Immunogen HIV-1 infection
Species (MHC) human (B*4402)
Keywords optimal epitope
References Frahm *et al.* 2007

- C. Brander notes this is a B*4402 epitope.

HXB2 Location gp160 (31–40)
Author Location gp160 (30–39 WEAU)
Epitope AENLWVTVYY
Immunogen HIV-1 infection
Species (MHC) human (B44)
Keywords immunodominance, escape

References Borrow *et al.* 1997; Borrow & Shaw 1998; Goulder *et al.* 1997a

- Two CTL lines from the patient WEAU were studied – one had an optimal peptide of (A)AENLWVTVYY, and the other (A)AENLWVTVY, and both responded equally well with one or two N-term Alanines.
- Rapidly post-infection, a strong immunodominant response was observed against this epitope.
- The naturally occurring forms of the peptide found in WEAU were tested as targets for early WEAU CTLs – the form TENLWVTVY was as reactive as the wild type AENLWVTVY – but the forms AKNLWVTVY, AGNLWVTVY, AANLWVTVY did not serve as targets.
- The glutamic acid in the second position is a B44 anchor residue.
- Goulder *et al.* [1997a] and Borrow & Shaw [1998] are reviews of immune escape that summarizes this study in the context of CTL escape to fixation.

Species (MHC) human (B44)
Country Thailand.
Assay type Chromium-release assay
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization
References Paris *et al.* 2004

- 21% (40/187) of Thai adults that received ALVAC-HIV with or without gp120 or oligomeric gp160 had a CD8+ T-cell response. HLA-B44 was positively associated with CTL responses, and A33 had a borderline significance association with response. A33/B44/DRB1*0701 is the most common haplotype in Thailand. B46, present in 30% of the population, was negatively associated with CTL responses, although it did not reach significance. HLA class I serotypes A11, A24, A33, B46 and B75 were the most common found in 245 Thai volunteers.
- 9/11 cases of pCTL activity to Env were in people with B44. The authors suggest some of the response may be directed at the previously mapped B44 Env epitope AENLWVTVYY in HXB2, DNLWVTVYY in their CRF01 ALAVC vaccine 92TH023. B*4403 is the most common B44 allele among Thais, while B*4402 is more common among Caucasians; a prior study had shown that B*4403 may be able to present a broader spectrum of epitopes than B*4402.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004
- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
 - The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
 - Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Assay type Cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay

References Dagarag *et al.* 2003

- Telomere length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescence. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytotoxicity, and may have therapeutic potential.
- Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope.

- This study examined variant recognition of epitopes presented by A*0201 and A*1101. Numerous amino acid substitutions can be introduced into epitopes without disrupting their recognition by CTLs, although epitopes with multiple substitutions were less recognized. An algorithm was constructed for prediction of epitopes capable of inducing responses to a great number of variant epitopes.
- A total of 9 variant forms of Env 47 were identified. More than 95% of the variant epitopes were recognized by CTLs from mice immunized with the parental form.
- Env 47 epitope (parent or variant form) was present in 82% of HIV sequences of many M group subtypes.

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope after a second stimulation *in vitro* gave a weak response in HEPS study subject 186 who was HLA A2/A11.

HXB2 Location gp160 (36–46)**Author Location** gp120 (36–46 CM243 subtype CRF01)**Epitope** VTVYYGVPVWR**Subtype** CRF01_AE**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Keywords** subtype comparisons**References** Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was not predicted by the EpiMatrix method to be likely to bind to A11, though it served as an epitope in the FSWs, and it was one of the six A11 epitopes that had been previously defined.
- 1/8 tested FSWs recognized this epitope.

- This epitope was only conserved in CRF01 and subtypes B and C, and exact matches were uncommon.

Assay type CD8 T-cell Elispot - IFN γ , Other

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
- There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. VTVYYGVPVW responses were detected in 2 women who reacted to all clades tested, A, B, C, and D, and the sequence was identical in all clades.

Epitope TVYYGVPVWK

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*0301)

Keywords acute/early infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.

- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PIIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human (A*0301)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Epitope VYYGVPVWKEA

Immunogen HIV-1 infection

Species (MHC) human (Cw7)

References Nehete *et al.* 1998a

- Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one.
- HLA-C antigens are expressed on lymphoid cells to a lesser extent than either HLA-A or -B.

- HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ

Keywords rate of progression, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive peptides found not to vary over time. It was one of four epitopes that were not precisely defined.

HXB2 Location gp160 (50–59)

Author Location Env (62–71)

Epitope TTLFCASDAK

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Assay type CD8 T-cell Elispot - IFN γ
Keywords escape, immune evasion, optimal epitope, HIV-1
References Liu *et al.* 2006
 - T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
 - This is a newly defined epitope. Positions 2 and 5 in the epitope had potentially experienced positive selection. YgTEVENW, YdTEVENW, YETEaHNVW and YdTEaHNVW escape variants were found.

Country Japan.
Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay, HLA binding
Keywords binding affinity, subtype comparisons, computational epitope prediction, rate of progression, escape, variant cross-recognition or cross-neutralization
References Kawashima *et al.* 2005

- A*26 is associated with slow progression to disease and is common in Asian populations (about 20%). 31/110 HIV peptides that carried the A*2603 motif ([VTILP] at P2, [ML] at the C-terminus) bound to HLA-A*2603. Only 2 of these were epitopes and could induce specific CD8 T-cell responses in PBMC from HLA-A*2603 positive subjects.
- This epitope induced specific CD8+ T cells in chronically infected individuals with A*2603, but not A*2601.
- 5 common B clade variants were synthesized. EVHNVWATHA and EVHNIWATHA bound to A*2603 with equal affinity. EIHNVWATHA and EaHNVWATHA bound to A*2603 with reduced affinity. EmHNVWATHA and EkHNVWATHA could not bind to A*2603. A CTL clone that recognized EVHNVWATHA was able to kill cells prepulsed with the 3 peptide variants that could bind to A*2602.
- EVHNVWATHA is the most common form in clades A, B, C, and E (CRF01), but EaHNIWATHA is the most common form in clade D.

Species (MHC) human (B35)

Donor MHC A3, A33, B14, B35, Cw*0401, Cw*0802

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Epitope DPNPQEMVL**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cells**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location gp160 (78–86)**Author Location** gp120 (47–55)**Epitope** DPNPQEVAL**Epitope name** DPN**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Donor MHC** A2, A68.1, B*07, B*3503, Cw*0401, Cw*0702, DR17, DR15, DR51, DR52, DQ2, DQ6**Assay type** CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ **Keywords** rate of progression, immunodominance, escape**References** Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was one of six epitopes found to be under positive selection for escape mutations, and was mostly replaced by an escape variant between days 66 and 369 (dpnpqeAal) and then replaced by a new escape variant (dpnpqevPl) by day 635.

HXB2 Location gp160 (78–86)**Author Location** gp160 (78–86)**Epitope** DPNPQEVVL**Immunogen** HIV-1 infection**Species (MHC)** human (B51)**Donor MHC** A03, A32, B51, B15, Cw03, Cw06, DR4, DR8, DQ7**Country** Netherlands.**Assay type** CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay**Keywords** rate of progression, escape**References** Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

HXB2 Location gp160 (88–96)**Author Location** gp120 (88–96 HIV-MN)**Epitope** NVTENFNMW**Epitope name** NW9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*2501)**Donor MHC** A*0201, A*2501, B*1801, B*5101, Cw*0102, Cw*1203**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** escape, immune evasion, optimal epitope, HIV-1**References** Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

- This is a newly defined epitope. Positions 5 and 7 in the epitope had potentially experienced positive selection. NVTEdFdMW, NVTEeFdMW and NVTEsFdMW escape variants were found.

HXB2 Location gp160 (89–97)

Country Kenya.
Assay type CD8 T-cell Elispot - IFN γ , Other
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
- There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. VTEEFNMWK responses were detected in 2 women who had Env responses to all 4 clades, and clade A gave the highest responses; a VnEEFNMWK variant was in clade B and D, and the clade C Env carried VnEEFNMW. One woman also reacted with RAIEAQQHL, the other with KNCSFNMTT.
- Both women that reacted with VTEEFNMWK carried HLA-B*5301, the only common HLA allele.

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPCLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDL), and Nef 180-189 (VLEWRFDSSL).
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- KLTPCLCVTL was recognized by 3 of the patients.

HXB2 Location gp160 (121–129)**Author Location** gp120 (120–128)**Epitope** KLTPCLCVTL**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** dendritic cells**References** Kundu *et al.* 1998b

- Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients.
- 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated.
- KLTPCLCVTL is a conserved HLA-A2 epitope included in this study – all six patients had this sequence as their HIV direct sequence, and a detectable CTL response.
- CTL demonstrated against peptide-coated target, epitope is naturally processed and enhancible with vaccine.

HXB2 Location gp160 (121–129)**Author Location** gp120 (120–128)**Epitope** KLTPCLCVTL**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**References** Kmiecik *et al.* 1998b

- Increased CTL response to cells expressing a VV construct Δv3 mutant compared with a full-length env gene product.

HXB2 Location gp160 (121–129)**Author Location** gp120 (121–129)**Epitope** KLTPCLCVSL**Immunogen** in vitro stimulation or selection**Species (MHC)** human (A2)**Keywords** dendritic cells**References** Zarleng *et al.* 1999

- This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses.
- Strong CTL responses were elicited by the epitopes DRFYK-TLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA.
- A weak response to KLTPCLCVSL was stimulated using macrophages as the APC.
- No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location gp160 (121–129)**Author Location** gp120 (121–129 IIIB)**Epitope** KLTPCLCVTL**Epitope name** D1**Subtype** B**Immunogen** vaccine*Vector/Type:* DNA, DNA with protein boost
Strain: B clade IIIB *HIV component:*
gp160, gp160ΔV3 *Adjuvant:* IL-12**Species (MHC)** mouse (A2)**Keywords** vaccine-specific epitope characteristics**References** Kiszka *et al.* 2002

- Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPCLCVTL, and the C-term region of gp41, SSLNATAIAV.

- Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells.

Species (MHC) transgenic mouse (A2)

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords vaccine-specific epitope characteristics, vaccine antigen design

References Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type 1 cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- Four A2 gag/pol epitopes were tested, and this Env A2 epitope was used as a negative control.

HXB2 Location gp160 (121–129)

Author Location Env (134–142)

Epitope KLTPLCVTL

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Assay type CD8 T-cell Elispot - IFN γ , Other

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade

CD8 T-cell responses were common and directed at conserved epitopes.

- There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. VTEEFNMWK responses were detected in 2 women who had Env responses to all 4 clades, and clade A gave the highest responses; a VnEEFNMWK variant was in clade B and D, and the clade C Env carried VnEEFNMW. One woman also reacted with RAIEAQQHL, the other one with KNCSFNMTT. KNCSFNMTT was identical in clades A and C, while clade B carried KNCSFNMis, clade D carried KNiSFNMTT.

Epitope NCSFNISTSI

Immunogen HIV-1 infection

Species (MHC) human (Cw*08)

Keywords epitope processing

References Ferris *et al.* 1999

- Recognized by CTL clone LWF A5, isolated from a lab worker exposed to HIV-1 in 1985.
- The processing of this epitope is TAP1/2-dependent, as are most Env epitopes, and it contains two N-linked glycosylation sites that are glycosylated in Env.
- Only peptide that has been deglycosylated, a process that changes asparagine (N) to aspartic acid (D) was recognized: the aspartic acid at position 5 was critical, position 1 could be either D or N.
- This peptide also contains a Cys involved in a disulfide linkage but reducing conditions did not effect recognition by CTL clone LWF A5.
- The HIV-1 Env epitopes are typically processed by a TAP1/2 dependent mechanism, which involves cotranslational translocation into the ER, glycosylation, export back into the cytosol, and deglycosylation for processing, and retransport into the ER for the association with class I molecules.
- The particular pathway of generating an epitope may have an impact on the presentation of that epitope, quantitatively as well as qualitatively.

HXB2 Location gp160 (156–165)

Author Location gp120 (156–165 IIIB)

Epitope NCSFNISTSI

Immunogen HIV-1 infection

Species (MHC) human (Cw8)

References Sipsas *et al.* 1997

- HIV IIIB proteins were used to define the range of CTL epitopes recognized by 3 lab workers accidentally infected with HIV-1 IIIB.
- NCSFNITTSI, a variant found in HIV-1 MN, was not recognized, thus this epitope was type-specific.
- NCSFNISTSI contains two potential N-linked glycosylation sites and cysteine residue, possibly related to the requirement for a high sensitizing dose of peptide for CTL activity.

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relative efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

HXB2 Location gp160 (192–211)**Author Location** gp120 (199–219 SF2)**Epitope** SLTSCNTSVITQACPKVSFE**Immunogen** HIV-1 infection**Species (MHC)** human**References** Lieberman *et al.* 1997a

- One of these 11 had CTL response to this peptide.
- The responding subject was HLA-A2, -B21.

HXB2 Location gp160 (199–207)**Author Location** Env (202–210)**Epitope** SVITQACPK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*1101)**Keywords** subtype comparisons, TCR usage**References** Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- SVITQACPK was found to elicit clade-specific responses in clade B (SVITQACPK is most common, sAitqacpk is most common variant in clade A, C and D) and clade E (saiKqacpk is most common). SVITQACPK was recognized by CTL from 3/5 B clade infected Japanese subjects, and aiKqacpk by CTL

from 0/7 E clade infected Thai subjects, so this seems to be a B clade exclusive epitope.

- The binding of the three variant peptides to HLA A*1101 was comparable, implicating TCR interaction differences.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, immunodominance, escape, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness
References Jones *et al.* 2004
- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined, WEAU and BORI, had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape. This epitope was recognized in both patients.
 - The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified. The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- Four escape variants to the SFPEPIPIHY epitope were found in the patient BORI. SFdPIPIHY came up first, at day 55 from onset of symptoms, and caused a reduced cytotoxic response. By day 218, two rare forms were found, SIEPIPIHf and SiEPIPIHf. By day 556, only tFEPIPIHY was found. The weakest response was detected in the double mutant, SiEPIPIHf, yet tFEPIPIHY was the form that persisted.
 - In WEAU, a minor variant, SsEPIPIHY was present at day 41. The SIEPIPIHf variant first came up day 136, gave a reduced CTL response, and then came to be the dominant form. Other variants were SFPEPIInY and SFPEPIIdf.

Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003
- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most

avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- Two subjects recognized this epitope during primary infection, both in the context of A29.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- This is a newly defined epitope. Last position (10) in the epitope had potentially experienced positive selection. YCAPAGFAIi escape variant was found.

Epitope RPNNNTRKSI

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B7)

Keywords subtype comparisons, immunodominance

References Wilson *et al.* 1998b

- The extent of CTL interclade cross-reactivity from CTL isolated from individuals newly infected with B clade virus was studied, and extensive cross-reactivity was observed.

- Two HLA B7 individuals had CTL response to B_LAI, A_92UG037 and C_92BR025 gp160, but were B clade strain MN non-responders – the authors note that the B7 epitope RPNNNTRKSI is immunodominant, conserved between the LAI and clade A and C strains, but is very divergent in MN (RPNYNKRKRI), and that this epitope might be dominating the specificity of the response in the HLA B7 individuals.

Author Location gp120 (303–312 SF2)

Epitope RPNNNTRKSI

Immunogen HIV-1 infection

Species (MHC) human (B7)

Keywords HAART, ART, acute/early infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 0/4 group 1, 1/3 group 2, and 1/1 group 3.

HXB2 Location gp160 (298–307)

Epitope RPNNNTRKSI

Immunogen HIV-1 infection

Species (MHC) human (B7)

Keywords rate of progression, acute/early infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconverter homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconverter failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

HXB2 Location gp160 (298–307)

Author Location gp120 (298–307)

Epitope RPNNNTRKSI

Epitope name B7-RI10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B7)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), acute/early infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 4/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 1/4 individuals had detectable responses to this epitope after STI.

Keywords vaccine-specific epitope characteristics

References Kiszka *et al.* 2002

- Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV.
- Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells.
- The most intense CTL responses to the intact gp160 vaccine were directed at three V3 peptides.

- Peptide immunization usually doesn't elicit a good CTL response because epitopes are not internalized and processed and presented, so vaccination with electric pulsing was tried (i.m. injection followed by 8 electric pulses), to enhance peptide uptake through electroporation.
- BALB/c immunized with HIV P18 or hepatitis C P17 peptides with an electric pulse elicited a CTL response, those that did not receive the pulse did not.
- The CTL response was enhanced by addition of immunostimulatory sequences ISS in the plasmid pCMV-LacZ, that contains hexamers GACGTC, AGCGCT, AACGCT, sequences common in prokaryotic genomes but rare in eukaryotic genomes that elicit Th1 cytokines and result in B cell and T-cell proliferation.
- The CTL response was also enhanced by addition of B7-1 cDNA – the B7 family of proteins transduce co-stimulatory signals through interaction with CD28.

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB *HIV component:* V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-12, IL-18, IL-1 α

Species (MHC) mouse (H-2D^d)

References Staats *et al.* 2001

- Cholera toxin (CT) is a potent adjuvant used in animal studies that is not safe in humans, so combinations of cytokines were used in nasal immunization of BALB/c mice V3 peptides to attempt to replace CT as a potent adjuvant.
- Peptide vaccine induced CTL activity was significantly increased by IL-1 α , IL-18, and GM-CSF given alone as adjuvant, but CT gave more potent CTL activity than any single cytokine.
- Combinations of cytokines could be more potent than CT as an adjuvant. The highest tetramer binding of H-2Dd peptide-specific PBMC after nasal immunization was observed with IL-1 α plus IL-18 as adjuvant.
- Nasal immunization with HIV peptide in the presence of IL-1 α , IL-12 and GM-CSF induced IFN- γ -secreting cells in the cervical lymph node, the lung and the spleen, and was associated with upregulation of MHC class II and B7.1 on nonlymphocytes in NALT/nasal mucosal cells.
- Consistent results were obtained for the IIIB and the MN peptides.

Donor MHC H-2d

Keywords TCR usage

References Yokosuka *et al.* 2002

- The TCR repertoire and its specificity was studied through analyzing the spectrum of TCR-alpha and beta chains able to reconstitute a reaction to the H-2 Dd-restricted P18 peptide. The RT-1 TCR alpha chain was able to react with 1/3 of the tested TCR beta chains to create a specific response. Experiments in transgenic mice also supported the observation that a single TCR alpha chain would confer the specificity of the response and could interact with a large variety of TCR beta chains.

Immunogen vaccine

Vector/Type: DNA *Strain:* B clade IIIB *Adjuvant:* FLt3 ligand (FL), GM-CSF, IL-12, IL-15, IL-2

Species (MHC) mouse

Keywords vaccine-specific epitope characteristics

References Moore *et al.* 2002a

- Intramuscular immunization of BALB/c mice with DNA vaccines carrying either gp160 or Nef in the expression vector plasmid pNGVL gave different responses – gp160 induced strong gp160-specific CTL and IFN-responses and low-titer humoral responses, and Nef generated humoral (IgG1, IgG2a) responses and IFN-responses but little CTL activity.

- Co-injection of DNA plasmids encoding cytokines and/or hematopoietic growth factors, IL2, IL-12, IL-15, Flt3 ligand (FL), and GMCSF tended to give responses that were enhanced quantitatively, but not altered qualitatively.
- Co-administration of GMCSF most strongly enhanced CTL and IFN-responses against pNGVL-gp160.
- Repeated immunization with pNGVL-Nef failed to induce CTL responses. Co-administration of IL-12 most strongly enhanced humoral and IFN γ responses.
- FL, which enhances innate immune responses, in combination with IL-2, IL-12 or IL-15 generated with most potent Nef responses.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, acute/early infection, kinetics, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was one of five reasonably strong responses in early infection in the patient WEAU, and the epitope sequence did not vary during the first year of the infection.

Keywords rate of progression, acute/early infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.

HXB2 Location gp160 (311–320)

Author Location gp160 (311–320)

Epitope RGPGRAFVTI

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, HLA binding

Keywords acute/early infection, optimal epitope

References Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was recognized both in acute and chronic infection, but slightly more frequently in chronic infection.

HXB2 Location gp160 (311–320)

Author Location gp160 (318–327 IIIB)

Epitope RGPGRAFVTI

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3

Species (MHC) mouse (D)

References Nehete *et al.* 1995

- RGPGRAFVTI was defined as the optimal peptide for vaccination, out of RIQRGPRAFVTIGK.
- This peptide, in a carrier-free form in Freund's adjuvant, could stimulate Env specific CTL in BALB/c mice.

HXB2 Location gp160 (311–320)

Author Location gp160 (318–327 IIIB)

Epitope RGPGRAFVTI

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3

Species (MHC) mouse (D^d)

Keywords dendritic cells

References Takahashi *et al.* 1993

- Successful priming with vaccination of peptide pulsed splenic dendritic cells.

HXB2 Location gp160 (311–320)

Author Location gp160 (318–327 IIIB)

Epitope RGPGRAFVTI

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3

Species (MHC) mouse (D^d)

References Takahashi *et al.* 1996

- Exposure of CD8+ CTL to free peptide corresponding to the epitope results in strong inhibition of the CTL response to targets sensitized with the same peptide.
- The authors propose this is due to a “self-veto”, where the CTL is inactivated by a CD8+ cell carrying the appropriate peptide-MHC complex.

HXB2 Location gp160 (311–320)

Author Location gp160

Epitope RGPGRAFVTI

Immunogen vaccine

Vector/Type: vaccinia

Species (MHC) mouse (H-2^{d17})

References Hanke *et al.* 1998a

- MVA is an attenuated vaccinia that can not replicate in mammalian cells – strings of CTL epitopes were delivered and expressed in a MVA DNA vector.
- INF γ and CTL activity were induced after a single vaccination.
- An MVA boost enhanced the response.

HXB2 Location gp160 (311–320)

Author Location gp160

Epitope RGPGRAFVTI

Immunogen vaccine

Vector/Type: DNA, vaccinia *HIV component:* Env *Adjuvant:* IL-12

Species (MHC) mouse (H-2^d)

References Gherardi *et al.* 2000

- Induction of HIV-1 specific CD8 gamma IFN secreting cells was enhanced when IL-12 and Env were given together in a prime, followed by a VV expressing Env boost.
- If IL-12 was also delivered as a boost from the viral vector, impairment of the IL-12 effects was noted, indicating that the vaccination schedule can be a critical parameter for success with DNA and vaccinia vectors used in combination with immunomodulators.
- The negative effect observed when IL-12 was delivered with the boost involved nitric oxide.

Epitope RGPGRAFVTI

Immunogen vaccine

Vector/Type: DNA *Strain:* B clade IIIB
HIV component: gp160, Rev *Adjuvant:* IL-12, IL-15, IL-2

Species (MHC) mouse (H-2^d)

Keywords Th1

References Xin *et al.* 1999

- A study of the DNA vaccine pCMV160IIIB/REV with IL-15 and IL-2 or IL-12 expression plasmids.
- Intranasal immunization of BALB/c mice with HIV DNA and IL-15 plasmid induced increased Th1 and CTL responses.
- Co-administration of IL-15 with IL-12 or IL-2 plasmids did not alter the effect of IL-15.
- Both the CTL (peptide pulsed targets) and DTH response (injection of peptide into footpad) to this peptide was monitored.
- The Ab response to NNTRKSIRIQRGPGRAFVTIGKIGN was monitored, and IL-15 co-administration resulted in a decrease in the IgG1/IgG2a ratio.

HXB2 Location gp160 (311–320)

Author Location Env

Epitope RGPGRGFVTI

Immunogen vaccine

Vector/Type: vaccinia, Sindbis *HIV component:* V3

Species (MHC) mouse (H-2^d)

References Villacres & Bergmann 1999

- HIV-1 epitope p18 was expressed in two different vaccine vectors and the CTL response was compared in BALB/c mice.
- Class I tetramer staining showed that up to 13% of the CD8+ splenocytes were p18 specific in the acute response using vaccinia, only 4% using Sindbis.
- vp18 had more gamma IFN secreting splenocytes and activated CD4+ and CD8+ T cells.
- The overall decline in CD8+ T cells in the transition into memory was 2-3 fold for both vectors.
- Sindbis virus recombinants induced protective memory cytotoxic T cells, although reduced quantitatively, without vaccinia associated inflammation and replication.

HXB2 Location gp160 (311–320)

Epitope RGPGRGFVTI

Immunogen

Species (MHC) mouse (H-2^d)

Keywords epitope processing, immunodominance

References Lopez *et al.* 2000

- A series of protease and proteasome inhibitors was used to identify elements of the processing pathway of this epitope, called p18, both from within Env and from within a chimeric hepatitis B protein which allows proper processing.
- Lactacystin, a proteasome inhibitor, partially inhibits endogenous processing of p18 epitope suggesting both a proteasome pathway and an additional pathway can be used.
- Both TAP dependent and TAP-independent pathways can be used.
- 1,10-phenanthroline (metalloproteinase inhibitor) blocks epitope presentation demonstrating metalloproteinase processing in the Tap-dependent pathway.
- The Tap-independent pathway does not involve processing by metalloproteinases.

- This epitope is immunodominant in mice, and is presented by multiple human HLA alleles – it has been suggested that the high processing efficiency of this epitope might result in poor presentation of co-expressed epitopes.

HXB2 Location gp160 (311–320)

Author Location gp120

Epitope RGPGRGFVTI

Immunogen vaccine

Vector/Type: vaccinia

Species (MHC) mouse (H-2^d)

References Hanke *et al.* 1998a; Hanke *et al.* 1998b

- This murine epitope was incorporated into a vaccine of CTL epitopes expressed together including 20 HIV epitopes recognized by humans from 12 HLA types, one murine HIV epitope and three macaque HIV epitopes, delivered in a vaccinia virus Ankara (VVA) construct.
- The murine vaccination was more effective at generating CTL when given i.v. rather than i.m.

Immunogen vaccine

Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag

Species (MHC) mouse (H-2D^d)

Keywords immunodominance

References Haglund *et al.* 2002a

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag, Env, or both, and compared to using rec Env and Gag in vaccinia virus (rVVs). The primary response was determined by cell lysis, cytokine production and tetramer staining.
- Primary CTL responses to the immunodominant Env (RGPGRAFVTI) epitope peaked 5-7 days after intraperitoneal vaccination with Env-rVSV, 40% of the CD8+ cells were tetramer positive, and this response was 6-fold higher than the response to Env-rVV.
- Vaccinating with GagEnv-rVSV carrying both Gag and Env allowed recognition of both HIV-1 proteins, but at reduced levels compared to either Gag-rVSV or Env-rVSV alone.
- Intranasal immunization with Env-rVSV yielded CTL responses that were strong but reduced compared to an intraperitoneal route.

Immunogen vaccine

Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2 *HIV component:* Env, Gag

Species (MHC) mouse (H-2D^d)

Keywords immunodominance

References Haglund *et al.* 2002b

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN-gamma production.

- Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive.
- Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN-gamma production.
- A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost.
- A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN-gamma producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit.
- A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.

HXB2 Location gp160 (311–320)
Author Location gp120 (V3) (IIIB)
Epitope RGPGRFVTI

Immunogen vaccine
Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-12, IL-18, IL-1 α

Species (MHC) mouse (H-2D^d)

References Staats *et al.* 2001

- Cholera toxin (CT) is a potent adjuvant used in animal studies that is not safe in humans, so combinations of cytokines were used in nasal immunization of BALB/c mice V3 peptides to attempt to replace CT as a potent adjuvant.
- Peptide vaccine induced CTL activity was significantly increased by IL-1 α , IL-18, and GM-CSF given alone as adjuvant, but CT gave more potent CTL activity than any single cytokine.
- Combinations of cytokines could be more potent than CT as an adjuvant. The highest tetramer binding of H-2Dd peptide-specific PBMC after nasal immunization was observed with IL-1 α plus IL-18 as adjuvant.
- Nasal immunization with HIV peptide in the presence of IL-1 α , IL-12 and GM-CSF induced IFN-gamma-secreting cells in the cervical lymph node, the lung and the spleen, and was associated with upregulation of MHC class II and B7.1 on nonlymphocytes in NALT/nasal mucosal cells.
- Consistent results were obtained for the IIIB and the MN peptides.

coli mutant heat labile enterotoxin (LT-R72),

Incomplete Freund's Adjuvant (IFA), CpG immunostimulatory sequence (ISS)

Species (MHC) mouse (H-2D^d)

Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords dendritic cells, Th1, Th2, genital and mucosal immunity

References Belyakov *et al.* 2004

- Transcutaneous immunisation (TCI) of BALB/c mice induced adjuvant-dependent HIV-1 specific CTL responses in the spleen and the gut mucosa that resulted in protection against mucosal challenge against a recombinant vaccinia virus carrying HIV-1 env. Activated DCs from skin were shown to migrate to immune-inductive sites in gut mucosa and to present antigen directly to resident lymphocytes.

Species (MHC) mouse (H-2D^d)

Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, JAM cytotoxicity assay

Keywords vaccine antigen design

References Hocknell *et al.* 2002

- BALB/c mice were immunized with HSV amplicons containing HIV-1 gp120. Helper virus free HSV-1 amplicon particles are capable of inducing potent cytotoxic CD8+ T-cell and humoral immune responses to the HIV-1 antigen in mice. Previous infection with wild-type HSV-1 reduces amplicon-induced cellular immune responses to HIV gp120 modestly (40-60%), but severally reduced B-cell responses. The route of vaccination impacted the nature and level of the responses (i.m., i.d., and i. p.).

Immunogen vaccine

Vector/Type: DNA, virus-like particle (VLP), polyepitope *HIV component:* Gag, p24 Gag, V3

Species (MHC) mouse (H-2D^d)

Assay type Cytokine production, Chromium-release assay

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance

References Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.
- Linking the region encoding the V3 immunodominant epitope to the gag gene did not diminish the response to the Gag p24 epitope A9I, but did enable a response to the V3 epitope.
- Minigenes were made incorporating just 1 epitope, minitopes, carrying 1 of 3 murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polyprotein.

Species (MHC) mouse (H-2D^d)

Donor MHC H-2D

Assay type Intracellular cytokine staining

Keywords vaccine antigen design

References Samino *et al.* 2004

- The endogenous processing of the HIV-1 envelope glycoprotein generates several different natural peptidic species presented by the H-2D molecule in infected cells, the 9-, 10-, and 11-mer peptides, GPGRAFVVTI, RGPGRFVVTI, and QRGPGRAFVVTI. CTL with the same antigenicity could recognize all three forms. The complexity of the binding peptides suggests naturally processed proteins could provide more variety as antigens, stimulating more robust and diverse CTL responses.

Donor MHC H-2d
Assay type Cytokine production, proliferation, CD8 T-cell Elispot - IFN γ
Keywords Th1, Th2, genital and mucosal immunity
References Gherardi *et al.* 2003

- Mice were intranasally primed with a recombinant influenza virus A vector that carries HIV-1 Env inserted into its hemagglutinin protein. Boosting was performed intranasally with either influenza-Env or intraperitoneally with two vaccinia virus recombinants expressing the Env protein, VVenV and MVAenv.
- Peritoneal heterologous immunization with VVenV induced a 60-fold higher CD8+ IFN-gamma T cell responses than homologous influenza prime-boost. The intraperitoneal MVAenv boost response was greater than the VVenV boost in the spleen and genital lymph nodes, while the VVenV response gave the highest boost with the intranasal route.
- Mice with increased CD8+-T-cell responses also had a higher Th1/Th2 ratio, indicated by the cytokine secretion profile and the IgG2a/IgG1 ratio.

Species (MHC) mouse (H-2^d)

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ

Keywords Th1

References Gómez *et al.* 2004

- Priming of mice with DNA-TAB vector, a polyepitope string carrying 8 different V3 loop sequences, followed by a booster with VV-TAB or MVA-TAB, induced humoral responses, as well as a CD8+ T-cell response against V3 epitopes from three different subtype B HIV isolates. The highest values of specific CD8+ T-cell response were achieved when priming with DNA-TAB and a DNA vector expressing IFN-gamma, followed by a MVA-TAB boost. The T-cell response was Th1.
- The eight V3 loops were linked with an A-G-G-G-A sequence. The three peptides that elicited a response were LR150, SRGIRIGPGRAIL; MN, RKRIHIGPGRAFY; and IIIB, SIRIQRGPGRAFVTI. These peptides were located at the beginning, middle and end of the polyepitope, indicating all parts were able to be processed. It is not known if there is an H-2d epitope in the other five V3 loop variants that did not elicit a response.

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single

patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.

- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- WEAU had a reaction to an epitope within this peptide, and there was very rapid accumulation of substitutions; variation continued through the last sample collected.

References Frahm *et al.* 2005
 - HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
 - This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. Borderline significantly more often recognized in subjects who carry B63, but not B57/B58.

Epitope SFNCGGEFF

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (Cw4)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.

- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.

- Among HLA-Cw4 women, 1/2 HEPS and 10/11 HIV-1 infected women recognized this epitope.

- The dominant response to this HLA allele was to this epitope in 6 of the 10/11 responsive HIV-1 infected women, and not in the HEPS case.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had

more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.

- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Epitope YAPPISGQI
Immunogen SHIV infection
Species (MHC) macaque (Mamu-A*01)
References Egan *et al.* 1999
- SHIV-infected rhesus macaques have high frequencies of response to the SIVmac epitope gag p11C,C-M (CTPYDINQM) but only a fraction of A*01 monkeys tested have responses to SIVmac pol epitope STPPLVRLV and HIV-1 env epitope YAPPISGQI.

HXB2 Location gp160 (435–443)
Author Location gp41 (89.6)
Epitope YAPPISGQI
Epitope name p41A
Immunogen SHIV infection, vaccine
Vector/Type: DNA, modified vaccinia Ankara (MVA) *Strain:* B clade 89.6, B clade HXBc2 *HIV component:* Env, Gag *Adjuvant:* IL-2/Ig

Species (MHC) macaque (Mamu-A*01)
Keywords immunodominance
References Barouch *et al.* 2001a

- Mamu-A*01+ rhesus monkeys infected with SHIV-89.6 and SHIV-HXBc2 make immunodominant responses to SIV Gag p11C epitope (CTPYDINQM) and a subdominant response to HIV-1 Env p41A epitope (YAPPISGQI)
- The binding affinities are the same for the two Mamu A*01 epitopes, so that is not what dictates the dominance.
- Monkeys vaccinated with MVA vectors carrying SIV gag/pol and HIV-1 env showed the same p11C epitope dominance and p41A epitope subdominance, but co-dominance was observed and the response to p41A increased when DNA vaccination was done using the SIV and HIV genes under CMV promoter control with IL-2-IG adjuvant.

HXB2 Location gp160 (435–443)
Author Location Env
Epitope YAPPISGQI
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade 89.6P, SIV *HIV component:* Env, Gag

Species (MHC) macaque (Mamu-A*01)
Assay type Flow cytometric T-cell cytokine assay
Keywords vaccine-specific epitope characteristics, rate of progression, kinetics, memory cells, characterizing CD8+ T cells
References Davenport *et al.* 2004

- Activation and expansion of antigen-specific CD8+ T-cells shows a delay following infection that allows early viral replication. Until day 10, the kinetics of CD8+ T-cell expansion was the same in vaccinated and control macaques. An increase in virus-specific CD8+ T-cell numbers around day 10 in vaccinated macaques coincides with a slowing in viral replication. This indicates that while cytotoxic T-lymphocyte-inducing vaccines may have a long-term benefit in controlling viral replication and preventing disease progression, they cannot prevent infection.

HXB2 Location gp160 (435–443)
Author Location Env (89.6)
Epitope YAPPISGQI
Epitope name p41A
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade 89.6, SIV *HIV component:* Env, Gag *Adjuvant:* IL-2/Ig

Species (MHC) macaque
References Barouch *et al.* 2000; Shen & Siliciano 2000

- Different HIV strains were used for different regions: SIV-mac239 Gag and HIV-1 89.6P Env

- Monkeys that received the DNA vaccines augmented with IL-2/Ig were infected when challenged with pathogenic SHIV-89.6P, but had potent CTL responses, stable CD4+ T-cell counts, preserved virus-specific CD4+ T-cell responses, low to undetectable viral loads, and no evidence of disease or mortality by day 140 after challenge – monkeys that got a sham vaccine had high viral load, progressed to disease, and were half were dead by day 140.
- IL2/Ig consisting of interleukin-2 (IL-2) for immune stimulation, and the Fc portion of immunoglobulin G (IgG) for stability, was delivered either as protein or as DNA – both enhance the CTL response to vaccination, DNA IL2/Ig giving the most intense response.
- Responses to a dominant Mamu A*01 gag epitope SIV Gag p11C (CTPYDINQM) and a subdominant epitope HIV-1 Env p41A (YAPPISGQI) were tracked and had good durability prior to challenge, and the higher the prechallenge peak p11C CTL response, the lower the post-challenge viral load.
- No NAb responses were detected in the vaccinated monkeys prior to challenge, and comparable peak NAb titers developed in vaccinated monkeys and control monkeys with preserved CD4+ T-cells.
- Shen *et al.* 2000 is an accompanying commentary.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.

- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Keywords optimal epitope
References Liu *et al.* 2006
 - T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

- This study describes maternal CTL responses in the context of mother-to-infant transmission.
- Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants.
- This epitope was invariant in both the mother and her infant.

HXB2 Location gp160 (557–565)**Author Location** Env (555–567 BH10, LAI)**Epitope** RAIEAQQHL**Immunogen** HIV-1 infection**Species (MHC)** human**References** Maksiutov *et al.* 2002

- This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins.
- This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is LL-RAIEAQQHLL) has similarity with human MHC class II regulatory factor RFX1 fragment LLRLMEDQQHMA.

HXB2 Location gp160 (557–565)**Author Location** gp160**Epitope** RAIEAQQHL**Subtype** A, B, C, D**Immunogen** HIV-1 infection, vaccine*Vector/Type:* vaccinia *Strain:* A clade, B clade, D clade NDK, C clade consensus *HIV component:* Env**Species (MHC)** human**Donor MHC** A*3201, A*3601, B*5301, B*8101, Cw*0401, Cw*0804**Country** Kenya.**Assay type** CD8 T-cell Elispot - IFN γ , Other**Keywords** subtype comparisons, variant cross-recognition or cross-neutralization**References** McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
- There was a greater magnitude of response to A clade peptides in individuals who responded to more than one clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. VTEEFNMWK responses were detected in 2 women that had Env responses to all 4 clades, and clade A gave the highest responses; a VnEEFNMWK variant was in clade B and D, and the clade C Env carried VnEEFNMW. One woman also reacted with RAIEAQQHL, the other with KNCSFNMTT. RAIEAQQHL was identical in clades A, B, and D, while C carried RAIEAQQHm.

HXB2 Location gp160 (557–566)**Author Location** Env (557–566)**Epitope** RAIEAQQHML**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*40, A*69)**Country** India.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** subtype comparisons, computational epitope prediction, immunodominance**References** Thakar *et al.* 2005

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa. 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef. 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.

HXB2 Location gp160 (565–573)**Author Location** Env (565–)**Epitope** LLQLTVWGI**Epitope name** Env565**Immunogen** HIV-1 infection, vaccine*Vector/Type:* peptide *HIV component:* Env *Adjuvant:* Incomplete Freund's Adjuvant (IFA)**Species (MHC)** human, transgenic mouse (A2)**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** binding affinity, subtype comparisons, computational epitope prediction**References** Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder, and induced CD8+ T-cell IFN gamma responses in mice. Responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.

HXB2 Location gp160 (565–573)

Author Location Env (731–739)

Epitope LLQLTVWGI

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, escape, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Eleven variants in the ERYLKDQQL epitope were found in the patient BORI. ERYLKeQQp came up first at day 17 from onset of symptoms, but wasn't tested for escape properties. ERYLrDQQL came up next, by day 31, but didn't confer escape in a Cr release assay. By day 218, three variants were found, all of which gave a diminished response: ERYLiDQQL, ERYLqDQQL, and ERYLsDQQL. By day 556 a complex mixture was present, also including the ERYLmDQQL variant

that gave a further reduction in the response, and many double mutants: ERYLmDQrL, ERYLmDrQL, ERYLmDQIL, ERYLtDQrL and ERYrtDQrL.

- In SUMA, the only variation found in the 24 epitopes was in three overlapping epitopes in Tat, and in this gp160 epitope; variation accumulated early in infection in the Tat epitopes, but this epitope was stable until a sample 736 days post-infection, when only the ERYLqDQQL variant was detected. This variant was not tested with CTL from SUMA, but gave a diminished response in BORI.

- An early-expressed Nef protein was modified to contain Env and Pol epitopes to enable the study the effect of expression kinetics on CTL mediated suppression of replication. The "EpiNef" construct was inserted into a recombinant vaccinia virus which was used to infect a target cell line; the target cells were lysed by CTL clones specific for the Env and Pol epitopes indicating that they were properly processed.

HXB2 Location gp160 (584–592)**Author Location** gp41 (584–592)**Epitope** ERYLKDQQL**Immunogen** HIV-1 infection**Species (MHC)** human (B14)**Keywords** class I down-regulation by Nef**References** Yang *et al.* 2002

- Nef down-modulates class I protein expression, and this study demonstrates directly that Nef-deleted HIV-1 NL-43 can be more effectively killed *in vitro* than NL-43 with an intact Nef. The effect was shown to be specific for class I presentation of epitopes, and unlike Nef, deleting Vpr did not alter CTL susceptibility of NL43 infected cells. The CTL clone 15160D75, specific for the class I B14 presented epitope ERYLKDQQL, was one of four used in this study.

HXB2 Location gp160 (584–592)

Author Location gp41**Epitope** ERYLKDQQL**Epitope name** B14-EL9(gp41)**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B14)**Donor MHC** A32, B7, B14**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).

HXB2 Location gp160 (584–592)**Author Location** gp41**Epitope** ERYLKDQQL**Subtype** A, B, C, D**Immunogen** HIV-1 infection, vaccine*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag**Species (MHC)** human (B14)**Keywords** subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance**References** Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].

- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN-gamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location gp160 (584–592)**Author Location** gp41 (73–81)**Epitope** ERYLKDQQL**Epitope name** Env EL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B14)**Assay type** Chromium-release assay**Keywords** binding affinity, TCR usage, characterizing CD8+ T cells**References** Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 4/14 CTL T-cell clones tested were specific for Env EL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Env EL9 was 5,000 - 60,000 pg/ml.

HXB2 Location gp160 (584–592)**Author Location** (B consensus)**Epitope** ERYLKDQQL**Epitope name** EL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B14)**Donor MHC** A28, A29, B14, B44, Cw8; A25, A32, B08, B14, Cw7, Cw8**Assay type** Cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** assay standardization/improvement, memory cells, characterizing CD8+ T cells**References** Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.

- 2/9 individuals recognized this epitope, presented by HLA-B14.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords escape, characterizing CD8+ T cells, optimal epitope

References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- The variant ERYLqDQQL was the only form of the epitope detected over a 6-year period in this person. Elispot reactions were reduced to the autologous form relative to the B clade consensus form, ERYLKDQQL.

Assay type CD8 T-cell Elispot - IFN γ , Other

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
- There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. ERYLRDQQL responses were detected in 2 women who had Env responses to all 4 clades, and clade A gave the highest responses; a ERYLkdQQL variant was in clade B and

C, and the clade D Env carried ERsLkDQQL. The epitope VSGFLALAW was also recognized by 1 of the women.

- HLA-B*5802 was the only HLA common to both women who reacted with ERYLRDQQL, so may be the presenting allele.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Keywords subtype comparisons, HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants (R)YL(R/K)DQQLL are specific for the A/B clade.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A24 women, 3/4 HEPS and 10/10 HIV-1 infected women recognized this epitope, and (R)YL(R/K)DQQLL tended to be reactive in HEPS and infected women, RDYV-DRFFKTL in infected women only.

- The dominant response to this HLA allele was to this epitope in all 3/4 HEPS cases but in only 4 of the 10/10 HIV-1 infected women.

- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (A24, B8)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Immunogen HIV-1 infection

Species (MHC) human (B*0801)

Donor MHC A*0101, A*0301, B*0801, B*5101; A*0101, B*0801

Country United Kingdom.

Assay type CD8 T-cell ELISPOT - IFN γ , HLA binding

Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization

References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- The second donor in the study shares A*0101 and B*0801 with his partner. Escape variant yIQdqll was transmitted, and it reduces binding to B*0801 by 92% relative to YLKDQQLL.

Epitope YLRDQQLLGIWGC
Immunogen HIV-1 infection
Species (MHC) human (Cw7)
References Nehete *et al.* 1998a

- Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one.
- HLA-C antigens are expressed on lymphoid cells to a lesser extent, 10% of either HLA-A or HLA-B.
- HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.

HXB2 Location gp160 (594–608)
Author Location gp41
Epitope GIWGC SGKLICTTAV
Immunogen HIV-1 infection
Species (MHC) human (B57)
References Jin *et al.* 1998b

- Progressive HIV-1 infection and CD4 decline was associated decreased the IL-2-expandable HIV-1 CTL response in 10 asymptomatic HIV-infected patients – this observation may be partially due to a reduction and impaired function of T helper cells, CTL exhaustion and APC dysfunction.
- Continued presence of HIV-1 specific memory cells (CTLp) was observed in three patients, one to GIWGC SGKLICTTAV, one to ALIWEDLRSLCLFSY, and one to PIPHYCAPAG-FAILKCNNK.

HXB2 Location gp160 (594–608)

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Keywords escape, immune evasion, optimal epitope, HIV-1

- References** Liu *et al.* 2006
- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
 - This is a newly defined epitope. Last position (9) in the epitope had potentially experienced positive selection. YSPLSLQTr escape variant was found.

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.
 - Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.

- This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

Country Kenya.

Assay type CD8 T-cell Elispot - IFN γ , Other

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
- There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. ERYLRDQQL responses were detected in 2 women who had Env responses to all 4 clades, and clade A gave the highest responses; an ERYLRDQQL variant was in clade B and C, and the clade D Env carried ERsLkDQQL. The epitope VSGFLALAW was also recognized by 1 of the women; A and C clade were identical, while clade B carried VnGsLiLAW, clade D VnGIsAiAW.

Epitope ALIWERDLRSLCLFSY
Epitope name Peptide78
Subtype B

Immunogen HIV-1 infection
Species (MHC) human (B55)
Assay type Chromium-release assay
References Carmichael *et al.* 1996

- Cross-reactivity of Env-specific CTL clones from 14 seropositive HIV-1 infected patients was tested using peptides based on 3 B clade variants (MN, IIB, and RF). The proportion of CTL clones that cross-recognized conserved variants was low. Most CTL clones recognized only one peptide variant, indicating most Env responses are not cross-reactive within the B clade.
- This HLA B22(55) epitope was defined using SF2 peptides. The CTL clone that recognized it did not cross-recognize the MN, IIB, or RF variants of this peptide.

Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

HXB2 Location gp160 (767–775)

- HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.
 - A rapid method was developed combining ELISPOT with intracellular IFN- γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood.
 - Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.
 - In both HLA-A*3002 individuals the response to RSLYNT-VATLY was dominant.
 - In subject 199 four additional A*3002 epitopes were identified.
 - Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)

Epitope name LR27

Subtype B

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade LAI

Adjuvant: Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG

Species (MHC) mouse (A*0201)

Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Immunogen vaccine
Vector/Type: peptide *Strain:* B clade LAI
Adjuvant: Incomplete Freund's Adjuvant (IFA), IL-12, P30

Species (MHC) mouse (A*0201)
Keywords vaccine-specific epitope characteristics, immunodominance
References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004
- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
 - This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords dynamics, immunodominance, acute/early infection, kinetics, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was one of five reasonably strong responses in early infection in the patient WEAU, and the epitope sequence did not vary during the first year of the infection.

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 1/4 tested FSWs recognized the E clade version of this epitope, which differs from the previously defined B clade version by three amino acids, RvievLqRa.
- This epitope was only conserved in CRF01 (subtype E), and identities were rare.

- HLA-A33 a very common allele in Asia, with HLA-A*3303 the most common among the Japanese. New A*3303 epitopes were defined to better characterize the immune response in this population.
- The anchor motif for HLA*3303 (A, I, L, V, F, Y in position 2 (F and Y bind most strongly), and R (K is also tolerated) in the C-terminal position) was used to define 82 potentially reactive peptides in Env; 37/82 peptides bound to A*3303; 3/37 peptides could induce peptide-specific CTL in bulk PBMC cultures from 1/3 HLA A*3303 positive individuals tested.
- 2/3 peptides that reacted with the bulk culture, EVAQRAYR and VIEVAQRAYR, were overlapping, with one encompassing the other, but EVAQRAYR was shown to be the one that was reactive with a CTL clone.

- CTL clones were isolated that killed target cells in a concentration dependent manner after pulsing with the EVAQRAYR peptide, that could also kill cells transfected with env expressed from a vaccinia vector. Bulk cultures were tested from six additional people, and only 2/6 reacted with this peptide, but the peptide is in a highly variable region.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, immunodominance, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was one of five reasonably strong responses in early infection in the patient WEAU, and the epitope sequence did not vary during the first year of the infection.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfield *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords class I down-regulation by Nef

References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-I down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the

impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more efficiently recognized when infected with viruses carrying the Rev L60F mutation.

- Patients in the asymptomatic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Keywords rate of progression, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

Keywords review, immunodominance, escape, acute/early infection, early-expressed proteins, kinetics, reversion, viral fitness

References Lichterfeld *et al.* 2005

- This review discusses the importance of 3 factors that impact the selection of immunodominant epitopes in acute HIV infection: i) the kinetics of viral protein expression, ii) the HLA class I background of the infected individual, and iii) the autologous sequence of the infecting virus. This is 1 of 12 peptides listed as immunodominant in acute HIV-1 infection.

HXB2 Location gp160 (843–851)

Author Location gp160 (clade A, B, C, D)

Epitope IPRRRIRQGL

- Subtype** A, B, C, D
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC A*6802, A*6802, B*1303, B*1401, Cw*0602, Cw*1701
Country Kenya.
Assay type CD8 T-cell Elispot - IFN γ , Other
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References McKinnon *et al.* 2005
- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
 - There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. IPRRIRQGL responses were detected in all 4 clades in 1 woman: clade A gave a high response; IPRRIRQGL was identical clade B; clade C and D had lower responses and carried variant peptides IPRRIRQGf and IvRRIRQGL.
- HXB2 Location** gp160 (843–851)

Keywords HAART, ART
References Sabbaj *et al.* 2003
- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
 - 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
 - Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
 - This epitope was newly defined in this study.
 - Patient 00RCH28 was African American, not on HAART, had a viral load of 5900 and CD4 count of 889, and she also recognized IN(219-227), KIQNFRVYY, A*3002.
 - Among HIV+ individuals who carried HLA A02, 6/21 (29%) recognized this epitope.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

II-B-22 Env CTL/CD8+ epitopes**HXB2 Location** Env**Author Location****Epitope****Immunogen** computer prediction**Species (MHC)** (A*0201, B*3501)**Keywords** subtype comparisons, computational epitope prediction**References** Schönbach *et al.* 2002

- Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.

Vector/Type: canarypox prime with gp120 boost, canarypox prime with gp160 boost
Strain: B clade LAI, B clade MN, B clade SF2
HIV component: Gag, gp120, gp41, Nef, Pol

Species (MHC) human (A1, A2, A24, B62, A25, A26, A30, A31, B8, B17, B39, B51, B57, B60, B70)**Keywords** subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance**References** Ferrari *et al.* 2001

- Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2
- HLA-B62 responses dominated the responses against an Env vaccine in an individual (022JAV) who was HLA A2, A26, B35, B62. The strongest response was against the MN peptide 381-400; a response diminished by half was observed against vaccinia expressed clade A and clade C relative to clade B.
- Class I presentation of Env CTL responses in vaccinee 022A12K: A25 > B39, A1 and B8 were undetectable.
- Class I presentation of Env CTL responses in vaccinee 022A12N: B57 » A2 > A26 and B60.
- Class I presentation of Env CTL responses in vaccinee 034GP3: A31 > A24 > B62 > B51.
- Class I presentation of Env CTL responses in vaccinee 0348PP: B17 > B70, A1 and A30 were undetectable.

HXB2 Location Env**Author Location** gp120 (303–327)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human (A2, A3, A11, B27)**Keywords** subtype comparisons**References** Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.
- For this cluster of epitopes spanning the tip of the V3 loop, they suggest including a sequence from each clade.

HXB2 Location Env**Author Location****Epitope****Subtype** B**Immunogen** vaccine

Vector/Type: canarypox prime with gp120 boost, canarypox prime with gp160 boost
Strain: B clade LAI, B clade MN, B clade SF2
HIV component: Gag, gp120, gp41, Nef, Pol

Species (MHC) human (A2, B8)**Keywords** vaccine-induced epitopes**References** Ferrari *et al.* 2001

- Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2
- No HLA-A*0201 or B8 responses were made against the Env vaccine in individuals carrying these alleles, despite these being common presenting molecules for CTL responses to natural infections.

HXB2 Location Env
Author Location Env
Epitope
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*35)
Keywords rate of progression
References Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

Immunogen vaccine
Vector/Type: DNA *Strain:* B clade IIIB
HIV component: gp120
Species (MHC) mouse (H-2 Dd)
Assay type Cytokine production, Intracellular cytokine staining, Th support of CTL response, Chromium-release assay
Keywords epitope processing, Th1, vaccine antigen design
References Vatakis *et al.* 2005

- Mice were vaccinated with three DNA epitope vaccines, differing in the affinity of the helper epitope to the MHC class II molecule. It was observed that a TH epitope with lower affinity decreased the magnitude of the CTL responses and decreased the numbers of epitope-specific T-helper cells and CTLs. Also, cytokine secretion and proliferative responses were diminished.

HXB2 Location Env
Author Location gp160 (MN)
Epitope
Immunogen vaccine

Vector/Type: DNA *Strain:* B clade MN
HIV component: gp120, gp160

Species (MHC) mouse (H-2^d)
References Vinner *et al.* 1999

- Mammalian codon optimization renders gp160 expression Rev independent, increases gp160 expression levels, and DNA vaccination of BALB/c mice yields a higher antibody response with an earlier onset than wild type.
- Secreted gp120 gave higher antibody titers than membrane bound gp160.
- In contrast to antibodies, synthetic codon-optimized DNA did not alter the CTL response, wild type genes generated equally strong CTL responses.

HXB2 Location Env
Author Location (IIIB)
Epitope
Immunogen vaccine
Vector/Type: peptide *HIV component:* V3
Adjuvant: Cholera toxin (CT), GM-CSF, IL-4
Species (MHC) mouse (H-2^d)
References Kato *et al.* 2000

- A multicomponent peptide vaccine VC1 with cholera toxin adjuvant was given to mice.
- Immunization of BALB/c mice with VC1 and CT induced a strong CTL response which was enhanced by IL-12 expressing plasmids.
- Immunization with VC1 and CT resulted in HIV-1 specific IgA antibody responses, which were increased by the combination of IL-4 or GM-CSF expressing plasmids.

- pCMV160/Rev is a DNA vaccine candidate carrying gp160 and Rev linked to a cytomegalovirus (CMV promotor)

HXB2 Location Env

Author Location Env**Epitope****Immunogen** vaccine*Vector/Type:* adeno-associated virus (AAV)*HIV component:* Env, Rev, Tat *Adjuvant:* IL-2**Species (MHC)** mouse (H-2^d)**References** Xin *et al.* 2001

- An AAV vector expressing HIV-1 env, tat, and rev genes (AAV-HIV vector) was used to vaccinate BALB/c mice.
- A single injection stimulated and long lasting serum IgG, fecal IgA, and HIV-specific CTL.
- Boosting enhanced the humoral response, and IL2 enhanced T-cell immunity.

HXB2 Location Env**Author Location** Env**Epitope****Immunogen** vaccine*Vector/Type:* vaccinia, influenza *Strain:* Bclade IIIIB *HIV component:* Env, V3**Species (MHC)** mouse (H-2^d)**References** Gonzalo *et al.* 1999

- The use of two different live vectors for priming and boosting has a synergistic effect on the immune response against HIV-1—a 5-6 fold enhanced CTL response in Balb/c mice occurred when they were immunized with rec influenza virus (Flu-Env) expressing the V3 loop epitope from HIV-1 strain IIIIB, and boosted with a vaccinia virus recombinant (VV-Env) expressing the complete HIV-1-IIIIB env protein, compared to either immunogen alone.

HXB2 Location Env**Author Location** Env (subtype B)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* rabies virus *Strain:* B clade89.6, B clade NL43 *HIV component:* gp160**Species (MHC)** mouse (H-2^d)**References** McGettigan *et al.* 2001

- BALB/c were immunized with a replication competent recombinant rabies virus (RV) vaccine expressing HIV-1 gp160.
- A single vaccination induced induced strong and long-lasting (4.5 months) gp160-specific CTL cytotoxic responses.
- Although the greatest specific lysis was achieved when the vaccine strain was also used as the *in vitro* target strain to assess the response, there was extensive CTL cross-reactivity against other B clade HIV-1 envelope proteins, implying CTL recognition of multiple epitopes within the HIV-1 envelope protein.

HXB2 Location Env**Author Location** gp120 (V3)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* DNA, polyepitope *Strain:* B clade BRVA, B clade IIIIB, B clade JY1, B clade LR150, B clade MN, B clade RF *HIV component:* V3**Species (MHC)** mouse (H-2^d)**Assay type** CD8 T-cell Elispot - IFN γ **References** Vázquez-Blomquist *et al.* 2003

- Priming mice with recombinant MVA and boosting with fowlpox was shown to increase the number of specific IFN-gamma secreting cells relative to reversing the order (fowlpox prime, MVA boost) or priming with a Semliki Forest Virus DNA vector and boosting with recombinant MVA or fowlpox. The authors speculate why the order might be important. Fowlpox has more proteins, so there may be more CTL epitope competition; alternatively pox viruses may modulate the immune response through chemokine homologs.
- The antigen tested was a V3 loop polyepitope vaccine combining multiple V3 loop variants given by an intraperitoneal route to BALB/c mice.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** vaccine*Vector/Type:* DNA *HIV component:* gp120*Adjuvant:* Cholera toxin (CT)**Species (MHC)** mouse (H-2D^d)**Assay type** T-cell Elispot, Chromium-release assay**References** Bagley *et al.* 2003

- BALBc mice were immunized intramuscularly with single plasmids encoding gp120, or cholera toxin catalytic domain (CTA1) and gp120, or with a dicistronic DNA vaccine expressing both CTA1 and gp120. Vaccination including CTA elicited stronger and longer lasting Ab responses and T-cell responses to gp120.

HXB2 Location Env**Author Location** Env (SIV)**Epitope****Immunogen** SIV infection**Species (MHC)** macaque (Mamu-A*11, Mamu-B*03, Mamu-B*04, Mamu-B*17)**References** Dzuris *et al.* 2000

- Cell binding assays for Mamu molecules were employed to describe the peptide binding motifs for Mamu-A*11, -B*03, -B*03, -B*04, and -B*17 CTL epitopes – a similarity for Mamu-A*11 and -B*03 and human HLA-B*44 and -B*27, respectively, was observed – all epitopes studied were SIV epitopes, so not specifically listed here.

HXB2 Location Env**Author Location** gp160 (LAI, MN)**Epitope****Immunogen** vaccine*Vector/Type:* canarypox prime with gp120boost *Strain:* B clade LAI, B clade MN,B clade SF2 *HIV component:* Gag, gp120,

gp41, Protease

Species (MHC) human**References** Belshe *et al.* 1998

- The live canarypox vaccine ALVAC-HIV(vCP205) carrying MN gp120, LAI gp41, Gag and Protease, and boosted with SF-2 rpg120, was given to HIV-1 seronegative volunteers – HIV-specific Env or Gag CD8+ CTL were detected in 64% of the volunteers.

HXB2 Location Env**Author Location** gp160 (LAV)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** epitope processing, dendritic cells**References** Zheng *et al.* 1999

- Protein delivery (gp160 LAV, p66 LAV, and p24 NY5) to human dendritic cells (DC) with liposomes provides enhanced memory CTL response relative to delivery of protein alone.
- Chloroquine administration enhanced epitope presentation, and brefeldin A and peptide aldehyde inhibitors inhibited antigen presentation, suggesting epitopes were processed by classical proteasome pathway.

HXB2 Location Env**Author Location** Env (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression, Th1**References** Wasik *et al.* 2000

- HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of IL-2, as well as beta-chemokines, relative to other HIV+ infants.
- No HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors.
- CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Soudeyns *et al.* 2000

- Analysis of T cell receptor beta chain variable region repertoire indicates that antiretroviral therapy (ART) and highly active antiretroviral therapy (HAART) decrease global CD8 T cell oligoclonality during primary HIV infection.
- A sharp decline in HIV-1 gp120-specific CTL clones was observed in HAART-treated subjects.

HXB2 Location Env**Author Location** Env (LAI, MN)**Epitope****Immunogen** vaccine*Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp41, Protease, V3**Species (MHC)** human**References** Salmon-Ceron *et al.* 1999

- The vaccine used was a rec canarypox with HIV-1 gp120 MN, tm/gag/protease LAI (vCP205), alone or with p24E-V3 MN synthetic peptide (CLTB-36))

- Twenty HIV negative subjects were vaccinated in phase I trial with combinations of vCP205 and CLTB-36.

- Immunization with vCP205 induced HIV-1-specific ABs to gp120, V3, and p24 antigens, and CTL immune responses against vCP205 were detected after the fourth immunization in 33% of the subjects against Env, Gag and Pol, but the CLTB-36 peptide did not produce AB or CTL immune responses against p24 or gp160.

HXB2 Location Env**Author Location** Env**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** TCR usage**References** Gamberg *et al.* 1999

- 13/13 subjects with advanced HIV infections showed CD8 T cell proliferation and differentiation of CTL *in vitro*, and six individuals showed HIV-specific responses to Gag, Pol, Env or Nef antigens.
- Data suggests that the functional and genetic integrity of the CD8 T cell repertoire (TCR betaV gene intrafamily genetic diversity) remains intact through advanced HIV infection, although HIV-specific CTL activity decreases.

HXB2 Location Env**Author Location** Env (LAI, MN)**Epitope****Immunogen** vaccine*Vector/Type:* canarypox prime with gp120 boost *Strain:* B clade LAI, B clade SF2 *HIV component:* Env, Gag, Nef, Protease**Species (MHC)** human**References** Gorse *et al.* 1999b

- The vaccine used was rec canarypox expressing HIV-1 env, gag, pol, nef and protease (vCP300) with or without administration of HIV-1 SF-2 rpg120.
- In vitro inducible CTL activity against HIV-1 Env, Gag, Pol, and Nef antigens was observed in 79% (15 of 19) of vaccine recipients.
- The combination of vCP300 and vP1291 together resulted in an overall increase in CTL induction and detection sensitivity.

HXB2 Location Env**Author Location** Env (LAI)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** subtype comparisons**References** Buseyne *et al.* 1998b

- In infants with positive CTL responses, most responses showed cross-clade reactivity with somewhat diminished recognition of epitopes from different subtypes.

HXB2 Location Env**Author Location** gp120 (IIIB)

Epitope**Immunogen** vaccine*Vector/Type:* DNA *Strain:* B clade IIIB*HIV component:* gp120, gp160**Species (MHC)** macaque**References** Shiver *et al.* 1997

- DNA vaccinations of Rhesus monkeys with a gp120 or gp160 DNA vaccine elicited a strong CD8 cytotoxic T cell response.

HXB2 Location Env**Author Location** gp160**Epitope****Immunogen** HIV-1 infection**Species (MHC)** macaque**References** Kent *et al.* 1997b

- Macaques can be infected with HIV, and clear the infection within 6 months, so it is of interest to examine their initial immune response.
- A strong CTL response against env, pol and gag antigens can be detected.
- The CTL response peaked by 4 weeks and declined dramatically by 8 weeks.
- The response in the lymph nodes and peripheral blood was comparable.

HXB2 Location Env**Author Location** gp160**Epitope****Immunogen** vaccine*Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12**Species (MHC)** mouse**References** Kim *et al.* 1997c

- A gag/pol, vif or env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules B7 and IL-12, gave a dramatic increase in both the cytotoxic and proliferative responses in mice.
- When IL-12 was present, CTL response could be detected even without *in vitro* stimulation.

HXB2 Location Env**Author Location** gp160**Epitope****Immunogen** vaccine*Vector/Type:* DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12**Species (MHC)** mouse**References** Kim *et al.* 1997d

- A gag/pol or env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules CD86, gave a dramatic increase in both the cytotoxic and proliferative responses in mice.
- When CD86 was present, CTL response could be detected even without *in vitro* stimulation.

HXB2 Location Env**Author Location** gp120 (HXBc2)**Epitope****Immunogen** vaccine*Vector/Type:* DNA prime with gp160 boost*Strain:* B clade HXBc2 *HIV component:* gp160**Species (MHC)** macaque**References** Letvin *et al.* 1997

- Vaccination of Macaques mulatta (Rhesus monkeys) with an HXBc2 env DNA prime and a protein boost elicited a T cell proliferative response, a CTL response, and type-specific neutralizing antibodies.
- Vaccinated animals challenged with SHIV-HXB2 were protected from infection.

HXB2 Location Env**Author Location** gp120 (MN)**Epitope****Immunogen** vaccine*Vector/Type:* DNA *Strain:* B clade MN*HIV component:* Env, Rev**Species (MHC)** human**References** MacGregor *et al.* 1998

- An HIV DNA env and rev vaccine given to 15 asymptomatic HIV+ individuals at three different dosages, 30, 100 or 300 μ g, was safe.
- The CTL response to gp120 was enhanced in 0/4 patients in the 30 μ g group, 2/3 patients in the 100 μ g group, and 0/3 in the 300 μ g group – but the non-responding patients in the 300 μ g group had a strong CTL response prior to vaccination, and the CTL results are inconclusive.

HXB2 Location Env**Author Location** gp120 (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Trickett *et al.* 1998

- Twelve HIV-1 infected patients were re-infused with their own lymphocytes, cryopreserved from an earlier time point in the infection.
- Improvement in CD4+ and CD8+ T cells was seen in 7/12, and an increase in the CTL response to Env was seen in one patient.

HXB2 Location Env**Author Location** gp120 (LAI)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**References** Legrand *et al.* 1997

- Seventeen recently infected patients were tested for CTL response to HIV proteins Env, Gag, Pol, Rev, Nef, Vif and Tat.
- An early response (within a month following PI) was noted in 87% of the subjects to Gag, 75% to Env, and 50% to Nef.
- Early responses to Pol, Rev, Vif and Tat were rare.

HXB2 Location Env**Author Location** gp120 (LAI)**Epitope****Subtype** B**Immunogen** vaccine

Vector/Type: vaccinia prime with gp120 boost
Strain: B clade LAI, B clade MN, B clade SF2

Keywords review, HIV exposed persistently seronegative (HEPS)

References Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.

- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.
- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

Keywords epitope processing, escape
References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.

Keywords HAART, ART, immune dysfunction

References Trabattoni *et al.* 2004

- Reduced perforin-and granzyme- containing Env-specific CD8+ T cells were observed in ART treated individuals indicating that antiretroviral drugs might directly interfere with the production of perforin and granzymes, inhibiting CTL killing. Immunomodulants may be needed to enable CTL to become fully functional during ART.

HXB2 Location Env

Author Location gp140

Epitope

Immunogen vaccine

Vector/Type: protein, peptide in liposome
Strain: B clade IIBB *HIV component:* gp140, gp160, oligomeric gp140 *Adjuvant:* CpG immunostimulatory sequence (ISS), liposome

Species (MHC) mouse

Donor MHC H-2d

Assay type Cytokine production, proliferation, Chromium-release assay

Keywords Th1, Th2, adjuvant comparison, vaccine antigen design

References Rao *et al.* 2004

- Administration of ogp140 in liposomes containing lipid A (LA) induces high antibody titers which are increased by adding CpG ODN. Priming and boosting of BALB/c mice with ogp140+LA induces mixed Th1/Th2 immune response, while adding CpG ODN switches the immune response to a Th1 type. Mixing ogp140 with liposomes containing lipid A yielded excellent proliferative and CTL specific responses; CpG did not affect CTL responses. The antigen did not need to be encapsulated in the liposome to induce strong responses with LA as an adjuvant.

HXB2 Location Env

Author Location

Epitope

Subtype CRF02_AG

Immunogen vaccine

Vector/Type: virus-like particle (VLP), DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* CRF02 IC0928 *HIV component:* Env, Gag, Pol

Species (MHC) macaque

Assay type T-cell Elispot, Intracellular cytokine staining

Keywords vaccine-specific epitope characteristics, vaccine antigen design

References Ellenberger *et al.* 2005

- Macaques were given a Gag-Pol-Env DNA prime followed by an MVA boost. Two DNA constructs were compared, one that resulted in mature VLPs with processed Gag (IC48) and one that had a point mutation in Gag that resulted in immature VLPs (IC1-90). IC48 DNA vaccinations, which produced mature VLPs, yielded 2-fold stronger T-cell responses with greater breadth. CD4 T-cells responded to 3-fold more peptide pools than did CD8.

Species (MHC) macaque

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining

Keywords vaccine-specific epitope characteristics, vaccine antigen design, characterizing CD8+ T cells

References Sadagopal *et al.* 2005

- 22/23 macaques that were immunized with a DNA prime SHIV-89.6 and boosted with rMVA showed successful control of viremia, with low or undetectable viral loads and normal CD4 counts 200 weeks postchallenge. IFN-gamma producing T cells were found in unexpectedly low breadths and frequencies. T-cell responses were stable over time and maintained their production of IFN-gamma and IL-2. Long-term control was found in macaques of diverse histocompatibility types. The CD8 T cells seemed to have the most impact on well-contained chronic infections in the vaccinated and challenged animals.
- Both CD4 and CD8 responses were found to the SIV Gag and HIV Env proteins, 60% of CD8+ epitopes were in p27, and 80% of CD4+ epitopes.

II-B-23 Nef CTL/CD8+ epitopes

HXB2 Location Nef (1-16)

Author Location Nef (1-16)

Epitope MGGKWSKSSIVGWPAV

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Keywords subtype comparisons

References Novitsky *et al.* 2002

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.
- Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.
- This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

Epitope WSKSSIIGW

Epitope name WW9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*2501)

Donor MHC A*0201, A*2501, B*1801, B*5101, Cw*0102, Cw*1203

Assay type CD8 T-cell Elispot - IFN γ

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- This is a newly defined epitope. Positions 4 and 6 in the epitope had potentially experienced positive selection. WSKtSIIGW and WSKSSmIGW escape variants were found.

HXB2 Location Nef (11–20)

Epitope WPAIRERM

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*0801)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 infection

Species (MHC) human (B*0801)

Donor MHC A*0101, B*0801

Country United Kingdom.

Assay type CD8 T-cell Elispot - IFN γ , HLA binding

Keywords escape, acute/early infection

References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.

- The recipient mounted an acute CTL response to this epitope, and the escape variant wpAvrKrm emerged in the recipient soon after.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The variant WnTVRERM was present in 10/10 clones from a B8+ mother, was transmitted to her B8- infant, and present in 10/10 clones at months 2, 4, and 15.

Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Species (MHC) mouse (H-2^b)

References Liang *et al.* 2002

- BALB/c, C3H/HeN and C57BL/6 mice were given intramuscular immunization with Nef DNA constructs – C57BL/6 responded to this epitope.
- The Nef mutant that lacked the myristylation site (G→A) at position 2, and the dileucine motif (L→A at positions 174 and 175) was impaired in terms of its ability to elicit induction of Nef-specific CD4+ and CD8+ T-cell responses. The myristylation site is critical for Nef membrane localization and function, and the di-leucine motif for the down-regulation of surface CD4 molecules, and the mutation of these regions could yield a safer vaccine.
- N-terminal addition of human tissue plasminogen activator (TPA) to Nef, enhanced CD8+ T-cell responses and could compensate for the G2A, L174A, L175A mutations – this enhanced immunogenicity correlated with enhanced levels of protein expression in transfected cells.

Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection

References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- This epitope FPVVRPQVPL was identical in the initial and superinfecting strains, and the CTL response persisted in the patient before and after superinfection.

Author Location Nef (72–80 SF2)

Epitope FPVVRPQVPL

Immunogen HIV-1 infection

Species (MHC) human (B*3501)

References Tomiyama *et al.* 1997

- A CTL clone responsive to this epitope was obtained.
- 3/7 B35-positive individuals had a CTL response to this epitope.
- An R to T substitution at position 4 abrogates specific lysis, but not binding to B*3501.

HXB2 Location Nef (68–76)

Author Location Nef (72–80)

Epitope FPVVRPQVPL

Immunogen HIV-1 infection

Species (MHC) human (B*3501)

References Tomiyama *et al.* 2000a

- CD8+ T-cells that bound one of six HIV-specific B*3501-epitope tetramers did not express CD28 or CD45A.
- A significant increase in CD28-CD45RA- cells and a decrease of CD28+CD45RA+ cells was observed in chronically HIV-1-infected individuals relative to healthy individuals.
- CD28-CD45RA- cells are likely to be effector cells and have high levels of perforin in their cytoplasm.
- The mean percentage of total CD28- CD8+ cells in chronically infected HIV-1-infected patients was 76.6% in comparison to HIV-1-uninfected individuals (40.6%)

HXB2 Location Nef (68–76)

Epitope FPVTPQVPL

Immunogen in vitro stimulation or selection

Species (MHC) human (B7)

Keywords binding affinity, dendritic cells, Th1

References Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.
- B7 and A2 Nef epitopes were studied – FPVTPQVPL has a high affinity for B7.

HXB2 Location Nef (68–76)

Author Location Nef (68–76)

Epitope FPVTPQVPL**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Keywords** rate of progression, acute/early infection**References** Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconverter homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconverter failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

- There was a high degree of variation in three CTL epitopes in Nef in four slow and non-progressors, and variant specific CTLs arose over time to eliminate variants, indicating immune selection.

HXB2 Location Nef (68–77)**Author Location** Nef (subtype B)**Epitope** FPVTPQVPLR

Subtype B**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Keywords** HIV exposed persistently seronegative (HEPS), escape**References** Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- FPVTPQVPLR was recognized in 1 of the 6 women (ML1203), and the response was present in the last available sample prior to seroconversion, 7 months.
- 20/20 sequences of the infecting strain had no substitutions in this epitope, all were FPVTPQVPLR, so there was no evidence for escape.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- This epitope was recognized in 1/22 HEPS sex worker controls, ML851.

HXB2 Location Nef (68–77)**Author Location** Nef (66–75)**Epitope** FPVTPQVPLR**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**References** Ferrari *et al.* 2000

Epitope VTPQVPLRPMTYKAA

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 34% of the study subjects, and it was the second most frequently recognized epitope.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT). Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

Donor MHC A1, A3, B7, B57, Cw6, Cw7

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- This epitope was reactive, but escape mutations did not accrue in it over time.

Assay type CD8 T-cell Elispot - IFN γ

Keywords escape, cross-presentation by different HLA

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- People who carried either B07 or B81 tended to carry a variant of this epitope, while people who did not almost always carried the consensus form.
- B*4201 may also present this epitope, as the allele is enriched in people who react with the peptide that contains the epitope, and it is known from the database to be also presented by B*4201.

Immunogen in vitro stimulation or selection

Species (MHC) human (A*0301)

Keywords epitope processing, dendritic cells

References Andrieu *et al.* 2003

- This study demonstrates that lipopeptides carrying epitopes can be taken up by human dendritic cells, processed using different pathways, and recognized by epitope-specific CD8+ T-cells originally derived from HIV+ individuals. The RT ILKEPVHGV peptide was embedded in a longer peptide fragment in the lipopeptide, and was internalized by endocytosis and processed in the cytosol by proteasomal cleavage by following an endosome-to-cytosol pathway for processing and presentation. Administration of epoxomycin, a proteasome inhibitor, completely abrogated epitope presentation to a CD8+ T-cell line, while monensin, an inhibitor of acid-dependent endosomal enzyme activity did not.
- In contrast to the RT epitope, dendritic cell presentation of the Nef epitope QVPLRPMTYK embedded in a longer peptide in a lipopeptide was not inhibited by epoxomycin, but was inhibited by monensin, indicative of endocytotic epitope processing.

Donor MHC A*0101, A*0301, B*0801, B*5101

Country United Kingdom.

Assay type CD8 T-cell Elispot - IFN γ , HLA binding

Keywords escape

References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient.

In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.

- Two variants of this epitope, QVPvRPMTYK and QaPLRPM-TYK, were found in 1 donor. The QaPLRPM-TYK substitution reduced the binding affinity for A*0301 by 52%.

Subtype CRF01_AE**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)** human (A11)**Keywords** HIV exposed persistently seronegative (HEPS)**References** Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope was weakly reactive in HEPS study subjects 265 who was HLA A2/A11 and 128 who was HLA A11/A33, and after a second *in vitro* stimulation, in study subject 256 who was HLA A11/33, making it the most reactive epitope tested in HLA-A11 HEPS women, with 3/4 responding.
- This epitope was strongly reactive in HIV+ study subject 053 who carried HLA-A11.

HXB2 Location Nef (73–82)**Author Location** Nef (71–80 93TH253 subtype CRF01)**Epitope** QVPLRPMTYK**Subtype** CRF01_AE**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Keywords** subtype comparisons**References** Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined.
- 4/8 tested FSWs recognized this epitope.
- An HLA-A11 tetramer was made for this epitope, which was recognized by two subjects – only one subject had an expanded tetramer staining T-cell population after *in vitro* stimulation.
- This epitope was highly conserved in other subtypes, and exact matches were common.

HXB2 Location Nef (73–82)**Author Location** Nef**Epitope** QVPLRPMTYK**Epitope name** QVP**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Oxenius *et al.* 2002b

- Using previously defined epitopes Oxenius *et al.* [2000, 2001a] in an IFN γ Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI).
- STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.

HXB2 Location Nef (73–82)**Author Location** Nef**Epitope** QVPLRPMTYK**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Donor MHC** A2, A11, B8, B60, Bw6**Keywords** HAART, ART**References** Appay *et al.* 2002

- Four HIV patients with prolonged clinically successful anti-viral therapy but with ongoing evidence of replication and Nef mRNA transcription, showed specific T-cell responses by Elispot and Tetramer staining, maintained for 2-4 years after initiation of HAART.
- Nef epitope recognition was detected in all 4 subjects, gp120, Pol and Gag-specific in 1 or 2 subjects – two patients recognized this epitope, one using HLA-A3, one using HLA-A11.
- The HIV-specific CD8+ T-cells had an intermediate maturation phenotype characterized by low levels of perforin and high levels of CD27 expression.

HXB2 Location Nef (73–82)**Author Location** Nef (73–82)**Epitope** QVPLRPMTYK**Epitope name** QK10**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Donor MHC** A2, A11, B18, B44, Cw5, Cw12**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Flow cytometric T-cell cytokine assay**Keywords** optimal epitope**References** Allen *et al.* 2005b

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For 1 of the escape variants, a novel CD8 T-cell response equal in magnitude to the wildtype, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wildtype.
- This epitope did not vary.

HXB2 Location Nef (73–82)**Author Location** Nef (73–82)**Epitope** QVPLRPMTYK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Donor MHC** A2, A11, B18, B44, Cw5, Cw12**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- This epitope was reactive, but escape mutations did not accrue in it over time.

HXB2 Location Nef (73–82)**Author Location** Nef**Epitope** QVPLRPMTYK**Epitope name** QK9**Immunogen****Species (MHC)** (A11)**Keywords** review, immunodominance, escape, acute/early infection, early-expressed proteins, kinetics, reversion, viral fitness**References** Lichterfeld *et al.* 2005

- This review discusses the importance of 3 factors that impact the selection of immunodominant epitopes in acute HIV infection: i) the kinetics of viral protein expression, ii) the HLA class I background of the infected individual, and iii) the autologous sequence of the infecting virus. This is 1 of 12 peptides listed as immunodominant in acute HIV-1 infection.

HXB2 Location Nef (73–82)**Author Location** Nef (73–82)**Epitope** QVPLRPMTYK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A11, A*0301)**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , CD8 T-cell Elispot granzyme B**Keywords** Th1, characterizing CD8+ T cells**References** Kleen *et al.* 2004

- Only 20% of CD8+ T-cells produce IFN-gamma and granzyme B simultaneously (Tc1a). Two additional subpopulations of HIV specific CD8 cells are found, each one constituting 30-40% of the CD8 cell pool. One of these (Tc1b) secretes IFN-gamma only, and the other one (Tc1c) secretes GzB only.
- None of three patients responded to this peptide with GzB producing cells, while all three responded with IFN-gamma producing cells.

Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
- Full CD8+ T-cell responses to this epitope were dependent on co-stimulation with a CD4+ T cell dependent epitope from T-cells harvested during acute infection. The CD8+ T-cell response to this epitope was immunodominant in one study individual.

HXB2 Location Nef (73–82)**Author Location** Nef (73–82)**Epitope** QVPLRPMTYK**Immunogen** HIV-1 infection**Species (MHC)** human**References** Garcia *et al.* 1997

- The anti-Nef CTL line P1 specific for this epitope is able to kill target cells via two mechanisms.
- First: Ca²⁺-dependent, perforin-dependent Nef-specific lysis.
- Second: Ca²⁺-independent, CD95-dependent apoptosis that could also kill non-specific targets.

- Findings indicate that the two mechanisms are not mutually exclusive in human CTL, as they are in mice.
- CTL mediated CD95-dependent apoptosis may play a role in pathogenesis.

HXB2 Location Nef (73–83)**Author Location** Nef (73–82 BRU)**Epitope** QVPLRPMTYKA**Subtype B****Immunogen** HIV-1 infection**Species (MHC)** human (A3)**Keywords** binding affinity, epitope processing**References** Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- QVPLRPMTYKA was recognized in 9/15 (60%) of individuals with HLA A3. It was a high affinity HLA-A3 binder.

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Chromium-release assay

Keywords escape, acute/early infection

References Bansal *et al.* 2005

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.
- Point mutation of epitope at position 8 (Y to F, VPLRPMTf) was detected at a chronic infection timepoint. The CTL response was strong in early infection, but diminished by month 13. This mutation had reduced avidity.

HXB2 Location Nef (74–81)

Immunogen HIV-1 infection

Species (MHC) human (B35)

Keywords acute/early infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (B35)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ

Keywords rate of progression, immunodominance, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- VPL epitope was one of six that were largely or completely replaced by escape variants, with the two escape forms coming up between days 172 and 635, vplrpmSy and vplrpmTF.

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The variant RPMThqAAw was present in 10/10 clones from a B7- mother, was transmitted to her B7+ infant, and present in 29/30 clones at months 2, 6, and 152.

Epitope RPMTYKAAV

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Donor MHC A3, A33, B14, B35, Cw*0401, Cw*0802

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute/early infection, early treatment

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Immunogen HIV-1 infection

Species (MHC) human (B63)

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression, cross-presentation by different HLA

References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. There is no evidence for B57/B58 cross-presentation of this epitope.

- T-cell immune responses were examined in HIV-1 infected Ugandans. Similar levels of cross-clade responses for Gag, Env and Nef were observed. Higher frequencies of responses in conserved regions were found for Gag within a single clade, while areas with higher viral sequence variation had fewer detectable responses. Differential interclade sequence homologies between the Gag regions did not affect the respective level of cross-clade recognition.
- Novel unmapped epitope, this test peptide was conserved in the people that recognized it.

HXB2 Location Nef (80–87)**Author Location** Nef (80–87)**Epitope** TYKAAVDL**Subtype** B**Immunogen** vaccine*Vector/Type:* lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21**Species (MHC)** human (A24)**Assay type** proliferation, CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** vaccine-induced epitopes, variant cross-recognition or cross-neutralization**References** Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the 31 epitopes that the vaccinated volunteers responded to.

HXB2 Location Nef (80–87)**Author Location** Nef (80–87 BRU)**Epitope** TYKAAVDL**Subtype** B, CRF02_AG**Immunogen** HIV-1 infection**Species (MHC)** human (A24)**Country** Cote D'Ivoire.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** subtype comparisons**References** Inwoley *et al.* 2005

- CD8+ T-cells from HIV-1 CRF02_AG-infected Ivorians could recognize clade B epitopes. No difference was observed in the number of recognized peptide pools between nine French subtype B infected study subjects, and nine CRF02_AG infected Ivorian subjects.
- This epitope was recognized by 1/9 CRF02_AG-infected Ivorians, and 0/9 B-infected French subjects.
- This epitope was highly variable in Ivorians; 8/9 had amino acid substitutions. The only one that reacted carried the sequence TYKGAIDL. 3/5 of the B clade French subjects carried variants, which tended to have only 1 amino acid substitution.

HXB2 Location Nef (80–94)**Author Location** Nef (80–94 HXB2)**Epitope** TYKAAVDLSHFLKEK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** T-cell Elispot**Keywords** supervised treatment interruptions (STI), immunodominance, early treatment**References** Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 47% of the study subjects, and it was the most frequently recognized peptide.

HXB2 Location Nef (82–90)**Author Location** (C consensus)**Epitope** KGAFDLSFF**Subtype** C**Immunogen** HIV-1 infection

Species (MHC) human (B*57)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
- The CRF01_AE variant GaFdlSfFl had a higher HLA-A2 binding score than the HXB2 epitope.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- An escape form of the A2 epitope, AAVDmSHFL, was transmitted from an A2- mother to her A2+ infant, where it persisted in 29/29 sequences sampled over 11 months.
- Another form of this A2 epitope, gAIDLSHFL, was transmitted by an A2+ mother to an A2- infant, where it persisted in 30/30 sequences sampled over 15 months.
- AAVDmSHFL was shown to have lower responder cell frequencies than AAVDLSHFL.

Assay type CD8 T-cell Elispot - IFN γ
Keywords acute/early infection, early treatment
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- Four different individuals recognized this epitope during a primary infection, and it was shown to be presented by HLA B60, B62, C2*0802, and Cw8.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.

- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined.
- 4/8 tested FSWs recognized this epitope.
- This epitope was only conserved in CRF01 and subtype C, and exact matches were uncommon.

References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- AVDLSHFLK was found to elicit clade-specific responses in clade B (AVDLSHFLK is most common, aLdlshflk is a common variant also found in clade A) and clade E (aFdlsFflk is most common and is also common in clade C). AVDLSHFLK was strongly recognized by CTL from 2/5 B clade infected Japanese subjects, as was aLdlshflk, and aFdlsFflk by CTL from 5/7 E clade infected Thai subjects.
- The binding of aFdlsFflk to HLA A*1101 was 10-50 times lower than the other variants, and bulk CTL generated from individuals did not cross-react with the cross-clade peptides.

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (A11)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location Nef (86–94)**Author Location** Nef**Epitope** DLSHFLKEK**Subtype** A, B, D, F**Immunogen** HIV-1 infection, vaccine*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag**Species (MHC)** human, macaque (A*0301)**Keywords** subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance**References** Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Country United Kingdom.

Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords rate of progression, escape, TCR usage, characterizing CD8+ T cells

References Dong *et al.* 2004

- In 4 donors with delayed disease progression, the response to the FL8 Nef epitope was dominated by V-beta-13.2 TCR expressing CTLs with an unusually long CDR3 region. These CTLs were shown to be resistant to apoptosis and able to recognize escape variants of the FL8 Nef epitope. Thus, selection of these CTLs may be related to better clinical outcome.
- The Q5 variant fkeQgg1 was rapidly selected in a donor that responded to the FLKEKGGL epitope. The FLKEKGGL peptide and the variant fkeQgg1 HLA-B8 complexes bound to the Vbeta13.2 FLKEKGGL TCR with equal affinity, while the Vbeta6 FLKEKGGL TCR had reduced affinity for the FLKEKGGL form and did not recognize the Q5 variant. Other variants (T5, N5, and M5 as well as Q5) were recognized by Vbeta13.2 clones from all 4 donors. One clone from donor 046 that was not Vbeta13.2 could only recognize the index variant.

HXB2 Location Nef (90–97)

Epitope FLKEKGGL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*0801)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- Assay type** CD8 T-cell Elispot - IFN γ , HLA binding
Keywords escape, acute/early infection
References Milicic *et al.* 2005
- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
 - The recipient mounted an acute CTL response to this epitope, and the escape variant fIkeQggl emerged soon after.

Epitope FLKEKGGL

Epitope name FLK

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, escape, acute/early infection

References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- Six of the 7/8 study subjects that were HLA B8 recognized this early dominant CTL epitope.
- Patient SC2 (HLA A1, B7/8, Cw0701/0702, DR4/53, DQ7) had CTL responsiveness against epitopes FLKEKGGL, GP-KVKQWPL, and GEIYKRWII peptides – FLKEKGGL tetramer staining steadily declined and at day 1340 the FLKEKGGL stained cells were no longer detected and the escape mutant FLKENGGI was found in 8/10 clones.
- Patient SC9 (HLA A1/2, B8/13, Cw0/0701, DR2/11, DQ6/7) had a CTL response against epitopes FLKEKGGL, ILKEPVHGV, SQRRQDILDWYHTQGYFPDWQNY, and GEIYKRWII peptides and all responses declined during therapy initiated at day 390 but were restored when therapy become intermittent.
- Patient SC19 (HLA A11/12, B8/44, Cw06/0701, DR3/7, DR52/53, DQ 2/8) had a CTL response to epitopes

FLKEKGGL, GEIYKRWII, ACQGVGGPGHK, AVDSLHFLK, and FNCGGGEFFY that declined during therapy initiated at day 197.

- Patient SC10 (HLA A1/3, B8/35, DR1/8, DQ 4/5) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL and a response to GEIYKRWII through day 1088.
- Patient SC12 (HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL throughout and minor responses to GEIYKRWII, DCKTILKAL, GGKKKYKLLK – GEIYKRWII and GGKKKYKLLK responses were stimulated by a brief period off therapy.
- Patient SC11 (HLA A1, B8, Cw0201, DR3/11, DR52, DQ2/7) started therapy early, remained on therapy for 40 days, then reinitiated HAART at day 640 had a CTL response to FLKEKGGL, GPKVKQWPL, and GEIYKRWII throughout and received a benefit from the early limited course therapy.

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location Nef (90–97)**Author Location** Nef (90–97)**Epitope** FLKEKGGL**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B8)**Donor MHC** A1, A3, B8, B62, Cw3, Cw7**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** binding affinity, acute/early infection, early-expressed proteins**References** Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN- γ secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

HXB2 Location Nef (90–97)**Author Location** Nef (90–97 B consensus)**Epitope** FLKEKGGL**Epitope name** FL8**Subtype** B**Immunogen** vaccine*Vector/Type:* adeno-associated virus (AAV)
HIV component: gp120**Species (MHC)** human (B8)**Assay type** Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** dynamics, immune evasion**References** Brainard *et al.* 2004

- HIV-1 gp120 is shown to suppress the ability of antigen-specific CTLs to migrate or remain at sites of high viral replication by concentration-dependent chemotaxis and fugetaxis. Directional T-cell movement is shown to depend on the interaction of the V2 and V3 loops with the CXCR4 receptor. X4 HIV-1 gp120 causes the migration of T-cells, including HIV-1 specific CTL, away from infected target cells, another potential mechanism for immune evasion.

HXB2 Location Nef (90–97)**Author Location** Nef (87–95)**Epitope** FLKEKGGL**Immunogen** HIV-1 infection**Species (MHC)** human (B8)**Donor MHC** A03, A28, B07, B08**Assay type** proliferation, Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** HAART, ART, memory cells, immune dysfunction**References** Gamberg *et al.* 2004a

- HAART restores HIV specific immunity after advanced infection by increase of CD4+ and CD8+ T cell numbers after suppression of viral replication. However, HIV specific CTLs emerged only with detectable viral replication breakthroughs and were short-lived while CD4+ T-cell responses remained compromised, suggesting failure of generating stable CD8+ memory T-cells in the absence of HIV-specific T-helper responses.

Epitope FLKEKGGL

Subtype B

Immunogen HIV-1 infection

Species (MHC) (B8)

Keywords binding affinity, review, escape, characterizing CD8+ T cells

References da Silva 2003

- Evidence of the evolutionary adaptation of HIV-1 to the specific neutralizing antibody response and CTL detection is reviewed. Both SIV and HIV epitopes are discussed, with a detailed summary of one patient's response and CTL escape in the FLKEKGGL epitope. The three C-terminal amino acids were left unchanged, and it may be due to high fitness costs as these are putatively involved in CD4 down-regulation and formation of a hydrophobic pocket in Nef. The N terminal residue is involved in binding to protein tyrosine kinases.
- Immediately after infection the susceptible epitope FLKEKGGL was found in 20/20 viral sequences. Six months later, it was only found in 4/44 sequences. The flkeNggL form was most common, 24/44 cases; it bound poorly to HLA B08 and was poorly recognized by CTL. Two minor variants were found 3/44 times, flkeEggL and flkeQggL; both bound poorly to B08, but the K->Q substitution was still well recognized. A variant flkDkggL was found in 4/44 sequences; it bound B08 moderately well, but was poorly recognized. 3 double mutants were found once each, and were not recognized by CTL: flkeNggL, flEeNggL, and flkGNggL.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Tetramer binding

Keywords immunodominance, acute/early infection, characterizing CD8+ T cells, immune dysfunction

References Lichterfeld *et al.* 2004a

- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
- Full CD8+ T-cell responses to this epitope were dependent on co-stimulation with a CD4+ T cell dependent epitope from T-cells harvested during acute infection. The CD8+ T-cell response to this epitope was immunodominant in one study individual.

Assay type Chromium-release assay, CTL suppression of replication

Keywords escape

References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- Two cloned CTL lines recognized KEKGGLEGL, STD11 and KM3. Highly resistant clones emerged after a single round of passage with both CTL clones, and multiple substitutions accrued including frameshifts and stop codons, reflecting the dispensability of Nef in viral culture.
- The following epitope variants were observed after passaging with clone STD11 for one week: kekggegl, kKkggegl, and 12/20 frameshifts and 1 early stop. By two weeks, a more complex polyclonal mixture was observed including: kekggegl, kKkggegl kekggeglP, kekggeglE, kekggeglR, kekRgegl, keNggegl, and 11/22 frameshifts.

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 2/14 CTL T-cell clones tested were specific for Nef KL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Nef KL9 was 20-30 pg/ml, both high avidity. These clones were among the most efficient at inhibiting viral replication in the set tested, but because of the general lack of correlation between avidity and viral inhibition efficiency in this study, the authors attribute other reasons to Nefs ability to inhibit viral replication that pertain to presentation like kinetics and expression levels.

Donor MHC A*0202, A*3002, B*5703, B*5802; A*6801, A*7401, B*0702, B*3501

Country Uganda.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References Barugahare *et al.* 2005

- T-cell immune responses were examined in HIV-1 infected Ugandans. Similar levels of cross-clade responses for Gag, Env and Nef were observed. Higher frequencies of responses in conserved regions were found for Gag within a single clade, while areas with higher viral sequence variation had fewer detectable responses. Differential interclade sequence homologies between the Gag regions did not affect the respective level of cross-clade recognition.
- The sequence contains a previously-defined epitope (KRQEILDWLWVY) of unknown HLA restriction. The viral sequence from the subjects that recognized the peptide was skkrqKildlwvYnt.

Epitope RRQDILDLWIYHTQG

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope name RI9

Immunogen HIV-1 infection

Species (MHC) human (B13)

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression, escape, variant cross-recognition or cross-neutralization, optimal epitope

References Harrer *et al.* 2005

- An HLA-B13-restricted optimal epitope was defined in Nef, RI9. The frequency of CTLs specific for this epitope in B13-positive patients exceeded the number of CTLs against other epitopes, indicating that this is a dominant epitope in B13-positive subjects. Three B13-positive patients who had an immunodominant response to this epitope were good controllers of their infection, with low viral loads over long periods.
- In B13-positive patients with a previous diagnosis of AIDS, an RrDILDLWI escape variant was found.
- This is a well conserved epitope but natural variants were tested. Peptide titration experiments indicate a V9I RQDILDLWv variant and RQDILDLWI are equally well recognized. Other natural substitutions are less well recognized: RkDILDLWI, RQeILDLWI, aQDILDLWI, RQaILDLWI, RrDILDLWv.

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Epitope name N2

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A1)

Keywords HAART, ART

References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFN γ production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Epitope YHTQGYFDPWQNYTP

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ

Keywords assay standardization/improvement, epitope processing

References Draenert *et al.* 2004a

- 96% of optimally defined epitopes have one of only nine amino acids serving as the C-terminal anchor position. Seven amino acids are never found in this position and four are only present in 4% of cases. CD8 T-cell response to an epitope is shown to be best detected when the epitope is situated at the C-terminal end of a longer peptide, and authors suggest that Elispot reagents would be better designed if peptides ended on known C-terminal anchors.
- HTQGYFPDW is suggested to be the optimal epitope instead of HTQGYFPDWQ since Gln is not described as a C-terminal anchor residue in any of the other optimally defined epitopes. HTQGYFPDW was also found to be recognized at two times lower peptide concentrations than HTQGYFPDWQ.

Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection
References Pillay *et al.* 2005
- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
 - HTQGYFPDW is the C consensus form of the epitope; the autologous form in the mother was HTQGfFPDW, and this was transmitted to her infant. By 33 weeks a new dominant form of the epitope had emerged in the infant: nTQGfFPDW.

Epitope YFPDWQNYT

Immunogen HIV-1 infection

Species (MHC) human

Keywords immunodominance

References Betts *et al.* 2000

- Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.
- 95 optimally-defined peptides from this database were used to screen for INF γ responses to other epitopes.
- 1/11 of the A2+ individuals was HLA A*0205/A*0208, A30, B27, B44 but responded to HLA B37 epitope IYKRWILGL, and one of the other individuals that was A2+, but otherwise of unknown HLA type, reacted with seven epitopes including this one.

Epitope YFPDWQNYTPGPGIRYPLTFGWCK

Immunogen HIV-1 infection

Species (MHC) human (A24)

References Jassoy *et al.* 1992

- Epitope recognized by CTL clone derived from CSF.

HXB2 Location Nef (121–128)

Author Location Nef (121–128)

Epitope FPDWQNYT

Subtype B

Immunogen vaccine

Vector/Type: lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21

Species (MHC) human (A1)

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization

References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of 31 that the vaccinated volunteers responded to.

HXB2 Location Nef (121–128)

Author Location Nef (121–128 HXB2)

Epitope FPDWQNYT

Subtype B, CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A1)

Country Viet Nam.

Assay type HLA binding

Keywords subtype comparisons, computational epitope prediction, variant cross-recognition or cross-neutralization, vaccine antigen design

References Lazaro *et al.* 2005

- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
- CRF01_AE has 2 forms, FPDWQNYT, like the HXB2 form, and FPDWhNYT. Both are predicted to bind to A1.

Species (MHC) human (B57, B58)

Donor MHC A02, A33, B35, B57, Cw04, Cw07

Assay type CD8 T-cell Elispot - IFN γ

Keywords cross-presentation by different HLA, optimal epitope

References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel

B63-restricted epitopes can also be presented by HLA-B57 and -B58.

- This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. The optimal epitope was defined in a person carrying B57, and reactivity to the peptide was enriched in those with B57/B58, just a trend for B63.

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Chromium-release assay

Keywords escape, acute/early infection

References Bansal *et al.* 2005

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.
- Point mutation at position 2 (P to S, TsGPGVRYPL) was detected at a chronic infection time point, month 33. This escape variant had lower avidity.
- The response to the peptide that carried this epitope was initially strong and diminished over time.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection

References Pillay *et al.* 2005

- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
- Escape variants tSgpgvrypl and tQgpgvrypl were rapidly selected in an infant, by 26 weeks, but were not found in the infant's mother. These forms were demonstrated to be escape mutations by Elispot, and also had reduced binding to B*4201 in a competitive inhibition assay.

Assay type CD8 T-cell Elispot - IFN γ

Keywords cross-presentation by different HLA, characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords dynamics, supervised treatment interruptions (STI), acute/early infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

HXB2 Location Nef (128–137)

Epitope TPGPGVRYPL

Subtype B, C

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (B7)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 24% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Nef (134–141)**Author Location** (C consensus)**Epitope** RYPLTFGW**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (A*2301)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** epitope processing, rate of progression, optimal epitope**References** Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- Mutational patterns in a residue outside of the optimized epitope of RYPLTFGW are associated with the presence of the HLA presenting molecule in the host.

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was

an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.

- RYPLTFGW was a previously defined A*2402 presented epitope that encompassed an A*24 associated polymorphism, RYPLTFGW, in the second position.

HXB2 Location Nef (134–141)**Author Location** Nef (138–147 SF2)**Epitope** RYPLTFGW**Immunogen** HIV-1 infection**Species (MHC)** human (A24)**Keywords** HAART, ART, acute/early infection**References** Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-A24+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 2/3 group 2, and 0/0 group 3.

HXB2 Location Nef (134–141)**Author Location** Nef**Epitope** RYPLTFGW**Epitope name** A24-RW8(Nef)**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A24)**Donor MHC** A24, B7, B27**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.

- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection, characterizing CD8+ T cells

References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to the peptide that carried this epitope, RYPLTFGWCF, was present before superinfection but waned afterward. The epitope from the second strain had a mutation, rypICfgwcf. A second overlapping epitope in the reactive peptide might be involved, the B*35 epitope YPLTFGWCF.

Country Japan.
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords binding affinity, epitope processing, immunodominance, escape
References Furutsuki *et al.* 2004
- 70% of Japanese people carry HLA A*2402, and the rFpltfgwcf (2F) escape variant of this A*2402 epitope was found to be positively selected in Japan; reversion to wild-type in HLA-A24 negative individuals occurred very slowly over years. The 2F escape variant appears to be common in Japan due to escape and then transmission of this form in the population. The mechanism of escape appeared to be in processing of Nef and antigen presentation rather than HLA binding since both wild-type and 2F variant bound to HLA-A*2402 with almost same efficiency; the authors suggest the epitope may be cleaved at position 5 with a higher frequency when the 2F mutation is present.

Species (MHC) human (A24)
Assay type proliferation, CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization
References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the 31 epitopes that the vaccinated volunteers responded to.

Author Location Nef (134–143 HXB2)
Epitope RYPLTFGWCY
Subtype B, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (A24)
Country Viet Nam.
Assay type HLA binding
Keywords subtype comparisons, computational epitope prediction, variant cross-recognition or cross-neutralization, vaccine antigen design
References Lazaro *et al.* 2005
- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
 - CRF01_AE variant rylpCfgywcy had same HLA-binding score as the HXB2 epitope.

Epitope RYPLTFGWCF
Immunogen HIV-1 infection
Species (MHC) human (A24)
Donor MHC A*24, A*32, B*07, B*18, Cw*07
Country United States.
Assay type CD8 T-cell Elispot - IFN γ
Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, reversion, viral fitness
References Sanchez-Merino *et al.* 2005
- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
 - Variant rFpltfgwcf was detected in increasing frequencies in clones from an A24+ infant, but was absent in all sequences from the A24- mother at delivery, revealing selective pressure as early as 3 months of age.

Assay type CD8 T-cell Elispot - IFN γ
Keywords escape, immune evasion, optimal epitope, HIV-1
References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Assay type CD8 T-cell Elispot - IFN γ
Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection
References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to the peptide that carried this epitope, YPLTFGWCF, was present before superinfection but waned afterward. The epitope from the second strain had a mutation, yplCf_gwcf. A second overlapping epitope in the reactive peptide might be involved, the A*24 epitope RYPLTFGWCF.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Keywords cross-presentation by different HLA, characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Nef (135–143)

Epitope YPLTFGWCY

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (B18, B49)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants YPLTFGWC(Y/F) are specific for the B/D clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B18 women, 1/4 HEPS and 8/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYV-DRF(Y/F)K, while infected women tended to respond to YPLTFGWC(Y/F)
- The dominant response to this HLA allele was to this epitope for the one reactive HEPS case and in all 8/9 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

Author Location Nef (135–143)
Epitope YPLTFGWCF
Subtype B
Immunogen vaccine
Vector/Type: lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21
Species (MHC) human (B7 supertype)
Assay type proliferation, CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization
References Gahéry-Ségard *et al.* 2003
- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the most frequently recognized of the 31 epitopes that the vaccinated volunteers responded to.

Epitope YPLTFGWCF
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7, B18, B35, B49, B53)
Donor MHC A3, A31, B18, B39; A1, A3, B8, B35
Country United States.

- Assay type** Intracellular cytokine staining, Flow cytometric T-cell cytokine assay
Keywords HAART, ART, escape, variant cross-recognition or cross-neutralization
References Casazza *et al.* 2005
- Evidence of continued viral evolution during HAART therapy despite low viral load was found in 1/5 patients studied.
 - A predominant sequence of ypltfgwcf was found in 2 patients (in 11/11 and 15/15 sequences) that cross-recognized the peptide used for screening, YPLTFGWCF. In patient B, CD8 T-cell response of 0.95% was found for the dominant variant, while the response for the screening epitope ypltfgwcf was 0.58%. In patient F, the frequency of response did not differ significantly between the 2 variants. Assays for both patients were done immediately prior to the initiation of therapy.

Epitope YPLTFGWCF
Subtype B, CRF02_AG
Immunogen HIV-1 infection
Species (MHC) human (B7, B18, B53)
Country Cote D'Ivoire.
Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons
References Inwoley *et al.* 2005
- CD8+ T-cells from HIV-1 CRF02_AG-infected Ivoirians could recognize clade B epitopes. No difference was observed in the number of recognized peptide pools between nine French subtype B infected study subjects, and nine CRF02_AG infected Ivorian subjects.
 - This epitope was recognized by 3/9 CRF02_AG-infected Ivoirians, and 0/9 B-infected French subjects.
 - The three Ivoirians that recognized this peptide carried three different variants of the epitope: identical to LAI: YPLTFGWCF, YPLTFGWCF, and fPLTFGWCF. 6/8 Ivoirians carried a variant, 5/5 B clade infections were not identical.
- HXB2 Location** Nef (136–144)
Author Location Nef (136–144 BRU)
Epitope PLTFGWCFYK
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A3)
Keywords binding affinity, epitope processing
References Choppin *et al.* 2001
- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
 - 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
 - PLTFGWCFYK was recognized in 3/12 (25%) of individuals with HLA A3. It was a low affinity HLA-A3 binder.

Epitope PLTFGWCFKL

Immunogen vaccine*Vector/Type:* DNA prime with vaccinia boost**Species (MHC)** human (A2)**References** Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSSL).
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- PLTFGWCFKL was recognized by 1 of the HLA-A2 patients.

HXB2 Location Nef (136–145)**Author Location** Nef (135–144 93TH253 subtype CRF01)**Epitope** PLTFGWCYKL**Subtype** CRF01_AE**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** subtype comparisons**References** Bond *et al.* 2001

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 0/4 tested FSWs recognized the E clade version of this epitope PLCFGWCFKL, which differs from the previously defined B clade version by two amino acids, PLTFGWCYKL.
- This epitope was only conserved in CRF01 (subtype E) and subtype B.

HXB2 Location Nef (136–145)**Author Location** Nef (136–145)**Epitope** PLTFGWCYKL**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** rate of progression, acute/early infection**References** Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)

- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.

Assay type CD8 T-cell Elispot - IFN γ

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- This epitope was reactive, but escape mutations did not accrue in it over time.

HXB2 Location Nef (137–146)

Author Location Nef (135–146)

Epitope LTFGWCFKLV

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, HLA binding

Keywords acute/early infection, optimal epitope

References Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized during chronic infection.

HXB2 Location Nef (137–146)

Author Location Nef (158–167)

Epitope LTFGWCFKLV

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.

- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)
- Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific sells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

Epitope WCFKLVVPV

Epitope name Nef141

Immunogen HIV-1 infection, vaccine

Vector/Type: peptide *HIV component:* Nef
Adjuvant: Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords binding affinity, subtype comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was an intermediate A2 binder, and induced a CD8+ T-cell IFN gamma response in 1/6 mice. Responses were detected in 2/17 HIV+ HLA-A2 subjects.

Keywords Th1, characterizing CD8+ T cells

References Kleen *et al.* 2004

- Only 20% of CD8+ T-cells produce IFN-gamma and granzyme B simultaneously (Tc1a). Two additional subpopulations of HIV specific CD8 cells are found, each one constituting 30-40% of the CD8 cell pool. One of these (Tc1b) secretes IFN-gamma only, and the other one (Tc1c) secretes GzB only.
- Three of seven patients responded to this peptide with GzB producing cells, while one of the three patients responded with IFN-gamma producing cells.

HXB2 Location Nef (180–189)

Author Location Nef (180–189)

Epitope VLEWRFDSSL

Immunogen *in vitro* stimulation or selection

Species (MHC) human (A2)

Keywords binding affinity, dendritic cells, Th1

References Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.
- B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWYCYKL greater than VLEWRFDSSL which was much greater than AFHHVAREL.

HXB2 Location Nef (180–189)

Author Location Nef (180–189)

Epitope VLEWRFDSSL

Immunogen vaccine

Vector/Type: DNA prime with vaccinia boost

Species (MHC) human (A2)

References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWYCYKL), Pol 346-354 (VIYQMDDL), and Nef 180-189 (VLEWRFDSSL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- VLEWRFDSSL was recognized by 2 of the HLA-A2 patients.

HXB2 Location Nef (180–189)

Author Location Nef (180–189 LAI)

Epitope VLEWRFDSSL

Epitope name N3

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords HAART, ART

References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFN-gamma production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

HXB2 Location Nef (180–189)

Author Location Nef (179–188 93TH253 subtype CRF01)

Epitope VLEWRFDSSL

Subtype CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords subtype comparisons

References Bond *et al.* 2001

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 0/4 tested FSWs recognized the E clade version of this epitope VLIWKFDSSAL, which differs from the previously defined B clade version by three amino acids, VLEWRFDSSL.

HXB2 Location Nef (180–189)

Author Location Nef (180–189)

Epitope VLEWRFDSSL

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords rate of progression, acute/early infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.

HXB2 Location Nef (180–189)

Author Location Nef (178–187)

Epitope VLEWRFDSSL

Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Spain.
Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay
Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction
References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 5/19 patients recognized this epitope.

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope.

The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type HLA binding

Keywords subtype comparisons, computational epitope prediction, variant cross-recognition or cross-neutralization, vaccine antigen design

References Lazaro *et al.* 2005

- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
- CRF01_AE common variant Kfd5AlaR had same HLA-binding score as the HXB2 epitope.

Country United Kingdom.
Assay type CD8 T-cell Elispot - IFN γ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- DSRLAFHHM is the known A24 epitope. A known escape variant, DSRLAFqHM, was transmitted from an A24- mother to her A24+ infant, where it was gradually lost over time, present in 6/10 clones at 2 months, 7/10 at 4 months, and 0/10 at 15 months.
- Another escape variant was present in an A24+ mother, DStLAFqHk and this form was transmitted to her A24+ infant where it persisted in 30/30 sequences sampled over 12 months.
- DSRLAFHHM had higher responder cell frequencies in the A24+ mother than DStLAFqHk. Her A24+ infant did not recognize either form. The variant DSRLAFqHM also stimulated lower responder cell frequencies.

Author Location Nef (192–200 SF2)

Epitope KLAFFHHMAR

Subtype B

Immunogen HIV-1 infection, computer prediction

Species (MHC) human (A*3303)

Assay type Chromium-release assay

Keywords binding affinity, computational epitope prediction

References Hossain *et al.* 2003

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individuals, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 2/6 peptides that could induce CTL responses in the PBMC of infected individuals, but was not properly processed in a vaccinia-HIV infected target cell.

HXB2 Location Nef (188–196)

Epitope RLAFFHHVAR

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B52)

References Hadida *et al.* 1995

- The C-terminal region of Nef (182-205) contains multiple CTL epitopes with 5 distinct HLA restrictions.

HXB2 Location Nef (188–201)**Author Location** Nef (188–201 LAI)**Epitope** RLAFFHHVARELHPE**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B35, Cw4)**References** Buseyne *et al.* 1993a

- Vertical transmission of HIV ranges from 13% to 39%
- Primary assays showed that cytotoxic activity against at least one HIV protein was detected in 70% of infected children.
- Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures.
- Patient EM13, who had a CTL response to three epitopes in Nef, was infected via blood transfusion after birth and went from CDC stage P2A to P2E during the study.

HXB2 Location Nef (189–198)**Author Location** Nef (189–198)**Epitope** LAFHHVAREL**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (A*6901)**Country** India.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** subtype comparisons, computational epitope prediction, immunodominance**References** Thakar *et al.* 2005

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa. 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef. 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.

HXB2 Location Nef (190–198)**Author Location** Nef**Epitope** AFHHVAREL**Epitope name** Nef AL9**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** subtype comparisons, supertype, computational epitope prediction**References** Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.

- Three additional previously described HLA-A2 epitopes were added to the set of 20, including Nef AL9, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- RT VL9 was not recognized by any of the 22 HLA-A2 patients with chronic HIV-1 infection or the 13 HLA-A2 patients with acute HIV-1 infection included in this study.

HXB2 Location Nef (190–198)**Author Location** Nef**Epitope** ALKHRAYEL**Subtype** A**Immunogen** HIV-1 infection, vaccine*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag**Species (MHC)** human, macaque (A*0201)**Keywords** subtype comparisons, epitope processing, immunodominance**References** Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location Nef (190–198)**Author Location** Nef (190–198 LAI)**Epitope** AFHHVAREL**Subtype** B**Immunogen** HIV-1 exposed seronegative**Species (MHC)** human (A2)**Keywords** subtype comparisons, HIV exposed persistently seronegative (HEPS)**References** Rowland-Jones *et al.* 1998a

- CTL recognition reported in the context of HLA-B52 and A2.1, A2.2 and A2.4.
- A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating.
- The A subtype consensus is ALKHRAYEL.
- The D subtype consensus is AfEHKAREm.

- Hunziker *et al.* [1998] suggests that HLA-A2 does not in fact present this epitope, and notes that it does not promote A2 assembly Connan *et al.* [1994] – also see Brander *et al.* [1998b]
- Hunziker *et al.* [1998] maintains that HLA-A2 does not present this epitope contrary to an earlier report Hadida *et al.* [1995], (also see Brander *et al.* [1998a])—despite the position of Hunziker *et al.*, Rowland-Jones and colleagues are confident that this epitope in its A clade form is presented by HLA-A*0201 and A*0202, and it is one of the most common responses seen in both seropositive and exposed-uninfected donors from Nairobi (Rupert Kaul, pers. comm.)

HXB2 Location Nef (190–198)

Author Location Nef (190–198)

Epitope AFHHVAREL

Immunogen *in vitro* stimulation or selection

Species (MHC) human (A2)

Keywords binding affinity, dendritic cells, Th1

References Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.
- B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFD SRL which was much greater than AFHHVAREL.

HXB2 Location Nef (190–198)

Author Location Nef (190–198)

Epitope AFHHVAREL

Immunogen vaccine

Vector/Type: vaccinia

Species (MHC) human (A2)

References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFD SRL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- AFHHVAREL was recognized by 2 of the patients.

HXB2 Location Nef (190–198)

Author Location Nef (190–198 SF2)

Epitope AFHHVAREL

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords HAART, ART, acute/early infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-A2+ individuals that had a CTL response to this epitope broken down by group: 0/10 group 1, 1/6 group 2, and 0/4 group 3.

HXB2 Location Nef (190–198)

Immunogen HIV-1 infection

Species (MHC) human (A*0201, Cw*08)

References Shacklett *et al.* 2000

- HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.

HXB2 Location Nef

Author Location Nef

Epitope

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B*35)

Keywords rate of progression

References Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.

- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

Species (MHC) human

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.

- 96% (26/27) chronically infected HIV-1 infected patients elicited gamma-IFN CD8+ T-cell responses against Gag.
- Nef and/or Pol CTL responses were detected in 86% of the subjects.
- The magnitude and breadth of Gag and p24 T-cell responses correlated with absolute CD4 counts, and inversely correlated with viral load.
- Pol and Int CTL responses correlated positively with absolute CD4+ T-cell count.

- Nef and Env responses did not correlate with either CD4 counts or viral load.

HXB2 Location Nef**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, dendritic cells**References** Larsson *et al.* 2002b

- Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.

HXB2 Location Nef**Author Location** (SF2)**Epitope****Subtype** B**Immunogen** HIV-1 and HCV co-infection**Species (MHC)** human**Keywords** rate of progression**References** Lauer *et al.* 2002

- HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFN γ production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins.
- All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load.
- Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted.
- HIV-specific CD4 proliferative responses were detected in 9/17 coinfecting patients, but no HCV responses were detected.

HXB2 Location Nef**Author Location****Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, responses in children**References** Scott *et al.* 2001

- CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.
- Before ART 2/13 infants <6 months of age showed IFN γ Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy— 3 infants were coinfecting with CMV and all 3 had CMV-specific CD8+ T-cell responses.

- One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.

- Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.

HXB2 Location Nef**Author Location** (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Ortiz *et al.* 2001

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.

HXB2 Location Nef**Author Location****Epitope****Immunogen** vaccine*Vector/Type:* adenovirus *HIV component:* Gag-Pol, Nef, Vpr**Species (MHC)** mouse**References** Muthumani *et al.* 2002

- Vpr can cause cells to go into G2 arrest, and it suppresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens.
- Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol.
- In vitro, Vpr reduced T-cell cytokine production of IL-12 and TNF α , indicative of Vpr-mediated immune suppression.

HXB2 Location Nef**Author Location** Nef**Epitope****Subtype** multiple**Immunogen****Species (MHC)** human**Assay type** Flow cytometric T-cell cytokine assay**Keywords** subtype comparisons**References** Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.

- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining
Keywords assay standardization/improvement
References Draenert *et al.* 2003
- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptide sets, and 15 of these 17 had CD4 T-cell responses.
 - Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays.
 - Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivities were observed using the B.AU.AF064676 peptides but not the consensus.
 - Using an overlap of 10 or 11 amino acids did not make a difference.

Assay type CD8 T-cell Elispot - IFN γ

Keywords HAART, ART, immunodominance, acute/early infection, vaccine antigen design

References Lichterfeld *et al.* 2004b

- HIV-1 specific CD8 T-cell responses in individuals with acute and early HIV-1 infection are preferentially directed against epitopes in the central region of Nef, with 94% of the magnitude of the response in acute infection directed at Nef, and 46% during early infection. In chronic infection, CD8 T-cell immune responses are broadly diversified towards Gag, Env and Pol, and Nef accounts for only 17% of the response.
- The region of Nef that is targeted is the central most conserved region, but relative to other HIV proteins it is still quite variable. However, responses are cross-reactive enough to detect strong acute responses using consensus based peptides, and is an early expressed gene so may have advantages in the context of a vaccine.
- Nef immunodominance was retained in patients that were treated during acute infection, but no treatment and so continuous antigen exposure resulted in rapid diversification of the immune response.

Immunogen HIV-1 infection

Species (MHC) human (A11, B8, B40, Cw8)

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining

Keywords HAART, ART, acute/early infection, early treatment

References Alter *et al.* 2003

- Longitudinal study (24 mo) monitoring T-cell immune responses in 4 patient groups: Group 1 (n=6) consists of subjects who underwent HAART preseroconversion, group 2 (n=11) were HAART treated during early postseroconversion, group 3

(n=5) contained patients who started HAART during late post-seroconversion, and group 4 (n= 6) commenced with HAART during chronic HIV-1 infection.

- The experimental strategy was to test for reactivity levels with sets of peptides that each contain epitopes with known HLA-restricting elements, making the peptide selection based on the optimal epitope list in this database. The HLA alleles found in the patients were balanced so that the frequency in the groups were comparable. Peptides spanning parts of Gag, Env, Nef, and RT were used for Elispot, and Gag peptides were used for ICS.
- All group 1 patients, and 5/11 group 2 patients, maintained the breadth and the magnitude of the immune response throughout the study; those in group 2 that maintained response started therapy earlier. The hierarchy of intensity of responses to different peptides was preserved. Individuals in groups 3 and 4 all showed a decline, and after treatment lost responses. Groups 1 and 2 showed HAART-induced suppression of viremia but maintained responses. Groups 3 and 4 both showed viral suppression in association with a decreased immune response in breadth and magnitude after HAART. The authors suggest that preservation of HIV CD4+ responses can be maintained even if HAART is first given beyond the acute phase of infection, and a delay may allow a full CD8 response to develop while still allowing CD4 function to be preserved.

Immunogen vaccine
Species (MHC)
Keywords dynamics
References Altes *et al.* 2002
- This study employs a mathematical model to study the consequences of increasing the T-helper response through a vaccine, which would have counter-balancing effects in a new infection: a more intense response provides more help but also more target cells. The model indicates that if the infecting virus had a low replication rate, then CTLp and CD4 helper cells could control an infection. Only a vaccine that could increase CTL responsiveness could reduce viral set point with observed replication rates.
 - A CD4+ T-cell response without maintained CTL response was deleterious in this model.

Keywords review, epitope processing, supertype, computational epitope prediction, HIV exposed persistently seronegative (HEPS), supervised treatment interruptions (STI), immunodominance

References Newman *et al.* 2002

- This extensive review covers many aspects of T-cell immunity and natural HIV infections, and considers how this knowledge might be applied to a polyepitope vaccine approach. Strategies concerning ways to avoid the creation of junctional epitopes and use of linkers to enhance processing of such constructs are discussed.

- The C-terminal flanking residue (C1) was found to be associated with immunodominance of epitopes, such that R or K (positive charge) > N or Q (amide) > C, G, A, T, S (small) > F, W, Y (aromatic) > I, L, M, V (aliphatic) > D (negative). As this position is outside and proximal to the epitope, processing and cleavage is the likely reason for this observation.

- Changing the C1 residue from F to K for an HLA-A2 presented epitope from HBV resulted in a change from the epitope being non-immunogenic to strongly immunogenic.

- The frequency of HIV-1 specific T-cell responses was characterized in an Elispot IFN-gamma assay, using 507 overlapping peptides based on the B clade consensus sequence spanning all HIV-1 clade B proteins against PBMC from 57 HIV-1 infected patients at various disease and treatment stages. 63% of the peptides were recognized (range of 1-42 per subject, median=14). More variable peptides were targeted less frequently.
- Autologous virus sequences from six patients in acute infection spanning of HIV-1 p24, Tat and Vpr were used to scan for missed responses due to viral variation when using the consensus for peptides. 12/42 (29%) responses to these peptides were detected only with autologous peptides, and often these autologous responses were immunodominant. Responses were also generally higher using autologous peptides.
- A longitudinal analysis (5 yrs) of the T-cell responses in 5 patients showed that the autologous sequence detected stronger T-cell reconstitution than the HIV-1 clade B consensus sequence.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** chimpanzee**Keywords** review**References** Balla-Jhaghoorsingh *et al.* 2003

- This paper reviews HIV-1-specific cell-mediated immune responses in chimpanzees and discusses mechanisms that might control HIV-1 pathogenesis in chimpanzees. During the first decade of the HIV epidemic, more than 200 chimpanzees were experimentally infected with HIV. Among these only one case of declining CD4+ cells has been reported, all others have remained asymptomatic with no loss of immune function, some after 20 years of infection. In contrast to infected humans which have a skewed Th2 response, chimpanzees maintain balanced Th responses and are likely to support a fully mature CD8+ T-cell response.
- Specific HIV epitopes recognized by chimpanzees have been mapped and CTL detected, but overall the responses are at much lower levels than in humans, as viral loads are so low. Gag epitope responses are estimated to be 0.0095 to 0.0025% of the CD8+ T cell population in chimpanzee, and 1-2% in humans.
- The authors argue that the chimpanzee immune response may be effective at controlling virus because it focuses on conserved epitopes, and further speculate that long contact with lentiviruses may have put strong selection pressures on the chimpanzee MHC class I, narrowing the population's ability to respond to only the most conserved, and so useful, epitopes.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Fagard *et al.* 2003

- This study monitored the effects of repeated treatment interruptions (STI), in 2-week intervals, in 133 HIV-1 infected, HAART-treated patients. STIs were rarely able to control viremia without continued HAART, and increases in CD8+ T-cell response frequencies did not correlate with the level of control of viral replication. CD8+ T cell responses were measured by gamma IFN Elispot using between 2-32 different optimal HIV epitopes, selected to be appropriate for the patient's HLA type.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen****Species (MHC)** human**References****HXB2 Location** HIV-1**Author Location** HIV-1**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** responses in children**References** Feeney *et al.* 2003

- The magnitude and breadth of CD8+ T-cell responses in 18 pediatric (6-17 years) perinatally HIV-1 infected patients was determined using 1) overlapping peptides spanning all HIV-1 proteins and 2) peptides from all predefined appropriately class I HLA-restricted HIV-1 epitopes.
- Perinatally infected children's CD8+ T-cell responses were comparable in magnitude and breadth to adult responses. Many reactive peptides did not overlap with a previously characterized optimal epitope.
- On average 20% of all known pre-defined optimal epitopes presented by appropriate HLAs were recognized in these children. In two patients, autologous sequences spanning unrecognized potential epitopes usually corresponded to the reactive form of the epitope, so epitope variation alone did not account for unrecognized epitopes.
- Children with detectable viremia showed a broader and greater CTL responses than HAART responsive children with undetectable viremia.

- There are a number of factors that combined make HIV-infected cells resistant to CTLs. HLA-associations with disease progression are reviewed. Nef down-regulation of HLA class I A and B molecules is one important mechanism of HIV immune evasion. Rev allows late viral proteins to be expressed, enabling CTL specific for epitopes in these proteins to recognize infected cells. It is suggested that blocking the activity of Nef and Rev would reduce production of viral variants and enhance the ability of CTLs to combat HIV.

HXB2 Location HIV-1**Author Location** (SIV)**Epitope****Immunogen** SIV infection**Species (MHC)** macaque**Keywords** escape, reversion, viral fitness**References** Friedrich *et al.* 2004

- SIV CTL escape variants revert to wild-type epitopes after transmission to new hosts with disparate MHC class I alleles. Thus mutations in CTL epitopes may have moderate to severe negative effects on viral replicative fitness although some escape variants are shown to accumulate substitutions in flanking regions of the epitope that help compensate for fitness loss.

Vector/Type: canarypox prime with recombinant protein boost *Strain:* B clade SF2
HIV component: Env, Gag, Protease

Species (MHC) human
Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ
Keywords assay standardization/improvement
References Russell *et al.* 2003

- IFN γ Elispot assay is shown to be a good initial screening method for measurement of CD8+ T-cell responses in both vaccination and natural HIV-1 infection. Responses were detected using peptides at low concentrations (1-2 μ g/mL) and an increase in detection of HIV-1 specific CD8+T-cells by using 15-mers rather than 20-mer peptides for cell activation was observed. More responses were detected using smaller pools (10 or 2 peptides) than larger pools (25 or 50 peptides), so smaller pools may be needed to detect low frequency responses. Responses to natural infection were more than a log higher than to the vaccine.

HXB2 Location HIV-1
Author Location
Epitope
Immunogen HIV-1 infection, SIV infection
Species (MHC) human, macaque
Keywords review, escape, reversion, viral fitness
References Smith 2004

- This paper reviews several studies which track HIV and SIV CTL escape mutations after transmission into a new host, and reversion rates and fitness costs of CTL escape. Some escape mutants have a cost to viral fitness. The author suggests that CTL based HIV-1 vaccine should therefore not only increase cellular responses against viral epitopes but also favor epitopes where escape mutations result in significant decrease in viral fitness.

HXB2 Location HIV-1

Epitope
Subtype B
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade *HIV component:* gp140, gp160 *Adjuvant:* reovirus alpha 1 protein

Species (MHC) mouse
Donor MHC H-2d
Assay type Cytokine production, Chromium-release assay
Keywords adjuvant comparison
References Wang *et al.* 2003

- M cells are found in the follicular-associated epithelium in mucosal inductive tissues, and reovirus are able to attach to these cells via the alpha 1 protein. Respiratory mucosal sites were targeted with a reovirus protein alpha 1 protein delivered with a DNA vaccine administered i.n. in BALB/c mice. The naked

gp160 DNA vaccine did not elicit CD8+ T cell responses, but when delivered with alpha 1 protein, CTL responses were observed in the lungs, spleens and lymph nodes. gp160 was shown to be most immunogenic compared to a cytoplasmic gp140 and secreted gp140. The vaccinated animals had reduced vaccinia virus when challenged with a vaccinia-env recombinant.

HXB2 Location HIV-1
Author Location Gag
Epitope
Immunogen vaccine
Vector/Type: DNA with CMV promotor, fowlpoxvirus *Strain:* SIV *HIV component:* Env, Gag, Pol, Rev, Tat, Vpu *Adjuvant:* IFN γ , CpG immunostimulatory sequence (ISS)

Species (MHC) macaque
Assay type proliferation, T-cell Elispot, Intracellular cytokine staining
Keywords adjuvant comparison, vaccine antigen design
References Dale *et al.* 2004

- Macaques immunized with DNA and fowlpox vaccines showed high levels of CD4 and CD8 T-cell immune responses to Gag. Single DNA priming vaccination or coexpressed IFN-gamma with the fowlpox virus boost were shown to be less immunogenic and less protective than sequential DNA and fowlpox virus vaccination. Partial protective immunity was observed following a high dose, virulent SHIV challenge, for the DNA fowlpox prime boost, as well as the DNA vaccination alone, even though standard assays failed to detect a strong immune response with DNA alone.

HXB2 Location HIV-1
Author Location (IIIB, Thai B', Chinese CB)
Epitope
Subtype B, C
Immunogen HIV-1 infection
Species (MHC) human
Country China.
Assay type Intracellular cytokine staining, Chromium-release assay
Keywords subtype comparisons, characterizing CD8+ T cells
References François-Bongarcon *et al.* 2004

- The ability of circulating T-cells from 7 North American and 4 Chinese HIV+ donors to produce IFN-gamma and/or lyse autologous primary cells infected with HIVIIIB, B' (Thai B) or C/B recombinant form was tested. The results showed cross-clade CD8 T-cell responses to the Chinese viruses among North American donors and to HIVIIIB in Chinese donors, suggesting that many of the T-cell responses to clade B virus epitopes are conserved across clades. Lysis of cells by N. American donor CD8+ T cells infected with IIIB or a Thai B' strain were comparable, while lysis infected with the Chinese BC recombinant was somewhat reduced, although the reduction was not statistically significant.

HXB2 Location HIV-1

Epitope
Immunogen HIV-1 infection
Species (MHC) human
Country Canada.
Assay type Cytokine production, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords TCR usage, memory cells, characterizing CD8+ T cells, immune dysfunction
References Gamberg *et al.* 2004b

- A relationship was found between the proportion of HIV-specific CTLs expressing CD28 and CD4+ T-cell counts, viral load and disease progression. This association cannot be linked to disease related degeneration of CD8+CD28- T-cells in terms of their TCRbetaV family repertoire diversity or ability to produce cytokines. This suggests that effective immune responses contain CD8+CD28+ T-cell populations that shift to CD8+CD28- in ineffective responses.

Author Location

Epitope
Immunogen
Species (MHC)
Keywords review, epitope processing, vaccine-specific epitope characteristics, rate of progression, immunodominance, escape, acute/early infection, early-expressed proteins, TCR usage, reversion, viral fitness
References Goulder & Watkins 2004

- CTLs have a central role in the control of HIV infection. Emergence of escape variants to CTLs is one of the major obstacles to vaccine development. Factors that should be considered for the development of an HIV vaccine are CTLs that are specific for epitopes recognized during the acute phase of infection, CTLs that are able to efficiently control viral replication, and epitopes from regions of the viral genome that are highly conserved or where variation results in loss of viral fitness.

HXB2 Location HIV-1

Author Location

Epitope
Immunogen HIV-1 exposed seronegative
Species (MHC) human
Country Kenya.
Assay type Chromium-release assay
Keywords HIV exposed persistently seronegative (HEPS), characterizing CD8+ T cells
References Kaul *et al.* 2004

- HIV-1 specific CTL responses found in HIV exposed persistently seronegative Kenyan female sex workers were shown to be associated with age and recent HIV-1 exposure, but not with protection against HIV-1 infection. The authors note that CTL may be the result of a non-productive HIV infection, but not mediate protection; alternatively, the low incidence, possibly due to behavioral interventions, may not give adequate sampling to detect the response.

HXB2 Location HIV-1

Author Location

Epitope

Immunogen HIV-1 infection
Species (MHC) human
Country France.
Keywords HAART, ART, characterizing CD8+ T cells, immune dysfunction
References Kryworuchko *et al.* 2004

- A subset of HIV-1 infected untreated patients had CD8+ T-cells that were unable to respond to IL-2 by activating STAT5a and b proteins. This was correlated with an impaired activation of the upstream kinase Jak-3. 6 months of HAART was shown to restore Jak/STAT signalling in those patients and their CD8+ T-cell response to IL-2. This suggests another mechanism for immune dysfunction in HIV infected patients.

HXB2 Location HIV-1

Author Location

Epitope
Subtype A, B, C, D, F, G, U
Immunogen computer prediction
Species (MHC) human
Keywords vaccine antigen design
References Maksyutov *et al.* 2004

- Every HIV protein was shown to have some regions that were highly similar to the regions of human proteins. Most of those regions contained T-cell or/and B-cell epitopes. The epitopes shared by HIV and its host may have immunopathogenic potential through stimulating autoimmunity and should possibly be excluded from HIV vaccines. All HIV proteins from the sequence of BH10 were compared to human proteins, as well as many HIV-1 V3 variants.

HXB2 Location HIV-1

Author Location (ELI)

Epitope
Immunogen in vitro stimulation or selection
Species (MHC) human
Assay type Cytokine production, proliferation, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords class I down-regulation by Nef, rate of progression, dendritic cells, immune dysfunction
References Quaranta *et al.* 2004

- Exogenous Nef protein activates immature DCs and inhibits the capacity of DCs to prime CD8+ T-cell responses by down-regulating their proliferation and function capacities. Nef induces CD8+ T-cell apoptosis by up-regulating TNF-alpha and FasL production by DCs, while DCs are protected from apoptosis themselves. These mechanisms, as well as by down regulation of the HLA class I proteins, can contribute to HIV-triggered immune dysfunction.

Epitope

Immunogen

Species (MHC) human

Keywords review, epitope processing, rate of progression, escape, early-expressed proteins, vaccine antigen design

References Yang 2004

- This review considers CTL biology in HIV infection in the context of vaccine design principles. Since HIV-1 infection damages immunity through depletion of CD4+ T-cells, which in turn results in diminished capacity of the immune system to produce new and functional CTL responses, maximizing the breadth of CTL responses might not be enough for an HIV-1 vaccine. CTLs recognizing early proteins might be more prone to epitope escape mutation, while those recognizing more conserved structural proteins might be more likely to persist, so focusing on more conserved proteins those might be a good strategy to produce an attenuating vaccine.
- Original antigenic sin is discussed, the initial responses to an antigen that persist even after escape occurs, blunting the later immune response. If the goal is to prevent disease, focusing on conserved late expressed proteins might be the best target, where the fitness cost is greatest for escape; if the goal is to prevent infection, focusing the vaccine on the more variable early expressed proteins that elicit the first responses, Tat and Nef, might be best.

Assay type proliferation, Intracellular cytokine staining

Keywords HAART, ART

References López *et al.* 2004

- A clinical trial compared chronically HIV-1 infected patients who had replaced HAART with didanosine (ddI) and hydroxyurea (HU) were followed for 12 months to an untreated HIV+ group and a group that continued on HAART.

- Approximately 20% of the patients treated with ddI-HU had detectable CD4+ T-cell proliferative responses to Gag and Env in contrast to drug-naïve and HAART treated HIV-infected patients, who had few or no responses.
- HIV-specific CD8+ T-cell responses were higher in ddI-HU treated patients than HAART treated patients, even in individuals that maintained undetectable viral loads.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen****Species (MHC)****Keywords** review, adjuvant comparison**References** Mitchison & Sattentau 2005

- Review summarizes mechanisms of immunoregulation relevant for new vaccine development, with a brief summary of adjuvant triggering innate immunity through Toll-like receptors (TLRs), Nod molecules, and other activators. DNA encoded adjuvants that have been tested in DNA vaccines are summarized. The balance between Th1 (CTL activating) and Th2 (B cell activating) responses is discussed, and it is noted that BALB/c mice are predominately Th2 responders, C57BL Th1.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** escape**References** Piontkivska & Hughes 2006

- Greatest amino acid diversity is found in sites in the HIV genome that are spanned by antibody epitopes. Sites spanned by CTL epitopes, but not by antibody epitopes, showed reduced amino acid diversity, even in comparison to non-epitope sites. However, mutations within CTL epitopes were more likely to be convergent than mutations within antibody epitopes. These patterns were consistent both in Gag and in Env.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** CD8 T-cell Elispot - IFN γ , CD8 T-cell RecycleSpot - IFN γ **Keywords** assay standardization/improvement, optimal epitope**References** Bihl *et al.* 2005

- This study describes a novel approach to achieve maximal information from an extensive set of antigens (HIV, EBV, CMV, HCV, and HBV) to determine the magnitude of T-cell responses while requiring minimal cell numbers. Large sets of peptides based on optimally defined epitopes from each pathogen are used. It is shown that, when compared to ex vivo cell preparations, antigen-unspecific in vitro T-cell expansion maintains the breadth of detectable T-cell responses. Also, harvesting cells from negative ELISpot wells for re-use (RecycleSpot) maximizes the use of available cells.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** genital and mucosal immunity, characterizing CD8+ T cells**References** Ibarrondo *et al.* 2005

- The breadth and magnitude of HIV-1-specific CTL responses in blood and sigmoid colon mucosa were assessed in 16 patients. The magnitude of pool-specific CTL responses in blood and mucosa was correlated within each individual and across all individuals. CTL targeting was also found to correlate between these 2 compartments, with Nef being the most highly targeted region, followed by Gag. No correlation between the magnitude and breadth of CTL responses and viremia and blood CD4 levels was found in any of the compartments. Concordant peptide pool responses were found in the blood and mucosa 85%; pools that differed were near the threshold of detection.
- This study suggests that HIV-1-specific CTL responses in the blood mirror those in the mucosa during chronic infection.

HXB2 Location HIV-1**Author Location** (Z321)**Epitope****Subtype** A, B, C, G**Immunogen** vaccine**Vector/Type:** gp120 depleted whole killed virus **Strain:** AG recombinant HZ321 **HIV component:** gp120 depleted virus **Adjuvant:** CpG immunostimulatory sequence (ISS)**Species (MHC)** mouse**Assay type** Cytokine production, proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay**Keywords** subtype comparisons, genital and mucosal immunity, adjuvant comparison, vaccine antigen design, characterizing CD8+ T cells**References** Jiang *et al.* 2005

- Mice were given intranasal immunization with inactivated gp120-depleted HIV-1 antigen plus a CpG ODN adjuvant and examined for local immune responses in the genital tract. Mice immunized with HIV Ag plus CpG produced significantly higher levels of IFN-gamma and beta-chemokines than mice immunized with Ag alone, and their lymphocytes showed significant HIV-specific proliferation. CD8 T-cells were increased in the genital tracts of mice immunized with HIV Ag plus CpG.
- The vaccine antigen Z321 is clade G in Gag. Cross-clade protection against an intravaginal IVAG challenge was observed for clades A, C, and G, but not clade B.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** computer prediction**Species (MHC)** human**Assay type** Other**Keywords** assay standardization/improvement, computational epitope prediction

Part III

HIV Helper/CD4+ T-Cell Epitopes

T-Helper CD4+

III-A

Summary

This part includes tables, maps, and associated references of HIV-specific helper T-cell (Th) epitopes arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, as each entry represents a single publication in this part of the database. HLA specificity is usually not determined for Th epitopes. For more recent updates, epitope sequence alignments, and useful search capabilities, please see our web site: <http://www.hiv.lanl.gov/content/immunology>. Helper T-cell responses to proteins with no defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T cells and helper T cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

III-A-1 Epitope tables

Each T-helper epitope has a multi-part basic entry:

HXB2 location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: <http://www.hiv.lanl.gov/>

[content/hiv-db/LOCATE/locate.html](http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html).

Author location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Epitope name: If the epitope has a name attributed by the publication, it is recorded here, e.g. "SL9".

Subtype: The subtype under study, generally not specified for B subtype.

Immunogen: The antigenic stimulus of the Th response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted separately, and additional information about the vaccine antigen is provided as available.

Species (MHC): The species responding and MHC or HLA specificity of the epitope.

Donor MHC: The HLA genotype of the individual that responded to the epitope.

Country: The country where the samples were obtained—generally not specified if the study was conducted in the United States.

Assay type: Assay used to characterize the response.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the printed version to help identify entries of particular interest.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Following the entry for a given Th epitope brief comments explain the context in which the epitope was studied and what was learned about the epitope in a given study.

III-A-2 HIV protein epitope maps

All HIV Th epitopes mapped to within a region of 18 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of Th epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

III-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the Th epitope search tool at <http://www.hiv.lanl.gov/content/immunology>. The master alignment files from which the epitope alignments were created are available at our web site at http://www.hiv.lanl.gov/content/hiv-db/ALIGN_CURRENT/ALIGN-INDEX.html.

III-B

HIV Helper/CD4+ T-Cell Epitope Tables

All HIV Helper/CD4+ T-Cell epitopes are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location within the protein, and finally by HLA presenting molecule. Epitopes for which the HXB2 location is unknown appear at the end of the listing of the protein in which they are located.

III-B-1 Gag p17 Helper/CD4+ T-cell epitopes

HXB2 Location p17 (1–18)
Author Location p17 (1–18 B consensus)
Epitope MGARASVLSGGELDRWEK
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country United States.
Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This epitope was recognized by 14% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

HXB2 Location p17 (7–17)
Author Location Gag (7–17)

References Amara *et al.* 2005
- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
 - 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
 - LDRWEKIRLRP was not reported for human infections.
 - The response elicited to the B clade epitope LDRWEKIRLRP does not cross-react with the CRF02_AG form LDsWEKIRLRP. Other clades most commonly carry an A in this position, and C clade consensus carries K (LD[r/ak]WEKIRLRP).

Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding

Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 14% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Keywords HAART, ART, Th1, Th2

References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V β usage, and some clones had a Th1 cytokine secretion profile

(high IFN γ production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.

- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 6 recognized this peptide sequence restricted by DRB1*13. This clone had a high SI (27.1 to p55, 90.6 to peptide) secreted IFN γ , indicative of a Th1 response, as well as TNF α . Clone 6 was highly cytotoxic, through a perforin-mediated pathway.

Keywords supertype, rate of progression

References Boaz *et al.* 2003

- Proliferative and cytokine (IFN γ and IL-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNP (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+ T cell declined to <500 after 15 years. Patients were treatment-naive.
- Gag-specific CD4+ T cells in LTNP showed increased numbers of IFN γ and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFN γ , levels were correlated with proliferation.
- Gag 1 was 1 of 3 peptides that had a negative correlation between absolute number of responding cells and viral load.

Epitope QGQMVHQAI SPRTL N

Epitope name Gag 171

Immunogen vaccine

Vector/Type: DNA with CMV promotor, peptide
Adjuvant: Complete Freund's Adjuvant (CFA)

Species (MHC) mouse (I-Ab and HLA-DR)

Donor MHC H-2b

Keywords vaccine-specific epitope characteristics, immunodominance

References Livingston *et al.* 2002

- 4 Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented by murine class II molecule I-Ab, enabling testing of vaccine strategies in H-2b mice.
- Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promoter were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all 4 peptides, using either DNA or protein for the vaccination.

Epitope QMVHQAISPRTLNAWVKV

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Country United States.

Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding

Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

Immunogen vaccine

Vector/Type: Listeria monocytogenes

Strain: B clade SF2 *HIV component:* p24

Gag

Species (MHC) mouse (H-2^d, H-2^b)

Keywords immunodominance, Th1

References Mata & Paterson 1999

- *Listeria monocytogenes* is an intracellular bacterium that lives in the cytoplasm and generates a cell-mediated immune response.
- *L. monocytogenes* vaccine expressing HIV-1 p24 protein (Lm-Gag) was used to stimulate gag-specific CD4+ T cell proliferative responses in BALB/c(H-2d) and C57BL/6(H-2b) mice.
- 2/3 reactive p24 peptides (out of 22 overlapping peptides that span p24) were recognized by both murine strains; this epitope is immunodominant in C57BL/6 mice and also can stimulate a BALB/c response.
- The proliferative response is due to CD4+ IFN γ -producing cells, a Th1 response.

HXB2 Location p24 (11–30)

Epitope KVVEEKAFSPEVIPM

Epitope name G040

Immunogen HIV-1 infection

Species (MHC) human

Country Canada.

Assay type proliferation, Flow cytometric T-cell cytokine assay

Keywords memory cells

References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- γ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- γ only-producing cells are short lived.

Assay type proliferation, T-cell Elispot, Intracellular cytokine staining

Keywords HAART, ART

References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells μ l was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.
- The TCR that recognized this epitope used V β 2.

HXB2 Location p24 (28–38)

Immunogen HIV-1 infection

Species (MHC) human (DR1)

Assay type proliferation, Tetramer binding, CD4 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords binding affinity, escape, optimal epitope

References Norris *et al.* 2006

- This study demonstrates a mechanism of antagonism by a peptide shorter than the minimum length epitope for an HIV p24-specific CD4+ T-cell clone.
- Truncation of the peptide from PEVIPMFSALSEGATP (PP16) to PEVIPMFSALSEG (PG13) rendered the peptide unable to elicit proliferation, IFN γ release, or serine esterase release, even though it retained strong binding to MHC.
- Although both the original and truncated peptide-MHC complexes bound TCR clone, PEVIPMFSALSEGATP-DR1 tetramer bound with higher avidity than PEVIPMFSALSEG-DR1 tetramer, suggesting that tighter association of the peptide-MHC complex with the TCR is associated with the extent of T-cell activation.
- G/P substitution in the original full-length peptide (PEVIPMFSALSE[g/p]ATP) led to complete loss of agonist activity, and PEVIPMFSALSEpATP became antagonistic.

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
 - CD4 T-cell epitope previously reported for human is ETINEEAAEWDRVHPC. HLA restriction: DRB1*03, DRB1*0101.
 - The response elicited to the B clade epitope INEEAAEWDRV does not cross-react with the CRF02_AG form INdEAAEWDRV. The epitope is however conserved in CRF01_AE and CRF02_AG consensus sequences. Other clades tend to have L in the last position (INEEAAEWDR[v/l]).

- References** Lotti *et al.* 2002
- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
 - For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V β usage, and some clones had a Th1 cytokine secretion profile (high IFN γ production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
 - 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 12 recognized this peptide sequence restricted by DRB1*03 using TCR V β 22. This clone had a SI of 12.4 to p55, 49.6 to peptide, secreted low levels of IFN γ , indicative of a Th1 response. Clone 12 had cytotoxic activity, mediated through both a perforin and a Fas-based pathway.

• HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. Two clones recognized this epitope.

References Norris *et al.* 2004

- 5 CD4-T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T-cell proliferation. Cross-clade recognition was found to be impaired in 17/32 variants tested.
- Patient AC-01, who was infected with HIV-1 in 1997, recognized this epitope and epitope EPRGSIDIAGT during acute infection, and 19 months post-initiation of ART therapy started during primary infection.
- This was the most variable of the 5 epitopes studied. REPRGS-DIAGT natural variants were tested and did not usually diminish the response by much (rDprgsdiagt, clades B and C; and rDprgsdiagA and rGprgsdiagt, both clade C), although the CRF01_AE variant reprgAdiagt abrogated the response.

- Minimum length peptides for the epitopes studies were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T cell responses. This peptide was the exception, as REPRGSDIAGTT, which is elongated by 2 amino acids compared to the minimum epitope, elicited a stronger proliferative immune response as well as IFN γ secretion and cytolysis.

Epitope EIYKRWIIILG

Immunogen HIV-1 infection

Species (MHC) human (DRB1*1301, DRB1*1302)

Keywords binding affinity, HAART, ART, Th1

References Blankson & Siliciano 2001; Malhotra *et al.* 2001

- The DRB1*13-DQB1*06 haplotype is associated with maintained viral suppression after HAART – 7/7 early-treated DRB1*13-DQB1*06 positive people, but only 3/14 (21%) of those who did not have DRB1*13-DQB1*06, maintained viral suppression for 18 months.
- PBMC from individuals with the haplotype DRB1*13-DQB1*06 displayed increased IFN γ secretion and stronger proliferative responses against p24 80 weeks post treatment.
- DRB1*13-DQB1*06 was also found to be enriched among long-term non-progressors (it was in 9/18 versus, versus 21% of the general population)
- The truncated peptide that gave the optimal proliferative response for a Th1 phenotype clone was this nine-mer.
- This region, shared by 2 overlapping peptides, was the reactive region for clones from two DRB1*13 patients, one carried DRB1*1301 and one DRB1*1302.
- Two distinct epitopes were defined in the peptide region spanning 251 to 270, and this 20-mer bound with very high affinity to DRB1*1302 – DRB1*1301 and DRB1*1302 would be expected to have very similar binding properties.

Epitope IYKRWIIILGLNKIVRMYSP

Epitope name P27

Immunogen *in vitro* stimulation or selection

Species (MHC) human

Donor MHC DR4, DR7, DQ2, DQ3

Keywords immunodominance, Th1, Th2, TCR usage

References Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 74 recognized two peptides including this one with a Th1 response using TCR V β 13 (13s1); it required 200 ng/ml (100 nM) and 1 μ g/ml (0.5 μ M) for stimulation by peptides 480-500 and 261-280, respectively. Sequencing TCR V β regions of colonies from clone 74 suggested this was a clonal population.

Epitope KRWIIILGLNKIVRMY

Epitope name Gag3

Immunogen HIV-1 infection

Species (MHC) human (DR supermotif)

Country United Kingdom.

Assay type proliferation, intracellular cytokine staining

Keywords supertype, rate of progression

References Boaz *et al.* 2003

- Proliferative and cytokine (IFN γ and IL-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNP (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+

T cell declined to <500 after 15 years. Patients were treatment-naïve.

- Gag-specific CD4+ T cells in LTNP showed increased numbers of IFN gamma and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFNgamma, levels were correlated with proliferation.

Epitope WIILGLNKIVR

Epitope name Gag 14.2

Immunogen vaccine

Vector/Type: DNA prime with modified vac-

cinia Ankara (MVA) boost *Strain:* B clade

HIV component: Env, Gag, Protease, Rev, RT, Tat, Vpu

Species (MHC) macaque

Assay type T-cell Elispot, Intracellular cytokine staining

Keywords subtype comparisons, variant cross-recognition or cross-neutralization, memory cells

References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- The similar reported human epitope in this case is KRWILGLNKIVRMY, which is presented by 13 HLA-DR alleles.

- The response elicited to the B clade epitope WIILGLNKIVR cross-reacts with the CRF02_AG form WIVLGLNKIVR. WIILGLNKIVR is mostly conserved across other clades.

Immunogen vaccine

Vector/Type: Listeria monocytogenes

Strain: B clade SF2 *HIV component:* p24 Gag

Species (MHC) mouse (H-2^d, H-2^b)

Keywords Th1

References Mata & Paterson 1999

- *Listeria monocytogenes* is an intracellular bacterium that lives in the cytoplasm and generates a cell-mediated immune response.
- *L. monocytogenes* vaccine expressing HIV-1 p24 protein (Lm-Gag) was used to stimulate gag specific CD4+ T cell proliferative responses in BALB/c(H-2d) and C57BL/6(H-2b) mice.
- 2/3 reactive p24 peptides (out of 22 overlapping peptides that span p24) were recognized by both murine strains; this peptide stimulated a response in both BALB/c and C57BL/6 mice.
- The proliferative response is due to CD4+ IFN γ -producing cells, a Th1 response.

HXB2 Location p24 (161–180)

Author Location p24 (293–312 HXB2)

Epitope FRDYVDRFYKTLRAEQASQD

Subtype B

Immunogen vaccine

Vector/Type: Listeria monocytogenes

Strain: B clade HXB2 *HIV component:* Gag

Species (MHC) mouse (H-2^d, H-2^b)

References Mata & Paterson 1999

- BALB/c and C57BL/6 mice were immunized with *Listeria monocytogenes* (Lm-Gag) expressing HIV-1 HXB2 Gag.
- *L. monocytogenes* is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm; secreted *L. monocytogenes* antigens are processed and presented by both class I and class II pathways.
- The class II Th response was probed using 20mer peptides that overlapped by 10; the peptides VHQAISPRTLNAWVKVVEEK and FRDYVDRFYKTLRAEQASQD were recognized in H-2^b and H-2^d mice.

HXB2 Location p24 (163–175)

Author Location Gag (295–307)

Epitope DYVDRFYKTLRAE

Immunogen HIV-1 infection

Species (MHC) human (DR0101)

Assay type Cytokine production, proliferation, Tetramer binding, CD4 T-cell Elispot - IFN γ

Keywords HAART, ART, supervised treatment interruptions (STI)

References Iyasere *et al.* 2003

- Fifteen patients receiving HAART with strong CD4+ proliferative responses to HIV antigens while on therapy were examined, to see the effects of viremia on these responses during treatment interruptions. Increased viremia occurred in 12/15 patients during at least one treatment interruption. Anti-HIV proliferative responses were inhibited during viremia, but IFN γ production to Gag, Pol, and Nef peptide pools were maintained.

- IL-2 production diminished during viremia, and exogenous IL-2 revived *in vitro* proliferation of HIV-specific T-cells to Gag or Pol DR0101 epitopes in a tetramer, as well as Gag-specific total CD4 T-cell responses.

Country United States.

Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding

Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection

References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The peptides that were recognized by the most people were able to bind broadly to multiple HLA-DR molecules. This peptide showed very high cross-reactive binding capacity, and bound to 8/8 tested common HLA-DR molecules.
- This peptide was the most often recognized, with a responses by 58% of the study group.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

Assay type proliferation, Flow cytometric T-cell cytokine assay

Keywords memory cells

References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- γ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- γ only-producing cells are short lived.

Keywords HAART, ART, Th1, Th2, TCR usage

References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and $V\beta$ usage, and some clones had a Th1 cytokine secretion profile (high IFN γ production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 26 recognized this peptide sequence restricted by DRB1*03. This clone had a SI of 4.1 to p55, 5.3 to peptide, secreted high levels of IFN γ , indicative of a Th1 response, but also IL-4 and IL-5. Clone 26 had no cytotoxic activity.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for HLA driven HIV diversity as has been claimed in Moore *et al.* (Science 2002).
- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell responses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against

p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells/ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.
- The two Th clones that recognized this epitope utilized TCR V β 2 and B β 8.1.

Epitope name Gag 24.3

Immunogen vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost **Strain:** B clade
HIV component: Env, Gag, Protease, Rev, RT, Tat, Vpu

Species (MHC) macaque

Assay type T-cell Elispot, Intracellular cytokine staining

Keywords subtype comparisons, memory cells

References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. TTTTPPQKQEPI was not reported for human infections.
- The response elicited to the B clade epitope TTTTPPQKQEPI does not cross-react with the CRF02_AG form ipssP-KQEPr. The epitope is highly variable across other clades.

Epitope DKELYPLTSLRSLFGNDPSSQ
Immunogen *in vitro* stimulation or selection
Species (MHC) human
Donor MHC DR4, DR7, DQ2, DQ3
Keywords immunodominance, Th1, Th2, TCR usage
References Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 74 recognized two peptides, including this one, with a Th1 response using TCR V β 13 (13s1); it required 200 ng/ml (100 nM) and 1 μ g/ml (0.5 μ M) for stimulation by peptides 480–500 and 261–280, respectively. Sequencing TCR V β regions of colonies from clone 74 suggested this was a clonal population. Clone 74 was activated in response to vaccinia virus Gag-infected B-LCL, so it could recognize naturally processed epitopes.

III-B-4 Gag Helper/CD4+ T-cell epitopes

HXB2 Location Gag
Author Location p24 (IIIB)
Epitope
Immunogen *in vitro* stimulation or selection
Species (MHC) human (A*0201)
Keywords dendritic cells
References Engelmayer *et al.* 2001

- Recombinant canarypox virus vector containing HIV-1 sequences, upon infection of mature dendritic cells, can trigger specific lysis *in vitro* by T-cells from HIV-1 infected individuals at levels comparable to the response seen to HIV carried in vaccinia vectors.
- Recombinant canarypox virus vector containing HIV-1 sequences can also stimulate HIV-specific IFN γ CD4+ helper T cell responses to Gag from bulk or purified CD4+ T cells.

HXB2 Location Gag
Author Location p55
Epitope
Immunogen HIV-1 infection
Species (MHC) human (DRB1*13, DRB1*03)
Donor MHC A29, A30, B8, B35, DRB1*03, DRB1*13
Keywords HAART, ART, Th1, Th2, TCR usage
References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and V β usage. Two clones were DRB1*13 restricted and used TCR V β 17+19 or 5.1. Three clones were DRB1*03 restricted and used TCR V β 22. Some clones had a Th1 cytokine secretion profile (high IFN γ production) while some had a Th2 profile (high IL-4 and IL-5 production).

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Gag
Species (MHC) mouse (H-2^d)
References Qiu *et al.* 2000

- Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein.
- Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors.
- IFN γ levels were increased compared to an undetectable IL-4 response.
- CTL levels were also increased in secreted Gag expression vaccination studies.

HXB2 Location Gag
Author Location Gag

Epitope
Immunogen vaccine
Vector/Type: DNA, DNA with protein boost
Strain: B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18

Species (MHC) mouse (H-2^d)
Keywords Th1, Th2
References Billaut-Mulot *et al.* 2001

- DNA vaccinated BALB/c mice primed and boosted with a multiepitopic vaccine with IL18 showed lymphoproliferative responses 7 weeks post immunization.
- Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime + DNA boost was more effective than DNA prime + protein boost.
- Immunization with either the multiepitopic DNA or with the mixed DNA vaccine resulted in Th1 cytokines production (IL-2 and IFN γ) in spleen cell cultures stimulated by Tat and Gag, while Th2 cytokines IL-4 and IL-10 production was not detectable.
- Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: coxsackievirus *HIV component:* p24 Gag

Species (MHC) mouse (H-2^d)
References Halim *et al.* 2000

- An avirulent rec coxsackievirus (CB4-P) construct was generated that can express p24 Gag sequences – CB4-P is attenuated even in immunodeficient mice and T help responses can be elicited from peptides embedded in a surface loop of the VP1 capsid.
- This paper describes the vaccine strategy and generation of constructs, and employs amino-terminal fusion of Gag sequences to the viral polyprotein with subsequent cleavage to elicit CTL responses via MHC class I presentation in BALB/c mice.

- *L. monocytogenes* is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm; secreted *L. monocytogenes* antigens are processed and presented by both class I and class II pathways.
- This article is a review of *L. monocytogenes* biology and its potential as a vaccine vector for HIV, comparing to other vector systems, and discussing CD4+ Th1 T-cell-mediated Gag specific immunological protection in mice and the Gag CTL response.

HXB2 Location Gag
Author Location p24
Epitope
Immunogen HIV-1 infection, vaccine
Vector/Type: virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag

Species (MHC) human
References Kelleher *et al.* 1998b

- Immunization of HIV+ people with a p24-VLP virus-like particle did not significantly impact CD4+ lymphocyte count, viral load, or p24 antibody titre.
- Immunization with p24-VLP showed a modest, short-lived increased proliferative response to p24.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection, vaccine*Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)), protein *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus, p24 Gag**Species (MHC)** human**References** Maino *et al.* 2000

- 18 HIV-1-seropositive patients with a low frequency or no detectable CD4+ T cell response to HIV-1 antigen received an HIV-1 immunogen consisting of 10 units of native p24 and 100 ug of HZ321, a gp120 depleted antigen.
- Using flow-cytometric methods, HIV-1 specific CD4+ T cells were shown to increase in response to immunization – in many patients significant enhancement was observed after a single immunization.
- The frequency of CD4+ T cells expressing cytokines in response to antigen by FACS was correlated with a lymphoproliferation assay.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Ruiz *et al.* 2000

- Structured treatment interruption in chronically infected patients allowed recovery of p24 Th proliferative responses after HAART therapy discontinuation in 2/12 patients.
- The Th response to p24 was identified during peak viremia in one patient, while in the second it was noted when viremia was controlled after restarting antiviral therapy.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Lori *et al.* 1999

- Ten patients with acute, pre-seroconversion HIV-1 infections were treated with didanosine, indinavir and hydroxyurea – this treatment is associated with normalization of immune parameters.
- A vigorous HIV-specific Th response (stimulation index greater than 8) was observed in 7/8 patients treated before complete WB seroconversion, but in only 1/5 controls treated after seroconversion.
- Vigorous Th responses were detected as early as 34 days after treatment begin.
- Patients treated prior to seroconversion had no loss of naive CD4 T lymphocytes, recovery of up to 35% of the naive CD8 cells in several weeks, and a reduced latent viral reservoir.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI), Th1**References** Haslett *et al.* 2000

- 11/22 adult patients on HAART showed strong CD4+ T-cell IFN γ producing Th1 responses to HIV p24.
- The magnitude of the Th1 response correlated with previous interruptions in HAART, suggesting the interruptions primed or boosted the response.
- In contrast, the magnitude of the CD8+ CTL response did not correlate with interruptions in therapy, although a greater breadth in response was associated with interruptions in HAART.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection, vaccine*Vector/Type:* virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag**Species (MHC)** human**References** Klein *et al.* 1997

- Immunization of HIV+ people with a HIV-1 p17/p24 Ty virus-like particle (p24-VLP) resulted in a marginal, short-lived increased proliferative response to p24 and p17 and a transient elevation in viral load.
- Two of four subjects that received 500 or 1000 ug of p24-VLP had an increase in gag-specific CTL.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** vaccine*Vector/Type:* gp120 depleted virus HZ321 (REMUNE(TM)) *Strain:* AG recombinant HZ321 *HIV component:* gp120 depleted virus**Species (MHC)** human**Keywords** subtype comparisons**References** Moss *et al.* 1998

- Immunization with gp120 depleted HZ321 virus (REMUNETM) triggered an increase in lymphocyte proliferative response to native p24, a clade B virus and clade E viral antigens – Z321 is clade A in env and clade G in gag. Moss *et al.* [1998]

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Rosenberg *et al.* 1999

- This paper reviews the role of T-cells in viral control and HIV disease outcome.
- Strong anti-p24 lymphoproliferative responses were found in seven persons who were treated with potent anti-viral therapy during acute HIV-1 infection syndrome.

- This suggests that Th cells are part of the normal response to HIV-1 infection, but their numbers are rapidly diminished by either being infected during the peak viremia or by activation-induced cell death – if peak viremia can be controlled, a robust anti-p24 Th response can be maintained.

HXB2 Location Gag

Author Location p24

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART

References Rosenberg & Walker 1998

- Strong Th responses have been found in rare individuals who effectively maintain low viral loads.
- If aggressive anti-retroviral therapy is given prior to sero-conversion, strong helper responses can be maintained.

HXB2 Location Gag

Author Location p17

Epitope

Immunogen vaccine

Vector/Type: protein *HIV component:* p17
Gag

Species (MHC) mouse

References Birk *et al.* 1998a

- Different p17 genes derived from the same quasispecies and expressed and purified in *E. coli* primed different Th 1 and Th 2 subsets in mice, depending on their H-2 type.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen HIV-1 infection

Species (MHC) human

References Schiller *et al.* 2000

- Study of parameters that might influence the performance or reproducibility of clinical Th proliferative assays.
- HIV-1 replication *in vitro* is unlikely to influence the assay.
- Gag proteins including p17 and possibly p7 as well as p24 perform better than p24 alone.
- Frozen samples can be used in T-proliferative assays, but with lower radiolabeled thymidine incorporation.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART

References Pitcher *et al.* 1999

- In contrast to earlier studies suggesting that HIV-1 specific Th responses were eliminated in the early stages of infection in most HIV+ individuals, this paper shows using flow cytometric detection of antigen-induced cytokines that Th-1 CD4+ memory gag-specific Th cells are detectable in most HIV+ subjects.
- Effective anti-viral therapy reduces the frequency of these cells, presumably due to reduced antigenic stimulus.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART

References Plana *et al.* 1998

- Patients from later stages of infection given HAART do not show restoration of HIV-1 specific Th proliferative responses.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART

References Kelleher *et al.* 1998a

- Env and gag Th epitopes were pooled and used to test Th proliferative responses after IL2 therapy – while IL2 therapy causes an increase in CD4+ lymphocyte count, it does not increase HIV-1 specific proliferative responses.

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART, supervised treatment interruptions (STI), kinetics, Th1

References Carcelain *et al.* 2001

- Repeated structured HAART therapy interruptions (STI) in 3 chronically HIV infected patients induced rapid but transient (< 3 weeks) HIV-1 specific CD4+ Th1 responses concurrently with viral rebound, as measured by proliferation assays and by IFN γ production by CD8-depleted PBMC.

- Kinetics suggest that viral replication leads to rapid destruction of the HIV-specific Th1 cell response.

- HIV-specific CD8+ T-cell responses were delayed relative to the Th1 responses and were not sustained.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART

References Blankson *et al.* 2001

- 5/10 chronically HIV infected patients with low CD4+ counts who received HAART therapy and experienced immune reconstitution displayed p24, p17 and p66 T-helper CD4 proliferative responses, in contrast to 0/8 chronically HIV infected patients with high CD4+ counts at the initiation of antiretroviral treatment.

- This surprising result could be due to the low CD4 nadir patients being more likely to have thymic regeneration or a peripheral expansion of T cells.

Immunogen HIV-1 infection

Species (MHC) human

Keywords HAART, ART, subtype comparisons, escape, acute/early infection

References Fidler *et al.* 2002

- 37/45 patients with primary HIV infection underwent a short course of antiretroviral therapy (SCART). 29/37 patients received triple ART therapy and eight patients received four ART drugs. Initiation of SCART was effective in controlling HIV replication by ten weeks in all patients and preserving CD4+ T cell responses for up to 64 weeks after therapy.
- No induction of drug escape mutations was observed, although two individuals had escape mutations in their infecting virus at baseline.
- 34 UK infected patients were clade B infected. 11/45 subjects had non-UK acquired HIV infection, 2 were clade A, 1 was A/E, 1 was C, 1 was "untypable", the rest were B.

- Recombinant HIV-1 derived gp120, p24, p66 and overlapping peptide pools spanning Tat and Nef were employed to measure CD4 T-cell frequencies in ELISPOT assays. The strongest preservation of T helper responses 12 weeks off SCART was seen for p24-specific CD4+ T-cell responses.

- 6/8 of the untreated individuals were tested for CD4+ T-cell responses. 1 had no detectable response. 1 had detectable responses to all HIV-1 proteins tested at baseline, but this narrowed to p24 and gp120, then became undetectable by 52 weeks. 3 had detectable and persistent responses, but only to p24.

- Post-therapy, the average spot forming cells for all proteins tested in 17/37 with 24 weeks of follow up had not declined, although the plasma viral RNA was increasing. SFU using p24 were measurable following SCART and preserved at levels comparable to baseline.

- Gag-specific CD4+ helper T-cell clones were derived from 1 LTNP (CTS-01) and 3 individuals given therapy during acute infection, 2 before (AC-01 and AC-36) and 1 after (AC-25) STI.
- The immunodominant response in LTNP CTS-01 was to peptide 9, and 9/10 clones derived from this patient reacted with it. Three, two, and one clones were obtained from the 3 patients given therapy. These 6 clones all reacted with different p24 peptides, and all had peptide induced proliferative responses, IFN γ production, and cytotoxic responses. The implications of cytotoxic responses in CD4+ T-helper cells are discussed.

HXB2 Location Gag

Author Location p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Palmer *et al.* 2002

- CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses.
- No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.

HXB2 Location Gag**Author Location** p24 (SF2)**Epitope****Subtype** B, G**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression, Th1, Th2**References** Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile.
- SF2 p24 20mer peptides overlapping by 10 were used to assess the response in the different groups. At least 1/10 and up to 7/10 nonprogressors had a proliferative response with every one of the 22 p24 overlapping peptides. All peptides produced an IL-2 (Th1) response in at least one of the 10 nonprogressors. IL-4 (Th2) responses were strong, but somewhat less comprehensive as 6/22 peptides elicited no IL-4 production, and fewer IL-4 responses were seen per peptide. In contrast, only 1/10 progressors had a clear proliferative and IL-2 response to 2/22 peptides, and neither one made an IL-4 response.
- The results taken together suggest that a balanced Th1/Th2 response to HIV is important for viral control in long-term non-progression.
- One immunologically discordant progressor became symptomatic while on the study. He showed a rapid decline in proliferative activity at that point, and a shift from a Th1 to a Th2 IL-4 producing response.

HXB2 Location Gag**Author Location** (BRU)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* inactivated HIV *Strain:* B clade BRU *HIV component:* virus *Adjuvant:* Complete Freund's Adjuvant (CFA)**Species (MHC)** mouse**References** Haas *et al.* 1991

- A 51 year old male, infected presumably in 1988, diagnosed seropositive in 1993, has remained asymptomatic and is a long term non-progressor. He had very low proviral copy number in his PBMCs with high levels of G-A hypermutation, resulting in multiple stop codons, and viral replication was not evident. He was heterozygous for the CCR5 delta 32 allele, and has undergone a variety of treatments through the years. T cell responses in this patient and in two additional LTNPs were described, and this patient had particularly intense CD4+ Th responses.
- PBMC from this patient resisted infection from CCR5, CXCR4 and dual-tropic HIV-1 strains. Purified CD4+ T cells became infected, however, without detectable cytopathic effect. CD8+ T cells were shown to protect PBMCs from infection, and this protection was not mediated by IFN γ . Undefined CD8 T-cell secreted factors were stimulated by Gag, Pol and Nef genes introduced into target cells with vaccinia and processed through a class I pathway were responsible for the protective effect. This factor resembled CAF, the CD8+ cell antiviral factor described in Mackewicz and Levy (ARHR 8:1039, 1992)
- The CD4+ and CD8+ T-cell populations were both strongly skewed toward the CD45RO+ phenotype, many of which were terminally differentiated, CD28-, and expressed the activation markers CD38+ and HLA-DR+. Cell turnover, however, wasn't much elevated as measured by apoptosis or Ki-67+ and Bcl-2 dim expression.
- Vigorous p24-specific Th proliferative responses were observed, and 50% of CD4+ T-cells proliferated in response to p24 Gag, an extraordinary percentage. Responses were also detected against other regions in Gag, gp120 and Nef. It remains unclear how such vigorous Th responses are maintained with undetectable ongoing viral replication.
- Strong CD4+ T-cell IFN γ Elispot responses were mapped to many peptides in Gag for this patient. T-cells from two other LTNPs were tested here, and they did not react with as many Gag peptides as the main study subject of the paper. NIH reference Gag peptide set was used, but the sequences of the reactive peptides and the precise strain was not indicated in the paper, so we could not record them in the database.
- CD8+ T cell Elispot responses to Gag, Env, Nef, and Pol were detected as well, although CTL were not prominent, consistent with undetectable viremia.
- This subject had strong NAb responses when tested using the X4 primary isolate 228 200.

Epitope name pep23

Immunogen vaccine, *in vitro* stimulation or selection

Vector/Type: peptide presented on icosahedral protein scaffold *HIV component:* RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (DR5)

Assay type Cytokine production, T-cell Elispot, Th support of CTL response

References Domingo *et al.* 2003

- A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from *Bacillus stearothermophilus* has been engineered to display 60 copies of one or more epitopes on a single molecule. An E2DISP scaffold which displayed pep23, a 15-residue B and T helper epitope from the reverse transcriptase of HIV-1 elicited a T-helper response *in vitro*.
- The E2DISP scaffold displaying pep23 to stimulate a Th responses, and peptide RT2, which is a CTL epitope from HIV-1 reverse transcriptase, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to the class I and class II processing pathways.
- The Th response in vaccinated mice was also able to support Pep23 specific IgG response.

HXB2 Location RT (249–263)

Author Location RT (248–262)

Epitope KDSWTVNDIQKLVGK

- Immunogen** in vitro stimulation or selection
Species (MHC) human (DR5-11.01)
Donor MHC DR5, DR6
Assay type proliferation
Keywords binding affinity, epitope processing, vaccine-specific epitope characteristics, escape
References Moschella *et al.* 2003
- Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. They have different T cell receptor usage. Residue 11 (kdswtvndiqK-lvgk) is a natural variant, and K11A, K11G, K11I, and K11L variants were synthesized and studied in two presentation contexts, one as simple peptides, the other embedded in a recombinant protein, GST.
 - The two Th clones and the two presentation contexts gave different outcomes with the peptides. K11I was not stimulatory, and was an antagonist in GST, an agonist as a peptide. K11L retained reactivity when presented in the fusion antigen, and had no activity as a peptide. K11G stimulated in both contexts, but the concentrations required for half maximal reactivity were different. K11A could not bind to the MHC in the processed form and could only stimulate when given as a peptide.
 - In conclusion, substitutions in epitopes have different effects on Th stimulation depending on the mode of processing, and this should be considered when interpreting Th escape studies and vaccine development.

- HXB2 Location** RT (249–263)
Author Location RT (248–262)
Epitope KDSWTVNDIQKLVGK
Immunogen in vitro stimulation or selection
Species (MHC) human (DR5-11.01)
Donor MHC DR5, DR6
Assay type proliferation
Keywords binding affinity, epitope processing, vaccine-specific epitope characteristics, escape, TCR usage
References Bonomi *et al.* 2000
- Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. One of them used TCR V β 15, the other used V β 2. The substitutions D2A, W4A, D8A, I9A, and K15A were generated and only D8A, I9A failed to react with one clone, while W4A, D8A, I9A were all critical for a reaction with the other clone, showing the TCRs focused on different but overlapping residues.
 - Moving the epitope to different contexts in recombinant proteins for presentation by APCs, as well as adding polyalanine and polyserine strings to either side of the epitope, influenced reactivity, suggesting processing context can influence the structure of the presentation complex.

Immunogen vaccine
Vector/Type: DNA with CMV promotor, peptide *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (I-Ab and HLA-DR)
Donor MHC H-2b
Keywords vaccine-specific epitope characteristics, immunodominance
References Livingston *et al.* 2002

- 4 Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented by murine class II molecule I-Ab, enabling testing of vaccine strategies in H-2b mice.
- Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promoter were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all 4 peptides, using either DNA or protein for the vaccination.
- Although responses to this peptide indicated it was immunodominant, responses to all 4 peptides were made upon vaccination with linear constructs when GPGPG spacers were used.

Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004
 • CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ Elispot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.

- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP's responded to many peptides, comparable to acute STI.

Species (MHC) mouse

Donor MHC H-2d

Assay type proliferation, CD4 T-cell Elispot - IFN γ

Keywords Th1, vaccine antigen design

References Ramakrishna *et al.* 2004

- BALB/c and C57BL/6 mice were intramuscularly immunized with a codon optimized HIV-1 C-consensus Tat DNA vaccine that was linked to ubiquitin to facilitate rapid processing. Ubiquitin and codon optimization enhanced Th1 T cell responses, with increased proliferative responses, cytotoxic responses, and

Th1 responses measured by IFN γ EliSpot, but not the Th2 responses, measured by IL-4 EliSpot.

- Several immunogenic regions in HIV-1 Tat were identified in BALB/c mice using EliSpot. The strongest immune response was within the core region of Tat; the peptides based on the C subtype consensus positions 30-50 and 40-60 gave the strongest EliSpot responses in BALB/c mice, suggesting a putative helper T-cell epitope spanning the region of overlap, residues 40-50.

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB

HIV component: Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), macrophage activating lipopeptide-2 (MALP-2)

Species (MHC) mouse (H-2^d)

Assay type Cytokine production, proliferation, T-cell EliSpot, Th support of CTL response

Keywords Th1, Th2

References Borsutzky *et al.* 2003

- BALB/c mice that were vaccinated intranasally with Tat protein plus mucosal adjuvant macrophage-activating lipopeptide-2 (MALP-2) had increased proliferative, antibody, and IFN γ producing T-cell responses than did with Tat+IFA delivered by the i.p. route.
- IFA as adjuvant stimulated a Th2-dominant response pattern, and MALP-2 as adjuvant shifted to a Th1 response. Anti-Tat IgG1 dominated the Ab response with IFA, IgG2b dominated with MALP-2. In animals vaccinated with Tat+MALP-2, IFN γ and IL-2 were the most prominent cytokines, with some IL-6. In contrast, in mice vaccinated with Tat+IFA, IL-6 was the dominant cytokine. Secreted IL-4, IL-5 and IL-10 were below the detection limit in both cases.
- The strongest proliferation of spenocytes was observed was after re-stimulation with residues 36-50 and 56-70.

Epitope

Immunogen vaccine

Vector/Type: DNA, DNA with protein boost
Strain: B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18

Species (MHC) mouse (H-2^d)

Keywords Th1, Th2

References Billaut-Mulot *et al.* 2001

- DNA vaccinated BALB/c mice primed and boosted with a multiepitopic vaccine with IL18 gave lymphoproliferative responses 7 weeks post immunization.

- Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime + DNA boost was more effective than DNA prime + protein boost.
- Immunization with either the multiepitopic DNA or with the mixed DNA vaccine resulted in Th1 cytokines production (IL-2 and IFN γ) in spleen cell cultures stimulated by Tat and Gag, while Th2 cytokines IL-4 and IL-10 production was not detectable.
- Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.

HXB2 Location Tat

Author Location Tat

Epitope

Immunogen vaccine

Vector/Type: DNA *HIV component:* Nef, Rev, Tat

Species (MHC) human

Keywords HAART, ART

References Calarota *et al.* 1999

- 9/9 HIV-1 + subjects were given one of three DNA vaccinations for nef, rev or tat, and novel proliferative and CTL responses were generated.
- The nef DNA immunization induced the highest and most consistent CTLp activity, IFN γ production, and IL-6 and IgG responses.
- Highly active antiretroviral treatment (HAART) did not induce new HIV-specific CTL responses but reduced viral load, while DNA vaccination induced new immune responses but did not reduce viral load – thus this is a potentially complementary and promising combination.

Epitope

Immunogen in vitro stimulation or selection

Species (MHC) human

Keywords dendritic cells, Th1, Th2

References Corinti *et al.* 2002

- In vitro delivery of recombinant Tat protein conjugated to red blood cells (RBCs) via avidin-biotin bridges (RBC-Tat) to human dendritic cells was compared to dendritic cells pulsed with rec Tat.

- Dendritic cells pulsed with RBC-Tat elicited specific and significantly stronger CD4+ and CD8+ T-cell responses and required 1250-fold less antigen than DCs stimulated with soluble Tat.
- Dendritic cells which were matured in the presence of IFN γ induced elevated IL-12 and TNF- α secretion. IFN γ upregulated IP-10 and down regulated TARC, chemokines which attract Th1 and Th2 cells, respectively.

HXB2 Location Tat**Author Location** Tat (IIIB, BH10)**Epitope****Subtype** B**Immunogen** in vitro stimulation or selection**Species (MHC)** human**Keywords** epitope processing, vaccine-specific epitope characteristics, dendritic cells, Th1**References** Fanales-Belasio *et al.* 2002b

- Biologically active HIV-1 Tat is readily taken up by monocyte-derived dendritic cells (MDDC) (and activated endothelial cells), but not other APCs. Tat must be in a native, non-oxidized conformation for efficient uptake. Tat upregulates MHC molecules, IL-12, TNF α , RANTES and MIP-1- α and MIP-1- β production which drives Th1 immune responses and enhances antigen presentation.
- Native Tat enhanced the antigen presentation of MDDC and boosted proliferative recall and allogeneic antigen responses, and the authors propose it could be used as an adjuvant to drive the immune response as well as an antigen.

HXB2 Location Tat**Author Location** Tat**Epitope****Immunogen** vaccine*Vector/Type:* DNA, protein *HIV component:* Tat *Adjuvant:* aluminum hydroxide, Ribi adjuvant (MPL+TDM) (RIBI)**Species (MHC)** macaque**Assay type** Cytokine production, Delayed-type hypersensitivity (DTH)**Keywords** review, early-expressed proteins, Th1**References** Fanales-Belasio *et al.* 2002a

- HIV-1 Tat protein has several virtues vaccine component. It is an early expressed protein, and though variable, contains conserved T-cell and B-cell epitopes that allow cross-clade recognition. It is efficiently taken up by monocyte-derived dendritic cells (MDDCs) and in this context can stimulate Th1 immune responses. A Tat based vaccine can elicit an immune response that can control primary infection in monkeys that are in early stage of infection with SHIV89.6P.

HXB2 Location Tat**Author Location** Tat (1-72)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* protein, nanoparticle *Strain:* B clade BRU *HIV component:* Tat *Adjuvant:* aluminum hydroxide, lipid A**Species (MHC)** mouse**Donor MHC** H-2d**Assay type** Cytokine production, proliferation**Keywords** Th1, Th2, adjuvant comparison, vaccine antigen design**References** Cui *et al.* 2004

- Mice were subcutaneously injected on day 0 and 14 with either Alum and Tat (Th2 control) or Lipid A-adjuvanted Tat (Th1 control), or Tat coated anionic nanoparticles. Analysis of Ab and cytokine release in splenocytes (day 28) showed both IgG and IgM Ab responses; immunization with Tat-coated nanoparticles induced a Th1-biased immune response.
- IFN γ responses were 3.3-fold stronger with Tat and either Lipid-A or coated nanoparticles than with Tat and Alum.

- One of four peptides that stimulates in PBLs from HIV-1 + donors both CD4+ Th cell proliferation and CTL to autologous targets incubated with peptide were stimulated.

HXB2 Location Rev (14-30)**Author Location** Rev (14-30 B Consensus)**Epitope** KTVRLIKFLYQSNPPPS**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Country** United States.**Assay type** CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding**Keywords** supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection**References** Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNP responded to many peptides, comparable to acute STI.

Keywords HAART, ART, acute/early infection, cross-presentation by different HLA

References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
- This peptide showed bound to HLA-DRB1*0101.

Epitope CVPTDPPNPQEVV
Subtype B

- Immunogen** HIV-1 infection
Species (MHC) human
References Schrier *et al.* 1989
- Stimulates T-cell proliferation in HIV-infected donors.

HXB2 Location gp160 (80–99)
Author Location gp120 (51–70 HXB2)
Epitope NPQEVVLVNTENFNMWKND
Subtype B

- Immunogen** in vitro stimulation or selection
Species (MHC) human
Keywords TCR usage
References Li Pira *et al.* 1998
- Clonal heterogeneity was broad for a recall response to tetanus toxoid or PPD, but oligoclonal to primary HIV antigens, dominated in this case by TCR V β 13 usage.
 - Donor of PBMC that recognized this epitope had HLA-DR alleles 2 and 7.

HXB2 Location gp160 (81–100)
Author Location gp120 (80–99 89.6)
Epitope PQEVVVLGNVTENFNMWKNM
Immunogen vaccine

- Vector/Type:* protein *Strain:* B clade 89.6
HIV component: gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
- Species (MHC)** mouse (H-2^k)
Keywords immunodominance
References Dai *et al.* 2001
- Promiscuous immunodominant epitopes in gp120 were mapped by overlapping peptides in CBA/J H-2^k and BALB/c H-2^d mice, and all were found to be in the outer domain, proximal to regions of structural disorder indicated by the crystal structure or by sequence divergence.
 - This peptide was recognized by 10/10 CBA/J with an average SI of 8.2, and not by BALB/c mice, so is considered to be uniquely immunodominant for H-2^k
 - Uniquely immunodominant sequences tended to be in the inner domain of the protein.

- Helper epitopes used in this study were noted to be previously described Clerici *et al.* [1989], and were not explicitly described in Kaul *et al.* [1999]

HXB2 Location gp160 (105–117)

Author Location gp120**Epitope** HEDIISLWDQSLK**Epitope name** T2**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)** human**Keywords** subtype comparisons, responses in children, mother-to-infant transmission**References** Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

HXB2 Location gp160 (105–117)**Author Location** Env (112–124 IIIB)**Epitope** HEDIISLWDQSLK**Epitope name** T2**Subtype** B**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)****Assay type** Cytokine production**Keywords** mother-to-infant transmission**References** Clerici *et al.* 1993a

- Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activity were infected.
- PBL from 10/21 of the mothers showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.

HXB2 Location gp160 (105–117)**Author Location** Env (IIIB)**Epitope** HEDIISLWDQSLK**Epitope name** T2**Subtype** B**Immunogen** HIV-1 exposed seronegative**Species (MHC)****Assay type** Cytokine production**References** Clerici *et al.* 1994a

- Six of eight HIV-exposed health care workers had transient HIV-specific T-helper responses after percutaneous exposure to HIV, responding to two or more Env peptides among the set T1, T2, Th4.1, P18IIIB and P18MN. Responses were lost after 12-56 weeks. The HIV-specific Th responses occurred without seroconversion or PCR evidence for infection.
- Six of the eight HIV-exposed individuals responded to two or more peptides, whereas, only one individual exposed to HIV-negative blood responded to one peptide.

HXB2 Location gp160 (105–117)**Author Location** HIV-1 (IIIB)**Epitope** HEDIISLWDQSLK**Epitope name** T2**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)****Assay type** Cytokine production**References** Clerici *et al.* 1994b

- IL-10-specific mRNA was upregulated in PBMC from asymptomatic, HIV-infected (HIV+) patients, and was particularly high in those with severely compromised Th cells function. Th response to HIV peptides *in vitro* could be restored by IL-10 Ab.

HXB2 Location gp160 (105–117)**Author Location** Env (112–124)**Epitope** HEDIISLWDQSLK**Epitope name** T2**Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** proliferation**Keywords** responses in children, mother-to-infant transmission**References** Kuhn *et al.* 2001b

- T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistence of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retroviral exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrane *et al.*, Lancet 354:2050 (1999)).

Species (MHC) guinea pig

Keywords vaccine-specific epitope characteristics, Th1

References Chattergoon *et al.* 2002

- Hartley guinea pigs were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensitivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
- A total of 7 gp120 peptides elicited a delayed type hypersensitivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 4/5 animals vaccinated with rec gp120 responded by DTH to this peptide, as did 2/6 vaccinated with plasmid gp120 DNA.

Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005
HIV component: gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V2 region of UG92005 (UG, clade D) and the hybridoma that recognized it used Vβ5.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Epitope name RD20
Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type Cytokine production, proliferation, CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining

Keywords HAART, ART, acute/early infection

References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

Keywords subtype comparisons, epitope processing, TCR usage

References Surman *et al.* 2001

- This epitope is located in the C2 region of 1007 (US, clade B) and the V β usage of the TCR was V β 3.
- The epitope described here is the region of overlap of two 15mers that were both able to stimulate IL-2 production from the hybridoma (TSVITQACPKVSFEP and ITQACPKVSFEPIPI)
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and V β usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- Priming with 1007 and UG92005 env's induced both Env-specific (SNNTVGNPIILPCR1 and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHCN-VSKAKW, V3-C3) Th responses in murine spleen cells.

- Hartley guinea pigs were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensitivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
- A total of 7 gp120 peptides elicited a delayed type hypersensitivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 5/5 animals vaccinated with rec gp120 responded by DTH to this peptide, as did 2/6 vaccinated with plasmid gp120 DNA.

Keywords epitope processing, immunodominance

References Dai *et al.* 2001

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was reactive in 6/10 BALB/c mice tested, and in 6/10 CBA/J mice.

HXB2 Location gp160 (209–220)

Epitope SFPEIPIHYCAP

Epitope name SP12

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (DR)

Assay type Cytokine production, proliferation, CD4 T-cell ELISPOT - IFN γ , Intracellular cytokine staining

Keywords HAART, ART, vaccine-specific epitope characteristics, acute/early infection, cross-presentation by different HLA

References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
- Seven out of 12 clones recognized this conserved C3 region of gp120. Clone one was mapped to the optimal epitope and was found to be presented by HLA-DR. The peptide showed promiscuous binding to DRB1*0101, DRB1*0401, DRB1*1302, DRB1*0701, DRB1*0901, DRB4*0101, DRB5*0101.

Keywords epitope processing, vaccine-induced epitopes, escape, TCR usage

References Zhan *et al.* 2003

- A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035. Five of seven different Th hybridomas isolated from five immunized mice immunized reacted with the peptide PKVSFEPIPIHYCAP, located in the C2 region of gp120. TCR V β usage indicated each of the clones was unique. Splenic populations from other C57BL/6 mice immunized with 1035 env confirmed that the gp120 specific T-helper response was focused on the PKVSFEPIPIHYCAP peptide. The authors suggest the protein structural context may contribute to the immunodominance of this peptide.
- The minimal epitope was mapped for one of the hybridomas, and was FEPIPIHYC.
- The natural variant, fDpipihyc, did not stimulate a response in three of the hybridomas.

- Epitope was the minimal stimulatory sequence defined for two Th lines stimulated *in vitro*.
 - One Th line was stimulated by p66, one by a Glutathione-S-transferase (GST)-peptide fusion protein.
 - Alanine substitutions at position 914, 196, and 202 abrogated activity for the GST-peptide stimulated line, but not for a gp120 stimulated line.
 - Constructs linking GST to the PAGFAILKCNKTFNY gp120 peptide at the C-term end of GST stimulated Th cells, constructs linking at the N-term end did not.
 - The C and N termini of GST are not intrinsically permissive or non-permissive, presentation is epitope specific (see SSTVNDIQKLV for contrast)

Keywords subtype comparisons, immunodominance
References Fenoglio *et al.* 2000
- This peptide is an immunodominant Th epitope in BALB/c mice.
 - Substitutions in positions 237, 241, 243, 244 with Ala all cause reduced recognition.
 - Most natural analogs they tested did not cross-react, including peptides based on clade A, B, C, D, E and O sequences.
 - Position 237 and 244 when substituted with Ala cause an antagonistic response and the natural analogues of this epitope to loose antigenicity.

- Some of the naturally occurring variants also cause an antagonistic response.

Keywords acute/early infection
References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.

- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

Epitope RPYNNTRKGI
Immunogen vaccine

Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Species (MHC) mouse (H-2 IA^b)

Keywords subtype comparisons, epitope processing, TCR usage

References Surman *et al.* 2001

- This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by a hybridoma with V β usage not determined.
- The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (TINCTRPYNNTRKGI and RPYNNTRKGI-HIGPG)
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and V β usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.

- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.

- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

Epitope RAYTTNIVGNIRQ

Immunogen vaccine

Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Species (MHC) mouse (H-2 IA^b)

Keywords subtype comparisons, epitope processing, TCR usage

References Surman *et al.* 2001

- This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by two hybridomas with V β usage not determined, but one used V α 8.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and V β usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

- Hartley guinea pig were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensitivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
- A total of 7 gp120 peptides elicited a delayed type hypersensitivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 3/5 animals vaccinated with rec gp120 responded by DTH to this peptide, and 2/6 responded that were vaccinated with plasmid gp120 DNA.

component: gp140 *Adjuvant:* Complete

Freund's Adjuvant (CFA)

Species (MHC) mouse (H-2 IA^b)

Keywords subtype comparisons, epitope processing, TCR usage

References Surman *et al.* 2001

- This epitope is located in the V4C4 region of 1007 (US, clade B) and was recognized by 13 hybridomas with V β usage V β 4, 7, 8.1, 8.2, 10, 12 and not determined – one of the V β 8.2 was shown to utilize V α 2.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and V β usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Assay type Cytokine production, CD4 T-cell Elispot - IFN γ

Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization, vaccine antigen design

References Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- T-cell hybridoma 1007P3-23 was isolated from mice immunized with 1007, and it recognized the peptide SNNTVGN-PIILPCRI of the V4/C4 region. The minimal, core peptide recognized by 1007P3-23 was NPIL, a sequence not found in UG92005, which has a deletion in the core, so that the equivalent region in the D isolate is NNET—ITLQCRI
- Priming mixtures of 1007 and UG92005 induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHCN-VSKAKW, V3-C3) Th responses in murine spleen cells.

Immunogen vaccine

Vector/Type: canarypox prime with recombinant protein boost *HIV component:* gp120

Species (MHC) human (DRB1*13)

Donor MHC DRB1*01, DRB1*13

Assay type proliferation

Keywords enhancing activity, optimal epitope

References Okazaki *et al.* 2006

- KQIINMWQEVGKAMYA-specific human CD4+ T-cell line from a healthy Caucasian American volunteer immunized with a canarypox virus vector expressing gp120 and boosted with recombinant gp120 was developed and found to be restricted to DRβ1*13. Epitope enhancement with different amino acid substitutions was studied.
- Likely binding core for KQIINMWQEVGKAMYA was determined as WQEVGKAMY, based on single A or S substitutions that diminished recognition, and proliferation assay data using truncated peptides.
- HLA binding motif was studied using substituted peptides in anchor positions 1,4,6,9 from the N-terminus of WQEVGKAMY. In position 1, CD4+ response was reduced by kqiinm[w/ai]QEVGKAMYa substitutions, but not by kqiinm[w/f]QEVGKAMYa substitution suggesting a requirement of aromatic amino acid. In position 4, CD4 response was reduced by kqiinmMWQE[v/af]GKAMYa substitutions, but

- enhanced by kqiinmWQE[v/i]GKAMYa substitution, suggesting a requirement of aliphatic amino acid. In position 6, response was reduced by kqiinmWQEVG[k/ae]AMYa substitutions, but was enhanced by positively charged R substitution (kqiinmWQEVG[k/r]AMYa). In position 9, all peptides substituted with small, aromatic, or aliphatic amino acids (kqiinmWQEVGKAM[y/afi]a) induced enhanced response.
- The altered KQIINMWQE[v/i]GKAMYA peptide produced higher IFN- γ production than the original peptide, suggesting greater CD4 T-cell activation in a Th1 functional response.
 - Triple substituted peptide KQIINMWQE[v/i]G[k/r]AM[y/a]A shifted the peak proliferative response to lower concentrations.

Species (MHC) mouse (Ek)

Assay type Cytokine production, Th support of CTL response

Keywords binding affinity, Th1

References Ahlers *et al.* 2001

- BALB/c and A.AL were immunized with an Env-peptide vaccine construct containing the CTL epitope P18IIIB and a T helper epitope.
- Substitution of Glu (wt) to Ala, kqiinmwqAvGkamyA, caused increased affinity for MHC class II Ek. This resulted in the upregulation of CD40L in the responding Th cells, and shifted the response towards Th1. Increased Th responses stimulated DCs to produce higher levels of IL-12, and B7-1 and B7-2, thus enhance CTL responses.
- The modified epitope, T1A, elicited stronger protection against increasing doses of viral challenge with vaccinia expressing HIV-1 IIIB gp120 compared to the wildtype epitope T1.

Epitope name T1

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB

Species (MHC) mouse (H-2E α E β ^k)

References Boehncke *et al.* 1993

- C3H H2^k mice were used for immunization in the study because H-2^k mice are particularly good T1 responders – T1 can be presented by E α E β^k but not E α E β^b – the nature of the T1 class II molecular interaction was thoroughly explored.
- Alanine substitutions across peptide did not negatively affect MHC binding or effective presentation of epitope, except at three critical residues (432N, 435Q, 439K), however substitutions with larger side chains often diminished activity – only a few amino acids were found to be critical for class II interaction and for maintaining T-cell receptor specificity.
- A gain in potency was observed when 436E was replaced with A, suggesting that substitutions in positions that interfere with binding might allow the design of a more potent vaccine.

Keywords subtype comparisons, responses in children, mother-to-infant transmission

References Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.

- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

HXB2 Location gp160 (421–436)

Epitope KQIINMWQEVGKAMYA

Epitope name T1

Immunogen HIV-1 infection

Species (MHC)

Keywords epitope processing

References de Lorimier *et al.* 1994

- Proton NMR spectroscopy was employed to analyze the solution conformation of a hybrid peptide, T1-SPI0RF, in order to better understand the immunogenicity of its' T helper (KQI-INMWQEVGKAMYA, CTRPNNNTRKSI), CTL (SITKGP-GRVIYATG) and B-cell epitopes (RKSITKGPGRVIYATG).
- As a free peptide, the T1 segment, a T-helper epitope is in an extended conformation with nascent helical conformation. It may form a beta strand in native gp120, and a nonnative conformation may account for the inability of free T1 peptide to elicit antibody responses, in contrast to the T1 segment in native gp120. It lacks random-coil conformations, and it is suggested that this may make the peptide less susceptible to complete proteolytic degradation, and be favored within epitopes.

Assay type proliferation

Keywords responses in children, mother-to-infant transmission

References Kuhn *et al.* 2001b

- T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistence of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retroviral exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrane *et al.*, Lancet 354:2050 (1999)).

B clade 1007, D clade UG92005 *HIV*

component: gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Species (MHC) mouse (H-2 IA^b)

Keywords subtype comparisons, epitope processing, TCR usage

References Surman *et al.* 2001

- This epitope is located in the C4 region of UG92005 (UG, clade D) and was recognized by ten hybridomas with V β usage V β 6, 8.1, 8.2, 13, 14 and not determined – among the ND V β set, three V α s were identified, V α 2, 8, and 11.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and V β usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site

proximity may allow binding to lectins and promote trafficking through processing pathways.

Subtype M
Immunogen HIV-1 infection
Species (MHC) human
Country United States.
Assay type T-cell Elispot
Keywords computational epitope prediction
References De Groot *et al.* 2004
- Bioinformatic tools (EpiMatrix and Conservatrix) were employed to predict 9 highly conserved and promiscuous class II restricted T helper epitopes from HIV-1 env sequences for a cross-clade polyepitope vaccine. 10/34 HIV-1 infected patients induced Th1 immune responses to 8/9 study peptides.
 - 2/28 subjects tested responded to this peptide.
 - Class II peptides containing putative epitopes were selected to favor DRB0101 presentation, as there is a transgenic mouse model for this allele for future vaccine studies. The highest scoring DRB0101 sequence within this peptide was QIRCSS-NIT.

- HXB2 Location** gp160 (446–461)
Author Location gp120 (IIIB)
Epitope SSNITGLLLTRDGGTC
Immunogen in vitro stimulation or selection
Species (MHC) human
References Manca *et al.* 1995b
- Peptide stimulation of PBMC from non-infected individuals *in vitro*.
 - Peptide priming does not always induce T-cells that recognize whole protein.

- HXB2 Location** gp160 (452–471)
Author Location gp120 (452–471 IIIB)
Epitope LLLTRDGGNSNNESEIFRPG?
Epitope name I1
Subtype B

- Immunogen** HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994
- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
 - After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
 - IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
 - 2/15 responders recognized this peptide, average SI = 3.5.
- HXB2 Location** gp160 (456–470)
Author Location gp120 (IIIB)
Epitope RDGGTNTVDTEVFRFC
Immunogen in vitro stimulation or selection
Species (MHC) human
References Manca *et al.* 1995b
- Peptide stimulation of PBMC from non-infected individuals *in vitro*.
 - Peptide priming does not always induce T-cells that recognize whole protein.
- HXB2 Location** gp160 (459–473)
Author Location gp120 (459–473 IIIB, B10)
Epitope GNSNNESEIFRPGGG
Immunogen HIV-1 infection
Species (MHC) human
References Wahren *et al.* 1989b; Wahren *et al.* 1989a
- 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.
- HXB2 Location** gp160 (468–483)
Author Location gp120 (466–481)
Epitope FRPGGGDMRDNRSEL
Immunogen HIV-1 infection
Species (MHC) human
References Krowka *et al.* 1990
- Conjugation of HIV peptides to liposomes and rIL-2 stimulation may enhance cell-mediated responses.
- HXB2 Location** gp160 (472–491)
Author Location gp120 (472–491 IIIB)
Epitope GGDMDNRNRSSELYKYKVVKI?
Epitope name I3
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994
- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
 - After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.

- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
 - 2/15 responders recognized this peptide, average SI = 7.2.
- HXB2 Location** gp160 (474–488)
Author Location gp120 (474–488 IIIB, B10)
Epitope DMRDNWRSELYKYKV
Immunogen HIV-1 infection
Species (MHC) human
References Wahren *et al.* 1989b; Wahren *et al.* 1989a
- 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.
- HXB2 Location** gp160 (476–490)
Author Location gp120 (483–497 IIIB)
Epitope RDNWRSELYKYKVVK
Immunogen vaccine
Strain: B clade IIIB *HIV component:* gp160
Species (MHC) mouse (H-2^d, H-2⁴)
References Hale *et al.* 1989
- Six multideterminant helper T-cell regions are recognized by mice of three or four MHC types.
- HXB2 Location** gp160 (476–490)
Author Location gp160 (483–497 IIIB)
Epitope RDNWRSELYKYKVVK
Immunogen vaccine
Vector/Type: protein *Strain:* B clade IIIB
HIV component: gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2^k, H-2^s)
References Berzofsky *et al.* 1991b; Berzofsky *et al.* 1991a
- This peptide elicited proliferative responses in B10.BR mice (H-2A^k and B10.S(9R) mice (H-2A^s, E^s)
 - RDNWRSELYKYKVVKIEPLGVAPT encompasses several murine Th epitopes including RDNWRSELYKYKVVK and is referred to as a "multideterminant region" or cluster peptide.
- HXB2 Location** gp160 (476–499)
Author Location gp160 (483–506 IIIB)
Epitope RDNWRSELYKYKVVKIEPLGVAPT
Immunogen HIV-1 infection, vaccine
Vector/Type: protein *Strain:* B clade IIIB
HIV component: gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) human, mouse (H-2^k, H-2^b, H-2^s, H-2^d)
References Berzofsky *et al.* 1991b; Berzofsky *et al.* 1991a
- RDNWRSELYKYKVVKIEPLGVAPT encompasses several murine Th epitopes and is referred to as a "multideterminant region" or cluster peptide.
 - Six multideterminant region cluster peptides were evaluated Th responses in different MHC/HLA backgrounds after vaccination of mice with gp160, or in infected people.
 - This cluster peptide elicited proliferative responses in cells from all H-2 haplotypes tested: B10.BR mice (H-2A^k, E^k), B10.D2 mice (H-2A^d, E^d), B10.A(5R) mice (H-2A^b, E^b), and B10.S(9R) mice (H-2A^s, E^s)
 - IL-2 production in response to this peptide was observed in 52% (14/27) of asymptomatic HIV-infected individuals.

- HXB2 Location** gp160 (479–498)
Author Location gp120 (481–500 MN)
Epitope WRSELYKYKVVVTIEPLGVAP
Epitope name 2013
Subtype B
Immunogen vaccine
Vector/Type: DNA, protein *Strain:* B clade MN *HIV component:* gp120 *Adjuvant:* Complete Freund's Adjuvant (CFA)
- Species (MHC)** guinea pig
Keywords vaccine-specific epitope characteristics, Th1
References Chattergoon *et al.* 2002
- Hartley guinea pigs were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensitivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
 - A total of 7 gp120 peptides elicited a delayed type hypersensitivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
 - 0/5 animals vaccinated with rec gp120 responded by DTH to this peptide, while 6/6 vaccinated with plasmid gp120 DNA responded.

- HXB2 Location** gp160 (482–501)
Author Location gp120 (482–501 IIIB)
Epitope ELYKYKVVVKIEPLGVAPTKA
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade IIIB *HIV component:* Env
- Species (MHC)** macaque
References Lekutis *et al.* 1997
- HIV-1 env DNA vaccine induced Th cell response to this epitope in a rhesus monkey.
 - Epitope was recognized by both monkeys used in this study.

- HXB2 Location** gp160 (482–501)
Author Location gp120 (482–501 IIIB)
Epitope ELYKYKVVVKIEPLGVAPTKA?
Epitope name I4
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994
- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
 - After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
 - IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
 - 3/15 responders recognized this peptide, average SI = 6.0.

- HXB2 Location** gp160 (483–502)
Author Location gp120 (480–499 89.6)

- Epitope** LYKYKVVRIEPIGVAPTRAK
Epitope name Peptide 46
Immunogen vaccine
Vector/Type: protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
- Species (MHC)** mouse
Donor MHC H-2k, H2-d
Keywords epitope processing, immunodominance
References Dai *et al.* 2001

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was reactive in 7/10 BALB/c mice tested, and in only 1/10 CBA/J mice.

- HXB2 Location** gp160 (484–496)
Author Location gp120 (484–496 HXB2)
Epitope YKYKVVVKIEPLGV
Subtype B
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade HXB2 *HIV component:* Env
- Species (MHC)** macaque (DR*W201)
References Lekutis & Letvin 1998
- Variants of this epitope with substitutions at position 490(K) retained ability to bind to MHC class II, but failed to induce proliferation/cytokine secretion in HIV-1 env-specific CD4+ Th cells.
 - The modified peptide antagonized the wildtype peptide-induced proliferative response.

- HXB2 Location** gp160 (484–498)
Author Location gp120 (484–498 IIIB, B10)
Epitope YKYKVVVKIEPLGVAP
Immunogen HIV-1 infection
Species (MHC) human
References Wahren *et al.* 1989b; Wahren *et al.* 1989a
- 12 gag and 18 env peptides were identified that could commonly evoke T-cell responses.

- HXB2 Location** gp160 (484–499)
Author Location gp120 (492–506 IIIB)
Epitope CKYKVVVKIEPLGVAPT
Immunogen vaccine
Strain: B clade IIIB *HIV component:* gp160
- Species (MHC)** mouse (H-2^d, H-2^k, H-2^{k4}, H-2^{k5})
References Hale *et al.* 1989
- Six multideterminant helper T-cell regions are recognized by mice of three or four MHC types.

- HXB2 Location** gp160 (485–499)
Author Location gp160 (492–506 IIIB)
Epitope KYKVVVKIEPLGVAPT
Immunogen vaccine

Vector/Type: protein *Strain:* B clade IIIB
HIV component: gp160 *Adjuvant:* Complete Freund's Adjuvant (CFA)

Species (MHC) mouse (H-2^k, H-2^b, H-2^s, H-2^d)

References Berzofsky *et al.* 1991b; Berzofsky *et al.* 1991a

- This peptide elicited proliferative responses in cells from all H-2 haplotypes tested: B10.BR mice (H-2A^k, E^k), B10.D2 mice (H-2A^d, E^d), B10.A(5R) mice (H-2A^b, E^b), and B10.S(9R) mice (H-2A^s, E^s)
- RDNWRSELYKYKVVVKIEPLGVAPT encompasses several murine Th epitopes including KYKVVVKIEPLGVAPT and is referred to as a "multideterminant region" or cluster peptide.

HXB2 Location gp160 (485–500)

Author Location gp120 (IIIB)

Epitope KYKVIKIEPLGIAPTC

Immunogen in vitro stimulation or selection

Species (MHC) human

References Manca *et al.* 1995b

- Peptide stimulation of PBMC from non-infected individuals *in vitro*.
- Peptide priming does not always induce T-cells that recognize whole protein.

HXB2 Location gp160 (486–494)

Author Location gp120 (486–494 IIIB)

Epitope YKVVVKIEPL

Immunogen SHIV infection

Species (MHC) macaque (DRB*W201)

References Lekutis & Letvin 1997

- C5 region minimal epitope determined through fine epitope mapping.

HXB2 Location gp160 (487–512)

Author Location gp120 (494–518 IIIB)

Epitope KVVVKIEPLGVAPTKAKRRVVQREKRC

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade IIIB

Species (MHC) mouse

References Goodman-Snitkoff *et al.* 1990

- Identification of putative Th epitopes that stimulate an antibody response in peptide immunized mice.

HXB2 Location gp160 (492–512)

Author Location gp120 (492–512 IIIB)

Epitope EPLGVAPTAKARRVVQREKRA?

Epitope name I5

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.

- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 1/15 responders recognized this peptide, SI = 4.9.

Epitope TKAKRRVVEREKR

Immunogen in vitro stimulation or selection

Species (MHC) human (DR)

References Wilson *et al.* 1997b

- Thought to be a mimic of a HLA class II DR β chain variable region.
- Response to this epitope may cause a breakdown of self-tolerance.
- Presentation of epitope induced autoreactive T-cell lines in PBMC from uninfected donors.
- Suppression of proliferation to soluble antigens by the CD8+ fraction of TKAKRRVVEREKR stimulated T-cells was observed.

HXB2 Location gp160 (499–519)

Author Location gp41 (MN)

Epitope TKAKRRVVQREKRAAIGALF

Epitope name TF20

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type Cytokine production, proliferation, CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining

Keywords HAART, ART, acute/early infection

References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and

impaired lymphoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.

- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th responses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

- A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035, to the peptide PKVSFEPPIHYCAP, located in the C2 region of gp120. The only other peptide recognized using Elispot on Env overlapping peptides to test vaccine responses in the mice was this one: TNVPWNASWSNKSLE, located in gp41.

HXB2 Location gp160 (606–620)**Author Location** gp41 (UG92005)**Epitope** TNVPWNASWSNKSLE**Immunogen** vaccine*Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)**Species (MHC)** mouse (H-2 IA^b)**Keywords** subtype comparisons, epitope processing, TCR usage**References** Surman *et al.* 2001

- This gp140 epitope of UG92005 (UG, clade D) was recognized by five hybridomas with V β usage V β 8.1, 14 and not determined – one of the V β 8.1 was shown to utilize V α 8.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promoter, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and V β usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennessee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site

proximity may allow binding to lectins and promote trafficking through processing pathways.

HXB2 Location gp160 (609–616)**Author Location** gp41 (consensus)**Epitope** PWNASWSN**Immunogen** HIV-1 infection**Species (MHC)** human**References** Mutch *et al.* 1994

- Core region of peptides that can stimulate proliferative responses from seronegative and seropositive people.

HXB2 Location gp160 (611–620)**Author Location** gp41 (1007, UG92005)**Epitope** NASWSNKSLE**Immunogen** vaccine*Vector/Type:* DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)**Species (MHC)** mouse (H-2 IA^b)**Keywords** subtype comparisons, epitope processing, TCR usage**References** Surman *et al.* 2001

- This gp41 epitope is conserved in 1007 (US, clade B) and UG92005 (UG, clade D) and was recognized by two hybridomas from two different mice that were vaccinated with different clades – the V β usage was V β 4 and 14.
- The epitope described here is the region of overlap of two 15mers that were both able to stimulate IL-2 production from the hybridoma (T[TN]VPWNASWSNKSLE and NASWSNKSLE-QIWNN) – the only difference between 1007 and UG92005 for these two proteins is that 1007 has a T and UG92005 has an N in the second position of the first peptide.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3–4 weeks later boosted with VV, and 3–4 weeks later boosted again with purified protein in Freund's adjuvant.

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

HXB2 Location gp160 (827–841)**Author Location** Env (834–848 IIIB)**Epitope** DRVIEVVQGAYRAIR**Epitope name** TH4.1**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)****Assay type** Cytokine production**Keywords** mother-to-infant transmission**References** Clerici *et al.* 1993a

- Cord blood samples in 8/23 infants with HIV+ mothers showed IL-2 production in response to peptides from HIV-1 gp1260, demonstrating that Th cell priming to HIV env determinants can occur in utero. HIV-specific Th immunity in utero may be protective, as none of the 8 with HIV-1 specific Th activity became infected, while 3/15 infants with no detectable Th activated were infected.
- PBL from 10/21 of the mother showed HIV-1 specific Th activity through IL-2 production in response to Env peptides.

HXB2 Location gp160 (827–841)**Author Location** Env (IIIB)**Epitope** DRVIEVVQGAYRAIR**Epitope name** TH4.1**Subtype** B**Immunogen** HIV-1 exposed seronegative**Species (MHC)****Assay type** Cytokine production**References** Clerici *et al.* 1994a

- Six of eight HIV-exposed health care workers had transient HIV-specific T-helper responses after percutaneous exposure to HIV, responding to two or more Env peptides among the set T1, T2, Th4.1, P18IIIB and P18MN. Responses were lost after 12-56 weeks. The HIV-specific Th responses occurred without seroconversion or PCR evidence for infection.

- Six of the eight HIV-exposed individuals responded to two or more peptides, whereas, only one individual exposed to HIV-negative blood responded to one peptide.

Keywords responses in children, mother-to-infant transmission

References Kuhn *et al.* 2001b

- Th proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistence of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retroviral exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrane *et al.*, Lancet 354:2050 (1999)).

Species (MHC) human
Keywords Th1
References Hladik *et al.* 2001

- 16/29 HIV-1 infected and 24/30 vaccinated individuals had DTH reactions within 48 hours after an intradermal rec gp120 injection. Of nine DTH positive individuals, none had detectable proliferative responses. Thus skin testing may be a sensitive way to identify people with Th recall responses to vaccines, or in the absence of lymphoproliferation.
- No 48 hour DTH responses were detected among uninfected volunteers, although 10/35 (40%) of the high risk and 11/32 (34%) of the low risk individuals developed an induration resembling DTH after 7-12 days, that may be indicative of primary induction of HIV-1 specific Th1-immunity.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression, Th1, Th2**References** Wilson *et al.* 2000b

- Dysfunction of HIV-1 specific proliferative responses, but not responses to other antigens, is evident in HIV-1 progressive disease.
- Vigorous HIV-1 specific responses to p24, Nef and gp120 with SI between 8-99 were seen in 6/7 long term non-progressors (LTNP), the seventh had a borderline responses. IL-2 production was seen in all cases, and IL-4 production was also evident many responses.
- None of the progressors (0/5) had HIV-1 specific proliferative responses, or IL-2 or IL-4 induction.
- Non-HIV antigens (cytomegalovirus, PPD, Staphylococcus enterotoxin B, tetanus toxoid) gave similar responses in HIV-1 + LTNP, progressors, and HIV-1 controls.

HXB2 Location Env**Author Location** gp160**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression, Th1**References** Kalams *et al.* 1999a

- The strength of p24 specific Gag proliferative responses (SIs) were inversely correlated with viral load in 21 ARV naive patients. The responses were Th1, IFN γ producing.
- Proliferative responses against gp160 were rarely observed (only 4 cases).

HXB2 Location Env**Author Location** Env**Epitope****Immunogen** vaccine*Vector/Type:* DNA with CMV promotor*Strain:* B clade MN *HIV component:* Env,*Rev Adjuvant:* Bupivacaine**Species (MHC)** human**Keywords** early-expressed proteins**References** MacGregor *et al.* 2002

- A phase I clinical trial of a HIV-1 Env and Rev DNA vaccine with a CMV promoter was conducted and Th proliferative, CTL and Elispot responses monitored. The construct was modified for safety and included no LTRs or packaging signals. The vaccine strategy was safe, and elicited strong CD4-T cell responses, but not CD8 T-cell responses. Rev elicited strong Th responses, and is a early produced protein so may confer advantages.
- With a 300 ug dose, 4/6 individuals had a lymphocyte proliferation (LP) responses to gp120, 3/6 to Rev.
- With a 1000 ug dose, 4/6 individuals had a LP and 2/6 had IFN γ Elispot responses to gp160; 3/6 had LP, and 4/6 had IFN γ Elispot responses to Rev.

- No responses to three specific CTL epitopes were observed by Elispot in individuals with appropriate HLA. Some cytotoxic activity against whole protein was observed that was CD4+ T-cell mediated.

HXB2 Location Env**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Clerici *et al.* 2002b

- Specific immunity was compared in a two-year study of chronically HIV-1 infected i) HAART-naive patients who were not progressing and had strong immune responses, ii) newly treated patients followed for 24 months after initiation of HAART, iii) and long-term HAART patients who had been on HAART at least 12 months prior to the study.
- HAART naive patients had strongest proliferative responses at time zero, but long-term HAART patients the most significant increase in specific responses over the two year study period against HIV-1 gp160, influenza, and Candida. Similarly, IL-2 and IFN γ production in responses to gp160 was highest in the naive group at time zero, but increased the most in the long-term HAART treated patients.
- Short-term HAART patients showed a significant improvement in their CD4+ T cell count and a reduction of plasma viremia, and had augmented IL-7 production, which was slightly reduced in long-term HAART patients.

HXB2 Location Env**Author Location** gp160**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART**References** Palmer *et al.* 2002

- CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses.
- gp160 proliferation responses were apparent in 7/32 donors tested, but weaker overall, with a median value for the suppressed group not above that found for HIV seronegative controls.
- No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.

HXB2 Location Env**Author Location** gp120 (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 4/15 responders recognized this peptide, average SI = 4.4.

HXB2 Location Env**Author Location** gp120 (SF2)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** subtype comparisons, rate of progression**References** Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile.
- In a comparison of responses to HIV-1 proteins based on 10 non-progressors, 3 immunologically discordant, and 70 progressors, SIs were always much higher for non-progressors and immunologically discordant than progressors. Among the non-progressors, the responses to different antigens were greater using p24 peptides than native p24. Native p24, Nef, gp120 proteins, and Remune (gp120 depleted HIV-1, p24 is subtype G), had roughly comparable distributions of SI values from the non-progressors. Nef and gp120 responses were somewhat diminished in immunologically discordant patients.

HXB2 Location Env**Author Location** (BRU)**Epitope****Subtype** B**Immunogen** vaccine

Vector/Type: inactivated HIV **Strain:** B clade BRU **HIV component:** virus **Adjuvant:** Complete Freund's Adjuvant (CFA)

Species (MHC) mouse**References** Haas *et al.* 1991

- Of 5 mouse inbred lines tested: DBA/2 (H-2d, Ad, Ed), B10.A(4R) (H-2h4, Ak) and B10.A(5R) (H-2i5) showed particularly good CD4+ T cell proliferative responses to HIV proteins (gp160, gp120, p17, p24, Nef and RT), after vaccination with inactivated virus.
- B10.BR (H-2k, Ak, Ek) and C57BL/6 (H-2b and Ab) had weaker responses.

HXB2 Location Env**Author Location** gp120 (HIV-1,IIIB)**Epitope****Immunogen** HIV-1 exposed seronegative**Species (MHC)** human**Assay type** Cytokine production**Keywords** HIV exposed persistently seronegative (HEPS)**References** Fowke *et al.* 2000

- A cohort of Nairobi sex-workers were defined to be resistant to infection by virtue of remaining seronegative despite repeated high risk exposure. 24 were tested for HIV specific T-helper responses determined by IL-2 production *in vitro* in response to gp120 peptides or soluble gp120 protein.
- In 7/17 resistant women showed IL-2 stimulation ≥ 2.0 , and specific CTL responses were detected in 15/22 resistant women. 0/12 of the control low-risk subjects had detectable T-cell responses.

HXB2 Location Env**Author Location** gp160**Epitope****Immunogen** HIV-1 infection, vaccine**Vector/Type:** protein **HIV component:** gp160 **Adjuvant:** aluminum phosphate**Species (MHC)** human**Assay type** proliferation**Keywords** HAART, ART, immunotherapy**References** Hejdeman *et al.* 2003

- Groups of ten asymptomatic HAART-treated HIV-1 + patients with undetected viral loads were monitored for two years after i) no immunization, ii) immunization with rgp160, or iii) immunization with tetanus. Ten HIV-1- volunteers were immunized with tetanus as a control. Results were compared with an rgp160 group tested before HAART was available. The HAART-treated group had increased magnitude and duration of proliferative response to rgp160, maintaining the response for the two year study period. CD4 T-cell responses to tetanus were also improved in the HAART group.
- The recall response to tetanus toxoid and tuberculin were boosted by the rgp160 immunization, particularly in the HAART-treated group.

HXB2 Location Env**Author Location****Epitope****Immunogen** HIV-1 exposed seronegative

Species (MHC)**Assay type** Cytokine production**Keywords** HIV exposed persistently seronegative (HEPS), acute/early infection, early treatment**References** Puro *et al.* 2000

- This was a case report of a health care worker who had an percutaneous injury and exposure to HIV, and was immediately given combination therapy. The individual remained HIV Ab negative, but had transiently detectable viral RNA 2-3 weeks after the exposure. 58 weeks after exposure a Th response was detected by IL-2 production in response to HIV Env peptides.

HXB2 Location Env**Author Location****Epitope****Immunogen** vaccine*Vector/Type:* fowlpoxvirus, DNA prime with virus-like particle (VLP) boost *Strain:* B clade 89.6 *HIV component:* Env, Gag-Pol**Species (MHC)** rabbit**Assay type** Cytokine production**Keywords** Th1, Th2**References** Radaelli *et al.* 2003

- Rabbits were immunized with fowlpox recombinant vectors or expression plasmids, which express either SIVmac239 gag/pol or HIV-1 env 89.6P genes, and then boosted with virus-like particles (VLPs)(gag/pol SIV with HIV env 89.6).
- A lymphoproliferative Th0 profile response and homologous neutralizing Ab were seen in all three groups. The pcDNA3gag/pol SIV construct was more efficient at producing Abs than the fowlpox construct, although the fowlpox env89.6 construct elicited good humoral and cellular responses. VLP boosting was shown to be efficacious; the pseudoviral structure of the VLP providing a more natural protein conformational was considered helpful for eliciting long term memory cells.

HXB2 Location Env**Author Location** gp160**Epitope****Subtype** B**Immunogen** HIV-1 infection, vaccine*Vector/Type:* canarypox prime with gp160 boost *Strain:* B clade MN/LAI-2 *HIV component:* gp160**Species (MHC)** human**Assay type** proliferation**Keywords** vaccine-specific epitope characteristics, vaccine-induced epitopes**References** Ratto-Kim *et al.* 2003

- The CD4+ T-helper response to vaccinees given ALVAC-HIV(vCP205) alone, rgp160 MN/LAI-2 alone, or the two combined in a prime-boost was investigated by establishing T cell lines and comparing proliferative responses to a series of peptides (15 mers overlapping by 10) spanning autologous gp160 MN/LAI-2. Th responses against Env during natural HIV-1 infection were also studied.
- Broad, strong T-helper responses scattered across the Env were obtained from volunteers who received a prime boost vCP205 + rgp160MN/LAI-2, while those receiving rgp160 responded to fewer peptides, and vCP205 to very few peptides.

- HIV-1 + volunteers had less breadth and amplitude of Th responses than vaccinees that got the prime-boost vaccine, although T-cell lines were readily generated from HIV+ individuals. Some vaccinees targeted C1 and C5, while infected individuals did not, and some infected individuals targeted V3, while vaccinees did not.
- The authors note that the differences in response may be contributed to by the fact the peptides used to screen the responses were the same as the vaccine strain, and different than the strains in the natural infection, but that there also may be real immunological differences in the two scenarios of vaccine versus natural infection.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)****Assay type** proliferation**Keywords** HAART, ART**References** Sullivan *et al.* 2003

- Lymphoproliferative responses to HIV antigens p24, gp120 and Nef were enhanced in eight patients who were switched from protease inhibitors to non-nucleoside reverse transcriptase inhibitors.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** Cytokine production, proliferation**Keywords** HAART, ART**References** Hardy *et al.* 2003

- Upon initiating HAART, CD4+ T cell proliferative responses in 36 patients were restored to specific antigens, mitogens, and IL-2. Restored recall responses were largely to persistent antigens, and not to HIV-1 or new antigens, and recall responses were associated with IL-2, not IL-4 production.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** review, Th1, Th2, immune dysfunction**References** Becker 2004b

- The review suggests HIV-1 shed gp120 virions can act as an allergen, inducing Th2 cytokine production, in particular IL-4, by Fc epsilon RI+ hematopoietic cells. This could inhibit IgG production and CTL responses, and inactivate Th1 cells. New vaccination strategies employing IL-4 inhibitors and anti-allergen drugs are discussed.

HXB2 Location Env**Author Location** gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** review, Th1, Th2, immune dysfunction

References Becker 2004a

- Review raises the possibility that the switch from Th1 to Th2 activity along with an increase in IL-4 and IgE production in HIV-1 infected patients are an allergic response to HIV-1 protein gp120. Alternative treatments to block Th2 cytokine production, e.g with Il-4 receptor inhibitors, are discussed.

Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.

- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Immunogen vaccine
Vector/Type: peptide prime with protein boost
Strain: B clade BRU *HIV component:* Nef
Species (MHC) chimpanzee
References Estaquier *et al.* 1992

- Peptide alone could stimulate monkey T-cells in the absence of carrier protein – required carrier protein in rat.

HXB2 Location Nef (104–121)
Author Location Nef (104–121 B Consensus)
Epitope QKRQDILDWVYHTQGYF
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country United States.
Assay type CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.

- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Assay type proliferation, Flow cytometric T-cell cytokine assay

Keywords memory cells

References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN- γ , but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN- γ only-producing cells are short lived.

Keywords HAART, ART, rate of progression

References Kahn *et al.* 2000

- No benefit was observed in terms of progression free survival for HIV-1 patients on ART given vaccinations with HIV-1 antigen (N=1,262) versus those vaccinated with placebo (N=1,265). There was no statistically different outcome in HIV RNA, CD4 percentage, or body weight. HIV-1 ART patients that were vaccinated did have higher absolute CD4 counts.

- A cellular automata model was used to model the dynamics of HIV-1 infection and progression to disease. The model suggests the long asymptomatic period is due to immune escape mutants with lower viral fitness, and with AIDS resulting from a drastic reduction of the T-helper cell reservoir.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** vaccine**Species (MHC)****Keywords** dynamics, kinetics**References** Altes *et al.* 2002

- This study employs a mathematical model to study the consequences of increasing the T-helper response through a vaccine, which would have counter-balancing effects in a new infection: a more intense response provides more help but also more target cells. The model indicates that if the infecting virus had a low replication rate, then CTLp and CD4 helper cells could control an infection. Only a vaccine that could increase CTL responsiveness could reduce viral set point with observed replication rates.
- A CD4+ T-cell response without maintained CTL response was deleterious in this model.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)****Keywords** dynamics, HAART, ART, rate of progression**References** Bajaria *et al.* 2002

- This paper presents a dynamical model of HIV infection and progression that includes CD4 T-cell naive and memory populations distributed between the peripheral blood and the lymph nodes, as well as the effects of HAART. Increasing viral replication and infectivity and decreasing T-cell immunity had impact on the rate of disease progression in this model.

Species (MHC) mouse**Keywords** Th1, Th2**References** Ayash-Rashkovsky *et al.* 2002

- Parasitic helminthic infections in humans, common in parts of Africa and Asia, can shift immune responses to Th2 responses. To model this, BALB/c mice were infected with the parasite *Schistosoma mansoni*, and the infected mice showed a dominant Th2 immune response. Vaccination with gp120-depleted HIV-1 viral particles and incomplete Freund's adjuvant induced Th2 responses in these mice, but this could be shifted towards a Th1 profile when CpG oligodeoxynucleotide was added to the vaccine as an immunostimulatory agent.

HXB2 Location HIV-1**Author Location** HIV-1 except gp120**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, rate of progression**References** Ghanekar *et al.* 2001

- 12 long term non-progressors (>10 years) went on HAART, while 14 elected not to go on HAART. After a year on HAART, higher frequencies and absolute numbers of HIV-specific memory CD4+ T-cells were observed in untreated patients than patients receiving HAART therapy, tested by stimulation an proliferation responses to HIV Remune antigen (gp120 depleted vaccine).
- These results indicate a control of viral replication in therapy-naïve patients may be mediated by their ability to respond to recall viral antigen, and that the diminished response in treated patients may contribute to viral rebound.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, Th2**References** Pido-Lopez *et al.* 2002

- The thymic output in HAART-treated HIV-1 infected patients with progressive disease was studied. One patient also receiving steroid treatment therapy had a weak response in a sjTREC assay indicating a dysfunctional thymus, while four patients not on steroids had clear positive sjTREC readings after HAART. Stimulation of PBMC with multiple recall antigens including gp120, p24 and Nef and mitogens, and revealed that in the patient treated with steroids there was and induction of a Th2 type response indicated by increased levels of IL-4 secretion in response to antigen.

- A comparison of T cell responses in HIV-1 and HIV-2 infected asymptomatic patients with CD4+ cell counts of 20% showed no significant difference between both groups. Viral loads were roughly 20 times greater in HIV-1 positive patients than HIV-2 positive patients.
- 10/20 (50%) of HIV-1 infected patients demonstrated proliferative responses with SI greater than 1.4 to gp120, and 11/20 to p24. 8/29 (29%) of HIV-2 infected patients recognized gp105, and 8/29 (29%) p26. Cytokine responses in both groups did not differ.
- 9/21 (43%) of HIV-1 + and 15/30 (50%) of HIV-2 + patients had cytotoxic T cell responses to Gag, and 3/21 (14%) HIV-1 + and 8/30 (27%) HIV-2 + responded to Pol.

HXB2 Location HIV-1**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Country** Spain.**Assay type** proliferation, Intracellular cytokine staining**Keywords** HAART, ART**References** López *et al.* 2004

- A clinical trial compared chronically HIV-1 infected patients who had replaced HAART with didanosine (ddI) and hydroxyurea (HU) were followed for 12 months to an untreated HIV+ group and a group that continued on HAART.
- Approximately 20% of the patients treated with ddI-HU had detectable CD4+ T-cell proliferative responses to Gag and Env in contrast to drug-naive and HAART treated HIV-infected patients, who had few or no responses.
- HIV-specific CD8+ T-cell responses were higher in ddI-HU treated patients than HAART treated patients, even in individuals that maintained undetectable viral loads.

HXB2 Location HIV-1**Author Location** Tat (89.6)**Epitope****Immunogen** vaccine*Vector/Type:* DNA prime with protein boost, ISCOM *Strain:* B clade IIIB, SIV *HIV component:* Env, Gag, Tat *Adjuvant:* Immune stimulating complexes (ISCOM)**Species (MHC)** macaque**Assay type** Cytokine production, proliferation, CD8 T-cell Elispot - IFN γ **Keywords** vaccine-specific epitope characteristics, Th1, Th2, vaccine antigen design**References** Mooij *et al.* 2004

- This study compared vaccinating with Tat alone to vaccinating with Tat+Gag+Env. Rhesus macaques (*Macaca mulatta*) were intramuscularly immunized with a combination of DNA plasmids (HIV-1 IIIB expressing Tat, SHIV-1 89.6P expressing gp120 and SIV mac239 expressing Gag, followed by three boosts with HIV-1 Tat (IIIB) and Env (89.6, gp140) SIV Gag protein. Animals with multi-antigen vaccination had reduced viremia increased CD4+ T-cell counts.

- Tat-Env-Gag immunized animals had weaker Tat-specific Th responses in comparison to animals immunized with Tat alone; but the response to Tat alone was a Th2 response that did not protect from challenge.
- Immunization with Tat-Env-Gag boosted proliferation of Gag-specific IFN- γ and IL-2 producing cells in 3/4 animals (Th1 and Th2 responses) and induced a Th2-immune response (IL-2, IL-4) to Env.
- CD4+ T helper responses to Tat-Env-Gag immunization were correlated with control and reduction of viremia, suggesting a combination of Th1 and Th2 vaccine responses to multiple HIV antigens is advantageous.

Part IV

HIV Antibody Binding Sites

B Cell

IV-A

Summary

This part summarizes HIV-specific antibodies (Abs) arranged sequentially according to the location of their binding domain, organized by protein. We attempted to make this part as comprehensive as possible. For the monoclonal antibodies (MAbs) capable of binding to linear peptides, we require that the binding site be contained within a region of 30 or so amino acids to define the epitope, but not that the precise boundaries be defined. MAbs that do not bind to defined linear peptides are grouped by category at the end of each protein. Antibody categories, for example CD4 binding site (CD4BS) antibodies, are also noted in the index at the beginning of this part. Studies of polyclonal Ab responses are also included. Responses that are just characterized by binding to a protein, with no known specific binding site, are listed at the end of each protein. For more recent updates, epitope sequence alignments, and search capabilities, please see our web site: <http://www.hiv.lanl.gov/content/immunology>.

IV-A-1 Indices

Three indices are provided. The first provides a concise list of anti-HIV-1 MAbs by cross-competition category, with both discontinuous epitopes (for example, CD4BS) and some well known linear epitopes (for example, cluster I) summarized. The second lists the MAbs' IDs in alphabetical order so one can find their location in the table. The third is a listing by order of appearance in the tables.

IV-A-2 Tables

Each MAb has a twelve-part basic entry:

Number: Order of appearance in this table.

MAb ID: The name of the monoclonal antibody with synonyms in parentheses. MAbs often have several names. For example, punctuation can be lost and names are often shortened (M-70 in one paper can be M70 in another). Polyclonal responses are listed as "polyclonal" in this field.

HXB2 location: Position of the antibody binding site relative to the viral strain HXB2 (GenBank Accession Number K03455), which is used as a reference strain throughout this publication. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation, the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to

the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: <http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html>.

Author location: The amino acid positions of the epitope boundaries and the reference sequence used to define the epitope are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases, position numbers were provided but the reference sequence identification was not. Because of HIV-1's variability, position numbers require a reference strain to be meaningful. Binding sites that cannot be defined through peptide binding or interference studies are labeled as discontinuous. The approximate location on the protein, sequence number, and reference sequence are listed.

Sequence: The amino acid sequence of the binding region of interest, based on the reference strain used in the study defining the binding site. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Subtype: The subtype under study, generally not specified for B subtype.

Neutralizing: **L:** neutralizes lab strains. **P:** neutralizes at least some primary isolates. **no:** does not neutralize. No information in this field means that neutralization was either not discussed or unresolved in the primary publications referring to the MAb.

Immunogen: The antigenic stimulus of the original B cell response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted on a separate line,

and additional information about the vaccine antigen is provided as available.

Species (Isotype): The host in which the antibody was generated, and the isotype of the antibody.

Research Contact: Information about who produced an antibody, how to obtain it, or who should receive credit.

Country: The country where the samples were obtained—generally not specified if the study was conducted in the United States.

References: All publications that we could find that refer to the use of a specific monoclonal antibody. First is a list of all references. Additional details for some of the older references can be found in Part V, although we have tried to keep the entries self-contained since 1997.

Keywords: Keywords for antibody entries were initiated in 2004. The keywords are listed when available as part of the main entry, and also follow the note in bold type so references pertaining to particular types of studies can be found quickly. The keywords include acute/early infection; ADCC; adjuvant comparison; anti-idiotypic; antibody binding site definition and exposure; antibody generation; antibody interactions; antibody sequence, variable domain; assay development; assay standardization/improvement; autologous responses; binding affinity; brain/CSF; co-receptor; complement; computational epitope prediction; enhancing activity; escape; genital and mucosal immunity; HAART, ART; HIV exposed persistently seronegative (HEPS); immunodominance; immunoprophylaxis; immunotherapy; immunotoxin; inter-clade comparisons; isotype switch; kinetics; mimics; mimotopes; mother-to-infant transmission; mucosal immunity; neutralization potency; rate of progression; responses in children; reversion, viral fitness; review; structure; subtype comparisons; superinfection; Th1; Th2; vaccine antigen design; vaccine-induced epitopes; vaccine-specific epitope characteristics; and variant cross-recognition or cross-neutralization.

Notes: Describe the context of each study, and what was learned about the antibody in the study.

IV-A-3 HIV protein binding site maps

The names of MAbs and the location of well characterized linear binding sites of 21 amino acids or less are indicated relative to the protein sequences of the HXB2 clone. This map is meant to provide the relative location of epitopes on a given protein, but the HXB2 sequence may not actually bind to the MAb of interest, as it may vary relative to the sequence for which the epitope was defined. Above each linear binding site, the MAb name is given followed by the species in parentheses. Human is represented by 'h', non-human primate by 'p', mouse by 'm', and others by 'o'. More precise species designations for any given MAb can be found using the web search interface or in the tables in this part.

IV-A-4 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the Ab search tool at <http://www.hiv.lanl.gov/content/immunology>. The master alignment files from which the epitope alignments were created are available at our web site at http://www.hiv.lanl.gov/content/hiv-db/ALIGN_CURRENT/ALIGN-INDEX.html.

IV-B

Cross Reference Listing of MAbs

IV-B-1 MAbs by binding type

Cross reference by protein and binding type of MAb names and their order of appearance in the tables.

Binding type	MAb ID (No.)
p17	
C-term	sc-FV p17 (34)
p24	
C-term	13B5 (116)
Protease	
N-term	1696 (176)
flap region	F11.2.32 (178)
RT	
RT palm domain	6B9 (204)
RT thumb domain	5F (205), 5G (206), 7C4 (207)
gp120 C2	polyclonal (184)
Integrase	
Integrase DNA binding domain	5D9 (224), 2-19 (227), 8-22 (228), 4-20 (229), 6-19 (230)
Integrase catalytic core	7-16 (221), 4F6 (222)
N-term	1C4 (208), 2C11 (209), 2E3 (210), 3E11 (211), 3F9 (212), 5F8 (213), 6G5 (214), 7B6 (215), 7C6 (216), 6C5 (217), 4D6 (220)
gp120 V3	polyclonal (235)
Pol	
C-term	33 (256), F-6 (257)
Vif	
C-term	TG001 (259)
Tat	
C-term	polyclonal (263), polyclonal (274), polyclonal (275), 1D2F11 (277), 2D9E7 (278), 4B4C4 (279), 5G7D8 (280), NT2/4D5.24 (282), polyclonal (283), 2D9D5 (293), polyclonal (294), polyclonal (295), polyclonal (296)
N-term	polyclonal (263), TA9 (265), TD84 (266), TE135 (267), polyclonal (268), NT3/2D1.1 (269), 1D9D5 (271), polyclonal (274), polyclonal (275), polyclonal (283), polyclonal (294), polyclonal (295), polyclonal (296), G1 (297), G2 (298), J1 (299), TC15 (300), polyclonal (301), polyclonal (302)

IV-C

HIV Antibodies Tables

All HIV MAbs and polyclonal Abs that bind to linear epitopes 30 amino acids or less in length are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location, then by antibody type, and finally by antibody name. Abs that bind to conformational epitopes or with unknown epitopes are listed at the end of each protein section.

IV-C-1 Gag p17 Antibodies

No. 1
MAb ID L14.17
HXB2 Location p17 (11–25)
Author Location p17 (11–25 BRU)
Epitope GELDRWEKIRLRPGG
Neutralizing no
Immunogen vaccine
Vector/Type: viral lysate *Strain:* B clade BRU *HIV component:* HIV-1
Species (Isotype) mouse (IgG)
References Robert-Hebmann *et al.* 1992a; Robert-Hebmann *et al.* 1992b; Tatsumi *et al.* 1990

No. 2
MAb ID polyclonal
HXB2 Location p17 (11–25)
Author Location p17 (11–25 LAI)
Epitope GELDRWEKIRLRPGG
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein, virus-like particle (VLP)
Strain: B clade LAI *HIV component:* Gag, p17 Gag, p24 Gag *Adjuvant:* Complete Freund's Adjuvant (CFA)

Species (Isotype) mouse
References Truong *et al.* 1997

- An ELISA assay was used to study a panel of Gag peptides – mature p24 CA epitopes mapped to residues 176-192, 201-218, 233-253, 285-304, and were recognized by antibodies elicited by rp24CA – one p17MA epitope, residues 11-25, and one p24CA epitope, residues 176-192, were recognized by antibodies raised against anti-p55 virus-like particles, suggesting a different antigenic properties for p24CA and p17MA antibodies depending on whether they are produced against the mature soluble protein or the immature assembled form of the gag proteins. Truong *et al.* [1997]

No. 3
MAb ID 32/5.8.42

HXB2 Location p17 (12–19)
Author Location p17 (12–19 IIIB)
Epitope ELDRWEKI+ALDKIE
Neutralizing no
Immunogen vaccine
Vector/Type: viral lysate
Species (Isotype) mouse (IgG)
References Papsidero *et al.* 1989

- 32/5.8.42: Binds to two discontinuous regions, positions 12-19 and 100-105, peptides ELDRWEKI and ALDKIE – inhibited infectivity of cell free virus. Papsidero *et al.* [1989]

No. 4
MAb ID 32/5.8.42
HXB2 Location p17 (12–19)
Author Location p17 (IIIB)
Epitope ELDRWEKI+ALDKIE
Neutralizing no
Immunogen vaccine
Vector/Type: viral lysate *HIV component:* HIV-1
Species (Isotype) mouse (IgG)
References Papsidero *et al.* 1989

- 32/5.8.42: Inhibited infectivity of cell free virus – bound to two peptides, ELDRWEKI and ALDKIE, at positions 12-19 + 100-105. Papsidero *et al.* [1989]

No. 5
MAb ID HyHIV-1
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTTY
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-1: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 6
MAb ID HyHIV-2
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTTY

Neutralizing no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-2: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 7

MAb ID HyHIV-3**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLY**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-3: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 8

MAb ID HyHIV-4**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLY?**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-4: epitope uncertain, based on the best estimate from JMH1 sequence– Ka is 1.8×10^7 M⁻¹ for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface. Ota *et al.* [1998]
- HyHIV-4: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 9

MAb ID HyHIV-5**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLY**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-5: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 10

MAb ID HyHIV-6**HXB2 Location** p17 (12–29)**Author Location** p17 (12–29 JMH1)**Epitope** ELDKWEKIRLRPGGKTLY**Neutralizing** no**Immunogen** vaccine*Vector/Type:* protein *HIV component:* p17
Gag**Species (Isotype)** mouse (IgG1)**References** Ota & Ueda 1998; Liu *et al.* 1995

Ota & Ueda [1998]

No. 11

MAb ID 32/1.24.89**HXB2 Location** p17 (17–22)**Author Location** p17 (17–22 IIIB)**Epitope** EKIRLR**Neutralizing** L**Immunogen** vaccine*Vector/Type:* viral lysate**Species (Isotype)** mouse (IgG)**References** Papsidero *et al.* 1989

- 32/1.24.89: Inhibited infectivity of cell free virus. Papsidero *et al.* [1989]

No. 12

MAb ID 3B10**HXB2 Location** p17 (19–38)**Author Location** p17 (19–38 SIVmac)**Epitope** IRLPGGKKKYMLKHVVWAA**Neutralizing** no**Immunogen** vaccine*Vector/Type:* inactivated HIV *Strain:* B
clade AGM TYO-7 *HIV component:* HIV-1**Species (Isotype)** mouse (IgG1)**References** Otteken *et al.* 1992

- 3B10: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H), SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one conserved immunogenic epitope recognized serologically. Otteken *et al.* [1992]

No. 13

MAb ID 3E11

HXB2 Location p17 (19–38)

Author Location p17 (19–38 SIVmac)

Epitope IRLPGGKKKYMLKHVVWAA

Neutralizing no

Immunogen vaccine

Vector/Type: inactivated HIV *Strain:* B clade AGM TYO-7 *HIV component:* HIV-1

Species (Isotype) mouse (IgG1)

References Nilsen *et al.* 1996; Otteken *et al.* 1992

- 3E11: There is another MAb with this ID that recognizes integrase. Nilsen *et al.* [1996]
- 3E11: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H), SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one highly conserved immunogenic epitope. Otteken *et al.* [1992]

No. 14

MAb ID 8H10

HXB2 Location p17 (30–52)

Author Location p17 (30–52 JMH1)

Epitope KLKHIVWASRELERFAVNPGLLE

Neutralizing

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade JMH-1 *HIV component:* p17 Gag *Adjuvant:* BSA

Species (Isotype) mouse (IgM)

References Ota & Ueda 1999; Ota *et al.* 1999

- 8H10: The p17 MAb also can bind to the V3 loop. Ota *et al.* [1999]
- 8H10: Inhibits viral replication of the HIV-1 infected MT-4 cells by decreasing p17 DNA levels in the infected cells, and the effect of growing the 8H10 hybridoma in co-culture with HIV-1 infected MT-4 cells was studied. Ota & Ueda [1999]

No. 15

MAb ID HyHIV-21

HXB2 Location p17 (30–52)

Author Location p17 (30–52 JMH1)

Epitope KLKHIIWASRELERFAVNPGLLE

Neutralizing no

Immunogen vaccine

Vector/Type: protein *HIV component:* p17 Gag

Species (Isotype) mouse (IgG2a)

References Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-21: epitope uncertain, based on the best estimate from JMH1 sequence – Ka is 3.6×10^6 M-1 for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface – inhibited growth of HIV-1 JMH1 in MT-4 cells when added 24 hours after the initial culture. Ota *et al.* [1998]

No. 16

MAb ID B4f8

HXB2 Location p17 (51–65)

Author Location p17 (51–65)

Epitope LETSEGCRQILGQLQ

Neutralizing no

Immunogen vaccine

Vector/Type: HIV infected-cell lysate

Strain: B clade IIIB *HIV component:*

HIV-1

Species (Isotype) rat (IgG2a)

References Shang *et al.* 1991

- -B4f8: Did not bind live infected cells, only cells that had been made permeable with acetone. Shang *et al.* [1991]

No. 17

MAb ID HyHIV-22

HXB2 Location p17 (52–83)

Author Location p17 (53–87 JMH1)

Epitope ETSEGCRQLGQRQPSLQTGSEELRSYNTIH

Neutralizing no

Immunogen vaccine

Vector/Type: protein *HIV component:* p17 Gag

Species (Isotype) mouse (IgG1)

References Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-22: epitope uncertain, based on the best estimate from JMH1 sequence – stains the surface of infected cells indicating the antigen is exposed at the cell surface – Ka is 2.3×10^5 M-1 for rec p17. Ota *et al.* [1998]

No. 18

MAb ID 12H-D3b3

HXB2 Location p17 (62–78)

Author Location p17 (62–78)

Epitope GQLQPSLQTGSEELRSL

Neutralizing no

Immunogen vaccine

Vector/Type: HIV infected-cell lysate

Strain: B clade IIIB *HIV component:*

HIV-1

Species (Isotype) rat (IgG2a)

References Shang *et al.* 1991

- 12H-D3b3: Did not bind live infected cells, only cells that had been made permeable with acetone. Shang *et al.* [1991]

No. 19

MAb ID 12G-A8g2

HXB2 Location p17 (86–115)

Author Location p17 (86–115)

Epitope YCVHQRIEIKDTKEALDKIEEQNKSKKKA

Neutralizing no

Immunogen vaccine

Vector/Type: HIV infected-cell lysate

Strain: B clade IIIB *HIV component:*

HIV-1

Species (Isotype) rat (IgG2a)

References Maksiutov *et al.* 2002; Shang *et al.* 1991

- 12G-A8g2: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKKGQ. Maksiutov *et al.* [2002]
- 12G-A8g2: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. Shang *et al.* [1991]

No. 20

MAB ID 12G-D7h11

HXB2 Location p17 (86–115)

Author Location p17 (86–115)

Epitope YCVHQRIEIKDTKEALDKIEEEQNKSKKKA

Neutralizing no

Immunogen vaccine

Vector/Type: HIV infected-cell lysate

Strain: B clade IIIB HIV component: HIV-1

Species (Isotype) rat (IgG2a)

References Maksiutov *et al.* 2002; Shang *et al.* 1991

- 12G-D7h11: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKKGQ. Maksiutov *et al.* [2002]
- 12G-D7h11: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. Shang *et al.* [1991]

No. 21

MAB ID 12G-H1c7

HXB2 Location p17 (86–115)

Author Location p17 (86–115)

Epitope YCVHQRIEIKDTKEALDKIEEEQNKSKKKA

Neutralizing no

Immunogen vaccine

Vector/Type: HIV infected-cell lysate

Strain: B clade IIIB HIV component: HIV-1

Species (Isotype) rat (IgG)

References Maksiutov *et al.* 2002; Shang *et al.* 1991

- 12G-H1c7: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKKGQ. Maksiutov *et al.* [2002]
- 12G-H1c7: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. Shang *et al.* [1991]

No. 22

MAB ID 12I-D12g2

HXB2 Location p17 (86–115)

Author Location p17 (86–115)

Epitope YCVHQRIEIKDTKEALDKIEEEQNKSKKKA

Neutralizing no

Immunogen vaccine

Vector/Type: HIV infected-cell lysate

Strain: B clade IIIB HIV component: HIV-1

Species (Isotype) rat (IgG2a)

References Maksiutov *et al.* 2002; Shang *et al.* 1991

- 12I-D12g2: This epitope is similar to a fragment of the human protein CD40 ligand TNF-related activation protein (T-cell antigen GP39) (CD154), LDKIEDERN, as well as to a fragment of Lens-epithelium-derived growth factor, DIITEEDKSKKKKGQ. Maksiutov *et al.* [2002]
- 12I-D12g2: Bound to 30-mer, but not to internal peptides – did not bind live infected cells – antigenic domain known as HPG30. Shang *et al.* [1991]

No. 23

MAB ID polyclonal

HXB2 Location p17 (86–115)

Epitope YSVHQRIDVKDTKEALEKIEEEQNKSKKKA

Neutralizing L

Immunogen vaccine

Vector/Type: peptide HIV component: p17

Gag Adjuvant: Cholera toxin (CT)

Species (Isotype) mouse (IgA)

References Bukawa *et al.* 1995

- Polyclonal secretory IgA antibody raised by oral mucosal immunization is able to neutralize IIIB, SF2, and MN – HIV-1 neutralization may be due to the V3, CD4 or HPG30 component of the multicomponent peptide immunogen. Bukawa *et al.* [1995]

No. 24

MAB ID HyHIV-15

HXB2 Location p17 (87–115)

Author Location p17 (87–115 JMH1)

Epitope SVHQRIDVKDTKEALEKIEEEQNKSKKKA?

Neutralizing L

Immunogen vaccine

Vector/Type: protein HIV component: p17

Gag

Species (Isotype) mouse (IgG1)

References Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-15: epitope uncertain, based on the best estimate from JMH1 sequence – Ka is 1.4×10^7 M⁻¹ for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface – inhibited growth of HIV-1 JMH1 in MT-4 cells when added 24 hours after the initial culture. Ota *et al.* [1998]

No. 25

MAB ID 11H9

Neutralizing L

Immunogen vaccine

Strain: B clade IIIB

Species (Isotype) mouse (IgG)

References Levin *et al.* 1997; Robert-Hebmann *et al.* 1992a; Robert-Hebmann *et al.* 1992b; Niedrig *et al.* 1989

- 3-H-7: Called 3H7 – using a bicistronic vector, an intracellular Fab intrabody, 3H7, can inhibit HIV-1 infection when expressed in the cytoplasm of dividing CD4+ T cells – HXBI-II B and SI primary isolate virions from 3H7 expressing cells were far less infectious – 3H7 intrabody acts both at the stage of nuclear import and virus particle assembly. Levin *et al.* [1997]
- 3-H-7: No cross-reactivity with HIV-2 ROD or SIV MAC by immunoblot. Niedrig *et al.* [1989]

IV-C-6 Gag Antibodies

No. 135
MAb ID polyclonal
HXB2 Location Gag (24–34)
Author Location Gag
Epitope GKTHYMINPL
Neutralizing
Immunogen vaccine
Vector/Type: peptide *HIV component:* Env,
 Gag, Nef, Pol
Species (Isotype) rabbit
References Li *et al.* 2005
Keywords mimics

- In early HIV-1 infection, patients develop autoimmune thrombocytopenia, with Ab directed against beta3 integrin, GPIIIa49-66. Panning with a 7-mer phage display library using rabbit anti-GPIIIa49-66 (CAPESIEFPVSEARVLED), the immunodominant epitope of the identified potential molecular mimicry epitopes with HIV-1 Env (sklFDeGLFn, elfnkTIIFP), Pol (geAPEFPskq), Gag (gktHyMINPI) and Nef (qeeeeVgFPVt, qeeeeVgFPVt, edeGigFPVr, fkLVPVSEae, ssnTPTTNa) proteins. Pools of these peptides elicited Ab in rabbits that induce platelet oxidation in vitro and thrombocytopenia in vivo upon passive transfer. Nef (qeeeeVgFPVt), Gag (gktHyMINPI), and Nef (fkLVPVSEae) all overlap with known HIV-1 epitopes. Li *et al.* [2005] (**mimics**)

Immunogen vaccine

Vector/Type: DNA with CMV promotor, DNA with CMV/MCK hybrid promotor, DNA with MCK promotor

Species (Isotype)

References Bojak *et al.* 2002a

- 16/4/2: The ability of three different promoters to induce Gag specific immune responses was compared. The cytomegalovirus (CMV) early gene promoter, which allows constitutive expression in different cells of host tissue, the tissue specific muscle creatine kinase (MCK) promoter, which may be restricted to differentiated, multinucleated myofibers and so safer, and a hybrid MCK/CMV promoter – intramuscular immunization of BALB/c mice utilizing the MCK promoter in combination with a codon optimized gag gene generated humoral (IgG1 (Th1) and IgG2a (Th2)) and CTL immune responses against HIV-1 Gag, however, the quantified immune parameters were clearly reduced as compared to CMV promotor-driven Gag expression. Bojak *et al.* [2002a]

Immunogen HIV-1 infection

Species (Isotype) human

References Montefiori *et al.* 2001

- In 7/9 patients in whom HAART was initiated during early seroconversion, NAb to autologous strains were not found immediately following treatment interruption after 1-3 years, and Env and Gag Abs were low or undetected by ELISA indicating, that early HAART suppresses the normal antibody response to HIV-1, presumably by limiting the concentration of viral antigens needed to drive B-cell maturation – in 3 patients with a viral rebound autologous NAb rapidly appeared and correlated with spontaneous down-regulation of viremia – prolonged control of viremia after stopping treatment persisted in the absence of detectable NAb, suggesting that cellular immune responses alone can control viremia under certain circumstances – these results support the notion that virus-specific B-cell priming, combined with CD8+ CTL induction, may be beneficial for HIV-1 vaccines that aim to suppress viremia in the absence of complete protection to prevent disease and reduce the rate of virus transmission. Keywords acute/early infection, assay development

- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLLGIWGC-SGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by

EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. This assay can be used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development, acute/early infection**)

- A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from *Bacillus stearothermophilus* has been engineered to display 60 copies of one or more epitopes on a single molecule. An E2DISP scaffold which displayed pep23, a 15-residue B and T helper HIV-1 RT epitope elicited a pep23-specific T-helper response *in vitro*. The E2DISP scaffold displaying peptide RT2, which is a CTL HIV-1 RT epitope, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to both the class I and class II processing pathways. The Th response in vaccinated mice supported Pep23-specific IgG responses. Epitope
Subtype B

Neutralizing

Immunogen HIV-1 infection

Species (Isotype) human

Research Contact Amon Hizi, Sackler School of Medicine, Tel Aviv, Isreal

References Herschhorn *et al.* 2003

Keywords antibody generation, antibody sequence, variable domain, immunotherapy

- 5B11: One of five human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. Herschhorn *et al.* [2003] (**antibody generation, immunotherapy, antibody sequence, variable domain**)

Immunogen HIV-1 infection
Species (Isotype) human
Ab Type gp120 V3
References Barin *et al.* 2005
Country France
Keywords acute/early infection, assay development
 • A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLGIWGC-SGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. Integrase antibodies are among the last to appear after infection. This assay can be used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development, acute/early infection**)

References Schreiber *et al.* 2005; Yi *et al.* 2002; Yi & Skalka 2000; Levy-Mintz *et al.* 1996; Bizub-Bender *et al.* 1994
Keywords antibody binding site definition and exposure, computational epitope prediction, mimotopes, structure

- 33: Called Fab33. A new computer program designed to recognize conformational epitopes in 3D structures that correspond to linear peptide mimotopes (3DEX) was tested using the known conformational epitope of this Fab. 223F, 224R, 226Y, 244K, 267I, and 268I, previously defined as the epitope from NMR structural studies (Yi2002) were confirmed, along with two additional amino acids, (A265 and K266). Schreiber *et al.* [2005] (**antibody binding site definition and exposure, mimotopes, computational epitope prediction, structure**)
- 33: Called mAb33 – mAb33 and mAb32 compete for binding to the C-term domain of Integrase – while mAb32 only weakly inhibits IN activity, mAb33 inhibits strongly, mAb32 has a lower affinity than mAb33, and Fab32 does not inhibit at all while Fab33 inhibits catalytic activity and DNA binding – heteronuclear NMR indicated eight residues of Integrase are immobilized upon Fab33 binding, two in the core of the protein, and 6 on the outer face that form a contiguous patch likely to contain the epitope – 223F, 224R, 226Y, 244K, 267I, and 268I, which may be a useful target for drug design – the Fab33-IN

complex is far more soluble than IN alone and may be useful for crystallization. Yi *et al.* [2002] (**antibody binding site definition and exposure**)

- 33: Limited proteolysis combined with mass spectrometric analysis were used to define the binding site for Fab32, but Fab33 binding to the Integrase C-term domain left it resistant to proteolytic digestion. Yi & Skalka [2000]
- 33: Used for the creation of single chain variable antibody fragments (SFvs) for internal cellular expression – neutralization of IN activity prior to integration, whether the Ab is expressed in the nucleolus or the cytoplasm – relative binding affinity to IN: 12 > 17 = 33 > 21 > 4. Levy-Mintz *et al.* [1996]

- F-6: One of five human single chain Fv (ScFv) Abs isolated from an phage display library. F-6 was shown to bind to the carboxyl terminal segment of the p66 RT polypeptide, corresponding to RNase H. F-6 inhibited the DNA and RNA-dependent DNA polymerase (RDDP) activities of HIV-1 RT; two others, 6E9 and 5B11, inhibited RDDP and so have possible therapeutic potential. To pinpoint the mechanism of inhibition, three peptides were synthesized corresponding to the CDR3 sequences of F-6, and a cyclic version of the CDR H3 region bound to purified RT and blocked RDDP. Author Location Vpr (89.6)
Epitope
Subtype B
Neutralizing
Immunogen HIV-1 infection
Species (Isotype) human (IgG)
References Richardson *et al.* 2003
Country France
Keywords rate of progression

- Serum samples were obtained from the French GRIV (genetic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses, as both may contribute as extracellular proteins to pathogenesis. Serum anti-Vpr IgG responses were significantly higher in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) and unstable non-progressors (declined during a 20 month follow up), than fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). Serum anti-Tat IgG was found to be significantly higher in stable non-progressors compared to unstable non-progressors and fast progressors indicating that higher levels of serum anti-Tat IgG are associated with maintenance of non-progression status. Richardson *et al.* [2003] (**rate of progression**)

Vector/Type: protein *Strain:* B clade 89.6, B clade HxBc2 *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Species (Isotype) macaque (IgG)
Ab Type C-term, N-term, Tat basic region
References Silvera *et al.* 2002
Keywords antibody binding site definition and exposure, vaccine antigen design

- Anti-Tat and Tat toxoid responses were raised in rhesus macaques using HxBc2 and 89.6P Tat, and Tat toxoids. High anti-Tat IgG responses were observed in all animals, and helper responses were detected in 8/16, and IFN gamma CTL in 11/16.. Ab and proliferative responses were observed, and the truncated 86 amino acid IIIB Tat was more immunogenic than the full 102 amino acid Tat. Tat vaccinated animals when challenged with SHIV89.6 were infected despite a robust immune response. The most consistent reactions to the vaccinations were to peptides in regions: N-term, 1-15 (MEPVDRPLEPWKHPG), basic domain 46-60 (SYGRKRRRQRRRAHQ),

and 61-91, particularly C-term 76-90 (QPRGDPTGPKQKKK). Silvera *et al.* [2002] (**antibody binding site definition and exposure, vaccine antigen design**)

Species (Isotype) mouse (IgA, IgG)
References Borsutzky *et al.* 2003
Keywords adjuvant comparison, genital and mucosal immunity, immunodominance, mucosal immunity, Th1, Th2, vaccine-induced epitopes

- Intranasal immunization of BALB/c mice Tat with MALP-2 induced stronger immune responses than i.p. vaccination of Tat with IFA. Also i.n. MALP-2 vaccination favored Th1 responses, while i.p. IFA favored Th2. Ab, T help and CTL responses were observed. MALP-2 enhanced Tat-specific IgA responses in the lung and in the genital tract. Three linear Ab epitopes were recognized. The most frequent response (80% of vaginal lavage, 100% of sera and lung lavage) was to Tat peptide 1-20. The second strongest to Tat 46-60 (20% of vaginal lavage, 50% of lung lavage, 50% of sera). Finally, 50% of the sera of Tat+ IFA i.p. immunized mice recognized Tat 73-86. Ab Type N-term
References Noonan *et al.* 2003
Keywords immunotherapy, vaccine-specific epitope characteristics

• Intramuscular injection of Tat-toxoid induced high titers of anti-Tat reactivity in serum samples of six HIV-1 positive and of four HIV negative study subjects. Anti-Tat antibodies successfully blocked extracellular Tat from transactivating HIV Tat-sensitive promoters. The anti-Tat IgG response in sera from two healthy and HIV infected patients inhibited cell entry of synthetic Tat, thus blocking its functional activity. Additionally, the anti-Tat antibodies inhibited intercellular Tat transfer as demonstrated by a co-culture cell system. All HIV-1 infected patients had Ab responses to the N-term region of Tat, and 4/4 HIV-1 + and 5/6 HIV-1 negative patients responded to the basic domain. Several additional peptides were recognized either exclusively or more commonly in the HIV+ people. The N-terminus region of Tat mediates binding to CD26, that may be involved in modulation of chemokine function, and may also mediate T-cell apoptosis. Species (Isotype) mouse (IgG)
References Marinaro *et al.* 2003
Keywords adjuvant comparison, mucosal immunity
 • Intranasal immunization of BALB/c mice with Tat and e.coli heat-labile enterotoxin (LT) and non-toxic LT-R72 LT induced strong antigen-specific IgG Abs which remained stable for one year. Tat-specific IgA responses were measured in vaginal and intestinal secretions. Immunization of BALB/c mice with native Tat (aa1-86) induced serum IgG directed against an immunodominant epitope (aa1-20) and against a second epitope (aa 46-60). CTL responses were also observed. Anti-Tat serum Abs neutralized Tat activity in a dose-independent manner. C57BL/6 remained unresponsive to Tat immunizations when Tat was co-administered with LT or cholera toxin (CT) as adjuvant; BALB/c mice are H-2d, C57BL/6 are H-2b. Congenic BALB.C mice that express H-2b rather than H-2d also could not respond to Tat, suggesting the response to Tat is constrained by the haplotype. Keywords immunotherapy, rate of progression

- Comparing 67 fast progressors with 182 non-progressors in the GRIV cohort, only anti-Tat Ab levels, not Abs to Env, Gag, or Nef, were correlated as a serological indicator of rate of progression. This suggests that raising Tat Abs may be beneficial as immunotherapy or in a vaccine. Zagury *et al.* [1998] (**immunotherapy, rate of progression**)

Keywords antibody binding site definition and exposure, rate of progression, subtype comparisons, vaccine-specific epitope characteristics

- Serum samples were obtained from the French GRIV (genetic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses as both may contribute as extracellular proteins to pathogenesis. Serum anti-Tat IgG responses were significantly higher and maintained for up to 20 months in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) compared to unstable non-progressors and fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). Anti-Tat IgG from GRIV stable non-progressors recognized linear epitopes located within the N-terminal, basic and the C-terminal domains of Tat. Humoral responses of fast-progressors and of one unstable non-progressor were restricted to the basic region of Tat. Tat toxoid vaccinees from Milan tended to recognize N-terminal and C-terminal domains. Sera from some GRIV and Tat toxoid vaccinees cross-reacted in an ELISA assay with a truncated 89.6 S/HIV 89.6P Tat, 89.6P Tat, HIV-1 subtype E (CMU08) and with SIVmac251 Tat (one sample). Ab Type C-term, N-term, Tat basic region

References Richardson *et al.* 2002

Keywords antibody binding site definition and exposure, vaccine antigen design, variant cross-recognition or cross-neutralization

- Anti-Tat responses were raised in rhesus macaques using IIIB Tat, SHIV89.6P Tat, carboxymethylated Tat and 89.6P Tat toxoids. Tat IgG responses to the vaccine were cross-reactive with subtype E and MAC 251. Ab and proliferative responses were observed, and the truncated 86 amino acid IIIB Tat was more

immunogenic than the full 102 amino acid Tat. Tat vaccinated animals when challenged with SHIV89.6 were infected despite a robust immune response and were not distinguishable from controls. - Vaccinia p14 can elicit NAbs and p39 tends to be immunodominant, so these two proteins were fused to regions of HIV-1 Env – reduced glycosylation was noted when p14 or p39 was placed in the N-term region of the fusion protein – chimeric proteins shifted the Env Ab response from V3 to either a C1 or C4 domain, depending on the construct – all chimeric Env proteins: 14kEnv, 39kEnv, and Env39k elicited a strong Ab response to the C1 region of gp120 (LFCASDAKAYDTEVHNVWAT), and Env39k mounted a strong response to the C4 region (KAMYAPPISGQIRCSSNITG) Collado *et al.* [2000]

Keywords vaccine antigen design

- 133/237: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 133/237. Pantophlet *et al.* [2004] (**vaccine antigen design**)

- 133/237: The relative affinity, denatured/native gp120 is 1.4 – mutation of position 69 W/L impairs binding. Moore *et al.* [1994c]
- 133/237: Region of overlap for reactive peptides is WATHA – weak neutralization of lab strains. Niedrig *et al.* [1992b]

Keywords vaccine antigen design

- 133/290: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 133/290: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 133/290: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 133/290: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. Wyatt *et al.* [1997]
- 133/290: Reciprocal binding inhibition with the antibody 522-149, that binds to a discontinuous epitope – binding is enhanced by some C5 and C1 binding site antibodies. Moore & Sodroski [1996]

- 133/290: Used for antigen capture assay, either to bind gp120 to the ELISA plate, or to quantify bound gp120. Wyatt *et al.* [1995]
- 133/290: The relative affinity for denatured/native gp120 is 2.2 – mutation in position 69 W/L impairs binding. Moore *et al.* [1994c]
- 133/290: Region of overlap for reactive peptides is WATHA – weak neutralization of lab strains. Niedrig *et al.* [1992b]

Neutralizing
Immunogen vaccine
Vector/Type: protein *Strain:* B clade BH10
HIV component: gp120
Species (Isotype) rat (IgG2b)
Ab Type gp120 C1
References Peet *et al.* 1998; McKeating *et al.* 1993b; McKeating *et al.* 1992a

- 11/65: UK Medical Research Council AIDS reagent: ARP3076.
- 11/65: Called 11/65a/5h – The most variable amino acids in the V3 loop were replaced with serines to make the immunodominant V3 loop less immunogenic – these changes did not affect the ability of sCD4 or MAbs to V1/V2, C1 and C4 to bind – 11/65 was not affected by V3 serine substitutions –

mice injected with serine substituted gp120 had a reduced response relative to wildtype, and no enhanced immunogenicity of conserved regions. Peet *et al.* [1998]

- 11/65: Binds only soluble gp120, not virion bound – used to quantify gp120 shedding – (numbering is incorrect in original?) McKeating *et al.* [1992a]

Research Contact Matthias Niedrig

References Yang *et al.* 2000; Kropelin *et al.* 1998; Binley *et al.* 1998; Binley *et al.* 1997a; Trkola *et al.* 1996a; Moore & Sodroski 1996; Moore *et al.* 1994d; Moore *et al.* 1994c; Niedrig *et al.* 1992b

- 135/9: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120

- or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 135/9: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
 - 135/9: Noted to bind to C1 peptide HEDIISLWDQSLK – blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) Kropelin *et al.* [1998]
 - 135/9: Binding is enhanced by some anti-C1 and anti-C5 antibodies – enhances binding of some anti-V3, anti-C4 and anti-V2 MAbs – 135/9 binds to predicted alpha-helix in C1. Moore & Sodroski [1996]
 - 135/9: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
 - 135/9: The relative affinity for denatured/native gp120 is 15 – mutation 113 D/R impairs binding to native and denatured, 113 D/A only to denatured. Moore *et al.* [1994c]
 - 135/9: Substitutions 106 E/A, 113 D/A or R, and 117 K/W impair binding, some substitutions enhance binding. Moore *et al.* [1994d]
 - 135/9: Defines the epitope as gp120(114-123) MHEDIISLWD (core LWD?) – weak neutralization of lab strain. Niedrig *et al.* [1992b]

References Gorny & Zolla-Pazner 2004; He *et al.* 2002

Keywords antibody binding site definition and exposure, antibody generation, review, variant cross-recognition or cross-neutralization

- 35D10/D2: In an extensive review of gp120 binding MAbs in this database, V1-specific MAbs are noted to be unusual, but in one study transgenic mouse immunization with SF162 yielded ten V1 MAbs with highly strain-specific autologous NAb responses, and V1 was immunodominant. Human MAbs to V1 may be difficult to isolate due to selection with heterologous strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review**)
- 35D10/D2: Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2kappa MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with HIV SF162 gp120 – several of the MAbs obtained were effective at neutralizing the autologous strain – C-term-V1- region was immunodominant in these mice and the ten V1-specific MAbs could potentially neutralize autologous strain SF162 but were

highly type specific. He *et al.* [2002] (**antibody binding site definition and exposure, antibody generation**)

Keywords ADCC, antibody binding site definition and exposure, co-receptor, enhancing activity, review, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 697-D: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V2 MAb 697-D did not bind to mCHO and had diminished binding to GDMR, while V2 MAb 8.22.2 bound to GDMR but not mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design, vaccine-specific epitope characteristics**)
- 697-D: In a review of Envelope binding MAbs in this database, V2-specific MAbs are noted to have some ability to neutralize HIV-1, but generally weak with limited cross-reactivity; it weakly neutralizes some primary but not TCLA strains. 697-D is the best characterized of the anti-V2 MAbs, and binds weakly and sporadically to isolates from clades A-D. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization, review, subtype comparisons**)
- 697-D: Called 697D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)
- 697-D: Called 697D – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A, 4117C and 697D were used as controls. He *et al.* [2002]

- 697-D: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIR-LKVQK. Maksiutov *et al.* [2002]
- 697-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V2 MAbs 697-D, 1357 and 1361 favored the monomer by approximately 2 fold. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 697-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V2 MAb 697-D did not effect proliferation. Hioe *et al.* [2000]
- 697-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 anti-V2 MAbs, which showed weak and sporadic binding, with the most frequent binding to C and D clades. Nyambi *et al.* [2000] (**subtype comparisons**)
- 697-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – V2 Abs 697-D, 1361, and 1357 tended to bind weakly with a similar pattern of specificity to virions, and bound well to soluble gp120: weak binding to 1/4 B clade viruses (CA5), and weak binding to viruses from subtype A and D. Nyambi *et al.* [1998] (**subtype comparisons**)
- 697-D: Called 697-30D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998] (**variant cross-recognition or cross-neutralization**)
- 697-D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 697-D bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 697-D: Does not neutralize TCLA strains but neutralizes some primary isolates weakly. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 697-D: Partial inhibition of gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor**)
- 697-D: Not neutralizing, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC, enhancing activity**)
- 697-D: Review: called 697/30D – neutralizes some primary, but not lab adapted strains. Moore & Ho [1995] (**variant cross-recognition or cross-neutralization, review**)
- 697-D: Conformational with weak reactivity to V2 peptide IST-SIRGKVQKEYAFFYKLD – neutralized 3/4 primary isolates, but none of 4 lab strains – V2 substitutions 176/177 FY/AT, 179/180 LD/DL, 183/184 PI/SG, and 192-194 YSL/GSS abrogate binding – anti-C4 MAbs G3-536 and G45-60 enhance

binding – mild oxidation of carbohydrate moieties inhibits binding. Gorny *et al.* [1994] (**antibody binding site definition and exposure**)

Keywords ADCC, antibody binding site definition and exposure, antibody generation, antibody interactions, antibody sequence, variable domain, review, variant cross-recognition or cross-neutralization

- C108G: This MAb is type-specific and neutralizes BaL and HXB2. It is the most potent anti-V2 MAb, is glycan dependent, and contrary to earlier reports requires disulfide bonds. Neutralization by C108g is not mediated by CD4 or CCR5 receptor blockage on the cell surface. Binding to CD4 was inhibited by b12, but not by C108g. Binding to CCR5 was completely inhibited by two V3 MAbs, 4117C and 2219, and was substantially inhibited by 2G12, but was not inhibited by C108g. JR-FL is a neutralization resistant strain; modification of JRFL at positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potentially neutralize the modified JR-FL. The MAb 10/76b, that binds to a linear V2 epitope that is unaffected by deglycosylation or reduction eliminating disulfide bonds, could only weakly neutralize this modified JR-FL. Similarly SF162 substitutions in the neutralization sensitive virus SF162 GVK->NMK (167-169) plus the glycosylation site at 160, created a G108g neutralization sensitive virus. In contrast, 10/76b binds to the NMK substituted variant, but addition of the glycosylation site inhibited binding. Pinter *et al.* [2005] (**antibody binding**)

site definition and exposure, variant cross-recognition or cross-neutralization)

- C108G: This MAb is unusual among V2-directed MAbs. It is glycan dependent and can neutralize both a primary isolate (BaL and a TCLA (IIIB) strain. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure, review**)
- C108G: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – C108G bound and directed lysis against only IIIB – this is first demonstration of ADCC directed by a V2 specific MAb. Alsmadi & Tilley [1998] (**ADCC, variant cross-recognition or cross-neutralization**)
- C108G: Inhibits HX10 binding to both CD4 positive and negative HeLa cells. Mondor *et al.* [1998]
- C108G: Viral binding inhibition by C108G was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- C108G: Synergistic neutralization of HIV-1 when combined with anti-V3 MAbs 0.5beta and C311E, or anti-CD4BS MAbs, 1125H and 5145A – neutralization further enhanced by presence of both 1125H and 0.5beta. Warriar *et al.* [1996] (**antibody interactions**)
- C108G: Characterization of MAb variable region. Warriar *et al.* [1995] (**antibody sequence, variable domain**)
- C108G: Strain specificity: LAI, BaL, HXB2 – conformational character – glycosylation site at 160 critical – mutation of conserved glycosylation site at 156 increased epitope exposure. Wu *et al.* [1995] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- C108G: Chimps were infected with HIV-1 IIIB, and this high affinity MAb was obtained from an Epstein-Barr virus transformed B-cell line. It gave potent neutralization of HIV-1 IIIB. Binding was not affected by reduction of disulfide bonds. Binding was disrupted by removal of N-linked glycans. The peptide binds with lower affinity than glycosylated Env. Warriar *et al.* [1994] (**antibody binding site definition and exposure, antibody generation**)

No. 391

MAb ID 10/76b

HXB2 Location gp160 (162–170)

Author Location gp120 (162–171 BH10)

Epitope STSIRGKVQ

Neutralizing L (HXB10)

Immunogen vaccine

Vector/Type: protein Strain: B clade BH10
HIV component: gp120

Species (Isotype) rat (IgG2a)

Keywords antibody binding site definition and exposure, antibody generation, variant cross-recognition or cross-neutralization

- 10/76b: UK Medical Research Council AIDS reagent: ARP3077.

- 10/76b: This study is about the MAb C108g, and 10/76b was a control. C108g is type-specific and neutralizes BaL and HXB2. It is the most potent anti-V2 MAb, and is glycan dependent and contrary to earlier reports requires disulfide bonds. Neutralization by C108g is not mediated by CD4 or CCR5 receptor blockage on the cell surface. JR-FL is a neutralization resistant strain; modification of JRFL at positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potentially neutralize the modified JR-FL. The MAb 10/76b, that binds to a linear V2 epitope that is unaffected by deglycosylation or reduction eliminating disulfide bonds, could only weakly neutralize this modified JR-FL. Similarly SF162 substitutions in the neutralization sensitive virus SF162 GVK->NMK (167-169) plus the glycosylation site at 160, created a G108g neutralization sensitive virus. In contrast, 10/76b binds to the NMK substituted variant, but addition of the glycosylation site inhibited binding. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 10/76b: Neutralizes HXB2, but fails to neutralize chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996]
- 10/76b: Cross-competes with MAbs 10/76b and 11/4b – HXB2 neutralization escape mutant has the substitution I/T at residue 165. Shotton *et al.* [1995] (**antibody binding site definition and exposure**)
- 10/76b: Included in cross-competition and neutralization studies. Shotton *et al.* [1995] (**antibody binding site definition and exposure**)
- 10/76b: HX10 strain specificity – binds native, deglycosylated, or denatured gp120. Wu *et al.* [1995] (**antibody binding site definition and exposure, variant cross-recognition or cross-neutralization**)
- 10/76b: This MAb was obtained from a hybridoma cell line. An R to L substitution abrogated binding. Human sera recognize the 10/76 epitope. McKeating *et al.* [1993b] (**antibody generation**)
