1997b
	• Macaques can be infected with HIV, and clear the infection within 6 months, so it is of interest to examine their initial immune response. • A strong CTL response against env, pol and gag antigens can be detected. • The CTL response peaked by 4 weeks and declined dramatically by 8 weeks. • The response in the lymph nodes and peripheral blood was comparable.				
Env	gp160		Vaccine	mouse	Kim1997c
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12 • A gag/pol, vif or env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules B7 and IL-12, gave a dramatic increase in both the cytotoxic and proliferative responses in mice. • When IL-12 was present, CTL response could be detected even without *in vitro* stimulation.				
Env	gp160		Vaccine	mouse	Kim1997d
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12 • A gag/pol or env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules CD86, gave a dramatic increase in both the cytotoxic and proliferative responses in mice. • When CD86 was present, CTL response could be detected even without *in vitro* stimulation.				
Env	gp120 (HXBc2)		Vaccine	macaque	Letvin1997
	Vaccine *Vector/Type:* DNA prime with gp160 boost *Strain:* B clade HXBc2 *HIV component:* gp160 • Vaccination of Macaques mulatta (Rhesus monkeys) with an HXBc2 env DNA prime and a protein boost elicited a T cell proliferative response, a CTL response, and type-specific neutralizing antibodies. • Vaccinated animals challenged with SHIV-HXB2 were protected from infection.				
Env	gp120 (MN)		Vaccine	human	MacGregor1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* Env, Rev • An HIV DNA env and rev vaccine given to 15 asymptomatic HIV+ individuals at three different dosages, 30, 100 or 300 ug, was safe. • The CTL response to gp120 was enhanced in 0/4 patients in the 30 μg group, 2/3 patients in the 100 μg group, and 0/3 in the 300 μg group – but the non-responding patients in the 300 μg group had a strong CTL response prior to vaccination, and the CTL results are inconclusive.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	gp120 (IIIB)		HIV-1 infection	human	Trickett1998
	• Twelve HIV-1 infected patients were re-infused with their own lymphocytes, cryopreserved from an earlier time point in the infection. • Improvement in CD4+ and CD8+ T cells was seen in 7/12, and an increase in the CTL response to Env was seen in one patient.				
Env	gp120 (LAI)		HIV-1 infection	human	Legrand1997
	• Seventeen recently infected patients were tested for CTL response to HIV proteins Env, Gag, Pol, Rev, Nef, Vif and Tat. • An early response (within a month following PI) was noted in 87% of the subjects to Gag, 75% to Env, and 50% to Nef. • Early responses to Pol, Rev, Vif and Tat were rare.				
Env	gp120 (LAI)		Vaccine	human	Corey1998
	Vaccine *Vector/Type:* vaccinia prime with gp120 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* gp160 • Vaccinia-naive subjects were vaccinated with vaccinia-gp160 LAI and boosted with gp120 SF2, LAI, MN, or 160 MN. • 26/51 had an anti-Env CTL response, and those that were boosted with gp120 tended to produce Abs that neutralized autologous laboratory strains with some cross-reactivity.				
Env	Env (IIIB)		HIV-1 infection	human	Betts1997
	Keywords inter-clade comparisons. • 6/8 individuals from Zambia infected with C clade virus had CTL that were able to make response to B clade HIV-1 IIIB vaccinia-expressed Gag, Pol and Env proteins. • A vigorous cross-clade response was not limited to a particular protein, and the level of recognition of different proteins varied among the six patients.				
Env	Env		HIV-1 infection	human	De Maria1997
	• CD3+ cells that also carry a natural killer cell receptor (NKR+) can exhibit down regulation of T cell function. • Anti-NKR IgM MAb masked this inhibitory function and increased HIV-1 specific CTL activity in phytohemagglutinin-activated PBMC cultured in the presence of IL-2 from 3/5 patients, and in one other case anti-NKR MAb brought HIV-1 specific CTL activity to detectable levels.				
Env	Env (IIIB)		HIV-1 infection	human	Betts1999
	Keywords rate of progression. • This study demonstrated an inverse correlation between HIV Type I plasma viral load and CTL activity directed against HIV-1 Pol, and stronger combined effects of Pol- and Env-specific CTL, in long-term survivors (LTS) of HIV-1 infection.				
Env	Env (LAI)		HIV-1 infection	human	Buseyne1998a
	• This study showed a correlation between strong CTL memory and breadth of response in 7-12 month old infants, and remaining AIDS-free for the first year of life, higher absolute CD4 and CD8 cells, and lower viral load.				
Env	Env		HIV-1 exposed seronegative	human	Goh1999
	• 13/37 exposed uninfected individuals with repeated high-risk sexual exposure had HIV-1 specific CTL against Env, Gag, Pol, or a combination of proteins – CTL activity was correlated with a CCR5 wildtype genotype. • In this group, the highest CTLp frequencies were directed at Gag, but the most common response was to Env and four individuals had responses to multiple HIV-1 proteins.				
Env	Env (LAI, MN)		Vaccine	human	Evans1999
	Vaccine *Vector/Type:* canarypox *HIV component:* Gag, gp120, gp41, Nef, Protease, RT • A Canarypox vaccine expressing gp120, gp41, Gag, Protease, Nef and Pol CTL epitopes gave rise to CTL that could be detected in 61% of the volunteers – responses to Gag, Env, Nef and Pol were detected 3-6 months after the last vaccination.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	Env (LAI)		Vaccine	macaque	Kent1998
	Vaccine *Vector/Type:* DNA prime with vaccinia boost *Strain:* B clade LAI *HIV component:* Env, Gag **Keywords** Th1, Th2. • Priming with an HIV-DNA vaccine and boosting with a vaccinia construct induced greater levels of HIV T cell immunity than either vaccine alone. • The proliferative response to Env and Gag after the DNA vaccination had a mean SI of 1.5-4, but after boosting with rHIV-fowlpox virus, there was a 6-17 fold increase in the mean SI for HIV Gag and Env. The T help response happened despite a fall in antibody titers, suggesting that the Th response was primarily Th1, not Th2. The CTL response was also enhanced.			
Env	Env (LAI, MN)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease • A live attenuated canarypox vector expressing MN gp120 and LAI gp41/gag/protease could induce CTL and a lymphoproliferative response in healthy, uninfected volunteers.				
Env	Env (MN)		Vaccine	chimpanzee	Kim1998
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86 • The study explores the use of co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.				
Env	gp120 (IIIB)		Vaccine	macaque	Notka1999
	Vaccine *Vector/Type:* Semliki-Forest Virus with virus-like particle boost *Strain:* B clade IIIB *HIV component:* Gag, gp120 • Immunization of SIV Pr56Gag-derived VLPs with HIV-1 gp120 anchored on their surface induced Abs, CTL and Th responses to HIV gp120; priming with the HIV antigens in Semliki-Forest Viruses enhanced the immunological outcome. • Immunized monkeys challenged with SHIV showed a more rapid reduction of plasma viremia.				
Env	Env		HIV-1 exposed seronegative	human	Akridge1999
	• This study suggests that HIV-1-resistance in exposed and uninfected individuals is not only associated with the 32-bp deletion in the HIV-1 co-receptor CCR5, but can be related to HIV-1 specific CTL immunity.				
Env	gp120 (BRU)		HIV-1 infection	human	Aladdin1999
	Keywords rate of progression. • In vitro measurements of CTL-activity by Cr release assay in bulk culture showed no correlation between CTL-activity (gp120, Gag, Pol and Nef) and disease progression as measured by viral load, CD4 and time to death.				
Env	gp120		HIV-1 infection	human	Aladdin2000
	Keywords HAART. • The administration of IL-2 caused an initial enhancement of CD4 cell counts that was accompanied by a decrease in CTL activity – IL-2 therapy did not reduce initial HIV viral load and viral replication was ultimately enhanced.				
Env	Env		HIV-1 infection	human	Jin1998a
	• CTL precursor frequencies were determined in HIV-1 infected pregnant women, and higher CTLp frequencies to Pol and SF2 Nef, but not IIIB Nef, were found in non-transmitting mothers than in transmitting mothers – Nef CTL responses have been found in uninfected infants born to HIV+ women (Lazuriaga95); • Very different CTLp frequencies were observed in env depending on whether IIIB, MN, RF, BK, or SF2 was used as antigen – no association between env specific CTL and transmission was observed.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	Env		Vaccine		Zavala2001
	Vaccine *Vector/Type:* vaccinia *HIV component:* Env **Keywords** review. • This paper is a review of vaccinia in the context of vaccines strategies that use different vectors to prime and boost, and emphasizes a unique capacity of vaccinia to very efficiently boost memory T-cell responses. • HIV is discussed in the context of Gonazalo *et al.* 1999, where a V3 CTL epitope expressed in reFlu was boosted most effectively by vaccinia expressing the full Env.				
Env	Env		Vaccine	macaque	Akahata2000
	Vaccine *Vector/Type:* DNA *Strain:* ZF1 *HIV component:* complete genome • Rhesus macaques were vaccinated by i.m. injection with naked plasmid DNA carrying an HIV-1 complete genome vaccine, strain ZF1, with a mutated zinc finger in the nucleocapsid to prevent packaging. • Env and Gag specific CTL but no antibody responses were induced in 2/4 vaccinated monkeys (MM145 and MM153) • 2/4 monkeys (MM146 and MM143) produced antibodies against p24 and/or gp160, but no CTL response was detected. • PBMC from all vaccinated monkeys produced IFN-gamma, in response to HIV-1 gp160, indicating a Th response – this response was 5 times higher in MM145, the animal with the strongest CTL response. • 4 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM145 and MM153 (with a homologous Env) decreased to near or below the detection limit. • 6-8 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM146 and MM143 decreased near or below the detection limit.				
Env	gp120		HIV-1 infection	human	Young2001
	• Addition of recombinant rec human IL12 (rhIL12) to cultures increased HIV-specific lysis of HIV-Gag, Pol and gp120 vaccinia expressed antigens (11/15 tested increased lysis by > 5%) if the culture was derived from HIV+ individuals who had CD4 cells/ul > 500. • 2/10 individuals with <200 CD4 cells/ul, and 3/10 individuals with 200-500 CD4cells/ul, had an increase of >5% upon treatment of the culture with rhIL12, so a few individuals in late stage disease had CD8 cells that maintained responsiveness to rhIL12.				
Env	Env (subtype A, B, D)		HIV-1 infection	human	Cao2000
	Keywords inter-clade comparisons. • HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in HIV infected Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D. • Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype.				
Env	Env		Vaccine	human	AVEG022PT2001
	Vaccine *Vector/Type:* canarypox, protein *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Env, Gag, Protease *Adjuvant:* MF59 • Different HIV strains were used for different regions: MN (gp120), LAI (gp120, protease and gag), and SF2 gp120 • 26/42 subjects who received CP vac-env-pro vaccine had a CTL response measured by Cr-release, while only 3/17 who were vaccinated with rec gp120 had a CTL response. • A combination of a CP vac-env-pro vaccine with rec gp120 gave CD8+ T-cells in 62% of subjects, and NAbs in 91% of subjects.				
Env	Env		HIV-1 infection	human	White2001
	• HIV-specific CTL activity was detected in the female reproductive tract of only 1/3 HIV-infected women who underwent a hysterectomy, although CTL could be identified in the PBMC of all three women.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	Env (IIIB)		HIV-1 infection	human	Jin2000a
	Keywords rate of progression.				
	• The CTL precursor level (CTLp) was measured in long term non-progressors (LTNP) with low viral load using limiting dilution analysis and measuring CTL against Env Gag and Pol expressed in vaccinia in autologous targets.				
	• LTNPs have high memory CTL numbers and low viral load.				
Env	Env (IIIB)		HIV-1 infection	human	Jin2000a
	Keywords HAART, rate of progression.				
	• The CTL effector levels (CTLe) were compared in long term non-progressors (LTNP) with low viral load and in patients whose virus was well-suppressed by therapy, using a tetramer assay.				
	• LTNPs have high memory CTLe numbers and low viral load, while HAART patients had low CTLe numbers and low viral load.				
Env	Env		HIV-1 exposed seronegative	human	Rowland-Jones2001
	Keywords review, HIV exposed persistently seronegative (HEPS).				
	• This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.				
	• The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.				
	• CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.				
	• CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.				
	• HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.				
Env			Vaccine	mouse	Nabel2002
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol				
	Keywords review.				
	• Env DNA constructs were designed that were codon optimized for human genes, express Env in the absence of the regulatory protein Rev, both increasing Env expression levels, deletions in the cleavage site and in the fusion domain. These constructs increased Ab responses to Env, while not diminishing CTL responses, when injected into mice.				
	• Removing N-linked glycosylation sites did not alter the humoral or cellular immune responses to this HIV protein, as has been seen in analogous SIV experiments.				
Env			HIV-1 exposed seronegative	human	De Maria1994, Kuhn2002
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission.				
	• 6/24 HIV uninfected infants (ages 15-50 months) born to HIV+ mothers had HIV-1 specific CTL responses to vaccinia-expressed Nef, Gag/Pol, Env.				
	• Reviewed in [Kuhn2002].				
Env			HIV-1 infection	human	Kuhn2002, Wasik1999
	Keywords HAART, HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission, rate of progression.				
	• In HIV-infected infants HIV-specific, CTL responses were not detectable in cord blood or in PBMC collected shortly after birth and were absent or remained very low in 3 infants with a rapidly progressive disease. For those who progressed more slowly, the HIV-specific CTL activity varied.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The two infants with high levels of Env peptide-stimulated IL-2 responses had the highest CTLp frequencies. • Stronger responses were detected after initiation of the antiretroviral therapy. • Two babies that were not infected though born to HIV+ mothers had detectable though low HIV-specific CTLp responses to Env (1/2), Pol (2/2), Gag (1/2) cord blood and transiently in PBMC after birth. • Reviewed in [Kuhn2002].				
Env			HIV-1 infection	human	Aldhous1994, Kuhn2002
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • Six of nine HIV vertically infected infants had HIV-1 specific CTL responses to vaccinia expressed Tat (4/6), Pol (6/6), Env (1/6), or Gag (1/6), but not all responses were detected at all time points. • Two of eleven babies that were not infected though born to HIV+ mothers had detectable responses Tat (1/2), Pol (2/2), Gag (1/2). • Reviewed in [Kuhn2002].				
Env			HIV-1 infection	human	Kuhn2002, McFarland1994
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • Only 9% of HIV+ infants had HIV-specific CTL against Env or Gag in unstimulated PBMC. After CD3 stimulation of PBMC, Gag and Env specific CTL were found in PBMC from 91% and 78% of HIV-infected children, respectively, with high precursor frequencies. • 2/9 babies that were not infected though born to HIV+ mothers had detectable responses to Env. • Reviewed in [Kuhn2002].				
Env			HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.				
Env			HIV-1 infection	human	Trabattoni2002
	Keywords HAART. • CD8+ T-cells that were stimulated by HIV-1 Env expressing targets from 25 HIV+ patients receiving ART and 17 ART-naive patients were compared. CTL from the individuals receiving ART showed increased TNFalpha production and a reduction of perforin and granzyme expressing CTL, suggesting a functional defect in ART-treated individuals, and a potential benefit of immunomodulants during therapy.				
Env	(HXB2)		HIV-1 infection	human	Edwards2002
	Keywords rate of progression. • 96% (26/27) chronically infected HIV-1 infected patients elicited gamma-IFN CD8+ T-cell responses against Gag. • Nef and/or Pol CTL responses were detected in 86% of the subjects. • The magnitude and breadth of Gag and p24 T-cell responses correlated with absolute CD4 counts, and inversely correlated with viral load. • Pol and Int CTL responses correlated positively with absolute CD4+ T-cell count. • Nef and Env responses did not correlate with either CD4 counts or viral load.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env	Env		Vaccine	mouse	Ishii2001
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* cationic liposome, GM-CSF, IL-2 **Keywords** Th2. • Vaccination route of HIV-1 DNA immunization with gp160 and Rev genes was compared including intranasal (i.n.), intramuscular (i.m.), and topical application of DNA directly on the skin after elimination of keratinocyte layers using a strong adhesive. Topical exposure resulted in high level CTL responses, IFN-gamma and IL-4 production, and delayed type hypersensitivity (DTH). Topical application favored Th2 responses. • DNA delivered topically with adjuvant-like cationic liposomes gave a stronger response than DNA alone, and co-administration of the DNA vaccine with IL-12 and GM-CSF expression vectors enhanced cytotoxic activity and DTH.			
Env			HIV-1 infection	human	Larsson2002b
	Keywords HAART, dendritic cells. • Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.				
Env	(IIIB)		HIV-1 infection	human	Trickett2002
	Keywords immunotherapy. • Conditions were optimized for ex-vivo expansion of CD8+ and CD4+ T-cells with the goal of functional T-cell production for autologous immunotherapy. 10,000-fold expansions were obtained in 14 days with optimized concentrations of IL-2, anti-CD3 and anti-CD28 coated microspheres, and decreasing amounts of serum over the first 8 days.				
Env	(IIIB)		HIV-1 and HCV co-infection	human	Lauer2002
	Keywords rate of progression. • HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFNgamma production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins. • All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load. • Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted. • HIV-specific CD4 proliferative responses were detected in 9/17 coinfected patients, but no HCV responses were detected.				
Env			HIV-1 infection	human	Luzuriaga1995
	Keywords responses in children. • 2/3 infants infected in utero had detectable HIV-1 Gag and Env specific CTL responses, one by 4 months, one by 11 months of age. Levels of the responses varied at different time point. Pol responses were not detected. • 2/4 infants infected intrapartum had detectable responses, one note until 11 months, one not until 42 months. • HIV-specific CTL were not detected in ten HIV- infants that were born to HIV+ mothers.				
Env			Vaccine	human	Gupta2002
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *HIV component:* Env, Gag • A safety and immunogeniticity study of a vaccine dosing schedule was studied in a trial conducted in high and low risk study subjects. There was a 76% cumulative probability of detecting a Gag or Env CTL response by day 728.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env			HIV-1 infection	human	Scott2001

Keywords HAART, responses in children.

- CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.
- Before ART 2/13 infants <6 months of age showed IFNgamma Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy– 3 infants were coinfected with CMV and all 3 had CMV-specific CD8+ T-cell responses.
- One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.
- Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.

Env	(IIIB)		HIV-1 infection	human	Ortiz2001

Keywords HAART, supervised treatment interruptions (STI).

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.
- One of seven subjects with a detectable NAb response had an augmented neutralization titer in response to STI.

Env	(SF2)		HIV-1 infection	human	Tomiyama2002

Keywords class I down-regulation by Nef.
Donor HLA B*3501, A*2402, B*5101, B*3303.

- Nef down-regulates class I molecules, and the killing activity of HLA B*3501, A*2402, B*5101 and B*3303-restricted HIV-1-epitope specific CTL clones was inhibited by an HIV-1 strain carrying Nef, relative to a Nef-deleted virus; while Nef-induced HLA class I down-regulation inhibited lysis, it did not abolish cytokine production by HIV-1-specific CD8+ T-cells.

Env	Env (gp160) (IIIB)		Vaccine	macaque	Akahata2003

Vaccine *Vector/Type:* DNA *Strain:* B clade NL43 *HIV component:* Env

- Four monkeys were injected i.m. with a SHIV plasmid (SHIV-NM-3rn ZF1*) which encodes all viral proteins driven by the SIV LTR promoter. Infectivity is prevented by the introduction of mutations within the zinc-finger motifs of the nucleocapsid (NC) that prevents RNA packaging. An original NC ZF1 mutant plasmid was constructed using NL43 (Akahata 275:116-124 (2000) – the SHIV construct was made as an alternative to get improved expression in macaques using an SIV promotor. CTL were detected by lysis of HIV-1 Env IIIB or SIV Gag mac239 expressing expressing target cells, and a T cell proliferative response to Env was observed. Env-directed antibodies were detected by ELISA. All vaccinated macaques had a low peak viral loads that fell below the level of detection within 6 weeks post-challenge with autologous SHIV SHIV-NM-3rn.

Env	Env (MN)		SIV infection, SHIV infection	macaque	Calarota2003

Keywords assay standardization.
Assay type CD8 T-cell Elispot - IFNγ.

- The senstitivity of gamma INF Elispot assays can be enhanced for the detection of low frequency responses, like after ART, by adding IL-15 to the assay.
- CD8+ T-cells from SHIV and SIV infected macaques with peptide pools from Gag and Env were used to test this system.

Env	Env			human	Currier2003

Keywords inter-clade comparisons.
Assay type Flow cytometric CTL assay.

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env. • For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.				
Env	Env (HIV-1 IIIB)		HIV-1 exposed seronegative	human	Fowke2000
	Keywords HIV exposed persistently seronegative (HEPS). **Assay type** cytokine production. • A cohort of Nairobi sex-workers were defined as resistant to HIV-infection by virtue of remaining seronegative despite repeated high risk exposures. 24 were tested for HIV specific T-helper responses detemined by IL-2 production *in vitro* in response to gp120 peptides or soluble gp120 protein. • 7/17 resistant women showed IL-2 stimulation which was greater than or equal to 2.0, and specific CTL responses were detected in 15/22 resistant women as compared to 0/12 of the control low-risk subjects.				
Env			computer prediction	(A*0201, B*3501)	Schönbach2002
	Keywords inter-clade comparisons, computational epitope prediction. • Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.				
Env			Vaccine	human (A1, A2, A24, B62, A25, A26, A30, A31, B8, B17, B39, B51, B57, B60, B62, B70)	Ferrari2001
	Vaccine *Vector/Type:* canarypox prime with gp120 boost, canarypox prime with gp160 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Nef, Pol **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance. • Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2 • HLA-B62 responses dominated the responses against an Env vaccine in an individual (022JAV) who was HLA A2, A26, B35, B62. The strongest response was against the MN peptide 381-400; a response diminished by half was observed against vaccinia expressed clade A and clade C relative to clade B. • Class I presentation of Env CTL responses in vaccinee 022A12K: A25 > B39, A1 and B8 were undetectable. • Class I presentation of Env CTL responses in vaccinee 022A12N: B57 » A2 > A26 and B60. • Class I presentation of Env CTL responses in vaccinee 034GP3: A31 > A24 > B62 > B51. • Class I presentation of Env CTL responses in vaccinee 0348PP: B17 > B70, A1 and A30 were undetectable.				
Env	gp120 (303–327)		HIV-1 infection	human (A2, A3, A11, B27)	Ferrari2000
	Keywords inter-clade comparisons. • One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles. • For this cluster of epitopes spanning the tip of the V3 loop, they suggest including a sequence from each clade.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Env			Vaccine	human (A2, B8)	Ferrari2001
	Vaccine *Vector/Type:* canarypox prime with gp120 boost, canarypox prime with gp160 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Nef, Pol **Keywords** vaccine-induced epitopes. • Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2 • No HLA-A*0201 or B8 responses were made against the Env vaccine in individuals carrying these alleles, despite these being common presenting molecules for CTL responses to natural infections.				
Env	Env		HIV-1 infection	human (B*35)	Jin2002
	Keywords rate of progression. • Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501. • Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env. • The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.				
Env	gp41 (842–850 IIIB, BH8)		HIV-1 infection	human (B7)	Pantaleo1997, Soudeyns1997
	• Clonotype-specific PCR and analysis of *in vivo* HIV-specific CTL showed that in early infection HIV-specific CTL clones preferentially accumulate in blood rather than lymph nodes and that they accumulate prior to down-regulation of virus.				
Env	gp160 (MN)		Vaccine	mouse (H-2^{d})	Vinner1999
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* gp120, gp160 • Mammalian codon optimization renders gp160 expression Rev independent, increases gp160 expression levels, and DNA vaccination of BALB/c mice yields a higher antibody response with an earlier onset than wild type. • Secreted gp120 gave higher antibody titers than membrane bound gp160. • In contrast to antibodies, synthetic codon-optimized DNA did not alter the CTL response, wild type genes generated equally strong CTL responses.				
Env	(IIIB)		Vaccine	mouse (H-2^{d})	Kato2000
	Vaccine *Vector/Type:* peptide *HIV component:* V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-4 • A multicomponent peptide vaccine VC1 with cholera toxin adjuvant was given to mice. • Immunization of BALB/c mice with VC1 and CT induced a strong CTL response which was enhanced by IL-12 expressing plasmids. • Immunization with VC1 and CT resulted in HIV-1 specific IgA antibody responses, which were increased by the combination of IL-4 or GM-CSF expressing plasmids.				
Env	gp160 (IIIB)		Vaccine	mouse (H-2^{d})	Kaneko2000
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* PLG • A PLG-microparticle encapsulated DNA encoding gp160 was given to mice. • Oral DNA vaccination of BALB/c mice induced mucosal and systemic gp160 glycoprotein-specific cellular and humoral immune responses, and mice vaccinated orally had higher resistance to HIV-env expressing vaccinia intrarectal challenge than mice vaccinated i.m.				
Env	Env		Vaccine	mouse (H-2^{d})	Ishii1997
	Vaccine *Vector/Type:* DNA with CMV promotor with cationic liposome *HIV component:* gp160, Rev				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• pCMV160/Rev is a DNA vaccine candidate carrying gp160 and Rev linked to a cytomegalovirus (CMV promotor)				
Env	Env		Vaccine	mouse (H-2^d)	Xin2001
	Vaccine *Vector/Type:* adeno-associated virus (AAV) *HIV component:* Env, Rev, Tat *Adjuvant:* IL-2 • An AAV vector expressing HIV-1 env, tat, and rev genes (AAV-HIV vector) was used to vaccinate BALB/c mice. • A single injection stimulated and long lasting serum IgG, fecal IgA, and HIV-specific CTL. • Boosting enhanced the humoral response, and IL2 enhanced T-cell immunity.				
Env	Env		Vaccine	mouse (H-2^d)	Gonzalo1999
	Vaccine *Vector/Type:* vaccinia, influenza *Strain:* B clade IIIB *HIV component:* Env, V3 • The use of two different live vectors for priming and boosting has a synergistic effect on the immune response against HIV-1 – a 5-6 fold enhanced CTL response in Balb/c mice occurred when they were immunized with rec influenza virus (Flu-Env) expressing the V3 loop epitope from HIV-1 strain IIIB, and boosted with a vaccinia virus recombinant (VV-Env) expressing the complete HIV-1-IIIB env protein, comared to either immunogen alone.				
Env	Env (subtype B)		Vaccine	mouse (H-2^d)	McGettigan2001
	Vaccine *Vector/Type:* rabies virus *Strain:* B clade 89.6, B clade NL43 *HIV component:* gp160 • BALB/c were immunized with a replication competent recombinant rabies virus (RV) vaccine expressing HIV-1 gp160. • A single vaccination induced induced strong and long-lasting (4.5 months) gp160-specific CTL cytotoxic responses. • Although the greatest specific lysis was achieved when the vaccine strain was also used as the *in vitro* the target strain to assess the response, there was extensive CTL cross-reactivity against other B clade HIV-1 envelope proteins, implying CTL recognition of multiple epitopes within the HIV-1 envelope protein.				
Env	gp120		Vaccine	mouse (H-2Dd)	Bagley2003
	Vaccine *Vector/Type:* DNA *HIV component:* gp120 *Adjuvant:* Cholera toxin (CT) **Assay type** T-cell Elispot, Chromium-release assay. • BALBc mice were immunized intramuscularly with single plasmids encoding gp120, or cholera toxin catalytic domain (CTA1) and gp120, or with a dicistronic DNA vaccine expressing both CTA1 and gp120. Vaccination including CTA elicited stronger and longer lasting Ab responses and T-cell responses to gp120.				
Env	Env (SIV)		SIV infection	macaque (Mamu-A*11, -B*03, -B*04, and -B*17)	Dzuris2000
	• Cell binding assays for Mamu molecules were employed to describe the peptide binding motifs for Mamu-A*11, -B*03, -B*03, -B*04, and -B*17 CTL epitopes – a similarity for Mamu-A*11 and -B*03 and human HLA-B*44 and -B*27, respectively, was observed – all epitopes studied were SIV epitopes, so not specifically listed here.				

II-B-21 Nef CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (1–16)	Nef (1–16)	MGGKWSKSSIVGWPAV	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
Nef (13–20)	Nef (13–20 LAI)	WPTVRERM	HIV-1 infection	human (B*0801)	Frahm2004, Goulder1997g
	• C. Brander notes this is a B*0801 epitope.				
Nef (13–20)	Nef (HXB2)	WPTVRERM	HIV-1 infection	(B*0801)	Peng2001
	Keywords class I down-regulation by Nef. • Deletion of the 19 N-terminal amino acids from Nef including the myristolation signal eliminates Nef-induced down-regulation of MHC class I and CD4 molecules. Such a construct has the potential to serve as a more potent immunogen. The known T-cell epitopes that that would be disputed by this deletion are minimal, including the HLA-B8 CTL epitope WPTVRERM.				
Nef (13–20)	Nef (13–20 LAI)	WPTVRERM	HIV-1 infection	human (B8)	Goulder1997g
	• Unusual epitope for HLA-B8, but compatible with crystal structure predictions.				
Nef (13–20)	Nef (13–20)	WPTVRERM	HIV-1 infection	human (B8)	Betts2000
	Keywords immunodominance. • Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant. • 95 optimally-defined peptides from this database were used to screen for INFγ responses to other epitopes. • 1/11 of the HLA A2+ was HLA A*0201, A31, B8, B51 and responded to this epitope as well as seven others.				
Nef (13–20)	Nef (13–20 SF2)	WPTVRERM	HIV-1 infection	human (B8)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B8+ individuals that had a CTL response to this epitope broken down by group: 1/3 group 1, 0/3 group 2, and 1/2 group 3.				
Nef (13–20)	Nef (13–20)	WPTVRERM	HIV-1 infection	human (B8)	Day2001
	• B8-restricted CTL accounted for about 1/3 of the total CTL response in one individual.				
Nef (19–27)	Nef (19–27)	RMRRAEPAA	HIV-1 infection	human (B*1501)	Frahm2004
Nef (19–27)	Nef (19–27)	RMRRAEPAA	HIV-1 infection	human (B62)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Donor HLA A*0201, A29, B58, B62, Cw*0301, Cw*1601. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.				
Nef (37–45)	Nef (37–45)	LEKHGAITS	HIV-1 infection	human (B*4001)	Frahm2004
Nef (37–45)	Nef (37–45)	LEKHGAITS		human (B*50)	Frahm2004
Nef (42–50)	Nef (44–52 HXB3)	ALTSSNTAA	Vaccine	mouse (HLA-A201 transgenic)	Sandberg2000
	Vaccine *Vector/Type:* DNA, peptide *Strain:* B clade HXB3 *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** binding affinity, computational epitope prediction. • Ten Nef 9-mer peptides were predicted to have a strong binding affinity with HLA-A*0201 – of these, four did bind strongly by a T2 class I stabilization assay, several others bound weakly. • A CTL immune response to only 3/10 peptides was detected by a 51Cr-release assay after immunization of HLA-A201 transgenic mice with either nef DNA under the control of a CMV promotor, coated on gold particles delivered to abdominal skin by gene gun. • ALTSSNTAA was also tested by subcutaneous injection of Nef peptides in Freund's adjuvant. • ALTSSNTAA bound weakly to HLA-A2, but it had the strongest CTL response among the three elicited by the DNA vaccine and a strong response to the peptide vaccination.				
Nef (48–56)	Nef (58–66 JRFL)	TAATNADCA	Vaccine	mouse (H-2^b)	Liang2002
	Vaccine *Vector/Type:* DNA *Strain:* B clade JRFL • BALB/c, C3H/HeN and C57BL/6 mice were given intramuscular immunization with Nef DNA constructs – C57BL/6 responded to this epitope. • The Nef mutant that lacked the myristylation site (G–>A) at position 2, and the dileucine motif (L –> A at positions 174 and 175) was impaired in terms of its ability to elicit induction of Nef-specific CD4+ and CD8+ T-cell responses. The myristylation site is critical for Nef membrane localization and function, and the di-leucine motif for the down-regulation of surface CD4 molecules, and the mutation of these regions could yield a safer vaccine. • N-terminal addition of human tissue plasminogen activator (TPA) to Nef, enhanced CD8+ T-cell responses and could compensate for the G2A, L174A, L175A mutations – this enhanced immunogenicity correlated with enhanced levels of protein expression in transfected cells.				
Nef (50–58)	Nef (50–)	ATNADCAWL	HIV-1 infection, Vaccine	human (A2)	Corbet2003
	Vaccine *Vector/Type:* peptide *HIV component:* Nef *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Nef50. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This peptide was a low A2-binder that did not induce CTL or CD8+ T-cell IFN gamma responses in mice. Responses were detected in 2/17 HIV+ HLA-A2 subjects.				
Nef (62–81)	Nef (61–80)	EEEEVGFPVTPQVPLRPMTY	HIV-1 infection	human	Lieberman1995
	• HIV-specific CTL lines developed by *ex vivo* stimulation with peptide.				
Nef (62–81)	Nef (61–80 SF2)	EEEEVGFPVTPQVPLRPMTY	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Twelve subjects had CTL that could recognize vaccinia-expressed LAI Nef. • Two of these 12 had CTL response to this peptide. • The responding subjects were HLA-A11, A24, B8, B35, and HLA not determined.				
Nef (62–81)	Nef (61–80 SF2)	EEEEVGFVTPQVPLRPMTY	HIV-1 infection	human	Lieberman1997b
	• CTL expanded *ex vivo* were later infused into HIV-1 infected patients.				
Nef (62–81)	Nef (SF2)	EEEEVGFPVTPQVPLRPMTY	HIV-1 infection	human	Altfeld2001a
	• HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study. • Nef peptides PQVPLRRMTYKAAVDLSHFL, KAAVDLSHFLKEKGGLEGLI and EEEEVGFPVTPQVPLRPMTY were recognized and the first two share KAAVDLSHFL (a Cw8 epitope), the first and last share PQVPLRPMTY.				
Nef (66–80)	Nef (66–80 BRU)	VGFPVTPQVPLRMT	HIV-1 infection	human (A1, B8)	Hadida1992
	• HIV-1 specific CTLs detected in lymphoid organs of HIV-1 infected patients.				
Nef (66–80)	Nef (64–78)	VGFPVTPQVPLRMT	HIV-1 infection	human (A1, B8)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
Nef (66–97)	Nef (66–97 LAI)	VGFPVTPQVPLRPMTYKAA-VDLSHFLKEKGGL	Vaccine	human	Gahery-Segard2000
	Vaccine *Vector/Type:* lipopeptide • Anti-HIV lipopeptide vaccine consisting of six long amino acid peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial. • A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 5/10 reacted to this Nef peptide. • 9/12 tested mounted a CTL response to at least one of the six peptides; each of the six peptides elicited a CTL response in at least one individual. • 5/12 tested had an IgG response to this peptide.				
Nef (67–81)	Nef (67–81)	GFPVRPQVPLRPMTY	HIV-1 infection	human	Novitsky2002
	Keywords inter-clade comparisons. • HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein. • Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses. • This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.				
Nef (68–76)	Nef (68–76)	FPVTPQVPL	HIV-1 infection	human (B*0702)	Frahm2004

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (68–76)	Nef (72–80 SF2)	FPVRPQVPL	HIV-1 infection	human (B*3501)	Tomiyama1997
	• A CTL clone responsive to this epitope was obtained. • 3/7 B35-positive individuals had a CTL response to this epitope. • An R to T substitution at position 4 abrogates specific lysis, but not binding to B*3501.				
Nef (68–76)	Nef (72–80)	FPVRPQVPL	HIV-1 infection	human (B*3501)	Tomiyama2000a
	• CD8+ T-cells that bound one of six HIV-specific B*3501-epitope tetramers did not express CD28 or CD45A. • A significant increase in CD28-CD45RA- cells and a decrease of CD28+CD45RA+ cells was observed in chronically HIV-1-infected individuals relative to healthy individuals. • CD28-CD45RA- cells are likely to be effector cells and have high levels of perforin in their cytoplasm. • The mean percentage of total CD28- CD8+ cells in chronically infected HIV-1-infected patients was 76.6% in comparison to HIV-1-uninfected individuals (40.6%)				
Nef (68–76)	Nef (72–80 SF2)	FPVRPQVPL	HIV-1 infection	human (B35)	Shiga1996
	• Binds HLA-B*3501.				
Nef (68–76)	(SF2)	FPVRPQVPL	HIV-1 infection	human (B35)	Kawana1999
	Keywords rate of progression. • HLA B35 is associated with rapid disease progression. • The sequences of 9 previously described HIV-1 B35 CTL epitopes were obtained in 10 HLA B35+ and 19 HLA B35- individuals. • 3/9 CTL epitopes had substitutions that were more common in B35+ individuals than in B35- individuals, but this was one of the six that had no B35 associated pattern of mutation.				
Nef (68–76)	Nef (66–74)	FPVRPQVPL	HIV-1 infection	human (B35)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
Nef (68–76)	Nef (68–76 BRU)	FPVTPQVPL	HIV-1 infection	human (B35)	Choppin2001
	Keywords binding affinity, epitope processing. • Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein. • 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing. • FPVTPQVPL was recognized in 1/13 (8%) of individuals with HLA B7, and 1/12 (8%) of individuals with HLA B35. It was a high affinity HLA binder.				
Nef (68–76)	Nef (68–76)	FPVTPQVPL	in vitro stimulation or selectio	human (B7)	Wilson1999b
	Keywords binding affinity, dendritic cells, Th1. • Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors. • Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within. • B7 and A2 Nef epitopes were studied – FPVTPQVPL has a high affinity for B7.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (68–76)	Nef (68–76)	FPVTPQVPL	HIV-1 infection	human (B7)	Day2001
	Keywords rate of progression, acute infection.				
	• The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)				
	• 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.				
	• Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.				
	• An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes.				
	• The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.				
	• The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.				
Nef (68–76)	Nef (68–76 BRU)	FPVTPQVPL	HIV-1 infection	human (B7)	Choppin2001
	Keywords binding affinity, epitope processing.				
	• Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.				
	• 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.				
	• FPVTPQVPL was recognized in 1/13 (8%) of individuals with HLA B7, and 1/12 of individuals with HLA B35. It was a high affinity HLA binder.				
Nef (68–76)	Nef (68–76)	FPVTPQVPL	HIV-1 infection	human (B7)	Yu2002a
	Keywords dynamics, supervised treatment interruptions (STI), acute infection.				
	Donor HLA A3, B7, Cw7.				
	• CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.				
	• One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.				
	• 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. Also, none of 4 individuals had detectable responses to this epitope after STI.

Nef (68–77)	Nef (68–77 LAI)	FPVTPQVPLR	HIV-1 infection	human (B7)	Haas1996
	• There was a high degree of variation in three CTL epitopes in Nef in four slow and non-progressors, and variant specific CTLs arose over time to eliminate variants, indicating immune selection.				
Nef (68–77)	Nef (subtype B)	FPVTPQVPLR	HIV-1 infection	human (B7)	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS), escape.				
	• This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.				
	• FPVTPQVPLR was recognized in 1 of the 6 women (ML1203), and the response was present in the last available sample prior to seroconversion, 7 months.				
	• 20/20 sequences of the infecting strain had no substitutions in this epitope, all were FPVTPQVPLR, so there was no evidence for escape.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was recognized in 1/22 HEPS sex worker controls, ML851.				
Nef (68–77)	Nef (66–75)	FPVRPQVPLR	HIV-1 infection	human (B7)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
Nef (68–77)	Nef (68–77 SF2)	FPVTPQVPLR	HIV-1 infection	human (B7)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 0/4 group 1, 0/3 group 2, and 1/1 group 3.				
Nef (68–77)	Nef (68–77)	FPVTPQVPLR	HIV-1 infection, HIV-1 exposed seronegative	human (B7)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.

	Keywords inter-clade comparisons. • Nef sequences were obtained from Brazilians to study epitope diversity in this geographic region—the HXB2 sequence is FPVTPQVPLRMTY, but fpvRpqvplrmty was observed in most Brazilian sequences regardless of the subtype (A, C, D and F).				
Nef (68–84)	Nef	FPVRPQVPLRPMTYKGA		human	Jubier-Maurin1999
	Keywords inter-clade comparisons. • 41 new HIV-1 strains describing envelope subtypes of HIV-1 A-H were genetically characterized in the nef region – 34 subtypes were classified in the same subtype in nef and env and 7 of the 41 strains were recombinants. • This region was defined as a CTL epitope region that is conserved among HIV-1 M group subtypes.				
Nef (70–84)	Nef (70–84 HXB2)	VTPQVPLRPMTYKAA	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 34% of the study subjects, and it was the second most frequently recognized peptide.

Nef (71–79)	Nef	TPQVPLRPM	HIV-1 infection	human (B7)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** B7-TM9(Nef). **Donor HLA** A32,A?,B7,B14; A24,A?,B7,B27. • Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT). Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

	Keywords epitope processing, dendritic cells. • This study demonstrates that lipopeptides carrying epitopes can be taken up by human dendritic cells, processed using different pathways, and recognized by epitope-specific CD8+ T-cells originally derived from HIV+ individuals. The RT ILKEPVHGV peptide was embedded in a longer peptide fragment in the lipopeptide, and was internalized by endocytosis and processed in the cytosol by proteasomal cleavage by following an endosome-to-cytosol pathway for processing and presentation. Administration of epoxomycin, a proteasome inhibitor, completely abrogated epitope presentation to a CD8+ T-cell line, while monensin, an inhibitor of acid-dependent endosomal enzyme activity did not. • In contrast to the RT epitope, dendritic cell presentation of the Nef epitope QVPLRPMTYK embedded in a longer peptide in a lipopeptide was not inhibited by epoxomycin, but was inhibited by monensin, indicative of endocytolitic epitope processing.				
Nef (73–82)	Nef	QVPLRPMTYK	HIV-1 infection, Vaccine	human, macaque (A*0301, A11)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000]. • Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
Nef (73–82)		QVPLRPMTYK	HIV-1 infection	human (A03)	Sabbaj2002b
	Epitope name Nef-QK10. • Among HIV+ individuals who carried HLA A03, 9/20 (45%) recognized this epitope.				
Nef (73–82)	Nef (73–82)	QVPLRPMTYK	HIV-1 infection	human (A11)	Le Borgne2000
	• Soluble factors in supernatant from both an HIV-specific cloned CTL line and an EBV (Epstein-Barr-virus) CTL line inhibit viral replication, but do not block viral entry in CD4+ T lymphocytes, by a noncytotoxic mechanism.				
Nef (73–82)	Nef (73–82 LAI)	QVPLRPMTYK	HIV-1 infection	human (A11)	Robertson1993
	• Development of a retroviral vector (pNeoNef) to generate autologous CTL targets. • [Hunziker1998] suggests that HLA-A2 does not in fact present this epitope. • The initial assignment of HLA-A2 presentation for this epitope was based on a serological HLA typing. Subsequently, the authors revisited the issue with genetic HLA typing and found that HLA-A11 was the correct presenting molecule (Dr. Florence Buseyne, pers. comm., 2000)				
Nef (73–82)	Nef (73–82 LAI)	QVPLRPMTYK	HIV-1 infection	human (A11)	Couillin1994, Goulder1997a
	Keywords review, escape. • Mutational variation in HIV epitopes in individuals with appropriate HLA types can result in evasion of CTL response. • [Goulder1997a] is a review of immune escape that summarizes this study.				
Nef (73–82)	Nef (73–82 LAI)	QVPLRPMTYK	HIV-1 infection	human (A11)	Couillin1995
	• Mutations found in this epitope in HLA-A11 positive and negative donors were characterized.				
Nef (73–82)	(LAI)	QVPLRPMTYK		(A11)	Buseyne1999, Frahm2004
Nef (73–82)	Nef (73–82)	QVPLRPMTYK	HIV-1 infection	human (A11)	Oxenius2000
	Keywords HAART, supervised treatment interruptions (STI), immunodominance, acute infection. **Epitope name** QVP. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • One of the 2/8 HLA-A11 study subjects recognized this CTL epitope. • Patient SC18(HLA A2/11, B8/44, Cw06/0701, DR3/7, DR52/53, DQ2) recognizes the epitopes ACQGVGGPGHK, QVPLRPMTYK, AVDLSHFLK, and one called QIY but not fully described – he had brief therapy upon seroconversion and has had low viral load during 600 days of follow up.

	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A1, A3, B7, B14, cw*0702, Cw*0802.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.				
Nef (73–82)	Nef (73–82 LAI)	QVPLRPMTYK	HIV-1 infection	human (A3 supertype)	Mollet2000
	Keywords HAART, supertype. **Epitope name** N1. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.				
Nef (73–82)	Nef (94–103)	QVPLRPMTYK	HIV-1 infection	human (A3 supertype)	Propato2001
	Keywords supertype, rate of progression. • Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes. • Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs. • A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus. • This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).				
Nef (73–82)	Nef (73–82 BRU)	QVPLRPMTYK	HIV-1 infection	human (A3, A11, B35)	Culmann1991

Nef (74–81)	Nef (subtype B)	VPLRPMTY	HIV-1 exposed seronegative	human (B35)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among A, B, and D clade viruses.				
Nef (74–81)	Nef	VPLRPMTY		human (B35)	Rowland-Jones1999
	• CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5. • In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, • HIV-2 version of this epitope is conserved: VPLRPMTY, and CTLs are cross-reactive – one of five B35 CTL epitopes that are cross-reactive, see also [Rowland-Jones1995b]				
Nef (74–81)	Nef (74–81)	VPLRPMTY	HIV-1 infection	human (B35)	Oxenius2000
	Keywords HAART, acute infection. **Epitope name** VPL. • Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • One of two HLA B35+ among the eight study subjects recognized this epitope. • Patient SC15 (HLA A1/68, B8/35, Bw4/6, Cw4/0704) was given acute and sustained therapy and recognized epitopes PPIPVGDIY and VPLRPMTY during 331 days of HAART treatment.				
Nef (74–81)	Nef (75–82)	VPLRPMTY	HIV-1 infection, HIV-1 exposed seronegative	human (B35)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVIYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion.				
Nef (74–81)		VPLRPMTY	HIV-1 infection	human (B35)	Sabbaj2002b
	Epitope name Nef-VY8. • Among HIV+ individuals who carried HLA B35, 12/22 (55%) recognized this epitope. • Among HIV+ individuals who carried HLA B*5301, 0/11 (0%) recognized this epitope.

Nef (74–81)	Nef (74–81 BRU)	VPLRPMTY	HIV-1 infection	human (B35)	Choppin2001

Keywords binding affinity, epitope processing.

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- VPLRPMTY was recognized in 5/16 (31%) of individuals with HLA B35, and it was a moderate affinity HLA binder. Cleavage at the C-term Y was frequent *in vitro*.

Nef (74–81)		VPLRPMTY	HIV-1 infection, Vaccine	human, macaque (B35)	Hanke2000, Wee2002

Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance.

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].

Nef (74–81)	Nef (74–81)	VPLRPMTY	HIV-1 infection	human (B35)	Cao2003

Keywords acute infection, early treatment.
Assay type CD8 T-cell Elispot - IFNγ.
Donor HLA A1, A3, B8, B35.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. SubjectBroadcast message from root Thu May 27 21:34:36 2004...n of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma vBattery Low Notification from APM BIOS (8% 0:12)or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Nef (77–85)	Nef (77–85)	RPMTYKAAV	HIV-1 infection	human (B7)	Yu2002a

Keywords dynamics, supervised treatment interruptions (STI), acute infection.
Epitope name B7-RV9.
Donor HLA A3, B7, Cw7.

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 2/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 3/4 individuals had detectable responses to this epitope after STI.

Nef (77–91)	Nef (77–91)	RPMTYKGAFDLSFFL	HIV-1 infection	human	Novitsky2002

Keywords inter-clade comparisons.

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.
- Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.
- This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

Nef (79–87)	Nef (81–89 HXB3)	MTYKAALDL	Vaccine	mouse (HLA-A201 transgenic)	Sandberg2000

Vaccine *Vector/Type:* DNA, peptide *Strain:* B clade HXB3 *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA)
Keywords binding affinity, computational epitope prediction.

- Ten Nef 9-mer peptides were predicted to have a strong binding affinity with HLA-A*0201 – of these, four did bind strongly by a T2 class I stabilization assay, several others bound weakly.
- A CTL immune response to only 3/10 peptides was detected by a 51Cr-release assay after immunization of HLA-A201 transgenic mice with either nef DNA under the control of a CMV promotor coated on, gold particles delivered to abdominal skin by gene gun.
- MTYKAALDL bound weakly to HLA-A2, but the DNA nef vaccine elicited a good CTL response.

Nef (80–94)	Nef (80–94 HXB2)	TYKAAVDLSHFLKEK	HIV-1 infection	human	Addo2003

Keywords supervised treatment interruptions (STI), immunodominance, early treatment.
Assay type T-cell Elispot.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 47% of the study subjects, and it was the most frequently recognized peptide.

- AALDLSHFL was predicted to have a strong binding capacity for HLA-A2, and did, but it was the only one of the peptides recognized that was a strong binder, the other two recognized peptides were weak binders.
- AALDLSHFL was also tested by subcutaneous injection of Nef peptides in Freund's adjuvant and gave a strong response to the peptide.

Nef (83–92)	Nef (81–90 93TH253 subtype CRF01)	GAFDLSFFLK	HIV-1 infection	human (A11)	Sriwanthana2001

Keywords HIV exposed persistently seronegative (HEPS).

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Epitope name N83-92. • This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand. • HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed. • This epitope was strongly reactive in HIV+ study subjects 053 and 184 who carried HLA-A11.				
Nef (83–92)	Nef (81–90 93TH253 subtype CRF01) **Keywords** inter-clade comparisons. • HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive. • 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified. • This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined. • 4/8 tested FSWs recognized this epitope. • This epitope was only conserved in CRF01 and subtype C, and exact matches were uncommon.	GAFDLSFFLK	HIV-1 infection	human (A11)	Bond2001
Nef (83–92)	Nef (83–92) **Keywords** acute infection, early treatment. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A*0201, A11, B51, B61, Cw2, Cw14. • CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.	AAVDLSHFLK	HIV-1 infection	human (A11)	Cao2003

Nef (84–92)	Nef (84–92)	AVDLSHFLK	HIV-1 infection	human (A*1101)	Fukada2002
	Keywords inter-clade comparisons. • Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals. • AVDLSHFLK was found to elicit clade-specific responses in clade B (AVDLSHFLK is most common, aLdlshflk is a common variant also found in clade A) and clade E (aFdlsFflk is most common and is also common in clade C). AVDLSHFLK was strongly recognized by CTL from 2/5 B clade infected Japanese subjects, as was aLdlshflk, and aFdlsFflk by CTL from 5/7 E clade infected Thai subjects. • The binding of aFdlsFflk to HLA A*1101 was 10-50 times lower than the other variants, and bulk CTL generated from individuals did not cross-react with the cross-clade peptides.

	Keywords epitope processing.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• KM is a B60 restricted CTL clone that recognizes KEKGGLEGL. • CTL could be activated by a fusion protein of an HIV protein and anthrax lethal factor (LFn-HIV) that promotes antigen presenting cell uptake of exogenous protein and allows processing through the MHC class I pathway. This strategy for CTL detection could allow antigen presentation without generation of cells by the standard methods of using live viral vectors carrying a protein, or by loading the cells with peptides and by-passing processing.				
Nef (92–100)	Nef (92–100 NL-43)	KEKGGLEGL	HIV-1 infection	human (B60)	Ali2003
	Keywords class I down-regulation by Nef, escape. • NL43 was passaged in the presencNL43 was passaged in the presence of Nef KEKGGLEGL-specific CTL clones STD11 and KM3, rapid selection of escape mutations, including E93G, E93K, K94N+G99R, G95R+G99R, E98K, E98D, G99R, G99E, L100P, and L100I; insertions, deletions, frameshifts and an early stop codon. 34/36 (94%) of sequences carried mutations in the epitope by seven days, 36/36 (100%) by 14 days. • NL43 was also passaged in the presence of a Nef TQGYFPDWQNY-specific CTL clone. 7/15 clones had a frameshifting or stop codon introduced by one week; F121T was also observed. The most common escape mutation for both Nef epitopes was an early stop codon at position 91. • Several mutations selected by KEKGGLEGL-specific CTL were shown to impair the down regulation of class I MHC by Nef, in particular E93G, E93K, and a truncation mutation at position 51. • Nef deletion mutants increased 100-fold NL-43 susceptibility to inhibition by CTL specific for epitopes in other proteins, the A2 epitopes ILKEPVHGV in RT and SLYNVATL in p17 Gag.				
Nef (92–100)	Nef	KEKGGLEGL	HIV-1 infection	human (B60)	Montefiori2003
	Keywords supervised treatment interruptions (STI), early treatment. **Epitope name** KL9. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A2, A24, B38, B60, Cw2, Cw12. • HIV-1+ patient AC10 underwent early HAART treatment, which was discontiuned 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.				
Nef (92–100)	Nef (92–100 NL43)	KEKGGLEGL	HIV-1 infection	human (B60)	Yang2003
	Keywords escape. **Epitope name** KL9. **Assay type** Chromium-release assay, CTL suppression of replication. • Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts. • Two cloned CTL lines recongized KEKGGEGL, STD11 and KM3. Highly resistant clones emerged after a single round of passage with both CTL clones, and multiple substitutions accrued including frameshits and stop codons, reflecting the dispensability of Nef in viral culture. • The following epitope variants were observed after passaging with clone STD11 for one week: kekggegI, kKkggegl, and 12/20 frameshifts and 1 early stop. By two weeks, a more complex polyclonal mixture was observed including: kekggegI, kKkggegl kekggegP, kekggeEl, kekggeRl, kekRgeRl, keNggeRl, and 11/22 framshifts.

	• A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Nef (115–129)	Nef (115–129 HXB2) **Keywords** supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2. • Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides. 	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B7 women, 4/5 HEPS and 5/6 HIV-1 infected women recognized this epitope. • The dominant response to this HLA allele was to this epitope in 3 of the 4/5 HEPS cases and in 2 of the 5/6 HIV-1 infected women. • Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.			
Nef (128–137)	Nef (128–137)	TPGPGVRYPL	HIV-1 infection	human (B7)	Appay2000
	• Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV. • HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation. • In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α			
Nef (128–137)	Nef (128–137)	TPGPGVRYPL	HIV-1 infection	human (B7)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person. • Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes. • An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes. • The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested. • The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.			

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef (128–137)	Nef (128–137 BRU)	TPGPGVRYPL	HIV-1 infection	human (B7)	Choppin2001

Keywords binding affinity, epitope processing.

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- TPGPGVRYPL was recognized in 8/16 (50%) of individuals with HLA B7, and 1/9 (11%) of individuals with HLA B35. It was a high affinity HLA binder.

Nef (128–137)	Nef	TPGPGVRYPL	HIV-1 infection	human (B7)	Yu2002a

Keywords dynamics, supervised treatment interruptions (STI), acute infection.
Epitope name B7-TL10.
Donor HLA A3, B7, Cw7.

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

Nef (128–137)	Nef	TPGPGVRYPL	HIV-1 infection	human (B7)	Appay2002

Keywords HAART.
Donor HLA A2,A3,B7,Bw6.

- Four HIV patients with prolonged clinically successful anti-viral therapy but with ongoing evidence of replication and Nef mRNA transcription, showed specific T-cell responses by Elispot and Tetramer staining, maintained for 2-4 years after initiation of HAART.
- Nef epitope recognition was detected in all 4 subjects, gp120, Pol and Gag-specific in 1 or 2 subjects.
- The HIV-specific CD8+ T-cells had an intermediate maturation phenotype characterized by low levels of perforin and high levels of CD27 expression.

Nef (128–137)	Nef	TPGPGVRYPL	HIV-1 infection, Vaccine	human, macaque (B7)	Hanke2000, Wee2002

Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance.

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].

Nef (128–137)	Nef (subtype B)	TPGPGVRYPL	HIV-1 exposed seronegative	human (B7(*8101))	Rowland-Jones1998b

Keywords inter-clade comparisons.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • Clade A version of the epitope: TPGPGIRYPL, clade D version: TPGPGIRYPL.				
Nef (128–137)	Nef (128–137 subtype B)	TPGPGVRYPL	HIV-1 exposed seronegative	human (B7, B*8101)	Kaul2000
	• 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses. • Low risk individuals did not have such CD8+ cells. • CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.				
Nef (130–139)	Nef (130–139 BRU)	GPGVRYPLTF	HIV-1 infection	human (B35)	Choppin2001
	Keywords binding affinity, epitope processing. • Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein. • 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing. • GPGVRYPLTF was recognized in 0/10 (0%) of individuals with HLA B7, and 1/11 (9%) of individuals with HLA B35, although it was a high affinity HLA binder.				
Nef (130–143)	Nef (130–143 LAI)	GPGVRYPLTFGWCY	HIV-1 infection	human (B*57)	Goulder1996b
	• CTL response to this epitope observed in 4 long-term survivors. • Peptide defined on the basis of B*5801 binding motif, yet not cross-restricted except at high concentrations.				
Nef (130–143)	Nef (121–141)	GPGVRYPLTFGWCY	HIV-1 infection	human (B57)	Ferrari2000
	• One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.				
Nef (130–144)	Nef (130–144 HXB2)	GPGVRYPLTFGWCYK	HIV-1 infection	human	Addo2003
	Keywords supervised treatment interruptions (STI), immunodominance, early treatment. **Assay type** T-cell Elispot. • Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI. • 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. • A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed. • The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Responses to this peptide were detected in 24% of the study subjects, and it was one of the 25 most frequently recognized peptides.				
Nef (132–144)	Nef	GIRYPLTFGWCFK		human	Jubier-Maurin1999
	Keywords inter-clade comparisons. • 41 new HIV-1 strains describing envelope subtypes of HIV-1 A-H were genetically characterized in the nef region – 34 subtypes were classified in the same subtype in nef and env and 7 of the 41 strains were recombinants. • This region was defined as a CTL epitope region that is conserved among HIV-1 M group subtypes.				
Nef (132–147)	Nef (132–147 BRU)	GVRYPLTFGWCYKLVP	HIV-1 infection	human (A1, B8)	Hadida1992

Nef (134–141)	Nef (138–147 SF2)	RYPLTFGW	HIV-1 infection	human (A24)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-A24+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 2/3 group 2, and 0/0 group 3.				
Nef (134–141)	Nef	RYPLTFGW	HIV-1 infection	human (A24)	Altfeld2002
	Keywords HAART, supervised treatment interruptions (STI). **Epitope name** A24-RW8(Nef). **Donor HLA** A24,A?,B7,B27.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).			
Nef (134–141)	Nef (134–141)	RYPLTFGW	HIV-1 infection	human (A33)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A3, A33, B14, B35, Cw*0401, Cw*0802. • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.			
Nef (134–141)	Nef (134–141 LAI)	RYPLTFGW		human (B27)	Culmann1998
	• Optimal peptide defined by titration.				
Nef (134–143)	Nef (138–147 SF2)	RYPLTFGWCF	HIV-1 infection	human (A*2402)	Ikeda-Moore1997
	• Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402. • This peptide induced CTL in 3/4 HIV-1+ people tested. • RYPLTFGWCF bound to A*2402 strongly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.				
Nef (134–143)	Nef (138–147)	RYPLTFGWCF	Vaccine	human (A*2402)	Kawana-Tachikawa2002
	Vaccine *Vector/Type:* Sendai virus vector system (SeV) **Epitope name** Nef138-10. • A Sendai virus vector system (SeV) was developed that expressed HLA-A*2402-restricted class I/peptide complexes; this system could be used to detect responses and has the potential to elicit immune responses. • MHC class I/peptide tetramers could be made using this system that bound to epitope-specific CTLs in PBMCs. • Cells transfection with SeV modified to express A*2402-HIV epitope complexes induced CTL mediated specific cell lysis.

	• Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles. • 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN. • 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN. • Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses. • Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).				
Nef (135–143)	Nef (135–143)	YPLTFGWCY	HIV-1 infection, HIV-1 exposed seronegative	human (B18, B49)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS), immunodominance. • Variants YPLTFGWC(Y/F) are specific for the B/D clades. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers. • Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women. • 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure. • Among HLA-B18 women, 1/4 HEPS and 8/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYVDRF(Y/F)K, while infected women tended to respond to YPLTFGWC(Y/F) • The dominant response to this HLA allele was to this epitope for the one reactive HEPS case and in all 8/9 HIV-1 infected women. • Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.				
Nef (135–143)	Nef (139–147 SF2)	YPLTFGWCF	HIV-1 infection	human (B35)	Shiga1996
	• Binds HLA-B*3501.				
Nef (135–143)	Nef (135–143 BRU)	YPLTFGWCY	HIV-1 infection	human (B35)	Choppin2001
	Keywords binding affinity, epitope processing. • Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein. • 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing. • YPLTFGWCY was recognized in 2/13 (15%) of individuals with HLA B7, and 11/14 (79%) of individuals with HLA B35, and it was a moderate affinity HLA binder.				
Nef (135–143)	Nef	YPLTFGWCY	HIV-1 infection	human (B35)	Sabbaj2002a
	Keywords mother-to-infant transmission. **Donor HLA** A3, A11, B35, B51.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• IFNgamma T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release. • T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFNgamma after stimulation with a peptide that carries known B35 epitope YPLTFGWCY. • The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.				
Nef (135–143)	Nef	YPLTFGWCY	HIV-1 exposed seronegative	human (B49)	Rowland-Jones1998a
	Keywords inter-clade comparisons. • A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating. • The A subtype consensus is identical to the B clade epitope. • The D subtype consensus is ypltfgwcF.				
Nef (135–143)	Nef (subtype B)	YLPTFGWCY	HIV-1 exposed seronegative	human (B49)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • This epitope is conserved among A and B clade viruses. • The Clade D version of the epitope, YPLTFGWCF, was preferentially recognized by CTL.				
Nef (135–143)		YPLTFGWCY	HIV-1 infection	human (B49)	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope, YPLTFGWC(Y/F), was recognized in 1/22 HEPS sex worker controls (ML1668)				
Nef (135–143)	Nef (135–143 BRU)	YPLTFGWCY	HIV-1 infection	human (B7)	Choppin2001
	Keywords binding affinity, epitope processing. • Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein. • 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing. • YPLTFGWCY was recognized in 2/13 (15%) of individuals with HLA B7, and 11/14 (79%) of individuals with HLA B35, and it was a moderate affinity HLA binder.				
Nef (136–144)	Nef (136–144 BRU)	PLTFGWCYK	HIV-1 infection	human (A3)	Choppin2001
	Keywords binding affinity, epitope processing.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The frequency of recognition may be in part dictated by the cleavage step in processing. • PLTFGWCYK was recognized in 3/12 (25%) of individuals with HLA A3. It was a low affinity HLA-A3 binder.				
Nef (136–145)	Nef (136–145)	PLTFGWCYKL	in vitro stimulation or selectio	human (A*0201)	Wilson1999b
	Keywords binding affinity, dendritic cells, Th1. • Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors. • Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within. • B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSRL which was much greater than AFHHVAREL. • Noted in Brander *et al.*, 1999 this database, to be A*0201.				
Nef (136–145)	Nef (136–145 LAI)	PLTFGWCYKL		human (A*0201)	Frahm2004
	• C. Brander notes this is an A*0201 epitope.				
Nef (136–145)	Nef (136–145 LAI)	PLTFGWCYKL	in vitro stimulation or selectio	human (A*0201)	Lucchiari-Hartz2000
	Keywords epitope processing. • Five naturally processed MHC class I ligands were identified in Nef in the conserved immunogenic region Nef between 123-152. • All five could be transported by TAP, and 4/5 had N-termini that were major cleavage points for the proteasome, only one had extended precursor fragments. • The CTL that recognized PLTFGWCYKL also recognized PLTFGWCYKLV, and both forms of the epitope are naturally processed and both seem to be the direct product of a proteasomal digest, although in low copy number.				
Nef (136–145)		PLTFGWCYKL	HIV-1 infection	human (A02)	Sabbaj2002b
	Epitope name Nef-PL10. • Among HIV+ individuals who carried HLA A02, 3/29 (10%) recognized this epitope.				
Nef (136–145)	Nef (136–145)	PLTFGWCFKL	HIV-1 infection	human (A2)	Durali1998
	Keywords inter-clade comparisons. • Cross-clade CTL response was studied by determining the CTL activity in seven patients from Bangui, (6 A subtype, and 1 AG recombinant infections) and one A subtype infection from a person living in France originally from Togo, to different antigens expressed in vaccinia. • Pol reactivity: 8/8 had CTL to A subtype, and 7/8 to B subtype, and HIV-2 Pol was not tested. • Gag reactivity: 7/8 reacted with A or B subtype gag, 3/8 with HIV-2 Gag. • Nef reactivity: 7/8 reacted with A subtype, and 5/8 with B subtype, none with HIV-2 Nef. • Env reactivity: 3/8 reacted with A subtype, 1/8 with B subtype, none with HIV-2 Env. • Patient B18 had the greatest breadth and diversity of response, and recognized Gag SLYNTVATL and Nef PLTFGWCFKL.				
Nef (136–145)	Nef (157–166)	PLTFGWCFKL	Vaccine	human (A2)	Woodberry1999
	Vaccine *Vector/Type:* DNA prime with vaccinia boost • A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice. • CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost. • No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL) • Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested. • PLTFGWCFKL was recognized by 1 of the HLA-A2 patients.				
Nef (136–145)	Nef (135–144 93TH253 subtype CRF01)	PLTFGWCYKL	HIV-1 infection	human (A2)	Bond2001
	Keywords inter-clade comparisons. • More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested. • 0/4 tested FSWs recognized the E clade version of this epitope PLCFGWCFKL, which differs from the previously defined B clade version by two amino acids, PLTFGWCYKL. • This epitope was only conserved in CRF01 (subtype E) and subtype B.				
Nef (136–145)	Nef (136–145)	PLTFGWCYKL	HIV-1 infection	human (A2)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.				
Nef (136–145)	Nef (136–145 BRU)	PLTFGWCYKL	HIV-1 infection	human (A2)	Choppin2001
	Keywords binding affinity, epitope processing. • Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein. • 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing. • PLTFGWCYKL was recognized in 9/28 (32%) of individuals with HLA A2. It was a low affinity HLA-A2 binder.				
Nef (136–146)	Nef (136–146 LAI)	PLTFGWCYKLV	in vitro stimulation or selectio	human (A*0201)	Lucchiari-Hartz2000
	Keywords epitope processing. • Five naturally processed MHC class I ligands were identified in Nef in the conserved immunogenic region Nef between 123-152. • All five could be transported by TAP, and 4/5 had N-termini that were major cleavage points for the proteasome, only one had extended precursor fragments. • The CTL that recognized PLTFGWCYKL also recognized PLTFGWCYKLV, and both forms of the epitope are naturally processed and both seem to be the direct product of a proteasomal digest, although in low copy number.

	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI Nef. • One of these 11 had CTL response to this peptide.				
Nef (166–177)	Nef (160–179 SF2)	HPVSLHGMDDPE	HIV-1 infection	human (B35)	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 1/2 group 1, 0/2 group 2, and 0/1 group 3.				
Nef (172–191)	Nef (171–190 SF2)	GMDDPEREVLEWRFDSRLAF	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI Nef. • One of these 11 had CTL response to this peptide. • The responding subject was HLA-A2, B21.				
Nef (175–184)	Nef (175–184)	DPEKEVLQWK	HIV-1 infection	human (B7)	Jin2000b
	• This a B7 epitope, a subdominant CTL response, was defined by an un-conventional approach used to predict epitopes in an HLA B7+ long-term non-progressor. • Three additional sub-dominant HLA B7 epitopes were defined using EpiMatrix, a non-anchor based strategy for defining potential epitopes, which highlighted 2078 possible epitopes in the autologous HIV-1 derived from the study subject, followed by B7 anchor residue prediction which narrowed the set to 55 peptides, three of which could serve as functional CTL epitopes.				
Nef (180–189)	Nef (180–189 LAI)	VLEWRFDSRL	HIV-1 infection	human (A*0201)	Haas1996, Haas1997
	• There was a high degree of variation in three CTL epitopes in Nef in four slow and non-progressors, and variant specific CTLs arose over time to eliminate variants, indicating immune selection. • Noted in Brander *et al.*, 1999 this database, to be A*0201.				
Nef (180–189)	Nef (180–189 LAI)	VLEWRFDSRL		human (A*0201)	Frahm2004
	• C. Brander notes this is an A*0201 epitope.				
Nef (180–189)	Nef (180–189 LAI)	VLMWQFDSRL	Vaccine	transgenic mouse (A*0201)	Boissonnas2002
	Vaccine *Vector/Type:* peptide *Strain:* natural variants *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** binding affinity, vaccine-specific epitope characteristics. • Ten naturally occurring variants of this epitope were tested for their affinity to HLA-A*0201 and for their ability to induce gamma-IFN and cytotoxic functions through vaccination of HLA-A*0201 transgenic mice. • Only two variants could induce vaccine responses: VLMWQFDSRL, a high affinity binder, and VLQWRFDSRL a medium affinity binder to A*0201. • In vivo priming with Nef peptide VLMWQFDSRL induced cross-reactive CTL to 6/7 peptides tested (AlmwKfdsKl, vlmwKfdsrl, vlmwKfdsKl, vlQwRfdsKl, vlVwrfdTrl, and vlAwKLdsrl but not the LAI peptide vlEwrfdsrl) • In vivo priming with Nef peptide VLQWRFDTRL induced cross-reactive CTL to 3/6 variant Nef peptides (vlMwQfdsrl, vlqwrfdSrl and vlEwrfdsrl).				
Nef (180–189)	Nef (190–198)	VLEWRFDSRL	Vaccine	mouse (A*0201)	Singh2002, Sykes1999
	Vaccine *Vector/Type:* DNA *HIV component:* HIV-1 **Keywords** epitope processing, vaccine-specific epitope characteristics, immunodominance. • C3H (H-2k) transgenic mice carrying a fused HLA-A*0201 alpha1 and alpha2 and H-2Dk alpha3 hybrid class I molecule were immunized using an epidermal gene gun with an ubiquitin expression library of 32 plasmids that spanned the HIV-1 genome. Ubiquitin targets the expressed HIV-1 peptides to the proteasome. • A single immunization with the UB-HIV-1 library vaccine induced potent, stable and multivalent CTL responses against all library members.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Immunodominant epitopes SLYNTVATL (Gag), ILKEPVHGV(Pol), RIQRGPGRAFVTIGK(P18) and AFHHVAREK (Nef) elicited strong CD8+/IFN- responses and stimulated CTL that were functional in a Cr-release assay and against wild type antigen. • The presence of multiple plasmids HLA-A*0201-restricted CTL epitopes did not decrease CTL immunogenicity, and CTL responses to single peptide immunizations were comparable to responses based on mixtures of either 16 or 32 peptides.				
Nef (180–189)	Nef (180–189)	VLEWRFDSRL	in vitro stimulation or selectio	human (A2)	Wilson1999b
	Keywords binding affinity, dendritic cells, Th1. • Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors. • Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within. • B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSRL which was much greater than AFHHVAREL.				
Nef (180–189)	Nef (180–189)	VLEWRFDSRL	Vaccine	human (A2)	Woodberry1999
	Vaccine *Vector/Type:* DNA prime with vaccinia boost • A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2. • HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^{d} – this transgene is the only MHC molecule expressed in the mice. • CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost. • No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL) • Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested. • VLEWRFDSRL was recognized by 2 of the HLA-A2 patients.				
Nef (180–189)	Nef (180–189 LAI)	VLEWRFDSRL	HIV-1 infection	human (A2)	Mollet2000
	Keywords HAART. **Epitope name** N3. • A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses. • In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished. • Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.				
Nef (180–189)	Nef (179–188 93TH253 subtype CRF01)	VLEWRFDSRL	HIV-1 infection	human (A2)	Bond2001
	Keywords inter-clade comparisons. • More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 0/4 tested FSWs recognized the E clade version of this epitope VLIWKFDSAL, which differs from the previously defined B clade version by three amino acids, VLEWRFDSRL.				
Nef (180–189)	Nef (180–189)	VLEWRFDSRL	HIV-1 infection	human (A2)	Day2001
	Keywords rate of progression, acute infection. • The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP) • 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.				
Nef (182–198)	Nef (182–198 BRU)	EWRFDSRLAFHHVAREL	HIV-1 infection	human (A1, B8)	Hadida1992
	• HIV-1 specific CTLs detected in lymphoid organs of HIV-1 infected patients.				
Nef (182–198)	Nef (182–198 LAI)	EWRFDSRLAFHHVAREL	HIV-1 infection	human (A2, A25(10))	Hadida1995
	• The C-terminal region of Nef (182-205) contains multiple CTL epitopes with 5 distinct HLA restrictions.				
Nef (182–198)	Nef (182–198 BRU)	EWRFDSRLAFHHVAREL	HIV-1 infection	human (A25)	Cheynier1992
	• CTL isolated in children born to HIV-1 positive mothers.				
Nef (182–198)	Nef (182–198 LAI)	EWRFDSRLAFHHVAREL	HIV-1 infection	human (B35)	Hadida1995
	• The C-terminal region of Nef (182-205) contains multiple CTL epitopes with 5 distinct HLA restrictions.				
Nef (182–198)	Nef (182–198 LAI)	EWRFDSRLAFHHVAREL	Vaccine	mouse (H-2^d)	VanderRyst1998
	Vaccine *Vector/Type:* vaccinia, Mengo virus *Strain:* B clade LAI *HIV component:* Nef • Macaca mulatta did not have a detectable response to Rec Mengo virus-HIV-1 Nef 65-206 vaccine. • BALB/c mice had a weak response to this epitope in the Mengo virus construct – in contrast, HIV-1 Nef induces a strong CTL response in mice when presented in a vaccinia background.				
Nef (182–201)	Nef (191–205 SF2)	EWRFDSRLAFHHVARELHPE	HIV-1 infection	human	Lieberman1997a
	• Of 25 patients, most had CTL specific for more than 1 HIV-1 protein. • Eleven subjects had CTL that could recognize vaccinia-expressed LAI Nef. • One of these 11 had CTL response to this peptide. • The responding subject was HLA-A2, B21.				
Nef (182–205)	Nef (182–205 LAI)	EWRFDSRLAFHHVARELHP-EYFKN	Vaccine	human	Gahery-Segard2000
	Vaccine *Vector/Type:* lipopeptide • Anti-HIV lipopeptide vaccine consisting of six long amino acid peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial. • A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 4/10 reacted to this Nef peptide. • 9/12 tested mounted a CTL response to at least one of the six peptides; each of the six peptides elicited a CTL response in at least one individual. • None of the 12 tested had an IgG response to this peptide.				
Nef (183–191)		WRFDSRLAF	HIV-1 infection	human (B*1503)	Sabbaj2002b
	Keywords HAART. **Epitope name** Nef-WF9.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Donor HLA A*2904 A*3002 B*1503 B*5802 Cw*0202 Cw*0602. • This study monitored epitope responses in HIV-1 infected minority women living in the United States. • 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described. • Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release. • This epitope was newly defined in this study. • Subject 01RCH50 also recognized the epitope RMRGAHTNDV, RT(356-365), A*3002 – she was African American, was on HAART, had a viral load of 960 and CD4 count of 728. • Among HIV+ individuals who carried HLA B15, 3/17 (18%) recognized this epitope.				
Nef (183–191)	Nef (183–191)	WRFDSRLAF	HIV-1 infection	human (B*1503)	Frahm2004
Nef (183–191)	Nef (183–191)	WRFDSRLAF	HIV-1 infection	human (B*1503)	Cao2003
	Keywords binding affinity, acute infection, early-expressed proteins. **Assay type** CD8 T-cell Elispot - IFNγ. **Donor HLA** A*2301, B*3501, B*1503 (B72), Cw2, Cw7. • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env. • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag. • More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.				
Nef (186–193)	Nef (186–193 LAI)	DSRLAFHH	HIV-1 infection	human (B35)	Hadida1995
	• The C-terminal region of Nef (182-205) contains multiple CTL epitopes with 5 distinct HLA restrictions.				
Nef (186–194)	Nef (186–194)	DSRLAFHHM	HIV-1 infection, HIV-1 exposed seronegative	human (A24)	Kaul2001a
	Keywords HIV exposed persistently seronegative (HEPS). • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
Nef (186–194)	Nef (186–194 BRU)	DSRLAFHHV		human (B51)	Connan1994
	• Resulted in the assembly of HLA-B51.				
Nef (188–196)	Nef (192–200 SF2)	KLAFHHMAR	HIV-1 infection, computer prediction	human (A*3303)	Hossain2003
	Keywords binding affinity, computational epitope prediction. **Assay type** Chromium-release assay. • HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individuals, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This epitope is one of the 2/6 peptides that could induce CTL responses in the PBMC of infected individuals, but was not properly processed in a vaccinia-HIV infected target cell.				
Nef (188–196)	Nef (188–196 LAI)	RLAFHHVAR	HIV-1 infection	human (B52)	Hadida1995
	• The C-terminal region of Nef (182-205) contains multiple CTL epitopes with 5 distinct HLA restrictions.				
Nef (188–201)	Nef (188–201 LAI)	RLAFHHVARELHPE	HIV-1 infection	human (B35 or C4)	Buseyne1993a
	• Vertical transmission of HIV ranges from 13% to 39% • Primary assays showed cytotoxic activity against at least one HIV protein was detected in 70% of infected children. • Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures. • Patient EM13, who had a CTL response to three epitopes in Nef, was infected via blood transfusion after birth and went from CDC stage P2A to P2E during the study.				
Nef (190–198)		ALKHRAYEL	HIV-1 infection	human	Kaul2001c
	Keywords HIV exposed persistently seronegative (HEPS). • This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative. • The epidemiological factor associated with seroconversion was stopping sex work and HIV-specific CTL activity declines when HEPS sex workers stop working for a period or retire. • This epitope was in 1/22 HEPS controls, ML1749.				
Nef (190–198)	Nef	AFHHVAREL	HIV-1 infection	human (A*0201)	Altfeld2001c
	Keywords inter-clade comparisons, supertype, computational epitope prediction. **Epitope name** Nef AL9. • HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested. • Three additional previously described HLA-A2 epitopes were added to the set of 20, including Nef AL9, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2) • RT VL9 was not recognized by any of the 22 HLA-A2 patients with chronic HIV-1 infection or the 13 HLA-A2 patients with acute HIV-1 infection included in this study.				
Nef (190–198)	Nef	ALKHRAYEL	HIV-1 infection, Vaccine	human, macaque (A*0201)	Hanke2000, Wee2002
	Vaccine *Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag **Keywords** inter-clade comparisons, epitope processing, immunodominance. • The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string [Hanke2000].				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string [Wee2002].				
Nef (190–198)	Nef (190–198 LAI)	AFHHVAREL	HIV-1 exposed seronegative	human (A2)	Rowland-Jones1998a
	Keywords inter-clade comparisons. • CTL recognition reported in the context of HLA-B52 and A2.1, A2.2 and A2.4. • A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating. • The A subtype consensus is ALKHRAYEL. • The D subtype consensus is AfEHKAREm. • [Hunziker1998] suggests that HLA-A2 does not in fact present this epitope, and notes that it does not promote A2 assembly [Connan1994] – also see [Brander1998b] • [Hunziker1998] maintains that HLA-A2 does not present this epitope contrary to an earlier report [Hadida1995], (also see [Brander1998a])—despite the position of Hunziker *et al.*, Rowland-Jones and colleagues are confident that this epitope in its A clade form is presented by HLA-A*0201 and A*0202, and it is one of the most common responses seen in both seropositive and exposed-uninfected donors from Nairobi (Rupert Kaul, pers. comm.)				
Nef (190–198)	Nef (190–198)	AFHHVAREL	in vitro stimulation or selectio	human (A2)	Wilson1999b
	Keywords binding affinity, dendritic cells, Th1. • Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors. • Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within. • B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSRL which was much greater than AFHHVAREL.				
Nef (190–198)	Nef (190–198)	AFHHVAREL	Vaccine	human (A2)	Woodberry1999
	Vaccine *Vector/Type:* vaccinia • A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2. • HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^{d} – this transgene is the only MHC molecule expressed in the mice. • CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost. • No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL) • Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested. • AFHHVAREL was recognized by 2 of the patients.				
Nef (190–198)	Nef (190–198 SF2)	AFHHVAREL	HIV-1 infection	human (A2)	Altfeld2001b
	Keywords HAART, acute infection.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Previously described and newly defined optimal epitopes were tested for CTL response. • Number of HLA-A2+ individuals that had a CTL response to this epitope broken down by group: 0/10 group 1, 1/6 group 2, and 0/4 group 3.				
Nef (190–198)	Nef (190–198)	ALKHRAYEL	HIV-1 infection, HIV-1 exposed seronegative	human (A2)	Kaul2001a
	Keywords inter-clade comparisons, HIV exposed persistently seronegative (HEPS). • Variants ALKHRAYEL and AFHHVAREL are A/B clade specific. • ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.				
Nef (190–198)	Nef (190–)	AFHHVAREL	HIV-1 infection	human (A2)	Corbet2003
	Keywords binding affinity, inter-clade comparisons, computational epitope prediction. **Epitope name** Nef190. **Assay type** CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric CTL assay. • HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient. • This epitope was one of the previously identified HLA-A2 epitopes studied. • None of the 17 HIV-infected HLA-A2+ people in this study recognized this epitope.				
Nef (190–198)	Nef (subtype B)	AFHHVAREL	HIV-1 exposed seronegative	human (A2, A*0202, A*0201)	Rowland-Jones1998b
	Keywords inter-clade comparisons. • HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection. • Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world. • Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes. • Clade A version of the epitope: ALKHRAYEL, Clade D epitope: AFEHKAREM. • This epitope was recognized by two different exposed and uninfected prostitutes.				
Nef (190–198)	Nef (190–198 LAI)	AFHHVAREK	HIV-1 infection	human (A3)	Hadida1995
	• Naturally occurring L to K anchor substitution abrogates A2 binding, but permits HLA-A3 binding.				
Nef (192–206)	Nef (192–206 BRU)	HHVARELHPEYFKNC	HIV-1 infection	human (A1)	Hadida1992
	• HIV-1 specific CTLs detected in lymphoid organs of HIV-1 infected patients.				
Nef	Nef (IIIB)		HIV-1 infection	human	Wasik2000
	Keywords rate of progression, Th1. • HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of beta-chemokines and IL-2 relative to other HIV+ infants.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• No HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors. • CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.				
Nef	Nef		HIV-1 infection	human	De Maria1997
	• CD3+ cells that also carry a natural killer cell receptor (NKR+) can exhibit down regulation of T cell function. • Anti-NKR IgM MAb masked this inhibitory function and increased HIV-1 specific CTL activity in phytohemagglutinin-activated PBMC cultured in the presence of IL-2 from 3/5 patients, and in one other case anti-NKR MAb brought HIV-1 specific CTL activity to detectable levels.				
Nef	Nef		HIV-1 infection	human	Lubaki1999
	• Three strategies were used to analyze CTL activity: area under the net HIV-specific lysis curve (ACU), linear regression (LR) of net specific lysis, and the standard method, lytic units (LU20) • A correlation between low HIV plasma viral load and increased levels of HIV-specific Gag and Nef CTL activity was observed using ACU and LR, but not LU20.				
Nef	Nef (LAI)		Vaccine	human	Gorse1999b
	Vaccine *Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade SF2 *HIV component:* Env, Gag, Nef, Protease • The vaccine used was rec canarypox expressing HIV-1 env, gag, pol, nef and protease (vCP300) with or without administration of HIV-1 SF-2 rgp120. • In vitro inducible CTL activity against HIV-1 Env, Gag, Pol, and Nef antigens was observed in 79% (15 of 19) of vaccine recipients. • The combination of vCP300 and vP1291 together resulted in an overall increase in CTL induction and detection sensitivity.				
Nef	Nef		HIV-1 infection	human	Gamberg1999
	Keywords TCR usage. • 13/13 subjects with advanced HIV infections showed CD8 T cell proliferation and differentiation of CTL *in vitro*, and six individuals showed HIV-specific responses to Gag, Pol, Env or Nef antigens. • Data suggests that the functional and genetic integrity of the CD8 T cell repertoire (TCR betaV gene intrafamily genetic diversity) remains intact through advanced HIV infection, although HIV-specific CTL activity decreases.				
Nef	Nef		Vaccine	human	Calarota1999
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat **Keywords** HAART. • 9/9 HIV-1+ subjects were given one of three DNA vaccinations for nef, rev or tat, and novel proliferative and CTL responses were generated. • The nef DNA immunization induced the highest and most consistent CTLp activity, IFN-gamma production, and IL-6 and IgG responses. • Highly active antiretroviral treatment (HAART) did not induce new HIV-specific CTL responses but reduced viral load, while DNA vaccination induced new immune responses but did not reduce viral load – thus this is a potentially complementary and promising combination.				
Nef	Nef (LAI)		HIV-1 infection	human	Buseyne1998a
	• This study showed a correlation between strong CTL memory and breadth of response in 7-12 month old infants, and remaining AIDS-free for the first year of life, higher absolute CD4 and CD8 cells, and lower viral load.				
Nef	Nef (LAI)		HIV-1 infection	human	Buseyne1998b
	Keywords inter-clade comparisons. • In infants with positive CTL responses, most responses showed cross-clade reactivity with somewhat diminished recognition of epitopes from different subtypes.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef	Nef (LAI)		Vaccine	human	Evans1999
	Vaccine *Vector/Type:* canarypox *HIV component:* Gag, gp120, gp41, Nef, Protease, RT • A Canarypox vaccine expressing gp120, gp41, Gag, Protease, Nef and Pol CTL epitopes gave rise to CTL that could be detected in 61% of the volunteers – responses to Gag, Env, Nef and Pol were detected 3-6 months after the last vaccination.				
Nef	Nef		HIV-1 infection	human	daSilva1998
	• CTL dense regions of Nef tend to lie in conserved domains with low non-synonymous substitution per site – authors consider that this may be due to a host adaptation to infection that focuses the CTL response to be directed against conserved functional domains [daSilva1998]				
Nef	Nef (LAI)		HIV-1 infection	human	Legrand1997
	• Seventeen recently infected patients were tested for CTL response to HIV proteins Env, Gag, Pol, Rev, Nef, Vif and Tat. • An early response (within a month following PI) was noted in 87% of the subjects to Gag, 75% to Env, and 50% to Nef. • Early responses to Pol, Rev, Vif and Tat were rare.				
Nef	Nef (LAI)		HIV-1 infection	human	Zerhouni1997
	Keywords rate of progression. • CTL responses to Env, Gag, Nef and RT were tested at various phases of disease progression – 10 asymptomatic patients generally had CTL responses to all proteins, 10 ARC patients responded well to all proteins except Nef, and AIDS patients had few responses to any proteins.				
Nef	Nef		HIV-1 infection		Kuiken1999
	Keywords epitope processing. • A correlation between conserved regions of Nef and CTL epitope density was also noted in [Kuiken1999]. The authors suggest that this may be due to biological reasons such as the one described above [daSilva1998], or due to epitope processing, or may possibly be an artifact of experimental strategy for epitope definition such that conserved epitopes would tend to be identified because they would be more likely to be cross-reactive with the test reagents. • Both p17 and Nef show a correlation between epitope density and conserved regions in the protein – in contrast, p24 is a more conserved protein and known epitopes are evenly distributed across p24.				
Nef	Nef (BRU)		HIV-1 infection	human	Aladdin1999
	Keywords rate of progression. • In vitro measurements of CTL-activity by Cr release assay in bulk culture showed no correlation between CTL-activity (gp120, Gag, Pol and Nef) and disease progression as measured by viral load, CD4 and time to death.				
Nef	Nef (SF2)		HIV-1 infection	human	Jin1998a
	• CTL precursor frequencies were determined in HIV-1 infected pregnant women, and higher CTLp frequencies to Pol and SF2 Nef, but not IIIB Nef, were found in non-transmitting mothers than in transmitting mothers – Nef CTL responses have been found in uninfected infants born to HIV+ women (Lazuriaga95);				
Nef	(subtype C)			human	Novitsky2001
	Keywords inter-clade comparisons, immunodominance. • This study is provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswanan cohort. • 37 of 45 subjects (82%) demonstrated Nef specific ELISPOT CTL responses of more than 100 SFC/106 PBMC. • Two Nef-immunodominant regions were identified, one spanned amino acid positions 67 to 96 using HXB2 numbering system while the second corresponded to amino acid positions 122 to 141.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• While there was some subtype B and C cross-reactivity, there was greater breadth and intensity of response if the CTL from HIV-1-infected individuals was probed with ELISPOT using peptides derived from the same subtype (a median of three Nef epitopes recognized within subtype C compared with one Nef epitope recognized from subtype B peptides, and ELISPOT results with a median of 763 SFC/106 PBMC among responses to HIV-1 C, versus a median of 318 SFC/106 PBMC among responses to HIV-1 B.				
Nef	Nef (subtype A, B, D)		HIV-1 infection	human	Cao2000
	Keywords inter-clade comparisons. • HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in HIV infected Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D. • Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype.				
Nef	Nef		HIV-1 infection, Vaccine	human	Calarota2001
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat *Adjuvant:* CpG immunostimulatory sequence (ISS) **Keywords** review. • This review discusses the cellular immune response, and comments on the stimulatory role of CpG motifs and how HIV-1 DNA vaccines can boost the CTL and Th proliferative responses in asymptomatic HIV+ individuals.				
Nef			HIV-1 exposed seronegative	human	De Maria1994, Kuhn2002
	Keywords HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • 6/24 HIV uninfected infants (ages 15-50 months) born to HIV+ mothers had HIV-1 specific CTL responses to vaccinia-expressed Nef, Gag/Pol, Env. • Reviewed in [Kuhn2002].				
Nef			HIV-1 infection	human	Yusim2002
	Keywords epitope processing, escape. • Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17. • While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins. • In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.				
Nef	Nef (HXB)		HIV-1 infection	human	Lu2000a
	Keywords epitope processing, vaccine-specific epitope characteristics. • Bacillus anthrax lethal toxin (LFn)-HIV fusion proteins are candidate HIV vaccines that are safe in mice, and LFn-V3 region fusion proteins induce CD8 T cells in BALBc mice. LFn causes exogenous protein to be taken up and processed in a class I pathway. Expressed proteins from Gag p24 and nef fragments cloned into the LFn expression plasmid stimulate gag-specific CD4 proliferation and CTL responses in HIV-infected donor PBMCs *in vitro*.				
Nef	(BRU)		HIV-1 infection	human	Edwards2002
	Keywords rate of progression. • 96% (26/27) chronically infected HIV-1 infected patients elicited gamma-IFN CD8+ T-cell responses against Gag. • Nef and/or Pol CTL responses were detected in 86% of the subjects.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The magnitude and breadth of Gag and p24 T-cell responses correlated with absolute CD4 counts, and inversely correlated with viral load. • Pol and Int CTL responses correlated positively with absolute CD4+ T-cell count. • Nef and Env responses did not correlate with either CD4 counts or viral load.				
Nef			HIV-1 infection	human	Larsson2002b
	Keywords HAART, dendritic cells. • Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.				
Nef	(SF2)		HIV-1 and HCV co-infection	human	Lauer2002
	Keywords rate of progression. • HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFNgamma production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins. • All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load. • Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted. • HIV-specific CD4 proliferative responses were detected in 9/17 coinfected patients, but no HCV responses were detected.				
Nef			HIV-1 infection	human	Scott2001
	Keywords HAART, responses in children. • CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age. • Before ART 2/13 infants <6 months of age showed IFNgamma Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy– 3 infants were coinfected with CMV and all 3 had CMV-specific CD8+ T-cell responses. • One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol. • Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.				
Nef	(IIIB)		HIV-1 infection	human	Ortiz2001
	Keywords HAART, supervised treatment interruptions (STI). • Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.				
Nef			Vaccine	mouse	Muthumani2002
	Vaccine *Vector/Type:* adenovirus *HIV component:* Gag-Pol, Nef, Vpr • Vpr can cause cells to go into G2 arrest, and it surpresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens. • Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol. • In vitro, Vpr reduced T-cell cytokine production of IL-12 and TNFalpha, indicative of Vpr-mediated immune suppression.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef	Nef			human	Currier2003
	Keywords inter-clade comparisons. **Assay type** Flow cytometric CTL assay. • CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01. • Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env. • For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.			
Nef	Nef (B.AU.AF064676)			human	
Nef	Nef		HIV-1 infection	human	Draenert2003
	Keywords assay standardization. **Assay type** CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses. • Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays. • Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivites were observed using the B.AU.AF064676 peptides but not the consensus. • Using an overlap of 10 or 11 amino acids did not make a difference.			
Nef	(C consensus)		HIV-1 infection	human	Novitsky2003
	Keywords rate of progression. **Assay type** CD8 T-cell Elispot - IFNγ. • In this study, PBMC from 105 asymptomatic HIV-1 C clade infected patients from Botswana were screened for HIV-1 subtype C specific T-cell responses directed against Gag, Pol, Vif, Vpr, Tat, Rev, Vpu, Env and Nef. Nef-specific T-cell responses positively correlated with plasma viral load. In contrast, HIV-1 Gag and especially Gag p24 showed an inverse correlation with viral load.			
Nef	(C consensus)		HIV-1 infection	human	Novitsky2003
	Keywords rate of progression. **Assay type** CD8 T-cell Elispot - IFNγ. • In this study, PBMC from 105 asymptomatic HIV-1 C clade infected patients from Botswana were screened for HIV-1 subtype C specific T-cell responses directed against Gag, Pol, Vif, Vpr, Tat, Rev, Vpu, Env and Nef. Nef-specific T-cell responses positively correlated with plasma viral load. In contrast, HIV-1 Gag and especially Gag p24 showed an inverse correlation with viral load.			

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Nef	Nef		HIV-1 infection	human (A*0201 and Cw*08)	Shacklett2000
	• HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.				
Nef	Nef		HIV-1 infection	human (B*35)	Jin2002
	Keywords rate of progression. • Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501. • Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env. • The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.				
Nef	Nef (BRU)		Vaccine	mouse (H-2D^d)	Collings1999
	Vaccine *Vector/Type:* DNA *Strain:* B clade BRU *HIV component:* Nef • A comparison of DNA vaccination with HIV-1 Nef expression vectors pBN-CMV-NEF and pBN-RSV-NEF (self-replicating), pCGE2-NEF (non-replicating). • CTL immune responses were detected using all three expression vectors, while a humoral immune response to Nef was only observed in the self-replicating expression vectors; possibly antibody responses require higher levels of protein expression.				
Nef	Nef (SIV)		SIV infection	macaque (Mamu-A*11, -B*03, -B*04, and -B*17)	Dzuris2000
	• Cell binding assays for Mamu molecules were employed to describe the peptide binding motifs for Mamu-A*11, -B*03, -B*03, -B*04, and -B*17 CTL epitopes – a similarity for Mamu-A*11 and -B*03 and human HLA-B*44 and -B*27, respectively, was observed – all epitopes studied were SIV epitopes, so not specifically listed here.				

II-B-22 HIV-1 CTL epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
HIV-1			HIV-1 infection	human	Schito2001
	Keywords HAART.				
	• Longitudinal analysis (72 weeks) of 15 patients with acute or recent HIV-1 infection implies that HAART treatment alone can not completely conserve CD8+ cell homeostasis and preserve the original T-cell receptor repertoire.				
HIV-1			HIV-1 infection	human	Mackewicz2000
	• Non-cytotoxic anti-HIV responses of CD8+ T cells cultured with CD4 infected HIV cells are mediated be blocking expression of viral RNA, and do not influence viral replication steps through integration of provirus.				
HIV-1			Vaccine		Altes2002
	Keywords dynamics.				
	• This study employs a mathematical model to study the consequences of increasing the T-helper response through a vaccine, which would have counter-balancing effects in a new infection: a more intense response provides more help but also more target cells. The model indicates that if the infecting virus had a low replication rate, then CTLp and CD4 helper cells could control an infection. Only a vaccine that could increase CTL responsiveness could reduce viral set point with observed replication rates.				
	• A CD4+ T-cell response without maintained CTL response was deleterious in this model.				
HIV-1			HIV-1 infection	human	Currier2002b
	Keywords assay standardization.				
	• Elispot standardization was sought using a reference peptide pool of 23, 8-11 mer epitopes from Influenza, cytomegalovirus (CMV), and Epstein Bar Virus (EBV) presented by 11 common HLA class I molecules.				
	• 15/17 (88%) HIV- and 14/20 (70%) HIV+ individuals reacted with this test set and *in vitro* simulation of the PBMC from these individuals were capable of killing cells expressing the target antigen.				
HIV-1			HIV-1 infection	human, macaque	Wodarz2002
	Keywords dynamics, HAART.				
	• Mathematical modeling is used to support the idea that T-helper cell dysfunction results in a compromised ability to maintain an anti-HIV CTL memory response. Models suggest strategies to restore CTL memory through therapy and improve long-term immunological control of the virus.				
HIV-1			HIV-1 infection, Vaccine	human	Zinkernagel2002
	Keywords review.				
	• HIV immunity and vaccine strategies are compared with to other pathogens. We do not have a successful vaccine agains TB leprosy, HIV, HCV and most parasites, and the author suggests this is associated with the need for a strong T-cell response to these diseases. Vaccine strategies that achieve a physiological low does infection that is well controlled but persists may be required to alter the immunopathological consequences of infection with HIV.				
HIV-1			Vaccine	human	Gaschen2002
	Keywords review, inter-clade comparisons, epitope processing.				
	• The concept of using an artificial consensus sequence for vaccine design is discussed, comparing the concepts of a model ancestor sequence or a consensus sequence, with illustrations of the potential advantages of the strategy based on C-clade comparisons.				
	• See also a comment [Nickle2003], and reply [Gao2003]				
HIV-1			HIV-1 infection	human, macaque	Johnson2002
	Keywords review, class I down-regulation by Nef, escape.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Reviews evidence for CTL escape in HIV epitopes in natural human infections, and in SIV infections of macaque where viral clones with a known time of infection and multiple animals with the same HLA molecules can be tracked. • Vigorous CTL responses are made despite class I down-regulation by the Nef protein, but it may delay cytolysis of infected cells. Too great a loss of MHC proteins may enhance NK cell killing so the fitness advantage of this function of Nef may be in balance.				
HIV-1			HIV-1 infection, Vaccine	human	Newman2002
	Keywords review, epitope processing, supertype, computational epitope prediction, HIV exposed persistently seronegative (HEPS), supervised treatment interruptions (STI), immunodominance. • This extensive review covers many aspects of T-cell immunity and natural HIV infections, and considers how this knowledge might be applied to a polyepitope vaccine approach. Strategies concerning ways to avoid the creation of junctional epitopes and use of linkers to enhance processing of such constructs are discussed. • The C-terminal flanking residue (C1) was found to be associated with immunodominance of epitopes, such that R or K (positive charge) > N or Q (amide) > C, G, A, T, S (small) > F, W, Y (aromatic) > I, L, M, V (aliphatic) > D (negative). As this position is outside and proximal to the epitope, processing and cleavage is the likely reason for this observation. • Changing the C1 residue from F to K for an HLA-A2 presented epitope from HBV resulted in a change from the epitope being non-immunogenic to strongly immunogenic.				
HIV-1			HIV-1 infection, Vaccine	human	Johnston2001
	Keywords review, HIV exposed persistently seronegative (HEPS). • Reviews the current state of HIV vaccine approaches, and discusses the role of CTL induced immunity in protection or partial protection in animal studies, likening it to the CTL found in HEPS studies.				
HIV-1			HIV-1 infection	human	Klenerman2002
	Keywords binding affinity, review, escape. • The importance of breadth, or spread, of CTL responses is discussed, as narrowly focused responses can be more readily escaped. • Some HLA types and specific epitope recognition may be associated with a better disease outcome. Reasons for this are considered, including NK cell activity, epitope affinity, epitope conservation, and class I specific induction of more effective T-cell receptors.				
HIV-1			HIV-1 infection	human	Kuhn2002
	Keywords review, HIV exposed persistently seronegative (HEPS), responses in children, mother-to-infant transmission. • Intrauterine exposure of infants to HIV from their mothers results in HIV-1 specific T-helper cell proliferative responses in 1/3 of exposed uninfected babies, and HIV-1 specific CTL in some. Such responses are evident, but it is unknown whether they are associated with lack of infection, but there is some evidence that HIV-1 T-cell responses may reduce transmission in breastfeeding mothers. Summary tables are provided of CD4 and CD8 responses detected in earlier studies.				
HIV-1			HIV-1 infection	human	Kuhn2002, Levy1998
	Keywords HIV exposed persistently seronegative (HEPS), mother-to-infant transmission. • A non-HLA-specific, non-chemokine-mediated CD8+ T-cell non-cytotoxic anti-HIV response, measured by suppression of acute viral infection of CD4 cells, was detectable in approximately 16/31 (52%) of uninfected children born of infected mothers, was more commonly detected in those <1 year old, and could reflect a protective response. • Reviewed in [Kuhn2002].				
HIV-1			Vaccine	human	Altes2001
	Keywords dynamics.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Mathematical modeling suggests if the effector CTL vaccine response exceeds the level of response seen in chronic infection, that a memory CTL population is established that can respond very quickly to protect from infection.

HIV-1			HIV-1 infection	human	Altfeld2003

Keywords assay standardization, acute infection.
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining.

- The frequency of HIV-1 specific T-cell responses was characterized in an Elispot IFN-gamma assay, using 507 overlapping peptides based on the B clade consensus sequence spanning all HIV-1 clade B proteins against PBMC from 57 HIV-1 infected patients at various disease and treatment stages. 63% of the peptides were recognized (range of 1-42 per subject, median=14). More variable peptides were targeted less frequently.
- Autologous virus sequences from six patients in acute infection spanning of HIV-1 p24, Tat and Vpr were used to scan for missed responses due to viral variation when using the consensus for peptides. 12/42 (29%) responses to these peptides were dectected only with autologous peptides, and often these autologous reponses were immunodominant. Responses were also generally higher using autologous peptides.
- A longitudinal analysis (5 yrs) of the T-cell responses in 5 patients showed that the autologous sequence elicited stronger T-cell recongition than the HIv-1 clade B consensus sequence.

HIV-1			HIV-1 infection	chimpanzee	Balla-Jhagjhoorsingh2003

Keywords review.

- This paper reviews HIV-1-specific cell-mediated immune responses in chimpanzees and discusses mechanisms that might control HIV-1 pathogenesis in chimpanzees. During the first decade of the HIV epidemic, more than 200 chimpanzees were experimentally infected with HIV. Among these only one case of declining CD4+ cells has been reported, all others have remained asymptomatic with no loss of immune function , some after 20 years of infection. In contrast to infected humans which have a skewed Th2 response, chimpanzees maintain balanced Th responses and are likely to support a fully mature CD8+ T-cell response.
- Specific HIV epitopes recognized by chimpanzees have been mapped and CTL detected , but overall the responses are at much lower levels than in humans, as viral loads are so low. Gag epitope responses are estimated to be 0.0095 to 0.0025% of the CD8+ T cell population in chimpanzee, and 1-2% in humans.
- The authors argue that the chimpanzee immune response may be effective at controlling virus because it focuses on conserved epitopes, and further speculate that long contact with lentiviruses may have put strong selection pressures on the chimpanzee MHC class I, narrowing the population's ability to respond to only the most conserved, and so useful, epitopes.

HIV-1			HIV-1 infection	human	Fagard2003

Keywords HAART, supervised treatment interruptions (STI).
Assay type CD8 T-cell Elispot - IFNγ.

- This study monitored the effects of repeated treatment interruptions (STI), in 2-week intervals, in 133 HIV-1 infected, HAART-treated patients. STIs were rarely able to control viremia without continued HAART, and increases in CD8+ T-cell response frequencies did not correlate with the level of control of viral replication. CD8+ T cell responses were measured by gamma IFN Elispot using between 2-32 different optimal HIV epitopes, selected to be appropriate for the patient's HLA type.

HIV-1				human	
HIV-1	HIV-1		HIV-1 infection	human	Feeney2003

Keywords responses in children.
Assay type CD8 T-cell Elispot - IFNγ.

- The magnitude and breadth of CD8+ T-cell responses in 18 pediatric (6-17 years) perinatally HIV-1 infected patients was determined using 1) overlapping peptides spanning all HIV-1 proteins and 2) peptides from all predefined appropriately class I HLA-restricted HIV-1 epitopes.
- Perinatally infected children's CD8+ T-cell responses were comparable in magnitude and breadth to adult responses. Many reactive peptides did not overlap with a previously characterized optimal epitope.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• On average 20% of all known pre-defined optimal epitopes presented by appropriate HLAs were recognized in these children. In two patients, autologous sequences spanning unrecognized potential epitopes usually corresponded to the reactive form of the epitope, so epitope variation alone did not account for unrecognized epitopes. • Children with detectable viremia showed a broader and greater CTL responses than HAART responsive children with undetectable viremia.				
HIV-1	HIV-1				
HIV-1			Vaccine		Hanke2003
	Keywords review. • Review of HIV vaccine development discussing diversity, the merits and difficulties of stimulating different arms of the immune response, and different strategies, including DNA vaccines, viral vectors, CTL epitope based, and protein- or peptide-based vaccines)				
HIV-1	HIV-1 (HXB2)		HIV-1 exposed seronegative	human	Hladik2003
	Keywords HIV exposed persistently seronegative (HEPS). **Assay type** CD8 T-cell Elispot - IFNγ. • Longitudinal study analyzed IFN-γ CD8+ T cell responses in highly exposed, seronegative homosexual men. Overlapping peptides spanning the Gag, Env, Nef and Pol subtype B HXB2 sequence were used to stimulate PBMC from 26 individuals, whose frequency of HIV-1 specific IFN-γ T cell responses were very low. • CD8+ T cells from 3/15 individuals (EES15, ES29, and ES63) recognized > 3 peptide pools.				
HIV-1			HIV-1 infection	human	Kousignian2003
	Keywords dynamics. **Assay type** Chromium-release assay. • The diversity of HIV protein (Gag, Pol, Env, Nef, Rev, Tat, Vif) recognition by CTLs was studied longitudinally in a cohort of 152 HIV-infected untreated individuals, and was analyzed by Markov modelling. CTL responses from 152 HIV-1 infected patients in four stages of disease progression were collected for a period of 5 years. Results show that memory CTL responses against HIV-1 proteins are acquired during early HIV-1 infection and subsequently lost. As viral load increased there was an accelerating loss of multiple protein recognition.				
HIV-1			HIV-1 infection, Vaccine	human	Lederman2003, Robbins2003
	Vaccine *Vector/Type:* gp120 depleted whole killed virus *Adjuvant:* Incomplete Freund's Adjuvant (IFA) • Lederman and Douek is an editorial comment referring to the study presented by Robbins *et al.*, in which the authors discuss why an HIV-1 gp120-depleted inactivated HIV vaccine elicits HIV-1 specific T helper responses in 5/5 HIV+ people, but not CD8+ CTL responses. In chronically infected people it appears that stimulating Th responses in and of itself is not enough to restore strong CTL responses.				
HIV-1			Vaccine	human	Lehner2003
	Vaccine *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72), CpG immunostimulatory sequence (ISS), HSP70 **Keywords** review, Th1, Th2, genital and mucosal immunity. • This review discusses the importance of mucosal and innate immunity for future vaccination strategies in HIV infection in humans. Different mucosal adjuvants are compared, and the advantages of a Th1 polarized response.				
HIV-1			HIV-1 infection	human	Onyemelukwe2002
	• Longitudinal study (1991-1997) of the clinicial presentation of 80 HIV-1 or HIV-II seropositive people in Zaria, Nigeria, who contracted HIV-1 primarily via heterosexual transmission. Main complicating diseases were tuberculosis and bacterial infections including Salmonella, Streptococcus peneumoniae and Stahhylococcus. HIV-1 progression was associated with a decline of not only CD4+ T cells, but CD8+ T cells as well – patients had CD4+ counts < 200 cells/ul, and CD8 counts were 190 cells/ul versus 440 cells/ul for controls.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
HIV-1			HIV-1 infection	human	Onyemelukwe2002

- Longitudinal study (1991-1997) of the clinicial presentation of 80 HIV-1 or HIV-II seropositive people in Zaria, Nigeria, who contracted HIV-1 primarily via heterosexual transmission. Main complicating diseases were tuberculosis and bacterial infections including Salmonella, Streptococcus peneumoniae and Stahhylococcus. HIV-1 progression was associated with a decline of not only CD4+ T cells, but CD8+ T cells as well – patients had CD4+ counts < 200 cells/ul, and CD8 counts were 190 cells/ul versus 440 cells/ul for controls.

HIV-1			HIV-1 infection	human	Price2003

Keywords HAART.
Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ.

- CD4+ and CD8+ T cell responses were analyzed in this longitudinal study (19 mo) of 53 patients with chronic HIV-1 infection receiving continous ART therapy. Three subgroups were compared: one with suppressed viremia and increasing CD4+ T cell counts, one with dectable viral load and declining CD4, and one with detectable viral load with a postive CD4+ T cell slope.
- IFN-γ ELISPOT analysis was performed with peptide s spanning RT, Env, Gag (p24), Gag(p17), Nef, Tat and Rev. The IFN-γ analysis showed the greatest CD4+ as well as CD8+ T cell responses in the group with stable CD4+ T cell responses despiete detectable viurs over a median time course of 9 months.

HIV-1				human	Sindhu2003a, Sindhu2003b

Keywords rate of progression.
Assay type Chromium-release assay.

- In a cross-sectional study of 31 HIV+ people, a correlation was observed between CTL-mediated bystander HLA-unrestricted lysis of primary CD4+-T cells. $\gamma\delta$ CTL are abnormally expanded in HIV+ people, and the Vδ1 subset can deplete bystander CD4+ T-cells and expedite progression. In a sset of 13 patients, an inverse correlation was observed between CD8+ T-cell activation markers and viral load, and suggested to be an indicator of CTL-associated immunopathogenesis in HIV progression.

HIV-1			HIV-1 infection		Vella2003

Keywords review.

- This article reviews the CD8+ T-cell antiviral factor (CAF). CAF contributes to MHC restricted, CD8+ T-cell mediated non-cytolytic suppression of HIV in infected individuals.

HIV-1			Vaccine	human (A11)	Ariyoshi2002

Keywords review, vaccine-specific epitope characteristics, escape.

- This review summarizes issues discussed at a meeting held to discuss options for determining CTL responses to vaccines. Problems are noted: cost for any assay are prohibitive for a Phase III study, Elispot shows interlaboratory variation but could be extended to many samples. HLA-A11 is very common in Thailand – over 30% carry the HLA-A11 allele. Predominant strains may be evolving to evade recognition of A11 restricted epitopes. Few full length CRF01 sequences are available. Epitopes may differ in vaccinees and infected individuals.

HIV-1			HIV-1 infection	human (A11, B8, B40, cW8)	Alter2003

Keywords HAART, acute infection, early treatment.
Assay type cytokine production, CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining.

- Longitudinal study (24 mo) monitoring T-cell immune responses in 4 patient groups: Group 1 (n=6) consists of subjects who underwent HAART preseroconversion, group 2 (n=11)were HAART treated during early postseroconversion, group 3 (n=5) contained patients who started HAART during late postseroconversion, and group 4 (n= 6) commenced with HAART during chronic HIV-1 infection.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The experimental strategey was to test for reactivity levels with sets of peptides that each contain epitopes with known HLA-restriciting elements, making the peptide selection based on the optimal epitope list in this database. The HLA alleles found in the patients were balanced so that the frequency in the groups were comparable. Peptides spanning parts of Gag, Env, Nef, and RT were used for Elispot, and Gag peptides were used for ICS. • All group 1 patients, and 5/11 group 2 patients, maintained the breadth and the magnitude of the immune response throughout the study; those in group 2 that maintained response started therapy earlier. The hierarchy of intensity of responses to different peptides was preserved. Individuals in groups 3 and 4 all showed a decline, and after treatment lost responses. Groups 1 and 2 showed HAART-induced suppression of viremia but maintained resposnes. Groups 3 and 4 both showed viral suppression in association with a decreased immune response in breadth and magnitude after HAART. The authors suggest that preservation of HIV CD4+ responses can be maintained even if HAART is first given beyond the acute phase of infection, and a delay may allow a full CD8 reponse to develop while still allowing CD4 function to be preserved.				
HIV-1			HIV-1 infection	human (A11, B8, B40, cW8)	Alter2003
	Keywords HAART, acute infection, early treatment. **Assay type** cytokine production, CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining. • Longitudinal study (24 mo) monitoring T-cell immune responses in 4 patient groups: Group 1 (n=6) consists of subjects who underwent HAART preseroconversion, group 2 (n=11)were HAART treated during early postseroconversion, group 3 (n=5) contained patients who started HAART during late postseroconversion, and group 4 (n= 6) commenced with HAART during chronic HIV-1 infection. • The experimental strategey was to test for reactivity levels with sets of peptides that each contain epitopes with known HLA-restriciting elements, making the peptide selection based on the optimal epitope list in this database. Groups 3 and 4 both showed viral suppression in association with a decreased immune response in breadth and magnitude after HAART. The authors suggest that preservation of HIV CD4+ responses can be maintained even if HAART is first given beyond the acute phase of infection, and a delay may allow a full CD8 reponse to develop while still allowing CD4 function to be preserved.			
HIV-1			Vaccine	human (B27, B8)	McMichael2002
	Keywords binding affinity, review, inter-clade comparisons, epitope processing, escape. • CTL response-eliciting vaccines are reviewed. The natural epitope interactions with the HLA class I presenting molecules and T-cell receptors are described, and the impact of breadth of CTL responses and diversity considered in a vaccine context. • Interesting specific examples are given concerning anchor chain residues. For B27, the B pocket fits Arg (R) but not Lys (K), so even this conservative change is not tolerated. In B8 either R or K can fit in the B pocket, but the substitution will cause conformational shifts in other parts of the epitope.				
HIV-1	gp120 (V3) and p24 (IIIB, MN, BH10)		Vaccine	mouse (H-2^d)	Buonaguro2002
	Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* A clade UG5.94UG018, B clade IIIB *HIV component:* Gag, gp120 **Keywords** inter-clade comparisons. **Assay type** Chromium-release assay. • Different HIV strains were used for different regions: gp120 A clade UG5.94UG018, and B clade IIIB • BALB/c mice were given intraperitoneal immunization with virus-like particle (VLPs) expressing recombinant subtype A gp120 and Pr55gag in the absence of adjuvants.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• High dose-independent humoral responses against both gp120 and p24 peptides were detected. Antibodies able to elicit 50% neutralization against A clade IIIB and the autologous clade a virus were obtained. • Recombinant rgp120 (clade B, MN) induced T-cell proliferative responses *in vitro* from vaccinated animals. • CTL activity was observed against splenocytes expressing Env (clade A) and Gag (clade B, BH10) from a vaccinia construct.				
HIV-1			Vaccine	mouse (MHC H2d)	Lieberman2002
	Vaccine *Vector/Type:* Listeria monocytogenes *HIV component:* Gag **Keywords** review. • Attenuated Listeria monocytogenes vectors elicit strong persistent CTL responses in vaccinations of BALB/c mice and can protect mice from a vaccinia-gag challenge.

Part III

HIV Helper T-Cell Epitopes

III-A

Summary

Part III includes tables and maps of HIV-specific helper T-cell (Th) epitopes arranged sequentially according to the location of the proteins in the HIV-1 genome. This part parallels the organization of the CTL part. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a region of 30 amino acids maximum, but not that the precise boundaries be defined. The HLA specificity is usually not determined for Th epitopes. For more recent updates, epitope sequence alignments, and useful searching capabilities, please see our web site: `http://www.hiv.lanl.gov/content/immunology`. The same epitope can have multiple entries, as each entry represents a single publication. Helper T-cell responses to proteins with no defined epitope are described at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T-cell and helper T-cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T-cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

III-A-1 Tables

Each Th epitope has a multi-part basic entry:

HXB2 Location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2, rather the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: `http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html`.

Author Location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope Sequence: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Immunogen: The antigenic stimulus of the Th response to the defined epitope. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted on a separate line, and additional information about the vaccine antigen is provided as available.

Species(HLA): The species responding and HLA specificity of the epitope, when known.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the printed version to help identify entries of particular interest.

Following the entry for a given Th epitope are brief comments explaining the context in which the epitope was studied and what was learned about the epitope in a given study.

III-A-2 HIV protein epitope maps

All HIV Th epitopes mapped to within a region of 21 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of Th epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

III-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the T helper epitope search tool at `http://www.hiv.lanl.gov/content/immunology`. All epitopes are aligned to the HXB2 sequence, with the sequence used to define the epitope indicated directly above it. Sequences are sorted by their subtype and country of origin.

The master alignment files from which the epitope alignments were created are available at our web site (`http://www.hiv.lanl.gov/ALIGN_CURRENT/ALIGN-INDEX.html`). The alignments were modified in some cases to optimize the alignment relative to the defined epitope and minimize insertions and deletions; epitope alignments are generated by anchoring on the C-terminal residue. A dash indicates identity to the consensus sequence, and a period indicates an insertion made to maintain the alignment. Stop codons are indicated with a `$`, and frameshifts by a `#`, or ambiguous codons (nucleotide was `r`, `y`, or `n`) by an `x`; they are inserted to maintain the alignments. In consensus sequences an upper case letter indicates the amino acid was present in all sequences, a lower case letter indicates the amino acid was present in most sequences in a given position, and a question mark indicates two or more amino acids were represented with equal frequency.

III-B

HIV Helper T-Cell Epitope Tables

All HIV Helper T-Cell epitopes arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location within the protein and finally by HLA presenting molecule. Epitopes for which the HXB2 location is unknown appear at the end of the listing of the protein in which they are located.

III-B-1 p17 Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p17 (18–42)	p17 (18–42 PV22)	KIRLRPGGKKKYKLKHIVW-ASRELE	HIV-1 infection	human (DRB1*13)	Lotti2002
	Keywords HAART, Th1, Th2. **Donor HLA** A29(19)/A30(19), B8/B35, DRB1*03/DRB1*13. • 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response. • For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity. • 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 6 recognized this peptide sequence restricted by DRB1*13. This clone had a high SI (27.1 to p55, 90.6 to peptide) secreted IFNgamma, indicative of a Th1 response, as well as TNFalpha. Clone 6 was highly cytotoxic, through a perforin-mediated pathway.			
p17 (21–35)	p17 (21–35 SF2)	LRPGGKKKYKLKHIV	HIV-1 infection	human (DR13.02)	Harcourt1998
	Keywords escape. • 43 asymptomatic HIV+ individuals were screened for proliferative responses to HIV – 12 showed a response, and dominant epitopes were mapped for two individuals, one in p24 and one in p17. • Patient 024's naturally occurring variant LRPGGKKKYQLKHIV also elicited a strong proliferative response. • Naturally occurring variants of this epitope were found within the individual who made this response – several did not stimulate the CD4+ T-cell line that recognized the index peptide, suggestive of immune escape.				
p17 (22–29)	p17 (22–29 LAI)	RPGGKKKY?	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors. • Schrier lists this peptide as p24(22-29), but it appears to be in p17.				
p17 (33–47)	p17 (33–47 IIIB, B10)	HIVWASRELERFAVN?	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• Peptides were identified that commonly evoke T-cell responses – 57% of 90 HIV+ people had a T-cell response to this peptide.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p17 (35–59)	p17 (35–49 PV22)	VWASRELERFAVNPGLLET-SEGCRQ	HIV-1 infection	human (DRB1*13)	Lotti2002
	Keywords HAART, Th1, Th2, TCR usage. **Donor HLA** A29(19)/A30(19), B8/B35, DRB1*03/DRB1*13. • 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response. • For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity. • 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 25 recognized this peptide sequence restricted by DRB1*13 using TCR Vβ 5.1. This clone had a SI of 4.9 to p55, 13.7 to peptide, secreted low levels of IFNgamma, indicative of a Th1 response. Clone 25 had cytotoxic activity, mediated through both a perforin and a Fas-based pathway.			
p17 (93–107)	p17 (93–107 IIIB, B10)	EIKDTKEALDKIEEE	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
p17 (118–132)	p17 (118–132 IIIB, B10)	AAADTGHSSQVSQNY	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				

III-B-2 p24 Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p24 (1–9)	Gag (p24) (133–141 HXB2) **Keywords** HAART. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. **Donor HLA** DRβ1*0101, DRβ1*1501, DQ5, DQ1, DR51. • HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. • The TCR that recognized this epitope used Vβ5.1.	PIVQNIQGQ	HIV-1 infection	human (DRβ1*0101)	Boritz2003
p24 (1–11)	p24 (1–11 SF2) **Keywords** escape. • 43 asymptomatic HIV+ individuals were screened for proliferative responses to HIV – 12 showed a response, and dominant epitopes were mapped for two individuals, one in p24 and one in p17. • Out of five truncated versions of peptide PIVQNLQGQMVHQAISPRTL, only p24(1-11) elicited a proliferative response. • Nine naturally occurring variants of this epitope were found within the individual who made this response – all bound to HLA-DR1, but three did not stimulate the CD4+ T-cell line that recognized the index peptide, suggestive of immune escape.	PIVQNLQGQMV	HIV-1 infection	human (DR1)	Harcourt1998
p24 (1–15)	p24 (133–147 IIIB, B10) • Peptides were identified that commonly evoke T-cell responses – 62% of 90 HIV+ people had a T-cell response to this peptide.	PIVQNIQGQMVHQAI	HIV-1 infection	human	Wahren1989b, Wahren1989a
p24 (1–22)	p24 (133–154 SF2) • While anti-HIV CD4 Th responses are characteristically undetectable in chronic infections, strong p24-specific proliferative responses were inversely correlated with low viral load in 10 chronically infected people. • The dominant proliferative response in one of two long term survivors was to this peptide.	PIVQNIQGQMVHQAISPRT-LNA	HIV-1 infection	human	Rosenberg1997
p24 (7–21)	Gag (171–185) **Keywords** inter-clade comparisons. **Epitope name** Gag 171. • Eleven peptides were identified that had the HLA-DR supermotif, all were found to bind to MHC class II DR molecules and all elicited proliferative responses from multiple HIV-infected donors. • This epitope binds to nine HLA-DR alleles: DRB1*0101, DRB1*1501, DRB1*0401, DRBI*0405, DRB1*1302, DRB1*0701, DRB1*0901, DRB5*0101 and DRB4*0101 with an IC_{50} threshold below 1,000 nM. • This epitope sequence is conserved in 52% of clade B isolates. • 7/22 HIV infected individuals responded to this epitope (13/22 responded to some of the DR supermotif epitopes, the 9 non-responder peptides tended to also not have recall responses to rec HIV-1 whole proteins)	QGQMVHQAISPRTLN	HIV-1 infection	human (DR supermotif)	Wilson2001

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p24 (7–21)	Gag (171–185)	QGQMVHQAISPRTLN	Vaccine	mouse (I-Ab and HLA-DR)	Livingston2002
	Vaccine *Vector/Type:* DNA with CMV promotor, peptide *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** Gag 171. **Donor HLA** H-2b. • Four Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented my murine class II molecule I-Ab, enabling testing of vaccine strategies of in H-2b mice. • Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promotor were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all four peptides, using either DNA or protein for the vaccination.				
p24 (11–26)	p24 (143–157)	VHQAISPRTLNAWVKC	in vitro stimulation or selectio	human	Bedford1997
	• Epitope elicits a primary proliferative response in PBMC from uninfected donors. • Matches 3/3 anchor residues for HLA DR: **V**HQAI**S**PR**T**				
p24 (11–30)	Gag (143–152 SF2)	VHQAISPRTLNAWVKVVEEK	Vaccine	mouse (H-2^d, H-2^b)	Mata1999
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade SF2 *HIV component:* p24 Gag **Keywords** immunodominance, Th1. • Listeria moncytogenes is an intracellular bacterium that lives in the cytoplasm and generates a cell-mediated immune response. • Listeria moncytogenes vaccine expressing HIV-1 p24 protein (Lm-Gag) was used to stimulate gag specific CD4+ T cell proliferative responses in BALB/c(H-2d) and C57BL/6(H-2b) mice. • Two of three reactive p24 peptides (out of 22 overlapping peptides that span p24) were recognized by both murine strains – this epitope is immunodominant in C57BL/6 mice and also can stimulate a BALB/c response. • The proliferative response is due to CD4+, IFNγ producing cells, a Th1 response.				
p24 (11–30)	p24 (143–162 HXB2)	VHQAISPRTLNAWVKVVEEK	Vaccine	mouse (H-2^d, H-2^b)	Mata1999
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag • BALB/c and C57BL/6 mice were immunized with rec Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways. • The class II T helper response was probed using 20 mer peptides that overlapped by 10, and the peptides VHQAISPRTLNAWVKVVEEK and FRDYV-DRFYKTLRAEQASQD were recognized in H-2^b and H-2^d mice.				
p24 (21–36)	p24 (153–167)	NAWVKVVEEKAFSPEC	in vitro stimulation or selectio	human	Bedford1997
	• Epitope elicits a primary proliferative response in PBMC from uninfected donors.				
p24 (28–36)	Gag (p24) (160–168 HXB2)	EEKAFSPEV	HIV-1 infection	human (DRβ1*0101)	Boritz2003
	Keywords HAART. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. **Donor HLA** DRβ1*0101, DRβ1*1501, DQ5, DQ1, DR51.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. • The TCR that recognized this epitope used Vβ2.				
p24 (31–46)	p24 (163–177)	AFSPEVIPMFSALSEC	in vitro stimulation or selectio	human (A*0201)	Bedford1997
	• E elicits a primary proliferative response in PBMC from uninfected donors. • Peptide contains a CTL epitope identified in HIV-positive patients. • Peptide binds to HLA A*0201 and causes regulation of class I expression on T2 cells. • Matches 3/3 anchor residues for HLA DR: **V**IPMF**S**AL**S**				
p24 (31–52)	p24 (163–184 SF2)	AFSPEVIPMFSALSEGATP-QDL	HIV-1 infection	human	Rosenberg1997
	• Low viral load correlated with strong HIV-1-specific proliferative response. • A proliferative response to this epitope was detected in two long term survivors.				
p24 (35–44)	Gag (p24) (167–176 HXB2) **Keywords** HAART. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. **Donor HLA** DRβ1*0101, DRβ1*1501, DQ5, DQ1, DR51.	EVIPMFSALS	HIV-1 infection	human (DRβ1*0101)	Boritz2003
	• HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.				
p24 (41–56)	p24 (173–187)	SALSEGATPQDLNTMC	in vitro stimulation or selectio	human	Bedford1997
	• Epitope elicits a primary proliferative response in PBMC from uninfected donors.				
p24 (48–62)	p24 (180–194)	TPQDLNTMLNTVGGH	HIV-1 infection	human	Adams1997
	• One of four immunogenic Gag peptides used in study of proliferative response to p24. • Homology to an SIV epitope recognized by macaque T-cells. • T-cells from 8 of 19 HIV+ individuals responded to this epitope. • Improved assay system (increase in culture time to 8 days and addition of IL-2 to cultures) gave increased detection of proliferative response.				
p24 (51–66)	p24 (183–197)	DLNTMLNTYGGHQAAC	in vitro stimulation or selectio	human	Bedford1997
	• Epitope elicits a primary proliferative response in PBMC from uninfected donors.				
p24 (51–82)	Gag (183–214 LAI) **Vaccine** *Vector/Type:* lipopeptide	DLNTMLNTVGGHQAAMQML-KETINEEAAEWDR	Vaccine	human	Gahery-Segard2000
	• Anti-HIV lipopeptide vaccine consisting of six long peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 2/10 reacted to this peptide. • 9/12 tested mounted a CTL responses to at least one of the six peptides, each of the six peptides elicited a CTL response in at least one individual. • None of the 12 tested had an IgG response to this peptide.				
p24 (69–88)	Gag (p24) (201–220 IIIB) **Keywords** immunodominance, Th1, Th2, TCR usage. **Epitope name** P21. **Donor HLA** DR4, DR7 DQ2 and DQ3. • PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA clas II DR restricted. • Clone 85 recognized this peptide using TCR Vβ 8 and 18; the two TCR receptors indicates this limiting dilution represents a mixed population. This clone was only activated by peptide, not by processed protein from vaccinia virus Gag-infected B-LCL.	LKETINEEAAEWDRVHPVHA	in vitro stimulation or selectio	human (DR)	Venturini2002
p24 (71–86)	p24 (203–220) • Epitope elicits a primary proliferative response in PBMC from uninfected donors.	ETINEEAAEWDRVHPC	in vitro stimulation or selectio	human	Bedford1997

p24 (73–97)	p24 (205–229 PV22)	INEEAAEWDRVHPVHAGPI-APGQMR	HIV-1 infection	human (DRB1*03)	Lotti2002
	Keywords HAART, Th1, Th2, TCR usage. **Donor HLA** A29(19)/A30(19), B8/B35, DRB1*03/DRB1*13. • 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response. • For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity. • 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 12 recognized this peptide sequence restricted by DRB1*03 using TCR Vβ 22. This clone had a SI of 12.4 to p55, 49.6 to peptide, secreted low levels of IFNgamma, indicative of a Th1 response. Clone 12 had cytotoxic activity, mediated through both a perforin and a Fas-based pathway.				
p24 (76–85)	p24 (208–217)	EAAEWDRVHP	HIV-1 infection	human	Adams1997
	• One of four immunogenic Gag peptides used in study of the proliferative response to p24. • T-cells from 11 of 24 HIV+ individuals responded to this epitope. • Improved assay system (increase in culture time to 8 days and addition of IL-2 to cultures) gave increased detection of proliferative response.				
p24 (76–90)	p24 (208–222 IIIB, B10)	EAAEWDRVHPVHAGP	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
p24 (79–88)	Gag (p24) (211–220 HXB2)	EWDRVHPVHA	HIV-1 infection	human (DRβ1*0101)	Boritz2003
	Keywords HAART. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. **Donor HLA** DRβ1*0101, DRβ1*1501, DQ5, DQ1, DR51. • HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. Two clones recognized this epitope.

p24 (81–102)	p24 (213–234 SF2)	DRVHPVHAGPIAPGQMREP-RGS	HIV-1 infection	human	Rosenberg1997
	• While anti-HIV CD4 Th responses are characteristically undetectable in chronic infections, strong p24-specific proliferative responses were inversely correlated with low viral load in 10 chronically infected people. • The dominant proliferative response in one of two long term survivors was to this peptide.				
p24 (86–94)	p24 (NY5)	VHAGPIAPG	HIV-1 infection	human (DQ7)	Norris2001b
	Keywords HAART, supervised treatment interruptions (STI), rate of progression, immunodominance, acute infection, cross-presentation by different HLA, early treatment, TCR usage. • Gag-specific CD4+ helper T-cell clones were derived from one long-term non-progressor (LTNP) (CTS-01), and three individuals given therapy during acute infection, two before (AC-01 and AC-36) and one after (AC-25) STI. Gag peptide recognition induced proliferation, IFNgamma production and perforin-mediated cytotoxicity in all CD4+ T-cell clones isolated. • 3/23 p24-derived peptides tested induced proliferative p24-specific T-helper cell responses in the LTNP CDT-01. The immunodominant response was to the peptide DRVHPVHAGPIAPGQMREPRGS (81-102), and 9/10 CD4+ T-cell clones reacted with it. One was characterized in detail and used a Bβ4 TCR. • The minimum peptide recognized by the clones from CDT-01 was VHAGPIAPG and it was restricted by HLA-DQ7.

p24 (156–174)	p24 (287–306)	QPKEPFRDYVDRFYKTLRA	HIV-1 infection	human	Adams1997
	• One of four immunogenic Gag peptides used in study of the proliferative response to p24. • T-cells from 5 of 21 HIV+ individuals responded to this epitope. • Improved assay system (increase in culture time to 8 days and addition of IL-2 to cultures) gave increased detection of proliferative response.				
p24 (157–165)	Gag (p24) (289–297 HXB2) **Keywords** HAART. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. **Donor HLA** DRβ1*0101, DRβ1*1501, DQ5, DQ1, DR51. • HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.	PKEPFRDYV	HIV-1 infection	human (DQ5)	Boritz2003
p24 (161–180)	Gag (293–312 SF2) **Vaccine** *Vector/Type:* Listeria monocytogenes *Strain:* B clade SF2 *HIV component:* p24 Gag **Keywords** Th1. • Listeria moncytogenes is an intracellular bacterium that lives in the cytoplasm and generates a cell-mediated immune response. • Listeria moncytogenes vaccine expressing HIV-1 p24 protein (Lm-Gag) was used to stimulate gag specific CD4+ T cell proliferative responses in BALB/c(H-2d) and C57BL/6(H-2b) mice. • Two of three reactive p24 peptides (out of 22 overlapping peptides that span p24) were recognized by both murine strains – this peptide stimulated a response in both BALB/c and C57BL/6 mice. • The proliferative response is due to CD4+, IFNγ producing cells, a Th1 response.	FRDYVDRFYKTLRAEQASQD	Vaccine	mouse (H-2^d, H-2^b)	Mata1999
p24 (161–180)	p24 (293–312 HXB2) **Vaccine** *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag • BALB/c and C57BL/6 mice were immunized with rec Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways. • The class II T helper response was probed using 20 mer peptides that overlapped by 10, and the peptides VHQAISPRTLNAWVKVVEEK and FRDYV-DRFYKTLRAEQASQD were recognized in H-2^b and H-2^d mice.	FRDYVDRFYKTLRAEQASQD	Vaccine	mouse (H-2^d, H-2^b)	Mata1999
p24 (163–175)	Gag (295–307) **Keywords** HAART, supervised treatment interruptions (STI). **Assay type** cytokine production, proliferation, Tetramer binding, CD4 T-cell Elispot - IFNγ.	DYVDRFYKTLRAE	HIV-1 infection	human (DR0101)	Iyasere2003

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Fifteen patients recieving HAART with strong CD4+ proliferative responses to HIV antigens while on therapy were examined, to see the effects of viremia on these responses during treatment interuptions. Increased viremia occurred in 12/15 patients during at least one treatment interuption. Anti-HIV proliferative responses were inhibited during viremia, but IFNgamma production to Gag, Pol, and Nef peptide pools were maintained. • IL-2 production diminished during viremia, and exogenous IL-2 revived *in vitro* proliferation of HIV-specific T cells to a Gag or Pol DR0101 epitopes in a tetramer as well as Gag-specific total CD4 T-cell responses.				
p24 (163–177)	p24 (295–309)	DYVDRFYKTLRAEQA	HIV-1 infection	human (DRB1*1302)	Blankson2001b, Malhotra2001
	Keywords HAART. • The DRB1*13-DQB1*06 haplotype is associated with maintained viral suppression after HAART – 7/7 early-treated DRB1*13-DQB1*06 positive people, but only 3/14 (21%) of those who did not have DRB1*13-DQB1*06, maintained viral suppression for 18 months. • PBMC from individuals with the haplotype DRB1*13-DQB1*06 displayed increased IFNγ secretion and stronger proliferative responses against p24 80 weeks post treatment. • DRB1*13-DQB1*06 was also found to be enriched among long-term non-progressors (it was in 9/18 versus, versus 21% of the general population) • This epitope was mapped with truncated peptides using the Elispot assay, and is highly conserved.				
p24 (163–177)	p24 (295–309)	DYVDRFYKTLRAEQA	HIV-1 infection	human (DRB1*1302)	Blankson2001b, Malhotra2001
	Keywords HAART. • The DRB1*13-DQB1*06 haplotype is associated with maintained viral suppression after HAART – 7/7 early-treated DRB1*13-DQB1*06 positive people, but only 3/14 (21%) of those who did not have DRB1*13-DQB1*06, maintained viral suppression for 18 months. • PBMC from individuals with the haplotype DRB1*13-DQB1*06 displayed increased IFNγ secretion and stronger proliferative responses against p24 80 weeks post treatment. • DRB1*13-DQB1*06 was also found to be enriched among long-term non-progressors (it was in 9/18 versus, versus 21% of the general population) • This epitope was mapped with truncated peptides using the Elispot assay, and is highly conserved.				
p24 (175–199)	p17 (307–331 PV22)	EQASQEVKNWMTETLLVQN-ANPDCK	HIV-1 infection	human (DRB1*03)	Lotti2002
	Keywords HAART, Th1, Th2, TCR usage. **Donor HLA** A29(19)/A30(19), B8/B35, DRB1*03/DRB1*13. • 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response. • For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity. • 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 26 recognized this peptide sequence restricted by DRB1*03. This clone had a SI of 4.1 to p55, 5.3 to peptide, secreted high levels of IFNγ, indicative of a Th1 response, but also IL-4 and IL-5. Clone 26 had no cytotoxic activity.				
p24 (181–196)	p24 (313–327)	VKNWMTETLLVQNANC	in vitro stimulation or selectio	human	Bedford1997
	• Epitope elicits a primary proliferative response in PBMC from uninfected donors. • Matches 3/3 anchor residues for HLA DR: **V**KNWM**T**ET**L**				

III-B-3 p2p7p1p6 Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
p2p7p1p6 (18–37)	Gag (p24) (384–400 HXB2) **Keywords** HAART. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. **Donor HLA** DRβ1*0101, DRβ1*1501, DQ5, DQ1, DR51. • HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells/ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. • The two Th clones that recognized this epitope utilized TCR Vβ2 and Bβ8.1.	GNFRNQRKIVKCFNCGKEGH	HIV-1 infection	human (DR15/51)	Boritz2003
p2p7p1p6 (30–44)	p15 (393–407 IIIB, B10) • 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.	FNCGKEGHTARNCRA	HIV-1 infection	human	Wahren1989b, Wahren1989a
p2p7p1p6 (55–69)	p15 (418–432 IIIB, B10) • 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.	KEGHQMKDCTERQAN	HIV-1 infection	human	Wahren1989b, Wahren1989a
p2p7p1p6 (60–74)	p15 (423–437 IIIB, B10) • 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.	MKDCTERQANFLGKI	HIV-1 infection	human	Wahren1989b, Wahren1989a
p2p7p1p6 (76–83)	p24 (439–446 LAI) • Stimulates T-cell proliferation in HIV-infected donors. • Schrier lists this peptide as p24(439-446), but because of the numbering used for Gag epitopes, we placed it in p2p7p1p6.	PSYKGRPG	HIV-1 infection	human	Schrier1989
p2p7p1p6 (83–97)	p15 (446–460 BRU) • Peptide G4: could prime for *in vitro* immunoproliferative responses and for subsequent IgG responses.	GNFLQSRPEPTAPPA	in vitro stimulation or selectio	mouse (H-2^b)	Vaslin1994
p2p7p1p6 (98–112)	p15 (473–487 IIIB, B10) • Peptides were identified that commonly evoke T-cell responses – 50% of 90 HIV+ people had a T-cell response to this peptide.	ESFRSGVETTTPPQK	HIV-1 infection	human	Wahren1989b, Wahren1989a
p2p7p1p6 (103–110)	p24 (466–473 LAI) • Stimulates T-cell proliferation in HIV-infected donors. • Schrier lists this peptide as p24(466-473), but it is in p2p7p1p6.	REETTTPS	HIV-1 infection	human	Schrier1989
p2p7p1p6 (117–137)	Gag (p6) (480–500 IIIB) **Keywords** immunodominance, Th1, Th2, TCR usage. **Donor HLA** DR4, DR7 DQ2 and DQ3. • PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.	DKELYPLTSLRSLFGNDPS-SQ	in vitro stimulation or selectio	human	Venturini2002

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Clone 74 recognized two peptides, including this one, with a Th1 response using TCR Vβ 13 (13s1); it required 200 ng/ml (100 nM) and 1 µg/ml (0.5 µM) for stimulation by peptides 480-500 and 261-280, respectively. Sequencing TCR Vβ regions of colonies from clone 74 suggested this was a clonal population. Clone 74 was activated in response to vaccinia virus Gag-infected B-LCL, so it could recognize naturally processed epitopes.				

III-B-4 Gag Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	p24		HIV-1 infection, Vaccine	human	Kelleher1998b
	Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag • Immunization of HIV+ people with a p24-VLP virus-like particle did not significantly impact CD4+ lymphocyte count, viral load, or p24 antibody titre. • Immunization with p24-VLP showed a modest, short-lived increased proliferative response to p24.				
Gag	p24		HIV-1 infection, Vaccine	human	Maino2000
	Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)), protein *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus, p24 Gag • 18 HIV-1-seropositive patients with a low frequency or no detectable CD4+ T cell response to HIV-1 antigen received an HIV-1 immunogen consisting of 10 units of native p24 and 100 ug of HZ321, a gp120 depleted antigen. • Using flow-cytometric methods, HIV-1 specific CD4+ T cells were shown to increase in response to immunization – in many patients significant enhancement was observed after a single immunization. • The frequency of CD4+ T cells expressing cytokines in response to antigen by FACS was correlated with a lymphoproliferation assay.				
Gag	p24		HIV-1 infection	human	Ruiz2000
	Keywords HAART, supervised treatment interruptions (STI). • Structured treatment interruption in chronically infected patients allowed recovery of p24 Th proliferative responses after HAART therapy discontinuation in 2/12 patients. • The Th response to p24 was identified during peak viremia in one patient, while in the second it was noted when viremia was controlled after restarting antiviral therapy.				
Gag	p24		HIV-1 infection	human	Lori1999
	• Ten patients with acute, pre-seroconversion HIV-1 infections were treated with didanosine, indinavir and hydroxyurea – this treatment is associated with normalization of immune parameters. • A vigorous HIV-specific Th response (stimulation index greater than 8) was observed in 7/8 patients treated before complete WB seroconversion, but in only 1/5 controls treated after seroconversion. • Vigorous Th responses were detected as early as 34 days after treatment begin. • Patients treated prior to seroconversion had no loss of naive CD4 T lymphocytes, recovery of up to 35% of the naive CD8 cells in several weeks, and a reduced latent viral reservoir.				
Gag	p24		HIV-1 infection	human	Haslett2000
	Keywords HAART, supervised treatment interruptions (STI), Th1. • 11/22 adult patients on HAART showed strong CD4+ T-cell IFNγ producing Th1 responses to HIV p24. • The magnitude of the Th1 response correlated with previous interruptions in HAART, suggesting the interruptions primed or boosted the response. • In contrast, the magnitude of the CD8+ CTL response did not correlate with interruptions in therapy, although a greater breadth in response was associated with interruptions in HAART.				
Gag	p24		HIV-1 infection, Vaccine	human	Klein1997
	Vaccine *Vector/Type:* virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag • Immunization of HIV+ people with a HIV-1 p17/p24 Ty virus-like particle (p24-VLP) resulted in a marginal, short-lived increased proliferative response to p24 and p17 and a transient elevation in viral load.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Two of four subjects that received 500 or 1000 ug of p24-VLP had an increase in gag-specific CTL.				
Gag	p24		Vaccine	human	Moss1998
	Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus **Keywords** inter-clade comparisons. • Immunization with gp120 depleted HZ321 virus (REMUNE^{TM}) triggered an increase in lymphocyte proliferative response to native p24, a clade B virus and clade E viral antigens – Z321 is clade A in env and clade G in gag. [Moss1998]				
Gag	p24		HIV-1 infection	human	Rosenberg1999
	Keywords HAART. • This paper reviews the role of T-cells in viral control and HIV disease outcome. • Strong anti-p24 lymphoproliferative responses were found in seven persons who were treated with potent anti-viral therapy during acute HIV-1 infection syndrome. • This suggests that Th cells are part of the normal response to HIV-1 infection, but their numbers are rapidly diminished by either being infected during the peak viremia or by activation-induced cell death – if peak viremia can be controlled, a robust anti-p24 Th response can be maintained.				
Gag	p24		HIV-1 infection	human	Rosenberg1998
	Keywords HAART. • Strong Th responses have been found in rare individuals who effectively maintain low viral loads. • If aggressive anti-retroviral therapy is given prior to sero-conversion, strong helper responses can be maintained.				
Gag	p17		Vaccine	mouse	Birk1998a
	Vaccine *Vector/Type:* protein *HIV component:* p17 Gag • Different p17 genes derived from the same quasispecies and expressed and purified in E. coli primed different Th 1 and Th 2 subsets in mice, depending on their H-2 type.				
Gag	Gag		HIV-1 infection	human	Schiller2000
	• Study of parameters that might influence the performance or reproducibility of clinical Th proliferative assays. • HIV-1 replication *in vitro* is unlikely to influence the assay. • Gag proteins including p17 and possibly p7 as well as p24 perform better than p24 alone. • Frozen samples can be used in T-proliferative assays, but with lower radiolabled thymidine incorporation.				
Gag	Gag		HIV-1 infection	human	Pitcher1999
	Keywords HAART. • In contrast to earlier studies suggesting that HIV-1 specific Th responses were eliminated in the early stages of infection in most HIV+ individuals, this paper shows using flow cytometric detection of antigen-induced cytokines that Th-1 CD4+ memory gag-specific Th cells are detectable in most HIV+ subjects. • Effective anti-viral therapy reduces the frequency of these cells, presumably due to reduced antigenic stimulus.				
Gag	Gag		HIV-1 infection	human	Plana1998
	Keywords HAART. • Patients from later stages of infection given HAART do not show restoration of HIV-1 specific Th proliferative responses.				
Gag	Gag		HIV-1 infection	human	Kelleher1998a
	Keywords HAART.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Env and gag Th epitopes were pooled and used to test Th proliferative responses after IL2 therapy – while IL2 therapy causes an increase in CD4+ lymphocyte count, it does not increase HIV-1 specific proliferative responses.				
Gag	Gag (LAI)		Vaccine	macaque	Kent1998
	Vaccine *Vector/Type:* DNA prime with vaccinia boost *Strain:* B clade LAI *HIV component:* Env, Gag **Keywords** Th1, Th2. • Priming with an HIV-DNA vaccine and boosting with a vaccinia construct induced greater levels of HIV T-cell immunity than either vaccine alone. • The proliferative response to Env and Gag after the DNA vaccination had a mean SI of 1.5-4, but after boosting with rHIV-fowlpox virus, there was a 6-17 fold increase in the mean SI for HIV Gag and Env – The Th response happened despite a fall in Ab titers, suggesting that the Th response was primarily Th1, not Th2. The CTL response was also enhanced.				
Gag			Vaccine	macaque	Heeney1999
	Vaccine *Vector/Type:* DNA, protein, virus-like particle (VLP), ISCOM **Keywords** Th1, Th2. • Ten different vaccine strategies were evaluated for their ability to protect from infection in a rhesus macaque model using a non-pathogenic SHIV challenge. • Protection correlated with the magnitude of NAb responses, beta-chemokines, and a balanced Th response. • DNA, protein+adjuvant, VLP and ISCOM vaccines were tested. • HIV-1/ISCOMS gave the highest NAb titers, Th1 and Th2 responses, was the only vaccine formulation tested with a detectable CTL response, and gave enhanced beta-chemokine production.				
Gag	Gag/Pol (MN)		Vaccine	chimpanzee	Kim1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86 • Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.				
Gag	Gag/Pol (LAI, MN)		Vaccine	human	Salmon-Ceron1999
	Vaccine *Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease • A live attenuated canarypox vector expressing MN gp120 and LAI gp41/gag/protease could induce CTL and a lymphoproliferative response in healthy uninfected volunteers.				
Gag	p55 (IIIB)		HIV-1 infection	human	Zhang2001b
	Keywords HAART. • T-helper cell proliferative responses to HIV p24, p55 and gp120 were tested in 27 patients with HIV infection – vigorous responses directed at Gag were detected in ten patients, but an Env specific response was detected in only one patient. • Untreated patients showed a negative correlation between plasma viral load and HIV p24-specific T-cell responses, and the responses could be detected after extended HAART therapy with viremia below the detection limit.				
Gag	p24		HIV-1 infection	human	Carcelain2001
	Keywords HAART, supervised treatment interruptions (STI), kinetics, Th1. • Repeated structured HAART therapy interruptions (STI) in 3 chronically HIV infected patients induced rapid but transient (< 3 weeks) HIV-1 specific CD4+ Th1 responses concurrently with viral rebound, as measured by proliferation assays and by IFNγ production by CD8-depleted PBMC. • Kinetics suggest that viral replication leads to rapid destruction of the HIV-specific Th1 cell response. • HIV-specific CD8+ T-cell responses were delayed relative to the Th1 responses and were not sustained.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	Gag		HIV-1 infection	human	Blankson2001a
	Keywords HAART. • 5/10 chronically HIV infected patients with low CD4+ counts who received HAART therapy and experienced immune reconstitution displayed p24, p17 and p66 T-helper CD4 proliferative responses, in contrast to 0/8 chronically HIV infected patients with high CD4+ counts at the initiation of antiretroviral treatment. • This surprising result could be due to the low CD4 nadir patients being more likely to have thymic regeneration or a peripheral expansion of T cells.				
Gag	p24		HIV-1 infection	human	Angel2001
	Keywords HAART. • Prolonged viral suppression resulting from potent anti-retroviral therapy allowed a T helper response to Gag p24 and PHA to develop in many HIV+ patients. • At baseline, 2/41 (4.9%) subjects had a proliferative response to Gag p24, and 7/41 (17.1%) had a response to PHA, but by week 72 of therapy, 53% had a detectable response to p24 and 94% to PHA.				
Gag	p24		HIV-1 infection	human	Blazevic2000
	Keywords HAART. • Prolonged viral suppression resulting from potent anti-retroviral therapy did not allow an HIV T helper response to p24 or gp160, but Th proliferative responses to influenza, alloantigen, and PHA did develop in many HIV+ patients, and asymptomatic patients had stronger and more frequent Th response recovery than AIDS patients.				
Gag	Gag (SF2)		HIV-1 infection	human	Altfeld2001b
	Keywords HAART, acute infection. • Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection. • The breadth and specificity of the CTL response was determined using Elispot by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef. • Individuals who were given HAART during acute or early in infection had significantly stronger proliferative responses than individuals who were chronically infected.				
Gag	p24		HIV-1 infection	human	Oxenius2000
	Keywords HAART. • Patients who started therapy at acute HIV infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV-specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV-specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable. • In 3/4 responders tested p24 gave the strongest T helper response.				
Gag	p24		Vaccine	rat	Moss2001
	Vaccine *Vector/Type:* gp120 depleted whole killed virus *Strain:* AG recombinant HZ321 *HIV component:* virus *Adjuvant:* Complete Freund's Adjuvant (CFA), CpG immunostimulatory sequence (ISS) • Different HIV strains were used for different regions: subtype A env, subtype G gag • Lewis rats simultaneously immunized with HIV-1 antigen and with immunostimulatory sequences CpG had increased Th proliferative responses, but when CpG was given as a prime prior to the injection of HIV-1 antigen it was not as effective.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	p24		Vaccine	rat	Moss2000
Vaccine *Vector/Type:* gp120 depleted whole killed virus *Strain:* AG recombinant HZ321 *HIV component:* virus *Adjuvant:* Complete Freund's Adjuvant (CFA), CpG immunostimulatory sequence (ISS) • Different HIV strains were used for different regions: subtype A env, subtype G gag • Lewis rats co-immunized with HIV-1 antigen in Freund's and with immunostimulatory sequences CpG stimulated increased IFNγ expressing CD4+ and CD8+ T cells and anti-p24 antibodies relative to antigen in Freund's without CpG.					
Gag	p24		HIV-1 infection	human	Kalams1999a
Keywords rate of progression, Th1. • The strength of p24 specific Gag proliferative responses (SIs) were inversely correlated with viral load in 21 ARV naive patients. The responses were Th1, IFNγ producing. Proliferative responses against gp160 were rarely observed (only 4 cases). • Gag specific CTL levels were correlated with Gag proliferative responses but were not correlated with viral load. 8 subjects lacked p24 specific Gag proliferative responses, and 4/8 had no CTLp to any HIV-1 antigen tested.					
Gag	p24		HIV-1 infection	human	Kalams1998
Keywords HAART, review, rate of progression. • This paper reviews the role of specific T cell help in many viral infections, and covers the interplay between Th, CTL and survival, and discusses briefly advantages of HAART during acute HIV infection to prevent the early decimation of the Th response in HIV infections.					
Gag	p24		HIV-1 infection	human	Wilson2000b
Keywords rate of progression, Th1, Th2. • Dysfunction of HIV-1 specific proliferative responses, but not responses to other antigens, is evident in HIV-1 progressive disease. • Vigorous HIV-1 specific responses to p24, Nef and gp120 with SI between 8-99 were seen in 6/7 long term non-progressors (LTNP), the seventh had a borderline responses. IL-2 production was seen in all cases, and IL-4 production was also evident many responses. • None of the progressors (0/5) had HIV-1 specific proliferative responses, or IL-2 or IL-4 induction. • Non-HIV antigens (cytomegalovirus, PPD, Staphylococcus enterotoxin B, tetanus toxoid) gave similar responses in HIV-1+ LTNP, progressors, and HIV-1 controls.					
Gag	p24		HIV-1 infection	human	Alatrakchi2002
Keywords rate of progression, Th1. • LTNP co-infected with HCV and HIV showed higher frequencies of Th1 response to both HIV-1 p24 and HCV antigens. • HIV-1 CD4 Th1 responses in untreated LTNP were inversely correlated with viral load.					
Gag	p24		HIV-1 infection	human	Lange2002
Keywords HAART. • Cross-sectional study compares CD4 T-cell count and age matched untreated HIV-1+ patients (N = 14) with patients undergoing HAART therapy (N = 14). • The fractions of naive and memory T-cells were comparable for both groups, as were proliferative responses to non-HIV antigens. Lymphocyte proliferation responses to HIV-1 p24 were of greater magnitude in the group treated with HAART (5/10 had SI >10, versus 1/12 in the untreated group), suggesting that ongoing viral replication impairs the anti-Gag response, and the response can be improved and restored through HAART. • DTH responses to recall antigens were tested, and responses to C. albicans and Trichophyton were comparable in both treated and untreated patients, although patients on therapy had higher responses to mumps.					
Gag	p24		HIV-1 infection	human	Fidler2002
Keywords HAART, inter-clade comparisons, escape, acute infection.					

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 37/45 patients with primary HIV infection underwent a short course of antiretroviral therapy (SCART). 29/37 patients received triple ART therapy and eight patients received four ART drugs. Initiation of SCART was effective in controlling HIV replication by ten weeks in all patients and preserving CD4+ T cell responses for up to 64 weeks after therapy. • No induction of drug escape mutations was observed, although two individuals had escape mutations in their infecting virus at baseline. • 34 UK infected patients were clade B infected. 11/45 subjects had non-UK acquired HIV infection, 2 were clade A, 1 was A/E, 1 was C, 1 was "untypable", the rest were B. • Recombinant HIV-1 derived gp120, p24, p66 and overlapping peptide pools spanning Tat and Nef were employed to measure CD4 T-cell frequencies in ELISPOT assays. The strongest preservation of T helper responses 12 weeks off SCART was seen for p24-specific CD4+ T-cell responses. • 6/8 of the untreated individuals were tested for CD4+ T-cell responses. 1 had no detectable response. 1 had detectable responses to all HIV-1 proteins tested at baseline, but this narrowed to p24 and gp120, then became undetectable by 52 weeks. 3 had detectable and persistent responses, but only to p24. • Post-therapy, the average spot forming cells for all proteins tested in 17/37 with 24 weeks of follow up had not declined, although the plasma viral RNA was increasing. SFU using p24 were measurable following SCART and preserved at levels comparable to baseline.			
Gag			Vaccine	human	Klein1997, Lindenburg2002
	Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* B clade IIIB *HIV component:* p17 Gag, p24 Gag *Adjuvant:* aluminum hydroxide **Keywords** rate of progression. • HIV-1 p17/p24:Ty virus-like particles therapeutic vaccination of 56 HIV-1 infected patients had no effect on disease progression, AIDS and CD4+ T-cell decline in a longitudinal study, despite some evidence suggesting it can enhance Th anti-Gag proliferative responses in HIV+ individuals [Klein1997]				
Gag	p24 (NY5)		HIV-1 infection	human	Norris2001b
	Keywords HAART, supervised treatment interruptions (STI), rate of progression, immunodominance, acute infection, cross-presentation by different HLA, early treatment. • Gag-specific CD4+ helper T-cell clones were derived from one long-term non-progressor (LTNP) (CTS-01), and three individuals given therapy during acute infection, two before (AC-01 and AC-36) and one after (AC-25) STI. • The immunodominant response in LTNP CTS-01 was to peptide 9, and 9/10 clones derived from this patient reacted with it. Three, two, and one clones were obtained from the three patients given therapy. These six clones all reacted with different p24 peptides, and all had peptide induced proliferative responses, IFNgamma production, and cytotoxic responses. The implications of cytoxic responses in CD4+ T-helper cells are discussed.				
Gag	p24		HIV-1 infection	human	Palmer2002
	Keywords HAART. • CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses. • No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.				
Gag	p24 (SF2)		HIV-1 infection	human	Imami2002b
	Keywords rate of progression, Th1, Th2. • 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. • SF2 p24 20mer peptides overlapping by 10 were used to assess the response in the different groups. At least 1/10 and up to 7/10 nonprogressors had a proliferative response with every one of the 22 p24 overlapping peptides. All peptides produced an IL-2 (Th1) response in at least one of the 10 nonprogressors. IL-4 (Th2) responses were strong, but somewhat less comprehensive as 6/22 peptides elicited no IL-4 production, and fewer IL-4 responses were see per peptide. In contrast, only 1/10 progressors had a clear proliferative and IL-2 response to 2/22 peptides, and neither one made an IL-4 response.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The results taken together suggest that a balanced Th1/Th2 response to HIV is important for viral control in long-term non-progression. • One immunologically discordant progressor became symptomatic while on the study. He showed a rapid decline in proliferative activity at that point, and a shift from a Th1 to a Th2 IL-4 producing response.				
Gag	(BRU)		Vaccine	mouse	Haas1991
	Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade BRU *HIV component:* virus *Adjuvant:* Complete Freund's Adjuvant (CFA) • Of 5 mouse inbred lines tested: DBA/2 (H-2d, Ad, Ed), B10.A(4R) (H-2h4, Ak) and B10.A(5R) (H-2i5) showed particularly good CD4+ T cell proliferative responses to HIV proteins (gp160, gp120, p17, p24, Nef and RT), after vaccination with inactivated virus. • B10.BR (H-2k, Ak, Ek) and C57BL/6 (H-2b and Ab) had weaker responses.				
Gag	Gag (III-B)		Vaccine	mouse	Bojak2002a
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* Gag **Keywords** vaccine-specific epitope characteristics, Th1. **Donor HLA** H-2^d. • Codon-optimized gag gene DNA vaccines were compared to wild type by vaccination of BALB/c mice. Codon optimized DNA gave a Th1 polarized Th response, a strong antibody response that persisted from more than 20 weeks, and CTL responses, while wild-type DNA induced weak and inconsistent immune respones.				
Gag	Gag (MN)		HIV-1 infection	human	Malhotra2003
	Keywords HAART, acute infection. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.				
Gag	Gag (p24)		HIV-1 infection, Vaccine	human	Moss2003
	Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)), protein *Strain:* AG recombinant HZ321 *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** HAART, supervised treatment interruptions (STI), immunotherapy. **Assay type** cytokine production, proliferation, T-cell Elispot. • Structured treatment interruptions (STIs) were compared in individuals that had been given prior therapeutic vaccines, and those that had not. Therapeutic immunization increased gag p24 stimulated proliferative responses and MIP-1β responses prior to STIs, although total CD4 counts viral RNA levels were unchanged. Proliferative responses and chemokine induction in the vaccinated group correlated with the control of viremia during subsequent STIs.				
Gag			HIV-1 infection	human	Papasavvas2003
	Keywords supertype. **Assay type** proliferation, T-cell Elispot, Intracellular cytokine staining. • Children with full or partial viral supression along with stable CD4+ T cell counts had significantly increased levels of anti-HIV CD4+ T cell proliferative responses, and decreased CD38+ T-cells. • Preservation of high levels of CD4+ T-cells was associated with a high percentage of CD4+ naive T-cells relative to memory T-cells.				
Gag	Gag (p24)		HIV-1 infection, Vaccine	human	Robbins2003
	Vaccine *Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Keywords** HAART, immunotherapy.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Assay type proliferation, T-cell Elispot, Delayed-type hypersensitivity (DTH). • Augmented Th cell responses to Gag p24 were seen in five out of five chronically infected individuals who had virological control with HAART, after therapeutic immunization with REMUNE (gp120 depleted inactived virus). The magnitude of responses ranges from a five-fold to a 200 fold incresase, with fluctuation in magnitude over time. • There was no change in the magnitude and breadth of CTL responses, CD4 counts or percentages, or DTH responses. • , and intermittently negative for some.				
Gag	Gag (p24)		HIV-1 infection	human	Wang2002a
	Keywords rate of progression, immunodominance. **Assay type** cytokine production, proliferation, CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. **Donor HLA** A1, A2, B8, B44, DR4, DR15; LTNP S24: A2, A11, B55, B57, DR4, DR13; LTNP C135: A1, A33, B50, B57, DR7, DR13. • A 51 year old male, infected presumably in 1988, diagnosed seropositive in 1993, has remained asymptomatic and is a long term non-progressor. He had very low proviral copy number in his PBMCs with high levels of G-A hypermutation, resulting in multiple stop codons, and viral replication was not evident. He was heterozygous for the CCR5 delta 32 allele, and has undergone a variety of treatments through the years. T cell responses in this patient and in two additional LTNPs were described, and this patient had particularly intense CD4+ Th responses. • PBMC from this patient resisted infection from CCR5, CXCR4 and dual-tropic HIV-1 strains. Purified CD4+ T cells became infected, however, without detectable cytopathic effect. CD8+ T cells were shown to protect PBMCs from infection, and this protection was not mediated by IFNgamma. Undefined CD8 T-cell secreted factors were stimulated by Gag, Pol and Nef genes introduced into target cells with vaccinia and processed through a class I pathway were responsible for the protective effect. This factor resembled CAF, the CD8+ cell antiviral factor described in Mackewicz and Levy (ARHR 8:1039, 1992) • The CD4+ and CD8+ T-cell populations were both strongly skewed toward the CD45RO+ phenotype, many of which were terminally differentiated CD28- and expressed the activation markers CD38+ and HLA-DR+. Cell turnover, however, wasn't much elevated as measured by apoptosis or Ki-67+ and Bcl-2 dim expression. • Vigorous p24-specific Th proliferative responses were observed, and 50% of CD4+ T-cells proliferated in response to p24 Gag, an extraordinary percentage. Responses were also detected against other regions in Gag, gp120 and Nef. It remains unclear how such vigorous Th responses are maintained with undetectable ongoing viral replication. • Strong CD4+ T-cell IFNgamma Elispot responses were mapped to many peptides in Gag for this patient. T-cells from two other LTNPs were tested here, and they did not react with as many Gag peptides as the main study subject of the paper. NIH reference Gag peptide set was used, but the sequences of the reactive peptides and the precise strain was not indicated in the paper, so we could not record them in the database. • CD8+ T cell Elispot responses to Gag, Env, Nef, and Pol were detected as well, although CTL were not prominent, consistent with undetectable viremia. • This subject had strong NAb responses when tested using the X4 primary isolate 228 200.				
Gag	Gag (p24)		HIV-1 infection		Sullivan2003
	Keywords HAART. **Assay type** proliferation. • Lymphoproliferative responses to HIV antigens p24, gp120 and Nef were enhanced in eight patients who were switched from protease inhibitors to non-nucleoside reverse transcriptase inhibitors.				
Gag	Gag (p24)		HIV-1 infection	human	Hardy2003
	Keywords HAART. **Assay type** cytokine production, proliferation. • Upon initiating HAART, CD4+ T cell proliferative responses in 36 patients were restored to specific antigens, mitogens, and IL-2. Restored recall responses were largely to persistent antigens, and not to HIV-1 or new antigens, and recall responses were associated with IL-2, not IL-4 production.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	p24 (IIIB)		in vitro stimulation or selectio	human (A*0201)	Engelmayer2001
	Keywords dendritic cells. • Recombinant canarypox virus vector containing HIV-1 sequences, upon infection of mature dendritic cells, can trigger specific lysis *in vitro* by T-cells from HIV-1 infected individuals at levels comparable to the response seen to HIV carried in vaccinia vectors. • Recombinant canarypox virus vector containing HIV-1 sequences can also stimulate HIV-specific IFNγ CD4+ helper T cell responses to Gag from bulk or purified CD4+ T cells.				
Gag	p55		HIV-1 infection	human (DRB1*13, DRB1*03)	Lotti2002
	Keywords HAART, Th1, Th2, TCR usage. **Donor HLA** A29(19)/A30(19), B8/B35, DRB1*03/DRB1*13. • 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response. • For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage. Two clones were DRB1*13 restricted and used TCR Vβ 17+19 or 5.1. Three clones were DRB1*03 restricted and used TCR Vβ 22. Some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production).				
Gag	p24		Vaccine	mouse (H-2^d)	Qiu2000
	Vaccine *Vector/Type:* DNA *HIV component:* Gag • Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein. • Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors. • IFNγ levels were increased compared to an undetectable IL-4 response. • CTL levels were also increased in secreted Gag expression vaccination studies.				
Gag	Gag		Vaccine	mouse (H-2^d)	Billaut-Mulot2001
	Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18 **Keywords** Th1, Th2. • DNA vaccinated BALB/c mice primed and boosted with a multiepitopic vaccine with IL18 showed lymphoproliferative responses 7 weeks post immunization. • Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime + DNA boost was more effective than DNA prime + protein boost. • Immunization with either the multiepitopic DNA or with the mixed DNA vaccine resulted in Th1 cytokines production (IL-2 and IFNγ) in spleen cell cultures stimulated by Tat and Gag, while Th2 cytokines IL-4 and IL-10 production was not detectable. • Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.				
Gag	p24		Vaccine	mouse (H-2^d)	Halim2000
	Vaccine *Vector/Type:* coxsackievirus *HIV component:* p24 Gag • An avirulent rec coxsackievirus (CB4-P) construct was generated that can express p24 Gag sequences – CB4-P is attenuated even in immunodeficient mice and T help responses can be elicited from peptides embedded in a surface loop of the VP1 capsid. • This paper describes the vaccine strategy and generation of constructs, and employs amino-terminal fusion of Gag sequences to the viral polyprotein with subsequent cleavage to elicit CTL responses via MHC class I presentation in BALB/c mice.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Gag	gp120 (V3) and p24 (IIIB, MN, BH10)		Vaccine	mouse (H-2^d)	Buonaguro2002
	Vaccine *Vector/Type:* virus-like particle (VLP) *Strain:* A clade UG5.94UG018, B clade IIIB *HIV component:* Gag, gp120 **Keywords** inter-clade comparisons. • Different HIV strains were used for different regions: gp120 A clade UG5.94UG018, HIV-1 IIIB • BALB/c mice were given intraperitoneal immunization in the absence of adjuvants with virus-like particles (VLPs) expressing recombinant subtype A gp120 and Pr55gag. • High dose-independent humoral responses were elicited against both gp120 and p24 peptides, and CTL responses were observed against target cells carrying vaccinia expressed gp120 and Gag.				
Gag	Gag (HXB2)		Vaccine	mouse (H-2^d, H-2^b)	Mata2001
	Vaccine *Vector/Type:* Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag **Keywords** Th1. • BALB/c and C57BL/6 mice were immunized with rec Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag and mice were challenged with vaccinia expressing Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways. • CD4+ Th1 T-cells mediated the Gag specific immunological protection in mice immunized with Lm-Gag and challenged with vaccinia-Gag. • Gag-specific CTL may enhance viral clearance via IFNγ secretion, but are not essential for immunity.				
Gag	Gag		Vaccine	mouse (H-2^d, H-2^b)	Mata2000
	Vaccine *Vector/Type:* Listeria monocytogenes *HIV component:* Gag **Keywords** review, Th1. • BALB/c and C57BL/6 mice were immunized with rec Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag and mice were challenged with vaccinia expressing Gag. • L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways. • This article is a review of L. monocytogenes biology and its potential as a vaccine vector for HIV, comparing to other vector systems, and discussing CD4+ Th1 T-cells mediated Gag specific immunological protection in mice and the Gag CTL response.				

III-B-5 RT Helper T-cell epitopes

	• T-cells from RT immunized mice have enhanced proliferative response with peptide.				
RT (124–138)	Pol (303–317)	FRKYTAFTIPSINNE	HIV-1 infection	human (DR supermotif)	Wilson2001
	Keywords inter-clade comparisons.				
	Epitope name Pol 303.				
	• Eleven peptides were identified that had the HLA-DR supermotif, all were found to bind to MHC class II DR molecules and all elicited proliferative responses from multiple HIV-infected donors.				
	• This epitope binds seven HLA-DR alleles: DRB1*0901, DRB1*0802, DRB1*0701, DRB1*0405, DRB1*0401, DRB1*1501 and DRB1*0101, with an IC_{50} threshold below 1,000 nM.				
	• This epitope sequence is conserved in 68% of clade B isolates.				
	• 8/22 HIV infected individuals responded to this epitope (13/22 responded to some of the DR supermotif epitopes, the 9 non-responder peptides tended to also not have recall responses to rec HIV-1 whole proteins)				
RT (124–138)	Pol (303–317)	FRKYTAFTIPSINNE	Vaccine	mouse (I-Ab and HLA-DR)	Livingston2002
	Vaccine *Vector/Type:* DNA with CMV promotor, peptide *Adjuvant:* Complete Freund's Adjuvant (CFA)				
	Keywords vaccine-specific epitope characteristics, immunodominance.				
	Epitope name Pol 303.				
	Donor HLA H-2b.				
	• Four Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented my murine class II molecule I-Ab, enabling testing of vaccine strategies of in H-2b mice.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promotor were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all four peptides, using either DNA or protein for the vaccination.				
RT (133–147)	RT (133–147 BRU)	PSINNETPGIRYQYN	Vaccine	mouse (H-$2^{k, i5}$)	De Groot1991
	Vaccine *Vector/Type:* protein *Strain:* B clade BRU *HIV component:* RT • T-cells from RT immunized mice have enhanced proliferative response with peptide.				
RT (144–158)	RT (144–158 BRU)	YQYNVLPQGWKGSPA	Vaccine	mouse (H-2^{t4})	De Groot1991
	Vaccine *Vector/Type:* protein *Strain:* B clade BRU *HIV component:* RT • T-cells from RT immunized mice have enhanced proliferative response with peptide.				
RT (156–170)	Pol (335–349)	SPAIFQSSMTKILEP	HIV-1 infection	human (DR supermotif)	Wilson2001
	Keywords inter-clade comparisons. **Epitope name** Pol 596. • Eleven peptides were identified that had the HLA-DR supermotif, all were found to bind to MHC class II DR molecules and all elicited proliferative responses from multiple HIV-infected donors. • This epitope binds nine HLA-DR alleles: DRB1*0101, DRB1*1501, DRB1*0405, DRB1*1101, DRB1*1302, DRB1*0701, DRB1*0901, DRB5*0101 and DRB3*0101, with an IC_{50} threshold below 1,000 nM. • This epitope sequence is conserved in 79% of clade B isolates. • 7/22 HIV infected individuals responded to this epitope (13/22 responded to some of the DR supermotif epitopes, the 9 non-responder peptides tended to also not have recall responses to rec HIV-1 whole proteins)				
RT (156–170)	Pol (335–449)	SPAIFQSSMTKILEP	Vaccine	mouse (I-Ab and HLA-DR)	Livingston2002
	Vaccine *Vector/Type:* DNA with CMV promotor, peptide *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** vaccine-specific epitope characteristics, immunodominance. **Epitope name** Pol 335. **Donor HLA** H-2b. • Four Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented my murine class II molecule I-Ab, enabling testing of vaccine strategies of in H-2b mice. • Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promotor were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all four peptides, using either DNA or protein for the vaccination.				
RT (171–189)	Pol (171–189 HXB2)	FRKQNPDIVIYQYMDDLYV	HIV-1 infection	human (DR0101)	Iyasere2003
	Keywords HAART, supervised treatment interruptions (STI). **Assay type** cytokine production, proliferation, Tetramer binding, CD4 T-cell Elispot - IFNγ. • Fifteen patients recieving HAART with strong CD4+ proliferative responses to HIV antigens while on therapy were examined, to see the effects of viremia on these responses during treatment interuptions. Increased viremia occurred in 12/15 patients during at least one treatment interuption. Anti-HIV proliferative responses were inhibited during viremia, but IFNgamma production to Gag, Pol, and Nef peptide pools were maintained.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• IL-2 production diminished during viremia, and exogenous IL-2 revived *in vitro* proliferation of HIV-specific T cells to a Gag or Pol DR0101 epitopes in a tetramer as well as Gag-specific total CD4 T-cell responses.				
RT (171–190)	RT (171–190 HXB2)	FRKQNPDIVIYQYMDDLYVG	HIV-1 infection	human (DR1, 2 or 3, 4 and 7)	vanderBurg1999
	Keywords Th1. • T-cells specific for this epitope from the three donors were stimulated when presented with target cells pulsed with whole RT, indicating that the peptide is naturally processed for multiple HLA-DR molecules. • Epitope binds to HLA-DR1, -DR2, -DR3, -DR4, and DR7, and can elicit Th1 cells that recognize peptide, protein, and HIV pulsed stimulator cells in the context of DR1, 2 or 3, 4 and 7 – these HLA types cover more than half of the general population.				
RT (171–190)	RT (171–190 HXB2)	FRKQNPDIVIYQYMDDLYVG	HIV-1 infection, in vitro stimulation or selectio	human (DR1, DR2, DR3, DR4, DR7)	vanderBurg1999
	Keywords binding affinity, cross-presentation by different HLA, Th1. • The goal of this study was to identify Th epitopes that could be cross-presented by multiple class II HLA molecules. 5 RT peptides were identified that could bind to more than one HLA class II protein, and but only 2/5 could stimulate strong proliferation responses in PBMC derived from multiple healthy donors. • This highly conserved epitope binds with high affinity to HLA-DR1, -DR2, -DR3, -DR4, and -DR7 but not HLA-DR5, and stimulated proliferation in 3/3 PBMC individuals with the appropriate HLA alleles. • This epitope was able to be naturally processed in protein pulsed stimulator cells, and responding clones had a Th1 cytokine profile. • This epitope is highly conserved and spans the highly conserved YMDD motif, and showing only minor variability in clades A, B, and D.				
RT (195–209)	RT (IIIB)	IGQHRTKIEELRQHL	in vitro stimulation or selectio	human	Manca1995b
	• Protein priming induced T-cells that recognize peptide.				
RT (196–215)	RT (351–370)	GQHRTKIEELRQHLLRWGLT	in vitro stimulation or selectio	human	Manca1995a
	• Protein priming induced T-cells that recognize peptide, 4 clones from a single donor recognized this peptide.				
RT (249–263)	RT (IIIB)	KDSWTWNDIQKLVGK	in vitro stimulation or selectio	human	Manca1995b
	• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming did not induce T-cells that recognize whole protein.				
RT (249–263)	RT (248–262)	KDSWTVNDIQKLVGK	in vitro stimulation or selectio	human	De Berardinis1999
	• PBMC from donors GD (HLA DR 11; DRB52) and LD (HLA DR 11, 13; DRB52) recognized this epitope (pep23) • A subset of T-cell lines generated from these donors were capable of recognizing pep23 expressed on the surface of filamentous phage fd, fused to the major coat protein gVIIIp. • This peptide was selected to study phage presentation of peptide sequences because it was known to serve as a T-cell helper determinant which could induce proliferation from a naive repertoire [Manca1995a]				
RT (249–263)	RT (249–263)	KDSWTVNDIQKLVGK	Vaccine, in vitro stimulation or selectio	human (DR5)	De Berardinis2000
	Vaccine *Vector/Type:* HIV-1 peptide in filamentous bacteriophage major coat protein *HIV component:* RT **Keywords** epitope processing. **Epitope name** RT2. • Phage display of the CTL epitope, ILKEPVHGV coupled with T helper epitope KDSWTVNDIQKLVGK, elicited specific CTL responses in PBMC from HIV negative individuals and *in vivo* in immunization of HLA-A2 transgenic mice.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Bacteriophage presentation of peptides is generally used for stimulation of antibodies, and this novel discovery of CTL epitope processing and presentation suggests new possibilities for these vectors. • HIV-1 peptides were displayed in filamentous bacteriophage fd virion major coat protein pVIII.				
RT (249–263)	RT (249–263)	KDSWTVNDIQKLVGK	Vaccine, in vitro stimulation or selectio	human, transgenic mouse (DR5)	Domingo2003
	Vaccine *Vector/Type:* peptide presented on icosahedral protein scaffold *HIV component:* RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA) **Epitope name** pep23. **Assay type** cytokine production, T-cell Elispot, Th support of CTL response. • A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from Bacillus stearothermophilus has been engineered to display 60 copies of one or more epitopes on a single molecule. An E2DISP scaffold which displayed pep23, a 15-residue B and T helper epitope from the reverse transcriptase of HIV-1 elicited a pep23-specific elicited a T-helper response *in vitro*. • The E2DISP scaffold displaying pep23 to stimulate a Th responses, and peptide RT2, which is a CTL epitope from HIV-1 reverse transcriptase, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to the class I and class II processing pathways. • The Th response in vaccinated mice was also able to support Pep23 specific IgG response.				
RT (249–263)	RT (248–262)	KDSWTVNDIQKLVGK	in vitro stimulation or selectio	human (DR5-11.01)	Moschella2003
	Keywords binding affinity, epitope processing, vaccine-specific epitope characteristics, escape. **Assay type** proliferation. **Donor HLA** DR5,DR6. • Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. They have different T cell receptor usage. Residue 11 (kdswtvndiqKlvgk)is a natural variant, and K11A, K11G, K11I, and K11L variants were synthesized and studied in two presentation contexts, one as simple peptides, the other embedded in a recombinant protein, GST. • The two Th clones and the two presentation contexts gave different outcomes with the peptides. K11I was not stimulatory, and was an antagonist in GST, an agonist as a peptide. K11L retained reactivity when presented in the fusion antigen, and had no acitivity as a peptide. K11G stimualted in both contexts, but the concentrations required for half maximal reactivity were different. K11A cuold not bind to the MHC in the processed form and could only stimulate when given as a peptide. • In conclusion, substitutions in epitopes have different effects on Th stimulation depending on the mode of processing, and this should be considered when interpreting Th escape studies and vaccine development.				
RT (249–263)	RT (248–262)	KDSWTVNDIQKLVGK	in vitro stimulation or selectio	human (DR5-11.01)	Bonomi2000
	Keywords binding affinity, epitope processing, vaccine-specific epitope characteristics, escape, TCR usage. **Assay type** proliferation. **Donor HLA** DR5,DR6. • Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. One of them used TCR Vβ15, the other used Vβ2. The substituions D2A, W4A, D8A, I9A, and K15A were generated and only D8A, I9A failed to react with one clone, while W4A, D8A, I9A were all critical for a reaction with the other clone, showing the TCRs focused on different but overlapping residues. • Moving the epitope to different contexts in recombinant proteins for presentation by APCs, as well as adding polyanalanine and polyserine strings to either side of the epitope, influenced reactivity, suggesting processing context can influence the structure of the presentation complex.				
RT (249–263)	RT (248–262 HXB2)	KDSSTVNDIQKLVGK	in vitro stimulation or selectio	human (DRS)	Fenoglio1999
	• RT pep23 epitope exhibited antagonistic activity against proliferation of gp120-specific T-cells when flanked by unrelated amino acid sequence.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• The glutathione S-transferase (GST)-peptide system can be used to display peptides; antigenicity was maintained when this peptide was expressed at the C-term end, but antagonism resulted when this peptide was expressed at the N-term end.				
RT (251–261)	RT (250–260)	SSTVNDIQKLV	in vitro stimulation or selectio	human (DR5(11.01))	Manca1996
	• This peptide was the minimal stimulatory sequence. • One Th line was stimulated by p66, one by a Glutathione-S-transferase (GST)-peptide fusion protein. • Constructs linking GST to the KDSSTVNDIQKLVGK peptide at the N-term end of GST stimulated Th cells, but not constructs linking at the C-term end. • The C and N termini of GST are not intrinsically permissive or non-permissive, presentation is epitope specific (see FAILKCNNK for contrast)				
RT (258–272)	RT (IIIB)	QKLWGKLNWASQIYP	in vitro stimulation or selectio	human	Manca1995b

III-B-8 Pol Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Pol	Gag/Pol		Vaccine	mouse	Kim1997b
	Vaccine *Vector/Type:* DNA *HIV component:* Gag, Pol, Vif *Adjuvant:* B7, IL-12				
	• A gag/pol DNA vaccine delivered in conjunction with the plasmid encoding the co-stimulatory molecules B7 and IL-12 gives a dramatic increase in both the cytotoxic and proliferative responses in mice.				
Pol	Gag/Pol		Vaccine	mouse	Kim1997d
	Vaccine *Vector/Type:* DNA *HIV component:* Gag, gp160, Pol *Adjuvant:* CD86				
	• A gag/pol DNA vaccine delivered in conjunction with the plasmid encoding the co-stimulatory molecule CD86 gives an increase in proliferative responses to Pr55 in mice.				
Pol	Gag/Pol (MN)		Vaccine	chimpanzee	Kim1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade MN *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86				
	• Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.				
Pol	Pol		HIV-1 infection	human	Blankson2001a
	Keywords HAART.				
	• 5/10 chronically HIV infected patients with low CD4+ counts who received HAART therapy and experienced immune reconstitution displayed p24, p17 and p66 T-helper CD4 proliferative responses, in contrast to 0/8 chronically HIV infected patients with high CD4+ counts at the initiation of antiretroviral treatment.				
	• This surprising result could be due to the low CD4 nadir patients being more likely to have thymic regeneration or a peripheral expansion of T cells.				
Pol	p66		HIV-1 infection	human	Oxenius2000
	Keywords HAART.				
	• Patients who started therapy at acute HIV infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.				
Pol	p66		HIV-1 infection	human	Palmer2002
	Keywords HAART.				
	• CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses.				
	• No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.				
Pol	(BRU)		Vaccine	mouse	Haas1991
	Vaccine *Vector/Type:* inactivated HIV *Strain:* B clade BRU *HIV component:* RT, virus *Adjuvant:* Complete Freund's Adjuvant (CFA)				
	• Of 5 mouse inbred lines tested DBA/2 (H-2d, Ad, Ed), B10.A(4R) (H-2h4, Ak) and B10.A(5R) (H-2i5) showed particularly good CD4+ T cell proliferative responses to HIV proteins (gp160, gp120, p17, p24, Nef and RT), after vaccination with inactivated virus.				
	• B10.BR (H-2k, Ak, Ek) and C57BL/6 (H-2b and Ab) had weaker responses.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Pol	RT (248–256 HXB2)		in vitro stimulation or selectio	human (DR5)	Manca1995b
	• CD4+ T-cell lines from uninfected individuals by stimulation with p66-pulsed APC. • TcR Vβ Dβ Jβ sequences were obtained from p66-specific T-cell clones. • There were multiple responses to peptides throughout p66, but because of uncertain locations, they have not been mapped. • Response to peptide 248-256 was associated with DR5.				
Pol	RT		Vaccine	mouse (H-2^{d})	Kim2000
	Vaccine *Vector/Type:* DNA *HIV component:* Env, Gag, Pol *Adjuvant:* IFN-gamma, IL-2, IL-4 **Keywords** Th1. • Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of Th1 cytokine IFNγ drove Th1 immune responses and enhanced CTL responses.				
Pol	RT		Vaccine	mouse (H-2^{d})	Burnett2000
	Vaccine *Vector/Type:* Salmonella *HIV component:* RT • A live attenuated bacterial vaccine, Salmonella SL3261-pHART, with an inserted HIV RT gene in the Lpp-OmpA-HIV fusion protein, induced a lymphoproliferative Th response in BALB/c mice.				

III-B-9 Vif Helper T-cell epitopes

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
Vif (65–76)	Vif (65–80)	VITTYWGLHTGE	HIV-1 infection	human	Ranki1997

	• T-cell response to this epitope persisted after seroreversion.				
Tat (17–32)	Tat (17–32 HXB2)	QPKTACTNCYCKKCCF	HIV-1 infection	human (DR5? plus others)	Blazevic1993
	Keywords immunodominance. **Epitope name** D26. • 9/14 (64%) of HIV-1 positive patients had proliferative T-cell responses associated with IL-2 production against at least one Tat-derived synthetic peptides of twelve overlapping 15-16 mer peptides spanning Tat. T cell proliferation was associated with IL-2 production. • 3/12 peptides were recognized. • This immunodominant, highly conserved and most frequently recognized peptide was recognized by 57% of the HIV-1 infected patients. A beta-sheet secondary structure was predicted at aa residues 21-28, but no amphipathic helix structure, suggested to be most favorable for T-cell epitopes, was indicated. • This peptide contained epitopes restricted by several HLA DR alleles, although the frequency of DR5 was enriched (3/6) among the patients that recognized the peptide.				
Tat (31–50)	Tat (31–50 LAI)	CFHCQVCFTTKALGISYGRK	Vaccine	mouse (H-2^d)	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Tat (33–48)	Tat (33–48)	HCQVCFMTKGLGISYG	HIV-1 infection	human	Ranki1997
	• T-cell response to this epitope persisted after seroreversion.				
Tat (33–48)	Tat (33–48 HXB2)	HCQVCFITKALGISYG	HIV-1 infection	human (DR5? plus others)	Blazevic1993
	Epitope name D28. • 9/14 (64%) of HIV-1 positive patients had proliferative T-cell responses associated with IL-2 production against at least one Tat-derived synthetic peptides of twelve overlapping 15-16 mer peptides spanning Tat. T cell proliferation was associated with IL-2 production. • 3/12 peptides were recognized. • 4/14 HIV+ people recognized this peptide. • An alpha-helix structure was predicted at residues 39-44, but charge patterns did not indicate it was an amphipathic helix, suggested to be most favorable for T-cell epitopes.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• This peptide contained epitopes restricted by several HLA DR alleles, although the frequency of DR5 was enriched (2/4) among the patients that recognized the peptide.				
Tat (36–50)	Tat (36–50 HTLV IIIB)	VCFITKALGISYGRK?	Vaccine	mouse (H-2^d)	Borsutzky2003
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), macrophage activating lipopeptide-2 (MALP-2) **Keywords** Th1, Th2, mucosal immunity. **Assay type** cytokine production, proliferation, T-cell Elispot, Th support of CTL response. • BALB/c mice that were vaccinated intranasally with Tat protein plus mucosal adjuvant macrophage-activating lipopeptide-2 (MALP-2) had increased proliferative, antibody, and IFNγ producing T-cell responses than did with Tat+IFA delivered by the i.p. route. • IFA as adjuvant stimulated a Th2-dominant response pattern, and MALP-2 as adjuvant shifted to a Th1 response. Anti-Tat IgG1 dominated the Ab response with IFA, IgG2b dominated with MALP-2. In animals vaccinated with Tat+MALP-2, IFNγ and IL-2 were the most prominent cytokines, with some IL-6. In contrast, in mice vaccinated with Tat+IFA, IL-6 was the dominant cytokine. Secreted IL-4, IL-5 and IL-10 were below the detection limit in both cases. • The strongest proliferation of spenocytes was observed was after re-stimulation with residues 36-50 and 56-70.

	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally; rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Tat (65–80)	Tat (65–80 HXB2)	HQASLSKQPTSQPRGD	HIV-1 infection	human (DR2? plus others)	Blazevic1993
	Epitope name D32. • 9/14 (64%) of HIV-1 positive patients had proliferative T-cell responses associated with IL-2 production against at least one Tat-derived synthetic peptides of twelve overlapping 15-16 mer peptides spanning Tat. T cell proliferation was associated with IL-2 production. • 3/12 Tat peptides were recognized. • 3/14 HIV+ people recognized this peptide.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• An alpha-helix structure was predicted at residues 65-72, but charge patterns did not indicate it was an amphipathic helix, suggested to be most favorable for T-cell epitopes.. • This peptide contained epitopes restricted by several HLA DR alleles, although the frequency of DR2 was enriched (2/3) among the patients that recognized the peptide.				
Tat (67–86)	Tat (67–86 LAI)	VSLSKQPTSQPRGDPTGPKE	Vaccine	mouse (H-2^d)	Hinkula1997
	Vaccine *Vector/Type:* DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat • Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein. • Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.				
Tat	Tat		Vaccine	human	Calarota1999
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat **Keywords** HAART. • 9/9 HIV-1+ subjects were given one of three DNA vaccinations for nef, rev or tat, and novel proliferative and CTL responses were generated. • The nef DNA immunization induced the highest and most consistent CTLp activity, IFNγ production, and IL-6 and IgG responses. • Highly active antiretroviral treatment (HAART) did not induce new HIV-specific CTL responses but reduced viral load, while DNA vaccination induced new immune responses but did not reduce viral load – thus this is a potentially complementary and promising combination.				
Tat	Tat		HIV-1 infection, Vaccine	human	Calarota2001
	Vaccine *Vector/Type:* DNA *HIV component:* Nef, Rev, Tat *Adjuvant:* CpG immunostimulatory sequence (ISS) **Keywords** review, Th1. • This review discusses the cellular immune response, and comments on CpG induction of Th1 cytokines and enhanced immune responses, and HIV-1 DNA vaccine boosting of CTL and Th proliferative responses in asymptomatic HIV+ individuals.				
Tat	Tat		in vitro stimulation or selectio	human	Corinti2002
	Keywords dendritic cells, Th1, Th2. • In vitro delivery of recombinant Tat protein conjugated to red blood cells (RBCs) via avidin-biotin bridges (RBC-Tat) to human dendritic cells was compared to dendritic cells pulsed with rec Tat. • Dendritic cells pulsed with RBC-Tat elicited specific and significantly stronger CD4+ and CD8+ T-cell responses and required 1250-fold less antigen than DCs stimulated with soluble Tat. • Dendritic cells which were maturated in the presence of IFNgamma induced elevated IL-12 and TNF-alpha secretion. IFNgamma upregulated IP-10 and down regulated TARC, chemokines which attract Th1 and Th2 cells, respectively.				
Tat	Tat (IIIB, BH10)		in vitro stimulation or selectio	human	Fanales-Belasio2002b
	Keywords epitope processing, vaccine-specific epitope characteristics, dendritic cells, Th1. • Biologically active HIV-1 Tat is readily taken up by monocyte-derived dendritic cells (MDDC) (and activated endothelial cells), but not other APCs. Tat must be in a native, non-oxidized conformation for efficient uptake. Tat upregulates MHC molecules, IL-12, TNFα, RANTES and MIP-1-α and MIP-1-β production which drives Th1 immune responses and enhances antigen presentation. • Native Tat enhanced the antigen presentation of MDDC and boosted proliferative recall and allogeneic antigen responses, and the authors propose it could be used as an adjuvant to drive the immune response as well as an antigen.				
Tat	Tat		Vaccine	macaque	Fanales-Belasio2002a
	Vaccine *Vector/Type:* DNA, protein *HIV component:* Tat *Adjuvant:* aluminum hydroxide, Ribi adjuvant (MPL+TDM) (RIBI) **Keywords** review, early-expressed proteins, Th1. **Assay type** cytokine production, Delayed-type hypersensitivity (DTH).				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• HIV-1 Tat protein has several virtues vaccine component. It is an early expressed protein, and though variable, contains consverved T-cell and B-cell epitopes that allow cross-clade recognition. It is efficiently taken up by monocyte-derived dendritic cells (MDDCs) and in this context can stimulate Th1 immune responses. A Tat based vaccine can elicit an immune response that can control primary infection in monkeys that are in early stage of in infection with SHIV89.6P.				
Tat	Tat		Vaccine	mouse (H-2^d)	Billaut-Mulot2001
	Vaccine *Vector/Type:* DNA, DNA with protein boost *Strain:* B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18 **Keywords** Th1, Th2. • DNA vaccinated BALB/c mice primed and boosted with a multiepitopic vaccine with IL18 gave lymphoproliferative responses 7 weeks post immunization. • Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime + DNA boost was more effective than DNA prime + protein boost. • Immunization with either the multiepitopic DNA or with the mixed DNA vaccine resulted in Th1 cytokines production (IL-2 and IFNγ) in spleen cell cultures stimulated by Tat and Gag, while Th2 cytokines IL-4 and IL-10 production was not detectable. • Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.

gp160 (62–81)	gp120 (MN)	DTEVHNVWATQACVPTDPNP	HIV-1 infection	human (DR)	Malhotra2003
	Keywords HAART, acute infection, cross-presentation by different HLA. **Epitope name** DP20. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy. • This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintainted in Env. • This peptide showed bound to HLA-DRB1*0101.

	Keywords TCR usage. • Clonal heterogeneity was broad for a recall response to tetanus toxoid or PPD, but oligoclonal to primary HIV antigens, dominated in this case by TCR Vβ 13 usage. • Donor of PBMC that recognized this epitope had HLA-DR alleles 2 and 7.				
gp160 (81–100)	gp120 (80–99 89.6)	PQEVVLGNVTENFNMWKNNM	Vaccine	mouse	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 6.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Donor HLA H-2k. • Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was not reactive in any BALB/c mice tested (0/10), but was highly reactive in all (10/10) CBA/J mice.				
gp160 (81–100)	gp120 (80–99 89.6)	PQEVVLGNVTENFNMWKNNM	Vaccine	mouse (H-2^k)	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** immunodominance. • Promiscuous immunodominant epitopes in gp120 were mapped by overlapping peptides in CBA/J H-2^k and BALB/c H-2^d mice, and all were found to be in the outer domain, proximal to regions of structural disorder indicated by the crystal structure or by sequence divergence. • This peptide was recognized by 10/10 CBA/J with an average SI of 8.2, and not by BALB/c mice, so is considered to be uniquely immunodominant for H-2^k • Uniquely immunodominant sequences tended to be in the inner domain of the protein.				
gp160 (81–101)	gp120 (81–101 IIIB)	PQEVVLVNVTENFNMWKND-MV?	HIV-1 infection	human	Geretti1994
	Epitope name B1. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 2/15 responders recognized this peptide, mean SI = 5.1.				
gp160 (92–101)	gp120 (90–100 W6.ID)	YFNMWKNNMV	Vaccine	human	Jones1999
	Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120 *Adjuvant:* MPL-SE adjuvant, QS21 • An HIV seronegative volunteer was vaccinated with rgp120 and a QS21/MPL adjuvant and HIV-1 specific T-cell lines were isolated. • One T-cell clone reacts with two overlapping peptides, and the region of overlap is: YFNMWKNNMV. • The first 20-mer peptide that this clone reacts with is PQEVVLGNVTEYFNMWKNNMV, and the IIIB version of this peptide does not induce proliferation in the T-cell line that responds to the W61D version: IIIB: pqevvlVnvteNfDmwknDmv.				
gp160 (92–111)	gp120 (92–111 W6.ID)	YFNMWKNNMVDQMHEDIISL	Vaccine	human	Jones1999
	Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120 *Adjuvant:* MPL-SE adjuvant, QS21 • An HIV seronegative volunteer was vaccinated with rgp120 and a QS21/MPL adjuvant and HIV-1 specific T-cell lines were isolated. • The IIIB version of this peptide does not induce proliferation in the T-cell line that responds to the W61D version of the peptide NfDmwknDmvEqmhediisl. • Six T-cell lines react with this peptide, but some of these can also be stimulated by other gp120 peptides located in different regions of gp120.				
gp160 (101–126)	gp120 (101–126)	VEQMHEDIISLWDQSLKPC-VKLTPLC	Vaccine	mouse (H-2^k)	Sjolander1996
	Vaccine *Vector/Type:* protein *HIV component:* gp160 • Study showing that T-cell determinants from glycoproteins can be dependent on the glycosylation of the protein.				
gp160 (102–114)	gp120 (109–121)	EQMHEDIISLWDQ	Vaccine	mouse (H-2^{bxk})	Sastry1991
	Vaccine *Vector/Type:* peptide				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Peptides induced T-cell proliferative response to immunizing peptide and to gp160.				
gp160 (102–116)	gp120 (109–123 IIIB)	EQMHEDIISLWDQSL	Vaccine	mouse (H-$2^{d, i5}$)	Hale1989
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 • Six multideterminant helper T-cell regions are recognized by mice of three or four MHC types.				
gp160 (102–116)	gp160 (109–123 IIIB)	EQMHEDIISLWDQSL	Vaccine	mouse (H-2^{d}, H-2^{b})	Berzofsky1991b, Berzofsky1991a
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA) • B10.D2 (H-$2A^{d}$, E^{d}) and B10.A(R5) (H-$2A^{b}$, E^{b}) mice immunized with rec gp160 showed a proliferative response to EQMHEDIISLWDQSL. • EQMHEDIISLWDQSLKPCVK encompasses several murine Th epitopes including HEDIISLWDQSLK and is referred to as a "multideterminant region" or cluster peptide.				
gp160 (102–121)	gp120 (102–121 IIIB)	EQMHEDIISLWDQSLKPCV-K?	HIV-1 infection	human	Geretti1994
	Epitope name B3. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 5.9.				
gp160 (102–121)	gp160 (109–128 IIIB)	EQMHEDIISLWDQSLKPCVK	HIV-1 infection, Vaccine	human, mouse (H-2^{k}, H-2^{s})	Berzofsky1991b, Berzofsky1991a
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA) • EQMHEDIISLWDQSLKPCVK encompasses several murine Th epitopes and is referred to as a "multideterminant region" or cluster peptide. • Six multideterminant region cluster peptides were evaluated Th responses in different MHC/HLA backgrounds after vaccination of mice with gp160, or in infected people. • This cluster peptide elicited proliferative responses in cells from vaccinated B10.BR mice (H-$2A^{k}$, E^{k}) and B10.S(9R) mice (H-$2A^{s}$, E^{s}), while shorter peptides from within this region stimulated H-2^{k}, H-2^{d} and H-2^{b} responses, but not H-2^{s} • IL-2 production was observed in response to this peptide in 64% (23/36) of asymptomatic HIV-infected individuals.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK	HIV-1 infection	human	Clerici1997
	Epitope name T2. • Used in a study of pentoxifylline's influence on HIV specific T-cells.				
gp160 (105–117)	gp120 (112–124 BH10)	HEDIISLWDQSLK	Vaccine	human	Berzofsky1988
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** T2. • Proliferative response to T1 and T2 peptides in 14 immunized, uninfected humans.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK	HIV-1 infection	human	Clerici1989
	Epitope name T2. • IL-2 production detection of Th lymphocytes from asymptomatic HIV-positive individuals.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK	HIV-1 infection	human	Clerici1991a
	Epitope name T2. • Peptides stimulate Th cell function and CTL activity in similar patient populations.				
gp160 (105–117)	gp120 (112–124)	HEDIISLWDQSLK	Vaccine	human	Clerici1991b
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** T2. • Immunizing uninfected individuals with rgp160 results in stronger Th response than does natural infection.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK		human	Clerici1992
	Epitope name T2. • Cell-mediated immune response to HIV-1 peptides in HIV-1 exposed seronegative men.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK	Vaccine	macaque	Hosmalin1991
	Vaccine *Vector/Type:* peptide prime with protein boost *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** T2. • Peptide priming to induce T-cell help enhances antibody response to gp160 immunization.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK		human	Pinto1995
	Epitope name T2. • CTL activity analyzed in parallel with Th reactivity in exposed but uninfected health care workers.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK	HIV-1 infection	human	Kaul1999
	Epitope name T2. • Kenyan sex workers that remained seronegative were found to frequently have HIV-env peptide specific Th responses detected by an IL-2 assay (11/20 cases) and mucosal genital tract anti-HIV IgA (16/21 cases) • Helper epitopes used in this study were noted to be previously described [Clerici1989], and were not explicitly described in [Kaul1999]				
gp160 (105–117)	gp120	HEDIISLWDQSLK	HIV-1 infection, HIV-1 exposed seronegative	human	Kuhn2001a
	Keywords inter-clade comparisons, responses in children, mother-to-infant transmission. **Epitope name** T2. • In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4. • The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents. • 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding. • Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.				
gp160 (105–117)	Env (112–124 IIIB)	HEDIISLWDQSLK	HIV-1 infection, HIV-1 exposed seronegative		Clerici1993a
	Keywords mother-to-infant transmission.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Epitope name T2. **Assay type** cytokine production. • Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activited were infected. • PBL from 10/21 of the mothers showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.				
gp160 (105–117)	Env (IIIB)	HEDIISLWDQSLK	HIV-1 exposed seronegative		Clerici1994a
	Epitope name T2. **Assay type** cytokine production. • Six of eight HIV-exposed health care workers had transient HIV-specific T-helper responses after percutaneous exposure to HIV, responding to two or more Env peptides among the set T1, T2, Th4.1, P18IIIB and P18MN. Responses were lost after 12-56 weeks. The HIV-specific Th responses occurred without seroconversion or PCR evidence for infection. • Six of the eight HIV-exposed individuals responded to two or more peptides, whereas, only one individual exposed to HIV-negative blood responded to one peptide.				
gp160 (105–117)	HIV-1 (IIIB)	HEDIISLWDQSLK	HIV-1 infection		Clerici1994b
	Epitope name T2. **Assay type** cytokine production. • IL-10-specific mRNA was upregulated in PBMC from asymptomatic, HIV-infected (HIV+) patients, and was particularly high in those with severely compromised Th cells function. Th response to HIV peptides *in vitro* could be restored by IL-10 Ab.				
gp160 (105–117)	Env (112–124)	HEDIISLWDQSLK	HIV-1 infection	human	Kuhn2001b
	Keywords responses in children, mother-to-infant transmission. **Epitope name** T2. **Assay type** proliferation. • T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistance of detectable HIV RNA in the mothers at delivery. • The reduction of Th responses in newborns raises the possibility that anti-retrovial exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrame *et al.*, Lancet 354:2050 (1999)).				
gp160 (105–117)	gp120 (112–124 BH10)	HEDIISLWDQSLK	computer prediction	mouse (H-$2^{k, s}$)	Cease1987
	Epitope name T2. • 1 of 2 functional epitopes identified using an amphipathic helix epitope prediction algorithm.				
gp160 (105–117)	gp120 (112–124 IIIB)	HEDIISLWDQSLK	Vaccine	mouse (H-2^{k})	Hale1989
	Vaccine *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** T2. • Six multideterminant helper T-cell regions are recognized by mice of three or four MHC types.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (105–117)	gp160 (112–124 IIIB)	HEDIISLWDQSLK	Vaccine	mouse (H-2^k)	Berzofsky1991b, Berzofsky1991a
	Vaccine *Vector/Type:* protein *Strain:* B clade IIIB *HIV component:* gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA) • B10.BR (H-2A^k, E^k) mice immunized with rec gp160 showed a strong proliferative response to three overlapping peptides, QMHEDIISLWDQSL, HEDIISLWDQSLK, and DIISLWDQSLKPCVK, and HEDIISLWDQSLK is common to between them. • EQMHEDIISLWDQSLKPCVK encompasses several murine Th epitopes including HEDIISLWDQSLK and is referred to as a "multideterminant region" or cluster peptide.				
gp160 (105–123)	gp120 (112–130 IIIB)	HEDIISLWDQSLKPCVKLT		human	Furci1997
	• 9/11 exposed-uninfected individuals in this study had a proliferative response to a C5 peptide, but none reacted with this previously defined epitope.				
gp160 (108–119)	gp120 (108–119 LAI)	IISLWDQSLKPC	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.				
gp160 (110–125)	gp120 (110–125)	SLWDQSLKPCVKLTPL	HIV-1 infection	human	Caruso1997
	Keywords rate of progression. • As HIV-1-infected individuals progress to disease, T-cells show reduced ability to proliferate in response to HIV antigen, but retain the ability to express the activation antigens CD25 and CD71. • The ability to express activation markers in response to HIV is retained, but the response to tetanus toxoid recall antigen is lost. • This study investigated CD25 and CD71 expression in PBMC from patients at various stages of progression, measuring the response to *in vitro* stimulation by peptide cocktail containing four antigenic Env peptides, or p17 and p24.				
gp160 (111–123)	gp120 (118–130)	LWDQSLKPCVKLT	Vaccine	macaque	Nehete1993
	Vaccine *Vector/Type:* peptide • Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice. • Proliferative response to this peptide was observed in 3/3 immunized rhesus monkeys.				
gp160 (112–130)	gp120 (112–130 IIIB)	WDQSLKPCVKLTPLCVSLK?	HIV-1 infection	human	Geretti1994
	Epitope name B4. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 3/15 responders recognized this peptide, average SI = 4.4.				
gp160 (112–141)	gp120 (112–141 NL43)	WDQSLKPCVKLTPLCVSLK-CTDLGNATNTN	Vaccine	human	Sitz1999
	Vaccine *Vector/Type:* protein *Strain:* B clade NL43 *HIV component:* gp120, gp160 • There was a great breadth of proliferative response to env peptides in 19 HIV-1 infected rgp160 and 17 HIV-1 infected rgp120 vaccine recipients. • Over 35% of vaccinees had a stimulation index of greater than 5 to this peptide.				
gp160 (115–126)	gp120 (115–126 LAI)	SLKPCVKLTPLC	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.

	• Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • Five peptides were recognized most frequently: C2 (aa 142-161), C3 (aa 152-171), C5 (aa 172-191), E5 (aa 272-291) and G4 (aa 380-393). The first three were in or near V2, the other two were proximal to the V3 and V4 loops. • 4/15 responders recognized this immunodominant peptide, average SI = 4.4.				
gp160 (155–169)	Env (UG92005)	KNCSFNITTELIDKK	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This epitope is located in the V2 region of UG92005 (UG, clade D) and the hybridoma that recognized it used Vβ5. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant. • The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (155–169)	gp120 (160–174 LAI)	KNCSFNISTSIRGKV		human (HLA-DR)	Gaudebout1997
	Keywords binding affinity. • Peptide binds to both HLA-DR*1101 and HLA-DR*0401 with high affinity. • Because of the distinctive binding pockets of HLA-DR*1101 and HLA-DR*0401, peptides that bound both were considered candidates for promiscuous HLA-DR binding.				
gp160 (159–178)	gp120 (160–179 89.6)	FYITTSIRNKVKKEYALFNR	Vaccine	mouse	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 14. **Donor HLA** H-2k, H-2d.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was highly reactive in 6/10 BALB/c mice tested, and in 4/10 CBA/J mice.				
gp160 (162–181)	gp120 (162–181 IIIB)	STSIRGKVQKEYAFFYKLDI	Vaccine	macaque	Lekutis1997b
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* Env • HIV-1 env DNA vaccine induced Th cell response to this epitope in a rhesus monkeys.				
gp160 (162–182)	gp120 (162–182 IIIB)	STSIRGKVQKEYAFFYKLD-II?	HIV-1 infection	human	Geretti1994
	Epitope name C4. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 3.3.				
gp160 (166–185)	gp120 (MN)	RDKMQKEYALLYKLDIVSID	HIV-1 infection	human	Malhotra2003
	Keywords HAART, acute infection. **Epitope name** RD20. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy. • This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail.These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintainted in Env.				
gp160 (169–189)	gp120 (141–160 W6.ID)	VQKEYALFYNLDVVPIDDD-NA	Vaccine	human	Jones1999
	Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120 *Adjuvant:* MPL-SE adjuvant, QS21 • An HIV seronegative volunteer was vaccinated with rgp120 and a QS21/MPL adjuvant and HIV-1 specific T-cell lines were isolated. • The IIIB version of this peptide does not induce proliferation in the T-cell line that responds to the W61D version of the peptide ——F–K–II—N-TT vqkeyaFfyKldIIpidNdTT. • Two T-cell lines react specifically with this peptide.				
gp160 (172–191)	gp120 (172–191 IIIB)	EYAFFYKLDIIPIDNDTTSY	Vaccine	macaque	Lekutis1997b
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* Env • HIV-1 env DNA vaccine induced Th cell response to this epitope in a rhesus monkey.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (172–191)	gp120 (172–191 IIIB)	EYAFFYKLDIIPIDNDTTS-Y?	HIV-1 infection	human	Geretti1994

Keywords immunodominance.
Epitope name C5.
- Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- Five peptides were recognized most frequently: C2 (aa 142-161), C3 (aa 152-171), C5 (aa 172-191), E5 (aa 272-291) and G4 (aa 380-393). The first three were in or near V2, the other two were proximal to the V3 and V4 loops.
- 4/15 responders recognized this immunodominant peptide, average SI = 7.4.

gp160 (175–189)	Env (UG92005)	LFYKLDVVQIDNSTN	Vaccine	mouse (H-2 IA^b)	Surman2001

Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Keywords inter-clade comparisons, epitope processing, TCR usage.
- This epitope is located in the V2 region of UG92005 (UG, clade D) and the Vβ usage of the TCR was not determined.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

gp160 (186–215)	gp120 (191–220 NL43)	NDTTSYTLTSCNTSVITQA-CPKVSFEPIPI	Vaccine	human	Sitz1999

Vaccine *Vector/Type:* protein *Strain:* B clade NL43 *HIV component:* gp120, gp160
- There was a great breadth of proliferative response to env peptides in 19 HIV-1 infected rgp160 and 17 HIV-1 infected rgp120 vaccine recipients.
- Over 30% of vaccinees had a stimulation index of greater than 5 to this peptide.

gp160 (188–207)	gp120 (89.6)	NTKYRLISCNTSVITQACPK	Vaccine	mouse	Dai2001

Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Keywords epitope processing, immunodominance.

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Epitope name Peptide 17. **Donor HLA** H-2k, H-2d. • Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was reactive in only 1/10 BALB/c mice tested, but was one of the most reactive in CBA/J mice, reacting with 9/10 mice.				
gp160 (188–207)	gp120 (190–209 89.6)	NTKYRLISCNTSVITQACPK	Vaccine	mouse (H-2^k)	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** immunodominance. • Promiscuous immunodominant epitopes in gp120 were mapped by overlapping peptides in CBA/J H-2^k and BALB/c H-2^d mice, and all were found to be in the outer domain, proximal to regions of structural disorder indicated by the crystal structure or by sequence divergence. • This peptide was recognized by 9/10 CBA/J with an average SI of 9.8, one of the two immunodominant peptides in CBA/J mice, and not by BALB/c mice, so is considered to be uniquely immunodominant for H-2^k • Uniquely immunodominant sequences tended to be in the inner domain of the protein.				
gp160 (192–211)	gp120 (192–211 IIIB)	KLTSCNTSVITQACPKVSF-E?	HIV-1 infection	human	Geretti1994
	Epitope name D2. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 3.6.				
gp160 (193–218)	gp120 (193–218)	LTSCNSVITQACPKVSFEP-IPIHYC	Vaccine	mouse (H-$2^{d, b}$)	Sjolander1996
	Vaccine *Vector/Type:* protein *HIV component:* gp160 • Study showing that T-cell determinants from glycoproteins can be dependent on the glycosylation of the protein.				
gp160 (198–212)	Env (1007)	TSVITQACPKVSFEP	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This epitope is located in the C2 region of 1007 (US, clade B) and the Vβ usage of the TCRs for two clonotypes was Vβ3 and Vβ8.1-2. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant. • The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (199–211)	Env (204–216)	SVITQACSKVSFE	Vaccine	macaque	Nehete1993
	Vaccine *Vector/Type:* peptide • Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice. • A weak or transient proliferative response to this peptide was observed in 3/3 immunized rhesus monkeys.				
gp160 (199–211)	Env (204–216)	SVITQACSKVSFE	HIV-1 infection	human, chimpanzee	Nehete1998b
	• HIV-infected chimpanzees and HIV-positive patients show positive proliferative responses to multiple peptides from five conserved regions of the HIV-1 Env.				
gp160 (199–211)	gp120 (204–216)	SVITQACSKVSFE	Vaccine	mouse (H-$2^{bxk, sxd}$)	Sastry1991
	Vaccine *Vector/Type:* peptide • Peptides induced T-cell proliferative response in mice representing four haplotypes.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
gp160 (200–214)	gp120 (205–219 LAI)	VITQACPKVSFEPIP	Peptide-HLA interaction	human (HLA-DR)	Gaudebout1997

Keywords binding affinity.

- Peptide binds to both HLA-DR*1101 and HLA-DR*0401 with high affinity.
- Because of the distinctive binding pockets of HLA-DR*1101 and HLA-DR*0401, peptides that bound both were considered candidates for promiscuous HLA-DR binding.

gp160 (201–212)	Env (1007)	ITQACPKVSFEP	Vaccine	mouse (H-2 IA^b)	Surman2001

Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Keywords inter-clade comparisons, epitope processing, TCR usage.

- This epitope is located in the C2 region of 1007 (US, clade B) and the Vβ usage of the TCR was Vβ3.
- The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (TSVITQACPKVSFEP and ITQACPKVSFEPIPI)
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

gp160 (206–220)	Env (1007)	PKVSFEPIPIHYCAP	Vaccine	mouse (H-2 IA^b)	Surman2001

Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Keywords inter-clade comparisons, epitope processing.

- This epitope is located in the C2 region of 1007 (US, clade B) and 12 hybridomas recognized the peptide with Vβ usage of Vβ4,6,7,8.1-2,8.3,11,12 and others not determined.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.

The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (208–222)	Env (UG92005)	ITFEPIPIHYCAPAG	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This epitope is located in the C2 region of UG92005 (UG, clade D) and it was recognized by five hybridomas with Vβ usage Vβ5, 8.2, 12 and not determined. • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant. • The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (208–227)	gp120 (210–229 89.6)	VSFQPIPIHYCVPAGFAMLK	Vaccine	mouse	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 19. **Donor HLA** H-2k, H-2d. • Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was reactive in 6/10 BALB/c mice tested, and in 6/10 CBA/J mice.				
gp160 (209–220)	gp120 (MN)	SFEPIPIHYCAP	HIV-1 infection	human (DR)	Malhotra2003
	Keywords HAART, vaccine-specific epitope characteristics, acute infection, cross-presentation by different HLA. **Epitope name** SP12. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy. • This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintainted in Env. • Seven out of 12 clones recognized this conserved C3 region of gp120. Clone one was mapped to the optimal epitope and was found to be presented by HLA-DR. The peptide showed promiscuous binding to DRB1*0101, DRB1*0401, DRB1*1302, DRB1*0701, DRB1*0901, DRB4*0101, DRB5*0101.			
gp160 (210–218)	Env (186–194 1035)	FEPIPIHYC	Vaccine	mouse (Class II I Ab)	Zhan2003
	Vaccine *Vector/Type:* vaccinia prime with gp120 boost *Strain:* B clade 1035 *HIV component:* Env *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** epitope processing, vaccine-induced epitopes, escape, TCR usage. **Assay type** proliferation, T-cell Elispot. • A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035. Five of seven different Th hybridomas isolated from five immunized mice immunized reacted with the peptide PKVSFEPIPIHYCAP, located in the C2 region of gp120. TCR Vβ usage indicated each of the clones was unique. Splenic populations from other C57BL/6 mice immunized with 1035 env confirmed that the gp120 specific T-helper response was focused on the PKVSFEPIPIHYCAP peptide. The authors suggest the protein structural context may contribute to the immunodominance of this peptide. • The minimal epitope was mapped for one of the hybridomas, and was FEPIPIHYC. • The natural variant, fDpipihyc, did not stimulate a response in three of the hybridomas.			
gp160 (210–223)	gp120 (215–228)	FEPIPIHYCAFPGF	Vaccine	mouse (H-2^{bxk})	Sastry1991
	Vaccine *Vector/Type:* peptide • Peptides induced T-cell proliferative response to immunizing peptide and to gp160.				
gp160 (212–231)	gp120 (221–240 W6.ID)	PIPIHYCAPAGFAILKCNNK	Vaccine	human	Jones1999
	Vaccine *Vector/Type:* protein *Strain:* B clade W61D *HIV component:* gp120 *Adjuvant:* MPL-SE adjuvant, QS21 • An HIV seronegative volunteer was vaccinated with rgp120 and a QS21/MPL adjuvant and HIV-1 specific T-cell lines were isolated. • Two T-cell lines react specifically with this peptide.				
gp160 (212–231)	gp120 (212–231 IIIB)	PIPIHYCAPAGFAILKCNN-K?	HIV-1 infection	human	Geretti1994
	Epitope name D4. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 3/15 responders recognized this peptide, average SI = 4.2.

Keywords immunodominance. **Epitope name** E5. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • Five peptides were recognized most frequently: C2 (aa 142-161), C3 (aa 152-171), C5 (aa 172-191), E5 (aa 272-291) and G4 (aa 380-393). The first three were in or near V2, the other two were proximal to the V3 and V4 loops. • 4/15 responders recognized this immunodominant peptide, average SI = 5.0.					
gp160 (274–288)	gp120 (274–288 IIIB, B10)	SANFTDNAKTIIVQL	HIV-1 infection	human	Wahren1989b, Wahren1989a
• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.					
gp160 (276–295)	gp120 (MN)	NFTDNAKTIIVHLNESVQIN	HIV-1 infection	human	Malhotra2003
Keywords acute infection. **Epitope name** NN20. **Assay type** cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining. • 92 acutely or early HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy. • This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail.These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintainted in Env.					
gp160 (280–296)	gp120 (IIIB)	NAKTIIVQLNESVAIC	in vitro stimulation or selectio	human	Manca1995b
• Peptide stimulation of PBMC from non-infected individuals *in vitro*. • Peptide priming does not always induce T-cells that recognize whole protein.					
gp160 (288–307)	gp120 (290–309 89.6)	LNESVVINCTRPNNNTRRRL	Vaccine	mouse	Dai2001
Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 27. **Donor HLA** H-2k, H-2d.					

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was reactive in only 1/10 BALB/c mice tested, but reacted in 8/10 CBA/J mice.				
gp160 (289–297)	gp120 (292–300 SF2)	NESVAINCT	Vaccine	human	Botarelli1991
	Vaccine *Vector/Type:* protein *Strain:* B clade SF2 *HIV component:* gp120 • A non-glycosylated form of SF2 gp120, env 2-3, was used as an immunogen – 20% of T-cell clones do not recognize the glycosylated form.				
gp160 (290–306)	gp120 (296–312 LAI)	SVVEINCTRPNNNTRKS	HIV-1 infection	human	Schrier1989
	• Stimulates T-cell proliferation in HIV-infected donors.				
gp160 (292–310)	gp120 (292–310 IIIB)	VEINCTRPNNNTRKRIRIQ?	HIV-1 infection	human	Geretti1994
	Epitope name F1. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • Only 1/15 responders recognized this peptide, but it had the highest SI in the study of 9.9.				
gp160 (296–307)	gp120 (301–324 RF)	CTRPNNNTRKSI	HIV-1 infection		deLorimier1994
	Keywords epitope processing. • Proton NMR spectroscopy was employed to analyze the solution conformation of a hybrid peptide, T1-SP10RF, in order to better understand the immunogenicity of its' T helper (KQIINMWQEVGKAMYA, CTRPNNNTRKSI), CTL (SITKGPGRVIYATG) and B-cell epitopes (RKSITKGPGRVIYATG). • This epitope embedded in the T1-SP10RF peptide does not form a helical amphipathic conformation. It lacks random-coil conformations, and this may make a peptide less susceptible to complete proteolytic degredation and be favored within epitopes.				
gp160 (296–314)	gp120 (303–321 IIIB)	CTRPNNNTRKSIRIQRGPG-(Y)	Vaccine	goat	Palker1989
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB • Goats were immunized with peptides containing V3 type-specific neutralizing determinants coupled to T1.				
gp160 (297–321)	gp120 (302–324 MN)	TRPNYNKRKRIHIGPGRAF-YTTK	Vaccine	mouse (H-2^d)	Oscherwitz1999b
	Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3 • Epitope presented as a tandem repeat (eight copies) elicits stronger B-cell and T-cell responses than the epitope presented as a single copy. • This study indicates that the increased response was not due to neodeterminants created at the junction of the peptides, but rather due to an epitope density effect, increased immunogenicity through a high ratio of epitope to protein.				
gp160 (297–330)	Env (303–335 BX08)	TRPNNNTRKSIHIGPGRAF-YATGEIIGDIRQAH	Vaccine	human	Gahery-Segard2000
	Vaccine *Vector/Type:* lipopeptide				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• Anti-HIV lipopeptide vaccine consisting of six long peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial. • A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 6/10 reacted to this peptide. • 9/12 tested mounted a CTL responses to at least one of the six peptides, each of the six peptides elicited a CTL response in at least one individual – this peptide was particularly immunogenic, eliciting a CTL response in five vaccinees. • None of the 12 tested had an IgG response to gp120 or gp160 and vaccinees could be differentiated from HIV-1 seropositive individuals with a commercial HIV detection kit – no neutralizing antibodies were observed.				
gp160 (298–307)	Env (UG92005)	RPYNNTRKGI	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA) **Keywords** inter-clade comparisons, epitope processing, TCR usage. • This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by a hybridoma with Vβ usage not determined. • The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (TINCTRPYNNTRKGI and RPYNNTRKGIHIGPG) • C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant. • The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells. • Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined. • Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO. • 80 unique clonotypes were characterized from six mice. • H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41). • Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.				
gp160 (298–319)	gp120 (300–319 89.6)	RPNNNTRRRLSIGPGRAFYA	Vaccine	mouse	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 28. **Donor HLA** H-2k, H-2d. • Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was reactive in 7/10 BALB/c mice tested, and in 5/10 CBA/J mice.

gp160 (301–325)	gp120 (IIIB)	NNTRKSIRIQRGPGRAFVT-IGKIGN	Vaccine	mouse	Sasaki1998
	Vaccine *Vector/Type:* DNA *Strain:* B clade IIIB *HIV component:* Env, Rev *Adjuvant:* QS21 **Keywords** Th1. • The env response is what is being sought, but co-expression of rev is required. • Intramuscular versus nasal vaccination with DNA vaccine with a QS-21 adjuvant was studied. • QS-21 enhanced the IgG2a response mediated via Th1 cytokines IFNγ and IL-2 and delayed type hypersensitivity (DTH) in response to the V3 peptide was measured by a foot pad swelling test [Sasaki1998]				
gp160 (302–315)	gp120 (307–322 IIIB)	NTRKSIRIQRGPGR	Vaccine	mouse	Goodman-Snitkoff1990
	Vaccine *Vector/Type:* peptide *Strain:* B clade IIIB *HIV component:* V3 • Identification of putative Th epitopes that can stimulate an antibody response in peptide-immunized mice.				
gp160 (302–321)	gp120 (302–321 IIIB)	NTRKRIRIQRGPGRAFVTI-G?	HIV-1 infection	human	Geretti1994
	Epitope name F2. • Th proliferative responses were studied in 36 asymptomatic HIV-1+ patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools. • After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders. • IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation. • 1/15 responders recognized this peptide, SI = 5.6.				
gp160 (302–327)	gp120 (307–332 MN)	NKRKRIHIGPGRAFYTTKN-IIGTIR	Vaccine	mouse	Anderson2001
	Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3 *Adjuvant:* Montanide (ISA 51) • Hypervariable epitope constructs (HECs) are degenerative peptide cocktails that are made in a single peptide synthesis reaction. Vaccination with a V3 degenerative peptide cocktail containing 64 distinct peptides, NTRK-[SR]-I-[HR]-IGPG-[RQ]-AFY-[AT]-TG-[DE]-IG-[DN]-IRQ, elicited broader and more durable Th responses than the MN V3 peptide alone in BALB/c mice immunized and boosted with V3 peptides, although the MN peptide elicited a transient MN-specific V3 response.				
gp160 (305–321)	gp120 (312–329)	(CG)KSIRIQRGPGRAFVT-IG	HIV-1 infection	human	Adams1997
	• Used as positive control in study examining T-cell response to four p24 Gag peptides.				
gp160 (308–319)	gp120 (subtype C)	(CKR)KIHIGPGQAFYT	HIV-1 infection	mouse (H-$2^{b, d, k, s}$)	Ahluwalia1997
	Keywords Th1. • A V3 loop peptide modified to resemble an Indian form (GPGQ) was incorporated into ISCOMS (immune stimulating complexes) or liposomes, and used to immunize mice – the IgG2a/IgG2b Ab response was enhanced by the presentation in the ISCOM suggestive of a Th1 response.				
gp160 (308–321)	gp120 (MN)	RIHIGPGRAFYTTK	Vaccine	mouse (H-2^{d})	Klinman1995
	Vaccine *Vector/Type:* peptide *Strain:* B clade MN *HIV component:* V3 **Epitope name** SP10. • Hybrid T1-V3 peptide activates IL-4 and IL-6 in a dose dependent manner.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	• 10-mer from V3 contributes to this response.				
gp160 (308–322)	gp120 (308–322 IIIB)	RIHIGPGRAFYTTKN		human	Furci1997
	• 9/11 exposed-uninfected individuals in this study had a proliferative response to a C5 peptide, but only 1/11 exposed-uninfected individuals recognized this peptide. • 1/18 unexposed-uninfected controls could recognize this peptide. • Erroneously documented as IIIB sequence - most likely MN peptide.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	Vaccine	macaque	Nehete1993
	Vaccine *Vector/Type:* peptide **Epitope name** P18. • Synthetic peptide derived from conserved region of the HIV-1 envelope that stimulates a proliferative response in mice. • Despite the proliferative response to this peptide in mice and humans, no response was observed in 3 rhesus monkeys.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	HIV-1 infection	human	Wasik1997
	Keywords responses in children, Th1, Th2. **Epitope name** P18. • The breadth and intensity of the CTL response and the type of Th response was studied in seven rapidly progressing HIV-1+ infants. • IL-2 and γ IFN production from Th1 cells correlated with the CTLp frequency against HIV-1 Gag, Env, Nef and Pol. • IL-4 production from Th2 cells was inversely correlated with the CTLp frequency. • The HIV-1+ children with strong CTL responses had levels of anti-CD3 MAb induction of Th1 cells comparable to uninfected children. • The children that did not mount a good CTL response had dramatically decreased numbers of Th1 relative to Th2 cells.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	HIV-1 infection	human	Wasik2000
	Keywords responses in children, kinetics, Th1. **Epitope name** P18. • Th responses measured by IL-2 responses to P18 and T1 in HIV-1 infected infants were undetectable at less than 1 month of age, and remained low in children with AIDS symptoms, but increased with age in children with slowly progressive disease. • The kinetics and intensity of the CTL activity during the first year of life was related to the child's ability to make Th1 responses.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK		human	Pinto1995
	Epitope name P18. • CTL activity analyzed in parallel with Th reactivity in exposed but uninfected health care workers.				
gp160 (308–322)	gp120 (315–329 MN)	RIHIGPGRAFYTTKN		human	Pinto1995
	Epitope name P18. • CTL activity analyzed in parallel with Th reactivity in exposed but uninfected health care workers.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	HIV-1 infection	human	Clerici1989
	Epitope name P18. • IL-2 production detection of Th lymphocytes from asymptomatic HIV-positive individuals.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	HIV-1 infection	human	Clerici1991a
	Epitope name P18. • Peptides stimulate Th cell function and CTL activity in similar patient populations.

	Epitope name P18. • Linked HIV-1 T1 and P18 peptides to anti-HLA-DR and IgD Fab fragments to enhance uptake by antigen presenting cells thus increase immunogenicity.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	Vaccine	mouse (H-2 A^d)	Takahashi1990
	Vaccine *Vector/Type:* vaccinia *Strain:* B clade IIIB *HIV component:* gp160 **Epitope name** P18. • Induces both class II restricted CD4+ Th cells, and class I restricted CD8+ CTL.				
gp160 (308–322)	gp120 (315–329 IIIB)	RIQRGPGRAFVTIGK	Peptide-HLA interaction	mouse (H-2 I-A^d)	Takeshita1995
	Epitope name P18. • Binds Class II H-2 I-A^d requiring riqrgPgRaFvti, and Class I H-2 D^d, requiring iGPgRaFvtI.				
gp160 (308–322)	Env (IIIB)	RIQRGPRAFVTIGK	Vaccine	mouse (H-2^d)	Lu1999
	Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* MIP-1alpha **Keywords** Th1. **Epitope name** P18. • MIP-1a expression plasmid co-inoculated with a DNA vaccine consisting of HIV-1 pCMV160IIIB and pcREV enhanced the HIV-specific T-cell immune response as measured by a CTL test against using V3 peptide pulsed targets, and a DTH test to V3 peptide. • The IgG1/IgG2a response was lowered with co-inoculation of MIP-1 alpha, suggesting it preferentially elicits a Th1 response.				
gp160 (308–327)	gp120 (306–325 MN)	RIHIGPGRAFYTTKNIIGIT	HIV-1 infection	human (DRB1*0101)	Hayball1997
	• Tandem repeated presentation of epitope enhances binding to class II molecule and therefore induction of T-cell proliferation. • Tandem peptides are thought to enhance proliferation through improved recruiting of CD4 to the activation complex, which can counter-balance gp120's sequestering of CD4 and consequential inhibition of a proliferative response.				
gp160 (309–323)	gp120 (309–323 IIIB, B10)	EQRGPGRAFVTIGKI	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (309–325)	gp120 (314–330)	IQRGPGRAFVTIGKIGN	HIV-1 infection	human	Caruso1997
	Keywords rate of progression. • As HIV-1-infected individuals progress to disease, T-cells show reduced ability to proliferate in response to HIV antigen, but retain the ability to express the activation antigens CD25 and CD71. • The ability to express activation markers in response to HIV is retained, but the response to tetanus toxoid recall antigen is lost. • This study investigated CD25 and CD71 expression in PBMC from patients at various stages of progression, measuring the response to *in vitro* stimulation by peptide cocktail containing four antigenic Env peptides, or p17 and p24.				
gp160 (310–328)	gp120 (310–329 89.6)	SIGPGRAFYARRNIIGDIRQ	Vaccine	mouse	Dai2001
	Vaccine *Vector/Type:* protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72) **Keywords** epitope processing, immunodominance. **Epitope name** Peptide 29.				

HXB2 Location	Author's Location	Sequence	Immunogen	Species (HLA)	References
	Donor HLA H-2k, H-2d. • Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences. • This peptide was reactive in 2/10 BALB/c mice tested, and in 8/10 CBA/J mice.				
gp160 (311–319)		RGPGRAFVT	Vaccine	mouse	Barouch2002
	Vaccine *Vector/Type:* DNA *Strain:* B clade BH10 *HIV component:* gp120 *Adjuvant:* GM-CSF • gp120 encoding DNA co-injected with a plasmid carrying GMCSF gave meager CD4+ T-cell responses in BALB/c mice relative to bicistronic gp120 and GMCSF cloned into the same vector and expressed from the same promoter. • The bicistronic gp120/GM-CSF vaccine induced an approximately 10-fold increase of CD4+ T cell proliferative responses to gp120, as well as a significant increase in IL-2, IL-4, IL-10, IFNγ and GM-CSF production, compared to immunization with the monocistronic pVIJ-gp120 with GMCSF. The enhanced proliferative responses were substantiated by CD4+ T-cell Elispot. • Both mono and bicistronic DNA vaccines induced similar CTL responses directed against the H-2Dd restricted P18 peptide RGPRAFTVTI in murine splenocytes despite the enhanced proliferative responses.				
gp160 (311–320)	gp120 (IIIB)	RGPGPAFVTI	Vaccine	mouse (H-2^d)	Xin1998
	Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* IL-2 **Keywords** Th1. • Intranasal immunization with IL-2 expression plasmid in addition to DNA vaccine amplifies cellular response to antigen, probably via activation of Th type 1 (Th1) cells.				
gp160 (311–320)	gp120 (IIIB)	RGPGPAFVTI	Vaccine	mouse (H-2^d)	Xin1999
	Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* IL-15 **Keywords** Th1. • Intranasal immunization with IL-15 expression plasmid in addition to DNA vaccine increases DTH response and CTL activity to the antigen, and decreases the serum IgG1 to IgG2a ratio, enhancing Th type 1 (Th1) cell-mediated immunity. • Expression of IL-2 or IL-15 can enhance Th1 response to the vaccine, but they to do not appear to elicit a synergistic response.				
gp160 (311–320)	gp120 (IIIB)	RGPGPAFVTI	Vaccine	mouse (H-2^d)	Ihata1999
	Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* CD40 **Keywords** Th1, Th2. • CD40L expression increases DTH, and Th1-dependent responses based on enhanced IgG2a titers, with no lowering of IgG1 titers. • Elispot assay indicated co-injection with hCD40L resulted in greater numbers of IFNγ producing Th1cells, as well as increased IL-4 producing Th2 cells. • Results suggest hCD40L enhance both Th1 and Th2 cells, and such a pattern of induction is unique among adjuvants, as most adjuvants increase either Th1 or Th2.				
gp160 (311–322)	Env (IIIB)	RGPGRAFVTIGK	Vaccine	mouse (H-2^d)	Kusakabe2000
	Vaccine *Vector/Type:* DNA with CMV promotor *Strain:* B clade IIIB *HIV component:* gp160, Rev *Adjuvant:* GM-CSF **Keywords** Th1, Th2. • The timing of delivery of the pGM-CSF expression plasmid for intramuscular DNA pCMV160IIIB/REV vaccination impacts the Th response, maximizing Th2 responses when administered 3 days prior to the DNA vaccine, and Th1 responses when administered 3 days after the DNA vaccine.

gp160 (314–328)	gp120 (314–328 IIIB, B10)	GRAFVTIGKIGNMRQ	HIV-1 infection	human	Wahren1989b, Wahren1989a
	• 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.				
gp160 (314–341)	gp120 (319–346 NL43)	GRAFVTIGKIGNMRQAHCN-ISRAKWNAT	Vaccine	human	Sitz1999
	Vaccine *Vector/Type:* protein *Strain:* B clade NL43 *HIV component:* gp120, gp160				
	• There was a great breadth of proliferative response to env peptides in 19 HIV-1 infected rgp160 and 17 HIV-1 infected rgp120 vaccine recipients.				
	• More than 25% of vaccinees had a stimulation index of greater than 5 to this peptide.				
gp160 (315–328)	Env (UG92005)	RAYYTTNIVGNIRQ	Vaccine	mouse (H-2 IA^b)	Surman2001
	Vaccine *Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)				
	Keywords inter-clade comparisons, epitope processing, TCR usage.				
	• This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by two hybridomas with Vβ usage not determined, but one used Vα 8.				
	• C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.				
	• The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.				
	• Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.				
	• Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.				
	• 80 unique clonotypes were characterized from six mice.				
	• H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).				
	• Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.
